Gladstone's support for Home Rule divided British Liberalism. Landed interests remained dominant within the British ruling class at least until the World War I. The granting of Home Rule for Ireland was perceived as a major erosion of landed power. More than that: it undermined the empire. While Gladstone sought to draw analogies with Canada during the parliamentary debates, the question of India kept arising.

The Home Rule debates brought out the stark contrast between Ireland's formal integration into the British state and its colonial heritage. Tory leader Lord Salisbury described the Irish Home Rule members of parliament as "eighty foreigners." Sir George Campbell, former governor of Bengal, wrote that Ireland "is a colony which we have only partially colonised, and in which the natives have neither been exterminated nor thoroughly assimilated and we have the race difficulties in the way of self-governing institutions with which we are familiar with in other colonies, but in a more aggravated form" (Coakley 2012).

The divisions created within the British ruling class by the Home Rule crisis signalled an erosion of liberal imperialist culture. In the mid-Victorian era, liberal theorists like John Stuart Mill had argued that Britain's role toward its colonies was essentially that of a benefactor, analogous to that of parents toward their children. The native populations of the colonies were at an early stage of social and cultural development, akin to children, who needed careful supervision. Once they advanced to a higher level, at some point in the future, they would be permitted independence. The revolt in India and the mutinous behavior of the Irish had demonstrated not only the ingratitude of the natives but also their incorrigible character.

By the late Victorian era, it became widely accepted in British ruling circles that there existed a fathomless chasm between the civilized peoples and those they ruled over. This expressed not just divergent levels of development but a deeper divide between higher and lower races. This shift in elite opinion seems to have been sharpened by the reemergence of social unrest within England, giving greater weight to the need for domestic social cohesion. The innate superiority of British civilization, and of the English race within that civilization, became a cardinal belief of the era, shared high and low (Mantena 2010).

Conservatives and Liberal Unionists responded to Gladstone's initiative by focusing on Ulster, the only part of Ireland where there was any significant popular opposition to Home Rule. The northern province of Ulster was the only region of Ireland where a colonial mass settlement had been successful. However, in Ulster, there were two fairly distinct settler communities, Presbyterians from Scotland and Anglicans from England. Though not as severely maltreated as the Catholics, the Presbyterians did experience significant levels of exclusion, and over the course of the eighteenth century, they became increasingly alienated from the governing order. Heavily influenced by the American settler revolution, with which many had close connections, they played a leading role in the United Irish rebellion.

In the wake of the 1798 rebellion, the predominantly Anglican landlord class made an effort to reunify the Protestant communities in the province, upholding the informal traditions of the "Ulster Custom," which gave tenant farmers far greater levels of security than existed elsewhere in Ireland. As a consequence, there existed in Ulster, especially in the eastern regions where Protestants were concentrated, a more prosperous layer of tenant farmers than was found elsewhere in the country. The Presbyterian tenant farmers of the north largely supported the demands of the Land League but were more cautious about the rebellious spirit it seemed to encourage.

The northeast was the only region in Ireland to experience any significant level of industrialization in the nineteenth century. The linen industry was slower to mechanize than the other textile industries, and by the mid-century, the Belfast region had become the main geographical center for linen production. Later in the century, the industrialization of the Belfast region was consolidated by the development of a passenger shipbuilding industry. This industrial growth enabled the northeast to escape the worst of the underdevelopment that marked the rest of Ireland, but it remained much too limited to overcome the wider Irish socioeconomic context. Specifically, it was insufficient to provide employment for the "surplus" population of Ulster, much less the rest of Ireland. Many more handicraft textile workers were made redundant by the process of mechanization than were employed in the new factories. Between 1841 and 1911, Ireland lost half its population, while Ulster lost a third. The limited character of industrialization in the Belfast region encouraged the reemergence of a confessional politics in the region. Anglican laborers imported the anti-Catholic Orange Order into Belfast in the early nineteenth century. Later, as a nationalist mass movement developed, Orangism broadened its social appeal. From the period of the Home Rule bill in the 1880s, Ulster Unionism and Orangism effectively merged. The alliance between Conservatives and Liberal Unionists (they would later merge to form the Conservative and Unionist Party: the Tory Party) proved sufficiently powerful to block Gladstone's Home Rule bills in the 1880s, but they were unable to suppress the nationalist political movement in Ireland or to curtail a resurgent nationalist popular culture.

What a Conservative government did do was to initiate a policy of peasant proprietorship in Ireland: the state lent money to tenants to buy out the landlords. This policy, "killing Home Rule by kindness," had a major long-term effect, though by the time of the World War I it had only been partially implemented. It helped to strengthen a stratum of large farmers and, alongside them, an emergent Catholic middle class (Coakley 2012).

Ireland and the Imperialist War

Throughout the long period of its global ascendancy in the nineteenth century, Britain avoided becoming involved in fixed alliances with other European states, preferring a more flexible "balance of power" approach. This changed in the early twentieth century. Growing rivalry with Germany and increased dependence on India to maintain sterling's role as the world's hegemonic currency compelled Britain into an alliance with Tsarist Russia (which was seen as a potential threat to British rule in India). This geopolitical logic for war was reenforced by the need to unify their domestic population against deepening political antagonisms and social unrest. The Irish drive for independence played a key role here (De Cecco 1984; Newton 2015).

After the 1910 election, the Liberal Party was dependent upon support from the Irish Home Rule Party to govern and was compelled to introduce a new Home Rule bill. Despite the fact that the Home Rule bill granted Ireland very limited powers of self-government, it was strongly opposed by the Tories. The Tories encouraged militant opposition in Ulster, and the British state apparatus acquiesced in the arming of Ulster loyalist volunteers, who were determined to use force if necessary to block Home Rule. Irish nationalists responded by developing their own force of armed volunteers.

The European war was welcomed by many in the ruling class because it seemed to offer the prospect of overcoming these domestic conflicts and unifying the kingdom against an external enemy. Both the leadership of the Ulster Unionists and of the Home Rule Party supported the war effort and encouraged the volunteers to enlist in the British Army.

If Europe's leaders imagined that a large-scale war would instill widespread social discipline, they miscalculated badly. The sheer scale of the slaughter undermined the legitimacy of their rule, not only in Europe but throughout the colonial world. The 1916 insurrection in Dublin by the radical separatists of the Irish Republican Brotherhood and the labor leftists in the Irish Citizen Army captured the popular imagination in Ireland, as well as inspiring opponents of empire across the world.

The extent of the transformation of Irish political life became evident in 1917, when the British government attempted to impose conscription on Ireland. The anti-conscription movement was the broadest and deepest mass campaign in Ireland since the Land War. Not only was the conscription plan defeated, but it laid the groundwork for Sinn Fein's victory in the 1918 elections. Both socially and politically, Sinn Fein was a coalition of forces, ranging from left-leaning radical republicans to more moderate nationalists who were alienated by the Home Rule leaders' support for the war.

The elected Sinn Féin members refused to go to Westminster, meeting instead in Dublin to declare a separate Irish parliament, Dáil Éireann, and an independent republic. This triggered a battle of independence with the republicans developing a guerrilla war strategy. Though poorly armed, they succeeded in paralyzing the workings of the British state in Ireland.

The war of independence was also accompanied by a wave of social unrest. In rural areas there was a new upsurge in land agitation. Half of the land was still owned by landlords, and small holders struggled for access, especially where land had been allocated to graziers. There was also a wave of labor struggles provoked by a wartime wage freeze. Both struggles were encouraged by a paralysis of the state, which enabled a huge growth of trade union membership (Campbell 2005; Kostick 2009).

The war of independence revealed the weakness of the British state in Ireland: its conspicuous failure to establish any significant degree of hegemony. But it also revealed the social conflicts within nationalist Ireland. Rising social tensions within Ireland encouraged both the British government and the Sinn Fein leadership to seek a compromise solution.

The 1921 Treaty accepted partition and the British insistence that Ireland remain part of the British Empire. The six counties in the northeast, Northern Ireland, remained part of the United

Kingdom but acquired a separate parliament and a regional government. The "Irish Free State" would have dominion status within the empire, similar to Canada or Australia. The British monarch would remain head of state, and all members of the Irish parliament would have to swear allegiance to the crown. The Royal Navy would also retain control of a number of ports.

The Treaty was passed narrowly by the Dáil but opposed by most of the republican activists. The civil war that followed was won by the Free State forces with the assistance of the British state. The defeat of the republicans was also accompanied by a suppression of agrarian radicalism and a rolling back of labor rights and organization (Lee 1989; Regan 1999).

The two new states in Ireland bore the marks of their origins. The Cumman na nGaedheal government of the Irish Free State sought to maintain institutional continuity with the British order. The civil service and the legal system were retained more or less intact, and there was little change in social or economic policy. The effect was to continue Ireland's subordination to Britain. The vast bulk of Irish exports – overwhelmingly agricultural – went to Britain. The Irish currency was tied to sterling. Interest rates were determined by the Bank of England and the Treasury in London. The government was dominated by ministers from large farming and upper middle-class backgrounds who were reluctant to adopt any policies of state-led development or import substitution.

Only with the coming of the depression did matters change. Fianna Fáil, formed from elements of the losing side in the civil war, came to power in 1932 and began a program of encouraging industrialization through import substitution and protective tariffs. Semi-state bodies were formed to promote development, and some effort was made to reduce the worst of the poverty. They introduced a major program of publically owned house building. The Fianna Fáil government ended the Oath of Allegiance to the monarchy and began the process of distancing themselves from the British Empire. These policies did lead to some growth in industrial employment and did something to improve social conditions, but it was never enough to compensate for the "flight from the land" or eliminate the legacies of uneven development.

Northern Ireland was the only part of the United Kingdom permitted a devolved government. It was ironically the only part where a mass movement opposing devolution existed. The Northern Irish state was dominated from its formation by the Ulster Unionist Party, the local branch of the Tory Party. Almost all the Unionist members of parliament were also members of the Orange Order, which helped it secure majority support from all classes of Protestants in Northern Ireland. The Unionist leaders had envisaged that Northern Ireland was economically the most advanced part of Ireland, but in the interwar years, economic stagnation was even more extreme than in England. Both shipbuilding and linen industries were in decline, and unemployment and emigration rates were much higher than elsewhere in the United Kingdom, though at all times, these rates were far higher among Catholics than among Protestants. The practices of systematic exclusion of Catholics from most areas of public and private employment left a legacy of discontent which would later explode and engulf the state in decades of civil warfare (Farrell 1976; Lee 1989).

Definition

This essay explores the work of British social liberal and writer John Atkinson Hobson (1858–1940), focusing on his evolving understanding of economic imperialism, its causes and its consequences. It concludes with an assessment of Hobson's contemporary significance.

In 1902, John Atkinson Hobson (1858–1940), published *Imperialism: A Study*. In this, his most famous work, he argued that there was a systemic mal-distribution of income and of wealth in advanced capitalist societies that led, on the one side, to under-consumption by the masses; on the other, to over-saving by the few rich. He went on to claim that, unable to find profitable markets at home, this over-saving was translated into investments in overseas markets and had been, amongst other things, the primary motivation behind Britain's recent imperial expansion in Africa and Asia. This is undoubtedly Hobson's most famous anti-imperial argument but two cautions are necessary. In the first place, *Imperialism* offered far more than just a bald theory of economic imperialism and was actually a brilliant critique of many aspects of British imperial ideas and practice. Second, although the fullest and most compelling of his works on empire and imperialism, Hobson lived a long life and changed his mind on the subject on more than one occasion.

Hobson's Early Writings

Hobson was the son of a provincial newspaper owner who supported the Liberal orthodoxy of free trade, low taxation, and a very limited role for government in the economy. Hobson did not initially think differently. After taking a disappointing degree at Oxford, he became a schoolmaster in Exeter. In the mid-1880s, he moved to London where he wrote a weekly column for his father's paper on national and international affairs, and then began to contribute to the periodical press. In the late 1880s he approved of British 'free trade imperialism' in China as a means of encouraging exports: and when alerted by Charles Booth's survey of the London masses to the dire poverty of so many of them, his first reaction was to fear that their position would be made worse by the looming industrialisation of Asia under Western auspices; that inclined him to hint that protection was a solution (Hobson 1891).

Also, when Joseph Chamberlain, a leading imperialist politician, suggested in 1896 the establishment of an imperial Zollverein which would put a tariff barrier around the white empire, Hobson was quite supportive of the idea.

However, by the mid-1890s, his views on the economy were changing swiftly. In 1889 he and A.F. Mummery produced *The Physiology of Industry* which challenged the orthodox notion that full employment was the norm towards which free markets were constantly tending. At first this theoretical revolution had little impact on Hobson's policy views: but, partly under the influence of radicals such as William Clarke, by 1896, in *The Problem of the Unemployed,* he was claiming that inequality was producing underconsumption and over-saving; and that they could only be corrected by redistribution of income and of wealth (for the development of Hobson's thinking, see Allett 1981). At the same time, Hobson's rather complacent approach to British imperialism was shaken by the financier Cecil Rhodes's failed attempt to overthrow the Afrikaner government in the Transvaal. That was widely seen on the left of politics in Britain as a prime example of an emergent 'financial imperialism'. But it was only in an article of 1898 that Hobson finally linked domestic economic imbalance with expansion of empire (Hobson 1898). On the strength of that article, Hobson was sent to South Africa by the *Manchester Guardian* to investigate the growing crisis there as Joseph Chamberlain tried to force the Afrikaner republics, whose gold wealth threatened to make them the dominant force in South Africa, to recognise British authority. That confrontation ended in the South African War of 1899–1902. His trip convinced Hobson that Rhodes and other gold magnates had used the British government for their own ends and that, through control of the press, had fooled the public, in South Africa and in Britain, into believing that the war was fought for noble ends rather than to fill the pockets of mining millionaires. Much of his thinking on South Africa was published in *The War in South Africa* (1900) and *The Psychology of Jingoism* (1901). *Imperialism: A Study* went much further and was nothing

less than an attempt to explain the nature of modern imperialism in general.

Hobson and the Radical Tradition

Because Lenin found *Imperialism* useful in constructing his own interpretation of European expansion overseas, historians have often talked of a 'Hobson-Lenin' theory of imperialism. In fact, Hobson's approach owed nothing to Marxism but did reflect a long radical tradition of hostility to imperial expansion which can be traced back as far as Adam Smith and Tom Paine. Radicals were supportive of capitalism: what they objected to was privilege and monopoly; and, of course, they identified the landed interest as the chief example of that. Radicals such as Paine, Bentham, and James Mill also pointed to aristocratic control of the state across Europe and aristocrats' use of government to fight wars and grab colonial possessions with which they could enrich themselves and their allies in the military services and business. Richard Cobden and John Bright, two of Hobson's radical heroes, took up the fight in the mid-nineteenth century, attacking land monopoly, demanding an end to protective duties on agriculture as a form of privilege, claiming that taxes were damaging industrial investment and that their proceeds were too often spent on wars and colonialism that produced jobs for the aristocracy's allies. Herbert Spencer, an enthusiastic Cobdenite whose work Hobson became familiar with, divided the world into 'militant' societies that were aristocratic, hierarchical, warlike, and imperialist; and 'industrial' societies that were based on voluntary co-operation, were economically progressive, and which forged peaceful links with other nations (for more detail on radicalism, see Cain 2002, pp. 47–53).

Once radicalised, Hobson eagerly adopted the Cobden-Spencer line on imperial expansion but he made two great innovations to it. Firstly, he recognised that by 1900 the power of aristocracy had waned and he suggested that it had been superseded, as the chief force maintaining the status quo at home and driving expansion abroad,

by finance and foreign investment: 'militant' society still existed but it was now itself subject to the powers of 'parasitism', a complex of forces centred on the City of London but also now rampant on Wall Street in New York and on the Paris Bourse. Secondly, he linked this financial imperialism directly with his analysis of underconsumption, thus arguing forcefully that the remedies necessary to cure the latter ailment – such as more progressive taxation – would simultaneously remove the pressure for overseas expansion and thus solve the imperial problem that plagued all advanced capitalist societies.

Imperialism: Hobson's Analysis

In *Imperialism,* Hobson was right to identify London and the service sector of the South East of England as the area from which most foreign investment sprang, and in suggesting that it had a big economic stake in imperial expansion. His assumption that foreign investment was largely the concern of a small, wealthy elite also has historical credibility. However, Hobson's attempts to analyse the costs and benefits of imperialism statistically were severely flawed. To begin with, he overestimated the costs of imperial expansion after 1870. He assumed that all increases in defence expenditure since that time could be debited to imperial expansion, whereas only a part of the army costs and a smaller fraction of the naval expenses were so attributable.

Nor did Hobson make a good job of proving his contention that finance gained far more in material terms than any other economic sector and that it was the only sector that gained more than it paid out in terms of the taxes needed to support imperial expansion. In pursuit of this objective, Hobson tried to prove that industry gained very little from the new markets of Africa and Asia. However, he reached this conclusion by using very contentious methods. When estimating the value of exports to the economy, he claimed that this value arose from the extra profit that was gained by selling abroad rather than at home. This 'net value' approach to foreign trade was even challenged by some sympathetic to his general

position. Given that the costs of imperial expansion were lower than Hobson believed, those critics who had a rather more generous view of the importance of foreign trade to the economy could make a reasonable case for saying that new territories were beneficial to industrial exports. Moreover, Hobson failed to engage seriously with the argument that the value of new territories to the economy would be much greater in the future once imperialist control had been fully established.

Hobson also assumed that the returns on foreign investment were much higher than those on foreign trade but, in doing so, he failed to compare like with like. As we have seen, he valued foreign trade in *net* terms but he then went on to compare that with the gross returns on foreign investment, ignoring the possibility that the capital could have found outlets at home, albeit at lower rates of return. Hobson, therefore failed to prove that the returns to investment from imperialism were higher than the returns on trade. In addition, it must be said that he compounded the difficulties of his position by failing to say anything precise about the distribution of British foreign investment. He produced figures which proved that more foreign capital went to areas such as the US and the white British colonies than to areas subject to recent imperial exploitation; but he said little to indicate, for example, which parts of Africa had received large amounts of capital and which had not. His argument that Cecil Rhodes and his financial associates were directly responsible for Britain's imperial aggression in South Africa was asserted rather than proved.

Hobson's other main line of argument was that finance, or rather financial elites in the City of London, controlled the political and military process of expansion. More specifically Hobson identified a cluster of mainly Jewish financiers, operating from the City of London and a number of lesser financial centres, as controllers of the main flows of international capital. In a famous passage he argued that the 'motor power' of imperial expansion was provided by soldiers, traders, missionaries, statesmen: but that finance was the 'governor of the imperial engine, directing its energy and determining its work' (Hobson 1988/1902, p. 59).

Elsewhere in *Imperialism,* however, Hobson unconsciously subverted his simple argument about the dominance of finance in different ways. He was trying to generalise about the whole Western world rather than just explain British imperialism; and when writing of the US, where the relations between finance and manufacturing were different to those in Britain, he spoke of 'the great controllers of industry' as key players. When he was thinking about imperial expansion from a British point of view, Hobson was inclined to present it as the result of a conspiracy engineered by a small group of financiers who had an exceptional degree of power and influence: when considering the US, on the other hand, he was really attributing expansion to 'finance capitalism', a conjunction of industrial and financial interests described in terms that Veblen, Hilferding, or Lenin would have recognised.

He also developed another argument concerning the complicity of a congeries of propertied interests in British imperial expansion which, interesting though it was, undermined the argument that finance was 'the governor of the imperial engine'. At this point he claimed the following:

> The city ground landlord, the country squire, the banker, the usurer, the financier, the brewer, the mine-owner, the ironmaster, the shipbuilder, and the shipping trade, the great export manufacturers and merchants, the clergy of the State Church, the universities and the great public schools, the legal trade unions and the services have … drawn together for common political resistance against attacks upon the power, the property and the privileges that they represent. (142)

Hobson was here describing what Gramsci later called an 'historical bloc' of forces that exercised cultural as well as economic 'hegemony' over the nation and which used imperialism as a means of maintaining the status quo at home. But it is noticeable that in Hobson's list of villains, the financier is accorded no special place.

Lastly, it is evident that Hobson believed the extraordinary influence of financial interests came partly from the fact that they encouraged imperial fervour and even presented expansion as a moral duty, while remaining immune from any emotional commitment to empire and clinically intent on pursuing their economic agenda. Financiers pursued rational economic goals: all other interests involved were irrational, uninformed, or deluded. Hobson's discussion of the wide variety of arguments used to justify imperialism and imperial expansion was often brilliant and arresting. He was also extraordinarily sensitive to the ways that imperialists could cloak essentially materialist concerns – and the violence and exploitation that sometimes involved – in the language of morality, mission, liberty and destiny. Yet in the process he often showed that the financiers were also prisoners of imperial ideology, that they could be as much wedded to causes like 'the civilising mission', as much misled by heightened imperial rhetoric, as anyone else.

Hobson on China and Africa

Much of the emotional force behind the arguments of Imperialism came from Hobson's involvement in South Africa. Yet when in 1898 he first discovered the connection between over-saving and imperialism, his immediate inspiration came from thinking about the growing battle for control of China between the European imperial powers. A careful reading of *Imperialism* reveals clearly what Norman Etherington (1984, chaps. 3–4) has argued: that Hobson thought of the South African crisis as an early stage in the unfolding drama of imperialism, a drama whose central scenes would be acted out in China, the place where the future course of civilisation would be determined. Like many of his contemporaries not only in Britain but also across Europe and the US, Hobson was sure that China's population and resources were so immense that the manner of their development would radically affect the political as well as the economic structures of the globe in the twentieth century. Some British and American writers argued that the powers that controlled China and its market would be pre-eminent for the foreseeable future, and that those who failed to establish themselves would be depressed into the second rank. Certainly, this fear of being left out of what was

potentially the greatest market in the world was a potent force in Great Power diplomacy in China around 1900. But opinion in Britain and other imperial powers was also strongly influenced by a more complex vision of a 'Yellow Peril'. In his *National Life and Character,* first published in 1893, Charles Pearson predicted that China, like Japan, was rapidly learning the economic arts of the West, would soon industrialise itself on modern lines and then become a formidable military power. Western civilisation would be thrust back to its pre-imperialist borders. European powers would be impelled into greater militarism to protect themselves, and into heavier tariffs to contain Chinese competition, stifling the dynamism that had driven Western civilisation for the previous four centuries, and inducing both economic and cultural stagnation and possibly outright decline.

As we have seen, Hobson had anticipated Pearson's predictions about industrial decline in Europe in 1891 though he believed that China could only industrialise under European control. In 1902, Hobson still did not think that China could achieve autonomous economic development: it would, he thought, become such a sink for foreign capital that no one country could command the resources necessary to the task. The outcome would be what Hobson called 'inter-imperialism' (1988/1902, p. 332), a combination of European, American, and Japanese capital resources which would ensure the exploitation of China over the coming generations without military conflict. Based on Western capital and on an abundance of cheap, highly submissive labour, the Chinese economy would be brutally transformed into the mightiest manufacturing nation in the world. As a result, industry in the West would be largely destroyed and its economies would become dependent on services and dominated by financial capitalism. True to his radical perspective, Hobson claimed that the decline of industry in the West would involve far more than simply a loss of economic resources: it would also mean the extinction of liberty, democracy, and progress in general; and Britain, like other Western nations, would become parasitic on the progress of Asia.

Despite the fierceness of his critique of expansion, Hobson shared some of the prejudices of the imperialists he criticised. The first was that no nation or community had the right to cut itself off from international trade and the progressive ideas that such trade brought with it. Secondly, he accepted the common Western assumption that the ancient civilisations of the East had ceased to progress and that they had needed an infusion of the West's energy to awaken them, though he felt that the stimulus given by trade and other informal contact was all that was now required to galvanise them. Besides that, Hobson was convinced that the 'mushroom civilisations of the West' (1988/1902, p. 326) had much they could learn from the East. Thirdly and in contrast, Hobson, like most of his contemporaries, failed to appreciate the richness of the African past and talked of 'lower races' (see the heading of pt II, chap. 4 in *Imperialism*) who could only progress under direct Western leadership because otherwise the local populations would be exploited by European capitalism. But given his belief that current Western governments were in thrall to their business leaders, Hobson argued that, in an ideal world, leadership would be provided by some form of international authority rather than by particular European nations. It was in this context that he first became a vigorous supporter of the idea of international government, and of the League of Nations formed after the First World War, which established the idea, in theory at least, that European nations held their colonial dependencies as mandates granted by the League.

Imperialism and Hobson's Later Writings

In 1902, Hobson painted a black picture of the future partly because he wanted to shock his readers into realising where present policies might lead and to stimulate action against them. His own solution was simple and drastic. Progressive taxation and state welfare spending would eliminate over-saving and, therefore, the main source of foreign investment, and thus reduce the need for imperial expansion. Simultaneously, redistribution would give a boost to domestic

demand and divert to the home market a large part of the produce previously destined for export. The implication of that analysis was that, under this new regime and despite free trade, he expected that the amount of international trade would decline. Economic development in the West would then proceed on lines dictated by local democracy rather than by an international financial oligarchy; and those countries like China that were subject to forced industrialisation under foreign control would be released to develop in ways that best suited their own genius. 'Industry', understood in the broad sense as all forms of productive activity, would triumph over 'parasitism'.

Imperialism is now a 'classic' text but it was not a great success when first published and even some radicals who were impressed by Hobson's domestic arguments thought of empire and imperial expansion as both economically necessary and morally defensible (see e.g. Samuel 1902, pp. 301–325). Although the book was republished in 1905, this was only made possible by a subsidy from a radical organisation. Indeed, from 1910–14, Hobson had drifted far from the arguments of *Imperialism* and was now writing of European expansion overseas as a phase in the extension of a benign, global capitalist network and one that would eventually lead to an economic convergence between the developed and underdeveloped worlds, to global peace and to some form of world government. This strain in Hobson's thinking is most evident in *The Economic Interpretation of Investment* (1911). After 1914, and in the face of world war and then acute economic depression, Hobson drew away from that pre-war optimism. His book *Democracy after the War* (1917) repeated many of the arguments of *Imperialism* and extended some of them. His inter-war writings on imperialism were a sometimes uneasy compromise between the stern denunciations of *Imperialism* and *Democracy after the War* and the rather Panglossian assumptions of 1910–14.

In 1938, aged 80, Hobson decided to republish *Imperialism*. By the late 1930s, middle-class public opinion in Britain was becoming much more critical of empire and imperialism. Under growing

Marxist influence, there was also an increasing tendency to offer economic interpretations of imperial expansion and control, and writers such as John Strachey (1938, pp. 85–89) and Leonard Barnes (1939, p. 195) began to think of Hobson's work as a precursor of Marxism. Encouraged by the new interest and convinced that the approaching war was about re-dividing the imperial spoils, Hobson decided that his ancient text was worth reprinting. But in republishing it, and despite adding a new long preface, he did not attempt to update the argument. Nor did he give any indication that he had ever held different views. His autobiography *Confessions of an Economic Heretic* (1938), published in the same year, suffered from the same degree of amnesia. However, in that autobiography Hobson did confess that he now thought that the stress laid on economic causation in *Imperialism* was overdone (Hobson 1938, pp. 63–64); and he now admitted that economic gains should also be seen as a means of exercising power rather than simply as an end in themselves (especially in Hobson 1937, pp. 13–14, 24). This line of thinking was probably influenced by his reading of Thorstein Veblen but it was not mentioned in the preface to the 1938 edition of *Imperialism* and thus it fell out of view, along with most of the other ideas he had had on the subject before and after 1902.

Hobson's Significance

Hobson's analysis has often been found wanting by historians and economists both in general terms and in specific cases. Nonetheless, a recent analysis by Cain suggests that he still has a lot to offer historians interested in the economic elements of the scramble for territory and influence in Africa and Asia in his own time (2002, chap. 8). Speaking more generally, *Imperialism* remains a book worth reading because the questions it poses about the role of foreign investment in provoking imperial expansion remain on the agenda: for example, Hobson's ideas were important to Cain and Hopkins in helping them recently to reinterpret the evolution of British imperialism (Cain

and Hopkins 2001). It is also true that books like Naomi Klein's *No Logo* (2000), which analyses modern US imperialism, approach their subject from a radical rather than a Marxist perspective and one that is recognisably Hobsonian though Klein might not be aware of it. *Imperialism* also has extremely interesting things to say about the politics, the psychology and even the theology that lay behind imperial expansion in its time, and its commentary on the ideological foundations of the so-called 'civilising mission' are extraordinarily acute. Indeed, some of Hobson's analysis could be applied to empires throughout history. He was, for example, aware – in a way most of his contemporaries, including other critics of empire were not – of just how easy it was for Britons to assume that the possession of military and economic power not only gave their nation the *ability* to possess empire but also the *right* to possess it because it was assumed that the material power was the result of a moral superiority. That was an insight that can be applied to empires from the Assyrian one to the current Chinese hold over Tibet.

If Part I of *Imperialism,* which deals with the economics of empire, is full of errors as well as inspirational ideas, Part II probably deserves a bigger audience from historians than it has so far received. *Imperialism; a Study* may have been published over a century ago but it is still a living text rather than just another item in the historiography of empires.

Definition

This entry concerns James Connolly, the most important Marxist thinker and activist Ireland has produced. Famous for his part in the Easter Rising of 1916, Connolly also was intensely active in labor politics, Marxist theorization, and radical historiography. His work is now recognized to contribute to the critique from the imperial margins and global South of the Eurocentrism of the mainstream Marxist tradition, and as such as is seen as proleptic of thinkers as various as Amin and Guha.

James Connolly (1868–1916) is one of the heroic figures of Irish revolutionary history. A leader of the Easter Rising of 1916, he was the last of the signatories of the Proclamation of the Irish Republic to be executed at Kilmainham Jail in Dublin – tied into a chair because his wounds prevented him from standing and shot to death by firing squad.

Yet Connolly was the odd man out among his executed colleagues. He was a proletarian, a labor leader, and a Marxist. These qualifications mark him out for his exceptional status in the pantheon of Irish historical figures of note. More than most of his colleagues – except perhaps the IRB veteran Thomas Clarke – Connolly saw himself for most of his adult life as a *revolutionary.*

Connolly's very prominence in Irish popular affection is peculiar given the history of the Irish Left and the way that Ireland's relationship to empire has mostly been understood. This essay will seek to tease out these complications and anomalies, noting their political and disciplinary, even methodological, roots. Ranked fourth in a 2010 poll of "greatest persons in Irish history" (behind John Hume, Michael Collins, and Mary Robinson and ahead (thankfully) of Bono), Connolly's life is yet little known, and his internationalism is rarely given serious discussion. Mostly, he is associated with the Dublin Lockout of 1913 and then with his part in the Rising. The wider framework and the larger spaces in which he moved and found his political identity and purpose are infrequently considered in Ireland.

A number of reasons account for the ways in which Connolly, his life, activities, and ideas, have been framed and received in Ireland. These reasons consist of factors operating both in the wider society and political system and in the narrower, but no less "political," academic sphere. Most broadly speaking, Connolly's isolation among the Rising leaders illustrates the fact that in the revolutionary period 1880–1922, the predominant political currents in Ireland were those concerned with nationalism – either constitutional (the Home Rule movement and its political analogues in the Irish Parliamentary Party, led by Charles Stewart Parnell and then John Redmond) or militant (the Irish Republican Brotherhood and those forces that came in its wake, the Irish Volunteers and the Irish Citizen Army) – and with empire (represented in Ireland by the movements against Home Rule and in favor of the preservation of the Union (most strikingly the Ulster Volunteers)). This great opposition between nationalism and unionism, which changed the "Irish question" as it was known in the nineteenth century into the "national question" in Ireland in the twentieth century, structured the political sphere and seemed for many people to exhaust the range of possibilities of political action, social positioning, cultural allegiance, and ideological thinking in Ireland, both in Connolly's time and long after it. This overwhelming polarity is one which contemporary Ireland still wrestles with, and it's one which events and forces operative long after independence and partition still seem shaped by.

Such has been the power of the national question that other modes of action and understanding – most obvious for our purposes in regard to Connolly, the mode of thinking and acting in society and politics on the basis of *class*, but also the modes of feminism, of regionalism, and of minoritarianism – have been weak and have found it hard to win themselves an audience. Over and over again, in Connolly's lifetime, the national question would trump or override other issues. The felt need for secession from the United Kingdom, the opposition to Britain, appeared to be *the* radical mode of thinking and acting politically, socially, and culturally. Other angles of vision were, apparently, irrelevant, or a damaging distraction, or a disuniting force, in the single-minded push for Home Rule or independence.

This powerful framing did not, of course, operate only at the level of discourse. It emerged out of solid historical factors. Most obviously, the constitutional question had been a crucial feature of Irish politics for hundreds of years: that is, the source of sovereignty and, arising from that, the ability of the Irish polity (or polities) to legislate for itself had been fundamentally determined by forces beyond the island, whether in London or in Rome. In 1155, Pope Adrian IV empowered King Henry II of England, by way of a "bull," to reform the Irish Church and people. This proposal was not acted upon, but it served as a retrospective justification for later actions and events. In 1166, the Gaelic Irish king of Leinster, Dermot MacMurrough, invited Richard FitzGilbert, the Earl of Pembroke, to assist him militarily against his local Irish rivals. FitzGilbert – known in Ireland as "Strongbow" – was promised Dermot's daughter, Eva, the Leinster succession and fine fiefdoms for his lieutenants. Strongbow's full-scale intervention began in 1170, but he was wise enough immediately to place his conquests in Ireland under the protection of Henry II. In this way, English sovereignty in Ireland found its origin and its basis. Pope Alexander III reinforced this dispensation, by granting Henry II the lordship of Ireland. The emergence of Parliament in Ireland followed that in England, deriving from the Magna Carta which provided for a Magnum Concilium, called in Ireland by the Crown's representative, the viceroy. This assembly, initially only of great lords and church prelates, operated more or less successfully as English power expanded or decreased in Ireland. In 1494, with English power shrunk to the small eastern region around Dublin known as the "Pale," and therefore in danger of being overawed by the great Gaelic lordships and the independent Norman magnates, the Irish Parliament passed Poynings' Law, effectively subordinating itself to the London Parliament.

The great features of Irish history for the next 200 years, principally, the erosion and then collapse of the Gaelic order and the implantation of colonies in at least three major waves, Laois and Offaly in the midlands and the southern province of Munster in the 1500s and then, under James II, the most successful and serious plantation of Ulster in the 1600s, though possessed of their own dynamics and details, can also be read principally as mutations in the constitutional status of Ireland. Parliament sat infrequently – usually at the start of a monarch's reign and then only to pass legislation at the monarch's request or that of the viceroy. As colonization increased, Parliament became a representative forum and a legislative mechanism for that Anglo-Protestant colonial community. This sectarianization of the legislature was most firmly reinforced by the passing of penal legislation against Roman Catholics, starting soon after the victory of William II in the "Glorious Revolution" of 1689. Catholics could vote in parliamentary elections until 1728, but taking a seat in Parliament was forbidden to Catholics. Yet because of the subordination of the Irish economy, and Parliament, to London, the Anglo-Irish suffered a depletion in numbers during the eighteenth century. Many emigrated to the American colonies, and this pattern eventually bore fruit when the "patriot" tradition of Protestant-led Irish autonomy vis-a-vis Britain eventuated in "Grattan's Parliament" of 1782. Henry Grattan and his allies sought the independence of the Irish Parliament and, to this end, won the repeal of Poynings' Law. Furthermore, Grattan's "patriot" politics – essentially a politics predicated on Protestant leadership of a constituency composed both of Protestants and Catholics – saw the Irish Parliament pass a Roman Catholic Relief Act in 1791 (matching comparable legislation passed in Westminster) which permitted Catholics once again to vote in elections, though not to attain membership of Parliament. The constitutional progress which many would see in this brief phase was snuffed out in the wake of the United Irishmen's great rebellion in 1798 and the Act of Union of 1800. The attempted republican revolution and secession, led by Wolfe Tone and partially aided by revolutionary France, was put down in a brutal war, and, in the context of the fear of revolutionary and then Napoleonic France, Britain sought to quash Irish dissent and unrest by abolishing the Dublin Parliament. From 1801 to 1922, the Irish would have no legislative independence, and their Parliamentary representatives sat in Westminster.

J

In his masterpiece, *Labour in Irish History*, Connolly would provide a formidable critique of the tradition sketched out here: that characteristic oscillation between "constitutional" (or parliamentary) politics, on the one hand, and armed or violent secession (associated with "republicanism" after the 1790s), on the other. Connolly's crucial insight was into the class presuppositions of both legislative and militant nationalism. This powerful wedge which he pushed into Irish political and historical interpretation accounts for his importance in his own time and his ongoing importance in ours.

Early Life

James Connolly lived a short intense life, which crossed national borders, juxtaposed cultures, mixed ideas, and combined action and reflection in a particularly dramatic way. He was a true internationalist, and this issued eventually in his explicit and highly articulated anti-imperialism. Connolly was born in 1868, in a desperately poor area of Edinburgh named Cowgate, to Irish immigrant parents. As with so many cities in the late twentieth and early twenty-first centuries, Edinburgh's core has undergone profound processes of revanchist gentrification, turning former working class and residential areas into tourist zones or expensive new housing. Cowgate has been part of this process, but in Connolly's day, it was known as "Little Ireland," and it housed a large and impoverished Irish community. The actual building in which Connolly was born is long gone, but on the building now on the site, a modest wall plaque reads:

TO THE MEMORY OF JAMES CONNOLLY
BORN 5TH JUNE 1868 AT 107 COWGATE
RENOWNED INTERNATIONAL TRADE UNION AND
WORKING-CLASS LEADER
FOUNDER OF IRISH SOCIALIST REPUBLICAN
PARTY
MEMBER OF PROVISIONAL GOVERNMENT OF
IRISH REPUBLIC
EXECUTED 12TH MAY 1916 AT KILMAINHAM JAIL
DUBLIN

The plaque's wording neatly summarizes Connolly's career – noting his internationalism, pointing out his work as a union leader of the working poor, his standing as the founder of Ireland's first explicitly Marxist political party, and then his fate as a guerilla commander and leader of the projected Republic, his execution cutting short his hoped-for contribution to the anticipated polity.

James's father, John, was a collector of horse manure off the streets of Edinburgh. His third son James received his only formal education at St. Patrick's School, near the family home. Young James took up his first job at the age of only 11 years in 1879. He worked as a printer's assistant; his elder brother, John, was already a compositor at the *Edinburgh Review*. The skills the boy learned in his first job would be essential to his political work in later life, for Connolly would become an inveterate radical journalist and writer, mostly publishing his work in leftwing and union newspapers he often set up and edited himself.

However, the economic prospects were dim for the Connolly family, and in 1882, James joined the British Army. At 14, he was underage, of course, and when he deserted in 1891, he compounded the illegality of his enlistment by the way he left the British service, putting himself forever after at risk of capture and court-martial. Yet it was the Army which brought him first to Ireland, and it is fair to suppose that coming to the country of his patrimony wearing the uniform of the Army of the metropolis can only have stirred his sense of restless Irish nationalism while at the same time keeping him in mind of the fact that that very Army was staffed mostly by the poorest of the poor like himself, of whatever ethnic identity. It's also worth noting that, shortly after the moment of his desertion, Connolly's unit was due for deployment to India. Obviously, such a posting would have put James at a very great distance from his wife, for a prolonged period. But, with the foundation of the Indian National Congress in 1885, Indian secessionist nationalism was stirring at this moment also, and Connolly may have noted this. He would later write about British governance of India and the independence movement there.

Connolly served several tours in Ireland, but this did not prevent him from meeting and

courting the woman who became his wife, Lizzie Reynolds, in Edinburgh, and though he had left formal education behind him, he became (and remained for the rest of his life) a formidable autodidact, immersing himself in reading history and also leftist thought, including some of the work of Marx and Engels.

Connolly's first involvement in socialist politics was, in fact, in Scotland, shortly after his desertion from the Army. Following his brother John, he became involved with and then secretary of the Scottish Socialist Federation. Influenced by the SSF's John Leslie, Connolly learned the stress on propaganda, information, and education which would become the hallmarks of his maturity. Working with the SSF and also with the Independent Labor Party of Keir Hardie, Connolly also observed the wave of what was called "the new unionism" sweeping Britain. The "new unionism" was a movement, marked by strikes and protests, which concentrated on recruiting into the union organizations workers who had previously fallen outside of their ambit and scope. Trades unionism by this time was dominated by powerful craft unions which catered to the needs and priorities of skilled labor. But for the unskilled poor – doing the kind of basic and menial work his father had done – there were no organizations or representation. This focus on those who fell out of the bottom of the labor movement would crystalize most powerfully for Connolly when he was close to the foundation of the Industrial Workers of the World, during his residence in America. And it would help shape his revolutionary positions also, since he shifted from an emphasis on avowedly political organizations – the leading party – to radicalized unions, such as the IWW and the Irish Transport and General Workers, as the vehicles for his revolutionary activity.

The "new unionism" was eventually crushed by the British government, and Connolly became more involved with the ILP. But it was the ILP's relationship with Irish politics which eventually soured Connolly's affiliation with this party. The ILP aspired to a political alliance with the British Liberal Party, but this move would also put it into sympathy with the Home Rule movement, insofar as the latter had networks of sympathizers and

campaigners in the Irish community in Britain. In other words, Connolly realized, and learned with Leslie, that the ILP was tied, via the Liberals, to mainstream Irish nationalism, which had little time for socialism or the working class. Leslie published a pamphlet, *The Irish Question*, which was crucial in shaping Connolly's views at this time. Leslie made a powerful attack on any linkage between Scottish or British leftwing politics and the generality of the Irish nationalist movement. Leslie supported Irish independence, but he shrewdly realized that the Irish nationalist elite, with its links into the Irish communities in Scotland, was thoroughly in hock to capitalism generally and specifically to a structure of economic dominance of Ireland by the larger island. Irish nationalism, Leslie pointed out, was a middle-class social and economic formation, and the Irish working classes needed to affiliate to their true class allies in seeking to make connections beyond Ireland's shores: "The emancipation of their class from economic bondage meant emancipation from all bondage . . . if they refuse to be any longer the mere pawns in the great chess-game of the lay and clerical state gamblers for power and place, then they will clasp hands with the workingmen's parties of all other countries" (Leslie 1894: 12–13). This vision analysis decisively shaped Connolly's political activism in Ireland thereafter. Needless to say, it did not make him popular with the local outriders of the Home Rule movement, the Irish National League.

Contesting the 1894 Edinburgh local elections on the SSF ticket, but failing to win a seat, Connolly, always on the lookout for opportunities of both work and activism, was invited by the Dublin Socialist Club to become its organizer. The wage was a modest £1 per week, but Connolly, giving up a plan to emigrate with his wife and young children to Chile, arrived in Dublin in May 1896.

The Irish Context

Ireland at the end of the nineteenth century was primarily an agrarian society. Dublin, the capital, was the center of the administration and along

with Belfast and Cork the country's main port. But it was not a hub of manufacturing. That distinction fell to Belfast and its environs in the northeast, where, through the eighteenth and nineteenth centuries, industries such as rope-making, tobacco, heavy engineering, and, preeminently, linen and ship-building made the city a major element in the Industrial Revolution in the United Kingdom and integrated the city in the trading networks of the Empire. This development, combined with the much older sectarian divisions which developed after the colonization of Ulster in the seventeenth century, contributed to the contention over Home Rule and independence which would be the crucial frameworks for Connolly's political career in Ireland.

Arriving in Dublin, Connolly moved into a city and country in ferment. The great wave of political and cultural activity which constituted the Irish revolution was in the early years of its gathering in the 1890s, and Connolly's activities must be understood as both a part of this seething excitement and also as embodying or at times articulating one of the most formidable critiques of it in its own time and since. Ireland at the end of the nineteenth century was, as explained earlier, a constituent part of the United Kingdom. The Dublin Parliament having been abolished under the terms of the Act of Union, Irish political representatives sat in the Houses of Parliament in London. The nineteenth century being the century of "questions," the main answers offered to the Irish Question at this time were (1) Home Rule, or the drive for Ireland to attain, once again, legislative autonomy within the United Kingdom, and (2) violent secession from the Union as envisaged by republican revolutionary militants. The primary vehicle for the "constitutional" campaign for Home Rule was the Irish Parliamentary Party, founded by the Wicklow landlord, Charles Stewart Parnell, in 1882 and led by him until his death in 1891. Due in part to Parnell's skillful leadership of his party and its possession of a balancing minority in the Commons, British Liberal governments had been forced to bring forward Home Rule Bills in 1886 and 1893 (under Gladstone), but the legislation had been blocked initially by a split in the Liberal Party, and then by the rejection of the House of Lords. With Parnell's early death, the IPP and the Home Rule movement were becalmed at the time of Connolly's arrival in Dublin. Meanwhile, the revolutionary movement of the day was the Irish Republican Brotherhood, with its American Fenian affiliates. Founded by James Stephens, John O'Leary, and others in 1858, it had been active in a variety of ways, organizing a failed uprising in 1867, and, following the execution of the Manchester Martyrs, running a bombing or "dynamite" campaign in Britain in the 1880s. The IRB was a secret, oathbound society of revolutionary conspiracy, whose primary tenets were that Ireland should attain independence from the Union and that the most effective way to achieve this goal was by military means.

These two elements – the Home Rule movement and the Republican movement – dominated the Irish political scene, as Connolly found it. But it would be seriously mistaken to suppose that he found no leftwing or socialist movement. On the contrary, a fertile and active labor movement provided a ready-made ideological context for Connolly and his activism. Forms of unionization or "combination" of rural laborers had developed in Ireland since the eighteenth century. Mostly illegal, their rise accompanied that of Whiteboy rural agitation. One might note, for example, that Parnell, forming the Irish National League out of the ruins of the Land League in 1882, was immediately given the support of the Irish Labor and Industrial Union, which mostly represented rural workers. The ILIU dissolved itself into the new organization, in a crucial example of the (self-)subordination of Irish labor politics to the politics of Home Rule or nationalism – a pattern which would become all too familiar in the twentieth century.

Meanwhile, Ireland in the 1880s and 1890s was also undergoing an intellectual and cultural transformation of a very profound kind. As we noted above, Connolly is a political writer and activist, but he could not but be influenced by the situation in which he found himself and in which he found Irish society more generally. Paraphrasing *The Eighteenth Brumaire of Louis Bonaparte*, one might suggest that Connolly was

an important actor in events in Ireland between 1896 and 1916, but he did not always act under conditions of his own choosing. The nineteenth century had witnessed sweeping changes in Irish society – changes that could be characterized reasonably as the most radical since the plantations of the seventeenth century. Looked at schematically, these changes might be put thus:

1. The emergence and tremendous growth of a mass Anglophone politics, through the O'Connellite campaigns for Catholic Emancipation and then for the repeal of the Act of Union. O'Connell succeeded in fostering an Anglophone politics of the masses, even before the Famine swept away the poorest of the rural population (and those most likely to speak Irish).
2. The catastrophic effects of the Great Famine of the 1840s, which killed one million people by starvation and disease and which induced the emigration of another one million in those brief terrible years and set in train a wider pattern of emigration which helped shape Irish society for the following century.
3. Partly as a result of the Famine, which effected an extraordinary and brutal rearrangement of Irish rural society, and the politics of land and agriculture which came out of it – most notably the agitation of the Land League – the British government began in the 1870s a process of land reform which would by the early twentieth century produce a new large and politically and culturally crucial class of small farmers.

Exemplifying the structural paradoxes of nationalism, a political tendency which generally combines progressivist and often democratizing forward movement legitimated by a backward glance at a sometimes mythologized past or invented tradition, the very changes wrought by O'Connell and the Famine made possible, motivated and drove the cultural revival of the nineteenth century. Translations of ancient, medieval, and more recent Irish writing were produced and circulated. In a society which was officially integrated into the United Kingdom, whose high politics was focused on London, whose economy traded mostly with Britain and America, and

where the machinery of the state – education, policing, welfare, and the army – was overwhelmingly Anglophone, the rise of interest in and dissemination of songs, ballads, poetry, and other kinds of writing translated from the Gaelic came with a powerful sense of discovery or rediscovery. By the late nineteenth century, this had issued in a battery of cultural, civic, and political institutions. To the arrival of the Literary Revival – in the work of WB Yeats, Standish O'Grady, Lady Gregory, JM Synge, Lennox Robinson – in the sphere of high culture corresponded the creation of organizations such as the Gaelic League and the Gaelic Athletic Association in the sphere of mass culture. WB Yeats, Edward Martyn, and Lady Augusta Gregory founded the Irish Literary Theatre in 1899, which became the Abbey Theatre in 1904. The Gaelic League was founded by Douglas Hyde in 1893, to promote the Irish language – even before the Famine, the language was in decline. And in 1884, Michael Cusack founded the Gaelic Athletic Association, which aimed to promote Irish field games and other aspects of Irish culture. The upshot of such developments was the creation of a powerful, popularly based, and variegated culture of nationalism in Ireland. National consciousness was not simply new in Ireland, but we can recognize that in breadth and depth the movements of the late nineteenth century achieved a penetration and range in Irish society unattained by either prior movements for constitutional change – the "patriot politics" of Henry Grattan and Henry Flood in the 1780s, the "Repeal" campaign of Daniel O'Connell of the 1840s, or Isaac Butt's Home Rule campaigning after the Famine – or prior revolutionary movements for change by force, the United Irishmen's Rebellion of 1798, the Young Ireland Rebellion of 1848, and the Fenian Rebellion of 1867.

In retrospect, we look back now and realize that these institutions (all of them still in existence) were the cultural institutions of a proto-state, elaborations (in Gramsci's terminology) of a rich counter-hegemony in both "high" and "mass" culture. This was the cultural sea in which Connolly swam: a complex *mélange* of ideas, principles, and projects, all of them variously shot through with the spirit of change and

the hope of the new. To the political "revolution" which would occur eventually in 1916 and afterward corresponded (approximately) this sense of "cultural" revolution or at the very least revolutionary possibility – a world where all values were there to be remade or transvalued. The point here is not to make an argument that Connolly, in fact, was a "revivalist" in any simple sense, however. He consistently argued the importance of the "historical materialist" vision of history promulgated by Marx and Engels in *The Communist Manifesto* and *The German Ideology*, and as such was often skeptical of what would now be called "culturalism." Yet his radical activist and intellectual energy partakes of the general ferment in Irish society at this time, his interest and effort in political propaganda, and his capacity to deploy various rhetorics or registers – speaking and writing – were frequently augmented by his love of poetry and literature. We see this in his frequent quotation of both poetry (James Clarence Mangan, Alfred Lord Tennyson) and popular song, buttressed by his sense of street theater and the value of political balladry.

Connolly and the Irish Socialist Republican Party

Connolly immediately and rapidly reorganized the Dublin Socialist Club and renamed it the Irish Socialist Republican Party (ISRP). Although the party was never more than a very small organization – it is estimated that membership never exceeded one hundred – it was an important formation in the history of the Irish Left. In its very name, the party embodied and dramatized the problematic around which most Irish leftwing political organization has revolved ever since – the tension between class and national struggle, the quandary as to the possibility for making a coherent and appealing affiliation between socialism or Marxist political activism, on the one hand, and republicanism, on the other. Though the party dissolved in 1904, it must be seen as having a crucial element in Connolly's career. The ISRP ran candidates in local Dublin elections, and it also produced Ireland's first

Marxist newspaper, edited by Connolly himself: *The Workers' Republic*.

Connolly's Marxism was of the moment of the Second International. What does this mean? The International itself was formed in 1889, the year Connolly became involved in socialist politics, and it collapsed in the year of Connolly's death, broken by the nationalism unleashed across Europe by the Great War. So we can say that Connolly's career parallels that of the International and the particular phase of Marxist thought and praxis which it represented. Where the First International – the International Working Men's Association of Marx and Engels, founded in London in 1864 – was an affiliation of various socialist groups, the Second International was an umbrella organization for the unions and socialist mass parties of Europe, dominated by the German Social Democrats, which could muster millions of voters and hundreds of parliamentary seats. Strikingly, the expansion of the socialist movement in Europe, while spurred by a major recession in European economies between the 1870s and the 1890s, ran concurrently with the economic boom of the turn of the century, the era of high imperialism and monopoly capitalism. That the International was both a source of opposition to that form of capitalism, and fundamentally imbricated with it, is illustrated by its benefiting from parliamentary reforms across Europe which opened the vote to working men in Britain and Ireland in 1884, in Germany in 1871, in Spain in 1890. This parallel of the expansion of socialism and the expansion of empire and monopoly capital is in part to be expected – an expanding capitalism was producing an expanding proletariat – but it brought with it tensions which would be exposed to devastating effect with the coming of the First World War.

Despite their growth, the socialist parties of Europe were still largely marginal to the overall political systems in which they operated. Consequently, they were mostly reformist in orientation: their rhetoric was usually far in advance of their actual policies. Parties spoke aggressively about capitalism, while the unions to which they were often affiliated sought modest adjustments in the workplace. Their Marxism was inherited from Engels and was often interpreted in a dogmatic

and pseudoscientific manner. So they saw the demise of capitalism and the rise of socialism as inevitable and the task of socialist parties as being to help that trend on its way.

Connolly's thinking both partakes of this intellectual and ideological context and sits outside or athwart it. It is precisely this aspect of Connolly's work and thought that makes it particularly valuable and exemplary now. His position dramatizes and flushes out into the open that paradoxical conjuncture described above – the parallel between the Second International and the era of high imperialism, the Berlin Conferences, and the "Scramble for Africa." Another way to put this is to note that Connolly wrestles with the problematic of producing a Marxist understanding of a region which was (and still is) peripheral to the great flows of capital and the redoubts of political power which structured the world-system in his time and continue to do so in ours. Connolly's Marxism is notable in the way it openly discusses the issues of peripherality which would be so formative for decolonizing movements and Marxisms later in the twentieth century.

Of course it also must immediately be admitted that Marxist thought and agitation outside of the European core economies and states (Germany, France, Britain, Italy) would produce, just a year after Connolly's death, the great revolution of 1917 in Russia – not a peripheral territory of a major economy the way that Ireland was, but a great empire – yet an empire whose place in the global economy remained, in fact, peripheral due to the truncated and partial development of industrial capitalism in Russia in the late nineteenth and early twentieth centuries. The Russian Marxist revolutionaries – Lenin and Trotsky preeminent among them – would wrestle with problems proximate to those which Connolly mulled over. Furthermore, we need to remember too that Marx and Engels themselves had taken an intense interest in Ireland, its status within the United Kingdom and its restless and troubled politics. From an early argument that the main engine of Irish progress would be proletarian revolution on the larger island, Marx toward the end of his life reversed his prior position to realize that a leftist uprising in Ireland could have a decisive effect on the

political balance in Britain. We can say then with confidence that Connolly wrote and acted within a rich and complex Marxist tradition of consideration of the "Irish Question" and that the focus on Ireland's peripherality, while significantly developed by Connolly, did not start with him.

The Marxist theory of the Second International was dominated by a "stage-ist" model, exemplified in the work of Karl Kautsky, itself an inheritance from Engels. If the collapse of capitalism was inevitable, then, as Kautsky saw it, this would happen no matter what positions human actors might take on the stage of history, since the historical process was understood to move in accordance with ineluctable scientific laws. But this model was problematic for a figure such as Connolly, working on the periphery of Europe. The briefest study of Irish history revealed significant "deviations" from the general pattern of development of the European core. Furthermore, the determinism of Kautskyan thinking left no space or requirement for human agency. If the process of capitalism's demise and socialism's victory is always already structured into the future, then what need for activism, campaigning, strike or protest, parliamentary maneuver, legislative reform, or violent insurrection? It would take Lenin's break with the International for a more flexible and nuanced model of historical development to be put forward.

But meanwhile the International advocated propaganda-making and consciousness-raising as the primary task of socialist parties and activists. Connolly worked within this paradigm, and he also accepted the International's stress on parliamentary politics. This issue had been the occasion of the expulsion of the anarchists from the International's Congress of 1893. At least until his departure for America in 1903, Connolly saw political good for socialism in contesting parliamentary elections and hoping for seats in national legislatures. He did not give much thought – as Marx had not before him – to the importance or value of the state, whether for its seizure or destruction or for its actual workings. Connolly tended to assume the state as a machinery for the management of capitalism, though his interest in and affiliation with syndicalism after 1907 would

produce a profound change in his view. Connolly's approach to parliamentarism and to the state thus contrasts with the secret and conspiratorial approach to the seizure of the state as adopted by his republican contemporaries.

We can therefore say that Connolly differed from his colleagues in the International, in the voluntarism of his politics, and in his strong sense of Irish history. Yet the "stage" model of the historical process as a general rule retained its attraction for him, and this issues in torsions and paradoxes in his historical vision as it touches on other European peripheries or on territories elsewhere in the imperial world. Connolly was well aware, and was eager to show, that the tracks of Irish history sometimes cross over or run athwart metropolitan British or European patterns. At the root of this seeming contradiction is Ireland's status as – arguably – England's oldest colony, dating back as we have seen to the high Middle Ages, and yet a colony which was folded into the constitutional heart of the metropolis by the Act of Union of 1800. In retrospect, we would now say that this incorporation of periphery into metropolis occurred too late for it to be fully politically effective, for it took place only after an Enlightenment civic nationalism had found expression in the country (in Grattan's Parliament and then the United Irish rebellion at the end of the eighteenth century). Accordingly, in Connolly's time, Ireland was gripped by a pervasive and powerful secessionist nationalism which manifested itself in terms we would now call "anti-imperialist" and "anti-colonial."

The activities and ideas of the ISRP reflect this overdetermined intellectual and political location on which Connolly found himself planning and campaigning. Ireland was a country riven with the greatest class divisions, intersected with religious and regional differences. Such differences ran between the intensely industrialized northeast around Belfast and the agrarian south and west of the country, between a residual "ascendancy" landed gentry (now losing its economic base as land reform and redistribution took place) and the mass of small farmers and tenants. Connolly, as we've outlined, prosecuted an oppositional politics in a field already contested by rival parties or

groupings which jostled him and his comrades for electoral and ideological space. The electoral franchise had been expanded in 1884, and the 1889 Local Government Act had opened up local government as a cockpit for working-class politics. The ISRP published in *The Workers' Republic* a bold national program in 1896, which called for the nationalization and public ownership of the means of production and all infrastructure, for free secular education up to university level, for the abolition of private banks, and for restrictions on the length of the working week. Asserting this position compelled Connolly constantly to work out his location and that of his party on the plane of ideas and policies. He argued that the Irish nationalist movement had been taken over by – if it had not always been in the control of – middle-class or bourgeois forces and equally that revolutionary republicanism was largely lacking in a class analysis of the Irish situation. Connolly's overall point – and this remained consistent for the rest of his career – was that nationalism, parliamentary or militant, was likely to reproduce the existing distribution of wealth and privilege in any autonomous or independent Ireland that might emerge under their aegis.

Connolly's felt the need to articulate simultaneous critiques of bourgeois constitutional nationalism and revolutionary republicanism is related to his anti-imperialism. It must be remembered that at this time, the term "imperialism" referred specifically to the imperial polities of Europe – the British Empire, the Austro-Hungarian Empire, and the Russian Empire – and their rivalries and alliances. It did not yet refer to the projection of power overseas and the relationship of metropolises with peripheries that the term has come to mean in more recent times. This usage prevailed even with the Marxist thinkers of this generation (with the possible exception of Rosa Luxemburg).

Connolly, Ireland, and Empire

Two particular events in the 1890s help us see Connolly's political position-takings in their complexity and peculiarity: the centenary of the 1798

Rising and Irish responses to the South African War (1899–1902). Preparing for the centenary of the United Irish rebellion, so-called 1798 Committees sprang up around the country. The ISRP both joined this action and took a class angle on it by forming its own "Rank and File '98 Club." Connolly's purpose was to reveal the bourgeois nature of the Enlightenment republicanism of the United Irishmen, which had posited sectarian unity, but which was predicated in part on class superiority. Nationalist sentiment, Connolly rightly asserted, had clouded the memory of the Rising. Wolfe Tone's ideas were revolutionary insofar as they touched on class, but it was important to realize that the rebellion was betrayed by constitutional nationalists as much as by failed French revolutionary assistance.

In 1899, the Second Boer War began. Britain tried to contain the drive to independence of the Transvaal Republic and the Orange Free State. The empire had previously struggled to assert control of the valuable natural resources of this region, and now war broke out again and the Boer cause attracted considerable Irish interest and sympathy. The 1890s had seen a wave of Irish migration to the Transvaal. Figures who would later attain high prominence in the Irish revolution, such as Arthur Griffith (founder of Sinn Fein) and John McBride (the husband of Maud Gonne and a senior combatant in the 1916 Rising) had moved to southern Africa. McBride was invited to form and lead an Irish brigade to fight for the Dutch republics. Though McBride turned this command down, he did part in the ensuing fighting. Three hundred Irish Volunteers joined this pro-Boer commando. Sympathy for the Boers swept Dublin: street protests and rallies were held, and the Transvaal flag was flown. Advanced nationalists openly supported the Boers in their struggle with the might of empire and so did Connolly and the ISRP. Connolly argued that the war showed that Britain was complacently reducing its garrison in Ireland in order to provide troops for the suppression of the Boers, because it regarded Ireland as entirely pacified. He argued that any struggle which saw the empire bested or damaged was one worth supporting. As with the 1798 centenary, Irish nationalist and

republican opinion was intensely engaged by the Boer secession, but, to Connolly's disgust, when a "Transvaal Committee" was set up, republicans invited Home Rule constitutional nationalists to join it. This confirmed Connolly's class critique – bourgeois political forms would make common cause, even across the divide of the debate on violence, and republican "revolutionaries" would abandon their working-class allies and the economic dimension in order to push forward their own agenda. Furthermore, it was not only the Irish angle in this contest that was difficult for Connolly to negotiate: we see also his failure (along with that of other putatively radical political activists in Ireland) to recognize that while the Boers were courageously resisting incorporation into the empire, this very resistance had as a major condition of its possibility a colonial-racist exclusion of the native peoples of southern Africa. Black Africans were invisible to Connolly's anti-imperialism – whether as oppressed or displaced victims or as historical and political agents in their own right. The irony of history shows us that just 13 years later, the South African Native National Congress – the forerunner to the African National Congress – was formed in Bloemfontein by Sol Plaatje, John Dube, and their comrades. Black Africans becoming the subjects of their own history was a possibility inconceivable to even as radical and revolutionary thinker and agitator as Connolly.

Connolly and Theory: *Erin's Hope and Labour in Irish History*

Connolly was constitutively skeptical of theory: he rejected "theorickers" early in his career while always describing himself, from early on, as a "revolutionary." He would have agreed with Antonio Gramsci's description of Marxism as a *philosophy of praxis*. Nevertheless, he produced two extended essays on Irish history, *Erin's Hope* (1897) and *Labour in Irish History* (1910), which have a decided theoretical underpinning. This undergirding comes from various sources. Both works are derived from Connolly's Marxism, of course, but they also partake of the spirit of the

Irish Revival of the late nineteenth and early twentieth centuries. Not merely this, but *Labour in Irish History*, written while Connolly was in the United States, shows the influence of his immersion in that country in syndicalist politics.

Erin's Hope is a pamphlet, published shortly after Connolly's arrival in Dublin, which shows the influence of James Fintan Lalor, arguably the most radical, or class-aware, of the leaders of the Young Ireland movement of the 1840s. Young Ireland was notable for its fostering, through its newspaper *The Nation*, of a very wide readership for cultural and political nationalist ideas and content, in English. The movement ran in parallel (though not always in agreement) with the late career of O'Connell and partook of that same development of a mass politics. Like O'Connell's Repeal movement, it was decapitated by the Famine. Lalor had advocated the political mobilization of the Irish peasantry and also for the crucial nature of the land question in the Irish countryside. Connolly edited and introduced a collection of Lalor's writings, *The Rights of Ireland and The Faith of a Felon*, which would be published in 1900. At the root of Connolly's thesis in *Erin's Hope* is the argument, which transgresses Marxist interpretations, that in Ireland both feudalism and capitalism were accretions of firstly Norman and then English colonization. Following nationalist historians of the day, such as Alice Stopford Green, Connolly argued that Gaelic Ireland had been characterized by a "primitive communist" society of the kind mentioned by Marx and Engels. He noted that under the Irish Brehon legal system, land was held in common ownership, and this joint possession persisted longer in Ireland than elsewhere. Further, this arrangement offered a model, Connolly suggested, for the development in what were still primarily agrarian societies, like Ireland. Irish capitalism had been too recent a growth, and too much under British influence or tied into British markets, for it to have much hope for strong future development. Connolly hinted that industrialism could actually be bypassed as a "stage" on the road to socialism in a country like Ireland.

Connolly's interpretation, both in *Erin's Hope* and later in *Labour in Irish History*, was and

remains a controversial one. He gave "primitive communism" a positive value, contrary to Engels and Marx who had seen the replacement of primitive communism by the regime of private property and capital accumulation as inevitable and progressive: only in such ways could the forces of production be expanded and developed. At the heart of Connolly's deviation from Marxist orthodoxy lie different visions of the historical process. Marx and Engels, though they reckoned to have inverted Hegel with their interpretative mode of historical materialism, remained creatures of the Hegelian and indeed Enlightenment traditions. By this we mean that their view of history was subtended by a grand progressive "narrative" of increasing optimism, human development and betterment, and economic and political modernization. But Connolly's historical vision cuts across and troubles this vision. It does so in a number of ways. Firstly, and as we'll see with *Labour in Irish History*, Connolly provides a series of interpretations of notable Irish political or even revolutionary conjunctures and shows each time how what might have been progressive developments were betrayed or compromised by their bourgeois leaderships. Secondly, Connolly's vision partakes of the "revivalist" spirit of his own day, in that he suggests, however loosely, that the Gaelic past offers a model of the desired future. That is, Connolly's vision of the future partakes of an image of the past. In this, he joins with the language revivalists of the Gaelic League and the fascination of writers such as WB Yeats, Lady Augusta Gregory, and John Millington Synge with the great myths of the Irish Celtic past. This revivalist element of Connolly's thinking is not linear, in the Marxist or Enlightenment sense, but cyclical, more in the manner of Vico or Nietzsche.

The problem with Connolly's structure of vision is that his view of the Gaelic past is rather more positive than most professional historians allow that the evidence suggests. Connolly argues forcefully for socialist answers to the national question, but is led into paradoxes and contradictions which would reappear at later points in his career and in his writing. His foundational assumption that capitalism and a class society

were constitutively alien to Ireland represents an essentialism of his thought which would lead him in the future to take a more positive view of nationalism than was warranted by his own instincts and analyses. Flowing from this would be his inclination to see a contradiction between republicanism and capitalism – a contradiction which is itself contradicted by historical evidence from republicanisms of many kinds in many countries – and would lead him sometimes to misunderstandings of Irish capitalism and of Irish republicanism's class revolutionary potential. An example of this kind of error can be seen in Connolly's efforts to make alliance with Arthur Griffith and Sinn Fein. Connolly cooperated with Griffith, who was a member of the IRB and was anti-imperialist, in the Boer War protests. But this was to pass over the fact that Griffith's sympathies with the Boers and his opposition to the British war was based on openly racist and supremacist grounds, and he eagerly anticipated the expansion of Irish capitalism in any independent Irish state which might eventually be won.

Connolly and Syndicalism

By the early 1900s, Connolly, with the ISRP still struggling to make an impression on the Irish political scene, had become aware of the American Socialist Labor Party, which seemed to be attaining some successes under the energetic leadership of Daniel DeLeon. The context for Connolly's learning of the SLP and DeLeon was a debate within the Second International on the question of socialist parties making alliance with bourgeois parties: DeLeon and his SLP were fiercely opposed to such marriages of convenience, as were Connolly and the ISRP. He tried to use the example of the SLP to force a leftward move in British socialism and to wean it away from its support of Home Rule, with its reformist, bourgeois, and pro-capitalist tendencies. But this effort, which involved shuttling back and forth between Ireland and Scotland, did not pay substantial dividends. Connolly then took the drastic step of emigrating to America, with his wife and young family following him in stages.

We will not enter into the detail of Connolly's sojourn in America, which began in 1903 and ended in 1910. But it's important to note the outlines of the shifts in Connolly's ideological positioning which were occasioned by his American stay. He quickly quarreled with DeLeon, finding him authoritarian and dogmatic. By 1905, Connolly was drifting away from the SLP and was caught up in the foundational drama of the Industrial Workers of the World (IWW), nicknamed the "Wobblies." Emerging from mining disputes, the IWW was formed at a congress in Chicago in 1905. Well to the left of the SLP, the IWW also was deeply critical of the dominant American craft union, the American Federation of Labor (AFL), for its reformist attitude to capitalism and its refusal to accept unskilled workers into its membership. The IWW was a trenchantly and explicitly syndicalist organization, with its motto of "one big union" for all workers and its resistance to the elitism, racism, and sexism of the AFL, which had no space in its ranks for female or immigrant workers. The IWW was also an expression of the powerful energy given to the labor movement globally by the Russian uprising of 1905, which seemed to demonstrate the revolutionary potential of the general strike as a weapon of the proletariat.

Syndicalism is a movement on the anarchist side of socialism. It is predicated on workers' initiative, militancy, and power and workers' organization and an approach to the political realm founded in the place of work. It was often known in America as "industrial unionism," because of its stress on organization and action within the industrial workplace. The term "syndicale" is of course the French term for a union; this reveals the roots of the phenomenon in the labor movement. In Europe, syndicalism stood as a rebuke to the mainstream socialist or social democratic parties, which it saw as bureaucratic, corrupted by parliamentarism and compromise with the bourgeois state, too inclined to a reformist acceptance of capitalism. To destroy capital, the workers must concentrate their struggle in the workplace. Syndicalism was strongest in those European countries (such as Spain) with an anarchist tradition and also with little experience of centralized collective bargaining.

Connolly was galvanized by the unadulterated revolutionism and militant aggression of the IWW. Here was an organization of the workers and of the poorest of the poor, which regarded them as the engine of the revolution and of history. Here was a workers' organization which was as forceful in its stress on revolution as any "physical force" Irish republican secret society. On his return to Ireland in 1910, his activity in the increasingly febrile years leading to the Easter Rising would be considerably shaped by what he learned from syndicalism.

This activity would be underpinned by the historical and theoretical arguments of *Labour in Irish History*. In a strong sense, this book, Connolly's most sustained work, could be seen as a syndicalist history of Irish politics. At each of its stages, it tries to attend to the fate of the working poor. At each of those stages, it finds that Irish political action, both nationalist and republican, has worked by stirring the sleeping giant of the sentiments and energies of the massed poor, sought to control this motive force, and then ultimately abandoned it or even betrayed it in the pursuit of bourgeois goals.

Labour in Irish History was mostly composed in America. In 16 brief chapters, Connolly offers a critique of mainstream views of Irish history of a ruthlessness and penetration few modern "revisionists" can match. Repeatedly, the highlights of Irish nationalist political history are interrogated and found wanting in class terms. Studies of Jacobite heroes, of eighteenth-century "patriot" politics, of the Enlightenment radicals of the United Irishmen, and of Daniel O'Connell and his campaigns for Catholic Emancipation and the Repeal of the Act of Union show each time the cynical class compromises that repeatedly were made. Connolly sees nationalism as the "idealized expression of class interests," but he also hoped for a more "authentic" nationalism.

The antinomies which complicate Connolly's work are those we've already delineated. On the one hand, he recognizes and compels his reader to see that there is in his time and has for a very long time been a greater identity of interests and goals between the Irish owners of capital and those of Britain, than exists between the Irish bourgeoisie

and the Irish workers and peasants. Herein lies Connolly's radicalism. On the other hand, he wishes, partly for tactical political reasons, to find resources for action, grounds for alliance, in the Irish revolutionary tradition, dominated as it is by republicanism. Part of the book's project, therefore, is to scour the republican tradition for hints of class-orientated progressivism. Herein lies Connolly's compromise with his context.

At its most abstract, Connolly's argument is that the understanding of private property in Ireland is and has been different from that in England. This is the political-theoretical version of his point in *Erin's Hope* that feudalism and capitalism in Ireland had only arrived by way of Norman and then Tudor colonization. But in this later and longer book, the stakes in the argument are higher. As we've noted earlier, and indeed as Connolly writes himself, *Labour in Irish History* is a work of the Irish Revival, and this is not only a matter of context but of the book's subtext. In a manner similar to the discovery – or, more importantly, rediscovery – of an ancient Irish Gaelic culture, and hence "nation," which was to be discerned in cultural nationalists of Connolly's own time and earlier, such as Standish O'Grady, Samuel Ferguson, WB Yeats, and Lady Gregory, Connolly reads back into the historical evidence an idea of Irish national character, even an idea of Irish national consciousness. Modern historians, certainly of the liberal "revisionist" kind, and also of the Marxist kind, would argue that Connolly over-interprets his materials. Modern historians of nationalism, mostly nowadays working in the wake of the important writings of Benedict Anderson, Ernest Gellner, Miroslav Hroch, Eric Hobsbawm, and Shlomo Sand, would argue that nations are mostly *post-factum* "inventions" or "invented traditions" and that national consciousness emerged in Europe mostly in the nineteenth century. Not merely this, but Connolly ascribes to that national consciousness attributes of coherence, self-consciousness, organization, and resistance which are difficult to verify in positive terms. In particular, his chapters on agrarian radicalism in the eighteenth and nineteenth centuries – the Whiteboys of the 1700s and the Ribbonmen of the 1800s, for example – remain

both provocative and problematic. Connolly makes the wager – a hermeneutical maneuver finely balanced between political and historical interpretation – on their having forged a national (as against local or regional) program of resistance. In his reading of the late eighteenth and early nineteenth centuries, he excoriates "patriot" politics of the kind associated with the parliamentarism of Grattan and Flood for its bourgeois character. But in doing so, he also fails to see the potential radicalism of the new middle classes, both Protestant and Catholic, which would form the engines of nationalism after the failure of the United Irish rebellion in 1798. Connolly is hesitant to see nascent radicalism in the middle-class movements for separatism. Middle-class nationalism for him is inauthentic. Yet further, Connolly reads into the agrarian movements of these pasts, and of his present moment, a desire to return to the supposed ancient Gaelic modes of commonage. In the context of the Revival, of course, the implication is that the spirit of Irish "primitive communism" is latent within the rural poor of the present, just waiting to be reawakened by the right ideological and political leadership.

This helps to account for Connolly's positive view of the United Irishmen. He admires Tone's forceful Jacobinism, but that admiration helps to gloss over the bourgeois character of the United Irish movement (whose famous newspaper, *The Northern Star*, staunchly defended property rights). So too with Connolly's assessment here of Young Ireland, and, once again, James Fintan Lalor. As we saw with *Erin's Hope*, Connolly focuses on Lalor's left-leaning stance within the Young Ireland group, with its stress on a radicalized and nationalized peasantry. Not only this, but, in an echo of his sympathy for the South African Boers, he passes over John Mitchel's late-career support for slavery in the American South.

Labour in Irish History is undoubtedly Connolly's masterpiece. With all its flaws, it remains one of the most remarkable and radical essays in Irish historiography. That it is not a "professional" academic history is both a source of its weakness and of its strength or importance. Just as Georg Lukacs's towering *History and Class Consciousness* (published in 1923, just after the Hungarian revolution of 1919) represents both a formidable critique of German Idealist philosophy and a manual for proletarian revolution that works by re-reading Marx in that tradition, written during the revolution, so Connolly's book should be understood both as a theoretical underpinning of his syndicalist vision and as a text taking part in the attempted revolution in Ireland between 1913 and 1923.

Connolly and the Irish Revolution

Connolly's return to Ireland in 1910 was to a country wracked increasingly by political and social turbulence. The Home Rule crisis of 1912; the accompanying Ulster crisis, where a massive movement was forged to resist Home Rule; the great Dublin Lockout of 1913; and then the outbreak of war in Europe in 1914 – all of these events demanded of Connolly an exceptional political and intellectual effort and agility. Even as he threw himself into the work of the new syndicalist union formed by James Larkin in 1909, the Irish Transport and General Workers, Connolly was also writing and reflecting on revolutionary movements elsewhere: in other territories of the British Empire such as India and Egypt and also in Russia and other areas of Europe. The Ulster crisis offered him particular problems for the kind of activism and ideological positioning Connolly stood for, as it revealed that the most powerful and dynamic political force, in the region of Ireland most industrialized and linked into the global trading and industrial economy, was still the reactionary sectarian and ethnic movement which he had been arguing against for years. In other words, the region which ought, in the analysis of the International, to have been most politically and ideologically advanced and radical, had proved also to harbor the most formidable anti-revolutionary forces and sentiments. The 1913 Lockout was one of the decisive battles for the militant left in the south of Ireland, and it was a battle ultimately lost, a crucial moment in the consolidation of the social and economic forces which would come to rule Ireland in the

independent Free State after 1922. The First World War itself broke open the consensus in the International and among the various elements of the European left. On or around August 4, 1914, the leaders of most of the socialist parties of Europe declared their patriotic support for the war policies of their governments. The only opposition came from the Russians and the Serbs and from Connolly and some of his Irish comrades. In the north of Ireland, the Ulster Volunteers proudly declared their support for the Empire and for war. The Home Rule movement declared support for war, and the Irish Volunteers, a nationalist and pro-Home Rule militia formed in opposition to the Ulster Volunteers, was split, with the largest grouping, under the leadership of the head of the Irish Parliamentary Party, Parnell's successor John Redmond, joined the Crown forces in huge numbers. Connolly was one of a handful of principled figures in the European left – among them Lenin and Luxemburg – who opposed the war. Connolly, like the Bolsheviks, saw that the war must not simply be opposed on Kautskyan "humanitarian" grounds of pacifism, but must be used as an opportunity for revolution.

Connolly's first move in the context of the war was to call for general strike across the continent of Europe. Action by the workers who were being conscripted into the vast forces now arrayed against each other would cause the war effort to grind to a halt. He helped to found the Irish Neutrality League and *The Workers' Republic* proclaimed in its headlines that "We serve neither King nor Kaiser." But his arguments fell on deaf ears, and this became only more apparent as the war went on. By 1916, it was clear that neither nationalists nor the workers shared Connolly's vision. The former had joined the British forces in large numbers in the hope that a display of "loyalty" to the empire would bring Home Rule after the war; large numbers of Ulster anti-Home Rulers joined up with a view to attaining the contrary goal. The bases on which Connolly had argued for Irish anti-imperialism and anti-capitalism were being washed away under his feet.

As the grounds on which Connolly had constructed his hopes for the Irish working class,

and the workers of Europe were eroded, his thinking also changed. He was always clear that the main task of revolutionary socialism was to end the war as speedily as possible. But at the same time, the war was an opportunity for revolutionary action. The balance of these angles of vision had turned by the middle of the war. For Connolly, the perfervid eagerness of the mass of Irish workers to serve in the British forces, in a war against their German brethren, represented a kind of degeneracy, and he reckoned that violent uprising could help to shake off this reactionary tendency. It's in this context that one must judge his willingness (along with many other "advanced nationalists" in Ireland at this time) to put some of his faith in imperial Germany. At the most basic level, the IRB's seeking alliance with Germany (via Roger Casement's mediation) in its Easter 1916 rebellion was an example of the simplest and most brutal political-military calculus: "My enemy's enemy is my friend." For Connolly, the liberal rhetoric of the great powers of the Triple Entente – that, in the words of Lloyd George, the war was being fought for "the rights of small nations" – was the most arrant hypocrisy. No alliance of which anti-Semitic imperial Russia was a part, no alliance which supported a brutal colonial power such as Belgium, and no alliance of imperialist powers such as Britain and France which spoke for liberal values while holding millions in subjugation could be taken seriously. In this conjuncture, Germany, with its developing welfare state, and with its enormous and well-organized working class (which would rise up against its imperial rulers at war's end anyway), was an acceptable ally. Connolly's willingness – in a position of extreme isolation and desperation – to negotiate the historical moment with a view to prosecuting revolution (his goal, above all else) by a tactical alliance is easy to judge negatively, in retrospect, just as we judge his support for the Boers in the same manner. But such judgment is arguably both unfair and unhistorical. Connolly wished to strike out from Second International passivity and collapse in the face of the nationalism of the great powers. The likelihood of Irish insurrection in alliance with a particular balance of republicans, nationalists, and

allies abroad seemed to him like the opportunity for such a blow.

It is this context that led Connolly ever closer to the separatist revolutionary republicans of the IRB, who had by this time also come to control the remainder of the Irish Volunteers who did not follow Redmond's call for service in the British Army. The course of the Easter Rising does not need to be rehearsed here, but it is noteworthy that the small militia which Connolly founded to protect striking workers after the Lockout, the Irish Citizen Army, brought out almost all of its strength to join the Irish Volunteers and their IRB leaders, and Connolly's own military participation and leadership were recorded as courageous and capable. The British government's reaction to the Rising was swift and ruthless, with all of the Rising leaders court-martialed executed during May 1916. Connolly was the last to die.

Reaction to the Rising abroad was complex and interesting. Parts of the British left saw the Rising as a militarist coup and a betrayal. But in Europe, views were more nuanced. Many Marxist leaders were skeptical of the capacity of national revolutions on the peripheries of the continent to damage imperial great powers. The Austrian Karl Radek expressed this view shortly before the Rising, and just before Connolly's execution on May 9, he reiterated his view, considering the Easter Rising no more than a nationalist putsch, which could never have been class-progressive because of the process of land reform which had been carried out since the late nineteenth century by the colonial government. Trotsky, too, was dubious. But Lenin, writing a year later with the Russian revolution only months away, was more positive: the Irish rebellion was premature, but it showed that, though small peripheral national revolutions were on their own powerless against empire, they helped to produce the ferment necessary for the primary revolutionary agent, the proletariat, to appear on the stage of history.

Connolly crammed more action and drama into his 48 years than could be contained in several ordinary lives. He always considered himself a revolutionary, from the start of his political activity. Both in his ideas and in his actions, he helps show us the dynamics and complications of the anti-imperialist Marxist left, in his time and in our own, differentially located between class, nation, and capital. Irish attitudes to Connolly's legacy have tended to swing between uncritical hero-worship and unnuanced liberal condemnation of his seeming final affiliation with nationalist violence. Modern international scholars and intellectuals of the postcolonial world, such as Robert Young and David Lloyd, have taken a much more productive and nuanced view. They have seen in Connolly a harbinger of the radical critique of the Eurocentrism both of liberal and Marxist thought. Connolly's peculiar relationship with the stage-ism of the Second International combines with the radical vision of peripheral precommunism and Utopian syndicalism in *Labour in Irish History* to offer a harbinger of the critique of Western historicism elaborated by intellectuals such as those of the South Asian Subaltern Studies group. Ranajit Guha and his confederates in the 1980s sought to produce a model of historiography which could attend to the inner logics of apparently fissiparous and ephemeral Indian popular protests, riots, strikes, and rebellions of the eighteenth and nineteenth centuries, rather than dismiss them as mere "outrages" or "meaningless violence" as had been done by both British imperial and Indian nationalist historians hitherto. This has led them to profound questioning of the traditional metanarratives of class war and development and modes of production which have underpinned traditional thought on the left. Lloyd and also Greg Dobbins and Spurgeon Thompson see in Connolly an anticipation of such "provincialization" of the Eurocentric left. Connolly, whose work critiques nationalist radicalism half a century before Frantz Fanon's incendiary analyses in *The Wretched of the Earth*, negotiates dialectically the uneven temporalities and anomalous spatialities of Ireland – located geographically near the heart of the *imperium* but functionally marginal to it. It is in this extraordinary quality of his thought and his praxis that his importance lay and still lies.

Life of a Revolutionary

The black Trinidadian historian and writer Cyril Lionel Robert James was one of the most eloquent and critical anti-imperialist figures of the twentieth century. It is easier, as James noted at one point in *The Black Jacobins* (1938), his masterful history of the Haitian Revolution, 'to find decency, gratitude, justice, and humanity in a cage of starving tigers than in the councils of imperialism' (James 2001: 229). *The Black Jacobins* analysed the transformation of colonised Saint-Domingue into the world's first independent black republic outside Africa from 1791 to 1804, and its publication on the eve of decolonisation established James as 'a thinker who posed questions about "postcoloniality" well before his contemporaries realized that all empires must fall' (Scott McLemee, dustjacket of Worcester 1996). As well as writing a classic of revolutionary anti-colonialist literature, James was also a leading militant Pan-Africanist activist, novelist, playwright, sports writer, literary critic, and penetrating commentator on cultural matters. Perhaps above all, James was a creative and original revolutionary Marxist theorist who felt towards the end of his life that his 'greatest contributions' had been 'to clarify and extend the heritage of Marx and Lenin' and 'to explain and expand the idea of what constitutes the new society' (Buhle 1986: 164).

C.L.R. James was born on 4 January 1901 in Trinidad, a tiny Caribbean island then languishing as a 'Crown colony' in the economic backwaters of the British Empire, essentially ruled by a governor appointed by the monarch on the advice of the secretary of state for the colonies. His parents, Robert and Ida Elizabeth James, were black and lower middle class, and both their fathers had worked their way up from almost nothing as immigrants from Barbados. On his father's side, James's grandfather succeeded as a pan boiler on one of Trinidad's huge sugar estates (a post traditionally reserved by the white owners for other whites) and so into the nascent emerging black middle class of Trinidad after the abolition of colonial slavery in the 1830s. His struggle enabled his son Robert James to escape a life of manual labour on the sugar estates and become a

respected teacher, and later headmaster. Possessing only 'cultural capital,' the James family invested this in the only place they could, preparing their son C.L.R. to sit the entrance examination for the island's elite school, Queen's Royal College (QRC). C.L.R. James was an uncommonly gifted boy and, aged just nine, became the youngest boy ever to win the necessary exhibition. Yet expectations that he would graduate from QRC with a scholarship to go abroad and study for a profession in medicine or law were to be dashed. James clearly could have chosen such a route had he wanted to, but his interest was increasingly distracted by life outside the classroom. Instead of paying full attention to Oxbridge-educated teachers of Latin and Greek, James indulged his love for the game of cricket and for reading English literature.

After he left QRC in 1918, all the contradictions of British colonial rule – the hypocrisy, tyranny, and injustice – dawned on James. His public school education had trained him to lead men forward for 'King and Country', but when James tried to do just this by enlisting with an army officers' regiment in 1918, he was blocked on account of being black. When a mass nationalist movement took off in the mid-192os around Captain Cipriani, a charismatic workers' leader who often declared himself 'the champion of the barefooted man', James – now teaching English and history back at QRC – took notice. 'My hitherto vague idea of freedom crystallised around a political commitment: we should be free to govern ourselves' (James 1969: 119). James, a writer of implicitly anti-colonialist short stories about life in the poor 'barrack yards' of Trinidad's capital Port of Spain for shortlived local magazines such as *Trinidad* and *The Beacon,* became a supporter of Cipriani's social-democratic Trinidad Workingmen's Association (TWA). James's first published book would be a political biography, *The Life of Captain Cipriani* (1932), in which he passionately, and with his characteristic devastating wit, exposed the lie behind the dictatorial British colonial authorities' line of 'self government when fit for it', showing how the growth of the TWA demonstrated beyond doubt that Trinidadians were manifestly ready for 'self government'. As James later noted, 'the basic

constituent of my political activity and outlook' was first set out in 'the "human" aspect' of *Minty Alley* (1936), a novel he wrote in 1928 about the working people of one 'barrack-yard' he stayed with that summer (Grimshaw 1991: 94).

In 1932, James made the 'voyage in' to imperial Britain, and after a brief stay in London he stayed in the Lancashire cotton textile town of Nelson with the family of his friend and compatriot, the legendary cricketer Learie Constantine. James's ten months in Nelson would be 'ten months that shook James's world': he did not only witness the devastating effects of the collapse of the Lancashire cotton industry, but also saw, alongside mass poverty, a working-class community of resistance proudly fighting back. In Nelson, James was also inspired by reading the *History of the Russian Revolution* of Leon Trotsky (1879–1940), and he began independently to politically orientate himself towards revolutionary Marxism, joining the tiny Trotskyist movement in 1934 after witnessing the rise of fascism across Europe on the back of mass unemployment created by the worst crisis in the history of capitalism. The rise of Hitler onto the world stage proclaiming himself the saviour of the Aryan race meant that James now defiantly also adopted a more radical, transnational identification with other black people (and their culture) – breaking from his earlier ingrained identification with 'imperial Britishness' as a British colonial subject and evolving from a campaigner for 'West Indian self-government' into a militant Pan-Africanist.

James, having by now moved from Nelson down to London – and having secured a prestigious job reporting cricket for the *Manchester Guardian* alongside Neville Cardus – was soon to establish his reputation on the wider British left as a leading anti-colonial activist. In 1935, James – by now a member of the Trotskyist 'Marxist Group' inside the Independent Labour Party (ILP) – played a critical role in the organization of opposition to fascist Italy's barbaric war against the people of Ethiopia, co-founding and chairing the International African Friends of Ethiopia (IAFE) alongside Amy Ashwood Garvey, former wife of the famous Jamaican Pan- Africanist Marcus Garvey. In time-honoured fashion, Mussolini had in 1935 declared his

criminal invasion and occupation of a sovereign nation 'a war of civilization and liberation', even a war 'of the poor, of the disinherited, of the proletariat!' (quoted in Padmore 1972: 153). James cut through what he called 'the mountain of lies and nonsense' which surrounded Mussolini's war, lies which had confused even sections of the left in Britain, damning the role of not just fascist Italy but European imperialism in Africa more generally in a series of outstanding articles in the ILP's paper, the *New Leader*, and in fiery speeches up and down the country. James challenged the idea that the League of Nations, dominated by the Great Powers of Britain and France who had carved up most of Africa between them already, would act decisively to defend the people of Ethiopia from Mussolini, and argued that to call for action by the league, 'to come within the orbit of Imperialist politics is to be debilitated by the stench, to be drowned in the morass of lies and hypocrisy'. Instead of demanding league sanctions on fascist Italy, James urged an alternative strategy of 'workers' sanctions': international industrial action to stop Mussolini's war machine:

> Workers of Britain, peasants and workers of Africa, get closer together for this and for other fights . . . Now, as always, let us stand for independent organisation and independent action. We have to break our own chains. Who is the fool that expects our gaolers to break them? ('Is This Worth a War? The League's Scheme to Rob Abyssinia of its Independence', *New Leader,* 4 October 1935, quoted in James 1984: 16)

Alongside his political campaigning and cricket reporting, since arriving in Britain, James had also made time to research the Haitian Revolution, regularly visiting archives in Paris, and in 1934 he had turned his research into a remarkable anti-imperialist play focusing on Haiti's revolutionary leader Toussaint Louverture. In 1936, James's *Toussaint Louverture: The Story of the Only Successful Slave Revolt in History* was staged at London's Westminster Theatre, with the American singer and actor Paul Robeson in the title role; this was the first time black professional actors had starred on the British stage in a play by a black playwright (and the only time Robeson ever starred in a play by a black playwright). James had by now been re-united in London

with his boyhood friend from Trinidad, George Padmore, a former leading figure in the Communist International who in 1933 had broken away in protest at the Soviet Union's apparent betrayal of the anti-colonial liberation struggle. In 1937 James had helped Padmore found the militant Pan-Africanist International African Service Bureau (IASB) in London together with other figures including Amy Ashwood Garvey, Jomo Kenyatta, Ras T. Makonnen, Chris Braithwaite, and I.T.A. Wallace-Johnson. James edited the IASB publications *Africa and the World and International African Opinion* and wrote a path-breaking short history of revolutionary 'black internationalism', *A History of Negro Revolt* (1938).

This little work was however destined forever to be overshadowed by James's magisterial *The Black Jacobins*, another work written with African resistance to European colonialism in mind. James demonstrated how the Marxist theory of permanent revolution illuminated not just anti-colonial struggles in the age of socialist revolution, but also the antislavery liberation struggle in the age of 'bourgeois-democratic' revolution, with the Haitian Revolution intrinsically intertwined with the great French Revolution throughout. In the process of recovering one of the great world-historic revolutions, James revolutionised scholarly understanding of Atlantic slavery and abolition, intellectually demolishing much-cherished British nationalist mythology as created by 'Tory historians, regius professors and sentimentalists' and other 'professional white-washers' of the historical record. *The Black Jacobins* did not simply restore slave 'agency' but insisted that the self-activity of the enslaved themselves was central to the story of emancipation from slavery.

James's thrilling and dramatic demonstration of how 'the transformation of slaves, trembling in hundreds before a single white man, into a people able to organize themselves and defeat the most powerful European nations of their day' represented 'one of the great epics of revolutionary struggle and achievement', was written to ideologically arm colonial liberation struggles (James 2001: xviii, 11, 15). As George Padmore noted in his review:

[C.L.R. James] has combined with great skill history and biography without sacrificing one to the other. Mr. James is a real historian, with the sensitive mind of the scholar and an excellent literary style . . . *The Black Jacobins* is a fascinating story, brilliantly told, and should be an inspiration to Africans and other colonial peoples still struggling for their freedom from the yoke of white imperialism. ('Toussaint, The Black Liberator', *The People,* 12 and 19 November, 1938, quoted in Høgsbjerg 2014: 196–197)

The Black Jacobins also contained an outstanding materialist analysis of capitalism and slavery – one that would influence James's former student, friend, compatriot, and fellow historian Eric Williams (1911–81) – and also of the dynamics of race and class in a colonial situation. 'The race question is subsidiary to the class question in politics, and to think of imperialism in terms of race is disastrous. But to neglect the racial factor as merely incidental is an error only less grave than to make it fundamental.' At the close, James noted, 'imperialism vaunts its exploitation of the wealth of Africa for the benefit of civilization. In reality, from the very nature of its system of production for profit it strangles the real wealth of the continent – the creative capacity of the African people.' Yet 'the blacks of Africa are more advanced, nearer ready than were the slaves of San Domingo . . . the imperialists envisage an eternity of African exploitation: the African is backward, ignorant . . . they dream dreams' (James 2001: 230, 303–304).

In the 1930s, James had also played a critical role as the intellectual driving force of British Trotskyism, editing the journal *Fight* and writing *World* Revolution, *1917–1936* (1937), a pioneering anti-Stalinist account of 'the rise and fall of the Communist International'. In late 1938, James embarked on what was meant to be a six-month speaking tour of the US for the American Trotskyist movement, but he ended up staying in America for the next 15 years. In April 1939, James spent a week with Leon Trotsky himself in order to discuss the strategy and tactics of black liberation struggles in the US. James's radical and original attempt to solve what was then known as 'the Negro question', developed after actively organising among striking black sharecroppers

in south-eastern Missouri and carrying out wider anti-war agitation, would in the 1960s influence important groups in America such as the League of Revolutionary Black Workers.

After Trotsky's murder in 1940, James under the pseudonym 'J.R. Johnson', alongside Raya Dunayevskaya ('Freddie Forest') and Grace Lee Boggs, formed the 'Johnson–Forest Tendency' within American Trotskyism in order to attempt to deal with the profound crisis the movement was now thrown into. The tendency made a highly original attempt to make, as James wrote in 1948 in *Notes on Dialectics*, a 'leap from the heights of Leninism' through breaking with 'orthodox Trotskyism' and returning to the writings of Hegel, Marx, and Lenin in order to face up to the new realities after the Second World War (James 1980: 150). James refused to treat Trotsky's writings of the late 1930s as sacrosanct but instead attempted to develop Marxist theory theoretically so that it could make sense of new realities. The Johnson–Forest Tendency's development of a theory of state capitalism to understand the Stalinist regimes enabled it, like the French group 'Socialisme ou Barbarie' around Cornelius Castoriadis and the Socialist Review Group around Tony Cliff in Britain, to preserve an orientation around Marx's central theoretical insight that the emancipation of the working class would be the conquest of the working class itself. The Tendency also attempted to 'Americanise' Marxism and Bolshevism, and James's wide-ranging writings on culture and society in this vein included *American Civilization* (1949–50) and *Mariners*, *Renegades and Castaways* (1953), a fascinating study of Herman Melville, the author of *Moby Dick*.

However, for all James's grasp of Marxism as a living, ever-evolving theory, the rising tide of McCarthyism at the height of the Cold War had inevitably damaging consequences, and in 1953, he was forced to return to Britain. The Johnson–Forest Tendency soon split and broke up, though its analysis of state capitalism was to be vindicated by events such as the rebirth of Workers Councils in the Hungarian Revolution of 1956. James's own lifelong anti-colonialism was also to be vindicated with the victories of national independence movements across Africa and the

J

Caribbean, not least in Ghana under the leadership of Padmore's protégé Kwame Nkrumah (1909–72), and in Trinidad itself with the rise to power of the People's National Movement (PNM) led by Eric Williams. Yet, perhaps as a result of his objective political isolation as a revolutionary Marxist and perhaps as a result of his personal connection with the leaders of many national liberation movements, James now seemed to shift away from classical Leninist strategy and tactics to accommodate himself to the new situation of decolonisation – something Lenin had not foreseen as a possibility in his study *Imperialism.* In *World Revolution* (1937), James had approvingly quoted Lenin when he 'called for "determined war" against the attempt of all those quasi-Communist revolutionists to cloak the liberation movement in the backward countries with a Communist garb' (James 1993: 234). Yet now amid decolonisation, James refused to wage any such 'determined war' and indeed showed a disastrous misjudgement of many autocratic leaders of 'Pan-African Socialism', cloaking the likes of Nkrumah in a communist garb, only to then have to break bitterly from those he had previously declared anti-capitalist revolutionaries on a par with Lenin (see his speech praising Nkrumah in Accra, Ghana, in 1960, in James 1977: 164).

Aside from playing a leading role in achieving a significant symbolic victory in the appointment of Frank Worrell as the first black captain of the West Indian cricket team, James's return to Trinidad in 1958 to play his part in the movement towards independence was not a political success for him personally. As a supporter of Williams, James became secretary of the Federal Labour Party, the governing party of the embryonic West Indies Federation, and took on the editing of the PNM's weekly paper *The Nation*. By 1960 however, as James detailed in his book *Party Politics in the West Indies*, he had been forced to break with Williams as a result of the breakup of the West Indies Federation, and the latter's agreement to the retention of a US naval base at Chaguaramas and more general abandonment of nonalignment in favour of support for America in the context of the Cold War. In 1960, James

gave a lecture series on Marxism in Trinidad, lectures which seem to reveal a return to a more classical Leninist understanding of imperialism as a system after the dashing of his high hopes in Third- World nationalist movements. 'The passing of colonialism . . . is a sign of the weakness of the capitalist bourgeois state . . . nevertheless there is no question about it: the basic opposition to imperialism must come from the proletariat of the advanced countries' (James 1973: 90). The publication of these lectures – under the title *Modern Politics* – was banned in Trinidad, and James returned to England a few days before Trinidad's independence in 1962.

In 1963, James published his seminal semiautobiographical cultural history of West Indian cricket, *Beyond a Boundary* (1963), another pioneering study of how the dynamics of race, class, and nation in the 'dramatic spectacle' of cricket played themselves out amid the rise, decline, and fall of the British Empire. In 1965, James made another attempt to intervene in Trinidadian politics, only to be briefly placed under house arrest by the increasingly autocratic Williams on his arrival. His attempt to then electorally challenge the hegemony of Williams's PNM through founding a new political party, the Workers' and Farmers' Party, was not successful. James now travelled widely between Britain, the US, Canada, and the Caribbean, lecturing, writing, and finding a new audience among a new generation of radicals both in the Caribbean and internationally, including the historian and activist Walter Rodney (1942–80). In the 1980s James moved to Brixton in London, where he lived in a room above the 'Race Today' collective, and, though confined in his movements, lived to see the eruption of Solidarity in Poland in 1980–81 and, just before his passing, the opening scenes of the 1989 revolutions in Eastern Europe. Such challenges to the Soviet empire for James served not only as a vindication of his revolutionary democratic perspective of 'socialism from below' but also as a reminder of an elementary, essential truth – one that James did so much to powerfully elucidate in all his work – that liberation from oppression and exploitation can come only from

below, from the mass movements and struggles of the oppressed and exploited themselves.

Nationalism; Race

Definition

Jazz is a product of the New World, embedded
with the history of slavery, imperialism, and
decolonialization. Constructed from elements
found in African and European musical tradi-
tions, jazz originated in the United States, but
was later embraced by many musicians and lis-
teners beyond the borders of its country of origin.
Jazz not only allowed for the expression of old
and new beliefs and issues resulting from the
mixture of people in the New World, but also
welcomed the incorporation of non-U.S. ele-
ments, creating the possibility of adaptation that
allowed for a potentially global musical tradition,
that addressed issues of imperialism and anti-impe-
rialism. By examining moments of cultural borrow-
ing, destabilisation, and decolonization in jazz,
different processes of identity construction and
negotiation in the U.S. become visible.

When thinking of jazz, thoughts of imperialism
and decolonisation may not be the first that come
to mind. One thinks of leisure time spent in
dancehalls and late-night clubs before issues of
hegemony and self-determination. But it could be
argued that jazz is one of many products that
formed out of the hundreds of years of cultural
interaction throughout the course of the New
World slave trade. This cultural product and pro-
cess first coalesced in the city of New Orleans at
the beginning of the twentieth century and later
spread throughout the US and the rest of the globe
before, during, and after the World Wars. And
with the spread of jazz, the process of identity
maintenance, contestation, and reconstruction
accompanied the music. Throughout the history
of jazz, this undercurrent of identity negotiation
intensifies in moments of cultural borrowing,
destabilisation, and decolonisation. The hope of
this work is to outline some of these moments in
jazz's history and provide a resource on some of the
literature, recordings, and films on the processes.

Most literature on jazz addressing issues
around imperialism is found in discussions on
jazz and its relationship to black nationalism or
social protest (e.g. Baraka 1963, 1967; Budds
1978; Carles and Comolli 1974; Floyd 1995;
Hobsbawm 1993; Kelley 2002, 2012; Kofsky
1970 and 1998; Monson 2007). Very little litera-
ture deals with jazz in relationship to imperialism
or decolonisation overtly. During this research, I
found only Lane (2013) and McClure (2006).
Many jazz musicians and listeners of jazz see
jazz and its tradition as a celebration of freedom.
Such ideas and feelings are what initially draw
many people into jazz, myself included (first as a
listener and later as a performer and a scholar).
Cornell West sums up these feelings best and how
they are embedded in the process of democracy in
his book *Democracy Matters: Winning the Fight
Against Imperialism,* stating:

> [One of the] crucial traditions [that] fuel deep dem-
> ocratic energies [is] the mighty shield and inner
> strength provided by the tragicomic commitment
> to hope. The tragicomic is the ability to laugh and
> retain a sense of life's joy – to preserve hope even
> while staring in the face of hate and hypocrisy – as
> against falling into the nihilism of paralyzing
> despair. This tragicomic hope is expressed in Amer-
> ica most profoundly in the wrenchingly honest yet
> compassionate voices of the black freedom strug-
> gles; most poignantly in the painful eloquence of
> the blues; and most exuberantly in the improvisa-
> tional virtuosity of jazz. (2004: 16)

The potential of jazz to propel the process West
calls 'tragicomic hope' is undeniable to those who
love the music. Jazz (along with voices of the
black freedom struggle and the blues) can prevent
individuals and society from falling into despair.

Such a notion is liberating. But we rarely see discussions on such transformation in the traditional literature on jazz, except in the autobiographies by jazz musicians or the writings of non-musicians like Ralph Ellison, Jack Kerouac, Albert Murray, and others who adore the music from a distance.

Additionally, by taking a larger and wider view from an international perspective, one can begin to see jazz as an agent of social change and by extension see decolonisation and anti-imperialism throughout its history. In his introduction to the book *Jazz Planet,* E. Taylor Atkins outlines how jazz is not only the precursor to globalisation, but is also simultaneously a national and a post-national music:

> Jazz, though certainly born on U.S. soil, was both product and instigator of early-twentieth-century processes and trends that were global in scope: the mass manufacture of culture, urbanization, the leisure revolution, and primitivism. It is this fact – combined with the sheer, and early, ubiquity of the music – that leads us to conclude that, practically from its inception, jazz was a harbinger of what we now call 'globalization'. In no one's mind have the music's ties to its country of origin been severed, yet the historical record proves that it has for some time had global significance, if not necessarily for the commonly accepted, purely aesthetic reasons. Jazz exists in our collective imagination as both a *national* and *postnational* music, but is studied almost exclusively in the former incarnation. Our purpose here is to recuperate its career as a transgressor of the idea of the nation, as an agent of globalization. (2003: 13)

The failure to see jazz as more than a national music and simultaneously a national and a postnational music hampers the discussion of jazz and its true and greater potential for anti-imperialism. We begin to see that since its beginning, jazz is a music that originated in the United States, but at the same time had success beyond its country of origin due in part to its hybridity as a product of the centuries-old process of cultural mixture between Africa and Europe. Jazz has of course spread to all parts of the world like Africa, Asia, Australia, the Middle East, and South America. In discussing jazz around the world, Atkins borrows the term 'jazz nationalism' from Japanese jazz critic Yui Shoichi to explain the simultaneity of jazz as national and post-national music through the rejection of an idea of America:

> [Yui's] theory of 'jazz nationalism'... maintained a faith in the much-proclaimed 'universality' of jazz as a language, while incorporating nationalistic themes of fundamental ethnic difference and Japanese exceptionalism to distinguish Japanese jazz and accentuate its originality. As Yui wrote in liner notes for the CD reissue of the TAKT Jazz Series in 1996, 'The movement for "national [ethnic] independence" that surged through each country [in the sixties] became the motive power for what must be called "jazz nationalism" [*jazu nashonarizumu*], "to be free of America" [*Amerika banare*]'. (2001: 246–247, additions in the original)

My hope is to show that moments of cultural borrowing, destabilisation, and decolonisation in jazz in the U.S. can be seen as an internal process within jazz's native country 'to be free of America'. By juxtaposing the tension of laughter in the face of hate and hypocrisy in West's notion of tragicomic hope with the tension of Atkins's depiction of jazz as both a national and postnational music, the true anti-imperialist potential of jazz can be better understood. Without these two dynamics, jazz might not have spread around the world and continued to evolve outside the U.S. in the twentieth century. By recognising moments of cultural borrowing, destabilisation, and decolonisation in jazz, we can illustrate and celebrate jazz's anti-imperialist character.

Before going forward, these ideas of cultural borrowing, destabilisation, and decolonisation should be explained. The three exist on a spectrum with varying degrees of cultural mixture and disruption. For cultural borrowing to occur, certain elements and ideas are simply incorporated from one culture into another. For cultural destabilisation to occur, traditional elements and ideas within a culture are challenged. For cultural decolonisation to occur, traditional elements and ideas are removed and replaced with alternative or hybridised ones. Viewing the three processes on a spectrum helps to unpack some of the cultural exchanges that take place throughout the history of jazz. And one of the first and most important exchanges happens before jazz begins.

While waiting for a train late one night in 1903, brass band conductor and cornetist W.C. Handy

heard what would later be called the blues for the first time, and to his ears it was '. . .the weirdest music [he] had ever heard' (Handy 1941: 74). These new sounds sung and performed by an African-American guitarist casually at a train station and other experiences he had while traveling in the South would have a profound effect on Handy's musical output. Beginning in 1912, he first published 'Memphis Blues' that included the 'earthy flavor' (78) he was so enamoured with. Handy would later pen such famous songs as 'St. Louis Blues' (1914) and as a result would be known as the Father of the Blues, not because he invented the blues, but because he wrote it down. Handy's borrowing of these southern sounds fused with his brass band experience would create a foundation for what would later become jazz.

Many agree that the first jazz record ever made was 'Livery Stable Blues' in 1917 by the Original Dixieland Jazz Band, five white musicians from New Orleans billing themselves as the 'Creators of Jazz'. Previously, New Orleanian and Creole cornetist Freddy Keppard was offered the chance to record for the Victor Talking Machine Company, but refused, worrying that other musicians might copy his recordings (Giddins and DeVeaux 2009: 88). The members of the Original Dixieland Jazz Band would become very successful touring the country and travelling all the way to London to perform for King George V in 1919. But controversy surrounds this success as many feel that the all-white Original Dixieland Jazz Band did not deserve their place in history. This is only the beginning of the dynamics of race and jazz. In 1923, Paul Whiteman (who later dubbed himself the 'King of Jazz' and was the originator of a new music called 'symphonic jazz') commissioned pianist George Gershwin to compose a piano concerto to be debuted at Aeolian Hall in New York City as part of an all-jazz concert entitled 'An Experiment in Modern Music'. Gershwin heard jazz in Harlem and befriended pianist James P. Johnson. Gershwin incorporated much of what he heard of early jazz in his new piece *Rhapsody in Blue* (1924), which was hugely successful at Whiteman's concert. But these two moments in jazz's early history are associated with musicians who are not fully representative of the community

that produced the music. My aim here is not to start a debate on the validity of the contribution to jazz made by white musicians, which has already been discussed elsewhere (e.g. Lees 1994). Rather, my emphasis is on the cultural borrowing and the use and appropriation of music by the Original Dixieland Jazz Band and Gershwin. On the positive side, their successes most definitely helped propel future successes by musicians both black and white.

In a letter to the editor of *Downbeat* in 1938, pianist and composer Jelly Roll Morton stated that he invented jazz in 1902. And when Morton's recording of pianist Scott Joplin's 'Maple Leaf Rag' (1899) on *The Smithsonian Collection of Classic Jazz* is compared to one of Joplin's piano rolls on the same collection (Morton 1938; Joplin 1899/1916), such an assertion can begin to be entertained. Morton's improvisatory contribution and adaptation of Joplin's original composition are noteworthy. But Morton's letter was aimed as an attack on Handy as the creator of jazz. Handy would later admit that he made no such claim and did not even consider himself a jazz musician:

> I . . . would not play jazz if I could, but I did have the good sense to write down the laws of jazz and the music that lends itself to jazz and had vision enough to copyright and publish the music I wrote so I don't have to go around saying I made up this piece and that piece in such and such a year like Jelly Roll . . . (Handy 1938: 37)

Interestingly, Morton is commonly credited with jazz's first composition in 1915 with 'Jelly Roll Blues'. This bickering is typical of the early arguments regarding the creation of jazz and legitimisation of musicians both black and white.

In the same year that Gershwin and Whiteman debuted *Rhapsody in Blue,* jazz's first great soloist and trumpeter Louis Armstrong arrived in New York after a thorough apprenticeship under Kid Ory, King Oliver, and others. Shortly thereafter, jazz's first great composer and pianist Duke Ellington started working regularly at the Cotton Club in Harlem in 1927. Both Armstrong and Ellington would record songs that would foreground race. First, Ellington recorded 'Creole Love Call' in 1927, which featured a haunting melody sung by Adelaide Louise Hall. And in

1929, Armstrong recorded Fats Waller's '(What Did I Do To Be So) Black and Blue?' from Waller's hit Broadway show *Hot Chocolates*. The song tells a story of personal damage that results from social discrimination based on skin colour:

> Even the mouse, ran from my house
>> They laugh at you, and all that you do
>> What did I do, to be so black and blue?
>
> I'm white, inside
>> But, that don't help my case
>> That's life, can't hide
>> What is in my face
>
> How would it end? Ain't got a friend
>> My only sin, is in my skin
>> What did I do, to be so black and blue?
>> (Armstrong 1929)

Armstrong's foregrounding of race is a moment of cultural destabilisation. His admonition is powerful and begins to open doors to discuss issues of race. Only a decade later, in 1939, Billie Holiday made her landmark recording of 'Strange Fruit' (and later, a chilling re-recording in 1956). Her song illustrated the horrors and violence of lynching in the South, climaxing in the final verse:

> Here is a fruit for the crows to pluck
>> For the rain to gather, for the wind to suck
>> For the sun to rot, for the tree to drop
>> Here is a strange and bitter crop
>> (Holiday 1939)

Holiday's performance of the song for mixed audiences at New York's Café Society can be considered not only a moment of cultural destabilisation, but also a moment of cultural decolonisation for listeners in how it provided them with such a graphic account of violence predicated on skin colour. Armstrong and Holiday are opening the conversation within jazz to create an alternative dialogue around race. Coincidentally, around the same time these discussions were happening, clarinettist and bandleader Benny Goodman broke the colour line in jazz by hiring and predominantly featuring pianist Teddy Wilson in 1935 (and a year later including vibraphonist Lionel Hampton) as both part of his big band and in a special small combo with drummer Gene Krupa.

A much more subtle version of cultural decolonisation can be seen in the recordings of saxophonist Charlie Parker. Simply by looking at his composition 'Ornithology' (1946), we can see a manifestation of what could be called cultural decolonisation on a sonic level. 'Ornithology' is a contrafact, which is a new song based on previously used chord progression. Having evolved from the blues, which uses a small combination of chord changes to create several new pieces of music, it should come as no surprise that jazz would do the same. In the case of 'Ornithology', Parker borrowed the then popular song 'How High the Moon' from the Broadway review *Two for the Show* (1940). Clarinettist Benny Goodman had recorded a hit version of 'How High the Moon' the year the review debuted. For 'Ornithology', Parker developed a new melody over the 'How High the Moon' chord progression, thus creating something new out of something old. 'Ornithology' has since become a jazz standard. And the origin of the song is not lost, as singer Ella Fitzgerald reversed the process in her famous live performance of 'How High the Moon' on *Ella in Berlin* (1960) by singing the melody of 'Ornithology' during her scat solo. This process may not seem as powerful as Armstrong's, Ellington's, and Holiday's contributions, but Parker has subtly embedded a jazz standard with a history of cultural decolonisation.

Additional moments of cultural borrowing that could arguably lead to cultural decolonisation by providing alternative narratives are the many suites of Ellington (recorded 1947–71) and the 'jazz impressions' and other non-traditional recordings of Dave Brubeck (recorded 1957–67). Both musicians had toured the world and were official cultural ambassadors for the U.S. The history and the cultural dynamics of their and other musicians' global tours have been documented (see Davenport 2009; Sehgal 2008; Von Eschen 2004), but the globally influenced recordings of Ellington and Brubeck are a testament to the adaptability of jazz. For example, Ellington wrote suites that either incorporated elements from or were dedicated to regions of the world like Africa (both Liberia and Togo), England, Eurasia, the Far East, and Latin

J

America. Brubeck made recordings with elements from and homages to Germany, Japan, Mexico, and Turkey. Both musicians also created new music and homages to their home country. Without delving deeply into each recording, these recordings are a manifestation of the openness of jazz in addition to its adaptability. These recordings illustrate Atkins's concept of jazz being simultaneously a national and a post-national music.

Now we come to the more documented and discussed period of jazz in relationship to ideas of imperialism and self-determination. The recordings made in the late 1950s, 1960s, and 1970s embody the social issues of the time from the Civil Rights Era to the Black Power Movement. Musicians like bassist Charles Mingus, drummer Max Roach, and saxophonist Archie Shepp also incorporated issues and themes directly from the Civil Rights Movement. In his 'Fables of Faubus' (1959) and its later incarnations, Mingus criticised Arkansas governor Orval Faubus and his segregationist politics for not letting nine African-American students (known as the Little Rock Nine) attend a recently desegregated, public school in 1957. Roach referenced the Greensboro sit-ins on the cover of his album *We Insist! Freedom Now Suite* (1960) with a photo of three African Americans sitting at a lunch counter. Shepp composed several pieces of music in honour of Malcolm X. And these are just the most notable examples from each musician. In addition, musicians like Cannonball Adderley, Art Blakey, Ornette Coleman, Charlie Haden and his Liberation Music Orchestra, Joe Henderson, Roland Kirk, Joe McPhee, Sonny Rollins, Pharoah Sanders, and Randy Weston recorded music with similar themes. Many of the relevant recordings of these and other musicians are included in the Discography.

John Coltrane also reflected historical moments from the Civil Rights Movement with compositions like 'Song of the Underground Railroad' (1961a) and 'Alabama' (1964), homages to heroes of the freedom struggle, like Harriet Tubman, and also its casualties like the four African-American girls killed in the 16th Street Baptist Church bombing in Birmingham, Alabama. But of a more spiritual nature, Coltrane's masterpiece

A Love Supreme (1965d) was a four-part suite that acknowledged his victory over his drug addiction and subsequent spiritual enlightenment as a result. In the form of a letter to the album's listener, Coltrane detailed the experience and explained the intent of the recording in the liner notes:

> During the year 1957, I experienced, by the grace of God, a spiritual awakening, which was to lead me to a richer, fuller, more productive life. At that time, in gratitude, I humbly asked to be given the means and privilege to make others happy through music. I feel this has been granted through His grace. ALL PRAISE TO GOD . . .
>   This album is a humble offering to Him. An attempt to say 'THANK YOU GOD' ...

After *A Love Supreme* and as part of this new consciousness, Coltrane would begin to explore more freely structured music and include elements from the musics of Africa and India. His wife Alice Coltrane would take such cultural mixture further after his death by borrowing culturally from Indian, Egyptian, and other Middle Eastern philosophies and religions. Other musicians also incorporated non-Western musicians and instrumentation in their recordings. For example, guitarist John McLaughlin worked with world-renowned tabla player Zakir Hussain in their group Shakti starting in the mid-1970s.

Though not necessarily directly related to specific historic events, trumpeter Miles Davis would also create music that was reflective of the social changes of the time. After spending time in France recording the soundtrack to *Ascenseur pour l'échafaud* [Elevator to the Gallows] (1958), Davis returned to the U.S. with a different mindset, as he was treated differently and more respectfully in Europe than he was in the U.S. He began to take artistic risks in his recordings, most notably the blues-influenced *Kind of Blue* (1959) that was very minimal in contrast to the dense harmonies of bebop and the aggressive rhythms of hard bop. A year later, Davis recorded the ethereal, flamenco-influenced *Sketches of Spain* (1960), augmented by a large ensemble arranged by Gil Evans. During the late 1960s and early 1970s, Davis converted his ensemble from acoustic instrumentation to a more rock-oriented instrumentation. Davis exchanged the acoustic piano and upright bass for synthesisers and electric

bass with additional electric guitars and percussion. After seeing rock musicians like Jimi Hendrix and Sly Stone, Davis had hoped to attract a younger audience. Davis fused rock rhythms and textures with jazz harmonies and extended improvisation on such recordings as *In a Silent Way* (1969) and *Bitches Brew* (1970a). Many alumni of Davis's bands from this time went on to form successful fusion ensembles and make ground-breaking recordings, most notably Chick Corea's *Light as a Feather* (1972) with Return to Forever, Herbie Hancock's *Headhunters* (1973), and Joe Zawinul's *Heavy Weather* (1977) with Weather Report. This is not the typical cultural borrowing that had happened earlier with the Original Dixieland Jazz Band and Whiteman, as Corea, Hancock, and Zawinul all helped pioneer fusion with Davis. But it should be noted that these three musicians and others made music after their tenure with Davis that they might not have made before. Davis would continue to use the latest forms of technology until his death in 1991. Two of his most successful later recordings referenced the social and political struggles in South Africa: *Tutu* (1986), a homage to South African bishop (later archbishop) Desmond Tutu; and, *Amandla* (1989), a Xhosa and Zulu word meaning 'power'. Davis continually borrowed from many sources, both technological and cultural.

In the 1970s, cultural destabilisation continued. Band leader and keyboardist Sun Ra had been making recordings since the 1950s. But his ideas of interstellar space travel as a metaphor for cultural disruption and evolution crystallised in his movie *Space is the Place (1974).* Sun Ra had constructed a persona for himself based on the idea that he was originally from Saturn. His belief was that humanity did not understand its origins and was therefore out of step with its destiny. Sun Ra's ideas were an attempt at a cultural decolonisation of the mind. Mark Dery would later group Sun Ra's philosophies and others like it under the term 'Afrofuturism' (1994: 180), which combines ideas of technology and science fiction with ideas of race and magic realism. One could view both Davis's and Sun Ra's uses of technology as a gateway to another place or

space. Though they may not overtly discuss the use of technology, such themes of exodus and desire to move to a new world had appeared earlier in the music like Ellington's piano concerto *New World A-Comin'* (1945), inspired by the 1943 Roi Ottley book of the same name, Eddie Harris's *Exodus to Jazz* (1961), Lee Morgan's *Search for the New Land* (1964), and others. So Sun Ra's philosophy can be seen as an extension of an earlier theme of exodus in jazz. In the film *Space is the Place,* Sun Ra invited people to join him in his space travels by registering with his employment service. The recruitment pitch stated: 'If you find Earth boring / Just the same old, same thing / C'mon, signup / With Outer Spaceways, Inc'. Though comical here and serious elsewhere, such themes of exodus are obviously anti-imperialistic and are aimed at promoting cultural decolonisation. And starting in the 1960s before Sun Ra's invitation, many musicians formed groups and associations as an alternative to record companies and to help promote their own music (for example, the Association for the Advancement of Creative Musicians (AACM) in Chicago, the Black Artists Group (BAG) in St Louis, the Jazz Composers Guild in New York, the Union of God's Musicians and Artists Ascension (UGMAA) in Los Angeles, and others).

The process of augmenting the conversation of jazz with new issues continued through the 1980s. Most notably, saxophonist Fred Ho drew heavily on the black freedom struggle and applied its issues and challenges to additional groups, such as Asian Americans, Latin Americans, and women. Ho not only has an extensive catalogue, but was also an accomplished author. The trend to augment the conversation of jazz continued through the 1990s with musicians like bassist William Parker and saxophonist John Zorn, both associated with the downtown scene in New York. Parker established the group Other Dimensions of Music to provide an alternative to the neo-bop young lions like the Marsalis brothers, Nicholas Payton, Joshua Redman, and others. Parker's group was firmly rooted in the free jazz tradition of Ornette Coleman and others, as opposed to the hard bop tradition of the young lions. Parker was key to establishing the Sound Unity Festival in the

1980s and later the Vision Festival beginning in 1996. Zorn widened the conversation by emphasising Jewish culture in his work, starting in the 1990s with his various incarnations of the Masada groups and the accompanying repertoire. Zorn also founded the record label Tzadik in 1995 to document his output and continually cultivate younger musicians. Zorn opened his own venue, The Stone, in 2005 to support his own output and the music of other adventurous musicians. Parker and Zorn, both prolific authors, have borrowed from other sources in order to destabilise the norm of jazz performance. Parker's further development of free jazz and Zorn's incorporation of Jewish culture both widen, contest, and attempt to decolonise the jazz tradition as envisioned by the neo-traditional young lions since the 1980s.

It should be noted that both Marsalis brothers have reinterpreted and recorded Coltrane's *A Love Supreme* (see B. Marsalis 2002; W. Marsalis 2004). Wynton Marsalis recorded multiple works by Mingus with the Lincoln Center Jazz Orchestra (2005). And Branford Marsalis recorded Rollins' *Freedom Suite* (2002). Plus, trumpeter Terrance Blanchard has paid tribute to Malcolm X both on the soundtrack for Spike Lee's *Malcolm X* (1992) and his own album *The Malcolm X Jazz Suite* (1993). It could therefore be argued that these young lions have recolonised and thus canonised what were originally disruptive music and themes. To be fair, all three musicians have also released adventurous original music in some way. Branford Marsalis worked with Sting and released albums by his hip-hop project Buckshot LeFonque (1994–97). Wynton Marsalis wrote and recorded the Pulitzer Prize-wining *Blood on the Fields* (1997) and the thought-provoking *From the Plantation to the Penitentiary* (2007). And Blanchard composed and recorded music inspired by the devastation of Hurricane Katrina and its aftermath on three different occasions: the soundtrack to Spike Lee's documentaries *When the Levees Broke: A Requiem in Four Acts* (2006) and *If God is Willing and Da Creek Don't Rise* (2010), plus his own album *A Tale of God's Will: A Requiem for Katrina* (2007).

Venturing beyond the boundaries of jazz, it should be noted that the musical contributions of jazz musicians have not only spread around the world, but have also been sources of inspiration for non-jazz musicians. Since the late 1960s, a vibrant scene of improvisatory rock bands (known as jam bands) has flourished in the U.S. Bands like Blues Traveller, the Dave Mathews Band, Gov't Mule, Phish, Widespread Panic, and others all have roots in bands like the Allman Brothers Band, the Grateful Dead, and the Jimi Hendrix Experience, which based much of their improvisatory nature on jazz. Improvisation and the openness to collaboration may be the only markers shared with jazz, but to ignore jam bands and leave them out of a conversation of music and anti-imperialism would be short-sighted. Most of these jam bands have received little to no radio support. And though they all have created a large repertoire of original material, their fans attend their concerts repeatedly to witness each band's exploration of the musical possibilities of their repertoire with hopes of new discoveries. Thus, jam bands have borrowed improvisation from jazz, destabilised the usual radio-friendly, single-dependent structure of rock, and arguably decolonised the attitudes of many young people to make them open to more exploratory musical environments.

To close this examination of moments of cultural borrowing, destabilisation, and decolonisation in jazz, there are three more recent examples that show that these processes continue. First, French multi-instrumentalist Michel Henritzi released the album *Keith Rowe Serves Imperialism* in 2007. The title of the album references composer Cornelius Cardew's book *Stockhausen Serves Imperialism (1974)*, criticising both John Cage and Karlheinz Stockhausen, and denouncing his involvement with the avant-garde. Similarly, Henritzi believes that the music of improvisers like English table-top guitarist Keith Rowe are non-subversive. In the album's liner notes, Henritzi criticises the idea of a recorded improvisation, arguing that once recorded, an improvisation is no longer an improvisation: 'The manufactured record [of an improvisation] is deifying the living moment of the performance into a finished work, into an object which is just feeding the market of Art'. Instead, Henritzi has taken improvisations

conducted at separate times and places and assembled them into a performance, stating:

> [The musicians] were all ignorant of the other one's music. But this is precisely where improvisation is taking place, just through the arbitrary collage . . . We are not free with our choices. The record as an object gives us a restraint with which we must deal. The market is selling us its norms and we need the market to sell our cultural production. (2007)

Henritzi is trying to redefine (and thus decolonise) the idea of recorded improvisation. This may just be a mental exercise, but it reinforces the idea that improvisation needs to be experienced in the moment. And once it is over, it cannot be repeated.

Another moment of cultural destabilisation (and potentially decolonisation) is pianist Robert Glasper's Grammy win for his album *Black Radio* (2012). This may not sound like a moment of destabilisation at first. But in spite of the fact that Glasper is a product of the jazz tradition and the album was released on a jazz record label (Blue Note), the recording won a Grammy for Best R&B Album. Granted, Glasper was working under the moniker the 'Robert Glasper Experiment' and included many R&B, hip-hop, and other non-jazz musicians on the album such as Erykah Badu, Yasiin Bey (formerly known as Mos Def), and Me'Shell Ndegéocello. But for a musician rooted in jazz to be able to cross over and win in a non-jazz category is noteworthy. Previously, pianist Herbie Hancock won Album of the Year with his album *RIVER: the joni letters* (2007), but Glasper's cross-genre shift is more of a departure from the norm.

The final example of cultural decolonisation is the music video released by bassist and singer Esperanza Spalding entitled 'We are America' (2013), which calls for the closure of the U. S. detention facility known as Guantanamo Bay in Cuba. The music video also features other famous musicians such as Harry Belafonte, Janelle Monáe, and Stevie Wonder. The song does not appear on any of Spalding's albums and was released solely as a music video. And though more of an R&B song, Spalding's association with the greater jazz community firmly attaches 'We are America' to the jazz tradition. The song

itself does not reference Guantanamo Bay, but the video features quotations regarding the facility, statistics of detainees, and its closure. Spalding repeatedly states: 'We are America / In my America / We take a stand for this' and 'Let 'em out', both phrases reinforcing the quotes in the music video.

Hopefully, the above-mentioned examples will begin a discussion surrounding cultural borrowing, destabilisation, and decolonisation in jazz. Keeping West and Atkins in mind, jazz serves as a model where one can remain calm during moments of adversity, but also have multiple identities that are rooted in different ways. Recently in the *New York Times*, Herbie Hancock commented on how and why jazz keeps evolving: 'The thing that keeps jazz alive, even if it's under the radar, is that it is so free and so open to not only lend its influence to other genres, but to borrow and be influenced by other genres. That's the way it breathes' (2013: AR25). The more recent moments in jazz of borrowing, destabilisation, and decolonisation seen in the work of Henritzi, Glasper, and Spalding are in agreement with Hancock's statement. And the many moments from W.C. Handy to John Zorn also fit into Hancock's statement. The necessity is to keep breathing, and the breath or exchange is the balance between borrowing and being borrowed, destabilising and being destabilised, and decolonising and being decolonised.

The title of this work 'Come On and Let's Get Free', is borrowed from the lyrics of Funkadelic's song 'Good to Your Earhole' on their album *Let's Take it to the Stage* (1975). In many ways, funk bands in the 1970s continued many of the same ideas of cultural destabilisation found in jazz. The idea of dancing as a way to 'get free' is not too far from the previously discussed ideas. But the real message of these moments of cultural borrowing, destabilisation, and decolonisation is best stated in the lyrics of the title track of Funkadelic's album *Free Your Mind and Your Ass Will Follow* (1970): 'Freedom is free of the need to be free'. The projects of anti-imperialism and decolonisation and their corresponding agendas could not be more accurately expressed. Though not the first to say this, trumpeter Nicholas Payton reminded the

readers of his blog that the word 'jazz' is a pejorative term that should be avoided and is not reflective of the music and its tradition:

> 'Jazz' is an oppressive colonialist slave term and I want no parts [sic] of it. If jazz wasn't a slave, why did Ornette [Coleman] try to free it? Jazz is not music, it is an idea that hasn't served any of us well. It saddens me most that some of my friends can't see that. (2011)

The word and its history are problematic. But it may be appropriate that the word and its history embody the very cultural and historical struggle that produced the music. Hopefully, these and other moments of cultural borrowing, destabilisation, and decolonisation in jazz (or whatever one calls it) can be seen as progress toward the goal of getting free, and maybe even getting beyond the need to be free.

John A. Hobson

Jones, Claudia Vera Cumberbatch (1915–1964)

Carole Boyce Davies
Africana Studies and English, Cornell University, Ithaca, NY, USA

Synonyms

Origins

Definition

Claudia Vera Cumberbatch Jones was a major contributor to the articulation of black left feminism, bringing together her political orientation as a Marxist-Leninist with a commitment to advancing the rights of women, workers, and black people in the United States, the United Kingdom, and the Caribbean. Her primary vocation as a journalist, honed in Communist Party USA (CPUSA) media, provided her with the means to articulate these positions and the experience to create institutions to serve her various communities. The *West Indian Gazette and Afro-Asian Caribbean News* was the first black newspaper in London which she founded in 1958 and through which created the first London carnival in 1959. These provided some of the opportunities for the growing Caribbean community in England to begin a process of self-definition.

Introductory Paragraph

Claudia Vera Cumberbatch Jones was a journalist, editor, intellectual activist, anti-colonial/imperial communist theorist, community leader, and human rights advocate. She was born on February 21, 1915, in Belmont, Port of Spain, Trinidad, to

Charles Bertrand Cumberbatch and Sybil Logan Cumberbatch and died in London in December 1964. She was the only black woman elected to the Central Committee of the Communist Party USA (1945–1946) and for this was tried and punished (1952–1953) for being a communist. She became a political prisoner in 1955 in the United States for delivering a speech entitled "International Women's Day and the Struggle for Peace" on International Women's Day in 1950 which was cited as the "overt act" in her subsequent arrest and during her trial. After serving 10 months in the Women's Penitentiary, Alderson, West Virginia, beginning January 11, 1955, she was released October 23, 1955 after numerous petitions on her behalf for health reasons. Her one (1) year and a day sentence was commuted for "good behavior," but she was ordered to be deported by December 5, 1955. Technically still a "British subject" as she was denied US naturalization because of her early membership in CPUSA, she left for England on December 9 and arrived in London on December 22, 1955.

Despite suffering the ill effects of incarceration, once she got to London, she began a life of activism to support the many needs of the growing Caribbean community in England following the large-scale migration after the now legendary Windrush 1948. There she became the founder of the first black newspaper in London, the *West Indian Gazette* (*WIG)* in 1958 which subsequently became the West Indian Gazette and Afro-Asian Community News. She organized the first London carnival in 1959 under the theme "A People's Art Is the Genesis of Their Freedom" in response to the Notting Hill and Nottingham racially – motivated riots. In this way, her praxis bridged the Caribbean, the United States and United Kingdom informed by the black world politics of decolonization.

Political Formation

In assessing her political life up to the point of deportation, Claudia Jones described the themes which defined, motivated, and guided her activism:

> I was deported from the USA because as a Negro woman Communist of West Indian descent, I was a thorn in their side in my opposition to Jim Crow racist discrimination against 16 million Negro Americans in the United States, in my work for redress of these grievances, for unity of Negro and white workers, for women's rights and my general political activity urging the American people to help by their struggles to change the present foreign and domestic policy of the United States. (Interview with George Bowrin)

This combination of women's rights, workers' rights, and black rights would consistently reappear in her writings as in her organizational approaches. As a result, she would become an active organizer among African American communities in the US and Caribbean communities in the United Kingdom on a variety of issues such as inadequate housing and employment biases, discriminatory immigration practices, and aesthetic and cultural hierarchies which negatively impacted black people.

Seeking Full Equality: Race, Gender and Class Activism

Claudia Vera Cumberbatch (Jones was an adopted name to protect herself and family from intrusive FBI surveillance) joined the Young Communist League in 1936 and was its New York State Chair and National Council Member in 1938. She worked as a journalist and editor for several communist party organs culminating in 1945 as the Editor of Negro Affairs for the *Daily Worker* when she was elected full member of the National Committee, CPUSA, at its 1945 annual convention.

Claudia Jones was a part of the first wave of Caribbean migration to the United States. She arrived in New York at the age of 8 in the middle of what would be the Harlem Renaissance and came of age in the depression era of the 1930s. Irma Watkins-Owens (1996) and Winston James's (1998) works provide some of the historical and sociological contexts for this period. There were 40,000 immigrants between 1900 and 1930, many of whom settled in Harlem with 1911–1924 being the heaviest period. Caribbeans were able to enter the United States unrestricted until the 1924 Immigration Act which instituted and placed Caribbean colonies under quotas.

J

Many were the educated elite or working-class urban dwellers who began, as the Garvey movement indicates, to interact socially with African Americans. A secondary group of migrants were former Panama Canal workers, largely male. Amy Ashwood Garvey in the early 1920s co-founder of the UNIA joined Garvey in 1918, but lived for a time in Panama as well, so there were also black women who worked in various capacities in the Panama Canal Zone. Several migrants to Harlem were single and young, male students like Harlem Renaissance poet Claude McKay or Panafricanist/Communist activist George Padmore. Many came with a sound primary and secondary British-style education. Several soon became entrepreneurs. But above all they experienced racism and ethnic oppression common in the United States at the time. Several Caribbeans joined the Communist Party (Turner 2005; Perry 2009).

Claudia credits her political activism as having been generated by two incidents, one domestic and the other international. Organizing in defense of nine black youth, called the Scottsboro Boys, accused erroneously of raping two white women in a train in Scottsboro, Alabama, in 1931 and tried repeatedly from 1931 to 1937, led many, including Rosa Parks, to activism on racial issues. The Mussolini invasion of Ethiopia (1935) was a similar international event which catalyzed organizational responses in Harlem in particular but in other black world locations as well. This twinned domestic and international approach would mark Claudia Jones's politics consistently.

Her work in women's rights was more explicit when she became secretary of the CPUSA Women's Commission in 1947 and began to write a women's rights column titled "Half the World" for *The Daily Worker*. Assigned by Party to work with working class and black party women for peace and equality, she toured 43 US states, including the West Coast, reorganizing state-level Women's Commissions, recruiting new party members, and organizing mass rallies. Claudia Jones is credited with putting consistently on the platform of the Communist Party the triple oppression of black women based on their race, class, and gender and for popularizing the triple

rights call on behalf of workers, women, and black people. During her trial, she asserted publicly in her "Speech to the Court" before sentencing in 1953 the place of the intellect for black women: "You dare not, gentlemen of the prosecution, assert that Negro women can think, and speak and write!" (Speech included in *Claudia Jones, Beyond Containment*).

Claudia consistently qualified her communist politics with her identities as a black woman from the Caribbean and did not see any contradiction as she embraced all her identities and political positions. Throughout the 1950s, during the oppressive House on Un-American Activities (HUAC) Red Scare period, many activists, entertainers, and intellectuals were targeted. Claudia Jones who was a member of the Communist Party USA would experience a variety of arrests, detentions, and incarcerations. Arrested, finally, under the Smith Act, along with 16 other communists and convicted in 1953, she (along with Elizabeth Gurley Flynn) was sentenced to 1 year and a day, to the Federal Women's Penitentiary, Alderson, West Virginia (beginning January 11), after the group lost all appeals. Released on October 23 after numerous petitions on her behalf for health reasons, her deportation order was finally executed on December 5, 1955. She left by ocean liner for England on December 9 and arrived in London on December 22, 1955. There she was able to have a major role in shaping the nature of black community and institution-building in London because she arrived along with the first massive influx of Caribbeans identified as beginning with the Windrush, another ocean liner, in 1948. Though now "doubly or triply diasporized," Claudia Jones was able to use her communication and organizing skills developed in New York to aid a community in need. Her last published essay, "The Caribbean Community in Britain" (1964), documents the demographic and sociocultural turns ushered in by Caribbean migration to the United Kingdom but is also clear about the troubled future of the Caribbean islands themselves under US imperialism:

> A special importance attaches itself to the Caribbean, where there is evidenced the two paths to national liberation: either the path of

obsequiousness to US imperialism and neo-colonialism or the high road to Socialist advance as exemplified by Socialist Cuba. Particularly in the Caribbean, where United States imperialism threatens socialist Cuba; infringes on the national sovereignty of all Latin American peoples; intervenes in the internal affairs of British Guiana and Panama; and whose pretensions of a "free America in a free world" stands exposed before the massive hammer lows of the mounting Negro liberation struggle . . .. (181)

Claudia Jones is identified as being an advocate for African-Caribbean and Asian migrants to Europe and the larger international community. With the Committee of Afro-Asian and Caribbean Organizations, she organized a parallel "March on Washington" to the US Embassy in London. She worked with the African National Congress to organize a hunger strike against apartheid, to boycott South Africa, and for the freedom of political prisoners such as Nelson Mandela. She participated in protests outside the South African Embassy in London and spoke at rallies against the UK Immigration Act of 1962. As a delegate to the 10th World Conference against hydrogen and atom bombs in Japan, she served as Vice Chair of the Conference Drafting Committee where she also proposed a resolution in support of liberation struggles in the third world. In the last year of her life, she visited China, as a guest of the China Peace Committee, where she met Chairman Mao and interviewed Soong Ching Ling, wife of Sun Yat-sen.

Claudia Jones suffered from complications of hypertensive cardiovascular disease throughout her adult life, was hospitalized for 21 days at the end of her trial, was repeatedly hospitalized during and after incarceration and upon arrival in London, and once during a visit to Moscow in 1962 was hospitalized in the Crimea. The exact date of her death on or around December 25, 1964 is attributed to heart failure and the fact that she did not show up for a Christmas party she was scheduled to attend. Her January 9, 1965 funeral and cremation in Golders Green, London, drew international recognition from governments around the world, diplomatic representations, and media coverage including an obituary read by Ruby Dee. Her ashes were interred in a plot purchased by her partner Abhimanyu Manchanda to the left of the grave and bust of Karl Marx, in Highgate Cemetery, London (February 27).

Anti-imperialism and Women's Rights

When Claudia Jones entered the Communist Party USA, there were already very active examples of black communist women and men who had visible identities that she could emulate and positions she could advance. What marks her instead is that she became both an **organizer** and a leading **theoretician** in the CPUSA. Claudia Jones, following Lenin on the Woman Question, would advance the position that black working-class women had to be at the vanguard of these struggles and would therefore argue for a parallel gender, race, and class advancement for black women or minimally "An End to the Neglect of the Problems of Negro Women" (1949). Her landmark essay which advances this position is "We Seek Full Equality" (1949) which actually begins "Taking up the struggle of the Suffragists, the Communists have set tasks, new objectives in the fight for a new status of women" and continues "Marxism-Leninism exposes the core of the woman question and shows that the position of women in society is not always and everywhere the same, but derives from woman's relation to the mode of production." This woman, race, and class orientation would become a central feature of the Communist Party USA during the time of Claudia Jones and would have subsequent articulations in the work of Angela Davis (*Women, Race and Class* 1983).

Recent work of Jeffrey B. Perry, *Hubert Harrison: The Voice of Harlem Radicalism, 1883–1918* (2009), reveals a range of active communist women such as Williana Jones Burroughs as a teacher, union activist, and communist and Grace Campbell of Caribbean and African American descent as well as " British Guiana-born office worker and communist Hermie Dumont Huiswoud" (2). Joyce Moore Turner's *Caribbean Crusaders and the Harlem Renaissance* (2005) has pretty good detail on Huiswoud and Grace Campbell (1882–1943) who had moved from Washington DC in 1905. Grace Campbell is identified as from Georgia originally, the daughter of a Jamaican father and an African

American mother (77) and the sole woman member of the African Blood Brotherhood (77) with an "unwavering dedication to the socialist cause" (78).

The issue of imperialism and its effect on colonized peoples would be more directly addressed in the work of the Lenin component of Marxism-Leninism which Claudia would consistently invoke. Her essay "American Imperialism and the British West Indies" (1958) offers the best summary of her anti-imperialist position which is one of the earliest to bring together an analysis of the conjunction between British colonialism and American imperialism: "For Britain, the West Indies is not only a source of cheap food and raw material, it is also a market for her manufactured products. Britain holds a predominant position in West Indian trade...But despite all obstacles, American business has penetrated this market" (158).

This position which identifies the operations of both forms of imperialism (the United States and the United Kingdom) and their operations in the Anglophone Caribbean then on the verge of forming a Federation which would collapse soon after it was instituted (1958–1962) offers a timely assessment of the conditions at that point in history which would hamper the full realization of subsequent independence movements. It also offers a set of recommendations including full civil liberties, the freedom to travel, and protection of rights of minorities. She was also critical of the fact that the national bourgeoisie class was making the decisions which would forever hamper full Caribbean national independence. Still for her, "What united the all-class struggle of the West Indian peoples' opposition to foreign imperialism" (163).

Basically then, Claudia Jones is in the leadership of an anti-colonial/anti-imperial Caribbean feminism which was able to link the conditions of working women to the larger working-class interests, both domestically and internationally. Claudia Jones, a transatlantic activist and a black radical intellectual from the Caribbean, opened up Marxism-Leninism to theorize the specifics of the superexploitation of black women. There is a clear influence here of Lenin's discussion on "The Woman Question" with Clara Zetkin that provides a full reasoned analysis of the issue and relevance of gender. Claudia Jones is indicated as having this work republished by CPUSA Women's Commission while she was its secretary, in her essay "For Unity of Women in the Cause of Peace."

Conclusion

Claudia Jones's critique of imperialism runs through her entire political trajectory from her early essay "Jim Crow in Uniform" 1940 where she critiques British imperialism and asserts that it is "only the abolition of imperialism, of the whole system of the war makers, will guarantee peace and security for all peoples" to her final essay, on "The Caribbean Community in Britain" (1964). The domestic operations of these practices on women, on working class, and on black peoples allowed her to make the link with the international nature of imperialist practice, particularly the conjoined British and American manifestations.

By these means, she found ways to reshape her politics and expanded Marxism-Leninism to account more fully for black women in the United States, people of color in general, African-Caribbean, and Asian migrants to Europe and so impacted that society that her burial left of Karl Marx in London is a fitting statement of the nature of her politics as of her life.

Claudia, for her part, was well aware of the complication that her gendered identity posed and says as much to interviewers whenever she was questioned. The interview with George Bowrin indicated earlier is a good place to understand these combinations. Ironically, it is her subjectivity as a "British Subject" of Afro-Caribbean origin which renders her more visible in the smaller UK context. Still, Jones's internationalism in the United States had already provided her with the tools to read the US and British varieties of imperialism as well as its "immigration" policies.

Interestingly it is important to say in closing that the case against Jones and her co-defendants, the 13 communists prosecuted and punished for having communist ideas, was remedied in a subsequent case Yates vs. the United States (1957 – 354 U.S. 298) which argued that having political views was not the same as acting on them. Whereas the Smith Act which had made it illegal to have communist ideas and prosecuted and

punished communists on this basis, "the Court held that for the Smith Act to be violated, people must be encouraged to do something, rather than merely to believe in something. The Court drew a distinction between a statement of an idea and the advocacy that a certain action be taken." But by then, though Jones could have returned and have her case overturned, many of her colleagues had been so embattled and had moved on to other lives or indeed had had their lives significantly destroyed by the state. In my view, Jones was by then so heavily involved in the London community that a return to the United States would not have been any more interesting to her. She had other vistas that she wanted to engage – China, Japan, Russia, and definitely her own developing Black British/Afro-Caribbean community. In the last year of her life, she visited China and as reported in the *People's Daily* on what Claudia Jones thought of socialist China:

> When she talked about her visit to China followed by her participation in the 10th Anti-Hydrogen Bombs Conference in Tokyo, she said, "In the struggle of the people of Asia, Africa and Latin America against imperialism, China is their greatest friend. (October, 1964)

Kenya: Repression and Resistance from Colony to Neo-colony 1948–1990

Shiraz Durrani[1] and Kimani Waweru[2]
[1]Vita Books, London, UK
[2]Vita Books, Nairobi, Kenya

Introduction: The Dialectics of Repression and Resistance

Kwame Nkrumah (1962), in his quote, 'The enemy is imperialism, which uses as its weapons, colonial (1962ism and neo-colonialism', sums up the struggle in Kenya and Africa – historical as well as current. It also provides the context and the scope of this article. Repression by imperialism and people's resistance in response to it cannot be seen in isolation from each other. These opposites – repression and resistance – are in a cause-and-effect relationship with each other, with the process having been started by colonial repression in 1884. The struggle continued in the 1960s as African countries achieved political independence: now it was neo-colonialism that people's forces had to fight. Neo-colonialism's grip on African countries is now as entrenched as was that of the colonial powers in the earlier period. The contradiction between imperialism and people was, and is, the main feature of life for working people in Kenya and Africa. The global "cold war" between capitalism and socialism was reflected in Kenya in the contradiction between the conservatives and the radicals in KANU in the independence period. Later this developed into the contradiction between the comprador ruling class and resistance movement maintaining the line of Mau Mau and seeking socialist solutions.

This contradiction needs to be seen not only in its particular manifestation in Kenya but also in its global, universal aspect as well. History is sometimes seen in mutually exclusive country-perspectives, and thus the complete picture of global repression and resistance is missed. Imperialist repression, exploitation, and oppression in Kenya can only be fully understood in the context of similar repression in India or Malaysia, for example. Similarly, the resistance of the peoples of Kenya and India, among others, has much in common with each other. Only such an overarching approach can help us understand, not only the

geographical aspects of repression and resistance in different countries, but also the historical links between events at different historical periods in any one country.

At the same time, it is necessary to understand the reasons that imperialist repression started. It was not, as some imperialist apologists have claimed, to "civilize natives" but to acquire for free the wealth, land, resources, and products of labor from the colonial- and imperialist-dominated world. While military was the primary weapon that they used against people, other, subtler, methods were also used. These included ideological, economic, cultural, and social attacks that reinforced the military aspect. The main method of imperialist exploitation was the creation of capitalist relations so that capital controlled colonial resources and power, while the working class, peasants, and others linked to them were forced to provide labor, land, and other resources which swelled capitalists' pockets. In this way, capitalism created classes and class divisions which destroyed the previous system based on relative equality for all. However, the introduction of capitalist relations also inculcated class consciousness among people. They thus became aware that class exploitation and social oppression were not an inevitable part of social life but were inherent in capitalism and imperialism. It was this awareness that helped to liberate their minds from the blinkers created by imperialism and prepared people for their battles against colonialism, capitalism, and imperialism. As the enemy came in these three guises, so did people's struggle for liberation contain three aspects of resistance: anti-colonialism, anti-capitalism, and anti-imperialism. This resistance did not aim only at opposing colonialism, capitalism, and imperialism: it was a proactive movement to create a society that was not capitalist and was opposed to imperialism. It was a socialist society, based on principles of justice and equality for all, that Mau Mau aspired to, not always by name, but certainly in their aspiration and aims. That such a prospect was attacked so vehemently by forces of neo-colonialism and imperialism indicates that they understood clearly that what people wanted was nothing less than the destruction of the very

system of economic exploitation and social oppression: capitalism and imperialism. Their aim was to replace this with socialism – in theory and practice.

That is the context of repression and resistance in Kenya from colonial to neo-colonial stages. That remains the struggle of the people of Kenya to date.

Note:

The term "nationalities" is used to indicate various ethnic groups in Kenya, for example, the Kikuyu and the Luo. They were labelled "tribes" by the colonialists.

The Colonial Period: 1948–1963

Repression

The scope of this article is limited to the period 1948–1990. This does not imply that there was no repression or resistance before and after this period. Indeed, British colonialism had to use severe repressive measures to suppress people's resistance in Kenya long before this period. The Truth, Justice and Reconciliation Commission of Kenya (2013) records the methods used by the invaders to suppress resistance:

> The conquest of state and territory for British settlement and exploitation in Kenya was achieved through colonial violence. To force Africans into submission, the colonial administration in Kenya conducted 'punitive expeditions' in the 1890s against what they called 'recalcitrant tribes'. There were military expeditions against the Nandi in 1901, 1905, and 1906, against the Embu in 1905, against the Abagusii in 1904, 1908, and 1914, against the Kipsigis in 1905 and against the Abagishu and Kabras in 1907 . . . Practically everywhere in Kenya, as was the case in the rest of Africa, the imposition of colonial rule was resisted. Such resistance inevitably provoked military retaliation from the colonial powers. Better armed and employing crack shot mercenaries, colonial powers imposed their rule by violence and/or military expeditions. This was particularly the case between 1895 and 1914; a phase of pacification of 'recalcitrant tribes' fighting for the preservation of their political, cultural and economic independence. The period was thus characterized by an unimaginable degree of human rights abuses against defenceless Africans. The military expeditions were accompanied by crimes such as theft, rape, death and destruction

of property by the colonial soldiers or their associates. Such actions defy the view that the British colonialist used humane and gentle methods to impose their rule in Kenya.

This then is the background to the period covered in this article. There were clear economic reasons that drove colonialism and imperialism to invade large parts of the world. Woddis (1960, p. 1) sums up:

> The history of Africa's relations with the West has been a history of robbery – robbery of African manpower, its mineral and agricultural resources, and its land. Even though direct slavery no longer exists, labour, resources and land remain the three dynamic issues over which the struggle for the future of Africa is being fought out. The form of this struggle, it is true, is a political fight for national independence; but the abolition of foreign control of labour, resources and land is the substance for which this independence is being sought.

Thus labor, resources, and land were the central aspects of the contradiction between Britain and Kenyans. These formed the reason for colonial exploitation and repression, which in turn led people to resist. The demands of the people were for land and freedom – hence the Kenya Land and Freedom Army, with the term "army" indicating the method of achieving land and freedom.

The strategic importance of Kenya for Britain after the Second World War is summed up by Sik (1974, p. 21):

> After World War II the importance of Kenya for the British imperialists was increasing. Having lost a whole series of strategic bases in the Near and Middle East (India, Egypt, Palestine), they found Kenya most fitted to be developed into a strategic base. To attain this aim they had to build roads and airfields, to develop agriculture and industry, and these projects needed – in addition to capital – the assistance of the settlers who aspired to independence and the more intense utilization of the cheap (and in part free) labour of African millions... Accordingly the post-war policy of Britain was directed towards increased economic development of the colonies, by breaking the resistance of Africans and silencing their demands, by forcing them to serve meekly the united interests of monopoly capitalists and settlers.

The control over land, labor, and natural resources fuelled the industrial revolution in Europe at the expense of Africa. The contradiction

between colonialism and the people of Kenya is well summarized by Laski (1954?, p. 7):

> The climate of much of the territory [Kenya] is excellent for agriculture, and it is free from tropical diseases. These conditions, however, have encouraged the settlement of Europeans who have invaded the healthy areas and alienated the land formally owned and tilled by Africans. The African population must now either perish or work for starvation wages on the farms they and their parents owned for countless generations. In addition they are compelled to pay a Poll Tax to sustain the Administration which has deprived them of their land.

Thus, the so-called land question was also linked to other issues, such as land ownership, particularly of the most productive land, the enforced movement of peasants from their land to work as cheap labor in colonial plantations and industries, as well as government policies on taxation. The reality of land grabbing by the colonial authorities in Kenya is examined by Woddis (1960, pp. 2–3):

> In Kenya, some 4,000 white farmers have been given the monopoly of 16,500 square miles of the White Highlands, which are estimated to contain no less than thirty per cent of all the good land in Kenya.

Then in July 1920, the British Government declared Kenya a "colony." Singh (1969, p. 9) explains the reasons for this:

> This was aimed at ensuring that the British could deal with the land and labour of African people as they thought fit. It was to guarantee that the land taken away from the African people and given to settlers would remain settlers' land and that the forced labour system prevailing in Kenya could be further tightened. Secondly a conspiracy began to be organised to make Kenya a "White Man's Country" and to establish a white settlers' government. Thus the African people were being turned from a "protected people" into a slave people.

The overall contradiction in Kenyan society during the entire colonial period has been summed up by Singh (1969, pp. xi–xii):

> There was now a fierce struggle between two great forces. On the one hand were the British rulers, helped by settlers and other employers. They were determined to perpetuate for ever their complete domination over the African people and exploit the human and natural resources of Kenya for the benefit of imperialism and colonial interests. On the

other hand were the African and other freedom-loving people. They were bent upon resisting, attacking and defeating the imperialist colonial rule and its consequences – land robbery, forced labour, low wages, long working hours, compulsory registration system, racial segregation, colour bar, oppressive laws and such other practices. The basic contradiction was the main driving force throughout the colonial period in Kenya and has influenced the historical development in Kenya.

The struggle over land had implications for the entire economic, political, and social life of people. Koinange and Oneko (1952, pp. 10–11) examine some of these related aspects of colonial policies:

'Colonial development' which seeks merely to produce more food and raw material for export, without reference to African needs, will fail. Cheap colonial food that relies on cheap colonial labour is not a contribution to development. Wages are already very low . . . The lives and destinies of more than five million Africans are controlled arbitrarily by 29,000 Europeans in general, and 3,000 European Settlers in particular. This arbitrary rule by a small minority raises many questions . . . Believing in full democracy, we aim at a common roll for all the peoples of Kenya, to eliminate racial, religious and colour discrimination . . . With these discriminations, there are others: so that in education, health, and many other aspects of life, the Africans of Kenya are placed in a position of relentless inferiority. They, alone of the inhabitants of Kenya, have to carry passes which control and restrict their freedom of movement.

The scene was thus set for violent clashes between British colonialism and the people of Kenya.

Resistance

In the early period, resistance to colonialism was led by peasants from different nationalities. As these were defeated by colonial bullets and atrocities, there was a need for a qualitative leap in resistance to this superior firepower. This was provided by a combination of people power, trade unions, and armed resistance, each working in unison with the other. Capitalism and colonialism had consolidated class structures, and the working class now joined other forces to resist colonial repression. Maxon and Ofcansky (2000, p. 167) explain the class basis of Kenyan history:

On the whole, those who joined the armed struggle against colonialism and European supremacy

were the poor and landless, while those who were wealthy, called loyalists, supported the colonial government.

Trade-union activities, such as strikes, were then added to peasant resistance to create a new level of resistance guided by a clear ideology and a stronger organization. Thus, the strength of the working class added the missing element to confront colonialism. The three aspects of this united front against colonialism were the peasants and people's militancy, the trade unions, and the armed resistance by Mau Mau.

The first aspect of this new people power was the united action of millions of people. That was the advantage that people had over the occupying colonial forces, but it was not merely a matter of numbers. It was how this numerical advantage was used in combination with other advantages, such as the radical trade-union movement, the working-class ideologies that supported the liberation of people, and the organizational structures developed by people over many decades. Singh (1969, p. 4) shows how it was people's resistance that led the anti-colonial movement in Kenya:

In order to struggle against foreign occupation of the country, against seizure of African lands and against forced labour, the African people, wherever possible, resorted to armed harassing of the British authorities, attacks upon labourers building the railway, and boycott of work for settlers and other employers. All this resistance was sporadic but secretly organised. At times it used the tribal organisation with sanction or tacit consent of a patriotic chief. At other times it was organised by secret tribal groups in spite of opposition from stooge chiefs.

Colonialism came with a number of methods to subjugate people, the primary one being armed repression. This was reinforced by attempts to control people's world outlook and thinking, using mass media and educational and religious systems to create thinking friendly to colonialism. One of its highly effective methods was to create disunity among people based on "tribes," religion, region, ethnicity, and gender, among others. Yet another method was to destroy people's awareness of their history and, in particular, history of people's resistance – not only in Kenya but throughout the world where imperialism faced

resistance. In this and other ways, colonialism created a dependency mentality among people, killing their creativity and self-confidence by destroying their culture and lifestyle while also depriving them of means of survival.

In this situation of multiple attacks on people, resistance in Kenya was also multidimensional. Independent schools were set up to give knowledge and mental tools to Kenyans to face colonialism. Cultural activities such as songs and dance reflected local and national pride; publishing of newspapers and other means of social communications allowed people to talk to people, often using nationality languages to bypass colonial censorship; independent church organizations reflected local conditions and needs. Unity among workers of all nationalities was forged in cities, towns, and plantations where workers from all nationalities came together and charted joint resistance. These methods were then linked to the armed resistance under Mau Mau which then created a national, multidimensional armed resistance force. Some aspects of this resistance are examined below.

Trade Unions

The introduction of capitalism in Kenya consolidated and sharpened class relations, class divisions, and class consciousness and struggles. The people who had cultivated land for generations were displaced from their land and became landless "squatters" or were forced into selling their labor on lands now "owned" by settlers and plantations owned by multinationals. Other people were forced from the countryside into towns and cities where they found employment in industries, domestic service, or government departments. At the same time, the construction of railways and roads strengthened class consciousness among workers as they organized and struggled for better working conditions. The formation of trade unions became the defining feature of this period. The development of the working class was given a boost by people taking up employment for subsistence and to pay taxes such as the hut tax and the poll tax. Indeed, the colonial tax system was designed to force people to take up employment in order to provide cheap labor to capitalist institutions.

The trade-union movement provided other requirements for resisting capitalism, colonialism, and imperialism: a committed leadership, guided not by personal greed but a clear ideological vision in the interest of the working class. Taken as a whole, the crucial factors of leadership, ideology, and organization made the trade-union movement a formidable force to combat colonialism. The trade-union movement understood that the economic interests of the working class could only be safeguarded if it, at the same time, protected their political interests. For this reason, it became active in politics and influenced the ideological direction of the progressive forces generally but in particular Mau Mau. Gupta (1981, 50) provides a brief overview of the trade-union movement:

> Labour movement – organised effort on the part of wage earners to fight for their social and economic betterment – in Kenya had manifested itself in several directions. In a short span of 40–50 years of colonial conditions, it had acquired maturity and its own structure. It had grown as a response to growing capitalist exploitative institutions in Kenya. Kenyan trade unions have been bargaining with capitalism. In the context of Kenya the settlers represented the capitalist class. The Kenyan workers have fought to raise their standards of living, to organise a struggle for democratic rights and to end the domination of European settlers.

The struggle of the working class in Kenya thus included the political struggle for independence. The input from South-Asian Kenyans, in terms of links with working-class struggles from India, provided valuable lessons in class struggles. Gupta (1981, p. 56) traces some aspects of this history and the links with India:

> Ever since its origin the trade-union movement in Kenya had a sharply pronounced anti-colonial character; it developed in the struggle for national independence, for political rights and freedom. During the absence of political parties, workers' organisations were the only mass organisations representing and defending the interest of the broad masses. Struggle for the rights of the workers tended to be the struggle against the foreign capitalists who controlled the means of production.

> For many years it was difficult to separate the trade-union movement from political struggle against colonialism. During the post second world war period, particularly during emergency (1952–61)

many trade-union functionaries developed into prominent political leaders and later became high ranking statesmen of Kenya.

The trade-union movement in Kenya had a long history of struggles. It had used its main weapon – strikes – very effectively. Some of the first strikes took place as early as 1900, as documented by Singh (1969). That history points to yet other factors that Britain feared: the trade unions had no room for the divisive "tribal" or regional policies instigated by Britain. Workers were spread throughout the country, and the railway system helped to unite and organize the working class countrywide. Plantation and other rural workers not only provided a strong link with the peasants but helped to overcome the urban-rural split that colonialism sought to use as yet another divisive factor against the people. It was this unity that the British feared. It was a force that could not be isolated, divided, and destroyed by colonialism.

A brief survey of earlier trade-union activities from Durrani (2018a, pp. 89–90) provides a background to the later advances made by the working class:

1921

The Kenyan workers demonstrated their strength in 1921 by forming the first politico trade-union organization, the East African Association (EAA), under the leadership of a telephone operator, Harry Thuku. EAA organized the resistance of plantation workers to fight against the employers' proposal to reduce wages.

1930s

In the 1930s, the trade-union movement among the African workers took a new turn. Under the leadership of Makhan Singh, a Marxist, an Asian worker union was set up in 1934 on East African level – the Labour Trade Union of East Africa (LTUEA). Ever since the inception of LTUEA, Makhan Singh attempted to unite African and Asian workers.

1937

Various strikes led by LTUEA took place, including one for 62 days in April. A settlement was reached with employers agreeing to a wage increase of between 15% and 22%, an 8-h week, and reinstatement of all workers.

1939

Realizing the importance of labor organization, the KCA was cooperating with the Labour Trade Union of East Africa. African workers joined the Union in large numbers. In 1939, Makhan Singh celebrated May Day. This was the first time that a workers' meeting was held on the workers' day. The most significant development in Kenya trade-union movement was the August 1939 Mombasa strike. The strike began with the municipality workers for higher wages and quickly spread to electricity, docks, and post and telegraph workers in the town. Nearly 6000 African and Asian workers stopped work. The strike was sponsored by the LTUEA and supported by KCA (Kikuyu Central Association). The LTUEA and the KCA held a solidarity meeting of Asian and African workers in Nairobi. To break the strike, the government used all the high-handed methods. One hundred and fifty workers were arrested. However, the strike was a success and ended in workers' favor.

A new situation developed after 1947 under increasing activities by the trade-union movement. There was a general strike in Mombasa on 13 January 1947 when over 15,000 workers took part and led to the formation of the African Workers' Union, later renamed the African Workers' Federation. Following the Mombasa strike, there were strikes in other towns. The colonial government was fast losing its control over events and people. It reacted by arresting the trade-union leaders. In 1951, the working class replied by staging a boycott of colonial buses and foreign beer in protest against colonial repression. The stage was set for the period of armed resistance.

Mau Mau Armed Resistance

The earlier anti-colonial struggles by peasants, the nationalities, the general people's resistance, the nationalist struggles, and trade-union activism ultimately led to armed resistance under Mau Mau. However, this transition did not happen overnight. These different strands of resistance fed the overall resistance and taught lessons that

then became resistance strategy. Soon after the Second World War, the hopes of peaceful removal of colonialism from Kenya began to fade. The revolutionary line of armed, organized people's war began to emerge by around 1948. The lessons of the past struggles were clear to the politically aware workers: the contradiction with colonialism and imperialism could not be resolved without an organized, armed confrontation. This realization began to be put into practice gradually as the subjective and objective conditions developed. It was becoming clear that, in the meantime, intense working-class struggles under Makhan Singh and Fred Kubai had developed ideas and experiences of working-class struggles and organizations which added to the anti-capitalist arsenal at the disposal of working people. Soldiers returning after the Second World War, the resistance in India and other places, as well as the examples of revolutions from USSR and China added to people's knowledge and understanding of the need and strategies for resistance.

It is important to see what the aims of Mau Mau were. Barnett (Barnett and Njama 1966, p. 199) sums these up:

> The *secular* aspects of Mau Mau ideology was revealed most clearly in the oft-repeated demands of the Movement for higher wages, increased educational opportunities, removal of the colour-bar. . ., return of the alienated lands and independence under an all-African government.

These aims thus encompassed the demands for independence as well as the class demands for land for the peasants and higher wages for the working class.

At the same time, social and political activists had decided that the formation of a strong resistance organization was necessary to meet the new challenges of fighting colonialism. Thus was born Mau Mau. The name came later, but its organization, ideology, vision, and strategies were all decided by the conditions of the time. Its struggle was against a foreign power that had captured people's land, labor, and resources and, in the process, had created an unequal and unjust system under capitalism in order to maintain its power to exploit, to oppress, and to govern without the people's authority.

A study of the differing forms of organization of Mau Mau at different times reveals that changing conditions at different stages of the struggle gave rise to corresponding changes in its organization. The changes were also reflected in a refinement of strategies and tactics so as to better reflect changing conditions. Thus, the organization of the revolutionary movement was different in its early years (i.e., before October 1952) from that which evolved after 1952. Further changes meant that the organization was different again by 1955 and also by 1960.

At a political level, new organizational structures began to emerge. After about 8 months of armed warfare, during which valuable military and guerrilla warfare experience had been gained, it was decided to call a representative meeting of the various units. The meeting was held in August 1953 near the Mwathe River and came to be known as the Mwathe Conference. After an exchange of ideas and long discussions, it was decided to form the Kenya Defence Council as the highest military and political organ of the armed struggle. The Mwathe Conference then elected the leadership of the Kenya Defence Council and organized the fighting forces into eight armies. Kimathi was elected the President of the Kenya Defence Council, with Gen. Macharia Kimemia as Vice-President, Gen. Kahiu-Itina as the Treasurer, and Brig. Gathitu as Secretary.

Changing needs at a later time led to the formation of the Kenya Parliament. A meeting of the Kenya Defence Council was held in February 1954. Eight hundred delegates attended the meeting, and after intensive discussions, a decision was taken to replace the Kenya Defence Council by a new body – the Kenya Parliament. This was a change of fundamental importance. The Kenya Parliament was the first legitimate African government of Kenya. Its aims were to separate political and military aspects of the struggle, making the former paramount, to emphasize the national character of the freedom movement, to ensure the representation of all Kenyan nationalities, and to assume authority over liberated and semi-liberated areas and people. Militarily, it established its authority over all fighting units and

prepared a new military offensive. It also formulated a foreign policy and sent representatives to foreign governments. Twelve members were elected to the Kenya Parliament, and Kimathi was elected the first Prime Minister. Their first loyalty was to the Kenya Parliament and not to their former armies. Macharia Kimemia was elected as Field Marshal. Kimathi was now free to devote his full attention to the political sphere and to the affairs of Kenya Parliament. In addition, all the 33 districts of Kenya were represented in the Kenya Parliament, thus making it a national body.

In the early years, new cadres were recruited and given political education in preparation for a time when they would become fully active in the resistance. Prospective members were placed under observation, then given the first oath, that of unity. They were then set specific tasks to test their commitment and provided with opportunities for practice. At the same time, they were placed in an underground cell structure and assigned to work at a democratic level in legal organizations. Many of these became part of the Mau Mau intelligence-gathering network.

The guerrilla forces established their own government in the areas they liberated from colonial forces. They controlled law and order and ran an effective administration with its own legal system and a policy for financial control with its own taxes to finance the war effort. It was this tax levied in liberated and semi-liberated areas in the enemy territory that bought guns, ammunition, food, and other supplies for the guerrilla army. It established hospitals as well as factories for the manufacture of armaments and other necessities such as clothing. As the armed struggle advanced after 1952, Mau Mau forces liberated more areas. They maintained a large administrative machinery, which had jurisdiction over vast areas with hundreds of thousands of people for whose economy, welfare, education, health, and security they were responsible.

Achievements of Mau Mau

Mau Mau has been given a negative interpretation by imperialism. Its achievements are either ignored or misrepresented. The following section looks at some aspects of its work that mark it out as a pioneer in Africa as well as a strong anti-imperialist force.

Anti-imperialist Ideology

Three strands of Mau Mau's ideological stand were anti-colonialism, anti-imperialism, and a proletarian-world outlook in the struggle against capitalism. They thus represented the unity of workers and peasants and all those who were not allied to the colonialists. This stand was derived from peasants' anti-colonial struggles and from the trade-union movement and working-class struggles in the liberation struggle as well as from the nationalist forces resisting colonialism through political organizations over a long period.

Different aspects of the ideology became dominant at different times, and freedom fighters responded differently at different times depending on the particular needs of each period. Just as at the political level, different organizational structures were created in response to specific needs, so at the ideological level, different perspectives came to prominence in keeping with the specific contradictions and needs in the struggle at the specific times.

As time went on, there was a gradual shift in the struggle from an anti-colonial phase to an anti-neo-colonial one. This change in ideology reflected a change in the material condition at the time. In the period leading to independence and the period after independence, imperialism, the main force that Mau Mau fought, changed from colonialism to neo-colonialism. In keeping with this change, Mau Mau also changed its political and military priorities.

The class stand of Mau Mau was clear right from the beginning. The enemy was not seen in terms of the color of their skin, as the colonialist propaganda had insisted and, in effect, encouraged. Indeed, black homeguard collaborators were prime target of revolutionary wrath. Kimathi explained in a letter he wrote from his headquarters in Nyandarwa in 1953, "the poor are the Mau Mau." Poverty can be stopped, he explained, "but not by bombs and weapons from the imperialists. Only the revolutionary justice of the struggles of the poor could end poverty for Kenyans"

as Kimathi stated in his letter to the Nairobi newspaper, *Habari za Dunia* (Odinga 1968). Thus the movement was not against European people or Black people but against colonialism and capitalism. It is also clear that Kimathi and the movement were taking a definite class stand.

As the enemy that Mau Mau faced came in three guises of colonialism, capitalism, and imperialism, so did people's struggle for liberation contain three aspects of resistance: anti-colonialism, anti-capitalism, and anti-imperialism. This resistance did not aim only at opposing the imperialist status quo: it was a proactive movement to create a society that was not capitalist and was opposed to imperialism. It was a socialist society based on principles of justice and equality for all that Mau Mau aspired to, not always by name, but certainly in their aspiration and aims. That such a prospect was attacked so vehemently by forces of neo-colonialism and imperialism indicates that they understood clearly that what people wanted was nothing less than the destruction of the very system of economic exploitation and social oppression. Their aim was to replace this with socialism – theory and practice.

Organization

No struggle as large and facing a vastly superior military power as did Mau Mau could have existed without a strong organization. The organizational strength of the movement needs to be recognized. Edgerton (1990) provides a succulent summary of Mau Mau's organizational structure:

> The Mau Mau movement was directed by what they usually called "Muhimu," or the Central Committee. The Central Committee consisted of 12 men, including Kubai and Kaggia, with Eliud Mutonyi as its chairman. When the police began to make arrests at oathing ceremonies, the Central Committee created another group, known as the "30 Committee," to direct oathing and to shield the true directorate from government detection. Under the direction of Fred Kubai, the 30 men on this committee were responsible for coordinating the activities of local leaders in the tribal reserves and townships. In addition, the leaders of Man Mau were advised by what they called the KAU Study Circle, a kind of brain trust composed of four or five KAU members and an equal number of outsiders who were sympathetic to KAU's stated goals. These men prepared

background research on policy matters that the Central Committee might need to address in Kenya, as well as international concerns, especially ways of attracting foreign support.

The formation of the Kenya Defence Council and of the Kenya Parliament indicates the importance that Mau Mau gave to organizations at national level. Its organizational structures at other levels have also been well documented, for example, by Barnett and Njama (1966) and Mathu (1974). Further evidence of Mau Mau's strong organizational structure is provided by Edgerton (1990):

> No rebels fought from forest camps. The rebellion also depended on the support of sympathizers in the reserves, and in Nairobi and other towns. Until mid-1954, the Central Committee and its War Council still purchased weapons, organized food supplies, and recruited new fighters for the forest armies. These new recruits were issued special identification cards in order to prevent infiltration by government informers. Meanwhile, men and women in the Kikuyu, Embu, and Meru reserves continued to supply money, information, food, and weapons. Many risked their lives as often as those who fought in the forest. In fact, much of the actual fighting was done by men and women who lived in the reserves, and in Nairobi or smaller towns. Units from the forests often entered the reserves at night, and spent the day sleeping in the houses of sympathizers or hiding in a secluded area, before carrying out their raids and returning to camp. But others who had never entered the forests were sometimes called into action by a local leader, usually with the approval of higher Mau Mau authority. Sometimes they were ordered to kill a Kikuyu traitor, at other times to raid a Homeguard or police post for weapons.

Strategy

The strategy that Mau Mau used against a militarily stronger enemy was crucial in its struggle. Mau Mau saw Kenyan peoples' contradiction with imperialism as an antagonistic one, which could not be resolved peacefully. It thus used the methods of armed struggle, guerrilla warfare, and people's struggle against imperialism. But it made a distinction between the three aspects of the enemy. Against the colonial military forces, it used the method of guerrilla warfare and military battles (both offensive and defensive), which included attacks on military

K

targets, on prisons to free captured guerrilla fighters, and on arsenals to procure arms.

The other "face" of the enemy was white Settlers, many of whom benefited from free or cheap land and had taken up arms against the people of Kenya. The Mau Mau movement used another method to deal with this threat. The Settlers' main concern was to protect "their" property on which their wealth depended. Indeed, their main aim in settling in Kenya was to appropriate, or acquire very cheaply, peasant land and labor and use it to produce wealth for themselves. The freedom fighters attacked them where it hurt most: the property itself. This served not only to threaten the very economic base of the Settlers; it also helped the guerrillas to procure food and rations they needed to continue their armed struggle, thus providing the material base for the armed revolution.

Mau Mau used yet another method against the third "face" of the enemy, the African homeguards. Considering that many had been forced either by economic reasons or through force or ignorance to become collaborators, many of those deemed capable of reforming were given advance warnings to stop betraying the cause of national liberation. Only when these were ignored was action taken against them, depending on the seriousness of their collaboration, but sanctioned by Mau Mau courts. In this way many who had initially sided with the enemy were won over to the nationalist side, and some of them then made important contributions to the anti-imperialist struggle. Many whose economic base was tied too strongly to imperialism refused to reform and had to be dealt with more severely in order that they did not pose a threat to the armed resistance forces.

Another tactic used against the collaborators involved information warfare aimed at demoralizing them. An example of this was spreading favorable news about guerrilla successes in enemy-held territory. Pinning large notices on trees and walls near schools, police stations, and social halls was one such way. It was not only the message of these posters that put fear in the enemy but the very fact that such notices could be placed in areas under colonial control. Despite the fact that strict security measures were taken by the colonial armed forces, the Mau Mau activists managed to reach areas in the very heart of the city to pin these posters thus showing their strength and demoralizing enemy soldiers and civilians.

It would be incorrect to deny that there were contradictions among the ranks of Mau Mau fighters and among the people. These became sharper under enemy attack. But these were not antagonistic ones, at least at the beginning, and were resolved by the use of non-violent means. In the main, democratic methods were used to resolve these contradictions. One of the aims of Mau Mau was to form a democratic society where everyone would have equal rights and duties and an equal access to the wealth produced by their joint labor. They put their ideas into practice in the liberated areas even as they engaged the enemy in a fierce battle.

The democratic method involved the use of meetings, conferences, and congresses where free discussions could be held and ideas could be expressed without fear of persecution. After long discussions, decisions would be taken on basis of majority vote. Questions of leadership were settled through secret ballots, and elections were held at every level in so far as war conditions allowed.

Mau Mau's military strategy ensured that the military might of the greatest military power at the time was kept at bay for over 4 years.

Infrastructure

There is no doubt that Mau Mau was well organized as a military and as a political organization. The colonialists were aware of their abilities, as they had discovered many examples of infrastructure in towns and forests even as the war of independence was going on. They deliberately chose to hide these facts and set out to destroy such evidence so as to continue their myth that Mau Mau was a primitive group of people who had nothing to do with the War of Liberation. Such structures included hospitals, libraries, social halls, as well as rules and regulations and records of civil and legal practice that guided the movement.

Politics of Information

Mau Mau's information and communication strategy reflects different aspects of its overall work. Each of the elements of governance, such as ideology, organization, and strategy, required effective flow of information between different units and parts of the resistance movement. This flow was the lifeblood of the organization. This is essential in peacetime in any organization but was of particular significance in an underground movement facing a war situation against a heavily armed enemy. Survival depended on this life-giving process of flow of information and communication. And yet this was difficult to achieve in the war situation created by the imposition of the state of emergency by British colonialism which relied not only on its military and political might but also on its experience of oppression in its other colonies, particularly India and Malaysia. The difficulties for Mau Mau were compounded by the absence of global networks such as the Internet and the imposition of information embargoes by colonialism. Thus experiences from the resistance forces in India and other countries were not easily available to the resistance organization. It was to prevent the availability of such information that the Kenya colonial government banned various progressive publications, including many from USSR, People's Republic of China, and India. That Mau Mau managed to develop sophisticated information policies and practices is a reflection of its strength as an advanced twentieth-century resistance movement.

Leadership

All the aspects of governance, the actual conduct of warfare, the political aspects of Kenya Parliament, and other Mau Mau actions were not spontaneous acts happening in a political, social, and military vacuum. There was a guiding force behind them all. And that force was Mau Mau leadership, which is often ignored or minimized by historical studies. Mau Mau leadership needs to be seen in a dynamic level in all its aspects. It is not possible to see Mau Mau leadership in the sense that one sees the leader of a Western country personalized in the person of a president or a prime minister. True, Kimathi and other leaders did stand out. But the reality of fighting against the superpower of the day with limited resources dictated that a different model of leadership had to be found if the movement was to succeed. At the same time, the war of independence in Kenya was not directed by an organized political party as happened in Mozambique under FRELIMO or in Namibia under SWAPO. Such forces in Kenya were coming together to form a political-military organization before British colonial government preempted the development with its excessive use of force under the guise of an emergency. Of necessity, Kenya's war of independence was led and organized in a way that suited local conditions.

Independence and Neo-colonialism: 1963–1990

By about 1956–1957, it became clear that colonialism was no longer sustainable in Kenya. The departure of British colonialism was a matter of time. In just a few years of warfare, Mau Mau had changed the balance of power. Kenya became independent on 12 December 1963. Now an African prime minister and an African government ruled the country. The old order had given way to the new. And that achievement was due entirely to Mau Mau.

And yet it was not the independence that those who participated in the war of independence had fought for. The changes were soon seen for what they were: the replacement of colonialism by neo-colonialism and the replacement of European Settlers by African "owners" of land. European Settlers remained, as did multinational corporations as the rulers behind the scene. Government policies were handed down by financial forces in London and New York. Policy "guidance" came from the IMF and the World Bank. The only aspect that did not change was the condition of the working class, and the situation of those who fought in the war of independence deteriorated. It was, in effect, independence for the ruling classes (black and white this time) to rule, kill, massacre, suppress, and loot as they pleased. And suppress, kill, and massacre they needed to do in

K

order to remain in power as the people who had sacrificed all were not yet ready to hand over control to new masters with the same agenda. But the new masters were fully backed by the same imperialist powers which had engineered their coming to power.

Repression by "Independent" Government

The British colonial government's legacy of impunity as it massacred, murdered, and tortured people at will was then bequeathed to the governments it set up after independence. The lesson that colonialism passed on to the comprador regime was that it was acceptable to eliminate and destroy people who oppose their policies. The TJRC Report (2013, Vol. IIA, p. 72) records the events of the time:

> Kenyatta, having realized that he would not be able to meet the needs and expectations of all Kenyans, engaged in measures that would ensure political survival and self sustenance of his government. This lead to a strengthening of the role of the security agencies similar to the role they played during the colonial period, and particularly aimed at controlling, and suppressing dissent and organized political opposition. In brief, in the words of Charles Hornsby, 'the Independent State soon echoed its colonial parent's repressive attitudes to dissent'.

It was not only the Kenyatta government that used force to remain in power. The Moi-KANU government that followed it did the same, as TJRC Report (2013) says:

> Political assassinations have occurred under each of the three successive governments since independence. The motives associated with these assassinations have varied, from getting rid of political competition, weeding out ambitious politicians, and removing perceived "dissidents" of the government or those who posed as "threats" to power. Evidence of state involvement and subsequent cover-ups is evident in the majority of political murders. Propaganda and commissions of inquiry are often used as smokescreens to get to "the bottom of the matter," and often have the effect of masking the motives and faces behind the assassinations. Prominent figures in government are said to be implicated. Key witnesses into the assassinations disappear or die mysteriously. No real perpetrators have ever been prosecuted, much less effectively investigated.

Under the KANU governments of Kenyatta and Moi, issues relating to the return of people's land were not resolved. Instead, the local and settler elites and transnational corporations consolidated their grip on this basic national resource. They were, in fact, further aggravated. Landlessness, the single most significant issue in Kenya before and after independence, continued to increase. Moi continued the torture, killings, executions, and massacres. The three pillars of resistance – Mau Mau, trade union organisations and people's forces – were responsible for the achievement of independence in 1963. But imperialism saw the danger that this combined force posed to its continued exploitation after independence. The comprador regime systematically attacked all the three. Mau Mau fighters in the forests were killed in large numbers by colonial military forces and those who continued the struggle were hunted down and killed; others who came out in good faith at independence were ruthlessly murdered by armed forces. The radical wing of KANU which represented the demands of Mau Mau was systematically attacked and rendered ineffective. The trade union movement was weakened by attacks on militant trade union movement and the marginalisation or detention of its militant leaders. Thus, all the avenues of militant political action were banned. All public resistance activities were suppressed either "legally" or by the use of force.

The murder in 1965 of Pio Gama Pinto, a socialist who was active in Mau Mau, signalled a new period of repression in Kenya. The banning of opposition political parties followed. In 1969, the Kenya People's Union was banned, and its leadership was arrested and detained. This one chance of having open radical politics in Kenya was lost. All political activities now went underground as did the expression of any independent ideas and opinions.

Resistance

Throughout the 1970s, underground groups flourished and articulated their vision of a Kenya free from capitalism and imperialism, issuing various underground pamphlets. Some of these are recorded in Durrani (1997). These included *Mwanguzi* and *Kenya Twendapi* which questioned the direction Kenya was taking after

independence under the new elite. Many former Mau Mau combatants began to recount their experiences and stated that they had not suffered during the anti-colonial struggles merely to see a minority elite getting all the benefits of independence. Many such views could not be published within Kenya and were published overseas. The murder in 1975 of the popular politician, J.M. Kariuki, brought out a national unanimity in anti-government feelings. It also saw the publication and distribution of a large number of underground leaflets in support of basic human and democratic rights. The key feature of this period was the continued resistance by workers, peasants, and progressive people's movements.

An important feature of resistance after independence was the lack of the strong united force such as the one that opposed colonialism in the earlier period. The strict censorship by the independent governments ensured that no strong, radical, organized working class and trade-union movement survived, nor did it tolerate any form of people's resistance. Political parties that supported Mau Mau's vision were also not allowed. Such suppression of resistance was the legacy that colonialism left in Kenya, and it curtailed, initially at least, the resistance of people. Nevertheless, resistance was not suppressed totally as the following section shows.

People's Resistance

Worker Resistance

Worker resistance throughout the country was in the forefront of direct action through strikes and related actions, reminiscent of the practice during the colonial period. Seen as an overall systematic resistance, these strikes and other struggles helped to build a movement against the government which has come down heavily against trade unions. It banned strikes and imprisoned trade-union leaders. And, in the end, the Central Organisation of Trade Unions (COTU) was affiliated into the ruling party, KANU, thus ending its role as a workers' organization to fight for economic and political rights of working people. But this did not suppress working-class militancy

as activists and shop stewards continued resistance, isolating the official, conservative leadership. Year after year, thousands of workers broke KANU laws and went on strikes for their rights.

The militant activities of the earlier radical organized trade-union movement were absent in this period. But it was the daily struggles of the workers that gave true significance to the growing worker movement. Not willing to accept the situation, which meant daily erosion of their already very low standard of living, the workers intensified their struggles for a decent living wage and their economic, social, and political rights. Mwakenya (1987b, p. 4) breaks down the workers' demands into three categories:

- Economic demands: for higher wages, land, and employment
- Social demands: safety at places of work, improved working conditions, adequate health facilities, and adequate and relevant education
- Political demands: right to organize, right to assembly, union rights, support other workers, and liberation from the entire oppressive system

It is significant that Kenyan workers saw workers' rights in the same way as Mau Mau did: that workers' rights should include social and political as well as economic rights as legitimate demands of the trade-union movement. This was the main plank of the trade-union movement set up by Makhan Singh, Fred Kubai, Bildad Kaggia, and others during the colonial period under the East African Trade Union Congress. The colonial administration, as well as the independent Kenyan government, legislated to remove workers' political rights from trade-union remit – an aspect that has gravely weakened the trade-union movement in Kenya. Workers' resistance in this period took various forms: strikes, demonstrations, boycotts, work-to-rule, and refusal to accept unfair practices.

Peasant Resistance

Landlessness remained a key factor in resistance after independence. Peasants and pastoralists

reverted to their colonial practices of resistance. No week passed without reports of peasant resistance to the Moi government's policies and attacks on government officials. They used varying methods of demanding their rights and often used violence against corrupt government officials and armed police supporting new landlords. At the same time, because of the shortage of land which resulted in high prices, it often became necessary for a large number of peasants to pool their resources together to purchase one farm. This came in useful when they faced common problems: thousands of small land owners found strength in defying government directives, whereas individual plot owners may fear taking direct action. Peasants as a class joined hands with workers in resisting the policies of the government. Conditions were ripening in the countryside for a more systematic and organized resistance by peasants. Underground resistance movements got much support from the peasants. Indeed, the government's use of force against peasants showed its fear of this resistance building up into a formidable force.

Student Resistance

Students throughout the country joined workers and peasants in opposing government policies. In representing their own interests as students, they also articulated the aspirations of the working people. The youth derived their political consciousness from the material conditions of their own lives as well as from the experiences of their parents who in the main were workers and peasants. The government attempted to turn students into docile acceptors of its policies, including those in the education field such as the curricula. School, college, and university syllabi were controlled to remove any progressive ideas, similarly removing the militant ideology and aims of Mau Mau and the war of independence. Their cultural and social activities were vetted to ensure that there were no mentions of facts and events which could inspire independent thought. In short, the whole educational process was geared to produce supporters of capitalism and comprador rule.

But students never accepted this. They consistently resisted not only the colonial and imperialist-oriented elements of the education system itself but also the socioeconomic system that blindly followed Western capitalist ideas and encouraged corruption. They instead sought a united student national movement which would ensure free circulation of ideas and links with fellow students from Africa and other progressive students from around the world. The strength of student resistance was indicated in 1988 when thousands of students throughout the country went on strike.

Students were also in the forefront of writing and distributing underground pamphlets setting out their demands. This was especially the case at universities. Students at the University of Nairobi, for example, produced a vast amount of such literature, reflecting the militancy of the students there. Indeed, a tradition of at least one enforced closure per year was the norm as the government dealt with student protests by sending in the dreaded paramilitary general service unit (GSU) and closing the institution. New repressive regulations were introduced after every closure, but this did not stop student militancy. Most student union leaders ended up being thrown out of the University and jailed, detained, or murdered. The student newspaper produced at the School of Journalism reflected socialist tendency among students. Mwakenya (1987a, p. 12) summarizes student resistance:

> After the banning of K.P.U., democratic opposition was led by University and Secondary school students. Nairobi and Kenyatta University students unions played a major role in fighting for democracy and human rights, and opposing neo-colonialism and foreign military bases in Kenya. They demonstrated in the streets, wrote leaflets, spoke in public and student gatherings, and in so many ways helped expose the reactionary character of the KANU regime.

The significance of these student activities was that they represented a new generation which refused to accept a corrupt, man-eat-man society. The future of Kenya in reality lay in their hands. And they indicated their rejection of the regime's policies which were to accommodate capitalism and imperialism in Kenya.

Release Political Prisoners Group and the Assassination of Karimi Nduthu

National and overseas campaigns forced the government to make constitutional changes. It repealed Section 2A of the Constitution in 1991, thus ushering in the multiparty system. This, however, did not bring change as many of the people who had been jailed for fighting social injustice remained in prison. In response to this situation, the Release Political Prisoners Pressure Group (RPP) was formed in the same year to put more pressure on the government. The group mobilized mothers of some political prisoners and presented a petition to the Attorney General demanding the release of all political prisoners. After presenting the petition, the mothers headed to Uhuru Park (Freedom Corner) and staged a hunger strike (surviving on water and glucose). Their demands were, however, not taken seriously by the government which sent the police on 3 March 1992 to disperse them. In the process they beat them up. The government later rounded up the mothers and forcefully took them to their respective homes. This government action did not weaken the women's resolve to fight for their children's freedom. The following day they came back to Nairobi and continued with their hunger strike. They were hosted by Reverend John Njenga of All Saints' Cathedral. The government continued to harass them by sending police to the cathedral and arresting members of RPP. The campaign ultimately bore fruits as by late 1992, all political prisoners except Odhiambo Apiny had been released from prison. RPP believed political prisoners were not only those confined and serving a jail term but anyone whose freedom, livelihood, conscience, ethics, values, and principles were compromised by state powers. Based on this tenet, RPP members worked tirelessly with people in the community to try to resolve their problems and overcome their challenges. The group was at the forefront of fighting for reforms and challenging unjust laws. RPP also partnered with the underground Mwakenya, and this sharpened its members ideologically. The national coordinator of Mwakenya, Karimi Nduthu, was also the Secretary General of

RPP. Due to Nduthu's unwavering commitment to social justice, the enemy of the working people sent its agents to his residence in Riruta Satellite, a suburb of Nairobi, where they brutally murdered him on 24 March 1996. The assassination of Nduthu did not kill the spirit of RPP members. They continued their struggle by raising awareness among the masses at grassroot level and also organizing demonstrations against injustices by the state. The government kept arresting its members and charging them with illegal assembly. The sacrifice of Karimi Nduthu and the commitment of RPP members, together with other social movements, were not in vain as this, together with other developments, helped to force the regime to agree to the drafting of the new Constitution.

Organized Resistance

It was comparatively easy for the government to control people's resistance as it lacked a central ideology, leadership, and organization. It was often focused on local issues of relevance to a comparatively small number of people. What was lacking was the nationwide perspective that the radical trade-union movement and Mau Mau provided in the anti-colonial stage. This was rectified by the organized underground movements, the chief one being the December Twelve Movement that provided ideological direction, an analysis of history, and proposals for future action. In this way they provided the overall strategy for socialism that opposed the capitalist direction of the ruling party and class.

December Twelve Movement

Earlier attempts by radical groups to continue the vision of Mau Mau within KANU had failed, reflecting the total surrender of the comprador class to imperialist interests. It became the historical role of underground resistance movements to articulate the new phase in Kenyan politics where open opposition to the government was not possible. The tradition of organized underground resistance in Kenya goes back to the beginning of the twentieth century and continued throughout the colonial period and post-independence. Moreover, it carried on throughout the

period of Kenyatta's regime and intensified under Moi, as the US-backed regime consolidated its neo-colonial grip on the country. Among the key underground movements was the December Twelve Movement (DTM) which later emerged as Mwakenya.

DTM's activities represented a continuation of resistance from pre-independence days. DTM opposed the capitalist outlook of the ruling class and their party. It was active in articulating its ideological position, policies, and outlook, not only among its active members grouped in secret cells but also in disseminating these to its actual and potential supporters among the masses. It was not a mass movement, and only accepted into its membership were those who showed a clear grasp of its ideological stand and were willing to put into practice their commitments. The emergence of the DTM marked the end of the attempts by democratic forces to form legal opposition parties. DTM's activities and ideological stand are best seen in its publications.

One of the most important underground publications of DTM was *InDependent Kenya*, (Cheche Kenya 1981) published by the group Cheche Kenya, an earlier name of the DTM. *InDependent Kenya* documented, from the perspective of the Kenyan working people, the history of Kenyans' struggle for independence, the struggle of militants and conservatives within the Kenya African National Union (KANU), the corruption that became a way of life within the regime, and the cultural dependency on imperialism. *InDependent Kenya* was cyclostyled and widely distributed through underground channels in Kenya. It was published in book form in London by Zed Press in 1982, sponsored by the Journal of African Marxists "in solidarity with the authors."

It was DTM's newspaper *Pambana, Organ of the December Twelve Movement*, however, which had the widest circulation and the greatest impact in post-independence Kenya. The first issue was published in May 1982. DTM's program became, in effect, an alternative to that of KANU's essentially capitalist one. DTM stood for a national democratic revolution which could unite all national forces opposed to imperialism and the neo-colonial comprador regime. As *Pambana* made clear, the December Twelve Movement supported all genuine Kenyan organizations and individuals, "fighting any aspect of local or imperialist reaction." It set out the tactics of achieving a broad unity of all democratic forces, and, in the process, it clearly isolated the comprador class.

The short-lived coup of August 1982 was, at one level, a reflection of the developing democratic forces. The coup's message (Kenya Coup, 1982, Broadcast) reflected the desire of millions for an alternative political system from the one KANU offered. It was clearly a vindication of DTM's program, which appears to have influenced the coup leaders.

The aftermath of the coup altered the political scene in Kenya. Realizing how little public support it had, the KANU Government took repression to new heights and relied even more on the military. Many people who were active before the coup were brutally murdered or illegally detained. All pretenses of democracy disappeared. Economically, the Moi regime aligned itself even more firmly with US imperialism, which now acquired military facilities in the country in return for supporting the unpopular regime. At the same time, the coup ended prematurely the developing revolutionary forces from gathering more support and setting up an appropriate organizational and ideological framework to challenge the government on a stronger basis. The coup also gave the Moi government an excuse to undermine every strand of resistance to its rule and to arrest, detain, and eliminate those it saw as opposing its rule. This included the growing trade-union and student movements and also DTM. With strong support from Britain and the USA, it re-established its rule, but this time it would be even more oppressive. It is difficult to speculate how the forces of resistance would have developed had Moi not used the coup to silence all opposition. It is fair to say, however, the resistance movement suffered a setback with Moi's reign of terror unleashed in the wake of the coup.

The DTM just about survived Moi's attacks on all forces opposed to him but as a much-weakened movement following the jailing, detention,

or elimination of its members and leaders. It continued the production of *Pambana*, and the second issue came out in July 1983. It summed up the experiences following the coup and exposed the attempts of "the ruling clique and their army to instil fear amongst the people." It identified the root causes of the problems facing people and resolutely called for unity to defeat "the enemy." *Pambana* drew strength from the revolutionary traditions of the Mau Mau's use of struggle songs to mobilize people.

DTM also carried on its struggle overseas through Umoja in London, as recorded later in this article. In its short life, DTM left a legacy of progressive policies, vision, and experiences reflected in its publications. These provided an alternative vision of a free, socialist Kenya.

Mwakenya

Mwakenya came into existence in the late 1980s and was composed largely of members of the December Twelve Movement (DTM), the revolutionary movement formed in mid 1970s. DTM members partnered with other progressive forces and formed Mwakenya. By the1980s, the Moi regime had become increasingly repressive and did not tolerate any divergent views. Mwakenya as an underground movement played crucial role in exposing the ills that the regime was committing against the people. It summed up the democratic mood of the underground resistance under its slogan *Ni haki yetu kupingania haki* (It is our right to struggle for our rights). One of the rights denied to Kenyans was the right to organize. For this reason, Mwakenya concentrated in organizing people and distributing its literature throughout the country in secret.

Mwakenya was guided by the following fundamental goals or objectives:

1. The recovery of national sovereignty and integrity
2. The building of an independent and integrated national economy
3. The establishment of genuine democracy
4. The establishment of social justice for all classes and nationalities
5. The promotion of a patriotic and democratic national culture
6. The building of a strong people's defense force
7. The pursuit of an independent foreign policy

Events were to prove that many practices of DTM which had given it strength were not carried on into Mwakenya and that this perhaps led to its decline in the long term. DTM's strict recruitment policy was discarded. Instead Mwakenya became a mass party by opening up membership to all, irrespective of ideological commitment, clarity, and experience in the struggle. The earlier requirements of study and practice were also dispensed with.

And yet there were important contributions made by Mwakenya. Its greatest achievement was the creation of a clear political and ideological framework in opposition to the KANU government's pro-Western, pro-capitalist program. It did so with an evidence-based analysis of the conditions of the time and the state of contradictions in the society. Based on such analysis, it produced two important documents setting out its vision.

The first document was Mwakenya's *Draft Minimum Programme* which set out the history of neo-colonialism in Kenya and also traced the history of resistance in Kenya. It also gave the background to the formation of Mwakenya itself and recorded its publications and Congresses. The most significant part was "the Fundamental Goals and Objectives of Mwakenya." The publication *Draft Minimum Programme* marked a new stage in the anti-imperialist struggle in Kenya. Once again, an underground opposition party challenged the monopoly of KANU as the true spokesperson for the masses of Kenya. No longer could KANU claim its exclusive right

to speak for all the classes in Kenya. It now became obvious that KANU spoke for the comprador class in Kenya, while Mwakenya and allied progressive movements represented the interests of the rest of the people. The challenge to KANU was on ideological and organizational fronts as well, as Mwakenya set out the demands of the "oppressed and exploited classes of Kenyan people" and called upon the people "to overthrow the entire neo-colonial system, seize political power and establish a peaceful state of democracy and social progress." The silent class struggle since independence was formally brought into broad daylight. Under its slogan "In Struggle Lies the Way Ahead," Mwakenya proclaims its stand, *Ni haki yetu kupigania haki zetu* (It is our right to fight for our rights).

The other publications by Mwakenya were *Mzalendo Mwakenya* and *The Register of Resistance*. The publications exposed the deceptions of the Moi regime and attracted a wider readership from the people who were looking to resolve some of the problems facing the country. The period saw a large number of strikes and demonstrations. According to the *Register of Resistance* (1986), a total of 65 strikes involving over 42,000 workers took place in over 44 towns. Moi's regime unleashed its security agents (police, GSU) to quell the resistance but with little success.

The history of Kenya shows that resistance builds on the achievements of an earlier period of struggle. The ideas of earlier anti-colonial struggles influenced Mau Mau, just as these ideas then influenced DTM-Mwakenya.

Overseas Resistance

From Kenya Committee to Umoja
The suppression of people's rights led many of the vocal academics as well as progressives to seek asylum abroad. These newly resettled asylum seekers continued the activities that had been frowned upon by the Kenyan regime. These included campaigning for the release of political prisoners, and it was on this basis that the Committee for the Release of Political Prisoners in Kenya (CRPPK) was established in London on 2

July 1982. The Committee acted as a solidarity organization for those who were arrested, detained, or harassed for their political activities in Kenya. Its objectives were:

- To campaign for the release of political prisoners in Kenya
- To express solidarity with the people of Kenya in their struggle for democratic rights (e.g., political, cultural, and trade-union freedom)
- To sensitize international public opinion on the repressive nature of the Kenyan regime
- To support Kenyan people in their opposition to US military bases and all foreign military presence in Kenya

The Committee continued its campaign throughout the 1980s and into the 1990s publishing the influential *Kenya News* bulletin and coordinating with other Kenyan democratic and solidarity movements abroad. In October 1987, a number of resistance groups abroad came together and formed United Movement for Democracy in Kenya (Umoja) which was committed to:

- The restoration of national sovereignty
- The building of a truly democratic society
- The restructuring of the economy for the social progress of all Kenyans

It had constituent branches and contacts in Britain (where the Secretariat was based), Norway, Denmark, Sweden, the USA, and also some African countries. Umoja also liaised and worked with progressive groups in Kenya among them Mwakenya though on a principled basis.

Conclusion: Uhuru Bado [not yet Independent]

The history of Kenya parallels trends in many other countries. The colonial government passes on power to a comprador class which it created and nurtured. This anti-people ruling elite then rejects the interests of people who had borne the brunt of fighting colonialism and imperialism. Working class and other people are then relegated to the

margins of society by the new comprador ruling class. A "show-democracy" creates a number of political parties and a parliamentary system that represents the interests of the ruling class.

The crucial dividing line between the contending forces in Kenya is which class is in power and on whose behalf it rules. This class struggle is obscured by propaganda from the ruling classes. The contradiction between homeguards and Mau Mau was that the former sought superficial political change, while the latter demanded economic, political, and social transformation in the interest of the working class. That contradiction has not yet been resolved. If the workers' forces are to continue the legacy of Mau Mau and fight for justice, equality, and socialism today, they will need to arm themselves with revolutionary ideology and organize themselves as an effective fighting force to confront imperialism and its local allies. Among their first tasks will be to liberate their minds from colonial and imperialist world outlook and to recognize that their liberation can be achieved only through a struggle against their class enemies.

Mutunga (2017) sums up the current situation in Kenya:

> The Kenyan elite, like many in Africa, has not identified or supported our national interests. They do not represent us patriotically in national relations with either the West or the East, preferring to build their own personal power bases among foreign interests, national and international cartels ...The bottom line is – This status quo MUST GO!

There can be no better way to understand Kenya's past than to study Pio Gama Pinto's analysis (Pinto 1963, quoted in Durrani, Shiraz, Ed. 2018b, p. 246) at the time of independence:

> Kenya's Uhuru must not be transformed into freedom to exploit, or freedom to be hungry and live in ignorance. Uhuru must be Uhuru for the masses – uhuru from exploitation, from ignorance, disease and poverty ...The sacrifices of the hundreds of thousands of Kenya's freedom fighters must be honoured by the effective implementation of the policy - a democratic, African, socialist state in which the people have the right to be free from economic exploitation and the right to social equality.

Events have shown, however, that the aims of the Uhuru that Pinto and others died for have not been met even after 55 years of independence. The struggle that earlier generations, the radical trade-union movement and Mau Mau, waged continues.

Kenyatta, Jomo (c. 1893–1978)

Gregory R. Smulewicz-Zucker
Department of History and Philosophy at Baruch College, The City University of New York, New York, NY, USA

Definition

Jomo Kenyatta was one of the leading figures in Kenya's independence movement from Great Britain. As the head of state after Kenya's independence from Britain, Kenyatta invoked Pan-Africanism rhetorically, but did little to actively pursue Pan-Africanist policies.

Introduction

Jomo Kenyatta was one of the leading figures in Kenya's independence movement from Great Britain. He served as the country's first prime minister (1963–64) and president (1964–78). Both during his lifetime and after his death, Kenyatta has been criticised for increasing the political power of his native majority ethnic group or Gikuyu (see Kenyatta 1965, pp. xix–xx; 1968, pp. 226–231; Lonsdale 1992). It was as a spokesperson for Kikuyu interests that Kenyatta

first became politically engaged and began to oppose British colonial rule. As a student in Britain, he worked closely with Pan-African, African-American, Afro-Caribbean, and African intellectuals and activists. He wrote his thesis on the Kikuyu at the London School of Economics under the supervision of the famous Polish-born anthropologist Bronislaw Malinowski. This would later be published as *Facing Mount Kenya,* which remains an important work of African anthropology. During his time abroad, Kenyatta played an important role in the growth of Pan-Africanist politics as the leadership of the movement shifted from intellectuals among the African diaspora to Africans. As the head of state after Kenya's independence from Britain, Kenyatta invoked Pan-Africanism rhetorically, but did little to actively pursue Pan-Africanist policies. Initially, he worked to forge co-operation with neighbouring East African states. Internal challenges to his political authority led him to focus on consolidating power, silencing potential enemies, and turning Kenya into a single-party state.

Early Life and Kikuyu Politics

Kenyatta was born Kamau wa Ngengi in the town of Gatundu in British East Africa. Because of the absence of birth records, the precise year of his birth is unknown and is listed in various biographies between 1889 and 1894. His parents died while he was still a child. His grandfather, a Kikuyu medicine man, raised him. Kenyatta would later note that the education he received from his grandfather informed his discussion of Kikuyu rites in *Facing Mount Kenya.* The book's second chapter on land tenure is also particularly relevant to Kenyatta's biography because his entry into politics occurred in the context of the colonial restructuring of the Kikuyu agricultural economy. Colonial rule brought with it the creation of chiefs who would administer the African districts. Local councils had previously governed the Kikuyu. The introduction of chiefs was a colonial invention, which functioned both to help govern the population and to turn it into a cheap labour source for colonial officials and

settlers. (A deeper account of the creation of the chiefs and the political and economic motivations can be found in Elkins 2005, pp. 18–19; and a study of the effects of colonialism on agriculture and labour in colonial Kenya is Berman and Lonsdale 1992). It was against this setting that the Kikuyu Central Association (KCA) was established by educated Kikuyu to rival the power of the chiefs and campaign for Kikuyu interests. Kenyatta, who had changed his name to Johnstone Kenyatta after converting to Christianity in 1914, joined the KCA in 1924. He was soon promoted to be its secretary and founded the organisation's monthly newspaper *Muigwithania* (Reconciler) in 1928.

Kenyatta first travelled to London in 1929 to lobby on behalf of the KCA. In that same year, a long-brewing political conflict over the issue of clitoridectomy would come to a head. In response to an effort by missionaries to ban the practice, the KCA leadership argued for the reconcilability of Christianity and traditional Kikuyu practices (the early years of the KCA are covered very well by Anderson 2005, and Elkins 2005). The issue helped the KCA to put the chiefs on the defensive because they relied on support from missionaries and the colonial government. Kenyatta echoed the KCA's official position and wrote articles on the subject in European publications. He would later revisit the issue and reiterate his defence of clitoridectomy in *Facing Mount Kenya.* After his second visit to Britain in 1931, he established his home there to further pursue his education, and his active participation in KCA politics decreased. It was at this time that Kenyatta started to associate with the community of radical Afro-Caribbean and African students and intellectuals living in Britain. In particular, he was a member of the intellectual circle of the Trinidadian communist writer and labour activist George Padmore. Radical political affiliations brought him to Moscow in 1933 to study economics at the Comintern School. Kenyatta left Moscow in 1934 to return to London. In 1935, he enrolled in the London School of Economics to study social anthropology with Malinowski. He would publish his thesis under his new name Jomo (translated as 'Burning Spear') Kenyatta.

Anthropology and Anti-colonialism

In 1938, *Facing Mount Kenya* was published in Britain and included an introduction by Malinowski. Malinowski noted the significance of having a study written by an African with intimate knowledge of the social structure and practices of the Kikuyu. The book stands out for this reason as well as for offering an insight into Kikuyu society in the pre-colonial and colonial periods. In it, Kenyatta is particularly attentive to the ways colonial life transformed and, in his own lifetime, continued to transform the lives of the Kikuyu. Yet, in this respect, there is an unmistakable political undertone to the work. As has also already been indicated, Kenyatta's discussions of social hierarchy, land tenure, and rites, such as clitoridectomy, had a direct bearing on the debates that dominated Kikuyu political concerns and discourses. But several sections of the book are also distinguished by the contrasts Kenyatta draws between pre-colonial and colonial life. Perhaps one of the more striking sections is the oft-cited Kikuyu myth regarding the dispute between a man and an elephant. This tale, in which an elephant appropriates a man's hut from him, is clearly a criticism of European incursions on African lands and properties, the grander enterprise of colonialism, and the more specific land disputes between the Kikuyu, white settlers, and the chiefs serving colonial authorities (Kenyatta 1965, pp. 48–52).

Kenyatta remained in Britain throughout the Second World War, working on a farm. The end of the War seemed to offer an opportunity for a renewed challenge to colonialism. This prompted a group of Afro- Caribbean and African intellectuals, led by Padmore and Ghana's future head of state Kwame Nkrumah, to plan a meeting that would outline the demands and positions of colonised peoples in the aftermath of the war. The Fifth Pan-African Congress was held in Manchester on 15 October 1945 (see Cooper 2002, pp. 58–59; Padmore 1947). It was framed as a successor to the four preceding congresses, the first of which had been organised by W.E.B. Du Bois in Paris in 1919. Du Bois played little role in the organisation of this event. Nevertheless, he

K

attended and was given the title of President. This congress, however, was distinct from previous meetings insofar as Africans played a greater role in its planning and organisation. Though representatives came from other British colonies and protectorates, much of the discussion centred on African affairs. Further, despite claims on the part of the participants that they spoke on behalf of colonised peoples throughout the world, the attendees came entirely from British colonies. Kenyatta's own role in the planning and events of the meeting is difficult to gauge. It is interesting to note that, when compared to the strong anti-capitalist positions of the West African resolutions, the East African resolutions, which it is likely that Kenyatta played a large role in drafting, were altogether more moderate in tone and focused on particular grievances. Nevertheless, later in life, he would reflect proudly on his participation in the Congress, but gave little clear indication of his part in it (see Adi and Sherwood 1995, p. 165). According to Padmore, Kenyatta served as assistant secretary (Padmore 1971, p. 133).

Return to Africa and Independence

The long-term effects of Pan-Africanism on the larger movement for African independence remain in question. Kenyatta would assert that the ideology remained an important facet of his thought throughout his life (Kenyatta 1964, p. 32). Yet, as Frederick Cooper has observed, there is little evidence that the Pan-African position advanced at the congress was of central importance for the subsequent politics of the participants (Cooper 2002, p. 59). When Kenyatta returned to the Colony and Protectorate of Kenya in 1946, the anticolonial struggle there was already facing its own distinct challenges. Kenyatta soon re-entered Kenyan politics. In 1947, he was elected president of the Kenyan African Union (KAU), which had been founded in 1942 and secured itself as the successor to the KCA. Under Kenyatta's leadership, the KAU formed itself into a powerful political party in

the independence movement. By 1952, Kenyan anti-colonial activities took a more violent turn. A series of attacks by different groups, which the British summarily referred to as 'Mau Mau', were carried out against both the colonial authorities and white settlers (for an account of the 'Mau Mau' from the standpoint of a participant, see Barnett and Njama 1966). But the Mau Mau revolt also created deep rifts within Kikuyu society. British colonial policy had manufactured a society in which a number of Kikuyu benefited greatly from colonialism; for example, the chiefs and their supporters. The revolt prompted a violent campaign of suppression by the British with thousands of Mau Mau and suspected Mau Mau killed or imprisoned in camps (the major studies of this period are by Anderson 2005, and Elkins 2005).

Kenyatta tried to distance himself and the KAU from the revolt (Kenyatta 1952). The British declared a state of emergency and the Rebellion was used as a pretext for banning the KAU and arresting its leadership. Kenyatta was arrested in October 1952, imprisoned and detained until 1961. He was one of six Kenyan nationalist leaders – defended by the Labour politician and barrister D.N. Pritt – who were tried and known collectively as the Kapenguria Six. Although he was charged as a supporter of Mau Mau, there is little evidence linking him to the Rebellion. When the state of emergency was lifted in 1960, the KAU was renamed the Kenya African National Union (KANU) and re-emerged as a major political party. Kenyatta was elected president of the party during his detainment. Upon his release, he represented KANU at the 1961 and 1962 Lancaster Conferences in London to negotiate with British authorities the terms of Kenya's independence. Here, the KANU, which supported a unitary state, was opposed by the Kenya African Democratic Union (KADU), which campaigned for a federated state. The KANU won a majority of the seats in the Legislative Council in the 1963 election and Kenyatta was named prime minister. On 12 December 1964, Kenya declared its full independence and Kenyatta became the country's first president. Soon after, he began to be referred to as 'Mzee' (Elder).

Head of State

On 25 May 1963, the Organization of African Unity (OAU) was formed and held its first meeting at Addis Ababa. The OAU's stated aim was to forge co-operation among the newly independent African states and to continue to press for the decolonisation of the remaining regions of Africa under either European or white African domination. But the meeting also served to indicate the future fault-lines in the continent's politics. Nkrumah appeared in the hope that this meeting would serve as a precursor to a federation of African states. His support came from more radical states, like Guinea, and many of the North African states, which formed the so-called Casablanca bloc. But Nkrumah was opposed by the Monrovian bloc, led by Senegal's Léopold Senghor, which sought closer ties to the newly formed French Community. Nkrumah's former ally Kenyatta also opposed his call for the immediate creation of a united states of Africa. Instead, Kenyatta allied himself with Tanzania's Julius Nyerere who advocated the gradual creation of a federation (Kenyatta discusses the one-year anniversary of the gathering in Kenyatta 1964, pp. 33–45, and there is an extensive discussion of Kenyatta's handling of the legacy of the Mau Mau in relation to his efforts to unify the country in Branch 2009). Early on, Nyerere and Kenyatta entered into talks with Uganda's Milton Obote about the possibility of forming an East African regional federation. Increasingly, he was confronted by internal problems within Kenya and focused his attentions there.

Unlike many of his contemporaries in other newly independent African countries, Kenyatta did not oust the many European civil servants working in Kenya. Instead, Kenyans gradually assumed the positions that had been held by Europeans. Kenyatta maintained much of the colonial infrastructure and retained close ties with Britain. As the West and Communist East wrestled over influence in Africa, Kenyatta remained staunchly pro-Western. In the wake of independence, Mau Mau left lingering hostilities, including among those Kikuyu who had

participated in the rebellion and those who had supported the British. Nationalism served as a means for unifying the country as well as a justification for disempowering tribal leaders (note discussion in Peterson 2012, pp. 14–15). It was in the context of efforts to unite the recently independent country that Kenyatta used the slogan 'Harambee' ('Let's all pull together'). Kenyatta also faced foreign conflicts. Land disputes with neighbouring Somalia led to military confrontations between the two countries for which Kenyatta sought British military aid. Kenyatta's modernisation policies relied upon his efforts to win diplomatic support from Western countries and investment from Western companies. Although Kenyatta's policies might be understood as an effort to maintain a unified state in an unstable political climate, his politics took on an increasingly autocratic turn which favoured his political party and ethnic group. In 1964, the KADU, Kenya's major party of opposition, was dissolved and joined KANU.

After his re-election in 1966, Kenyatta changed the constitution to extend his powers, and established KANU as Kenya's only legal party. He and his political allies amassed an enormous fortune during his presidency. Political dissension within KANU became increasingly apparent. Jaramogi Oginga Odinga, Kenya's vice-president and a leading figure in both the KAU and KANU, became a public critic of Kenyatta's consolidation of power and, in 1966, resigned from Kenyatta's Government to form the Kenya People's Union (KPU) in opposition. Odinga was later arrested in 1969 after an argument with Kenyatta. His fall from power came as a relief to Kenyatta's Western supporters who viewed him as potentially too radical (for more on Kenyatta and Odinga, see Branch 2011, pp. 56–65).

But a stroke in 1968 led to increasing worries about Kenyatta's health and, more importantly, who would succeed him. Kenyatta expressed hopes that it would be his second vice-president, Daniel arap Moi, who had formerly been a leader of KADU. At the same time, Kenyatta's erstwhile ally and minister of economic planning and

development, Tom Mboya, had been building a strong political base for himself. Only in his early 30s, Mboya had already had an outstanding political career having worked with Nkrumah, briefly led his own political party, and been instrumental in establishing student exchange programmes with the United States. Though Mboya could boast a base in growing urban regions as well as among members of Kenya's parliament, he had also marginalised the labour movement in his efforts to discredit Odinga (Branch 2011, pp. 69–81). His attacks on Odinga gained Mboya strong support from the West. Mboya was assassinated on 5 July 1969. Though mourners at his funeral protested against Kenyatta's attendance and alleged that he had been responsible, no definitive evidence to this effect has emerged.

Final Years and Legacy

The KPU was banned after Odinga's arrest in 1969. The left wing of KANU had joined the KPU and was ousted from power. KANU was the only party on the ballot in the 1970 and 1974 elections and Kenyatta was the only presidential candidate. Without any opposition parties, Kenyatta continued to consolidate power and played a direct role in most of the country's political affairs. Political power was solidified in the hands of the Kikuyu majority. Kenyatta often suspected Luo and Kalenjin peoples of seeking to overthrow him and worked to consolidate his Kikuyu base. During the final years of his life, an increasing number of associations were formed to advocate the rights of the smaller ethnic groups, such as the Luo, but any attempt to form political parties was blocked. Moi increasingly took on Kenyatta's responsibilities as the latter's health worsened. Kenyatta died on 22 August 1978. Moi succeeded him and retired from politics in 2002 amidst charges of corruption and human rights abuses.

Kenyatta was a pivotal figure among the first generation of African intellectuals who would later lead their countries to independence from Britain. Unlike many of Africa's first political leaders, he was an experienced and weathered political activist by the time he became a head of state, with anywhere from one to three decades' seniority. His

scholarly training and the fact that he had already produced a study of major intellectual significance just as other future African leaders were first becoming politicised only serves to further distance his personality and biography from theirs. From this standpoint, Kenyatta's politics appear very different from those of his fellow leaders of independent African states. The political problems and concerns that shaped him were those of a distinct and earlier period of anti-colonial politics, which makes it more difficult to bring him into dialogue with younger African politicians. As a politician, Kenyatta's career was marred by autocratic tendencies. He turned Kenya into a singleparty state with power consolidated around himself. He barred any possible opposition groups from political participation ranging from tribal leaders to members of his own cabinet. He solidified the power of a Kikuyu elite, which had begun to emerge under colonialism and retains much power in the country today. His family continues to exert enormous political influence (for more on political corruption in Africa, see Bayart 2012). In this respect, the contemporary complexities of ethnic conflict in Kenya, taking both the form of physical violence and disputes at the ballot box, must be cast in the light of Kenyatta's legacy.

Though a man who flirted with left-wing politics in his youth, Kenyatta adopted increasingly conservative positions as Kenya's president. While Kenyatta has at times been labelled a Pan-Africanist or socialist, his biography does little to support such claims. It is perhaps more fruitful to understand him as a Kikuyu nationalist. Throughout his career, he remained concerned with Kikuyu political affairs above all. His politics might also be best understood by situating him in the context of colonial-era agrarian politics, which most directly affected the Kikuyu. His most significant intellectual work, *Facing Mount Kenya,* was largely a study of and political intervention in discussions about the effects of colonialism on the Kikuyu. It is, at the same time, impossible to ignore Kenyatta's essential role in the development and strengthening of a succession of political parties, beginning with the KCA and culminating with the KANU, which continually challenged colonial authority and guided Kenya to independence.

Definition

This chapter explores the life, political practice, and legacy of Kim Il Sung (1912–1994), the first President of the Democratic People's Republic of Korea.

When the first Comintern-affiliated communist party was established in Korea proper, in Seoul in April 1925, Kim Il Sung (Kim Ilsŏng) was 13 years old and living in China's Jilin Province, a part of north-eastern China historically known as Manchuria. The Korean Communist Party did not last long. It disbanded in November 1928 after suppression by the Japanese imperial government, but it left an impressive legacy, many of its members holding leadership positions two decades later in the inaugural Korean Workers' Party (KWP) of Democratic People's Republic of Korea (DPRK). One member of that early communist party, Pak Hŏnyŏng, was the first secretary of KWP. Pak, a veteran revolutionary who had studied at the International Lenin School in Moscow (from 1929–31, when his friend Ho Chi Minh was also studying in the city), was also the minister of foreign affairs of the first DPRK cabinet. The young Kim Il Sung and the veteran Pak Hŏnyŏng were both comrades and rivals, and after the Korean War Pak was blamed for the failures of the conflict and put to death on Kim's orders. Kim was not part of Korea's early history of socialism, as Pak was, but he joined its surviving members as Korea's radical activities continued as an anti-imperial movement and eventually as a state-building project in the post-liberation period.

Kim Il Sung and his family had moved to Manchuria in 1919, to the village of Fusong in Jilin, so that the family could find more economic opportunities (a response common to many Koreans at the time). His father, Kim Hyŏngjik, a nationalist activist, continued to participate in the independence movement in Manchuria, where the chances of arrest by the colonial police were less than in Korea proper. Such a practice was common in the diverse struggle for independence from Japanese colonialism. Manchuria was a kind of frontier in East Asia, and it became an important location for activists to remobilise themselves, whether as intellectuals writing

K

pamphlets or as partisans fighting in the mountains. The backgrounds of the people in the anti-imperial resistance in Manchuria were diverse. They were not just Koreans from Korea proper but also Chinese-Koreans, Soviet-Koreans, and of course the Chinese themselves. Their political ideologies too varied, from capitalist conservatism and socialist nationalism to Leninism and anarchism. They fought as comrades, and sometimes they fought each other. Kim's beginnings took place in this situation, at the edges of an empire. In many ways, the theme of *manoeuvring from the margins* continued throughout his life; as a guerrilla in Manchuria (1930s), as a minority power in North Korea's early revolutionary government (1950s), as a leader of a young state situated between China and the Soviet Union (1960s and 1970s), and as an aging ruler of an isolated state-socialist country in East Asia (1990s).

Kim Il Sung was born on 15 April 1912, in South P'yŏngan Province's Taedong county, now part of Man'gyŏngdae district in the western part of the capital city Pyongyang (P'yŏngyang). Kim is the surname (written and spoken in East Asia as the first syllable of the whole name), and his family belongs to the Kim clan of the Chŏnju region in the south. His birth name is Sŏngju, which means 'to attain the essence'. He took on the nom de guerre Ilsŏng (officially spelled Il Sung, meaning 'to attain the light') in the early 1930s as he joined the partisan forces in Manchuria. His father, Hyŏngjik, held several occupations, including being a schoolteacher, and from the time Kim was a young child, he was an activist in the independence movement. His mother, Kang Pansŏk, was a fellow activist and a devout member of a local Presbyterian Church, where her father was a deacon; her name means 'bedrock', and it is a Chinese-Korean transliteration of the biblical name Peter (which also means 'rock'). Many members of Kim's mother's family were serious Protestant Christians, and although there is no record of Kim being baptised, he was surely raised in a Christian household. In the missionary work of western believers in Asia, the monotheistic nature of Christianity sometimes transmuted into a sense of anti-monarchism and anti-

imperialism, all in the name of the Christian deity. Kim's view of the modern world seems to have first come from his Christian upbringing.

Other than a few years of school back near Pyongyang in the mid-1920s, Manchuria was where Kim spent his young adulthood attending Chinese schools and learning to speak and read Chinese fluently. He first studied Marx and Lenin in middle school, in 1929, taught by a young Chinese teacher named Shang Yue, who later became a respected historian in China (Wada 2002, p. 41). Kim's initial experience in a radical movement was around this time as well, as he joined a youth communist association and was even arrested for engaging in anti-Japanese activities. Biographies of Kim published in North Korea tell the story that Kim, as a young teenager in Manchuria, formed his first armed organisation called Down-With-Imperialism Union. Most scholars outside North Korea do not think this is true, but he seems to have joined an organisation founded by a militant radical named Ri Chongrak, an organization that sometimes went by the name Down-With-Imperialism Union. This organisation was disbanded by Japan in 1931. Soon after, Kim joined his first Comintern-affiliated party, the Chinese Communist Party (CCP), which at the time accepted many Korean socialists.

Japan began colonising Asia in the late nineteenth century, starting with Taiwan in April 1895 and annexing Korea in August 1910. In September 1931, Japan invaded China through Manchuria after a bomb exploded at a railway owned by Japan's South Manchuria Railway Company. Known as the Manchurian Incident, the bombing is known to have been staged by Japan to create a cause for military invasion. The entrance of the Japanese military into Manchuria further galvanised the Chinese and Korean nationalists and socialists in the area. Kim's guerrilla days began during this time as he, in the spring of 1932, joined the Chinese National Salvation Army based in Antu. Partly due to the difficulty of sustaining a unified communist party in colonial Korea, and partly due to the Comintern's 'one country, one party' directive of 1928, Korean independence fighters in Manchuria were largely absorbed by the Chinese Communist Party in the

early 1930s. This is not to say that the Chinese communist leadership was in full control of Korean fighters, for in certain branches of CCP in Manchuria, especially among CCP's guerrilla units, Koreans were the majority of membership (Armstrong 2003, p. 29).

The international situation of anti-colonial forces in Manchuria was grounded in solidarity, but it was also one of mistrust and suspicion that, in 1933, erupted into a series of purges by the CCP. Suspecting pro-Japanese and anti-communist Koreans of having infiltrated the party, the CCP carried out a campaign to 'clean up' the Korean membership, arresting and expelling thousands and executing several hundred others. Kim himself was arrested in late 1933 but was absolved in early 1934. One major result of the purges was a reorganisation of the guerrilla forces in Manchuria, resulting in the formation of the North-East Anti-Japanese United Army (NEAJUA) in early 1934. Kim fought as a member of NEAJUA from June 1934 until October 1939, when NEAJUA was defeated by imperial forces. At his height, under the authority of the CCP, he commanded a detachment of several hundred fighters, and in June 1937 he and his unit engaged in a battle at Poch'ŏnbo, a border town on the Korean side, against a Japanese police garrison. The Battle of Poch'ŏnbo later became the most famous battle of Kim's guerrilla days, although its actual military significance at the time was likely small. In late 1940, with NEAJUA crushed by Japan, Kim and his unit retreated into the Soviet Far East, a region where borders are shared between Korea, China, and Russia.

For the next year-and-a-half, they stayed at a Soviet military camp in Vorosilov (today's Ussuriysk), just north of Vladivostok. In August 1942, Kim and his partisans were called up to Vyatskoye near Khabarovsk and reorganised as part of the 88th Special Reconnaissance Brigade of the Soviet 25th Army. The commander of the brigade, which had about 600 soldiers, was Zhou Baozhong, a veteran Chinese leader of Manchurian partisans. Kim attained the rank of captain and commanded his own battalion of some 200 troops, of whom 60 were Korean (Seiler 1994, p. 33). The partisans of the 88th Brigade

who remained loyal to Kim became the most important officials in the DPRK's beginnings, including Choe Yonggŏn, who became the commander of the Korean People's Army and the defence minister, and Kim Ch'aek, who became deputy prime minister and industry minister.

Kim's life in the Soviet military camp was one of both respite and restlessness. He had been a fighter living dangerously for more than 10 years, but for the next 5 years he stayed within the Soviet Union without seeing battle. He studied, trained, and devoted himself to the Soviet Red Army. An important reason for the relative isolation of former Korean partisans was the Soviet-Japanese Non-Aggression Pact of April 1941, which kept the two countries from going to war until 8 August 1945, when the Soviet Union declared war on Japan. As guerrilla fighters in Manchuria, they had not been obliged to observe international treaties, but as soldiers in the Soviet army, albeit with greater resources and recognition, Kim and his fighters now had to manoeuvre within the legal boundaries of nation states.

Kim Il Sung's time in the Soviet Far East included having a family with his partner Kim Choŏngsuk. She was a fellow partisan, and they were married in September 1940. (This was Kim's second marriage. His first had been with another partisan named Han Sŏnghui, who had mistakenly been presumed dead after her arrest by the Japanese police. Kim reconnected with her years later.) Born in 1917 in North Hamgyŏng Province's Hoeryŏng, in north-east Korea, Chŏngsuk had joined Kim's NEAJUA unit in 1937 and is believed to have fought alongside him in many battles, including the Battle of Poch'ŏnbo. Their first child, a son, was born on 16 February 1942. He was named Yuri Irsenovich Kim. After the family's return to Korea in September 1945, Yuri was given a Korean name, Chŏngil (officially spelled Jong Il). Another son was born in the Soviet camp in 1944. He was called Alexander Irsenovich (Shura for short), and was later named in Korean as P'yŏngil. He died in the summer of 1947 in Pyongyang in a drowning accident.

The two children born in the Soviet military base were officially given Russian names, even following the custom of using their father's first

name as their middle names (Kim's Russianised first name was Irsen). An interesting aspect of Kim's life during this time is that he perhaps did not envision returning to Korea, much less a socialist Korea, but rather saw his future as an officer in the Soviet Red Army (Lankov 2002, p. 57). The Kim family went on to have a daughter in liberated Korea, born in May 1946. She is Kyŏnghui, a party central committee member, a powerful politician in her own right, and the wife of Chang Sŏngt'aek, who was ordered to be executed by his nephew, Kim Jong Un (Kim Chŏngŭn), in December 2013. Chŏngsuk did not live to see North Korea for long: she died in September 1949 in childbirth, along with the child. Kim Chŏngsuk is memorialised in North Korea as a martyr and a heroine.

Kim married once more, in 1952, to Kim Sung Ae (Kim Sŏngae), his former secretary. They had a daughter in 1952 (Kyŏngjin) and subsequently had two sons. The elder son, Pyong Il (P'yŏngil), was born in 1954; he was named after the dead son from the previous marriage, who was, in turn, posthumously renamed Man'il. The second Pyong Il is the current DPRK ambassador to Poland. The younger son, Yong II (Yŏngil), born in 1955, was also a diplomat. He died in Germany in 2000 from illness. The daughter Kyŏngjin is a diplomat, too, and her husband, Kim Kwang Sop (Kim Kwangsŏp), currently serves as the DPRK ambassador to Austria. Kim Il Sung is known to have had two more children with two other women: a son named Hyun (Hyŏn) in 1971 with Madame Chegal, Kim's former nurse, and a daughter named Paegyŏn with a woman named Kim Songjuk. Kim Hyun is thought to have been killed by Kim Jong Il in 2001. In his relatively long life, Kim married three times and, with four women, had three daughters and five sons.

The empire of Japan ended when it surrendered on 15 August 1945. The Second World War was also over. The final days of the empire were singularly tragic: enormous death and destruction that culminated with atomic bombs on Hiroshima, on 6 August, and Nagasaki, on 9 August. The colonies of the empire were free, but for the people of Korea, freedom was very brief. Colonialism was quickly replaced by another kind of

occupation, by the US in the South and the Soviet Union in the North. Washington's proposal for the division of the Korean peninsula at the 38th parallel, on 10 August, was immediately accepted by Moscow, which, having declared war on Japan on 8 August, was already landing troops on the eastern coast of the Korean peninsula at the port cities of Unggi, Najin, and Ch'ŏngjin. Various native governing bodies freely emerged throughout the peninsula, but they now faced two powerful hegemonic entities growing more hostile toward each other. The occupation of Korea by the militaries of the US and the Soviet Union was a fiercely divisive issue among the Koreans. Left-wing nationalists opposed both sides; right-wing nationalists supported it from an anti-communist standpoint; and socialists and communists, including Kim Il Sung, tended to support it with the goal of a revolution on the entire peninsula. Korea's liberation in 1945 was thus simultaneously a moment of lamentation: freedom had come not through the efforts of Korean independence fighters; and the occupation divided the land for the first time in at least 500 years.

The Soviet occupation of North Korea began with the deployment of the 25th Red Army stationed in the Fast East; it arrived in Pyongyang on 26 August. The Korean and Chinese partisans of the 88th Brigade were initially left out of Moscow's plans, and they did not accompany the first wave of Soviet troops into Korea. Moscow understandably had more trust in the Moscow-trained Soviet- Koreans than in rebels such as Kim Il Sung, indicating that Kim was not a hand-picked puppet of Stalin. The Chinese and Korean guerrilla fighters of 88th Brigade thus independently prepared to return to their homelands. Kim Il Sung and 60 other Korean fighters formed the Korean Work Team at the end of August and left Soviet territory on 5 September 1945. During the time between the Work Team's formation and departure from Far East Russia, Kim travelled to Moscow and met Stalin, who then approved Kim's separate entrance (but not much more). After 2 weeks of travelling, on 19 September, Kim and his team of 60 partisans disembarked at Wŏnsan. Kim had returned home after two decades of life as a guerrilla fighter. He

was 33 years old. The legend of Kim Il Sung was already in the making.

In the political terrain of Soviet-controlled North Korea, Kim's close group of Manchurian partisans was a minority, both in number and political strength. His group competed and collaborated with at least six other groups in the aftermath of liberation: the Chinese-Korean group from Yan'an who had participated in the Chinese revolution; the Soviet-Koreans dispatched by Moscow and the Communist Party of the Soviet Union; the socialists and communists based in Seoul whose leadership, headed by Pak Hŏnyŏng, had moved north; the communists from the northern part of Korea known as the Kapsan group; the powerful Korean Democratic Party led by the Christian nationalist Cho Mansik; and the populist Ch'ŏndogyo Young Friends Party formed by the activists who followed the native religion of Ch'ŏndogyo.

The Soviets governed through the Soviet Civil Administration (SCA), established on 3 October 1945. The SCA's role in North Korea's founding is the topic of much debate that continues today. One view, particularly from the right, is that the SCA was an extension of Stalin's imperialistic and totalitarian grip, placing a puppet government in the North with Kim as its figurehead. Another view, espoused by the DPRK, is that the SCA recognised Kim as the leader from the start, because he had the full support of peasants and workers. The actual situation was a bit of both. Moscow was indeed interested in backing a pro-Soviet government in the northern part of Korea, but it was cautious of a full socialist revolution lest it should provoke the US into taking military action. As for personnel, the SCA had brought the Russianspeaking Soviet-Koreans, who were well educated and well trained in bureaucracy, but it also saw that popular support was an aspect it could not manufacture. The support of the people lay more with the nationalists, including Cho Mansik's Korean Democratic Party and the Ch'ŏndogyo Young Friends Party, than with elite socialists. Another player with growing popular support was Kim Il Sung, who embodied the ideas of patriotism, direct action, and social reform, while having connections with the Chinese and

the Soviets. The objectives of SCA and the situation on the ground eventually elevated the socialist and communist leaders who had the support of the masses. One result was the weakening of the non-socialist Korean Democratic Party; Cho himself was placed under house arrest in January 1946 for opposing Soviet and US occupations of Korea. The SCA also placed advisors in the central government, especially on foreign affairs, and in provincial governments; but below the provincial level, the SCA did not seem to have much influence (Armstrong 2003, p. 54).

Kim Il Sung quickly gained the support of fellow socialists, the Soviets, and the ordinary people. In the first legislative organ, the North Korean Provisional People's Committee (NKPPC), founded on 8 February 1946, Kim was elected chairman. NKPPC was the coming together of representatives from political parties, social organisations, and local governments called people's committees. Functioning as North Korea's first law-making institution, the NKPPC ordered two major reforms that were revolutionary in scale. First was the land reform of March 1946. NKPPC confiscated land from Japanese landowners, large Korean landowners, and private institutions (such as Churches) and redistributed the properties for free to over 700,000 households, the majority of whom had never owned land before. The second reform was the nationalisation of industries beginning in August 1946. Over 1,000 industrial sites were nationalised within a year, from steel and mining to chemical and consumer goods. The SCA undoubtedly approved and advised these reforms, but the newly formed Korean leadership, led by Kim, was the essential source of change, along with the ordinary people, who were willing to work with the new regime.

Kim's emergence in the political world occurred along with the gradual political ascent of his former partisan comrades. At the first congress of the Korean Workers' Party in August 1946 (then called the North Korean Workers' Party, as an ally to the South Korean Workers' Party), the central committee of 43 members had only four members from the Manchurian partisan

group, with Kim as deputy chair (Sŏ 2005, p. 178). The dominant groups were the Soviet-Koreans, domestic communists, and the most numerous Chinese-Koreans. The number of Kim's group in the central committee increased with each party congress, while, except for the communists from northern Korea, the numbers from other groups decreased. At the fourth congress in September 1961, called the 'Congress of Victors,' Kim's group had placed 31 members in the 85-member central committee, with Kim as chair, while the Chinese-Korean group and Soviet-Korean group had three and one, respectively (Sŏ 2005, p. 796). Noteworthy in Kim's gathering of political power is that he was very capable of negotiating and compromising with various groups and linking actual progressive changes in people's livelihood with the nationalist ideals of his own group. This meant, at crucial moments, attributing failures to others and, with little due process, removing them from positions of authority, which usually meant sending them to the countryside. Executions in North Korea certainly happened, but they were symbolic events and far less in percentage than in China and the Soviet Union. This is not to downplay the violence of the Kim regime but to talk about its complexity in practice. As much as its 'purging' was extralegal and arbitrary, the regime relied on the influence of exoneration and rehabilitation: within the authority of Kim Il Sung, anybody could be punished, and anybody could be forgiven. Such a practice of power fits with Žižek's interesting statement that socialist 'totalitarian' regimes were 'regimes of mercy' (2008, p. 676).

The Democratic People's Republic of Korea was established in September 1948, 3 weeks after the Republic of Korea (ROK) was established in the South. The chance for a unified Korea was fading by late 1947, as the US-Soviet Joint Commission failed to negotiate the terms for a single independent country. The 'Korea Question' was turned over to the United Nations, which established the United Nations Temporary Commission on Korea (UNTCOK) in November 1947. One role of UNTCOK was to observe a nationwide election in Korea, but the UN-sponsored election was rejected by North Korea, forcing the election to be held only in the South, in May 1948. This election established a legislative body, which, in turn, elected a president, Rhee Syngman (Yi Sŭngman), and proclaimed the founding of ROK on 15 August 1948. North Korea saw ROK as an illegitimate entity and carried out its own election on 15 August 1948, establishing the legislative organ the Supreme People's Assembly (SPA). The SPA declared the founding of the DPRK on 9 September 1948. Kim Il Sung became the prime minister of the cabinet, while the position of the chair of the SPA (a position of the head of state) went to Kim Tubong, a veteran soldier from the Chinese-Korean group. Kim himself did not become the head of the SPA until 1972, when the presidency system was implemented, at which point he became the president of the DPRK, a position he held until his death in 1994. In 1998, the DPRK abolished the presidency system, reinstated the cabinet system, and symbolically elevated Kim as the last and eternal president of the DPRK; a move not unlike the posthumous promotion of George Washington in 1976 as the highest-ranking military officer of the United States (for eternity).

From the moment of the formation of two separate nation states, each side loudly expressed the desire to unify the land, even if that meant a war. The ROK president Rhee Syngman spoke about the DPRK as a puppet state of the Soviet Union, and Kim publicly lamented that the US had set up a colony in the southern half and was exploiting the Korean people. Both sides built up the military and engaged in conflicts along the border. The Korean War, that is recognised by most of the world started on 15 June 1950, with an invasion by North Korea, and ended on 27 July 1953 with an armistice. What is less recognised is the situation leading up to the June clash: the guerrilla insurgencies in South Korea and 9 months of border fighting that together resulted in thousands of casualties. While they envisioned different futures, Kim and Rhee during this time shared the manoeuvres of strengthening the military, acquiring the support of powerful allies, and waiting for the right provocation to initiate attack (Cumings 1997, p. 251). The moment came earlier for North Korea when, first, the well-trained

Korean soldiers who fought with the CCP in the Chinese revolution returned to ultimately form an army of over 100,000 soldiers and, second, Mao and Stalin decided to support North Korea when it launched an attack (China with a 'volunteer' army and the Soviet Union with weapons). The war that started in June 1950 was thus the most ambitious offensive (a tragic continuation) in the belligerent relationship between the two states since 1948.

Death, displacement, and destruction produced by the Korean War were a political opportunity seized by Kim Il Sung and his partisan group. Post-war economic reconstruction required a strong state, which could only follow a massive political consolidation. The removal of groups from positions of authority was, at the time, a justifiable act for the failures of the war. The purging lasted throughout the decade and involved a nationwide party membership renewal, public trials of rival groups, teach-ins at all branches and regions of the government, censorship of intellectuals, and repatriation of Soviet-Koreans back to the Soviet Union. It even lasted through the attempt to overthrow Kim in August 1956 by the Chinese-Korean and Soviet-Korean groups, an event known as the 'August Factional Incident'. By the fourth party congress in September 1961, Kim and his partisan group (and their loyalists) had control in the cabinet, legislature, party, and military. The once diverse world of North Korea's politics, which reflected the various actors in the resistance against Japanese imperialism, was reduced to Kim's partisan group as the sole legitimate representation of the people.

The anti-imperial past of Kim Il Sung was a crucial factor in the shaping of his political authority. In the eye of North Korea's party-state machinery, imperialism did not end in Asia with the dissolution of the Japanese empire. The new enemy was the US, and it had once again colonised the Korean people in the South and set up a military-capitalist outpost. North Korea had valid reasons for this outlook. First was South Korea's export-oriented light manufacturing industry geared toward American and Japanese consumers. From the late 1960s, South Korea's cities became centres of exploitative factory work

for millions of young women and men. They left their home towns for low-wage work that placed them in unhealthy and dangerous work settings with little legal or union protection. Another reason was the establishment of dozens of US military bases across South Korea after the signing of the Status of Forces of Agreement (SOFA) in 1953. The most notorious was the US Eighth Army's base in central Seoul, the same location in which imperial Japan had stationed its army for three decades. (After six decades, the Eighth Army is in the process of relocating to a base outside Seoul.) With SOFA came the twice-a-year joint military exercises between the US and South Korea that were live simulations of another war on the peninsula. North Korea's leadership sent out the message that it had defended itself in the Victorious Fatherland Liberation War, largely because of Kim's military strategy and his brotherly ties to Mao and Stalin. These two features originated from Kim's days as a guerrilla fighter in Manchuria, and as long as imperialism is a threat to North Korea, Kim would be the leader. Enemy making is a universal tool for the political unity of a nation, and the making of North Korea's new enemy in the US further fostered the people's trust in the Kim Il Sung regime.

Kim's rise within the DPRK officialdom accompanied the production of devotion toward him and the Manchurian partisans. The devotion toward a political leader is often called the 'cult of personality'. State-socialism from the Soviet Union to Vietnam suffered from the culture of glorifying leaders, and in no other place was it stronger than in North Korea. Filled with images of tearful adulation, dancing children, and large statues, the cult of personality is a quality that immediately seems bizarre and conjures up a sense of brainwashing. But it must be said that monarchies, national histories, and celebrity cultures everywhere also depend on personality worship, with their own ways of publicity, consumption, and socialization (or brainwashing). As bizarre as it may seem, the cult of personality is not a matter of absence or presence (because it is pervasive in our world) but a matter of degree. A major degree of difference in places like North Korea was the involvement of the education system. Kim Il Sung

and his partisans were hyperbolised from early on, but a systematic production of devotion began with the publication of *The Memoirs of Anti-Japanese Partisans* in June 1959. The book was read by the whole society, especially in schools. The others who also fought for independence were either portrayed as part of Kim's command or excluded from the new revolutionary history of North Korea. Beginning in 1972, around the time of the promulgation of his *chuch'e* ideology, the system of glorifying Kim placed him above all other revolutionaries, including Stalin, Mao, and even Marx. Kim's actual authority, however, was in decline, as his son Jong Il rose in the ranks and orchestrated his father's place in history. (In almost all cases, personality cult reaches its height when actual power diminishes.) Through literature, movies, songs, and textbooks, all that seemed decent about living in North Korea was attributed to Kim. On the one hand, it was a simple process of learning the rationale, from childhood, that Kim Il Sung was the ideological source of happiness and that its opposite was caused by the enemy: the US military and capitalism. On the other hand, the process of attribution had a strong effect on language and performance. Every person learned to speak and to act in a certain way according to the situation, not unlike etiquettes and manners in church or at a formal dinner. Publicly, the people of North Korea praised his life, wept about his sacrifices, and shook their fists at the US; but in private life, behind closed curtains, they lived a life beyond the rhetoric and performance. Kim's personality cult was produced at a great level and became a part of children's education, but, as with any belief, the actual hold varied among the people.

The attribution of Kim Il Sung to North Korea's progress was rooted in real economic growth. Between 1946 and 1960, North Korea claimed to have experienced a 2,000% increase in industrial output, a 683% increase in national income, and a 539% rise in labour productivity (Central Statistical Board 1961, pp. 22–28). These numbers are questionable, but given the low starting point, there is little doubt of a large absolute economic growth. Industrialisation (focused on heavy industries like steel, chemical, and mining) created hundreds of thousands of jobs and urbanised the country. The Three-Year Plan from

1954–56 had raised production back to pre-war levels, and the Five-Year Plan from 1957–60 completed the co-operativisation of agriculture and the nationalisation of all forms of production (finishing a year early in 1960). Modern industrial management of time, space, and wage took place in conjunction with mass campaigns, such as the famous Ch'ŏllima Movement that began in 1959. One important achievement in the process was the proletarianisation of the workforce, as farmers and private producers became wage-workers in the fully nationalised economy. Within a decade after the Korean War, North Korea had established the foundations for a state-led socialist economy. This meant the state would appropriate that total surplus created from production and decide how it would be utilised. The state also controlled distribution through its ration system, although small private plots were allowed in the countryside. At least formally, the force of the market was removed from production, distribution, and consumption. By the late 1960s, North Korea was meeting the minimum need for food, housing, and clothing, while providing employment, medical care, and education for the entire population. Some regions were still poor, but until the 1980s, the people of North Korea on the whole fared better than their neighbours in the South.

In the setting of political unity and economic growth in the 1950s and 1960s, Kim Il Sung developed the idea of *chuch'e* (officially spelled Juche). As Kim's most defining thought, Juche is the guiding principle of North Korea's official sectors, including the party, the military, economic planning, and education. Although the word itself is a common one in East Asia, meaning 'subjectivity' and 'self-reliance', in North Korea it takes on the message that one's life is determined by oneself, and by extension, the progress of a nation state is determined by its people (Kim 2012, p. 72). The origin of Juche is considered to be Kim's speech in December 1955 titled 'On Eliminating Dogmatism and Formalism and Establishing Juche in Our Ideological Project'. But theorisation did not happen until the early 1970s when Kim organised a group of scholars for the task, a group led by the philosopher Hwang Jang Yop (Hwang Changyŏp, 1923–2010) who

went on to serve as chair of SPA's standing committee. (In February 1997, he became the highest ranking official to defect to South Korea, where he lived a second life as a vocal critic of Kim and the DPRK.) Two international events further influenced the development of Juche. First was the diminishing foreign aid from the Soviet Union and Eastern Europe. Economic independence, especially in consumer goods, was a growing necessity. And second was the Sino-Soviet Split of the 1960s during which North Korea criticised both states: the Soviet Union for being soft against capitalism (especially after the Cuban Missile Crisis of 1962); and China for ignoring the situation of the people (with the Cultural Revolution of 1966) (Kim 2012, p. 76). Juche was thus a response to the changing international context of less foreign aid and growing antagonism between two socialist superpowers. At the same time, Juche was a positive manifestation, an expression of North Korea's success in post-war reconstruction and nationalised industrialisation.

The announcement of Juche to the public (especially the foreign public) in 1972 was a year-long event. It was written about in popular magazines. Kim Il Sung gave interviews to foreign newspapers, one of which was Japan's major daily *Mainichi Sinbun*. And throughout the 1970s, North Korea took out full-page advertisements in Western newspapers, including the *New York Times*, the *Washington Post*, and the *Guardian*. As the world experienced the Vietnam War and uprisings in every region, Kim's Juche had a moment in the sun. Post-colonial developing countries saw North Korea's economic expansion as a model, and Kim's Juche was an empowering text for emerging regimes and radical organisations. One interesting case was the Black Panther Party in the US, whose leading member, Eldridge Cleaver, visited North Korea in 1969. Endorsing the Juche idea, Cleaver, in 1972, wrote the foreword to an English-language book on Kim's writings. '[T]he manuscript before me is one that *must* be read and understood by the American people above all', Cleaver wrote (Kim 1972: ix, emphasis in the original). For two decades, in the 1960s and 1970s, Kim's regime represented a successful alternative outside the domination of superpowers. Especially for those critical of liberal democracy, North Korea had achieved political and social unity, equal distribution of wealth, and independence from the hegemonic policies of the US, China, and the Soviet Union.

In the 1980s, while his national image grew more righteous and virtuous under the direction of his son, Kim Il Sung's international reputation waned. This was the period of glasnost and perestroika in the Soviet Union; Deng Xiaoping's China embraced the market economy. The world increasingly viewed North Korea as an isolationist country with a failing economy. The economy had started to seriously weaken in the mid-1970s when trade among socialist countries slowed down and North Korea had to borrow from foreign banks flush with oil money (as did many other developing countries). North Korea defaulted the loan in 1980. Meanwhile, South Korea's economic growth overtook North Korea's and climbed at an astonishing rate. Like China's Deng Xiaoping, Kim Il Sung invited foreign capital investment into North Korea with the announcement of the Joint Venture Law in 1984. Initial investments came from companies originating in Japan, France, and Hong Kong, but foreign investment was not enough to offset the decline. The dissolution of state-socialism in Eastern Europe and the Soviet Union further devastated North Korea's economy. In the early 1990s, North Korea began to experience a dramatic decline in agricultural production, and with dwindling foreign aid and import of fuel, food shortages soon appeared as a major crisis. And as much as Juche was seen as an outcome of progress, it was perceived as the cause of misery. Kim was now viewed as a tyrant who had created a disastrous economy and indoctrinated the people to obey his words. He was indeed a tyrant who ruled with absolute power, and the Juche ideology had turned him into a guiding light of the masses. But what needs to be juxtaposed is that: first, almost all post-colonial states have remained poor for complex reasons; and, second, ideological control of a people is never complete. Ideology, including Juche, is largely about rhetoric and performance. Even under great oppression by the state, people create their own everyday life that is

distanced from any complete ideological hold. The people of North Korea are no different.

The last days of Kim Il Sung are indelibly marked by the catastrophe of famine and the global portrayal of North Korea as a possible nuclear threat. He died from a heart attack on 8 July 1994 at the age of 82, probably knowing that the people of North Korea were beginning to die from hunger. That situation would continue until the end of the 1990s. The last efforts at trying to revive the economy involved the strengthening of the nuclear programme and the selling of weapons on the international market. Kim Il Sung had initiated a nuclear programme in 1959 with assistance from the Soviet Union, and by the early 1990s the two countries were building a nuclear power plant on the east coast (Kotkin and Armstrong 2006, p. 119). When the joint project came to a halt due to financial reasons, North Korea turned to selling missiles and nuclear technology on the arms market, while accumulating plutonium independently. In the summer of 1994, North Korea tested ballistic missiles and rejected an inspection by the International Atomic Energy Agency. Washington and Seoul considered using military strikes on North Korea's nuclear sites. But as the peninsula braced for another war, during what is now considered the first nuclear crisis, Kim Il Sung met with the former US president Jimmy Carter in June and negotiated a deal to stop the nuclear weapons programme and to work with a multinational consortium including South Korea, the United States, and Japan. Kim did not live to see the agreement, but at the end of his life he was shifting the course of his country. He was welcoming the partnership with governments that he had once vowed to destroy.

There exists a photo of Kim and Carter from that summer. They are on a boat and smiling. Kim looks like a gentle old man, not the ruthless politician who crushed his rival groups, not the tyrant vilified in postwar South Korea's anti-communist education system. Then again, Kim was not a singular character; no one who achieves greatness ever is, for better or worse. 'Rice is socialism', he frequently said. Socialism was a space in which he manoeuvred as an anti-imperialist, as a populist, and as a compromiser. But one aspect remains unbroken in Kim's life: power is constant movement, something he realised early on as a partisan in the mountains among more formidable forces.

Definition/Description

The Korean peninsula is where Russia, China, Japan and the United States meet and contest. It is the most strategically valuable location in the world and inevitably has been of consuming interest to imperialism, either to use as a strategic base for onward expansion or to deprive competitors of control. The actors have changed over the course of history – the Mongol and Japanese empires are no longer and the hegemony of the recently

arrived US empire is under challenge especially from China. Korea, divided by the US into North and South in 1945 as part of its strategy against the Soviet Union, is still struggling to find a way to reunification and independence. Current US policy on Korea can only be understood within the framework of imperialism and resistance to it.

Introduction

The Korean Peninsula has been a prime site of contestation for US imperialism since the defeat of Japan in 1945 and for Japanese imperialism in the preceding half century. Any analysis of imperialism must be grounded in specifics – a lazy, undifferentiated, and historically decontextualized description is inimical to understanding – but because of its importance, a study of imperialism in Korea can offer insights into the nature of contemporary imperialism. Moreover since US imperialism is a global phenomenon (the Japanese variant was essentially regional), looking at imperialism in one theatre in isolation makes no sense, though it is often done by apologists and by mainstream writers generally. Thus talking of "the North Korean problem" as if the issue emanates from Korea and is limited to a bilateral interaction with the USA either directly or in its guise as "the international community" obfuscates as perhaps it is intended to do. Instead we must look at the Korean case within the context of the empire as a whole, whether that is American or Japanese. That inevitably brings us to a contemplation of imperialism, its nature, its constituents, its motivations, and its constraints. Thus the specific and the general are inextricably linked, each giving meaning to the other. At the same time because of the limitations of the author's knowledge and the constraints of space in a short chapter, the focus will be on US imperialism for reasons which need no elaboration.

A discussion of the general issues about imperialism that the Korea case study throws up starts with the simple question, why Korea? It is necessary to understand what is it that makes the Korean Peninsula of such interest to imperialism. This chapter is not an attempt to formulate a

K

general theory of contemporary imperialism but simply to contextualize the Korean case which in turn may deepen our understanding of the concept of imperialism.

After addressing the question of why Korea is of such importance to imperialism, we turn to a historical overview to familiarize the reader with the basic facts. It hardly needs to be noted that this is important because most writing on the subject comes from an imperialist perspective where lies, obfuscation, and myth happily mingle to mislead us.

Why Korea?

There are four main reasons why imperialism is interested in a particular place. The strength of a reason will vary with the specific imperialist power; what applies to Japan may not apply to the USA.

1. History and Destiny

    The place may have a special role in the history of the imperial power. Mussolini's attempt to resurrect what he could of the Roman Empire and Israel's claims in Palestine are examples. If the target country is not part of the past, it might be seen as part of the future, as inherent in the nation's destiny. The American concept of Manifest Destiny, of a nation from sea to shining sea and across the Pacific, provides a foundation for the US presence in Korea (Cumings 2009).

2. Resources

    Gold, silver, and oil are obvious historical examples, but are less pressing reasons in the modern world where the question is not access itself, but the terms of access. The USA did not invade Iraq in 2003 simply to seize its oil because it was able to buy it commercially, and the Iraqi government was not threatening to curtail that. The reasons were deeper. Countries, especially in times of war, may take action to prevent a resource being available to, or seized by an adversary: the Anglo-Soviet invasion of Iran in 1941 is a case in point ("Anglo-Soviet invasion of Iran" 2018). This was not an issue in Iraq 2003, nor is there any

reason to see it being applicable to Korea. The US invasion of Iraq was driven by a complex combination of motives: the power balance in the Middle East; the particular role of Israel; general antipathy toward independent governments, even if they had been friends and allies the day before; and a general desire to control the supply and sale of oil. This in turn involved the issue of petrodollars, and Iraq's attempt to move to Euros, an issue which was paralleled in Libya and the continuing confrontation with Iran (Doran 2012). The use of dollar for trade in oil is a subset of the larger question of the role of the US dollar as the world's trading and reserve currency, which leads to the very heart of US imperialism. So the motives for the US conquest of Iraq in the twenty-first century were very different from the Spanish plundering of Latin America for silver and gold in the sixteenth century though that simple avarice for resources had momentous global consequences.

There are reports, perhaps exaggerated, that North Korea has substantial mineral resources (Mollman 2017) but this provides no compelling rationale as such for US policy since North Korea has long sought foreign investment (Shi 2014). The issue is respect for sovereignty. With Japan not merely were the historical circumstances different, but Korea's resources were a magnet, rice from the south and from the "mineral-rich north," gold, iron ore, and coal (King 1975; Roy 2015).

3. Labor

    Capital without labor is valueless, and the search for suitable labor is a constant theme in imperialism, from the African slave trade to the Americas to low-paid workers today in the Global South. Again, for the USA, Korea's labor resources were initially of no interest; it was much more plentiful in Japan and China. Today South Korea is a major economy with workers who are skilled, disciplined, and notoriously overworked (Haas 2018), but only 6% of the 27 million labor force are employed in foreign companies ("FORCA Brochure" 2018). Of more interest to US imperialism, now is the military "labor force." According to the International Institute for Strategic

Studies, the combined total of the three types of military personnel (active, reserves, and paramilitaries) in South Korea is 5.1 million, by far the largest in the world, outstripping that of the USA (2.2 m), Russia (3.5 m), China (3.4 m), and North Korea (2.0 m) ("Military Balance 2017" 2017). Since the South Korean military is under the "wartime" Operational Command (OPCON) of the USA, this is a formidable asset (Jun 2018a).

4. Geopolitical Location

Although resources and labor were important considerations for Japan, by far the most important and enduring reason for imperialism's interest in the Korean Peninsula is its unique geopolitical location. It is the only place in the world where all the great powers, other than the Europeans, come together. This is where Russia, China, Japan, and, from across the "American Lake," the USA meet and contest. This is the place, in the words of the Australian scholar of Northeast Asia, Tessa Morris-Suzuki, "where empires have collided" (Morris-Suzuki et al. 2018). Imperialism abhors a vacuum and a crossroad such as the Korean Peninsula will not be ignored.

The Korean Peninsula in the past has been the conduit whereby Buddhism and Chinese culture, particularly Confucianism and its writing system, flowed through from the Asian mainland to Japan. In the future it will hopefully serve as a transit corridor for gas pipelines from Russia and have railways linking Japan with the west of Europe – what Kim Dae-jung dubbed an Iron Silk Road (Kim 2006) – though for obvious strategic reasons, this would not find favor in Washington.

From a strategic perspective, the Korean Peninsula has two functions. It may serve as a staging post and a corridor toward the main objective. This is how the Mongols and the Japanese used it. Or it may serve as a barrier and a bastion against incursion from adversaries. This was, and remains, the Chinese perspective. Or, it may serve both functions: that is the American position.

How have these various objectives played out in history?

Historical Overview

Perhaps few states in history have not displayed attributes of imperialism, state creation usually being a violent business originating in greed and ambition. The northern Korean state of Koguryo (Goguryeo) which dates from roughly 37 BCE to 668 CE extended its territory far beyond the Amnok River (Yalu) into the plains beyond into what are today parts of China's Northeast, Inner Mongolia, and Russia; it was according to a South Korean website a "Korean empire whose brilliant history flourished on a vast expanse of land in East Asia" ("Koguryo Proud History of Korea" 2018). In 2004 a controversy erupted between Chinese and South Korean historians as to whether Koguryo had been a tributary state of China or "truly Korean." The debate was arcane and ultimately unresolvable because modern concepts of nationalism cannot be easily applied to the past, but it had important modern implications. China considers itself a multiethnic state built to a large extent on cultural soft power, and the tributary system was a manifestation of that. Under that concept a historical state which was militarily independent poses no challenge to the modern Chinese polity. If Tibetans and Manchus, Mongols, and Miao can be Chinese citizens, why not Koreans? This conflicts with a vision of a "Korean empire" that once held sway over a large part of what is now China and might do again one day; as the *New York Times* put it: "China Fears Once and Future Kingdom" (Brooke 2004). It was a coming together of two aspirations, Korean revanchism and American interest in the dismemberment of China. It is unknown to what degree South Korean dreams are shared in the North, but since Pyongyang was the major capital of Koguryo, it would be surprising if that were not so.

In the event Koguryo was destroyed by an alliance of the Chinese Tang dynasty and the southern Korean state of Silla which absorbed it. With the consolidation of state power in China, and elsewhere in Northeast Asia, the possibility of an extension of formal Korean rule beyond the peninsula faded although interaction, sometimes peaceful, sometimes bloody with the semi-sinicized peoples to the north, such as the Jurchen/

Manchu, was unremitting. However the end of Korean imperialism did not mean that imperialism was finished with Korea, given its strategic location that was impossible.

This process of focus on the peninsula itself culminated in the two centuries long seclusion policy of the latter days of the Choson Dynasty (1392–1910). Isolationism was a reaction to foreign incursions of various sorts and was ultimately fruitless, but it is a common phenomenon. Incursions may be military, commercial, or intellectual (usually religious), but if too strong they threaten to destabilize the existing social order which, unable to cope, erects barriers against the outside world. Some societies are able to cope. The rulers, realizing that the old gods are not as powerful as the foreign ones knocking on the door, embrace the new religion, be it Catholicism or capitalism. The spread of Islam throughout Southeast Asia and the transformation of Germany under Bismarck are examples. In some circumstances relatively peaceful adaptation is possible; in others the process of transition is traumatic and frequently bloody.

All three East Asian countries – Japan, China, and Korea – embraced forms of seclusion under the Western impact. China's was nuanced – welcoming Jesuits with their knowledge of cartography and cannon-making under the Ming, keeping foreign traders (many of whom were drug dealers) as far away from the capital as possible during the Qing. The geography and size of Japan and Korea allowed for more absolute measures. The *Sakoku* ("closed country") policy of the Japanese under the Tokugawa shogunate tried to extirpate Christianity, which was seen as not merely subverting the social order but placing Japan under the control of foreigners in a way that acceptance of Chinese culture had not. Foreign trade, previously flourishing, was stifled although some was tolerated, mainly through the distant southern city of Nagasaki. This was brought to an end by the Americans in the person of Commodore Perry who in 1854 "opened up" Japan and imposed the first of the "unequal treaties" (Rabson 2016). This exercise in gunboat diplomacy, still a staple of imperialist statecraft today, had profound consequences, some of them unintended. It led to the

Meiji Restoration and the modernization of Japan, but also to Japanese imperialism which was to challenge America at Pearl Harbor in 1941.

Korea's opening up was also produced by force, but there was a preceding experience of imperialism which needs to be sketched.

Korea had long been a tributary state of China, and while this was an imperialistic relationship, it had its own special characteristics which need to be considered. There are, in a sense, two Chinas – one is those dynasties such as the Tang, Song, and Ming – which were ruled by the Han, the dominant ethnicity in China. Then there were the two "barbarian" dynasties when China was under the rule of people from the steppes – the Yuan (Mongols) and the Qing (Manchus). Han China was essentially inward looking because the outside world had little to offer. Horses from Fergana in Central Asia were prized, and of course Buddhism from India had a profound impact and wide acceptance, but in most respects the Middle Kingdom was richer and more advanced than anything in its purview. This is in distinct contrast to the imperialism of the Portuguese and their fellow Europeans who, utilizing military superiority, went scouring the world for riches – gold, silver, spices, slaves, and land. There are interesting, if partial, parallels here between China and the USA whose imperial expansion was not based on a simple lust for foreign riches. Han China's interest in peripheral states, such as Korea, was primarily a desire for stability on its borders. The states paid tribute, of more importance symbolically than economically, and in return were accorded legitimacy by the Chinese emperor. Again this is similar to the modern American system where legitimacy, the difference between being a government and a regime, is seen as something that can only be bestowed by Washington (Dulles 1957). The American ideology of "exceptionalism," the USA being a "city on a hill" to which the world looks for inspiration and leadership in many ways, mirrors the traditional Chinese concept of "culturalism" where the superiority of Chinese culture is evident to all and irresistible to barbarians who even if they have military superiority (as did the Mongols and Manchus) inevitably become sinicized (Fairbank 1942).

The non-Han dynasties had other priorities. The Mongols were hugely expansionist, creating the largest land empire in history, and the economic basis of their imperialism was rent-seeking in the form of extracting tribute from conquered peoples. The principle military advantage they had was their highly mobile cavalry, but as their empire expanded into settled economies, this advantage was dissipated; the short life span of the empire was inevitable. Their rule over Korea lasted only 80 years and that over China (the Yuan dynasty) not much longer. Despite their reputation as ruthless conquerors, spreading terror before them to demoralize their enemies, with piles of skulls being their version of Rumsfeld's "shock and awe" (Sanders 2013), diplomacy was an important component of their strategy; indeed in the tribal clusters that made up their society, the ability to create bonds and alliances was the prerequisite for Genghis Khan's creation of a Mongol nation. This style of politics was naturally carried forward into the imperialist stage. After the initial military conquest, they sought to consolidate and continue their power through marriages much like the Hapsburgs in Europe, but with less long-term success.

While China was by far the main prize, there was a desire to exact tribute from Korea and then Japan, which was (falsely) reputed to have gold in measureless quantities, though this might not have been an important consideration. It may have been that the Mongol empire once born was, rather like the American, driven not so much by immediate economic gain but by the need for permanent war, hence unending conquests; like a bicycle without forward motion, it would fall over. The Korean Peninsula has been described as a dagger pointing to the heart of Japan, and although the expression dates from the nineteenth century when the dagger was pointing the other way and it was really only a pretext for Japanese seizure of Korea in the fourteenth century, it had validity (Jun 2013). Korean-built ships, sailors, and soldiers were an important component of the forces assembled by the Mongols, now under Kublai Khan, who was by then the emperor of Yuan China, in two attempts to invade Japan. Both ended in catastrophe caused by a combination of Japanese resistance and storms which wrecked the invasion fleets, a fate shared by the Spanish Armada. The exercise was an ill-conceived product of imperialistic hubris. The war-machine which had proved so devastating of the steppes of Eurasia was ill-suited for a hugely ambitious amphibious campaign in which the ships would be vulnerable to the vagaries of the weather. The Mongol failure had important ideational consequences for Japan's subsequent interaction with the outside world. This first encounter with invading foreigners produced a sense of Japaneseness that had not existed before. The typhoons which had wreaked the Mongol fleets were labelled *kamikaze* – divine winds – and this led to the myth of divine intervention which would also provide security against invasion in the future (Conlan 2001). It was an unfortunate illusion, as illustrated by the futility of the suicide bombers, called *kamikaze*, to invoke the past, on the eve of Japan's defeat in 1945. In the meantime it gave a confidence to Japanese imperialism that it might otherwise have lacked. One imperialism begets another and just as Western imperialism in the nineteenth century generated modern Japanese imperialism, so perhaps did Mongol imperialism stimulate Hideyoshi's dreams of conquest in Korea and beyond.

Mongol success had another very important, and broader, ideational consequence. The peace that the empire brought to Eurasia meant that for the first time in history, merchants could travel under a uniform regime between Europe and East Asia. Marco Polo was one such, and his fantastical tales of the riches of Cathay were profoundly influential in stimulating exploration, such as that by Columbus and the Western Expansion. Trans-Eurasia had long existed, as the Silk Road attests, and late-medieval Europeans were not alone in exploring the world; the Moroccan Ibn Battuta traveled more widely through Africa, the Middle East, South Asia, and China. Columbus only got as far as the Americas, and there are doubts that Marco Polo actually got to China (Wood 1996). But it is the thought that counts, and whatever its provenance, the idea of an Orient of untold wealth, and hence a subject of imperialist desires, received a substantial boost from the Mongols.

K

The Japanese did not require a Marco Polo to tell them about China, or Korea, but the abortive Mongol attempts did perhaps seed the idea of invasion of the Asian mainland, along with the perceived security of the *kamikaze*. The prerequisite was the unification of Japan and that was achieved by Oda Nobunaga (1534–1582) and Toyotomi Hideyoshi (1537–1598), with the process being consolidated by Tokugawa Ieyasu, who established the Tokugawa shogunate which lasted until the Meiji Restoration of 1868. Hideyoshi launched two invasions of Korea, in1592 and 1597 (with China as the larger objective), and both ended in failure, and the attempt was finally brought to an end with the death of Hideyoshi. The invasion of Asia was militarily as ill-conceived, though for different reasons, as the Mongol invasions of Japan but it may be that, as so often with imperialism, they proceeded from domestic considerations more than a rational assessment of success. Hideyoshi needed foreign success to bolster his legitimacy at home, and he also needed to provide an outlet for the military now made redundant by the peace imposed by his conquests. The unemployment threatened by demobilization and the potential economic slump caused by demilitarization lay behind the creation of the permanent war economy in the USA in the late 1940s (Melman 1974), and the Cold War, in which the Korean War played a significant role; so too in its own specific way did sixteenth century Japan attempt to cope with similar problems.

While the Japanese do not seem to have had the problems with the weather as the Mongols did, they faced considerable opposition from the Chosun navy. However the big difference was Chinese intervention. Ming China sent forces to support the Koreans against the Japanese, as did Qing China in the nineteenth century. Neither wanted to see a hostile power occupying Korea as a prelude to attacking China, and this was also behind the Chinese intervention in 1950. And indeed China would surely intervene again if the USA did invade North Korea (Editorial 2017).

There are other parallels between Hideyoshi's campaigns and the Korean War. The Japanese were harassed by guerillas, as were the Americans in the fluid period of the war between the Inchon landing and the Chinese intervention, and it ended with a military stalemate where neither side was strong enough to subjugate the other and drive it from the peninsula. In the sixteenth century, the impasse was essentially resolved by Hideyoshi's death; the armistice of 1953 remains an unfinished business with the formal peace it promised still rejected by the USA despite the Panmunjom Declaration of the two Koreas and Chinese advocacy (Lim 2018; Seong 2018).

Although this early Japanese attempt to invade China via Korea failed, it remained a dream that readily resurfaced in more propitious circumstances toward the end of the nineteenth century.

The Manchus also launched two invasions against Korea, in 1627 and in 1636. As with the Japanese in preceding invasion in the sixteenth century and the later annexation of Korea in the twentieth, this was part, albeit an important one, of a larger design against China. Unlike the Japanese, the Manchus were successful on both counts. This was symbolized in 1636 when the Korean King Injo surrendered and transferred his tributary status from the Ming to the newly established Qing dynasty of the Manchus. The Qing took the Ming capital of Beijing in 1664 but did not overcome Ming resistance until the capture of Taiwan in 1683.

The Qing dynasty has left an important legacy for contemporary imperialism; it expanded westward, establishing control over Tibet and Xinjiang and northward into Mongolia. However it did not absorb Korea but continued the tributary status of previous dynasties. As the Qing declined in power from the nineteenth century, foreign imperialists imposed unequal treaties and carved out spheres of influence. The British seized the island of Hong Kong in 1842 and tried to detach Tibet at the beginning of the twentieth century, hoping to attach it to the British Raj. However in general the foreign powers recognized the territorial integrity of the Qing Empire, legally if not in practice. The USA, in particular, firmly supported the territorial integrity of China, arguably because it confidently expected one day to hold commercial and political sway over all of it (Kennan 1948). The Qing therefore established the boundaries of

the modern state and both the Republic of China (ROC), established in 1911, and the People's Republic of China (PRC), established in 1949, regard themselves as the legal successor to the Qing territory. The only major difference between the two relates to Outer Mongolia which declared independence in 1924; this was accepted by the Communists (i.e., PRC) but not by the nationalists (ROC).

In 1945 the victorious allies, which means basically the USA, insisted that Japan return the territory it had seized on the Chinese mainland (Manchuria and the eastern seaboard), Taiwan, and the islands of the South China Sea. The South China Sea has become a hot point in recent years because it is a major chokepoint for China's seaborne trade in case of war, and, with historical amnesia, the USA has objected to Chinese control of the islands and their defensive militarization (Beal 2016d).

Taiwan became an issue and continues to be one, because the nationalist government of Chiang Kai-shek's Kuomintang Party (KMT) retreated there in 1949 and, protected by the USA, established the Republic of China on Taiwan, still claiming legal inheritance of the Qing territory and dreaming, for a while, of a return to the mainland. With the USA switching diplomatic recognition to the PRC in the 1970s, the KMT legitimacy was eroded, and indigenous Taiwan secessionism grew in strength. This has presented the USA with challenges. The One China Policy – claiming the legal territorial integrity of the Qing inheritance while being pragmatic on matters of actual control – is the cornerstone of Chinese foreign policy, which the USA and most other countries have accepted. On the other hand, fragmentation of adversaries (*divide and rule*) is a standard strategy of imperialism, and Taiwan is a prime target, though Hong Kong, Tibet, and Xinjiang are also candidates (Xinjiang is problematic because of the connection with Islamism (Lin 2016)). These ongoing issues in US relations with China have obvious, if often indirect, implications for Korea.

The other legacy of the Qing of relevance here is the intriguing historical conundrum that if Korea had been formally a part of China that had, like Taiwan, been seized by Japanese imperialism, would it, like Taiwan, have been returned to Chiang Kai-shek's China in 1945? In which case whatever would have happened, it would surely have been very different from what did happen: no division of Korea and no Korean War to start with.

The Japanese Annexation of Korea

Apart from resistance, and some support, from the Koreans themselves, Japan had to deal with four other imperialist powers in its annexation of Korea – China, Russia, Britain, and the USA. They each of course presented specific challenges and opportunities, but more crucially they fitted into Japan's plans for the future in different ways. China especially and to a lesser extent Russia had a territory which Japan desired and which were a major reason for the seizure of Korea in the first place; Korea was the gateway to the Eurasian continent. Britain and America, though they had desirable colonies, some of which Japan snapped up temporarily during the Pacific War, were a different matter. Because of power and geography, they were invulnerable, so the prime object was not conquest per se, but their neutralization and perhaps even support for the Eurasian expansion.

China and Russia were dealt with by war around the turn of the twentieth century. The First Sino-Japanese war of 1894–1895, and the resounding Japanese victory, demolished Qing pretensions to be a suzerain and protector of Korea, losing the province of Taiwan in the process. Even happy events can have unfortunate consequences, and the humiliation of the Qing hastened the demise of the dynasty and gave rise to revolutionary movements, some of which were inspired by Japan, but which led to the establishment of the PRC in 1949 and the end of Japan's leading role in Asia for the foreseeable future. Besides being an American client because of its defeat, the resurgence of China was to return East Asia to its natural state where China was predominant economically, militarily, and politically. Japan was never to achieve Ezra Vogel's 1979 prediction of becoming "number one" (Vogel 1979).

Much of this was replicated with Russia. Japan had again a resounding victory which started with

a surprise attack on the Russian fleet at Port Arthur (now Lushun) in a stratagem was repeated at Pearl Harbor, though without attracting, in the West, the opprobrium of "infamy." Japan's military success removed Russian influence and protection for Korea and opened the way into Manchuria. As with China the defeat had revolutionary and transformation effects which eventually blocked Japan's expansion into Siberia.

Britain war, at this stage, was not necessary. Because of fears of Russian expansion in Central Asia (the so-called Great Game), Britain looked to Japan as a counterbalance, a potential second front on Russia's furthest flank, rather like the USA automatically looks to India today in its containment of China (Kolko 2012). The relationship was formalized with the Anglo-Japanese Alliance of 1902 which recognized Japan's "interests" in Korea and condoned any action Japan might take to protect them from a foreign power (i.e., Russia) or the Koreans themselves. British interests in China were similarly recognized, and this was subsequently extended to India.

The USA was different again. It was a rising imperialist power whose appetites were clear – after all it was America that "opened up" Japan and imposed the first of the unequal treaties. It was likely that it would become a rival for the domination of China, far more of a challenge than either Britain or Tsarist Russia. Resolution of the issue was achieved, for a couple of decades, by the Taft-Katsura understanding of 1905. Although not formalized as an agreement or treaty (Congress at that time was loathe to do such things), it was clearly a realpolitik deal whereby Japan would not object to the US conquest of the Philippines in return for free rein in Korea (Larson et al. 2004; "The Taft-Katsura Agreed Memorandum" 1905). This betrayal of Korea rankles today both North and South (Larsen and Seeley 2014; Lovmo 2014; Park 2014).

Japan's colonization of Korea proceeded in three stages. The Korea-Japan Treaty of 1876 (to which the Japanese, but not the Koreans, attached the word "amity") was a variant of the unequal treaties which the Europeans and America had imposed on China and Japan and was brought about, as was its predecessors, by "gunboat diplomacy." Sea power, in the nineteenth century, was where the military superiority of imperialism was most marked. It was joined in the twentieth century by airpower whereby recalcitrant natives could be pummeled with virtual impunity, though as John McCain found out when shot down over Vietnam in 1967 that immunity was never quite absolute. Although imperialist states tend to have overwhelming military superiority, as casualty figures attest, there is always the danger in a land war of quagmire as the Japanese discovered in China in the 1930s and the USA in Vietnam and in the Middle East.

Casualties are difficult to pin down with any accuracy. The imperial power keeps good records of its losses, but pays scant attention to those of its victims and often of its "allies" and civilians (Davies 2018a, b, c; Sherlock et al. 2018). In the Korean War, there are presumably accurate data for the USA (36,574 dead of which 33,686 were battlefield) and US expeditionary allies such as Britain (1109). Chinese figures are perhaps less dependable because of conditions obtaining at the time; Wikipedia gives 183,108; a Xinhua article quotes 197,653; however this may be to a matter of definition; one may be battlefield deaths and the other includes subsequent deaths from wounds ("Burial ceremony held for remains of Korean War soldiers in NE China" 2018). Data for the Koreans, North and South, is uncertain; Wikipedia gives 137,899 for the South, which seems spuriously precise, and 215,000–350,000 for the North ("Korean War" 2018). On a rough calculation for every soldier, the USA and its expeditionary allies lost; the North Korean/Chinese lost 12. Imperialism, especially that of the last two centuries or so, depends heavily on technological superiority. The Romans might have had superior training, discipline, and tactics, but their weapons, though benefitting from higher-quality metals, were in general at a par with those of their enemies. The USA may be confronting challenges to its superiority in military technology from the Russians and Chinese, but Afghanistan, Iraq, and Libya were conquered (if not pacified) with impunity (Farley 2018). North Korea might be different, and it does have a nuclear deterrent (Cooper et al. 2018; Rogin 2018).

Japanese military superiority over the Koreans was never put to the test, but since it had been demonstrated against China (1895) and then Russia (1905), further proof was not needed.

The Japanese were not alone in wanting to batter down the doors of what Westerners called the "hermit kingdom." The French made an attempt in 1866 and the Americans in 1871 following the destruction of the armed merchant ship General Sherman in 1866; visitors to Pyongyang today are taken to the spot on the Taedong River where the ship was destroyed.

The Japanese were not satisfied with opening up Chosun Korea to trade. Korea was too important for that. It was the nearest country to Japan, and culturally similar, it possessed resources and labor which cultural affinity made utilizable, and it was a bridge to the Eurasian continent, which meant primarily China but then Russia and then perhaps India. Japan's future in a world of contesting empires seemed to depend on its carving out one for itself, and Korea was an obvious choice (Taiwan had been merely a collateral benefit of the Sino-Japanese war). Moreover if Japan did not control Korea, others, perhaps the French but more likely the Americans, would probably do so. Japan had been moved in 1879 to annex the Ryukyu islands, which became the Okinawa Prefecture for fear that Commodore Perry would take it for the USA (Tinello 2018). Following the Treaty of 1876, Japan moved on to more intrusive measures. The treaty of 1905, following the defeat of Russia, established a protectorate over what was now ironically called the Korean Empire. This was followed by outright annexation in 1910. Japan was now truly an empire and Korea was the jewel in the crown.

The Japanese seizure of its neighbor marked a new stage in the history of imperialism and Korea. Past imperialisms were concerned with rent and tribute, with retaining the momentum of imperial expansion, or in the case of China protection against foreign incursions. Japan was different, a modern imperialism with modern concerns – mines and mineral, railways and ports, rice for the factory workers at home, labor for factories at home and abroad, and settlers for the conquered territories of Manchuria. Again Korea was part of

a wider canvas, and here again history had produced a different imperialist framework, closer to that of today and more complex than in the past.

This framework had its own dynamic because Japanese expansion happened not merely at the expense of conquered people but also of the interests of competing powers. The Japanese empire at its height encompassed Southeast Asia reaching to the borders of India, then the British Raj, down the South Pacific through the then Dutch East Indies (Indonesia) to New Guinea. It took in Manchuria (through the puppet state of Manchukuo) and most of the eastern seaboard of China extending into central China as far as Changsha and Wuhan. Crucially the advance to the north into Siberia had been stopped by the Soviet victory at Khalkhin Gol on the Manchukuo/Mongolian border in 1939. This dashed Japanese hopes of expansion in that direction and focused attention south, especially on the oil, rubber, and other strategic resources of the Dutch East Indies, and contributed to the attack on the Americans at Pearl Harbor. In the aftermath Japan and the Soviet Union signed a neutrality pact, a move of obvious, if temporary, benefit to both, avoiding a war on two fronts. In 1945, for reasons which are unclear given the inevitability of Japanese defeat and surrender and progress in developing nuclear weapons, Roosevelt was anxious to bring the Soviet Union into the war against Japan, and at Yalta in February 1945, Stalin agreed that within 3 months after the end of the German War, the Soviet Union would enter the Pacific War (Deparle 1989; Mankoff 2015). If Roosevelt had not insisted on Soviet intervention, the USA would have had an easier task dominating East Asia and would not have needed to share Korea.

These issues were in the future as Japan began its process of assimilating and transforming Korea after 1910.

Economic and Social Transformation: The Destructive Creation

The traditional Korean economy was a familiar one, seen throughout the world in pre-modern times, except in proto-capitalist economies such as Athens. The family and village were the basic units, production was focused on agriculture with

handicrafts as an accompaniment, and wealth was measured in terms of land. The coming of the Japanese transformed that, and there was considerable modernization and development of the Korean economy. Some have argued that this enabled the country to escape the Malthusian trap, where the stagnant economy of the Choson period inevitably led to destitution and capped population growth (Cha 2010); that, of course, begs the question of what would have happened with modernization without Japanese colonialism even if that had been slower without the imposed forced march.

The Library of Congress country study on South Korea skips all too quickly over the subject of the Japanese colonial development of Korea – 1 page out of 472 – perhaps partly because the successful "top-down government management of the economy" which was taken up again by Park Chung-hee in the 1960s contravened economic orthodoxy (Metraux 1992). The Japanese colonial government developed the infrastructure of a modern economy, with railways, roads, ports and shipping, mining, electricity generation and light, and chemical and heavy industries.

Railways, which were important not merely for economic reasons, but also for military ones providing a facility for moving troops and materiel into Manchuria and further afield, increased to 6362 km by 1945. Similarly the road network was expanded to 20,000 miles by that year. Ports were built and shipping reached 230,000 tons. Manufacturing's share of industrial output rose from 11% in 1911 to 40% in 1943, and between 1936 and 1943, the number of employees in manufacturing jumped from 188,250 to 549,751. Stimulated by the war, heavy industry's share of industrial output rose from 38% in 1930 to 73% in 1942 (King 1975).

And so the statistics roll in. Two sets capture some of the complexity and consequences of forced imperialist development.

Firstly there was established "a well-developed network of post offices, almost all equipped to transmit telegrams, 7,100 telephone lines, 5,600 miles of telegraph lines, 15 radio stations, 440,000 radio receivers, 72 theaters and 51 cinemas" (King 1975) quoting (Henderson 1968).

We have the makings here of a modern society with communications (second in Asia only to Japan) with social implications as well as the obvious commercial and military ones and radio and cinema facilities which seem to have penetrated quite deeply into the Korean populace, excluding the destitute which constituted about a quarter of the population in1929 (King 1975). This provided entertainment but also social control and indoctrination, perhaps not up to Hollywood standards, but serving the same function.

Secondly, after the rice riots in Japan in 1918, the government made determined efforts to spread the use of the high-yielded varieties that had been developed in Japan to Korea and Taiwan, along with the necessary investment in infrastructure and irrigation, and by the late 1930s, yields in these two colonies were much higher than elsewhere in Asia (Booth 2007). But although rice production went up 50% in the period between 1915/1919 and 1935/1939, exports, mainly to Japan, rose 279%, so that Korean consumption actually fell. Some of the shortfall was made up by the import of sorghum (a grain traditionally used by the rich as animal feed and by the poor as sustenance), but even so the per capita consumption of grain fell during the colonial period (King 1975).

Thus there was considerable economic growth, but the development was structured principally to serve Japan as a component of the Japanese empire, and Koreans were to a large degree excluded from the management of the modernization process; "in manufacturing, the Japanese occupied the high-paying technical jobs and Koreans performed the low-paying manual labor" (Chung 2010). Only in Manchuria, "a land of opportunity not only for Japanese but also for Koreans," did there seem to be some access to higher positions (Han 2008).

This entailed a commensurate transformation of the social structure. The traditional Confucian hierarchy in which the *yangban* elite dominated government and military positions had been abolished in 1894, formally if not in actuality, and the Japanese took this further and then displaced Koreans from positions of power replacing them with Japanese. Some *yangban*

managed to hang on to wealth and power through collaborating with the Japanese, and the *yangban* in South Korea experienced a certain restoration in the late 1940s under Syngman Rhee. Abolition of the traditional strictures would normally have had a progressive and liberating effect, but this was muted by the constraints of Japanese control of Korean society.

This control was welcomed by some, accepted by most, yet resisted in various complex ways, with all of this changing over time as the grip of Japan tightened and the exigencies of the expansion into China and then the Pacific War with the USA generated new economic imperatives.

The Japanese Legacy

There has been a considerable academic debate over the years, especially in the USA (and Britain), South Korea, and Japan, on the impact of Japanese imperialism on the economic development of Korea after liberation (Booth 2007; Haggard et al. 1997; Kohli 1994, 1997). Given the provenance of the academics and the imperial mindset, this has tended to focus exclusively on South Korea, ignoring North Korea. This exclusion is unfortunate since Korea was one entity under the Japanese and a comparison of the two halves would have helped to disentangle the Japanese legacy from the subsequent impact of US imperialism. The USA has impoverished North Korea through physical war, 1950–1953, and continued military threat and economic warfare ever since, and because of the North's very existence, the USA has privileged the South with economic aid, military spending, and access to Western markets and technology. If US imperialism had not faced the challenge of China, Vietnam, and North Korea, then the four "little dragons/tigers" – Singapore, Hong Kong, Taiwan, and South Korea – would not have had the rapid growth they had. Overlooking this fundamental reality has tended to vitiate the debate.

There is a need to distinguish between the "Japanese model" of economic development when utilised as part of Japanese imperialism, and so serving Japan at the expense of its colonies, and that same model when applied to a particular country, such as South Korea under Park Chung-

hee. It can be argued that Park was very successful (Pearlstine 2018) but this success was largely due to it being focused on developing South Korea as such rather than Korea as part of the Japanese empire. The role of the new imperial framework must be taken into account. The USA poured in huge amounts of civilian aid to bolster the competition against North Korea. It also incurred large military expenditure in South Korea as part of its strategy of containing China, the Soviet Union, and North Korea itself. Moreover South Korea benefitted, as did many others especially on the arc from Korea through Japan around to Thailand from American expenditures in its war in Indochina.

The Japanese period produced huge changes. A forced economic and social development that Bruce Cumings has aptly described as a "pressure cooker" (Sheng 2000; Cumings 1997). There was a massive disruption of Korean society in terms of class structure, occupation (from farm to factory or army), and physical location. Large numbers of Japanese moved into Korea and on to Manchuria; an even greater number of Koreans was forced into Manchuria and further into Asia and to Japan – some 700,000 labor conscripts among them (Underwood 2007). Clearly in the long term, there were many positive outcomes, and that is true of the impact of imperialism in general. We cannot undo the past, but then again now that is over and the price has been paid, perhaps we do not want to either. At the same time, it goes without saying that progress could have been made without the accompanying brutality.

NBC sports commentator Joshua Cooper Ramo ignited a furor in Korea during the Pyeongchang Winter Olympics when he said "But every Korean will tell you that Japan is a cultural, and technological, and economic example, [that] has been so important to their own transformation" (Essertier 2018b; "NBC apologizes after praise for Japan's 'example' angers Koreans" 2018; Pearlstine 2018; Selk 2018).

If appraisal is so contested after 70 years, it must have been even more difficult for those living through the Japanese occupation who had to cope with reality on a daily basis. Some fled to Manchuria, the Soviet Union, or China and took

part in the armed struggle; most did not but had to find other ways to resist, accept, or embrace the colonial experience.

Collaboration, Acceptance, and Resistance

Conservative Japanese see their rule over Korea as benign and disinterested, producing great economic and social benefit and indeed requested by the Koreans themselves – an attitude which is widely mirrored in other imperialist countries and similar, for instance, to textbook portrayals of America's colonization of the Philippines (Caprio 2010). That might be expected but what is intriguing, though unfathomable, is how many Koreans privately, if not publically, shared and still share that opinion to some degree (Editorial 2014). Looking back at the Japan period before 1945, we must also bear in mind the American period after 1945. Most Americans would see their country's role in Korea as similarly benign, disinterested, and welcome, and many (South) Koreans would agree; how many, for what reasons and how inculcated, and how that has varied over time are a complex matter. Complicating matters further, there is the question of empire-resident diaspora, those Koreans who for various reasons – forced labor, migration, or birth – ended up in Japan or America and, again for a variety of reasons, remained there. In 2016 it was estimated that there were some 330,000 Koreans in Japan (Ishibashi et al. 2017) and the US census for that year gives 1.8 m ethnic Koreans ("Asian alone or in any combination by selected groups" 2016). Imperialism, in association with globalization, the two being often intertwined, shifts incredible numbers of people from their traditional homelands and renders fixed concepts of nationality (and culture) problematic.

History is not only written by the victor; it is, by definition, written with hindsight. The historian knows what is to come but the historical actor does not. The empire, whether it be Roman, British, Japanese, or American, might well seem permanent to colonial subjects, a natural state of affairs to which man must adapt and get on with life. Resistance is often invented after the empire has fallen. Few Koreans today would freely admit that their parents and grandparents collaborated

actively with the Japanese, although many obviously did, and not merely out of self-interest (Han 2008; Park 2004a, 2016). From the late nineteenth century onward, for many Asians Japan was the wave of the future.

However there was also considerable resistance to Japanese rule, covert and overt, and two specific events among many others require special note. Firstly there were the demonstrations which started on March 1, 1919, and which became known as the March 1st Movement. This was not merely a movement demanding democracy and national sovereignty but also an expression of the disappointment that the USA and the other (victorious) imperialist powers had so soon betrayed Woodrow Wilson's lofty rhetoric of "self-determination" first outlined to Congress in 1918 and proclaimed at the Versailles Peace Conference in January 1919. The Korean protests were mirrored elsewhere, notably by the May 4 Movement in China that year.

It is perhaps in the nature of rising imperialism to promise liberation to colonies and then to forget that promise when the former imperial power is displaced; this is very much the story of imperial Japan in Asia. However talk of self-determination and freedom holds a special place in US imperial rhetoric even as that rhetoric is contradicted by reality; Richard Nixon's 1972 report of US foreign policy, as the battle to subjugate Indochina was reaching its inglorious end, "was filled with encomiums to American support for self-determination as a principle of U.S. policy" (Simpson 2012).

The March 1st Movement (called in the North "March First People's Uprising" ("The March 1st Movement in 'Korea's Fight for Freedom'" 2017)) did mark the beginnings of resistance, initially non-violent protest but subsequently armed struggle against Japanese colonialism. After its suppression there was some temporary softening of Japanese rule. But the main result was that it became the symbol of Korean desire for independence which resonates today. It is significant that Moon Jae-in has claimed that March 1, 1919, marks the beginnings of the "Republic of Korea." This can be seen as an attempt to appropriate historical legitimacy, though the

Democratic People's Republic of Korea has of course an equal claim, but it also sidelines the US establishment of the Republic of Korea under Syngman Rhee in 1948 which did, in many eyes, lack legitimacy. This was how it was seen in an attack by the conservative *Chosun Ilbo* which charged President Moon with refusing "to acknowledge Syngman Rhee as the country's first president..[with] its national security firmly anchored in its steadfast alliance with the United States" (Jong 2018).

The other main event was the establishment of a Korean government in exile in Shanghai on April 11, 1919. This again was mainly of symbolic importance since its military arm, which became the Korean Liberation Army in 1940, never achieved substantial size or effectiveness and was, in any case, under Chinese (nationalist) control although toward the end of the Pacific War, there was cooperation with the US Office of Strategic Services (OSS), the precursor of the CIA. The OSS cooperated with various liberation movements during the war, including the Viet Minh of Ho Chi Minh (Bergin 2018), but not it appears with Kim Il-sung. In any case US relations with wartime allies – Ho, Tito, and of course the Soviet Union itself – quickly soured after victory as their interests diverged.

That the Provisional Government of the Republic of Korea (or KPG) was established in China was significant. There were strong parallels between the Chinese and Korean experiences of the Japanese incursion and the failure of the West, despite the rhetoric, to support self-determination, until of course Japan became an enemy after Pearl Harbor. The USA never recognized the KPG although it did make use of its standing in Korean eyes by taking Syngman Rhee, who had been its first president for a short period, and installing him as the first President of the Republic of Korea in 1948.

If we had to take three individuals to exemplify different Korean responses to imperialism, it would be Syngman Rhee, Kim Il-sung, and Park Chung-hee. Only Japan and the USA can be truly classified as imperialist but China, both before and after 1949, and the Soviet Union/Russia being great powers necessarily exhibit some of the characteristics of imperialism. Koreans often compare

their country to a shrimp among whales, and although it would be simplistic to consider that all whales are the same, it has to be recognized that they are all large, potentially dangerous, and self-centered.

These three Koreans, for all their differences, were contemporaries, straddling the Japanese and American periods.

Syngman Rhee took a political stand against the Japanese, but his main activity was ingratiating himself with the Americans, seeking their support for an independent Korea, under his leadership. He collaborated with the Americans and manipulated them for his own and national ends. He was no mere obsequious puppet but a calculating and ruthless operator. The conservative American historian Robert Dallek suggests that he precipitated the Korean War:

> In 1949 Rhee's government had initiated a series of attacks upon the North Korean forces stationed along the 38th parallel. Because he lacked sufficient troops and equipment to launch a serious push north, Rhee provoked the fighting not only to command Washington's attention and stimulate an outpouring of military and financial aid but also to provide a pretext for cracking down on leftist opponents. (Dallek 2010)

He opposed the armistice, wanting the Americans to keep on fighting, and at one stage there were high-level deliberations going up as far as President Eisenhower on removing his from power (Gwertzman 1975). In the event the Americans decided against his arrest, but in 1960 Rhee was toppled by student riots and flown, by the CIA, back to the USA, taking, in is alleged, $20 million with him (Lee 2000).

Park served in the Japanese puppet Manchukuo army after submitting a letter pledging loyalty to the Japanese emperor signed with his own blood ("Evidence of Park Chung-hee's military allegiance to Japan surfaces" 2009). During the American period, he carved out a degree of autonomy and developed the South Korea economy, at the expense of the people certainly but also by defying American "advice," following the Japanese model of state-guided development, with a focus on heavy and chemical industries aiming to build a comprehensive economy, rather than one which just serviced the American (Kamiya 1980).

In this he was following somewhat the same road as Kim Il-sung in the North, who refused to join COMECON (the Soviet-led common market) because it would have trapped the DPRK in a position of economic and technological dependency (Person 2013). The history of Park's collaboration with the Japanese was largely suppressed during the period of the military dictatorships only being publically revealed during the progressive administrations of Kim Dae-jung and Roh Moo-hyun (Choe 2008). The conservative administrations of Lee Myung-bak and Park's daughter Park Geun-hye tried to restore amnesia, partly by diverting attention, as Park Chung-hee had done, by waving the nationalist flag and criticizing Japan (Han 2014; McGill 2014). As late as 2012, there were reports of South Koreans being surprised to learn of Park Chung-hee's collaboration (Lee and Shin 2012).

Kim Il-sung, the most famous leader of the anti-Japanese guerrilla movement, was in a very different position to Rhee and Park, though there were obvious challenges in common. He was independent of Japanese and American imperialism, but he did have to cope with the Soviet Union and with China who necessarily had their own agendas and priorities. Since the Soviet Union was the occupying power in the North after the Japanese surrender, it clearly was in a position to determine, within limits, the successor regime. According to the *Washington Post*, he was not the "first choice" but "...they turned to Kim, who had a reputation in Korea as a heroic fighter in Manchuria against the Japanese" (Fifield 2017). Over the years he became adept at playing the Chinese off against the Soviets with the aim of developing a state which was independent politically, militarily, and economically (Beal 2005). Having two competing patrons was an advantage denied to his Southern counterparts. Unlike Rhee he was genuinely popular – there is only so much a "personality cult" can achieve – and his enduring reputation is indicated by American annoyance in 2012 that the new leader, Kim Jong-un, was utilizing memories of his "revered grandfather" to establish his position (Associated Press 2012; Choe 2012). Of course the Soviet Union was anxious to establish a friendly regime in post-liberation North Korea but neither they nor Kim Il-sung and his colleagues were burdened with the corpse of Japanese imperialism the way the USA was. The Soviet footprint in North Korea was very much lighter than the American one in the South. The Soviet occupation ended in 1948, and while Soviet pilots – flying MiG-15s to great effect according to Russian reports (Malishevski 2015) – were sent to the war, the involvement was negligible compared to that of the Americans. The USA reassumed operational control (OPCON) of the South Korea military during the war and still holds that today along a substantial military presence.

Korea, being a small country, was unable to gain its own liberation from Japanese rule; that came about through the intervention of the major powers, principally the USA and to a lesser extent the Soviet Union. Whether it will be able to wrest full independence from the USA is as yet unknown; it is an unfinished story. This has meant that Koreans have had to work with more powerful foreign countries in a varying mélange of collaboration and manipulation.

In the aftermath of wars, there is an understandable tendency to vilify, persecute, and sometimes execute those charged with collaborating with the defeated occupier. With the passage of time, historians develop a more nuanced appraisal, moving away from a Manichean dichotomy of good resistance fighters and evil collaborators (Brook 2008; Duara 2008; Kwon 2008). While it is valuable to move away from simplicities toward a deeper analysis of a complex phenomenon, most of this is from the perspective of the victorious imperialism, discussing those who collaborated with "them" while ignoring those who collaborate with "us."

Stephen Gowans in his book *Patriots, Traitors and Empires: The Story of Korea's Fight for Freedom* reminds us that the story of modern Korea is a continuing relationship with imperialism that continues to this day (Gowans 2018). While the dichotomy patriot/traitor might be considered too neat, the essential point that acknowledging the role of imperialism is the key to understanding Korea is quite correct (Beal 2018).

Three Decisions that Shaped Contemporary Korean History

1945 marked the beginning a transformative era in East Asia. The old empires were swept away, unleashing dynamic new forces, principally, though by no means exclusively, the resurgence of China, while the USA became the dominant power. The USA had been active in the region for a century, notably with the opening of Japan and the Open Door Policy toward China, but now it was the mighty hegemon. This imperialism was to face an increasing challenge but in 1945 it was supreme.

In that year the USA took three momentous and decisive actions that were to shape the future of the Korean peninsula, and since by then the USA was becoming a global empire, these actions had worldwide ramifications. These were the atomic bombing of Japan, the division of Korea, and the inauguration of the policy of imperial succession.

The Inauguration of the Nuclear Age

The American decision to use atomic weapons against Japan – the first and only use – has generated considerable controversy. By August 1945 Japan was clearly on the threshold of defeat although it seems that Hirohito had fantasies that he could play off the Soviet Union against the USA to get a better deal (Bix 2014). With the USA having mastery of sea and air, their forces moving inexorably across the Pacific and the Soviet Union poised to launch a huge ground offensive from the west, it is often claimed that the destruction of Hiroshima and Nagasaki was unnecessary and so was a dreadful crime. That is no doubt true but imperialism moves to the tune of other calculations.

Firstly, and mundanely, the new weapons had to be tested and calibrated in a real-world situation. Hiroshima and Nagasaki, among a handful of other Japanese cities, had been spared conventional bombing so that they would provide a virgin target. Secondly this enabled the power of nuclear weapons to be demonstrated, to the world and specifically to the Soviet Union. By that reckoning Japan was merely collateral

damage and the real target was the Soviet Union. It is likely that Truman prolonged the war against Japan in order that the new weapon could be tested in the USA and then be employed against Japan. While the atomic bomb was untested, Truman followed Roosevelt's strategy of urging Stalin to join the war against Japan; once it had been successfully tested, Russian participation became unwelcome. Soviet intervention could not be reversed, but its consequences could be diminished. Thirdly by thus hastening the end of the war with such a coup de grace, the USA was able to exclude the Soviet Union from a share in the disposal of Japan and much of its empire (Alperovitz 1995; Wilson 2013). The atomic bomb greatly strengthened Truman's hand, but dominance was not absolute, and concessions had to be made. The chief of these was the division of the Japanese colony of Korea.

The Japanese emperor had acknowledged in his surrender speech that "the war situation has developed not necessarily to Japan's advantage" – surely one of the most bizarrely euphemistic phrases in history (Hirohito 1945). Ironically it so happened that nuclear weapons would also turn out not to be in America's advantage as anticipated. Firstly the nuclear monopoly inevitably did not last long. In particular the Soviet Union tested its first device in 1949, China in 1964, and, cruelest off all, North Korea in 2006. Secondly, nuclear weapons are by their nature primarily a deterrent. Paradoxically, because of their huge destructive power, they are not suited for offensive war even against an enemy who cannot retaliate because they destroy the spoils of war. The invasion of oil-rich Iraq in 2003 is a case in point. By contrast nuclear deterrence is primarily of interest to the weak, who may consider it the only defense against the predations of the strong. The USA does not need nuclear weapons to deter a far weaker country such as North Korea, but for North Korea deterrence is the only defense (Beal 2017a). So nuclear weapons which seemed to give the USA unrivalled superiority in 1945 have turned out to be a great leveler. It is North Korea's nuclear deterrent that has brought the USA toward the negotiating table (although not, at the time of writing

sitting down and seriously negotiating), and the concern for Washington is that this example could be followed by others, thus diminishing imperial power.

Division of Korea

It is often claimed that Korea was divided in 1945 by the Soviet Union and the USA acting in unison. In reality it was a US initiative on 10 August to which Stalin acquiesced immediately, perhaps unnecessarily and unwisely. Certainly Perry Anderson thought so, calling it "one of Stalin's two great timorous blunders in the last months of the War" (Anderson 2013). Whether that is a fair assessment given the demonstration of American power and ruthlessness at Hiroshima on 6 August and Nagasaki on 9 August the advantages to the USA of the division are obvious. By capitulating to the American demand, Stalin was in no position to insist on Soviet involvement in the Japanese surrender process. Stalin, admonishes Anderson, agreed:

> ….that US troops occupy the southern half of the country, when none were anywhere near it, and the Red Army could without breaking any agreement have strolled to Pusan. Naturally, Truman did not reciprocate the favour and allowed not so much as a Soviet military band into Japan. (Anderson 2013)

Furthermore the division of the peninsula created a cordon sanitaire between leftist and anti-imperialist Eurasia and the new American possession and gave the USA a beachhead on the continent that might be utilized in the future. Interestingly the beachhead idea, though it does seem fanciful in the context of the dangers of getting involved in a land war in Asia (the USA avoided that in China but not in Vietnam), still holds purchase in US strategic thinking. One of the charges laid against Donald Trump in negotiations with Kim Jong-un in 2018 was that he might not realize that "American strategy in Asia ... necessitates a forward military presence in places like South Korea" (Jackson 2018).

If Korea had not been divided and the Koreans left to their own devices at liberation, it is likely that the People's Republic of Korea, which was proclaimed by the broadly-based Committee for the Preparation of Korean Independence in Seoul on 12 September, would have prevailed and Korea would have become some sort of "socialist republic" although not necessarily one in which Kim Il-sung was preeminent.

The conservative journalist and one of Park Geun-hee's unsuccessful nominees for premier, Moon Chang-keuk, had no doubts about that:

> "in retrospect, it was also God's will" for Korea to be divided.... Noting that there were many Communists among Korea's elite at the time, Mr. Moon said, "Given the way we were then, had Korea been liberated as a whole, it would have been Communized." (Choe 2014)

In reality as events elsewhere have shown (Vietnam comes to mind), such a regime would over time temper both its socialism and its independence making what it considered to be the necessary compromises to adapt to the realities of a world dominated by the USA. But this is not how the USA saw things in the 1940s or today for that matter. In those days and for decades after that, Washington policy makers viewed local struggles for independence and social change, what might conveniently be labelled anti-imperialism, as being orchestrated and controlled by Moscow, or later by Beijing, or both. Soviet expansion is the key phrase which colored all thinking.

The mindset is well illustrated by a memorandum from George F. Kennan, the "architect of the Cold War", to Secretary of State George Marshall (he of the Marshall Plan that did so much to preserve the US position in Western Europe) in November 1947 on the world situation:

> As to Korea, there is no longer any real hope of a genuinely peaceful and free democratic development in that country. Its political life in the coming period is bound to be dominated by political immaturity, intolerance and violence. Where such conditions prevail, the communists are in their element. Therefore, we cannot count on native Korean forces to help us hold the line against Soviet expansion. Since the territory is not of decisive strategic importance to us, our main task is to extricate ourselves without too great a loss of prestige. In doing so, however, we should remember that it makes no sense to yield in Korea and then to try to insist on the elimination of Soviet influence behind Korea, in northern Manchuria. (Kennan 1947)

By 1950 the USA decided that Korea was after all of decisive strategic importance, probably

because of the Communist's victory in the Chinese Civil War. Back in 1945 that was not a forgone conclusion.

In the event the People's Republic of Korea was banned in the American zone in December and in the north became absorbed into the Soviet administration which favored Kim Il-sung and was a component of the Democratic People's Republic of Korea (DPRK) established in 1948 and which survives today.

The idea of "Soviet expansion" was in fact a self-serving myth which served to obfuscate US imperial expansion. The American historian William Stueck contrasts the Soviet and US objectives as played out in Korea. For Moscow its acceptance of the American proposal to divide Korea was a manifestation of "the determination of the Soviet Union to protect its eastern frontier." In other words it was defensive, rather than offensive. This is consistent with its policy in Eastern Europe where it wanted to create a cordon sanitaire to protect itself from the USA and from German revanchism. The USA, on the other hand, had rather more ambitious objectives. It wanted "to create a stable world order" (Stueck 1995). This bland description was rephrased a bit more forcefully by the (South) Korean historian Lee Won Sul who regarded the division of Koreas as "part of a grand scheme to put the whole Pacific basin under American influence" (Lee 1982). In fact the division was an expression of, and a temporary pause in, the course of America's Manifest Destiny. The dreams had come true, and the USA was now hegemon, primarily maritime, of the Pacific Basin and of course further afield (Clark 1932). In the Pacific it was to "lose China" in 1949 (Kifner 1999) and Vietnam in 1975, but the line it drew across Korea still holds. And dreams of continuing Manifest Destiny and of North Korea collapsing and China collapsing extending American dominance into the heart of Eurasia persist (Chang 2011; Mattis 2018b).

The American division of the Korean Peninsula was to have momentous and long-lasting consequences. It led to the Korean War, still not formally over and the concomitant confrontation with the DPRK. Korea is still divided.

The Western press sometimes indulges itself in describing the demilitarized zone (DMZ) as "freedom's frontier," especially when an American president makes an inspection tour (McCurry 2012). Freedom can have various connotations; one could stand at the DMZ and looking east see the American military, currently some 25,000 troops and under its control the South Korean military, then to Japan the headquarters of the US military presence in East Asia and home to some 50,000 US troops, then across with Pacific with its innumerable American islands, the fruit of an earlier stage of Manifest Destiny, and the bases that constitute such a large part of their economies, to the shores of continental America itself. Turning around and looking in the other direction the landscape is different: no American bases (or of any foreign power for that matter) in North Korea or China or the Russian Federation. The DMZ can thus be considered as the western boundary of the American empire.

In 1945 Korea in itself was of slight importance to the USA. It was primarily the place where the line was drawn between the USA and the Soviet Union, the line that marked a temporary boundary between the empire and the land beyond. It was a pragmatic consolidation in much the same way as the Romans would create a frontier on the Rhine. Since then there have been four major developments. China has replaced the Soviet Union/Russia as the main challenge. The myth of "monolithic Communism" has faded, and no serious observer thinks that North Korea is anyone's puppet. The Korean War was the first that the USA did not win and North Korea's independence and resistance since then have infuriated generations of American policy makers so that an animus against Pyongyang has become hardwired in the system. South Korea has become a major economy. Nevertheless the reasons for the original division of Korea still obtain, albeit in a form modified by these developments. In other words, any analysis of US policy toward North Korea must be situated within this geopolitical context, the main component of which is at the moment the challenge from China (Beal 2016b; Kim 2015; Petras 2017).

K

Imperial Succession

1945 marked a major turning point in US imperi-
alism. Germany and Japan were both defeated
with the USA in de facto control of Western
Germany and complete control of Japan – neither
the Soviet Union nor the European powers were
permitted to play any significant role there. The
USA was the global hegemon – the "American
Century" was at hand (Hunt 1999; Luce 1941) –
and in Asia moved inexorably to take over the
French and Dutch possessions, though in Indo-
china that did not go well. The Soviet Union,
despite the brouhaha about Soviet expansion,
was exhausted by the war and, despite the histor-
ical links with Socialist, Communist, and anti-
colonialist movements, was basically on the
defensive.

Empires, once established, then have to be
governed. In Japan plans to abolish the "emperor
system," remove the Showa emperor Hirohito,
and prosecute him for war crimes and thoroughly
"democratize" the country were abandoned. In an
act of astute imperial statecraft though one
scarcely consistent with "American values," Hiro-
hito was left on the throne, to reign if not to rule,
and apart from a few token executions and impris-
onments, the Japanese elite was essentially allo-
wed to continue in power under American
supervision. There was no Japanese equivalent
of "denazification"; Kishi Nobusuke, for instance,
one of the signatories of the Pearl Harbor declara-
tion, was released from jail and subsequently
made Prime Minister (Schaller 1995). His grand-
son, Abe Shinzo, has followed in his footsteps as
Prime Minister, even being award the accolade of
"Trump's loyal sidekick" (Nakamura 2017). This
failure to exorcise the past still enrages East Asia
today, as is exemplified by the "comfort women"
issue (Nozaki and Selden 2009).

This change of policy was incredibly success-
ful, and although there have been protests and
demonstrations over the years, especially in Oki-
nawa where the bulk of the American military are
stationed, and despite earlier fears of a bloodbath
(which is why Roosevelt and Truman begged
Stalin to enter the war), the occupation was
unopposed. Hirohito had said "we must endure
the unendurable," and so they did. Korea was

different. American officials noted that while
there was "relative order and docility" in Japan,
there was turmoil in Korea. "Southern Korean can
best be described as a powder keg ready to
explode at the application of a spark" wrote H
Merrill Benninghoff State Dept political advisor
on Korea 6 September 1945 (Stueck 1995).

Here again the Japanese imperial system came
to the rescue. The solution was to utilize the
remnant Japanese colonial administration and
the police and security apparatus they had set up.
In the north there was revolutionary transforma-
tion, with land reform producing dispossession of
the landlords and retribution against Japanese col-
laborators. This violent turmoil sent landlords and
collaborators fleeing to the south, along with
many Christians who were perhaps neither but
who feared living under an atheistic regime.
Some 400,000 people went south. As a result the
north lost a lot of human capital. The fleeing
collaborators who had acquired skills serving in
the Japanese military or civilian, "with few excep-
tions, [] passed smoothly into the higher echelons
of the new US-controlled South Korea" (Han
2008). Japanese colonialism continued, under
new management and staff changes, "Japanese
colonialism without the Japanese" as Stephen
Gowans expressed it (Gowans 2007).

Japanese colonialism had been deeply hated in
Korea, and there was widespread and enthusiastic
desire for freedom and independence and a
mélange of other aspirations such as democracy
and socialism. The Soviet-backed administration
in the north, though economically straightened
(there was a desperate need for rice from the
south, for instance), was politically well equipped
to ride the tide of change. The Americans, for all
their wealth and resources, were not. As Kennan
had put it, "[Korea's] political life in the coming
period is bound to be dominated by political
immaturity, intolerance and violence" (Kennan
1947). Because of this "political immaturity," the
USA imposed a Military Government (USMGIK)
which ruled South Korea until 1948 when the
Republic of Korea was established with Syngman
Rhee as president.

Hugh Deane, an American journalist who cov-
ered South Korea in the late 1940s and into the

Korean War, quotes with approval the aphorism of historian Bruce Cumings that "For Americans, the war began with a thunderclap in 1950". For Koreans, it began in 1945 to support the title of his book *The Korean War, 1945–1953* (Deane 1999). Cumings in 2010 suggested that the USA had "inherited a Japanese-Korean enmity that broke into a decade of warfare in Manchuria in the 1930s, and in that sense is almost eighty years old—and no one can say when it will finally end" (Cumings 2010). However the Americans not merely inherited and fostered this enmity; they elevated it to a higher stage as part of a global struggle for hegemony.

Deane describes the repression, executions, beating, and massacres in South Korea that preceded the outbreak of hostility in 1950. The horrors were amplified during the actual war itself and then continued into the postwar period (Ahn 2009). Rhee was toppled in a popular uprising in 1960, ferried by the CIA back to the USA but replaced before too long by General Park Chung-hee, who inaugurated what might be called the "Manchurian period" when South Korea was largely run by a clique of fellow Koreans who had served under the Japanese in Manchuria (Han 2008). Thus Japanese imperialism continued after 1945, and to some respects up to today, a vampire enclosed within, feeding upon American imperialism (Park 2016).

The Road from 1945 to an Uncertain Future

It is now nearly three-quarters of a century since 1945, and naturally there is an immensely rich and complex history that could be explored. This could take many directions. A political perspective would focus on the domestic politics in each of the two Koreas and their interrelationship and their relationships with the outside world, mainly China, Soviet Union, Japan, and, above all, the USA. During this period there has been staggering economic growth and social transformation in differing ways in both Koreas. This of course has been happening in many other parts of the world, but the Korean case has its own special characteristics emanating from the bedrock of Korean culture and geography, the Japanese inheritance, and American ascendancy. Here we

briefly take five themes to illustrate aspects of this history within the overarching perspective of the role of imperialism.

The Korean War

Although the Korean War has been labelled "the forgotten war" (Blair 1987), it is surely the one thing, apart from the well-publicized malevolent belligerence of North Korea, that most people outside the peninsula know about Korea. Both the standard description of this war being an unprovoked invasion of South Korea by North Korea and the more nuanced and plausible analysis that North Korea reacted at an opportune time, when the large contingent of Koreans fighting on the side of the Communists in the Chinese Civil War returned home, is somewhat irrelevant (Hart-Landsberg 2000). Just as civil wars erupted in other places and times – the USA in the 1860s, China in the 1940s – because of the buildup of irreconcilable forces, so too the Korean Civil War had the markings of inevitability given US policy in Korea since 1945. The war caused immense death and destruction of the peninsula, and casualties among the participants, although as the way with imperialism, the USA which bears the greatest responsibility came off by far the lightest. In fact, apart from its casualties on the battlefield – 33,686 out of 1.3 million (Lacina and Gleditsch 2005), with millions of Korean civilians – in many ways it and the empire did well from the carnage. The Korean War rescued the Japanese economy from the doldrums and set in on the path to high-speed growth. More importantly, at the imperial center, Korea was the Hot War that bedded the Cold War into the American political system along with the permanent war economy and the military-industrial complex (Melman 1974, 2003; Eisenhower 1961).

Park Chung-hee, Vietnam, and the Imperial Framework

Park Chung-hee, who had served the Japanese in Manchuria, as an officer in the puppet Manchukuo army, also served the Americans, both at home and abroad, principally in Vietnam. The rightwing *Chosun Ilbo* encapsulated the imperial service and its benefits:

A total of 312,853 Korean troops were sent to Vietnam until March 1973, when all Korean soldiers were pulled out. In the intervening years, they had carried out 1,170 large-scale operations and 556,000 smaller-scale operations, killing about 41,000 Vietcong.

The dispatch brought enormous economic benefits to Korea. Exports to South Vietnam rapidly increased as materials and services necessary for soldiers were produced here. The country earned more than US$1 billion in total from the wages for soldiers and workers and the profits of companies operating in South Vietnam.

The dollars earned in Vietnam were used as a key financial source for the government's second and third five-year economic development plans. The term "Vietnam" became a buzzword of the times. ("60 Years of the Republic: Troop Dispatch to Vietnam" 2008)

The word "Vietcong" is used here in the usual fashion to refer to foreign dead, even babes in arms. The South Korean troops were particularly notorious for their brutality, which can be seen as a natural consequence of the history of serving imperial Japan and implementing Syngman Rhee's bloody rule. In recent years there has been a growing awareness and shame in South Korea over the atrocities committed by their troops in the "pacification" of South Vietnam (Armstrong 2001; Cho 2018). In 2017, on a visit to Vietnam, President Moon Jae-in attempted to apologize for the past but was ignored by Vietnamese media (Choi 2017a).

By contrast Kim Il-sung sent support to the Vietnamese and also to the various anti-colonialist struggles around the world, including Africa. Although American pressure has recently compelled various Africa countries to curtail or sever ties with the DPRK, there is still gratitude for past solidarity and resistance to US demands (Harris 2017a).

Park's policy was certainly more profitable than Kim's, and the growth of the South Korean economy owes much to the blood money earned in Vietnam. In fact, much of the success of the Four Asian Tigers (or Dragons) – South Korea, Hong Kong, Taiwan, and Singapore – was due to US imperial expenditure in Vietnam and elsewhere in the region.

However, with the USA facing defeat in Vietnam in the early 1970s, and the opening to China,

Park Chung-hee became very worried that the USA might cut and run in Korea and that he would be the victim of "strategic abandonment" (Sneider 2008). The domestic response was the Yushin Constitution which increased the repressive power of the presidency. Whatever popularity Park had garnered during the high growth of the 1960s, following from the disaster of the Syngman Rhee period, began to evaporate, and "dissidence became an enduring feature of student life at that time" (Avery 2012). North Korea was still stronger than the South – economically, militarily, and politically – and with US support uncertain, Park made the decision to develop nuclear weapons. The North would make the same decision later and for similar reasons, not so much for fear of the South but because of the overwhelming military superiority of the USA. For those that could achieve it, a nuclear deterrent became the obvious choice when faced with a much more powerful adversary.

Park, in fact, could not achieve it because the Americans found out and forced him to abandon the program (though there are indications that aspects of it continued even more clandestinely than before) (Eum and Ser 2004; Hayes and Moon 2011).

Park's increasingly unpopularity with the people, and sections of the elite, led to his assassination in 1979 by the director of the Korean Central Intelligence Agency (Breen 2010). Park's defiance of the USA over economic policy, and his attempt at developing nuclear weapons, gave him a cachet in nationalist thinking, and there was a very popular novel published in 1999 which ascribed his assassination to the USA (Moon 2009). At his funeral procession, US Assistant Secretary of State Richard Holbrooke cruelly observed "There wasn't a wet eye in Seoul" (Oberdorfer and Carlin 2001).

Park Chung hee is survived by a daughter, Park Geun-hee who, inheriting her father's standing among conservatives and a wider public approval of her father's role in South Korea's economic development, became president in 2013 until she was toppled by popular protests – the Candlelight Revolution – and is now in jail on corruption charges (Fifield 2018). Exile,

assassination, or disgrace is the norm for South Korean leaders (Lee 2016).

By contrast, north of the imperial divide, both Kim Il-sung and his son Kim Jong-il died peacefully, to great popular distress (the father more than the son), and the third in line, Kim Jong-un, is in power, unchallenged it would seem and with popular support (Ryall and Irvine 2015; Kong 2018).

Jeju: From Massacre Island to US Naval Base to Encircle China

Jeju (formerly usually spelt Cheju) is the Korean peninsula's largest island, and its subtropical climate makes it a popular tourist destination. It also has Hallasan, South Korea's highest mountain and symbolic twin to Paektusan in the north, considered to be the spiritual home of the Korean people, and where it is claimed Kim Jong-il was born.

Jeju was the site of the most infamous massacre of the Syngman Rhee period. On March 1, 1947, a rally was held commemorating the March 1st Movement against Japanese colonialism and protesting against the forthcoming election to be held by the US Military Government in Korea (USMGIK) in 1948 that would finalize the division of the peninsula and install Syngman Rhee as president. Police fired upon the meeting killing six people and injuring eight. This led over the next year to strikes and various protests which cumulated in the Jeju Uprising of April 3, 1948. The authorities reacted with a scorched earth policy, and by the time the island was finally pacified, 7 years later in 1954, at least 30,000 people – 10% of the population – had been killed (Heo 2018a; "Remembering the April 3 Jeju Uprising" 2018; Song 2010; Yetter 2011). The massacre was kept under wraps, with severe penalties against anyone who publicized it until 2000 when the Kim Dae-jung administration allowed an investigation. In 2003 his successor, President Roh Moo-hyun, apologized on behalf of the national government: "Due to wrongful decisions of the government, many innocent people of Jeju suffered many casualties and destruction of their homes" (Song 2010). The phrasing was significant. Not only was there no mention of the scale of the massacre, which was merely attributed to "wrongful decisions" (would the Holocaust be so described?),

but the use of the word "innocent" implies that others – those who took up arms for Korean sovereignty and against repression and perhaps even those who merely protested – were guilty. The description reveals the dilemma that South Korea "progressives" such as Kim Dae-jung, Roh Moo-hyun, and now Moon Jae-in face. They wish to exorcise the crimes of the past and build a peaceful and just Korea but are unable to confront the reality of the domination by US imperialism. Sovereignty always remains beyond their grasp (Elich 2018). However the ghosts of Jeju refuse to go quietly away and in 2018, on the 70th anniversary of the uprising there have been a number of articles in the South Korea press on the subject, with rallies and demonstrations outside the US embassy and a petition with over 100,000 signatures called on the US Government to apologize for its role in the massacre (Huh 2018; "Special features on the 70th anniversary of the Jeju April 3rd Incident" 2018).

The subservience of South Korean progressives (also termed liberals in contradistinction to conservatives) is manifest in the issue to the Jeju naval bases. Back in the late 1940s, there were rumors that the US Navy was planning to establish a base on the island which had been used by the Japanese to bomb China during the war. That might have had some attraction being halfway between its two major possessions in Northeast Asia, but at the time the USA still "owned China" (then under Chiang Kai-shek) and the issue was clearly not pressing and nothing seems to have come of it (Heo 2018b). Subsequently America "lost China" which by the twenty-first century became the major challenge to US power, especially in Asia, and the desirability of a base on Jeju took on a new lease of life. However an explicit US naval base would cause political problems, certainly within South Korea and in a different way with China. In addition, naval bases are expensive to construct, and little of the expenditure would come to US corporations. Better to have the locals pay the bills and be the front man. The South Korean government, then under Roh Moo-hyun, came to the rescue ("West Sea Becomes New Arena for Big-Power Rivalry" 2012). The base would be South Korean, not

American though of course "The United States, according to its Status of Forces Agreement and its Mutual Defense Treaty with South Korea, can use at whim and at will any South Korean base" (Kang and Hong (Interviewer) 2012). Moreover it was not really a naval base but a "Civilian-Military Port" (Kim and Kang 2013). One problem with this ploy was that no doubt the Chinese were not taken in nor were South Korean activists and there have been continuing protests over the years, even attracting the attention of US film-maker Oliver Stone (Gwon 2011; Huh 2013). The current president, Moon Jae-in, rather gave the game away with the International Fleet (or Naval) Review of October 2018.

The Review, the third in a series, was held to commemorate the 70th anniversary of the Armed Forces of the Republic of Korea (Oh 2018). That it was held in a place where, at their birth, those same Armed Forces had massacred 10% of the population is significant (Kim 2018). It might be an expression of the sense of impunity of the Korean military for past crimes and their power over the civilian presidency. Clearly any ROK president that wants to claw back sovereignty from the US, and make peace with the North, has to reckon with the possibility of a military coup.

Although it was ostensibly a South Korean affair, the Review was also an expression of enthusiastic fealty to the USA. It brought together a motley collection of US "allies" – although the Japanese dropped out over a furor over Korean protests over the flying of the Imperial Japanese Navy ensign (Hurst 2018). The Jeju base and activities connected with it such as the review are clearly aimed at China. At the review ceremony, President Moon declared, "I will further strengthen the Republic of Korea Navy so it may go beyond the Korean Peninsula and contribute to peace in Northeast Asia and the entire world." This may have been no more than boilerplate rhetoric that politicians indulge in but it may have been a commitment to something more. Not only are the South Korean military under the wartime command of the USA, but modern weapons systems are merely a component of an integrated whole and cannot really function on

their own; this is termed "interoperability." Large countries, especially the USA, have a comprehensive capability, but small ones can only operate as subordinate units within this wider framework. In the 2011 invasion of Libya, for instance, the British and French air forces did not have the signals intelligence to operate on their own but had to depend on US leadership, a fact that has not been lost on Korean analysts (Song 2012).

A preventive war precipitated by the USA to impede the "peaceful rise" of China is the main danger facing the Asia-Pacific, and perhaps the world, today. Whether to support US belligerence toward China or to seek ways to avoid being embroiled is the major question facing countries in the region; Australia for one is a source of some forceful debate (Menadue 2018).

Why then does Moon Jae-in endorse a strategy fraught with danger? The controversy over the US deployment of THAAD – a component of the US missile defense system whose radar can be used for surveillance of Chinese missile sites and which is seen as an important part of an American first strike capability – demonstrated Chinese sensitivities and resolve (Beal 2016a). THAAD not merely makes South Korea a prime Chinese target in case of war but led to substantial and continuing economic costs (Yonhap 2017, 2018b). It may be that Moon calculates that by displaying such enthusiasm for the military and its supporting role in maintaining the US containment of China, he will be allowed some leeway on North policy. If so, it is surely a miscalculation.

OPCON and the Military Presence

When the Republic of Korea was formally established in 1948, USAMGIK was dissolved, and control of the armed forces passed in theory to the new republic, though US advisers continued to be influential and allegedly complicit in the massacres, such as in Jeju, leading up to the Korean War (Heo 2018b). The ROK Army (ROKA) was an ineffectual force certainly in in the early fluid stages of the Korean War despite American advisors (Ramsey 2006). This was not surprising as the first officers trained by the USA from 1945 were selected from those who had served under

the Japanese in pacification operations in Manchuria and China, and this is what they continued to do in Korea after 1945. They were not experienced in fighting another army. The Korean People's Army (KPA) formed in the north was very different. The first cohorts were formed from those who had fought against the Japanese, mainly in conjunction with the Chinese Communists in Manchuria but also with the Soviets in Korea. The Americans claim that it was well equipped compared to the ROKA. In 1949 the KPA was greatly supplemented by thousands of Korean who had fought in the Chinese Civil War. When full-scale war broke out in 1950, the ROKA crumbled, and had it not been for American intervention, the war would have soon been over (Scobell and Sanford 2007).The American response to the debacle was twofold.

The US intervened massively, not merely with its own troops but troops from 15 other countries; this was perhaps the zenith of American authority. By comparison only seven countries sent supporting troops to the Vietnam War, and a mere three countries participated in the coalition of the willing in the invasion of Iraq in 2003. Because of the Soviet boycott of the UN Security Council over the refusal to transfer the China seat to the new government in Beijing, the USA was able to dragoon the UN into endorsing American intervention, which came under the auspices of the United Nations Command (UNC). Despite its name the UNC is not controlled by the United Nations but exclusively by the USA (Norton 1997).

The USA also reasserted Operational Control (OPCON) over the South Korean military which it holds to this day. Initially this was done via the UNC, but in the 1970s the UN General Assembly passed a motion declaring that the UNC should be abolished. The USA seems to have ignored that, but it did transfer OPCON directly to the Combined Forces Command (CFC). This is the unified command over the ROK military and US Forces in Korea (USFK), which might suggest some joint ownership. In fact the Commander of the CFC is the Commander of USFK. It is, in other words, a front organization. That is under discussion and may conceivably change, though that is unlikely.

OPCON has changed slightly over time. Park Chung-hee tried to get it back in the late 1960s but the Americans refused. General Roh Tae-woo raised it again in the later 1980s when running for president, and on 1 December 1994, during the Kim Young-sam administration, the USA handed back peacetime control, retaining control in wartime, when of course it really mattered ("Experts address misconceptions about OPCON transfer" 2010). Peacetime control did have some significance because it meant, for instance, that General Chun Doo-hwan needed US permission in 1980 to move troops from the DMZ to Kwangju in the south to repress demonstrations (Shorrock 2015). Protests in Kwangju were part of a democratic upsurge following the assassination of Park Chung-hee. US complicity in the massacre in Kwangju, which may have left over 600 dead, was well-established, and US peacetime control was part of the evidence (Kim 2017a) (Shorrock 2017). Why the USA insisted on hanging onto what was a minor part of OPCON is a mystery. Or alternatively, since they had the power, why did they not use it more wisely; massacres that passed unnoticed in the 1940s were less easily covered up in the 1980s. Moreover, from the US point of view, there was little point to Kwangju. The generals had done their job, and by then democracy did not pose the challenge to US control in Korea as it had in the aftermath of liberation from the Japanese.

US control over South Korea was also eased, although temporarily, in respect of the massive joint military exercises it holds with the ROK military. The USA had handed over management of the exercises to the ROKA in 2007/2008 but reasserted control in 2010 following the Cheonan incident (Jung 2010; Kim and Ser 2010). The Cheonan was a ROK Navy ship which sank, probably in an accident with South Korean mines off the coast of North Korea. The inquiry held by the ROK Ministry of Defense predictably pinned the blame on North Korea (Elich 2010; "Russia's Cheonan investigation suspects that the sinking Cheonan ship was caused by a mine in water" 2010; Gregg 2010). What the real reason for the US resuming control of the exercises is unknown.

K

Full transfer of OPCON, namely, wartime control, has been postponed numerous times. It is rumored that Moon Jae-in had wanted it to happen during his term in office but has instead called for "early transfer," whatever that might mean (Park and Lee 2017). He has expressed frustration that despite having a GDP claimed to be 45 times that of the North and massive military spending, "our troops can't handle the North Korean military on their own" ("Moon vows to push for early takeover of wartime troop control, enhance deterrence against North" 2017; Park et al. 2017). He might also have mentioned that the South has far better military equipment (it jostles with Saudi Arabia for being the biggest purchaser of American weapons) and could field twice as many troops (Kim 2017b). And moreover, because of the US-ROK alliance, war would automatically bring in the USA in support irrespective of OPCON. It is hard to imagine any country less in need of foreign control of its military, something which has been described by a former commander of USFK no less as being the "most remarkable concession of sovereignty in the entire world" (Son 2014).

Both the US and ROK governments claim that the postponement of OPCON transfer is consensual and the conservative press in the past has suggested that delays were at Seoul's request ("Korea Asks U.S. to Delay Troop Control Handover Again" 2013). However, even though the ROK military establishment might have its own secret reasons to approve of the postponement it seems that the real reason for the delay is American reluctance to lose control over what is one of the most powerful militaries in the world, at probably the most strategic location in the world. The ostensible reason for the delay is that conditions are not ripe, and since it is really the USA that decides, there is potential for indefinite postponement (Salmon 2018). The "conditions" usually refer to North Korea's nuclear deterrent, and since that will not be laid aside without some sort of security guarantee from the USA, which Washington is unwilling to provide, there again matters are in American hands.

Nevertheless negotiations on OPCON transfer must continue and a framework for a superficially new, if essentially unchanged command structure agreed upon.

There are four major components in the existing structure – the South Korean armed forces (ROKA for convenience), the US forces in Korea (USFK), the United Nations Command (UNC), and the Combined Forces Command (CFC). The CFC has overall wartime command of ROKA and USFK, and the Commander of USFK is also Commander of CFC, under OPCON. The same American general also heads UNC. A number of different entities within the military command structure but all controlled by Washington.

United Nations Command

The UNC does not appear to have any warfighting function, but apart from providing a fig leaf of respectability for the US military presence in South Korea, it does control the southern side of the DMZ. When the USA wanted to block attempts to rejoin the North-South railway network in August 2018, and important part of the détente process, the US commander spoke as head of UNC ("Korean rapprochement efforts stymied by UN rail block" 2018). That the United Nations was being used to prevent peace rather than promote it went largely unnoticed.

However the UNC has an uncertain future. If there were a Peace Declaration ending the Korean war, as advocated by the two Koreas (supported by China and Russia), then UNC would lose its raison d'etre (Park 2018a). This would not necessarily be an insuperable barrier to American utilization of the UN flag in Korea. When a raison d'etre is a pretext, its disappearance can lead to other justifications. NATO was ostensibly founded to "deter Soviet aggression," but when the Soviet Union collapsed, NATO not merely continued in existence but expanded both its membership (into Eastern Europe) and its role (Yugoslavia, Afghanistan, Libya) (Chomsky 2014; Daalder 1999; Rice 2016). It is no surprise then that thought is being given to how to continue UNC if the Korean War is declared over (Shorrock 2018a; Yoo 2018).

Combined Forces Command

The CFS oversees USFK and ROKA and so OPCON transfer is focused on it. The transfer and the post-OPCON structure have been

discussed for many years, but it has now become established that the envisaged new structure would, on the face of it, be quite revolutionary. Up until now the commander of CFC has been the American general commanding the USFK, with a Korean general as his deputy. Under the new arrangements, the roles would be reversed. This was confirmed in a meeting held in Washington on 31 October 2018 between US Secretary of Defense James Mattis and ROK Minister of National Defense Jeong Kyeong-doo which stated that:

> The Secretary and the Minister decided to maintain the current CFC structure and reaffirmed the mutual commitment that the future CFC is to have an ROK four-star general as the Commander and a U.S. four-star general as the Deputy Commander. ("Guiding Principles Following the Transition of Wartime Operational Control" 2018; Mattis and Jeong 2018)

Earlier Andrew Salmon in *Asia Times* had noted that having a Korean in overall command "might prove politically impossible in Washington" (Salmon 2018). That seems a reasonable assumption and yet Mattis agreed to it. There has been curiously little coverage in the US media on this. Clint Work, perhaps the leading American expert on OPCON, writing in the *Washington Post* a month before the agreement, makes no mention of Korean control (Work 2018b), though in the specialist magazine *The Diplomat* in 2017, he had commented:

> The obvious obstacle to this option is that it would require the U.S. president, Congress, and public accept putting U.S. forces under the OPCON of a foreign commander. Considering the current political climate and Trump's brand of politics, such a shift would require thorough public explication. (Work 2017)

Defense News, in an article a few days after the Mattis-Jeong agreement, did mention the CFC transfer to South Korea but buried it a long way from the headline which merely mentioned the control of Korean troops – "South Korea could soon take control of its own wartime operations from the US" (Jeong 2018a).

It was as if they did not want Trump (or the general public) to find out that US troops were being put under foreign command. The reticence of the US media is curious since the story is so obviously newsworthy, a case of man biting dog rather than dog biting man as the old adage has it. Yoo Kang-moon, writing in the *Hankyoreh*, pointed out that:

> The case has been mentioned as the only exception to the so-called "Pershing rule," which holds that the US military does not assign command authority to a member of another country's armed forces. (Yoo 2018)

Pershing was the commander of US troops in Europe in World War I, and he later criticized the deployment of American troops under foreign command. He did not trust the British, or the French, and since he was famous in the aftermath of the war – he was the only general to be awarded six stars – his opinions were influential and have passed into conventional wisdom (Maurice 1931). For instance, Karl Rove, election strategist to George W. Bush, claimed on Fox News in 2011 that "American troops have never been under the formal control of another nation. Why should we start now?" (Jacobson 2011). Rove was factually incorrect when it came to details but political, and essentially he was right (Bruner and Serafino 2001; Schuler 2006). Since Pershing's day various US units have been under foreign command, but the importance of those cases has decreased and in recent years has been confined to US peacekeeping operations of no substantial military consequence and where, in reality, the USA is in overall strategic control. Why, in Korea of all places, start now?

It is unclear how the idea of relinquishing CFC control to a Korean initially got traction, but it did and is now the subject of a formal agreement. It may be that the transfer will not happen until it no longer matters. There is no fixed date – the latest prediction is 2023 – and it is contingent of conditions and capabilities, so the opportunity for postponement is always there (Jun 2018a). But if it does take place and there is a formal transfer of command, what then?

The world has been distracted by Trump's strident calls to put "America First," foolishly dismantling America's soft power strengths (Beal 2017d). In the meantime the bureaucracy and here the Pentagon have been working away at more sophisticated ways to run the empire in a time of decline where brute force is increasingly ineffective.

One technique is embedment where senior officers of "friendly and responsible allies" – usually from English-speaking countries and certainly from subservient one – are embedded into high-ranking positions in the global US military structure (Williams 2018). Thus, for instance, we have Harry Harris, in a speech in Australia, claiming that the present international framework has:

> ... been made possible by a security order under-written by seven decades of robust and persistent U. S. military presence, alongside a robust network of allies and security cooperation partnerships – alliances like the one we've shared with Australia for the greater part of a century.
>
> Our alliance is so important that Australian Army Major General Roger Noble is the Deputy Commanding General for Operations at U.S. Army Pacific – he followed Greg Bilton. That's right; an Aussie General Officer is a fully integrated partner at the top of one of my service component commands.
>
> Leading U.S. troops is a responsibility that I take very seriously and isn't something we just give away. In fact, the first offensive action by American Expeditionary Forces serving under non-American command was during World War I in the Battle of Hamel under the overall command of the Australian commander Lt. Gen. Sir John Monash. ... At the end of the day, friends help friends... and it's an honor and privilege to have our Australian friends working alongside us every day. (Harris 2017b)

Alliances are very much stuff of empires and how to co-opt elites into the imperial structure, without abandoning control is a continuing challenge. Harry Harris was then the Commander of United States Pacific Command (USPACOM), since May 2008 United States Indo-Pacific Command (USINDOPACOM). He was subsequently Ambassador-designate to Australia before being transferred to Seoul after Victor Cha, for unspecified reasons, was not appointed ambassador. Harris, incidentally, is an embodiment of modern US imperialism; his father was a US naval officer and his mother Japanese. Unlike his nineteenth-century predecessor Lieutenant Pinkerton, who abandoned Madama Butterfly for an American woman, Harris senior moved his Japanese wife and family to Tennessee.

Embedment might be seen as the human resources equivalent of interoperability, whereby weapon systems are integrated into the imperial military architecture making independent action by subordinate alliance members difficult if not impossible. A key component of interoperability is Intelligence Surveillance Reconnaissance (ISR) capability (Elich 2012; Song 2012). We might see ISR as the brains of the military machine which directs the various tools – fighter, bombers, missiles, aircraft carrier, and troops in the field – to carry out appropriate functions. He who controls ISR controls the army, irrespective of the formal chain of command. It is no accident that the air force – the battlefield kingpin to ISR – is to be kept under separate US control (Yoo 2018).

This might be seen – in a nod to Barack Obama's policy of "leading from behind" – to be one of "leading from below" (Lizza 2011). Indirect rule is an old imperial technique, employed, for instance, by the British in the Princely States of the Raj and by the Japanese in Manchukuo. Indirect rule, as Dirks has pointed out, is generally more advantageous to the imperial power than direct rule:

> .... providing ultimate sovereignty could be reserved for the colonial power, and it was frequently the case that indirect rule was both cheaper and easier than ruling by direct means. It was not only more efficient to conquer territory when rulers were allowed to maintain local control, it was also less likely to provoke serious resistance down the line. And yet, in early years of British expansion, the siren of full and direct control was hard to resist; it was only after years of learning the difficulties of imperial rule that Britain began to devise new strategies of indirect rule. (Dirks 2004)

Both the British and the Japanese used a mix of direct and indirect rule in their empire. American control in South Korea at the governance level was direct up to 1948, under the Military Government, and then indirect after that through the Republic of Korea. At the military level, it was direct until 1948, indirect until the USA took over Operational Control 1950, and then direct after that especially in respect of wartime control. However, even during the Korean War, American military "advisors frequently found themselves working with a counterpart two to three ranks above their rank and advising units larger than the ones they had served in, much less commanded," a classic indirect rule function (Ramsey 2006).

Indirect rule incurs a certain loss of control, but it is usually advantageous, and sometimes for historical reasons becomes inevitable. If OPCON is finally transferred to the South Koreans, it may really have little effect on American power in Northeast Asia.

US-NK Negotiations and the Sad Failure of Moon Jae-in

The USA and North Korea have been in negotiations of various sorts since 1945, but they entered a new stage in the 1990s and since then have seldom been out of the news. Before the collapse of the Soviet Union, North Korea was militarily secure, and the economic relationship provided a reasonable environment for development. The Soviet Union was much poorer than the USA, and costs of trade over the trans-Siberian railway were much higher than those which South Korea experienced with seaborne trade to the USA and the world capitalist economy. The USA gave South Korea access to its market – the largest and richest in the world – and to its technology and education. American military spending, especially but not exclusively with the Vietnam War, was another bonanza. Despite these advantages the North did better than the South for some decades; according to a South Korean authority, the South did not overtake the North in terms of per capita GDP until 1986 (Hwang 1993). When the head of the BBC World Service China section visited North Korea in the mid-1980s, he found it wealthier than China (Hoare 2016).

The collapse of the Soviet Union, along with the reintroduction of capitalism in China, changed all that. Agriculture had been industrialized to circumvent the geographically unfavorable environment caused by the lack of arable land and the short growing season (the warmer south had traditionally been the main agricultural area of the peninsula). This policy had been successful but was dependent on industrial inputs such as oil and fertilizer from the Soviet Union and agriculture went into a tailspin when they dried up. During the "Arduous March," perhaps hundreds of thousands of people died prematurely because of malnutrition and other consequence of the economic breakdown.

On top of this catastrophic domestic situation, North Korea was faced with two overriding international challenges. One was to gain security from the ever-powerful but now triumphalist USA which, freed of restraint from the Soviet Union, was embarking on new crusades, such as the destruction of Yugoslavia. The obvious solution to that was to attempt to develop a nuclear deterrent.

The other challenge was to come to some sort of rapprochement with the USA and to get it to accept peaceful coexistence. Here again perhaps a nuclear deterrent was the solution.

The challenges for the USA were different and of course far less pressing and only a small part of global concerns, even if greatly overblown by government for domestic reasons and the media for commercial ones. Again two are preeminent-nuclear weapons and East Asia strategy.

Military and Political Dimensions of the Nuclear Weapons Challenge

North Korea's small and uncertain nuclear capability is regularly touted as the greatest threat to the USA and an existential one (Graham 2017; Landler 2016; Reich 2016). This narrative goes back to at least 1991, 15 years before North Korea even conducted a nuclear test, let alone had anything approaching a credible capability (Gelb 1991). The American public certainly seems to believe this (Choi 2017b; Yoon and Cho 2016). This is a striking demonstration of the fact that people will usually believe something, however, untrue and indeed preposterous, if it is repeated constantly and not contradicted. Adolf Hitler, who considered that English propaganda was so much better than the German during World War I, concluded that the trick was simplicity and repetition:

> But the most brilliant propagandist technique will yield no success unless one fundamental principle is borne in mind constantly and with unflagging attention. It must confine itself to a few points and repeat them over and over. Here, as so often in this world, persistence is the first and most important requirement for success. (Hitler 2002)

The idea of North Korea being a great, perhaps the greatest, threat to the USA is certainly frequently repeated and often by what most Americans would reasonably, if naively, think of as

authoritative and dependable voices, such as James Clapper then Director of National Intelligence (Landler 2016). It is very seldom challenged, and on the rare occasions when it is, it is inserted into a propaganda envelope which obscures the real relationship between the USA and Korea (Fish 2018).

And yet on examination, the idea is preposterous. Even if North Korea had a handful of ICBMs capable of delivering a nuclear warhead to the USA, there is no likelihood of an aggressive attack. What would be the point? There would be nothing to be gained. No country could conquer the USA let alone a small one like North Korea. Nothing would be achieved except retaliation that would destroy their country. This obvious and incontrovertible reality is, to be fair, occasionally admitted by experts:

> Some US officials and pundits are fond of talking about the "threat" from North Korea. But what are the chances that its leader Kim Jong-un would initiate some kind of conflict or attack on the United States?
>
> The suggestion prompts snorts of amusement from some Korea experts.
>
> "The likelihood of a sneak attack by North Korea," says Frank Jannuzi, "especially one with nuclear weapons, to me, is infinitesimally small."
>
> Jannuzi was the policy director of East Asian and Pacific affairs for the Senate Foreign Relations Committee from 1997 to 2012. He's now head of the Mansfield Foundation, a think tank in Washington, DC.
>
> Sung-Yoon Lee, of Tufts University's Fletcher School, agrees. "In the short term, the threat level is low and manageable," he says. "North Korea is not suicidal, so it would not initiate a conflict." (Woolf 2017)

Unfortunately these experts, and the journalists who interview them, seldom get round to analyzing the real situation. If North Korea is not the threat that James Clapper et al. claim it to be, what is it all about? What is the role of North Korea's nuclear capability?

Nuclear weapons, as mentioned earlier, function primarily as a deterrent, and that is the case here. North Korea cannot attack the USA, though many Koreans would no doubt like to follow the example of George Washington and expel foreign power from the peninsula. That is not feasible and there is no reason to suppose that anyone in Pyongyang

thinks it is. North Korea cannot effectively defend itself from an American attack; it might perhaps do better than Afghanistan, Iraq, or Libya, but the real danger to Americans comes when they put boots on the ground. There would be no stopping US missiles and bombers. If attack is out of the question and defense is ineffective, that leaves deterrence.

Deterrence is an amorphous concept revolving around bluff, credibility, and acceptable risk and a deterrent that is used is a deterrent that has failed (Beal 2017a). From the point of view of America, North Korea is a high-risk, low-value target. For North Korea it is what Seymour Hersh called, in respect of Israel, the "Samson Option" in that its use would entail destruction (Hersh 1991). There being no other military way to counter possible American aggression, North Korea is left with the nuclear deterrent, not a good option but unfortunately the best.

If North Korea's nuclear capability is not a threat to the USA but rather an ability to retaliate if attacked, what is the fuss about? If there is no attack, there can be no retaliation. Besides, Pyongyang's nuclear arsenal is by far the smallest of all the nuclear powers and of course dwarfed by that of the USA.

The answer lies with imperialism. It makes an attack on North Korea unpalatably dangerous and strikes at the heart of imperial power. The USA may, or may not, attack a particular country, but it wants the option to be able to. What is the point of military power if it cannot be used to subjugate those who resist? The very smallness of North Korea and its deterrent and the historical circumstances in which it was developed make it especially challenging for US imperialism. Even the strongest of empires – and the USA is the most powerful in history – recognize that large countries cannot be attacked with impunity. Small countries should be different. It is frequently observed that if Iraq or Libya had possessed a meaningful nuclear deterrent, they would not have been attacked (Frolov 2010; Sanati 2011; Taylor 2017). North Korea thus poses a strategic challenge to US imperialism rather than a direct military threat. There is always the danger that the Korean example might be contagious spreading to Iran and further afield.

US-East Asia Strategy and Its Contradictions

US difficulties are compounded by the contradiction inherent in its East Asia strategy. On the one hand, there is the long-standing desire to destroy the North Korean state, thus extirpating the shame of the failure to achieve victory in the Korean War and extending American power to the very borders on China. This might take place through direct military action (Read 2017; Thompson 2016). Alternatively and very attractively, there is the fantasy that North Korea will "collapse" and that all the USA will need to do is to "manage" that collapse, utilizing the South Korea military (Foster-Carter 1998; Glaser and Snyder 2010; O 2016; Olson 2016). Obama seemed to believe this, hence his policy of "strategic patience" (Foster-Carter 2015; "Obama: North Korea is bound to collapse" 2015). There are myriad problems involved in all this for the USA. These include North Korean retaliation, nuclear or conventional, and resistance – one authoritative study estimated that up to 400,000 troops would be required for pacification even if there was no significant military resistance (Bennett 2010; Bennett and Lind 2011). On top of these dangers Chinese intervention is almost certain ("Annual Report to Congress: Military and Security Developments Involving the People's Republic of China 2018" 2018).

Leaving all this aside and assuming that the USA now has another scalp on its belt without being locked in a war with China, there is the problem of justifying the huge US military presence in the region (Holmes 2017). USFK has no plans to leave whatever happens, and President Moon has agreed that the presence will continue even if peace is declared (Cho and Kim 2018; Kim 2018a). Nevertheless it is clear that pressure will mount.

The presence has two components – one is the actual physical deployment of troops and assets such as THAAD in South Korea and elsewhere in maritime East Asia such as in Japan and Guam – the "military presence." The other is the alliance structure that locks South Korea, as well as Japan and Taiwan, into the encirclement of China. Some analysts have realized that the latter is the important one and have been prepared to consider a slimming down of the physical presence (Sokolsky and DePetris 2018). Others, including Congress, have been loath to see any withdrawal of US troops from the front line, even though that might be strategically a wise decision (Yonhap 2018c).

The Military Presence and Its Complications

The North Korean position on the military presence is interesting and shrouded in some fantasizing. Ever since the 2000 summit between Kim Dae-jung and Kim Jong-il Seoul has been claiming that Pyongyang has accepted that the US military presence should continue: "Kim Jong-il clearly agreed with President Kim Dae-jung that United States forces in Korea (USFK) should remain in Korea even after unification for peace keeping and maintaining the balance of power" ("NK Backs Continued USFK Presence" 2000). This assertion has been continued in 2018 regarding meetings between Moon Jae-in and Kim Jong-un (Yi 2018b). It is obvious why South Korea should claim this because it allows them to talk détente with the North without challenging US dominance, but the South Korean claims, as presented, appear preposterous. It seems like that neither Kim Jong-il nor Kim Jong Un, realizing the South Korea presidents' predicament, made the US presence a confrontational issue for strategic reasons. The small US contingent (roughly 23,000 at the moment) is of no great military significance in itself and would probably mainly serve to facilitate the bringing in of an expeditionary force in the event of war (Elich 2012; "Joint Press Conference with Secretary Panetta and Defense Minister Kim in the Pentagon Briefing Room" 2012).

Moreover USFK might well be a hostage against attack. Over the last 15 years, US forces have been drawn back from Seoul to Pyeongtaek some 60 km to the south to take them out of range of North Korean artillery ("N Korea angry at US army plans" 2003). This would have made the USA more likely to launch an attack on the North, with its bases being safe, but would leave Seoul vulnerable to retaliation. One might have been thought that the South Korean government would have objected and attempted to block the

K

move. Though there have been long-running protests by the inhabitants of Pyeongtaek, the South Korean government seems to have remained silent (Choe 2006). As with the deployment of THAAD and the naval base on Jeju, South Korean interests were sacrificed on the altar of American strategic objectives, yet another manifestation of the imperial-client relationship.

However the US sense of security may be misplaced. The KPA has claimed that its long-range artillery can now reach Pyeongtaek and even Pusan ("U.S. Troops in S. Korea Can Never Escape Strikes by KPA's Long-range Artillery: Panmunjom Mission" 2017). That may be an exaggeration, but in any case the US bases are vulnerable to missile attack (Oh 2017). This makes Korea a special case, though the Iranians now claim that they can retaliate against US bases in the region if attacked (Sharafedin 2018). Pearl Harbor is the only instance of a US base outside the theatre of operations ever having been attacked; US wars – Korea, Vietnam, Yugoslavia, Afghanistan, Iraq, and Libya, to name a few – have always been prosecuted from bases at a sufficient distance to be invulnerable to counterattack.

Moreover the US bases at Pyeongtaek – Osan Airforce Base and especially United States Army Garrison (USAG) Humphreys, where USFK is now headquartered – is home not merely to troops but also an increasing number of dependents. It is now US policy to encourage dependents to live on base in order to discourage the sorts of things that soldiers on their own get up to, such as drunkenness and the occasional rape. If the USA were to launch an attack on North Korea, it would almost certainly have to evacuate the dependents first, thus giving warning to Pyongyang and antagonizing the South Korean people aware of the implications for their own safety (Lamothe 2017). The evacuation problem in fact extends far beyond the military presence issue since there are also hundreds of thousands of other civilians – Americans and citizens of core allies such as Australia and Britain – who would also have to be evacuated (Hayes 2018; Jun 2018b). Nuclear retaliation aside, the reported confidence of President Trump and Senator Lindsey Graham that in the

event of a war with North Korea "it will be over there. If thousands die, they're going to die over there. They're not going to die here" leaves out this inconvenient fact (Ortiz and Yamamoto 2017).

Another drawback in the US military presence is that it reminds Beijing of the US containment of China and the role of the Korean Peninsula in that. USAG Humphreys is not merely the largest overseas US base (and mainly paid for by the South Korean taxpayer), but it is also the one closest to Beijing (Hincks 2018; Lee and Jung 2012; Letman 2017).

The US military presence in South Korea is an affront to Korean sovereignty but whatever opprobrium that would attract from South Korean citizens would fall on the government in Seoul which endorses it rather than that in Pyongyang which condemns it.

North Korea policy toward the USA is therefore not straightforward. Being so much weaker, it must attempt to be flexible and pragmatic, sometimes being conciliatory and at other times defiant. Nevertheless its very weakness and vulnerability mean that peace and security, coupled with economic development, are the overriding and simplifying objectives. The *Byungjin* policy which attempts to use the relative cheapness of a nuclear deterrent compared to conventional defense to allow space for economic development despite US economic warfare is the expression of this (Beal 2014; Feron 2017; Toloraya 2016).

The USA is in a very different position. It has security and no need for peace – indeed peace is anathema to what is termed too simply the military-industrial complex. It has innumerable options. They may come with costs as well as benefits, but there are still many choices to be made. Often that is an uncomfortable place to be in, and the solution is to defer difficult choices and opt for the status quo.

Pushback and the Attraction of the Status Quo

The USA has constantly considered and frequently threatened war against North Korea since the armistice of 1953 and yet has never taken the decisive step even though it has engaged in military action around the world, overt and

covert many times over that period (Blum 2018). A large part of the reason is clearly the military dangers of retaliation, resistance, and Chinese intervention. There are those who engage in wishful thinking, arguing that resistance would be minimal, that China could be persuaded to approve of an American-led invasion, and that only South Koreans would suffer the costs of retaliation (Luttwak 2018). However wiser or more cautious counsel has so far prevailed, and it is noticeable that when politicians ramp up the threats, as Trump did before Kim Jong-un's peace overture in 2018, the military and their affiliates in the media have been careful to cool matters down warning of "catastrophic consequences" (Marx 2018; Shankar 2017).

On the other hand, the military wants to preserve its military presence in South Korea and its forward strategic position in Asia, and tension on the Korean Peninsula is seen as a necessary justification for that. President Jimmy Carter tried to scale down the US military presence on assuming office in 1977 and to withdraw the 700 nuclear weapons deployed in South Korea. He was outmaneuvered by US intelligence which exaggerated the strength of the KPA and ascribed, without evidence, an intention to invade on the part of Pyongyang if Carter's plan was put into effect (Gady 2018; Whyte 2015). Carter gave in and the military presence continues to this day, at a slightly lower troop level and, in theory, without land-based nuclear weapons since 1991, though this is disputed (Staines 2004). However, since the focus of US-Asia strategy is China, with Korea being merely a part, albeit an important part of that, then even a successful invasion of North Korea would be counterproductive.

However if war in Korea presents dangers for the United States peace perhaps poses greater challenges. It is just conceivable that a domestically strong and deeply strategic US administration might be able to construct a deal with North Korea that would not greatly undermine the global position of the USA in respect of proliferation (the "North Korean example"). If North Korea could be quickly integrated into the global capitalist system, the deal might even be passed off as a

victory. If the USA could tolerate an independent North Korea and an autonomous South Korea in some sort of pre-unification confederal system, then it is possible that the old dream of harnessing the Korean Peninsula to the anti-China alliance, as is attempted with countries such as the Philippines, Vietnam, and India, could be pursued (Carlin and Lewis 2007; Cumings 2008; Richardson 2007). None of this is likely to come to pass. The Trump administration is extremely weak with its hold on domestic political power quite tenuous. The foreign policy establishment despises it for incompetence and has been trying through various devices – Russiagate and Mueller – to remove Trump from office. In addition the Democrats have taken the House of Representatives in the November 2018 midterm elections, and many Republications in Congress have a profound hatred for Trump's foreign policy, the late John McCain being an obvious example. Strategically the administration is incoherent and disheveled. Although Donald Trump might hanker after a Nobel Peace Prize and the legacy of being the American president who "solved the North Korea crisis," he has so little understanding of the issues that he allows his North Korea policy to incorporate elements, such as "maximum pressure" of sanctions and a refusal to negotiate meaningful security guarantees that ensure there will be no deal. The process of derailment of negotiations is especially facilitated by his very own Rasputin, John Bolton (Jeong 2018)

Moreover these machinations within the bureaucracy are complemented by obstruction from the Democratic Party (Hwang 2018a; Manchester 2018) and by the media. An important example of the media serving as a megaphone for those in the establishment wishing to derail any progress toward a peaceful settlement was the article by David Sanger and William Broad in the *New York Times* on 12 November 2018 with the tendentious heading "In North Korea, Missile Bases Suggest a Great Deception" (Sanger and Broad 2018). The thrust of the article was that North Korea was "cheating" on commitments made at the Singapore Summit in June. This was untrue and easily debunked by commentators

(Essertier 2018a; Shorrock 2018b; Sigal 2018a). The South Korean government was dismissive:

> Blue House spokesperson Kim Eui-kyum stressed that Pyongyang "never promised to dismantle its missile bases, nor did it sign any agreement obliging it to dismantle its missile bases."
>
> "It seems inappropriate to refer to that as 'deception,'" Kim suggested. (Noh 2018b)

Interestingly the article was also derided by some fellow mainstream journalists such as the *Washington Post's* Adam Taylor and *CCN's* Will Ripley (Ripley 2018; Taylor 2018). The lead author of the NYT article, David Sanger, has a nickname going back at least to the 1990s of "Scoop Sanger" from his success in publishing journalist scoops deriving from his role as a mouthpiece for elements in the intelligence community who wanted to influence government policy (Cumings 2003; Lewis 2005, 2015). The mainstream media is of course part of the state propaganda system, but presumably Taylor and Ripley thought that Sanger was being rather too blatant. The obvious inaccuracies in the article, and its agenda, were so egregious that the Executive Editor of the *Hankyoreh*, South Korea's leading liberal newspaper, wrote a personal open letter to his counterpart on the Times protesting (Kim 2018e).

However it would be a mistake to lay too much stress on the foibles and foolishness of the Trump administration. American presidents find it very easy to make war and, even when they do try, very difficult to make peace. It is a systemic issue which transcends individuals though specificities are important.

Empires are by their nature, warlike animals and although they may impose peace within their domain – as euphemized by the phrases *Pax Romana* and *Pax Britannica* – they are created and continue through force. Traditional empires may have wanted stability on their borders which were far away in terms of time and control, and what was on the other side might not have merited further conquest. Competitor empires also imposed constraints. The US empire is different. Globalization means there are no limits and technology has largely abolished the former constraints of time and control. The military has always been a powerful force in previous empires, but the modern American military-industrial complex – encompassing all those who make their living from not so much from war itself but from the possibility of war, from generals and arms manufactures to journalists and politicians – has grown mightily in influence. The military-industrial complex, it should be noted, does not necessarily want war itself so much as the prospect and likelihood of war. Nothing is more threatening to the permanent war economy than the prospect of peace. This does not mean that militarism is not a force in target countries such as North Korea. Having been under existential threat from the world's hyperpower for all of its existence, it would be strange if the North Korean military was not a powerful political force. But it is constrained by the overwhelming necessity of peace and security. The USA is different. For all the talk of the "National Security State," the national security of the USA has not really been under threat since the ebbing of British power at the beginning of the nineteenth century (Fordham 1999; Hendrickson 1998; Hogan 1998). The USA is indeed exceptional; all other countries to varying degrees have to be concerned for national security. The US, for reasons of geography, size, and power, has little need for such concerns. Rather it is a matter of projecting power with relative impunity. The "National Security State" is really a euphemism describing a new, globalist stage in US imperialism.

This power and impunity means that the USA can conduct its foreign affairs in ways which would be fatal for other countries. An aspect which is of special relevance here is the two-party adversarial system. The USA has developed a political framework in which there are effectively only two political parties (though the maverick Trump has dented that somewhat). The parties are very similar ideologically, and in fact their foreign policy positions are easily switched. They differentiate themselves for the voters not so much by policies as by being adversarial, opposing what the other party is doing. This gives the voters the illusion of choice without the reality. It has an important consequence in terms of foreign policy because it automatically engenders discontinuity and incoherence of which

there are many instances. George W. Bush was famous for his ABC foreign policy – Anything But Clinton (Delury 2008; Sigal 2005). One result was that he tore up the Agreed Framework that Bill Clinton had signed with the DPRK in 1994 on spurious grounds (Cumings 2003). Trump has torn up Obama's deal with Iran, and in turn the Democratic Party is attempting to sabotage his negotiations with North Korea (Hwang 2018a, b; Kristof 2018; Manchester 2018). Since political principles are not a major factor, there is a tendency for American politicians to compete with the opposition by waving the flag of "patriotism" every more vigorously, even when it is strategically counterproductive. Dropping bombs on foreigners, or at least those with no air defenses, is a sure way of upstaging the competition and winning praise; after Trump launched a missile attack on Syria in 2017, prominent foreign policy analyst Fareed Zakaria proclaimed on CNN that by doing so, "I think Donald Trump became president of the United States" (Chasmar 2017; Naureckas 2017).

Apart from the structural forces underlying the reluctance of the USA to accept peace in general in the case of the Korean peninsula, there is also the overriding need to contain China (Fullilove and Lemahieu 2018). From the division of the peninsula in 1945 up until today, Korea has essentially been a subset of wider geopolitical concerns – first the Soviet Union and subsequently China.

If a hostile North Korea disappears whether through war or through peace, the USA faces a challenge of justifying its military presence in East Asia and specifically in South Korea. With war too dangerous, peace unpalatable, and an incapacity of both the current administration and the foreign policy establishment to surmount these challenges, the USA necessarily prefers the status quo. Whatever Trump's hankering for a Nobel Peace Prize today or a yearning to be a great war president tomorrow, it is likely that his attempts in either direction will be frustrated.

The Dilemmas and Impotence of Moon Jae-in and the South Korean Elite

If the USA is an imperialist state and North Korea an independent, resistant state, then South Korea can perhaps best be characterized as a "swing state." Both the USA and North Korea have fixed positions which are unlikely to change. North Korea may be fluid in negotiations, but there is no reason to suppose it will succumb to US pressure and surrender. The USA may make various peaceful pronouncements, but its essential thrust for domination will remain, and it will not, in Mao Zedong's phrase, lay down its butcher's knife and become a Buddha. South Korea is different. Created by the USA from the detritus of the Japanese empire as a client state, it has wrestled ever since with the conflicting demands of subservience and wresting a degree of autonomy. Japan itself became a client state at the same time, and the parallels are intriguing (McCormack 2018). The OPCON issue is a formal expression of its client status, but American domination is more extensive and invidious than that, extending throughout society both at popular and elite levels. South Korea has the potential to swing toward independence; it is a major economy, with a stable society and a powerful military. Its military budget is far greater than that of the North; in 2013 it was claimed in the National Assembly that it was 33/34 times greater (Kim 2013). In its first decades, it needed the USA to protect it from domestic rebellion and the threat from North Korea. But ruthless repression, economic growth, American support, and indoctrination have produced great changes; even today challenging the official government line can lead to prosecution under the National Security Act (NSA or more commonly NSL) (Shim 2018). The North has been greatly weakened by the collapse of the Soviet Union and by unrelenting pressure from the USA. South Korea now has the potential to make its own way and to escape from American domination. It also has the necessity to do so, for as long as it remains a client state, it will be used by the USA as a pawn against China. If the USA goes go to war against China – something which is frequently discussed (Berg 2018; Heath 2018; Kagan 2018) – then South Korea will be on the front line and will face devastation.

However the structural forces of potential and necessity do not necessarily translate into action, as is brought home by the presidency of Moon Jae-in.

Paik Nak-chung has argued that the "Candle-light Revolution" of 2017 which led to the downfall of Park Geun-hye, and opened the way for the election of Moon Jae-in, was a "real revolution" (Paik 2018). It may well have been real in aspiration, but the Moon administration has not fulfilled that desire and promise. "Revolution" does imply an overturning of domestic social relations and international relationships, the two being intertwined, certainly in the Korean context. Moon's popularity has plummeted, mainly so far because of inherited economic problems and his failure to address them (Park 2018b; Rhyu 2018). More important here is his failure to stand up to the USA which will dash prospects for detente and peace. Paik claims that the Candlelight Revolution produced a new government able to respond the Kim Jong-un's peace overtures of 2018 (Paik 2018). That is true but the response is constrained and vitiated by domestic forces, particularly the military and the conservatives, and subordinated to the policies of the United States. Since the USA does not want peace, South Korea will not attain it unless it defies America, and Moon shows no signs of doing that. This was apparent months after he took office in 2017 and has been continually reconfirmed since then (Beal 2017b, c). Moon clearly faces formidable obstacles. He has limited formal political power, and, more substantially, there is always the danger of some sort of coup, either political (Roh Moo-hyun narrowly escaped impeachment in 2004) or military. The USA can apply immense pressure to achieve its aims, even instigated a coup if necessary. So the challenge for Moon is to nudge the USA into a meaningful peace dialogue with Pyongyang without inciting a counteroffensive from the conservatives and military in South Korea. There are various aspects to that, with sanctions having high visibility, but the fundamental one is persuading the USA to accept peaceful coexistence with an independent North Korea which retains the right and ability for self-defense a compromise which could be called "capping" (Dalton and Levite 2018; Miller and Sokolsky 2018; Sigal 2018b; Work 2018a). It is unlikely that any such persuasion would be successful since the USA, for reasons discussed above, is not able to make

the geostrategic adjustments necessary and will opt for the status quo. Nevertheless, if Moon is to help remove the specter of devastation from the Korean peninsula, he must try. North Korea has developed a nuclear deterrent because of the threat from the USA, so Pyongyang will not move toward denuclearization unless that threat is addressed. However, despite pretensions, South Korea has no direct role to play in the negotiations between the USA and the DPRK on the nuclear issue. What it can do is, on the one hand, improve bilateral relations with the North – the détente process – and on the other address the issue of sanctions.

While a number of useful and productive moves have been made during 2018 to promote détente with the North, there is a limit to what can be achieved at the bilateral level. Enthusiasts abroad, often Korean Americans, were carried away with the thought that, at last, Koreans were able to take their destiny in their own hands and forge peace (Feffer 2018; Freeman-Woolpert 2018; Lindorff 2018; Shorrock 2018c). In South Korea the government, naturally, and the liberal media echoed this fantasy (Editorial 2018; Lee 2018b; Noh 2018a; Yi 2018; Yu 2018). In reality there was very little of substance that South Korea could do with the North that did not require US approval (Jeong et al. 2018; Kim 2018b, c; "Korean rapprochement efforts stymied by UN rail block" 2018; Lee 2018a; Shin 2018; Yonhap 2018a).

Much of the constraint that the USA is able to impose on the detente process is exercised through its dominance of the United Nations (and the UNC) and is manifested through sanctions. It is well established that sanctions are usually ineffective in compelling governments to succumb to US demands and that their main function is a domestic one, to "satisfy the need to appear to be acting while avoiding the risks of action" (Friedman 2018). In respect of small countries such as North Korea, they are a particularly cowardly weapon, costing little and posing no danger while inflicting great pain on the target population, especially the most vulnerable, that is, the elderly and children. They produce disease, ill-health, malnutrition, and sometimes starvation.

Currently the UN estimates that 40% of the population of North Korea "require humanitarian assistance" ("UN Humanitarian Chief to visit the Democratic People's Republic of Korea 9–12 July 2018" 2018). Maternal mortality is eight times higher in North Korea than in the South (Kim 2018d). Sanctions are fanning a TB epidemic in North Korea, and Seoul has fears it may spread south (Talmadge 2018). The US attitude toward sanctions was famously summed up by the US Ambassador to the UN Madelaine Albright who when asked on CCN in 1996 about reports that sanctions had killed half a million Iraqi children replied ". . .we think the price is worth it" (Stahl 2007).

In the present context, sanctions have an added dimension, with two aspects. As long as Washington thinks that it can achieve the unilateral surrender of North Korea with sanctions, it will not find it necessary to negotiate on the security issue. That is wishful thinking and we may suppose that more astute minds see sanctions as a convenient device with which to scuttle negotiations. North Korea is not going to believe any US professions of peaceful intent while it is carrying out economic aggression.

Sanctions therefore have become a key element in current negotiations. Unless there is movement on sanctions, there will be no progress. If Moon Jae-in is to have any effect on US-DPRK negotiations then sanctions alleviation is the button to push. He has made some noises, but as soon as he has encountered opposition from the US, or its subordinate allies, he has backed down. On his trip to Western Europe in October 2018, he raised the issue (how strongly we don't know) with Macron and May and was rebuffed by both (Jeong 2018b; Ryall 2018; Yi 2018a; Yoon and Norman 2018). He went to New Zealand, and the message was the same: Prime Minister Ardern "said New Zealand would not be receptive to any calls to ease sanctions" and "sanctions would continue to be essential until Pyongyang completely abandons its nuclear program" (Beal and Wilson 2018; Kim 2018c). Moon capitulated to this pressure from the imperial periphery and from the center and reiterated his subservience to US sanctions policy (Kim 2018d; "Seoul to

Maintain N. Korea Sanctions until Complete Denuclearization" 2018).

Moon could have attempted to stand up to the USA over sanctions. There is a moral opprobrium; sanctions are variously described as "war crimes" (Cockburn 2018; Pilger 2014; "Rule 53. Starvation as a Method of Warfare" 2017) or "economic terrorism" ("Iran's Rouhani denounces US sanctions as 'economic terrorism'" 2018). This opprobrium is latent because the facts are usually suppressed or glossed over – blaming the victim is a common technique – but could be activated. Moreover the key sanctions are those emanating from the United Nations Security Council, and since they are ostensibly largely to protect South Korea, then an appeal to the UNSC by President Moon would have traction. The actions would not be without danger to Moon or his administration, but if sanctions continue, then the possibility of war with the North, and with China, will continue.

It may be that the current measures between South and North to develop détente will create sufficient momentum and become unstoppable, but this is unlikely since at any time the USA can put its foot down and bring things to a halt.

The failure of Moon Jae-in to stand up to the USA over sanctions is but one instance, albeit a crucial one, of a wider incapacity of the South Korean élite, over generations, to wrest autonomy from the USA. While it is subservient, it will continue to be used as a pawn by US imperialism in its broader struggle to maintain hegemony, especially in respect of the Chinese challenge. For the moment the best strategy for the USA is to preserve the status quo in respect of the Korean peninsula. Both war and peace would be less preferable to the present situation where a constructed fear of the "North Korean threat" produces sufficient tension to justify the US military presence in Northeast Asia, along with missile defense and other components of the permanent war economy. Moreover it comes with little cost or danger. Much of the forward military presence is funded by the host countries (Elich 2016; Lim et al. 2017; Park 2018b). Sanctions may cause huge damage to North Korea – $65trillion according to one estimate ("KCNA on Tremendous Damage

Done to DPRK by US" 2010) – and danger to South Korea, but have no meaningful effect on the American economy. And since the "North Korean threat" is essentially bogus, the risks are quite manageable.

Themes and Issues

If an analysis of the role of imperialism is essential for an understanding of the Korean peninsula, and its history, then Korea, being a principal site of contestation, throws much light on imperialism, in particular on contemporary US imperialism. The Trump presidency adds another dimension because of its disjunction with standard imperialist practice and thinking. Trump, as president, is charged with running an empire but, to the dismay of the establishment, does not comprehend the task. This opens up fissures – counter challenges of "fake news" – that scarcely surfaced in the past. The screams of outrage are a useful indication of just how important the empire is perceived to be and what are its most valuable assets. However since Trump is not anti-imperialist, merely incompetent, these protests from the establishment are not a comprehensive guide.

Trump, the roche moutonnée, and the Unravelling of the Imperial Idea

An empire, at one level, can be considered a conglomeration of states. It is hierarchal with the imperial state at the center surrounded by others at various levels of influence and subordination. Traditionally empires have boundaries, either geographical or with contestant states, and these are marked by a band of liminal states in between which may move either way to one empire or the other. And then there are states which are similar to a roche moutonnée, or *sheep rock,* hard outcrops over which glaciers pass and surround but do not destroy and sweep away. North Korea is such a roche moutonnée. The major crime in the eyes of an empire is rebellion from existing subordinates and resistance from states at the periphery. Independence is not easily tolerated, and naturally the smaller the defiant state, the greater the frustration, hence the animus towards North

Korea, so much smaller than the US. Historically empires have tended to recognize the idea of limits, though with internal quarrelling over where those limits should be, and strategists and historians often warned of imperial overreach. Though there have been very large empires before and the later European empires straddled the globe – the British had an empire on which the sun never set – it is only with the USA that we have an empire with a truly global, all-encompassing appetite which sees no limit to its domain. Hence the frequent talk of war with Russia, or China, or sometimes both together (Farley 2017). There are those that warn of overreach, and urge restraint, but the prevailing trend is aggressive, leading to the eastward expansion of NATO and shenanigans in the South China Sea (Buruma 2011; Fraser 2014; White 2017).

Empires are of course dynamic, expanding, declining, collapsing, rising, and falling. Within the empire the hierarchy is in a state of flux with the subordinate states rising or declining in power and consequently in influence, although size and inherent power is an important factor. South Koreans are often aggrieved when it becomes clear that Washington considers Tokyo more important than Seoul (Cumings and Park (Interviewer) 2015; Kang 2014; Nakamura 2017). The process is historical with strong cultural factors. Britain, for instance, has claimed and has been granted a "special relationship" with the USA since it handed over the baton of hegemony in the twentieth century. This may decline if Britain leaves the EU and so loses its position as the USA's "best friend in Europe" but will retain something as long as American leaders remain monolingual, judging foreigners on their ability to speak English (Birnbaum 2018).

The preferred American term for empire, in polite mainstream circles, is *alliance* over which the US exercises *leadership*. From this it follows that the major foreign duty of the US president is management of the alliance, to keep the subordinate states compliant and unified against any competitors. It might be termed Imperial Management 101. Although Trump's sudden decision to withdraw (in theory) from Syria might have been the trigger which led to the resignation of Secretary of

Defense James Mattis in December 2018, his resignation letter does not mention Syria but focuses exclusively on the importance of the alliance structure for the USA (Mattis 2018a). Trump's incompetence in managing alliances is his besetting sin, in the eyes of the US establishment, one that leads to the various measures, principally Russiagate, by which they hope to pull him down (Sullivan 2019; Tharoor 2018). The basic reason for Trump's failure, more important than any personal inadequacies, is that he does not understand that he is supposed to be running an empire. Niall Ferguson once commented that Americans were imperialists in denial – they had an empire but would not admit to it (Ferguson 2003). The American elite has tended, except in unguarded moments, to perform this charade, but subconsciously they were not taken in. Words might go in one direction, but actions in another. The curious thing about Trump, due perhaps to his famous incuriosity and his lack of political experience, is that he does believe the denial myth.

The curiosity does not stop there. In his speech to the UN General Assembly in September 2017, he outlined his view of the world as being composed of "sovereign nations" – he used the word "sovereignty 21 times – which "with different values, different cultures and different dreams not just coexist but work side by side on the basis of mutual respect" (Jaffe and DeYoung 2017). This, in fact, is the vision of the world enshrined in the UN Charter and one espoused by North Korea, among others, "Sovereignty is the life and soul of the Korean people" ("Rodong Sinmun on DPRK's Bolstered War Deterrent Force" 2008).

Trump was as usual inconsistent, and he singled out North Korea, Iran, Cuba, Syria, and Venezuela whose sovereignty did not merit respect, so it was not quite all the way with the UN Charter. Nevertheless his worldview is strikingly different from the global system that the USA has been at such pains to construct since World War II and with considerable success. For an American president, putting America first among the world's sovereign nations is a very different concept from exercising leadership over the international community and harnessing its alliances to preserve the Liberal International Order (Haass 2018; Ignatius 2017; Mathews 2017; "Petition: Preserving Alliances" 2018).

Alliances are the keystone of this imperial order. Trump sees them as an encumbrance by which allies "are ripping us off" (Sherlock 2016; Zeynalov 2018). Leaving aside things such as host countries paying much of the cost of US troops stationed there and the purchase of US military equipment (which enriches the manufactures, keeps costs down for the Pentagon and, through interoperability, locks foreign forces into the US military machine), a quick look at statistics for military expenditure indicates why the establishment is so horrified by Trump's ignorance of the benefits of alliances for US military power.

According to the annual *Military Balance 2017* published by the International Institute for Strategic Studies, a standard source, the official military budget of the USA in 2016 was $604 billion. The total for the main allies – Western Europe, Japan, South Korea, etc. – together came to $450 billion bringing the grand total to $1054 billion. In other words, to the degree that the USA could utilize the military of its subordinates, it augmented its military budget by 75%. This is merely a rough, indicative measure for obvious reasons, but it does quantify the military value of its empire to the USA ("Military Balance 2017" 2017). It is not surprising then when analysts write of US military power, they often mention the "globe-spanning alliance structure that constitutes the core of the existing liberal international order" (Brooks and Wohlforth 2016). The total military budget of the empire is also the metric to be used when comparing US power with that of its adversaries. That $1054 billion was, using the same source, 7 times that of China, 22 times that of Russia, and 64 times that of Iran. The *Military Balance* does not give data for North Korea, but using estimates from other sources, the imbalance in military spending ranges from about 300 times to a thousand ("World Military Expenditures and Arms Transfers 2016" 2016; Kim 2013). Trump has frequently claimed that US "allies" are freeloading and should pay more for the US forward presence in their countries (Cloud 2016; Yoon 2018). He has it the wrong way round; it is

K

the allies who subsidize the USA. The US presence is primarily to serve Washington's geopolitical strategy with the claim that it is providing protection a pretext. A war on China to protect its hegemony might make sense for Washington, but it is difficult to conceive how it could benefit South Korea in any way.

However the alliance structure has value extending far beyond the military aspect. It allows the USA to claim that it speaks for the "international community." That supposed community may leave out most of the world's population – in China, Russia, India, and much of the rest of the world – but it does include, from an American perspective, the countries that count or at least their governments. It endows the USA with huge diplomatic power which is evidenced most significantly in international bodies such as the United Nations.

For historical reasons the USA has an automatic majority in the United Nations Security Council (UNSC). It "owns" three of the five permanent members – itself, the UK, and France – and inevitably most of the nonpermanent members. The Soviet Union used to use its veto with some vigor, China less so, and currently the veto is used sparingly with Russia and China attempting to horse trade on unwelcome resolutions then, if pushed through, implementing them with reluctance. UNSC resolutions, and the ensuing sanctions, have been an important weapon of the USA against North Korea. To most people they appear legitimate because they bear the imprimatur of the UN even when they violate the Charter of the UN and the norms of international law (Weeden 2012). However the UNSC is a political construction within which power is very unevenly distributed. In general its resolutions privilege the USA even when they are clearly illegal (McCormack 2017; "UN Security Council exceeds its authority" 2017; Xavier do Monte 2016). North Korea has been condemned by the UNSC for, of all things, attempting to launch an artificial satellite. This was done on the spurious grounds that it employed "ballistic missile technology"; however, all satellites are launched by ballistic rockets. Such rockets are only missiles if they have a warhead (Beal 2016c). Moreover ballistic

missiles themselves are not illegal or uncommon, and of course the USA has thousands of them.

The problem with the UNSC exceeds far beyond the North Korea issue. Not merely do its resolutions often punish the innocent but it often fails to condemn, let alone punish, infringements of international law by the USA or its allies. For instance, in April 2018 it rejected a Russian-sponsored resolution condemning US airstrikes against Syria (Chan 2018). Indeed it appears that the USA has never been condemned for its flagrant violations international law such as the invasion of Iraq. It does not have to use its veto because its alliance system gives it a virtually guaranteed majority whatever the composition of the nonpermanent members. The UNSC is a place of political power, not the disinterested dispensation of international law.

US influence penetrates far deeper into international institutions such as the United Nations than formal resolutions. The CIA has long been thought to have been involved in the death of UN Secretary General Dag Hammarskjold in 1961 (Cowell and Gladstone 2017; Lynch 2016). More prosaically the USA can make or break careers. Presumably both Russia and China have an informal veto over senior appointments, but the balance of power means that only US-supported people get the jobs. Nevertheless the USA has fallen out with the chosen ones when they have not lived up to expectations of deference and they are forced out of office and did not have their appointments renewed or left under a cloud. Notable examples include UN Secretary Generals Boutros Boutros-Ghali and Kofi Annan, International Atomic Energy Association (IAEA) Director General Mohamed ElBaradei, and Organization for the Prohibition of Chemical Weapons (OPCW) Director General José Bustani (Urquhart 2004; Meisler 2018; Linzer 2004). Bustani had the particular pleasure of reportedly being threatened by John Bolton: "We know where your kids live" (Hasan 2018).

US influence extends far below the highest levels of the international bureaucracy. Even modest positions in international agencies are well paid and have prestige. It is unlikely that in general any person who is considered anti-American

could expect a good career in this milieu. At the same time, pressure to conform to US policy must be immense and would not require a Boltonesque threat but would just be internalized through the ordinary course of administration. Moreover these people are not merely individuals but also citizens of a country whose government may well be subject to US influence, so in sensitive areas the pressure comes from two directions. One instance of this, unfortunately under-researched, is the UN Commission of Inquiry (COI) on the DPRK chaired by Michael Kirby assisted by Sonja Biserko and Marzuki Darusman. Marzuki had been a henchman of General Suharto, largely responsible, with the help of the CIA of one of the biggest massacres of the postwar period, perhaps half a million Indonesians, so he knew something about human rights, and how to ingratiate with the powerful (McBeth 2012; Scott 2017).

The statement by the UN Commissioner for Human Rights announcing the appointment of the CIO is telling (emphasis added):

> The President of the Human Rights Council, Ambassador Remigiusz A. Henczel (Poland), announced today the appointment of Michael Donald Kirby of Australia and Sonja Biserko of Serbia who will join Marzuki Darusman, the Special Rapporteur on the situation of human rights in the Democratic People's Republic of Korea, to serve as the members of the commission of inquiry **to investigate human rights violations** in the Democratic People's Republic of Korea, mandated by the Council at its last session. Mr. Kirby will serve as Chair of the three-person commission.
>
> The Council decided to establish, for a period of one year, the commission of inquiry at its twenty-second session on 22 March 2013 **to investigate the systematic, widespread and grave violations of human rights** in the Democratic People's Republic of Korea with a view to ensuring full accountability, in particular for violations which may amount to crimes against humanity. ("Council President appoints Members of Commission of Inquiry on the Democratic People's Republic in Korea" 2013)

It will be noted that the word "allegation" does not appear. The task of the COI was not, as would be the case in any normal court trial or inquiry to assess the veracity of allegations but merely to confirm the guilt of the accused. In other words a show trial with a pre-determined verdict and the confirmation of guilt duly provided. The investigation contented itself with hearing testimony from what the South Korean government calls "defectors" – North Koreans who for whatever reason had left their homeland to live in South Korea or elsewhere. The general motive for this appears to have been economic; a South Korean Ministry of Unification survey in 2004 found that only 9% cited "political dissatisfaction" (Park 2004b). This is not what the COI wanted to hear. Defectors or people in similar situations are notoriously unreliable. Being desperate they tend to say what they think their interrogators want to hear, which is why countries which do not want them – such as EU countries faced with a flood of asylum seekers – use overly rigorous screening techniques to give themselves an excuse for refusal (Souter 2016). The same method applies for Britain barring unwanted North Koreans or South Korea refusing asylum to Yemenis (Bell 2018; Park 2018b). There are many instances of defectors in South Korea fabricating stories (Fifield 2015; Jolley 2014; Song 2015). Moreover there is an incentive to make fabrications as lurid as they can (Yun 2018).

It appears that the CIO heard the testimony of defectors, selected presumably by the National Intelligence Service (NIS) in South Korea and its equivalents elsewhere, and without demur or scrutiny predictably concluded that:

> Systematic, widespread and gross human rights violations have been and are being committed by the Democratic People's Republic of Korea, its institutions and officials. In many instances, the violations of human rights found by the commission constitute crimes against humanity. These are not mere excesses of the State; they are essential components of a political system that has moved far from the ideals on which it claims to be founded. ("Report of the commission of inquiry on human rights in the Democratic People's Republic of Korea (main findings and recommendations)" 2014)

The assertion that these "systematic, widespread, and gross human rights violations" were an "essential components of a political system" had the useful implication that any action taken by the USA to destroy this political system would be both justified and virtuous.

It is clear what is going on here. Demonization of the enemy is a standard tactic and particularly important for a democratic imperialism. The French with their *mission civilisatrice* (civilizing mission) or the Spanish and Portuguese spreading Christianity had their own justifications; the USA dwells a lot on human rights and democracy which it claims it embodies (Walt 2011). In American eyes the most potent form of delegitimization of a foreign government, thus providing justification for its overthrow, usually euphemistically described as "regime change," is the accusation of the violation of human rights and deprivation of democracy. A "dictator" who "starves his own people" ticks all the boxes (Von Drehle 2018). Since all governments, not least the American, fall short on human rights and democracy, albeit in different ways, there is always plenty of ammunition around, so all it needs is a powerful propaganda machine to amplify, decontextualize, and distort then spew it out.

Akin to demonization ("they are evil"), although rather different, is dehumanization. This is used in the sense of portraying the adversary as so different from us that the ordinary rules of human behavior do not apply, and we can believe narratives about them which we would not entertain about ourselves or fellow humans. Thus we have the idea that North Korea deliberately and with malice "starves its own people" or the opinion of General Westmoreland, US commander in Vietnam, that "The Oriental doesn't put the same high price on life as does a Westerner. Life is plentiful. Life is cheap in the Orient" (Jackson 2005). Of course Vietnamese don't like dying any more than anyone else, and of course the North Korean government does not starve its people – what would happen to the army, who would work in the factories and fields? Of course it was General Westmoreland who thought that Vietnamese life was cheap, not the Vietnamese, and of course it is the US government not the North Korean that inflicts starvation – that is one of the functions of sanctions after all. Why is it that US imperialism is so often successful in getting people to overlook the obvious and to accept self-serving falsehoods?

Despite the ineptness of Donald Trump, the growing power of China, the resurgence of

Russia, and the resistance of the roches moutonnées such as North Korea, Syria, and Iran, US imperialism is still incredibly strong. It has unparalleled hard power – carriers, missiles, bombers, submarines, and an array of other instruments, including the chemical weapons we are not supposed to notice (Higgins 2017). However it is in soft power spectrum that US strength is most manifest. The alliances greatly magnify its military power and enable it to use international bodies such as the United Nations to further its objectives. Trump may have eroded the alliance system, but it was still able to get Canada, at great cost and danger and to no benefit – to arrest Huawei executive Meng Wanzhou (Karabell 2018; Landler et al. 2018; Sachs 2018). Although the dollar's role as the world's trade and reserve currency is under threat, the USA still has considerable influence over the international banking system; it can, for instance, force Chinese banks to stop dealing with North Korea (Kim 2017c). It still dominates the Internet and on global telecommunications, hence the attack on Huawei (Fifield 2016; McCarthy 2018; Zhong et al. 2018). It has huge resources to corrupt a bribe – General David Petraeus even wrote a manual for the army on how to use money as a weapons system (*Commander's Guide to Money as a Weapons System* 2009; Thompson 2013). The armory of US imperialism is extensive and varied, but perhaps its most effective weapon is propaganda.

The USA dominates the global intellectual space. It controls perceptions through an extensive array of instruments – universities, thinks tanks, popular culture, literature, news agencies, media, and so forth. Its influence permeates the world. Even in adversarial countries such as Russia and China, the media tends to follow the American narrative unless national interests are at stake.

Harold Pinter, in his Nobel Prize lecture, expressed it well:

> Hundreds of thousands of deaths took place throughout these countries. Did they take place? And are they in all cases attributable to US foreign policy? The answer is yes they did take place and they are attributable to American foreign policy. But you wouldn't know it.
>
> It never happened. Nothing ever happened. Even while it was happening it wasn't happening.

It didn't matter. It was of no interest. The crimes of the United States have been systematic, constant, vicious, remorseless, but very few people have actually talked about them. You have to hand it to America. It has exercised a quite clinical manipulation of power worldwide while masquerading as a force for universal good. It's a brilliant, even witty, highly successful act of hypnosis.

I put to you that the United States is without doubt the greatest show on the road. Brutal, indifferent, scornful and ruthless it may be but it is also very clever. As a salesman it is out on its own and its most saleable commodity is self love. It's a winner. Listen to all American Presidents on television say the words, "the American people," as in the sentence, "I say to the American people it is time to pray and to defend the rights of the American people and I ask the American people to trust their President in the action he is about to take on behalf of the American people." (Pinter 2005)

It is this awesome act of hypnosis that enables the USA to condemn North Korea for having a handful of nuclear warheads when it has thousands itself, for having conducted six nuclear tests when it has conducted over a thousand and for being belligerent and aggressive and a threat to the region and the world, even though North Korean troops have scarcely ventured beyond the peninsula and then only by invitation while the USA is a country in a state of permanent war. The list of such instances of hypocrisy and inversion of reality is extensive and is, of course, not confined to Korea. However the USA has conducted an unremitting propaganda campaign against Korean independence for over 70 years, so it probably provides the best example of the awesome power of sustained propaganda to distort the perceptions of people, not merely Americans, about imperialism and its criminal ways.

Korea has long drawn the attention of imperialism and because of its location that will surely continue. The Mongols and the Japanese were attracted by Korean resources, both natural and human, but for both the peninsula was primarily the route to a larger prize. For the Mongols, that was Japan, and for the Japanese, that was China and Eurasia. The Americans saw Korea as a place to erect a barrier to protect its recently acquired war booty, Japan, from the influence of the Soviet Union. It also provided a beachhead on the Eurasian mainland. China has replaced the Soviet Union as the main challenge, but the desire to maintain US hegemony remains the primary underlying driver of US policy toward Korea. However imperialism is also a complex historical process and in the course of that an obsession with North Korea has assumed a distinctive importance. Moreover the development of the Permanent War Economy also fuels US imperialism, complementing and reinforcing geopolitical considerations. It used to be said that the business of America was business but with American decline and loss of civilian competitiveness war, and the profitable preparation for it is becoming the core business.

Underlying momentous historical forces intersect with the quotidian. Donald Trump is a symptom of American decline and the alienation and disenchantment which is it producing. He is accelerating the decline but doing it in erratic ways. One day he threatens war against North Korea, the next he is talking peace. Even if he is not removed from power by the establishment, he is unlikely to bring about either peace or war.

Whatever happens it is certain that the Korean Peninsula will continue to be a focal point for imperialism and the resistance to it.

A Note on Spelling

Korean, and other non-Latin scripts, can be transliterated (a process usually called Romanization) in a variety of ways. The forms most familiar to Western readers are usually constructs by the nineteenth-century missionaries and scholars, who often disagreed among themselves. With decolonization and reassertion of national identity, governments have engaged in script reform; thus *Tokio* became *Tokyo*, and the PRC developed the *pinyin* system in the 1950s, with *Nanking* becoming *Nanjing*. For transliterating Korean the American McCune–Reischauer system, dating from the 1930s, is the most commonly used, but in 2000 the South Korean government introduced a revision so that, for example, *Pusan* becomes *Busan* and *Chosun* becomes *Joseon*. North Korea continues to use what is essentially the McCune–Reischauer system, so *Pusan* remains *Pusan* although the correct P'yŏngyang

usually appears simply as Pyongyang. However, even in South Korea, there is no thorough consistency; the *Chosun Ilbo* has not revised its title to *Joseon Ilbo*, but it does use *Busan* for the name of the city while retaining the original in titles such as *Pusan* National University. The reader must be prepared for inconsistency.

This chapter tends to use the McCune–Reischauer to preserve continuity with the past and most foreign writing on Korea, as well as providing a link to North Korean usage. There has been a talk in the past of a joint North-South revision, but that has not yet come about.

Korean names, like those in China and Japan, place the surname first, and while the Japanese often Americanize their names, with *Abe Shinzo* becoming *Shinzo Abe*, both Korea and China keep to the original order. However in South Korea the given names are hyphenated, thus Moon Jae-in, while in the North they are written separately and capitalized, thus Kim Jong-un. Here we follow the usage of the country of origin.

Synonyms

Anti-imperialism; Australia; Bandung conference; Decolonization; Foreign labour; Labour; Southeast Asia

Definition/Description

This chapter examines labour unrest and strikes against Dutch efforts to reclaim Indonesia as an imperial colony in Australia during the Second World War as a precursor to the decolonization project in Southeast Asia. The chapter reveals that a coalition of workers emerged who strove to end colonialism in China, India, and Indonesia which was instrumental in expanding the movement to decolonize the Southeast Asian and South Asian regions. As the colonial systems were eroded by the Japanese imperial invasion new systems would emerge to initiate the construction of new states.

Introduction

Labour constituted a significant site of struggle in favour of decolonisation and against the reimposition of the imperial order in the period immediately following the Second World War. In Australia, this struggle against the return to the pre-war regime in the Netherlands East Indies (NEI)/Indonesia flared up within months of the surrender of Japan and became a long-running dispute on the waterfront that lasted until the formal handover of sovereignty to the Indonesian nationalists. The actions involved the unions 'black banning' Dutch and British ships that were intended to support the Dutch military in the Indies. Similar bans and strikes were seen globally, with actions in the US, Canada, New Zealand and the United Kingdom all contributing to popularising the anti-imperial cause and aiding in the backing-down of the

Netherlands. More than 500 ships were declared black and the delays caused by the black bans allowed the Indonesian Republic to secure itself and push for a negotiated peace, where otherwise it might have been swept away (Lockwood 1987: 4–6).

While earlier historical accounts of this event lionized the role of Australia's white workers in taking a strong stand against renewed conflict and imperialism, recent studies have revised this narrative significantly. Instead, the emphasis has turned to the role of 'foreign workers' in Australia at the end of the war – the Chinese, Indonesian and Indian seafarers who maintained the maritime arteries of Asia – and placed these workers in their rightful position as highly conscious, well organised anti-imperialist members of a transnational coalition determined to ensure independence not just for Indonesia, but for all victims of colonialism.

The Wartime Situation for Labour in Australia

The war in the Pacific, which had begun with the Japanese assault on China in 1937, saw the imperial Japanese forces cut a wide swathe through the colonial regimes of South-East Asia, sweeping British and Dutch forces from their colonies in Malaya and the Indies, and gaining de facto control of Cochin China from collaborationist France. The speed with which the Japanese had been able to clear these forces from their positions was staggering, and caused a large number of Dutch and British vessels that were manned by sailors from China, India, and Indonesia to find themselves in Australian waters, with thousands of stateless workers (Cottle and Keys 2008: 2–3). The NEI elite also retreated south, establishing themselves in Australia as a government in exile and bringing with them a retinue of up to 10,000 Indonesians including sailors, soldiers, and their most dangerous political prisoners from the Tanah Merah concentration camp (Fitzpatrick and Cahill 1981: 168).

Formally excluded from Australia's existing unions, and seen as naturally subservient and unfit for unionism by the ideology of 'White Australia' dominant in the labour movement, Asian seafarers had taken steps to organise themselves during the war. Chinese sailors who found themselves stranded in Australia on vessels commandeered for wartime service took strike action for wages owed to them in Fremantle in 1942, where two of their own died at the hands of police violently dispersing their picket. The Seamen's Union of Australia (SUA) negotiated with the Chinese sailors to join the Australian Army and provide other assistance to the war effort, while at the same time an independent branch of the Chinese Seamen's Union (CSU) – technically an affiliate of the Kuomintang that had existed since 1913 – was established in Australia under militant leadership and with the endorsement of the SUA. By the end of the war, the CSU could claim a well-organised membership in the hundreds (Cottle 2003: 138).

Indonesian seamen likewise took action with the support of the SUA for better wages and conditions on board ships during the war, and by the end of the war had seen their monthly wages increase twentyfold (Fitzpatrick and Cahill 1981: 171). Indian sailors had also been organising, with a major strike in 1939 securing better wages and conditions throughout the Commonwealth, although they were still largely an unknown factor in industrial struggles and, unlike the Indonesians or Chinese, had no significant communal bonds in Australia (Balachandran 2008: 65).

Within this context, one of the most significant issues facing the Allied powers as the end of the war drew closer was the issue of decolonisation – an issue that was most pressing in the Asia Pacific region, where the retreating forces of imperial Japan had acceded to the demands of nationalist movements and granted independence to former European colonies. The war-shattered European powers were keen to resume exploiting the resources of their lost colonial possessions, and Australia, which had become the home of the displaced colonial apparatus of the NEI, was expected to be the rallying point of the push to restore the status quo ante (see Dorling 1994: x).

Initial Strikes of 1945–46

News of the Indonesian declaration of independence was broadcast by shortwave radio to Australia, and within 2 days desertions from the Dutch government in exile were occurring. Australia was home to an active network of Indonesian nationalists thanks to the release in 1943 (under Australian pressure) of the prisoners transported from the Tanah Merah concentration camp. These ex-prisoners had put their release to good work, and had established Indonesian Independence Committees in major ports that actively propagandised to the Indonesian sailors (Lockwood 1982: 33–35).

Within a week of the declaration of independence, the Dutch ships in Australia were preparing to sail back to the archipelago – with Indonesian sailors manning them – to re-establish 'order'.

The Indonesian Seamen's Union had been monitoring radio from the Indies when the Republic was declared, and with the support of Australia's maritime unions had resolved to mutiny. By early September 1945, several thousand Indonesian sailors were refusing to man their ships, and the Indonesian Seamen's Union was working with the Waterside Workers' Federation (WWF) and the SUA to place a ban on any shipments to aid the Dutch and their allies in their struggle with the Indonesian Republican forces (Fitzpatrick and Cahill 1981: 171). The CSU organised food and supplies for Indonesian sailors left stranded in Australia – including for more than 60 patients who had been expelled from a Dutch-run tuberculosis clinic (Cottle 2003: 146).

On 23 September, the WWF and SUA declared all Dutch ships destined for the Indies 'black'. Dutch forces began using coercion to attempt to get their employees back to work, but to no avail. Nevertheless, there was still a lack of co-ordination on the part of workers, and Indian mariners had continued working Dutch ships, to the confusion and anger of some strikers. Indian sailors had quietly alerted waterside workers to the fact that they were being compelled to load munitions and other military supplies onto ships bound for Java. The Indian Seamens' Union in Australia organised for a mass liberation of workers being coerced on ships in Sydney Harbour, with a flotilla of small boats ferrying Indian soldiers to land from the *Patras*, where they had been held at gunpoint. In other instances, Indian sailors agreed to work ships, only to withdraw their labour at the critical moment that a ship was to leave port, causing maximum disruption. When British forces, concerned by the problems the Dutch were having in re-establishing order, flew Indian sailors by military transport to Australia to scab on the ban, they were met by Indian union organisers asking them to join the strike. The overwhelming majority of these workers did so. Indian organisers also went ship to ship, eventually organising more than a thousand Indian sailors (Goodall 2008: 53–59; Lockwood 1982: 149–155).

The leader of the Country Party, the third largest political party, denounced the strikers as 'busy running rickshaws through White Australia' (quoted in Fitzpatrick and Cahill 1981: 171). The Dutch ships, unable to get the necessary coal from the waterside workers or the necessary manpower, remained idle in Australian ports.

The demands of troublesome foreign workers from Indonesia, China, and India to be repatriated were acceded to from late 1945 through 1947, but the white maritime unionists in Australia were committed to the strike and continued the bans. Attempts by the Dutch to bypass the bans by manning ships with army personnel or fuel ships with firewood failed. Some 31 unions joined the strike, and the bans were retrospectively endorsed by the Australian Council of Trade Unions (ACTU), the peak organisation for unions (Lockwood 1982: 189).

In desperation, the commander of South-East Asia Command, Lord Mountbatten, flew to Australia in March 1946 to negotiate directly with the union movement and Australian government to lift the ban. The leader of the SUA informed Mountbatten that no Dutch ships would leave Australian waters unless expressly approved by the Indonesian Republic. Mountbatten was unable to secure this approval from the Indonesian prime minister, Sjahrir (Fitzpatrick and Cahill 1981: 175).

The conservative press campaigned against the ban, declaring that Australian unionists were holding up 'mercy ships' filled with medical supplies for war-ravaged Asia, despite evidence provided by maritime workers that every single 'mercy' ship was carrying weapons and war supplies. Pressure from the Federal Government led to the New South Wales Trades and Labour Council and the ACTU rescinding its support of the boycott. Only the WWF and SUA pledged to continue the boycott until asked to lift it by the Indonesian government. A small union of coal lumpers (comprising around 30 members) was induced to break the ban in mid- 1946, and most Dutch ships were able to limp out of Australian ports crewed by ex-internees and military personnel. It was 11 months after the declaration of independence that the last Dutch military ship was able to leave Australia, and the ban – though still in place theoretically – became a dead letter as the Dutch military steered clear of Australia or were able to avoid engaging Australian workers for work covered by WWF and the SUA (Lockwood 1982: 211–214).

The Bans Return (1947)

The Dutch were still hopeful of being able to rescue military supplies still in Australia and, in July 1947, WWF Secretary Jim Healy publicly threatened reprisals after a Dutch ship in Melbourne began loading army vehicles (Lockwood 1982: 215). The isolation of the maritime unions still engaging in a boycott was short-lived. In July 1947, the Dutch launched attacks on Republican forces across Indonesia, in breach of undertakings they had given the Indonesian nationalists and the international community to negotiate a peaceful settlement. This was the first 'Police Action' – a phrase concocted to sidestep potential breaches of the new United Nations charter.

The effect in Australia was immediate, with a spontaneous reimposition of bans on Dutch ships by workers covered by the Building Workers' and the Amalgamated Engineers' unions. There was also a significant shift in official policy with the

government's Stevedoring Industry Commission instructing its Brisbane Port affiliate to refuse requests from Dutch ships to refuel and repair (Lockwood 1982: 215–217). The Australian government also referred the actions to the United Nations as a breach of the peace – the first such instance for the new international body (Dorling 1994: vii). An August 1947 meeting of the ACTU, which had been active in breaking the previous ban, passed a motion calling on all Australian trade unionists to refuse to handle any Dutch goods until the ACTU had received advice from the United Nations and the Indonesian trade union movement (Lockwood 1982: 218).

This opposition continued through to the second 'Police Action' of 1948, which was met with similar levels of resistance and provoked significant opposition across class divides. Though only two Dutch ships were in Australian waters, they were denied tugs and were unable to have cargo loaded or unloaded. More importantly, Australians took to the streets to voice their support for Indonesian independence and the new international order. Hundreds of students joined maritime workers in protests, and the first student 'riot' in Australian history led to the arrest of several students of the University of Sydney. The bans continued in place until the formal transfer of sovereignty negotiated by the Dutch and Indonesian nationalists (Barcan 2002: 196–198).

Towards a World Boycott

The strikes against Dutch shipping were not isolated to Australia, although Australia's proximity to the contested islands magnified the significance of strikes there. The International Longshoremen's and Warehousemen's Union of America under Harry Bridges, the dock-workers of London and New Zealand all at some point during Indonesia's struggle for independence withheld labour on Dutch ships or goods in support of Indonesia's claims, as did the dockworkers of Ceylon, Singapore, the Philippines, and China in a truly international boycott aimed at isolating the intransigent Dutch (Lockwood 1982: 228–230).

Motivation of Workers Participating in the Anti-Imperialist Struggle

There were naturally different motivations for labour organisations to take part in the bans. The first distinction that must be made is between the two types of union which simultaneously engaged in strike action against Dutch interests: the formal, almost exclusively white Australian trade unions, and the semi-legal 'foreign worker' unions that had been formed by colonial subjects who found themselves in Australia during the war. The CSU and the Indian Seamen's Union both looked to the nationalist movements in their homelands for political direction; the Indonesian Seamen's' Union in Australia was formed solely within Australia with political guidance from the Tanah Merah network of former political prisoners.

The motives of these foreign-worker unions are clear: as a social group, all were victims of colonisation, and as workers in the dangerous and extremely stratified seafaring industry, the workers shared a common bond of racial and class oppression. The 'foreign-worker' unions in Australia were already notoriously restive, all three having taken action at various times for improved conditions and Australian rates of pay. The war had thrown the imperial division of the world into chaos, and a sense of solidarity was strong enough to transcend ethnic divisions and the usual 'divide and rule' tactics of colonial authorities. These workers were united not just by their exclusion from the white workforce: the CSU and Indonesian Seamen's Unions both had members from the Chinese diaspora community of Java, and many Indian and Indonesian seamen shared a common Islamic faith. Despite this, anti-colonialism was the key to their coalition. At one banquet organised by Indian sailors to thank their supporters, strike leader Mohamed T. Hussain gave a speech in which he declared:

> There can be no new world while there are any people who are slaves of others … The winning of freedom in Indonesia will surely be followed by the freedom of India. For that reason we must do everything possible to see that the Dutch are driven out of Indonesia. (Quoted in Goodall 2008: 55)

The motives of the 'white' unions are more complex. On the one hand, it is clear that sections of the union movement and the communist leadership of the maritime unions in particular were sympathetic to the cause of decolonisation and autonomous unionising amongst Asian sailors. Jim Healy and Elliot V. Elliot, the leaders of the WWF and SUA respectively, were doctrinaire Stalinists who would have been fully aware and supportive of the post-war Popular Front policies of the communist movement which included a renewed emphasis on peace, internationalism, and national liberation for imperial subjects.

Preventing another war into which Australia would be dragged, this time against the nationalists of Indonesia, also loomed large in the rationale of senior union leaders for their support for the ban. This reasoning has spurred much of the mythologising of the black ban, with Jim Healy's biography including the (most likely) apocryphal story of his first public declaration on the Indonesian independence campaign:

> Indonesia is calling, calling for our help, for a black ban on all ships. They call on us to stall the armada with which they would start a new war in the Pacific. Haven't we had enough of war? (Williams 1975: 60)

While it is true that support for decolonisation and war weariness were important factors for the unions in taking a principled stand for Indonesian independence, the WWF – which went the farthest of any union in preventing Dutch forces access to Australian ports – also had its own motives for flexing its industrial muscle, and the Indonesian Revolution can be seen in many ways as the first opportunity that presented itself.

The WWF had been forced to back down over the so-called 'pig iron' dispute of 1937–38, and the Dutch bans were an opportunity to prosecute again the case of conscientious objection. In 1937, workers in some Australian ports – inspired by Popular Front anti-fascism and egged on by communist agitators – refused to load scrap iron on to ships bound for Japan, citing their right to conscientious objection. Workers argued that Australian scrap iron was contributing to Japan's war machine and that it wouldn't be long before

Australia 'got it back in bullets'. The Lyons Government, which had previously expressed guarded sympathy for fascism, quickly moved to stop the dispute escalating into a national ban and to get the 'whar-fies' back to work. Threatened by invocation of the punitive measures in the Transport Workers Act (which had previously been used to 'break' the union on the Melbourne docks), the disorganised union was unable to expand or sustain the strike and was forced into an embarrassing retreat by its own membership without, however, surrendering the principle of conscientious objection to certain jobs (Lockwood 1987: 208).

The war, which in many ways proved the anti-fascist dockworkers right, greatly strengthened the position of the union as it performed the vital role of organising the waterfront for Australia's war effort. At the same time, the exact strength of the union could not be tested as the war placed a dampener on strikes and political activities in the name of the fight against fascism. The union leadership was co-opted onto the Stevedoring Industrial Commission, and worked hand in hand with the Labour Government to improve productivity in exchange for concessions that secured the WWF position on the docks and brought some stability to workers. The end of the war meant that the union leadership could use these concessions and its position of power to fulfil the union's political policy (Beasley 1996: 115–118).

Importance of the Strike to History of Decolonisation of South-East Asia

The strikes and bans that struck Dutch shipping in Australia reveal some important aspects of decolonisation in the aftermath of the Second World War. Firstly, they demonstrate that a transnational anti-imperialist coalition could be formed on the ground, and that support for this coalition was secure enough for people to risk significant punishment to support its anti-colonial actions. No group represented this more than the sailors from India, who walked off their ships or flatly refused orders from their bosses in opposition to the Dutch attempts to reclaim Indonesia. These men suffered great personal punishment for their

stand. Each was labelled a deserter on their discharge papers, effectively barring them from working for any of the large international shipping lines. That the workers of China, India, and Indonesia were striving and suffering for their common goal of ending colonialism a full decade before the Bandung Conference of 1955 shows that there was a heightened consciousness amongst the masses of the links between groups exploited by colonial and imperial structures of domination, not just amongst the educated elite.

Secondly, the strikes provide evidence of the ways that the war had seriously weakened the imperial project in the Pacific. The old colonial apparatus had been swept away by the Japanese, who supported certain nationalist groups with the aim of developing a 'Co-prosperity Sphere' in Asia free from Western imperialism. It would have taken more bloodshed and war to re-establish the colonial states in Asia that the West's elite wanted. But Allied victory in the war had been predicated on class collaboration and the full strength of the working class being integrated into the war effort. When this was withdrawn after the war (due to unhappiness with the self-denial inherent in wartime labour conditions and war weariness), the balance of forces in Western society was ultimately for peace and against intervention in imperial ventures, at least until the Cold War hardened political thinking and isolated pacifism from the political mainstream. (See Hobsbawm (1994: 45–49) for a broad view of what twentieth-century 'total war' meant. Zinn (2005: 407–442) challenged the idea of the Second World War as a 'people's war'.)

Another important element of this struggle is the way that the participants used the language and symbolism of supporting the Atlantic Charter and United Nations in defending their actions. A new language and symbolism had been introduced into the global discourse on colonialism and imperialism. Opponents of the Dutch – be they far-left communists or centre-right anti-intervention liberals, white Australians, or Indian seafarers – couched their demands in the language of support for the principles of the Atlantic Charter. This Charter and its promises of non-intervention, equality, and world peace became

more than an agreement between nations, but also a challenge to national elites from their own citizens to refrain from imperial and colonial enterprises that violated these aspirations. Future actions, such as the anti-apartheid movement and the promotion of human rights, followed this pattern of appeals to a universal standard.

Labour Imperialism

Kim Scipes
Department of Sociology, Purdue University, West Lafayette, IN, USA

Definition

Labour imperialism is the concept that has been developed to describe one labour movement dominating or seeking to dominate the labour movement of another political community, and is overwhelmingly based on analyses of the international activities of the American Federation of Labor, both before and after its 1955 merger with the Congress of Industrial Organizations, creating the AFL-CIO (hereafter styled Labour). Although sometimes used interchangeably with 'trade union

imperialism' (e.g., Thomson and Larson 1978), 'labour imperialism' is the more encompassing term as it includes working with militaries and other right-wing forces, including right-wing labour organisations, while 'trade union imperialism' limits itself to dominating unions.

Introduction

This essay explains the concept of labour imperialism. It begins with a theoretical discussion and then focuses on findings from empirical research. It next discusses three periods of research findings to illuminate the processes by which this conceptualisation has developed, and then presents Kim Scipes's argument about the role of American Nationalism in the development of US labour imperialism. It discusses the work of the AFL-CIO's Solidarity Center with the US Government's National Endowment for Democracy (NED). Finally, it discusses efforts within the American labour movement to challenge this labour imperialism of the AFL-CIO.

Theoretical Discussion

Building on the work of Jan Nederveen Pieterse (1989), Kim Scipes (2010b) discusses the former's conceptualisation of imperialism, and extends it to certain acts by labour, which Nederveen Pieterse does not. Importantly, Nederveen Pieterse's conceptualisation goes *beyond* that of the Marxists, and he argues that, 'imperialism is *domination extended* across *political community borders*' (Scipes 2010b, p. 467). Scipes explains:

A political community usually refers to a nation-state; however, while including nation-states in this category, Nederveen Pieterse's understanding of imperialism extends beyond the nation-state level. He recognizes that because of external domination during past history, groups who share common culture, traditions, languages, and political organization (i.e., 'political communities') may have been incorporated within the boundaries of other political communities. Examples of this include Native American nations being incorporated into the U.S., the Palestinians into Israel, the Kurds into Turkey, Syria, Iran and Iraq, and certainly this is

also true of the indigenous people around the world. Thus, instead of ignoring these peoples or making them irrelevant by confining the understanding of imperialism to only nation-states, Nederveen Pieterse broadens the conceptualization of imperialism to include the domination of one political community over another, and this can exist within the current boundaries of a nation-state; these cross-political community border relationships are based on unequal power relations, with the stronger dominating the weaker.

Nederveen Pieterse also sees different levels of domination. Instead of just confining the concept to political communities, however, he recognises different levels of domination, which can be at a super-state level and a substate level.

In other words, Nederveen Pieterse not only expands the concept of imperialism on a horizontal axis through broadening it to include domination across political community borders, but he also extends it vertically by including different levels of domination. It is in recognizing that domination can take place at a level *below* nation-state domination that allows Labour's across-political-community-borders domination to be included within the concept of imperialism. (468)

And finally, Nederveen Pieterse's conceptualisation is not economistic. In addition to the Marxist claim that imperialism can be for economic gain (i.e. profit), he 'recognizes that imperial domination also can be implemented to achieve political power in the global realm, such as through geostrategic positioning, and through mobilizing and/or controlling social forces in other countries for the benefit of the imperialist force'. These, however, are often in combination, so 'the issue is not a dichotomous categorisation and choice between economics or politics, but rather is a search for primacy at any one time and/or situation: in other words, economic motivations may be primary with political ones secondary, and in others, political control may be primary, and economic ones secondary' (468).

Empirical Findings

Scipes has applied this conceptualisation to theoretically understand the five sets of interrelated empirical findings on the AFL-CIO's foreign

policy programme. This has shown that Labour has actively sought to dominate foreign labour movements since the early years of the twentieth century under Samuel Gompers, and that it continues to do so today despite changes suggested in the early years of the [John] Sweeney Administration:

- Labour's foreign-policy leaders have worked to help overthrow democratically elected governments, have collaborated with reactionary, pro-dictator labour movements against progressive labour movements, and have supported reactionary labour movements against progressive governments (Scipes 2000, p. 12; see among others Andrews 1991; Armstrong et al. 1988; Barry and Preusch 1986; Bronstein and Johnston 1985; Buhle 1999; Cantor and Schor 1987; Carew 1998; Filipelli 1989; Hirsch 1974, n.d. [1975]; Hirsch and Muir 1987; Morris 1967; Nack 1999; Radosh 1969; Schmidt 1978; Scipes 1986, 1990, 1996, pp. 116–125; Scott 1978; Shorrock and Selvaggio 1986; Sims 1992; Snow 1964; Spalding 1984; Weinrub and Bollinger 1987; see also Barker 2011; Bass 2012; Cox and Bass 2012; Rahman and Langford 2014; Scipes 2004a, 2005b, c, 2007a, b, 2010a, b; Sustar 2005).

- This dominative project is a product of forces *within* the labour movement, and not of *external* forces such as the US government, White House and/or the US Central Intelligence Agency (CIA) (Scipes 1989; see also Andrews 1991; Briogi 2013; Carew 1998; Chenoweth 2013; Dower 2013; Filipelli 1989; Hughes 2011, 2013; Nack 1999; Scipes 2010a, b; Stoner 2013; Von Bülow 2013.)

- Labour's foreign-policy leaders have voluntarily chosen to be conscious actors in major initiatives by the US State (Carew 1998; Chenoweth 2013; Correa 2013; Dower 2013; Filipelli 1989; Hughes 2011, 2013; Scipes 1989, 2000, 2005a, b, c, 2007b, 2010a, pp. 83–112; 2010b; Sustar 2005; Van Goethem 2013; Vergara 2013; Wehrle 2013).

- Labour imperialism has been carried out in union members' 'name' yet behind union members' backs, and Labour's foreign-policy leaders have refused to 'come clean' about past operations even when union members have advanced their request for information through established labour-movement processes and procedures (Hirsch 1974, 2004; Scipes 2004b, 2005d, 2010a;

- Labour activists have fought over the years in opposition to this domination (Battista 2002; Hirsch 1974, n.d. [1975], 2004; Hirsch and Muir 1987; Nack 1999; Scipes 1989, 2004b, 2010a, pp. 69–82; Scipes 2012, 2014b; Shorrock 1999, 2002, 2003; Zweig 2005, 2014).

'In short, the range of operations in this effort to dominate labour globally has been extremely well-established, and has generally been referred to as "Labour imperialism"' (Scipes 2010b, pp. 466–467).

Accordingly, the key word that we get from understanding 'labour imperialism' is domination.

Literature Review

Although the subject is not generally well known, there have actually been a considerable number of studies published on Labour's foreign policy over the years (this section is heavily based on Scipes 2010a, pp. xxi–xxiv). The literature critically examining Labour's foreign policy (critical labour foreign-policy studies) has gone through three stages. These have included both exposés and analysis of Labour operations around the world, variously seeing factors internal to or external from the labour movement as being responsible for these operations.

The first stage, which began in the mid-to-late 1960s and continued into the late 1970s, began with a series of exposés. This period ended with George Schmidt's (1978) exposé of the American Federation of Teachers (AFT) involvement in Labour's foreign operations, and Jack Scott's 1978 study of US Labour's operations in Latin America. Most important in this period, however, was Ronald Radosh's 1969 book *Labor and*

United States Foreign Policy, which tried to explain why Labour had such a terrible foreign policy. Radosh's claim was that Labour was acting as an agent of the US government, and that external forces were driving this reactionary foreign policy. Radosh's claim had a long-standing influence on the field of critical labour foreign-policy studies, in which for many years his claim of external forces operating in some form or another was accepted.

Critical labour foreign-policy studies entered a resurgent second stage in the mid-to-late 1980s, and this extended into the early 1990s. Stimulated by US government efforts to overthrow the revolution in Nicaragua, and to counter-act revolutionary processes in Guatemala and especially El Salvador, there was an explosion of interest in and publication of studies about Labour's foreign policy, especially in Latin America but elsewhere as well. This work paid off during the mid-1980s as the National Labor Committee was able to prevent the AFL-CIO leadership from endorsing President Reagan's apparent plan to invade the region (Battista 2002).

This second period was largely a period of exposé, and understanding of Labour's efforts greatly expanded. Like the first period, this one had a summarising book: Beth Sims's 1992 *Workers of the World Undermined: American Labor's Role in US Foreign Policy*, which tried to explain why these efforts took place, and why Labour's foreign policy had been so bad. She too focused on external forces, but with a more sophisticated effort. Sims focused on actors within Labour's foreign-policy 'establishment' and their ties with right-wing political networks, basically suggesting that Labour had been infiltrated and, because of the success of these efforts, had acted against its own efforts (see Scipes 1993 for a review of this important book.)

The third period, which continues today but which overlaps the end of the second one, begins with the publication of an article by this author on the origins of Labour's foreign policy (Scipes 1989). This author rejected the argument that external factors were responsible for Labour's foreign policy, and through a careful examination of the development of business unionism under

Samuel Gompers, not only focused on internal factors but argued that Labour's adoption of business unionism in an imperialist country led to at least passive and, later, active support for US imperialism (this article was updated in Scipes 2010a, pp. 1–25).

Writing independently, four other authors subsequently came to the conclusion that internal factors were responsible for Labour's foreign policy: Ronald L. Filipelli (1989) studied US Labour's activities in Italy between 1943 and 1953; Gregg Andrews (1991) studied the role of the AFL in the Mexican Revolution; Anthony Carew (1998) studied the interjection of CIA funding in post-Second World War Labour operations in Europe; and David Nack (1999) focused on the role of internal conflict within the AFL between progressives and reactionaries around events in Russia beginning with the 1905 Revolution, and demonstrated how the reactionaries' victory then became a force in determining US foreign policy in response to the Soviet Revolution of October 1917. These four works, along with Scipes's 1989 piece, have conclusively established that Labour's foreign policy and operations are determined internally and not externally.

The third period has seen the emergence of a new twist in critical labour foreign-policy studies. Following John Sweeney's election as President of the AFL-CIO in October 1995, there was the hope that Labour would play a positive role internationally. Instead of just criticising what Labour has done, there were several articles published by people in or close to the AFL-CIO who argued for the need for international labour solidarity with workers around the world: see Banks 1998; Blackwell 1998; Figueroa 1998; Mantsios 1998; Shailor 1998; Shailor and Kourpias 1998.

There has also been exposés of Labour's foreign operations in this third period, some historical and some contemporary. This author wrote about the affects of AFL-CIO operations in the Philippines during the 1980s (Scipes 1986, 1990, 1996), and in Chile in the early 1970s (Scipes 2000). Anthony Carew (1998) wrote about AFL efforts in Western Europe in the early post-Second World War years. Paul Buhle (1999) had some

interesting insights into the historical development of Labour's foreign policy. James Ciment and Immanuel Ness (1999) wrote about the National Endowment for Democracy (NED) and its role in funding current Labour operations. Douglas Valentine (1999) wrote about the role of drug trafficking in funding at least some of Irving Brown's work for the AFL in Europe during the late 1940s. And Peter Rachleff (2000) wrote about Labour's efforts in Mexico during the late 1990s to undercut organising among railroad workers against privatisation.

However, the third period has also seen the intensification of efforts within the labour movement itself to challenge AFL-CIO foreign policy and operations. Scipes's 2000 piece – which revolved around a detailed account of Labour's operations in destabilising the democratically elected Allende Government in Chile in the early 1970s –was actually questioning whether Labour wanted to expand on John Sweeney's then more progressive approach to foreign policy, or revert back to the reactionary policies under George Meany and Lane Kirkland (Scipes 2000). Judy Ancel's (2000) response to this article supported Scipes's approach, and argued that we had to recognise that much of Labour's foreign policy was a result of trying to globalise business unionism.

However, Scipes has subsequently repudiated this idea of 'trying to globalize business unionism' as the motivating factor for Labour's imperialism:

> What holds all of this together, what explains Labor's well-established history and contemporary activities described by the concept of 'labor imperialism'? It is argued here that the acceptance and propagation of Labor imperialism is an ideological construct. ... what has guided the Labour movement's foreign policy has been American Nationalism, the idea that the US is unequivocally *the* best country in the world, and that it *should* run the world.

... Labor imperialism flows from the belief in American Nationalism – which is based on race, empire and capitalism (Nederveen Pieterse 1989), *and* the superiority of the 'American' version of each. This is joined with Labor's conscious unwillingness to challenge the efforts of the US Government around the world. At the same time, Labor's foreign policy leaders attempt to impose American 'union beliefs' (as developed by a few key people) and business unionism on workers in other countries for the further wellbeing of the US Empire from US Labor's perspective.

> In other words, Labor imperialism accepts capitalism, and has traditionally accepted race and empire. However, the [2004] actions of the California AFL-CIO have shown that business unionism can accept or reject race and empire; it does not automatically include race and empire. Therefore, the decision whether to accept race and empire is a conscious choice. The argument is that AFL/AFL-CIO Presidents Gompers, Meany, Kirkland, and Sweeney [and Trumka], and their foreign policy teams, have each accepted race and empire, usually at the expense of the US Labor movement [and workers throughout the developing world]. (Scipes 2010b, p. 473, emphasis in the original).

Where this can be most clearly seen is in the Solidarity Center's key participation in the National Endowment for Democracy (NED).

National Endowment for Democracy

Although the decision to work with the US government in its foreign-policy efforts was made and continuously reaffirmed by top leaders of the AFL-CIO – without ever telling most of its leaders or the rank-and-file members – it is notable that US trade unions have chosen to work with the National Endowment for Democracy (NED) (see Robinson 1996; Scipes 2010a, pp. 96–105).

Before going into details, it is important to note what NED is and is not. First of all, it has *nothing* to do with the democracy we are taught in civics classes, concerning one person-one-vote with everyone affected having a say in the decision, etc. (This is commonly known as 'popular' or grassroots democracy.) The NED opposes this kind of democracy. The NED promotes top-down, elite, constrained (or 'polyarchal') democracy. This is the democracy where the elites get to decide the candidates or questions suitable to go before the people – and always limits the choices to what the elites are comfortable with. Once the elites have made their decision, *then* the people are presented with the 'choice' of which the elites

L

approve. And then NED prattles on with its nonsense about how it is 'promoting democracy around the world.'

The other thing to note about NED is that it is *not* independent despite what it claims *ad nauseam.* Operating from funds provided annually by the US government, it was created by the US Congress and signed into US law in 1983 by President Ronald Reagan (that staunch defender of democracy). Additionally, its Board of Directors is drawn from among the elites in the US government's foreign-policy-making realm. Past Board members have included Henry Kissinger, Madeleine Albright, Zbigniew Brzezinski, Frank Carlucci, General Wesley K. Clark, and Paul Wolfowitz. Perhaps most notable among today's board members is Elliot Abrams of Reagan Administration fame.

In reality, NED is part of the US Empire's tools, and is 'independent' only in the sense that no elected presidential administration can directly alter its composition or activities, even if it wants to. Its initial project director, Professor Allen Weinstein of Georgetown University admitted in the *Washington Post* of 22 September 1991 that 'a lot of what we do today was done covertly 25 years ago by the CIA'. In other words, according to Professor William Robinson in his book *Promoting Polyarchy,* NED is a product of a US government foreign-policy shift from 'earlier strategies to contain social and political mobilisation through a focus on control of the state and governmental apparatus' to a process of 'democracy promotion' whereby 'the United States and local elites thoroughly penetrate civil society, and from therein, assure control over popular mobilization and mass movements' (Robinson 1996, p. 69). What this means, as I note in my 2010 book *AFL-CIO's Secret War against Developing Country Workers: Solidarity or Sabotage?* is that 'instead of waiting for a client government to be threatened by its people and then responding, US foreign policy shifted to intervening in the civil society of a country "of interest" (as defined by US foreign policy goals) before popular mobilization could become significant, and by supporting certain groups and certain politicians, then channel any potential

mobilization in the direction desired by the US Government' (Scipes 2010a, p. 96).

Obviously, this also means that these 'civil society' organisations can be used offensively as well, against any government the US opposes. NED funding, for example, was used in all of the 'color revolutions' in Eastern Europe, is currently a factor in Ukraine as well as elsewhere, and continues to be used in Venezuela (Golinger 2014; Scipes 2014a).

How do they operate? The NED has four 'institutes' through which they work: the International Republican Institute (currently headed by US senator John McCain), the National Democratic Institute for International Affairs (currently headed by former US secretary of state Madeleine Albright), the Center for International Private Enterprise (the international wing of the US Chamber of Commerce), and the American Center for International Labor Solidarity (ACILS), also known as the Solidarity Center. The latter is the foreign-policy operation of the AFL-CIO, with Richard Trumka the head of its board of directors. The NED gives grants (allocated by the US Congress) to each of these organisations, both to fund their activities and for them to pass on to 'affiliated' organisations. Approximately 90% of the Solidarity Center's budget each year is provided by the NED or other US government departments or agencies (Scipes 2010a).

As documented, ACILS was indirectly involved in the 2002 coup attempt in Venezuela by participating in meetings beforehand with leaders later involved in the coup, and then denying afterwards the involvement of the leaders of the right-wing labour organisation (CTV) in the coup, leaders of an organisation long affiliated with the AFL-CIO. The NED overall had been active in Venezuela since 1997 (Scipes 2010a, pp. 56–66).

The NED and its institutes continue to actively fund projects in Venezuela today (this section is heavily based on Scipes 2014a). From the 2012 NED Annual Report, we see they had provided $1,338,331 to organisations and projects in Venezuela that year alone: $120,125 on projects for 'accountability'; $470,870 on 'civic education'; $96,400 on 'democratic ideas and values';

$105,000 on 'freedom of information'; $92,265 on 'human rights'; $216,063 on 'political processes'; $34,962 on 'rule of law'; $45,000 on 'strengthening political institutions'; and $153,646 on the Center for International Private Enterprise (CIPE).

Additionally, however, as found on the NED 'Latin American and Caribbean' regional page, NED has granted $465,000 to ACILS to advance NED objectives of 'freedom of association' in the region, with another $380,000 destined for Venezuela and Colombia. This is in addition to another $645,000 to the International Republican Institute, and $750,000 to the National Democratic Institute for International Affairs.

The irony of these pious claims for 'freedom of association' and so forth is that Venezuela has developed public participation to one of the highest levels in the world, and has one of the most free media in the world. Even with massive private TV media involvement in the 2002 coup, the government did not take away their right to broadcast afterwards.

In other words, NED and its institutes – specifically including the Solidarity Center – are not active in Venezuela to help promote democracy, as they claim, but in fact, to act against popular democracy in an effort to restore the rule of the elite top-down democracy. They want to take popular democracy away from those nasty Chavistas, and show who is boss in the US Empire.

Discussion

> This labour imperialism has not gone unchallenged within US Labour. Activists challenging the AFL-CIO foreign-policy programme have met with significant success, most notably in California. The 25th Biennial California State AFL-CIO Convention in July handed a stunning rebuke to national-level foreign policy leaders of the AFL-CIO at their state convention in San Diego.' Over 400 representatives of the state's almost 2.5 million organized workers, about one-sixth of the labour federation's membership, adopted the 'Build Unity and Trust Among Workers Worldwide' resolution. (Scipes 2004b)

However, when taken to the 2005 national convention of the AFL-CIO, this resolution was not even allowed to be discussed on the floor, much less voted upon (Scipes 2005d). This challenge has not risen since to this level of direct contestation.

While he admits that activists have been unable to win the AFL-CIO Executive Council to this position, Scipes argues that, nonetheless, the dominant narrative has been so challenged that the cultural groundwork has been laid for an 'alternative globalization movement [to emerge] in labor', although whether it will do so remains to be seen (Scipes 2012).

Interestingly, within Labour, the work of USLAW (US Labor Against the War) has developed on the ground somewhat in parallel to the efforts of those challenging labour imperialism as a whole, which have been organised by the Worker to Worker Solidarity Committee (WWSC). However, USLAW has developed far beyond the WWSC, and been considerably more successful (Scipes 2012; see Zweig 2005, 2014).

As a result of labour activists' growing opposition to the AFL-CIO's foreign policy program, what appears to be the result of internal differences *within* the AFL-CIO and especially among staff members within the International Affairs Department, and efforts such as US Labor Against War, the Solidarity Center *has* carried out some progressive projects, perhaps most notably in Central America and in the Dominican Republic, as well as in Iraq and Bangladesh (see Scipes 2010a, pp. 73, 218, endnotes 12 & 13; and Armbruster-Sandoval 2013; see also Kumar and Mahoney 2014; Rahman and Langford 2014; Zweig 2014).

However, while unable to yet confirm, it appears to this writer that the Solidarity Center has made some internal decisions regarding its projects around the world, perhaps classifying them into areas strategic and non-strategic to the US Empire, and allowing progressive projects to take place in the nonstrategic areas or strategic areas (such as Iraq) where considerable pressure from within the labour movement to do good things has been developed. As far as this author knows, there have been no detailed published reports by the Solidarity Center of their operations in the former Communist-led states in Eastern

L

Europe or Russia, nor in oil-producing countries around the world, especially in the Middle East, nor have there been any reports by independent researchers about their efforts in many parts of the world.

Thus, while I am glad to know they are doing some things in some places that are progressive or at least not totally detrimental, as long as the Solidarity Center is integrally tied to the National Endowment for Democracy (NED) – see Scipes 2010a, pp. 96–105 – then the charge of engaging in labour imperialism, regarding the overall program, remains. See also Barker 2011. For an indepth study of the Solidarity Center's operations from 2002–09, see Bass 2012. See also Scipes 2014a.

Nonetheless, a collection published in 2013 (Waters and van Goethem 2013) appears to be a political challenge to the 'labor imperialism' school. Focusing on AFL and AFL-CIO efforts during the Cold War, they suggest a more nuanced analysis of AFL-CIO operations. However, while contributing some additional empirical research, close examination shows that they affirm the point made by writers within the labour imperialism school since 1989: that this labour imperialist foreign policy has emerged from within the labour movement. Their enhanced nuance is really over a 'straw person' argument: they argue workers have resisted AFL-CIO domination, yet no-one, to this author's recollection, has argued otherwise. Ironically, while trying to weaken the 'labour imperialism' school, this collection actually strengthens its claims (Scipes 2014c).

Conclusion

This essay has established theoretically and empirically the concept of labour imperialism. It has placed AFL-CIO operations under the auspices of the National Endowment for Democracy. Further, it has discussed some of the impact that challenges to this labour imperialism have had upon the AFL-CIO leadership, including some efforts by the AFL-CIO to support workers overseas, especially in areas non-strategic to the US Empire or in strategic areas where significant

Labour support has been built by activists, as USLAW has done with Iraqi labour activists.

The AFL-CIO leadership has painted itself into a corner. They have shown so little leadership at home in the US that the labour movement today represents only about 11% of all workers – in the private sector, it is below 7% (lower than in 1900). As shown at the 2013 National Convention, they are (desperately) seeking outside allies to bolster their power and impact. The problem they face is that activists in other movements know about their foreign operations, and many are reluctant to join in what is euphemistically referred to as the 'AFL-CIA'. The choice the leadership will have to confront – probably sooner than later – is this: Do they continue to support the US Empire (whose leaders are actively trying to disembowel Labour's power at home), or do they reject the US Empire so they can join other social and political movements here and abroad, and offer a real option to working people? Stay tuned.

Definition

This essay begins by outlining several influential theories of economic imperialism and examines how these relate to the segmentation and stratification of the working class. It then looks at the new international division of labour to understand the growth and enlargement of unequal exchange and capital export imperialism, providing empirical estimates of international value transfer. The conclusion highlights some of the most salient political effects of imperialist class structuration and considers the prospects for anti-imperialist trends at the global level. The essay aims to demonstrate that imperialism is not a matter of history, but a primary factor influencing the course of events in today's world.

Synonyms

Class; Embourgeoisement; Imperialism; Labour aristocracy

Labour, Imperialism, and Globalisation

> I was in the East End of London (a working-class quarter) yesterday and attended a meeting of the unemployed. I listened to the wild speeches, which were just a cry for 'bread! bread!' and on my way home I pondered over the scene and I became more than ever convinced of the importance of imperialism . . .. My cherished idea is a solution for the social problem, i.e., in order to save the 40,000,000 inhabitants of the United Kingdom from a bloody civil war, we colonial statesmen must acquire new lands to settle the surplus population, to provide new markets for the goods produced in the factories and mines. The Empire, as I have always said, is a bread and butter question. If you want to avoid civil war, you must become imperialists. (Cecil Rhodes, 1895, quoted in Lenin 1960/1916, 694)

This essay begins by introducing several influential theories of imperialism and examining how these relate to the segmentation and stratification of the working class. The second section looks at the new international division of labour to understand the growth and enlargement of unequal exchange and capital export imperialism. The third section provides empirical estimates of international value transfer. The conclusion of the essay highlights some of the most salient political effects of imperialist class structuration and considers the prospects for anti-imperialist trends at the global level. The essay aims to demonstrate that imperialism is not a matter of history, but a primary factor influencing the course of events in today's world.

Classical Theories of Imperialism and the Labour Aristocracy

The following section introduces the theory of imperialism and its relationship to the concept of the labour aristocracy, that section of the working class which benefits materially from imperialism and the super-exploitation of oppressed-nation workers (Cope 2012: 122). In particular, we outline the views of some of the most important writers on the subject, namely, Hobson, Lenin, Amin, and Emmanuel.

Hobson

Hobson was a British economist whose foundational experience was the Great Depression of the late 1800s. Proposing an explanation for the same, Hobson developed a theory of under-consumption which argued that as capitalism developed there would be insufficient demand for its manufactures. Hobson's views on under-consumption were first set out in his *Physiology of Industry*. The second key experience in his career was the time he spent in South Africa as a correspondent during the Boer War. Hobson properly viewed that war as resulting from a tension between the mining interests of supporters of imperialism (like Cecil Rhodes) and the farming interests of Boer settlers (Hobson 1900: 197).

In light of these experiences, Hobson suggested that British capital (personified by Rhodes himself) was behind the drive for expansion of the British Empire. He concluded that imperialism was a characteristic of late capitalist development where capital was more productively invested outside of Britain:

> It is open to imperialists to argue thus: 'We must have markets for our growing manufactures, we must have new outlets for the investment of our surplus capital and for the energies of the adventurous surplus of our population: such expansion is a necessity of life to a nation with our great and growing powers of production. An ever larger share of our population is devoted to the manufactures and commerce of towns, and is thus dependent for life and work upon food and raw materials from foreign lands. In order to buy and pay for these things we must sell our goods abroad'. (Hobson 2005: 70–71)

Rivalry with other imperial powers was one of the key economic facts that helped bring about this situation. For Hobson, the erosion of British industrial supremacy resulting from competition with Germany, the US and Belgium made it difficult to 'dispose of the full surplus of our manufactures at a profit' (71). In Hobson's view, a specific type of capitalist, investors, was behind the drive to imperialism. Hobson noted that social inequality ensures that '[large] savings are made which cannot find any profitable investment in this country; they must find employment elsewhere, and it is to the advantage of the nation that they should be employed as largely as possible in lands where they can be utilized in opening up markets for British trade and employment for British enterprise' (73).

Hobson believed that imperialism would result in a situation whereby entire regions of the world would become parasitic upon the labour and resources of colonial territories. Discussing the economic prospects liable to result from the imperialist partitioning of China, Hobson writes:

> The greater part of Western Europe might then assume the appearance and character already exhibited by tracts of country in the South of England, in the Riviera and in the tourist-ridden or residential parts of Italy and Switzerland, little clusters of wealthy aristocrats drawing dividends and pensions from the Far East, with a somewhat larger group of professional retainers and tradesmen and a larger body of personal servants and workers in the transport trade and in the final stages of production of the more perishable goods; all the main arterial industries would have disappeared, the staple foods and manufactures flowing in as tribute from Asia and Africa . . . . (314)

Lenin

The principal motivation for Lenin to develop his analysis of imperialism was the outbreak of the First World War and the associated breakdown of international socialist solidarity.

In Lenin's theory there are five key components:

> (1) the concentration of production and capital has developed to such a high stage that it has created monopolies which play a decisive role in economic life; (2) the merging of bank capital with industrial capital, and the creation on the basis of this 'finance capital', of a financial oligarchy; (3) the export of capital as distinguished from the export of commodities acquires exceptional importance; (4) the formation of international monopolist capitalist associations which share the world among themselves; and (5) the territorial division of the whole world among the biggest capitalist powers is completed. (Lenin 1960/1916, 700)

Lenin's theory of imperialism develops the idea of parasitism, denoting a situation whereby the imperialist countries are transformed into rentier states:

> The export of capital, one of the most essential economic bases of imperialism, still more completely isolates the rentiers from production and sets the seal of parasitism on the whole country that lives by exploiting the labour of several overseas countries and colonies. (ibid.)

For Lenin, investors export capital to obtain 'superprofits', higher profits than are available within their own countries due to lower wages, cheap raw materials, and the ability to secure a monopoly.

Lenin argued that the source of imperialism was investment rather than trade. Citing Hobson, Lenin noted that '[the] income of the rentiers is five times greater than the income obtained from the foreign trade of the biggest "trading" country in the world! This is the essence of imperialism and imperialist parasitism' (ibid.). In its original form, Lenin's investment-focused theory of imperialism can be seen as being in tension with later theories of unequal exchange emphasising the role of trade.

In Lenin's theory, one of the most important consequences of imperialism was its impact on the class structure of the imperialist countries. Lenin argued that the benefits of imperialism would not be restricted to capitalists, but would instead be spread to other classes in imperialist societies, including the working class. There is contention within Marxist theory and ambiguity within Lenin's writings about the extent to which the working class are 'bribed', both in terms of the percentage of the working class thus endowed, and the sum of the subvention. However, Lenin settled upon a broad conception of the labour aristocracy as encompassing much of the working class of the imperialist countries:

> Why does England's monopoly [industrial and colonial] explain the (temporary) victory of opportunism in England? Because monopoly yields superprofits [the] capitalists can devote a part (and not a small one, at that!) of these superprofits to bribe their own workers, to create something like an alliance between the workers of the given nation and their capitalists against the other countries. (ibid.)

Lenin's thinking on imperialism and the labour aristocracy rests on several pillars. First, he emphasises the role of monopoly capitalism, a theme that would later be carried forward by theorists such as Paul Baran and Paul Sweezy in the US. Secondly, he focuses on capital export as the principal means to secure super-profits. Finally, Lenin argues, imperialist states attempt to buy off the domestic workforce to avoid the possibility of revolutionary change. As will be seen in the

subsequent discussion of unequal exchange, there are theories of imperialism that presume neither the existence of monopoly capital, the export of capital, nor any conscious decision by capitalists to bribe the working class on their home soil.

Amin

The majority of Amin's work was concerned with imperialism, unequal exchange, and what he called the law of worldwide value. Amin's position is influenced by the tradition of Baran, Sweezy, and Magdoff in that the motive forces driving imperialism are monopolies (Brolin 2007: 243). It therefore contrasts with Emmanuel's perspective, which places the wages and living standards of imperialist-country workers front and centre of his theory of unequal exchange.

Amin's concept of imperialist rent – profits realised through imperialism – is central to understanding the ways wealthy countries transfer value from the Third World. For Amin, the appropriation of imperialist rent defines capitalism from the moment of its inception (84). Capitalism has not homogenised the world's economic conditions over time, but has instead hardened and deepened the asymmetries between imperialist countries and 'peripheral' economies.

In the most recent edition of his *The Law of Worldwide Value,* Amin was more open about the role of imperialist-country workers as beneficiaries of imperialism and the impact this has had on workers' internationalism (Amin 2010: 91–93). While not using the term 'labour aristocracy', he is clear that the exploitation of the peripheries is the material basis upon which the consensus between imperialist capital and imperialist-country workers rests. For Amin, however, '[the] Southern nations by their victories would create conditions in the North that would once again challenge the consensus founded on profits deriving from imperialist rent. The advance posts of the Northern peoples are dependent on defeat of the imperialist states in their confrontation with the Southern nations' (111).

By contrast with Emmanuel, who was more forthright than most Marxists about class antagonism between imperialist-country workers and workers in the Third World, Amin has typically been softer on this question. Brolin, for instance, suggests that '[the] popularity of Samir Amin ... is largely explained not only by his attempting to place unequal exchange in a perspective where productivity differences matter more, but also ... by the theoretical vagueness on this point, and by his drawing the politically correct conclusion' (Brolin 2007: 243).

Emmanuel

Emmanuel's theory places trade at the centre of imperialism. The basic premise of Emmanuel's *Unequal Exchange* (1972) is that the relative mobility of capital and the relative immobility of labour are fundamental features of the world economy. As a result, the international rate of profit has a tendency to become equal, whereas wage levels in different countries remain unequal. For Emmanuel, differences in wages explain differences in commodity prices. With immobility of labour undergirding international wage and, therefore, price differentials, Emmanuel explains national wage levels as the product of a number of factors which are primarily institutional.

Emmanuel, following Marx, considered that the value of labour power goes beyond the minimum costs of sustaining and reproducing the physiological capacity to work. Historically determined moral and cultural factors (most importantly, the power relationship between labour and capital as manifested, in particular, by the success of the trade union movement in securing gains for workers) establish national wage levels (116–123).

For Emmanuel, unequal exchange occurs through trade between high-wage countries and low-wage countries. As high wages are built into commodity prices in high-wage countries, the goods produced therein command a significantly higher number of goods from low-wage countries. Thus, high wage countries develop quickly and low-wage countries slowly. Wages, then, are the cause, rather than the effect, of economic development. Emmanuel's theory implies that

solidarity between workers of high- and low-wage countries is unlikely with the material interests of each group of workers being diametrically opposed.

Changes in Global Production and the Global Division of Labour

Common to all of the above theories is their formulation in a world where the imperialist countries were the centres of world industry. The international division of labour prior to decolonisation largely involved the production of raw materials in the periphery and the production of manufactured goods in the metropolitan countries. This no longer holds true in the twenty-first century. The well-documented decline of First-World manufacturing beginning in the 1980s has led to a situation today where most primary commodity production *and manufacturing* is done in the Third World. Most First-World workers are employed in 'services', primarily jobs in retail, hospitality, administration, and finance. Thus, the OECD (2011b: 168) reports that, 'on average, services now account for about 70% of OECD GDP'.

Both the unequal exchange (UE) and the capital export imperialism (CEI) paradigms can shed light on this new international division of labour. Complementing these are the theories of imperialist rent and producer/consumer states.

Contemporary Theories of Imperialism

A recent attempt to apply UE in a way that accounts for the post-industrial nature of First-World capitalism is in combination with the global commodity chain perspective (Heintz 2003). A simple summary of global commodity chains is that they 'explicate the interorganisational dynamics of global industries in order to understand where, how, and by whom value is created and distributed' (Appelbaum and Gereffi 1994: 42). Commodity chain analysis was developed by Hopkins and Wallerstein (1986: 159) as a means of explaining transfers of value between countries.

Heintz's (2003) main contribution is to use global commodity chain analysis as a way of bringing UE theory into line with contemporary conditions. In doing so, his analysis reconciles the Leninist approaches to imperialism based on investment by monopoly capital and the Emmanuelist approach based on a competitive global market generating unequal exchange. Thus, Heintz notes that 'one of the key features of global commodity chains is the differences in market power that are evident as we move along the chain. Subcontractors and direct producers face highly competitive conditions while brand name multinationals and large retailers enjoy a much higher degree of monopolistic influence' (11).

Following Amin, a number of theorists have attempted to advance the concept of imperialist rent and explore questions of international worker solidarity under conditions of 'globalisation'. Higginbottom (2013), for example, has applied the concept of imperialist rent to describe the way British firms extract value from South Africa through mining corporations and the importance this has in bolstering the British economy. Like Emmanuel and Amin, he continues a tradition of theorists who see problems for international workers' solidarity in light of this global division.

The most significant work in recent times on the issue of the labour aristocracy, however, has been Cope's *Divided World, Divided Class (DWDC)*. The central argument in *DWDC* is that the ubiquitous white nationalism and cultural elitism of societies in the global North is not the result of false consciousness, misinformation, indoctrination, or ignorance to the extent assumed by much of the political left. Rather, these are ideological expressions of the shared economic interest of a variety of social strata in the First World in maintaining imperialism (Cope 2012: 11).

Critical to *DWDC* is the evidence base around unequal exchange and capital export imperialism. Specifically, Cope measures parasitism effected through the transfer of surplus labour internationally by means of analysing and correlating such economic and demographic variables as income distribution, wage levels, profit flows, trade and investment patterns, growth rates, price levels,

L

industrial output, productivity, unit labour costs, working hours, the composition of imports and exports, occupational structure, and labour supply at national, regional, international, and global levels. Cope follows classical Marxist thinking in positing a clear distinction between prices, profits, and surplus value. For Cope, 'super-profits' are not the result of higher profit rates in the Third World but, rather, of monopoly capitalist accumulation based upon higher rates of exploitation there.

Producer and Consumer States

The concepts of producer and consumer states were developed by Kerswell in order to explain a situation where a country's workforce moves from being a net producer of surplus value to being a net consumer of surplus value. States where the majority of workers are employed in productive labour (within capitalist national accounting this is typically agriculture or industry, but some services may also be considered productive) are known as producer states. By contrast, those economies where the majority of the labour force is not employed in productive labour are consumer states. The definition of 'productive' becomes critical in determining the existence of parasitism in the contemporary global division of labour.

Following Marx, Shaikh and Tonak (1994: 20–21) conceived four forms of activity which every society must carry out, namely, production, circulation, distribution and reproduction of the social order. Shaikh (1980) developed a fifth concept of 'social and personal consumption' to distinguish between consumption that occurs in the course of production and consumption in general. Savran and Tonak (1999: 121–127) demonstrated that in a Marxist sense (where production is an activity which produces use values through the transformation of nature for the purpose of expanding capital), activities concerned with circulation, distribution, and reproduction of the social order and consumption are not productive activities. As such, they subtract from rather than add to the total social product.

Capitalist societies where most workers are not engaged in productive work can exist in one of two ways. First, unit labour costs in the domestic productive sector may be so low as to compensate for the unproductive work done in the rest of the economy (Kerswell 2012: 342). This may be due to the super-exploitation of a group of people *within* the same state; for example, slaves or those facing national oppression, racism, and/or discrimination because of their status as undocumented migrants (342–343). The second case is where an exploitative economic relationship exists *between* states leading to the transfer of value from producer states to consumer states. Under this model, the material basis of consumer states is value imported by means of imperialist rent or unequal exchange. Such states may also be conceptualised as rentier states (Beblawi 1990: 87–88). The main thrust of Kerswell's argument is to recognise the producers of the peripheries as the primary creators of worldwide value (Kerswell 2012: 345).

Empirical Estimates of Global Value Transfer

We propose herein to measure international value transfer resulting from CEI *and* UE. Both of these theories are fundamentally based upon the labour theory of value and we do not consider them contradictory. However, rather than combine our respective estimates of surplus value transfer (1) by means of CEI (surplus value exported from capital-importing countries through the exploitation of their low-wage labour) and (2) by means of UE (surplus value transferred via the under-valuation of non-OECD goods and the overvaluation of OECD goods vis-à-vis average socially necessary labour), and thereby risk double-counting, we shall attempt to distinguish super-profits thus obtained. We propose to do so by weighting our estimates of super-profits obtained through capital export (whether through investment or loans) by the ratio between the nominal value of non-OECD production (industry and agriculture) and that of non-OECD merchandise exports. This should allow for a rough estimate of value generated by

internal non-OECD sales and, hence, the sum of value entering OECD countries represented as money capital as opposed to that portion imported by means of undervalued commodities. We will then add both estimates of surplus value transfer and compare the combined dollar value with the sum of non-OECD labour hours required to produce it, comparing this total with total production labour hours in the OECD. We thereby demonstrate the reliance of the capitalist nations of the global North upon the uncompensated labour of the capitalist nations of the global South.

Estimates of global value transfer necessarily rely on data that measure the results of transactions in marketplaces, not value-generation in production processes. Specifically, GDP or value-added figures represent not the value that a particular firm, nation, or world region has added, but their share of the total value created by all firms competing within the global economy as a whole. For Smith (2012: 86), reliance on GDP as a measure of value creation results in 'a systematic under-estimation of the real contribution of low--wage workers in the global South to global wealth, and a corresponding exaggerated measure of the domestic product of the US and other imperialist countries' and the 'misrepresentation of value captured as value added'. As an economic measure, 'value added' is extraneous to the amount of actual 'domestic' production it purports to quantify. If GDP were an accurate measure of a nation's product, employees in Bermuda, an offshore tax haven boasting the world's highest per capita GDP and producing virtually nothing, are amongst the most productive workers in the world. Unlike much left political economy, which is content to repeat only those conclusions provided for in capitalist accounting terms, we aim to present economic processes within the context of international class relations.

The much-vaunted superior 'productivity' of First World workers (value added per unit of labour, especially as measured in time as opposed to unit cost) is regularly used to justify the prevailing unequal global wage dispensation. For both liberals and Eurocentric Marxists, global wage differentials are the mechanical effect of productivity differentials resulting from

differences in the level of countries' productive forces (these conceived as ineluctably national in origin). By contrast, we argue that although the uneven and dependent development of the productive forces in Third-World countries conditions the value of labour-power (Amin 1977: 194), as Marx (1977/1867: 53) argued, an hour of average socially necessary labour always yields an equal amount of value independently of variations in physical productivity, hence the tendency for labour-saving technological change to depress the rate of profit. Although increased productivity results in the creation of more use values per unit of time, only the intensified consumption of labour power can generate added (exchange) value. Since wages are not the price for the result of labour but the price for labour power, higher wages are not the consequence of (short-term) productivity gains accruing to capital. Rather, in a capitalist society, the product of machinery belongs to the capitalist and not the worker, just as in a feudal or tributary society part of the product of the soil belongs to the landlord, not the peasant (Engels 1995/1884). Nor is the difference between simple and compound (skilled and unskilled) labour at the root of global wage differentials. It is normal today for a completely unskilled and/or unproductive worker to be paid significantly more than a highly skilled and/or productive worker, or for a highly skilled worker in one sector to be paid significantly more than another in the same sector.

As Jedlicki (2007) argues, value-added figures already incorporate those wage and capital differentials which Western socialists justify in the name of superior First-World productivity. In doing so, 'a demonstration is carried out by using as proof what constitutes, precisely, the object of demonstration' (ibid.). The present essay, by contrast, considers that the value of labour-power is a product of global market forces:

> Wage goods which represent the real counterparts of the value of labour power are in fact also international goods with international value. If the labour-day is the same in countries A and B (eight hours, for example) and the real wage of the proletariat is 10 times higher in B (real wage in B equivalent to 10 kilograms of wheat per day as against only one kilogram in A), and world output of wheat

(where wheat productivity is highest) is 10 kilograms in four hours, the rate of surplus value in B will be 100 percent (four hours of necessary labour and four hours of surplus labour) while it will be 1900 percent in A (twenty-four minutes of necessary labour and seven hours and thirty-six minutes of surplus labour). This reasoning does not call for a comparison between the productivities of the two capitalist productions in which A and B specialise; it is meaningless to do so. (Amin 1977: 187–188)

It is incorrect to say, as Emmanuel does, that the products exported by the periphery are specifically produced by the periphery. Rather, as Amin (1977: 209) notes: 'most of the Third World exports are raw materials produced both at the centre and at the periphery: crude oil is produced by the United States and the Arab countries, cotton in the United States and India, iron ore in Europe and Africa. Many of these raw materials are close substitutes for one another: tropical oilseeds and those from the temperate zones, natural fibres and rubber and their synthetic substitutes, tropical fruits and those of Europe'. Moreover, the techniques used to produce most of the exports from the Third World are the same as those used at the centre, in the same branches, particularly those dominated by the monopoly capital that controls the modern export industries of the Third World, including those producing for local markets. However, real wages are much lower in the periphery (211). Thus, Amin defines unequal exchange as 'the exchange of products whose production involves wage differentials greater than those of productivity' (ibid.).

Bracketing the difficulties involved in using value-added figures on productivity to measure rates of exploitation and global surplus value transfer, however, we will placate social chauvinist apologies for global wage differentials and assume *ad arguendum* that productivity may be defined in purely price-based terms. Thus correcting for divergences in productivity, we find that divergences in wages exceed these such that there is a huge transfer of uncompensated value from the neo-colonial periphery to the imperialist centre of the world economy. Our intention throughout the following calculations is to reasonably correlate value-transfer estimates with estimates of the abstract universal labour

(average socially necessary labour time) involved in production.

First, we obtained the total full-time equivalent global workforce in industry and agriculture by multiplying the economically active population (EAP) in each of 184 countries by the rate of full employment for its corresponding global income quintile and then by multiplying this total by the percentage of each country's workforce in industry and agriculture. The figure thus obtained was, finally, multiplied by 133%, since we have defined 'under-employment' as being employed for only one-third of the hours of a full-time worker (CIA World Factbook 2012; ILO LABORSTA Database; Köhler 2005).

In 2010, the OECD accounted for 16.5% of the total full-time equivalent global workforce in industry and agriculture of approximately 1.15 billion, or 190 million workers, whilst the full-time equivalent non-OECD workforce in industry and agriculture accounted for 83.5% of the total, or 960 million workers. Merchandise exports from the non-OECD to the OECD were nominally worth US\$5.2 rillion and merchandise exports from the OECD to the non-OECD were worth US\$2.5 trillion (see Fig. 4). The "import content of exports" measure provides an estimate of the value of imported intermediate goods and services subsequently embodied in exports. Changes in the same can reveal the evolution of domestic value added due to exporting activities. In 2005, the average import content of OECD exports was 33% and the average import content of non-OECD exports was 17% (see Fig. 1). Weighing the nominal value of goods exports by that portion that was added domestically, we can say that OECD to non- OECD goods exports were worth (US\$2.5 trillion * 0.67) US\$1.68 trillion; and non-OECD to OECD goods exports were worth (US\$5.2 trillion * 0.83) US\$4.32 trillion, or 13.1% and 60.8% of total value added in industry and agriculture of the OECD (US\$12.8 trillion) and non-OECD (US7.1 rillion), respectively. Therefore, we can say that the domestic value-added export-weighted workforce of the non-OECD to OECD goods sector is (960 million * 0.61) 585,600,000 workers, and the domestic value-added export-weighted workforce of the

L

OECD to non-OECD goods sector is (190 million ∗ 0.13) 24,700,000 workers. Each non-OECD worker in the goods exports to the OECD sector generated domestic value-added worth (US$4.32 trillion/585.6 million) US$7,377; and each OECD worker in the goods exports to the non-OECD sector generated domestic value-added worth (US$1.68 trillion/24.7 million) US$68,016. The productivity ratio between the OECD and

non-OECD is, by this measure, (US$68,016/US$7,377) 9.2 (Fig. 2).

Meanwhile, OECD manufacturing workers were paid approximately 11 times more than their non-OECD counterparts in 2012 (see Fig. 3). Thus, wage differentials exceeded productivity differentials by an approximate factor of 1.2 (11/9.2). Adjusted by this figure, which represents a coefficient for the real value of goods exports to

Labour, Imperialism, and Globalisation, Fig. 2 Value Added by Activity in 2010 (US$ Trillions)[a]. (Source: The Economist 2010: 110–242. [a]For Regional GDP data based on United Nations estimates, (see http://unstats.un.org/unsd/snaama/dnltransfer.asp?fID=2). Approximate sectoral GDP estimates calculated from a sample of 62 countries' value added by activity as percentage of national GDP (The Economist 2010, pp. 110–242). The countries sampled were: (OECD) Australia, Austria, Belgium, Canada, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Israel, Italy, Japan, Mexico, Netherlands, New Zealand, Norway, Poland, Portugal, Slovak Republic, South Korea, Spain, Sweden, Switzerland, Turkey, United Kingdom and United States; (non-OECD) Algeria, Argentina, Bangladesh, Brazil, Bulgaria, Cameroon, Chile, China, Colombia, Cote d'Ivoire, Egypt, Hong Kong, India, Indonesia, Iran, Kenya, Latvia, Lithuania, Malaysia, Morocco, Nigeria, Pakistan, Peru, Philippines, Romania, Russia, Saudi Arabia, Singapore, Slovenia, South Africa, Taiwan, Thailand, Turkey, Ukraine, United Arab Emirates, Venezuela, Vietnam and Zimbabwe. Agriculture includes farming, fishing, and forestry. Industry includes mining, manufacturing, energy production, and construction. Services cover government activities, communications, transportation, finance, and all other private economic activities that do not produce material goods.)

Labour, Imperialism, and Globalisation,
Fig. 3 Inflation-Adjusted Average Hourly Manufacturing Wages, 2012[a]. (Source: International Labour Organisation (ILO) LABORSTA Database [a]Hourly wage rates in national currencies for both OECD and non-OECD countries were divided by each region's average working hours in manufacturing; i.e. 39.7 and 42.2 h per week, respectively. National currencies were converted into US dollars using www.google.com, www.coinmill.com, and http://finance.yahoo.com/currency-converter/. Having converted the latest available wage data for each country into US dollars, these were then adjusted for inflation using The Inflation Calculator http://www.westegg.com/inflation/. This calculation does not account for changes in the value of a country's currency relative to the US dollar from the latest year for which data is available to 2012, nor the possibility of a country's wages having since increased more than inflation.)
the OECD from the non-OECD countries under conditions of equal exchange (equal international distribution of value added according to equivalent productivity) and where the overall price stays the same, non-OECD goods exports should have been worth approximately US$6.24 trillion. Since only US$5.2 trillion was paid for these goods, unrequited value worth over US$1 trillion was transferred from the non-OECD goods exports sector by the OECD in 2012. If OECD

goods exports to the non-OECD were overvalued by the same proportion, then OECD merchandise exports to the non-OECD should only have been worth around (US$2.5 trillion/1.2) US$2 trillion. Since US$2.5 trillion was actually paid for these goods, unrequited value worth US$500 billion was transferred from the non-OECD goods export sector by the OECD in 2012. In total, our very conservative estimate is that around US$1.5 trillion of value was transferred from the non-OECD by means of unequal exchange in 2012.

In 2002, the outward FDI stocks of OECD countries were valued at around 22% of OECD GDP (Economic and Social Research Institute Japan 2006). Assuming rates of FDI have remained constant since then, OECD FDI stock was worth approximately US$9.8 trillion in 2010. FDI in non-OECD countries by OECD countries was around 25% of total outward FDI stock in 2002, and therefore worth approximately US$2.45 trillion in 2010 (ibid). Using US Bureau of Economic Affairs data, Norwood (2011) has calculated that the average rate of return on US direct investments in Central and South America, Africa, Asia, and the Pacific was 12.5% (compared to around 9.1% for Europe) in 2009. (The rate of return is measured by dividing income in that year by the average of that year's and the previous year's stock of investment (historical cost basis.) Therefore, repatriated profits from the exploitation of Third-World workers amounted to approximately US$300 billion in 2010.

The difference between the nominal value of OECD profit repatriation and its value were the non-OECD workforce paid according to the median average value of labour-power between the two zones (the median wage pertaining between the average manufacturing wage in the OECD and that in the non-OECD) represents super-profits. In 2012, OECD hourly wages in manufacturing were a mean average US$29.07 per hour, and non-OECD wages in manufacturing were a mean average US$2.66 per hour. OECD manufacturing wages were approximately 11 times those in non-OECD manufacturing, with the median wage pertaining between the two regions being US$15.87, six times the

average value of non-OECD wages and 55% of the value of OECD wages (see Fig. 3). Multiplying the US$300 billion in repatriated profits accruing to the OECD from the non-OECD in 2010 by the average wage factor thus calculated, we can estimate that (US$300 billion * 6 – US$300 billion) US$1.5 trillion of uncompensated value was transferred from the non-OECD to the OECD in 2010. However, in order to distinguish uncompensated value transfer from returns on imperialist capital export alone from that portion resulting from unequal exchange of commodities at equivalent productivity, we will weigh our estimate of super-profits from capital export imperialism by the share of total non-OECD value added in agriculture and industry (US$7.1 trillion) that is greater than the value of non-OECD commodities exports to the OECD (US$5.2 trillion), namely, 27%. Accordingly, we estimate that approximately (US$1.5 trillion * 0.27) US$405 billion of uncompensated value was transferred from the non-OECD to the OECD by means of capital export imperialism in 2012.

Combining these estimates of global value transfer due to unequal exchange and capital export imperialism, and ignoring value transferred by means of transfer pricing, royalties from intellectual property rights, and interest on loans (Babones et al. 2012: pp. 199–200), we can say that approximately US$1.9 trillion worth of value was transferred from the non-OECD to the OECD sui *gratia* in 2012. Weighing this total against the number of full-time equivalent non-OECD workers in agriculture and industry required to produce it, we may estimate the total amount of value (as measured in average socially necessary labour time) that the OECD extracts from the non-OECD and, hence, the rate of surplus value pertaining in the OECD itself. Thus, 960 million full-time equivalent non-OECD workers in industry and agriculture created a nominal value added of US$7.1 trillion in 2010. As such, we can say that if the uncompensated value transferred from the non-OECD to the OECD in 2012 amounted to 26.8% of the total value of non-OECD industry and agriculture, then this represents the surplus labour of (960 million * 0.27) 259,200,000 workers. That means that for

every one fulltime equivalent worker employed in OECD industry and agriculture (190 million), there are 1.4 non-OECD workers in industry and agriculture working for free alongside her. By this estimate, the rate of surplus value or of exploitation (i.e., the ratio of surplus labour to necessary labour) is negative for the OECD countries (Fig. 4).

This analysis is corroborated by a more straightforward comparison between the share in global consumption and the contribution to global production of each of the world's income deciles.

In Fig. 5 below, the EAP is defined as all persons who furnish the supply of labour for the production of goods and services. As such, the EAP includes hundreds of millions of persons engaged in private, so-called subsistence farming in the Third World. We have favoured Eurocentric assumptions that subsistence farmers contribute nothing to global production (even though most contribute money rent to capitalist landlords and supply goods for sale on the market), and have assumed that only wage-labour capable of generating surplus value is productive. [a]Figures for merchandise trade shares are approximate, based on 34.3% of North American merchandise exports and 20.4% of European merchandise exports going to South and Central America, the CIS countries (Commonwealth of Independent States, the former Soviet Union), Africa, the Middle East and Asia, respectively, and 42.6% of South and Central American, 58% of CIS, 52.9% of African, 20.9% of Middle Eastern and 34.3% of Asian merchandise exports going to North America and Europe, respectively.)
Labour, Imperialism, and Globalisation, Fig. 5 Global Exploitation Index, Production/Consumption Ratio for World Income Deciles. (Sources: CIA World Factbook 2012; ILO LABORSTA Database; Köhler (2005); Piketty and Saez (2004); United Nations Statistics Division n.d.)

production is defined as the working hours of full-time equivalent production-sector wage-employment in all countries. As above, the total production workforce was obtained by multiplying the EAP in each country by the rate of full employment for its corresponding global income quintile and then by multiplying this total by the percentage of each country's workforce in industry and agriculture. The figure thus obtained was then multiplied by 133%. To calculate capitalists' share of household income expenditure, Piketty and Saez's (2004) measure of the income share of the top echelons of the US income distribution (42%) has been used as a global benchmark. Subtracting the share of wealth of the top 10% of the population from total household consumption expenditure figures for each country allows a focused comparison of relations between the world's working and middle classes (i.e. the bottom 90% of the population).

In Fig. 5, each of the world's working- and middle-class income decile's contribution to global production is divided by its share in global consumption to arrive at a rate of exploitation, a level beyond which households consume more than they produce. The illustration shows that the top 20% of the world's population consumes an average 4.6 times more than it produces. Those countries where the bottom 90% of the population consumes more than double their share in global

production are, in descending order of magnitude: Hong Kong, Luxembourg, US, The Bahamas, Norway, Kuwait, Switzerland, United Kingdom, Australia, Denmark, Ireland, Israel, Canada, Netherlands, Kyrgyzstan, Belgium, France, Germany, United Arab Emirates, Japan, Italy, Singapore, Sweden, Austria, New Zealand, Finland, Iceland, Spain, Greece, Malta, Cyprus, Barbados, and the Republic of Korea. For a better understanding of national disparities between consumption and production it is, of course, necessary to determine the degree of inequality within the bottom 90% of the population. Nonetheless, these figures make it clear that those working- and middle-class populations inhabiting countries in the top 30–20% of the world by income are consuming almost exactly what they produce. The majority of the world's working class and middle class, in countries whose combined populations are at least 70% of the world total, meanwhile, is consuming significantly less than it produces, by an average factor of 4.8.

The Political Results and Prospects of Mass Embourgeoisement

The 'imperial endowment' (Alexander 1996: 59) enjoyed by the Western European world has provided it with inconceivably large subsidies for its

nascent industry and subsequent productivity in the form of:

- The addition of nearly 10 million square miles to Western Europe's 2 million square miles of territory by 1900, and the ongoing occupation of a quarter of the earth's most productive land;
- The theft of up to 20 million Africans and their subsequent enslavement;
- The indentured servitude of millions of Asian workers;
- The onerous taxation of millions of colonial peasants;
- The plunder of hundreds of tons of gold and thousands of tons of silver from Latin America alone, without which Western capital markets would have been impossible;
- The import of underpriced colonial foods, industrial materials, and medicines including cotton, maize, wheat, rice, potatoes, rubber, tea, tomatoes, turkeys and countless other products;
- The deliberate destruction of colonial industries and the capture of guaranteed markets for Western manufactures;
- The wholesale restructuration of colonial markets to serve Western interests;
- The unrestrained use of land and natural resources as dumps for toxic waste and other noxious by-products of industry; and
- The unequal trade and tariff regulations that negatively impact the profit margins of Third-World exporters (Alexander 1996: 59–70).

Propaganda by the corporate media and governments of the *haute bourgeoisie* augments and provides popular justification for the national, ethnic, and racial hierarchies established through job discrimination, segregation, and imperialism. In contemporary Western culture, reflex racist tropes concerning the 'cultures' of Third-World peoples prevail. The more backward aspects of social and political life in the global South have become magnified, hypostatised, and detached in people's minds from the historical legacies and current realities of economic dependence, exploitation by imperialist capital and its local clients, and violent oppression maintained by the

principal institutions of the former colonial powers and their successors. Yet those forces of democracy championing the rights and interests of workers, women, ethnic minorities, and oppressed nationalities remain the principal enemies of the imperialists and their domestic supports. Insofar as imperialism is able to maintain conservative structures of class rule, so must all the forces of progress be set on the back foot especially, but certainly not exclusively, in the poorer nations.

Whilst it is scarcely conceivable that a bourgeois working-class or labour aristocracy such as is described here should have the organisational wherewithal, the strategic vision, or the material interest to identify its short-term welfare with that of the majority working class in the global South, ultimately, no nation can be free if it oppresses other nations (Engels). The industrialisation of the Third World, especially following the restoration of capitalism in China, led to an explosion of foreign investment and the exponential growth of world trade. Under neo-liberalism, global labour arbitrage (Roach 2003) created the conditions for the commercialisation and financialisation of the imperialist economies, with all of the known consequences. In the wake of the Great Recession begun in 2008, the core imperialist powers are increasingly involved in a deadly military effort to shore up their hegemony. This has taken the form of: (1) the subjugation of hitherto sovereign Third-World states, particularly those with insufficiently 'open' economies and too independent leaderships; and (2) heightened tensions with emergent imperialist rivals, principally Russia and China, in order to exclude them from strategic markets, particularly in arms and energy.

In the Third World, the demand for national self-determination is again coming to the fore as imperialism and capitalism have merged symbiotically. The rise of revolutionary national liberation movements and post-colonial states, changes and developments in the productive forces (information, communication, and transport technology) and monopoly capital's drive for new ways to sustain profit rates after the oil crisis of the 1970s are coterminous with the semi-industrialisation of the Third World. Under the

new globalised capitalism, producer and con-
sumer states are bound together through the mech-
anisms of unequal exchange and finance
imperialism. More than ever, for the exploited
working classes of the global South, the struggle
for national sovereignty and the reclamation of the
land to meet popular needs is indissolubly linked
with the struggle against capitalism.

Definition

The capture of African indigenous land was one of the first acts of imperialism, leading Africans to found movements such as the Aborigines' Rights Protection Society. While coercion was the usual approach adopted by international forces and their comprador local allies, the claim that such land capture would ultimately ensure to the benefit of locals has remained a core logic, as has the international character of the process now regarded as 'land grab.'

L

Introduction

The capture of African indigenous land was one of the first acts of imperialism, leading Africans to found movements such as the Aborigines' Rights Protection Society. While coercion was the usual approach adopted by international forces and their comprador local allies, the claim that such land capture would ultimately ensure to the benefit of locals has remained a core logic, as has the international character of the process now regarded as 'land grab'. It is a phenomenon for which mainstream economics is poorly equipped to analyse. A Marxian framework is a better alternative, even if that too requires modification (Obeng-Odoom 2015).

The aim of this essay is, therefore, to adapt a Marxian framework in placing the land-grab discourse within global capitalist dynamics and imperial networks. It conceptualises land grab around the imperialist notion of primitive accumulation and expanded reproduction. While the debate around this subject has been cast into a simplistic binary of whether or not land grab is

tantamount to imperialism and over-emphasis on the newness of land grabbing as argued in international relations scholarship (see Margulis 2012), a synthesis of the current state of knowledge undertaken from a historical materialist perspective clearly shows that there are several similarities between old enclosures and current land grabs; for example in terms of displacement and hence changes in property relations, but also several points of dissimilarity. Indeed, there are new actors, motives, and processes that do not, for example, generate jobs in the industrial sector as old enclosures did. The land grab–imperialism nexus in Africa is therefore better framed as a 'variety of imperialism'.

Thus, rather than restrict our analysis to 'enclosures', based on the assumption that contemporary processes are simply a progression from and modern manifestation of primitive accumulation in Britain which is being extended to partially capitalist spaces of the world, or confine our discussion to the 'newness' of the phenomenon, this essay frames land grabbing as part of the dynamic dialectic processes of accumulation by dispossession and expanded reproduction that are fundamental to the working of capitalism but in ways that sometimes mimic former enclosures but do not exactly follow the paths of the past.

The essay begins with a conceptual discussion of imperialism and anti-imperialism. This background provides a framework through which it discusses empirical examples. The illustration is not exhaustive. It is, instead, limited to land grabbing and imperialism in Africa, where the phenomenon is most advanced and most pervasive. However, the analyses developed are relevant to other regions, especially Latin America where recent research has also revealed growing number of cases of land grabs (Alonso-Fradejas 2012; Berlanga 2012; Borras et al. 2012; Galeano 2012; Urioste 2012; Wilkinson et al. 2012).

Imperialism and Anti-imperialism

As other essays in this work show, imperialism is a slippery concept. The old notions of imperialism offered by thinkers such as Lenin were organically linked to colonialism and the thirst for continuing profit. Later conceptions, such as those offered by Rosa Luxemburg, suggesting that without external markets capitalism would falter, were notably criticised by the African Marxist political economist Amin Samir as too simplistic and not very attentive to imperialism itself. To Samir (1977: 108–109), imperialism means more than the expansion of capitalism, and it is distinctive for intensifying uneven development. It generates a labour aristocracy in the centre and leads to the erosion of backward areas at the periphery constituted by small and medium-scale economic activities that are not competitive. It is typified by the ascent of monopoly capital in the core areas of the world system and the suppression of weaker classes at the periphery. This classical definition is offered by other Marxists, too. They are tied to notions of globalisation and internationalisation. Two commentators writing for the *Review of African Political Economy* put it succinctly as that 'bring imperialism back into the globalisation debate' (Bush and Szeftel 1999). So, there is a strong connection with global expansion of capitalism. But imperialism is not just about capitalism expanding on a global scale. It is, instead, about domination of foreign control. The 'foreign' in the hegemonic process can be by the state or other supranational bodies. There are those who contend that the state has withered due to globalisation and hence imperialism is mainly by other political economic actors such as transnational corporations. A second view positions US power as imperialist and focuses greatly on American expansionism and Zionism. A third holds that imperialism remains mainly in the domain of interstate conflict and rivalry (Dunn 2009: 306–317). This third view is currently the most dominant and is styled as the new imperialism literature (Robinson 2007). David Harvey is a chief advocate of it, emphasising in his book *The New Imperialism* (Harvey 2003) interstate rivalry and how this leads to domination. It has a ring of the classical core–periphery analysis to it and it powerfully shows change and continuity in imperialist processes by highlighting the continuity of 'primitive accumulation' in 'accumulation by dispossession'. Yet its artificial separation

of politics from economics and the placing of one sphere as economic and the other as political have drawn sharp criticism (Brenner 2006; Dunn 2009; Robinson 2007).

To Robinson (2007), contemporary imperialism is broader and multipronged. It is certainly capitalism on a world scale, but the domination is by multiple actors within different class fractions within and without the territory of domination. Power here is diffused rather than wielded mainly by the nation state or the transnational corporation. Similarly, the boundaries, if any, between the economy and the polity are blurred. There is a co-dependence and each sphere has elements of the other while the two are also fused together. But, the hallmarks of imperialism remain ever evident despite the substantial changes in the form or the process. These are empire building, territorial expansion, the alloy of faraway markets previously unarticulated to centres of power, and domination of the weak by the strong classes within an expanding but highly exploitative world system which is frequently portrayed as good for the exploited. Messianic features often imbue the imperialist self-belief in being on a form of holy mission for the good of all (Dunn 2009: 121–127; Stilwell 2012: xviii), although the source of the right to embark on such a pilgrimage of honour is not made explicit. This epoch of imperialism in Africa is a third type, rather different from the two earlier versions recently analysed by Zack-Williams (2013) for the *Review of African Political Economy*. According to Zack-Williams, the first epoch (1875–1945) covered the period of colonialism and fits of independence, and the second epoch was typified by imperialism without by a formal coloniser (1940s and 1950s–1990s). The present imperial process (2000–) is therefore distinct from the old forms of imperialism.

However, like earlier forms of imperialism, the contemporary iteration is organically linked to resistance of various kinds which can be called anti-imperialism, as other essays in this book show. But unlike past forms of anti-imperialism, which emphasised only a workers' revolution, the present struggles are multifaceted, taking the form of various acts of discontent (Moyo and Yeros

2005), not all of which are in the nature of social movements.

Regarding land grabs within an imperialism–anti-imperialism framework is long overdue. However, the question to ask is what forms they take, and of which variety of imperialism and anti-imperialsim they may be. These are empirical questions and so necessarily require that we examine examples on the African continent where the process has been most evident. Besides, dialectical materialism, the approach most widely used to inform analysis of imperialism of whichever variety, is historically specific and places emphasis on praxis (Marx 1990: 17–25). This essay loosely follows that orientation, and will therefore entail concrete examination of material experiences.

Land Grabs: Scale, Uses, Processes

The control of land has a long history going back to the days of the land enclosures in Great Britain. Yet the fencing and control of common land continued in the nineteenth-century colonial era with attempts to declare most indigenous land *terra nullius*, with varying consequences which included displacements and the formation of protest movements such as the Aborigines' Rights Protection Society of Ghana. The postcolonial era saw a continuation of colonial land policies and later so-called 'land reforms' sometimes related to structural adjustment programmes, especially in Africa, Asia, and Latin America, where the reaches of the market were extended to widen property relations in land. Such neo-liberal land reforms, which are essentially neo-colonial law making because they are inherited forms of previous policies, have continued to commodify land tenure in the global South (Alden Wily 2013; Moyo and Yeros 2005; Njoh 2013).

Since 2007–08, large tracts of land have been leased to foreign and local interests for periods sometimes as long as 99 years. When GRAIN, the global NGO, first reported this surge in large-scale land acquisition in 2008 (Alden Wily 2012; Borras and Franco 2012), the initial estimates given were 2.5 million ha of land.

L

Subsequently, the World Bank updated the figure to 56 million ha around 2010. Now the figure seems to be around 71 million ha (International Land Coalition 2012).

These figures are likely to be conservative and of indicative value only because a substantial number of land deals go unreported, are shrouded in secrecy, and do not make it as far as collation by any central body. Furthermore, some of the countries offering deals have done no proper scientific mapping from which any categorical claims can be made. In the case of South Sudan, for example, one deal was said to be for 600,000 acres in Lainya, but cross-checking shows that the county of Lainya is itself only 340,000 ha in extent (Pearce 2012: 45). More fundamentally, to date, a definition of land grab has remained elusive. The Food and Agriculture Organisation attempted a three-criterion definition in which land grab is said to have occurred only if a transaction in land covers over 1,000 ha, involves foreign governments, and leads to food insecurity. However, this definition has been rejected as parochial and misleading, as it says nothing about the amount of capital that is used in tilling the land and restricts the consequences of land grab to food insecurity (Borras et al. 2012).

While some of the leased land has been put to the development of recreation complexes and other parts to the development of nature reserves, most land-use change has been of four kinds: from food cultivation for local consumption to food cultivation for export; from food to biofuel production; from nonfood to food cultivation; and from non-food to biofuel production (Borras and Franco 2012). These changes are not always clear-cut. In Agogo, Ghana, for example, one transnational land lease entered into by ScanFarm started as jatropha land lease, but the lessees changed the originally agreed use to food production. Sometimes, farms also have different land uses simultaneously (Wisborg 2012). According to International Land Coalition (2012: 4), 78% of land leases are used for agricultural production, with biofuel production taking about 75% of the agricultural category. The rest are for mineral extraction, forest conservation, and tourism.

In addition to 'physical land', water has also been grabbed for the purpose of irrigating the land. In Senegal, a 400,000-acre deal with Saudi Arabia is close to River Senegal which will be the source of irrigation (Pearce 2012: 33). In South Sudan, the new government seems to be negotiating a deal to send water to Egypt by preparing to allow Egypt to construct a canal to channel water from the Nile around the giant Sudd Swamp, which is the second largest swamp in the world and the site of great wildlife diversity and pasture. The canal will enable the Nile to deliver more water to Egypt, much of which currently evaporates from the swamp during its year-long journey (Pearce 2012: 49). Under international law, host countries must generally undertake to provide water to investors as without water the investors cannot fully benefit from their investment. In turn, governments may be sued if, say, in the process of supplying water to their citizens, they are unable to satisfy international private interests (Pearce 2012:102–103).

The identity and methods of the land grabbers vary greatly. Countries, state corporations, private interests, missionaries, NGOs, and universities are all involved. International interests dominate, although there are local actors involved in land deals, too. Unlike pre-2007/8 land leases, the current lessees come from within and without the West, including from countries such as South Korea, Saudi Arabia, and India which have been prominent in land purchases. 'Traditional' land grabbers such as the UK have remained active, too. Three main methods have been used to obtain land leases, namely negotiations with: central government without consulting local government and local chiefs; local chiefs without consulting central and local government and local communitie;, central and local government and local elites, including chiefs, but without consulting other elders in the communities. The triggers or factors influencing success and failure of negotiations are mainly religious affinity, whether indigenous title is recognised, national governments' business policies, and level of development (Maconachie and Fortin 2013; Pearce 2012; Schoneveld et al. 2011). Also, rich governments improve their chances of

seeking land deals by investing in the dilapidated infrastructure of poorer countries in return for land. That is evidently what for a while was going to happen in Kenya where the government of Qatar was to build a billion-dollar port facility in exchange for 100,000 acres of irrigated land on Lamu Island (Pearce 2012: 36).

The role of the global financial institutions, such as the World Bank, has been shadowy, consigned to carrying out studies to identify vacant land such as *Rising Global Interest in Farmland. Can It Yield Sustainable and Equitable Benefits?* (World Bank 2010). Also, they have favoured the registration of titles to make it easier to trade in land. On the part of investors, the financial power houses have offered huge loans, others have directly invested, and many more have offered guarantee and investment advice. Glossy magazines have been produced as has an aggressive campaign to encourage people to invest.

The Many Posited Motives, But Common 'Improvement' Logic

Since the actors vary, specific reasons for obtaining large tracts of land vary too. For some, it is investment; for others, it is food security or sustainable energy development. These reasons are not unconnected. For example, for those who look at investment, they are doing so mainly because the food and energy issues make demand for certain crops higher and hence investment in land is promising. Thus, it is possible to be 'ethical' and rich at the same time, so the argument goes. There are those who stress green growth and for them buying out indigenous owners who destroy the natural environment is a way to attain sustainable development. Neo-liberals have used a discourse of 'economic development' to support the varied motives of land grab. That is, land grab, from the perspective of neo-liberals, is a win-win situation where poor people can be helped while investors help themselves. Land grab, advocates claim, will lead to agricultural modernisation, mechanisation, and hence development in Africa. For neo-liberals, it is a win-win situation where

more food will be produced, more jobs will be created, more investment will flow, and more mechanisation will take place (Collier 2009).

This line of reasoning is familiar. Colonisation was even posited as good for the colonies. As one commentator at a banquet to end slavery observed:

> Men's destiny lies in the South ...To fashion a new Africa, to make the old Africa amenable to civilization – that is the problem. And Europe will solve it. Go forward, the nations! Grasp this land! Take it! ... Change your proletarians into property-owners! Go on, do it! Make roads, make ports, make towns! Grow, cultivate, colonize, multiply! (quoted in Rist 2008: 51, exclamation marks in original)

The ardent supporter of colonialism Cecil Rhodes once noted that 'we colonial statesmen must acquire new lands to settle surplus population, to provide new markets for the goods produced in the factories and mines. The empire, as I have always said, is a bread and butter question. If you want to avoid civil war, you must be imperialist' (quoted in Uzondu 2010: 1).

However, it is not entirely correct to say, as some activists have suggested (Alden Wily 2011), that land grab is the same as colonialism and imperialism. Unlike the experiences in the colonial era, where North–South imperial land relations dominated, as we have seen, the current land grab phenomenon includes South–South deals too. Also, the modus operandi is not always the same. Now obtaining land is mainly through markets; in the past it was mainly through force or *faux* negotiations. To Peluso and Lund (2011: 668), what is new about recent dynamics is the tilling of land for 'new crops with new labour processes and objectives for the growers, new actors and subjects, and new legal and practical instruments for possessing, expropriating, or challenging previous land controls'. To these, as we have seen, it may be added that these recent changes are accompanied by tensions to do with acquiring bodies of water and natural reserves in ways previously unknown – a twist respectively referred to as 'water and green grabs' (see e.g. Fairhead et al. 2012). So, rather than simply positing a new colonialism, it can be argued that

L

there are historical continuities and discontinuities. However, on the basis of an analysis of the posited benefits, losses, and resulting questions, we shall argue that contemporary land grabs are best understood as a particular variety of imperialism.

Posited Benefits, Losses, and Hard Questions

In some cases, land grabs have created employment, increased food production, introduced modern equipment in agricultural processes, and increased the circulation of foreign currency in local and national economies. But, to a greater extent, they have displaced large households and populations, created inequality and food insecurity, and dispossessed large sections of the indigenous population of their land (Mwakaje 2012). However, these benefits and costs are not equally borne by different classes.

How to analyse costs and benefits can be done in many ways. One method is to compare the aims and claims of the projects. Another approach is to use the concept of opportunity cost; that is, the cost of the alternative forgone in order to experience land-use change.

Using these methods to analyse the existing evidence, examples abound of projects which have given fewer than the claimed benefits. For instance, jatropha companies in the Pru district in Ghana provide 120 low-income jobs (US$50/ month) for 780 ha of land leased out. While employees like their jobs for the security of income flow, they see that it is better as a complement rather than as a substitute (Schoneveld et al. 2011). In Ethiopia, the Daudi Star Agri has employed only about 12% of the number it promised to do. Where some benefits have accrued, in opportunity cost terms, these have been fewerd benefits accruing to the people who have lost their land. In Togo, for a lease of 2,700 ha of land for 99 years, Global Greenleaf Plc (Greenleaf Togo) has created only 600 jobs (*Stadia Trustees* 2011: 2), and '[a]t the plantation site villages . . . their inhabitants are being helped to relocate to the edges of the plantation or to areas set aside for

the locals' (*Stadia Trustees* 2011: 4). Here, even where jobs have been created, as in Ghana, the people have lost control of their labour. That is, they have shifted from being self-employed to being employees.

Further, there is a creeping tendency to squeeze the control of seeds out of the hands of local farmers and hence make them further dependent on agro business capital. According to Greenleaf Global Plc, in Ghana, early maturing breeds of maize (maturing in 110 days) produced by scientists were going to be used by Greenleaf Global, and for the jatropha plantation in Togo, jatropha seeds were sent from Ghana, (Greenleaf Global Plc 2011). The role of Togolese farmers as seedlings cultivators was thus done away with. While the use of genetically modified seeds and imported varieties may be economically efficient, the gradual disempowerment of farmers by making their skills redundant raises important political-economic concerns.

Evidence also abounds of poor labour conditions on the new farms arising from land use change and dwindling job prospects. In the case of Ghana, for instance, people in the Pru district have got jobs but have failed to obtain leave to enable them to do community work. In Kenya, the agro-missionary entity, Dominion, has failed to give proper medical treatment to workers injured while working (Pearce 2012). The jobs created on the new farms, especially those for the locals with little education, have a tendency to dwindle in number with time when the jobs for which they are qualified are no longer available, as is openly admitted by agribusinesses in Ghana (Schoneveld et al. 2011). There are already signs that engineers, scientists, and other high-profile agri-professionals are preferable to common labourers. Most agribusinesses tout the impressive array of professionals in their teams, and local expertise is hardly valued or it is valued up to the point that it no longer yields sufficient business (Pearce 2012). Related to this is the lack of expertise in host regions and the imported labour from Egypt, especially, but also elsewhere. In one case, a Dubai-based finance group is paying $100 million for one farmer from the US to develop similar American-type farming in Tanzania (Pearce 2012: 36).

The claims that land-use change brings modernisation and food security are equally problematic. Most produce is sent out of the host countries unprocessed. In the few cases of mechanisation, this has come at a cost to the environment as large amounts of natural reserves are destroyed, as found by Schoneveld et al. (2011) in Ghana and Mwakaje (2012) in Tanzania. Also, most food grown locally is exported. For instance, Greenleaf Global PLC planned exporting 70% of the maize it produced locally (Greenleaf Global PLC 2011).

It is not that investment in land has created no benefits; rather that these have been unevenly distributed. Chiefs in countries where customary law is recognised often directly benefit from land deals. In Ghana, chiefs typically compare the benefits from land deals with how much donation they get from settler farmers. Government officials too benefit, and in some cases government officials are used as consultants by some agribusinesses (Schoneveld et al. 2011). In the Bombali and Tonkolili districts of Sierra Leone, the Swiss firm Bovid Agroenergy has invested in a 50-year lease of a large lot of 57,000 ha and changed its use from food production to an export-oriented biofuel project. In so doing, it has expedited de-agrarianisation forces that have put most small-scale farmers out of work and spat them into agribusiness apparatus making them wage labour. While land grab for biofuel production has given some jobs to some individuals, most are only casual labour whose wages are much lower than they were made to believe and a lot more have been rendered jobless (Maconachie and Fortin 2013).

Companies and investors obviously earn a lot more profit, which explains their growing interest. According to Agri Capital Ltd. (2012), a London-based firm investing in Sierra Leone, there was a 16.2% return on investment in its first year of harvest in January 2011, and a promised 7% increase in land value. Most companies pay little or no taxes. Most of these companies get tax waivers, so governments hardly benefit from tax revenues. Indeed, it seems the government of Ghana exempted Greenleaf Plc from corporate taxes for 10 years (Greenleaf Global 2011).

Also, because most of the investors are from countries outside the land-grab area, most of the returns are repatriated to foreign lands. Indeed, in most of the land deals, there are no restrictions on capital flight. In turn, the countries from which the investors originate benefit, while the host countries remain primary producers.

Investors do not benefit equally, of course. Some investors are swindled and obtain little or no rewards for the risks they take. An example is the case of Greenleaf Global Plc which was operating in Ghana and Togo. Investors sunk £8.2 million into land deals with the promise that they would receive a return of about 20% within 12 months when, in fact, no careful prior analysis had been made. Also, the company had claimed it had had a bountiful harvest in 2010 and paid huge returns to investors when, in fact, no such thing had ever happened. In the end, the company was rendered insolvent (Insolvency Service 2012).

The distribution of losses is also uneven. Settler farmers have missed out more than native farmers. For instance, in Ghana, settler farmers are the first targets to lose land. Also, ethnic minorities are left worse off. In Ethiopia, people from the lowlands, historically opposed to the government, lose more of their land than those on the highlands (Makki 2012). Furthermore, the distribution of losses is gendered. Women in Ghana experience the losses differently to men because land often regarded by men as fallow is used by women to grow some vegetables, so when these fallow lands are grabbed women lose out. Given that women do most of the water fetching, outsiders grabbing water lengthens the journey time for them. Similarly, the journey time for looking for firewood seems to have lengthened. While, private agribusinesses claim that such lengthening was already happening after years of destroying their own environment (Schoneveld et al. 2011; Wisborg 2012), evidence from Tanzania disputes such claims (Mwakaje 2012). Curiously, these differential impacts are not creating major conflicts, resistance, or riots, as some Marxist analyses might lead us to expect. Part of the reason is the influence of chiefs. Chiefs are seen as 'owners' or all-knowing in most African countries where the chieftaincy institution remains. Another

L

reason is the feeling by settler farmers that they have no rights anyway. A third reason is a feeling that the benefits will come in the future. A fourth is that people feel land deals involving the government must be good. Heavy policing is yet another reason, and the divide-and-rule tactics used by governments create cracks within the ranks of people who have missed out on the so-called benefits of land grabs. Also, international law, sometimes called international investment agreements, supports private expatriate interests over and above local and national interests when the two conflict (Pearce 2012: 102–103; Schoneveld et al. 2011; Wisborg 2012). The most important reason, however, is that there is a general feeling that 'development is coming' and endurance rather than resistance is needed. In one case, in Ghana, a regional director of the Environmental Protection Agency would not insist that companies do the right thing because he did not want to obstruct development (Schoneveld et al. 2011).

Meanwhile, land grab is widening income and social inequality. By the very nature of the distribution of benefits and losses, people who have are getting more, while the rest are struggling. According to Pearce (2012: 78), there is now an 'enclave economy' in which land grabbers and their cronies live in great prosperity, while the others struggle to make ends meet. Social inequality has been linked to poor health, poor food security, crime, grime, and unhappiness. Poverty eventually worsens when these worsen. Indeed, the massive displacement illustrates the growing inequality. In Gambella, Ethiopia, the government has launched the villagisation project in which some 180,000 people will be resettled in areas where, according to the government, social amenities are available. Yet even people with such amenities are being moved, an experience which exposes the overt mission of the project. Not surprisingly, the place of the resettled people is being taken by agroindustries. For the resettled locals, their new locations have worse livelihood conditions than their original homes (Pearce 2012: 11). Thus, starting from a perspective of coming out to 'help' the poor or the world, to get energy or food, land grab seems to be the cause rather than the cure for this canker.

These empirical examples dispute both populist and ideological representations of land grabs. It is misleading to contend that land grabs have brought no benefits to local populations, but also misleading is the claim that the processes and phenomena of land grab are win-win. What the examples reveal is a clear case of accumulation by both dislocation and dispossession. Exploitation and expropriation are commonplace and the so-called benefits are concentrated rather than spread. Actors in a stronger class position have appropriated greater gains, with the majority of people having to leave with secondary and transitional land rights, and insecurity. Even within the marginalised classes, there is great social differentiation along ethnic and tribal lines as global capital takes advantage of non-capitalist or partially capitalist systems transformed by colonial and neo-colonial forces to accumulate and dissipate. These differential scales of benefits and losses at the local, national, regional, and global levels reveal land grab as a particular type of imperialism that is not only different but also differentiated from 'classical imperialism'. However, as with classical imperialism, land grab has evoked counter-imperialist responses.

Anti-imperialism: Alternative Agriculture as Protest, Conflict, and Resistance

Anti-imperialism may come in the form of alternative forms of agriculture that part company with the capitalist logic. It may also take the form of overt protest against the advancement of the reaches of capitalism. A hybrid of both can also take place; that is, resistance to agricapitalist forms of land use and the use of land for non-capitalist farming.

Regarding organising agriculture in an anti-imperialist way, smallholder farming has gained great popularity in recent times. In this agricultural form, farmers decide what to produce and for whom – a system widely regarded as eco-friendly. In Africa, there is a collection of examples about how smallholder farming in urban areas generates decent income and food to support large numbers

of families with small plots (Obeng-Odoom 2013). This is not just an African practice. In Asia and Latin America such evidence abounds too. However, the most popular of such farming types is organised by the global peasant movement La Vía Campesina, formed in 1993. According to eminent sociologist Walden Bello, 'La Via Campesina is probably the most effective of these movements of people ...' (Bello 2007: 4). Its central vision is fighting for 'food sovereignty' – a broader concept than food security – that entails looking at food as a human right, not just as an aspiration, discouraging fast and junk food, and encouraging a return to common land in which people have use rights in the commons rather than owning them as 'property'. The project challenges individualism and seeks to speak truth to power by advocating humanism and communalism (Desmarais 2007; Riddell 2009). La Via Campesina embodies a transnational peasant struggle. Indeed, the name in Spanish means 'Peasant way' or 'Peasant Road' (Desmarais 2007: 8).

Other forms of anti-capitalist struggles exist in the form of overt protests or local attempts to use violence to protect land. At present, conflict has been reported between natives and settler communities. In the Pru district in Ghana, minor confrontation between settlers and natives have been reported. Violence also in the Greenleaf area in Juapong, Ghana, where one labourer was shot dead on 3 April 3 for trying to clear land for jatropha cultivation when that land was the subject of a long dispute between the chief and another person (Thornycroft 2012). In South Sudan, there was a public meeting at which residents in the sub-county of Mukaya decided to reject one lease made by so-called 'influential people' who had acted without addressing community concerns (Pearce 2012: 46). In Juba, in the same country, the mobilisation of indigenous land rights claims continues to be used as a shield to parry attempts at appropriating land for 'development' (Badiey 2013).

Elsewhere, there are talks of preparing the youth for armed attack in Gambella, Ethiopia. Conflicts have been reported between the Anuak and the more privileged highlanders, the Anuak and the government, and between the government, the highlanders, and the Anuak over struggles concerning land. In one case, some 420 people were killed (Pearce 2012: 9–16). In another case in Agogo in Ghana, local residents have expressed much concern about the nature of the land transactions, including the lack of consultations, and the like. In April 2010, a demonstration by the residents became slightly violent, and when police were called in there was shooting in which 14 people were wounded. Another demonstration was started in 2011 to protest against the dispossession of land (Wisborg 2012). In Dipale in Ghana, the natives have resisted by abstaining from sharing local knowledge about how to prevent fires. or by not helping to quench fires when they start in a region which is very prone to such problems (Yaro and Tsikata 2013).

There has been an innovative anti-capitalist twist towards constitutional political economy. A university academic in the Knutsford University College has filed a constitutional case at the Supreme Court of Ghana seeking that the court should compel the Ghanaian state to prevent takeover of Ghanaian lands, and obliging it to fund institutions mandated to protect Ghanaian lands from foreign takeover. The plaintiff is said to have noted: 'It appears the Government of Ghana is not sufficiently prepared to deal with the challenges that such rapid and massive exposure to foreigners pose to Ghana's national welfare' (Issah 2013), prompting him to file the case on 9 April 2013. The case has yet to be decided, but the route taken complements the existing avalanche of anti-imperialist struggles.

These anti-imperialist responses, to be sure, are not only local or localised. Instead, they are getting increasingly regionalised. In 2010 there was the Kolongo Appeal made by peasant groups in Mali who organised local resistance to land grabs. Subsequently, there was the Dakar Appeal which led to a global conference of peasants in Mali in 2011 that ended with a 'commitment to resist landgrabbing by all means possible, to support all those who fight land-grabs, and to put pressure on national governments and international institutions to fulfill their obligations to ensure and uphold the rights of peoples' (Nyeleni Declaration 2011: 2).

Developmentalist transnational bodies such as the Food and Agricultural Organisation and the World Bank advocate regulations, including the so-called 'Responsible Agricultural Investment Principles' and other voluntary charters such as The Food and Agriculture Organisation's (FAO) Voluntary Guidelines on the Responsible Governance of Tenure of Land, Fisheries and Forests in the Context of National Food Security (FAO 2012). These endorse business as usual, but address socially sensitive or welfarian concerns. However, anti-imperialist movements or protests have called for small-scale farming, and there is proof that such alternative land uses and forms are viable and sustainable. Most of Africa's cities are fed by small-scale urban farmers (Schmidt 2012). Indeed, in both Cote d'Ivoire and Ghana, respectively the first and second largest producers of cocoa in the world, smallholders are the centrepiece of production (Ryan 2011). There is proof that a combination of community land titling, community-made rules, and conflict resolution improves security of tenure, as it did in the cases of Uganda and Liberia (Knight et al. 2012). Of course, these have their problems too, but they ought to be studied in their own terms and improved based on consultation, mutual respect, and inclusive ideology.

Conclusion

The imperialist processes of land grabbing justified on grounds of 'improvement' and 'progress', 'employment', and 'food security' have produced cataclysmic outcomes for the majority poor and weaker classes and gender. De-peasantisation, landlessness, loss of sovereignty, employment, and livelihoods are but a few of the outcomes of this particular type of capitalist development. It follows that the benign motives mask detrimental ethnicised, gendered, and class outcomes that advantage powerful groups within and without the nation states of Africa.

As with historical processes of enclosure in days past, the dispossession and loss of control of labour from the product of their exertion has been naturalised as the only path to human development. However, this imperialist model is being contested on multiple fronts: through demonstration, constitutionalism, lack of co-operation, and a small amount of armed struggle. Unfortunately, these antiimperialist responses are not yet co-ordinated and the demands of the various groups vary greatly. There is no common rallying point such as food sovereignty nor a common voice such as La Via Campesina. Even worse, the comprador states and their spokespersons are extremely determined to bring about greater modernisation and industrialisation, and give the false impression of consensus when, in most cases, local farmers and indigenous usufructs have not been consulted. Nevertheless, the existence of discontent itself and the modest but important achievements it has chalked up give much hope for the future of anti-imperialist struggles.

This epoch of imperialism though has important distinctive features relative to old forms of imperialism. It is not simply statecentric and is not sharply divided between the 'economy' and 'politics'. This imperialism has diverse loci and actors which do not neatly fit within a core–periphery framework although core–periphery processes are at play. It is, to this extent, a new variety of imperialism, albeit one with similarly destructive outcomes for the majority in the weaker classes and monopolised benefits for a few.

Language Imperialism

Language, Translation, and Imperialism

Stefan Baumgarten
German School of Modern Languages, Bangor University, Wales, UK

Synonyms

Cultural imperialism; Inequality; Language imperialism; Linguistics

Definition

This essay explores the question of whether linguistics can help to foster equality, social justice, and international solidarity. This widely unexplored question helps to remind us of ways in which the institutional sanctification of academic discourse prevents linguists from effectively agitating for positive social change. This essay attempts to clearly relate linguistic inquiry to questions of inequality, hegemony, and domination at the international level.

Introduction: The Linguist in the Shell

> The philosophers have only interpreted the world in various ways; the point is to change it. (Marx 1845)

Karl Marx's ultimate 'philosophical mission' was, indeed, to help reduce inequality and suffering caused by large-scale transformations in economic production in the wake of the industrial and scientific revolutions of the long nineteenth century. To replace 'philosophers' by 'linguists' within Marx's apposite statement provides a pretty accurate assessment of the current state-of-the-art in thinking about questions of language. But can linguists help to change the world? Is there any currency in the idea of a 'linguistic mission' to foster equality and social justice? It is telling about the state of the world (academic or otherwise) that linguists – just as nineteenth-century philosophers (and those of the 20th and 21st centuries) – suffer heavily from anti-social tendencies. This widely unexplored question, although not the purpose of this essay, nonetheless helps remind us of ways in which the institutional sanctification of academic discourse prevents linguists from effectively agitating for positive social change.

Post-Marxian critical theorist Herbert Marcuse (1964) famously attributed revolutionary potential only to the marginalised and downtrodden. Therefore, it would seem that writing anything about imperialism and language – with most of us well-established and well-adjusted, or simply too indifferent to care about the fate of the world – is pointless. Besides, modern academia is so fragmented into thousands of knowledge tribes

(cf. Becher and Trowler 2001) that this fact alone plays into the hand of the powerful few who rule the world by dint of military, economic, and financial might. Ways to circumvent this quandary might be to call for intellectual class warfare: (*Linguists of the world unite!*) or to succumb to a quasi-taoist social-democratic reflex: *Let's meditate and then perhaps discuss the options!* There might be, however, a tiny glimmer of hope in preventing our linguists from constantly retreating into their shells. And this glimmer would attempt to firmly relate linguistic inquiry to questions of inequality, hegemony, and domination.

Discourse in the World

Language is much more than a simple tool of communication. Only a small minority of linguists *presuppose* an ontological connection between 'language use and unequal relations of power' (Fairclough 1989, p. 1). Most linguists like to divorce language from its historical, socio-cultural and above all political-economic roots. The generic term 'language' itself already constitutes part of the problem, for language cannot speak by itself. It is *put to use* by speakers who are caught up in historically situated and largely unequal relations of power. People rarely use language consciously, nor are they able to speak with their own 'unique' voice. Language never fully 'belongs', it is populated with the 'voices' of other speakers; in other words, it is shot through with direct or indirect references to what others have uttered before (Kristeva 1986). But speakers do not only use language by means of intertextual reference. Language is a site of ideological struggle, for 'the ideological becoming of a human being' constitutes 'the process of selectively assimilating the words of others' (Bakhthin 1981, p. 134). Language is *in* the world. It is there for us to be *appropriated* in order to pursue our – often unconsciously held – ideological interests.

The onset of institutionalised positivist science from the nineteenth century onwards, in addition to the ever-increasing fragmentation of scholarship, has not been conducive to a self-reflective and critical engagement with the ways in which imperialism as a manifestation of dominant power relations shapes language and vice versa. For the linguists in the shell, language is not a predominantly social activity. They shield it away from the world; they clip its wings and incarcerate it within a prison of rhetorical and grammatical rules. They conform to the dogma of objective rationality and, in their quest for sanitised scientific knowledge, they overlook language as a force of imperial power. Generations of linguists – sociolinguists, semanticists, and so forth – have consciously ignored this communicative force. After all, who wants to bite the hand of the institutional master that feeds them? In the late nineteenth century, modern linguist Ferdinand de Saussure (1983/1916) theorised language as a decontextualised and abstract system of interrelated signs; whilst in the mid-twentieth century, Noam Chomsky (1957) theorised language as the interplay of speakers' knowledge of grammatical rules (competence) in relation to their linguistic output in real-life situations (performance). Chomsky's cognitive essentialism strictly separates language and society and thus still has a detrimental effect on attempts to construct a critical theory of language (but for a counterexample, see Lecercle 2006).

The preconditions of semantic essentialism – a decontextualised theory of meaning and language – can be sought in the Western imperial project of modernity. In its zealous strife for popularised enlightened reason and disciplinary conformism, modernity ultimately aims to triumph over the anarchic outgrowth of localised and thus alternative modes of knowing, speaking, and writing. Today, a totalitarian vision of cultural, economic, and technological mastery over linguistic resources lies at the heart of the prevalent neo-liberal orthodoxy of governance. In one of the most cited passages of contemporary scholarship, Foucault (1981, p. 52) laid the ground for what has by now become a truly hegemonic notion in thinking on language in the world, by suggesting that:

> in every society the production of discourse is at once controlled, selected, organised and redistributed by a certain number of procedures whose role is to ward off its powers and dangers, to gain mastery over its chance events, to evade its ponderous, formidable materiality.

Foucault's conception of language as a form of discourse is a tacit dig at the linguist in the shell, who insists on a positivist separation of grammatical competence and real-life linguistic performance. The ambiguous term 'discourse' nonetheless allows for a more holistic view on language as a socially grounded activity, and its etymological origins – from the Latin *discurrere* – connote a semblance of fuzziness and diffusion rather than clarity and convergence. Discourse as a mode of speaking and writing is indeed a precarious notion. It suggests movement *and* stillness, knowing *and* ignorance, sound *and* silence, language *and* its absence. Whether discourse is seen as a discontinuous set of material and linguistic practices à la Foucault, or as a more or less continuous 'flow of knowledge through time' (Jäger 2001), discourse structures knowledge and is structured by it. Yet most importantly, both conceptions of discourse epitomise its central role in the historical struggle over human destiny, authority, and material resources. Discourse is truly *anarchic* and thus, since time immemorial, has been a crucial instrument of social control and by extension of the construction and maintenance of empires.

Language and translation are manifestations of discourse. Most work in mainstream linguistics simply ignores the perseverance of inequality, hegemony, and domination. Linguistic and social-theoretical research indeed tends to eschew a rigid interrogation of the inter-dependency of imperialism, knowledge, and discourse, given that such questioning inevitably promotes value judgments on entrenched social hierarchies. A further weakness in the study of discourse constitutes the conscious avoidance of political-ideological bias by a persistent emphasis on blurry concepts such as modernity and its role in the construction of empire. Perhaps closest to an engaged study of discourse are the efforts by scholars working in the field of critical discourse analysis (e.g., van Dijk 2011), an academic movement which emerged during the 1980s with the aim to uncover underlying relations of power and ideology in language use. Critical discourse analysis largely draws on continental social theory (e.g., Bourdieu 1991) and contextualised

interpretations of grammar (e.g., Halliday 1994). Unfortunately, however, these intellectual efforts serve no other additional purpose than to raise awareness of unequal power relations among a small educated elite. In view of such epistemological shortcomings, the entanglement of imperialism *with/in* discourse will now be illuminated through a brief account of language and translation, which can then be fruitfully merged with an account of reified and post-imperialist discourse.

Imperialism *in* Language and Translation

Imperialism manifests itself through processes of communication. Imperialism enforces and naturalises relations of dominance and hegemony. Hegemonic relationships tend to firmly remain in place even after their power base has been removed. Most languages of colonised cultures, for instance, apart from having been installed as languages of government *after* colonisation, have never fully recovered from a stigma of being 'deficient' in terms of their powers of expression in order to face the challenges of the (post-) modern world. Nineteenth-century linguists, sub-consciously enthralled by Western hegemonic intellectualism, gladly classified African languages as exhibiting 'feminine' characteristics in contrast to the 'male' and hence, as they thought, superior Western languages such as German, English, or French (Irvine 2001). Standard languages, to be sure, have 'high symbolic value' simply by dint of their connection to cultural and political elites (Foley 1997, p. 409). Imperialism *in* discourse is indeed to a large extent a 'gendered' phenomenon where cultures and nationalities are highly sexualised (MacDonald 1994). By 'othering' the unknown, these linguists perpetuated the myth of ideological and, not least, racial superiority between the West and the rest. Against this background it becomes clear that research on imperialism in discourse cannot merely trace origins, contextualise geopolitical developments, or pinpoint ideological battles.

Research on imperialism in language and translation needs to map dominant modes of

knowledge pertinent to specific groups across time and space. Accounting for the dominance of English and some other languages, for instance, necessitates the tracing of discourses that sustain this dominance. In line with the evolution of scientific thought and methods, certain discourses on madness and social deviance, especially from the sixteenth century onwards, have increasingly stigmatised marginal groups (Foucault 1988). Likewise, intellectual discourses on language and communication, especially the ominous equation of language and national character by the German philosopher Johann Gottfried Herder (1966/1787), have cultivated an exclusionary ideology of language as the property of privileged, mostly nationally defined, social classes. Just as *any* language carries social, cultural, symbolic, and economic capital (Bourdieu 1991), so language can be (mis)used as an instrument of exclusion and inclusion, of persuasion and dissuasion, or of clarification and deceit. The fact that every language is closely tied to individual and collective identities renders it of utmost importance to political and corporate decisionmakers in the (post-)modern world. Linguistic domination is strongly tied to cultural hegemony, an aspect often overlooked in imperialism research. Educational efforts to spread the English language are often underpinned by short-term political-economic and long-term ideological objectives. In the 1980s, for instance, the head of the British Council, the UK's central promoter of English as a foreign language, maintained that 'Britain's real black gold is not North Sea Oil but the English language' (quoted in Phillipson 1992, pp. 48–49). Anglo-American linguistic imperialists – even if they might not always be conscious of their own imperial mindset – will do everything to spread the value of possibly its most crucial tool of imperial domination: the English language.

Studying English as a language of empire has a long intellectual tradition. Many leading linguists, however, play down the threat of English language imperialism (e.g., Crystal 2004; Graddol 2006). It is fair to say that much of what has been said in recent years about power and discourse has been blighted by a conformist reflex to provide an either 'post-modern' and thus relativistic image of cultural domination (e.g., Derrida 1976), and simultaneously a culture-theoretical impulse which has nothing to say about the real suffering linguistic imperialism has caused (e.g., Tomlinson 1991). After all, it does not need a sophisticated analysis to realise that the neglect of indigenous and minority languages in materially deprived parts of the world can be clearly traced back to economic interests (cf. Ngugi 1986). However, some useful suggestions are made to undercut the dominance of only few major languages. Phillipson (1992, 2009) has embarked on an influential and long-term research programme to combat the 'linguistic imperialism' of English. Furthermore, ecolinguistics (Mühlhäusler 1995) is a growing subdiscipline with the aim to defend languages from 'linguicide' (Ngugi 2009). Many sociolinguists explore issues of language planning and language politics, practices that are prime examples for the appropriation of discourse for political-ideological ends. An even more obvious example in this regard is the study of historical discourse in totalitarian regimes such as Fascist Italy or Nazi Germany where the 'correct' use of language is prescribed and rigorously enforced through cultural and literary censorship (Hutton 1999), a phenomenon which also applies to contemporary extremist politics (Wodak and Richardson 2012). It is telling that totalitarian control places particular emphasis on cultural and literary contact with the outside world, and this contact is mainly maintained through the sociocultural act of translation (Baumgarten 2009).

Translation as a mediating phenomenon is an act of linguistic and cross-cultural communication. Translation has been theorised as inhabiting an 'in-between space' of linguistic contact with its own characteristics, as it is always caught in the tension between a so-called 'source' and 'target' cultural pole (Bhabha 1994). The source/target dichotomy has come under much scrutiny in the wake of post-structural theory, however, as upon closer inspection it is far from clear how to precisely define *a* specific culture, *a* language, or a supposedly *faithful* relationship between a 'source' and its 'target text'. It is most crucial to conceive of translation as an act which by

definition occurs within asymmetrical relations of power. Such relations are sustained through social hierarchies and different types of Bourdieusian capital, resources which are partly predetermined and partly battled out between the actors involved in any act of translation. Mainstream Anglo-American publishers, for example, have accrued such a massive amount of sociocultural prestige and economic capital, based largely on the communicative hegemony of English, that this provides them with almost monopolistic powers to control the flow of translations in the global book market (cf. Apter 2001). Yet the people involved at the heart of the process, the translators themselves, largely remain 'invisible' agents of cross-cultural exchange (Venuti 1995). In addition, naked statistics on translations between English-language literature and other languages are indicative of unequal cultural relations, given that 50% of all books worldwide are apparently translated from English and only 6% into English (Grossman 2010, p. 50).

Linguistic domination leaps over into linguistic hegemony when people internalise the power and ideology of a prevailing discourse to such an extent that they forget their own subjection to its manipulative force. Many Portuguese academics, to give an example, when translating their own work into English, tend to self-censor their efforts by subconsciously adapting their work to entrenched hegemonic norms of English academic discourse. In this way, a more flowery and digressive discourse style, traditionally rooted in Portuguese-language humanities research, is eradicated through the process of translation, whilst the translations themselves become absorbed into the global hegemony of English-language academic discourse. Whilst this surely happens to the majority of academic self-translation into English, this discursive phenomenon constitutes a constant danger of 'epistemicide' through translation (Bennett 2007). It appears in fact more important to scrutinise such communicative undercurrents, in true analogy to Gramsci's theory of hegemony, than more obvious examples of linguistic 'manipulation'. After all, the underlying processes of knowledge exchange, rather than their linguistic surface materialisations, help to sustain or subvert existing relations of power. Moreover, Foucault's insight on the suppression of the anarchic proliferation of voices in the world proves nothing less than the inherent – and most often subconscious – conformism of discourse participants.

Discursive Reification and Post-Imperialist Discourse

Discourse is perhaps the most decisive tool in processes of capitalist globalisation and in turn of reification. The capitalist revolution since around the late eighteenth century has furthered an ongoing reification, or commodification, of human and material relations. In line with the positivistic evolution of science and its technological offshoots, this commodification of social relations bears decisive consequences for the way patterns of language and communication develop. The English language has become the world's 'lingua franca', having replaced French during the ascent of the British Empire in the nineteenth century and especially the evolving US-American Empire during the twentieth century. In the context of social change, Fairclough (1992, pp. 200–224) speaks of the (pseudo-)democratisation, commodification, and technologisation of discourse. And there seems no way out of this quandary. Discourse is produced and reproduced in what Bourdieu (1991) calls the 'linguistic market', and the struggle over resources and interests is decided by the forms of capital – most evidently economic ones – at the disposal of discourse participants.

Since discourse research largely relies on a post-modern ethics which first and foremost rejects conceptual binarisms and politically engaged research, the crucial problematics of imperialism have largely been sidelined. This is all the more deplorable as imperialism, one of the prime forces of domination, is a strong transformative force which shapes historical destinies and identities. In this context, popular imperialism is at its strongest in education, owing to its authority to captivate the imagination of the youngest and ideologically most vulnerable subjects in society.

A popular poem entitled *Foreign Children* from the high times of the British Empire begins as follows (Stevenson 1907, quoted in MacDonald 1994, p. 9):

> Little Indian, Sioux or Crow,
> Little frosty Eskimo,
> Little Turk or Japanese,
> Oh, don't you wish that you were me?

This is possibly the strongest subconscious internalisation of empire's authority that can be achieved through the medium of discourse. However, such a 'language of power' not only 'hails' its receivers through immediate ideological impact, but through a persistent spinning of dominant networks of perception and understanding by means of repetition and re-publication. Such a discourse congeals into hegemonic forms of Bourdieusian capital which are for the most part not consciously reflected by those subject to their powers. In other words, ideological supremacism can be seen as one of the prime communicative modes of English language imperialism. Even apparently critical voices during the high times of British imperialism, such as Mary Kingsley (1898), whose travel writing communicated scepticism towards the empire, nonetheless abound in references to an unspoken white master race.

On the whole, the history of linguistic imperialism should not be separated from the economic contexts of its inception. Modern technology is increasingly setting the agenda for how we communicate. Communication is increasingly morphing from traditional 'face-to-face' interactions into one-to-many or many-to-many communication platforms (Jin 2013). Anti-imperialist discourse can criticise and resist the homogenising practices of English language education. And it is also in education and in the social margins of the lower classes where resistance can flourish. It is in education where dominant cultural, symbolic, and above all economic interests are perpetuated. Anti-imperialist discourse as an effective site of resistance to domination and hegemony is unlikely to originate from the powerful. At the same time, however, large parts of dominated groups and populations tend not to be conscious of their domination, as they are entrapped, so to speak, within the dominant

logic of discourse. Suggestions for a 'discourse ethics' whereby, within an 'ideal speech situation', only the better justified argument shall win, have already been put forward in the 1980s (Habermas 1985), yet without any consequences for 'discourse in the world'.

Conclusion

It is clear that 'imperial globalisation' (Phillipson 2009, p. 15) intends to create a one-language-fits-all world. What is crucial is to see that modern imperialism is capitalist and that it is driven by a dual strategy of political control and wealth accumulation (Harvey 2005, p. 132). These ideological activities, nourished further by the neo-liberal forces of 'techno-science', are the key determinations of modern imperialist discourse (Pellizoni and Yllönen 2012). The linguists in the shell, if they want to recognise these phenomena at all, would do better to change dominant perceptions rather than only attempt to interpret them.

Definition

The relation between capitalism and imperialism in the current context of capitalist development unfolding in both the center and the periphery of the world system exists as a a class struggle for land and labor. The agents and agencies of this resistance in the countryside were the social movements formed by the "rural poor" composed of peasants dispossessed as the result of the capitalist development of agriculture. It is not of a class struggle but a socio-territorial struggle for improved access to the global commons, as well as protesting the destructive impacts of extractive capital on their livelihoods and habitats.

Although imperialism preceded the evolution of capitalism, they are intimately connected and have been since the origins of both capitalism and the modern nation state. The aim of this short essay is to clarify the relation between capitalism and imperialism in the current context of capitalist development unfolding in both the center and the periphery of the world system. The relationship of imperialism to capitalism has created considerable confusion, with some scholars drawing a clear distinction between them and disconnecting their respective dynamics while others conflate the two. As I see it, both views are wrong and need to be corrected. We will attempt to do so, with a focus on the contemporary dynamics of what might be described as "US imperialism," i.e., imperialism as it unfolded in the wake of the Second World War when the idea of "development" and the project of international cooperation (or foreign aid) were "invented" – to cite the argument advanced by Wolfgang Sachs and his associates in post-development theory (Sachs 1992). Because each advance of capital in the development process and each stage in the evolution of capitalism generate new forces and different forms of resistance to both capitalism and imperialism, we also review some of the contemporary dynamics of anti-imperialist resistance, or anti-imperialism.

The Marxist *Debate on Imperialism*

The aim of this brief review of the role of imperialism and the anti-imperialist resistance in the development process is to contribute to the debate as well as settle some confusion that surrounds the concept of imperialism. On this point, it is commonplace in the liberal political science tradition of imperialist theory to view imperialism as a purely political dynamic that is entirely disconnected from capitalism and its economic dynamics; this political dynamic is seen as arising out of a lust for power or purely geopolitical considerations by the guardians of the "national interest" in the most powerful countries. In contrast to this politically reductionist view of imperialism, Marxists generally take the view that the state is a major agency of capitalist development and hegemonic power, that capital and capitalism cannot advance without the active support and agency of the state, and that in the projection of state power to secure this advance and establish hegemony over the system, the state tends to equate the economic interests of the dominant capitalist class or the ruling political class with the "national interest" – advancing the former with the aim of protecting the latter. This view is in stark opposition to the liberal political science tradition of imperialist theory.

But this view is also in opposition to the theory of the "new imperialism" advanced by some Marxists in recent years (exponents of world systems theory) (The originator of this theory, a mutant or revised form of Latin American "dependency theory," is Immanuel Wallerstein (1974), but it has evolved into a school of Marxist thought associated with the journal *Globalizations* as well the Fraudel Braudel Institute's *Review.*), namely, that the process of economic globalization has both weakened the power of the peripheral capitalist state to make public policy and the imperial state to take action in the defense of capitalism (to facilitate the advance of capital and exert hegemonic power over the whole system). The theory (see Amin 2001; Arrighi 2005a, b; Panitch and Leys 2004; Robinson 2007) is that the powers of the state have been supplanted by the economic power of multinational corporations, which, as the operating agents of the world capitalist system, no longer need or are beholden to the imperial state – resulting in what might be described as an "empire without imperialism" (Hard and Negri 2000).

L

Without going into details, it is evident that the exponents of the "new imperialism" deviate from Marxist thought on imperialism in the opposite direction to theorists in the liberal tradition – by ignoring the institutional specificity of the state as an instrument of class power, reducing imperialism to a purely economic dynamic, and essentially confusing imperialism with capitalism (On this see Veltmeyer (2005). Contemporary theorizing about imperialism, it must be said, tends to ignore the sociopolitical and ideological power configurations of imperial policy, as well as the role of international financial institutions such as the World Bank in shaping the institutional and policy framework of the New World Order, which not only provides a system of global governance but the rules of engagement for the class war launched by the global capitalist class against labor in its different redoubts of organized resistance.). In opposition to both views, we hold (Petras and Veltmeyer 2005b) that the imperial state is an essential agency for ensuring the advance of capitalism and the dominion of capital and this is so both in the past and in the current conjuncture of capitalist development.

Capitalism and Imperialism: The Dynamics of an Intimate Relationship

Michael Parenti (1995) in his illuminating primer *Against Imperialism* defines imperialism as a system so organized as to permit economically dominant groups and the ruling class of powerful nations to advance their political and economic interests by expropriating the land, appropriating a society's natural resource wealth, and dominating the markets of subjugated nations for their own enrichment. More generally imperialism is commonly understood as a policy or practice by which the government of a country increases its power by gaining control over other areas of the world, either by direct territorial acquisitions or, more commonly in the post-Second World War era of US imperialism, by gaining indirect control over the political or economic life of other countries in order to advance the economic interests of the ruling classes in the advanced capitalist countries.

So understood, imperialism has been a powerful force in world history over the last four or five centuries, in which powerful states with an imperialist agenda carved up entire continents, looting and pillaging countries on the periphery of the world capitalist system of their wealth and natural resources, while oppressing the indigenous people and nations and obliterating entire civilizations in the process.

Yet, despite the momentous importance and devastating impact of capitalism and imperialism over the years, imperialism is seldom accorded any serious attention by academics, media commentators, and political leaders, or it is viewed as a left-wing ideology without any basis in reality or as the political practice of non-Western, non-democratic nations governed by authoritarian regimes. In actual fact imperialism in its diverse forms over the past four or five centuries – and especially over the past seven decades of the American empire – is intimately connected to capitalism, a means of advancing the interests of capitalists and the ruling class of the capitalist Western democracies where the economic and political interests of the capitalist class are equated with the "national interest." In these cases, rather than being directly colonized by the imperial power, the weaker countries subordinated to this power have been granted the trappings of sovereignty and freedom (liberal multiparty democracy) – while the owners of finance capital retain control of the lion's share of their profitable resources. This relationship has gone under various names: "informal empire," "colonialism without colonies" or "neocolonialism," and "the new imperialism."

Lenin (1916 [1963]) had famously described imperialism as the "highest stage of capitalism." His reference point here was the global expansion of capital at the turn into the twentieth century, which entailed the export of capital in search of more profitable investments; the colonization of societies on the periphery of the system (Africa, Asia, Latin America, and the Caribbean) and the settlement of North America, a dominion of the British Empire; and the imposition by the imperial state of a trading system that would provide a market for goods manufactured in the Center in

exchange for natural resources and other inputs needed for the capitalist development of industry. However, what Lenin failed to appreciate or take into account was that imperialism so understood, as a handmaiden of and an agency of capitalist development, was not specific to this particular phase in the evolution of capitalism as a world system but that it is a feature of capitalism at all phases of its development, from the mercantilist era of colonial rule and state-sponsored/sanctioned merchant's capital to the current neoliberal era.

As noted by Parenti, the preponderant thrust of European and North American imperial power over the years from the nineteenth to the twenty-first century was the subjugation, exploitation, and colonization of societies in Africa, Asia, and Latin America on the periphery of the world capitalist system. By the end of the nineteenth century, investors and capitalists saw Africa, Asia, and Latin America and the Caribbean as not only a source of valuable or strategic raw materials, a source of wealth and slave labor, but also as a market for good manufactured at the center of the system. In the twentieth century, the Western industrial nations were exporting not only goods but capital, in the form of machinery, technology, investments, and loans. But to say that the world entered the "most advanced stage of capitalism," namely, imperialism (a particular stage of capital export and investment, and the territorial division of the world), is not to imply that imperialist exploitation and the plunder of natural resources ceased. As argued by Petras and Veltmeyer (2014), the exploitation and pillage of the natural and human "resources" of the weaker, poorer countries on the periphery of the world capitalist system – what we describe as "extractive imperialism" – and the despoliation of the environment greatly accelerated in the neoliberal era of free market capitalism, i.e., over the past three decades of US imperialism.

Capitalism and imperialism are closely related, but imperialism is a lot older than capitalism. The Persian, Macedonian, Roman, and Mongol empires all existed centuries before the British and American empires of the twentieth century. Emperors and conquistadors were interested mostly in plunder and tribute, gold, and glory. But the imperialism of the nineteenth, twentieth, and twenty-first centuries – capitalist imperialism – differs from these earlier forms in the way it systematically accumulates capital through the organized exploitation and the penetration of overseas markets. Capitalist imperialism invests in other countries, transforming and dominating their economies, cultures, and political life and integrating their financial and productive structures into an international system of capital accumulation.

Sometimes imperial domination is explained as arising from an innate desire for domination and expansion, a "territorial imperative" or a "lust for power." But of the various notions about imperialism circulating today in the United States and Canada, and Europe, the dominant view is that it does not exist. Imperialism is not recognized as a legitimate concept, certainly not in regard to the United States or Canada. One may speak or write of "Soviet imperialism" or "nineteenth-century British imperialism" but not "US imperialism". As Parenti observes graduate students in political science at most American universities (and the same is true for Canadian universities) would not be granted the opportunity to research US imperialism on the grounds that such an undertaking would not be scholarly. While many people throughout the world charge the United States with being an imperialist power – and Canada has now acquired this status in Latin America thanks to the destructive operations of Canadian mining companies (on this see Engler 2012; Gordon 2010) – those who talk or write of US imperialism are usually judged to be "mouthing ideological blather," as Parenti puts it.

Contemporary Dynamics of US Imperialism: Three Cycles of Development and Resistance

The end of the Second World War saw the transition from Pax Britannica and European imperialism to Pax Americana and what some neocon theorists conceived of as the "the US Century" – a century dominated by the power of the US state

L

to advance its "national interests" (equated with the interests of US-based multinational corporations) and establish its hegemony over the system as a whole. At that time the United States commanded a predominant share of both industrial capacity and the financial resources to invest in the capitalist development of both the economy and others whose "development" was of strategic interest to the United States. However, the United States also faced the growing industrial power and competitive opposition of the USSR, which constituted a fundamental threat to US power and economic interests, particularly as regards the states on the periphery of the system that were seeking to liberate themselves from the yoke of European colonialism.

In fact, both the idea of development and the project of international cooperation were invented and constructed to the purpose of ensuring that these postcolonial states would pursue a capitalist and not a socialist path toward development (Hayter 1971; Veltmeyer 2005). In 1960, in the Latin American context in the wake of the Cuban Revolution, the development idea was transmuted in the form of agrarian reform and integrated rural development to dampen the revolutionary ferment in the countryside and provide the "rural poor" – i. e., the peasants who were dispossessed from the land and their means of production by the advance of capital – a nonconfrontational option to the revolutionary social movements that had formed in the resistance to the advance of capital, which, as always and everywhere, was accompanied by a process of productive and social transformation of a traditional agrarian society with a traditional culture and precapitalistic relations of production into a modern industrial capitalist nation, and the transformation of the peasantry into an industrial proletariat, providing industrial capitalists an "unlimited supply of surplus labor" (Arthur Lewis) or an "industrial reserve Army" (Marx).

In this development cycle, from around 1948 to 1982, the resistance to the expansion of capital – the capitalist development of the forces of production – was led by organized and unionized wage workers (the labor movement) in the cities and by social movements formed by the landless or near-landless peasants or "landless rural workers" as they are called in Brazil. Like the Zapatistas in their insurrection on January 1, 1994, the day on which NAFTA took effect, the movements in the land struggle took the form of "armies of national liberation." Since Latin America, unlike the colonized states in Africa and Asia, had achieved their national independence in the nineteenth century, the reference to "national liberation" was to US imperialism – to actions taken by the state to advance the economic interests of US capital, the multinational corporations in the advance of this capital in the form of foreign direct investment (FDI).

The resistance to the advance of capitalism and US imperialism was engaged by the forces of capitalist development, including the Latin American states that served as proxies for US imperialism, by means of a two-pronged strategy: (i) to offer the rural poor an alternative to the confrontational politics of the movements that were demanding not only "national liberation" but revolutionary social change – to turn the rural poor (the dispossessed peasantry) away from these movements – in the form of "development" (a program of technical and financial assistance, as well as a state-led land reform program) and (ii), when or if the poor did not receive the message or take the bait, deployment of the repressive apparatus of the state. We might term this strategy as the velvet glove of US imperialism (development) and its iron fist (repression), deployed if and where necessary. In any case, by the end of the 1970s, the forces of resistance in the land struggle had been defeated and their capacity to resist destroyed.

The Neoliberal Era: A Second Development-Resistance Cycle

With the advent of what David Harvey and others have dubbed the "neoliberal era" – based on the installation of a New World Order based on the Washington Consensus and a belief in the virtues of free market capitalism – the 1980s saw the unfolding of a second development-resistance cycle. The driving force of change and development in this cycle was the expansion of capital in the form of FDI, an expansion that was facilitated by the US imperial state (via the agencies of the

World Bank and the IMF, both agencies and extensions of US state power). The anticipated outcome and promise of the bold structural reform in macroeconomic policy mandated by the Washington Consensus and imposed on governments by the Bank and the IMF were the activation of the accumulation impulse and economic growth process, leading to "general prosperity."

The actual outcomes were rather different. They included (i) a decade lost to development; (ii) the destruction of forces of production built up in both agriculture and industry (this beyond the protectionist wall of an endogenous industrial policy); (iii) a massive inflow of unproductive and productive capital in the form of FDI in search of natural resources (to meet the growing demand for these resources on the world market), markets, and economic opportunity (to profit and make money); (iv) a rural exodus of poor dispossessed peasant farmers, many of whom took the "development pathway out of rural poverty," namely, immigration and labor (World bank 2008); and (v) destruction of a nascent industrial proletariat and the formation of what might be described as a rural-urban semiproletariat, with one foot in the urban economy (in the informal sector, on the margins of the capitalist system and 'modern society' where they had to work on their own account) and another in agriculture and the rural communities, which served as a sort of a reservation, a reserve of surplus rural labor available to capital should it require another infusion of cheap labor.

To cut short a complicated story, "development" in this form, advanced by forces of change released in the capitalist development process, as might be expected, also generated powerful forces of resistance, this time in the form of peasant social movements that challenged and directly confronted the governments and their neoliberal policies. These movements were relatively powerful – relative to other parts of the world system – basically because the neoliberal reform agenda was more fully implemented and with greater devastating destructive force than in any other macro-region of the world system. By the end of the 1990s, the activism of these movements was sufficient to delegitimate the neoliberal policy agenda and put it everywhere on the defensive –

if not halting its advance, as in the case of Bolivia and Ecuador, where the neoliberal agenda was effectively brought to an end. This activism, as it turned out, was also an essential ingredient and condition of a transition into a third development-resistance cycle in the new millennium.

Imperialism and Anti-imperialism on the Frontier of Extractive Capital

The new millennium opened with a major reconfiguration of economic power in the global economy, leading to the ascension of China as a major economic power and the emergence of "emerging markets" in a number of countries, particularly in the bloc of countries that makes up BRICS (Brazil, Russia, India, China, and South Africa). In these countries the capitalist development process had resulted in the formation of a growing middle class, whose consumption capacity and demand for agro-food products and precious metals (gold and silver) provided a further impetus to the advance of resource-seeking extractive capital – in addition to the expanding industries and associated development process, which required and demanded not only access to a supply of labor (accessed from the global labor force constructed on the periphery by means of the mechanism of international migration) but large volumes of natural resources in the form of energy (oil and gas), industrial minerals and metals, and agro-food and biofuel products.

The 1990s saw a considerable expansion of inflow of capital in the form of FDI, particularly in the extractive sector, where the weight of extractive capital in total investments increased from some 20% in 1990 to 40% by 2012. The inflow of resource-seeking capital (investment in the acquisition of land and natural resource wealth) over the 1990s and the first decade of the new millennium was more or less double the inflow of total investments, exhibiting a clear sectoral trend in favor of resource-seeking extractive capital. This "development" – the new geo-economics of capital – had a major impact on the economic model for economic development used

by governments in Latin America, particularly in South America, the major destination point of this capital, and also the center of a new "progressive cycle" in Latin American politics that paralleled almost precisely the "primary commodities boom" on the world market (2002–2012).

The "progressive" governments that formed in South America in the wake of a "red" or "pink" tide of regime change in the first decade of the new millennium constructed as a guide to their national development policy an economic model that some describe as "neodevelopmentalism." The reference here is to the aim of achieving a more "inclusive" form of development. Others, including the author (see Veltmeyer 2013; Veltmeyer and Petras 2014), describe instead as "neoextractivist," with reference to its dependence on FDI for the extraction of natural resources and the export of these resources in primary commodity form. In either case, the model has two foundations: (i) extractivism and "inclusive state activism" – using the fiscal resources derived from the export of natural resources (resource rent in the form of royalties and export taxes) to finance their program of poverty reduction, the central component of their "progressive" post neoliberal policy agenda (Veltmeyer 2013).

In terms of the development process it implicates and combines the agency and complex dynamics of three types of capital(ism) – industrial (based on the exploitation of labor), extractive (based on the exploitation of nature's resource wealth), and human capital (based on investment in education and applied scientific knowledge related to production). As mentioned, in the current context, this synergetic mix of these three forms of capital includes a pronounced preference for resource-seeking extractive capital – to expand and deepen extractive operations (mining, drilling, fracking, harvesting, etc.) with the agency of multinational corporations in the extractive sector and with the active support and agency of the imperial state (the United States and Canada, the dominant investor and player in the extractive sector, particular as regards gold and silver mining) (Engler 2010; Gordon and Webber 2016).

With the collapse of the primary commodities boom in 2012, the capacity of the states in the region to pursue their progressive policy agenda (to bring about a more inclusive form of development based on poverty reduction) has been drastically curtailed, leading to a swing in the pendulum of electoral politics toward the Right – toward the formation or restoration of right-wing authoritarian national populist regimes oriented toward a restoration of the neoliberal policy agenda. This agenda is very much supported by the US imperial state in opposition to progressive regimes such as Bolivia, Ecuador (under the Presidency of Rafael Correa), and Venezuela that have been leading the post-neoliberal and anti-imperialist coalition in the region. In any case, because of the dependence of the progressive center-left regimes – in power until recently, and still in power in Bolivia and Venezuela – on FDI and extractive capital, many of these states – even those like Ecuador and Bolivia that are part of the anti-imperialist coalition in the region – in the conflict between the companies in the extractive sector and the communities contiguous to the sites of extraction in the countryside the progressive governments more often than not have taken the side of the companies, branding activists in the struggle against extractivism and imperialism as "environmental terrorists."

As for the cycle of resistance generated by this development process it has taken a different form from the resistance in the first development-resistance cycle (a class struggle over land and labor) or the second cycle (social movements protesting the neoliberal policy agenda). On the frontier of extractive capital in the Latin American countryside resistance has taken – and is taking – the form of (i) a socio-environmental movement that has mobilized the forces of resistance against the destructive impacts of extractive capital and (ii) communities reclaiming their territorial rights of access to the global commons of land, water, and other resources for production and subsistence, as well as a space for mobilizing the resistance. More broadly, the resistance to the advance of both capital and imperialist intrusion has taken the form of (i) the search for alternative and more inclusive forms of development and (ii) the construction "from below" of social and solidarity economies based on worker's self-management

(in the case of Argentina), cooperatives (region-wide), and local development (Azzellini 2016; Veltmeyer 2018) . In other words, while the political landscape throughout the world in the twentieth century was dominated by a class struggle over land and labor, the class struggle has been transformed into a socio-territorial struggle and the active search for more sustainable forms of development.

Conclusion

Imperialism has had a long inglorious history that has spawned diverse forms of struggle and forces of resistance. This history extends well back into what historians describe as "ancient history," but as of the origins of capitalism in the sixteenth century, and particularly with the turn into the twentieth century, imperialism has been intimately connected with the globalizing dynamics of capitalism, serving as both a facilitating condition and a fundamental agency of capitalist development.

The history of capitalism can be traced out in the form of a process of productive transformation that always accompanies capitalist development. Each advance of capital in the development process also generates new forces of resistance, allowing us to trace out the dynamics of different cycles of development and resistance in the post-Second World War period, which includes three decades under the aegis of the development state, and three within the institutional policy framework of the neoliberal policy agenda.

In the first cycle, the resistance to the advance of capital and the actions taken by the imperial state to facilitate this advance in the form of a class struggle for land and labor, the agents and agencies of this resistance in the countryside were the social movements formed by the "rural poor" composed of dispossessed peasants – dispossessed as the result of the capitalist development of agriculture. These movements took the form of "armies of national liberation" that demanded liberation from imperialist intervention and revolutionary change.

In the second cycle dominated by the imperialist imposition of a policy agenda of free market capitalism and the expansion of capital in the form of FDI, the forces of resistance were mobilized by peasant movements against the neoliberal policies of the governments that were aligned with both the neoliberal policy agenda and US imperialism. Each advance of capital was characterized by specific dynamics of development and resistance that correspond to cycles in the neoliberal era and, in the current conjuncture, the advance of resource-seeking extractive capital, which is based on the exploitation of the endowment of natural resources of each country. By the end of the 1990s, the activism of these movements led to widespread disenchantment and rejection of neoliberalism as an economic doctrine and policy agenda, placing the imperial state on the defensive and creating conditions for a new development-resistance cycle. The popular resistance in this conjuncture has taken the form not of a class struggle but a socio-territorial struggle for improved access to the global commons, as well as protesting the destructive impacts of extractive capital on their livelihoods and habitats. As for the anti-imperialist political front of the resistance movement, it is directed against both the imperial policy agenda of neoliberal reform and the changing and new forms of imperialist intervention in both the political and development process.

Latin American Solidarity: Human Rights and the Politics of the US Left

Steve Striffler

Definition

A broad range of US actors have engaged in solidarity with Latin Americans from the Haitian Revolution in the early 1800s until the present day. Most of these efforts have not been centralized or coordinated by large or prominent organizations, and a defining feature of Latin American solidarity has been its ideological differentiation, lack of institutional continuity, and inconsistent presence. It is hard to pin down. Nevertheless, during the long period from the 1800s until the onset of the Cold War, Latin American solidarity was channeled primarily through an anti-imperialism that was at times inflected by pacifism, black internationalism, and radical labor solidarity. Although anti-imperialism was part of mainstream debate during this period, revolutionary currents rooted in more radical understandings of empire also emerged – first around the Haitian Revolution, then persisting unevenly through the 1800s around the global struggle against slavery and the Cuban fight for independence, and then intensifying during the early twentieth century around the Mexican Revolution and US military occupations in the Caribbean. World War II and the Cold War, however, deeply disrupted this uneven development of international solidarity, in large part because left internationalism within the United States was largely destroyed by the force of anti-communism in the decades following the war. Any yet, with violence sweeping Latin America, US actors recognized the need for international solidarity and adopted human rights as a way of framing, imagining, and mobilising solidarity during the 1970s and 1980s. This shift shaped the trajectory of Latin American solidarity through the present.

Introduction

Modern US–Latin American solidarity came of age during the Cold War through the human rights and peace movements of the 1970s and 1980s. US-based solidarity tentatively emerged around the Dominican Republic and Brazil in the 1960s following US interventions, gathered steam during the 1970s in response to US support for South

American dictatorships, and reached its apogee during the 1980s when Ronald Reagan's aggressive backing of military regimes in Central America drew tens of thousands of people into the peace movement.

The following essay situates this Cold War solidarity boom within a longer history of international solidarity, and asks a straightforward, but complex, question: Why human rights? Why did activists turn to human rights in the 1970s and 1980s as a way of framing, confronting, imagining, and mobilising solidarity? Why were human rights, as opposed to other currents of internationalism, the vehicle through which US–Latin American solidarity emerged as an identifiable political project? And, perhaps most importantly, what did it matter that US-based solidarity developed (primarily) through a particular form of internationalism? What is the legacy of human rights for the US left?

In retrospect, the close association between international solidarity and human rights appears almost inevitable. By the 1980s, the two were increasingly synonymous as many activists simply saw human rights as *the* way to engage in progressive internationalism. Yet, as late as 1970, the capture of internationalism by human rights was far from assured. Human rights were barely on the map and not part of mainstream discourse. More than this, there were other, more prominent and longstanding internationalisms from which people could (and did) draw upon in order to understand and organise solidarity in the Americas, including most notably socialism, anti-imperialism, anti-colonialism, labour solidarity, and pan-Africanism. What needed to happen, in a sense, was that human rights had to replace other better travelled internationalisms in the marketplace of ideas. Human rights had to become established, in relation to already existing projects, as a compelling and useful vision, cause, and form of advocacy and engagement.

Human rights would do this, and in the process (as human rights and peace gained prominence during the 1970s and 1980s) other internationalisms faded, becoming further marginalised even as they continued to inform and challenge their more visible counterparts. The following, then, traces the interrelated histories of two broad (and internally differentiated) currents within US-based international solidarity, one defined by human rights and the other by left internationalism, arguing that the dramatic ascent of human rights not only profoundly shaped US–Latin American solidarity during its formative period, but assumed and facilitated the marginalisation of other forms of internationalism. Human rights became the dominant way to think about and practise internationalism, a process that drew unprecedented human and financial resources to international activism, while at the same time largely detaching such solidarity from an identifiably left politics. Nor was this uneven process without long-term consequences. Subsequent generations of international solidarity activists not only inherited a narrowed political vision from the human rights movement, but acquired an organisational infrastructure and analysis that has been ill-equipped to deal with the central concern of solidarity since the 1990s: neo-liberal capitalism.

The Emergence of Solidarity

US–Latin American solidarity first emerged around the Haitian Revolution during the early 1800s. At its core, Haiti was a struggle by blacks to overthrow both colonialism and slavery, in effect claiming full citizenship before a world audience. It was an early precursor to post-Second World War anticolonial movements that took revolutionary nationalism in internationalist directions. The quest to achieve the nation state, to become citizens, required dealing a blow to empire. In its time, Haiti became a radical inspiration for freed and enslaved blacks and a promoter of revolution within the Americas. US-based efforts at solidarity were limited, but small groups actively supported the Haitian revolution.

Subsequent solidarity tended to follow US aggression. The US war against Mexico in the mid-1800s generated considerable dissent from mainstream politicians, peace groups, anti-imperialists, abolitionists, immigrants, and even some of the soldiers charged with carrying out the war. Such opposition, however, involved little

active solidarity with Latin Americans, and virtually evaporated once the war was in full swing. Similarly, when the US flirted with becoming an overseas colonial power in the late 1800s, the American Anti-Imperialist League was formed (1898) to oppose US annexations of the Philippines, Cuba, and other territories after the Spanish-American War. Although it put limits on US imperial designs, its perspective was more isolationist than internationalist and offered little in the way of cross-border solidarity.

The deepest example of international solidarity during the pre-Second World War era occurred around the Mexican Revolution in the 1910s. US-based actors participated in the first truly trans-border solidarity with Mexican rebels who rose against the US-supported dictatorship of Porfirio Díaz. Drawing on the left internationalism of the period, this was a radical and working-class solidarity that went beyond anti-imperialism. The newness and permeability of the border itself, the fluidity of Mexican-American identities in the region, and the common experience of an integrated and highly exploitative borderlands economy allowed for a uniquely rooted and revolutionary form of international solidarity to emerge (Foner 1988; MacLachlan 1991).

Finally, when the US occupied the Dominican Republic, Haiti, and Nicaragua during the 1910s and 1920s, a vibrant anti-imperialism re-emerged. When Dominicans launched a campaign in the US to get its military out of their country, they were able to build on a growing internationalism that facilitated connections with allies in the US who worked with them to shift public opinion and pressure the US government. By the end of a very effective campaign, the US was internationally embarrassed and effectively forced from the country (Calder 1984; Juarez 1962: 182).

The US occupations of Haiti and Nicaragua lasted longer. African-Americans took up the cause of Haiti, with the National Association for the Advancement of Colored People, black press, and black churches, along with small groups of white allies, exposing the brutal nature of the US occupation while supporting the Haitian struggle for independence. The US would eventually be

forced out, but it would take two decades (Pamphile 1986; Plummer 1982: 130–131; Renda 2001; Suggs 1988). The US occupation of Nicaragua, which effectively lasted from 1912–33, generated very little opposition until 1926 when Augusto Sandino began a seven-year guerrilla war to oust the US Marines. Sandino would capture the imagination of a portion of Americans. Some campaigned against the US occupation while others even actively supported Sandino in his rebellion (Gosse 1993; Grossman 2009).

The point here is not that pre-war solidarity was deep or wide, evolving in any particular direction, or somehow more ideologically pure or radical than what came later. In all these cases, we are talking about very few people in the US, acting for brief moments, sometimes for quite reactionary motives, and rarely in active/direct solidarity with Latin Americans themselves. Yet, not only did these efforts draw and develop from a wide range of existing internationalisms (not just peace/pacifism but pan-Africanism, anti-imperialism, and labour) but they all contained and promoted political projects, visions, and agendas. Such projects were, to be sure, incomplete, inconsistent, and muddled on a number of levels, but they nonetheless assumed that the world should be ordered in fundamentally different ways. They were political not simply in the sense of being partisan, or in the recognition that power and wealth were unequally distributed, but in that they were implicitly or explicitly grounded in collective notions of liberation that would usher in a fundamentally different world.

Solidarity and the Cold War

The Second World War and the Cold War deeply disrupted this uneven development of international solidarity by bringing about the near complete destruction of all forms of US-based left internationalism. This, in turn, created space for alternative internationalisms such as human rights to emerge.

During the Second World War, much of the US, and especially the liberal left, set aside

concerns about US empire and participated in the anti-fascist struggle. This was reasonable enough given the importance of the fight and the fact that the US government itself was preoccupied with Europe, and hence not intervening as aggressively in Latin America (i.e. FDR's Good Neighbor Policy). In a world threatened by global fascism, the political projects of anti-imperialism, anti-colonialism, and pan-Africanism seemed like secondary concerns, and labour internationalism and pacifism started to feel like quaint anachronisms of the nineteenth century.

Moreover, because anti-fascism quickly gave way to anti-communism following the war, left internationalism within the US was slow to rebound. The US emerged a superpower, its imperialism turbo-charged by anti-communism, and there was very little in the way of domestic opposition to empire. Opponents either acquiesced to, or were silenced by, imperial power. Some within the liberal left joined the fight against communism, seeing it as part of a broader struggle against 'totalitarianism', while others stayed the course and found themselves under attack (Gosse 2005: 10–15).

The real impetus and energy for internationalism during this period ultimately came not from the US and Europe, but from Asia and Africa where anti-colonial movements defined the two decades following the Second World War. More than 40 countries threw off colonial rule and became independent nation states during this period (Wu 2013: 29–30), reducing the number of people living under colonialism from some 750 million to less than 40 million (Moyn 2010: 95). In this global pursuit for self-determination and the nation state, anti-colonialists drew from a range of leftish projects that were both nationalist and internationalist in scope, including most notably communism, but also from a variety of panisms (pan-Arabism, pan-Africanism, etc.). This collective struggle against empire rarely drew on human rights for inspiration, and when it did it conceptualised them not in terms of individual protection against the state, but as part of a collective struggle for self-determination against imperial rule (Keys 2014; Moyn 2010).

More importantly for our story, although the anti-colonial nationalism of Third-World revolutionaries had a significant (and complex) impact on US radicalism during the 1950s and 1960s, its ability to become a central way of framing, inspiring, and organising solidarity was limited by a number of factors. Not only was it centred in other parts of the world, but anti-colonialism's close association with communism put it at a considerable disadvantage within the ideological marketplace of the Cold War US. This was especially true as the romance of Third World revolutionaries, which appealed to young Americans during the 1960s, started to wane in the 1970s. The effective end of formal colonialism, marked by Portugal's withdrawal from its colonies in the mid-1970s, only added to this tendency. Anti-colonialism not only seemed less urgent, even outdated, once self-determination been achieved, but it became less attractive to many Americans as revolutionaries began to govern new nations beset by poverty and violence (Moyn 2010).

The fragility of left internationalism, including the uneven appearance of anti-colonialism within US radicalism, was both reflected in and shaped the primary instance of solidarity from the period. Solidarity with Cuba in the early 1960s occurred at a time when open support for the revolution was becoming virtually impossible within the US. It came from two sources: African Americans and the Fair Play for Cuba Committee, a solidarity organisation that 'brought together the broadest array of constituencies of the early New Left, from old-fashioned liberals to early Black Nationalists' (Gosse 2005: 59). Both groups mobilised support for Cuba just as mainstream opinion turned against the revolution. Collectively, they prefigured and stimulated a multi-racial, anti-imperialist, anti-colonial strand of solidarity that would expand within the US during the Vietnam War (and then largely evaporate as a political force).

These efforts, which were severely restricted by the conservative milieu of the early 1960s and then actively crushed by the US government, were then followed by the Venceremos Brigades of the late 1960s. An outgrowth of Students for a Democratic Society, the Brigades brought hundreds of US citizens to Cuba to support the revolution at a

time when anti-imperialism/colonialism, which had been on life support, was once again informing a greatly expanded and diversified US radicalism. During a period when activists were frustrated by the inability to end the Vietnam War, trips to Cuba offered people an opportunity to practise hands-on solidarity. This did not last long, however, as solidarity with Cuba effectively ceased when the US government made travel to the island impossible (Lekus 2004: 63–64).

What this ultimately suggests is that when US-backed Cold War violence swept over Latin America, the very forms of left internationalism that might have been expected to offer a challenge were either absent or severely debilitated. Few within the US paid much attention to Bolivia during the 1950s, the violence surrounding Stroessner's Paraguay in 1954, the overthrow of Arbenz in Guatemala in the same year, military rule in Brazil during the mid-1960s, or the US invasion of the Dominican Republic in 1965. More to the point, when Latin Americans sought foreign allies they had few places to turn. Human rights networks had not yet developed, leaving Latin Americans to appeal for solidarity through the most familiar of internationalisms, as socialists reaching out to fellow socialists. Their calls were not completely ignored, especially in the Soviet Union and Europe, but there was not much to connect to in the US.

And yet, in many ways the origins of modern US solidarity with Latin America are found during this relatively bleak period in the thousands of US Church people who began travelling and working in the region in the 1950s and early 1960s. Their first-hand experience of US-sponsored repression in Latin America (at a time when Americans were starting to question foreign policy more broadly) coincided with a deeper and often politicising engagement with Latin Americans (Gosse 1988: 16–21; 1995: 24–25). Together with an increased emphasis on social commitment within religious communities, in effect institutionalised through the Second Vatican Council (1962–65) and the Medellin Conference (1968), this lived experience of US foreign policy, and its often devastating impact on Latin American friends, provided the basis for a growing collective awareness within faith-based communities about the role of the US and the presence of social movements in the region.

In this respect, President Johnson's 1965 invasion of the Dominican Republic was particularly important and 'had a profound impact on a cluster of radicalised missionaries and former volunteers who had served' (Green 2003: 92) in the country and returned to the US 'committed to turning their own religious institutions away from complicity in dominating the hemisphere' (Gosse 1988: 17). Although their efforts, combined with those from small groups of academics and activists, would only produce a minor public backlash (Calandra 2010: 22), the phenomenon of religious actors returning from Latin America and energising the movement would become a recurring theme. More than this, the 1965 invasion itself would become one of the foundational events that over time formed part of a shared knowledge and consciousness among growing numbers of progressives. Solidarity's most important research centre, the North American Congress on Latin America (NACLA, founded in 1966), and its oldest activist group, the Ecumenical Program for Inter-American Communication and Action (EPICA, founded in 1968), were both by-products of the Dominican experience (Gosse 1988: 16–17).

The occupation of the Dominican Republic, then, along with the unravelling of Vietnam, the US presence in Latin America more broadly, the emergence of democratic socialism in Chile, as well as the civil rights movement, liberation theology, and the rise of the New Left, were all part of a leftward shift that led faith-based groups to view US foreign policy more critically at the exact moment when they were developing sustained connections with Latin Americans. To be sure, the longterm consequences of this process were far from clear in the mid to late 1960s. It would take years to attract significant numbers to the embryonic movement, build institutions, and develop visions and strategies. But it was this diverse faith-based community that would, in the 1970s and 1980s, provide the human, financial, and organisational core of the broader solidarity movement. In its early small-scale manifestations in relation to events in the Dominican Republic,

Brazil, and Central America during the 1960s, this solidarity, much like its secular counterpart, was part and parcel of the broader left.

There is probably no clearer evidence of both the poverty of US-based internationalism during this period, as well as the energy, promise, and tensions embodied in early solidarity efforts, than in the case of Brazil during the mid-1960s. When the Brazilian military, with the full blessing of the US government, staged a coup in 1964 with the goal of restoring the domestic political order by eliminating all forms of dissent, there was little in the way of opposition from groups within the US. Vietnam had not sufficiently unravelled to allow for the broader questioning of US foreign policy, and few Americans were interested in, let alone challenged, US policies toward Latin America.

However, as James Green charts, by 1968 when the Brazilian military regime renewed its commitment to violence, the political winds had shifted sufficiently to produce a small, but energetic, solidarity campaign between Brazilians, made up largely of exiles, and Americans, made up largely of academics, clergy, and other progressives with experience and expertise in Brazil. The campaign, which would eventually expand to include leaders within the World Council of Churches and the Catholic Church, a wide range of academics, prominent civil rights activists such as Ralph Abernathy and Andrew Young, and Amnesty International (which launched one of its first widely publicised campaigns regarding torture) succeeded in shaming the Brazilian regime internationally (Green 2003, 2010).

Its emergence, moreover, was due in part to the fact that activists began to unevenly and tentatively frame the Brazilian cause in the language and practices of human rights. In what would become routine within a decade, Latin Americans asked international allies to publicise the crimes of the Brazilian military government. Human rights would prove to be a particularly effective way of doing this, in part by separating the violence itself from the messiness of political agendas, and doing so in a way that the 'international community' could understand, connect with, and rally around. Although this shaming strategy would not prove

particularly effective in lessening the repression or removing Brazil's military government, the campaign did succeed in turning the Brazilian government into an international pariah defined by human rights violations. This 'success' ensured that the tactic of shaming military governments by exposing human rights abuses would become a central part of the solidarity toolkit.

It is important to note, however, that the small number of activists who were most actively involved in the initial efforts, including both Brazilians and their US allies, tried to articulate and use a (left) version of human rights that made connections between repression and the broader political projects of both the military regime and its opposition. It was by no means common sense during this period to understand repression as 'human rights violations', or to disconnect such violations from a larger politics of oppression or emancipation. As James Green highlights, activists worked to help people make connections between, on the one hand, the horror of human rights abuses and, on the other, the military's war on the poor; on US backing for repressive regimes in Latin America, support for similar governments in other parts of the world, and regressive economic policies; on the relationship between repression and the Brazilian government's treatment of indigenous people in the Amazon. These efforts at education, at making connections, met with some success as the mainstream media in the US caught on to some of these themes and issues, especially as they resonated with the war in Vietnam. Yet, torture and brutal prison conditions, particularly when disconnected from politics, were always an easier sell than economic inequality, especially in a climate where such discussions could quickly be labelled communist (Green 2003, 2010).

Moreover, the broader effort to link the 'human rights' cause to leftist programmes for social change, to understand and support the political projects of those being targeted by state violence, did not find much traction in the US. Not only was there not much to connect to in the US, but what there was tended to focus narrowly on torture, leaving aside the question of broader collective political projects and solidarity. James Green

captures the complexity of this early campaign, including not only its inability to produce a fundamental shift in the policies and practices of the Brazilian dictatorship, but also the ambiguous nature of 'solidarity' itself.

> The campaigns against torture won international support and linked the Brazilian government to repressive actions but did not seem to have a palpable effect on the military's policies. The regime was not about to introduce political liberalization, and the opposition was still reeling from aftershocks of the previous four years. In the United States, torture in Brazil had been denounced, and then men and women of good will had moved on. Even the phrase *Brazilian solidarity group,* has a clumsy, inauthentic ring to it, because many signatories of petitions against Brazilian torture and repression were reacting against an inhumane situation and not necessarily in favor of a program or political current in Brazil. (Green 2010: 3)

Brazil provided a hint of solidarity's future, but both international solidarity and human rights in the Americas were in their infancy in the late 1960s. Latin Americans were much more comfortable with other internationalisms, particularly socialism, and were often sceptical or simply unclear about human rights as a concept or tool. On the US side, both Cuba and Brazil demonstrated the political limits of US-based internationalism, and although activists found human rights to be useful in the case of Brazil, the campaign remained quite small and the concept itself had limited traction.

Even as late as the 1973 coup in Uruguay, where intense repression seemed ideally suited for a human rights framing, Uruguayan activists were slow and reluctant to adopt the language, instead understanding 'torture and death as part of the risks of leading a proper revolutionary life. In the years immediately before the coup, denunciations of abuses by the police, the military, and paramilitary forces adopted a revolutionary language in which local ruling elites and US imperialism were to blame' (Markarian 2005: 99). This was no doubt common sense to many Latin American leftists who had long struggled with how to combat state violence while simultaneously fighting for socialism. Many activists assumed that occasional arrests, brief stays in prison, periodic exile, and certain levels of state violence were fundamental features of being active in the left.

The primary question was how to 'advance the popular cause' by overcoming repression and persecution (ibid.).

Even with respect to political prisoners (the very issue that would animate the human rights movement for the rest of the decade), Uruguayan leftists felt the problem 'should be confronted politically, positioned in terms of class struggle' (ibid.). Such a framing by no means precluded international solidarity, and Uruguayans found some like-minded allies in Europe, but it was not intended to (nor could) attract an emerging human rights movement, much less appeal to US policymakers. The potential audience for a revolutionary framing of repression remained small and weak in the US.

Nevertheless, if Latin Americans were sceptical/unclear about human rights as a form of engagement, by the early to mid-1970s the emerging international movement was difficult to ignore. The level of repression in many countries had intensified so dramatically that it made it increasingly difficult to even be a leftist. The struggle for socialism, many reasoned, could not be advanced without first securing basic civil and political rights. More than this, initial indications suggested that human rights possessed the potential for attracting a wider range of allies both at home and abroad, in part because even people who agreed on little, who shared no political project, could agree that governments should not falsely imprison and torture their citizens. Human rights were also difficult for Latin Americans to ignore because other internationalisms were bringing relatively few allies (especially from the US) to the table at a time when they were so desperately needed. And, as the growing presence of organisations like Amnesty suggested, the international human rights movement seemed poised to provide support from around the world at a time when allies were scarce. It was a potentially useful tool.

Amnesty International and the Rise of Human Rights

The rise of Amnesty International captures most clearly the sudden and powerful emergence of

human rights during the 1960s and early 1970s, as well as the long-term impact of its brand of solidarity. Founded in 1961, Amnesty barely survived the 1960s. It almost collapsed in 1967 due to internal disputes, and the US section (AIUSA), which emerged in 1965, nearly folded under financial pressure in 1970 (Cmiel 1999: 1234). The organisation's fortunes then changed dramatically in the 1970s:

> Between 1970 and 1976, the number of dues-paying members in the US went from 6,000 to 35,000. AIUSA had one paid, half-time staff member in 1970. The organization, such as it was, was run by a volunteer board of directors. A decade later, however, there were fourteen paid staffers with offices in New York City, San Francisco, California, Chicago, Illinois, Colorado, and Washington, D.C. The international organization grew similarly in those years. In 1977, it was awarded the Nobel peace prize. (1235)

Within a decade, then, AI went from near collapse to become the world's foremost human rights organisation.

Timing was clearly part of its success. Human rights activism exploded during the 1970s. Organisations formed, governments took note, and the term itself became part of mainstream public discourse. By the end the decade there were more than 200 groups working on human rights in the US. The Ford Foundation and other funding agencies made human rights a focus, channelling millions of dollars toward the cause. The US Congress held hearings, eventually tying foreign aid to a country's human rights record. And President Carter made it a cornerstone of US foreign policy. Human rights had arrived. It had become respectable. (1234–1238)

Amnesty's success was due to more than good timing, however. It did not simply benefit from the human rights boom. It propelled it, an achievement that was due in part to strategic decisions by the organisation's staff. In 1970, AIUSA committed resources to organising local branches around the country, a tactic that worked remarkably well in expanding its base, and helped bring human rights out of the hallways and offices of the United Nations and into the public arena. This emphasis on building at the grass roots, especially on college campuses, was a by-product of the political milieu; 'nearly all of the 1970s AIUSA staff had

done antiwar and civil rights work', and assumed mass mobilisation was a fundamental feature of progressive politics and social change (1240).

With AI, however, the tactic was not about mass mobilisation in the sense of taking to the streets, but mass membership to support well-orchestrated letter-writing campaigns. This was AI's central tactic during the early years. Each AI affiliate, or adoption group, was assigned a political prisoner. Members then wrote letters to offending governments, journalists, politicians, and international organisations. Done with increasing sophistication, and in large enough numbers, this tactic proved relatively effective in securing the release of prisoners (1240–1241). What this also meant, however, was that AI had to devote more and more resources to identifying worthy prisoners in order to satisfy the demand of growing numbers of local affiliates.

As a result, AI leaders discovered fairly quickly that not only did the organisation not need the masses for street mobilisations, but they did not need a membership to adopt prisoners and write letters. Professional human rights organisations could do the work themselves, saving prisoners in Latin America by lobbying politicians in Washington. Gathering information ceased to be a means to an end, a way of building a mass base. It became the end in itself. AI became a professional organisation that gathered facts and then directly lobbied journalists and politicians in an effort to put pressure on human rights violators (1240–1241). In short, it became a modern human rights organisation. Whatever its virtues, this was a different type of politics, one that relied on insider access to political elites and a mass membership whose central purpose was not taking to the streets or writing letters, but writing a cheque to support Amnesty's efforts.

As Kenneth Cmiel outlines, the question as to what path of political engagement to pursue, of whether to be a grass-roots type organisation or a professional lobby (or a bit of both), was one that AI leadership debated quite intensely during the 1970s (1240–1245). The leaders had, after all, come from a tradition of grass-roots organising. However, for other human rights organisations (which were emerging almost on a daily basis during the 1970s, and in many ways became the

path within US–Latin American solidarity), the question itself was increasingly off the radar. A new political formula, supported in part by the innovation of direct-mail fundraising and the largesse of philanthropic foundations, had emerged. If a network of professional activists, lawyers, and academics could influence elites, get results, and be financially sustainable through grant writing and fundraising, why bother building a mass base? And Amnesty was hardly alone. Its rival, Human Rights Watch, was a product of Ford Foundation funding and created as an 'independent' human rights monitor focusing on abuses in the Soviet Union (Keys 2014: 265–266).

This was a form of politics that increasingly required being divorced from (traditional) politics altogether. As the central task of human rights organisations became the professional gathering and public dissemination of accurate information about human rights violations, the legitimacy of human rights organisations within the eyes of governments, the United Nations, and the broader public became crucial. Human rights organisations came to deal in information, and that information had to be reliable. This legitimacy rested, at least partially, on ensuring that human rights organisations were themselves not only professionally run, but were neutral and nonpartisan, that their activities were independent of politics, particularly the (transformative) political projects of human rights victims, violators, and their supporters. Like most human rights organisations of the period, AI not only 'traded on its claim to be above and beyond politics', but 'defined itself against the left', even when it targeted the victims of right-wing dictatorships (Moyn 2010: 132). As it developed, then, the heart of human rights activism did not simply forget or postpone a larger political vision. It actively separated itself from broader political agendas.

In this sense, the meteoric rise of this brand of human rights did not simply serve to further marginalise a range of left internationalisms, to replace one internationalism with another. Its rise altered the very nature of internationalism itself, of solidarity, by displacing a range of internationalisms that assumed a collective politics of liberation with a form of internationalism that was openly antithetical to political projects or visions rooted in notions of collective emancipation. This was solidarity without politics as the left had traditionally understood it, whereby politics assumes collectively struggling for an alternative way of ordering the world. The emerging human rights movement, by contrast, treated 'political problems as moral ones, thereby eliding the deeper political changes that social justice often required', a tendency that would gather steam during the peace movement of the 1980s (Keys 2014: 201).

Many activists recognised this tension, with some reasoning that in order for the human rights movement to be effective its organisations had to be seen as legitimate, and this required a strict separation from partisan politics. This was a strategic decision. The torture had to be stopped, and required a pragmatic, whatever-works, act-now-think-later approach. Some adopted the nonpartisan practice and language of human rights quite consciously as a way to attract larger numbers of people into political activism, and as a tool for gaining access to policymakers and the mainstream media (even as they tried to tie human rights work to a larger politics by maintaining relationships with movements in Latin America). For many, then, human rights remained contested terrain, particularly with respect to whether it should or should not be openly connected to a larger politics. Regardless, however, when the left in both Latin America and the US began to resist and frame their opposition to repression through human rights, they not only helped elevate human rights – a remarkably vague and elastic concept – to new heights. They also embraced a concept and set of practices whose broad contours and uses the left would ultimately not control. This was a 'decision' that in turn generated a range of short and long-term consequences that were not immediately transparent at the time.

What is perhaps even more important than the open tensions within solidarity circles is the fact that this distinction itself, between human rights and various forms of left internationalism, became increasingly invisible to a generation that came of age during the 1980s and 1990s. For many activists who had limited connection with left

internationalism and took it for granted that socialism was dead, or who simply 'became political' when human rights overshadowed other forms of solidarity, human rights was simply a 'progressive' way of engaging the world in a meaningful way. Human rights became the beginning and end of political work. The goal was to end human rights abuses, a supremely worthy cause, and other projects were deemed too complicated, impractical, or (more often) simply not part of a narrowed political imagination.

To be sure, there was always a portion of activists for whom human rights served as a gateway towards a more radical politics. Currents of left internationalism persisted, pushing the human rights movement and attracting activists who were inspired by the urgency of human rights, but ultimately frustrated by its limited political project. Yet, over time, especially as the 1970s slipped into the 1980s and 1990s, the political avenues of left internationalism faded from public view and became increasingly hard to find for new generations of progressives. There were fewer places to pursue a more militant politics even for those who became radicalised. More importantly, this broader shift towards a solidarity divorced from politics was stimulated by, and brought with it, a very different method of political engagement, one that relied much more heavily on professional staff, lobbying, insider access to political and media elites, etc. This NGO-isation of solidarity work, which emerged very unevenly during the coming decades, would never become completely hegemonic, but nevertheless became a defining form for much of international solidarity in the coming decades, regardless of one's 'politics'.

Chile

Chile made human rights and human rights made Chile. Chile, including the 1973 overthrow of Allende, the intense repression that followed, and the global debate that emerged, was central to the development of the broader human rights movement. Human rights came of age in part through Chile, a process that not only

encompassed the left, liberals, religious communities, the media, policymakers, and broad swathes of the US population, but also ensured that human rights would be a dominant political current within US solidarity from the 1970s onward. At the same time, the growing presence of human rights during this period also made Chile a subject of global interest and a site for political engagement through the 1970s. Chile would not have garnered so much interest, especially in the US, had it not emerged through a blossoming human rights movement.

At the time of the coup, however, it was far from clear that human rights would become a vehicle through which the coup was understood and political activity channelled. Chile itself was home to a powerful left that, although caught off guard by the level of repression following the coup, understood Pinochet's assault as part of a broader class war. Intense debates and divisions emerged within the Chilean left over how and when to respond to the coup, but the broader goal was to forge a political opposition that could regain political power and build a better future.

On a global level, there was very little certainty that human rights would become the primary way through which international actors would understand Chile. The million-plus people throughout Latin America, Europe, and to a lesser extent the US who took to the streets after the coup did so not because Chile was understood as a human rights cause, but because it inspired as a socialist democracy (Power 2009: 52). Within the US, despite some inroads made by Amnesty, 'human rights' was a largely unfamiliar term that was most commonly understood as a rough equivalent to civil rights, and thus associated with domestic issues. For the broader public, the term '*international human rights*' was largely connected with conservatives who adopted the concept to re-energise the Cold War fight against communism. It was not something that mainstream liberals had yet captured in order to confront right-wing military dictatorships supported by the US (Keys 2014). More than this, Chile itself was not of great interest to the US mainstream. On the eve of the coup, Chile was the province of the left, and understood

L

primarily in terms of an anti-interventionism that was seen through the lens of anti-imperialism.

In this sense, given that the left had such a head start and there was no human rights movement at the time of the coup, how and why did human rights become so central, so quickly, to understanding and engaging with Chile? And how did the rise of human rights shape the potential of other internationalisms to frame Chile and solidarity efforts in general? The short answer to this latter question is that as the left lost hold of how solidarity with Chile would be framed it was also losing hold of how international solidarity would be understood and practised.

Events in Chile played a decisive role in elevating human rights. The repression on and after 11 September was so intense that it essentially wiped out pre-existing political actors on the left. Virtually all forms of political activity were curtailed and Churches quickly emerged as among the few actors which still possessed a relatively intact organisational infrastructure (Cleary 1997; Frühling 1992; Hawkins 2002). Chileans who wanted to remain politically active flocked to the relative protection of Church-led organisations. The turn to human rights also happened very quickly in large part because other political avenues were cut off. The international spotlight gave Churches limited room to manoeuvre, but they could not criticise the regime on most matters or be seen as taking a 'political' stance (Frühling 1989; Hawkins 2002; Power 2009). Yet, as a moral authority, religious institutions could cautiously criticise the regime for actions that were simply 'beyond the pale'. Human rights provided both the language and practice for such an intervention. It became the preferred path for political activity in part because it was one of the only ones that remained.

Within three weeks of the takeover, Chilean religious leaders founded the Comité de Cooperación para la Paz en Chile (COPACHI). COPACHI was not actively or formerly opposed to the military regime, and initially saw itself as an apolitical human rights office, but it quickly developed an expansive social agenda (Frühling 1992: 121–141). COPACHI's human rights reports, documenting hundreds of cases, became the raw material for groups like Amnesty, the Red Cross, Americas' Watch, and the United Nations (Hawkins 2002: 57). COPACHI's successor, the Vicaría de la Solidaridad, would also stress that it was a humanitarian (and not political) organisation, both for safety reasons and to win more conservative supporters within and outside the Church, but the lines between economic aid, charity, and more political work were inevitably blurred (Cleary 1997: 10–11; Frühling 1992; Hawkins 2002).

Even still, within the US, it was far from clear that Chile would be framed through human rights. What interest and solidarity there was prior to the coup came from small groups of academics, independent journalists, religious actors, radicals, and others who were broadly influenced by or actively part of the New Left, and in some cases had lived in Chile. They understood Chile primarily in terms of an anti-interventionism coloured by anti-imperialism, and in many cases saw their work as supporting the Allende Government and Chilean opposition to the coup. Consequently, much of the work focused on educating Americans about the truth regarding Allende, the military regime, and US government/corporate intervention. Most of the pre-coup efforts did not reach mainstream audiences, but journalist Jack Anderson's 1972 report, followed by Senator Frank Church's (March 1973) investigation into International Telephone and Telegraph (ITT) represented high-water marks that both energised solidarity and led sectors of the media and political establishment to view events in Chile more critically (Gosse 2003: 102–104).

Anti-interventionist solidarity expanded dramatically following Allende's overthrow. Significant numbers of prominent academics and other professionals quickly 'labeled the coup as beyond the pale'. Such a consistent and immediate reaction from respectable members of the intelligentsia proved decisive in forcing media outlets to provide more critical coverage of the coup and US involvement. Academics also led the first national protests after the coup (Gosse 2003).

Solidarity subsequently went in a variety of directions, reflecting the diversity of the left. US communists took something of a leadership role,

establishing local solidarity organisations throughout the country while establishing the National Coordinating Center in Solidarity with Chile. Antiimperialists cohered in the form of Non-Intervention in Chile, were committed to a fairly militant style of protest, and stressed connections between US corporate capitalism at home and abroad. The National Chile Center took a more moderate stance and stressed a pragmatic emphasis on legislation and working with liberals (Gosse 2003: 103–106; Calandra 2010). There were eventually somewhere between 50 and 100 solidarity groups working throughout the country in large cities and college towns, holding events, distributing newsletters, and otherwise trying to get the message out. Cultural icons of the liberal-left, such as Joan Baez and Pete Seeger, also lent support (Goff 2007: 101–105).

Chile also represented perhaps the earliest example of dissension within the labour movement over the staunch support of the American Federation of Labour and Congress of Industrial Organisations (AFL-CIO) for Washington's Cold War anti-communism (a break that would widen around Central America during the 1980s). Numerous unions, such as the United Farm Workers, United Automobile Workers, and others, quickly passed resolutions against the coup, and for a moment it even looked as though the AFL-CIO was going to take a strong stance against continued aid and trade with Chile. In the end, after Pinochet offered up a few labour concessions, the AFL-CIO returned to form, but the presence of labour within the broader opposition served to tie economic issues (particularly aid, trade, and international lending) to human rights abuses (Tinsman 2014: 178–195).

The left's (albeit limited) success in promoting and framing Chile was made possible not only by the fact that they were the only ones paying attention prior to the coup, but by the strong anti-interventionist current running through American society following Vietnam. Opposition to US foreign policy was now mainstream, producing a liberal-left bloc that rejected the basic premises of the Cold War and was willing to contest US efforts to contain popular movements overseas

(Gosse 2003: 100–102). As a minority partner, the left's challenge was to take this anti-interventionism in an anti-imperialist direction, in effect making the case that US intervention was not apolitical or well intentioned, but supported repressive regimes that undermined democratic movements and sustained wealthy interests at home and abroad.

This would have been an uphill battle under any circumstances, but human rights complicated the terrain. The success of human rights was tied to the fact that it would effectively capture anti-interventionism, disconnecting it from a left politics while taking it in a depoliticised direction. Liberal versions of human rights offered an anti-interventionism that was politically neutral (and neutered), one whose central requirement was that the US government should not support military regimes that committed the grossest of human rights violations (no doubt, a worthy goal). The politics and policies of these regimes, as well as the politics of their opponents, were essentially irrelevant, as were the deeper motivations and practices of the US government and corporations in other parts of the world. This is an anti-interventionism that moves beyond the politics of the Cold War by ignoring it, in effect declaring traditional politics irrelevant and left solidarity obsolete, undesirable, or anachronistic.

This soft anti-interventionism was also central to the success of human rights as a movement. The human rights movement allowed for a diverse range of anti-interventionists to work under its broad umbrella, to oppose US policy, in part because the vagueness of the human rights concept allowed people to work together who had quite different understandings of what 'it' meant. The net result was that as human rights experienced a meteoric rise in the second half of the 1970s, what passed as anti-interventionism was increasingly disconnected from a left politics. Human rights did not simply marginalise other internationalisms, but also coopted them while defining the outer limits of opposition to US foreign policy in politically neutral terms. Nevertheless, it was by no means given that human rights would capture and energise Chilean solidarity. It had been effectively captured by conservatives in

order to reinvigorate anti-communism through a focus on Soviet repression. Most of what Americans would come to associate with international human rights, including its affiliation with liberals, its principle institutions, and its tight focus on torture and political prisoners, either did not exist or was barely off the ground in 1973. The US section of Amnesty International had a total of 3,000 members in 1974, and struggled to find meeting space in Washington DC. Human Rights Watch did not exist, nor did the Lawyers Committee for Human Rights, the Human Rights Law Group, nor the hundreds of other rights groups that would emerge in the second half of the 1970s. There was one international human rights organisation headquartered in the US at the time (Keys 2014; Moyn 2010).

And yet, between religious groups, secular non-governmental organisations, and sympathetic policymakers (the three core constituencies of what would eventually become the human rights movement) there was a sufficient presence to respond to calls for solidarity from Chile. Of the three groups, religious actors were in the best position to respond to a call for human rights solidarity at the time of the coup. From the end of the Second World War until the late 1960s, the most consistent source of human rights discourse emanated from small groups of religious actors and international lawyers. They toiled away in relatively obscurity, often working with largely unknown and impotent sections of the United Nations (Keys 2014; Quigley 2002). The relative readiness of church groups was heightened by the growing emphasis on social commitment within religious circles, along with increasing distrust of US foreign policy, two trends brought about by a decade of civil rights organising, the rise of liberation theology, and the broader disenchantment surrounding Vietnam. A growing sector of the religious community was, in a sense, ready for Chile.

The religious response to Chile was immediate, global, included a wide range of denominations, and had support from the highest levels of Church hierarchy. Pope Paul IV immediately expressed concern, as did Church leaders from around the world. Calls for restraint quickly turned to concrete action, including direct support

for Chilean human rights organisations, the development of a sophisticated lobbying campaign in the US, and active aid to refugees/exiles. The World Council of Churches (WCC) immediately established the Emergency Task Force on the Chilean Situation, promising to commit over $500,000 to the cause, a fundraising goal that was immediately surpassed. The WCC, along with Catholic, Presbyterian, and Lutheran Churches, helped COPACHI get off the ground, and foreign sources would provide the organisation with almost all of its budget. Between 1974 and 1979, international actors, with Churches taking the lead, would funnel more than $100 million to Chilean Churches and their human rights organisations (Hawkins 2002: 57–79).

The Washington Office on Latin America (WOLA) was quickly formed by the Latin American Strategy Committee, an ecumenical collection of North American Church groups that had coalesced in connection to Brazil in 1968 (Calandra 2010: 25; Quigley 2002). WOLA would become a significant force on Capitol Hill with respect to Latin American policy. Efforts steamrolled, and by the mid-1970s, groups like WOLA, the US Catholic Conference, and the (Quaker) American Friends Service Committee had established what came to be known as 'the religious lobby', a relatively small number of faith-based activists, numbering probably less than 150 people at the end of the decade, who were well resourced, well informed, and had strong connections with sympathetic policymakers. With close ties to human right organisations in Chile, they became an important information source for the media, decisionmakers, and the broader public (Calandra 2010: 22–26; Quigley 2002; Schoultz 1981: 77–80). They were also, by and large, quite sophisticated in their analysis of repression in Latin America, including the role of the US (Schoultz 1981: 77–97), and very committed to the region in a way that emphasised building pragmatic, strategic, non-sectarian alliances aimed at addressing an urgent situation.

The collective efforts of this very diverse religious community were predicated on and stimulated by the broader rise of secular-liberal human rights within the US. Within a very short period of

time, it was liberals, both within the US government and outside in organisations such as Amnesty, who would take the lead, defining the broad contours and orientation of the movement. The liberal turn to human rights happened slowly and unevenly during the late 1960s and early 1970s, shaped by events in Greece and Brazil, as well as growing awareness about the Holocaust and political prisoners in South Vietnam. International human rights attracted liberals in part because its limited aspirations were such a good fit at a moment when there was little appetite for a more ambitious US foreign policy; in part because dictatorships were a very real problem; in part because human rights allowed the US to reclaim the moral high ground without investing much at all; and in part because human rights proved effective at garnering public attention (Hawkins 2002; Keys 2014: Chap. 7). The increasingly sharp focus on torture and prisoners propelled this process by defining human rights and foreign policy aspirations in narrow terms while framing the issue in a way that captured the public's attention and confirmed the US's moral superiority.

The liberal embrace of human rights could not gain full momentum until after the Vietnam War finally ended in January of 1973, in part because it was difficult to lecture the rest of the world about human rights abuses when the US government was committing massive atrocities in Asia. In this respect, the September coup in Chile was timely, and was 'the watershed event that would grab headlines and bring liberal human rights concerns – political imprisonment and torture above all – into mainstream public consciousness' (Keys 2014: 148). Amnesty International and the International Commission of Jurists responded immediately after the coup, cabling the Inter-American Commission on Human Rights to insist that refugees be allowed to leave the country and that the new government respect human rights (Hawkins 2002: 55–56). Within the next two years, virtually every major human rights organisation would send delegations to Chile and/or issue reports. Sectors within the UN did all they could to keep up.

It took a bit longer to establish a critical mass in the US Congress, and the process was the product of both politics in the US and genuine concern about human rights abuses in Chile. Human rights activists pushed policymakers with increasing intensity and sophistication, providing information, talking points, and even wholesale legislation. More than this, human rights and Chile provided liberal Congresspersons with a compelling avenue for challenging the Nixon Administration. Kissinger's intransigence and hostility, his initial unwillingness to give an inch on Congressional human rights proposals, created an energetic backlash at a time when the Nixon Administration was vulnerable and increasingly seen as morally bankrupt. Subsequent revelations that the US, under Kissinger's direction, had actively undermined the democratically elected government of Allende provided Congressional opposition with powerful ammunition and elevated Chile to a cause célèbre. Supported by human rights organisations, leading liberal Congressional Democrats such as Donald Fraser, Edward Kennedy, and Tom Harkin adopted human rights as a liberal tool for pursuing a foreign policy project that was at once remarkably limited and profoundly important: to make sure the US government did not aid dictators who torture and imprison their own citizens. On the one hand, ceasing to pay for dictatorship did not require even modest change to a country's political or economic system, or necessarily imply a more democratic vision for the future. It could simply be 'an outlet for moral indignation and a program for virtue without cost' (Keys 2014: 156). On the other hand, the withdrawal of military aid could (in certain countries at particular moments) have profound consequences for Third-World social movements. This possibility would be a central concern as solidarity activists turned their attention to Central America from the late 1970s onward, a region that contained not only repressive military dictatorships backed by the US, but armed revolutionary movements pursuing radical political agendas.

Human Rights and the US Left

By the late 1970s, the broad contours of US–Latin American solidarity were set on a shifting ground defined by two differentiated and intertwined

currents, left internationalism and liberal human rights, with the latter coming to occupy a dominant place within the movement as a whole. Both strands would blossom and expand in the 1980s on a scale that was unimaginable during South American solidarity efforts of the 1970s. Left internationalism, which occupied a key place within Chilean solidarity even as human rights became ascendant, would experience a revival during the Central American peace movement. This resurgence was, somewhat ironically, tied to the broader rise of the right and decline of the left.

When Carter embraced human rights in the late 1970s, it seemed quite plausible that human rights would thoroughly capture, and in effect become, progressive internationalism in the US. With Reagan in office, however, conservatives would try with renewed vigour (and considerable success) to claim human rights in the fight against communism. And yet, Reagan's obsession with communism, combined with the fact that his foreign policy had horrific consequences in Central America and lacked support in the US, ensured that not only would an important current of human rights remain under the jurisdiction of liberals, but that the left was handed a cause at a time when domestic issues failed to inspire. As the remnants of a broader US left based in the civil rights, labour, and anti-war movements evaporated in the late 1970s and 1980s, activists turned their attention to Reagan's foreign policy with such energy that the progressive wing of the peace movement essentially became the left in the US. They were, however, increasingly isolated.

This 1980s surge of internationalism was, to be sure, a testament to the unpopular nature of Reagan's foreign policy and the hard work of activists, but it also signalled the broader decline of the left in the US. The Central American peace movement did not represent the reinvigoration of the US left as much as it marked one in a long series of last gasps. The rapid decline of the broader left not only placed real limits on what a politically isolated peace movement could accomplish in an increasingly conservative climate. It also pushed internationalists to focus narrowly on Central America and US foreign policy while

largely avoiding connections to domestic issues altogether. Central America was attractive to many US leftists precisely because Central Americans were advancing political projects that were completely off the table in the US.

Nevertheless, this left internationalism was quite real, significant, genuinely radical, and had both secular and religious elements. US-based solidarity with Nicaragua during the 1980s was defined not only by an anti-interventionism deeply soaked in antiimperialism, but more often than not sought to support socialist revolution. Solidarity with El Salvador, which would ultimately be the primary focus of the broader peace movement, was also shaped by a left (primarily through the Committee in Solidarity with the People of El Salvador [CISPES]) that was fighting imperialism to advance socialism in Central America. In the hands of the left, human rights often served as a tool (alongside anti-interventionism, self-determination, anti-imperialism, and socialism) that could be disconnected or connected to a larger politics depending on the strategic needs of the moment.

This was not, to be sure, a struggle to build a US left that would advance a domestic political agenda, or one that was particularly interested in connecting working-class struggles across borders. Such a project was not offered, in part because it seemed impossible given the US political climate, in part because the movement prioritised the needs of Central Americans, and in large part because Central American revolutionaries saw their US allies as a 'North American Front.' US actors were to advance the Central American cause by confronting Reagan while providing physical protection, emotional support, and material aid (Gosse 1988). On this, the solidarity left, working within and outside human rights, had considerable success, even if in the end the results may have been less than had been hoped for. This history is important to remember.

And yet, the broad parameters of US–Latin American solidarity that had been established in the 1970s would hold through the 1980s. That is, as dynamic as left internationalism was during this period, the dominant current of international solidarity was a human rights/peace movement

based in Church groups, liberal human rights organisations, and Washington DC-based policymakers. It was also a movement that inherited and deepened a contradiction from 1970s' solidarity efforts in South America.

On the one hand, the movement as a whole cohered around a fairly narrow, but important, political project, namely opposition to human rights abuses and US support for military regimes in Central America. To be sure, a significant and important minority saw solidarity in terms of radical transformation, and worked directly with revolutionary movements to advance socialism in Central America. Yet, the core of a heavily faith-based movement, supported by liberal human rights organisations and sympathetic policymakers, saw solidarity not in terms of a longterm struggle to build a new world, but as an urgent call for help to end human rights atrocities and military repression (or to protect its victims). The gravitation towards this limited political project came from a now familiar set of sources. Many Church people shied away from taking sides in the civil wars, either because they did not support the revolutionary movements themselves, did not see it as their place to intervene, or simply felt that being 'political' would empower anticommunist rhetoric and otherwise undermine a fragile movement that was struggling against a popular president in an increasingly conservative climate. The tendency to cohere around a soft anti-interventionism that avoided connections with broader political projects was also embraced because it was a useful way for communicating with politicalmedia elites and attracting larger numbers to the movement. Regardless of whether one supported the FMLN or simply wanted to end/lessen the repression, everyone could agree (or at least enter into a discussion) about US military aid being stopped. More than this, the struggle to stop military aid (pushed by Central Americans themselves) had potentially radical implications in that it could undermine dictatorships and allow revolutionary movements to succeed.

On the other hand, and here lies something of a paradox, although the fact that the movement coalesced around a fairly limited project may explain why it was able to bring thousands of people under its broad umbrella, this narrowed political vision did little to facilitate the movement's own coherence. It never possessed anything resembling an organisational centre. As Gosse aptly noted about the movement, 'everyone knew it was there, but few, even among its supporters, knew where it came from or how it operated' (Gosse 1995: 23). Activism came in a variety of forms, from candlelight vigils, street marches, and travelling to Central American war zones to illegally housing refugees, committing civil disobedience, and pressuring political representatives. National-level entities such as Sanctuary, Witness for Peace, Pledge of Resistance, Neighbor to Neighbor, and CISPES gave the movement a certain coherence, but in many ways 'the movement' was characterised by the proliferation of local solidarity organisations, most of which were sharply focused in one way or another, working on a particular country/city, organised by or around a particular group (i.e. nuns, students, etc.), or limited to a particular type of solidarity (e.g. lobbying). This was no doubt a strength, lessening sectarianism, inviting broad participation, and making a relatively small and isolated movement appear as though it was everywhere at all times (Gosse 1995: 23).

Yet, it also produced a movement that was, despite some significant national-level organising efforts, rooted in hundreds of relatively small, autonomous, and semi-isolated organisations that had few resources. They were increasingly sophisticated at political lobbying, fundraising, accessing media attention, and aiding individual victims from Latin America; but they were largely incapable of, or simply unconcerned about, building a political base with the level of coherence required to achieve even short-term goals, let alone to advance a larger political project. That such a description captures today's solidarity landscape is not entirely a coincidence.

In this sense, it was not simply that the broader shift to the right in the US, and the corresponding decline of the left, put serious limits on international solidarity. As Latin Americans pointed out over and over again, the type of international solidarity they needed most was one that would

'change things in the US', something that in the long term required precisely what the peace movement could not deliver: a meaningful left that would not only stop military aid but transform the fundamentals of US engagement with the region. More than this, the peace movement, due both to the urgency of its cause, directives from Central Americans, and its increasing political isolation within Reagan's US, was not simply unconcerned with domestic politics, but settled on a mode of politics that resisted cohesion and undermined the possibility of forging a viable left.

The movement's limited political project, combined with its embrace of organisational fragmentation, signalled a form of internationalism that was never designed to outlive its short-term goal of stopping human rights atrocities and the US policies that supported them. It was not simply that a portion of the movement lacked a larger political vision, that activists failed to make connections between human rights abuses and the regressive economic policies being implemented by Central American regimes; or between repression and the political projects being pursued by 'human rights victims'. It was that much of the peace movement pursued a form of internationalism that actively dissociated itself from politics altogether, offering up instead a form of solidarity whose noble aspiration worked to obscure a limited goal that was to be pursued through an organisational infrastructure that was not built for sustained international solidarity.

Nor was this without long-term consequences for US-based internationalism. At a time when domestic issues were failing to inspire a rapidly disintegrating US left, human rights and the peace movement appeared as a progressive bright spot. It was how increasing numbers of would-be activists came to 'progressive' politics in the first place. The urgency of the human rights cause, the limited nature of its political project, and its active separation from left internationalism, brought large numbers of people into internationalism relatively quickly. People who shared little in common ideologically, or found the Cold War politically paralysing, could agree that state violence against its own citizens had to be stopped immediately. The fact that such violence appeared to be on the upswing, was being meted out by both right and left-wing regimes, and engendered deep resistance from Central Americans themselves, made the human rights movement both compelling and attractive to those who wanted to engage in 'progressive' politics. People were drawn to a movement that had avenues for political participation and that was addressing an urgent social issue. And they made an important difference.

Yet, ultimately, in part because human rights were not a long-term project rooted in a collective politics of liberation, many international activists considered their work to be 'done' once state-led violence was reduced and political prisoners freed. What this meant in practical terms was that once the Cold War was over, and democracies slowly replaced military regimes throughout Latin America, the number of US-based actors engaged 'in solidarity' declined dramatically. Perhaps more importantly, those who remained or became active in the 1990s inherited a solidarity infrastructure, complete with established practices, tactics, strategies, and institutions, that had been built through human rights/peace and was often poorly equipped to analyse, let alone effectively challenge, neo-liberal capitalism, the central concern of US-based solidarity since the 1980s.

What remained, to oversimplify more than a bit, was a solidarity left that possesses a narrowed political vision, agenda, and imagination, in part because so many activists came of age at a time when left internationalism was all but disappearing from public space and 'progressive' international solidarity came to be defined by the very limited politics of human rights. This narrowed vision was accompanied by an understanding of solidarity that is defined more in terms of responding to calls for help than linking struggles, is often disconnected from US political currents, and inhabits an organisational infrastructure that is rooted in the proliferation of non-governmental organisations that have few resources, are not designed to advance political mobilisation, and are overly focused on witnessing, exposing, and establishing (largely disconnected) 'campaigns' against the most extreme and high profile of abuses.

University of Giesen, Gießen, Germany

Synonyms

Anti-colonial conferences; Anti-colonial movement; Independence; League against imperialism; League of nations; Sovereignty; W. E. B. Du Bois

Definition/Description

This chapter examines the anti-colonial conferences and organisations that formed and were held in the 1920s as crucial to the development of independence movements in the era between the First and Second World Wars. These movements and forums developed solidarity among opponents of the continuation of colonialism in Asian and African territories which were to gain independence after the Second World War and formed the basis for the development of independent states and the ineluctable development of nominal independence throughout the world.

League Against Imperialism and for National Independence (LAI)

Demonstrations opposing colonialism have always gone hand in hand with colonialism itself (see Mishra 2013; Stuchtey 2010; Young 2009), but during the years between the two World Wars there was an increase in the dynamics of anti-colonialism partly due to the fact that protests had now become globalised. At a time when European expansion had achieved its 'universal historical maximum' (Osterhammel 2009: 42), the willingness of anti-colonialists to co-operate with one another was concomitantly on the rise. Disenchanted with the League of Nations, political leaders in Latin America, Africa, and Asia strove to link and co-ordinate their diverse anti-colonial movements while continuing their activities within the League's frame of reference and modelling their joint efforts on those of European colonial powers within the League. Their starting point was a shared but unspecified criticism levelled at colonial and imperialistic forms of government by both anti-colonialists and anti-imperialists, the policies of the League of Nations and the US for their failure to champion universal enforcement of the right to selfdetermination, and the desire to have their demands publicly recognised (see Bao 2008; Manela 2007; Prashad 2007).

It was no accident that numerous anti-colonial conferences took place during the 1920s. Based on his assumptions about cultural and geographical

commonalities, W.E.B. Du Bois organised pan-African conventions in Brussels, Paris, London, Lisbon, and New York between 1919 and 1927, attended by between 50 and 200 participants respectively. These in turn were part of a larger pan-African movement that made use of diverse methods and goals to promote the emancipation of black peoples (see Esedebe 1994; Legum 1962). The two pan-Asian conferences that were held at Nagasaki (1926) and Shanghai (1927), with 39 and 11 participants respectively, served the same purpose. The intellectuals gathered there criticised the policies of the League of Nations, demanded the end of European colonial rule, and declared the creation of a united and independent Asia as their common goal. These conferences too formed part of a broader discourse about Asia and its position in the world (see Aydin 2007; Saaler and Koschmann 2007). Nevertheless, the geographical focus of activities critical of colonialism was still to be found in Europe, where anti-colonialists established numerous new organisations during the inter-bellum period (see Derrick 2008).

This anti-colonial movement in Europe also enjoyed the support of communist organisations. Agents sent by the Communist International (Comintern) moved into the vacuum left by the US's withdrawal from European politics and attempted to present themselves as allies of the anti-colonial movement. On the one hand they thus hoped to improve their contacts with non-communist actors whom they desired to convert to their ideology; on the other, the Soviet government itself, which had by no means achieved stability at that time, was hoping to find allies among international political players. Within this context, the government in Moscow organised the Congress of Oriental Peoples at Baku in 1920, with about 2,000 participants. At the same time the Communist Party in England sought to organise an Oriental Congress in 1925, but without success (see Petersson 2013; Weiss 2013; Young 2009: 134–139).

In contrast, anti-colonialists were more fortunate in Germany, which had lost all its colonies after the First World War. On 10 February 1926, the Liga gegen Kolonialgreuel und Unterdrückung (League Against Colonial Atrocities and Oppression) was founded during the course of a rally championing anticolonial movements in Morocco and Syria, which took place under the leadership of Fritz Danzinger. Here all the most important anticolonial activists of the inter-war years came together: communists, socialists, committed German anti-colonialists, as well as representatives of similar movements in the colonies. In the spring of 1926, the League set up an organising committee for the purpose of planning a meeting of anti-colonial groups under the chairmanship of the communist Willi Münzenberg, the Indian nationalist Virendranath Chattopadhyaya (Chatto), and the Hungarian Comintern agent Luis Otto Gibarti (see Barooah 2004; McMeekin 2003). Unlike the pan-Asian and pan-African congresses, these organisers envisaged a global forum that would unite anti-colonial activists from all parts of the world and all ideological camps. After a good year of preparation, it took place at the Palais Egmont in Brussels from 10–15 February 1927.

Some 174 delegates from around the globe, representing 134 organisations and movements, attended the First Congress Against Colonial Oppression and Imperialism. In addition, numerous prominent personalities such as Albert Einstein, Henry Barbusse, and the wife of Sun Yat-Sen endorsed the gathering (see LAI 1927: 241). Finally, the organisers succeeded in persuading politicians, intellectuals, and members of the three most important anti-colonial movements of the inter-war period to take part in the Brussels conference: the socialists/communists, the liberal humanitarians, and the representatives of colonial independence movements.

Communists such as Willi Münzenberg and members of the Comintern viewed these movements for colonial independence as an opportunity to gain potential allies in their struggle against capitalistic colonial powers, and attempted to win them over to their own objectives. Leftist social democrats like George Lansbury (vice-chairman of the British Labour Party), Edo Fimmen, and Fenner Brockway opposed colonial rule as well and vied with the communists for influence within the colonies. They did not want the notion that only communists were committed to its goals and interests to gain currency in the anti-colonial

movement, and soon initiated attempts to influence members of this fast-growing faction by promoting social-democratic ideas. Intellectuals who, like the French Nobel Prize winner Romain Rolland, opposed colonial rule for liberal and humanitarian reasons supported the congress. Finally, numerous delegates from opposition movements within the colonies also attended. Among the relatively few representatives from South Africa, African National Congress (ANC) representative Josiah Tshangana Gumede, the South African trade unionist Daniel Colraine, the communist James La Guma and a few more made the journey. Others who came included: the Argentinian author Manuel Ugarte; Richard B. Moore as spokesperson of the Universal Negro Improvement Association; Messali Hadj-Ahmed, co-founder of the Algerian Étoile Nord-Africaine; and Lamine Senghor and Mohammed Hafiz Bey as delegates of the Egyptian National Party. Close to 30 Chinese exiles represented Chinese organisations. Jawaharlal Nehru was one of seven Indians and spoke for the Indian National Congress (INC) that was participating in a convention outside India for the first time. Mohammad Hatta, later vice-president and foreign minister of Indonesia, spoke in the name of the Indonesian nationalist movement Perhimpunan Indonesia. (LAI 1927: 228; 229–242).

They all wanted to make their political demands known to a larger public; they wanted to gain new allies for their political goals and to create a counter-weight to the League of Nations and the colonial powers (see Dinkel 2012). Lacking real military, political, and economic strength, the participants in the Brussels congress put their hopes in co-ordinated public relations work as well as the creation and expansion of an anti-colonial network. As a short-term goal they agreed to collect, publicise and disseminate arguments condemning colonialism via publications, conferences, and exhibits; they planned to establish and maintain contacts among individual anti-colonial activists, and improve the organisational structure of the League Against Imperialism and Colonial Rule and For National Independence, which later was known only as the League

Against Imperialism and for National Independence, or League Against Imperialism, LAI for short. In the longer term, the LAI was envisaged as becoming an effective organisation carrying greater political weight, in which anti-colonialists from all parts of the world and from all political camps would join together (LAI 1927: 228, 243–250).

Following the Brussels congress, the participants at first succeeded in making their political demands generally known. The international media were overwhelmingly positive in their reporting about the anticolonial bent of the congress. Some sympathisers, such as Nehru, travelled through Europe and later returned to their homelands, where they promulgated the LAI's cause in lectures, rallies, and sympathetic newspapers. Furthermore, in 1927, the LAI had its conference proceedings published in book form by Münzenberg's communistic Neuer Deutscher Verlag (New German Press), and in July of 1928 issued the first edition of *The Anti-Imperialist Review*, a magazine expressly founded for the purpose of making their aims known. And indeed this soliciting of new members frequently proved successful. Thus, Carl Lindhagen, lord mayor of Stockholm, joined the LAI as early as 4 March 1927 and was chosen as honorary chairman of its second congress in 1929. Several ethnic minorities within Europe also appealed to the LAI for support in their struggles for independence and were eager to gain membership. However, their initial efforts were in vain, since the LAI was primarily focused on coordination and co-operation with its non-European members (see Dinkel 2012).

The LAI also succeeded in channelling the euphoria generated by the congress into consistent, well-organised co-operation among its associates. On 29/30 March 1927, the heads of the LAI had an initial meeting in Amsterdam at which they confirmed the work of their international secretariat that was based in Berlin. Both institutions – the executive conference that, until 1929, met at least once annually at varying European venues, and the permanent international secretariat in Berlin, headed by Willi Münzenberg and Luis Gibarti – functioned as LAI co-ordination centres for the

purpose of enabling and encouraging other anti-colonial groups to turn to them for support. This, according to several official reports, actually happened. Thus, by April of 1927, about 30 organisations from Latin America, the US, Africa and South-East Asia were associated with the LAI. The most prominent among them were: Algeria's Étoile Nord-Africaine, co-founded by Ahmed Ben Messali Hadj; the Indonesian Perhimpunan Indonesia; the African National Congress (ANC), represented in Brussels by J.T. Gumende; and from December 1927 the Indian National Congress (INC). In addition to encouraging their members to form alliances with organisations already in existence, the international secretariat urged them to establish their own local branches of the LAI. At the end of 1927, LAI affiliates existed in 22 individual countries and colonies (see ibid.).

Yet concurrently with the successes of the LAI came a change in the political environment. The colonial powers crushed uprisings in Morocco, Syria, and Indonesia, thus destroying the hopes of the Brussels congress, which had seen these revolts as harbingers of a new era. On top of that, the Netherlands and France promptly reacted to the Brussels meeting by arresting individual members of the LAI such as Mohammed Hatta and Lamine Senghore. At the same time they banned magazines sympathetic to the LAI and thus restricted its ability to disseminate information (see ibid.).

Despite this, most of the problems besetting the LAI after its founding were internal in nature, for the euphoria surrounding the convention had aroused hopes about the LAI's potential to influence events that it proved unable to fulfil. Technical and financial difficulties robbed both conferences and League of a good part of their effectiveness. The decisive factor leading to the dissolution of this much publicised anti-colonial solidarity group were power struggles among its three leading allies: the social democrats, the communists and the representatives from the colonies. These had already been completely at loggerheads about the future course of the LAI by the end of 1927, and thus rendered the League almost totally incapable of acting. Their common opposition to

the League of Nations and to a woolly concept of imperialism was no longer enough to bridge differences among the members, since each faction strove to exploit the League's network and its other members to further its own interests.

Two years later the National Socialists outlawed the League, and the international secretariat in Berlin was shut down. Equally ominous was the fact that Willi Münzenberg, the long-time organiser of the secretariat, resigned from the League in 1933. The remaining members fled to London via Paris, where they handed its leadership over to Reginald Bridgeman in the autumn of 1933. At the beginning of 1935, Bridgeman noted that no actions had been taken internationally since the secretariat had fled Berlin, and that the League was now leading little more than a pro forma existence on paper. His attempts at rebuilding the organisation were unsuccessful. With the exception of a few brochures that came to publication, little is known about the activities of this English branch that survived until its official dissolution on 11 May 1937, when it turned over whatever material it possessed to the Aborigines Rights Protection Society (see Jones 1996: 29, 32).

The LAI and its conferences exemplified an experimental field in which anti-colonialists were able to test various forms of organisation and co-operation with diverse anti-colonial actors from all over the world. When all is said and done, however, the conferences and activities organised by the League were ultimately mere moments in time when viewed from a historical perspective. The meetings and activities of the LAI had next to no influence on the policies of the colonial powers, nor is there any evidence that they triggered any broader debates about the legitimacy of colonial rule. Even so, the LAI conferences had enormous significance for the anticolonial movement per se. They proved to its members that it was possible to hold such conventions in spite of manifold difficulties and regardless of the political and cultural differences that existed among participants; and for a brief time they had been able to make a broader public aware of their political demands. These meetings were products of an era during which the importance of publicity for the policies of anti-colonial movements and post-

colonial rule was on the rise, and at the same time they themselves served to accelerate these developments. They also offered delegates the opportunity to meet anti-colonialists from other regions, and this facilitated the establishment of personal contacts and networks that often endured beyond the timeframes of the conferences themselves.

As far as the history of ideas is concerned, these meetings left a hodgepodge of anticolonial and anti-Western stereotypes in their wake as well as spawning vague political utopias such as visions of a united Asia and Africa and a world free of colonial rule, beliefs that persisted even after anti-colonialists' attempts at co-operation dwindled towards the end of the 1920s and despite the dreadful experiences of the Second World War. As ever more time elapsed, the anti-colonial conferences and organisations of the inter-war period, particularly the League Against Imperialism, appeared as moments during which all the anti-colonial actors manifested their solidarity without regard to national frontiers. Many governments of African and Asian states striving for independence saw the League as a model for a new solidarity group waiting to be organised and created within a completely altered international environment, although the conferences that were held between the two wars specified neither the time, the membership structure, nor even the organisational forms later congresses were to have. Instead of heeding this fact, various actors resorted to the congress 'legacy' of a diplomacy based on anti-colonialism. During the Second World War, Japan invoked anticolonial and pan-Asian notions in its war against the Allied powers as a way of legitimising its own expansion; in 1947, Jawaharlal Nehru partly justified the pan-Asiatic organisation Asian Relations Conference on the basis of his positive experiences at the Brussels conference of 1927; and the Indonesian president Sukarno opened the Asian-African Conference in Bandung in 1955 with a similar reference. By so doing, he first placed the Bandung Conference squarely within the anticolonial tradition, thus stressing the common experience of the participants, and then he spelled out the political changes that had occurred since that time as well as the new challenges that arrived in their train:

'I recall in this connection the Conference of the "League Against Imperialism and Colonialism", which was held in Brussels almost thirty years ago. At that Conference many distinguished Delegates who are present here today met each other and found new strength in their fight for independence. But that was a meeting place thousands of miles away, amidst foreign people, in a foreign country, in a foreign continent. It was not assembled there by choice, but by necessity. Today the contrast is great. Our nations and countries are colonies no more. Now we are free, sovereign and independent. We are again masters in our own house. We do not need to go to other continents to confer. (Ministry of Foreign Affairs Republic of Indonesia 1955: 19ff.)

The anti-colonial conferences and organisations that had been formed during the period between the two wars, particularly the LAI, were not forgotten in the wake of the Second World War. With the passing of time, they seemed like snapshots in which the boundless solidarity of all the opponents of colonialism was displayed, and for this reason the governments of many Asian and African countries striving towards independence took them as blueprints for the creation of a new regional or international organisation of postcolonial states within a completely transformed global environment.

Definition

This essay focuses on Vladimir I. Lenin's theory of imperialism, as he developed it in his *Imperialism: The Highest Stage of Capitalism* (1916). Examining the rise of capitalism on a global scale at the beginning of the twentieth century, Lenin provides an analysis of the development and expansion of capital from the local, to the national, and finally to the global level and shows how domination of the global economy by a handful of capitalist monopolies and trusts leads to the domination of capital in other spheres. Above all, he argues that the real power and significance of modern capitalist monopolies could not be fully understood unless one takes into consideration the part played by the banks, i.e., finance capital. Together, they perform the

basis of the expansion of capitalism on a global scale and come to represent the highest and most advanced stage of capitalism, i.e., imperialism. Finally, the extent and intensity of capitalist expansion on a world scale that involves the exploitation of wage-labor throughout the world leads Lenin to conclude: "Imperialism is the eve of the social revolution of the proletariat on a worldwide scale" – one that has resonated throughout the world during the course of the twentieth and early twenty-first century.

Vladimir Ilich Lenin (1870–1924) was the greatest Marxist revolutionary and successful leader of the Great October Socialist Revolution in Russia in 1917. A great strategist and tactician of the first proletarian revolution of the twentieth century, Lenin was a true anti-imperialist who waged an unrelenting revolutionary struggle against the global capitalist-imperialist system by first overthrowing the despotic Russian Empire and its semi-feudal/semi-capitalist system, and subsequently fought the internal and external reactionary enemies propped up by Western imperialism that attempted to dislodge the young proletarian state that had brought the working class to state power.

Writing on the eve of the Socialist Revolution in Russia, Lenin produced two important works that have become Marxist classics: *The State and Revolution* (1917) and *Imperialism, the Highest Stage of Capitalism* (1916). Always understanding the political implications of his analyses of the capitalist state and the political economy of the highest stage of capitalism from the point of view of the working class, the class struggle, and the necessity of the overthrow of the global capitalist system, Lenin developed a keen interest in understanding the underlying class contradictions of capitalist expansion on a world scale that served as the basis for the rise of the working class against capital and the capitalist state on a worldwide basis. To understand the economic roots and political manifestations of the development and expansion of capitalist imperialism across the globe, Lenin studied both bourgeois and Marxist analyses of the highest stage of global capitalist expansion to understand its various dimensions and develop an appropriate strategy and tactics for a protracted class struggle against it. Thus,

more than developing a scientific understanding of the inner workings of the capitalist-imperialist system, Lenin was interested in untangling these contradictions to develop the response necessary in the struggle against imperialism.

Clearly, acutely aware of the class contradictions of global capitalist expansion and of imperialism in general, Lenin was interested in understanding the inner logic and dynamics of the capitalist-imperialist system to generate the ultimate response to it that only the working class could provide through revolutionary class action. In fact, the global expansion of capital in spreading capitalist relations of production across the world was the catalyst that – through the exploitation of labor on a world scale – was preparing the material conditions for the rise of the working class on a worldwide scale. It is in this political context of the struggle against imperialism that Lenin took up the pen to write about the economic underpinnings and social-political implications of the global capitalist system in the age of imperialism.

Lenin's theory of imperialism is based on the Marxist analysis of the development and expansion of capitalism on a global scale from the late nineteenth to the early twentieth century. Benefiting from two other important works which he studied – John A. Hobson, *Imperialism: A Study* (1905) and Rudolf Hilferding, *Finance Capital: A Study of the Latest Phase of Capitalist Development* (1910) – Lenin provided us with a concise analysis of the highest stage of capitalist development on a world scale.

Lenin's theory of imperialism centres essentially around the five fundamental features of capitalism at the turn of the twentieth century:

1. The concentration of production and capital has developed to such a high stage that it has created monopolies that play a decisive role in economic life.
2. Bank capital has merged with industrial capital and created, on the basis of this, 'finance capital', a financial oligarchy.
3. The export of commodities acquires exceptional importance.
4. International monopolist capitalist combines form and share the world among themselves.

5. The territorial division of the whole world among the biggest capitalist powers is completed.

The beginning point of Lenin's analysis of imperialism is his conception of the dynamics of modern capitalism: the concentration and monopolisation of production: 'The enormous growth of industry and the remarkably rapid concentration of production in ever larger enterprises are one of the most characteristic features of capitalism . . . . [A]t a certain stage of its development, concentration itself, as it were, leads straight to monopoly, for a score or so of giant enterprises can easily arrive at an agreement' to monopolise the market ([1917] 1975, 642, 643). He argued that 'This transformation of competition into monopoly is one of the most important – if not the most important – phenomena of modern capitalist economy' (643). Referring to Marx's *Capital* (1967/1867), Lenin pointed out that 'by a theoretical and historical analysis of capitalism [Marx] proved that free competition gives rise to the concentration of production, which, in turn, at a certain stage of development, leads to monopoly' (645). 'Today', he added, 'monopoly has become a fact . . . and that the rise of monopolies, as a result of the concentration of production is a general and fundamental law of the present stage of development of capitalism' (645). In outlining the dynamics of competitive capitalism developing into its special, monopoly stage (i.e., imperialism), Lenin noted that:

the principal stages in the history of monopolies are the following: (1) 1860–70, the highest stage, the apex of development of free competition; monopoly is in the barely discernible, embryonic stage; (2) After the crisis of 1873, a lengthy period of development of cartels; but they are still the exception. They are not yet durable. They are still a transitory phenomenon; (3) The boom at the end of the nineteenth century and the crisis of 1900–03. Cartels became one of the foundations of the whole of economic life. Capitalism has been transformed into imperialism. (646–647)

He observed that:

Cartels come to an agreement on the terms of sale, dates of payment, etc. They divide the markets among themselves. They fix the quantity of goods

to be produced. They fix prices. They divide the profits among the various enterprises, etc. . . . In order to prevent competition . . . the monopolists even resort to various stratagems: they spread false rumors about the bad situation in their industry; anonymous warnings are published in the newspapers; lastly, they buy up 'outsiders' (those outside the syndicates) and pay them 'compensation'. (647, 651–652)

For Lenin, 'the real power and significance of modern monopolies' could not be understood unless one took 'into consideration the part played by the banks' ([1917] 1975, 653).

The principal and primary functions of banks is to serve as middlemen in the making of payments. . . .

As banking develops and becomes concentrated in a small number of establishments, the banks grow from modest middlemen into powerful monopolies. . This transformation of numerous modest middlemen into a handful of monopolists is one of the fundamental processes in the growth of capitalism into capitalist imperialism. (653)

After examining an enormous quantity of data, Lenin came to the following conclusions on the concentration of banking, especially in Germany, and the extent to which banks control the market and the significance of that control:

The small banks are being squeezed out by the big banks, of which only nine concentrate in their hands almost half the total deposits. . . . The big enterprises, and the banks in particular, not only completely absorb the small ones, but also 'annex' them, subordinate them, bring them into their 'own' group or 'concern' (to use the technical term) by acquiring 'holdings' in their capital, by purchasing or exchanging shares, by a system of credits, etc., etc. . . .

We see the rapid expansion of a close network of channels which cover the whole country, centralizing all capital and all revenues, transforming thousands and thousands of scattered economic enterprises into a single national capitalist, and then into a world capitalist economy. . . .

[T]he concentration of capital and the growth of bank turnover are radically changing the significance of the banks. Scattered capitalists are transformed into a single collective capitalist. When carrying the current accounts of a few capitalists, a bank, as it were, transacts a purely technical and exclusively auxiliary operation. When, however, this operation grows to enormous dimensions we find that a handful of monopolists subordinate to their will all the operations, both commercial and industrial, of the whole of capitalist society; for they

are enabled – by means of their banking connections, their current accounts and other financial operations – first, to *ascertain exactly* the financial position of the various capitalists, then to *control* them, to influence them by restricting or enlarging, facilitating or hindering credits, and finally *entirely determine* their fate. . . .

Among the few banks which remain at the head of all capitalist economy as a result of the process of concentration, there is naturally to be observed an increasingly marked tendency towards monopolist agreements, towards a *bank trust*. . . .

Again and again the final work in the development of banking is monopoly. ([1917] 1975, 654–662)

Lenin's detailed study of the process of concentration and monopolisation of banking in the major capitalist countries at the turn of the twentieth century convinced him to conclude that 'at all events, in all capitalist countries, notwithstanding all the differences in their banking laws, banks greatly intensify and accelerate the process of concentration of capital and the formation of monopolies' ([1917] 1975, 658). Lenin then explained the 'close connection between the banks and industry'. The monopolistic relationship between the banks and industrial capitalists is such that 'the industrial capitalist becomes more completely dependent on the bank' (662). To stress the existence of this mutual relationship and to outline the specific mechanisms through which such a relationship is established, Lenin pointed out that 'a personal union, so to speak, is established between the banks and the biggest industrial and commercial enterprises, the merging of one with another through the acquisition of shares, through the appointment of bank directors to the Supervisory Boards (or Boards of Directors) of industrial and commercial enterprises, and vice versa' (662).

All of these, then, signified to Lenin: (a) 'the ever-growing merger of bank and industrial capital'; and (b) 'the growth of the banks into institutions of a truly 'universal character' ([1917] 1975, 664). 'Thus, the twentieth century marks the turning point from the old capitalism to the new, from the domination of capital in general to the domination of finance capital' (666).

In his chapter on finance capital and the financial oligarchy, Lenin, by way of quoting

Hilferding, clarified the underlying dynamics of 'finance capital'. According to Hilferding, 'bank capital, i.e., capital in money form, which is . . . transformed into industrial capital' can be called 'finance capital'. In other words, 'finance capital is capital controlled by banks and employed by industrialists' (Hilferding, as quoted in Lenin [1917] 1975, 667). But, to Lenin, 'this definition is incomplete insofar as it is silent on one extremely important fact': '[T]he increase of concentration of production and of capital to such an extent that concentration is leading, and has led, to monopoly. . . . The concentration of production; the monopolies arising therefrom; the merging or coalescence of the banks with industry – such is the history of the rise of finance capital and such is the content of that concept' (667).

Lenin then described 'how, under the general conditions of commodity production and private property, the 'business operations' of capitalist monopolies inevitably lead to the domination of a financial oligarchy' (667). And the 'cornerstone' of that domination is the 'holding system.' (As an example of this, Lenin mentioned the Deutsche Bank 'group' as 'one of the biggest, if not the biggest, of the big banking groups.') Quoting from the work of the German economist Hans Gidion Heymann, Lenin developed the following observations of the nature and structure of the 'holding system':

The head of the concern controls the principal company [literally: the 'mother company']; the latter reigns over the subsidiary companies ['daughter companies'] which in their turn control still other subsidiaries ['grandchild companies'], etc. In this way, it is possible with a comparatively small capital to dominate immense spheres of production. Indeed, if holding 50 percent of the capital is always sufficient to control a company, the head of the concern needs only one million to control eight million in the second subsidiaries. And if this 'interlocking' is extended, it is possible with one million to control sixteen million, thirty-two million, etc. (Heyman, as quoted in Lenin [1917] 1975, 668

Basing his facts on bourgeois sources, such as Professor Liefman (an 'apologist of imperialism and of finance capital'), Lenin argued that 'it is sufficient to own 40 per cent of the shares of a company in order to direct its affairs' (668). The 'holding system', he added, 'not only

serves enormously to increase the power of the monopolists; it also enables them to resort with impunity to all sorts of shady and dirty tricks to cheat the public, for the directors of the 'mother company' are not legally responsible for the 'daughter company', which is supposed to be 'independent', and *through the medium* of which they can 'pull off' *anything* (669). And to illustrate his point, Lenin cites several examples from the publications of finance capital itself (e.g. *Die Bank*).

In short, finance capital:

> concentrated in a few hands and exercising a virtual monopoly, exacts enormous and ever-increasing profits from the floating of companies, issue of stock, state loans, etc., strengthens the domination of the financial oligarchy and levies tribute upon the whole of society for the benefit of monopolists. . . . The supremacy of finance capital over all other forms of capital means the predominance of the rentier and of the financial oligarchy; it means that a small number of financially 'powerful' states stand out among all the rest. (Lenin [1917] 1975, 672, 677)

And these states, made up of 'the richest capitalist countries' (Great Britain, the US, France, and Germany), together 'own 479,000,000,000 francs, that is, nearly 80 per cent of the world's finance capital' (678). 'In one way or another', Lenin added, 'nearly the whole of the rest of the world is more or less the debtor to and tributary of these international banker countries, these four 'pillars' of world finance capital' (678).

The obvious international implications of world finance capital led Lenin to examine next the part which the export of capital plays in creating the international network of dependence and connections of finance capital. He argued that, unlike under conditions of competition when the principal characteristic of capitalism is the export of *goods*, under the rule of monopolies, it is the export of *capital*:

> On the threshold of the twentieth century we see the formation of a new type of monopoly: firstly, monopolist associations of capitalists in all capitalistically developed countries; secondly, the monopolist position of a few very rich countries, in which the accumulation of capital has reached gigantic proportions. An enormous 'surplus of capital' has arisen in the advanced countries.

> As long as capitalism remains what it is, surplus capital will be utilized not for the purpose of raising the standard of living of the masses in a given country, for this would mean a decline of profits for the capitalists, but for the purpose of increasing profits by exporting capital abroad to the backward countries. In these backward countries profits are usually high, for capital is scarce, the price of land is relatively low, wages are low, raw materials are cheap. The export of capital is made possible by a number of backward countries having already been drawn into world capitalist intercourse; main railways have either been or are being built in those countries, elementary conditions for industrial development have been created, etc. The need to export capital arises from the fact that in a few countries capitalism has become 'overripe' and (owing to the backward state of agriculture and the poverty of the masses) capital cannot find a field for 'profitable' investment. . . .

> The export of capital influences and greatly accelerates the development of capitalism in those countries to which it is exported. While, therefore, the export of capital may tend to a certain extent to arrest development in the capitalexporting countries, it can only do so by expanding and deepening the further development of capitalism throughout the world. ([1917] 1975, 679, 681)

An important channel through which capital is exported to the peripheral countries is international loans. Quoting from an article in *Die Bank*, Lenin pointed out that, in making these loans, the capital-exporting countries are nearly always able to obtain 'advantages': 'In these international transactions the creditor nearly always manages to secure some extra benefit: a favorable clause in a commercial treaty, a coaling station, a contract, a harbor, a fat concession, or an order for guns' ([1917] 1975, 681). '"The most usual thing" in this financial transaction is to stipulate that part of the loan that is granted shall be spent on purchases in the creditor country, particularly on orders for war materials, or for ships, etc. . . . The export of capital thus becomes a means for encouraging the export of commodities' (681). All these observations led Lenin to conclude that 'the capital-exporting countries have divided the world among themselves in the figurative sense of the term. But finance capital has led to the *actual* division of the world' (683).

Lenin argued that the economic division of the world among capitalist combines is the inherent

L

outcome of the development of capitalism into its highest stage: monopoly capital.

> Monopolist capitalist combines, cartels, syndicates and trusts first divided the home market among themselves and obtained more or less complete possession of the industry of their own country. But under capitalism the home market is inevitably bound up with the foreign market. Capitalism long ago created a world market. As the export of capital increased, and as the foreign and colonial connections and 'spheres of influence' of the big monopolist combines expanded in all ways, things 'naturally' gravitated towards an international agreement among these combines, and towards the formation of international cartels.
>
> This is a new stage of world concentration of capital and production, incomparably higher than the preceding stages. ([1917] 1975, 683)

To illustrate how this 'supermonopoly' develops, Lenin examined the electric industry, which, he said, is 'highly typical of the latest technical achievements and is most typical of capitalism at the *end* of the nineteenth and the beginning of the twentieth centuries' ([1917] 1975, 683). Drawing attention to the monopolisation of this sector of global industrial capital, he noted that 'this industry has developed most in the two leaders of the new capitalist countries, the United States and Germany' (683). After examining the process of a series of mergers in the global electrical industry from 1900–12, '*two* electrical "great powers" were formed':

> [I]n 1907, the German and American trusts concluded an agreement by which they divided the world between them. Competition between them ceased. The American General Electric Company (G.E.C.) 'got' the United States and Canada. The German General Electric Company (A.E.G.) 'got' Germany, Austria, Russia, Holland, Denmark, Switzerland, Turkey and the Balkans. Special agreements, naturally secret, were concluded regarding the penetration of 'daughter companies' into new branches of industry, into 'new' countries formally not yet allotted. The two trusts were to exchange inventions and experiments. (685)

But for Lenin, such agreements to divide the world are only temporary and do not 'preclude *redivision* if the relation of forces changes as a result of uneven development, war, bankruptcy, etc.' ([1917] 1975, 685). And to support his argument, he cited the fierce struggle for redivision

then taking place in the international oil industry: a struggle between John D. Rockefeller's Standard Oil Company, and the big German banks, headed by the giant Deutsche Bank, for the controlling interests of the oil industry in Romania. 'On the one hand, the Rockefeller "oil trust" wanted to lay its hands on *everything*; it formed a "daughter company" *right* in Holland, and bought up oil fields in the Dutch Indies, in order to strike at its principal enemy, the Anglo-Dutch Shell trust. On the other hand, the Deutsche Bank and the other German banks aimed at "retaining" Romania "for themselves" and at uniting her with Russia against Rockefeller' (686).

The conclusion Lenin reached was thus inescapable: the division and redivision of the world is the result of a permanent struggle between two or more major capitalist powers, for this is the essence of the contradiction within international monopoly capital (interimperialist rivalry):

> The capitalists divide the world, not out of any particular malice, but because the degree of concentration which has been reached forces them to adopt this method in order to obtain profits. And they divide it 'in proportion to capital', 'in proportion to strength,' ... But strength varies with the degree of economic and political development. In order to understand what is taking place, it is necessary to know what questions are settled by the changes in strength. ([1917] 1975, 689)

Moreover, 'the epoch of the latest stage of capitalism shows us that certain relations between capitalist combines grow up, *based* on the economic division of the world; while parallel to and in connection with it, certain relations grow up between political alliances, between states, on the basis of the territorial division of the world, of the struggle for colonies, of the "struggle for spheres of influence"' (689–690).

Thus, the characteristic feature of the epoch of the international expansion of monopoly capital, Lenin argued, is the final and definitive partition of the world – final, in the sense that repartition in the future is possible only in the form of transferring territories from one 'owner' to another. This is so because 'the colonial policy of the capitalist countries has *completed* the seizure of the unoccupied territories on our planet. For the first time the world is completely divided up' ([1917] 1975,

690). Related to this territorial division of the world, Lenin hinted at the existence of yet another motive force behind imperialism. He argued that as capitalism develops, the need for raw materials (essential for the continued reproduction of capital) increases, and this intensifies the competition between rival imperialist powers to acquire the sources of these raw materials throughout the world. This international rivalry in turn leads the imperialist countries to pursue imperial policies. This is summarised by Lenin in an important passage in *Imperialism:* 'The more capitalism is developed, the more strongly the shortage of raw materials is felt, the more intense the competition and the hunt for sources of raw materials throughout the whole world, the more desperate the struggle for the acquisition of colonies' (695).

Thus, as the principal feature of imperialism is domination by giant monopolies of advanced capitalist countries, 'these monopolies are most firmly established,' argued Lenin, 'when *all* the sources of raw materials are captured by one group. ... Colonial possession alone gives the monopolies complete guarantee against all contingencies in the struggle against competitors' ([1917] 1975, 695).

Finally, with regard to colonial policy 'in the epoch of capitalist imperialism', Lenin observed that 'finance capital and its foreign policy, which is the struggle of the great powers for the economic and political division of the world, give rise to a number of *transitional* forms of state dependence' ([1917] 1975, 697). Typical of this epoch is not only the group of countries that own colonies, and the colonies themselves, 'but also the diverse forms of dependent countries which politically are formally independent, but in fact, are enmeshed in the net of financial and diplomatic dependence' (697). These relations of dependence between the dominant and dependent states 'in the epoch of capitalist imperialism become a general system ... become links in the chain of operations of world finance capital' (698).

There are two other important points that Lenin raised: the parasitism of imperialism and, its consequence, the bourgeoisification of certain segments among the workers in the imperialist countries. Lenin maintained that the 'superexploitation' of

the colonies by the advanced capitalist countries has resulted in the latter turning from 'productive' to 'parasitic' states:

> Imperialism is an immense accumulation of money capital in a few countries. ... Hence the extraordinary growth of a class, or rather, of a stratum of rentiers, i.e., people who live by 'clipping coupons,' who take no part in any enterprise whatever, whose profession is idleness. The export of capital, one of the most essential economic bases of imperialism, still more completely isolates the rentiers from production and sets the seal of parasitism on the whole country that lives by exploiting the labour of several overseas countries and colonies. ...

> Monopolies, oligarchy, the striving for domination, ... the exploitation of an increasing number of small or weak nations by a handful of the richest or most powerful nations – all these have given birth to those distinctive characteristics of imperialism which compel us to define it as parasitic or decaying capitalism. ([1917] 1975, 709–710)

Furthermore, the receipt of enormous monopoly profits by the imperialist bourgeoisie 'makes it economically possible for them to bribe certain sections of the workers ... and win them to the side of the bourgeoisie of a given industry or given nation against all the others' (728).

The underlying argument of Lenin's analysis of imperialism as the highest stage of capitalism is that imperialism is the *necessary* outcome of the development of capitalism:

> Imperialism emerged as the development and direct continuation of the fundamental characteristics of capitalism in general. But capitalism only became capitalist imperialism at a definite and very high stage of its development.... Economically, the main thing in this process is the displacement of capitalist free competition by capitalist monopoly. ... Monopoly is the transition from capitalism to a higher system.

> If it were necessary to give the briefest possible definition of imperialism we should have to say that imperialism is the monopoly stage of capitalism. (699–700)

Thus, in summarising the fundamental features of imperialism, Lenin concluded, 'Imperialism is capitalism in that stage of development in which the dominance of monopolies and finance capital is established; in which the export of capital has acquired pronounced importance; in which the

L

division of the world among the international trusts has begun; in which the division of all territories of the globe among the biggest capitalist powers has been completed' ([1917] 1975, 700).

As we have seen from his analysis of the nature and contradictions of modern capitalist imperialism, Lenin concluded that imperialism today is a manifestation of the interests of the dominant capitalist class in a handful of advanced capitalist countries, and that it is especially beneficial to a section of the capitalist class engaged in overseas investment and finance, as well as to other sections of the bourgeoisie that are linked to it. He argued that economic gain, derived from the global operations of the big bourgeoisie (and the safeguarding of such operations on a world scale), constitutes the motive force of modern imperialism. Thus, the accumulation of capital and its appropriation by the capitalist class at the global level (through the mechanisms of the capitalist state, which this class controls) lies at the heart of the process of global capitalist expansion, hence of capitalist imperialism.

Examining the development of capitalism and its impact on countries around the world, Lenin stressed the domination of the export of capital over the export of goods in this period. His emphasis on the importance of the export of capital is crucial from the angle of its implications concerning the transformation of the relations of production in the periphery; that is, in the precapitalist and semi-capitalist regions of the world. With the export of capital, and the employment of wage-labour that this capital requires in the periphery, Lenin saw capitalism to have reached its highest and final stage when the inevitable conflict between exploiters (capitalists) and exploited (wage-labour) would result in a proletarian revolution by workers throughout the world as they rise up in arms against it (i.e. the revolutionary overthrow of capitalism by the politically organised international proletariat), a conclusion he reached in his book when he wrote, 'Imperialism is the eve of the social revolution of the proletariat ... on a worldwide scale' ([1917]

1975, 640). Thus, in the end, it is this political outcome that is the result of the global capitalist expansion that Lenin saw as the inevitable outcome of the contradictions of capitalist imperialism – an outcome effected by the working class on a global scale.

Western imperialism: Western militarism; Domination; Occupation; Aggression on non-western cultures

Definitions

Liberalism is a political theory/philosophy focusing on the rights and freedom of the individual and the inherent equality of persons and peoples.

Western imperialism is the occupation, domination, and exploitation of the rest of the world by the West.

Human rights are inherent and unalienable rights/claims/entitlements that an individual possesses by the virtue of being a social human being living in a socioeconomically and politically organized society.

Introduction

Combining these three concepts – liberalism, human rights, and Western imperialism – under the same title is unfair to all of them, since each has been the object of extensive study. Yet, taking them up together raises the question of their mutual and reciprocal relationship. In that regard, since the option of exploring each of them is impossible in one essay, the present work will explore the latter, focusing mostly on the commonplace claim that human rights are a new form of Western liberal imperialism.

Western imperialism, for sure, has been widely documented, and imperialism as such is not a new reality in world politics. On the contrary, it was even the rule in ancient times and in almost every corner of the earth. Don't we talk about Persian, Inca, Egyptian, Greek, Roman, Monomotapa, Japanese, and Ottoman empires, to mention just a few! (Lal 2004; Münkler 2007; Schumpeter 1971; Aldrich 2007). Why then has imperialism become a political evil to be fought by all means?

While relatively recently coined in English – it is a creation of nineteenth century (Pitts 2010: 214) – normatively speaking, imperialism is made through domination. From a political point of view, imperialism presupposes the occupation and domination of one people by another, politically, economically, socially, and culturally (Robinson 1972: 118–119; Laurens 2009: 14). As

L

such, it goes against certain norms and values, such as freedom, consent, self-determination, and autonomy, which constitute today's political discourse. Thus, a people fighting for freedom equals it with fighting against imperialism and domination. However, these very same norms and values are usually linked to liberalism, and this brings up the first problem with combining these terms. How can liberalism be connected with imperialism while it carries in itself anti-imperialist norms and values?

A similar question arises when imperialism is associated with human rights. The latter are believed to have become not only the *lingua franca* of international politics and discourse (Hogan 2015), but also they are presented as a powerful tool to fight against injustice and domination. For instance, studies show that human rights discourse was important in the struggle against colonization – which was the apex of Western imperialism (Klose 2013; Burke 2010). (Samuel Moyn (2012) seems to argue the contrary concerning the role of human rights in the anti-colonial movement.) That being the case, how can such a powerful instrument as human rights be assimilated to its fierce enemy?

These questions are just mentioned to underline the complexity of the relationship between these three concepts. Hence this essay is organized around four points to be developed in four sections. The first point will show how the Western imperialism crystallized around the racial ideology of the civilizing mission – *mission civilisatrice* – in order to justify the conquest of the rest of the world by the West with the goal of solving its internal problems. In the second section, I will analyze whether liberalism is intrinsically imperialistic, and I will also look at its relationship between liberalism and Western imperialism, since many liberals were hard advocates of imperialism, although some other liberals were against it. In this second moment, therefore, I examine the core norms and values of liberalism to see whether they are congenital to imperialism and their role in supporting Western imperialism. The third point elaborates the claim that human rights discourse is actually the new ideology of Western

imperialism, going through some of the different arguments presented by the critics of human rights, such as that human rights are essentially liberal and are used by Western states in order to expand the liberal imperialism even through military intervention, if necessary. Finally, in the last section, I sketch a response to that claim elaborated in the third point showing that, while human rights can be imperialistically defended and used, they (re)present not only a powerful tool against imperialism but also are a means of resistance against local injustices and discrimination. Such a sketch requires a new conception of human rights drawn from local practices of human rights, a conception that takes the whole practice of human right beyond the Western focus.

On Western Imperialism

As already alluded to in the introduction, imperialism entails the domination of one people over another, politically, culturally, economically, and socially. Furthermore, it has been highlighted that imperialism as a political practice is not new. Hence, talking about Western imperialism implies a normative shift in the understanding of the new political practice. It corresponds to a certain historical period during which the Western powers made it their purpose to dominate the rest of the world (Getz and Street-Salter 2011: 213). Independently of the different theories about imperialism (Mommsen 1980), or different schools that define it – for Lenin (1975) it is the highest stage of capitalism, while Schumpeter (1971) defends capitalism from being imperialist – Western imperialism corresponds to what scholars generally call "formal imperialism" (Getz and Street-Salter 2011), or "the true imperialism" (Laurens 2009: 74), or again "high imperialism" (Mommsen 1986: 339). It is agreed that this period extends from the 1870s to 1914. (Jonathan Hart (2008) dates high imperialism from 1830 to 1914 (see Chapter 5)). In relation to Africa, its climax is the Berlin Conference in 1884–1885, when the European powers divided the whole continent among themselves. It is the period when Western powers dominated and exploited the rest of world for their own interests.

During this time, the West was experiencing rapid economic growth due to the industrial revolution and the technological progress, which affected positively the demographic increase. Consequently, European industry needed both raw materials and the market to sell what was manufactured. Furthermore, the growth in industry and demography created the need for physical space for this demographic surplus and places in which to invest the capital surplus. That is why, while the economic factor is the most cited as the cause of Western imperialism, one has to agree with Johan Galtung et al. that Western imperialism had "a multicentered structure" (1980: 141).

As usual, if those economic and demographic problems were not resolved, they threatened political stability because they would have caused social upheaval. Hence Western powers needed the imperialist expansion in order to respond to their own economic, social, and political problems. Statements from political figures of the time attest to that. For Leopold II, then the King of Belgium, there is no possibility of greatness without colonies (Austen 1969: 60); and for the French prime minister, July Ferry, the French needed export markets for its products (Austen 1969: 71).

Hannah Arendt has well captured the imbrication of all these factors, showing that, indeed, Western imperialism was seen as a solution to the evils that were pushing the Western societies to the brink of disintegration. She observes:

> Older than the superfluous wealth was another by-product of capitalist production: the human debris that every crisis, following invariably upon each period of industrial growth, eliminated permanently from producing society. Men who had become permanently idle were as superfluous to the community as the owners of superfluous wealth. That they were an actual menace to society had been recognized throughout the nineteenth century and their export had helped to populate the dominions of Canada and Australia as well as the United States. The new fact in the imperialist era is that these two superfluous forces, superfluous capital and superfluous working power, joined hands and left the country together. The concept of expansion, the export of government power and annexation of every territory in which nationals had invested either their wealth or their work, seemed the only alternative to increasing losses in wealth and population.

> Imperialism and its idea of unlimited expansion seemed to offer a permanent remedy to a permanent evil. (Arendt 1958: 150)

The merit of Arendt's analysis is how she ties together the three factors at the origin of imperialist expansion. It was not an accident but a solution to internal problems created by conditions internal to Western societies. Imperialism helped to manage the wealth and demographic surpluses which hung over the sociopolitical order. Hence, the expansion was "to offer a permanent remedy to a permanent evil." Boris Kagarlitsky also notes that imperialism was used to solve social problems. Quoting Cecil Rhodes, the colonialist of the Southern part of Africa, he observes that for Rhodes, "Britain needed to 'acquire new lands to settle the surplus population, to provide new markets for the goods produced by them in the factories and mines'." He continues, "this was not merely 'a solution for the social problem', but the only way to avoid 'a bloody civil war'. In other words... 'if you want to avoid civil war, you must become imperialists'" (Kagarlitsky 2014: 281).

The interesting question for today is whether the same idea of imperialism as a solution to internal problems of the developed countries is not still at work in the international relations between the Western world and the developing world and, as such, has become a settled model in international cooperation. For indeed, if the conviction was that to avoid civil upheaval Western countries had to become imperialist, that is, to strive for "unlimited expansion," what could have replaced it in today's world order? This question is particularly relevant for the African case where a new version of "scramble for Africa" is at work, with the only difference that today there are also Asian powers – such as China (French 2014), looking for space and place for their demographic and capital surpluses.

Although these are the factors that led to Western imperialism, they could not be spelled out crudely without offending the public opinion; "civilized nations" could not just state that they were expanding their colonies to solve their own problems. Even a perspicacious analyst such as Hobson (1902) argues that imperialism was not

economically beneficial. There had to be a clean discourse to justify why people and capital were being exported into heathen lands; otherwise it could have been morally unbearable to these souls bathed into Christian traditions. Clearly, there was a need for a morally acceptable justification of the imperialist domination, and this justification came under the civilizing mission – *mission civilisatrice* – ideology. According to this ideology, Western powers were not going out to hunt for gold and other precious metals, nor were they exporting their surpluses to prevent social unrest. Rather, they were on a mission of higher order: civilizing the backward societies and communities. Such an enterprise was assured to gain even Christian endorsement, with missionaries playing, at times, the role of intermediaries between tradition and change (Lawrence 2014: 145; Scally 1975: 29), or simply being the precursors to imperialist occupation (Robinson 1972: 123).

Civilizing mission was also politically correct and was recommended by a moral duty emanating from a "political metaphysics," to quote Jules Ferry, the French Prime minister. For him, the imperialist expansion was needed for humanitarian and civilizational purposes, and this responsibility relied on superior races. He asserts, "it must be stated openly that, in effect, superior races have rights over inferior races. . .superior races have a right, because they have the duty to civilize other races" (Austen 1969: 71–72). From these observations, it is obvious that the civilizing mission was wrapped in a racist theory, categorizing some races as superior others inferior, with a moral duty to elevate the latter by the former to the level of civilization. With civilizing mission, the real imperial motives were forgotten to the benefit of this humanitarian endeavor of superior races vis-à-vis the lower ones. Imperialism was no longer a self-interested enterprise but rather a response to a moral call for the superior races to civilize lower ones; and the latter had to receive it as a benevolence.

Needless to say that the superior races are the white/Caucasian, while at the bottom of humanity are the dark ones/Negro, and in middle are the Mongolian/yellow. Science, arts, and cultures are bestowed on the superior races; that is the reason why they have the metaphysical duty to bring them to lower ones (Curtin 1972: 8–9). As A.P. Thornton rightly observes, the civilizing mission was so well crafted that "intelligent people everywhere believed they were the masters of progress and the servants of a civilizing mission" (Thornton 1977: 32). The civilized people had to civilize the uncivilized. The pair *civilized-uncivilized* is the foundation of the civilizing mission ideology.

Nevertheless, the moral discourse acceptable to sensitive souls for its justification was not enough for imperialism; it also needed a legal framework. Hence the coincidence between the birth of positive international law and the high imperialism period was not an accident. Some of the international lawyers of the time developed categories based on both a racist theory and the pair civilized-uncivilized, in order to supply the recognition or denial of sovereignty. As Martin Koskenniemi underlines, most of them were committed to the civilizing mission and wholeheartedly believed in the civilizational progress (Koskenniemi 2011: 3).

This is not, however, particular to this period. Reading Francesco de Vittoria – who is considered to be the father of modern international law – Anthony Anghie (2006) argues that imperialism is actually the origin of international law. For him, international law was developed when Western societies encountered the non-Western world, in order to facilitate colonization. "The fact of cultural difference" between Western and non-Western societies is the key concept to the construction of international law. This is illustrated by authors such as James Lorimer (1883), Pascal Fiore (1911), and John Westlake (1894) who, in way or another, constructed their theories on the civilized-uncivilized pair. They gave power and authority to European nations to colonize non-European people, denying the latter political recognition. The agency in the recognition process was granted to the civilized European nations, while other peoples, because they were qualified uncivilized, could not have a space in international law.

The contradiction (Ingiyimbere 2017: 37–38), however, is that the same international law that denied recognition to non-European nations as

full members of international order allowed the latter to enter into agreements through treaties so that European powers could occupy their lands and exploit their peoples and their wealth. If non-European peoples were not deemed worthy of recognition on the civilizational checkerboard, how could they be allowed to enter into agreement through a treaty with European nations? The question does not call for an answer since positive international law was meant to further the cause of imperialism, by providing a legal framework that could supplement the moral discourse of the civilizing mission ideology. From this perspective, Emmanuelle Jouannet is right when she remarks that "if we understand imperialism to mean domination and the imposition on others of one's own legal and economic systems, it cannot be denied that classical, Eurocentric international law both accompanied and legitimated this imperialism" (Jouannet 2007: 382).

The begging question here is whether international law has changed its course and mission. A law that was conceived through and for the cause of imperialism has it fundamentally changed in order to serve the interests of non-European nations, or is it still the instrument of imperialist domination? Again, this question is raised to underscore the different pockets that imperialism can hide and which anti-imperialism has to uncover.

To conclude this first section, we gather that Western imperialism is taken to mean high imperialism, that is, the period from the 1870s to 1914 during which, Western powers occupied and exploited most of the rest of the world, in order to respond to their economic, social, and political needs. They did so through the disguise of the civilizing mission ideology as a justificatory discourse, embedded into the nascent international law as its legal scheme. Now that we have delineated its contours, we can examine its relationship with liberalism.

Liberalism and Western Imperialism

Historically speaking, it is almost impossible to dissociate liberalism from Western imperialism as the latter developed during the spread of liberal ideas (Hausser et al. 1952). However, it is not just a historical coincidence. Some scholars contend that liberalism is intrinsically imperialist. For Uday Mehta (1999), the link between liberalism and colonialism is not accidental; they are congenital to each other because of the liberal belief in progress. It is the same view of Alan Ryan who argues that "liberalism is intrinsically imperialist" and even suggests that "we should understand the attractions of liberal imperialism and not flinch" (Ryan 2012: 107). In other words, there are solid grounds to examine what liberal imperialism entails.

According to Ryan, liberal imperialism is equivalent to liberal interventionism and is understood as "the doctrine that a state with the capacity to force liberal political institutions and social aspirations upon nonliberal states and societies is justified in so doing" (Ryan 2012: 107). Dan Cox follows the same line, defining liberal imperialism as "the aggressive foreign policy of forcing, through direct military action and soft-power coercion, democracy and a respect of Western notions of civil and political rights on the world" (Cox 2013: 634). These definitions share the identification of imperialist seeds inside liberalism itself, which are the liberal beliefs in internationalization of liberal norms developed in the Western world, without paying regard to local cultures and practices. Liberalism then embodies imperialism through its universalist orientation. Nevertheless, it is one thing to be universalist and another to impose universal ideas on others. Liberalism becomes imperialist when it presupposes that its normative ideals and sociopolitical institutions are the best and consequently should be imposed by all means on nonliberal societies. Pitts captures it when she observes that "liberalism arguably remains marked by features that rendered it often supportive of imperial domination, including commitment to progress and a teleological view of history, a suspicion of certain kinds of cultural or ethical particularism, and a hospitable stance toward capitalism and the economic exploitation of nature" (Pitts 2010: 216). This means that the core components of liberalism are at the origin of its connection with imperialist domination.

It has already been underlined that Western imperialism was the domination of nonwestern

societies in all their vital sectors by the West between the 1870s and 1914. During this period, many liberals supported empire and imperialism under the same ideological justification of civilizing mission, and liberal imperialism was tied to the civilizing mission (Mantena 2010: 45). They believed that uncivilized societies would benefit from the imperialist project in freedom and progress. Understandably, such a belief had to be founded on the racist distinction between the civilized and uncivilized, between superior and lower races, from which arose the "metaphysical" duty of superior races to civilize the lower ones; they had to believe in this universal vocation of some races over others. Thus, it is once more difficult to dissociate liberal thought from the rise of Western imperialism. As Pitts once again rightly notes, "whether we apply the term liberalism strictly to theories developed after 1810s, when 'liberal' became a political category, or more broadly but conventionally to the languages of subjective rights and self-government stemming back to the early-modern period, the evolution of liberal thought coincided and deeply intersected with the rise of European empire" (Pitts 2010: 216).

The enmeshing between liberalism and Western imperialism is not only because of the moral support of the civilizing mission ideology; it is also found in the development of positive international law. Started in Brussels under the *Association internationale pour le progrès des sciences sociales*, the founders had the goal of furthering liberal ideas. In Koskenniemi's words, "the *Association internationale* advocated liberal ideas, religious tolerance, freedom of opinion and free trade, as well as the development of contacts between peoples" (Koskenniemi 2011: 12). In addition to this pronounced liberal leaning of the positive international law, they saw themselves as the juridical conscience of the civilized world (Koskenniemi 2011: 41). This is a clear indication that they bought into the dichotomy civilized-uncivilized, and they sided with what was considered to be the civilized world. In other words, the imperialist dimension of liberalism was ingrained in the positive international law.

This point is made evident by reading some representative of liberalism at the age of high imperialism. (Jennifer Pitts (2005) studies the attitude of many liberal figures both in Britain and France toward imperialism, and their views are quite different. Uday Mehta (1999) is also a good source for some British liberals.) James Mill talks of non-European societies "from the South Sea island nomads to the peoples of the Chinese empire [as] rude and barbarous" (Pitts 2005: 131). Under such circumstances, they do not deserve self-rule; rather, as in the case of India, British rule has to be imported and implemented through colonialism in order to help them grow from "social childhood to social maturity" (McCarthy 2009: 168). His son John S. Mill pushed even further in justifying the need and benefit of imperialism, also distinguishing "rude," "savage," and "uncivilized" peoples from the civilized ones. Once more, the dichotomy between civilized-uncivilized was the operative concept. Not only did it denote a categorization of peoples – which entails hierarchy between them – that operative concept also presupposed that those using it believed in the ideological justification of the Western imperialism; they adhered to Jules Ferry's "political metaphysics," which gives superior races the duty to civilize the lower ones.

For J. S. Mill, the classification of peoples into those two categories determined the nature of political institutions corresponding to each, providing consequently the *raison d'être* of imperialism. According to him, the savages could not bear the weight of free institutions; therefore, only a despotic government was the best option for them. In his own words, "a people in a state of savage independence, in which every one lives for himself, exempt, unless by fits, from any external control, is practically incapable of making any progress in civilization until it has learnt to obey." Hence, "to enable to do this, the constitution of the government must be nearly, or quite, despotic" (Mill 1998: 232).

Before even highlighting the imperialist tone of this statement, it is a contradiction to say that there is a people if everyone lives by him/herself; if it is a people, the assumption should be that there has to be a certain social organization – however basic it might be! – to facilitate social cooperation. Not acknowledging this is already a

bias against nonwestern societies and a basis for justifying invasion, since it is believed that one is not entering a constituted political entity. Second, there is the belief in "progress in civilization." This is not offered as a choice; it is presented as a must for the so-called savage people. Therefore, as it has to happen, the only form of government that can lead them to it is a despotic one. It should be underlined that for John S. Mill, despotism is not an end in itself; it is a means to reaching civilization, which comes through obedience. He writes, "despotism is a legitimate mode of government in dealing with barbarians, provided the end be of their improvement, and the means justified by actually effecting that end" (1971: 263).

Mill connects the liberal belief in progress with the teleological view of history, as Pitts notes (2010: 216), and he represents a common view for the educated Europeans of his time. According to Koskenniemi, "by the 1870s the assumption of human development proceeding by stages from the primitive to the civilized had come to form the bedrock of social anthropology and evolutionary sociology that provided much of the conceptual background for cultivated European reflection" (Koskenniemi 2002: 102). Nevertheless, Mill's argument would not have promoted imperialism had it stopped there. But he went further. Not only did the savage people not deserve self-representative government, but they could not even produce a good despotic ruler to teach them how to obey. Hence, they had to get the despot from outside.

With these views, imperialism was normatively justified. If there had to be progress in the civilization of "barbarous" peoples, and the latter could not afford the means to that end, then those with the means had a moral duty to provide them. Translated into imperialist terms, the civilized nations had to provide despots for civilizing the barbarians; the latter had to be "governed by the dominant country, or by persons delegated for that purpose by it. . .[and] when the domination they are under is that of a more civilized people, that people ought to supply it constantly" (Mill 1998: 454). Once more, the civilized people were required by a moral duty to civilize the uncivilized people, and it was presented as benevolence.

With such arguments, it becomes difficult to defend the view that classical liberalism was not imperialist in its core and that it was not in connivance with the Western imperialism. Even Eileen Sullivan who thinks that most of English liberals were anti-imperialists concedes that "with his entire theory, Mill has been the most important intellectual figure in transforming English liberalism from a dominantly anti-imperialist theory to a very sophisticated defense of an expanding British empire" (Sullivan 1983: 617). As the above development shows, Mill's argument is not only for the British empire; it is rather a liberal normative theory of imperialism, because it is built on liberal norms to justify why one people can rule over another.

Following Ryan's and Cox's definitions of liberal imperialism, there is no need to ask whether liberal imperialism disappeared with the physical end of Western expansion – technically marked by the decolonization movement, although the latter has been labeled or taken to lead to a neocolonialism (Fanon 1996). On the contrary, it is a commonplace claim that Western imperialism has continued under liberal imperialism which pervades international politics and economic systems, by instituting the liberal international order (LIO) before which all countries have to bow. Established after the World War II under the hegemonic leadership of the United States of America in connection with its European Allies (Ikenberry 2010), a few years ago (2010), Ikenberry was convinced that LIO is here to stay and that it would maybe change its leadership and not really its foundational norms. Today with the arrival of Trump in the US politics and the increase of nationalism, protectionism, and populism in the Western world, he (2018) wonders whether it is not the end of the liberal order. LIO gained monopoly after the Cold War, celebrated in the now famous Francis Fukuyama's *End of History*. While for many the establishment of LIO represented the dreamt democratic peace through free trade and international cooperation based on international norms, others consider it as the continuation of the imperialistic project that started with Western expansion during the formal imperialism. For Inderjeet Parmar, "LIO is a class-based, elitist hegemony – strongly imbued with

explicit racial and colonial/imperial assumptions – in both US domestic and foreign relations" (Parmar 2018: 152). This system applies different standards "internally and externally" (Parmar 2018: 157), that is, it is favorable to Western societies while constraining non-Western societies, sometimes even through military interventions. In its many policies on liberal norms of democracy and human rights (Hinnebusch 2012) and neoliberal economic measures that mostly affect nonwestern societies, there is an outcry that LIO constitutes "a new age of liberal imperialism" (Rieff 1999), enforced through humanitarian intervention.

However accurate all these criticisms against liberalism are though, it remains to be underlined that resistance and contestation against imperialism were/are also rooted in liberal tradition. Sullivan contends that John S. Mill had actually inherited a liberal tradition that was anti-imperialist (Sullivan 1983: 599) and Andrew Fitzmaurice corroborates that opinion saying that there were both a critique and a justification of imperialism at the heart of liberalism. (Fitzmaurice 2012: 124). Thomas McCarthy (2009) also shows that there were many liberals who opposed imperialism. Even Mehta, who rather contends that liberalism is intrinsically imperialist, acknowledges Burke as a liberal who challenged the British empire. And Parmar who argues that LIO is imperialistic also recognizes that it was first conceived as anti-imperialist and anticolonial (2018: 160).

Under such conditions, while not completely agreeing with him, McCarthy is right to observe that:

> given this diversity of views, it seems to me an oversimplification to argue…that imperialism is constitutive for liberalism as such, especially since the critiques advanced by anticolonial liberals have typically appealed to liberal values. On the other hand, it is undeniable that mainstream of liberal thought, running from Locke through Mill to contemporary neoliberalism, has continually flowed into and out of European-American imperialism, and that ideas of sociocultural development have been integral to that connection. (McCarthy 2009: 169)

I do not completely agree with McCarthy that imperialism cannot be attributed to liberalism as

such, because it has been shown that the support of imperialism was constructed based on core norms of liberalism. However, he has a point to underscore that anti-imperialism also drew from liberal norms. Therefore, one can conclude with Fitzmaurice that "liberalism has been characterized by conflict over empire" (Fitzmaurice 2012: 124), because it is hard to dissociate liberalism from Western imperialism. In fact, some liberals thought imperialism would be good for the protection of natives. For instance, as once more Koskenniemi writes, the founders of international law "were liberals who supported the turn to formal empire in order to protect the natives from the greed of companies and ensure the orderly progress of civilizing mission." He adds, "they were imperialist not irrespective of their liberalism but as a consequence of it" (Koskenniemi 2011: 3). With such evidence, it would be hard to completely absolve liberalism as such from its involvement with imperialism.

Now, today, there is a claim that Western imperialism has changed its face and girded itself with the new fashion of human rights. The next section looks closely at that.

Western Imperialism Under the Cover of Human Rights

Many Third World and postcolonial scholars have been decrying human rights as the new ideology invented to cover Western imperialism. Indeed, having been formally interrupted by the decolonization movement, the unlimited expansion that was characteristic of high imperialism could not continue openly without hurting the moral sentiments of "civilized nations." Thus, forced to leave the newly acquired colonies, the West had to find another way to stay there, and it did so by leaving in place local bourgeoisie installed to protect Western interests (Fanon 1996). But that being the covert fact, the West once more could not state crudely and assume it openly. Thus, there is a need of another moral discourse to conceal this new stage of imperialism and that is, these scholars claim, the role of human rights.

It is worth recalling that Western imperialism was meant to solve political, economic, and social problems of the Western nations but had to be

justified in a morally acceptable discourse of the civilizing mission. That is how it could garner the support of intellectuals and galvanize missionaries for such a noble cause, hence the support of some liberals who conjured up a robust normative argument and put in place a legal framework in order to attain that end. The claim then is that the human rights corpus has embodied the same role of an ideology for advancing Western domination over the rest of the world, and it has also taken on a legal form in order to be effective in pushing forward the Western imperialist goal. For David Holloway, "the idea of 'human rights' substitutes for, and becomes indistinguishable from, older terms such as 'progress' or 'civilization,' and the gamut of racialized ideologies depicting white Anglo-Americanism as the engine of these values that first became part of the dominant US culture's explanations for its own domestic hegemony during the nineteenth century" (Holloway 2009: 32). Normatively speaking, the claim amounts to saying that human rights idea itself is imbued with the same characteristics of Western imperialism: the racial hierarchy and the civilizing mission entrusted to superior races toward the lower ones.

Makau wa Mutua captures the whole critique through a metaphor of savage-victim-savior (SVS) (Mutua 2002; Ingiyimbere 2017: 39–52). For him, human rights have become the ideological tool that the West, under the United States of America's leadership, has found to perpetuate Western imperialism. It should be underscored that here Western imperialism is understood as the imposition of liberal values and norms on nonwestern societies. Thus, for the critics, when British and French leaderships waned, the United States took over; and while the former hailed civilizing mission ideology as the reason for the expansion, today human rights discourse provides the moral discourse for the Western world to continue the salvific mission of the "burden of white man." According to Mutua, the human rights corpus depicts nonwestern societies as savages, which still need civilization by becoming liberal; it demonizes nonwestern states and officials as savages who violate human rights, and yet it remains silent when the same rights are trampled by Western states. It institutes double standards in

evaluating human rights, because it is designed to advance the Western interests by targeting nonwestern cultures. That is why, for Mutua, human rights corpus is rather Eurocentric; it is constituted with Western values of democracy and human rights, and it aims at imposing them on other cultures without taking into account their normative systems.

The whole point of this first metaphor of *savage* in relation to today's Western liberal imperialism is that, like the formal imperialism then needed to portray the new societies they were conquering as savages, barbarous, and uncivilized in order to justify itself, so too does the current liberal imperialism need to depict nonwestern societies as savage so that the West can perpetuate its domination. In that sense, although human rights discourse is heralded to protect victims and improve sociopolitical structures, it is a sham because it is used to hide the Western liberal domination over the rest of the world. That is why human rights discourse is labeled an ideology.

The anchor of this new imperialism, however, is the *victim*, and this is the second term of the metaphor SVS, and it is also a metaphor on its own. Presented as impoverished, weak, and helpless, the victim epitomizes the savagery of the nonwestern cultures, which the civilized world cannot tolerate. This victim is always from the nonwestern societies, displayed to the Western public in order not only to justify once more why the West cannot sit back and watch, but also to gain public moral support. Images of victims of human rights violations in the West or by the West are rarely presented to the public, and not even talked about, because this would affect the purpose of the whole enterprise, as it would reveal the West's own vulnerability. Furthermore, having presented the victim as helpless facing the ferocity and savagery of nonwestern states, there is only one moral option: to help her.

These kinds of images and discourses were the same used during the formal imperialism to arouse moral sentiment toward the "poor natives" and the need to protect them, without asking what the protector would gain in return. They portrayed the indigenous rulers as cruel and savage on the one hand and, on the other, the helpless local

populations as victims of these heartless rulers. Thus, the civilized public could not fail to support imperialism thus presented and seen as a salvific mission toward those poor souls. Mutua argues that it is the same dialectic operating with/in human rights discourse.

The third metaphor is that of *savior* which, as it sounds at the outset, has a religious flavor; it combines "Eurocentric universalism and Christianity's missionary zeal" (Mutua 2002: 30). The West feels that its natural duty is to come to rescue, as a salvific act, those helpless and poor victims of the savagery of nonwestern cultures. Those cultures need to be fixed – saved – once and for all, by bringing them the values and norms that lead to civilization: the Western liberal values and norms of human rights. The West needs human rights discourse to justify its return to nonwestern societies; otherwise it could be accused of recolonizing the nonwestern world. Furthermore, for carrying out that salvific mission, the Western world needs proselytizers who are ready to go on the new expeditionary missionary work, as they did during the time of high imperialism. Hence, for Mutua, the new instruments of the contemporary civilizing mission of human rights are:

(i) The UN institutions – which are sent to monitor nonwestern states in their human rights performance

(ii) The international nongovernmental organizations (INGOs) – which are mostly from the Western world and are concerned only with the records of liberal human rights outside the Western world, ignoring the status of human rights in their own respective countries.

(iii) The Western states that condition their cooperation with nonwestern states by their respect for human rights and liberal democracy in a unilateral way, since nonwestern states do not have any power to impose conditionalities for their cooperation with the West.

This process is reminiscent of the tutelage that undergirded the formal imperialism of the past, believed to help the nonwestern societies to progress toward civilization but without granting them political recognition and equality in bilateral or multilateral cooperation.

Thus, the SVS (savior-victim-savior) metaphor – whose terms are themselves metaphors – exemplifies the ideological dimension of human rights discourse at the service of the continuation of Western liberal imperialism. Indeed, while the human rights corpus itself is made of many generations of human rights, such as socioeconomic and cultural rights, as well as the right to development, the Western world is only concerned with the liberal rights, that is, the civil and political rights. It does not consider other rights, such as economic and sociocultural rights, as real rights because, it is said, they are not easily enforceable. This is another reason why, for some scholars, human rights discourse has become an ideology to advance the liberal culture over the nonliberal societies, for if it were a genuine fight for human rights, there would be no discrimination against nonliberal rights. Thus, the real content of human rights as ideology in the hands of the West is not the actual known Bill of Rights as enshrined in the international instrument – *Universal Declaration of Human Rights, International Covenant on Civil and Political Rights, and International Covenant on Economic, Social, and Cultural Rights*. Rather, when the West invokes human rights, it is referring to liberal values and norms where "liberal" means "human rights and the rule of law, representative democracy in governance, economic liberalism and free markets open to international trade and foreign investments, religious and cultural pluralism and the efficacy of science and technology" (Bowden 2009: 186). These norms have been set as the standards for nonwestern states in order to be accepted as a worthy member of the society of nations, namely, the civilized nations of the West. To attain civilization is to conform to these standards, and a failure in fulfilling them qualifies states as "rogue" and gives rise to Western intervention in the name of the protection of these rights.

Now, just as the civilizing mission ideology found a "juridical conscience" in the nascent positive international law, human rights discourse also has been incorporated into international

human rights law that Western states can activate when they want to invade a nonwestern one, not only as a moral justification but also as a legal argument. As Anghie puts it, "human rights is deployed as both argument for invasion and then, the invasion having been completed, as an argument for transformation, in which international human rights law…stands for the norm that must be achieved in order to bring about a 'civil state' thus, supposedly, bringing about international stability." He adds, "it is in this way, through the invocation of human rights, that what might be seen as an illegal project of conquest is transformed into a legal project of salvation and redemption" (Anghie 2005: 303). This again is a further reason to consider the contemporary human rights regime as an ideological instrument for the West to dominate the rest of the world.

However, although all these points highlight the ideological dimension of human right discourse, there is no area where the intersection between human rights and Western imperialism is more clearly demonstrated than the so-called humanitarian intervention, that is, the military intervention for protecting human rights. For some authors, humanitarian intervention in the name of human rights is simply another form of neocolonialism. For instance, for Jean Bricmont (2006) through humanitarian intervention, the West uses "human rights in order to sell war." For while there can certainly be a moral case for human intervention in certain circumstances of gross human rights violation – what Michael Walzer calls situations that "shock the moral conscience of human kind" (2006: 107) – those who oppose it show how selectively it is conducted (Ayoob 2004) and how it is always directed against nonwestern states by the Western ones. Crimes committed by Western states or their allies are overlooked, whereas when it comes to nonliberal states, international institutions and Western states under the pressures of Western international nongovernmental organization (INGO) appeal to human rights in order to invade those states with a declared goal of transforming them into liberal states (Fearon and Laitin 2004).

This obsession with installing liberal institutions in the whole world as a condition of international stability is inspired by the myth of "the democratic peace" according to which – following Immanuel Kant's idea of perpetual peace – democratic countries do not fight each other (Rawls 1999). Hence, only liberal democracies should enjoy the nonintervention from external forces, whereas they have a moral duty to export and defend civil and political rights where they are not yet established or are being threatened. In that way, they can bring a bit of civilization to other parts of the world which are still barbarous. (Téson 1988, 2005).

The way authors such as Téson justify humanitarian intervention confirms the suspicion of its opponents as being a neocolonialism, serving the liberal domination of the world. Indeed, the parallelism between imperialism and humanitarian intervention is appalling.

- First, only the West is given the responsibility to carry out humanitarian intervention, in almost the same terms the international lawyers were using to justify high imperialism.
- Second, only Western political institutions are recognized as truly sovereign, and, therefore, they are the standard for sovereignty. Any different political model which is not based on the liberal one is "not civilized". Therefore, it is a candidate for a civilizational lesson. Needless to say that such a practice violates the cornerstone of today's international order built on state sovereignty.
- Finally, humanitarian intervention is not really conducted for the benefit of the nonwestern society but rather for the expansion of liberal domination, and this justifies another reason given by the critics of humanitarian intervention.

For some of these scholars, victims, who are supposed to be the reason for humanitarian intervention, are just proxy and never the real motives. Victims are used as an acceptable reason for invasion, and this affects the purpose of human rights themselves, because they are meant to empower people (Orford 2003), and yet humanitarian

L

intervention is based on the image of a victim who is helpless and completely passive (Mégret 2009), without any agency in what is happening in his/her name. Hence, for Mahmood Mamdani, humanitarian intervention claims to protect political and civil rights, but it is actually a lie, since "rather than rights-bearing citizens, beneficiaries of humanitarian order are akin to recipients of charity. Humanitarianism does not claim to reinforce agency, only to sustain bare life" (Mamdani 2010: 54–55).

Once more, the practice of using a victim as proxy is not new because it was also used to justify formal imperialism as a way of saving natives from their savage rulers. The result was the occupation and exploitation of the occupied lands, under the pretext of protecting victims. Mamdani notes that "when it came to lands not yet colonized, such as South Asia and a large part of Africa, they highlighted local atrocities and pledged to protect victims against rulers" (Mamdani 2009: 276). The parallelism with humanitarian intervention is not difficult to draw as it invokes the victim as the reason for intervention, but the Western powers end up occupying the country with the goal of implanting liberal institutions for Western liberal interests. In recent years, examples are abundant, from Iraq to Libya through Afghanistan. Fearon and Laitin observe, "as with classical imperialism, we increasingly see the strongest states taking over, in part or in whole, the governance of territories where Western-style politics, economics, and administration are underdeveloped" (Fearon and Laitin 2004: 12). In other words, there are solid reasons to claim that human rights are being used by the West for liberal imperialist ends.

These criticisms of human rights as ideology implemented through humanitarian intervention are even supported by some defenders of human rights and humanitarian intervention, because they see human rights as an efficient means at the disposal of the West to increase its influence over the rest of the world. Jack Donnelly, who is a leading proponent of international human rights, does not flinch at finding the same legitimacy for human rights as that of the civilizing mission. According to him, "despite the fatal tainting of

the language of 'civilization' by abuses carried out under (and by the exponents of) the classical standard of civilization, internationally recognized human rights share a similar legitimating logic" (Donnelly 1998: 15). He commends the missionary zeal manifested by Western states in their foreign policy to use human rights in 1980s and 1990s, in order "to spread the benefits of (universal) values enjoyed at home." Moreover, the imperialist negative consequences "should not immobilize us in the face of abuses of power by murderous dictators hiding behind legal norm of sovereignty or a claim to radical cultural difference." Rather, "something like a standard of civilization is needed to save us from the barbarism of a pristine sovereignty that would consign countless millions of individuals and entire peoples to international neglect" (Donnelly 1998: 15–16).

Donnelly's views do not need comment, as their similarity with the imperialist ideology is clearly asserted, especially that he himself affirms that they share the same "legitimating logic." The West sets standards that everyone else has to conform to, and it has the obligation to spread them outside the West. "Others" and the nonwestern values and cultures are judged barbarous and murderous, while "Us", Westerners, enjoy "universal values"; the standards of civilization.

Clifford Orwin, on his part, illustrates how humanitarian intervention serves Western interests and the protection and expansion of Western "civilization." As he puts it, "with rare exception, humanitarian intervention is an encounter between Western or Westernized nations and non-Western ones, between lands where liberal democracy and technology have triumphed and land where they have not. It is... 'an encounter between two kinds of societies' of which the one characteristically shrinks from violence while the other takes its dominion for granted" (Orwin 2006: 203). Clearly, humanitarian intervention is a civilizational struggle, through which the Western world is extending its liberal influence and domination. It is the Western imperialism continued under more neutral means; "it is the white man's burden purged of its inconvenient whiteness. Precisely because it passes for nonpolitical, the relief of suffering affords a uniquely

uncontroversial ground for political action" (Orwin 2006: 16). Put otherwise, humanitarian intervention is the political action of the Western powers continuing to conquer the rest of the world.

These views are also confirmed by Western political figures who are honest enough to acknowledge that humanitarian intervention is meant to defend Western interests and spread Western values. For instance, Tony Blair, the former British Prime Minister, once said that "our actions are guided by a more subtle blend of mutual self-interest and moral purpose in defending the values we cherish. In the end values and interests merge" (Blair 1999). Indeed, values and interests merge because from the receiving end they are the same; they are all liberal interests. As for Bill Clinton, the former US president, "global interdependence requires global values commonly or evenly applied. But sometimes, force is necessary to get the space for values to be applied" (Jamison 2011: 365). In other words, humanitarian intervention is used to spread and defend the Western liberal interests in states and cultural spaces that resist them.

Following all these factors, it would be difficult to deny that human rights discourse has become the new way to continue liberal Western imperialism, making the three terms of the title – liberalism, human rights, and Western imperialism – quite fitting together. However, in the next section, despite this ideological use, I argue that human rights actually offer a means of resistance against both the Western imperialism and local oppression and injustice. But to do so, they need to be reconceived. Such a reconception is the goal of the following section.

Human Rights as an Anti-imperialist Tool

As the previous section substantiates, human rights discourse can be and has been used for imperialistic goals through humanitarian intervention. At the same time though, the same human rights discourse has been instrumental in fighting imperialism, such as colonialism. This claim, however, is not enough for demonstrating and defending that the contemporary paradigm of human rights embodies in itself an emancipatory

power. Rather, the latter has to be shown as belonging to the human rights corpus per se. To do so, it is first important to distinguish the contemporary paradigm from the modern paradigm of human rights, following the authoritative work of Upendra Baxi (2006).

By modern paradigm, Baxi means the development of human rights during the enlightenment through different declarations of rights, which sprang up in the Western world – for instance, the American Declaration of Independence or the French Declaration *des droits de l'homme et du citoyen*. Sure enough, rights contained in these declarations were of liberal inspiration, and they constituted what is today known as the first generation of human rights (Ishay 2004). Most importantly, however, although they came about as means of resistance against oppression and injustices, they incarnated exclusion as they were mostly concerned primarily with white middle class property owning men, following the liberal political theory of John Locke. That is the reason why they could be used to justify and further imperialism and colonialism. As Baxi remarks, "the foremost role performed by these was to accomplish the *justification of the unjustifiable*: namely *colonialism and imperialism*" (Baxi 2006: 44). Furthermore, the rights contained in those declarations did not have the pretention to a universal applicability, for they were framed for particular political societies. For instance, the French Declaration was never thought to be valid beyond the French kingdom, neither was the American Declaration meant to oblige every human being. In this regard, the validity of the modern paradigm of rights was limited in its outreach.

Contrary to the modern paradigm, the contemporary human rights paradigm was developed after World War II, and is more complex and richer, and includes more than just liberal rights. In addition to the latter, the actual human rights corpus also comprises socioeconomic and cultural rights, which originated from other ideological backgrounds, such as communism and socialism. It also contains rights formulated with the emergence of decolonization and the Third World, which are concerned with rights of peoples and right to development. Thus, the contemporary

paradigm embraces all the human rights instruments that constitute the current human rights practice.

Thus, although the contemporary paradigm of human rights shares the same emancipatory goal with the modern one, it is already clear that the two paradigms differ in their operating logic. While the modern paradigm was a tool of resistance for the white, middle-class men only – excluding women, children, and nonwhite peoples! – the contemporary paradigm is intrinsically inclusive and is meant to reach out to every human being, and it is formulated with inputs from different backgrounds. Once again, Baxi is on target when he notes that "the processes of formulation of contemporary human rights are increasingly inclusive and often marked by intense negotiation between the practitioners of human rights activism and of human rights repression" (Baxi 2006: 47). This observation by Baxi on the formulation of the contemporary human rights corpus is especially accurate when one looks at the commission that elaborated the Universal Declaration of Human Rights (Morinsik 1999; Glendon 2001). It was composed of members from different countries with different cultural backgrounds, although an objection can still be made that most of them had been educated in the West. Although valid, the objection would not deny the effort of inclusiveness displayed by the diversity of the commissioners. Despite this, critics contend that this contemporary paradigm of human rights is an ideology, which purports the Western liberal imperialism.

Thus, two things can be acknowledged as a way of responding to this claim.

(i) Firstly, the contemporary human rights corpus cannot be normatively rejected as simply being liberal, because it comprises different generations of rights that originated from different ideological backgrounds and it was motivated by diverse political and socioeconomic conditions.

(ii) Secondly, it cannot be rejected on the account that these rights were formulated by Westerners only for non-Westerners, because their formulation involved more than just Westerners, as shown by the members of UDHR's commission.

Nevertheless, the critics can still push further their charge, showing that, although the commission was diverse, Western members were the majority and the non-Western members had received their formal education in the West. Furthermore, they could continue underlying that the whole idea of International Bill of Human Rights originated in the atrocities happening in the West – especially the Holocaust – and not in the political and social conditions of nonwestern societies. In that sense, critics might claim, as it stands today, it cannot be disputed that the contemporary corpus of human rights has a Western imprint. And when one recalls the Western imperialistic use of these human rights – as it has been already shown! – there remains a good reason to suspect that the contemporary human rights corpus is a tool for extending and maintaining Western liberal imperialism.

This claim is valid and is grounded on solid facts because none can deny the Western historical origin of contemporary human rights regime. However, to limit its practice to the Western imperialistic use of human rights against the nonliberal world would be unfair. For human rights are also invoked in other contexts outside the West, and most of the time not for imperialistic motives, but rather as means of resistance against imperialism and local injustices and domination. My thesis, therefore, is that, in order to do justice to the practice of contemporary human rights, one has to study how they are being used in different contexts throughout the world. Such a study allows one to retrieve the emancipatory power of human rights because it disentangles them from the Western prism and leads to understanding them afresh. As Mark Goodale notes, "to study what human rights do is to study what human rights are" (Goodale 2006: 4). Once a new conception is achieved, it can then be tested whether it offers a satisfactory response to the arguments developed by the critics to demonstrate that contemporary human rights is an ideology serving to cover up Western liberal imperialism.

Now, since the goal is to reconceive human rights from what they do, the question is: What do human rights do? Though simple, the question is rather complex, because what human rights do can only be grasped through the actors who call upon them. And since the main actor of international politics is the state, most scholars have found that there is good reason to first focus on what human rights do *to* the state and what state does *with* human rights.

Concerning what human rights do *to* the state, they have noted that the contemporary human rights paradigm has, at least in theory, challenged state sovereignty as the individual has become a concern for the international community (Beitz 2009). Today, the individual has instances beyond a particular state to vindicate his/her rights when they are trampled upon and when the state is unwilling or unable to protect them. State sovereignty is normatively judged according to its human rights performance. It can no longer shield itself under its sovereignty when individuals' rights are violated inside its borders. In other words, human rights have become the warrant of state sovereignty, and from this perspective, we are led to the question: What does state *do* with human rights? The state uses human rights for protecting and enhancing human dignity, by respecting, protecting, and fulfilling the individual's human rights and/or peoples' rights (Lafont 2013). By doing so, the state enhances its sovereignty and comforts its international stature, because today the respect of human rights is part of international obligations. It is needless to recall that this is a normative argument.

However, this central role of state underlies the paradox of human rights practice, a paradox that necessitates the need to reconstruct the whole practice differently. Indeed, the history of human rights is a story of resistance to oppression and injustice mostly orchestrated by the state. Yet, the international order, which is supposed to be concerned with the fate of individuals, is founded on states, and it protects their sovereignty, whereas states are the main and dangerous violators of human rights. As Micheline Ishay rightly captures it, "we find ourselves pondering the role of the state as both the guardian of basic rights and as the behemoth against which one's rights need to be defended" (Ishay 2004: 8). That is why a state-centered analysis of the practice of human rights runs into a wall because, as Rawls (1999) has shown, most of the time, states are more concerned with power, prestige, and interest than the moral reasonable means to maintain international order. That is why some states can easily use human rights for their imperialistic goals, while others pay lips tribute to them, enforcing those which advantage them and rejecting or neglecting those which do not foster their rational interests.

Consequently, the problem with such a state-centered analysis is that it cannot uncover the emancipatory potential of human rights, because it only reveals how states manipulate them. Therefore, there is a need of a new model which decentralizes the analysis from the state, without excluding it. Such an analysis has to identify the other main actors involved in the actual practice of human rights and unveil the reasons beyond the state of those who appeal to human rights. Another reason for not focusing the human rights practice exclusively on the state is that the Westphalian model of nation-state is waning and regional blocks are emerging with more and more decision-making power over the classical nation-state. Furthermore, state is no longer the only entity threating human rights; some transnational and transborder entities – for instance, companies, industries, or terrorist groups – can be detrimental to the respect, protection, and fulfillment of human rights. For all these reasons, I suggest that we look at local practices of human rights in order to reconceive human rights in their emancipatory power. From there, it can be shown how they become a means of resistance against every sort of imperialism and oppression and how the new conception offers a better response to the critics who consider human rights as an imperialist ideology. (For a long development on this point, see Ingiyimbere (2017: 229–86).)

Thus, in addition to the state – which is the main actor in the world order! – the first observation that one makes when analyzing human rights practice outside the official space of the state is the tremendous role played by human rights activists.

They are the ones who lobby and even draft the major human rights documents, and without their work, few states would sign human rights treaties or take initiatives to plead the cause of human rights. Once the texts are adopted, human rights activists put pressure on states to ratify and implement them (Smith-Cannoy 2012; Wotipka and Tsutsui 2008; Finnemore and Sikkink 1998). They also translate the international texts into the local (in general terms, by local I mean the space below official space occupied by the state) languages and cultures, so that these international norms become relevant to those who need them in their fight against oppression and injustices in their particular contexts. Sally Merry calls these activists the people of the middle (2006). They are the ones who popularize human rights, put pressure on states, and educate local communities about them. They can work as independent individuals or be organized in nongovernmental organizations, and they are engaged in all areas of human rights. This diversity allows human rights practice to be multi-sectorial.

Hence, human rights activists constitute the cornerstone category in the decentralized practice, and they are subdivided into two groups. On the one hand, there are local non-state actors (LNSA), who work in local contexts, and on the other hand, there are international non-state actors (INSA) who work in regional and international organizations. As a reminder, these actors play a leading role in the drafting, adoption, ratification, and implementation of human rights instruments.

At the second level, once people learn about human rights – thanks to human rights activists – they use them in their struggle for justice and against oppression. Some people call upon them to challenge cultural norms which are oppressive – for instance, women who fight against gender violence and injustices against women (Merry 2005). Others appeal to human rights for gaining or protecting their cultural heritage, as in the case of indigenous groups (Goodale 2007). Not only are human rights used to challenge and change political culture and institutions, but they are also invoked to push for socioeconomic improvement (Young 2012). They are even summoned to fight the violation of human rights by the multinational companies which, with the complicity of the ruling elite, conduct activities that harm local communities. The people or groups of people who appeal to human rights discourse in their different and diverse fights do not do so because human rights are Western or because they want to become westernized. Rather, they resort to human rights because of the discursive power of human rights and their mobilizing capacity for political action (Beitz 2009). They find in human rights discourse a source of empowerment, which is not available in their cultural or political normative systems. That is why and how every group of people chooses the kind of rights that are relevant to its situation, without rejecting the other categories of rights. This fact underscores the vital role of the human rights activists who, through their network and pressure activities (Keck and Sikkink 1998), make sure that human rights instruments are legally ascertained, so that they can provide a solid moral and legal discursive source for political action, for people who need it in their different local situations.

This is not peculiar to the nonwestern world. Rather, it applies everywhere because political oppression and socioeconomic injustices can be found everywhere. As Jack Mahoney puts it, "all human cultures without exception are subject to constant scrutiny, evaluation and challenge by a doctrine of human rights, and none is ethically sacrosanct or immune from such critique" (Mahoney 2007: 110–111). This critical and discursive power of human rights that enables political action is beyond what can be politically manipulated by states in their pursuit of self-interests, because it is exactly meant to resist such state's behavior.

At a third level, the state-decentralized practice of human rights also shows the increasing role of regional blocs in the practice of human rights (Davies 2015). While not always obvious, today individuals can bring to court and, sometimes, win against state's policies that violate their basic human rights. Although European Union is a good example in this regard (Kanstroom 2012), cases can be found everywhere today, because many regional blocks have included the respect of human rights in their constituting acts and have even created institutions to that effect – although

the effectiveness of some of them might be wanting. These regional blocs, thanks to the network of human rights activists, can put pressure to the source of violation of human rights, be it from an individual state or a regional threat, and bring about improvement.

Once more, human rights discourse proves itself to be a means of resistance that empowers peoples who, otherwise, would not have found how to deal with their situations. In such cases, human rights are not seen as imperialist instruments at the disposal of the Western states in order to perpetuate Western imperialism. Rather, they offer a new tool to people to resist some of the Western negative impacts on their lives and their communities or to challenge local injustices and oppressive normative systems, and this is done in diverse contexts.

Once these other actors – human rights activists, peoples in local contexts, regional blocs, and other international institutions – are included in the human rights practice, human rights are not seen as instruments for states only; they are not even mainly meant for states. Rather, they reveal themselves to be an empowering source for those fighting for human dignity in every form. That is why they can be conceived as "standards empowering individuals or groups of individuals…in order to resist, through different levels of influence, any source of threat endangering their basic interests" (Ingiyimbere 2017: 250).

This conception of human rights as means of resistance allows, I would submit, to defend the contemporary human rights regime against the claim that it is an ideology meant for covering up the Western liberal imperialism.

(i) To start with, those who appeal to human rights do not do so because they necessarily like liberal culture or because human rights are Western. Rather, people appeal to human rights because of their discursive power and political effectiveness vis-à-vis their concrete situation. In other words, those using human rights discourse have their own justification of human rights, which is not necessarily the liberal origin or liberal inspiration of human rights. In addition, it has been

demonstrated that the human rights corpus is more than just liberal rights. Therefore, it is reductive vis-à-vis the contemporary paradigm of human rights per se to claim that it is only liberal.

(ii) Second, thanks to their critical power, human rights can be used to challenge Western imperialist ambitions over the rest of the world. That is how and why movements against neoliberal policies such as anti-globalist movements or Wall Street movements can be organized using human rights discourse in its complexity (Rajagopal 2003, 2006). In other words, human rights reveal themselves not to be only for nonwestern societies.

(iii) Third, while the imperialist ideology of civilizing mission considered victims as proxy for imperialist expansion, this analysis has revealed that in the contemporary practice of human rights, victims are the subjects of their own fights, instead of being passive receptors. They are the ones who lead the fight, and the external help comes in as a solidarity gesture around a common cause.

These were the main arguments put forward by critics to justify why human rights corpus is an imperialist ideology.

Concerning humanitarian intervention, if the decentralized practice is applied, it would be no longer the Western powers which decide when and where to intervene but rather the regional organizations which are close to the case. While international institutions and Western states could contribute financially and logistically, they should not be the ones to lead the intervention, except when the local means and mechanisms have been exhausted and failed. The responsibility of these regional organizations in carrying out humanitarian intervention would allow to avoid neocolonial invasions and belie the neocolonialist rhetoric. For some nonwestern ruling elites resort to neocolonial discourse in order to hide the crimes they are committing against their own people. If the humanitarian intervention is conducted by neighboring countries, the claim no longer stands because most of the countries involved share the same colonial history.

Furthermore, such intervention excludes the meddling of Western powers for their imperialistic goals. And if they do, human rights discourse still avails to activists and those opposing it as a tool for contestation and resistance. As to the fears of selectivity in implementing humanitarian intervention, they would also be reduced because the countries that are members of the regional blocs have common interests to protect for their common benefit. In other words, the new conception of human rights proposes a new model of conducting a humanitarian intervention that would curb the Western imperialist ambitions hidden in their interventions but also debunk the neocolonialist rhetoric usually advanced by local elites to cover their crimes against their peoples.

These regional developments and the critical power of human rights also help see the ways in which international law and the LIO – which we saw are in connivance with Western imperialism – can be challenged. Indeed, once many conflictual cases are resolved at the regional level and new economic powers arise from the nonwestern parts of the world, new practices different from the Western model will arise, and voices of change and reform of international order will appear. And here again human rights discourse provides a powerful tool in that struggle. Indeed, since human rights are recognized by many Western states, framing the claims into the human rights language will offer a common basis for discussion and help bring back home what a Western imperialist mind could have thought to be for non-Westerners only. Nonwestern societies will use human rights language to raise claims against Western violations of human rights outside. Just as the human rights discourse contributed to the anticolonial discourse (Burke 2010; Klose 2013) – which was certainly unintended by the imperialist countries at the time – the same human rights discourse offers a very effective means to resist today's Western imperialism in all its forms, be it political, economic, or cultural.

In fine, the claim that human rights have become an ideology for Western liberal imperialism is derived from looking exclusively at the human rights practice of some Western states, and this is a fair observation because, once more,

states are most of the time concerned with their interests, power, and prestige. In that regard, they can easily manipulate even human rights in order to achieve their goals. However, an analysis and a conception of human rights drawn from the larger picture of human rights practice ushered in by the contemporary paradigm show that the latter is essentially a means of resistance against any form domination and injustices. How effective this means is and whether it is the best among other means of resistance are different questions beyond the present essay.

From this point of view, then, the combination of liberalism, Western imperialism, and human rights which, at the first look, seemed to be for the benefit of the spread of Western imperialism, turns out to contain its own anti-imperialist antidote under the contemporary paradigm of human rights, provided it is understood from local practices and captured in its emancipatory power.

Conclusion

The aim of this essay has been to explore the relationship between liberalism, human rights, and Western imperialism. The three having been objects of extensive scholarship, I took the option of looking at their relationship through the claim that human rights have become a new ideology to perpetuate Western liberal imperialism. Hence my first point looked at the meaning of Western imperialism, which was carried out through the imperialist ideology of the civilizing mission. Racially embedded, it was built on the antithesis binary civilized-uncivilized, standing for the relationship between superior race and low races. The former was thought to have a moral duty to civilize the latter. The civilizing mission was an ideology because it concealed the reality that Europe needed empire to solve its internal problems. That ideology was helped by positive international law which provided a legal framework to the imperialist conquest.

The second point explored whether liberalism is imperialist in its core norms and values, given that the birth of this imperialist international law was inspired by liberal ideas. The section

established that it was not accidental that liberals supported imperialism and that liberalism became an imperialism on its own. It flowed from the liberal belief in progress, the teleological view of history, and the necessity of civilization. Hence liberalism could not and cannot resist to internationalize itself by all means – even through imposition if need be! – disrespecting other cultural normative systems, instead of choosing restraint as Georg Sørensen (2011) would suggest. On the other hand, though, liberalism also contained seeds of resistance, and many liberals were anti-imperialists, causing a conflict within liberalism itself about empire. However, with the liberal international order and its neoliberal economic institutions, the liberal imperialist dimension is difficult to hide. Critics, therefore, use these facts to claim that human rights have become an ideology of the West to pursue its perennial ambition of making the whole world in its own liberal image.

My third point, therefore, elaborated this claim, showing that there are indeed good reasons to suspect human rights as helping the West to maintain its imperial domination. Although composed of different generations, human rights originated from Western contexts, and some politicians in the West do not hide that they are using human rights to advance their own interests. Furthermore, some proponents of human rights justify them as new standards of civilization that the West has to use to bring civilization to barbarous lands. To apply the imperialist categories to human rights discourse demonstrates what some scholars are claiming that human rights are indeed an imperialist ideology. This is increasingly obvious in the so-called humanitarian intervention, which target non-Western states, while shielding Western states and their allies. Furthermore, most of the time, the invading countries claim to be protecting the human rights of the victims while they are actually pursuing their own economic and diplomatic interests. That is why victims are simply wrapped into the human rights discourse in order to justify a military intervention ordered to protect Western interests.

In face of these arguments which cannot be easily dismissed, I suggested, in the fourth and last section, a new conception of human rights that helps retrieve their emancipatory power and show that human rights can also become an anti-imperialist instrument. The new conception is decentralized from the state and looks at the practice of human rights from local contexts. It reveals a constellation of many actors working in synergy, with human rights activists as the engine of the whole practice. This practice shows that human rights embodies a very powerful critical and discursive capacity that is capable of animating political action to resist any kind of threat to individual' and people's basic interests, be it from the imperialist side or from local authorities. I hope to have exhibited the emancipatory power that is contained in the contemporary paradigm of human rights discourse which can be used against imperialism.

So far, however, I have been insisting on the power of human rights discourse as a tool or means. This is to say that human rights do not work magically. Human rights discourse, just like any tool, needs a subject who knows how to handle it in order to be effective to the maximum of its potentiality. For it to deliver its emancipatory power, current human rights regime needs people who believe in the power of that critical discourse and who have the capacity to guide political action and use that power accordingly. It is only under such conditions that human rights will become the powerful means to resist Western liberal imperialism. Moreover, human rights critical capacity is also internal to the human rights discourse itself, in order to become more effective in its empowering role. That is why new ideas and new mechanisms are created, and new initiatives started. But without people committed to the anti-imperialist struggle through human rights discourse, Western powers and other powers might continue to manipulate them in order to maintain the domination of the world and protect their imperialist interests.

Liberia

Liberia, the Struggle for Territorial Integrity, Sovereignty, and Democracy

Joe B. Jimmeh
Tuskegee University, Tuskegee, AL, USA

Synonyms

Africa; African-Americans; Emigration; Imperialism; Liberia; Nation-building; Slavery

Definition

The conventional historical and political literature commonly associates imperialistic designs and anti-imperialistic resistance with European colonies in Africa and other colonised peoples around the world. Because Liberia was not formally colonised under the 1884–85 Berlin Conference regime, it is usually left out of the discourse. However, this chapter argues that Liberia was born and built out of the interplay of imperialistic and anti-imperialistic forces external and, ironically, internal to the country. Liberia emerged out of the cross-currents of the Atlantic World: the slavery brought on by capitalist imperialism, anti-slavery movements, emigration, and the transplantation of African-Americans along the Atlantic corridor. The confluence of these three tributaries streamed into the founding of the Liberian state and the subsequent struggles, since the nineteenth century, to broaden its statehood and democratic space. Therefore, this essay focuses primarily on three interconnected phases of the shaping of Liberia, based on the dynamics of contending external and internal forces: (1) the historical roots and tension in the founding of the Liberian state in the American and the West African environments; (2) territorial sovereignty and security vs British and French imperialism on boundary issues; and (3) internal imperialism by the Liberian state itself vs the indigenous populations on the issues of slavery, effective occupation, and the politics of exclusion/

inclusion. Discussion of these central themes reveals the critical role of imperialist and anti-imperialist struggles in the formation and building of the Liberian nation state.

The conventional historical and political literature commonly associates imperialistic designs and anti-imperialistic resistance with European colonies in Africa and other colonised peoples around the world. Because Liberia was not formally colonised under the 1884–85 Berlin Conference regime, it is usually left out of the discourse. However, the fact is that Liberia was born and built out of the interplay of imperialistic and anti-imperialistic forces external and, ironically, internal to the country.

Liberia emerged out of the cross-currents of the Atlantic World: the slavery brought on by capitalist imperialism, anti-slavery movements, emigration, and the transplantation of African-Americans along the Atlantic corridor. The confluence of these three tributaries streamed into the founding of the Liberian state and the subsequent struggles, since the nineteenth century, to broaden its statehood and democratic space. Therefore, this essay focuses primarily on three interconnected phases of the shaping of Liberia, based on the dynamics of contending external and internal forces: (1) the historical roots and tension in the founding of the Liberian state in the American and the West African environments; (2) territorial sovereignty and security vs British and French imperialism on boundary issues; and (3) internal imperialism by the Liberian state itself vs the indigenous populations on the issues of slavery, effective occupation, and the politics of exclusion/inclusion. Discussing these central themes will reveal the critical role of imperialist and anti-imperialist struggles in the formation and building of the Liberian nation state.

Historical Background: The Journey from Enslavement to Statehood

Although the conventional historical narrative does not explicitly indicate this fact, the origins of the Liberian colony and state began in reality with the uprooting and enslavement of Africans in the 1400s. Then 400 years later, the return of descendants of former slaves to the Grain Coast (West Africa) through the policy of 'expedient deportation' of African-American and manumitted slaves began in 1820. Because African slaves were taken from the various regions of Africa, even if mostly from West Africa (Senegambia to Angola), it is reasonable to say that the African-American emigrants of the period represent Africa in microcosm. Comparative narratives reveal the experiences of the Black Loyalists from the Americas to England, then to Freetown, Sierra Leone in 1784; they are known as the Creoles. Some settled in Liberia as well. Afro-Brazilians returned to other countries in West Africa i.e. Dahomey, now Benin, Nigeria, Togo, etc. (Schick 1980, p. 4). Interestingly, the events of history are ever evolving, as protracted civil wars in Africa have brought descendants of emigrants, as exiles, to Europe and the Americas.

As kith and kin, the encounters between emigrants and indigenous Africans in Liberia and other countries are stories worth the telling and further research. Consequently, how to build a nation out of diverse emigrant and indigenous populations, estranged by 400 years of separation and radically different customs and physical environments, has remained the perennial task in Liberia's historical development. These communities are not monolithic. Although the American Colonization Society (ACS) was the premier national organisation, the emigrants were motivated by different reasons or attitudes and sponsored by various state colonisation societies (Sigler 1969; Clegg III 2004). Being the minority population, they forged unity out of necessity in the strange physical and human environments. In the case of the indigenous majority, comprising 16 different ethnic groups, then and now, it appeared united in the face of strangers on their soil who treated them as uncivilised or inferior and so excluded them from the body politic. However, the fact is that there existed intra-emigrant class struggles for power, the politics of colourism, and differences in settlement location (1820s–1980, the year of a coup d'état) vs the inter-ethnic clashes in the past, both after the coup and during the uncivil war (1989–2003).

These realities exposed how tenuous the presumed unity in both communities was. Also, both communities read historical events differently. Further, both manipulated or were manipulated by internal and external forces, for better or worse, in the nation-building process. The originally forced displacement out of Africa, then the encountering, and the singular task of nation building reveal the struggles and outcomes of contending forces and players of imperialism and anti-imperialism in Liberia.

Effectively, capitalist imperialism started the historical process of Liberia. Gleaning and summarising succinctly imperialism and anti-imperialism from the literature, a working definition is in order. Driven by the need for economic and non-economic advantage, imperialism is the ideology and policy of exercising asymmetrical power to attain such basic goals: the appropriation of foreign territory, labour/materials, and markets (colonialism), the export or transfer of social problems to foreign places (this is left out of the discourse), and cultural subversion and transformation (Bowman et al. 2007). Forces antithetical to imperialism/colonialism have taken different forms of violent and non-violent resistance throughout history, and the Liberian Experiment is no exception.

As a result of capitalist imperialism, an earlier form of globalisation, the four continents along the Atlantic corridor (Africa, Europe, and North and South America) have remained connected by the movement of people, materials, and ideas. First, most prominently, it was the legitimate trade in goods and services (up to 1400) and then the illegitimate slave trade (1400s–1800s). The largest and most ignominious of the 'Middle Passages' was the Trans-Atlantic Slave Trade. Though the Atlantic Slave Trade is most often referenced, this essay recognises slavery across other land and oceanic 'middle passages' around the world. Discourse on slavery must include the evils of Arab-imperialism since Islamic hegemony in North Africa in the seventh century and the Trans-Saharan Slave Trade subsequently. This policy culminated in the horrific and terroristic pillaging of Eastern and Central Africa by Arabs in the Trans-Red Sea/Indian Ocean Slave Trade at its height in the second half of the nineteenth century. Hamed bin Muhammed (known infamously as 'Tippu Tip') and his African collaborators were perpetrators of Arab imperialism. Arabs and Europeans enslaved Africans, respectively from the East and West. This trade transplanted millions of African slaves, first in the Caribbean islands, South America, and then the US to meet the great demand for labour.

African slaves provided the critical labour that sustained plantations, mines, and other industries that fuelled the economic development of Europe and the Americas. Accounting the devastation of the slave trade, followed by European imperialism and colonialism, Rodney would provide the conclusive assessment of Africa's general condition within the Trans-Atlantic capitalist system. Succinctly, it is that the earlier enslavement and the cheap labour and exploitation of natural resources contributed to capital accumulation abroad. Consequently, the development of Europe and America left Africa in a state of underdevelopment (Rodney 1982).

Africa's loss through the slave trade was America's gain, regardless of the smaller number of slaves on the mainland in comparison to South America and the Caribbean. Ironically, slave codes were first enacted in the New England colonies, the cradle of American liberty. Beginning with the slave codes in Massachusetts Bay Colony in the 1630s, slavery spread across the region and then South, where Virginia established the slave plantation model in the 1660s and slavocracy became commonplace.

In the crucible of America's Peculiar Institution (Stamp 1989), African slaves were burned in the fire and flames of dehumanisation and degradation, but they were unrelenting overcomers. They were battered and bruised by hard labour in the field from dawn until dusk as the field hands. Contrast is often made with the other group, the house slaves, enslaved to what is considered to be soft labour. So much has already been written about American slavery and belabouring is unnecessary. The sum of it all is the looming, grotesque contradiction of human bondage that co-existed with religious freedom and political liberty. African-Americans saw the

antithesis of that contradiction and fought in the American Revolutionary War. Like the colonies seizing their freedom from British tyranny, they too were aroused by the stirrings of the tones of the Liberty Bell. Consequently, they claimed the freedoms associated with the self-evident truths of equality and the inalienable rights to pursue life, liberty, and happiness.

Out of that contradiction, relentless struggles were waged. Like a mighty river, resistance flowed first from source (wars, captures, holding barracoons, and castle cells) in Africa through other forms of resistance (mutiny, suicides, non-co-operation, etc.) along the horrific Middle Passage. Then the waves of resistance onto the mainland as slaves on plantations continued to rebel through various tactics. As one historian would say, the slave plantation was a battlefield, contrary to elitist and revisionist interpretations about the financial costs of slave upkeep and the positive impact of slavery (Blassingame 1979).

The indomitable human spirit, like the buoy, could not be submerged indefinitely. Open resistance was commonplace. In reality, slave resisters and Founding Fathers alike knew that true freedom is natural and spiritual. As such, it is neither derived from corruptible papers called constitutions nor guaranteed by political systems guided and guarded by fallen beings.

As the historical outcome reveals, the evil of slavery contained the seeds or antithesis of its own destruction. In fact, the negro spirituals carry the timeless message of the indefatigable human spirit to be free. For example, though actually physically bound in chains and wearing the social stigma of degradation, it was in the liberationist spirit of the slave to sing and live in freedom (Carawan and Candie 2007, p. 66).

> Oh Freedom, Oh Freedom
> Over me, Over me
> And before I be a slave
> I be buried in my grave
> And go home to my Lord
> And be free.

The slave in mind and spirit never accepted his/her status as officially defined. The physically 'caged birds' could still sing and appropriate to themselves their inalienable rights of freedom.

How profound and confounding the unwavering spirit of slaves must have been to the enslavers who claimed to be the bearers of civilisation and Christianity. Fundamentally, slaves knew in their humanity that they belonged to no-one but 'to their Lord'. They were God's Property, not the property of man. Consequently, they were daring and unrelenting in destabilising the slave system long before national declarations and movements formally abolished it.

Resistance to slavery was indeed an enduring strain. The struggles overflowed beyond the plantations in waves: slave networks, conventions, abolitionist movements, and (most of all) the presence of free blacks in the cities (Huggins et al. 1971; Meier and Rudwick 1996; Foner and Walker 1979). Also, as news travelled along the mysterious grapevine, the slaves heard the echoes of the successful slave revolt of the Haitian Revolution (beginning in the 1790s). Defeating the French imperialists and enslavers, Haitians gained their independence on 1 January 1804.

Having knowledge of such a decisive victory, the slaves must have been encouraged and aroused by the hope of a similar revolt and freedom. Meanwhile, slavocracy was shaken by that possibility of the demonstration effects of the Haitian and other foreign revolutions. There was good reason for the tensions and fears, because major slave revolts on the mainland soon occurred: Gabriel Prosser (1800), German Coast Uprising (1811), Denmark Vesey (1822), and Nat Turner (1834). Despite the vigilance of local, state, and federal patrols, slavocracy was not absolutely secure in the face of unyielding slave resistance. In effect, these social upheavals demonstrate that slaves always created spaces of freedom by individual and collective acts. Slavocracy would not go unchallenged. Simply put, the slaves would not just let the slave system 'rest on flowery bed of ease' while they laboured in blood, sweat, and tears.

As the resistance spread and widened, abolitionist movements and the black conventions took to the cause. As could have been expected, there was convergence and disharmony of interests, strategies, and visions. The abolitionist movements sought primarily to challenge the evil of

slavery and then to expose what they saw as the surreptitious scheme to maintain slavery by supporting the emigration of free blacks. The abolitionists regarded such an insidious plan as a way of undermining black solidarity (free enlightened blacks leading slaves against slavery). On moral and political grounds the abolitionists challenged the evil of slavery. In the tradition of earlier religious groups like the Quakers of Germantown (1688), the abolitionists denounced vociferously the ugly contradiction in a land founded on freedom from religious and political persecution in Europe. Joining the outcry were public officials and private citizens and their publications articulated their opposition to slavery. Some of the notables and publications of that era included the following: William Lloyd Garrison's *Liberator,* David Walker's *Walker's Appeal,* Samuel Cornish's and John B. Russwurm's *Freedom Journal*, and vocal critics like Frederick Douglass, James Forten, Lydia Marie Child, and Robert Purvis etc.

Concerning the conventions, one may say that they served domestic and foreign agendas. Domestically, the conventions aimed at securing the freedoms of free blacks and uplifting other blacks from their plight (Foner and Walker 1979; Pease and Pease 1971, pp. 191–205). Notably, even before the conventions, Garrison was highly critical of the ACS. He wrote a treatise against the expatriation of blacks. In his Thoughts of African Colonization, Garrison (1832) sought to expose the 'doctrines, principles, and purposes' of the ACS that he considered to be fundamentally duplicitous, hypocritical, and harmful towards blacks. With respect to foreign interests, the conventions debated the issue of emigration. Prominent abolitionists previously mentioned were against slavery but not in support of emigration. However, some were disillusioned with the issue of equality in America, and shifted their stance to become ardent (colonialists) like John B. Russwurm, who became governor of Maryland in Africa, now the county of Maryland in the Republic of Liberia.

Prominent emigrationists, like Martin Delany and Highland Garnet, supported colonisation, whether in Canada, Central America, Haiti, or West Africa, in order to establish a black state.

Emigrationists felt that a state would prove that blacks could govern themselves and gain the respect of whites. Various colonisation schemes were undertaken subsequently, with varying degrees of success. While the colony at Haiti failed, Liberia stands conspicuously as the enduring black state that emerged out of that era.

Lastly, and most significantly, the presence of the growing number of free blacks was perceived as a creeping menace or perpetual social problem to white American society. The main concern was about miscegenation or 'mongrelisation' of white society (Schick 1980, p. 4). Also, free blacks were seen as troublemakers who would foment and encourage slave insurrections. Their presence in effect would destabilise slavocracy. Consequently, this social menace or social problem had to be excised and exported out of America. That led to the planting of the Liberian colony.

Emigration lingered as an issue, initially through private initiative. Notable was a prosperous free black of Bedford, Massachusetts: Paul Cuffe. He had actually transported 38 free blacks to Sierra Leone in 1815 at his own expense (Barnes 1980, p. 4). That bold initiative demonstrated the practicality of colonisation and inspired emigration ventures in the 1820s and thereafter.

After the Cuffe initiative, the issue resurfaced in churches, state legislatures, and on to the national scene. What was to be done with free blacks and manumitted slaves? Sermons extolled the virtue of sending blacks to Africa. They would be like missionaries to spread the light of Christianity and civilisation among their 'kith and kin' who were still dropping in the 'darkness' of slavery and non-progressive traditions. State colonisation societies were formed. All of these efforts culminated in a national meeting in Washington, DC in December 1816. The participants included religious leaders, state and federal legislators, slave owners, anti-slavery representatives, etc. This meeting established the American Society for Colonizing Free People of Color in the United States, abbreviated as the American Colonization Society (ACS).

In simplest terms, the idea and political project of Liberia emerged out of the long historical

Liberia, the Struggle for Territorial Integrity, Sovereignty, and Democracy, Table 1 Liberia vs imperialists: Conflicts and encroachments

Conflict/issue	Year	With whom
Dispute/slave trade vessel	1839	British
Dispute/sovereignty	1839	British
Preying on Liberia territory	1841–45	British and French
Dispute/vessel seizure	1845	British
Dispute/boundary	1852	French
Refusal to pay custom duties	1860	Trader John Harris with British support
Refusal to pay custom duties	1862	Trader John Harris with British support
Gunboat violates Liberian sovereignty	1860	Trader John Harris with British support
Attempt to declare Liberia a protectorate	1879	French
Dispute/boundary	1880	British
Dispute/boundary	1882	British
Dispute/land grab on SW border	1883	British
Dispute/land grab	1885	British
Dispute/land grab SE border	1891	French
Claim on mineral-rich N border	1899–1910	French
Annexation of NW border	1903	British

Forced labour/slavery charges	1920s–30s	British, French, German-led League of Nations

struggle of people and ideas. It is an historical journey from enslavement through emigration and colonisation into statehood. Effectively, the ACS was the principal private agency that implemented US public policy on race by the expedient deportation or resettlement of free blacks and manumitted slaves. Thus African-American emigrants left in the 1820s and subsequently on their 'journey of hope' sought a place of asylum, to be free from the 'deep degradation' in America. They were hopeful for a place of their own (Barnes 1980). They sought to attain freedom, equality, and the full stature of manhood and womanhood. That place on the Grain Coast, West Africa, would be called Liberia, from the Latin *liber*, meaning 'to be free'.

Imperialist Encroachments on Liberia's Sovereignty and Territory

Driven by the love of liberty, the emigrants began their torturous rebound down the Atlantic passage on 21 January 1820 aboard the *Elizabeth* from New York. This first voyage and transplantation was at Sherbro Island, near the colony of Sierra Leone (1787), the territory of repatriated Black Loyalists and other emigrants. The voyage was nearly abortive, as almost all the colonists died from malaria (Barnes 1980, p. 4). It was a fatal beginning. For further details on the conflicts and encroachments imperialists would impose on Liberia, see Table 1, constructed from events stated by Richardson (1959) and in Blyden's letters (Lynch 1979).

Imperialist Encroachments on Liberian Sovereignty and Territory

Although Liberia was established as a free and independent state on 26 July 1847, it was not immune to the flagrant violations of imperialist encroachments by the British and French (Akpan 1973). The grotesque irony is that these first recognisers of Liberia's independence later became Liberia's worst encroachers. Britain recognised Liberia (1848) and France did as well (1852). Despite the magnanimity of being the first two to welcome Liberia into the family of nations, that loftiness of international spirit was soon to be seriously debased by the malevolence of

L

imperialist encroachments upon Africa's first fledgling republic.

Even before the Berlin regime of 1884–1885, the British on the western frontier and the French to the north and east boundaries were lurking and making inroads into Liberian territory. As for the coastal areas, independent traders (British, Cuban, and French) were violating Liberia's territorial waters and sovereignty by evading the payment of custom duties. Further, in the process of their illegitimate trading, they fomented and encouraged conflicts between the Liberian state and the indigenous groups. Meanwhile, these traders had the unfailing support of their colonial governments. As events unfolded, the poor and weak Liberian state was caught in the strait of rocks (colonial imperial power) and the thorns of brazen traders who smuggled, harassed, and hassled the very limited capability of the infant republic.

The violations by these independent traders and the colonial governments that constantly supported them significantly reduced the size of Liberian territory. Edward Wilmot Blyden provides a description of Liberian territory. Blyden is most eminently qualified on the boundary issues because he was intimately and tirelessly involved. He was Liberia's secretary of state (1862–70) and ambassador to Britain and France (1877–79). He also served as president of Liberian College (1880–84). Blyden was itinerant in Liberia's interior and West Africa (Sierra Leone and Nigeria). Meanwhile, he was a Presbyterian minister and educator. In his 4 August 1860 letter to the Rev. John L. Wilson, corresponding secretary of the Board of Foreign Mission, Presbyterian Church of America, Blyden wrote, 'The Liberian territory now embraces 500 miles of coast with an interior of 200 miles, forming an area of 100,000 square miles, with a population of 2,000,000' (Lynch 1978, p. 40). Today, Liberia is the significantly truncated size of 43,000 square miles, far less than half its original size.

This large land area was the result of land purchased or ceded by various ethnic groups, from the Sherbro Island/Gallinhas area at the western end, to the San Pedro at the eastern. Regarding the Gallinhas area, the territory was purchased with money provided and raised by

the British philanthropist Lord Ashley, the Earl of Shaftesbury (Johnston 1969). He was founder of the British Anti-Slavery Society and supported the infant republic's fight against the slave trade on the coast. Further, Lord Ashley and other friends of Liberia were interested in the spread of Christianity and civilisation in Liberia. Liberians felt it their mission to do so. With the financial support, the Liberia state enlarged its territory.

Between 1850 and 1856, the size of Liberian territorial limits had settled and was never contested by Britain, France or any other group. Consistent with Blyden's claim, the map below illustrates this larger size, which existed until areas were seized by the 'gangster tactics and subterfuge' of the British and French (Anderson 1952, pp. 86, 88). If historical images and metaphors might be used to depict the nature of Liberia's struggle, the British ('the Lion') and the French ('the Cock') lurked along the coast and interior of Liberia, tearing and plucking away at Liberia ('The Pepper Bird'). The fact that this little, severely (defeathered) bird survived at all is providential and due to the relentless ingenuity and tenacity of Liberian statesmen's brinkmanship. What then explains the significant reduction of the size of the Liberian territory? Several factors apply: imperialist adventurism/expansionism, the role of independent European traders, and the Liberian state's weakness and lack of vision.

While it is true that the French and (especially) the British were not committed initially to expansion before the Berlin regime of 1884–85, they were interested in any opportunity that increased their chances of exploration and economic gain. In the case of Britain, having the Sierra Leone colony adjacent to Liberia motivated her curiosity and involvement in the internal affairs of the other little colony and young republic next door. For example, Elizah Johnson, one of the colonists on the first voyage on the *Elizabeth*, is supposed to have responded remarkably to the British captain who offered help to the emigrants in their struggle against the various indigenous groups: 'We want no flagstaff put up here that will cost us more to pull down than it would to flog the natives' (Richardson 1959, p. 302).

Meanwhile, the French were exploring and marking the interior (particularly the Nimba Mountain area with its rich iron ore deposits and other minerals) with the intent of expropriating it to their future territories (Guinea in the north and Côte d'Ivoire in the east). As it later turned out, the French would imitate the British by seizing territory under the guise of linguistic misinterpretation by the Liberian envoy (English-speaking) about riparian rights beyond the Cavalla River. Unequivocally refusing British help, emigrants contended with the indigenous groups over the issues of land and trade. The memory of American imperialism still fresh among the latter, Lieutenant Robert F. Stockton, USS *Alligator*, obtained the land sale for the emigrants through threat or coercion. The British knew of these ongoing conflicts and responded with ambivalence.

With respect to the European traders who operated independently initially, there was a convergence of interests between the colonial powers and the independent traders along the Liberian coast. After the formal abolition of international slave trade by the former enslaving nations, individuals pursued alternative business ventures. Those mentioned in Liberian history are Pedro Blanco (Cuban), Theodore Canot (French), and John Myer Harris (British). They were engaged in legitimate trade which also was a cover for slave trading.

Of the three, the role of Harris was the most detrimental and lasting upon Liberia's territorial integrity and sovereignty. With good financial means and schooners, he positioned himself strategically on the Liberian coast by 1860. Through various intentional acts, he settled in the Gallinhas territory, the area bought and ceded by the chiefs. Next, he intermarried into the families of powerful chiefs, like the Massaquois, and was then influential enough (through money, gifts, and rum) to be admitted into the men's secret society, the Poro, the cultural sanctum sanctorum of African/Liberian life. He therefore became very knowledgeable about the area and its customs, and was considered one of the prominent locals. Harris acted like a chief, an intermediary between the colonial representatives, missionaries, and the local people. Though he at times was the source of their conflicts, he even served as arbitrator among conflicting ethnic groups. Because of his means and big house on the idyllic oceanfront, it is said that Harris even hosted meetings that dealt with the boundary issues (Smyke 2004).

Through calculating methods, Harris took advantage of the schisms and conflicts between the emigrants and the ethnic groups of the area. Further, because of his means and assimilation into the area, he exploited the divide by flagrantly violating laws regarding point of entry. He would trade in what he regarded as 'no man's land', between southwestern Liberia and southeastern Sierra Leone (the Gallinhas territory). In regular violation, the Liberian state seized his schooners. He appealed directly to British colonial governors from time to time, and got support without fail. Harris was therefore emboldened to even claim indemnity for losses to his 'business'. In response, the British colonial governors of Sierra Leone disregarded Liberian sovereignty by sailing to Monrovia, the capital, and seizing Harris's schooners and demanding payments. Liberia was coerced to pay, though a renegotiated lesser amount.

Perhaps even more critical, and having a more lasting effect than the encroachments, is the fact that Harris contested the claim by British officials and philanthropists which asserted that the Gallinhas was legitimate territory of Liberia. Ignoring this claim, he again appealed to the colonial governors to interfere and they did. They did so by discouraging Liberia's claim to the area. Boundary commissions were then set up, but the findings were repeatedly contested, and settlements were delayed and never conclusive. Meanwhile, the US observed from a distance, but only occasionally showed peculiar interest, when its naval vessel appeared in the contested area. Though the officer served as arbitrator, he was not authorised by the US to seek conclusive settlements. The British thus handled the boundary issue that they had encroached upon.

Despite Liberia's appeals and representations to these imperialist governments, as well as the intervention of prominent British individuals (former officials and private citizens) in support of her cause, the status quo on the colonial front

L

was maintained. British and French governments eventually sanctioned the positions of their colonial agents. As the words of wisdom forewarn, 'The poor useth intreaties; but the rich answereth roughly' (Proverbs 18:23). Liberia was poor, needy, and weak (financially and militarily), and the British and French took advantage of this in order to violate her laws, invade her territorial waters to seize vessels lawfully impounded vessels for illegal trading, and encroach wantonly upon her borders. Meanwhile, the country was suffering from constant tensions and conflicts between the Liberian state and the indigenous population.

As a result of Harris's behaviour and the support of the colonial governors, Liberia remained 'threatened, perplexed, and anxious' about the security of its territory and sovereignty (Lynch 1978, pp. 54–81, 249–281). As secretary of state and Liberian ambassador to Britain, this was a recurring theme in Blyden's correspondence to the British government, the ACS and friends of Liberia who supported the establishment of the only Christian negro republic in Africa. The British and French charged that Liberia had mistreated the indigenous people by treating them as second-class and did not promote their well-being. Even more critically, they said that Liberia lacked the capability of effective occupation of the territories that it laid claim to. Meanwhile, when the Liberian state intervened against the independent traders, such as Harris, who were smuggling and not paying revenues, the colonial governors responded by force to protect their citizens.

Ironically, Liberia had to turn to British capitalists for its very first loan, which resulted in the infamous 1870 loan debacle. The £100,000 loan was negotiated by President Edward James Roye. Overall, the consequences were disastrous for Liberia because of the exorbitant interest rate, the terms of collection, and the political turmoil it caused that led to the resignation and death of President Roye (Anderson 1952, p. 85; Johnson 1987, pp. 92–93; Johnston 1969, pp. 258–276). If that were not humiliating enough, the Liberian government accepted the British offer to set up a frontier force. That too was a huge mistake, because the Liberian government found out that the insidious British designed it to destabilise the fledgling state. To correct this ill-advised collaboration, the government quickly turned to the US government to send a military training officer. The response was tangled and an African-American was sent to assist Liberia.

Struggle for Full Citizenship and Widening the Democratic Space

Liberia is the reality of the journey between hope and the realisation of the envisioned 'Glorious Land of Liberty'. The beginnings were very challenging between two peoples, the emigrants and the indigenous population. Though 'kith and kin', their relations were marked by sharp disharmony of interests. Table 2 sheds light on the issues (see also Richardson 1959).

In response, Elizah Johnson's infamous remarks towards the natives in 1820, about 'flogging' them, reflected the quintessential attitude of the young republic. It reflected paternalism and a lack of vision that would guide the dual policy of the Liberian state from the 1820s to 1964: 'Liberians vs the Natives', 'Class vs Tribe', 'Coastal vs Interior or Hinterland', and 'Civilised vs Country People'. This dualism was the defining feature of national policy for almost 150 years (Johnson 1987; Liebenow 1969; Fraenkel 1964).

In order to deal with the harsh physical environment and testy human conflicts, the Liberian colony and state became imperialistic and colonialist toward the indigenous population (Akpan 1973). Due to its non-progressive policies, essentially the policies of exclusion and privilege, the Liberian regime has been characterised variously as 'slavocracy', transplanted from America, 'oligarchy and the evolution of privilege dominated' by Americo-Liberians, 'kleptocracy' and 'rampant corruption', and 'autocracy' of one-party domination and circulation of elites from the True Whig Party since the 1870s to the 1980 coup d'état (Woodson 1990; Liebenow 1969; Cole 1968; Sawyer 1992).

Liberia has transitioned through three republics: 1840s–1980, 1980–90, 1990s–2005. Now into the fourth, the post-uncivil war republic marks a critical junction in the election of Liberia's and Africa's first female head of state, President Ellen Johnson Sirleaf in 2005. Since 1964, when the historic divide was officially declared nullified through the national policy of unification and integration, the full implementation and realisation is still weighed in the balance.

The fact that counties were constructed out of Liberia's interior, the formally neglected 'hinterland', and indigenous communities on the coast, was not enough. Even the election of representatives and senators or the appointing of their superintendents (county executives) still left more to be done. After all, policy impacts go beyond politics. Policy declarations and implementation have unintended consequences that politicians cannot imagine. The facts of the coup d'état (1980) and horrific uncivil war (1989–2003) suggest that the belated unification and integration policy was not sufficient to avert the national tragedies.

Now, the fourth republic is faced with the onerous and momentous task of repentance, reconciliation, and reconstruction. It is expected that the process will not be an 'evolution of privilege' but widely inclusive so that all Liberians will belong symbolically and materially. This is also the beginning of the period for unprecedented transparency so that leaders, groups, organisations, and citizens can be held accountable. As visionary and committed leadership and people are being transformed and engaged daily, the journey of hope can continue into the earthly 'Glorious Land of Liberty by God's Command'.

Definition

This entry explores the life of Toussaint Louverture (c.1743–1803), the heroic leading figure in the Haitian Revolution of 1791–1804, the only successful slave revolution in recorded history. Louverture remains an international inspiration and is seen by many to be one of the greatest anti-imperialist fighters who ever lived.

François Dominique Toussaint Louverture (c.1743–1803) was the heroic leading figure in the Haitian Revolution of 1791–1804, the only successful slave revolution in recorded history, and he remains an international inspiration, seen by many to be one of the greatest anti-imperialist fighters who ever lived. Toussaint was a military genius who led an army composed overwhelmingly of former enslaved Africans and people of African descent to victory after victory under the banner 'Liberty or Death' over the professional armies of France, Spain, and Britain, before paying the ultimate price himself for refusing to compromise with imperial power at the expense of the maintenance of liberty for all. His imprisonment in a freezing cold cell in the Jura mountains inspired a sonnet by William Wordsworth in 1803 paying tribute to Toussaint as an immortal symbol of 'man's unconquerable mind', meaning that 'there's not a breathing of the common wind that will forget thee' (Bell 2008: 3, 294; For recent

work on the Haitian Revolution see Dubois 2005 and Girard 2013a).

The diminutive black West Indian general certainly remains one of the African diaspora's few globally recognisable revolutionary icons, arguably comparable in impact and influence to Malcolm X (1925–65). Building up and organising a disciplined rebel black slave army in the midst of a general uprising among the half a million African slaves in the French Caribbean colony of Saint-Domingue, Toussaint was the critical figure who helped ensure that amid the French Revolution, the ideals of the Enlightenment, *liberté*, *égalité*, and *fraternité*, would be translated from rhetoric to become a material force without equal in the Atlantic world. Playing a critical role in the abolition of slavery in the Caribbean's wealthiest colony and the founding of Haiti, the first independent black republic outside Africa and the second independent state in the Americas, Toussaint not only outwitted numerous generals of European imperial armies but was also one of the first to anticipate the threat of neocolonialism in the context of post-colonial independence, as is evident in his constitutional and political tactics as well as his military manoeuvres.

'I was born a slave, but nature gave me the soul of a free man', Toussaint wrote in 1797 (Parkinson 1978: 37). It seems that Toussaint was born in the northern region of the French colony of Saint-Domingue around 1743, the eldest son of West Africans who had been captured and sold to European slave traders. Toussaint's father, who took the name Hippolyte in Saint-Domingue, was the son of Gaou Guinou, a powerful local official of the Alladas in present-day Benin, and the respect other slaves had for him apparently meant that he received favourable treatment from the plantation owner of the Bréda sugar plantation at Haut-du-Cap (Girard and Donnadieu 2013: 44–47). Toussaint himself was spared the often brutally short existence awaiting those who laboured in the sugar cane fields in one of the most intensive zones of capital accumulation in the Western world. Instead, picking up herbalist knowledge from his father, he worked

as a house slave with livestock as a stable-lad, developing skills as a horse doctor.

Toussaint could speak his parents' Aja-Fon language alongside the customary French Creole, and unusually learned to read from his slave godfather. He was born early enough to be exposed to Jesuit missionaries, who introduced him to Catholicism and from who he picked up some Latin phrases, and he soon developed a basic command of French from his contacts with white society. At some time in his mid- to late 20s, between 1769 and 1772, he managed to move from slavery into the small free black community, the very lowest stratum of the free people of colour on Saint-Domingue, and became a small landowner – indeed briefly also a slave owner himself. Yet Toussaint Bréda, as he was then known, continued to live and work as a coachman for the Bréda estate's French manager Bayon de Libertat. Though in his additional role as a *commandeur* Toussaint was involved in directing the work of slaves on the plantation, his own family remained enslaved (Geggus 2007: 116–117, 132).

Toussaint's literacy, his Christianity, and the nature of his professional work appear to have ensured him a degree of social mobility across colonial Saint-Domingue, and a degree of trust among white society. He developed a liking for European culture, reading some ancient history (including Julius Caesar's *Commentaries*) and political philosophy (including the former slave-turned-Stoic Epictetus, Machiavelli, and the Enlightenment *philosophe* Abbé Raynal) (Bell 2008: 61; see also James 2001). The American Revolution – which saw the transition of a former colony to independence while keeping the institution of slavery intact – inspired many of the white master planter class of Saint-Domingue, and doubtless its impact would have also registered with Toussaint.

The outbreak of the French Revolution in Paris in 1789 threw white society in Saint-Domingue into chaos and civil war between royalists and republicans, and saw the island's free people of colour make their own bid for equality. Toussaint himself seems to have watched the fray from the wings, though it seems he was at the Bois Caïman

ceremony in August 1791, which was the catalyst for a hundred thousand of the island's half a million or so black slaves to launch their own insurrection and so join the wider revolt. By late 1791 Toussaint had joined a band of rebel slaves, becoming a doctor, a secretary, and then an influential advisor to the second most important slave leader, the *former commandeur* Georges Biassou (Bell 2008: 23–24, 33).

Toussaint's background as a free black and his relationship with at least some of the white colonial elite perhaps help us to understand why he was initially willing to act in late 1791 and early 1792 to try and help secure a negotiated settlement between the leaders of the slave rebellion and the white planter class. However, the rebels' proposed offer, which guaranteed peace in return for an amnesty for a tiny minority of rebel leaders, the abolition of the whip, and one extra free day per week for the slaves on the plantations – was bluntly rebuffed by the white planters. Yet despite not agitating and taking a stand for 'general liberty' and the full abolition of slavery straight away, Toussaint personally rejected the opportunity to take up the offer that was made by the colonial authorities for an amnesty for free people of colour after the National Assembly in France voted to abolish racial discrimination in April 1792. Rather than defect to the white planters and play his part in the counter-insurgency operations then under way, Toussaint steadily now emerged as a critically important military leader of the black rebel slave army, itself now in alliance with the Spanish Empire, training up his own group of disciplined followers in the art of war – particularly guerrilla war (Geggus 2007: 119–121). From around mid- 1792, Toussaint seems to have moved to a position of support for 'general liberty' based on the principle of natural human rights (Bell 2008: 43).

On 29 August 1793, Léger Félicité Sonthonax, the French commissioner in Saint-Domingue, recognising the de facto reality of abolition at the hands of the black slave army, formerly proclaimed the end of the slavery in the colony, hoping to win the black slave armies and its leaders like Toussaint away from the slave-owning Spanish Empire. The response of

Toussaint – now casting off his old name and adopting the new name 'Louverture', meaning 'the opening' – was to openly declare his complete commitment to abolition of slavery in a proclamation made the same day: 'I am Toussaint Louverture . . . I want Liberty and Equality to reign in Saint Domingue' (Bell 2008; Geggus 2007: 121). This statement – and others from around this time discussing the need for general emancipation – challenged Sonthonax's claim to be the true apostle of liberty locally, and also distinguished Toussaint from other slave leaders such as Jean-François and Biassou, who had begun rounding up slaves for sale to the Spanish for their own personal ends.

On 4 February 1794, the Convention in revolutionary France – under the control of the Jacobins and with public detestation of racism, dubbed 'the aristocracy of the skin', rising in crescendo in France itself – voted not simply to ratify Sonthonax's emancipation proclamation but to abolish slavery throughout the French Empire (James 2001: 113–114). In May 1794, as news of this historic decree began to filter into Saint-Domingue, Toussaint made his famous yet still contested *volte-face* as he defected from the Spanish to join the French. Toussaint chose his moment well to enable his own troops to cause the maximum amount of damage to the Spanish and now also to a British invasion force, sent in 1793 to try and capture Port-au-Prince and other places in the south of the island. The British had the support of local white counter-revolutionary forces and the intention of ultimately claiming Saint-Domingue, the 'Pearl of the Antilles', for the British Empire and restoring the highly profitable business of slavery on the island. Toussaint's dramatic radical political shift from royalism to republicanism may have had ulterior and less noble motives, but as David Geggus notes, it was 'a decisive turning point in the Haitian Revolution . . . Black militancy and the libertarian ideology of the French Revolution were now melded, and the cause of slave emancipation had found a leader of genius' (Geggus 2007: 123–124; see also Geggus 1982, 2002).

In his classic 1938 work *The Black Jacobins*, the Trinidadian Marxist historian C.L.R. James

situated the Haitian Revolution within the wider age of bourgeois-democratic revolutions and showed how Toussaint's extraordinary career rose and fell with the wider revolutionary process in France during the 1790s. 'The great [French] revolution had propelled him out of his humble joys and obscure destiny, and the trumpets of its heroic period rang ever in his ears. In him, born a slave and the leader of slaves, the concrete realization of liberty, equality and fraternity was the womb of ideas and springs of power, which overflowed their narrow environment and embraced the whole of the world' (James 2001: 215). As not only the quintessential 'black Jacobin', but also a French general, Toussaint over the next 4 years now inspired and led the black rebel slave army to stunning victories over first Spanish and then British imperial armies. As James noted, 'Toussaint had the advantage of liberty and equality, the slogans of the revolution. They were great weapons in an age of slaves, but weapons must be used, and he used them with a fencer's finesse and skill' (James 2001: 120).

In recognition of his outstanding achievements on the battlefield and his apparent unceasing loyalty to the appointed representatives of Revolutionary France in the colony, above all the aristocratic Governor Laveaux, Toussaint steadily rose in prominence from proconsul of the western province to deputy governor in 1796, and then the colony's commander-in-chief in 1797. Toussaint not only defeated European generals on the battlefield but also effectively sidelined a number of rival political figures in Saint-Domingue. After putting down attempts to overthrow Laveaux's authority, Toussaint cunningly removed Laveaux himself from the scene by suggesting his return to France in order to counter the growing pro-slavery lobby in Paris in 1796. He then successfully forced out Sonthonax, and when the French Directory sent General Hédouville in 1798 to try and limit Toussaint's growing power, Toussaint outmanoeuvred him as well, sending him back to France within 6 months (Geggus 2007: 125–126).

As Toussaint, more confident than ever, now boasted, 'remember that there is only one Toussaint L'Ouverture in San Domingo and that at his name everybody must tremble' (James

2001: 180). When the Haitian free coloured leader André Rigaud, whose armies occupied lands in the south, refused to tremble before Toussaint's power in the north and west, Toussaint waged a brutal war from 1799 to 1800 to ensure his hegemony, forcing Rigaud and his followers to flee to France. By mid-1800, Toussaint was unquestionably the dominating political figure in Saint-Domingue, recognised as its governor and indeed the self-declared 'first man in the Archipelago of the Antilles' (James 2001: 28). As an established statesman and diplomat, Toussaint undertook a daringly independent foreign policy, for example making a trade and non-aggression treaty with Britain and America in 1798–99, and annexing Santo Domingo – then French territory – in January 1801, in order to deprive any future invading French army use of Santo Domingo's harbours (Geggus 2007: 129). Toussaint's antagonising of the French government in order to keep trading links with the slave-owning America and Britain, something which enabled him to stockpile munitions, would soon have costly consequences.

In terms of his domestic policies, following the defeat of the British, Toussaint attempted to rebuild towns and schools and develop a new anti-racist culture on Saint-Domingue. More controversially, he outlawed Vodou (though he himself may have personally continued to practise it secretly) and supported the re-introduction of the slave trade to guarantee a supply of labour. He also continued Sonthonax's scheme of imposed forced labour in order to try and revive the island's decimated plantation economy to its former prosperity. Toussaint needed a strong economy to support his standing army, which was essential to ensure adequate defence against the clear and ever-present danger of external intervention. However, his army was also used internally to force former slaves to work on plantations when they wished to found smallholdings of their own. The unpopularity of such a measure – and Toussaint's encouragement of white plantation owners to return to and reinvest in their former estates – led to resistance among black labourers, many of them women. In November 1801 a popular revolt from below in the north was blamed by

Toussaint on his adopted nephew, the popular General Moïse, who had opposed the militarisation of agriculture. The revolt was bloodily repressed, and Moïse shot. To many former slaves, Toussaint seemed ever more remote, even a figurehead of a new emerging black landholding class of army officers. In 1801, Toussaint promulgated a bold constitution that concentrated all power in his hands and made him governor for life, with the right to choose his successor. While he ruled out formal independence from the French Empire, he attempted to move the colony towards greater autonomy from France through statehood as a sister republic within a wider 'commonwealth' (Geggus 2007: 127–129; see also Fick 2009: 186–188).

Such audacity on the part of a former slave would soon lead to Toussaint's downfall, given the steady rise of counter-revolutionary forces in France itself around another military strongman, Napoleon Bonaparte. In February 1802, the French invaded Saint-Domingue with ten thousand troops commanded by Bonaparte's brother-in-law General Leclerc. Toussaint, and some of his loyal generals like Jean-Jacques Dessalines and Henri Christophe, retreated to the mountains to conduct heroic and desperate bloody guerrilla warfare. 'In the midst of so many disasters and acts of violence I must not forget that I wear a sword', Toussaint declared amid this War of Independence (James 2001: 246). However, despite the fact that the black resistance was beginning to gain the upper hand over the elite professional French military troops, first Christophe in April 1802 and then Toussaint himself in May 1802 made peace, perhaps half believing Napoleonic propaganda about their claimed commitment to the principle of 'general liberty' and perhaps half fearing an unstoppable steady stream of French reinforcements, given the Peace of Amiens which France had recently concluded with Britain.

As the French army at their moment of victory began to be withered away by disease, Leclerc secured the agreement of both Dessalines – who had developed his own vision of full independence for Saint-Domingue which went beyond that of Toussaint – and Christophe that they would

not launch a new uprising if the French now arrested Toussaint on the pretext that he was himself plotting a new rebellion. Toussaint – not realising he had been betrayed – agreed to meet with the French general Brunet in good faith in early June 1802, only to be arrested, kidnapped, and deported to France (Bell 2008: 258, 263–264). As Toussaint boarded the fateful ship to leave his homeland, he delivered a prescient warning to his French captors. 'In overthrowing me, you have cut down in San Domingo only the trunk of the tree of liberty. It will spring up again by the roots for they are numerous and deep' (James 2001: 271). Toussaint was right, for once it became clear that the French intended to restore slavery and the old racial order, many of their former collaborators deserted them and the War of Independence erupted once more with a vengeance. In the freezing cold prison at the Fort de Joux in the French Alps, Toussaint wrote his 'memoir', addressed to Napoleon, to justify his public record as governor of Saint-Domingue and his plea for a court-martial so as to allow him the opportunity – like that given to any white French general – to defend himself. However, in April 1803, with Napoleon's silence ever more deafening, Toussaint died, never living to hear that his life work would be vindicated in January 1804, when the violent struggle for Haitian independence would triumph at last, under the leadership of Dessalines and Christophe and in alliance with the formerly free people of colour (see also Girard 2013b; Nesbitt 2008).

Following James's understanding of 'black Jacobinism', some parallels between Toussaint Louverture and Maximilien Robespierre (1758–1794) may be noted by way of conclusion. Like Robespierre, Toussaint was said to be personally 'incorruptible' and had a keen sharp intellect which marked him out from his contemporaries. Both were also autocratic figures, content to remain somewhat aloof from the revolutionary masses – and even turn and crush the left wings of their respective revolutionary movements, actions which ultimately contributed to their downfall. Yet if Toussaint might be remembered as 'the black Robespierre', his 'blackness' should not be forgotten, for the Haitian Revolution was in many senses an African revolution in a Caribbean setting. Toussaint was a 'creolised' figure, drawing strategically on the various traditions by which he was influenced – including Vodou – to shape and deliver his revolutionary project.

'Men who serve their country well . . . have powerful enemies . . . I know I shall perish a victim of calumny', Toussaint once noted (James 2001: 208). Despite a recent powerful portrayal of Toussaint's life in the outstanding trilogy of novels by Madison Smartt Bell, what the late Haitian scholar Michel-Rolph Trouillot called the 'silencing' of Haiti's 'unthinkable' rich revolutionary history in the discourse of Western imperial countries reminds us that there are some historic figures about whom those in power have found it best not to let people find out too much (Trouillot 1995: 73, 97). It is telling, for example, that there has been no Hollywood film directly about either Toussaint or the Haitian Revolution for over 60 years (since *Lydia Bailey,* 1952).

This said, Toussaint's political legacy in Haiti and internationally across the black diaspora was nonetheless to be profound, and is testified to by, for example, the fact that during the American Civil War, the company nickname of the 54th Massachusetts Regiment, one of the first official units of African Americans, about a quarter of whom had been formerly enslaved, was 'the Toussaint Guards' (Clavin 2007: 91). In later periods – for instance the inter-war period amid the Harlem Renaissance, the US occupation of Haiti, and continuing European imperialist domination over Africa and the Caribbean – Toussaint once again became an inspiring symbol of revolutionary anti-imperialism and 'Black Power', invoked by figures as diverse as Marcus Garvey, C.L.R. James, Langston Hughes, Jacob Lawrence, Aimé Césaire, Pablo Neruda, and Sergei Eisenstein (for a useful survey of some of these representations see Forsdick 2006). Toussaint's refusal to see freedom as a 'gift', but rather as something that has to be taken and won through struggle, gives his political thought continuing resonance amid the revolutionary processes unfolding in recent years across the Middle East and North Africa.

Anti-imperialism; Assassination; Democratic Republic of the Congo; Imperialism; Pan-Africanism; Patrice Lumumba

Definition

This essay explores the life and work of anti-colonial and pan-Africanist Congolese politician, independence leader, and first Prime Minister of the independent Democratic Republic of the Congo, Patrice Lumumba (1925–1961).

In Congo's southernmost province of Katanga, the first prime minster of an independent Congo, Patrice Lumumba, along with two of his comrades, was shot on 17 January 1961. Their assassination followed hours of horrific torture. A Belgian officer organised the firing squad; the three bodies were quickly buried, meters from where they had fallen. The following day, another Belgian officer dug up the bodies, cut them into pieces, and dissolved them in acid.

Lumumba was a self-educated nationalist leader. Born in 1925 in Congo's Kasai province, he was expelled from school and ran away to the regional capital of Stanleyville (Kisangani). By the time of his arrival in Stanleyville, a new colony was being promised. Industry was being developed and new mining communities were established across the country. Copper was at the centre of the boom, being produced in huge quantities in the South and mined by the public-private giant Union Minière du Haut-Katanga (UMHK). The Belgian Congo was the source of vast profits for the colonial state and private businesses.

Arriving in Stanleyville in 1944, Lumumba quickly became a leading member of the *évolués* (literally meaning 'the evolved') in the city. This was a group of educated Congolese men who were trained to take part in the civilising mission of the Belgian state. They were given low-ranking jobs in the administration and groomed to regard themselves at champions of the 'Belgian Congo' community. Lumumba became a clerk in the Stanleyville post office.

For much of the 1950s, Lumumba's ideas did not stray from those held by the majority of the évolués. He was, effectively, an advocate of the colonial project. In June 1956 this began to change. Arrested and imprisoned unjustly for alleged embezzlement in his postal job, Lumumba started to criticise the 'motherland'. Released in September 1957, he decided to make his new life in the capital Leopoldville (today's Kinshasa). The city was a modern metropolis but still deeply segregated. Leopoldville became infected by the ideas of independence and political liberation.

By November 1958, Lumumba was elected to lead what became the principal party of national liberation, the Mouvement National Congolais (MNC). But Belgium was desperate to control the pace of radicalisation and sought to manipulate and divide the country's emerging political parties.

Other Western states were also eager to ensure that Congo's independence did not threaten their economic investments in the country. The US had been heavily involved in the region since the start of the twentieth century. Ryan and Guggenheim, the US mining groups, had interests in the region. The US also had investments in the Union Minière du Haut-Katanga (Mining Union of Upper Katanga, UMHK).

End of Conciliation

Two events signalled the end of Lumumba's conciliatory politics. He was inspired by the independence of Ghana in 1957. The most prominent black leader on the continent was Ghana's Kwame Nkrumah. Nkrumah took a personal interest in the struggle of the MNC and became a comrade and confidante to Lumumba. The second was more important. On 4 January 1959, Leopoldville erupted in violence. A demonstration was crushed by the notoriously brutal Force Publique, the colonial army. Hundreds were killed. The belief that a long transition and common understanding could pave the way to Congolese independence was over.

Congolese society was transformed, and Lumumba threw himself into the tumult. By March 1959, the MNC had 58,000 members. Lumumba's militancy rose with the gathering radicalisation. Now he demanded independence without delay. But other members of the évolués saw their future in an alliance with the colonial power and later with the US.

> The secret to Lumumba's leadership of the struggle for independence was his ability to respond to the radicalisation in Congolese society. This contrasted with other, more cautious, members of the Congolese évolués, who were prepared to accept the continuity, in new forms, of European influence. In April 1959, while in Belgium, Lumumba responded to a question about support for the party he now led among the Congolese masses – the process was inherently dialectical: 'the masses are a lot more revolutionary than us ... They do not always dare to express themselves in front of a police officer, or make their demands in front of an administrator but when we are with them it is the masses who push us, and who want to move more rapidly than us'. (Van Lierde 1972: 45)

Arrested, beaten, and imprisoned at the end of 1959, Lumumba was only released when negotiations were launched in Brussels in January 1960. In the negotiations he refused to allow the Congolese state to be divided up (with the country's wealth controlled by the provinces) as the Belgian rulers had hoped. Nor would the MNC accept the Belgian king as the head of state in an independent Congo. By the end of negotiations, a date had been set for independence: 30 June 1960. But Lumumba's radicalism had earned him the hatred of the Belgian elite. They decided to undermine the MNC's efforts to win the May 1960 general election.

L

Independence

However, the MNC emerged victorious in the election in May. Lumumba was now the undoubted leader of Congo's future. On the day of independence he reminded his audience of the struggle for freedom: 'For this independence of the Congo, even as it is celebrated today with Belgium, a friendly country with whom we deal as equal to equal, no Congolese worthy of the name will ever be able to forget that it was by fighting that it has been won'. Celebrations were quickly extinguished. In July, Belgium promoted the secession of the mineral-rich provinces Katanga and Kasai. These new 'states' were immediately recognised, armed, and supported by the old colonial power. Some évolués – using the language of ethnic divide and rule – helped provide an African veneer to these artificial breakaway provinces.

Lumumba attempted to mobilise his supporters. As the power he had just acquired began to slip away, he turned to the ranks of the MNC. But the forces against him were too great. Leading militants of the nationalist movement fell to bribes and co-option. Joseph Mobutu (the future dictator of the country, until then an ally and friend of Lumumba) was openly bribed by the US and persuaded to organise a coup d'état in September.

By October 1960 there were four operations underway to assassinate Lumumba. Western states openly called for his government to be removed. Lumumba fled the capital in November to reach his supporters in Stanleyville. Arrested days later, he knew that this probably meant death. Writing in prison to his wife, he said, 'History will one day have its say, but it will not be the history that Brussels, Paris, Washington, or the United Nations will teach, but that which they will teach in the countries emancipated from colonialism and its puppets' (cited in Zeilig 2008: 123).

Books and Debates

There has been little debate about responsibility for Lumumba's assassination since the publication of Ludo de Witte's *The Assassination of Lumumba*, which caused a parliamentary scandal in Belgium and an enquiry. De Witte's book is a superb exposé of the role of the Belgian state in Lumumba's murder. Major studies include biographies written in the 1960s and 1970s; unfortunately, most are out of print and in French. This means that there is very little available on Lumumba's entire life for an English-speaking audience. Robin McKown's *Lumumba, a Biography* was notable at the time (it was published in 1969) for being a very sympathetic portrayal of Lumumba. Another much cited biography is Pierre de Vos's *Vie et mort de Lumumba,* published in 1961.

By far the best source of Lumumba's own writing is *Lumumba Speaks: The Speeches and Writings of Patrice Lumumba 1958–1961*, edited by his collaborator and comrade Jean Van Lierde. This collection is a translation from the French edition that appeared in 1963. It is a superb collection of Lumumba's speeches and an interview published with a critical introduction by Jean-Paul Sartre. Lumumba's only book came out in the year that he was assassinated under contentious circumstances. It was published in English in 1962 under the title Congo, My *Country.* This is a fascinating insight into Lumumba's ideas in 1956.

Biographies

Robin McKown's *Lumumba, a Biography* (1969) is long out of print but can be bought on the Internet. Panaf Books's *Patrice Lumumba* (1973) was reprinted in 2002. These are valuable sources, but both are dated. McKown's book has a slightly patronising tone towards the Congolese, and the Panaf book is overloaded with occasionally tiresome political rhetoric.

Novels and Films

There are a number of novels that have fictionalised the period of Lumumba's assassination. Two of the most interesting are Barbara Kingsolver's *The Poisonwood Bible* (1998).

Although Lumumba only makes a short appearance in the book, it provides a powerful account of the hopes of the early nationalist movement in the Congo. Ronan Bennett's celebrated novel *The Catastrophist* (1999) takes the Congo crisis as the backdrop to an unusual love affair. The book is a powerful and largely sympathetic account of the crisis, but it makes the unfortunate error of asserting that Lumumba received money from an American agent. The novel reproduces Lumumba's final letter to his wife. Raoul Peck's film *Lumumba* was released to critical acclaim in 2000 and has received numerous awards. It is a moving and historically accurate account of Lumumba's life from his time in Leopoldville to his assassination in 1961.

Definition

Rosa Luxemburg was a Polish-Jewish socialist and anti-militarist. She had the unique ability to combine her theoretical engagement with fervent political practice. Her political work against the First World War, and her writings on imperialism, war, and militarism remain a testimony to her dedication to the socialist and internationalist cause.

Rosa Luxemburg was a Polish-Jewish socialist and anti-militarist. She had the unique ability to combine her theoretical engagement with fervent political practice. At the age of 15 she joined the Polish Proletariat Party. As a naturalised German she would later on in life become an educator and foremost representative of the left wing within the German Social-Democratic Party (SPD). Her political work against the First World War, and her writings on imperialism, war, and militarism remain a testimony to her dedication to the socialist and internationalist cause.

During her short life, not a year passed without military conflict. Her childhood in the 1880s took place against the backdrop of the new imperialism and the scramble for Africa. The Berlin Conference (also known as the Congo C/onference) of 1884–85 heralded a new era for the German Empire as it emerged as an imperial power. Intense inter-state rivalry would follow shortly after. The Sino-Japanese War in 1895 and the Spanish-US War in 1898 would be followed by the British Boer War in South Africa (1899–1902) and the campaign of the European powers in China (1900). These wars aimed to consolidate European influence across the world. In the meantime, an ascendant working class was to pay the price for these military excursions. In response to the Russo-Japanese War

(1904–07), Russian sailors mutinied; workers rebelled and set up what would come to be known as the first *soviets* (workers' councils) in one of the most 'under-developed' countries at the time. In the years to follow, tsarist Russia would invade Persia (1908) and France invade Morocco (1911). Meanwhile, the German Empire had fought the Herero Wars in South-West Africa; what is Namibia today. German troops repressed the revolt by selling prisoners to German businesses. To make matters worse, they set up concentration camps. One of these camps, Shark Island, would prefigure the Nazi concentration camps used to exterminate more than 10 million human beings.

In less than 30 years, the geo-political situation had been fundamentally transformed. Thus, it is no surprise that the colonial question was a high-priority item at the 1907 Socialist International Congress in Stuttgart. Speaking there, Rosa Luxemburg would argue that 'European antagonisms themselves no longer play their role simply on the European continent but in every corner of the world and on all oceans' (Luxemburg 1911a). She was to be proven right when the shooting of Franz Ferdinand of Austria triggered European inter-state rivalries that culminated in the First World War.

A few days into the war in 1914, the SPD, the largest Social-Democratic party in Europe, would vote for war credits. Luxemburg and her allies such as Karl Liebknecht, Clara Zetkin, Leo Jogiches, and others broke from the SPD to found the Spartakusbund (Sparticist League). They agitated and called demonstrations against the war. In Frankfurt, Luxemburg called on thousands of conscript soldiers to conscientiously object and refuse orders. In 1915 she would be imprisoned for incitement against the German Empire; a continuous and regular occurrence but one that would not lessen her determination.

The Spartakusbund operated within the Independent Social-Democrats (USPD) until Luxemburg, her collaborators, and many radicalised workers founded the German Communist Party (KPD) in December 1918. At that time the German Empire was on the brink of revolution. Soldiers and workers' councils had

taken hold all over the country and forced Kaiser Wilhelm II to step down.

The insurrection, known as the Spartacist Uprising, launched by workers in Berlin, would have devastating consequences and take the young Communist Party by surprise. On 15 January 1919, SPD chancellor Friedrich Ebert ordered the Freikorps militia to murder Rosa Luxemburg and her comrade Karl Liebknecht. Luxemburg was thrown into the Landwehrkanal where a memorial recalls her today.

Rosa Luxemburg's contribution to peace, democracy, and socialism amounts to no more than a memorial. Today more than ever her work informs those seeking to understand the faultlines of global capitalism. With her polemic against the revisionism of Eduard Bernstein *Reform and Revolution* (1900) she enhanced a rich Marxist tradition. *The Mass Strike* (1906), a treatise on the dynamics of the 1905 revolution in Russia, influences social-movement scholars, political scientists, and historians amongst others. In her famous essay 'Peace Utopias' (1911a) she argued that the SPD ought to make the 'question of militarism' the focus of its electoral campaigning and agitational work. In the article she condemns her internal party opponents Eduard Bernstein and Karl Kautsky for being utopians. While the former believed that peace was attainable through more integration of the world markets, the latter contended that it was not in capitalists' interest to go to war. In other words, war is merely a policy error. For Luxemburg the issue is clear-cut: imperialism and war are inherent to capitalism. The 'proletarian revolution [is] the first and only step toward world peace' (Luxemburg 1911a). This set her at odds with most peace campaigners in her day as well as the majority of the SPD leadership. Only a few months later she began her article on the French invasion of Morocco with these poetic yet frightening words: 'A dark imperialist cloud is hanging over the capitalist world' (Luxemburg 1911b). In the article she achieves two things. Firstly, she links the revolutionary upheavals in Mexico, Turkey, Egypt, and Persia to the imperialist dynamic emanating from the centre of the capitalist world by arguing that their integration into the world market as a resource of cheap

labour power and unregulated markets creates the conditions for spontaneous uprisings against the tumultuous shift in the regime of accumulation. Her continued relevance can be seen in the political revolutions in countries such as Egypt and Tunisia in 2011; countries in bondage to international loans and foreign direct investments.

Secondly, but no less importantly, she foreshadows the central tenet in her theory of imperialism by arguing that the driving force of imperialism was capitalism's need for third parties (colonies) outside of capitalist society (cf. Day and Gaido 2013, p. 459). In other words, imperialism is economically rooted in capital's need to continuously expand. As workers' consumption lags behind the production of goods and commodities in the capitalist centre, so third countries provide a new market for the excess capacity of goods and commodities. By integrating these countries into the world market, the capitalist centre could avoid the trap of a crisis of reproduction. Whereas Luxemburg suggests an underconsumptionist reading of such a crisis of reproduction, other Marxist writers of the Second and Third International emphasised the capacity for over-production.

Her most important anti-war pamphlet *The Crisis of Social Democracy or Junius Brochure* (her pseudonym being Junius) would contain her most famous words: 'Socialism or Barbarism'.

In the meantime, Luxemburg the trained economist had written *The Accumulation of Capital* (2013/1913). The book's subtitle *Contribution to the Economic Explanation of Imperialism* provides the answer to what it dealt with. She attempted to understand how surplus value is realised in capitalist society and why capitalist economies expand territorially, spatially as well as enclosing new markets internally. The book aroused much debate following its publication. Neither the reformists nor the revolutionaries in the International Socialist movement were satisfied. Otto Bauer criticised it at length. The Bolshevik leader Nikolai Bukharin called it a 'daring theoretical attempt' (Bukharin 1917/ 1915, Chap. 5), but also dedicated an entire book against it. Published at a time when Lenin's and Luxemburg's relationship was at an all-time low,

Lenin remarked: 'She has got into a shocking muddle. She has distorted Marx' (Lenin quoted in LeBlanc 2013). Even today there are ongoing debates within political economy and Marxism regarding her reading of *Capital* (vol. 2) (Dunayevskaya 1946; LeBlanc 2013). At the same time, there is renewed interest in its lessons on imperialism and the dynamics of capitalist dynamics (Bellofiore 2009; Bieler et al. 2013; Schmidt 2013). Bellofiore argues that the export of goods to the periphery necessarily facilitates an international loans system which creates a vicious cycle in the form of overindebtedness, interest payments, and repayments (2009). On the other hand, Bieler et al. (2013) emphasise the political nature of Luxemburg's explanation of imperialism by drawing on the following quotation which states that 'imperialism is the political expression of the accumulation of capital' (Luxemburg 2003/1913, p. 426). In other words, imperialism also takes on non-military forms.

What was Luxemburg's theory of imperialism? Her starting point was Marx's defining characterisation of capitalist social relations: the antagonism between capitalists and workers. Under capitalism, workers sell their labour-power below the value of what they produce. In turn, the earned wage of the labourer is used to buy food, clothes, and shelter in order to reproduce oneself and other commodities available through the generalised system of commodity production. Luxemburg observes that (unlike feudal landlords, ancient slaveholders, or other ruling classes) the capitalist reinvests rather than consumes the surplus made from exploiting labourers. Thus, there are fewer commodities consumed than produced. In classical economic terms, demand is lower than supply. This divergence means that an economy will stagnate and ultimately grind to a halt unless capital discovers new ways to sell the excess products. According to Luxemburg, the imperialist dynamic begins at the nexus when capitalists are compelled to expand into non-capitalist areas which Luxemburg labels 'the peasant economy' or 'natural economy'. Markets, raw materials, and labour are sought in this economic sphere. She writes that the 'non-capitalist

social environment … absorbs the products of capitalism and supplies producer goods and labour power for capitalist production' (Luxemburg 2013/1913: 347). Elsewhere she wrote: 'Only the continuous and progressive disintegration of non-capitalist organisations makes accumulation of capital possible' (416, 417). The childhood experience of Polish industrialisation, on the one hand, and the scramble for Africa outlined above, on the other hand, would have confirmed her thesis. Was she correct to criticise Marx for supposing capitalism's universal character in her *The Accumulation of Capital* (328)?

For Luxemburg, imperialism was not a phenomenon of the 'highest' stage of capitalism, as Lenin had argued in 1917, but occurred at what Marx called the stage of *primitive capitalist accumulation.* In reaching this conclusion, she transcended a *stage-ism* by which capitalism only develops internally within states and then moves outwards and extends its influence once internal markets have matured. It manifests itself, for example, through land robbing or the enclosure of common land – phenomena common to neo-liberalism. As domestic markets age and capitalism matures, it is in these spheres that value is realised. Inspired by Luxemburg's model, the Marxist geographer David Harvey calls this process 'accumulation by dispossession' (Harvey 2003, p. 145). According to Harvey, 'accumulation by dispossession' manifests itself through the following practices and policies: privatisation, financialisation, state redistributions to the private sector, and the management and manipulation of crises. In particular, the capitalist centre has imposed privatisation packages through structural adjustment programmes on countries in the global South. The same holds true for the management of crisis through the use of flexible interest rates exacerbating the dependency of the global South. In recent years, Harvey has used the same methodological framework to analyse this dynamic within the capitalist centre itself. Here, non-capital zones such as government-owned housing estates, public spaces, people on benefits, or even workers have been integrated into new forms of value extraction through the privatisation of publicly owned homes and spaces as well

as their integration into the finance and credit system (Harvey 2012). These constitute new antagonisms vis-à-vis contradiction in the capitalist world-system. However, it is questionable whether these forms of exploitation have replaced capital–labour antagonism as the central contradiction within capitalism and whether this reconfigures the imperialist dynamic between countries of the global North and South which was at the heart of Luxemburg's analysis.

Regardless of which position one adopts regarding her model of capitalist accumulation and imperialism, Luxemburg remains highly relevant to those studying the world economy and its processes of commodification and privatisation today. Spheres of life such as health, education, and our environment (formerly outside the control of the market) are now subject to the paradigms of profit and capitalist growth, displaying that the means of subordination and domination used on the peoples of the global South are in turn being used to dominate the centre's own populations. In doing so, 'Luxemburg does not confine capitalism's "outside" to a territorial phenomenon' (Bieler et al. 2013, p. 3) but includes new layers of the local populations which have been outside of this logic until recently. For example, the state employs this logic by dividing the poor into 'deserving' and 'undeserving', creating the need to enter the market in order to receive benefits such as food stamps, means testing etc. Yet, it can also explain geo-political developments. Since the fall of the Soviet Union, noncapitalist areas outside Europe and North America such as China have, and continue to be, integrated into the world market. Ingo Schmidt uses Rosa Luxemburg's framework to analyse US hegemony (Schmidt 2010). The Kosovo War (1999), Afghanistan (2001), Iraq War (2003), Libya (2011), and Mali (2012) can be regarded as events where new territories are integrated into the process of capital accumulation.

Furthermore she observes how capital investments by countries of the centre create dependency on exports and loans. In *The Accumulation of Capital* Luxemburg describes how the British took over Egypt. Once it was unable to repay its outstanding debts on loans it

was conquered and subjected to colonial rule. In many ways, this foreshadows the practices of the International Monetary Fund and World Bank today. The use of structural adjustment programmes, international loans, bailouts and credits has created new markets to realise value. Further examples include free trade and exportprocessing zones in the global South. Internally, this happened through the expansion of consumption through loans to people who previously could not afford to buy a house. The fire sale of Greek or Portuguese state assets to French and German businesses to raise money to repay loans, or the currency speculation which facilitated the East-Asian economic crisis of 1997/1998, both highlight the use of policy tools to maintain financial and economic dominance and extract value from the oppressed classes in peripheral countries while the profits are amassed in the capitalist centres. Exemplified here is how privatisation is a tool of imperialist policy. All in all, Luxemburg's model is a useful means to understand the way in which capitalism, at all times, depends on 'non-capitalist social environments' (Luxemburg 2013/1913: 347).

She also deciphers the underlying imperialist logic inherent in infrastructure programmes such as railways (408). Whether it be the Berlin–Baghdad railway or the expansion of US tracks westwards, railway lines are synonymous with capitalist expansion. Today, infrastructure programmes such as football stadiums for FIFA World Cups in South Africa, Brazil, or Qatar mean the displacement of hundreds of thousands of shantytown dwellers and destruction of *favelas*. In Qatar, the use of migrant labour from Nepal is another example of how labour from non-capitalised zones is integrated into the world market, production, and circulation of capital; and serves as a resource of cheap labour in centres of accumulation. The now infamous Gezi Park in Istanbul, Turkey, was to be bulldozed and replaced with a shopping mall. There are countless other examples which underline the applicability of Luxemburg's theory.

Yet many Marxists attacked Rosa Luxemburg for this theory. Critics included the reformist Otto Bauer and the Bolshevik Nikolai Bukharin

amongst others. Bauer argued that the reproduction schema did not lead to the kind of imbalances that Luxemburg based her theory on (Pannekoek 1934). On the other hand, Bukharin argued that capitalism did not necessarily have to expand to non-capitalised zones. Under no circumstances was capitalism dependent on integrating peasants or craftsmen into the general system of commodity production. Furthermore, his account of imperialism differs from Luxemburg's insofar as war and imperialism are a by-product of the centralisation of capital (Bukharin 1915/ 1917). Like Rudolf Hilferding, he emphasised the increased inter-relatedness of finance and industrial capital. Raya Duneveskaya writes: 'Methodically, however she did depart from Marxism in the analysis of the question of capital, and it was inevitable, therefore, that she arrives at false conclusions' (Dunayevskaya 1946). Others have criticised her for being an economic determinist; a label which many Marxists have been branded with. Ernest Mandel (1966) wrote: 'The fundamental weakness of Rosa Luxemburg's theory is that it is based simply on the capitalist class's need for markets to realise surplus value, and ignores the basic changes which have taken place in capitalist property and production'. But it was not only those Marxists from the Trotskyist tradition who were critical of Luxemburg's reproduction schemes and her analysis of imperialism.

In many ways the argument she advances in her reproduction scheme asserts underconsumption within capitalism as opposed to over-production. For example, her theoretical framework cannot account for the long boom of capitalism in the 1960s and the expansion of the welfare state which entailed large-scale decommodification. While she does concentrate on the lack of effective demand within capitalism and subsequent capitalist breakdown, Paul LeBlanc argues that she displays an 'anthropological sensitivity' like no other Marxist theoretician at that time. She acknowledges the fact that there are different cultures, types of society, and forms of social and economic organisation (cf. LeBlanc 2010, p. 163). Her sensitivity to the commodification of labour vis-à-vis the proletarianisation,

the genocides, famines, and slave-trading stands out in her account, as the quotation below displays:

> In Africa and in Asia, from the most northern regions to the southernmost point of South America and the South Seas, the remnants of old communistic social groups, of feudal society, of patriarchal systems, and of ancient handicraft production are destroyed and stamped out by capitalism. Whole peoples are destroyed, ancient civilizations are levelled to the ground, and in their place profiteering in its most modern forms is being established. (quoted in LeBlanc 2010; Luxemburg 2013/1913: 325)

These descriptions display her sensitivity to the plight of the oppressed peoples of the global South, and the way that capitalism would uproot their livelihoods and dissolve the social bonds which had kept these societies intact for centuries. Yet Lenin would simply criticise these as 'non-Marxist' (Lenin in LeBlanc 2010). For Luxemburg, imperialism was the 'deadly enemy of the workers of all countries …. The struggle against imperialism is at the same time the struggle of the proletariat for political power' (Cliff 1959). It is this message that makes Luxemburg's theory of imperialism as relevant as ever.

Luxemburg was not free from flaws. Having personally experienced the regressive nature of Polish nationalism and the militaristic nature of German nationalism, she believed that all nationalisms were equally bad and harmful for the socialist and workers' movement. Rather than understanding the contested nature of 'nation' in those oppressed countries, peripheral nations, and countries of the global South, she equated them with the nationalism of the oppressor (Luxemburg 1909). History has shown us that during progressive anti-colonial movements such as the Arab and Irish ones, nationalism successfully challenged imperial domination and colonialism.

Conclusion

In conclusion, Luxemburg's anti-imperialist message is as prescient now as it was when she first wrote at the beginning of the twentieth century. Drawing on her first-hand experience of war and the tumultuous changes taking place at the time, her work remains a benchmark in the study of imperialism and anti-imperialist strategies. The War on Terror, structural adjustment programmes in the global South, and the increased importance of the exploitation of foreign labour for capital accumulation highlight the need to deal with her ideas anew.

Her understanding of the relationship between the capitalist centre and the peripheral countries remains limited by her interpretation of Marx's reproduction schemes in *Capital* (vol. 2) and her emphasis on under-consumption. However, this allows her to see how these countries become testing grounds for policies later to be employed on the metropoles' populations. The criticisms levied against her from within the Marxist tradition raise valid concerns about some of her conclusions. Yet her work forms part of a rich Marxist tradition of anti-imperialist thought which cannot be dismissed but needs to be built on.

Definition

This chapters analyses Rosa Luxemburg's political work against the German Empire and the First World War. As a member of the German Social-Democratic Party and later the founder of the Spartakusbund (Sparticist League) and German Communist Party (KPD), she was committed to Marxism. Her writings on primitive accumulation, imperialism such as her book the Accumulation of Capital, war, and militarism remain reference points for the study of imperialism and anti-imperialist thought today. She was murdered on the eve of the German Revolution in 1918.

For Rosa Luxemburg, imperialism was a necessary outcome of capitalism. In the years leading up to the First World War, the Polish/German communist theorist and activist worked tirelessly to convince her fellow European socialists and trade union activists that war would only benefit the bourgeoisie and that only international labour solidarity could counter the imperial mission. As an economist she engaged with orthodox Marxian theory of capital accumulation to make an argument that seemed counter to the general Marxist project. Traditional Marxian narrative would argue that capitalism proceeds by exploiting the working class. Luxemburg argued that, though

this is true, it also proceeds via intra-class conflict between rich capitalist countries in Europe and non-capitalist countries still emerging. As an activist, she was a prolific writer and speaker, and her international outlook set her apart from other, more nationalist, leftists.

Much of her economics argument related to a crisis of under-consumption, but she also believed that populations that live outside or on the margins of capitalism ought to be viewed as part of a global reserve army of labour. Some of her critics have suggested that: (a) under-consumption is not the inevitable cause of crisis, or, even if it were, then (b) imperialism would not be the only countervailing force. Despite these criticisms, she is well appreciated for putting the tendencies of capitalism in the context of 'noncapitalist strata and countries' (Luxemburg 1968, p. 348). Up to this point, Marxist theory had tended to ignore the countries of the Third World, most of which had or continue to have experience of colonial binds and severe poverty. For her, it was of the utmost importance to emphasise the historical reality that primitive accumulation was an ongoing characteristic of capitalism, and not a one-time historical event roughly spanning the seventeenth century. Rather, the very viability of capitalism depends on internal and external pockets of available demand, therefore the imperialist nature of the capitalist countries is not a bourgeois vice but rather an historical necessity. The case for under-consumption depends on an interpretation of capitalist accumulation. Traditional Marxian analysis suggests that capitalism is an ongoing process of capital accumulation that creates more and more surplus value. Surplus value is created when labour is exploited into producing goods that have more value than what they are paid in wages. Interestingly, Marx essentially assumed that workers were paid what was necessary to reproduce themselves as workers i.e. a liveable wage. Put differently, workers are exploited into working more hours (surplus labour) than would be necessary to nurture themselves, and capitalists appropriate the exchange value of what is produced with that surplus labour. That value that is appropriated is surplus value. It is important that the surplus value be realised through sales so as to create the liquidity for more capital for the next

cycle. In *Capital*, Marx (1967b/1885, vol. 2) lays out a relatively formal model of expanded reproduction whereby an initial outlay of capital is transformed into an ever larger amount of capital.

According to one school of thought, Marx's model does leave room for a paradox whereby the value of the production would exceed the effective demand, and hence leave some amount of surplus value unrealised (Foley 1986). In order for all the surplus value to be realised, the production must be sold and the difference between the total revenue and what is paid out in wages must be spent. For expanded reproduction, some level of the realised surplus value would be converted into new capital and the cycle would start again, on an expanded scale. In order, though, for all the production to be consumed (by either the workers or the capitalists) there must be enough new money to do so. In addition, there must be a match in the types of goods that are produced and those goods that people want to buy.

A basic form of the under-consumption argument suggests that because workers are paid less than the value of their production they necessarily cannot buy all the output. However, capitalists themselves also consume; they use some of their surplus value to purchase new means of production and some of it for their own consumption. The question still remains, though: If there was a certain amount of money to begin with, even though new products have been created, where will the new money to buy them come from? This interpretation concludes that there will always be a gap between that which is produced and that which is bought, which would leave inventories waiting. In this way, surplus value is created, but not realised because the production is not actually sold for money.

According to under-consumptionist theorists like Rosa Luxemburg, capitalists are relying on an ever-increasing market to buy up the ever-increasing production, but they do not have control over effective demand from the worker-consumer. Luxemburg suggests that capitalists work against this type of crisis by incorporating non-capitalist spheres into the accumulation process. Her idea was that primitive accumulation, the transformation of non-capitalist systems and communities into market-oriented institutions,

was a regular and ongoing part of capitalism. Luxemburg's thesis was that the surplus value of the dynamic capitalist economy could only be realised by the interplay with non-capitalist spheres. Non-capitalist spheres were needed, she argued, to purchase the increased output of consumption and investment goods that become available as capital accumulation proceeds. It is here that she deviates from the traditional Marxian framework. Marx's mode of expanded reproduction assumed that capitalism was a complete mode of production across the globe. For the purposes of detailing the social relations of production between workers and capitalists, such a level of abstraction would be sufficient, she argued. Further, Marx analysed the process of primitive accumulation with the aim of explaining the historical events in Europe that marked the transition from feudalism to capitalism. The problem comes because '[a]s soon as he comes to analyze capitalism [as a] process of production and circulation he reaffirms the universal and exclusive domination of capitalist production' (Luxemburg 1968, p. 366).

According to Luxemburg, this level of abstraction ignored the concrete historical reality that capitalism had never been in a position of complete world dominance. Writing in the early twentieth century, she certainly had plenty of evidence of non-market communities nestled in Europe and the US. In addition, of course, was the plethora of countries whose existence was wrapped up in various European colonial projects as well as indigenous communities in Latin and Central America, Asia, and Africa. It was (and still is) clear that frontiers to capitalism exist. In addition to geographical boundaries, there are more nuanced spheres that are outside or on the margins of the logic of capitalism. For example, even in market-economies, markets do not usually pervade cultural and gender-based systems that reproduce labour power within households. Also, subsistence agriculture occupied (and occupies) the time and effort of most of the world's farmers, many of whom live in countries outside the global agricultural industrial complex headquartered in the US and the European Union. Luxemburg firmly held that the relationships between the capitalist and the non-capitalist

spheres played a necessary part in the capitalist production process, and she believed this was a form of ongoing primitive accumulation.

George Lee (1971) summarises Luxemburg's understanding of the imperialist strategy by which the capitalist countries assimilate the natural economy of the non-capitalist sectors. The overall plan has four stages: the appropriation of natural wealth; the coercion of the labour force into service; the introduction of a simple commodity economy where the majority of output is traded and not consumed; and the elimination of the rural industries which previously provided for the inhabitants. While this essentially describes traditional notions of 'primitive accumulation', for Luxemburg this is an ongoing phenomenon that characterises the relationship between capitalist and non-capitalist spheres, and imperialism itself.

Through this destabilising and often violent process, the capitalist nation states create new pockets of consumers for their output. They do this by the destruction of the existing economies, usually agrarian, thereby creating the need for consumer markets.

> Capitalist production supplies consumer goods over and above its own requirements, the demand of its workers and capitalists, which are bought by non-capitalist strata and countries. The English cotton industry, for instance, during the first two-thirds of the nineteenth century . . . [supplied] cotton textiles to the peasants and petty bourgeois townspeople of the European continent, and to the peasants of India, America, Africa and so on. (Luxemburg 1968, p. 352)

In addition to consumer goods, this process also creates markets for industrial goods designed and produced in the capitalist countries.

> [C]apitalist production supplies means of production in excess of its own demand and finds buyers in non-capitalist countries. English industry, for instance, in the first half of the nineteenth century supplied materials for the construction of railroads in the American and Australian states [locations where capitalism was in its infancy]. Another example would be the German chemical industry which supplies means of production such as dyes in great quantities to Asiatic, African and other countries whose own production is non-capitalistic. (p. 353)

In addition to appealing to a crisis in under-consumption, Luxemburg also argued that

the lack of co-ordination in capitalism suggested that demand will usually not equal supply, and that supply-chain interruptions will break down the cycle. In non-capitalist systems, the co-ordination of the actual production and distribution of the goods is achieved either by domination (slavery, military dictatorship, etc.) or by some form of communal decision-making process (such as in egalitarian households or socialist democracies). Such co-ordination mechanisms for capitalist societies are non-existent. The invisible hand is guided by profits and prices, and firms and consumers are guided by these signals in a very decentralized way. By appealing to imperialism, it is possible to manufacture demand or supply to fill in where needed by compelling agreement with a non-capitalist country. This can be accomplished via militarism, indebtedness, or an appeal to colonial (or post-colonial) relations.

> The process of accumulation, elastic and spasmodic, as it is, requires inevitably free access to raw materials in case of need . ...When the War of Seccession interfered with the import of American cotton, causing the notorious 'cotton famine' [in England] new and immense cotton plantations sprang up in Egypt almost at once, as if by magic. Here it was Oriental despotism, combined with an ancient system of bondage, which had created a sphere of activity for European capital. Only capital with its technical resources can effect such a miraculous change in so short a time – but only on the pre-capitalist soil of more primitive social conditions can it develop the ascendance necessary to achieve such miracles. (p. 358)

Critics of Luxemburg's view of imperialism as a vent for under-consumption either dismiss under-consumption from the beginning or they identify other pathways to vent the crisis. A key example of the former is Brewer (1982), who argued that under-consumption is not a problem. He suggests that if productivity, the real wage, and the profit rates increase at the same level and time, consumption will be sufficient as 'the whole system expands together' (p. 66). In addition, he argues that it is likely that at any given time some capitalists will have temporarily stored levels of capital that will initiate the next level of capital accumulation even while the goods from the previous period are being bought.

Alternatively, Foley (1986) acknowledges that the crisis might prevail but that it is rather instantaneously resolved via credit markets. That is, while inventories accumulate, firms need to borrow money to finance the next level of capital accumulation, and this will eventually ease the purchase of the goods produced in the previous cycle. Indeed, Luxemburg herself recognised that the main way the non-capitalist spheres are able to play the role of global consumer of last resort is to indebt themselves to the capitalist sphere. Therefore, debt and financialisation are the key response to under-consumption, which may or may not include the global South.

Luxemburg also argues that militarism itself is a response to the under-consumption crisis, though she believes that capitalism leads to military action and industry for other reasons as well (1968, pp. 454–467). She argued that the state, as consumer of military equipment, would contribute to solving the surplus value realisation problem in the same way that 'non-capitalist strata' might, this time be funded by taxpayers. In addition, she suggests that because multiple capitalist countries need access to the same set of non-capitalist countries, they will engage in militaristic competition to acquire the natural and labour resources, and new markets. Hence, she believes that war, as a necessary arm of imperialism, is a logical extension of capitalism.

In addition to viewing the imperial process as an inevitable outgrowth of the crisis of under-consumption, Luxemburg also employed Marx's concept of the reserve army of labour. In *Capital*, Marx (1967a/1867, vol. 1) described the effect that the cycle of capitalist accumulation had on the labour force. During times of enhanced technological growth, labour was often made redundant while being replaced by constant capital; this would actually lead to a decrease in surplus value as a capitalist cannot exploit his means of production. In addition, there are people who live on the margins of the labour market due to social, cultural, or legal barriers to employment. Together, these workers comprise the reserve army of labour; a necessary body that swells and shrinks directly with the needs of capital. Luxemburg considers the population in non-

capitalist countries to be key members of this reserve army. As technology changes, as profit rates fall, as methods of exploitation go out of fashion, it is necessary to have access to a pool of labour that can be easily enveloped into the labour market. Imperialism will ensure that the global reserve army will be available as capital's needs change.

In focusing her attention on the imperialist relationships between capitalist and non-capitlist spheres of influence, Luxemburg changed the basis of the accumulation process from one that drew its power from exploitation of the working class, to a system that drew its power from dominating the global South. Given this, the proletariat of the capitalist countries becomes complicit in the imperial project, which is a qualitatively different interpretation to the more orthodox Marxian vision. One of the implications of this deviation is that there would be no natural tendency toward (global) proletariat solidarity; southern workers were not allies in the working-class struggle for European workers, thus increasing the possibility for intra-class conflict.

Luxemburg's activism was oriented precisely around the point of fostering international solidarity amongst workers and sympathy for those in countries subject to Europe's imperial project. She was personally distraught at the onset of the First World War. She, and many others, had worked tirelessly to mobilise socialists across Europe to agitate against war and she wanted them to live up to their calls for cross-border solidarity. Believing that war would only serve the bourgeois state in the ongoing rush of capital accumulation, they also knew that it would be the working class that would pay the dearest price. However, when the time came, socialist parties in Germany, France, and England joined in the call for war, and hopes of international labour solidarity were crushed. Luxemburg was jailed for most of the war by the German state, though she continued to write and publish.

> In the prosaic atmosphere of pale day there sounds a different chorus – the hoarse cries of the vulture and the hyenas of the battlefield. Ten thousand tarpaulins guaranteed up to regulations! A hundred thousand kilos of bacon, cocoa powder, coffee-substitute – c.o.d., immediate delivery! Hand grenades, lathes, cartridge pouches, marriage bureaus for widows of the fallen, leather belts, jobbers for war orders – serious offers only! The cannon fodder loaded onto trains in August and September is moldering in the killing fields of Belgium, the Vosges, and Masurian Lakes where the profits are springing up like weeds. It's a question of getting the harvest into the barn quickly. Across the ocean stretch thousands of greedy hands to snatch it up. (Luxemburg 1915)

In November 1918 the war ended and Rosa Luxemburg was released from jail. She immediately headed for Berlin where she got back to work. By the end of December she and her long-time colleague in the Sparticist League Karl Leibnecht became part of the leadership of the new German Communist Party. A merger of several German socialist organisations, this group went on to become a major political force until the mid-1930s. In early January of 1919, the mis-named Sparticist Uprising (mis-named because the uprising was not initiated by Luxemburg and colleagues) swept Berlin. Upwards of 500,000 workers participated in a citywide strike. Eventually the social democratic government put this down with the help of the Freikorps, a paramilitary group made up of right-wing German war veterans. In the days after the uprising was suppressed, Luxemburg was captured by the Freikorps, tortured, and executed. Her body was found in a canal a few days later.

In the early 1950s, *The Accumulation of Capital* was translated into English and published by the *Monthly Review*. This book was Luxemburg's primary attempt to lay out a theoretical explanation of her theory of imperialism. Joan Robinson, one of the most respected economists of the twentieth century and a founding intellectual in the post-Keynesian tradition, has suggested that Marxists and non-Marxists unfairly neglected Luxemburg for her deviations from orthodoxy and her commitment to under-consumption. Robinson, with a warm touch, acknowledges the 'rich confusion in which the central core of the analysis is imbedded', referencing the difficult prose. But she concludes with utmost praise:

> The argument streams along bearing a welter of historical examples in its flood, and ideas emerge

and disappear again bewilderingly ... but something like [what Luxemburg intends to say] is now widely accepted as being true ... Few would deny that the extension of capitalism into new territories was the mainspring of what an academic economist has called the 'vast secular boom' of the last two hundred years and many academic economists account for the uneasy condition of capitalism in the twentieth century largely by the closing of the frontier all over the world. But the academic economists are being wise after the event. For all its confusions and exaggerations [Luxemburg] shows more prescience than any orthodox contemporary could claim. (Robinson 1968, p. 28)

Definition

Bernard Makhosezwe Magubane was born on 26 August 1930 close to Colenso, in Natal, South Africa. His life story, as a black South African and one of the country's leading scholar activists in the twentieth and twenty-first centuries, including during his years of exile, is an instructive and inspiring example. Magubane wrote some of the most powerful works of scholarship analysing the relationship between imperialism, white-settler colonialism, and race and class in South Africa and the global system. This included overseeing a massive ten-volume work on the history of the black liberation struggle upon his return to South Africa under the country's majority rule and multiracial democracy inaugurated in the 1990s with the election of President Nelson Mandela, the head of the African National

Congress (ANC), after his release from prison. This essay provides an overview of Magubane's life and work.

Bernard Makhosezwe Magubane was born on 26 August 1930 close to Colenso, in Natal, South Africa. His life story, as a black South African and one of the country's leading scholar activists in the twentieth and twenty-first centuries, including during his years of exile, is an instructive and inspiring example. Magubane wrote some of the most powerful works of scholarship analysing the relationship between imperialism, white-settler colonialism, and race and class in South Africa and the global system. This included overseeing a massive ten-volume work on the history of the black liberation struggle upon his return to South Africa under the country's majority rule and multiracial democracy inaugurated in the 1990s with the election of President Nelson Mandela, the head of the African National Congress (ANC), after his release from prison.

While a child, as recounted in *My Life and Times* (2010), Magubane's grandparents related stories to him of the Zulu War of 1879 and the Bambatha Rebellion of 1906, named after the Zulu minority ruler, and these made an indelible impression. Magubane's grandparents had seen the defeat of the Zulu Kingdom and its incorporation into Natal and the British Empire in 1897, soon followed by the Anglo-Boer War, which helped bring the word 'imperialism' into the English language, the formation of the Union of South Africa, which became a dominion of the

British Empire, and the passage of the 1913 Natives Land Act which dispossessed the African majority while concentrating them in some 7–13 per cent of the land, leaving 87% to the white invaders.

At around this same time, in 1912, the South African Native National Congress was founded by Zulus who had been educated in the US. Renamed the African National Congress in 1923, this was 'the country's first pan-tribal political organization' (3). Its aims were known to Magubane's father and friends by heart and they often recite them from memory: 'To encourage mutual understanding and to bring together into common action as one political people all the tribes and clans of various tribes or races and by means of combined effort and united political organization to defend their freedom, rights and privileges' (ibid.). The Land Act forced Magubane's family to become squatters and made Africans foreigners in their own land, replete with Pass law regulations that became infamous under apartheid. After his father, a farm worker, clashed with the owner of the farm, the Magubanes abruptly moved to the famous port city of Durban, where they were influenced by the Pass-burning campaign of 1919.

Magubane's political awareness was heightened in 1948 with the victory of the Nationalist Party and the full institutionalisation of apartheid, Bantu education (designed to limit Black African advancement), and the ANC's Programme of Action, as well as the adoption of the Freedom Charter and the Defiance campaign, anti-Pass law activities and related protests. At the University of Natal, Magubane earned his BA and MA in Sociology, and was introduced to the concepts of social pluralism and then as a postgraduate Marxist critiques of this, criticisms on which his subsequent scholarly career were initially built. With the banning of the ANC and at risk of his own arrest, Magubane went to study Sociology at UCLA in 1962, involving himself in the anti-apartheid movement in the city, this around the time of the Watts uprising, earning another MA and his PhD in Sociology there, before returning to Africa to teach at the University of Zambia from 1967–70.

In Zambia, Magubane became close to the vice-president and then president of the ANC (while Nelson Mandela was in jail) Oliver Tamboo, who began using his study to work and eventually moved in with the family. Magubane also befriended other Executive Committee members of the national liberation organisation, on whose behalf he attended various conferences as a delegate, meeting future leaders of South Africa such as one-time president Thabo Mbeki. It was in Zambia, in a fertile environment with many South African radicals and ANC leaders in exile, including Jack and Ray Simons, authors of *Colour and Class in South Africa* (1968), that Magubane's teaching and scholarship began to mature. At this time he published some of his earliest writings critiquing the Manchester School of Anthropology, with its master concept of the tribe as the supposed key to unlocking African society. This work included his 1968 'Crisis in African Sociology' in the *East African Journal* (reprinted in Magubane 1999: 1–26), followed by subsequent work on the political economy of migrant labour. Returning to UCLA in 1970, he eventually secured a position at the University of Connecticut and was for a time a visiting professor in the Department of Sociology at SUNY Binghamton, which had become the centre for world-systems analysis (formulated by Immanuel Wallerstein, Terence Hopkins, and Giovanni Arrighi) and was home of the Fernand Braudel Center. Throughout his time in the US, Magubane was active in the antiapartheid movement and with the ANC.

In 1979 Magubane published *The Political Economy of Race and Class in South Africa*, begun before he left Zambia in early 1970 (followed in 1989 by *South Africa: From Soweto to Uitenhage, The Political Economy of the South African Revolution*). Magubane's first chapter, 'The Problem and Its Matrix: Theoretical and Methodological Issues', starts off with an approving quotation from the famous African scholar who helped pioneer what would later become known as world-systems analysis, Oliver Cox, while also drawing on another of its forerunners W.E.B. Du Bois, notably from his towering work *Black Reconstruction*:

Our hypothesis is that racial exploitation and race prejudice developed among Europeans with the rise of capitalism, and that because of the worldwide ramifications of capitalism, all racial antagonisms can be traced back to the policies and attitudes of the leading capitalist people, the white people of North America and Europe. (1990: 1)

The book is a tour de force and was part of the long-term project of Magubane, chronicling as it did the story of how a white minority came to rule over the black South African majority. Especially significant about this work is that it is a deeply theoretically informed account, written from a black Marxist perspective, of the South African experience from the standpoint of its victims and protagonists in the liberation struggle. As Magubane relates:

The plight of black people in South Africa is intimately bound up with the history of white settlement in their lands, and the South African social formation itself represents a stage in the evolution of the world capitalist system . . . although there are many ways to define and study racial inequality, in this book we shall conceptualize it as an aspect of imperialism and colonialism, concepts that will be used to refer to roughly the same phenomena: the economic, political, and cultural domination of the African people by the white settlers. We will use the term imperialism to refer to the specific relation between a subjugated society and its alien rules, and colonialism to refer to the social structures created within a colonized society by imperialist relationships. (1–3)

The book then devotes itself to an historical sociological analysis of the pyramid of white wealth and power build upon the backs of black African labour, land, and resources, as part and parcel of processes of imperialism. Especially crucial is the way in which the so-called policy of apartheid, or separation, is shown to be a lie, with the exploitation of black Africans, rather than separation, the basis of the white-settler state. South Africa's system of racial stratification, which developed its own relatively unique aspects of course, is moreover related to the larger structure of global power whereby the imperialist countries assure the subordination and under-development of other states in the global capitalist system. Of particular importance is Magubane's emphasis on the central role of British imperialism during the era of British

hegemony in adumbrating the foundations of what would become South Africa's apartheid state, both before and most especially after the discovery of gold and diamonds in the region. Particularly important here was the special role of gold in the international monetary system and the historic control of the gold and the diamond mines in South Africa by British capital, in alliance with the US.

Subsequently, in his massive study *The Making of a Racist State: British Imperialism and the Union of South Africa*, *1875–1910,* Magubane (1996) turned to the question: How did the Union of South Africa come to be dominated for almost a 100 years by a white minority? Here, Magubane returned especially to the neglected theme of the central role of British imperialism in the emergence of white supremacy in South Africa. Analysed here is Britain's astonishing period of aggression and imperial advance in South Africa. Coming into particular focus is the legendary imperialist Cecil Rhodes (after whom Rhodesia, today's Zimbabwe and Zambia, was originally named), something curiously neglected in South African historiography and scholarship. As always, Magubane's quest for understanding has profound political implications, as he recognised:

As I write this preface the elections have just taken place which made Mr. Mandela the first democratically elected president of South Africa . . . The end of white minority rule and the beginning of the process of black emancipation are momentous events. Yet South African scholarship – which to this day is predominated by white scholars – has hardly prepared the people of South Africa to understand the meaning of this change . . . Indeed, the various schools of South African historiography and sociology have never confronted what it meant to the Africans to be deprived of the franchise and the claim that South Africa was a *white man's country.*

Reviewing the twists and turns of racist scholarship on South Africa, including efforts to let British liberalism and global capitalism off the hook for the structures of racial domination in South Africa, Magubane here illustrates the structures of knowledge and ignorance in the modern world-system, particularly Bonaventura de Souza Santos's argument that social injustice is always

M

accompanied by cognitive injustice. Yet this book is no mere study of the origins of the South African state, in and of itself. Instead, it is a larger study of centrality of race and class in the making of South African and global capitalism. Magubane draws on writings of the architects of imperialism to document their white supremacist views, from Ireland to Africa, squarely underscoring the role of British imperialism, most especially followers of Cecil Rhodes such as Alfred Milner, the one-time proconsul of South Africa, and his kindergarten – largely from Oxford – and the related Round Table Movement in forming the Union of South Africa and laying the material foundations of the South African political economy more generally, upheld as it was by cheap black labour. At the same time, Magubane draws on masters of race and class analysis and related structures of colonial domination such as Du Bois and Fanon, underscoring the spread of white-settler states across the globe, including Australia, Canada, New Zealand and the US, those lands that Alfred Crosby (2004), in his *Ecological Imperialism: The Biological Expansion of Europe, 900–1900*, named the neo-Europes, or what is sometimes referred to as the Anglo-sphere.

Indeed, in an important seminar paper, *The Round Table Movement: Its Influence in the Historiography of Imperialism* (1994), subsequently republished in his collected essays, *African Sociology – Towards a Critical Perspective* (1999), Magubane focuses more on the role of the Round Table movement, with chapters in each of the white dominions, assisted by the largesse of the Rhodes Trust, as a vehicle for British imperialism, replete with their quarterly journal of the same name. The Round Table movement also went on to form the Royal Institute of International Affairs, also called Chatham House, the British counterpart to the Council on Foreign Relations in the US. Participants in the Round Table movement read like a *Who's Who* of the British ruling class. Moreover, to a large extent, through the Round Table's special relationship with Oxford, notably All Souls College, the heart of the British Establishment, they largely controlled the historiography of the British Empire, including through contributions to Oxford's *Dictionary of National*

Biography. In this essay, Magubane's humility, with important lessons for scholar activists today, is made plain:

> Let me, at once make a confession. When I was writing my first book, *The Political Economy of Race & Class in South Africa,* I was embarrassed by how ignorant I was, not only about the history of our people but even more about the history of our conquest and colonization. My education had failed me completely. In order to educate myself, I decided to spend many hours in the library paging through whatever book I could find dealing with the so-called discovery of diamonds and gold and the impact of these events on the life of our people. My interest in the gold and diamond industry was the result of stories that my grandmother used to tell about my grandfather (who had died before I was born) as a result of working in the Kimberley mines and later in the Witwatersrand gold mines. She has told us about how my grandfather, in order to earn money to pay the poll tax, would divide his time between the Kimberley mines and working for a Boer farmer on whose 'land' we were squatters. (1994: 3)

Magubane goes on to relate being taught about Cecil Rhodes in South Africa and his supposed belief in equality for civilised men, seen as concomitant with English liberalism. Subsequently, Magubane uncovered the truth about perhaps the greatest imperialist the world had ever seen, reading his *Confession of Faith*, epitomising as it did the philosophy of white supremacy and imperialism. From this vantage point, Magubane underscores the extent to which the Union of South Africa, was not, as liberal British historians would have it, a concession to the Boers and their white supremacist views but in fact at one with British imperial policy as a whole. The structures of white supremacy that were integral parts of the British Empire and its white colonial settler domains were institutionalised to varying degrees in Australia, Canada, and New Zealand, not to mention Ireland and the US. Indeed, the origins of apartheid can be traced back to British imperialism, including Rhodes and leading members of the Round Table movement. Though there is by now a substantial literature on the Round Table movement, including Carol Quigley's (1981) *The Anglo-American Establishment*, much of it is difficult to obtain. Hence, the movement is largely unknown, despite its origins and evolution, going back to Cecil Rhodes and Alfred

Milner in the late nineteenth century, being arguably central for understanding British imperial policy from this time on. Magubane continued his work on related questions of global race and class with the publication of *Race and the Construction of the Dispensable Other* (2007).

Magubane's work represents a tremendous contribution to our understanding of capitalist imperialism and white supremacy in South Africa and the global system. But in retrospect, his most significant achievement may be his editorial leadership of the monumental multivolume *The Road to Democracy in South Africa* (various years). While formally chronicling the period largely from 1960 on, various parts of this project explore the earlier origins of South Africa, with the first volume beginning with an introduction by the then South African president Thabo Mbeki.

In Volume I, while underscoring the extent to which the roots of race-class oppression and exploitation go back to the origins of colonial and imperial settlement, Magubane again chronicles the discovery of gold and diamonds in the dispossession of the African peasantry and the creation of a system of labour reserves for the mines. Subsequent chapters by a host of different scholars chronicle armed and peasant struggles, various types of rural resistance, state repression (including South Africa's State of Emergency), the activities of the various national liberation and related organisations, from the Pan African Congress to the African People's Democratic Union, the South African Communist Party, and the African National Congress itself, including its turn to the armed struggle, its leaders in exile, its worldwide efforts, and of course those imprisoned at the infamous Robben Island.

volume 2 begins with two chapters by Magubane dealing with the social and political context and the rise of the garrison state from 1970–80. Coming into view here is the sustained period of mass upsurge, including the activities and repression of the Soweto students in 1976, the collapse of Portugal's fascist regime, Steven Bantu Biko and the Black Consciousness Movement and Biko's death in police custody in 1977. The mass upsurge during this period presaged the increased militarisation of South Africa. Deftly dealing with the changing composition of South African capital and the ruling hegemonic bloc as a whole, Magubane chronicles the evolution of the regimes Bantustan policy in the context of the increasing importance of the Black South African proletariat to South Africa's economy. The Nixon and Kissinger strategy of support for South Africa and the white minority regimes in the region, as expressed in National Security Strategy Memorandum 39 and South Africa's failed attempt to turn back the Angolan revolution as Cuban troops beat back the South African regime and the CIA, are also discussed here. These issues have also been discussed expertly by Piero Gleijeses (2013) in his *Visions of Freedom: Havana, Washington, Pretoria, and the Struggle for South Africa, 1976–1991 and his* (2002) *Conflicting Missions: Havana, Washington, and Africa, 1959–1976.* Recent newly released documents now show that then US Secretary of State, Kissinger, thought of attacking or possibly blockading Cuba over this issue.

Subsequent chapters detail the rise of the Black Consciousness Movement, the labour movement, Soweto, the ANC underground, the activities of the ANC and PAC and resistance and repression in the Bantustans. Other chapters deal with the rise of the Black Consciousness movement with Steve Biko in response to the segregation of university students, along with related articles on culture and representation, the revival of the labour movement, as well as the Soweto student uprising and its deadly repression in 1976. Two other chapters, co-written with Magubane, chronicle the ANC political underground, and the ANC armed struggle, respectively, in the 1970s.

volume 3, Parts I and II, take up the critical importance of international solidarity and the anti-apartheid movement. volume 4, Parts I and II, deal with the crisis of South Africa's garrison state and the collapse of its total war strategy, this at a time of renewed mass upsurge, with the rise of organisations such as the United Democratic Front. Subsequent chapters deal with the ANC and the beginning of negotiations between the national liberation organization and the white minority regime. Other chapters deal with both underground activity by the ANC and aboveground mass organising by the UDF and the emergence and development of the South African Congress of Trade Unions

M

(SACTU) and the Congress of South African Trade Unions (COSATU) and the Azanian People's Organisation. Still other chapters deal with the role of civic and religious organisations, with Zine Magubane contributing a chapter on the role of women in the ANC and the question of feminism while her father contributed final chapters on the collapse of the US policy of 'constructive engagement' and the garrison state.

volume 5, Parts I and II, deals with African solidarity. volume 6, Parts I and II, deals with the dismantling of the apartheid state, with an introductory and closing chapter by Magubane. There is a wide array of chapters, including detailed accounts of the National Party, the re-establishment of the ANC inside South Africa during the years leading up to the inauguration of its multiracial democracy, the Black Consciousness Movement in the 1990s, and the role of women and efforts for gender inclusivity during the transition. Finally, there is also another volume entitled *South Africans Telling Their Stories, 1950–1970.*

Magubane's journey, as a black South African, from poverty in Durban, to exile in the US and then back to South Africa, and his legendary work as a scholar activist for South African, African, Black liberation and human emancipation as a whole, presents a compelling tale for those interested in the history of imperialism and anti-imperialism. Moreover, as Magubane wrote in a review of Mandela's legacy:

> Until the economy is democratized, South Africa's newly born freedoms will remain a chimera. This central truth has been obfuscated in South Africa in particular and in capitalist countries in general … Indeed, current globalization with its challenge to the nation state highlights that *under capitalism democracy has always been restricted to the political domain, while economic management has been held hostage by non-democratic private ownership of the means of production.* Such a democracy is incomplete, even by Western standards. (2001: 36)

Malcolm X (1925–1965)

Brian Richardson
London, UK

Definition

Malcolm X was one of the most charismatic, controversial, and iconic figures of the US civil

rights and black power struggles of the 1950s and 1960s. His legacy has had a lasting influence on successive generations of political activists and intellectuals in the US and throughout the world. He spent the majority of his active adult life building the Nation of Islam.

Malcolm X was one of the most charismatic, controversial, and iconic figures of the US civil rights and black power struggles of the 1950s and 1960s. His legacy has had a lasting influence on successive generations of political activists and intellectuals in the US and throughout the world. Though he was a contemporary of Dr Martin Luther King (1929–68), Malcolm met the de facto leader of the Civil Rights Movement (CRM) just once, on Capitol Hill, Washington, on 26 March 1964, during the passage of the Civil Rights Bill. The primary reason for this was that he spent the majority of his active adult life building the Nation of Islam, an organisation which explicitly denounced and abstained from the civil rights struggles.

Malcolm X was neither the name that he was given at birth nor the one that he used when he died. He was born Malcolm Little in Omaha, Nebraska, on 19 May 1925 and died El Hajj Malik El Shabbaz in Harlem, New York, on 21 February 1965. This changing identity is indicative of what Manning Marable, the author of a major biography (2011), characterises in his title as a 'life of reinvention'.

Early Years and Influences

Malcolm was the son of Rev. Earl and Louise Little, who were politically active as supporters of Marcus Garvey's United Negro Improvement Association (UNIA), which sought to build its support in towns where racism was deeply entrenched. It is worth pointing out that the UNIA was the single largest black or New Afrikan organisation in US history. Malcolm's earliest memories were of travelling to meetings organised by his father to rally black people and encourage a sense of black pride. When Malcolm was aged just four, the family home was burned to the ground by members of the violently racist Ku

Klux Klan. The family survived this attack but Malcolm's father lived for only two more years. Officially his death on 8 September 1931 was a tragic accident in which he slipped and fell under a moving street car, but it is almost certain that he was murdered by racists. Louise Little was therefore left to raise a family on her own. She struggled valiantly for almost eight years but was eventually incarcerated at the Kalamazoo State Hospital, where she remained for 24 years.

These experiences had a profound and lasting effect upon Malcolm. Though he was a bright and popular pupil, Malcolm became increasingly disillusioned by an education system that refused to recognise him as anything other than a 'nigger' who should abandon any aspirations to be a lawyer and should instead 'plan on carpentry' because he was good with his hands (Malcolm X 1965: 118). Angry at the violent brutality of organised gangs and the institutional racism of the education system, he left school and sought refuge in the bright lights of the north, in Boston, New York, and Detroit. It was during this period of his life that he transformed himself from a country hick into a slick and streetwise hustler.

The racism of US society meant that it was almost impossible for black people to secure prestigious and well-paid work. Having initially struggled to survive as a sandwich vendor and shoeshine boy, Malcolm turned to the more precarious pastimes of drug running, pimping, and burglary. He enjoyed a certain amount of notoriety, glamour, and wealth as he mixed with famous artists such as the jazz singer Billie Holliday, but eventually his luck ran out. He was caught, charged, convicted, and sentenced to a ten-year term of imprisonment. He was just 20 years of age.

The Nation of Islam

It was while he was in prison that Malcolm underwent his next reinvention. Following an introduction by his brother Philbert, he abandoned his 'Detroit Red' hustler image and became an abstemious and devout member of the Nation of Islam ('the Nation'), a controversial and marginal organisation which was shunned by Islam. At the

M

heart of the organisation was a philosophy centred on a belief that white people were created in an experiment by a mad scientist called Yacub. These 'devils' had somehow managed to trick the world's original black inhabitants and seize control of society. The Nation's aim was to re-awaken the consciousness of Original Man and encourage black people to 'wake up, clean up' and reassert their authority. In the interim, it preached complete separation from white society and both encouraged and developed its own form of black capitalism. This philosophy culminated in the establishment of a major economic programme in which supporters were encouraged to contribute $10 towards the purchase of a 4500-acre farm in Georgia. Later the Nation was able to establish its own shops and restaurants. In a society in which racism was deeply entrenched and in the southern states legally enshrined, the appeal of this philosophy cannot be underestimated.

It was not surprising that the Nation's promotion of black pride was so attractive to someone who had heard a similar message being preached in his formative years. Malcolm threw himself into the Nation, and after leaving prison in 1953 he was to become its most charismatic figure. Following a meeting at which he received the approval of the Nation's leader, Elijah Muhammad, he abandoned his 'slavemaster's' surname and became Malcolm X. In 1954 he was appointed the minister for Temple No. 7 in Harlem, the de facto capital of black America. Later he founded and edited the monthly newspaper *Muhammad Speaks*.

The Nation's rhetoric was tough and uncompromising, and the appearance of its male members, clad in black suits and with short, neat haircuts, was equally imposing. Malcolm's role in promoting its appeal was pivotal. For example, he played a key role in recruiting the charismatic heavyweight boxing champion Cassius Clay (later Muhammad Ali). As the general tide of struggle and black political engagement increased, however, Malcolm became frustrated at the dictatorial leadership of Elijah Muhammad, his alleged sexual infidelities, and, in particular, his sectarian refusal to sanction the Nation's involvement in the wider movement.

Estrangement, Departure, and New Beginnings

Malcolm's increasingly strained relationship with Elijah Muhammad eventually came to a head in late 1963. Muhammad had instructed his followers not to attend the March on Washington which Dr King's Southern Christian Leadership Conference and several other civil rights organisations had called for 28 August. Officially Malcolm followed the line, decrying it in the days before as the 'Farce on Washington'. The demonstration attracted an estimated 250,000 black and white people but it was denounced by him. In one of his most famous speeches, 'A Message to the Grassroots' delivered in November 1963, he dismissed the event as 'a circus' and observed that instead of transforming the event into the 'black revolution . . . those Toms were out of town by sundown' (Breitman 1989: 3–18).

Privately, however, Malcolm disagreed with Muhammad's diktat. Not only was he present in Washington, but the night before the event he spoke to the actor and activist Ossie Davis and indicated that he was there to provide 'discreet' help if needed (Younge 2013: 113). The simple truth was that despite his political differences with Dr King, Malcolm admired the CRM's ability to motivate and mobilise people. The activist in Malcolm could not help but be impressed by an event that captured the world's attention and shone a light on racial injustice.

Within months Malcolm's relationship with Muhammad and the Nation was stretched to breaking point. The catalyst for his departure was his response to the assassination of President John F. Kennedy on 22 November 1963. As militant opponents of white American power, the Nation might have been expected to comment on the death of the world's most powerful imperialist political leader. Instead, Muhammad instructed his members to stay silent for fear of provoking outrage, and he himself issued a statement expressing shock 'over the loss of our president' (Marable 2011: 269).

Malcolm kept his counsel for over a week, but on 1 December he delivered an address on 'God's Judgment of White America' at a public rally in

Manhattan. Following the speech he responded to a journalist's invitation to comment on Kennedy's death by suggesting that it was an example of the 'chickens coming home to roost'. Emboldened by the enthusiastic reaction of the crowd, he continued by declaring that 'Being an old farm boy myself, chickens coming home to roost never did make me sad; they've always made me glad' (Marable 2011: 272–273). This act of insubordination provoked his leader's wrath, and Malcolm was immediately suspended from the Nation. He was never to return. Instead when it became clear that his rift with Muhammad would never be healed, Malcolm set up a new organisation, the Muslim Mosque Inc. (MMI), in March 1964, which was aimed at drawing black people away from the Nation and into a new spiritual home.

Despite his admiration for the CRM's mobilising capacity, he continued to define himself as a black nationalist. He renounced the idea that black people were American, declaring boldly instead that they were Africans oppressed by colonial rule. He argued that the oppressed nations of Africa had shaken off imperial control through nationalism, not by 'sitting in . . . waiting in' and 'singing we shall overcome'. Instead of abstaining from the struggle, however, he urged his supporters to join with their fellow Negroes in order to 'show him how to bring about a real revolution' (29 March 1964, in Breitman 1989: 23–45).

Sharp Move to the Left: The Final Year and the Final Reinvention

What proved to be his final year was arguably the most fascinating of Malcolm's life. It was in this period that he underwent what Marable (2011) characterises as his last reinvention. This was both a religious and political transformation, but at the time of his death it was by no means complete. Malcolm converted to Sunni Islam, changed his name, and embarked on a journey to Mecca.

The pilgrimage had a profound effect upon him. In a letter to his followers in the MMI he declared:

> Never have I witnessed such sincere hospitality and the overwhelming spirit of true brotherhood as is practised by people of all colors and races here in

this ancient Holy Land . . . For the past week, I have been utterly speechless and spellbound by the graciousness displayed all around me by people of all colors. (Malcolm X 1965: 454)

This was a radical break from the avowedly separatist rhetoric that he had previously preached. Malcolm did not completely break from black nationalism, however. Although he came to acknowledge the need to sit down and talk to white people, he continued to argue that black people needed to set up their own businesses, manage their own affairs, and control their own communities. In order to campaign for this he set up a parallel, nonreligious, and supposedly non-sectarian body called the Organisation of Afro American Unity (OAAU).

The inspiration for the OAAU was the Organisation of African Unity, which had been set up as an anti-colonial body by a collection of African governments in May 1963. Much of Malcolm's time in that final period was spent travelling to Africa and meeting the leaders of these newly independent states in an effort to learn lessons from their national liberation struggles. The establishment of the MMI and OAAU is therefore indicative of the fact that Malcolm retained a significant core of his old beliefs. In essence, he still did not believe that whites could be equal participants in the fight for black liberation, but in the wake of his pilgrimage, he did begin to accept that the 'sincere whites' could become involved in his organisations and play a supportive role in the struggle.

What is also true is that in his final year Malcolm's politics were moving sharply to the left. As part of this, he began to develop a more sophisticated critique of the economic system. Commenting on the increasingly successful struggle against colonialism in Africa, he observed of the newly independent states: 'None of them are adopting the capitalistic system because they realise they can't. You can't operate a capitalistic system unless you are vulturistic; you have to have someone else's blood to suck to be a capitalist. You show me a capitalist and I'll show you a bloodsucker' (Breitman 1989: 115–137). Arguably Malcolm's assessment that these states were developing 'socialistic systems to solve their

M

problems' ('At the Audubon', in Breitman 1989: 121) was mistaken, but the speech is nevertheless an indication of his attempt to grapple with and embrace new ideas.

In addition his writings began to appear frequently in the publications of left groupings, including the American Socialist Workers Party (SWP). This was partly because the SWP was one of the few organisations in the US willing to provide him with a platform, but it was also indicative of the political journey that Malcolm was embarking upon. Speaking at an event organised by the Militant Labour Forum in May 1964, he made a similar point about post-colonial Africa, suggesting that '. . . all of the countries that are emerging today from under colonialism are turning toward socialism. I don't think it's an accident.' He also explicitly remarked upon the link between capitalism and racism: 'It's impossible for a white person to believe in capitalism and not believe in racism.' He commented on the strong personal commitment to racial equality shown by socialists and noted the role that socialists had played in supporting and participating in anti-colonial struggles (Marable 2011: 336).

Malcolm's assassination on 21 March 1965 saw his final reinvention brought to an abrupt and violent end and the liberation movement lose one of its greatest figures just as it was entering a new phase. While the assassination was attributed to the Nation of Islam, it emerged following examination of the documentary evidence that the US Federal Bureau of Investigation had deliberately infiltrated the Nation of Islam as part of its COINTELPRO programme and had worked to increase acrimony and bitterness between it and the followers of Malcolm X.

Malcolm X's Legacy

Malcolm had realised that American society was about to explode and predicted that 1964 might be the year of 'the ballot or the bullet' ('The Ballot or the Bullet', in Breitman 1989: 23–45). That very year riots against police racism erupted in Harlem, and over the summer there were further rebellions in Rochester, Patterson, Jersey City, Elizabeth, Chicago, and Philadelphia. Within months of

Malcolm's death, there was another upsurge. In August 1965 an uprising in the Watts district of Los Angeles lasted several days and proved to be the biggest urban disturbance since 1943. Thirty-four people were killed and 4000 arrested, and $35 million worth of damage was caused. In 1967 there were eruptions on an even greater scale in Newark (New Jersey) and Detroit.

By this time it was becoming increasingly clear that racism would not be eradicated through legislative action alone. The CRM had succeeded in forcing the Federal Government to pass equal rights laws with the Civil Rights Act of 1964 and Voting Rights Act of 1965, but it had failed to transform the material conditions of black people in either the southern or the northern states. While Dr King remained a popular figure, the movement he was part of was increasingly being challenged by those who demanded a more militant strategy. Malcolm recognised this, and after his break with the Nation he threw himself into the task of articulating that anger and giving it organisational expression.

In the years that followed Malcolm's death the struggle for civil rights was transformed into a fight for black power, a demand for economic opportunities. Dr King himself realised this and sought to intervene in wider struggles, opposing the Vietnam War and campaigning for workers' rights. As these struggles progressed new organisations were established to try and take the movement forward. By far the most significant and influential of these was the Black Panther Party of Self Defense (BPP), founded in Oakland, California, in October 1966. Its leaders Huey P Newton and Bobby Seale openly acknowledged that the organisation was set up as 'a living testament to (Malcolm's) work' (Newton 1995: 113). They shunned the nonviolent approach of the CRM and instead encouraged their supporters to exercise their constitutional right to bear arms and challenge the oppressive, racist policing of their communities. In addition, they established a series of community-based projects which focused on black self-help and organisation. The BPP's '10 Point Program' represented a manifesto for political change which built upon and developed Malcolm's black nationalist philosophy. Like the latter-day Malcolm, however, they were prepared

to work with so called 'progressive whites' and left wing political movements.

Malcolm was denounced as a figure of violence and hate when he died, and for many years he was considered a divisive figure whose influence had been negligible. Latterly, however, he has enjoyed a huge resurgence in popularity, not least because of Spike Lee's 1993 film X. He subsequently received the official seal of approval with the unveiling of a 33 cent commemorative stamp by the US Postal Service as part of its 'Black Heritage' series in January 1999. For many young black Americans, the marginalised, excluded, and angry 'hip hop generation', and anti-racists across the world, however, Malcolm X remains an uncompromising icon who never betrayed his cause and fought injustice.

Arts University Bournemouth, Poole, Dorset, UK

Definition

Rolihlahla Nelson Mandela was an anti-apartheid activist, political prisoner, and president of

South Africa from 1994 to 99. He was born on 18 July 1918 in the rural Xhosa village of Mvezo in the Transkei (Eastern Cape, South Africa).

Introduction

Rolihlahla Nelson Mandela was an anti-apartheid activist, political prisoner, and president of South Africa from 1994 to 99. He was born on 18 July 1918 in the rural Xhosa village of Mvezo in the Transkei (Eastern Cape, South Africa). The name Nelson was given to him by a teacher at his primary school near the village of Qunu, where he later returned to establish his family home. His formative years were spent within a traditional African tribal context with its firmly established societal structures, including respect for the elders of the village. After his father's death in 1927, he moved to The Great Place (in nearby Mqhekezweni), where he was cared for by Chief Jongintaba Dalindyebo with an equally traditional upbringing. This included initiation through a Xhosa circumcision ritual which young boys of 16 customarily underwent. His school education included 6 years at the Clarkebury Boarding Institute (in nearby Engcobo) and at the Wesleyan College, Healdtown in Fort Beaufort. In 1939 he started a degree at the only black university in South Africa, University College Fort Hare, where he met his lifelong friend and fellow political activist Oliver Tambo (1917–93). Politics formed an instrumental part of Mandela's life from early adulthood onwards, with his tertiary education prematurely cut short after a year when he was expelled for his involvement in protest action.

Mandela's arrival in the sprawling urban city of Johannesburg in 1941 – after escaping from the prospect of an arranged marriage – would significantly alter the course of his life. With his solid understanding of the structures of traditional African society and a growing awareness of the racial injustices prevalent in South Africa, he became increasingly politically active in attempting to liberate the oppressed, majority, non-white population. In Johannesburg he worked on the mines as a security officer

M

(providing insights into the inhospitable working and living conditions of miners) and as an estate agent before meeting another lifelong friend and political collaborator Walter Sisulu. Sisulu introduced him to Lazar Sidelsky who employed Mandela as an articled clerk in the law firm Witkin, Sidelsky and Eidelman. He continued with his degree studies through the University of South Africa (UNISA) whilst working at the law firm, graduating with a Bachelor of Arts degree in 1942, the year in which he began attending African National Congress (ANC) meetings. Although nonwhite South Africans had, over the years, challenged the repressive colonial regime (in existence since the early 1900s) with numerous uprisings and protests, it was the formation of the ANC in 1923 (originally the South African Native National Congress from 1912) that would serve to strengthen the liberation struggle. Initially, membership was only open to black South Africans, but by 1969 the anti-apartheid movement recognised that true liberation would need to include representation from all racial and ethnic groups.

Mandela's first marriage to Evelyn Ntoko Mase took place in 1944 in the same year that he co-founded the ANC Youth League (ANCYL). The marriage produced four children: Thembekile (1945–69), Makaziwe, who died as an infant (1947), Makgatho (1950–2005), and Makaziwe (1954). The co-founding of the ANCYL was essential as the younger activists recognised that more hard-line approaches were necessary to challenge the oppressive discriminatory regime, impacting on the lives of all non-white South Africans. Mandela was elected as secretary of the ANCYL in 1948 and became its president in 1951. His positions as political activist and lawyer were complemented by his understanding of the complex systems of Western capitalist ideologies. These would inform his approaches to socialist and communist ideologies which dominated the liberation movement and which would come to play an important role in recognising the necessity of maintaining a strong economic power base during the transitional stages of reform when the apartheid administration was being dismantled in the early 1990s.

By 1948, when apartheid was legally implemented, South Africa had already been ruled by successive, racially discriminating governments. These took their cue from the colonial and imperialist policies of white domination over native inhabitants. Legislation such as the Natives Land Act (1913), banning black Africans from owning land and effectively giving 13% of the land to 87% of the non-white population, had already been implemented early on in the century. From 1948, however, when the right-wing National Party (NP, established in 1913) came to power with D.F. Malan as prime minister, the implementation of apartheid policies was made in earnest. Between 1948 and the formation of the Republic of South Africa in 1961, more than 800 laws were passed, systematically infringing the rights of South Africa's majority non-white population. These included: the Population Registration Act (1950), the Immorality Amendment Act (1951), the Suppression of Communism Act (1951), the South African Censorship Board (1951), the pass laws (1952), the Bantu Education Act (1953), and Separate Amenities Act (1953). The increasing suppression of political activity, oppression of the non-white peoples of South Africa, and the uncompromising stance taken by the National Party government (who retaliated against any political uprisings with brutal force) only served to consolidate the anti-apartheid movement, which also increasingly gained international support from the rest of Africa the Soviet Union and Europe.

In 1949, the ANC, recognising that the ruling National Party signalled further oppression of non-white peoples, took on board the ANCYL's Programme of Action, calling for increased protest action in the form of strikes and organised acts of civil disobedience. In 1952, when Mandela was head of the ANC's Transvaal region, he set up the first black legal practice in South Africa with Oliver Tambo. From June 1952 the ANC and the Communist Party led a Defiance Campaign, taking the path of passive resistance inspired by the *satyagrha* philosophies of Mahatma Ghandi. (Ghandi spent 21 years in South Africa [1893–1914], initially visiting as a legal representative for an Indian Company, and became

disillusioned with the colonial regime after being thrown off a 1st-class 'whites only' train carriage.) The Defiance Campaign included the burning of passbooks (compulsory identification documents which black South Africans were obliged to carry), the illegal occupation of areas reserved for 'whites only', and mass marches. Despite the generally peaceful nature of the Campaign, about 8,000 activists were detained, with Mandela and 19 other leaders convicted under the Suppression of Communism Act and sentenced to 9 months' hard labour. Despite the disappointing failure to generate any positive legislative changes and the government's banning of the Defiance Campaign, ANC membership increased and international awareness of the anti-apartheid struggle was also intensified. The results of the crackdown after the Defiance Campaign led Mandela to devise the M-plan for operations in 1953, which meant that the ANC was broken down into smaller cells of activity, enabling easier operations for operating underground.

The Congress Alliance, created in 1955, served as an umbrella operation encompassing all left-wing organisations, including the ANC, the Congress of Democrats, the South African Congress of Trade Unions, the South African Indian Congress, and the Coloured People's Congress. It was supported by the United Nations as they acknowledged the human rights violations being committed by the apartheid regime. In June 1955, Mandela (despite being under banning orders) drove to Kliptown for a 3,000-strong meeting to witness the adoption of the Freedom Charter by the Congress of People. The Charter outlined the principles of a free South Africa for all races, yet it would be another 40 years before the possibility of equality would become a reality.

The Freedom Charter and the continued actions of the Defiance Campaign were met with ever firmer governmental counter-measures to quash any political action against the policies of apartheid. These included Mandela's arrest, alongside 156 other Congress leaders and political activists, in December 1956. The activists were charged with high treason and with breaking the Suppression of Communism Act (1950). Interestingly, while imprisonment was not an

ideal situation, access to newspapers and detention in two large prison cells provided uncharacteristically welcome opportunities for interaction, as Mandela outlined:

> Our communal cell became a kind of convention for far-flung freedom fighters. Many of us had been living under severe restrictions, making it illegal for us to meet and talk. Now, our enemy had gathered us all under one roof for what became the largest and longest unbanned meeting of the Congress Alliance in years. Younger leaders met older leaders they had only read about. Men from Natal mingled with leaders from the Transvaal. We revelled in the opportunity to exchange ideas and experiences for two weeks while we awaited trial. (Mandela 1994: 233)

The Treason Trial would be dragged out for over 4 years, with Mandela being one of the last to be acquitted in 1961 through lack of evidence.

In his personal life, the pressures from political commitments finally resulted in the breakdown of his first marriage, with his divorce from Evelyn Ntoko Mase taking place in 1958. He had by this time met fellow political activist (and co-accused in the treason trial arrests) Nomzamo Winifred Madikizela, whom he married in 1958. They had two daughters Zenani (1959) and Zindziswa (1960), with 'Winnie' Mandela also continuing her role as a key anti-apartheid activist in her own right, and assisting the underground struggle for liberation while Mandela was imprisoned.

The Sharpeville Massacre in March 1960 brought further international attention to the brutality of the apartheid regime, particularly when police forces mounted an armed attack against protesters, leaving numerous dead and wounded. The Massacre was in many ways a turning point for the ANC as the slaughter of 69 unarmed protestors (and scores more wounded) left the ANC with no option but to resort to violence. The NP Government declared a national state of emergency, the banning of the ANC, and Mandela's detention under the Unlawful Organisations Act of 1960. Key political events continued to unfold when South Africa was declared a republic after a whites-only referendum in May 1960. This signalled a withdrawal from the Commonwealth, severing trade and economic links and in effect sanctioning the Afrikaner NP's

M

implementation of further discriminatory laws as it severed its ties with 200 years of imperial rule.

In December 1961, Albert Luthuli (ANC president-general 1952–67) received international recognition with the Nobel Peace Prize in honour of his role in the anti-apartheid movement. Yet despite this, and repeated attempts by the ANC to enter negotiations with the NP Government, their efforts went unheeded. Non-violent strike actions and attempts to generate some form of reaction through passive resistance were instead met with hostile and violent counter-resistance as the government attempted to quell the building opposition.

The events of the previous few years clearly demonstrated that passive resistance was not a workable strategy to overturn the oppressive apartheid regime or even to negotiate with the NP Government. The formation of the military wing of the ANC 'Umkhonto we Sizwe' (Spear of the Nation, or MK) was therefore launched on 16 December 1961, with Mandela as commander-in-chief. MK importantly operated as a separate military arm of the ANC so as not to confuse the ANC's main objectives in the liberation struggle. Although violence was the necessary action to take at this juncture, MK at all times sought to undermine government control with minimum harm to civilians. This was done through sabotage and the destruction of government property outside of the main working hours in the hope of accomplishing maximum damage to essential government resources. Strike actions were also called to destabilise government operations and a number of safe houses provided meeting places and shelter for the underground resistance movement. As soon as the government became aware of the emerging underground movement, further crackdowns were implemented, with anti-apartheid cells infiltrated by security police and leaders arrested where possible.

By this point, Mandela was also operating underground. He secretly left South Africa in January 1962 to travel through Africa to undergo military training, to seek support for the anti-apartheid movement further afield, and to visit Oliver Tambo in London for 2 weeks at the end of his trip. On his return to South Africa he was immediately arrested in the Eastern Transvaal (August 1962) and sentenced to 5 years' imprisonment for travelling without valid papers and inciting political strike action. After his arrest he was briefly interned at Robben Island before being returned to prison in Pretoria. At his trial he stated that the continued oppression of the majority non-white population and the events of 1960 had compelled the ANC to commit to armed struggle. MK continued with acts of sabotage by bombing or burning government resources, with an extensive underground networks developing which included cells set up across Africa and as far-afield as Moscow and Europe.

By this stage in the early 1960s, the police had increasingly been gathering information about the MK headquarters based at Liliesleaf Farm in a semi-rural area 40 km outside Johannesburg. The farm had been bought in 1961 for the South African Communist Party and fronted by a white family, the Goldreich's, who were not yet on the government's list of banned people. While the farm appeared to be an ordinary family home, it was here that regular meetings took place of MK's High Command, with their intentions to overthrow the increasingly oppressive government regime. On 11 July 1963, an undercover police raid took place, resulting in the arrest of almost all of the MK High Command. While Mandela had lived at Liliesleaf for the best part of 18 months (posing as farmhand David Motsamayi), he had at this point already been arrested so was not present on the day of the raid. Liliesleaf was significant as it was here that the important Operation Muyibuye was drawn up: a plan of sabotage action to bring down the South African government. The Rivonia Trial in June 1964 included Mandela and eight other activists ('Rusty' Bernstein, Dennis Goldberg, Ahmed Kathrada, Govan Mbeki, Raymond Mhlaba, Andrew Mlangemi, Elias Motsoaledi, and Walter Sisulu), all of whom were tried for sabotage. Mandela's now legendary statement from the dock, which he used not only to defend himself but also as a voice of reason outlining the motives and actions of the antiapartheid movement, is encapsulated in the final sentences:

> During my lifetime I have dedicated myself to this struggle of the African people. I have fought against white domination, and I have fought against black domination. I have cherished the ideal of a democratic and free society in which all persons live together in harmony and with equal opportunities. It is an ideal which I hope to live for and to achieve. But if needs be, it is an ideal for which I am prepared to die. (438)

All, with the exception of Bernstein and Goldberg, were sentenced to life imprisonment, and Mandela began his historic 26-year sentence, most of which was spent on Robben Island in a punishing regime breaking rocks at a lime quarry.

The intervening years between imprisonment and release saw Mandela become an international figurehead for the struggle against apartheid. Although he was periodically kept in solitary confinement or had limited access to other political prisoners, he managed to keep abreast of national and international activities taking place underground and within the growing international anti-apartheid movement. He secretly began writing his autobiography in 1975, smuggling it out through fellow-prisoner Mac Maharaj in 1976, but it would be another 18 years before the publication of *Long Walk to Freedom* (1994). Despite imprisonment, Mandela's political commitments never wavered and he continued, as much as it was possible for an interned person, to fight for freedom and justice for the majority non-white population of South Africa. He became an international symbol of resistance against the apartheid government, yet despite international pressures it would be almost three decades before apartheid was judicially dismantled and a new constitution brought into existence, adopting the principles of the 1955 Freedom Charter.

Mandela spent 18 years on Robben Island before being moved to Pollsmoor Prison in 1982, where he shared a communal cell with fellow political prisoners Ahmed Kathrada, Raymond Mhlaba, Andrew Mlangeni, and Walter Sisulu. The last few years of his internment were in Viktor Verster Prison (Paarl), where he stayed until his release in 1990. Mandela twice rejected an early release from prison, with the first offered in 1984 when his nephew Andrew Mlangeni, president of an 'independent' Bantustan (state),

offered sanctuary in the Transkei. A year later, when President P.W. Botha offered a conditional release (if he renounced the use of violence for political ends), Mandela again refused. Although these offers of release were rejected, Mandela entered into talks with the NP Government in which they explored viable conditions for future negotiation with the banned ANC. His house at Viktor Verster prison thus became an unlikely meeting ground for individuals from both sides of the political divide, as attempts were made to bridge the gaps between political ideologies and find a way towards reconciliation and peaceful resolution. During Mandela's extensive prison stay, he utilised the time available and continued studying for his law degree, finally graduating with an LLB in 1989 through the University of South Africa, shortly before his release.

In the intervening years, while Mandela was imprisoned, the NP had desperately attempted to maintain tight controls and hang onto power, countering any political unrest with increasingly violent crackdowns. Despite international economic sanctions, sports and cultural embargoes, and steady pressure from the international community, the ruling regime only conceded defeat in 1990 with the unbanning of all political organisations and finally the release of the figurehead of the anti-apartheid movement Nelson Mandela.

President F.W. de Klerk's role in the final years before Mandela's release would also be important in forging a path – alongside Mandela – for the transition to democracy and the future prosperity of South Africa. De Klerk surprised the nation with a speech delivered to Parliament on 2 February 1990. In this he announced the immediate unbanning of all political organisations (including MK) and Mandela's release a week later. Both Mandela and de Klerk were intent on overseeing a peaceful resolution, needing to include the white minority who formed the stronghold of the economic base in South Africa. They also recognised the need for economic stability to facilitate the emerging black middle class, as this would be central in the transition to a free and democratic society for all races in South Africa. While de Klerk was almost certainly committed to change there is no doubt that the governing

M

apartheid regime must have seen that there was no option but to start on the process of dismantling apartheid and moving towards a free South Africa for all its inhabitants.

Soon after the unbanning of all political parties, Mandela's long-awaited release took place on 11 February 1990, with a speech to the nation delivered to a jubilant crowd in Cape Town. Political exiles returned and additional political prisoners were released, including ANC (and MK) activists who were guaranteed protection from prosecution. The ANC president, Oliver Tambo, returned in December 1990 from his 30-year exile for the first ANC meeting on home ground in 31 years. In December 1991, de Klerk announced that key laws enforcing apartheid control such as the Land Act (1913), Group Areas Act (1950), and Population Registration Act (1950) would be revoked, thus in effect ceasing the legislative control of non-white peoples. These were historic shifts for a nation where the majority of the population had had to endure extreme infringements of their human rights.

Although the next 3 years entailed increasing violence, from right-wing white activists the Afrikaner Weerstandsbeweging (AWB) and Inkatha activists led by Mangosuthu Buthelezi, attempts were made to keep the transition process as smooth as possible. The first free general elections took place in April 1994 with almost 20 million queuing to vote over a 3-day period. As the ANC did not win with an absolute majority, a Government of National Unity was formed with the NP and the Inkhata Freedom Party. (COSATU and the Communist Party had aligned with the ANC for the elections.) Mandela was elected as president with F.W. de Klerk as vice-president. On a personal level, the hardships of being separated during his internment and Winnie Mandela's controversial political involvements (with alleged involvement in the death of Stompie Moeketsi in 1989) placed great strain on their marriage. Despite attempting to reconcile their differences, they divorced in 1996 and on Mandela's 80th birthday, 2 years later, he married Graça Machel, a humanitarian and politician (and widow of Mozambican president Samora Machel).

With South Africa's blemished past under apartheid and enormous changes undergone in the transition to freedom, it was hoped that the Truth and Reconciliation Commission (TRC), set up in 1995 and overseen by Archbishop Desmond Tutu, would enable a sense of forgiveness to prevail in the reconstruction of the new 'Rainbow Nation', as Tutu christened it. As traumatic as it often was for participants, the TRC was an important process to allow for the atrocities committed under apartheid to be brought into the public domain. While it also, to some extent, assisted the country in coming to terms with the oppressive apartheid regime, the mindset which apartheid had inculcated would take many more years to change. It would take at least one new generation of individuals to be educated side-by-side before there could be substantial progress to a more equitable and egalitarian society.

Mandela's roles as political activist, symbolic figurehead of the liberation movement whilst free and in prison, president, and also as icon of a free South Africa were instrumental in maintaining clarity of purpose in striving for justice and equality for all. The difficult yet miraculously smooth (on many accounts) transition to a free South Africa was to a large extent attributable to Mandela's unwavering perseverance, openness in finding a way forward with his oppressors, and his fairness and generosity as a human being. His death on 5 December 2013 was mourned internationally, and he will be remembered alongside other great leaders such as Mahatma Ghandi as one of the great historical figures of change in the twentieth and twenty-first centuries.

Definition

This essay focuses on three thematic arguments. The first is that in the post-Mao narrative, both in and outside China, the first three decades of the People's Republic of China (PRC) have either disappeared from history or have been largely distorted by the necessity of imperialist and capitalist logic. The second thematic argument is that Mao Zedong contributed greatly to anti-imperialism internationally and made huge efforts to build socialism at home. Finally the third thematic argument is that the Cultural Revolution was Mao Zedong's last effort to combat capitalism.

Introduction

In this essay I will not spend time on a descriptive presentation of Mao's biographical details since that kind of information is easily available on the Internet or in numerous other sources, for instance Snow (2008/1937–44), and Karl (2010). The Chang and Halliday book *Mao the Untold Story* of course has to be mentioned. Anyone who wants to have his or her anti-communist prejudices confirmed or who wants to enjoy ideological fantasies can read this book with relish, like former US president George W. Bush, jnr and the last colonial governor of Hong Kong Chris Patten.

Instead I will focus on three thematic arguments. The first is that in the post-Mao narrative, both in and outside China, the first three decades of the People's Republic of China (PRC) have either disappeared from history or have been largely distorted by the necessity of imperialist and capitalist logic. The second thematic argument is that Mao Zedong contributed greatly to anti-imperialism internationally and made huge efforts to build socialism at home. Finally the third thematic argument is that the Cultural Revolution was Mao Zedong's last effort to combat capitalism.

Why have the First Three Decades of the PRC Disappeared in History?

Post-Mao mainstream media in the West, especially Anglo-American media, and even some

mainstream scholarship, be it at universities or in think tanks, tends to portray contemporary China in terms of the so-called 'open up and reform' in the post-Mao period. They talk about the Chinese 'economic miracle' that was made possible by Deng Xiaoping's statement that 'getting rich is glorious', (a statement that has been repeated thousands of times orally and in print without any citation, and is most likely another little myth regarding China); about the double-digit growth of GDP for more than 20 years; about lifting 100 million people out of absolute poverty in three decades; about how Shenzhen, a fishing village, has turned into a modern cosmopolitan city; how rice paddies on the east side of the Huangpu River, Pudong of Shanghai, were turned into one of the main financial centres in Asia and how China has suddenly become a superpower threatening the world. The distinguished Harvard scholar and one-time US government Intelligence officer Vogel, in his monumental biography of Deng Xiaoping, spends only 30 pages on Deng up to the year 1979. In the section of biographies of key people of the PRC, Mao is not even included. From Vogel's point of view, the transformation of China did not happen until Deng became the paramount leader after the Third Plenum of the Eleventh Chinese Communist Party (CCP) Congress in 1978.

According to this convenient historiography, the Mao Zedong period had achieved nothing in bringing China to modernity. If anything, it is the opposite: Mao had delayed China's trajectory to modernity, with his initiation of the Great Leap Forward (GLF) programme that led to starvation and the Cultural Revolution that brought chaos. For some people, Mao is responsible for worse than the delay of China's modernity. They portray him as having been a mass murderer, the worst possible mass murderer in human history. It is such a saleable condemnation that the English historian Frank Dikötter's book *Mao's Great Famine* was reported to have sold 100,000 copies. Many claimed it to be a definitive history of Mao in relation to the GLF, and Professor Dikötter's book won the 2011 Samuel Johnson non-fiction prize. It does not matter that the cover photo of the book of a hungry boy was a photo of the 1942

famine in China. It does not matter that Professor Dikötter not only has great problems with his research methodology, as reviewed by Anthony Garnaut (2013) of Oxford University, but also has deliberately distorted documentary evidence as pointed out by Sun (Sun 孙万国 2013) at the Australian National University.

In fact nothing matters so long as you can find evidence or argument against the Mao era. The 1949 Chinese Revolution has to be denigrated, Mao's anti-capitalist and antiimperialist legacy has to be dumped, and the 30 years of the Mao era have to be wiped from history.

This process of erasing 30 years from PRC history in fact started in China and was initiated by the Chinese themselves. This has mostly to do with the Cultural Revolution. During the Cultural Revolution the political and intellectual elite were supposed to be the target of a cultural revolution aimed at remoulding their world outlook so as to prevent them from being agents turning China into a capitalist country. The method of this revolution (mobilizing the masses to rebel against their leaders) meant that a lot of the Chinese political and intellectual elite did suffer emotionally and some of them physically, and most of them were temporarily stripped of power. But, only about a month after the death of Mao in 1976, his widow Jiang Qing was arrested together with her closest colleagues in the name of the Gang of Four. Deng Xiaoping and his like were brought back to power.

As a backlash against the Cultural Revolution, the ten years from 1966–76 were denounced by the post-Mao authorities as 'ten years of holocaust' or 'ten years of calamities' (the Chinese term is shi nian haojie''', when 'haojie''' can either rendered as holocaust or disaster). Of course there were many Chinese at that time and even now today, especially among the non-elite sectors of Chinese society, who would not agree with this description.

Deng Xiaoping and his followers achieved their aim of denouncing the 1966–1976 decade by using two strategies. The first was either to execute or jail the followers of Mao, rebels or those who were active during the Cultural Revolution. The victims of this greatest purge in the history of the CCP and PRC, a history that is

hardly recorded, were called san *zhong ren* (three kinds of people). One example of the so-called san *zhong ren* is Lin Qinglin, a school teacher who during the mid-1970s wrote a letter to Mao, complaining about the hard life of the 'educated youth' who were sent down to the countryside. It was Mao's sympathetic response to that letter that led to great improvement of the life of the youth who had left their homes in cities and towns. But because Li was promoted to a leadership position as a result of his letter, he became victim of the post-Mao purge and was put in jail for many years (Gao 1999).

Another example typically illustrates the ups and downs of the political elite and the post-Mao purge. Wu Zhipu, party secretary of Anhui Province, initiated some of the most radical measures during the GLF which led to most of the damage during the famine. He admitted to his role and was held responsible for the large number of deaths in Xinyang County. He was so hated by the people who had suffered under his leadership that during the Cultural Revolution he was captured by the rebels and subsequently died as a result of torture. In 1979, Deng Xiaoping, a good friend of Wu, chaired a make-up memorial service for him in which his pre-GLF reputation was restored. On the other hand, Wu's rival Zhang Qinli was purged and jailed for 13 years after the Cultural Revolution. But Zhang was the very person who had criticised Wu's damaging policies and written a letter to Zhou Enlai about the serious consequences of his policies (Changkong Yihe 长空一鹤 2012) Just as Li Qinglin's letter had drawn attention to the problems of the educated youth policy, Zhang Qinli's intervention drew attention to the GLF problems in Anhui. Both men were promoted despite their criticism of Mao's policies because they had addressed real problems. And yet they were purged by the post-Mao regime in the name of correcting Mao's mistakes.

The other strategy that Deng used was a decree that the debate on the Cultural Revolution should cease altogether and that energy should instead be focused on economic development. This was a convenient as well as useful strategy for reducing dissent on the one hand and meeting the demand of material consumerism on the other. With the two strategies in place, any discussion of the Cultural Revolution has been out of the agenda or even taboo. Consequently, one decade of the PRC has disappeared from history.

The Chinese authorities under Deng Xiaoping wanted to sweep under the carpet two other important events in the history of the PRC: the GLF years of 1958–60 and the so-called three years of famine; and the anti-Rightist movement of 1957. There is no doubt that there was a famine during the period, but there are debates about whether its origin, cause, and effect owed anything to the GLF policies. It is generally accepted that there was a demographic change as a result of the famine. In other words, many people would have lived longer without the famine and many would have been born without the famine. However, in what way and to what extent China's population growth was affected by the Great Leap Forward is hotly debated even today. China's official population census in the early 1980s seems to show that there was a population decline in that period, instead of growth on the basis of normal death and birth rates, in the range of several to tens of millions of people.

But the Chinese official census statistics are based on data collected on household registration. There can be errors and fraud in household registration during that period for two important reasons. First, the data could not be complete because the household registration was in the process of being established at the time. Second, the Great Lead Forward policies involved huge internal migration first from rural to urban areas as industrialisation was expanding and then from urban to rural areas as industrialisation was contacting in the face of shortage of grain and the failure of some foolish policies such as backyard iron and steel manufacturing (Yang 杨松林 2013). During these years, households might fail to de-register when they left during the Great Leap Forward and then register when they moved back to rural areas. Because the population base of China was and is so huge, a tiny percentage of error or miscalculation leads to large differences in absolute numbers. Since members of the post-Mao political elite, such as Deng Xiaoping, were actually involved in the GLF and therefore any

evidence-based analysis would have implicated them, it was thought better to keep these years out of sight as well. In addition to the matter of famine estimates during the Great Leap Forward being based on dubious demographic data, it is important to note that they are crudely extrapolated from birth rates and mortality rates established in the decade before, these having improved massively from the pre-PRC era (Patnaik 2002). Moreover, even assuming the worst, the increase in mortality during the GLF was still no worse than that in many countries, including India's, during the same period. Even accepting the very dubious figure of 15–30 million excess deaths during the GLF, it must be admitted that the dramatic and unprecedented decline in infant mortality and rise in life expectancy achieved in the Mao era saved many more Chinese lives.

As for the anti-Rightist movement in 1957, though the CCP government represented by Deng Xiaoping acknowledged the wrongness and 'mistakes' of the movement and therefore rehabilitated almost all of those who were labelled the Rightists, scores of very well-known intellectuals were made to keep the label even so. This seemingly contradictory resolution has been maintained precisely because of the role that Deng Xiaoping played in the movement. Deng was the general secretary of the CCP and ran not only the day-today activities of the CCP at that time but also was responsible for putting abstract ideas and paper policies into practice. In other words, to condemn both the GLF and the Anti-Rightists movement fully and completely would have involved condemning of not just other leaders like Liu Shaoqi but also Deng Xiaoping himself. It was therefore convenient for the post-Mao power holders that these years should not be talked about either.

Furthermore, to justify the capitalist direction that has been taken since the death of Mao, the very revolutionary discourse of socialism and anti-imperialism had to be submerged if not abandoned altogether. On the one hand, the policies undertaken by the post-Mao government have been moved more and more to the opposite of the 1949 Revolution. On the other hand, the very

legitimacy of the CCP's rule rests on the 1949 Revolution. So symbolically, the portrait of Mao still hangs on the wall of the Tiananmen Rostrum, but almost nothing positive has been said officially about the Mao era since his death, while condemnation of him has been allowed here and there either in utterances by some members of the political and intellectual elite (e.g. the publication of *Yanhuang Chunqiu*), or outside of mainland China, as in Hong Kong. So basically the three decades of the Mao era have disappeared from the mainstream history of the PRC, except for condemnation.

Mao Zedong's Contribution to Anti-imperialism and Socialism

Mao's contribution to anti-imperialism and socialism has to be examined in the big picture of world capitalism dominated by the Anglo-sphere powers. Mao's contribution can be characterised domestically and internationally. Domestically, he tried to build a socialist system, with various degrees of success and failure. Internationally, Mao called for a united front to resist the force of US imperialism. In this section of the essay, I will start with Mao's efforts at building socialism in China and then I will follow by studying his international exertions. With regard to the latter, I will briefly discuss the issue of the Sino-Soviet relationship and the split between the CCP and Soviet leadership.

Socialism in the Mao Era

There have been disagreements and debates among scholars and thinkers of a left-wing persuasion about whether China in the Mao era was socialist. It has been argued that China in the Mao era was at best stood halfway between capitalism and socialism and, at worst, amounted to state capitalism. There are socio-economic and even political features in the Mao era that can be justifiably described as capitalist, such as exploitation of the rural sector to accumulate capital for industrialisation, the rigid household registration

system (*hukou*) that virtually held the rural population down as second-class citizens or even non-citizens, the eight scales of the wage system, and the privileges such as the provision of drivers, bodyguards, cooks and domestic servants enjoyed by high-ranking party officials and army officers.

However, there are two important points that are relevant to this line of reasoning. The first is whether any state, however socialist it wants to be, can afford not to industrialise. Given the fact that the PRC was born during the Cold War, with not only the West's economic and technological sanctions against it but also with real hot wars (the Korean War and the Vietnam War) threatening its very existence. Furthermore, it may be argued that, given the fact that China was in ruins after eight years of fighting brutal Japanese aggression and occupation and three years of civil war involving millions of troops, what could the PRC do but industrialise rapidly in a hostile environment? Surely, it had no choice but to exploit the rural sector as a way to accumulate capital for industrialisation? This strategy of survival was successful: by the late 1970s, China stood up as a nuclear power, a country that had satellite technology and had become the sixth largest industrial power in the world whereas in 1949, when the PRC was established, China's industrial capacity had only been that of little Belgium (Meisner 1999).

The second point is about the nature of the state in the Mao era: the means of production were all publicly or collectively owned. There were no individual capitalists. The arrogant party officials or army officers might have behaved like masters within their own organisations, but they could never claim to be owners of any means of production. Even at the height of collectivisation (i.e., in the rural commune system established after the GLF), land had been collectively owned by all the villagers of any particular village. People were constantly reminded of the possibility that there might be 'masters' in Mao's mass campaigns, and the Cultural Revolution, as will be discussed later in this essay, was Mao's last but most brutal reassertion that leaders should be the servants of the people.

Despite some capitalist features existing in the Mao era, there were many features that could only be characterised as socialist: the striving for gender equality; eight-hour working days; almost full employment; widespread availability of free housing; free education; free medical care for all urban people; retirement pension for the working class; and some subsidies for the widowed, old and childless rural residents.

It was during the Mao era that the average Chinese life expectancy rose from 38 in 1949 to 68 in the 1970s. The literacy rate increased so dramatically that it prepared millions and millions of skilled workers in the post-Mao period for economic expansion. Despite all the false and misleading claims to the contrary, China's GNP grew at an average annual rate of 6.2% between 1952 and 1978. Indeed, as Lin (2006) points out, the industrial sector outperformed most other developing economies. Although rural development was seriously impeded by the industrialisation strategy that was biased in favour of the urban sector, the quality of life by the 1970s had improved and was on the edge of being transformed throughout county towns and villages. Though China was decades behind the economically developed world, it was already 'on a par with middle-income countries' in human and social development (Bramall 1993: 335). Measured by social indicators such as life expectancy, infant mortality, and educational attainment, China (especially urban China) in the Mao era had already forged way ahead of most market economies at similar income levels and surpassed a number of countries with per capita incomes many times greater.

Throughout China's long history of civilisation, the Chinese have been plagued by hunger and starvation. As witnessed by foreign correspondents, missionaries, and travellers, China before the establishment of the PRC was constantly devastated by natural disasters and starvation on a large scale, some of which claimed millions of lives at one go. The GLF period of failure from 1959–61 could be considered the blackest spot in the history of the PRC, but this famine was the first one, the last and the only one in the whole history of the Mao era and of the

M

PRC. This is not a result of luck or accident, but of decades' hard work to buid a solid infrastructure of irrigation and management of rivers and lakes. It has entailed the mobilisation of massive manpower as part of Mao's campaign.

As I have personally witnessed in the village of Gao, life in rural China during the Mao era was poor and spartan. Even in the urban sector, life was very basic and most of the daily necessities such as oil, even soap, were rationed. Life here was not affluent but adequate and decent. Life in the rural sector was poor and hard but stable and improving. Some, especially those who are anti-communist, or anti-Mao, tend to take phenomenal features as evidence of linear causes and effects. This is not necessarily logical. They would compare the phenomenon of poverty in rural China and the rationed material scarcity in urban China in the Mao era with the material abundance in the post-Mao era to make the linear cause-and-effect argument that socialism failed because it is anti-human nature whereas capitalism succeeds because it motivates people to work hard. However, this kind of economic rationalist argument sounds logical only on paper. If one gets down to empirical data it does not accord with reality. As a case study of empirical work in the village of Gao shows, its inhabitants in the Mao era did work hard. On a national scale, China's GNP grew at more than 6%. The logical argument is that there is no economic miracle, and any rational economist should know there is no miracle in economic development in human history. The logic is that the hard work in the Mao era paved the way and laid a sound foundation for later take-off.

Let me take grain output as an example. Clearly, grain output in the Mao era was not as high as in the post-Mao era, and clearly most Chinese were hungry then but they are not hungry now. We know the staple grain in the Chinese diet is rice. There are two important factors that boost rice output. One is improved seeding and the other is chemicals for fertilising and for insecticide. We know the hybrid seeding developed by scientists like Yuan Longping has made a great difference in rice output. But very few bother to point out that the development of hybrid seeding takes many years to achieve and scientists like Yuan Longping started working on this kind of project in the Mao era and their results were implemented only during the post-Mao era. Likewise, it took some years for China to accumulate enough capital and technology to build up chemical factories to produce enough fertilisers; that stage of development again corresponds to the transition from the Mao era to the post-Mao era. When I was in the village of Gao in the 1960s and early 1970s, there was very little chemical fertiliser available and we had to use organic material such as pig manure. This kind of manure was good for the land but of slow and very limited quantity output. Nowadays, Gao villagers just spread large quantities of chemical fertiliser onto the land. The consequent output is high but the effect is hugely damaging to the environment, an issue yet to be addressed.

International Anti-imperialism

Mao made a great contribution to anti-imperialism, and China under his leadership supported weak and oppressed nations across the globe. For this very reason, Mao was accused of being a warmonger and communist threat to the world. This can be examined in a number of cases below.

Korean War

US imperialists and Western Cold Warriors justified their fighting in Korea on two grounds. The first was that the North Korean communists had fired the first shot and invaded South Korea. The second pointed to their moral high ground in needing to stop the domino effect of the communist threat. As the end of the Vietnam War has shown, there was no such domino effect. The so-called communists in both Korea and Vietnam were nationalists, and their primary goals were to get rid of Western colonialism, gain national independence, and possess their own sovereignty. Their struggle for independence was entirely legitimate and justified. The same goes for the point concerning North Korea's invasion. Both

sides wanted to overcome the other to unify Korea. It was none of the business of the Western powers if and when the Koreans wanted to fight for their own destiny, and it was their internal affair to choose to fight for any political system they wanted. As we know, the US imperialists and their allies not only beat back the North Koreans but also attempted to overtake North Korea and threaten the very existence of the new PRC that had been established barely a year before. It is not surprising that Chinese wanted to stop them, and China under Mao did so.

Vietnam War

The same was the case with the Vietnam War. In fact if there had been an election held in Vietnam at that time it would have been highly likely that the Communists, headed by Ho Chi-min, would have won the whole country. But imperialists would never allow that to happen. Not only did they want to stop a Vietcong victory, they also wanted to overrun North Vietnam. China under Mao gave US imperialism a timely warning: if the war extended to North Vietnam, China would intervene. On 24 June 1964, Mao declared that if the US invaded North Vietnam China would send volunteers to participate in the Vietnam War, just as China had done in the Korean War. Mindful of history, this time the US militaryindustrial complex listened.

However, the US imperialists could not stay clear altogether, and they started to bomb North Vietnam. It was in response to these circumstances that China began sending troops to support the North Vietnamese defending their own country. From June 1965 to August 1973, China despatched more than 300,000 air-defence personnel and road-construction workers to North Vietnam to help in the struggle. At the height of the war in 1967, there were 170,000 Chinese troops in Vietnam. Furthermore, China maintained a supply-chain of food, weapons and daily necessities to the North Vietnamese, some originating in the Soviet Union, some in China itself. Attempting to stop this supply chain, the US imperialists even started bombing countries such as Laos and Cambodia, aggression that had unfortunate consequences in the latter.

Supporting the People of Africa and Asia

China under Mao also supported other African and Asian countries in their struggles against Western colonialism and efforts to achieve national independence. For example, on 20 May 1970, China published Mao's declaration 'People of the World, Unite to Defeat the US Aggressors and All Their Running Dogs!' (全世界人民团结起来, 打败美国侵 略者及其一切走狗!) to support the antiimperialist struggles of Vietnam, Laos and Cambodia. In 1956, China declared its support for Egypt in reclaiming its rights over the Suez Canal. China also supported Algeria's struggle for independence, for example by supplying weapons and material goods. China supported Angola, Mozambique, Zimbabwe, and Namibia in their struggles against colonialism and imperialism by providing training courses and materials and supplying weapons.. According to the Organisation of African Unity, from 1971–72, some 75% of weapons supplied from outside Africa originated in China and most of them were supplied free of charge. On the 12 January 1964, Mao declared his support for the people of Panama people in their claim over the Panama Canal (中国人民坚决支持　　巴拿马人民的爱国正义斗争).

As an example of its support of weak and oppressed countries, consider China's use of the best technology and construction materials then available to help build the Tan-Zan Railway, a 1,860 km line from Tanzania to Zambia costing $500 m. According to a Chinese source on the Internet, China offered interest-free loans of nearly CN¥1b and sent more than 55,000 workers and technological personnel, 66 of whom lost their lives in the construction project (坦赞 铁路 http://baike.baidu.com/view/75336.htm233, accessed on the 4th January 2014). This was carried out at a time when China urgently needed capital and technology for its own construction.

In October 1954, China hosted a visit of the India premier Nehru, and in April 1955, China and Indonesia signed a contract on the issue of dual nationality, so that the ethnic Chinese who had Indonesian nationality automatically lost their Chinese nationality (中华人民共和 国和印度尼

M

西亚共和关于双重国籍问题的条约). From 1963–64, the Chinese premier Zhou Enlai and foreign minister Chen Yi visited 14 Asian and African counties including Egypt, Algeria, Morocco, Tunis, Ghana, Mali, Guinea, Sudan, Ethiopia, Myanmar, Pakistan, Sri Lanka, and Albania. Finally, but more importantly, Mao developed the idea of three worlds and held that Asia (except Japan) and all the African and Latin American countries were Third-World countries. China was on their side.

Mao Zedong's Last Efforts in Combating Capitalism

According to the current official historiography, if anything proves to be wrong or bad in the history of the PRC, Mao should be held responsible; and if anything proves to have been useful and good, it must have been done by those who did not follow Mao or who acted against him.

However, it should be possible, at least for some notable policy developments in the history of the PRC, to envisage events the other way around. According to this alternative narrative, Mao was the person who actually wanted to be moderate but those under him went further than what he wished. There is certainly evidence that Mao wanted the CCP to be criticised in 1957 and therefore launched what was called the 'Two Hundreds' (let a hundred flowers blossom and a hundred schools of thoughts contend). It was his colleagues in the CCP who resisted Mao's ideas first and then wanted a harsh crackdown as soon as possible when the very existence of the Party was under threat. There is also evidence that Mao was one of the first who saw the problems caused by radicalism during the GLF. For instance, Bo Yibo was the one who made a report to Mao that China could catch up with the UK in steel production in two years. Liu Shaoqi was the one who encouraged communal canteens for he thought that would liberate women from kitchens and so be one way to eliminate gender difference. Zhou Enlai was the one who invented the term 'Great Leap'; Chen Yi and Tao Zhu were the ones who believed and advocated unrealistic agricultural output. If one reads Mao's rambling talk in the 1958 Wuchang and Nanning Conferences and the 1959 Shanghai Conference, one can see that he was the person who wanted to slow down.

We have to realise that the choice of what has been allowed to be published (e.g. Mao's speeches, and speeches by Liu Shaoqi and Deng Xiaoping in their so-called collected works) has been very political. One might notice that in their selected works the speeches of Deng and Liu during the GLF years are not included. The politics is obvious: putting aside personal vengeance (as Vogel (2011) records, Deng Xiaoping was very passionately bitter about the Cultural Revolution because one of his sons was crippled during the movement), to justify a dramatic change of politics, the post-Mao leadership had to declare that it had been correct all the time and that it was Mao who was to blame for the past problems. For the Western audience, it is satisfying to nail down a villain: Mao the monster of evil communism.

By pointing out these issues, I am not suggesting that Mao was not responsible for bad outcomes. All I am trying to say is that he was not a god and therefore could not have been involved in all (bad or good) that had happened under his leadership. It was humanly and organisationally impossible for him to have been involved in all the policy making let alone policy implementation in such a large and war-torn country facing so many daunting tasks of reconstruction in the 1950s. Therefore it is reasonable to expect that many of the initial policies and their implementation were the responsibility of Mao's colleagues, and may even have been undertaken without his knowledge (Li Yi 李 毅 2005) thinks that Mao would probably not have known the exact details of Gaokao (the tertiary education entrance examination) that was introduced in 1955. According to Li Yi, once the system was established, it favoured educated families and disadvantaged poor ones. For instance in 1957, 80% of the enrolled university students were from landlord, rich peasant and capitalist family backgrounds. Mao of course was not happy with this, but did not have the chance to address this until the Cultural Revolution when the university operation stopped altogether. He then started an experiment of recruiting students from among the workers, peasants and soldiers directly via mass recommendation. According to

Li, the hierarchical scale of salary and the household registration that classified Chinese into virtually two different countries were also policies designed by Liu and his colleagues, which Mao was not very happy about. The Cultural Revolution's radical policies of abolishing army ranks and sending urban youth up into the mountains and down to the countryside were a reflection of Mao's ideology, one that was very different to that of Liu Shaoqi and Deng Xiaoping.

Mao was very aware that China could easily be swept along with the dominant capitalist system in the world. I would argue that the Cultural Revolution was his last, bold, and desperate attempt to steer China towards what he perceived to be socialism and to prevent the country from moving into the trajectory of capitalism. Mao is reported to have declared that he had only achieved two things in his life: to have driven Jiang Jieshi (Chiang Kai-shek), the leader of the Chinese Nationalist government, to the island of Taiwan; and to have launched the Cultural Revolution. It is therefore fascinating to read in Vogel's account of how Mao in his dying days urged Deng Xiaoping to acknowledge in writing (or before colleagues) that he supported the Cultural Revolution, even if not totally then at least 70% of it. According to Vogel (2011), Deng was very resistant on this although in writing he did pledge to Mao that he would never reverse the verdict of the Cultural Revolution. But history proves that Deng did reverse the verdict, as Mao said with a sigh of despair, referring to Deng Xiaoping: 'capitalist roader is still walking along the capitalist road. [He] says never reverse the verdict! Not reliable'. Deng did restore capitalism in China, and 'socialism with Chinese characteristics' steered by him was more blatantly capitalist than systems in many developed capitalist countries.

The Cultural Revolution has been constantly narrated as Mao's personal power struggle against his designated successor Liu Shaoqi, even though all the documentary evidence suggests otherwise. Mao's authority in the CCP and PRC was and could never be challenged by anyone after the establishment of the PRC. Mao knew it and everyone else knew it. He could easily have got rid of Liu without mobilising a mass movement like the

Cultural Revolution that was supposed to have lasted ten years from 1966–76. In fact, as early as August 1966 during the Eleventh Plenum of the Eighth Party Congress held in Beijing, Liu had already been demoted from the number-two position in the party ranking to number eight. All Mao had to do to achieve this was write a few lines on a piece of scrap paper called the 'big poster'. Many years later, Liu's widow, the intelligent Wang Guangmei, who also suffered terribly during the Cultural Revolution, admitted that Mao and Liu had policy differences and that Mao had not initially intended to get rid of Liu politically. Liu's political and even personal fate went downhill only after Mao was presented with 'solid evidence' that Liu was once a traitor during his days as an underground communist activist. How this could have happened is still a top secret in China, possibly because it at least partly involved the still beloved premier Zhou Enlai.

Why did Mao launch the Cultural Revolution then? For Mao it was to decide China's road ahead: to guarantee that China moved towards socialism rather than slipped into capitalism. In 1965, barely a year before the Cultural Revolution, Mao made a trip to Jinggangshan, where he had first started a base for guerrilla warfare, then continued to the establishment revolutionary base area in Jiangxi, where eventually most of the top CCP leaders gathered before the now famous Long March. Mao's symbolic visit to Jinggangshan was apparently to contemplate another new starting point for China. In some rare occasions during the visit there, Mao talked to those around him about why he did not like idea of contracting land to households, and why he thought collectivisation was crucial to Chinese socialism (Ma Shexiang 马社香 2006). This was a point about which Mao disagreed with Liu Shaoqi. It is worth pointing out that dismantling the commune system in rural China was the starting point at which the post-Mao leadership launched its so-called reform.

Mao knew such a task was difficult because it required the remoulding of mentality and world outlook. That was why the revolution for the elite to go through was called 'the *Cultural* Revolution'. In May 1966, when the launch of the Cultural Revolution was in full swing, Mao

M

called the inner-circle thinkers of the party (figures such as Chen Boda, Qi Benyu and also Lin Biao's hand-picked general Yang Chengwu) to Shanghai to listen to what he thought was a concrete way to change people's minds lifestyles. This was later called the 7 May Directive, after a letter written by Mao on that date praising a People's Liberation Army report which talked about how the soldiers were participating in not only military training but also cultural studies and agricultural production. The directive basically says that one should not work to live, to earn money, but one should live to work. Although division of labour cannot be abolished, a worker should do some farm work and a farmer should do some industrial work, a soldier should engage in production as well as military training. A student should do all kinds of physical labour as well social activities. Party official should sometimes live with those they lead, engage in production work with them and so on (Qi Benyu 戚本禹 2013).

Mao's idea of the Cultural Revolution as written into the Sixteen Articles document that launched the movement was for a three- stage movement: struggle; criticism; reform (*dou pi gai*). All Chinese should engage in struggling against established ideas and habits, especially these who are in leading or authoritative positions. After that, all Chinese should engage in criticism of others and of themselves. Finally, all the institutions should be reformed according to new ideas and consensus reached out of the struggle and criticism stages. As it happened, the Cultural Revolution did not develop the way Mao had envisaged.

Conclusion

Mao was and remains a controversial figure. For a long time after his death, the Chinese authorities, while not allowing a straightforward denunciation of Mao like Khrushchev's denunciation of Stalin, have encouraged or at least allowed implicit or explicit criticisms of him in many concrete areas of policy, like the Cultural Revolution. Thus, condemnation and damming of Mao, some elements of which are obviously false and fraudulent, by prominent economist Mao Yushi (not personally

related to Mao), school teacher Yuan Tengfei, party historian Xin Zilin and former journalist Yang Jisheng, have been allowed. On the other hand, any positive assessment of Mao, especially concerning the Cultural Revolution, has not been allowed. Especially poignant is that grass-roots activities to commemorate or celebrate Mao are very often banned or harassed. Websites that celebrate Mao and his ideas, *like wuyou zhixiang* (the Utopia), have been shut down several times.

This in a sense is understandable. Mao's theory of class struggle, which was used skilfully by the party power holders at various levels against the classic class enemies, when applied to themselves as a new class of enemies who wanted to turn China into a capitalist country, really caused much consternation. Not to utterly condemn Mao, ideologically and personally, was already a huge concession on the part the Chinese political and intellectual elite of that generation. For the broad sectors of the masses, however, it is a totally different story. According to a recent survey carried out in December 2013, 1,045 people above the age of 18 from Beijing, Shanghai Guangzhou, Chengdu, Xi'an, Changsha and Shenyang were asked whether they would agree that Mao had more merits than demerits. Some 78.3% agreed and 6.8% strongly agreed (*Global Times* 环球时报 2013). Some may doubt the validity of such a survey since it was carried out by the official Chinese media *Global Times*. But my research (Gao 2008) has convinced me that this percentage does indeed reflect the reality in China today. Another response, which is as predictable as the sun rising tomorrow, is that the Chinese have been brainwashed and they have not been told the truth. This kind of patronising response not only betrays the Cold War mentality with very little understanding of what China is like now, but also an astonishing arrogance; as if nobody else holds the key to the truth, as if the broad masses of the Chinese are so unthinking that they can be easily manipulated by a god-like hand. In fact the survey also asked what they thought Mao's biggest mistakes had been. The majority answer to that question was the Cultural Revolution and the Great Leap Forward. This shows that a positive evaluation of Mao was not based on blind and ignorant worship of a great leader but balanced by the

knowledge of what Mao was perceived to have done wrong.

There are signs that even the official Chinese evaluation of Mao by the present generation of leaders is going to be different from that of Deng's generation. Xi Jinping, chairman of the CCP and president of the PRC, recently made it clear that both the Mao era and the post-Mao period are an integral part of the history of the CCP and the PRC. One should not use the second 30 years to denigrate the first 30 years or versa versus. There are achievements and failures in both periods, Xin states. With this kind of less political attitude, let us hope a more relaxed and balanced evaluation of Mao is in the process of developing.

Definition

This essay explores the interrelation between nationalism, anti-colonialism, and Maoism. Its aim is not to elaborate on the relation between anti-colonialism and nationalism in general, but to focus on the period in which the two concepts interacted with the communist movement, and specifically with Chinese communism, or Maoism. We focus here on the period beginning with the revolutionary taking of state power by the Chinese Communist Party in 1949 and ending with the death of Mao Zedong in the mid-1970s, which led to an overall shift in Chinese politics. The essay examines the connection between nationalism and anti-colonialism in relation to the evolving Chinese foreign policy of the period.

Introduction

The national liberation and anti-colonial struggles of the post-Second World War period are often represented as if they were a unified global movement carried out under the banner of decolonisation. Despite a common primary aim (i.e. that of decolonisation), reality proves that there were diverse of political and ideological viewpoints and principles within these struggles and movements.

The subject of this essay is the interrelation between nationalism, anti-colonialism, and Maoism. Its aim is not to elaborate on the relation between anti-colonialism and nationalism in general, but to focus on the period in which the two concepts interacted with the communist movement, and specifically with Chinese communism, or Maoism. We are interested in the period beginning with the revolutionary taking of state power in 1949 and ending with the death of Mao Zedong in the mid-1970s, which led to an overall shift in Chinese politics. Before we examine the period under consideration, we must first clarify what we mean by the term 'Maoism'.

Clarifying Terminology: Maoism, Nationalism, Anti-Colonialism

Despite the fact that 'Maoism' has been a widely used term since the 1960s, it is neither well defined nor used in a single context. 'Maoism' was equally used to refer to the ideology of China and to designate that of supporters of Mao in the rest of the world from the mid-1960s onwards. It also came to be used by an ideological trend that emerged during the 1960s which upheld the ideological and political views of Mao and Chinese politics in general, yet at the same time rejected Stalin's views and rule of the Soviet Union.

In terms of terminology, groups that did not follow the "Marxist-Leninist" tradition that saw a continuity between the pro-1956 USSR and Mao's China, and thus, preferred the term Maoism instead of Marxism-Leninism or Marxism-Leninism-Mao Zedong thought. Such groups could be found in France, where they constituted of a particular ideological and political trend, that of Mao Spontex. (See: Lévy 1971).

In terms of ideology, Maoism has at its core the centrality of the peasants in a revolution in countries that it characterised as semi-colonial and semi-feudal—a characterisation that can easily be made to apply to the so-called Third World countries as a whole. Maoism also claimed that the path to seizing power passed through the creation of rural base areas that would eventually lead to encircling the cities in the course of a protracted people's war. This was a theoretical framework to which anticolonialists in the Third World could relate and for whom it served as a source of inspiration.

Apart from Mao's own views on anti-colonialism and nationalism, as well as their impact on anti-colonial struggles, a very important – if not the most significant – aspect of the question under consideration concerns Chinese foreign policy, regardless of whether it was dictated by Mao and his principles or not. Although 'Maoism' can be captured by a single definition, 'Maoist' China functioned at three distinct levels:

- An ideological and political framework related to anti-colonialism, as has been documented in the works of Mao and other Chinese communists
- The relation between the Communist Party of China (CPC) and parties, organisations, and groups that conducted, or were part of, anti-colonial struggles
- The foreign policy of the People's Republic of China (PRC) towards anti-colonialism and newly founded states.

Thus, we must examine the relationship between nationalism and anti-colonialism in their relation to Chinese foreign policy rather than in their relation to the Maoist ideology – in any of its definitions – per se. In addition to the vagueness of the definition of 'Maoism', the complexity of anti-colonialism and the decolonisation struggle in general makes it possible to describe the relationship between the three terms as if they might be grasped in linear fashion. Anti-colonialist forces, and therefore the decolonisation process, ranged from those who dreamed of a new socialist or communist homeland to those who would settle for the declaration of independence of their country.

That being said, nationalism and – to a greater extent, anti-colonialism—are terms that have also been subjected to multiple interpretations. Michel Caher (2012) elaborates on the issue of nationalism in relation to Marxism, colonisation, nations, states, and nation states. According to Caher, it would be rather difficult, if not impossible, to attempt to interpret the transformation process of decolonisation in a univocal manner, and by the same token anti-colonialism in terms of the path taken in order to fulfil the goal of decolonisation, nationalism in terms of the ideology of (part) of the anti-colonial forces, and Maoism as a concrete policy towards the former two issues.

Nationalism relates to anti-colonialism on two different levels. The first is the function of nationalism in relation to anti-colonial struggles as such, and the second is the relation between nationalism and communism within an anti-colonial struggle, front, or alliance. Both levels have ideological and political projections, but to view these issues in such a manner alone would be incomplete, since anti-colonialism is not merely a scholarly issue but a political orientation that is based in a material and practical situation. On the other hand, trying to analyse these matters by viewing the facts isolated by ideological doctrines and their respective political lines can easily lead one to draw hasty conclusions. Despite the fact that proletariat internationalism had been a fundamental task for every or any communist party, defending the PRC and its rights was also a basic commitment of the CPC, and maintaining an equilibrium between defending the state and upholding internationalism has not always been possible, despite the best efforts of the CPC.

The Three Phases of the Chinese Foreign Policy throughout the Maoist Era

Assisting (mainly South-East Asian) national liberation and anti-colonial movements during the 1960s in fact served both tasks, by ensuring that the US would not be anywhere near China's backyard and by fulfilling the commitment of the PRC and CPC to proletarian internationalism (Karl 2010: 113–115). As with any political formation, the CPC was not uniform, and serious opposition was raised against various political decisions or positions it took (Pillsbury 1975: 2). Such opposition was reflected in international relations and foreign policies. But prior to the 1960s, it is necessary to refer to a very important incident in the history of Chinese foreign policy, as well as a milestone of the decolonisation process: the Bandung Conference that took place in Indonesia in April 1955. The particularity of Bandung included the fact that it was a meeting of nation states representing different ideological and political positions (Herrera 2005: 546); that some of China's counterparts in the conference were countries with strong communist movements – such as India and Indonesia; and that it was the first time that both *non-alignment* and the *Third World* were

so central in the agenda of a significant number of countries. The Bandung Conference approach to China's international relations was gradually reinstated in the 1970s and especially after Mao Zedong's death in 1976.

The Bandung Conference

The Bandung Conference was where nationalism, anti-colonialism and Maoism intersected. The conference mainly served the interests of the Chinese state in ensuring that the surrounding states would be neutral in case of a possible intensification of the relations between China and the US. This would be achieved by declarations of non-alignment by these states in any possible theatre of war between the Great Powers (Betts 2004: 44). Even if this was a tactical alignment of the PRC in order to secure its borders, it had a major impact on the various communist parties of the region regarding their attitude towards nationalist forces in their countries. Headed by Premier Zhou Enlai, the Chinese delegation attended the Bandung Conference not as 'a communist nation but as a third world country' (Karl 2010: 89). Townsend (1980: 328–329) also refers to the foreign policy of PRC during that period as Zhou Enlai's 'peaceful coexistence' policy that was at the core of this conference's decisions, and according to Townsend a foreign affairs policy during the mid-1950s. Eight years later, in the Sino-Soviet exchange of letters that made the split of the Communist camp official, one may read the position of the Chinese on this very issue and especially in relation to those countries they refer to as nationalist ones:

> We differentiate between the nationalist countries which have newly attained political independence and the imperialist countries.
>
> Although fundamentally different from the socialist countries in their social and political systems, the nationalist countries stand in profound contradiction to imperialism. They have common interests with the socialist countries – opposition to imperialism, the safeguarding of national independence and the defence of world peace. Therefore, it is quite possible and feasible for the socialist countries to establish relations of peaceful coexistence and friendly co-operation with these countries. The

establishment of such relations is of great significance for the strengthening of the unity of the anti-imperialist forces and for the advancement of the common struggle of the peoples against imperialism. (Communist Party of China 1965a: 273)

This can be interpreted as a change of direction in Chinese foreign policy, away from a focus on the USSR and the Eastern bloc (Jian 2008a: 132; Townsend 1980: 328) and towards what was called 'The Third World'. According to Mao (1974) 'We are the Third World. ... All Asian countries, except Japan, belong to the Third World. All of Africa and also Latin America belong to the Third World.' Until then, China's attitude towards countries of the so-called Third World under nationalist rule was a combination of 'harsh criticism with tactics and actions designed to neutralize them in the Cold War confrontation' (Jian 2008b: 207). Thus it can be argued that after the first 5 years of the establishment of the PRC, the international affairs policy shifted from criticising 'non-Western, nationalist countries' (Jian 2008b: 207) to embracing them. Jian (2008b: 208–209) argues that Bandung – as well as the Geneva talks that took place 1 year earlier, in 1954, in order to resolve the issues concerning Korea, Vietnam, and Indochina in general, with the PRC represented by Zhou Enlai – should not be seen as change of course in Chinese foreign relations. For Jian, Bandung and Geneva should be viewed as part of the same revolutionary foreign policy that had been adopted since the very beginning of the PRC. Although Jian provides some very interesting arguments, there are a few indications that the PRC's foreign policy did not follow a single revolutionary policy, but that there were deviations from Mao's own views on foreign policy. Teiwes and Sun (2007: 85) also argue that there were no substantive divisions, at least for the period 1972–76, but throughout their work are several references to conflicts and disputes regarding foreign policies or the Ministry of Foreign Affairs even during the period 1972–76, where the authors see no major differentiations regarding foreign policy between the two major actors; that is, Mao and Zhou Enlai (2007: 30, 54–64, 85–93, 114–115, 124–146, 158–164, 427–434, 515–521).

The essence of the Bandung Conference was nothing more than the 'Five principles of peaceful cooperation': 'mutual respect for sovereignty and territorial integrity, non-aggression, non-interference in other country's internal affairs, equal and mutual benefit and peaceful coexistence' (Jian 2008b). But can we assume that this five-point agreement is in reality an agreement of noninterference in countries, some of which had strong communist movements, an agreement that would benefit the nationalist blocs that ruled them? Just 2 years before, China had intervened in Korea and was aligned with the Korean communists. Can this be viewed as a continuum?

It is true that, as Jian notes (2008b: 209–211), Chinese communists gave attention to the national aspect in revolution. But Maoism, here understood in terms of the doctrine formulated by the works of Mao, clearly stated that communists must act in an independent manner within a national front, take initiatives, and also work outside the front (Zedong 1967/1938: 213–217). In the aftermath of the Bandung Conference, the strategy and tactics of communists became both diverse and vague. In retrospect – and judging by the turnout in Indonesia alone – the results for China in terms of their task of promoting the revolution were unsuccessful, if not devastating. Zhou Enlai himself was forced to undertake self-criticism in 1957 regarding his work in the foreign affairs of PRC. More specifically:

> Zhou devoted a large portion of his selfcriticism to his 'conservative and rightist tendency' in handling the PRC's foreign relations. He admitted that the Foreign Ministry's work under his direction had neglected the necessary struggle in dealing with nationalist countries, had maintained a kind of wishful thinking concerning imperialism (especially toward Japan and the United States), and had failed to conduct necessary criticism of the revisionist policies of other socialist countries. He particularly mentioned that while it was reasonable to learn from the experience of the Soviet Union, it was a mistake to copy it completely. (Jian 2001: 73)

The case of Indonesian communists was a striking example of this situation. The Communist Party of Indonesia (PKI) left the initiative to President Sukarno. This was admitted in a document that was published after the Suharto coup took place in 1965 – when the PKI was destroyed and the vast majority of its members and sympathisers were slaughtered – that re-evaluated the politics of PKI during the period preceding the coup (PKI 1968: 25–56). Despite the fact that the outcome of the Bandung Conference is referenced as having had a causal effect on the PKI's politics, it is not so difficult to relate the two. The 6th Congress of the PKI, which took place in 1959, was addressed by Sukarno, who praised the party for its cooperation in the struggle for national unity. One year later, the PKI prioritised national struggle over class struggle (Mortimer 2006: 84–85). But can the subordination of a communist party to nationalist forces be regarded as a Maoist strategy? If we understand by 'Maoism' the doctrine based on the writings of Mao Zedong, the answer would be negative. However, if we understand by 'Maoism' the policies promoted by the Ministry of Foreign Affairs (MFA) of the PRC, including those that came out of the Bandung Conference, the answer would be positive.

A very interesting comment on the nature of PKI, which to some extent can be generalised to refer to other parties as well, has been made by G.P. Deshpande (2010: 474). According to Deshpande, the PKI had been a pro-Chinese party without for all that being Maoist, in terms of sharing the same ideological and political views; and this regardless of the PKI's strategy and how it related itself to the policies of the PRC. This valid assessment on the PKI's identity can be generalised. The history of the Maoist movement shows that the case of the PKI was very common, in terms of both parties and organisations that were aligned with the CPC during the Sino-Soviet split, and those that were created due to the split and adopted the CPC's positions.

The Sino-Soviet Split and the Abandonment of the Bandung Conference Line

During the Sino-Soviet split in the mid-1960s, the CPC redirected their international policy towards supporting revolutionary movements and parties, making a distinction between progressive and

reactionary nationalism and reaffirming the pre-condition of communist leadership within a national front. The CPC criticised the Soviet Union for aligning itself with reactionary nationalists such as Nehru (RCPC 1978: 21) who, along with Zhou Enlai, was one of the two keynote speakers of the Bandung Conference.

In 1963, the Editorial Departments of *Renmin Ribao* (People's Daily) and *Hongqi* (Red Flag) published the 'Fourth comment on the Open Letter of the Central Committee of the CPSU' that was entitled 'Apologists of Neo-colonialism' and, later on, was published in 1965 as part of the collection *Polemic on the General Line of the International Communist Movement,* by Peking Foreign Languages Press. This document, although seemingly nothing more than a criticism of the Communist Party of the Soviet Union's political views, was in reality a political manifesto of the CPC. In this document, the CPC explicitly stated that although it did not oppose 'peaceful coexistence', this could not replace revolution (Communist Party of China 1965b: 194). Furthermore, while Bandung unified former colonies through the notion of the 'Third World,' the CPC introduced the new term 'neo-colonialism' to its vocabulary:

> Consider, first, the situation in Asia and Africa. There a whole group of countries have declared their independence. But many of these countries have not completely shaken off imperialist and colonial control and enslavement and remain objects of imperialist plunder and aggression as well as arenas of contention between the old and new colonialists. In some, the old colonialists have changed into neo-colonialists and retain their colonial rule through their trained agents. In others, the wolf has left by the front door, but the tiger has entered through the back door, the old colonialism being replaced by the new, more powerful and more dangerous U.S. colonialism. The peoples of Asia and Africa are seriously menaced by the tentacles of neo-colonialism, represented by U.S. Imperialism. (Communist Party of China 1965b: 189)

In addition, the CPC's position on dealing with neo-colonialism is quite clear:

> The national liberation movement has entered a new stage. . . . In the new stage, the level of political consciousness of the Asian, African and Latin American peoples has risen higher than ever and the revolutionary movement is surging forward with unprecedented intensity. They urgently demand the thorough elimination of the forces of imperialism and its lackeys in their own countries and strive for complete political and economic independence. The primary and most urgent task facing these countries is still the further development of the struggle against imperialism, old and new colonialism, and their lackeys. This struggle is still being waged fiercely in the political, economic, military, cultural, ideological and other spheres. And the struggles in all these spheres still find their most concentrated expression in political struggle, which often unavoidably develops into armed struggle when the imperialists resort to direct or indirect armed suppression. It is important for the newly independent countries to develop their independent economy. But this task must never be separated from the struggle against imperialism, old and new colonialism, and their lackeys. (Communist Party of China 1965b: 191–192).

In achieving this, the CPC still holds the position that in each of these countries, the formation of a broad anti-imperialist united front in the national liberation movement under the leadership of the proletariat (i.e. the Communist Party) should take place (Communist Party of China 1965b: 204–205). But where does the PRC fit in all this?

> According to Marxism-Leninism and proletarian internationalism, every socialist country which has achieved victory in its revolution must actively support and assist the liberation struggles of the oppressed nations. The socialist countries must become base areas for supporting and developing the revolution of the oppressed nations and peoples throughout the world, form the closest alliance with them and carry the proletarian world revolution through to completion. (Communist Party of China 1965b: 207).

The CPC even accuses the Soviet Union of abandoning proletarian internationalism, since, from their perspective, the latter wanted 'to subordinate the national liberation revolution to their general line of peaceful coexistence and to the national interests of their own country' (Communist Party of China 1965b: 207). If one reviews Bandung, which took place about a decade before the polemics directed at the CPSU by the CPC, it can be said that it promoted a general line of peaceful coexistence and tried to harness national liberation movements in terms of the national interests of the PRC. In this respect, it

is very similar to the political line of the CPSU that is now being criticised. Thus, the polemics of the split period can be perceived as an indication of a shift back to the pre-Geneva/Bandung foreign policy of the PRC, or to a more orthodox communist/Maoist orientation in foreign affairs.

This shift in the PRC's international relations, from the moderate stance of the 1950s towards an open support of revolutionary movements worldwide during the 1960s, is also visible in terms of Chinese propaganda. In 1960, Radio Peking initiated a radio broadcast – in its French Language section – called 'Irresistible Tide' that referred to the rising independence movements in Africa. Two years before, it had launched a programme against the 'Western intrusion' in the Middle East. In the early 1960s, there was an expansion of the language sectors of Radio Peking. Most broadcasts aimed at Third-World countries either directly (in native languages, such as Arabic, Swahili, Hausa, Malay, Burmese, Thai, Filipino, Urdu) or indirectly (in the languages of colonialists, like Portuguese and French). Propaganda was also manifest in the launch of magazines such as *Peking Review, Pekin Information, China Reconstructs* – published in Arabic as well, from 1964 onwards – and an intensification of Foreign Language Press production both in terms of titles and in translations intended to promote Chinese politics worldwide. (Ungor 2009: 154–158, 258).

Back to Bandung

In 1974, Deng Xiaoping reintroduced the spirit of Bandung in the speech he delivered at the United Nations (1974). Two years later, shortly after Mao Zedong's death, Remin Rinbao published an article titled 'Chairman Mao's Theory of the Differentiation of the Three Worlds is a Major Contribution to Marxism-Leninism'. This article offered a deeper analysis of Deng's aforementioned speech, and both texts took the spirit of Bandung to the next level by identifying the so-called Second World as a potential ally of the Third World against the two superpowers, namely the USA and the Soviet Union. This article produced a major split in the Maoist camp, with most

of the Maoist parties denouncing the article as having been fabricated, and the Three World Theory as not being part of Mao's work. Whatever the case, it illustrates the complexity not only of Chinese foreign policy, but also of ideological and political shifts in the CPC that tracked changes in the balance of forces between the different factions of the party.

Conclusions

It is now evident that there cannot be a general assessment of Maoism in relation to nationalism and anti-colonialism, for the simple reason that there has not been a unitary approach of Maoism towards these two notions.

Chinese foreign policy shifted several times during the 1949–1976 period. In brief:

- 1949–1954: orientation towards the USSR and the socialist camp, with the Korean War being the key event.
- 1954–late 1950s: establishment of relations with former colonies that are mainly ruled by nationalist political forces.
- 1960s: promotion of revolution throughout the world.
- 1970s: shift towards a coalition with Third-World countries (similar to 1954–late 1950s) and an opening to the West.

Each of these shifts in the foreign policy of the PRC reflected a turn towards nationalism or anti-colonialism and altered relations between the two orientations. The 1960s had been the most favourable period for anticolonialism, while in the 1950s, and again in the 1970s, anti-colonialism was set aside in favour of nationalism.

In terms of the theoretical approach of Maoism towards anti-colonialism and nationalism, Mao regarded anti-colonial struggles as anti-imperialist. For Mao, anti-colonial armed struggle should be undertaken by an anti-imperialist united front that would constitute the national liberation movement. These fronts or movements should, on the one hand, include nationalist forces that could unite with the anti-colonial and anti-imperialist

M

goals, but, on the other, should be under the guidance and leadership of the communist forces.

Maralinga

▶ Nuclear Imperialism

Mariátegui, José Carlos (1894–1930)

Carlos Cruz Mosquera
London, UK

Marxism had already reached Latin America's shores prior to his ascendancy as a leading revolutionary theorist. Yet José Carlos Mariátegui is considered to be the founder of Marxism in the region on the grounds that he was the first to adapt it to local conditions. He famously stated that "we certainly do not want socialism in Latin America to be a copy or imitation. It should be a heroic creation. We have to give life to Indo-American

socialism with our own reality, in our own language" (Vanden and Becker 2011: 37). His pioneering contribution to Latin American Marxism has not only influenced political life in his native Peru but also revolutionary leaders and movements across the region, such as in Cuba and Nicaragua.

Mariátegui's historical analysis of Latin America continues to be foundational material in academic institutions and circles, as well as inspiration for revolutionary activists and workers. The Communist Party of Peru, known as the *Shining Path* after one of Mariátegui's famous phrases ("Marxism-Leninism will open the shining path to revolution" Jose Carlos Mariategui), has based much of their political ideology and analysis on his writings, complementing it with their Maoist ideology. Recently, the Communist Party of the Latin American Diaspora, also known as ANTI-CONQUISTA, made up of first- and second-generation Latin American immigrants in the United States and the United Kingdom, has adopted Mariátegui's ideas in an attempt to understand ongoing oppression of their communities (ANTICONQUSITA 2017).

Furthermore, his work has also helped to radicalize and inspire the region's middle and upper classes as was the case with Dr. Hugo Pesce, Mariátegui's confidant and one of the first members of the Peruvian Communist Party, founded by Mariategui in 1928. It was in Pesce's leper colony in Peru's Amazon that Ernesto "Che" Guevara was first introduced to Marxism and Mariategui's writing during his famous travels across the continent. According to Guevara himself, Pesce's influence inspired him to channel his enthusiasm for adventure "towards goals that are more harmonious to the needs of the Americas" (Krauze 2011: 335–337). Mariátegui's seminal book, *Seven Interpretive Essays on Peruvian Reality*, was republished by Cuba's national press at Guevara's request following their victorious revolution against the Batista dictatorship (Hodges 1986: 179).

His influence on Cuban revolutionaries, however, was not just Guevara's doing. Early Cuban Marxist thinkers were profoundly influenced by Mariátegui's revolutionary magazine *Amauta*, helping them develop a revolutionary theory that spoke to the particular conditions of Cuban workers (Becker 1993). In Nicaragua, this same magazine was a staple for revolutionary thought directly influencing Augusto Sandino who was a subscriber and contributor (Hodges 1986, 264). On the 50th anniversary of Mariátegui's death in 1980, Nicaragua's Sandinista press acknowledged him as "having launched the revolution in Latin American thought" and as the "first to investigate the origins, effects and functions, development... and role of diverse social phenomena including ideologies" (Ibid, 179–180).

The sharpness of Mariategui's revolutionary theory evidently cuts across class lines and epochs, bringing revolutionaries of different social strata and from distinct generations together in the task of building a socialist society on top of the ashes of capitalism. Today, as Eurocentric Marxism becomes ever more isolated and exposed, Mariategui's work becomes ever more relevant, not just for Latin Americans but for the world.

Inside the Life of José Carlos Mariátegui

José Carlos Mariátegui was born on June 14, 1894, in the small Peruvian mining town of Moquegua. His father, Francisco Javier Mariátegui, was descended from an upper-class and prominent family that had played a part in the country's independence. Conversely, his mother, María Amalia Lachira, was a mestiza and daughter of poor campesinos. Mariátegui's father, a government worker, abandoned his young family and left for the north of the country not long after his birth, leaving his mother to raise the three children on her own and in dire poverty.

A decade prior to his birth, Peru and Chile signed the peace Treaty of Ancón that put an end to the War of the Pacific. The war had resulted in the deaths of hundreds of thousands and the ceding of extensive territory to Chile by both Peru and Bolivia, leaving the latter landlocked up until the present day. The cause of the war was to do with the control of territories that were rich in

saltpeter and guano, primary resources that were heavily sought after by the United States and Britain for the development of transport technology and agricultural science (Travis 2015: 8–9). The Peru that Mariátegui was born in, then, was still only recovering from a devastating war with not only an immense loss of human life but that also left the country economically crippled.

It is in this context that his mother decided to move to Huacho, her native town, to be near relatives and began work as a seamstress, the most common subsistence job for a single mother in that period. Despite the economic difficulties, she put Mariátegui through primary school and at age 15, unable to continue supporting his education, secures an apprenticeship for him in the *La Prensa* newspaper as an office boy. Gradually, the young Mariátegui was able to make a name for himself at the newspaper, despite the fact that he had lost a leg as a young child due to an injury that was not treated in time. At *La Prensa*, he is eventually promoted to reporter of local events in 1912, aged just 16 years. Two years later he begins to write cultural critiques under the pen name Juan Croniqueur, catapulting him to national recognition. Although Mariátegui would later refer to this period in his life as his "stone age" due to the noticeable lack of political analysis, it was through writing these critiques that he honed his skill as a critical writer, eventually using it to expose the appalling conditions caused by capitalism and imperialism across the world, but especially in his native Peru. Mariátegui (2014) would later explain that Peru's economic development was impeded by a national economic structure that was designed to serve the interests of British and North American markets, with the help of local intermediaries.

Disenchanted with the elitist world of journalism and the pompous lifestyle of its circles in Lima, Mariátegui and a handful of colleagues begin to flirt with the idea of creating a publication that challenged the status quo, at least on a social and cultural level. The first attempt at a dissident newspaper appeared in 1916 under the name *Colónidad* but was discontinued after just four issues. That same year he left *La Prensa* to join the newly founded *El Tiempo* whose inclination was more left-leaning and allowed him to print articles that were somewhat critical of President José Pardo and his government.

By 1918 Mariátegui was producing over 200 articles a year for *El Tiempo* and other publications in Lima, also finding time to launch another of his dissident newspapers: *Nuestra Epoca*. In sharp contrast to the mainstream papers he had worked for, *Nuestra Epoca* was "destined for the masses" and not for a literary elite, as Mariátegui himself put it (Moretic 1970: 69–70). After printing just two issues, the paper had to be shut down due to lack of funding but not before provoking a national commotion with an article criticizing the excessive funding of the military. Funding that, according to Mariátegui, could have been going toward economic development and education instead. As a result, he was beaten up by soldiers and challenged to a dual (which he accepted without any firearms experience), all which led to the resignation of the minister of war (Paris 1973: 51).

This period marks the shedding of Mariátegui's title as a mere journalist and the commencement of his life as a political theorist and activist that was not content with simply informing his readers but in committing himself and his work to the transformation of society. As early as 1918, outside of his publications, Mariátegui and his *El Tiempo* colleague, Cesar Falcón, were deliberating the idea of creating a socialist party, meeting labor leaders multiple times to discuss their proposal. In the end, they decided that the conditions were not yet ripe for such an organization and instead formed the Committee of Socialist Propaganda and Organisation with the view of preparing the ground for a future party (Moretic 1970: 71).

The following year Mariátegui and Falcón leave their posts at *El Tiempo* to start yet another publication, this time called *La Razón*. The new paper immediately gains popularity as it is the only publication to champion the rights of workers and students in Lima. Such was the impact of *La Razón* on the labor movement that on the same day that labor leaders were released from prison after a major strike, marches were organized to meet at the offices where the paper was based as a gesture of gratitude for its

coverage. Addressing the huge crowd of workers that had gathered that day, Mariátegui reaffirmed the paper's loyalty to the movement by declaring that *La Razón* was "a newspaper of the people and for the people" and that it was inspired by a "profound love for justice" (Illán 1974: 56). During the same period, the paper would also champion the struggle of university students who were calling for reforms, prompting praise from student leaders and committees.

Notwithstanding the huge popular support and praise, *La Razón* suffered the same ill-fate as all of Mariátegui's previous publication projects, this time due to political persecution. Just 3 months after the first issue, the paper's printing operations were first shut down by Lima's conservative and right-wing archbishop, who owned the printing workshop, and then banned altogether by the incoming dictator Augusto B. Leguía who took power on July 4, 1919. It was not in his interest to enrage the public further by using force to eliminate his opponents and critics so Leguía effectively silenced Mariátegui and others, at least temporarily, by exiling them using foreign-based journalist roles in Europe as a guise (Baptista 2006: 89). Toward the end of 1919, Mariátegui and his colleague, Falcón, embarked for Europe with the former assigned to be based in Italy and the latter in Spain.

Mariátegui witnessed a postwar Europe that was struggling to reconstruct itself from the ashes of destruction, observing how radical European intellectuals made convincing arguments that singled out capitalism as the main culprit. A 2-month stint in France personally acquainted him with Henri Barbusse, Romain Rolland, and their *Clarté* movement which are said to have had a huge impact on his ideological development (Becker 1993: 30). Specifically, it was the *Clarté* movement's combination of both a radical internationalism based on worker's unity and the role of intellectuals in this struggle that really affected the Peruvian exile. The harsh weather in France, however, was too much for Mariátegui who was prone to illness, and so decided to move on to Italy where he settled for 3 years. Mariátegui wasted no time in acquainting himself with the worker mobilizations and radical anti-capitalist intellectuals

that developed out of turbulent postwar conditions.

He gravitated toward a number of radical Italian intellectuals of the time but especially to Benedetto Croce whom he would later reference abundantly in his work. Perhaps the most influential event of his European stay, however, was his presence at the socialist Congress of Livorno in January 1921 where the communists split from the social-democrats, effectively creating the Communist Party of Italy (Marchena 1987: 52). During a trip to Florence at around this time, Mariátegui met his Italian wife, Anna Chiappe, with whom he settled briefly in the idyllic little town of Frascati. He later wrote that it was during their time in Frascati as a newly married couple that Mariátegui was finally able to grasp the "confusing, heavy and cold" Marxist theory (Illán 1974: 68). Shortly after and as a consequence of what he had witnessed at the Congress, Mariátegui together with Falcón and two other compatriots are inspired to create the first cell of Peruvian communists. The cell, however, was short-lived as they were forced to leave Italy on the back of the rise of fascist violence. Together with their newborn son, Sandro, Mariátegui and Chiappe traveled to Germany, France, Austria, and Hungary further investigating the postwar conditions in Europe and writing journalistic reports on the catastrophe that those countries were suffering at that time. Although he yearned to visit the Soviet Union, the couple decided against the difficult trip that would have been too strenuous for Sandro.

Mariátegui and his young family headed to Peru in 1923 where he quickly got reacquainted with activist and political circles that were fighting back against Leguía's dictatorship. Shortly after his arrival in March, he was invited by Víctor Raúl Haya de la Torre, who was spearheading the student movement, to give a series of lectures titled *The World Crisis and Revolution* based on his travels in Europe at the Gonzalez Prada Popular University in Lima. The lectures, held in July through to January, argued that Peru's proletariat and their struggles were to be properly understood only when considered as part of the broader problem of global capitalism. Among a wide variety of

themes, Mariátegui expanded on the devastating conditions that Europe was living, the disunity of the European left, particularly the division between reformist social democrats and revolutionary communists (Marchena 1987: 57). Mariátegui would later cut ties with Haya due to their irreconcilable positions that were based along those same lines.

Before their fallout, however, Haya and Mariátegui worked closely together. When Haya was arrested on October 2, 1923, by the Leguía dictatorship for his role as rector of the Popular University, Mariátegui and others at the university were also arrested for meeting up to discuss a plan of action to free him. Mariátegui and his comrades were set free a few days later but Haya was deported to Panama. His competency as a lecturer and his popularity among students in Lima led to him being proposed for a professorship at the University of San Marcos, but the institution refused on the grounds that he did not have any formal qualifications. Instead, Mariátegui accepts Haya's offer to become the director of *Claridad*, a socialist-oriented magazine, in the latter's absence.

Simultaneously, Mariátegui became a contributor for *Variedades*, a weekly newspaper that had ties to the dictatorship. While it may appear strange that he would collaborate with such an institution, he used his column to inform his readers about world events and the development of socialism in Europe, namely, in the Soviet Union. At the same time that he used *Variedades* to inform the public about external events, *Claridad* continued to directly challenge Leguía's dictatorship prompting Mariátegui's second arrest in January 1924. Upon his release, he became even more involved with the labor movement and begins to call for a united front of the proletariat, as per the directives of the Third International (Illán 1974: 75–76). These efforts were interrupted toward the end of May when he is diagnosed with a tumor in his right leg, his only leg, leading to its amputation.

His journalist friends asked the public that rather than pity him that they should offer economic assistance for which they held a cultural and literary event, giving the proceeds to his wife (Illán 1974: 77). Although wheelchair bound and

distraught about his new physical condition, Mariátegui takes just a couple of months to recover before he is back leading *Claridad*, contributing articles to newspapers, and meeting with labor movements. In 1925, having realized that he was not going to get any institutional support, he founded the independent publishing house, *Editorial Minerva*, and launched his first book *La escena contemporánea* based on the articles that he had written since his arrival from Europe. It is also at this point that he became increasingly interested in including the indigenous question in his analysis of the political and economic situation of Peru. Importantly, Mariátegui centers indigenous people as the main actors of economic and political struggle in Peru, not as communities to be saved by benevolent mestizos as was the common view for many of his intellectual contemporaries but rather as the main actors because of their condition as the majority population in the country and the most affected by capitalist-imperialism (Cruz Mosquera 2018).

In September 1926, with the help of a cohort of intellectuals and artists, Mariátegui launches *Amauta*, a magazine whose intention was to attract and help develop a progressive intellectual movement that would serve as the ideological vanguard of the class struggle in Peru. The term *Amauta* in Quechua means "wise one" and was used as a title for professional teachers by the Inca. The magazine's logo, too, was of an artist's sketch of an Inca *Amauta*, and its pages were decorated with ancient Indigenous art and symbols. This indigenous aesthetic was a recurrent theme throughout its issues, demonstrating Mariátegui's deepening concern with the indigenous problem, a problem that would become central to his original Marxist approach.

Unlike Mariátegui's previous publications, *Amauta* was a huge success both in terms of impact and longevity, although it did survive several financial struggles over the years, thanks to contributions from "friends and sympathisers" (Marchena 1987: 71). In Peru, Amauta's stated objective to influence intellectuals and workers over to a socialist analysis of society was hugely successful, soon becoming a dangerous threat to the Leguía dictatorship who arrested and harassed

Mariátegui and attempted to shut down the magazine's printing operations without success.

The impact of the magazine was also felt across Latin America where in Cuba, for example, copies of *Amauta* circulated among the early Marxist vanguard, Mariátegui's ideas becoming evidently present in their own theoretical expressions and actions (Becker 1993: 63). Juan Marinello, one of these early Cuban Marxists, played an important role in bridging "the gap between the generation of Mella and Mariátegui and that of Castro and Guevara" (Ibid: 71). Nicaragua's Augusto César Sandino, too, is said to have kept copies of Amauta on his person and would go on to correspond with Mariátegui who published some of his anti-imperialist letters in the magazine (Hodges 1986: 264).

When Amauta was temporarily shut down and banned by the dictatorship in 1927, Mariátegui and his colleagues reacted by publishing a new magazine called *Labor*, which was less theoretical and aimed at informing workers about current events and labor actions. Through the connections that were made with the labor movement, in large part thanks to *Labor*, Mariátegui suggested the creation of the Confederación General de Trabajadores del Perú, the country's most affiliated national trade union center up until the present.

In 1928 Mariátegui and Haya de la Torre collided ideologically creating a rift not just between themselves but throughout the whole leftist movement in Peru and the whole of Latin America. Haya argued for a united front between the workers and the progressive bourgeoisie against North American imperialism, using the Kuomintang in China as an exemplar for his united front turned political party Alianza Popular Revolucionaria Americana (APRA), even after the former had betrayed the communists. Mariátegui, on the other hand, argued that the most fitting way to combat imperialism was for a communist worker's party to take power. Their ideological differences can be deduced from a back and forth they had in which Haya stated: "we are leftists because we are anti-imperialists" to which Mariátegui responded "we are anti-imperialists and leftists because we are

socialists" (Illán 1974: 164). Haya accused Mariátegui of being Europeanized in his position and suggested that he needed to analyze the situation in the Americas according to its own reality and not through what was dictated by the left in Europe. This accusation prompted Mariátegui's now famous phrase on socialism in Latin America having to be an original creation based on the region's own reality.

Following this exchange, Mariátegui is inspired to finally establish the Peruvian Socialist Party in September 1928 affiliated to the Third International, which changed its name to the Peruvian Communist Party in 1930. In this same period, he also publishes his second book *Seven Interpretative Essays on Peruvian Reality*, where he elaborates a socialist account of Peru's history. Even the most aggressive critics of the ideas expressed in the *Seven Essays* conceded that it was convincingly written and forecasted that it would have a great impact. It was only after his death, however, that the book really began to gain popularity, eventually praised as one of the most original pieces of work by a Latin American writer.

By September 1929 Mariátegui was, more than ever, attempting to integrate socialist ideas into the direction of the labor movement using his newly established party as the vehicle of influence. Leading members of Haya's APRA, especially in the diaspora, dissolved their branches and joined Mariátegui's Socialist Party and postulated him as their representative at forums such as the Second Anti-Imperialist World Congress of the League Against Imperialism and for National Independence. Leguía's dictatorship, however, did not stand by while his influence within the labor movement grew. Once again, using the accusation of a "communist conspiracy" against the government, officers were sent to shut down *Labor*'s printing operations as well as to search Mariátegui's home. In reality, Leguía was anxious about Mariátegui's anti-imperialist influence on the public as his government was increasingly dependent on trading relations with the United States who sought access to Peru's abundant primary resources such as rubber, cotton, sugar, silver, copper, and so on.

M

On the back of this renewed and intensified persecution, Mariátegui, toward the end of 1929, arranges to move with his family to Buenos Aires where he planned to continue to publish *Amauta* and advance his revolutionary projects. Ready to depart, Mariátegui's health rapidly deteriorates and is admitted into a hospital. Sensing the severeness of his condition, Mariátegui renounces his positions in the Party and Amauta, handing over the leadership to trusted comrades. On the morning of April 16, 1930, Mariátegui passes away at the age of 35. The next day, laborers from the Confederación General de Trabajadores led the funeral procession waiving a single red flag followed by tens of thousands of workers and supporters in what has been described as the largest funeral procession ever seen in Lima. Just prior to his death, Mariátegui had completed two manuscripts of books that were to be published in Spain by his long-time friend and comrade, César Falcón, but these were lost during shipping.

Definition

José Martí, a deported Cuban who resided in New York City between 1880 and his death fighting for Cuban independence in 1895, observed with alarm the emergence of US imperialism during the transformative decades leading up to US intervention in the Cuban War of Independence and its resolution in 1902, through which the US annexed Puerto Rico, the Philippines, and other islands, and set up a tutelary relationship to Cuba.

Introduction

José Martí, a deported Cuban who resided in New York City between 1880 and his death fighting for Cuban independence in 1895, observed with alarm the emergence of US imperialism during the transformative decades leading up to US intervention in the Cuban War of Independence and its resolution in 1902, through which the US

annexed Puerto Rico, the Philippines, and other islands, and set up a tutelary relationship to Cuba. His extended residence 'in the monster's entrails', as Martí described his life in New York to his dear friend and Mexican editor Manuel Mercado, provided him with insights about his host country's imperialist vision with respect to Latin America and the Caribbean. Viewing with greater prescience than most of his North and South American contemporaries, Martí developed a critique of the US's double dealings with Native Americans, of Westward expansion into the states that once were Mexican, of attacks on Chinese and European immigrants, of the miserable conditions of working people, and of lynching as a common method of administering justice.

Above and beyond his keen interest in Cuba's national independence from Spain, he devoted thousands of pages as a translator of US literature and society, its popular culture and politics, its prominent literary figures, and influential late nineteenth-century ideas such as the definition of what is the 'modern', as I argued in 2008. These translations facilitate his Latin American, Caribbean and Latina/o readers' conceptualisation of themselves as a region with common political, cultural, and economic interests, as 'Latins' and not 'Saxons', and as a 'United States of South America', with every bit as much or more potential than the republic north of the Río Bravo to define the future of America (Martí 2002/1894: 330). The key text that has established Martí's reputation as a foundational anti-imperialist in the Latin American and Latina/o tradition, is 'Nuestra América' (1891), but to grasp the ways he theorised race, class, culture, and politics in order to make a case against empire, let us consider the context in which this manifesto emerges.

Born José Julián Martí y Pérez in 1853 in Havana, Cuba, to a Valencian father, Mariano Martí Navarro, and a Canary-Islander mother, Leonor Pérez Cabrera, Martí was the eldest in a family of eight children and the only son. His early education with Rafael María de Mendive introduced Martí to a growing movement in support of Cuban independence dating to the early nineteenth century. Aged 16, as the first war of Cuban independence was unfolding, Martí was convicted of sedition and treason and condemned to 6 years of hard labour because of a letter (which he never sent) that discouraged his classmates from serving as part of the police forces of the Spanish colonial regime. Through the influence of his mother, the sentence was commuted after 6 months; he was released but with the stipulation that he live out his exile in Spain. The marks of the whippings and scars due to chains he wore coloured the rest of his life. In Spain, Martí pursued Law, Philosophy, and Literature; for political and financial reasons, he did not formally receive the degrees for which he completed courses of study during his lifetime. (In 1995, the University of Zaragoza granted the degrees posthumously.) Martí returned first to Mexico for 2 years. After a brief sojourn in Cuba in 1877, he moved to Guatemala and worked as a professor of literature where he became renowned for his fiery oratorical style. He resigned from his post after 1 year in protest at the firing of a fellow Cuban. Martí and his new wife Carmen Zayas Bazán returned to Cuba, but his political views led to him being deported a second time to Spain. As quickly as possible, he made his way to New York to join the efforts on behalf of Cuban independence.

While living in New York, Martí worked long hours and organised the growing Cuban and Puerto Rican émigré community at night. Having become bored by his work as a Wall Street office worker, Martí began to make his living by writing for major Latin American newspapers as a foreign correspondent, and by contributing to local Spanish-language newspapers and magazines. In the later 1880s, he also held posts as a consular officer for Uruguay, Argentina, and Paraguay. In his work as journalist and cultural critic, Martí engaged in translation of the events, the culture, and the politics of the US and Europe for readers in Venezuela, Colombia, Argentina, Mexico, and in the Spanish-speaking United States. The novelty of the scenes he described pushed him to forge a new genre, the *crónica* (short, very literary, prose essays), that convey non-fiction in highly metaphorical and rhetorically rich figurative language which Rubén Darío described as unforgettable. In these pages

M

of journalism, Latin American readers encountered for the first time and through Martí's critical eye the aesthetics and politics of Ralph Waldo Emerson, Walt Whitman, Oscar Wilde, Helen Hunt Jackson, Mark Twain, Henry Wadsworth Longfellow, George Bancroft, and Frank Blackmar among many others. He returned to teaching, but of Spanish as a second language at night. While immersing himself in this study and representation of the US, Latin America, and Europe, Martí also wrote several volumes of poetry, travel sketches, edited a newspaper, wrote a magazine for children and his own short novel, diaries, personal notebooks, and an extensive epistolary. Scholars such as Julio Ramos, Ivan Schulman, Evelyn Picón Garfield and Susana Rotker have attributed to Martí an inaugural role in defining a modernist sensibility in these texts, marked in large part by his attempt to depict the intense changes that accompanied industrialisation, immigration, urbanisation and imperial expansion and through his influence on subsequent writers. He sketched outlines for 50 book projects in his short lifetime, but lamented that his radical political commitments would require him to go to the grave with many books unwritten.

In New York, Martí expanded his nationalist vision to include a Latin Americanist regional consciousness. Simultaneously, he developed a critique of the US's betrayal of its own revolutionary tradition, insofar as it increasingly assumed the mantle of European-style empire. A series of historical events, often neglected in narratives of US history, contributed to Martí's anti-imperialist turn. These events proved crucial for shaping his profound alarm at the possibility that the US would simply 'take' his island and make it a protectorate. First, the annexation of the northern half of Mexico in 1848 haunted him as a possible future for Cuba: he depicted the maddening effects of annexation for the original Californianos in his translation of Helen Hunt Jackson's *Ramona*. Second, the 1879–83 War of the Pacific, in which US suppliers provisioned both Chile and Peru with arms, introduced Martí to the tactics by which the US sought to compete

with Britain and France for rights to exploit Latin America's resources. Secretary of State James Blaine, the most powerful Republican of the second half of the nineteenth century, blocked European attempts to mediate between Bolivia and Chile, invoking the Monroe Doctrine. After creating expectations that the US would defend Peru militarily, the US abruptly withdrew and left Peru open to the mercies of the Chileans. Third, real threats of popular expansionist sentiment horrified him, as when the US came close to invading another row of mineral-rich northern Mexican states in 1886, as a result of the intrigues of the Annexationist League and its leader Augustus K. Cutting, which prompted Martí to write a letter in fierce opposition, recently republished by Rodolfo Sarracino (2003).

The tactics of the Republican Party under Blaine's leadership generated a suspicion of the US's intentions that lasted until the end of Martí's life and informed much of his reporting on the other major historical event that shaped his critical understanding of US attitudes toward his America: the International American Conference of 1889–90, on which Martí reported with passion and vigilance. This Conference, organised by the same secretary of state, James Blaine, now under President Benjamin Harrison, promised to establish procedures for arbitrating military conflicts, common weights and measures, even a common currency to be called the 'Columbus' (in English), all in the name of friendship among the American Republics. The leaders of the 'pueblos latinos de América', as Martí described in his report in 1891, in his capacity as official delegate for Uruguay to the International American Monetary Commission, refused to co-operate with the official and unofficial aims of the conference and the Commission. Precisely during this period, Blaine made arguments about the convenience and wisdom of US annexation of Cuba. To Martí, this proposal was anathema. The culture of the 'Congreso Panamericano', as Martí referred to it, devised by Blaine as a means to secure business deals, concessions for US transportation industries, and to extend US influence in the

region, proved odious to Martí. He transcribed the heady imperial sentiments he found in the headlines reporting on the meeting for his Latin American readers: 'Clay's Dream'; 'The Just Influence'; 'Not Yet'; 'Steamships to South America'; 'Manifest Destiny'; 'The Gulf is Ours!' The proceedings of the conference and the Commission revealed to Martí and to his readers 'the open proposal of new era of domination of the United States over all the peoples of America' (Martí 1963–1975/1889: 52–53).

Simultaneous with Cutting's provocation and the popular call for a second invasion of Mexico, police abuse and corruption of the juridical system and failure to address the root causes of the massive protests of working peoples further confirmed to Martí, as he wrote in his unpublished notebook (no. 18), that 'Cuba must be free–from Spain and from the United States' (Martí 1963–75: vol. 21, 380). Although many Latin Americans had seen the US as a model for their newly independent nations, including Argentine president Domingo F. Sarmiento and perhaps even Martí, his descriptions of the largest demonstrations of workers in the history of the US, where hundreds of thousands demanded an 8-hour workday and an end to child labour, suggest that Martí came to question the appropriateness of the US model for his America. In his reporting on the Haymarket anarchist's trial and the eventual hanging of four men with anarchist political views on charges for which they were posthumously exonerated, Martí voiced the anger and shock of the immigrant workers as they realised that the US would not offer them a 'new' world: 'The police, proud in their wool jacket uniform, proud of their authority, and terrifying to the uneducated, beat and assassinate [the workers]. They are cold and hungry and they live in reeking shacks. America then is the same as Europe!'(1963–75/1888: Vol. 11, 338; *Selected Writings* "Class War in Chicago: A Terrible Drama" 200). In addition to this lack of representation for workers, Martí documented gruesome and xenophobic acts of vigilante violence, including the lynching of 11 Italian immigrants inside a Louisiana jail and of the burning at the stake of an African American, both of which reveal his awareness that structural injustice prevented full exercise of rights for all in the US. Martí's 'Letter to the Director of the *Evening Post*' (2002/1889), also entitled 'Vindication of Cuba' and republished in English and Spanish, denounces racism toward Cubans resident in the US and on the island as part of a founding imperialist discourse that stereotyped Cubans – because of their mixed race or supposedly failed masculinity – as incapable of governing themselves.

Martí meditated in his writings on events from his location within the empire's belly; 'Nuestra América' or 'Our America,' bears the oratorical flourish of its first enunciation as 'Madre América' at an 1890 gathering of same Latin American leaders who had assembled in New York for the International American Conference. The revised version, which we know now as Martí's antiimperialist manifesto, appeared in print in January 1891 simultaneously in New York and in Mexico. 'Our America' called upon its Latin American and Spanish readers inside the US to awaken to the threat that the US posed to the independence and sovereignty of Latin America's nations: 'It is the hour of reckoning and of marching in union, and we must move in lines as compact as the veins of silver that lie at the roots of the Andes' (2002/1891: 289). Although it was the document of a light-skinned creole leader addressed to other creole leaders, he asked his Latin American colleagues to turn their orientation away from European and North American models (the imported books and reheated leftovers of colonial legacies) and instead to embrace and celebrate the knowledge and culture of their own 'hybrid lands', for only an original creation would correspond to the 'enigma' of Latin America (294). He called for his America's schools to teach the native languages of 'our Greece', or the ancient American civilisations in order to decolonise Eurocentric curricula that are the legacy of colonialism and imperialism (291). In an anti-racist bid for unity

M

and equality, he declared that in his America 'there is no race hatred, because there are no races' (295). Here Martí differed from the vast majority of white people in the US who actively invested in and advocated for white privileges; but he underestimated the trenchant legacies of white supremacist policies and racial terror in the wake of centuries of colonisation and enslavement.

Within 2 years of the International American Conference, together with Arturo Schomburg and others, he founded the Cuban Revolutionary Party and its newspaper *Patria* in New York; from mid-1892 until his death he worked full time to raise money and support for a third strike for Cuban independence. In the first skirmishes of that war in 1895, Martí was killed by a Spanish soldier. He was quickly immortalised for his self-sacrifice as a martyr of the Cuban nation. In the wake of the 1959 revolution, both Cuban exiles and Fidel Castro himself have defined Martí as intellectual ancestor to their politically antagonistic projects. Philip Foner is clear that Martí was never himself a socialist nor a Marxist, although he knew of and respected Marx's commitment to the oppressed and disenfranchised and conveyed a thorough critique of the social conditions in which workers lived under the capitalism he observed in the US. In 2001, George W. Bush cited Martí in his speech on behalf of economic regionalisation at the Summit of the Americas in Quebec (21 April 2001), but study of Martí's writings suggests that he vehemently opposed such US-led 'pan-American' projects. Although Martí's politics continue to be hotly contested by Cubans on and off the island, his writings reveal growing suspicion and discontent with the US's imperial turn in the late nineteenth century. His writings and first-hand experiences as an economic migrant in New York led him to predict the US's aspirations to global empire in his final 'Letter to the Editor of the *New York Herald*', published in English on the day of his death (Martí 1895). Martí's writings call upon his readers to prevent this imperialist development by fighting for Cuba's independence and for his America's self-determination, which would in turn help the US to return to its founding revolutionary principles.

Introduction

"Marx was a man of his time." This is the first sentence that comes to mind when we discuss the topic Karl Marx and imperialism. This is certainly true. But Marx's time was not the "anti-colonialist," "liberal phase" of British capitalism that even Marxists like Karl Kautsky described as "the period of greatest freedom for India" (1907, p. 76). (We can find similar considerations in Lenin's *Imperialism* ([1917] 1996, p. 79).) It was the period of the so-called British free-trade imperialism, a phase of great expansion of British formal and informal empire (Gallagher and Robinson 1953). It is therefore no surprise that Marx reflected at length on these processes both in his writings on colonialism – such as those on Ireland, China, India, Russia, and the American Civil War – and in his notebooks, which are being published for the first time in the *Marx-Engels-Gesamtausgabe* (MEGA^2): the historical-critical edition of Marx's and Engels's complete writings.

The MEGA^2 project only started in the mid-1970s, and it took a long time for Marx's *New York Tribune* articles on colonialism to obtain recognition after their first publication in the 1950s. This is why these articles were not mentioned in the Second International's discussions on colonialism and, when the great debate on imperialism took place before and during World War I, neither Rosa Luxemburg nor Lenin showed any awareness of their existence. It is remarkable however how peripheral Marx's articles and notebooks on colonialism have remained even today.

In this entry I present a reading of Marx's *Capital* in the light of both his articles and writings on colonialism: this is not just a philological endeavor but an investigation into the place of imperialism within the overall process of capitalist accumulation and the class struggle.

My reading contradicts one of the main premises of Marxist debates on imperialism from the Second International until today: the view that the model of *Capital* volume 1 is a model of a "closed national economy" without colonial possessions or imperialist dominations (see, e.g., Brewer 1990, p. 19; Harvey 2005, p. 144; Patnaik and Patnaik 2016; Wood 2006, p. 21). In the next two sections, I argue that, on the contrary, in *Capital* Marx overcame the limits of classical political economy and understood capitalist accumulation as a polarizing process operating on a world scale. He included international investment, migration, and expansionism into his analysis and considered processes of capital centralization that, for Lenin, characterized the imperialist phase of capitalist development. In section "Accumulation and Imperialism," I challenge the view that the part of *Capital* volume 1 on the so-called primitive accumulation offers a description of the prehistory of capital and argue that it also contains a description of the permanent methods of capital reproduction. The violence of the state, for Marx, has a fundamental role in the global process of capital accumulation, which necessarily takes an imperialist form. In this framework, processes of imperialist domination are subsumed under the general laws of development of capitalism, under the law of impoverishment of the working class in particular. In this light, in section "Imperialism and World Revolution," I discuss Marx's evolving assessment of the prospects for international revolution. The final section draws some conclusions on the contemporary relevance of his critique.

Capital: A Globalizing System

In *Capital* Marx examines the capitalist mode of production and the conditions of production and exchange corresponding to that mode, using England as their chief illustration. At the time,

M

England was the core of an expanding empire and a completely developed instance of the capitalist mode of production. From the specific characteristics of capitalism in England, Marx abstracts the general laws of development of the antagonisms of the capitalist mode of production itself. Marx's *Capital*, therefore, is not limited to the analysis of a specific historical stage, i.e., mid-nineteenth-century English capitalism, but examines the general laws of its development (Marx 1996, p. 9). Volume 1, moreover, does not consider individual capital – as both Lenin and Rosa Luxemburg believe – but examines the production and reproduction of the "total social capital," which is both the individual capital and the sum total of all existing capitals. The concept of total social capital – or, more simply, "capital" – refers to all branches of a "given society," which is not confined by national boundaries. By analyzing one capital, Marx analyzes the totality of them, because plurality and competition are inherent to the essence of capital. The concept of capital reflects the tendency of the capital of the dominant states toward universal dominance. As competition is capital's very essence, however, this *limit* cannot actually be reached. Marx already rejected "ultra-imperialism" scenarios; for him, as we shall discuss, accumulation enhances capital competition, which expresses itself in increasing intercapitalist and interstate antagonisms (Marx 1996, p. 414).

In Chapter, ▶ "Sources of Surplus Value and Imperialism," Marx proves that expansionism is an immanent necessity for capital *at every stage of its development*. Chapter 25 "The General Law of Capitalist Accumulation", as we discuss in the next section, then shows that accumulation increases capital's expansive power and tends toward the *extreme limit* of absolute, universal wealth. In examining the "Conversion of Surplus Value into Capital" at the beginning of Chapter 24, in fact, Marx takes "no account of export trade, by means of which a nation can change articles of luxury either into means of production or means of subsistence, and *vice versa*." And he adds, "in order to examine the object of our investigation in its integrity, free from all disturbing subsidiary circumstances, we must treat the whole world as one nation, and assume that capitalist production is everywhere established and has possessed itself of every branch of industry" (Marx 1996, p. 580). According to Lenin ([1899] 1977, p. 54) and Rosa Luxemburg ([1913] 1951, p. 136) and to later interpretations, this abstraction means the isolation of England from the world market: Marx would analyze a "closed national system" and the development of the *domestic* market.

But this interpretation ignores crucial aspects of Marx's argument and, in particular, his critique of the classical economists' theory of reproduction. In Chapter 24, Marx criticizes classical political economy from Adam Smith to Henry Fawcett for failing systematically to analyze the origin of surplus value in the exploitation of labor. As a consequence, he maintains, Smith and Ricardo confused the total product with the newly created value: while the latter comprises variable capital and surplus value, the former includes constant capital in addition. Since they excluded constant capital from the country's total product, the classical economists ended up claiming that accumulation leads to the growth of the national revenue, as if capitalist production were aimed at the consumption of the national population and not at accumulation, which involves the expansion of constant capital and the foreign market.

This model presupposes that factors of production are mobile only within a particular country but never cross its boundaries: an assumption that clashed with the expansion of the "field of action" of British capital in the period of "free-trade imperialism," which included labor migration toward Britain, from Britain to the colonies, and between British colonies. For Marx, Henry Fawcett's *The Economic Position of the British Labourer* (1865) expressed this contradiction at the highest degree. On the one side, Fawcett adhered to the wage-fund theory: a theory built upon the classical economists' theory of reproduction according to which the average money wages received by each laborer corresponds to the amount of one country's "labor-fund" divided by the number of the laboring population within the same country. But on the other side, Fawcett claimed that the bigger portion of wealth annually saved in England was exported to foreign countries

(1865, pp. 121–123). With the additional capital exported, Marx concludes ironically, also part of the labor-fund "invented by God and Bentham" was exported (Marx 1996, pp. 606–607).

Marx's treating "the whole world as one nation," therefore, does not mean that he isolated England from the world market; this abstraction rather allowed him to take structurally into account the international mobility of capital and labor (Marx 1996, pp. 606–607). In the 1872–1875 French edition of volume 1, Marx (1989) makes this even clearer by arguing that in the age of mechanical industry the external market prevails on the internal market, impelling the annexation of new countries and increasing rivalries among the industrial powers (MEGA² II/7: 557). Thus, in Chapter 24 – using Harvey's words (2007, p. 59, 62) – Marx systematically includes geographical expansion as one path of surplus absorption and also as a means of increasing the industrial reserve army of labor: an aspect that has been underestimated in later interpretations of his work (Marx 1996, p. 634). British capital invested abroad is considered to be part of the "total social capital," while British colonies are seen, as economically were, as particular districts of the system of the dominant country providing it with labor-power exploitable in loco or through international migration. The "free" migration of the "industrial era" appeared to Marx as a new form of slave trade allowing capitalists to exploit workers to the utmost (1996, p. 272).

Although globally the overwhelming majority of resources and labor were not exploited in a *capitalist form*, Marx presupposes the universal extension of the capital-wage labor relation. On the one side, this abstraction reflects the fact that capital can *integrate* and *subordinate* forms of exploitation different from the "free" wage relation. As Jairus Banaji states (2010, p. 282), in some countries and particularly in the colonial world, *capitalist relations of exploitation* were nonetheless widespread and dominant. On the other side, the full worldwide establishment of the capital-wage labor relation is the extreme *limit* of capitalist development, which involves a constant process of expropriation and proletarianization of peasants, artisans, and the self-

employed, because of competition from industrial production and direct state intervention.

Accumulation and Imperialism

Marx continued to work on *Capital* Volume 1 long after its first publication in 1867. In revising Volume 1 for the 1872–1875 French edition, Marx put more emphasis on colonialism, imperialism, and precapitalist societies and elaborated on his studies of the corporations in the UK, the USA, and Germany. In this light, Marx distinguished for the first time between concentration and centralization of capital: while the former is a process of concentration of production, the latter denotes the fusion of already existing capital and the formation of joint stock companies and leads to the growth of a financial aristocracy less and less directly involved in production. Nevertheless, for Marx, there is a fundamental unity between "capital 'in' the production process" and "capital-'property', capital 'outside' the production process and yielding interest of itself" (Marx 1998, pp. 372–373). Treating "capital-property" as separate from "capital in production" is for Marx (1998, pp. 396–397) the highest form of fetishism.

This shows that Marx already addressed the growth of "finance capital" that became so central in later debates on imperialism. It is noteworthy that while in Hilferding's account the concentration of capital and the connection between industrial and banking capital play a decisive role in the rise of imperialism, capital concentration was virtually absent from Hobson's account (see Hobson 1902; Callinicos 2009, p. 48). This reflects the fact that the form of internationalization of German capital partially diverged from that of British capital: the former took place after a process of concentration at home and through the connection between industrial and banking capital, while British capital was invested overseas without big head offices at home (Wilkins 1988). Marx's analysis of capital concentration and centralization escapes some of the rigidities of later debates and makes it possible to understand the tendencies underlying different paths of accumulation:

M

In any given branch of industry centralization would reach its extreme limit if all the individual capitals invested there were fused into a single capital. In a given society this limit would be reached only when the entire social capital was united in the hands of either a single capitalist or a single capitalist company. (Marx 1976, p. 779) (This passage is not present in Marx (1996))

Centralization, for Marx, takes place "in any given branch" of industry and between different branches of a given society. It has the effect of abolishing, as far as it can, the demarcations between them and of strengthening the intrinsic characteristics of capital, which ignores sectorial and geographical frontiers. The increased mobility of the most centralized capital thus extends the scale of capital's operations and labor cooperation, enhancing the antagonism between capital and wage labor. All this shows that, for Marx, the processes that for Lenin marked the imperialist phase of development – export of capital, growth of a financial aristocracy, increase in the size of firms, and division of the world between capitalist associations – are part and parcel of the global process of capital accumulation.

What about the role of the state(s)? The point is that for Marx accumulation is not a purely "economic" process: given its antagonistic nature, state intervention is essential to the reproduction of capital. As evident in periods of economic crises, the links between capitals and their national governments have actually strengthened over time. This is why in Part 8 on the so-called primitive accumulation Marx incorporates the *state system* into his analysis. He does not describe "incidental" processes, "illustrating merely the genesis of capital, its first appearance in the world," as Rosa Luxemburg argues (1951, p. 364), but rather presents the state's permanent role both in generating the capitalist relation and in reproducing it. Combining the analysis of Western state- and empire-building, Marx describes both the processes of state-supported dispossession of communities aimed at securing land, resources, and labor-power for capitalist interests at home and the role of colonialism, trade policies, and war in concentrating the wealth then invested in industrial production. For Marx these processes are far from over in the industrial phase: "the

commercial war of the European nations, which has the globe as its battlefield," in his view, was "still going on in the shape of the Opium Wars against China." Even if Britain, France, and the USA cooperated in China with the goal of extending their spheres of influence, their reciprocal rivalries were increasing.

By examining the permanent character of methods of so-called primitive accumulation, Marx makes it possible to conceptualize what Rosa Luxemburg (1951, pp. 452–453) calls the "dual" aspect of capitalist accumulation, namely, the connection between surplus value production in workplaces and "force, fraud, oppression, looting" on an international scale, especially in the relation between capitalist and noncapitalist societies. These two aspects of accumulation were indeed "organically linked" for Marx, and "the historical career of capitalism can only be appreciated by taking them together" (ibidem). In stressing the fundamental importance of processes of the so-called primitive accumulation in the relation between capitalist and noncapitalist societies, Rosa Luxemburg made explicit some aspects Marx had already developed in his work at a higher level of abstraction, even though she assumed that Marx's *Capital* presupposes the model of a "closed national economy" (see, e.g., Luxemburg 1951, p. 428).

Marx, in my view, took two steps further with respect to Lenin, Luxemburg, and contemporary theorists of imperialism. First, he grounded his analysis of imperialism in his value theory. Following the so-called primitive accumulation, for Marx, it is capital accumulation as such that tends to concentrate higher value-added production in the system's most competitive centers, leading to a forced specialization of dependent countries in lower value-added sectors, to the repatriation of profits extracted in these countries, and to forms of unequal exchange between nations with different productivity levels. These forms of uneven and combined development are reflected in differential forms of labor exploitation in the nations involved. Marx, secondly, understood *evolving* interstate relations against this global backdrop. In his view, economic and military expansionism and the resulting growth of the relative surplus population were powerful factors raising the rate of

exploitation and countervailing the tendency of the rate of profit to fall. Marx thus conceptualized the reserve army in truly global terms and identified the permanent role of the state in its expansion.

This allowed him to examine the interaction between the dynamics of the global reserve army and the condition of the working class at the national level. In his eyes, the long-run combined effect of concentration and centralization is an increase in the organic composition of capital and a relative reduction in the demand for labor-power, which coexists with an absolute increase of the number of proletarians. As living labor is the only source of value, however, this causes increasing complications, pushing capital to exploit labor to the utmost, in intensity as well as duration. This explains why, for Marx, the law of impoverishment of the working class is the absolute, general law of capitalist development. Capital accumulation necessarily leads to the impoverishment of the world working class, in spite of and through the different conditions of its national sections. Significantly, at the end of Volume 1 Chapter 25, in order to illustrate this law, Marx also presents the case of Ireland, which he defines as an "agricultural district of England, marked off by a wide channel from the country to which it yields corn, wool, cattle, industrial and military recruits" (Marx 1996, p. 694). In the French edition, he further develops his analysis of the situation of Irish workers and farmers after the "Agricultural Revolution" that followed the Irish Famine and examines the opposite effects of agricultural development and rural migration in industrialized countries like England and colonized countries like Ireland, where emigration provoked depopulation (Marx 1996, pp. 699–700). In his articles on India and China, Marx presents the similar effects of British colonialism in Asia, which he considers to be "organic results" of the industrial system (see Anderson 2010; Pradella 2013 and 2014).

Imperialism and World Revolution

In Marx's *Capital*, the concentrated violence of the state is presented as an *economic force*, which operates according to the laws of accumulation. This makes it possible to understand imperialism as the concrete form of the accumulation of capital on a world scale. But the laws of capital accumulation appear to be natural and necessary only when workers are divided and subordinated under capital. Capitalism, however, develops in a contradictory way: any increase in the productive power of social labor subsumed under capital is due to cooperation, which is the premise of the expansion of capital's "field of action" and has the same universalizing tendency. The development of capital is therefore the development of the world working class and lays the basis for the creation of its historical alternative (Marx 1996, p. 750). As the international context is inherent in the condition of the working class in every nation, workers cannot limit themselves to economic struggles and to demands for a better distribution of the "national" product. As Marx explains in his 1867 address written on behalf of the General Council of the International Workingmen's Association to its Lausanne Congress, this kind of approach is impotent against the effects of international restructuring and migration. These processes, for Marx, have rendered national workers' associations powerless.

> A study of the struggle waged by the English working class reveals that, in order to oppose their workers, the employers either bring in workers from abroad or else transfer manufacture to countries where there is a cheap labour force. Given this state of affairs, if the working class wishes to continue its struggle with some chance of success, the national organisations must become international. (Marx and Engels 1985, p. 422)

While Marx's and Engels's internationalism has always been unambiguous with respect to industrialized countries, their conception of the relationship between proletarian and anti-colonial struggles evolved over time. In the *Manifesto* they argued that the proletarian struggle in industrialized countries was national only in its *form*, but not in its *substance*, and its victory could have led to the emancipation of the colonies as well. It was only in his 1850–1853 writings and articles on China and India that Marx recognized the active role of colonized and oppressed people in the revolutionary movement. In 1850, in the *Neue*

M

Rheinische Zeitung, Marx and Engels enthusiastically supported the Taiping revolution in China and welcomed the prospect of a social revolution in the country (Marx and Engels 1978, p. 267). In his much contested 1853 articles on India, moreover, Marx identified not only the destructive effects of British expansion in India but also the *material conditions* for a unified anti-colonial uprising of the Indian people. This was for Marx the only way in which the Indian people could get rid of the colonialist joke. Four years later, when the Indian national anti-colonial movement did indeed erupt, Marx *unconditionally* supported it, interpreting it as parts of a general uprising of the "great Asiatic nations" against British colonialism (CW15: 297–8).

These movements could have had a reaction on Europe, accelerating the tendency toward crisis and the possibility of a revolutionary outcome. But if the expansion of the world market laid the basis for the reciprocal reinforcement of the struggles on an international scale, Marx and Engels also recognized that the exploitation of the whole world by Britain was creating a "bourgeois proletariat," rendering this interconnection more difficult (Marx and Engels 1983, p. 342). If the connection between anti-colonial and proletarian struggles did not take place, for Marx, anti-colonial revolutions could be the starting point for the capitalist national development of these countries, as actually happened with the anti-colonial movement and the birth of capitalist nation-states in the Global South in the twentieth century. It is therefore not surprising that Marxism was such an inspiration in the great wave of anti-colonial struggles in the second half of the twentieth century.

Although they did not generate the hoped for revolutionary outcomes, anti-colonial movements throughout Asia represented aggravating factors in the 1857 economic crisis that enveloped the world market. The crisis and the Crimean War gave impulse to a number of social movements, in Russia for the suppression of serfdom and in the USA for the abolition of slavery, while in Europe the workers began to mobilize again through trade unions and politically. For Marx, mobilizing African Americans was the precondition for the

victory of the North in the American Civil War and for emancipation, and this was in turn the premise for any further progress of the labor movement in the USA and beyond. Indeed, in the 1867 preface to *Capital*, Marx wrote that the American Civil War was the harbinger of socialist revolution. In the 1860s, moreover, the Fenian movement gained strength both in Ireland and among Irish immigrants in Britain and the USA. Further revising his view of international revolution, in a letter to Engels of December 10, 1869, Marx states that he had changed his mind on the relationship between Irish question and the emancipation of English proletariat. "The English working class will 'never accomplish anything' before it has got rid of Ireland. The lever must be applied in Ireland" (Marx and Engels 1988, p. 398). The only means of hastening the social revolution in Britain was to promote the working class's support to the Irish national struggle as the *precondition of its own emancipation* (Marx and Engels 1988, pp. 473–475). (For an excellent analysis of the place of the USA and Ireland in Marx's critique of political economy, see Anderson (2010, pp. 79–153)). Significantly, it was soon after his writings on Ireland and the Paris Commune that Marx revised the French edition of *Capital*, Volume 1.

Marx's writings on Ireland and on the English labor movement played a fundamental role in the elaboration of Lenin's analysis of imperialism and the anti-imperialist program of the first congresses of the Third International. While in the preface to *Imperialism* (1996 [1917]) Lenin argues that in writing the pamphlet in Zurich he "suffered from a shortage of English literature," his *Notebooks on Imperialism* (1968 [1915–16]) documents Lenin's extensive engagement with Marx's political writings and letters, in particular those on the International, Ireland, the English labor movement, and the corruption of its political leaders. These writings were essential for Lenin in order to argue for the centrality of the connection between struggles of the metropolitan workers and those for national liberation of oppressed peoples against imperialism. Thus, even if Lenin presupposed a "national" interpretation of *Capital* Volume 1 and tried to integrate it in order to account for the new phase

of expanded imperialist development, he highlighted the economic and political centrality of processes that were, for Marx, integral components of capital accumulation. By building on Marx's statements and letters on Ireland, moreover, Lenin elaborated a broader political program for world revolution that was then formulated in the statements of the first congresses of the Third International.

Legacies and Consequences

Contemporary Marxist debates on imperialism still start from the assumption that Marx's *Capital* focuses on a self-enclosed national economy in a specific historical phase of accumulation, rather than on the overall tendency of the system as a totality. In analyzing capital reproduction, however, Marx treats "the whole world as one nation," anticipating Rosa Luxemburg's insight that "if the analysis of the reproductive process actually intends not any single capitalist country but the capitalist world market, there can be no foreign trade: all countries are 'home'" (Luxemburg 1951, p. 108). In this way, Marx took structurally into account the international mobility of capital and labor-power. By distinguishing *concentration* and *centralization* of capital, he recognized the importance of mergers and acquisitions, the formation of joint stock companies, and the growth of "finance capital." He rejected the separation between "capital in production" and "capital-property" and firmly situated imperialism within the global dynamics of capitalist accumulation.

Marx thus grounded the analysis of imperialism in that of global class relations, paying attention to the interrelationship between the expansion of the global reserve army and labor exploitation in production: a point that was largely overlooked in the debate on the "new imperialism." Harvey's assumption that Marx's *Capital* examines a closed economy "working under conditions of 'peace, property and equality'" (2005, p. 144), in particular, overlooks the interlinkages between processes of expropriation and exploitation within the overall dynamic of capital accumulation. This helps explain why Harvey

increasingly focused on processes of "accumulation by dispossession" as key to understanding imperialism, up to the point of arguing that forms of surplus value extraction are subsumed under "accumulation by dispossession," rather than vice versa (Harvey 2010, p. 311). As Alex Callinicos argued (2014, pp. 197–198), this approach expresses a wider tendency to denying the centrality of industrial production and wage labor in capital accumulation. It also ignores how different forms of expropriation are shaped by and interact with dominant forms of labor exploitation.

In recent years, this tendency has been countered by a series of works focused on imperialism and production restructuring. John Bellamy Foster et al. (2011), for example, highlight that for Marx "the tendency toward the domination of the economy by bigger and fewer capitals was as much a part of his overall argument on the general law as was the growth of the reserve army itself. The two processes were inextricably bound together." In their view, the emergence of a massive global reserve army of labor in the neoliberal period is one of the main defining features of the new imperialism of the late twentieth and twenty-first centuries. The expansion of the global reserve army is indeed the backdrop against which the process of industrial production outsourcing to low-wage countries has occurred over the last 40 years, whether via foreign direct investment or arm's length relationships. In *Imperialism in the Twenty-First Century*, John Smith (2016) has investigated the vast scale of the shift of industrial production to the Global South and shown that it signifies a greatly expanded exploitation of southern workers by US, European, and Japanese multinational corporations, which appropriate greatly increased flows of value and surplus value from them. As in Marx's own times, these flows of value are based on the super exploitation of workers in the South. In *A Theory of Imperialism*, moreover, Utsa and Prabhat Patnaik (2016) highlight the asymmetrical relationship capitalism rests upon, whereby the periphery continues to be saddled by unemployment, underemployment, and poverty. The existence of massive labor reserves in the periphery plays a crucial role in keeping down real and

money wages in the metropolis and can be used to discipline workers in imperialist countries also through international migration.

In different ways, all these studies point to the fact that in an era of globalized industrial production and accelerated international migration, the dynamic of the global reserve army of labor more directly rebounds on the condition of the working class in imperialist countries. Although they also start from the assumption that the model of Marx's *Capital* is the model of a "closed capitalist economy," Foster et al. (2011) argue that Marx "saw the general law of accumulation as extending eventually to the world level." For Utsa and Prabhat Patnaik (2016), moreover, a deeper Marxist analysis of capitalism needs to go beyond the model of a closed capitalism in *Capital* and highlight the importance, along with processes of relative immiseration, of absolute immiseration in the periphery. However, if Marx's *Capital* does not examine a self-enclosed national economy but the overall tendency of the system as a totality, then the impoverishment and super-exploitation of workers and petty producers in the South appear to be part of a unitary process of impoverishment that increasingly involves also workers in imperialist countries (see Pradella 2010).

Locating the development of class relations nationally within the global dynamic of capital accumulation is crucial to reflecting and elaborating on emancipatory strategies. It shows that the global spread of capitalist relations of production in the neoliberal period has not only weakened organized labor but has also led to the emergence of new working classes and generated new sources of structural power for workers (Alimahomed-Wilson and Ness 2018; Silver 2003). For Marx, relations of imperialist domination and gendered, racial, national, and religious oppression are constitutive dimensions of the class struggle. This is why he put in question his initial faith in the universal emancipatory significance of social revolution in Western Europe and warned against the dangers represented by the spread of nationalism and racism among workers in imperialist countries. If his warning resonates in the context of a rising global far-right, so should also his reflections on

the need to link up labor movements, anti-racist struggles, and anti-imperialist resistance. Marx's *Capital*, in fact, is, above all, a tool of struggle. And it shows us that capitalism is based on labor cooperation and thus continuously generates new sources of structural power for workers and new possibilities for working class and anti-imperialist solidarity.

Marx's Theory of International Price and Money: An Interpretation

Howard Nicholas
International Institute of Social Studies in the Hague, Hague, The Netherlands

Synonyms

Comparative advantage; David Ricardo; International trade; Karl Marx; Marxism; Prices and money; Underdevelopment; Unequal exchange

Definition

This essay seeks to contribute to extend Marx's explanation of prices and money to the international level. It begins with an outline of Marx's general explanation of prices and money, focusing in particular on those aspects of these theories which are fundamental in their extension to the international dimension, and dealing in passing with two alleged problems with Marx's theories of price and money. It then presents the key elements of the extension of Marx's theories of price and money to the international dimension. Lastly, it uses the resulting analysis to critically appraise Ricardo's theory of international price and money in the context of his doctrine of comparative advantage. The major aim of the critical appraisal of Ricardo's work is to further highlight the specificity of the Marxist approach and draw out some of its implications for an understanding of the historical and contemporary problems of the so-called developing countries – implications which are in stark contrast to those emanating from Ricardo's comparative advantage doctrine.

Introduction

As is well known, Marx's expressed intention when drafting his *magnum opus* on the workings of the capitalist system, *Capital,* was to include in

it the functioning of the capitalist system at the level of the world economy. To do so, he planned separate books on international trade and the world market (see Nicolaus 1973; Rosdolsky 1977; Shaikh 1979). However, numerous factors, including failing health, combined to prevent him from realising this and other expressed literary intentions. In fact, as is also well known, Marx lived to see only volume 1 of *Capital* completed to his satisfaction, the other two volumes of *Capital* and his *Theories of Surplus Value* (often referred to as volume 4 of *Capital*) being completed long after his death; volumes 2 and 3 of *Capital* were compiled by Frederick Engels and published in 1885 and 1894, respectively, and *Theories of Surplus Value* was compiled by Karl Kautsky and published in 1905–10. Most importantly, aside from a few isolated passages, Marx left no real indication in these or any other of his published works and correspondence as to how he saw his general explanation of prices and money extended to the world economy level.

Although this gap in Marx's economic analysis has been generally acknowledged (see e.g. Carchedi 1991a, b; Kühne 1979; Lapavitsas 1996; Shaikh 1979), it has failed to attract much attention from even those sympathetic to his work, with the notable exceptions of Shaikh (1979, 1980) and Carchedi (1991a, b), and to a certain extent in various contributions to the debate on unequal exchange initiated by the work of Emmanuel (1972). The reasons for this inattention are not difficult to discern. They stem from perceived intractable problems with Marx's general theories of price and money. As regards Marx's theory of price, the problem is argued to be his so-called transformation procedure: that he did not transform input values into prices of production (see especially Meek 1977 for an extensive account of this alleged problem, and Fine and Saad-Filho 2004: 126–134 for a summarised version of it). And as regards his theory of money, the problem is seen as the impossibility of extending his commodity theory of money to take into account the modern form of money: intrinsically valueless pieces of paper issued by the state (see Germer 2005 and Lavoie 1986 for arguments along these lines).

The present essay seeks to contribute to the development of this much-neglected area – the extension of Marx's explanation of prices and money to the international level. To do so I will begin with an outline of Marx's general explanation of prices and money (mostly drawing on *Capital* and *Theories of Surplus Value*), focusing in particular on those aspects of these theories which I consider to be fundamental in their extension to the international dimension, and dealing in passing with the two alleged problems with Marx's theories of price and money referred to above. I will then present what I consider to be the key elements of the extension of Marx's theories of price and money to the international dimension. And, lastly, I will use the resulting analysis to critically appraise Ricardo's theory of international price and money in the context of his doctrine of comparative advantage. The major aim of the critical appraisal of Ricardo's work will be to further highlight the specificity of the Marxist approach and draw out some of its implications for an understanding of the historic and contemporary problems of the so-called developing countries – implications which are in stark contrast to those emanating from Ricardo's comparative advantage doctrine.

Marx's Theory of Price and Money

The key elements of Marx's theories of price and money that require elaboration with a view to their extension to the international dimension are (a) the formation of prices and emergence of money and (b) the determination of the magnitudes of prices and value of money. I will begin with Marx's view of how prices are formed since it is foundational for understanding his explanation of the emergence of money as well as the determination of the magnitudes of prices and value of money.

Formation of Prices and Emergence of Money

Marx begins his analysis of prices in *Capital* by analysing prices in the context of the simple

reproduction of commodities, that is, abstracting from their existence as capital. This analysis takes up the first three chapters of *Capital,* and is known to have been a major preoccupation of his (see Aumeeruddy and Tortajada 1979). He then uses this as a basis for their subsequent analysis in the context of the circulation of commodities (and money) as capital in the remainder of *Capital.* It would appear that his purpose for doing so was that he saw the essence of the circulation of commodities in capitalism as captured by their simple circulation, and the latter as historically prior to the former (for more details see Fine and Saad-Filho 2004; Nicolaus 1973; Rosdolsky 1977). When analysing the simple circulation of commodities Marx sees prices as coming into existence in general when the production of commodities is organised on the basis of a division of labour and this division of labour is mediated by exchange. That is to say, when commodities are produced regularly for exchange in the context of a division of labour they acquire a form which indicates they have a certain exchangeable worth with other commodities (or things) – the price form. The price form is in the first instance the bodily form of the other commodities that each commodity exchanges for, but gradually becomes the bodily form of the commodities most frequently traded (bags of corn, metal objects), and, eventually, the bodily form of a particular commodity, the money commodity, which is usually a metal because of its homogeneity, divisibility, durability, and transportability. When the exchangeable worth of a commodity acquires the money form, the price form becomes the money price form. The worth of commodities in relation to one another is shown through their relation to one and the same commodity: money. This understanding of the formation of prices leads Marx to see their fundamental purpose as one of facilitating the reproduction of commodities. Prices do this by enabling producers to acquire the necessary inputs and means of sustenance through the sale of their commodities to continue production of them.

When Marx moves to the formation of prices in capitalism, he seeks to show that their formation involves the formation of a profit on the basis of unpaid labour for the representative capitalist firm, and takes place in the context of competition between individual firms within and between sectors. He argues that competition within sectors gives rise to the formation of standard prices for standard products which are produced using standard technologies, and that competition between sectors gives rise to the appropriation of an economy-wide average rate of profit by producers of standard products in all sectors. Marx was at pains to point out, however, that the formation of prices takes place in the context of continuous divergences: divergences between prices for the same generic product; divergences between products of the same generic type; divergences between technologies and methods of production of similar goods; and divergences between rates of profits appropriated by standard producers of a given product in different industries.

Marx's view of the emergence of money is a logical corollary of his view of the formation of prices. Specifically, his view of the formation of prices suggests that money emerges with, and is indispensable to, the formation of prices and the reproduction of commodities which prices facilitate. It performs this role by conferring on commodities homogeneous price magnitudes which permit their owners to acquire the necessary inputs and means of subsistence to reproduce commodities on an expanded scale. That is, it performs this role by reflecting the relative resource costs (labour time) required for reproducing commodities in their prices. It is money's role as a measure of (exchange) value that defines it as money and is the basis for *understanding the determination of its worth as money as opposed to a mere commodity.* The distinction is important when considering the value of money as intrinsically valueless pieces of paper issued by the state.

The Magnitudes of Prices

Naturally, Marx's explanation of the magnitudes of prices follows a similar trajectory to his explanation of the formation of prices. That is, he begins with the explanation of the magnitudes of

prices in the context of the simple reproduction of commodities, and then extends this to take into account the reproduction of commodities in the context of capitalism. It is important to note that he sees the explanation of the former as constituting the essence of the explanation of the latter. When explaining the magnitudes of prices in both settings Marx distinguishes between *relative and money prices,* seeing the explanation of relative price magnitudes as logically prior to the explanation of money price magnitudes and notwithstanding the fact that prices are in the final instance money prices. This is because the explanation of money price magnitudes requires an explanation of the magnitudes of relative prices as well as the magnitudes of the value of money. Although Marx also makes a distinction between *long- and short-run movements* in the magnitudes of prices, he makes this distinction explicit only when explaining (changes in) the magnitudes of prices in capitalism.

Explaining the Magnitudes of Relative Prices

At the heart of Marx's explanation of the magnitudes of relative prices in the context of the simple circulation of commodities is the notion that production on the basis of a division of labour involves the expenditure of social (although not necessarily equivalent) labour time which causes the products produced by this labour to have worth or value in relation to one another, with this worth reflecting the relative social labour time required for their production. When exchange comes to mediate the division of labour, the products of labour acquire the form of exchangeable worth, or the price form, and the labour time expended becomes additionally (in addition to being social) qualitatively equivalent units of simple general (abstract) labour time. It is magnitudes of this simple abstract social labour that fundamentally regulate the exchange ratios between the products of labour or commodities (Marx calls products 'commodities' when they assume the price form). What constitutes basic or simple abstract labour time will vary over time and geographic space, and will ultimately depend on the particular socio-economic setting.

When Marx moves to the explanation of the relative magnitudes of prices in the context of capitalism, he distinguishes between long- and short-run movements in the magnitudes of prices, and focuses in the first instance on the former notwithstanding the fact that he sees short-run movements as having a bearing on long-run trends. Focusing on long-run trends in relative price magnitudes, Marx seeks to show that the fundamental determinant of these trends remains the relative labour time required for the production of the commodity. To do so, he first shows that this labour time comprises the labour time required to produce the (manufactured) inputs into production as well as that expended by workers in the immediate process of production, with the latter equal to the labour required to produce the means of sustenance of the workers as well as a surplus of labour time over and above this (which is equal to that required to produce the goods purchased with the profits). Marx then shows that intrasectoral competition will lead to the prices of the standard products produced in each sector directly reflecting, and being determined by, their values as measured by the average labour time required to produce the bulk of these products in each sector, while inter-sectoral competition will result in the appropriation of an average rate of profit by standard producers in each sector such that the magnitudes of their prices will diverge from the magnitudes of their values. In spite of this divergence values will continue to be the fundamental determinant of the prices. Marx refers to the long-run relative prices which result from competition within sectors as market values and those which result from competition between sectors as prices of production, prices of production being modified market values. Obviously, with inter-sectoral competition it is the prices of production which are seen as deviating from the values of commodities, but still being determined by them.

Before proceeding it is necessary at this juncture to digress a little and pay some attention to one of the two alleged Achilles heels of Marx's analysis noted in the introduction: his so-called transformation procedure linking the values of products to their prices of production. This

procedure has been repeatedly criticised by even those sympathetic to Marx's economic analysis on the grounds that it fails to show the link between values and prices of production of commodities because it does not transform input values into prices of production. However, as I have argued elsewhere (see Nicholas 2011: 39–40), this incorrectly interprets what Marx is trying to do with this procedure. It sees him as trying to *calculate* prices in terms of values, when in fact he is trying to *explain* prices in terms of values. If Marx had transformed input values into prices he would have ended up tautologically explaining price by price in the manner of a number of supposed solutions to his transformation problem (see Nicholas 2011: 80, 86–87).

Although Marx sees long-run relative prices as fundamentally determined by relative labour time, and changes in these by changes in the relative productivity of labour in different sectors, his analysis does not preclude the possibility of other factors having a bearing on these long-run trends, including (a) non-productivity-related cost changes, (b) the appropriation of absolute rents, and (c) short-run movements in relative prices arising from demand and supply imbalances. Examples of non-productivity cost changes include sector-specific changes in taxes and/or subsidies and prices of raw materials. They do not include sector-specific changes in wages except in exceptional circumstances (see Marx 1978: 415–416). The appropriation of absolute rents would typically be associated with the behaviour of owners of key raw material inputs such as oil. And short-run movements in relative prices resulting from demand and supply imbalances can also be seen as having a bearing on long-run price trends if they give rise to changes in average methods of production. For example, if the demand for a product greatly exceeds supply such that relative prices correspond to those of the least efficient producers (and not producers producing the bulk of goods) and the majority of producers in the sector appropriate above economy-wide average rates of profit, the resulting inflow of capital into the sector may have some bearing on the average methods of production used in the production of the standard

commodity by the bulk of producers once demand and supply balance is restored (see Nicholas 2011: 39–40).

The Magnitudes of Money Prices

The magnitudes of the relative worth of commodities translate into their worth in relation to money, or money prices, when money mediates exchanges and the worth of commodities is expressed in terms of money. Although Marx recognises that money can assume many forms, ranging from commodity money to intrinsically valueless pieces of paper issued by the state, for the most part he assumes money to be a commodity, arguing that this is the earliest form which money assumes and understanding this form of money captures its essence as money in the process of reproduction of commodities (see Marx 1978: 192). Crucially, Marx argues that when money is a commodity its value, and therefore the level of aggregate commodity money prices, will be given by its value both as a commodity and as money, with the former exerting a gravitational pull on the latter, but the latter also having some bearing on the former (see Nicholas 2011 for an elaboration of this point). As a commodity the value of money is given by the relative labour time required for its production, while as money its value is given by the average labour time of commodities (including labour power) that it circulates over a given period of time. As long as money is a commodity, changes in the value of money and corresponding changes in the aggregate money price level of commodities will be fundamentally due to changes in the relative productivity of labour in the sector producing the money commodity This means that when money is a commodity inflation will mostly be due to a rise in productivity in the money-producing sector.

As with other commodities, so with the commodity that performs the role of money, its trend value can also be influenced by nonproductivity-related relative cost changes in the sector producing the money commodity, the appropriation of an absolute rent by producers of the money commodity, and short- run movements in it caused by demand and supply imbalances. The demand

M

and supply imbalances pertain to aggregate demand for, and supply of, all commodities, including labour power, and are brought about by changes in the desire of producers to hold money (or various financial assets) as opposed to repurchasing the necessary inputs to reproduce the commodity. Such imbalances in the supply of, and demand for, all commodities are mirrored by an excess supply of, and demand for, money. An excess demand for all commodities, implying an excess supply of money, would result in a fall in the exchange value of money below its value as a commodity, with attendant consequences for the latter resulting from capital flows into and out of the money-producing sector. The fall in the exchange value of money below its value is typically facilitated by the substitution of money in the performance of its function as medium of circulation by credit and tokens of itself. As long as money is a commodity, however, the extent of this divergence between the exchange value and value of money, and the corresponding impact of the short-run movements in the exchange value of money on its value, will be limited. Money's value as a commodity will anchor its value as money.

Marx denied, however, that increases in aggregate money prices could be due to an increase in the value of labour power over and above that warranted by labour productivity increases. This is because he saw the value of labour power falling with increases in productivity, and believed that where this was not the case it would result in falls in the general rate of profits. Marx also denied that the value of money could be influenced, let alone fundamentally determined, by an increase in the quantity of money in circulation. This is because pivotal to his explanation of money prices is the notion that money measures the exchange value of commodities and confers this worth on them in the form of certain magnitudes of money prices prior to their, and its own, entry into circulation. This means that for Marx commodities would always enter circulation with given money prices, and money with a given value. This does not, however, preclude the possibility of credit and various substitutes of money facilitating an expanded circulation of

commodities and giving rise to a divergence of the exchange value of money from its value.

The preceding interpretation of Marx's analysis of money as commodity money, and particularly his explanation of its value as money, suggests that there is in principle no problem with extending this analysis to take into account money as intrinsically valueless pieces of paper issued by the state, especially once it is recognised that even when money is a commodity a distinction needs to be drawn between its worth as a commodity and its worth as money, and that the latter does not require money to itself have worth. Indeed, since money's worth as money is given by the average labour time of commodities it circulates, the possession by it of intrinsic worth is unnecessary as long as what functions as money is accepted as having command over goods and services.

The implication of this view of the determination of the magnitude of value of intrinsically valueless paper money is that there will be a tendency for the value of this money to fall over time. This tendency arises from the fact that, on the one hand, there is no longer an anchor for the value of money when it is intrinsically valueless pieces of paper issued by the state and, on the other hand, this sort of money is more readily made available to validate the expansion of tokens of itself and credit than is the case with commodity money. This tendency for the value of money to fall will however be fundamentally conditioned by changes in average labour productivity levels in the production of all commodities. Increases in the growth of average labour productivity levels of all commodities would typically exert a downward pressure on the rate of fall in the value of money and corresponding rate of increase in the aggregate money price level, while falls in average labour productivity levels would ease this downward pressure. As in the case of commodity money, changes in costs and imbalances in supply and demand can also have a bearing on the value of money and the aggregate money price level. In the case of costs what matters is non-productivity-related real costs affecting the production of most commodities. In the case of supply and demand imbalances the important thing to note is that

where these imbalances induce a fall in the value of money – a rise in the money prices of commodities – there is no counterbalance redressing this fall. Indeed, the tendency is for a continuous fall in the value of money, with monetary authorities accommodating the increase in demand for money when it arises.

Extending Marx's Theory of Price and Money to the International Level

When extending Marx's explanation of prices and money to the international level it is again necessary to begin with how these prices are formed and how the money that facilitates the international trade of commodities, that is, world money, emerges. It is this starting point that provides the basis for the explanation of the magnitudes of international prices and changes in these.

International Price Formation and the Emergence of International Money

International prices reflect the relative worth of commodities being exchanged between residents of different countries. They are formed whenever such exchange takes place. As long as this exchange is *ad hoc*, the exchange ratio between the traded commodities will vary over time and space, being determined largely by the relative strength of demand in relation to the availability of the traded items. However, once this trade becomes more regular and more integral to the reproduction of commodities in the different countries, the traded commodities increasingly acquire international values measured by international labour time, with the international exchange ratios between the commodities increasingly reflecting these values. Where the exchange is between capitalist countries, the exchange ratios reflect what can be referred to as international market values, and when capital becomes increasingly mobile between the trading capitalist countries, they reflect what can be referred to as international prices of production.

With the development of exchange between countries money breaks out of its national confines and serves increasingly to measure the international exchangeable worth of commodities. When this happens the international exchange ratios between commodities assume the form of money – world money. As with money within national boundaries so with money flowing between countries: it initially assumes the form of a commodity. With the increasing development of commercial and financial links between countries, this form gives way to the form of the paper issued by the state of the most economically powerful country – that country whose paper currency is seen as backed by the largest amount of goods and services. (Carchedi 1991b: 275 argues that world money is issued by the technologically most advanced country. However, there are a number of obvious problems with such a view, not the least of which is that it is difficult to establish what might constitute technological leadership among advanced countries.)

What this view of the emergence of world money suggests most importantly is that the formation of international value does not require either the international flow of labour or capital between countries, or even that the trading countries are capitalist. All that is required is that the products traded become integral to the reproduction of commodities in the trading countries. It also suggests that the opening up of trade between countries does not lead to their specialisation in the production of particular commodities. Rather, it implies the gradual integration of the producers of the various countries engaged in trade into a more extensive division of labour. Although producers in certain countries may have certain cost advantages in the production of certain goods, these are unlikely to lead to a complete specialisation by each given initial conditions of national self-sustaining reproduction based on national divisions of labour and the requirement of some degree of trade balance between countries in the context of an expansion of trade between them. I will return to this point again in the discussion of Ricardo's doctrine of comparative advantage and the implications of Marx's analysis for understanding the impoverishment of the present-day

developing countries, but it is perhaps worth noting here that one of the important conclusions that will that emerges in this discussion is that it is not the development of trade *per se* that has led to this impoverishment.

Determination of the Magnitudes of International Prices

In keeping with Marx's explanation of the magnitudes of prices in general, an explanation of their magnitudes in process of international exchange needs to be founded on a distinction between relative and money prices as well as between trends in these prices and short-run deviations from the trends. Again, the starting point has to be an explanation of trends in the magnitudes of relative prices.

Relative International Prices

The international prices whose magnitudes need to be explained in the first instance are those formed in the context of *recurrent* trade between countries. The magnitudes of these prices are explained by the relative international values of the traded commodities, whether or not there is international labour or capital mobility. The international relative value or worth of commodities is measured by the average labour time required to produce the bulk of the commodities traded, allowing for skill and productivity differences. Marx notes that more skilful and/or productive labour counts as labour which is productive of a higher value than less skilful and productive labour because the former produces more commodities and/or commodities of a higher quality in the same time (see Marx 1976: 524–525; Marx notes that more productive labour can imply more skilful or hard-working labour, but will for the most part result from labour working with more advanced technology and possibly better-quality natural resources). A change in the relative national levels of skill and productivity of labour will affect the international value of goods exported by a country only if its producers account for the bulk of trade in these types of goods. If the producers do not account for the

bulk of goods of a certain type exported, increases in productivity will only translate into higher profits for these producers.

Although the logic of Marx's general analysis most certainly suggests that trend movements in the relative prices of internationally traded commodities need to be seen as dominated by relative productivity changes in the sector producing these commodities, whether this production is specific to one country or not, it does not preclude other factors having a bearing on relative international price trends in much the same way, and for the same reasons, as was argued above in respect of the general analysis. Specifically, it does not preclude the influence on these trends of non-productivity-related costs, absolute rents, and demand and supply imbalances. The non-productivity cost changes, absolute rents, and demand and supply imbalances which are of significance for trend movements in international relative prices would be those pertaining to the countries producing the bulk of the traded commodities of any given type. Since in the case of demand and supply imbalances their significance for trend movements in relative prices depends on the consequences which the forces accompanying the short-run movement of international prices have for the standard methods of producing the internationally trade commodity, the extent to which capital and technology is mobile will also have a bearing on this.

The logic of Marx's analysis suggests that trend movements in the values and prices of internationally *traded goods* will also exert an influence on the values and prices of *non-traded goods*, with the extent depending on the importance of non-traded goods in the reproduction of all domestically produced commodities, including labour power. This in turn means that the more open to trade the economy, the greater this influence is likely to be, with obvious implications for fully specialised and internationally integrated economies such as the present-day developing countries (see below).

The Value of World Money and the Aggregate World Money Price Level

The magnitudes of international money prices are determined by the magnitudes of relative

international prices and the international exchange value of money which facilitates the international circulation of commodities. The determinants of the magnitudes of relative international prices have been explained above. What is now required is an explanation of the magnitude of value of money which circulates commodities internationally. When explaining the international exchange value of money which facilitates the international circulation of commodities the point of departure is the exchange value of international or world money and not the international exchange value of national currencies (the determination of the international exchange values of national currencies – their rates of exchange with other currencies – is beyond the scope of the present study, but follows from the logic of the analysis being developed in it). This is because what facilitates trade between countries is something that is itself traded internationally and represents international worth. (Some Marxist commentators, e.g. Carchedi 1991b, have argued that explanation of world money prices requires an explanation of the international exchange values of national currencies, or exchange rates. However, the position taken in this essay is that it is world money and not national monies *per se* that facilitates international trade and confers comparable international exchangeable worth on commodities. Hence, it is the explanation of the value and exchange value of world money and not the values and exchange values of national currencies that is the appropriate point of departure for the analysis of international price formation and the determination of its magnitude.) As noted above, what initially facilitates trade between countries is a metal such as gold, but it eventually becomes the intrinsically valueless paper money issued by the monetary authorities of economically powerful countries. And, as in the case of commodity money so in the case of international paper money, for ease of international commerce the tendency will be for one world money to dominate, although for certain purposes and in certain settings paper monies of other countries can be seen to be acceptable substitutes.

When international money is a commodity its international value is determined by both its value as an internationally traded commodity (the relative international labour time required for its production) and its value as world money (the average amount of labour time it commands in the process of international exchange). There can, and normally will, be a divergence between the two, but as long as world money is a commodity the former exerts a gravitational pull on the latter, notwithstanding the fact that the latter will have a bearing on the former. Taking gold as international money, if its international exchange value as money falls below its relative international value as a commodity, for instance because of its replacement in the process of international circulation by tokens, the value of gold will increasingly correspond to the international value of gold produced by more efficient producers. This in turn will result in some of the more inefficient producers moving out of gold production. The resulting contraction in gold production will eliminate the excess supply of gold and lead to some reversal of the fall in the international exchange value of gold. If faith is shaken in the tokens of gold circulating internationally, the reversal may even result in a rise in the value of gold. In any case, the international exchange value of gold, or rather its international value as money, will have a bearing on its international value as a commodity.

In one of the few passages by Marx on the value of world money he argues that its worth can vary between countries in the sense of commanding more or less international labour time in different countries than the international average (see Marx 1976: 702). He argues that in more productive countries it will command less international labour time (the value of international money will be higher) and more international labour time in less productive countries (the value of international money will be lower). This means that, for Marx, as the relative productivity of a country increases the prices of its commodities in terms of international money will fall in relation to that of other countries, but the divergence will obviously be limited by the tendency of international money to exchange with commodities in the same ratios in different countries – the law of one price.

Although from the perspective of Marx's analysis the fundamental determinant of long-term trends in the aggregate world money price level is the relative productivity of labour in the production of world money, for reasons given above in the discussion of the value of money in general this does not preclude other factors having a bearing on these trends. Of note are, once again, non-productivity-related relative cost changes in the countries producing the bulk of gold, the appropriation of absolute rents by the producers of gold, and global aggregate demand and supply imbalances. Demand and supply imbalances can be conceived of as arising from changes in the propensity of those engaged in international commerce to purchase internationally traded commodities as opposed to holding on to gold (or purchasing financial assets with it). A concomitant of these aggregate demand and supply imbalances is, therefore, imbalances in the supply and demand for gold, and their consequence is deviations of the international exchange value of gold from its value. These deviations are facilitated by international credit and/or the international circulation of tokens of gold (e.g. silver), and can be seen as impacting on the international value of gold in the manner outlined above.

In the references to world money that Marx makes in his published writings he certainly assumes it to be a commodity, and in particular gold. However, in the same way as Marx's general analysis of money does not preclude its extension to intrinsically valueless paper issued by the state, so the analysis of world money as gold should not be seen as precluding an extension of this analysis to world money as the intrinsically worthless paper money issued by the state of a particular country.

When world money is the paper of a particular country its value is determined by both the average international labour time of the commodities that it commands in international trade and the average international labour time of the goods it commands in the domestic circulation of the country issuing the world paper money. In the final instance it is the latter that will dominate movements in the former, although the former can have a bearing on the latter. This means that the fundamental determinant of changes in the value of world paper money and level of world money prices is changes in the relative labour productivity of the country issuing the paper (see also Carchedi 1991b). Taking the US dollar as world money, an increase in the world rate of inflation and fall in the relative worth of the US dollar would mostly result from a slower growth in US labour productivity and, conversely, a fall in world inflation would mostly be due to a relative rise in US labour productivity. Of note in this context is that relative changes in aggregate output are seen as having no bearing on the relative international value of the world paper currency and world inflation rate since, from the perspective of Marx's analysis, the quantity of money in circulation will adjust to the amount and prices of goods in domestic circulation.

As in the case of a world commodity money, so with a world paper money, one can certainly conceive of the exchangeable worth of this money varying between countries, and in particular between the country issuing the world paper money and the rest of the world, along the lines noted above in the context of world commodity money. But again, the extent of the deviation will be limited by the tendency for prices in terms of world money to be equal in different countries (the law of one price).

Other factors affecting the world money price level in the context of a world paper money would be relative unit cost changes and aggregate demand and supply imbalances in the world-money-issuing country (absolute rent has no bearing on the relative worth of world money when it is not a produced commodity). The cost changes that matter are non-productivity-related relative international unit costs of the world-moneyissuing country. In the context of the current global economic system and the dollar as world money, one can imagine that the discovery of shale gas in the US and the prohibition of its export can exert downward pressure on its relative unit costs of production, resulting in upward pressure on the relative international worth of the US dollar and corresponding downward pressure on the world rate of inflation in US dollar terms.

The deviations in the aggregate demand for and supply of commodities that matter pertain to domestic and global imbalances. Since, as noted above, the value of the world currency is more fundamentally given by the international value of the goods it circulates in the world-money-issuing country, of greater significance for the short-run and trend value of this currency would be aggregate demand and supply imbalances in the money-issuing country, with part of the excess demand resulting in trade imbalances. Again, assuming world paper money to be the US dollar, an excess demand for commodities *in the US* would result in a rise in the US money price level and downward pressure on the exchange value of the US dollar pushing it below trend. Both would exert an upward pressure on global prices in dollar terms. These would in turn result in trend upward movements in world money prices only if the accompanying expansions in credit and tokens of money were validated by domestic increases in US dollars. An excess *world demand* for commodities would exert a similar upward pressure on world money prices in dollar terms, but the extent to which this would translate into a rise in trend world US dollar prices would depend on the extent to which the accompanying world demand for US dollars was accommodated through, say, the running of an expanded trade deficit, capital outflows, and US dollar loans (swaps) to other world central banks (interest rate differentials between countries would have a bearing on short-term movements in the world money price level via its impact on the balance between global demand and supply). This is not to say that the value of the US dollar and the level of world prices in US dollar terms is dependent upon the injection of US dollars into the global economic system, since the US monetary authorities cannot simply inject money into the global system irrespective of the demand for this money.

Ricardo's Theory of Comparative Advantage

Ricardo developed his explanation of international prices in the context of expounding his doctrine of comparative advantage. This doctrine endeavours to show that the liberalisation of trade between countries would, or should, lead producers in the trading countries to specialise in the production of goods they have a natural comparative advantage in *vis-à-vis* other countries (see Ricardo 1973: 81). Trade on the basis of such specialization would result in gains for all countries specialising and engaging in trade in the sense that each would save on domestic labour time that needs to be expended in the provision of the same amount of goods consumed domestically. In expounding this theory Ricardo is insistent that, unlike domestic relative prices, the relative prices of internationally traded goods would not depend on relative labour times, that is, they would not depend on international labour times. This is because for him the labour expended in different countries cannot be considered as comparable in the absence capital flows between them (1973: 81–83). There cannot be any such thing as international labour times in the absence of international capital flows. Instead, Ricardo sees the magnitudes of the relative prices of internationally traded commodities as settling somewhere between their autarchic pre-specialisation levels in the trading countries as determined by relative national labour times embodied in the production of the commodities. To illustrate his argument Ricardo uses trade between England and Portugal (see Table 1). He argues that with the opening up of trade between the two countries the relative international prices of cloth and wine will eventually settle somewhere between 1:1.2 and 1:0.9 – the autarchic relative prices of the two commodities in England and Portugal, with the exact ratio being indeterminate. Assuming that trade and specialisation results in England producing cloth and Portugal wine as per their comparative advantages in the production of the two goods, if the international exchange ratio of cloth to wine came to rest at 1:1 (i.e. between the two autarchic price ratios), then trade on the basis of specialisation would see England saving 20 domestic hours of labour time per unit of wine consumed domestically and Portugal saving 10 hours of domestic labour time per unit of cloth consumed domestically.

Both countries would have gained from trade and specialisation.

As a number of commentators have pointed out (e.g. Shaikh 1979), Ricardo certainly recognises that it is not relative but money prices that directly regulate international trade between countries and eventually give rise to the specialisation by each in production. That is to say, he recognises that trade and specialisation are not directly based on *comparative* advantage (reflecting relative national prices) but on *absolute* advantage (reflecting world money prices). However, he argues that comparative advantage translates into absolute advantage through the flow of world money between countries and the requirement for balance in this trade over the long run. For Ricardo it does this via a quantity theory type of mechanism whereby the inflows or outflows of world money cause all world money prices to rise or fall in the trading countries (see Shaikh 1979: 287–289). Hence, in the final instance, it is comparative advantage that determines patterns of trade and specialisation. Table 2 illustrates the results of this quantity mechanism in Ricardo's example when money flows from England to Portugal after the opening up of trade. Since Portugal is seen as having an absolute advantage in the production of both goods at the point of the opening up of trade, it will export both goods to England in the first instance. The resulting trade deficit will be paid for by a flow of gold from England to Portugal. The consequence of this flow is argued by Ricardo to be a rise in gold prices of all commodities produced in Portugal and corresponding fall of all gold prices of commodities produced in England (in this specific example by 10%). Relative prices of cloth and wine in each country will however remain the same. This process will continue until English producers become competitive in the production of cloth and export enough of it for there to be balance in the money value of trade flows between in the two countries.

From the perspective of the Marxist theory of international price and money developed above, Ricardo's theory can be argued to be fundamentally flawed in a number of important respects. Firstly, it suggests that Ricardo mistakenly denies the determination of international prices by international values measured by international labour time in the absence of capital mobility because he appears to have a mistaken view of how prices and values come to be formed. That is to say, it is not the mobility of capital, or even its existence, that explains the formation of prices, but rather production based on a division of labour mediated by exchange. For Marx, as soon as a good becomes integral to *the reproduction of an economic system based on exchange,* the labour expended in its

Marx's Theory of International Price and Money: An Interpretation, Table 1 Ricardo's example of trade between England and Portugal in cloth and wine

Before trade	Cloth (hours labour per unit)	Cloth gold price (oz)	Wine (hours labour per unit)	Wine gold price (oz)	Price ratio
England	100	50	120	60	1:1.2
Portugal	90	45	80	40	1:0.9

Note: 1 oz of gold = 2 hours of labour time in both England and Portugal

Marx's Theory of International Price and Money: An Interpretation, Table 2 The consequences of the opening of trade between England and Portugal

After trade	Cloth (hours labour per unit)	Cloth gold price	Wine (hours labour per unit)	Wine gold price	Price ratio
England	100	45	120	54	1:1.2
Portugal	90	49.5	80	44	1:0.9

Note: 1 oz gold = 2.2 hours of labour time in England; 1 oz of gold = 1.8 hours of labour time in Portugal
Source: Adapted from Shaikh 1979: 287

production becomes part of the labour required for the reproduction of the whole system and qualitatively equivalent to all other labour expended in the production of all other goods which are similarly integral to the reproduction of the economic system. The existence of capital is premised on the expenditure of part of the labour in the production of all commodities as surplus labour – labour over and above the labour required to produce the wage goods of labour – and manifest in the magnitude of price containing a profit component. The mobility of capital leads to the profit component being equalised across all sectors – prices becoming prices of production. It does not cause commodities to have either worth or prices. Hence, as soon as trade becomes integral to the reproduction of the economic systems of the trading countries, the goods traded represent international value or worth measured by international labour time and the magnitudes of the (relative) international prices of these goods come to be determined by the magnitudes of their (relative) international values. The fact that the firms exporting products are capitalist means only that the prices of the internationally traded commodities contain a profit component. The fact that capital is internationally mobile means only that this profit component corresponds to a certain international average rate of profit, and the prices of the internationally traded products become international prices of production. All of this means that if Portuguese producers of both cloth and wine produce the bulk of commodities for both the Portuguese and English markets, the values of the goods produced in Portugal will become the international values of these commodities, and it is these values that will determine the relative domestic prices of the traded products in England. That is, after the opening up of trade, and assuming all commodities are traded, the relative prices of cloth and wine in England will be those determined by Portuguese producers of both commodities. The relative prices of cloth to wine in England will move from 1:1.2 to 1:0.9.

Secondly, Ricardo is mistaken to argue that the movement of gold between countries would result in changes in its value in each country and a corresponding proportionate change in the gold

prices of commodities in each. The opening up of international trade between England and Portugal can certainly be expected to give rise to a fall in the gold prices of both cloth and wine in England, but only because these are the prices of the two goods set by Portuguese exporters of these. In fact, the gold price of wine will fall by proportionately more than that of cloth in England, contrary to what one would expect from a quantity theory type of mechanism at work. That is, unit gold prices of cloth in England fall from 50 to 45 ounces of gold while the unit price of wine falls from 60 to 40 ounces of gold. The fall in the gold prices in England has nothing to do with the implied outflow of gold from it since there is also a change in the relative price of both, much as there is no reason to suppose that the corresponding inflow of gold into Portugal would result in a rise in gold prices in it. This is because, once it is accepted that gold, like all internationally traded commodities, has a certain international price (an exchange ratio with all other commodities) determined by its international value, there is no reason to suppose that the flow of gold between England and Portugal would lead to the relative (international) labour time commanded by the gold falling in England and rising in Portugal (from 1 oz gold to 2 hours labour time in each to 1 oz of gold to 2.2 hours in England and 1 oz gold to 1.8 hours in Portugal) as is implied by Ricardo's quantity theory adjustment mechanism. The gold money prices of traded commodities and international value of gold in both England and Portugal will remain the same after the flow of gold between them.

This does not mean that there would be no tendency towards adjustments of the imbalances between England and Portugal, or even that the flow of money has no part to play in any adjustment. Rather, it suggests that the adjustments will come primarily from relative changes in productivity in England and Portugal (especially England as the deficit country) and/or patterns of trade between them. In the case of Ricardo's example this would mean that for England to begin exporting cloth to Portugal it would have to produce and sell cloth at, or below, the prices of Portuguese producers – that is, 45 ounces of gold

per unit. To the extent that the flow of money has an impact on the required adjustments, it would be through their impact on relative productivities – increasing the pressure on English producers to improve their productivity.

Lastly, the Marxist analysis presented above suggests that trade *per se* would not lead to the sort of complete specialisation postulated by Ricardo given initial conditions of self-sufficient national reproduction based on national divisions of labour and the requirement of a certain balance in trade between countries as trade between them develops, and notwithstanding some lending by surplus to deficit countries. Rather, the expansion of trade can be expected to lead to the *gradual* integration of the producers of the trading countries into a more extensive international division of labour in which producers in the different trading countries produce and export commodities in which they have natural or acquired advantages. This can most certainly be expected to have some corrosive effect on self-sufficient national reproduction systems. However, even if the producers of a particular country dominate the international sales of a particular product, the likelihood is that there will be a number of producers of the same product in other countries, some of whom may be using the same technologies and appropriating similar profits, while others will be using inferior technologies and appropriating lower levels of profits (see also Shaikh 1980). Some producers using inferior technologies may also be appropriating the same rate of profit as more efficient producers owing to their proximity to markets and various taxes and surcharges facing importers of these products. Moreover, with the flow of capital and technology between countries in the context of international competition between producers (and support by national states), initial patterns of specialisation are likely to change. Historically, the sort of complete specialisation envisaged by Ricardo has been the result of its imposition on the present-day developing countries by the present-day advanced countries during the early phases of the industrialisation of the latter and in the context of the destruction of the existing self-sufficient systems of reproduction in the former (see, for example, Kemp 1989, 1993). These are patterns of specialisation which the advanced countries

have sought to continue right up to the present through a myriad of economic, financial, and political pressures. They are not the natural outcomes of the development of trade, not even trade in the context of uneven development. (It needs noting that some Marxists appear to agree with the logic of Ricardo's explanation of specialisation, i.e. that it is the natural consequence of the expansion of international trade in the absence of capital and technology mobility, only denying that it gives rise to the sort of complete specialisation envisaged by him; see e.g. Shaikh 1980.)

Of note in this context is that pivotal to Ricardo's argument that countries specialising and trading with one another will gain, or at least not lose, is the implicit assumption that each country can revert to the production of the imported good should the international terms of trade they face be less favourable than the domestic terms of trade that existed prior to trade and specialisation. In terms of Ricardo's example of trade and specialisation between England and Portugal, this would mean that if England is not able to import wine at more than 0.83 units for each unit of cloth it exports it can revert to the production of wine and, similarly, if Portugal is not able to import cloth at more than 0.89 units for each unit of wine it exports it can revert to the domestic production of cloth. The important point is that England and Portugal are assumed to be able to revert to pre-trade and pre-specialisation patterns of production. If either England or Portugal could not revert to the domestic production of the imported good, then the logic of Ricardo's analysis suggests that there is in fact no limit to the movement of relative international prices in one direction or another and, therefore, no reason to suppose that countries will not lose from trade and specialisation. This fact has, of course, particular significance in the context of the above-mentioned imposition of patterns of specialisation on the present-day developing countries. These imposed patterns of specialisation, in the context of the destruction of self-reproducing systems of reproduction, in fact denied the present-day developing countries precisely this possibility (some degree of self-sufficient domestic reproduction) and, as a consequence, allowed the non-specialising countries, the advanced countries, to

exert continuous downward pressure on the international prices and values of commodities exported by the developing countries, and via this to increase the absolute and relative intensification of labour in these countries (see also Kühne 1979). It is the enforced and sustained patterns of specialisation in the developing countries in the context of the destruction of their national systems of reproduction that have been the real sources of their impoverishment and not, for example, their alleged lower levels of productivity as claimed by a number of Marxist writers on the subject (see, for example, Carchedi 1991a; Shaikh 1980; Warren 1973). Indeed, it is an understanding of this fact that has also pointed to two of the important pillars of more successful development strategies adopted by a number of (mostly East Asian) developing countries in recent times: food security and the diversification of their production and export bases. (In an extensive empirical study of development processes in the developing countries, Rodrik 2007 provides considerable evidence to show that economic development requires, among other things, diversification, not specialisation.)

Concluding Remarks

The preceding has sought to contribute to the extension of Marx's theories of price and money to the international level. It was argued that pivotal to this extension is an understanding of Marx's views on how prices are formed and, concomitantly, how money emerges and the role it plays in price formation. Marx's understanding of how prices are formed in general permits an understanding of how, with the development of international trade, international prices come to be formed and their relative magnitudes determined by relative international labour time, without any presumption of capital flows between countries. International capital flows have a bearing only on the magnitudes of relative international prices, not on their existence. Marx's understanding of how money emerges and contributes to price formation in general permits an understanding of the emergence of world money and the determination of its value as well as the world money prices of

commodities, denying most fundamentally any quantity theory mechanism related to world money flows between countries. Neither the value of world money nor world money prices in different countries change as a result of flows of money between countries.

This interpretation of the extension of Marx's theories of price and money to the international level was then used to consider Ricardo's explanation of international prices and money in the context of his theory of comparative advantage. It was argued that from the perspective of Marx's analysis Ricardo's explanation of international prices and money is fundamentally mistaken, as is his view that the opening up of trade between countries should lead to their complete specialisation with gains for all. Ricardo's explanation of relative international price is mistaken in that he sees relative international prices as determined in the final instance by the autarchic prices of the trading countries. He explicitly denies that international relative prices, unlike domestic relative prices, are determined by the (international) labour time required for their production on the basis of the mistaken view that such a determination requires international capital mobility. From the perspective of Marx's analysis what Ricardo fails to see is that once international trade becomes integral to the reproduction of different commodities in different countries the traded commodities acquire international values or relative international worth as measured by the relative international labour time required for their production. Ricardo's explanation of world money and world money prices is mistaken in that he sees, on the one hand, world money as reflecting the national worth of this money and not its international worth, and, on the other hand, this national worth as determined by the quantity of world money in circulation in any country in relation to the goods it circulates. The problem with this view is that it suggests world money can have a different worth in different countries and that this worth can change with flows of money between countries. From the perspective of Marx's analysis what Ricardo fails to see is that world money has basically a single world value which is determined by the international labour time required for its

production when it is a commodity, and the international labour time it commands when it is paper issued by a particular country. Flows of money between countries will not cause this value to change in the different countries. Finally, from the perspective of the extension of Marx's analysis to the international level Ricardo can be argued to be mistaken in seeing the opening up of trade leading to complete specialisation. This is because he fails to see that specialisation in the context of the opening up of trade is limited by the need for some semblance of balance in trade flows between trading countries in the process of the expansion of trade, especially given initial conditions of self-sufficient national reproduction. Indeed, complete specialisation would be found only where the national reproduction systems are ruptured and specialisation imposed, as in the case of present-day developing countries. The consequence of the imposition of specialisation patterns in the context of ruptured systems of reproduction is that the prices and values of the exports from these countries are subject to continuous downward pressure, something which is implicitly denied by Ricardo's doctrine of comparative advantage on the basis of the tacit assumption that all trading countries can revert to the production of all goods should they not obtain the relative prices they desire.

Definition

The relationship between Marxism and imperialism has been established since the writings of Marx himself. However, the Marxian study of imperialism since then has developed from a belief that, while some analysis of imperialism was present in the works of Marx, a dedicated analysis of the state and the international sphere had been left at an embryonic stage. The phenomenon of imperialism, while discussed by Marx in a number of instances, was not given the same sustained critical attention as other issues in his work. Imperialism, therefore, to Marxism has always been a 'problem' of some form. Indeed, the 'problem' of imperialism derives from a number of perceived sources: gaps in Marx's own writing; an explanation for why capitalism endures; an account of the phenomenon of globalisation. This essay contends that the ongoing relationship between Marxism and imperialism reveals one of Marxism's main strengths, and its clear weaknesses. It reveals Marxism's capacity to explain new phenomena coupled with a rigorous and critical method; however, it also reveals a reliance on systemic explanations for contingent developments, and a considerable partisanship among radical thinkers. This chapter on the relationship between Marxism and imperialism begins early in the twentieth century with the work of the 'classical' authors of imperialism, building on the work of Marx and critiquing extant understandings of imperialism, particularly John Hobson's. It then charts the origins of this relationship and its various iterations throughout the twentieth century until the present. This relationship has, fundamentally, changed very little, deriving largely from Marx's own work, and the work of the first Marxist theorists of imperialism. Indeed, the relationship is largely iterative rather than developmental, with particular ideas within Marxist theories of imperialism recurring perpetually. The essay is split into three sections according to various 'phases' of Marxist thought on imperialism: first, the 'classical' Marxists, from Hilferding to Lenin; second, the 'neo-colonialist' thinkers; and finally, the theorists of 'new imperialism', assessing the strengths and weaknesses inherent in each critical phase.

The relationship between Marxism and imperialism has been established since the writings of Marx himself. Particularly in *Capital, Volume I*, Marx discusses the international division of labour caused by the expansion of capital in Chapter 15, English capital in Ireland in

M

Chapter 25, as well as engaging with a theory of colonialism in Chapter 33 (1992a/1867). Marx's own views on both colonialism and imperialism have been well discussed in critical analysis of both his well- and lesser-known texts, many of which are presented in the compendium text *On Colonialism* (Marx and Engels 2001; see also Nimtz 2002; Pradella 2013). However, the study of imperialism post-Marx grew from a belief that, while some analysis of imperialism was present in the works of Marx, a dedicated analysis of the state and the international sphere had been left at an embryonic stage. This is broadly true, but this view has received criticism based on historiographical analysis of both Marx and the earliest authors on imperialism (Pradella 2013). The phenomenon of imperialism, while still discussed by Marx in a number of instances, was not given the same sustained critical attention as other issues in his work. This is the point at which Marxism's engagement with imperialism becomes more profound and substantial. Imperialism, therefore, to Marxism has always been a 'problem' of some form.

Indeed, the 'problem' of imperialism derives from a number of perceived sources: gaps in Marx's own writing; an explanation for why capitalism endures; an account of the phenomenon of globalisation. It is the contention of this essay, then, that the ongoing relationship between Marxism and imperialism reveals one of Marxism's main strengths, and its clear weaknesses. It reveals Marxism's capacity to explain new phenomena coupled with a rigorous and critical method; however, it also reveals a reliance on systemic explanations for contingent developments, and a considerable partisanship between radical thinkers.

This relationship between Marxism and imperialism therefore begins early in the twentieth century with the work of the 'classical' authors of imperialism, building on the work of Marx and critiquing extant understandings of imperialism, particularly John Hobson's. This chapter charts the origins of this relationship and its various iterations throughout the twentieth century until the present. This relationship has, fundamentally, changed very little, deriving largely from Marx's own work, and the work of the first Marxist theorists of imperialism. Indeed, the relationship is iterative rather than developmental, with particular ideas within Marxist theories of imperialism recurring perpetually. Most notably, the overarching power of Finance, or monopoly capital, within capitalism, and the idea of imperialism as a qualitatively distinct 'stage' of capitalist development are extremely powerful ideas within the tradition of Marxist theories of imperialism.

The essay will be split into three sections according to various 'phases' of Marxist thought on imperialism: first, the 'classical' Marxists, from Hilferding to Lenin; second, the 'neo-colonialist' thinkers; and finally, the 'new' imperialists.

The 'Classical' Marxists

The first Marxist theorists of imperialism, writing at the beginning of the twentieth century, sought to link contemporary international political developments to the nature of capitalism itself. The developing tensions between European states, it was argued, resulted from a need for states to secure control over foreign territories as an outlet for surplus capital (Bukharin 2003/1916; Lenin 2010/1916; Luxemburg 1963/1913). Alongside these systemic pressures, the early field of study was also shaped by the role of particular agency, especially financiers and bankers (Hilferding, 1981/1910). A notable division between those regarding capitalism as leading inevitably to conflict, and those who believed that such tendencies could be tamed by social and political reform, was also apparent with this distinction being most clearly articulated by the dialogue between Kautsky (1914) and Lenin (2010/1916).

From Hilferding onwards, however, there emerges the idea that existing Marxist texts lacked an explanation for the phenomenon of imperialism. Hence, Otto Bauer described Hilferding's *Finanzcapital* as the 'fourth volume' of *Capital,* addressing the international and imperial rivalries (and their origins) in a fashion not present in the three volumes of

Capital itself. The explanation for Hilferding (1981/1910) for the development of this phenomenon lies in the relationship between capital and the state, particularly the overwhelming power of monopoly capital over the state.

While Hilferding's approach laid a foundation for an analysis of imperialism, his approach focuses on the unification of capital within the 'metropolis' rather than on an analysis of relationships between states. It is Bukharin who develops, perhaps, the first 'theory' of imperialism, though his reliance on Hilferding's work is clear. Hilferding's imperialism was inextricably linked to the notion of monopoly: the conglomeration of the fractions of capital into finance capital controlled by bankers. Hilferding's understanding of the development of imperialism springs forth from the inherent tendencies of capitalism itself, as well as the personal direction of specific actors.

> A circle of people emerges who, thanks to their own capital resources or to the concentrated power of outside capital which they represent (in the case of bank directors), become members of the boards of directors of numerous corporations. There develops in this way a kind of personal union, on one side among the various corporations themselves, and on the other, between the corporations and the bank. (119–120)

Hilferding (319) then links the power of monopoly capitalism to the inherently crisis-prone nature of capitalism, and the role of the state in resolving those crises:

> As has always been the case, when capital first encounters conditions which contradict its need for valorization, and could only be overcome much too slowly and gradually by purely economic means, it has recourse to the power of the state and uses it for forcible expropriation in order to create the required free wage proletariat.

Hilferding also maintains that while capitalism, as a social relation, may exist everywhere, it is only when a state associated with an 'export capital' is in control of a territory that the process of surplus value extraction is at its most efficient.

> This explains why all capitalists with interests in foreign countries call for a strong state whose authority will protect their interests even in the most remote corners of the globe, and for showing the national flag everywhere so that the flag of trade can also be planted everywhere. (320)

As with Hilferding, subsequent authors also saw a problem of imperialism for Marxism. Lenin introduces Bukharin's *Imperialism and World Economy* by emphasising that the study of imperialism is the only means to understand political developments of the day:

> The problem of imperialism is not only a most essential one, but, we may say, it is the most essential problem in that realm of economic science which examines the changing forms of capitalism in recent times. Everyone interested not only in economics but in any sphere of present-day social life must acquaint himself with the facts relating to this problem . . . Needless to say that there can be no concrete historical analysis of the present war if that analysis does not have for its basis a full understanding of the nature of imperialism, both from its economic and political aspects. (Bukharin 2003/1915, p. 8)

Following Hilferding, Bukharin (152) argues that not only is monopoly capital important to understanding imperialism but that, without it, imperialism would not be possible. Indeed, this is a view shared by Lenin (2010/1916, p. 46) also, declaring monopoly capital the 'essence' of imperialism. As with Hilferding, Bukharin clearly links imperialism to the valorisation of capital, in that it 'is nothing more but a process of a continuous reproduction of the contradictions of capitalism on an ever wider scale' (Bukharin 2003/1915, p. 153). This is a view shared by all Marxist theorists of imperialism but it is especially clear in the earlier authors, sketching out the link between Marx and the spread of capitalism across the globe. Indeed, as Luxemburg (1963/1913, p. 365) notes, 'capital needs the means of production and the labour power of the whole globe for untrammelled accumulation; it cannot manage without the natural resources and the labour power of all territories'.

While a number of similarities exist within the works of authors on classical imperialism, it is possible to characterise these authors as using very similar methods to understand how capitalism developed a particular form at the beginning of the twentieth century. These methods are, principally, understanding the state as an instrument of the will of bankers, and presenting imperialism as a specific and predetermined period of capitalism (Sutton 2013). Kautsky (1916, p. 18), while also

M

offering an instrumentalist conception of the state, avoids the problem of periodisation by emphasising the contingent nature of extant accounts of imperialism, arguing that it is not a pre-determined period of capitalist development. Indeed, Lenin (2010/1916, p. 142) quotes Kautsky in order to criticise his claims of contingency as mere 'Socialist-chauvinist' claptrap:

> Cannot the present imperialist policy be supplanted by a new, ultraimperialist policy, which will introduce the joint exploitation of the world by internationally united finance capital in place of the mutual rivalries of national finance capitals?

Lenin rejected Kautsky's view since, he argued, states developed unevenly in capitalism and, therefore, national interests were constantly shifting and there could be no stable 'ultra-imperialist' policy, only the ultimately terminal impulsion to competition and conflict of the imperial stage of capital (ibid.). For Lenin, Kautsky had rejected Marx entirely and joined the ranks of 'bourgeois writers', thus leading Lenin to label Kautsky's idea of 'ultraimperialism' as 'ultra-nonsense' (ibid.: 35).

Lenin's argument is clear that imperialism is both a necessary and the highest stage of capitalist development. McDonough (1995, p. 364) argues that Lenin's work, along with the earliest Marxist authors on imperialism, represents the pivotal moment in resolving the 'first crisis of Marxism' as its introduction of a 'stage theory of capitalism' to Marxist thought helped to explain capitalist recovery instead of revolution. However, the subordination of the contingent developments in global society to a deterministic understanding of capitalist development remained highly problematic for these particular understandings of imperialism, especially given that the historical developments of the twentieth century led not to system-destroying warfare but, rather, to something closer to the 'bourgeois' understanding of imperialism held by Kautsky.

However, also problematic within these accounts is the emphasis placed on the role of Finance. These authors are not simply arguing that the power of banks and their domination of the state is a particular or contingent aspect of the imperial form of capitalism, but that it is inextricably linked to an understanding of capitalist production as teleological. In other words, the arguments offered by these early theorists were ill equipped to explain capitalism that did not follow this particular form.

The 'Neo-Colonialist' Thinkers

The historical developments of the early twentieth century, particularly the global wars of the period, devastated the European system of empires. This triggered the demise of the Eurocentric world order, led to the onset of decolonisation, and facilitated the rise of the US. This historical turn, therefore, undermined the original theorists of imperialism. Apparently, not only had European states withdrawn from their empires but the dominant world power was now a self-declared anti-imperial world power. Therefore, the concept was ostracised from the scholarly mainstream during the post-1945 era.

However, imperialism continued to be theorised and accounted for. The main focus was now no longer centred on themes of rivalry and warfare, but on the changing nature of international capitalism, the qualities of the 'world system', and on questions about economic dependency, underdevelopment, and the relations between core and peripheral states (Amin 1977; Arrighi 1994; Baran and Sweezy 1968; Cohen 1973; Frank 1966, 1978, 1980; Frank and Gills 1993; Galtung 1971; Mandel 1975; Wallerstein 1974, 1975, 1980, 1989). However, the continuities between this 'second wave' of scholars and the earlier scholars are quite remarkable. Rather than a revolution in the theorisation of imperialism, these later scholars were highly dependent on the key concepts developed by earlier authors.

The 'second wave' of theories of imperialism occurred in the 1960s and 1970s and is generally synonymous with Dependency Theory and World System Theory (Brewer 1990, p. 161), and developed from earlier ideas of uneven development, monopoly capital, and a stage theory of capitalism (McDonough 2007, p. 258; Soldatenko 1982, p. 41). Amin (1977, p. 112) accepts the Leninist notion that imperialism is the highest stage of

capitalism since it is the most exploitative stage of capitalism, and therefore the 'highest' stage of capitalism.

The authors of the 'second wave' characterised the world economy according to zones of development: core, semi-periphery, and periphery, with surplus value being channelled from periphery to core states. These theories argued that dependent territories are kept in a perpetual state of underdevelopment in the interests of monopoly capital in the core countries. This allows advanced monopoly capital to continue to exploit these territories without competition from native production, and without a working-class consciousness developing there. Where the earliest authors on imperialism emphasised the competition between states, the authors of the 'second wave' emphasised the importance of changes in international capitalism, particularly the dependency and uneven development between core and periphery states (Kettell and Sutton 2013, p. 4). This development in the literature does, to some degree, approximate Kautsky's notion of 'ultraimperialism', in emphasising a harmonisation of interests between 'core', or imperialist, states.

One further development of this characterisation led not just to a typology of states but also to a typology of class. Amin (1977, p. 115) identifies a core working class, and periphery working class, each with its respective bourgeoisie. They can be considered distinct in that they are divided nationally, holding apparently separate cultural and social values and interests. As such, the periphery bourgeoisie can be anti-imperialist allies to the periphery working class; so too can the core working class be pro-imperialist along with their respective bourgeoisie. However, this is an acceptance of the manner in which imperial relations present themselves in capitalism – not as global capitalist relations but rather as the relations between nationally constituted states.

To some extent, then, these approaches diminished the role of agency, focusing instead on the role of the 'world-system' and its typology of states to account for the persistence of capitalism not just in what Hilferding initially referred to as the 'metropolis', but also in the allegedly independent former colonies. Considering the debt owed

to Lenin by these theories, it is not surprising that the emphasis would be on such a structuralist account. The key development of these theories, building on earlier Marxist authors, was to account for an imperialism that was neither formally territorially bounded nor prone to system-threatening competition between imperial states (Song 2011: 293). However, the same problems resurfaced in 'second-wave' accounts as they had in the 'classical' Marxist accounts; namely, a stage theory of history, the role played by monopoly capital, and, therefore, the presentation of contingent developments as necessary aspects of capitalist social relations Furthermore, new problems emerged from the effort to resolve issues with the first theories, particularly a reliance on an explanation of state behaviour that split class along national lines.

The 'New' Imperialists

During the latter years of the twentieth century, the concept of imperialism remained at the academic margins. The principle means of understanding imperialism was now framed in terms of the debate on 'globalisation', particularly from the mid-1970s, which argued that the role and power of the state were being undermined by a hitherto unseen level of capitalist accumulation (Pozo-Martin 2006). The resurgence of imperialism as a field of study during the early years of the twenty-first century was once again linked to an assertion that this form of imperialism was also both qualitatively distinct and unique. Denoting a figurative as well as a literal shift from 'old' to 'new' imperialism, the view from many quarters was that imperialism was not merely 'back' but more profoundly exploitative than ever. There is both a lack of clarity, and some irony, in the term 'New Imperialism' to describe this development in the literature. In terms of the latter, the phrase 'New Imperialism' has been used since the very first dedicated study of imperialism by Hobson (1968/1902) to emphasise that this new 'phase' of imperialism rested both on conflict and competition between empires, as well as the power of finance over the state. Marxist authors on

M

imperialism owe a great deal to Hobson's account. In terms of the former, the use of the term 'New Imperialism' in the literature could potentially refer to either a new theoretical approach to understanding imperialism, or a qualitatively distinct form of imperialism (Harvey 2007, p. 57; Kettell and Sutton 2013, pp. 6–20).

David Harvey's account (2003, p. 116) of the New Imperialism highlights the importance of understanding how capital must valorise the role of the state in resolving blockages to the circuit of capital on a global scale. Harvey however relies on the idea of the neo-liberal state, deriving from an apparent caesura in the 1970s, the shift from Fordism to 'flexible' accumulation, and the ensuing turn from modernity to post-modernity, to substantiate his idea of contemporary imperialism. Harvey (1990, p. 124) lays the foundation for this by declaring, 'the contrasts between present political-economic practices and those of the post-war boom period are sufficiently strong to make the hypothesis of a shift from Fordism to what might be called a 'flexible' regime of accumulation a telling way to characterize history'. To Harvey (171), this movement to a 'flexible regime' is concomitant with the shift to post-modernism, emphasising 'the new, the fleeting, the ephemeral, the fugitive, and the contingent in modern life, rather than the more solid values implanted under Fordism'. In critique of Harvey, Wood (1997, p. 540) characterises his position as follows:

> Postmodernity then corresponds to a phase of capitalism where mass production of standardized goods, and the forms of labour associated with it, have been replaced by flexibility, new forms of production – 'lean production', the 'team concept', 'just-in-time' production, diversification of commodities for niche markets, a 'flexible' labour force, mobile capital and so on, all made possible by new informational technologies.

Harvey's understanding of a change within capitalism from modernity to post-modernity has already been well critiqued as the periodisation of capitalist society, used to explain the shift from Fordism to flexible accumulation (Wood 1997).

However, this is also true of Wood (2005, p.134) when she argues that the New Imperialism

rests on a 'Universal Capitalism' – one in which capitalism has already expanded to incorporate the entire globe, requiring a new type of imperialism based on 'economic domination' rather than the rivalry of nation states that characterised 'old imperialism'. Harvey (2007, p. 60) criticises Wood's (2005, p. 100) typologies of both imperialism and capitalism as unable to fully explain the dynamic changes in global capitalism. Harvey (2007, p. 67) acknowledges that neither he nor Wood (2005) did a 'very good job' of theorising the state in their accounts of imperialism, which incites him to exhort, 'Not only do we need a new theory of imperialism to match the conditions of our time but we also need a new theory of the capitalist state'.

For Harvey, 'around 1970 or so' is the beginning of the third stage of the global rule of the bourgeoisie (2003, p. 60). This, he declares, saw 'a different kind of system emerge' that was quintessentially neo-liberal in character, transforming the state itself into a different 'type' of state. (62). Indeed, Harvey is explicit that this shift to a newer imperialism only occurs due to the transition from Fordist to flexible accumulation, leading to an ascendant financial power (64). In fact, Harvey's emphasis upon the power of the 'Wall Street-Treasury-IMF' complex, as financial power over the state, is highly redolent of the earliest theories of imperialism, which rested on the idea of finance capital requiring the state to undertake imperialism.

The focus for Harvey, and the New Imperialism more broadly, has, unlike prior accounts, focused almost solely on the actions of a single state: the US, emphasising both its military dominance and its position as the centre of global financial capital. As the dominant power within the international state system, this is perhaps understandable but not entirely unproblematic, and has received considerable criticism from Marxist authors. Hardt and Negri (2000) term contemporary global society as 'Empire' and criticise the US-centric approach of Harvey. To Hardt and Negri (xii), Empire is a decentralised and deterritorialised global power structure. Empire has four distinct aspects: first, Empire is global;

second, Empire appears eternal; third, Empire pervades every aspect of society; fourth, Empire is exceedingly violent but appears peaceful (xv). Empire therefore seeks to reconcile the apparent deterritorialisation of imperialism with continued exploitation and the inherent violence of capitalism; however, this account becomes, in effect, indistinguishable from an account of capitalism itself and therefore provides nothing other than an abstract understanding of capitalism divorced from the still extant features of the international state system (Kiely 2005, p. 48). This critique is also made by Wood (2002, 2005, p. 6) of Hardt and Negri, whom, she argues, accept the superficial qualities of globalisation and miss something 'truly essential' about both capitalism and imperialism, namely a robust understanding of the state.

This critique has also found substantial purchase elsewhere. Panitch and Gindin (2006) Pozo-Martin (2006, p. 236), and Robinson (2007, p. 8) argue that an under-theorisation of the state is characteristic of most scholarship on the 'New Imperialism', including Callinicos (2005a, 2005b), Gowan (1999), and Harvey (2003). Callinicos's (2010, pp. 82–84) response to this is to invoke a formanalysis understanding of the state. However, Callinicos (ibid.) rejects form-analysis as more problematic than useful, leading him to accept a 'broadly Gramscian approach' to imperialism (99).

The New Imperialism developed following debates over 'globalisation' and the international proliferation of 'neo-liberal' ideology. These authors sought to explain the sudden and massive expansion of credit within the global economy, as well as to account for a perceived 'hollowing out' of the state. However, from this particular historical context derives the literature's fundamental problems, which, again, have not fundamentally resolved the problems of the first Marxist theorists of imperialism. First, the consensus on the New Imperialism is that we are, yet again, in a distinct phase of capitalism. Second, the role of Finance dominates explanations of the behaviour of states, and the nature of this New Imperialism. Last, perhaps distinctively in this new phase of

scholarship on imperialism, this apparent historical shift away from the state has also led to authors themselves neglecting the role of the state in understanding imperialism.

Conclusions

This relationship between Marxism and imperialism has been an illuminating one, highlighting not just the enduring value of Marxist scholarship on imperialism but also its persistent problems. Most notably, these problems derive from a conflation of factors contingent upon and necessary to capitalist social relations, which themselves derive from, perhaps, an emphasis on theory over historical research. Broadly lacking in Marxist theories of imperialism is a sustained engagement with historical scholarship. There is also a neglect of the specific relationships between states and the everyday 'minutiae' of capitalism. Rather, these accounts have generally focused more on 'top-down' systemic theories of imperialism. As such, Marxist theories of imperialism have almost always invoked Finance, or monopoly, capital to explain the phenomenon, which they have also sought to identify as a particular and discrete historical period of capitalism. These theories have changed, of course, depending on their particular historical circumstances. The first theories sought to explain imperial rivalries leading to a system-threatening war; the second wave of theories sought to explain the continued inequality between Western and post-colonial state; while the latest wave of Marxist thought has sought to incorporate globalisation and the apparent retreat of the state.

More recent developments in understandings of imperialism in Marxist scholarship have centred on the debate between so-called neo--Gramscian and open Marxist theories of the state. Most obvious in this debate is the limited engagement either approach has had with the other, leading to highly partisan scholarship by both sets of authors (see e.g., Bieler and Morton 2003 Bieler et al. 2010; Bonefeld 2009; Bruff 2009a, b; Burnham 1991). The main distinction

M

between these two groups is that, while open Marxists sought to demystify the nature of capitalism by a return to Marx himself, neo-Gramscian scholarship sought to base an understanding of modern capitalism upon the work of the Italian Marxist Antonio Gramsci. The value offered by both of these approaches, however, is in their desire to theorise the state, offering a rigorous critical lens through which to understand the changing conditions of capitalist social relations. Given the development of Marxist theories of imperialism over the course of the twentieth century, and their problems stemming from a lack of sustained analysis of the origins of state action, this more recent debate, although partisan, offers to inject new vigour into a Marxist understanding of imperialism.

Transnational transfer of value; Unequal exchange, globalized production, the smiley curve

Marx's critique of capitalist accumulation is based on an analysis of the commodity. Commodities are the cells in the capitalist system. In the commodity, we find the DNA of capitalism. It contains the contradictions that drive the system from a simple exchange of goods in a medieval town square to today's globalized capitalism. In *Das Kapital*, Marx unfolds the logic of capitalism in increasing complexity. His original plan was to "*examine the system of bourgeois economy in the following order:* capital, landed property, wage-labour, the State, foreign trade, world market" (Marx 1859: 1). However, Marx only got halfway through his analysis. He never properly outlined theories of the state, the world market, international trade, or imperialism for that matter (although he did analyze colonialism and England's exploitation of other nations).

My aim here is to explain how Marx's concept of value unfolds in neoliberal global capitalism, with a focus on how *transnational* transfer of value takes place – in short, imperialism. In order to do this, I find it necessary to convey certain features of the value concept, which are important for the transnational transfer of value. They may seem basic and simple, nevertheless often misunderstood.

Capitalist Accumulation and Value

The driving force in the capitalist mode of production is accumulation. The capitalist invests in order to create more capital. To accomplish this goal, the capitalist seeks to sell as many commodities as possible at the highest price to maximize

M

profit. Let us look in more detail at the characteristics of commodities.

A commodity has two forms of value: use value and exchange value. Its *use value* is defined as its ability to satisfy a physical or psychological need, as a raincoat or a Teddy bear. The use value is mainly of interest of the buyer. No matter how different their use value is, commodities have something in common, that is, they are comparable on a certain level of abstraction and in certain quantitative relations. This commonality is what Marx calls value – or more specific exchange value (in connection with use value). Exchange value is defined as the quantitative relation between commodities no matter how different they are. Thus, for instance, 500,000 toothbrushes equal one Mercedes-Benz.

Whether something is a commodity does not depend on certain physical qualities but on the social relationships between seller and buyer. We can neither touch nor see value. We can only touch and see the commodities that have value. Value can be measured in labor time or in quantities of other commodities, but it is not a quality physically embedded in commodities. As Marx put it, "So far no chemist has ever discovered exchange value either in a pearl or a diamond" (Marx 1867a: 53).The ultimate test is the market: whatever can be sold is a commodity. It has use value for the buyer, while it is on the market that the exchange value unfolds.

Therefore, what all commodities have in common is that they are produced by human labor for exchange. Both use value and exchange value are reflected in labor. Use value relates to the concrete labor necessary to produce a commodity: sewing, welding, etc. Use value and concrete labor are qualitative in nature and satisfy needs. Exchange value relates to abstract labor, which is quantitative in nature, measuring the time, energy, knowledge, and experience needed to produce. Of particular importance is the socially necessary labor time, which is the time required for the production of a commodity based on the average quality and intensity of labor as well as the technological development available for production.

Therefore, it is human labor in the production process that is the source of value. However, the specific determination of the actual exchange value occurs on the market. (I will return to how this is so.) It is the fact that all commodities are products of human labor, which makes it possible to relate them to one another. Thus, value reconciles the production sphere and the circulation sphere in capitalist accumulation. Both are necessary in the realization of the value.

In the preface to the first volume of *Capital* published in 1867, Marx announced his plans for four volumes: one on capitalist production, one on the circulation of capital, one on "the varied forms assumed by capital in the course of its development," and one on "the history of the theory." In a letter to Engels, dated July 31, 1865, Marx wrote that the volumes were to be considered as an "artistic whole" (Marx 1865: 173). If one only reads the first volume, one's impression might be that production is essential and circulation secondary. However, Marx was very clear about the relationship between production and circulation in the valorization of capital: "Capital cannot . . . arise from circulation, and it is equally impossible for it to arise apart from circulation. It must have its origin both in circulation and not in circulation" (Marx 1867b: 268).

The Value of Labor-Power and Surplus-Value

Labor is the common measure of the value of all commodities. However, the commodity that is purchased in the form of wages is not an ordinary commodity. What the capitalist buys is the labor-*power* of the worker: the strengths, the energy, the knowledge, and the commitment for a specific quantity of time. To keep up this power, the worker needs a certain supply of substance. The value of the labor-power is the amount of labor necessary to produce these substances. However, the two quantities are not equal. The labor time and energy the worker delivers are more than what is needed to produce the substances the worker needs to be able to deliver the labor-power.

Just as with other commodities, the value and use value of labor-power is different. Labor-power's use value for capital is its capacity to produce

an amount of commodities, the exchange value of which is greater than the exchange value of labor-power itself. This difference is what Marx called surplus-value – the source of profit. (Value and surplus-value are of no interest for workers or capitalist. What they are interested in are prices, wage, and profit. These concepts are certainly also of our interest; however in order to understand how these forms of appearance of value are generated and divided, we need to explain the basis for these forms of presentation. I will return to the transformation from value/surplus-value to wage, price, and profit.)

Technically, we can divide the workday into two periods: one, in which the worker reproduces the value of their labor-power, and another in which they create surplus-value (Marx 1867c: 162–164). The rate of surplus-value depends on the extent of the second period. The rate of surplus-value therefore indicates the level of exploitation of labor-power:

Rate of surplus − value = time of surplus − value/
  time required to reproduce the value of labor − power.

Alternatively, in terms of capital (variable capital equals wage):

$$\text{The rate of surplus} - \text{value} = \frac{\text{surplus} - \text{value}}{\text{variable capital}}$$

$$s' = s/v$$

There are basically three ways capital can increase the rate of surplus-value and thereby the potential volume of profit:

- **Increase the *absolute surplus-value*** by an extension of working time and/or the intensification of work, in relation to the required working hours to reproduce the "basket of goods" which forms the value of labor-power.
- **Increase the *relative surplus-value*** by a productivity increase as a result of new technology or more effective management form, which reduces the "necessary working hours" share of the total working hours.

- **Extract *super surplus-value*** by lowering the actual level of reproductive costs and thus the "necessary working time" share of the total working hours.

The concept of "super-exploitation" originates from Ruy Mauro Marini (1932–1997), a Brazilian economist known as one of the creators of Dependency Theory. In his book *Dialéctica de la Dependencia*, he describes how the breakthrough of industrialization in England in the nineteenth century was dependent on imports of cheap food produced through the *super-exploitation* of labor in countries such as Ireland and the countries of Latin America. An export-oriented capitalism in the periphery created a dynamic capitalist development in the center. Marini defines super-exploitation as a combination of all three measures to enlarge the amount of surplus-value:

> The intensification of work, the extension of the working day and the expropriation of part of the necessary labour for the labourer to replace his labour power. . .. (Marini 1974, p. 36, Here quoted from Higginbottom 2014, p. 30)

The "Intensification and extension of the working day" equals Marx's absolute surplus-value. However, it is the last mentioned form, which is of special interest here. By "expropriation of part of the necessary labour for the labourer to replace his labour power," Marini refers to a wage depression in the colonial arrears *under* the value of labor-power, as Marini concludes:

> In capitalist terms, these mechanisms. . . signify that the labour (Power) is paid under its value, and they correspond, therefore, to a super-exploitation of labour. (Marini 1974, p. 42. Here from Higginbottom 2014, p. 31)

Marini furthermore draws the interesting conclusion that the super-exploitation of labor-power in the periphery changes the pattern of extraction of surplus-value in England from being dependent on absolute surplus-value (longer and more intensified labor) to relative surplus-value (greater productivity) due to the dynamic development of industrial capitalism in the second half of the nineteenth century (Marini 1974, p. 13. Here from Higginbottom 2014, p. 32). The development of the productive forces in the center due to

M

colonial super-exploitation increased the relative surplus-value considerably. However, the working class in the center managed to get its share of the gains from the increased productivity by raising their level of wages through trade union struggle. There is no necessarily built-in relationship between a raise in productivity and an increase in wages; who gains is a question of class struggle (for a historical account for the development of wage in the late nineteenth century in England, see Lauesen 2018, p. 52–55).

I will return to the importance of super-exploitation as a generator of surplus-value in contemporary global capitalism, as based on low-wage labor arbitrage (Smith 2016). First, however, I will have to return to the relation between the value of labor-power and the development of highly different wage levels.

The Price of Labor-Power

Labor-power is not like other commodities. There is no factory that produces labor-power. Labor-power does not produce labor-power. Labor-power is generated in the private sphere of society – mostly in families. However in this process, the laborers consume a certain "basket" of commodities, produced in the capitalist sphere, and thereby the value of labor-power depends on the value of these commodities.

But what defines this "basket of goods" and how is its price of labor-power – the wage – determined? Marx distinguished between two factors: the bare reproduction costs of labor-power and what he called the "historical and moral element." The bare reproduction costs of labor-power relate to the costs that are necessary to keep the working class alive, fit to work, and able to have children who become new workers. In simple terms, they are the costs necessary for food, clothes, and shelter. When a worker receives a wage that covers only the bare minimum of what is necessary to reproduce the ability to work, it is often called a subsistence wage. However, the "necessary wants" also contain a historical and moral element, which was explained by Marx in the following way:

On the other hand, the number and extent of his so-called necessary wants, as also the modes of satisfying them, are themselves the product of historical development, and depend therefore to a great extent on the degree of civilisation of a country, more particularly on the conditions under which, and consequently on the habits and degree of comfort in which, the class of free labourers has been formed. In contradistinction therefore to the case of other commodities, there enters into the determination of the value of labour-power a historical and moral element. Nevertheless, in a given country, at a given period, the average quantity of the means of subsistence necessary for the labourer is practically known. (Marx 1867d: 121)

In other words, the historical and moral element of the value of labor-power is a product of class struggle – national and international – historical and current. This class struggle and the labor market it creates mediate the realization the value of labor-power into wages, in the same way as class struggle and the market mediate the realization of surplus-value into profit.

The long history of capitalism, the creation of a world divided into a center and periphery by colonialism and imperialism – together with the limited international mobility of labor – helps explain the enormous differences in *wages* globally. The price of labor-power, the *wage*, is relatively stable over time, but it varies significantly globally. That is in contrast with the price for other commodities, which varies significantly over time, but is relatively stable from place to place. The prices for copper and wheat, for example, go up and down almost daily, but they do so across the world. There is a world market price for most commodities with labor-power as a significant exception. The wage is dependent on national and global class relations. It is the result of norms, rules, laws, and not least the result of trade union efforts with regard to working hours, minimum wages, overtime pay, collective bargaining, and so on. Within countries – especially imperialist ones – there is a tendency for wages, for the same kind of work, to balance out. Globally however, the differences remain huge.

The Globalized Value of Labor-Power

When Marx formulated his conception of "the historical and moral element" of the value of

labor-power, capitalism consisted of distinct national economies. In today's neoliberal capitalism, there is a global market for capital and commodities with globalized production chains linking labor-power in the North and South together in the production of the same commodity. Furthermore, with the industrialization of the Global South, in the last decades, the level of technology and management regimes is also becoming increasingly similar on a global level. The value of a commodity is no longer based on varied and isolated national conditions. The value is based on global conditions. Thus labor-power also has a globalized *value*. Samir Amin writes:

> My major contribution concerns the passage from the law of value to the law of globalized value, based on the hierarchical structuring – itself globalized – of the price of labor-power around its value. ….this globalized value constitutes the basis for imperialist rent. (Amin 2010, p. 11)

It is crucial to distinguish between the value and the price (wage) of labor-power. As mentioned, labor-power is not an ordinary commodity produced by capital, but one generated in complex social relationships. Its value is determined by historical development as well as the current class struggle, family structure, and so on. This means that labor-power is reproduced under very different conditions in the South and North, but is nevertheless brought together through global production and consumption. The port worker who loads containers in Shanghai creates as much *value* as the port worker in Rotterdam who unloads them, assuming that the work has the same intensity and uses the same technology. However, the *price* of labor-power – the wage – varies due to the different historical backgrounds, different social relations, political conditions, and the limited mobility of labor, as Amin writes:

> Capitalism is not the United States and Germany, with India and Ethiopia only" halfway" capitalist. Capitalism is the United States and India, Germany and Ethiopia, taken together. This means that labor-power has but a single value, that which is associated with the level of development of the productive forces taken globally (the General Intellect on that scale). In answer to the polemical argument that had been put against him - how can one compare the value of an hour of work in the Congo to that of a labor-hour in the United States? –Arghiri

Emmanuel wrote: just as one compares the value of a hour's work by a New York hairdresser to that of a hour's labor by a worker in Detroit. You have to be consistent. You cannot invoke "inescapable" globalization when it suits you and refuse to consider it when you find it troublesome! However, though there exist but one sole value of labor-power on the scale of globalized capitalism, that labor power is nonetheless recompensed at very different rates. (Amin 2010, p. 84)

The "bare reproduction cost" and the "historical and moral component" of the value of labor-power are not two distinct and different elements. The class struggle may incorporate new elements in the "bare reproduction cost," and repression can pressure the wage below that level. The wage may vary below as well above this global value of labor. The combination of the historical development of highly different wage levels between the Global North and South and the constitution of a global value of labor-power has several consequences. It entails different rates of surplus-value. The combination of globalized value and low wages in the South is the basis of extraction of what Marini calls *super surplus-value,* which generates super-profits for capital and relatively low prices of commodities for a North wage level. Thus, the difference between value and price of labor also causes a transfer of value from South to both capital and labor in the North.

So what is the *global value of labor-power* in hard cash? As Marx explained in the quote above concerning the value of labor-power in a *country*:

> the necessary wants. … are themselves the product of historical development,. ….. depend on the degree of civilization. Nevertheless,. . . at a given period, the average quantity of the means of subsistence necessary for the labourer is practically known. (Marx 1867d: 121)

We can now apply this to the global level, meaning that we can determine the global value of labor-power as the global average wage at a given time period. That means the average wage is calculated according to the number of workers on a certain wage level in the different parts of the world. A given level of wages compared to the global value of labor-power indicates whether you are in the center or periphery of the world system. The difference in wages between the USA and

China is around 10:1 and between Sweden and Bangladesh 50:1. This definition of the global value of labor-power also allows us the possibility to quantify the size of transnational value transfer, and it allows us to measure whether a given wage level generates or consumes value in a global context. I have specified the method in the book, *Unequal Exchange and the Prospects for Socialism in a Divided World* (Manifest-Communist Working Group 1986: 110–113 and 131–140). At that time the average wage for workers in the imperialist countries was $5.50 per hour and $0.36 in the Third World. Hence, the difference was at a factor 15:1 and the average weighted factor was 5.7. Zak Cope in his book, *Divided World Divided Class: Global Political Economy and the Stratification of Labour Under Capitalism* (Cope 2015: 254–6), made the same calculation but with figures from 2008. He reaches a wage factor of 11 for OECD workers and 1 for Non-OECD workers, an average wage factor at 6,5, all summing up to a transfer of $4.9 trillion.

After this examination of the value and price of labor-power, I will turn to the transformation from value to price for commodities and the transformation of surplus-value into profit. The first step is a description of the circulation of capital.

The Circulation of Capital

For the capitalist, the use value of labor-power consists of its producing commodities whose exchange value exceeds the costs of the labor-power required to produce them. In order to exploit labor-power in this way, capitalists must own means of production. They must invest in workshops and factories, machines, raw materials, energy, and so on. This part of capital is called constant capital, because its value remains unaffected during the process of accumulation. The labor-power that the capitalist buys is called variable capital because it is used to create value that exceeds its own (Marx 1867e: 142–149).

The circulation of capital is divided into the sphere of production and the sphere of circulation. In the latter, commodities are bought and sold.

Both spheres are dependent on one another: there is no circulation without production, and there is no point in producing without circulation. The first phase of the circulation of capital consists of capitalists acquiring means of production and buying labor-power. The second phase consists of using the means of production and the labor-power purchased to produce commodities. The third phase of the circulation of capital consists of trading commodities. In this phase, the capitalist collects the surplus-value created in the production process.

The capitalist must be able to sell the commodities that have been produced on the market at a price that includes both the expenses for constant and variable capital plus the surplus-value that can be used to either start the circulation of capital anew (with expanded possibilities) or to consume (Marx 1867f: 400). The total circulation of capital appears as follows:
(Or use the figure in Lauesen 2018, p. 461)

Abbreviations used in tables and formulas:

C Aggregate capital	V Value = c + v + s
c Constant capital	p Profit = P(c + v)
v Variable capital	p′ Rate of profit = s/(c + v)
s Surplus-value	s′ Rate of surplus-value
P′ Average rate of profit = s/(c + v)	
PP Price of production = c + v−e−P′ (c + v)	

Although the price of a commodity can differ from its value, it is determined by value in the final instance. According to neoclassical market economists, prices are determined exclusively by supply and demand on the market. This is, however,

only the final touch. Commodities need to be produced and reproduced to keep the accumulation running. If capitalists do not recover the cost of production plus a profit on the market, they will not produce the commodities again, and accumulation ceases. The price they need is what Howard Nicholas calls "reproduction prices" (Nicholas 2011). But how do we measure costs of production, i.e., the inputs required to make a commodity? Freya Brown formulates the problem nicely:

> We cannot use prices to measure inputs, for prices are what we are trying to explain in the first place! The only thing common between all the inputs of a commodity is labor. Thus, in any economy based on commodity production, the prices of commodities will in the final instance be fundamentally tied to the (socially necessary) labor-time embodied in those commodities. (Brown 2011)

From Surplus-Value to Profit

However, just as the worker is interested in the size of her wage more than the concept of value, the capitalist is interested in profit more than surplus-value. Profit, as we have seen, is dependent on production costs in general or what is called the *cost price* (Marx 1883b). How the cost price is divided between constant capital and variable capital is of no interest to the capitalist either. Marx writes in the third book of *Capital*:

> In its assumed capacity of offspring of the aggregate advanced capital, surplus-value takes the converted form of profit. (Marx 1883b; Ibid.)

The relation between the surplus-value and the total capital used for production defines the profit rate, as shown in the formula:

$$\text{The rate of profit} = \frac{\text{surplus} - \text{value}}{\text{aggregate capital}}$$

$$\text{p}' = \text{s}/\text{C}$$

The profit rate depends both on the rate of surplus-value and on the relation between constant and variable capital. A rise in surplus-value brings a rise in the profit rate. The relation between constant and variable capital is called capital's *organic composition*. It is dependent on the relationship between labor-power and the means of production. This relationship varies from industry to industry. Capital has low organic composition if variable capital makes up a large part of total capital, and high organic composition of constant capital makes up a large part of total capital. An example for an industry with a high organic composition of capital is the petrochemical industry, which relies largely on constant capital. An example of an industry with a low organic composition of capital is the textile industry, which relies largely on variable capital.

The following table illustrates the immediate relation between capital's organic composition and the profit rate. The higher the organic composition, the lower the profit rate; the lower the organic composition, the higher the profit rate (Marx 1883a: 155) (Table 1).

Formation of the Average Rate of Profit

As the table above shows, capitals of the same size but with different organic compositions can, in *theory*, generate very different rates of surplus-

Marxism, Value Theory, and Imperialism, Table 1 Influence of organic composition on the profit rate

Aggregate capitals	Rate of surplus-value, %	Surplus-value	Value of product	Rate of profit, %
C = c + v	s/v	S	V = c + v + s	p′ = s/C
I	80c + 20v	100	20	120	20
II	70c + 30v	100	30	130	30
III	60c + 40v	100	40	140	40
IV	85c + 15v	100	15	115	15
V	95c + 5v	100	5	105	5

value and, therefore, very different profit rates. This, however, is not what happens in practice. Otherwise, capital would flock to industries with a low organic composition, yet this is not the case. We know that the average, long-term profit rates of different industries are very similar. But why? Capital always drifts toward those industries promising the highest profits. If there is increased demand for the products of a certain industry, their prices will rise and so, in turn, will the profit rate. This attracts capital formerly invested in other industries and leads to a growth of this particular industry. Often the consequence is overproduction and oversupply, falling prices, a lower profit rate, and capital moving elsewhere. Unequal profit rates between different industries cause the constant movement of capital and balance out the industries' average rates of profit. In other words, competing capitals ensure that the average, long-term profit rates of different industries are very similar. This also means that a given amount of capital will, in the long run, create similar profits, no matter what industries it is invested in or how it is divided between constant and variable capital.

This can be explained through the first step of the transformation of value into price. The original value of commodities is converted into a price of production. The price of production of a commodity consists of the cost price (used variable and constant capital) plus the average profit in relation to the total capital used in its production. This can be summarized in the following formula:

$$\text{Price of production} = \text{cost price} \\ \times \text{average rate of profit}$$

Therefore, the price of production of a particular commodity is not the same as its value. The cost price is equivalent to the quantity of labor time that is needed in order to ensure that a specific commodity can be *reproduced* in the context of reproduction of *all* commodities. At first glance, these two categories might seem the same. However, in a capitalist economy, where profit enters the equation, due to the different compositions of variable and constant capital reproduction, prices normally deviate from values. A certain transfer of value takes place via the formation of average profits. However, the combined price of production of all commodities is the same as the combined value of all commodities. In addition, combined profits are the same as the combined surplus-value created in production.

The price of production must not be confused with the market price, to which it is only coincidentally equal. The market price is the price a commodity is actually sold for on the market. Market prices are adjusted by supply and demand, the existence of monopoly, and so on. The goal for each commodity is to reach a market price that consists of its production cost plus the average rate of profit. This allows production, and therefore the accumulation of capital, to continue. Let us see how the average rate of profit affects the numbers in the table above. If we put a total capital at 100 and the rate of surplus-value consistently at 100% and we assume that the whole capital turns over in one circulation, then the new numbers indicate the formation of the average rate of profit (Table 2):

$$(20\% + 30\% + 40\% + 15\% + 5\%)/5 = 22\%.$$

As the table indicates, the amount of labor-power required in different industries and

Marxism, Value Theory, and Imperialism, Table 2 Creation of average rate of profit

Total capital		Surplus-value	Value	Average profit rate, %	Price of production	
C		S	V	P′	PP	Deviation of PP from value
I	80c + 20v	20	120	22	122	+2
II	70c + 30v	30	130	22	122	−8
III	60c + 40v	40	140	22	122	−18
IV	85c + 15v	15	115	22	122	+7
V	95c + 5v	5	105	22	122	+17

therefore the organic composition of capitals as well as surplus-value differ widely. When profits are distributed, surplus-value is transferred from industries with a low organic composition to industries with a high organic composition. As stated above, this is of no relevance for capitalists. However, for a Marxist analysis of capitalism, it is important to account for this transfer. Some economists have called this transfer "unequal exchange," but this must not be confused with Emmanuel's use of the term (which we will consider below). To speak of unequal exchange in this context can be misleading. The value transfer described above is inherent in the logic of capital. The fact that the profit rate is distributed among all industries, so that capitalists can make profits in each of them, is a key aspect of capitalist production. It allows capitalists to compete on the market and to develop the productive forces. If commodities were priced according to their value, instead of according to the price of production, investments in mechanization would come to a halt. Capitalists would only invest in labor-intensive industries with much variable capital and a low organic composition. The pharmaceutical industry would disappear, and woodcutting would prosper. In a developed capitalist country, labor is mobile enough to guarantee that the rate of surplus-value will be similar across different industries. Market prices of commodities depend on the price of production, not their value or cost price. However, I would like to draw attention to an important deviation from average rate of profit of capitalism cause by the development of monopoly capitalism – super-profit.

Super-Profits

In his writings on imperialism in 1916, Lenin spoke of super-profits, meaning profits substantially over the average profit in a given time period. The basis for this divergence is monopoly capitalism. Monopoly takes different forms. One has to do with the production sphere and monopolistic ownership of a certain technology that produces a commodity more efficiently

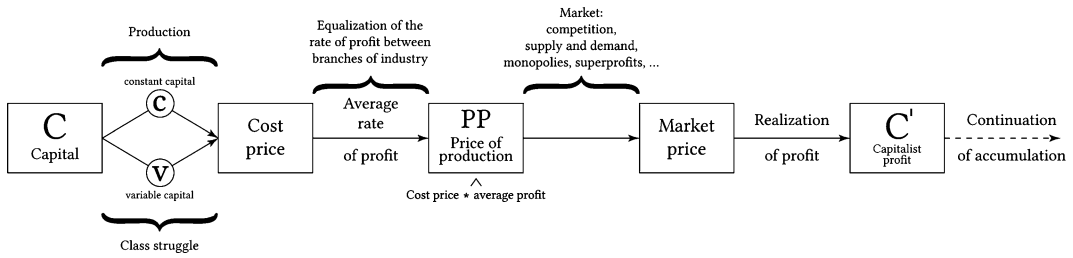
than others do. One has to do with the circulation sphere: branding, a certain privileged access to a market or raw material that others do not have. Monopolists get super-profits by selling commodities for more than their prices of production (i.e., prices that equalize the rate of profit) at the expense of lower profits for the other capitalists. Already English capital with its monopoly on industrial production and monopoly on colonial trade in many regions of the world in the second half of the nineteenth century gained super-profits. Lenin observed that:

> Superprofits have not disappeared; they still remain. The exploitation of *all* other countries by one privileged, financially wealthy country remains and has become more intense. A handful of wealthy countries – there are only four of them, if we mean independent, really gigantic, "modern" wealth: England, France, the United States and Germany – have developed monopoly to vast proportions, they obtain *super*profits running into hundreds, if not thousands, of millions, they "ride on the backs" of hundreds and hundreds of millions of people in other countries and fight among themselves for the division of the particularly rich, particularly fat and particularly easy spoils. (Lenin 1916: 105)

In the Second Congress of the Communist International (Comintern) in 1920, Lenin went as far as to state: "Super-profit gained in the colonies is the mainstay of modern capitalism" (Lenin 1920).

Samir Amin speaks of "generalized monopoly capitalism" when referring to capitalism's current phase. When he speak of monopolies, it is not just corporations dominating industries. It means networks that dominate the entire productive system. Small- and medium-sized firms serve as suppliers to the monopolized productions chains, which take a significant share of their profits. This means that the latter make a super-profit. So-called intellectual property rights constitute a new dimension of capitalist monopolization. The Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) is meant to protect the super-profits of the monopolies based in the North.

The entire transformation from value into market price can be summarized in the following figure:

Let us now return to how this all works out at the global level.


Marxism, Value Theory, and Imperialism, Fig. 1 The transformation from value to price

Unequal Exchange in International Trade

As mentioned above, Marx never properly outlined theories of the world market and international trade. The first theory of the world market in the spirit of *Capital* was formulated 100 years later by Arghiri Emmanuel. Emmanuel referred to value transfer from one country to another as *unequal exchange*. The basis of unequal exchange is the historically constituted different wage levels in the imperialist countries and those of the Third World (Emmanuel 1972).

Let us see what different wage levels mean for Marx's theory of the formation of prices of production, using Tables 3(a) and (b). In Table 3 we have two countries with identical rates of surplus-value, identical profit rates, and identical organic composition of industries. Unequal organic composition can therefore not be the cause for a possible value transfer. Value and price of production are the same. Capital also circulates at the same rate in both countries. In Table 3(a), the rate of surplus-value and the profit rate are equal. Both countries are at the same level of development.

On Table 3(b), however, wages in country A have risen by 50%, which leads to less exploitation and less surplus-value. This has consequences for the exchange of commodities between the two countries. The labor-power used is still the same, as is the value of production, but the price of labor-power has changed. This changes the rate of surplus-value in country A, as well as the prices of production. Where commodities with a value of 300 points each are to be exchanged between the two countries, the wage difference of 50% (which, compared with actual differences in wages, is very modest) leads to unequal exchange. Instead of 300:300, we have $333\frac{1}{3} : 266\frac{2}{3}$. Country B loses $33\frac{1}{3}$ value points, while country A gains them. The exchange puts country A ahead of country B by $66\frac{2}{3}$ value points. The rise in wages by 50% in country A means that the profit rate falls from 50% to $33\frac{1}{3}$ %. In this way, value is transferred from low-wage countries to high-wage countries according to Emmanuel (1972).

The Happy Smiley

Emmanuel's theory of unequal exchange was a critique of David Ricardo's classic comparative cost theory of foreign trade. However, the export-oriented industrialization of the Global South and the creation of global chains of production have brought new forms of unequal exchange. These are more intricate than swapping raw materials for industrial products, which characterized unequal exchange until the end of the 1980s and still characterizes relations between the more agrarian countries of the South and the industrialized countries today.

The theory of unequal exchange, as based on the difference in wage levels between the global North and South, is not only a critique of economists who advocate liberal foreign trade but also of those who adhere to the neoliberal theory of price formation.

In neoliberal economic theory, the formation of the market price, for example, of a computer, is described as a chain in which each step adds "value" to the product. The chain typically starts in the North, from where it heads South before

Marxism, Value Theory, and Imperialism, Table 3 The consequence of unequal exchange on price of production

	Constant capital	Variable capital	Surplus-value	Cost price	Value	Rate of profit, %	Average rate of profit, %	Price of production
	C	v	S	c + v	c + v + s	s/C	P′	(c + v) + P′ x C
(a) **Two countries with the same wage level**

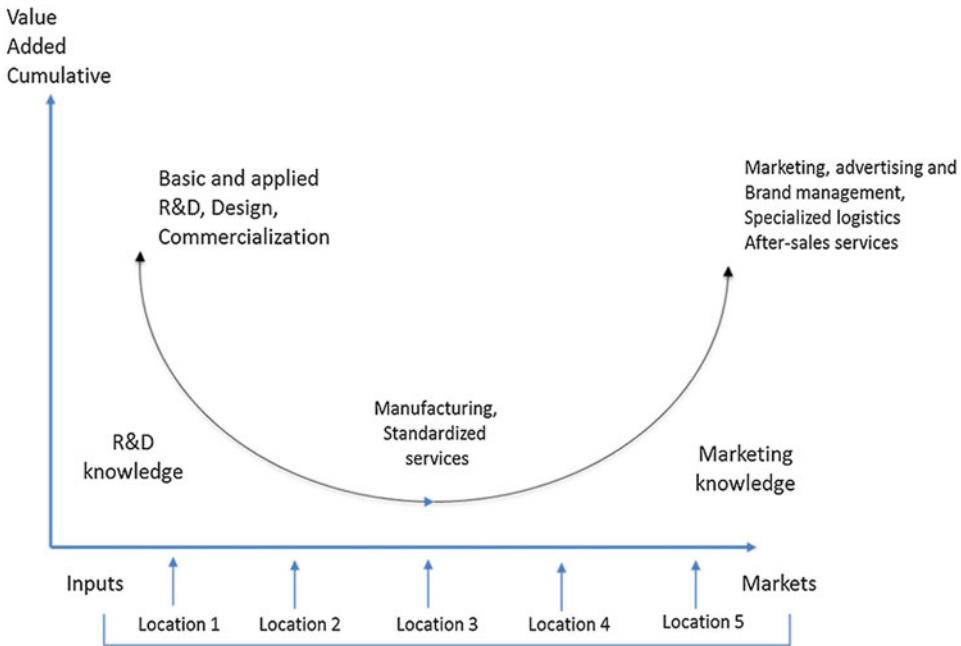
returning to the North and its consumers. A curve illustrating "value added" along this chain looks like a happy-face smiley (Dedrick et al. 1999: 156). In the beginning, when financing, management, development, and design are handled in the North, there is much "value" added; hence, the curve starts at the high end. Then the chain of production moves to the South, where low-wage labor actually produces the product; hence little "value" is added, and the curve falls. Finally, when the product returns to the North and requires branding and marketing to be sold, there is again much "value added" (Fig. 2).

A characteristic feature of global chains of production is that they pass through very different labor markets. According to the happy smiley curve, the biggest part of the product's "value" is created in the North – but in fact, it is the difference in wages – and not value in a Marxist sense, along the chain of production that shapes the curve.

The Sad Smiley

Even if there are many disagreements among economists of different stripes, they all seem to agree that production costs entail two main elements: raw materials, machines, factories, etc. are what Marx calls *constant capital* and wages called *variable capital*. However, what determines the price of all these elements? Here, economists begin to disagree. As mentioned above neoliberal market theory simply states that the prices of goods and services are determined by what consumers are willing to pay. If a product can be sold for a price that is higher than the production costs, someone makes a profit. For Marxists, on the other hand, it is not the market that determines the price, but the cost of production (also referred to as the *cost price*). This is the first step in the transformation of value into price.

So, what determines cost of production? To simply add up the costs of raw materials, wages, etc. is not an answer, because we want to understand *why* they cost what they cost. As mentioned above, what all the necessary parts in the production process have in common is that they can be traced back to the consumption of labor-power. (I am aware of the so-called transformation problem which consists in the assertion that Marx "failed" in his explanation of prices of production to transform the inputs (c + v) into prices of production. However, I do not think there is a problem. To transform inputs into prices would have been to explain prices in terms of prices. Instead Marx sticks to the concept of *value* (average socially necessary labor time) in the formation of prices of production.) We also explained above that labor-power is a very peculiar commodity; although it has a globalized value, its price – the specific wage – is determined by class struggles, historical and current on both the national and the international level. These struggles cause huge variations in global wage.


Marxism, Value Theory, and Imperialism, Fig. 2 The smiley curve (Mudambi 2008, P. 707)

If the question of surplus-value is not particularly important to capital, wages and working hours certainly are. Capital understands that long and intensive working hours and low wages are sources of profit. Furthermore, as we noted concerning capital's *organic composition*, what matters to the capitalist are the overall production costs, not the ratio between constant and variable capital and thereby surplus-value. A sweatshop in Bangladesh does not necessarily generate more profit than an automated electronics factory. It is not the raison d'être of capitalism to squeeze surplus-value out of workers. This is, under the given circumstances, simply a consequence of all that really matters to the capitalist, namely, to sell something for more than what it costs to make it. This is where profit comes from in the mind of the capitalist.

From a Marxist perspective, however, price is not the same as value. Some commodities are sold for less than their value and others for more. Price determines the profit rate but also the distribution of value and surplus-value, both between capital and labor (in the form of profits for the former and wages for the latter) and between fractions of

capital with different organic compositions (via the average profit rate). The transformation of value into price is therefore highly dependent on the political relationship between capital and labor as well as between different fractions of capital. The redistribution of value and surplus-value through market prices not only occurs between workers and fractions of capital within a single country but also globally, as a result of transnational movements of capital, trade, and production.

Marx's theory about the transformation of value into price assumed an integrated market for goods, capital, and *labor*. Such markets tend to form a single price for a single commodity, balance out profit rates, and pay the same wage for the same kind of labor. This is what we see in the USA, the EU, and Japan. The global market is different: it is an integrated market with respect to the movement of capital and goods, but not with respect to labor. Therefore, the wages paid for the same kind of labor can differ widely. This also applies to global chains of production. Depending on where labor is carried out, its impact on the price of a product is very different. The surplus-value of labor in one part of the world (the Global South) raises profits

and consumption ability (via cheap prices) in another part of the world (the Global North). The "value added" in the happy-face smiley's curve includes not only the value created by a company in its home country but also the value created elsewhere and usurped by capital via the price for which a commodity is sold on the global market. "Value added" is in reality value captured. In short, the basis for the profits made by companies in the North are created in the South.

In neoliberal economic theory, this fact is not recognized; on the contrary, lower wages mean less "value added." Therefore the "value added" curve in a global production chain running from North to South and back again has the shape of a happy smiley. However it is not a curve of "value added" in Marxist terms but a curve illustrating the formation of prices of production.

If we apply Marx's conception of value, the curve looks different. If you draw a curve for value added during the production of a computer or a pair of sneakers following Marx's theory, it will look like a sad-face smiley, the exact opposite of the curve drawn by neoliberal economists. This does not mean that their curve is "wrong." It simply illustrates the creation of price, while the sad-face smiley illustrates the creation of value. The reason for labor in the Global South being much cheaper than labor in the Global North is not that labor in the South creates less value. The reason is that laborers in the South are more oppressed and exploited (Fig. 3).

The Global Distribution of Value

A theory of value entails a theory of price formation. The transformation of value into price occurs on the market; in other words, in exchange. If we look at value only in the realm of production, we turn value into an essence that flows from the minds and bodies of workers into the commodities they produce. But, as we have seen, value is the result of social relationships. Exploitation occurs throughout the entire circulation of capital, that is, during the production of commodities as much as during their exchange. Surplus-value is created in production, but it is acquired and distributed in exchange.

It is in exchange that human labor appears as the only possible measure of the different commodities, that is, as the basis of value. It is the sphere of circulation – the market – that distributes the value created by human labor between industries, countries, and individuals. Among capitalists, the average rate of profit balances out. Value is transferred from industries with low organic composition to industries with high organic composition. Finance and trade capital can acquire value without being involved in production at all. Between capitalists and workers, the distribution of value follows a simple principle: profit for the capitalists and wages for the workers. Value is moved and allocated because of competition and class struggle national and global.

Value-transfer from the global South to North in the form of profit is common knowledge in Marxist
Marxism, Value Theory, and Imperialism, Fig. 3 The happy and sad Smiley curve. (Lauesen and Cope 2016, p. 59)

imperialism theory, yet value transfer in the form of consumption of commodities produced by low-wage labor by high-wage labor is controversial as it calls into question the unity and solidarity of the global working proletariat against global capitalism.

However, the fact that you are a wage earner does not necessarily mean that you are exploited when viewed in a global context. Some workers consume more value than they create. Due to the considerable difference in wages between North and South, the transformation of value into price, and the transfer of value through global production chains, it is quite possible for capital to employ labor with a relative high wage and get a profit out of it while, at the same time, this wage earner is able to consume more value than she or he creates. To be specific, the hidden value (in the relative cheap price) of the smartphone, the iPad, the sneakers, the t-shirt, the IKEA furniture, the chocolate bar, the bananas, and the coffee produced in the global South and consumed by workers in the global North may be greater than the value said wage earners in the North create. In a global perspective, the level of exploitation depends on the concrete relationship between the national price of labor-power (wage) and the global value of labor-power (global average wage).

Already in 1857, Marx discussed in *Grundrisse* that workers could draw an advantage from the work of other workers. This happens when the goods some workers produce are sold for less than their value and consumed by other workers who can afford them because of the wages they are paid:

> As regards the other workers, the case is entirely the same; they gain from the depreciated commodity only in relation (1) as they consume it; (2) relative to the size of their wage, which is determined by necessary labour. (Marx 1857)

Therefore, a wage earner can consume more value than she or he produces. Whether someone earns a million dollars or 100,000 dollars a year changes the extent of the value transfer, but not its nature. It is not a matter of principle but calculation. I estimate that the breaking point – the point at which workers above that income threshold cease to be exploited – is between 10,000 and 25,000 dollars per year in income.

The Laws of Capitalism and Class Struggle

After this exercise in political economy, I feel the need to underline the dialectic relation between the economic laws that have to be fulfilled in order to keep accumulation running and class struggle. The capitalist mode of production has its laws; we can even express these laws in algebraic formulas. However, they are not laws of nature. The laws of capitalism are the result of national as well as global political struggles. An enormous political apparatus stand behind these laws, and if necessary, they are secured by military intervention. The capitalist mode of production is made by humans, it consists of human relations, and it can – and will – be altered by humans. Human need can be fulfilled by another mode of production than capitalism.

Description

From World War II to the present day, the USA has been the world's dominant media and cultural superpower. The study of US Empire, cultural and media imperialism, and the cultural industries is important to critical political economists of communication, media studies scholars, and US foreign policy researchers. This entry is a holistic conceptualization of the US Empire and the cultural industries. The first section conceptualizes the "media" dimension of US Empire and cultural imperialism. The second section highlights the global economic dominance of the US cultural industries and the role played by the US State in supporting this dominance. The third section focuses on the global geopolitics of the US cultural industries and their support for US "soft power" or public diplomacy campaigns that attempt to build transnational consent to dominant ideas about America and US foreign policy. The fourth section conceptualizes "the media products" of US Empire. The concluding section identifies some of the consequences the US cultural industries, US State public diplomacy campaigns, and media products may have within non-US countries.

Introduction

In a *Life* magazine article entitled "The American Century," the media magnate Henry Luce (1941) predicted that the United States would achieve world hegemony, and he urged his fellow Americans to "accept wholeheartedly" their "duty" and "opportunity as the most powerful and vital nation in the world and in consequence to exert upon the world the full impact of our influence." Luce enthused at how "American jazz, Hollywood movies, American slang, American machines and patented products are in fact the only things that every community in the world, from Zanzibar to Hamburg, recognizes in common." The source of these "things" was the media and cultural industries or American news companies, publishers, radio and TV broadcasters, film studios,

and advertisers. Throughout the Cold War, the US cultural industries grew, internally, by developing new sub-sectors and, externally, by expanding their operations throughout Western Europe and across the newly independent postcolonial countries. As the cultural industries traveled the globe in search of new investments to make, new cross-border production, distribution and exhibition subsidiaries to acquire, new sources of advertising revenue to extract, new consumer markets to sell to, and new audiences to commodify, they carried ideas and images of the American liberal consumer-capitalist way of life to the world. After the Cold War, the US cultural industries expanded into the Soviet Union's former sphere of influence and across Asia, Africa, and the Middle East. At the turn of the millennium, CNN, Walt Disney, and Britney Spears seemed to encompass the entire planet: US media products were ubiquitous.

Nearly eight decades have passed since Luce spoke of America as the most powerful and vital nation in the world, and nowadays, the media products of the US cultural industries are common referents for billions of people. In 2017, the Walt Disney-owned blockbuster *Star Wars: The Last Jedi* was the highest worldwide grossing film: it took $712,358,507 from the global box office and ranked among the top ten highest-grossing films in Brazil, Russia, India, China, and South Africa. In that same year, Super Bowl LI drew a global TV audience of over 111 million viewers to a competition between the Atlanta Falcons and the New England Patriots for the Vince Lombardi Trophy. US-based TV corporations owned the world's five most popular TV shows (by ratings and social media buzz): *The Walking Dead* (AMC), *Game of Thrones* (HBO), *The Flash* (Warner Bros.), *Pretty Little Liars* (Warner Bros.), and *The Big Bang Theory* (Warner Bros.). In 2017, US interactive entertainment companies created most of the world's best-selling video games: Activision (*Call of Duty Black Ops III* and *Call of Duty WWII*), Electronic Arts (*FIFA 2019* and *Madden NFL 19*), and Take-Two Interactive (*NBA 2K19* and *Grand Theft Auto V*). Currently, billions of people around the world access the Internet with technologies owned by

Apple and Microsoft, shop at Amazon.com, send and receive email messages using Gmail and Outlook, virtually socialize with friends on Facebook, tweet personal opinions on Twitter, search for news and entertainment on Google and Yahoo, post photos to Instagram and Pinterest, let Netflix and YouTube algorithmically customize their media diet, and discuss topics on Reddit.

Throughout the twentieth century, the US drove and utilized developments in the media and cultural industries to build, project, and maintain its economic, geopolitical, and cultural power. In the twenty-first century, the United States is the world's dominant media and cultural superpower, the leading cultural-media imperialist. The study of US Empire, cultural and media imperialism, and the cultural industries is important to critical political economists of communication, media studies scholars, and US foreign policy researchers. The "field of study" of "media imperialism" crisscrosses many disciplines and fields and flags a plurality of approaches (Boyd-Barrett 2015, 2), but "imperialism in general and media imperialism in particular occupy intellectually a vital place in international media studies" (Nordenstreng 2013, 354). In the twenty-first century, theorizations and concrete studies of the nexus of Empire, imperialism, and the media and cultural industries are important because they address the "unequal relations of power" between the global system's dominant imperialist countries and others (Boyd-Barrett 2015, 6). Research in this area take it as axiomatic that all Empires, in territorial or non-territorial forms, rely upon communications technologies and cultural industries to expand and shore up their economic, geopolitical, and cultural influence.

This entry is a holistic conceptualization of the significance of the cultural industries to the US Empire and imperialism. The first section conceptualizes the "media" dimension of US Empire and cultural imperialism. The second section highlights the global economic dominance of the US cultural industries and the role played by the US State in supporting this dominance. The third section focuses on the global geopolitics of the US cultural industries, and their support for US "soft power" or public diplomacy campaigns that attempt to build transnational consent to dominant ideas about America and US foreign policy. The fourth section conceptualizes "the media products" of US Empire. The concluding section identifies some of the consequences of the US cultural industries, US State public diplomacy campaigns, and media products may have within non-US countries.

This entry's holistic overview of the significance of the cultural industries and media products to the US Empire and imperialism builds upon and draws upon the past five decades of cultural and political economy of communications research and writing on the topic (Bah 2008; Beltrán 1979; Boyd-Barret 1977, 1998, 2015; Boyd-Barret and Mirrlees 2019; Comor 1994, 1997; Dorfmann and Mattelart 1971; Fuchs 2010; Golding and Harris 1997; Harvey 2005; Herman and McChesney 1997; Fuchs 2010; Golding and Harris 1997; Herman and Chomsky 1988; Hills 2002, 2007; Innis 1950, 2007; Jin 2005, 2007, 2008, 2015; Mattelart 1976, 1979; McChesney 2006, 2008, 2014; Miller et al. 2005; Mirrlees 2006, 2009, 2013, 2014, 2016a, b, 2018; Mosco 1996; Murdock 2006; Nordenstreng and Varis 1974; Nye 2008; Simpson 1994; Tomlinson 1991; Tunstall 1977; Rothkop 1997; Schiller 1969, 1976, 1991, 2000; Sparks 2007, 2012; Tunstall 1977; Winseck and Pike 2007). There is no space in this entry to address all of the perspectives on and debates within political economy of communications research on Empire and cultural-media imperialism; so instead, this entry synthesizes some of the field's most salient insights and themes.

The US Empire and Cultural Imperialism: The US State and the Cultural Industries

For hundreds of years, the global system has been structured to serve the geopolitical, economic, and cultural interests of powerful imperial countries at the expense of less powerful ones. The history of capitalism and the Westphalian interstate system is part and product of the rise and fall of different types of Empires, some colonial, others

postcolonial, but all of which have expanded in pursuit of their interests over land and sea, recently, into air and "outer space," and now, in "cyberspace." Following World War II, the global system's center of gravity shifted from the colonial Empires of old Europe to the United States, and the United States began to distinguish its style of imperial rule from antiquated territorial-colonial forms. While colonialism typically involves one State's direct dispossession of a people's sovereignty and control of territory, the postcolonial US Empire strove to develop territorial nation-States that were integrated with and supportive of its overarching vision of order. Unlike the British Empire, the US Empire did not pursue the direct colonial domination and administration of territories, but rather, using tools of coercion and persuasion, it sought to build a global system of client or proxy states that shared its core features and reproduced its model: the capitalist mode of production, the (neo)liberal State form, and the consumerist way of life.

The motor of the US Empire's expansion is imperialism, and US imperialism involves a structural alliance between US corporations and the diplomatic and military agencies of the US Security State. While the political and economic spheres are formally distinct in capitalist society, and there may be conflicts and contradictions between the interests of particular blocs of US corporations and the various agencies of the US State, US imperialism – and cultural imperialism – entails a mutually beneficial alliance, as opposed to conflict, between US-based corporations and the US State. In this regard, US imperialism represents the US State's facilitation and legitimization of the interests of US-based corporations and, sometimes, non-US corporations, legally, diplomatically, and, sometimes, with military force, across the countries they wish to operate in. In the global system, numerous non-integrated and nonaligned corporations and States exist, and they assert national interests and pursue them in ways that may unsettle Washington. For this reason, the US Empire's economic and geopolitical planners have routinely deployed a combination of coercion and persuasion to achieve their goals in world affairs. Nye's (2009) concept of "smart power,"

for example, advises the US State to balance hard power strategies (making others do what you want by coercing them) with soft power strategies (getting others to want what you want by attracting and co-opting them) in their struggle to "lead" the world. To elaborate, the US State regularly projects its military power beyond its own territorial borders, declaring and waging wars against opponents. And with the help of private media organizations, the US State runs persuasion campaigns to get others to do what it wants and to want what it wants. With tools of force and consent, the US Empire pushes and pulls other States, peoples, and cultures to integrate with the institutions, policies, ideas, values, and practices that uphold its vision of global order.

All of history's Empires have been cultural imperialists, and the US Empire is no exception to this pattern. In general, US cultural imperialism describes the US State and corporate sector's coercive and persuasive means and practices that aim to impose or elicit consent to a "way of life" (i.e., production modes, institutions, political and legal norms, policies, languages, customs, and ideas) that is represented as "America" in other countries, with the goal of influencing their ways and without reciprocation of influence. This conceptualization of "cultural imperialism" emphasizes a nexus of the geopolitical and economic spheres and points to a synergistic intertwining of the US State and US corporate actors that drive, lead, and benefit from US Empire and cultural imperialism. What are the mass media and cultural industries, and why are they significant to the US Empire and the State-corporate project of US cultural imperialism?

The US mass media or the cultural industries are the privately owned US-based corporations that aim to turn a profit by financing, producing, distributing, promoting, and exhibiting new technologies, media services, and cultural goods that convey meanings about the social world. In general, the cultural industries refer to a wide range of sectors and firms that crisscross the publishing industries; the advertising, marketing, and public relations industries; the TV film, music, and video game or "entertainment" industries; the radio and TV broadcasting industries; the news media

industries; the telecommunications and related services industries; and the Internet, Big Data, and social media platform industries. Distinct from the cultural industries, the US Security State refers to the federal governmental departments and agencies – the White House, the Department of State, the Department of Defense (including the National Security Agency), the National Security Council, and the Central Intelligence Agency – involved in making and pursuing foreign policy decisions. The cultural industries pursue profit for financiers, CEOs, and shareholders. The State advances national security interests and goals, as authorized by the President (and sometimes US Congress), in the name of the "people" it is supposedly beholden to (but most often, for capital).

The cultural industries and the US Security State are different types of institutions, and the business goals of the cultural industries and the geopolitical interests of the US State do not always align. There may be tensions between sectors and firms of the cultural industries, as well as competitions between the lobbies of these sectors to influence or win favor among the political class of the US State's various departments and agencies. Yet, when the US cultural industries and US State agencies come together in collaborations that aim to influence the internal political and cultural affairs of other countries, the thoughts and behaviors of other citizens, and the "ways of life" associated with other national identities, the US-based globalizing cultural industries and the US State are advancing the "media" front of a cultural imperialist project. As a significant component of cultural imperialism, this "media" dimension of US Empire supports the capitalist dominance of the US cultural industries in other markets and buttresses the US State's geopolitical goal of promoting "America" and winning consent to US foreign policy in other countries.

In sum, US cultural imperialism is a State-corporate project that is frequently supported by the cultural industries, and furthermore, this project is represented through the products of these industries. How, specifically, are the US cultural industries integral to the US Empire's economic and geopolitical expansion?

The Economics of the US Cultural Industries: Supported by the US State in World Markets

The US Empire's cultural industries are significant to the overall growth of the US capitalist economy. According to the 2018 *Fortune 500* list, five of the top ten most profitable companies in the United States today are "in" the cultural industries: Apple ($48,351 million), Verizon ($30,101 million), AT&T ($29,450 million) Comcast ($22,714 million), and Microsoft ($21,204 million). In 2017, Apple's profits alone exceeded the combined profits of the "Big Three" automakers – Ford Motor, General Motors, and Fiat Chrysler. Five of the six most valuable companies in the United States (by market capitalization) are digital media companies including Apple, Alphabet (Google's parent), Amazon, Microsoft, and Facebook. Walt Disney, Time Warner, Twenty-First Century Fox, CBC, and Viacom are the biggest five media conglomerates in the United States by revenue; Apple, Alphabet, Microsoft, IBM, and Dell Technologies are the biggest technology companies; and AT&T, Verizon, Comcast, Charter Communications, and CenturyLink are the biggest telecommunication companies. In 2017, Wall Street rallied around Facebook, Apple, Amazon, Netflix, and Alphabet, which accounted for almost half of the gains on the Standard & Poor's 500 stock index. Clearly, the US cultural industries are part of and significant to US capitalism.

The US cultural industries are internationally expansive, and their cross-border reach is unrivalled. In 2018, the United States was the global system's headquarters for *most* of the largest corporations in the cultural industries. The 2018 *Forbes Global 2000* ranks the world's 2000 largest corporations in four metrics (sales, profits, assets, and market value). In 2018, the United States was headquarters to 76 of the 172 world's largest corporations in the cultural industries (44% of the world total). By comparison, China, which is often framed as a rival to the United States, is home to a mere 16 of the world's largest corporations in the cultural industries (9.3% of the world total) (Touryalai et al. 2018). The United States is

home to major global TV broadcasting corporations (Comcast, Walt Disney, Charter Communications, Time Warner, Dish Network, CBS, Viacom, Discovery Communications, and News Corp), advertising firms (Omnicom Group and Interpublic Group), computer hardware firms (Apple, Hewlett-Packard Enterprise, and Dell Technologies), computer service firms (Alphabet-Google, IBM, and Facebook), Internet and catalogue retail firms (Amazon.com, Netflix, and eBay), computer software and programming firms (Microsoft, Oracle, Adobe Systems), and telecommunication firms (AT&T, Verizon Communications).

The global capitalist power of the US cultural industries is further cemented by Hollywood's preeminence in the global entertainment market. Between 2000 and 2017, more than 90% of the top ten highest worldwide grossing films released each year were owned by one of the six major Hollywood studios: Warner Bros., Twentieth Century Fox, Paramount Pictures, Universal Pictures, Sony Pictures, and Walt Disney Studios (Box Office Mojo 2018). Furthermore, 11 of the global system's top 20 most visited websites were in 2018 owned by US corporations: Google.com, YouTube.com, Facebook.com, Wikipedia.org, Amazon.com, Yahoo.com, Twitter.com, Live.com, Google.co.in, Reddit.com, and Instagram.com (Alexa 2018). The United States is the globe's leading "platform imperialist" because US corporations own the lion's share of the Internet economy's hardware and software, intellectual property rights, and user data (Jin 2015). Moreover, in 2017, the United States was home to 8 of the world's biggest 15 video game publishers (Sony Interactive Entertainment, Apple, Microsoft Studios, Activision Blizzard, Google, EA, Warner Bros. Interactive Entertainment, and Take-Two Interactive) (Geoshen 2018). Strong capitalist and expansionist cultural industries exist in other countries (Nordenstreng and Thussu 2015), but most of the largest global corporations in the cultural industries are based in the United States and owned by a US-based transnational capitalist class (Birkinbine et al. 2016).

The many corporations that constitute the US cultural industries use a variety of savvy strategies to enter non-US countries to conduct their business and integrate nationally situated cultural industries into their networks and commodity chains. But apropos cultural imperialism as a State-corporate project, these US-based globalizing media and cultural corporations are often supported by the US State, which facilitates and legitimizes their worldwide position of economic primacy, privilege, and power. The international expansion of the US-based cultural industries is buttressed by US State agencies such as the US Treasury, the US Congress, the Department of Commerce's US Patent and Trademark Office (USPTO) and International Trade Administration (ITA), the National Telecommunications and Information Administration, the Federal Communications Commission (FCC), the White House Office of the US Trade Representative (USTR), and the US Department of State. These State agencies formulate policies that claim to serve a general "national interest," but they often support the particular capitalist interests of the cultural industries.

Concretely, the US State supports the cultural industries by protecting and promoting the property rights of its owners. Intellectual property rights (IPR) – copyright specifically – is the legal basis for the cultural industries' mode of capitalist accumulation, its existence and growth, and markets for the exchange of its commodified goods and services. The many media owners of the cultural industries depend on the US State to recognize and legally enforce their copyright, which gives them an exclusive right to enable or prohibit others from using or copying their cultural goods and gives them the right to sell, license, or trade these rights to others in worldwide markets. The US State aggressively protects and promotes the IPR of the US cultural industries with the force of law, at home and abroad. The White House's USTR, for example, monitors copyright infringing activities all over the world and pressures violating States to enforce within their own territories US-derived copyright legislation. Indeed, the USTR secures the copyright of US corporations "domestically and abroad, bilaterally, and in regional groupings" by "building stronger, more streamlined, and more effective systems for the protection and enforcement of

IPR" (USTR 2015, 80). To protect the copyright of its core media and digital technology corporations, the US State leads the world in anti-piracy initiatives. In October 2011, for example, the Office of the USTR established the Anti-Counterfeiting Trade Agreement (ACTA) "to strengthen the international legal framework for effectively combating global proliferation of commercial-scale counterfeiting and copyright piracy" (Office of the United States Trade Representative 2011).

The US State also supports the economic power of the cultural industries by allocating public wealth to them in the form of subsidies. From the earliest days of the US Republic, postal subsidies helped underwrite the commercial newspaper and magazine industry; State and party printing contracts subsidized a partisan press; public libraries and schools bought commoditized books and established a national readership for them; federal grants supported the nation's private telecommunications system; State-allocated research and development funds helped build the radio and TV broadcasting industries; and the FCC's allocation of monopoly rights to bits of the electromagnetic spectrum to private broadcasters and cable TV networks helped them grow and prosper (McChesney 1999, 2006, 2008, 2014). In the early twenty-first century, the US State continues to subsidize the various sectors of the cultural industries with income tax credits, property tax abatements, tax exemptions, and more. The US Federal Government and State-level governments, for example, use tax credits to keep TV and film production in the US territory and deter Hollywood studios from "running away" to countries like Canada or New Zealand, where labor costs are lower, subsidies more plentiful, and currency exchange rates a boon to business (Miller et al. 2005). Furthermore, some of the wealthiest Silicon Valley companies have raked in massive State subsidies: since 2000, Google has enjoyed State handouts of $766 million; from 2011 onward, Apple has banked $693 million; Facebook pocketed a total of $549 million; and Amazon built its commodity distribution and customer data centers with help from $613 million in State grants and tax benefits (Baron 2018).

Furthermore, the US State supports the expansion of the US cultural industries around the world and into other countries by promoting a neoliberal foreign policy framework that extols the liberalization, privatization, and deregulation of non-US communication and mass media systems. In 1946, US Assistant Secretary of State William Benton declared: "The State Department plans to do everything within its power along political or diplomatic lines to help break down the artificial barriers to the expansion of private American news agencies, magazines, motion pictures, and other media of communications throughout the world. Freedom of the press—and freedom of exchange of information generally – is an integral part of our foreign policy" (cited in Schiller 1984, 6). During the Cold War, the US State used the free flow of information doctrine to try to break down national protectionist barriers to the cultural industries' expansion and open borders (and markets) to its influence. This doctrine was "an aggressive [free] trade position on behalf of US media interests" that implied US-based and "trans-national media firms and advertisers should be permitted to operate globally, with minimal government intervention" (Herman and McChesney 1997, 17). Throughout the 1990s, the US State tried to universalize the free flow for media free-trade doctrine at the World Trade Organization (WTO) with multilateral agreements such as the General Agreement on Tariffs and Trade (GATT), the General Agreement on Trade in Services (GATS), and the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) (Herman and McChesney 1997; Schiller 2000).

In the early 2000s, the US cultural industries faced an impediment to its maximal expansion in UNESCO's *Convention on the Protection and Promotion of Diversity of the Cultural Expressions* (CPPDCE), which empowered States to exempt "culture" from multilateral free-trade deals and develop strategies for protecting and promoting national cultural industries and cultures. The US State rejected and condemned the CPPDCE and then negotiated bilateral free-trade deals with Chile, Costa Rica, Guatemala, Honduras, El Salvador, Nicaragua, Singapore, the

M

Dominican Republic, Australia, Morocco, and South Korea (Jin 2011). Currently, the US State "seeks to ensure the continued expansion of U.S. services trade through rules-based liberalization in the WTO, bilateral free trade agreements, and other regional venues" (USTR 2015). In 2011, the Department of State launched the *International Strategy for Cyberspace: Prosperity, Security and Openness in a Networked World* (ISCPSONW) – developed in consultation with Google, Facebook, Microsoft, and Yahoo – to reconfigure the Internet as a means of "opening markets to U.S. capital" (McCarthy 2011, 89). Since 2013, the US State has spearheaded new media services free-trade deals such as the Trans-Pacific Partnership (TPP), the Transatlantic Trade and Investment Partnership (TTIP), and the Trade in Services Agreement (TISA). In sum, from World War II to the present day, the US State has sought to open all countries up to the freedom of the US cultural industries to conduct their business wherever they like, whenever they want to.

In addition to promoting free trade in media and culture, the US State promotes *deregulation* (or the elimination of political constraints on the power of US and non-US media corporations to maximize profits) and *privatization* (or the transfer of State ownership over public telecommunication and broadcasting entities to privately owned and profit-seeking media corporations). From the 1980s, the US State has pushed telecommunication deregulation and privatization and played a role in making capitalist telecommunications systems the global norm (Comor 1994, 1997; Jin 2005). The US State's support for deregulation and privatization enabled US telecommunication firms to globally expand, and between 1983 and 2005, they acquired 1502 foreign telecom companies (Jin 2008). Currently, the United States headquarters some of the world's largest global telecommunications firms (AT&T and Verizon Communications). The US State has also promoted the deregulation and privatization of national public broadcasters. Over the past four decades, public broadcasters have declined and private media companies have grown, and these private media corporations frequently reproduce the capitalist logics of US-based media

conglomerates by pursuing profit maximization, exploiting waged cultural workers, buying and exhibiting copyrighted entertainment (often from the US cultural industries), selling audience attention to advertisers, and modeling their own cultural forms and products on those made popular by US-based firms.

The US State's unwavering support for the cultural industries may be explained with regard to an accommodative relationship between the US State's policy-makers and lobbies for the US cultural industries. Each day, the interests of the cultural industries are represented to and advanced within the US State by a network of lobbies such as the Motion Picture Association of America (MPAA), the National Association of Broadcasters (NAB), the American Association of Publishers (APP), the Recording Association of America (RIAA), the Software Alliance (BSA), the Entertainment Software Association (ESA), the Internet Association (IIA), and the International Intellectual Property Association (IIPA). These lobby groups struggle to influence the US State's communication and media policy and regulatory framework and often succeed in getting their way with political actors and policy-makers which recognize the importance of the cultural industries to the US's overall economic growth and perhaps also reap personal rewards for compliance. There is also a "revolving door" between the cultural industries and the US State; many lobbyists for the cultural industries have worked for the US State, and many policy-makers for the US State have worked for the cultural industries. For example, in 2014, Stan McCoy moved from his State job with the US Trade Representative to the MPAA, and he is now the MPAA's President and Managing Director of the region encompassing Europe, Middle East, and Africa (EMEA), responsible for policy, operations, advocacy, and personnel across the territory. Moreover, in 2013–2014, 118 out of 142 Comcast lobbyists were formally employed by the US State, 31 of 34 Time Warner lobbyists that period had previously worked for the US State too, and so did 23 of 28 News Corporation lobbyists and 15 out of 19 Walt Disney lobbyists (Open Secrets 2014).

In sum, the capitalist power and global growth of the US cultural industries have been facilitated and legitimized by the US State, which has protected and promoted US media and communications firms with IP security, subsidies, and a neoliberal policy framework that extols free media-cultural trade and the deregulation and privatization of public telecommunication and broadcasting entities. A convergence of interests – economic and geopolitical – plus a rapidly revolving door between public and private sector personnel primes the US State to support the US cultural industries. Though the owners of some non-US cultural industries push for and prosper as a result of US-derived and enforced neoliberal policy, the biggest beneficiary of this policy framework is the United States, which continues to be home base for the world's most powerful cultural industries.

The Geopolitics of the US Cultural Industries: Supporting the US State in World Affairs

The cultural industries are geopolitically significant to the US Empire's global "soft power" and public diplomacy. In the post-9/11 era, neoliberal "soft power" theorists exalted the global dominance of the US cultural industries and conceptualized US media products as instrumental to US world power. Nye (2004) defined soft power as "the ability [of the US State] to get what it want[s] through attraction rather than coercion or payments" (x) and called upon the US State to join forces with Hollywood, news media corporations, and PR firms to make media products that attract people to American values, identity, and foreign policy. Like Nye, Fraser (2004) asserted that US global leadership depends upon "soft power." "Make no mistake," said Fraser, "America's global domination is based mainly on the superiority of US hard power. But the influence, prestige, and legitimacy of the emerging American Empire will depend on the effectiveness of its soft power" (13). For Fraser (2004, 266), "American soft power (movies, television, pop music, fast food) promotes values and beliefs that, while

contentious, are ultimately good for the world." As such, "America's weapons of mass distraction are not only necessary for global stability, but also should be built up and deployed more assertively throughout the world."

Throughout the twentieth century, the US State built "information" and "media" agencies that partnered with the cultural industries to launch these "weapons of mass distraction" in support of the US Empire's expansion. The US State and private media corporations have routinely collaborated to inform, influence, and change the attitudes and behaviors of foreign publics in support of US strategic interests around the world (Cull 2008; Mirrlees 2016a; Snow 2003; Wagenleitner 1994). The Committee on Public Information (CPI) (World War I), the Office of the Coordinator of Inter-American Affairs (the inter-war period), the Office of War Information (OWI) (World War I), the United States Information Agency (USIA) (Cold War, 1945–1991) and the Department of State's Office of Public Diplomacy (post-9/11 Global War on Terror) devised and administered the US Empire's public diplomacy campaigns, forming alliances with the cultural industries to produce and distribute media and informational products that aimed to organize transnational consent to the American Way and to win support for contentious US foreign policy decisions.

The US State's public diplomacy agencies have conducted global polls to gauge and manage public impressions of US foreign policy; hired PR companies to conduct locally customized influence campaigns; dispatched academics and speakers to foreign countries to talk up US cultural mores; operated international news services and sourced private news companies with pre-packaged content; helped globalize the US book and magazine publishing industry and set up city-based reading rooms full of American content; administered international radio broadcasters like the Voice of America and Radio y TV Martí; worked with Hollywood studios to make documentary and war-time propaganda films; operated WORLDNET, a satellite TV agency; and engaged publics via social media platforms to influence them. The US State's public diplomacy agencies mobilize the total means of communications

M

media to win transnational consent to US Empire, and the US cultural industries have frequently rallied in support of the State's global persuasion campaigns.

For example, following the Bush Administration's post-9/11 launch of the Global War on Terrorism, a 2002 Independent Task Force on Public Diplomacy sponsored by the Council of Foreign Relations released a report entitled "Public Diplomacy and the War on Terrorism" that called for "the establishment of coordinating structure, chaired by a principal adviser to the president, to harmonize the public diplomacy efforts of government agencies, allies and private-sector partners" (Peterson 2002, 74). Described by *BusinessWeek* as the "Queen of Madison Avenue," Charlotte Beers was hired as the State Department's Undersecretary of State for Public Diplomacy (OPD). She pledged to rebrand America and recruited the US Advertising Council to help her do so. In 2002, Beers' launched a public diplomacy campaign across the so-called Muslim World called "Shared Values" comprised of five TV commercials, a Muslim version of *Sesame Street*, a magazine called *Hi,* ads in Pan-Arab newspapers, a website called "Open Dialogue," and virtual "American Rooms." The Broadcasting Board of Governors (BBG) supported Shared Values with Radio Sawa and soon after Radio Farda. While the OPD's Bureau of International Information Programs (BIIP) and Bureau of Public Affairs (BPA) handled Shared Values' media front, the Bureau of Educational and Cultural Exchange (BECA) coordinated cultural exchanges.

In 2018, the US Department of State coordinated its own $1.8 billion a year public diplomacy agency that created and circulated positive images of and messages about "America" around the world. The "mission" of the Office of Public Diplomacy (OPD) was "to support the achievement of U.S. foreign policy goals and objectives, advance national interests, and enhance national security by informing and influencing foreign publics and by expanding and strengthening the relationship between the people and Government of the United States and citizens of the rest of the world."

In 2018, the OPD oversaw the bureau of Public Affairs (PA), which "engaged domestic and international media" to further US foreign policy and national security interests as well as broadening understanding of American values." To that end, the PA deployed "Strategic and tactical communications planning"; conducted "press briefings for domestic and foreign press corps"; pursued "media outreach" to enable people "everywhere to hear directly from key Department officials"; mobilized "social media and other modern technologies to engage the public"; ran "six international Regional Media Hubs"; answered questions about US "foreign policy issues by phone, email, letter, or through social media"; arranged foreign policy town halls and "speakers to visit universities, chambers of commerce, and communities"; coordinated "audio-visual products and services in the U.S. and abroad for the public, the press, the Secretary of State, and Department bureaus and offices"; and prepared historical studies on "U.S. diplomacy and foreign affairs" (US Department of State 2018). Also, the OPD's US Agency for Global Media (USAGM) launched a Russian-language TV and digital network called Current Time, and its Voice of America and Radio Free Europe-Radio Liberty launched Polygraph and Factograph, English and Russian-language fact-checking websites to counter "disinformation." The OPD also ran the Bureau of International Information Programs (IIP), which leveraged "digital communications technology to reach across platforms" and took a "strategic, data-driven approach to develop multimedia, digital communications products" with 700 American Spaces in more than 150 countries.

A crucial tool of the US State's "soft power" arsenal, public diplomacy is a process of influence by which the US State and its private partners in the cultural industries impose upon publics in other countries dominant images of and stories about America and US foreign policy with the goal of winning them to or perpetuating their compliance with their integration with the US Empire. In the process, the US State and private sector public diplomacy campaigns sometimes subvert the media and cultural sovereignty of non-US States to protect the societies they govern

from unwanted foreign "meddling" in their internal affairs and foreign influence within their cultures. Public diplomacy uses magazines, newspapers, books, radio programs, TV shows, films, and websites to communicate the virtues of the US societal model to citizens in other countries with the goal of getting them to pressure their respective parties and State elites to adopt policies that the US Empire's planners are comfortable with. And when publics disagree with US public diplomacy, they tend to be constructed as having a flawed or false perception of America that needs to be changed. Yet, public diplomacy aims to change public perceptions of the US Empire without changing the often calamitous foreign policy decisions (including war) that may cause anti-American feelings in the first place. When public diplomacy's words do not reflect the concrete deeds of the US State in world affairs and when image triumphs over substance, its officials will face mass resentment. Though public diplomacy is sometimes framed as fostering dialogue, building mutually beneficial relationships and greater cross-cultural understanding, many US public diplomacy campaigns aim to persuade publics to support the US Empire. For the most part, public diplomacy does not listen to global public opinion so as to responsively change US foreign policy, but aims to know public opinion so as to better manage or control it.

The US Empire's Media Products

The previous two sections highlighted a nexus of the economics of the US cultural industries and the geopolitics of the US Security State and identified the major US corporate and State institutions responsible for producing and coordinating the mass-mediated front of US cultural imperialism. This section looks a little more closely at the media products of US Empire and imperialism.

The US cultural industries' products address millions of different people living the US as members of one nationalist "imagined community" and divide this national community into multicultural lifestyle identity niches. In any case, these media products do not stay put in the United States. At present, news stories, TV shows and films, interactive games, music videos, sports entertainment, advertisements, and digital media are carried by the US cultural industries, and sometimes the State's public diplomacy agencies, to the world. As these media products travel across the countries, continents, and entire hemispheres, they expose billions of people divided by geographies, classes, ethnicities, and languages to a wide range of scripts about and images of the American Way of Life and Way of War. The US Empire's media products turn the world into an audience of America. As mediated stories about and symbols of America and US foreign policy blanket the world, they make the United States akin to a second culture that mashes and mixes with other cultures elsewhere.

Many of the US media products traveling the globe carry nationalist consumer-capitalist and militaristic ideologies, but many also carry a plurality of stories about the social complexities and problems of the United States. At the same time, the US cultural industries are de-Americanizing media products to overcome the "cultural discount" associated with the specifics of national place, people, and culture. For example, Hollywood depends upon the worldwide box office for over half of its annual revenue, and so it designs blockbuster films that address a global as opposed to distinctly American audience. In the first decade of the twenty-first century, many of Hollywood's highest-grossing worldwide films were not explicitly about America: *Star Wars: The Force Awakens* (2015), *Avatar* (2009), *Jurassic World* (2015), *The Avengers* (2012), *The Dark Knight* (2008), *Rogue One: A Star Wars Story* (2016), *Beauty and the Beast* (2017), *Finding Dory* (2016), and *Avengers: Age of Ultron* (2015). Moreover, globalizing US TV corporations are sometimes integrating the business strategy of glocalization – or "think globally, act locally" – when designing global reality TV formats such as *Top Model* and youth music video brands such as MTV International.

Though many of the cultural industries' media products do not carry explicit representations of America to the world, they do support an

M

ideological environment in which capitalism and consumerism *must be* represented as the ideal, though no longer the exclusively American, way of life. The US cultural industries are in the business of selling media products and selling audience attention to advertisers. But they also play an important role in promoting the ethos of buying on behalf of US and transnational corporate clients such as Apple, McDonald's, and Coca-Cola. In support of the ongoing engineering worldwide consumer demand for US commodities, and on behalf of a global capitalist system that depends for its survival on the expansion of consumerism as a way of life, the US cultural industries support the national and transnational advertising needs of larger corporations by representing shopping as the meaning of life and promoting branded goods as a significant source of identity, community, and happiness.

Though the US cultural industries are globally dominant, the consumer-oriented media products it sells to the world don't always carry imagery of and messages about America that align with the State's public diplomacy campaigns. The autonomy of US media corporations from the US State means that there is no guarantee the cultural industries' media products will textually glorify America and US foreign policy. Interestingly, while neoliberals say the cultural industries are integral to US "soft power" (Fraser 2004), conservatives contend that globalizing media products cause anti-Americanism because they foster a global "false consciousness" about America by representing it as a land of sex, smut and violence, stupid teenagers, vapid consumerism, and political corruption (Defleur and Defleur 2003). Furthermore, Richard Kimball and Joshua Muravchick, of the American Enterprise Institute for Public Policy Research, say that Hollywood vilifies the United States by pumping out films that convey conspiracy theories of State power (Wellemeyer 2006). For conservatives, it would seem that American media products that do not represent Christian values, happy nuclear-patriarchal families, military veneration, hyper-nationalism, and the sexual chastity of youth are "un-American" and thus responsible for global anti-Americanism.

Yet, this is a simplistic explanation. Worldwide, people may enjoy the US cultural industries' popular TV shows, films, and video games but loathe the US imperial presidency and foreign policy. For example, in 2017, Hollywood made record profits, accumulating $43.4 billion in worldwide revenue (Robb 2018), but in the same year, support for US global leadership fell to an all-time low in almost every part of the world. The cause of waning transnational adoration of the US Empire was not the content of globalizing media products but the Trump presidency. The Pew Research Center's study of global attitudes found that "Donald Trump's presidency has had a major impact on how the world sees the US as it is "broadly unpopular around the globe, and ratings for the U.S. have declined steeply in many nations" (Wike et al. 2017). That said, when US media products glorify the US Empire's wars or attempt to build consent to contentious US foreign policy decisions, anti-Americanism may be exacerbated. As Miller (2005) says, "In the final instance, the links between popular culture and US government aims and policies are key to anti-Americanism, *not the content of popular culture*" itself (27).

In any case, the US cultural industries media products do not reflect "America" or the US State but represent many partial and selective stories about and images of America and the US State. Too often, the "media" of cultural imperialism is a blanket term for each and every media product exported by the US cultural industries to the world. This broad definition unhelpfully bundles together a wide variety of corporate and governmental media sources, different types and genres of media products, and diverse stories and images. This bundling is not unreasonable. At a macrolevel of analysis, it makes sense to classify any media product that is produced and circulated by an Empire's cultural industries, as the media of cultural imperialism. But this position is too general and conflates too much. There is a difference between a Hollywood film such as *Zero Dark Thirty* (2012) that affirms preemptive drone strikes and Robert Greenwald's *Unmanned: America's Drone Wars* (2013), which contemplates the moral dilemmas and human

consequences of drone warfare. Both of these films were directed by US directors and produced and distributed internationally by US film companies, but the former film supports the US Empire's new way of war, while the latter film scrutinizes it. How best to conceptualize the "media" of cultural imperialism?

As discussed previously, US cultural imperialism entails a close alliance between the US State and the cultural industries in competition and conflict with other States and capitals in a global system. The media products of US Empire are those shaped by a nexus of the US State and US cultural industries. To elaborate, the media products of cultural imperialism can be conceptualized in one or all of the four following ways, each which highlights a synergy of the US State and the cultural industries.

The media products of Empire can be conceptualized with regard to the geopolitics of ownership. These products are the intellectual property of a US-based and owned media company whose business operations are supported politically against rivals by the foreign policy policies of the US State. This support might take the form of the US State subsidizing IP owner's operations or protecting them from foreign competition, promoting and protecting the IP rights of the owning company against copyright violators in other countries, or trying to open up other country-specific markets to the free flow of the media product by pushing audiovisual free-trade agreements. Take, for example, the US Department of Commerce's Internet Policy Task Force's attempt to protect and promote Hollywood-enforcing copyright legislation in China or the State Department's brokering of audiovisual free-trade agreements with States around the world on behalf of Hollywood.

The media products of Empire can also be conceptualized with regard to State-corporate co-production dynamics. These products result from a collaborative production relationship between the cultural industries and the Security State, the combined labors of the cultural workers and State public affairs personnel. These media products are not politically innocent. They've been deliberately designed to exert some kind of ideological influence on the way people think about or perceive America and US foreign policy. They intend to have effects, those being, to get people to change the way people perceive the US Empire and potentially think about and behave toward it. Take, for example, the US Department of State's Office of Public Diplomacy and Public Affairs' post-9/11 recruitment of Madison Avenue to re-brand America and sell it to the "Muslim World"; the CIA's Office of Public Affairs' collaboration with Warner Bros. on *Argo* (2012); the Department of Defense's Entertainment liaison office's work with Paramount Pictures' global blockbuster film, *Transformers* (2007); the Navy Seals and Relativity Media's making of *Act of Valor* (2012); or the US Army's recruitment of the video game industry to make *America's Army*. All of these media products result from a collaborative relationship between the publicity agencies of the US Security State and privately owned media corporations.

Additionally, the media products of Empire can be conceptualized with regard to the content these products carry or express (i.e., the stories, images, messages, and themes). These products are not about any part of American culture, but rather, they show and tell stories about the past, present, or future of the US Empire. These products depict the diplomatic, security, and military agencies of the US State pursuing strategic interests, power, and influence in a world of threats and in a world that wants or is compelled to accept US-imposed order. The media products of Empire represent the US Empire in action, its hopes and fears, its victories and defeats, and its aspirations and sorrows. They may affirm, express ambivalence about, or directly oppose Empire, but all say something about the US State and US transnational corporations in conflict with other States, peoples, places, and cultures. In the video game *Battlefield 4* (2013), for example, the US State goes to war against China; *Call of Duty: Modern Warfare 3* (2011) is a virtual Third World War between the United States and Russia.

Significantly, the media products of the US Empire tend to play a significant role in shaping American and transnational public opinions about what geopolitical topics and issues are important

M

to think about and how to think about them. They may play an "agenda setting" role and tell US and transnational publics what world issues are significant to think about by constructing certain non-US people, places, and countries as objects worthy of public attention (and often, US military intervention). Additionally, these imperial media products tell people *how* they should think about the US role in world affairs. Media products about war, diplomacy, and national security are neither mirrors that reflect reality nor nonpartisan mediators of the power relations between the US Empire and other countries, peoples, and cultures. Far from acting as transparent windows to the world, imperial media products "frame" the world in partial and selective ways, thereby encouraging people to develop certain kinds of understandings of the world and often at the expense of others. In effect, these media products actively intervene in and give meaning to the world by telling people *what* and *how* to think about it, privileging certain topics and issues for focus over others. There is a need for more research on and case studies of the media products of the US Empire that attend to the economic and geopolitical conditions of their ownership, their State-corporate production dynamics, the stories and images they convey, and the agendas they attempt to set and the frames of reality they construct and invite identification with.

Conclusion: The Consequences of the US Empire's Cultural Industries

This entry has presented a holistic overview of the economic, geopolitical, and cultural-ideological significance of the cultural industries to the US Empire and imperialism. Though the US State and the cultural industries are different types of organizations and driven by different interests, there are symbiotic relations between them that support the US Empire and the media of US cultural imperialism. In the twenty-first century, the US cultural industries are the most powerful in the world, and the worldwide capitalist power of the US cultural industries is facilitated and legitimized by the US State. At the same time, the US

State's public diplomacy agencies often link with and mobilize the private cultural industries to produce media products that promote America and US foreign policy to the world. Nonetheless, the cultural industries are privately owned and controlled, and so the media products they produce and sell around the world do not always already align with the US State's public diplomacy goals. They may carry a wide range of stories and images: some may glorify the US Empire, some may scrutinize it, and others may say nothing at all.

One consequence of the extraordinary power of the US cultural industries is an asymmetrical cultural trade relationship between the US and other countries. The US-Canada cultural trade relationship is exemplary of this asymmetry. In 2016, the top ten TV shows watched in English Canada were American hits like *The Big Bang Theory*, *NCIS*, and *Grey's Anatomy*. Hollywood films usually take 94–99% of the Canadian box office each year, and in 2015, Canadian films accounted for a little over 1% of the total box office. The top 15 most visited websites in Canada are American (Alexa 2018). Netflix and Amazon Prime Video rule the video streaming service sector in Canada, and national upstarts like Bell's CraveTV never came close to rivalling the size of their subscriber base or revenues. Canada is probably the only country in the world where most people consume more foreign – American – TV than they do national TV shows. Lots of Canadians watch America on their screens; few Americans watch Canada on theirs. The US Empire leaves a big media footprint in Canada and elsewhere too. The US boasts an audiovisual trade surplus with nearly every country. In 2008, Hollywood films took in 16.4 billion rubles at the Russian box office, five times more than Russian-made films. The People's Republic of China blocks a lot of American entertainment, yet nine out of the top ten 2012 box office hits in China were Hollywood films. Over the past decade, China has tried to create blockbuster global entertainment, but it has not had any success in making entertainment hits in the US market.

Another consequence of the unmatched power of the US cultural industries is a largely

asymmetrical economic power relationship between US cultural industries and those based in other countries. In the early twenty-first century, the US Empire's cultural industries exist in a global system of sovereign nation-States where "national cultures" are frequently constructed by elites through nationally based cultural industries to fulfill strategic economic and political objectives. The State and business elites of many nation-States regularly use media and cultural policy tools to protect national cultural industries (and sometimes, "cultures") from the US cultural industries. At the same, time, they promote the internationalization of these industries and their media products to other countries and markets. While States in countries around the world protect and promote the interests of national cultural industries and media products, not all countries have the same (i.e., equal) ability to finance, produce, distribute, and exhibit media products worldwide. So while non-US cultural industries exist all over the world, none of them currently rival the United States. The corporations that constitute the backbone of the US cultural industries possess disproportionate power to integrate and influence the world's many cultural industries to increase their own returns. As such, the US-based globalizing corporations exert asymmetrical influence over the structure, ownership patterns, distribution and exhibition process, and standards of media product quality of other national cultural industries without proportionate reciprocation of influence by them. That said, the US State and corporate cultural imperialists have never been able to totally "Americanize" national cultural industries nor have they ever achieved "cultural domination."

Nonetheless, the US Empire's cultural industries and their media products often leave a mark within countries and cultures around the world. The outcome of the capitalist cultural relations between the United States and other countries is best conceptualized as "asymmetrical cultural hybridity" or "unequal cultural mixing," not "cultural domination." America is not an ethno-monolith reducible to "blood and soil" but rather a site of contestation: socialist, liberal, and conservative Americans battle over the meaning of "America"

and articulate it to different political projects, left and right. But because the US Empire is home to the most gargantuan cultural industries in the world, it is better able to produce and circulate media messages about and images of the US than non-US peoples are of their own cultures. Some people on the receiving end of the US Empire's media products may perceive them as threats to their cultures, while others may embrace them as a positive alternative to what their national State and cultural industries give (or take away). The "audience" of the US cultural industries may interpret, select, creatively mix, and redeploy the texts of American media products in a range of ways, yet there may still be effects, some barely noticeable, others more pronounced. All Empires leave a cultural mark. Undoubtedly, the US Empire's cultural industries and the media products they sell to the world do as well.

Media Imperialism

Oliver Boyd-Barrett
Bowling Green State University, Bowling Green, OH, USA

Introduction

In introducing his book *Media Imperialism*, Boyd-Barrett (2015) argued that it is more productive to regard the concept as referring to a field

of study rather than to a single theory. Many different theories could be credited with advancing our knowledge of the broad range of possible issues, topics, and relationships that integrate an interest in phenomena that are widely recognized as having to do with *empire*, with an interest in phenomena that are widely recognized as having to do with *media*. A great deal of scholarship that contributes to understanding of such relationships does not expressly adopt the term "media imperialism."

Scholars have long debated the relationship between the concepts "media" and human "culture." Some have conflated these two terms as though they were interchangeable. The prevalent view today is that media are an important element of culture but constitute only a fraction of the universe of manifestations of culture even if, at the same time, much of this broader universe is represented, mediated, or socially constructed through media.

Scholarship that expressly adopts the terminology of media imperialism (and much of the relevant scholarship that does not) tends to be interested in some or more of the following questions:

1. Do the information, entertainment, infotainment, and advertising contents of given media work to reinforce, resist, or modify relationships of inequality in power and wealth between and sometimes even within nations?
2. Do media operate autonomously in the determination of such contents or do they collude with centers of political, military, commercial, or other power in this process, to the extent that they might be rightly regarded as constituting components of the apparatus of imperial control?
3. Do media corporations sometimes acquire such degrees of market control domestically, internationally, or in certain sectors of media activity that they can be meaningfully described as media imperialists whose activities significantly shape, constrain, or otherwise shape the activities of smaller media corporations?
4. Is there a point at which the global networks of electronic communications that are built and sustained by media corporations – understood

to incorporate both hardware and software, infrastructure, delivery, and reception platforms – become so fundamental to the day-to-day conduct of big business, global trade, and information and entertainment flows that it is meaningful to talk of media imperialism as a distinct phase in the evolution of the global order?

Cultural and Media Imperialism

The terms cultural imperialism and media imperialism date from the same period and have similar roots. They interrelate theoretically and pragmatically. Relationships between processes understood as "culture" and processes understood as "imperialism" (however these are defined) often implicate one or more of the technologies and modes of communication that are denoted by the term "media." Media are constitutive of and constituted by the cultures from which they emerge.

The domain of culture is generally recognized as more pervasive and constitutive of social structure and process than that of media. Some scholarship broaches the subject of cultural imperialism from a broad perspective that may or may not embrace the media directly but which includes a wealth of other dimensions many of which continue to be relevant to studies of media. These include language, approaches to knowledge and knowing, belief systems, ideologies, cultures of governance, education, economic activity, social structure, interpersonal relationship, technologies, and artifacts. Appadurai's (1996) postulation of five "scapes" for the analysis of culture and globalization – ethnoscape, technoscape, finanscape, mediascape, and ideoscape – is an influential example. Bayly's (2000) examination of the relationship between colonialism, information-gathering, and social communication in India is another. Boyd-Barrett (1977, 2015) explicitly favored the term media imperialism, even though recognizing it as narrower than and encompassed by cultural imperialism, for its benefit of a focused discourse helpful in the specific context of unpacking the complexity of media operations. He located the study of the relationships between

media and imperialism at least as much within the realm of the subdiscipline of political economy as that of cultural studies.

While the terms share some common roots and are sometimes used interchangeably, they also have distinctive histories. In the sociology of mass media, for example, the significance of the term media imperialism in the 1960s and 1970s was based on large measure on its contrast to the "modernization paradigm" that had prevailed in an immediately preceding literature and which framed academic analysis of the contributions of media to processes of social and economic development. Modernization theories postulated an essential, benign role for media in "national development," whereas media imperialism theorists regarded media infrastructure, institutions, and content as part and parcel of western hegemony, working to groom peoples of the South or developing world for willing acceptance of, or consent to, their continued exploitation regardless of whether or not they were politically "autonomous." A broader understanding of the relationship between media and imperialism, however, is not confined to concerns about social and economic development, but may also embrace links between social systems, their distinctive communication processes, and preferred epistemologies.

An often cited exemplary text from earlier literatures that deals with the relationship between communication and empires (as distinct from more recent ideas of cultural or media imperialism) is that of the Canadian economist and communications scholar Innis (1950, 1951) who identified what he proposed were distinctive relationships between the physical properties of communication systems (e.g., stone, papyrus, or paper) and the structure and capabilities of power in ancient civilizations. The work of Innis had a direct influence on fellow Canadian and a scholar of literature and culture, Marshall McLuhan, who developed Innis' ideas about the relationship between prevailing modes of communication and evolving stages of social organization (see, in particular, McLuhan 1962, 1964, 1967). The works of Innis and McLuhan were contributions to a large and ever-evolving literature on causal and other modes of

relationship between writing (manuscripts), printing (newspapers, books), electronic and wireless media (telephone, radio, television), and digital and social media, on the one hand, and society in general or particular aspects of society (such as childhood and, of course, imperialism), on the other.

Extrapolating from Boyd-Barrett (2015), it is important to be sensitive to the historical constancy of interrelationships between imperialism, culture, and media, as well as to the ever-evolving manifestation of each of these. Imperialism, he argues, is always about the exploitation of one community by another, but this can take many forms. Direct control over territory is dispensable. Cultures change upon contact, sometimes evolving hybrid forms whose constituents are unequal. Media evolve most visibly in technological form but also through their relationships to different centers of power, ownership, control, geographical and demographic reach, accessibility, genre, purpose, symbolic constituents, and audiences. Across all of these dimensions, there is the play of power and issues of inequality of power.

A clear distinction needs to be made between actual phenomena of cultural and media imperialism, on the one hand, likely commensurate with humanity itself, and studies that fall under the rubric of "cultural/media imperialism" on the other and which we can date back to the 1960s. The currents of thought that emerged around this time and which intensified through the 1970s can be criticized overall for being insufficiently historical, lacking the nuance of a social anthropology of culture, overly focused on the particular case of the USA, and media-centric. But they are also a product of growing awareness in developing countries (or countries of the "Third World" – sometimes referred to later as "the South," "developing," "postcolonial" societies or "emergent" economies) that the achievement of nominal, political independence from the principal imperial powers of the nineteenth and twentieth centuries (especially Belgium, Britain, France, Netherlands, Japan, Portugal, Russia, Spain, and the USA) in the period after World War II was illusory. The "former" imperial nations, singly or in alliance, continued to shape, mold, or control the

M

destinies of "former" colonies and acolytes through military threat, economic ties, intelligence subterfuge, and the continuing reverberations of a not-so-distant imperial culture through ties of language, epistemology (determination of what should count as knowledge), esteemed art and literature, political procedure, and so on.

Korean and Vietnamese wars from the 1940s through to the 1970s exemplified threats of imperial invasion and occupation well after the World War II. Ruthless imperial suppression (gentrified or obscured by mainstream media) of indigenous insurgencies in possessions such as Algeria, Kenya, and Malaysia exposed the deep-seated unwillingness of empires to relinquish their most prized conquests. Civil wars in the wake of independence, as in the Indian subcontinent, Congo, or Nigeria, challenged the vaunted benefits of "freedom." Western-instigated or western-supported destabilization and regime change in countries such as Guatemala (1952), Iran (1953), Congo (1961), Indonesia (1965), Greece (1967), and Chile (1973), to name a few, instructed new nations of the "South" that when "independent" nations chose paths of development (nationalization, industrialization, diversification, import substitution, socialism, and secularism) of which their "former" imperial masters disapproved, they would be subject to brutal subversion and worse. Such punitive impacts typically endured for decades. Throughout, media were increasingly indispensable weapons amidst information and propaganda wars between hegemonic power and resistance to it.

Formulation of theories of cultural and media imperialism is particularly associated with a cluster of Latin American scholars of communication in the 1960s and 1970s. They included the Bolivian journalist and communication scholar Luis Ramiro Beltran (see, e.g., Beltran 1980), the sociologist Armand Mattelart (born in Belgium, but whose career spanned a decade in Chile during which he coauthored a significant 1975 study with Ariel Dorfman), and the Venezuelan scholar of social communication, Antonio Pasquali (see his foundational 1963/1977 publication). Many North American, European, and other scholars embraced the term. With particular relevance for

the foundation of cultural studies, the writings of Stuart Hall (Jamaican-British) have had incomparable influence. One of Hall's works, coauthored with Paddy Whannel in 1964, made the case for the serious study of film as entertainment. Relevant studies included the writings of Herbert Schiller (American; see, e.g., his foundational 1969 work), of whom I shall say more in a moment; Jeremy Tunstall (British; whose classic 1977 work delineated US primacy in media production and distribution worldwide); and Edward Herman and Noam Chomsky's 1988 exposition of a "propaganda model" of disinformation in which mainstream media were central players and which served to obfuscate the dynamics of (particularly US) imperialism. The propaganda model's first and principal target was the empire's domestic citizenry and then, courtesy of the broad influence of US media infrastructure and journalism worldwide, a global audience.

Tomlinson (1991) considered that the notion of "cultural imperialism" was too broad to yield an easy or single definition that was not controversial, proposing instead that a definition "must be assembled out of its discourse" (p. 3). A definition offered by Schiller touches on many but not all dimensions common to studies of cultural imperialism and which inform Schiller's own approach to media, namely, "the sum of the processes by which a society is brought into the modern world system and how its dominating stratum is attracted, pressured, forced and sometimes bribed into shaping social institutions to correspond to, or even promote, the values and structures of the dominating center of the system" which Schiller identified as the US (Schiller 1976, p. 9). This definition is consistent with world systems theory (Wallerstein 1981) and highlights modernity, agency, and inequalities of power and class structure. More controversially, it presumes that the term is appropriate only for the "modern" age, deems that the USA is indisputably the system's dominating center, and concentrates its critical energy on advanced capitalism.

Examining processes of cultural imperialism from the top down, Schiller's consideration of media reception at the levels of community and household was relatively primitive. At the macro-

level, his model compellingly demonstrated systemic interplay of the major components of an imperial system as it operated for much of the second half of the twentieth century: (1) advanced US-based privately owned and for-profit media industries; (2) principally financed by advertising; that (3) promoted consumerism, a cornerstone of US economic strength; (4) while adapting new communications technologies (e.g., satellite, later the Internet) initially developed by state-sponsored military and defense industries that also served goals of military and surveillance primacy; (5) simultaneously facilitating the global dissemination of US media, US-based multinational enterprise, and the US goods promoted through global advertising, all the while subject to (6) a national regulatory system and a US-directed global regulatory system that privileged the private, commercial media model and served US hegemony.

The term "media imperialism," emerging from this scholarship, figured as one component of a broader intellectual framework of "dependency theory" – a critical backlash not just against the "modernization paradigm" that had prevailed in developmental studies but more broadly against the democratic-pluralist model of thinking about media and society in general. The three basic presumptions at work behind the modernization paradigm were that (1) western societies were democratic and pluralistic (i.e., home to diverse sources of power in stable tension through their participation in democratic institutions) and enjoyed media "freedom" and their economies were advanced (all these seen to be interdependent, positive attributes); (2) other parts of the world would benefit if they adopted this model; and (3) because the main components of the model were interdependent, the introduction of one component into a developing society (e.g., "free" media or even just "media") would facilitate the appearance of the others. As the prevailing ideology of its time, one that informed the broad field of media scholarship up until the late 1960s and throughout much of 1970s, democratic pluralism and its corollary of the modernization paradigm contributed to Cold War discourses fashioned through direct and indirect

manipulation of knowledge production by political and intelligence actors. Several of the field's leading scholars had worked for US intelligence in one sense or another during World War II, and their ties to the intelligence establishment often persisted (Mody and Lee 2003). Additionally, the objects of their inquiries – news and entertainment media – were themselves infiltrated and exploited by political and intelligence actors to a degree that was not acknowledged in media scholarship of the period, as in Operation Mockingbird. The findings of at least three congressional committees of inquiry into CIA operations during the 1970s are of great importance (Church Committee Reports 1975–1976; Pike Committee 1976; Rockefeller Commission 1975), exposing CIA buy-out of large numbers of both journalists and academics (Boyd-Barrett 2004). The history of the Congress for Cultural Freedom reveals the extraordinary lengths to which the CIA went in order to shape an intellectual environment that was favorable to the interests of the USA and its allies (Whitney 2016). In recent decades, much more evidence has come to light of routine manipulation of movie and television programming by US defense and intelligence establishments (to be discussed further below).

Dependency theory was influenced by the writings of the Argentine economist Prebisch (1962), the German American economist and sociologist Frank (1979), and the American sociologist Wallerstein (1984). Its major points of consensus were that (1) economic growth in wealthy countries did not necessarily lift the economies of poor countries; (2) this negative outcome was a result of systematic political, economic, and cultural ties between countries whose operation favored the rich and disadvantaged the poor; and (3) relations between them (variously described as dominant/dependent, central/peripheral, or metropolitan/satellite) reinforced and intensified inequality. Frank ascribed this dynamic to capitalism specifically, others more generally to power imbalance.

With respect to media scholarship, dependency theory undermined the argument of "modernization" theorists that aid for media in the "developing world" would, of itself, contribute to development. It suggested that the interests

M

actually served by the growth of media in the dependent countries were (1) countries whose media systems were already strongest and engaged in exports of hardware and software; (2) the western-based media owners and suppliers who would most immediately benefit from international expansion of their operations, together with (3) corporations (western-based multinational corporations foremost among them) whose sales were linked to advertising expenditure in media, as well as (4) corporations who built the infrastructures for global communication (cable, wireless, satellite, etc.) as well as the technologies of media production, distribution and reception. All these interests subscribed to a general ideology of power, economic development, and growth (later referred to more generally as "neoliberalism") that stood to benefit from its broader dissemination and exemplification (the so-called demonstration effect) through media worldwide.

Dependency theory called attention to the role of media in facilitating and sustaining forms of imperialism. It demolished the idea that simple concession of "independence" by postimperial to postcolonial countries was an especially meaningful sign of autonomy or an end to actual imperialism. The relevance of dependency theory to media was exemplified within media studies by research that demonstrated the dominance of western and in particular US communications technologies corporations (in telecommunications, satellite, and computing) and content providers (notably in film, television, news agencies, and publishing) on global markets.

Dependency discourses were consistent with several other contemporary intellectual trends:

1. The growing influence of "political economy" approaches to media which acknowledged that how media operated, the contents and services that they provided, were significantly shaped by their underlying business models (of which advertising dependence was the most important), the particular markets they served, their strategies for gaining market advantage, and by the implicit and explicit understandings and relationships between major media and the other major centers of power, above all the power of state agencies – including agencies whose function was to regulate the media either for the benefit of a presumed "public interest" or increasingly for the benefit of corporations. The rise of a political economy view of the media drew from similar currents of thought as those of dependency theory, alongside other sources of inspiration.

2. Revitalization of interest in the critical, dialectical approach of the Frankfurt School, especially as represented by Horkheimer and Adorno (2007) and Marcuse (1970), and its fusion of Marxism and psychoanalysis.

3. Development of Marxist or post-Marxist analysis of the prospects for European social democracy of the struggle for influence between publicly and privately owned media systems and the implications of processes of media concentration, conglomeration, and commercialization for culture and politics, during a period of relative detente in the 1970s when potential convergence between the systems of western social democracy and Russo-Chinese communism seemed less unthinkable than it soon became.

4. Discourses of the New World Information and Communication Order (NWICO) within the context of a series of conferences organized by the United Nations Education Science and Culture Organization (UNESCO), also involving the Non-Aligned Movement, and which culminated in the 1980 publication of UNESCO's Many Voices, One World report of a committee chaired by Sean McBride. The concept of NWICO provided UN endorsement for the view that resolving economic inequalities was not simply an economic but also a cultural challenge. While eschewing talk of imperialism, the language of the report was suffused with premises and concerns recognizable as emerging from ideas of dependency and application of the concept to communication inequalities between nations, the origination of these from within political, economic, and cultural realms, and the identification of appropriate reforms of institutional structures and processes that were both external and internal to nation states.

The Fall and Rise of a Concept

The later demise of dependency theory and, with it, ideas of media imperialism has many roots. I shall identify some of the main ones and then explain why the loss of the critical edge that these ideas represented also gravely weakened the intellectual capacity of media scholarship to critique the ever more egregious evidence of resurgent western imperialistic intent from 1990 onward, and the collusion of mainstream media with imperial power, both within the imperial center(s) and their dependencies.

There were some valid objections to dependency and media imperialism theories (both had several variants). I shall concentrate on those that relate to media. These theories awarded primacy of concern to economic inequalities which they proposed should be remedied at least in part by a strengthening of local media systems – an "import substitution" strategy. However many smaller countries did not have a sufficiently large internal population or a market for media systems that could compete economically against cheap imports of higher production quality even at the expense of diminished cultural relevance. Even when like-minded nations pooled resources in order to create more robust productions, as did the nations of the Non-Aligned Movement when they formed the Non-Aligned News Agency, the resulting market still did not compare – remotely – with the advertising-abundant and media-affluent markets served by leading western news agencies, nor was the news product of sufficient appeal to those wealthier markets. Smaller, less wealthy countries turned to their respective government or state agencies for investment in media and media regulation, sometimes inviting unproductive tensions between creative energy, business entrepreneurship, and political or bureaucratic constraints, in the realm of entertainment media, while opening the door to greater political control over news and information products. State involvement invited the ire of western critics who were generally blind to the limitations and informal but profound de facto censorship exercised by advertising-supported, commercially driven, privately owned media in their own countries.

The dependency notion of "underdevelopment" postulated a vicious spiral of inequality between nations of the center and nations of the periphery. This did not always turn out to be the case in practice, and definitions of "development," once they extend beyond simple statistical aggregates such as gross national product and embrace less tangible, more experiential standards of what constitutes the "good life," became controversial. Applied to media, the term worked unevenly, at best. The past half a century had seen significant media development in many if not most countries of the world, including the quondam "developing economies" – the largest of these, such as Brazil, sporting media conglomerates (e.g., the Globo empire) that rivalled and perhaps surpassed most of those of the USA, while even small countries had taken advantage of falling costs of media production and distribution to invest more in local media production. Yet the "media *were* American" thesis (Tunstall 2007) attributed insufficient attention to the near universal neoliberalization of advertising-supported, hyper-commercial infotainment media as an exported western and capitalist ideology and offered insufficient justice to the new digital world of multimedia Internet service providers, portals, and websites, which is dominated by a small number of countries, the US preeminent among them. At the time of writing, the USA remains the world's single largest center of media power and wealth when all media domains are included: legacy and digital, hardware and software, across publishing, film, telecommunications, computing, and industries (Boyd-Barrett 2015).

Dependency theory prioritized the nation as the major unit of analysis in the study of processes that extended beyond national frontiers. Primacy of the nation state came under increasing fire with the popularization of globalization theory from the 1970s into the 1990s and beyond. Perspectives of globalization theory encouraged analysis of the interlinkages between global, regional, national, intranational, and local levels, without necessarily privileging any one of these, and acknowledged how phenomena at any one of these levels could only be explained with reference to other levels.

M

Oftentimes the nation state seemed to disappear as a significant entity even though in practice national states retained important regulatory and legislative influence over media and communications industries and even though most relevant international regulatory bodies were in fact governed by the legal representatives of nation states. De-prioritization of the nation state inspired scholars to consider the role of media not so much with reference to representations of nationhood and national institutions (or, for that matter, of other expressions of place) but to how media constituted the imaginaries of any of these and those of whose interests they served. Globalization added fuel to critical scholarship of self-acclaimed "global media" – that usually turned out, on close inspection, to represent interests associated with particular nations or alliances of elite national interests – and of the corporations that built the technologies and assembled the infrastructures required by market demand for international or global communication facilities.

The demise of the Soviet Union and the East European countries of the former communist bloc, from 1989 onward, brought about the balkanization of a vast swathe of EurAsia whose previous national identities – while never entirely eclipsed during their history as components of the USSR and its Yalta-endorsed zone of influence – were elevated into autonomous status through the lenses of media worldwide even though some retained close links with the Russian Federation and others were coopted by or fled into the fold of the European Union and/or NATO. Equally important was the "capitalist road" adopted under the continuing stewardship of the Chinese Communist Party by Chinese leadership under Chairman Deng Xiaoping, following the death of Mao Zedong in 1976, reaching apparent fruition in 2000 under Jiang Zemin when China was accepted as a member of the World Trade Organization.

Up until these events, western media scholarship had focused much of its critical gaze upon the media of the western world and the worldwide influence of (mainly) western media conglomerates. Japan was a "proxy" western partner, an acknowledged leader in many domains including animation and anime and, thanks largely to Sony, consumer electronics, not least in the form of Sony Walkman (until the arrival of Internet music sharing – Napster ran from 1999 to 2001 – and the appearance of the first version of the Apple iPod in 2001) and, later, the Sony PlayStation. Although open to Marxist and post-Marxist trends of thought, scholarship had shown little enthusiasm for and not much interest in the communist model of media production and control which were loosely dismissed as over-bureaucratized systems of state capital. The main media issue thought to be of interest, apart from the unsubtle theme of state censorship and control, was the adaptation of low-technology forms of anti-Communist resistance (Samizdat in Eastern Europe, e.g., or post-Maoist wall posters in China).

The influence of dependency theory had peaked around 1980 with publication of the McBride report. The report's recommendations expressed considerable trust in the regulatory power and responsibility of governments to act in the best interests of the community of nations. That faith was undermined by the Thatcher administration in the UK that took power in 1979 and by the Reagan administration that came to office in the USA in 1981. These administrations adopted the monetarist economics of Milton Friedman and the Chicago School of Economics. They had no interest in subordinating their policies to UN bodies in which the influence of the "South" or dependent economies was becoming stronger in the wake of post-colonialism, with the numerical advantage brought by the emergence of many new nations. The USA announced its intention to withdraw from UNESCO in 1983, followed by Britain. This was the era during which the West steadily withdraws from goals of détente with Russia. They adopted globalization policies of "free" trade and free flows of investment that principally favored the already wealthy countries. And they began stalling or reversing policies of social democracy that had funneled aid to the distressed through welfare programs, sickness and unemployment benefits, health care, and the like. They considered that their revisionist policies

were endorsed by the collapse of the communist countries of Eastern Europe and the Soviet Union and by China's capitalist road.

For Marxist-inclined media scholars, these developments further undermined their already dwindling confidence that Marxism was still relevant to the modern world and deprived them of even the hope that they might establish academic careers on such a basis. They were also under fire from postmodernist cultural studies which hammered irreverently at the foundations of all such "grand narrative" or mega systems of politics and philosophy. The reformist concept of "public sphere" that had emerged in the wake of the discovery and translation after several decades of the works of the German philosopher Jurgen Habermas provided a substitute language appropriate for media criticism, to a point, yet did relatively little to inspire vigorous appraisal of the rot of corrupt or partisan practices of corporations such as News International that had undermined democracy in Britain for several decades and which supported extreme right-wing interests in the USA. Media scholarship was confused by the apparent contradictions between continuing "legacy" problems of market concentration, corporate conglomeration, and so forth, on the one hand, and the urge to celebrate an overhyped abundance and pluralism of the brave new era of digital media.

By the early 1990s, the principal preoccupations of the field had largely bypassed Marx. The foci of attention were the continuing development of the study of "media effects" (including agenda-setting and uses and gratifications theories, refinements of the concept of "active viewer") and the role of media as constitutive or representative of popular culture. These studies were embedded in theories originating in cultural studies of the polysemic text and in social anthropology of the "interpretative reader" (not autonomous exactly but whose understanding of a text was refracted through the interpretive communities of which s/he was a member) as well as in positivist social psychology study of viewing and reception (see Boyd-Barrett 1996 for a brief overview of this field).

These greatly complicated the already considerable challenge to media scholarship of proving "effects" in the presence of large numbers of intervening variables. The influence of the active/autonomous reader approach to media reception would be modified somewhat by growing influence throughout the 1990s and beyond both of "framing" and "indexing" theories and theories of propaganda and persuasion. These provided a much more sophisticated understanding – in a field whose previous grasp of the techniques for study of media content and of how content "works" were shockingly rudimentary – of the wide variety of ways in which texts are routinely modified to privilege certain meanings, foregrounding particular events, people, information, citations, arguments and allusions, and the backgrounding or "disappearing" of others. They showed how such influence could be compounded by the creation and exploitation of "echo chambers," as when propagandists are successful in delivering the same message without significant challenge through multiple media outlets simultaneously. Where existing audience knowledge of a given topic and their motivations to acquire new knowledge were low, and where journalistic dependence on a limited range of "authoritative" sources was high – all of which frequently applied in the case in foreign affairs reporting, for example – then the scope for effective disinformation or propaganda was maximized.

Postmodernism and ideas of the autonomous reader synchronized well with a shift in thinking about media and development away from top-down models represented both by the original "modernization paradigm" (which, though falling out of favor in academe continued to be quite popular in the policy field) and its nemesis, dependency theory. These both attributed to the state a primacy of responsibility for determining what "development" should mean and how it should be implemented and resourced. Top-down approaches relied heavily on the inputs of external, approved "change agents" whose activities and recommendations presumed that innovation in itself was an unquestionably "good thing." They were often tied to NGO or corporate funding whose agendas were extraneous to those of the communities they ostensibly served. The products and processes they delivered were not always a good fit with conditions and needs on the ground.

M

Seemingly more democratic, bottom-up models (as identified among others by Melkote and Steeves 2015, and Jan Servaes) regarded "development" as something that communities at ground level should determine for themselves, perhaps with the technocratic input and resources of sympathetic nongovernment organizations. Ideologically attractive to western progressive intellectuals, this approach was hopelessly idealistic in those parts of the world (i.e., most) where initiatives at local level were considerably impacted by local, regional, and national political and other state and non-state agencies, vulnerable to the play of market forces and subject to distinctly unmodern patriarchal and often racist local elites. Bottom-up models of development have still to satisfactorily integrate with the single largest developmental push experienced since the industrial revolution, namely, the industrialization of communist China and neoliberal India in the 1990s and 2000s. This has resulted from multiple, complex forces operating from global to local levels with the support of the state and has elevated hundreds of millions from subsistence levels to something that more closely resembles "middle-class" status, albeit at the expense of massive environmental degradation.

Development theory has engaged in a fruitless quest to catch up with and provide meaningful input within the context of tectonic political, economic, and cultural shifts – veritable Schumpeterian "gales of creative destruction." These resulted from the collapse of traditional communism, the gathering speed of global economic integration (or globalization), and the increasingly universal application of digital technologies. Starting in the developed world, digital technologies have decimated the print newspaper industry. The recording industry has largely shifted online under the policing of Apple and comparable digital gatekeepers. Theatrical exhibition and DVDs for filmed entertainment and the "network model" of traditional broadcasting are in the process of conceding to electronic streaming. Traditional advertising and marketing conglomerates are threatened by the capacity of electronic platforms and social media to connect advertisers directly to consumers without middlemen (Auletta 2018).

Marxism provided an intellectual backcloth for continuing, critical analysis of media industries. But more than a strain of media, political economy had inched its way toward a less radical, industry-friendly study of media economics. The mass popularity of personal computing in the 1980s and of the Internet in the 1990s promised an infinite potential for mediated communications that would be easily available in the home and the office and, later, with the marriage of telecommunications, computing, and the Internet, in the street and air. For a while, the appearance of infinite communications capacity removed the sting from older concerns about market concentration and conglomeration. The monopolies of national landline communication collapsed before a seeming horde of local and mobile telephony companies offering telephony, television, and Internet services. These variously linked individual households to the Internet, established "portals" for safe or organized access online, and facilitated interaction via advertising-supported search engines.

When the mist had cleared from the scrummage by the late 2000s, it became clear that new, bigger, further-reaching conglomerates had formed, often incorporating older versions, more powerful than anything seen before. There were fewer regulatory boundaries separating telephony from television or from the Internet, or hardware from software, or either hardware or software from delivery system. Attempts to preserve a "level playing field" in the shape of "network neutrality" for the benefit of ordinary users weakened before the bulldozers of telecommunications behemoths demanding the freedom to control whatever they chose to make available, and the speed or convenience at which they delivered it, and to favor their own products or those of their affiliates. Media scholarship was scarcely able to catch its breath let alone make sustained meaning from the rush of these developments.

The speed and pervasiveness of change in the media industries themselves increased pressure on scholarship toward ever more media-centric analysis. Efforts to scale both the complexities of media change and their related transformations in the broader, momentous upheavals of global

politics, economics, and culture were generally underwhelming, often naive and senselessly trusting of mainstream media accounts. Examples included the excitement with which some scholars greeted media-originated narratives of the generally ill-fated 2010–2011 "Arab Spring" events as a "Twitter" revolution or, in 2017 accepted as a serious argument that through abuse of social media, the Russians had won the 2016 US presidential election for Donald Trump – an egregious example of a media-induced moral panic.

Review and Prospect

A striking feature of many attacks against the concept of media imperialism had been their irrelevance and inaccuracy. They universally assumed that the concept referred to a single theory whereas, as Boyd-Barrett had already observed in 1977, a far broader range of phenomena was at issue. They ignored the possibility that even if the concept did not speak usefully to their own time, it might have something of relevance to offer to an understanding of the workings of classic imperialism in the nineteenth and twentieth centuries and the role of communications in processes of imperial domination and resistance to it. In respect to their own time, critics frequently demonstrated surprising neglect of relevant historical evidence and an underestimation of the literature they were critiquing, as in the claim of "lack of evidence" (see Sparks 1991; Thussu 2006). The majority of the concept's critics exhibited little if any insight at all into the historical experience of imperialism and its hundreds of millions of victims.

Schiller (1975) had provided copious evidence of the close interrelationships between US foreign policy, US military interventions, US communications technologies, US media and advertising, and US-supported consumerism and capitalism. Wilson, Herman and Schiller (1989) provided devastating witness to how US mainstream media celebrated those Third World regimes that were its allies (no matter how dictatorial or fragile they were in practice) and denounced those whom the US deemed its enemies (no matter how heroic and how popular they were in practice) but also

showed how US media focused only on the incidentals of military gains and losses in their coverage of the extreme crime of the Vietnam War. Boyd-Barrett (1980) and Tunstall (1977) had shown how the media systems of many ex-colonial territories were established by and shaped and supported by western powers and western media giants and how the western-based international news agencies controlled the information flows around the world to the advantage of the powerful nations and to the disadvantage of newly developing nations.

Other empirical work on movies (Guback 1974) and broadcasting (Varis 1973) had provided strong support for the view that western media content dominated the non-communist nations of the developing world and how even within the developed world the media exports of a few dominated the contents of the many (even if this situation had in many but not in all respects transformed by the twenty-first century). The criticism that the media imperialism approach tended toward a magic bullet theory of media effects for the most part accuses the target literature of not embarking on a line of inquiry that was not then current in the field. Although audience-centered analysis has rightly exercised considerable influence in exploring the nuances between exposure to media and the takings of meanings and pleasures from media, the trajectory of agenda-setting study eventually paved the way to the concepts of framing and indexing, and these in turn have helped reintroduce the legitimacy of the notion of strong media effects, especially where campaigns put together by establishment propaganda apparatuses have secured hegemonic and homogeneous interpretations of events, in league with mainstream media, in support of the interests of major western powers. Major political developments in Washington meanwhile, through the course of at least three congressional hearings in the 1970s, exposed not just the immense corruption of literature, popular magazines, and newspapers resulting from the CIA's so-called Congress of Cultural Freedom and its contribution to the development and normalization of Cold War mythologies but also how Operation Mockingbird bought the complicity of hundreds of US

and foreign journalists, including noted editors and publishers, as well as academics, to fight the information Cold War. This corruption by the state apparatus of "independent journalism" has certainly continued and intensified over time, attested to by many sources.

More recent work, especially from 2000 onward, has reinstated the concept of media imperialism as central to media studies. This has worked in parallel with the growing, direct evidence of a resuscitation by the USA and NATO powers of activities that clearly resemble those of nineteenth century imperial machinations not so much against other great powers (though it has led to that) but, as always, against the weak. Scholarship was for long and in many ways is still rendered impotent, timorous, and orthodox in its reaction to the events of 9/11 despite clear indications of massive fraud perpetrated by the official accounts and supported by mainstream media (not least, but certainly not limited to the leading roles played by the Sunni Arab political and religious interests of Saudi Arabia). On the other hand, the illegal US-led invasion and occupation of Iraq in 2003, on entirely manufactured pretext, rekindled memories of the deceptions of the First Gulf War (notable among them the propaganda tricks of the "incubator babies" fairytale and the myth of "precision weapons"), and the suspicious complexities of western support for the breakup of Yugoslavia have catalyzed a more critically minded scholarship. Even so, relatively few dared to openly investigate the lies and deceptions of western powers and complicit western media in coverage of the "Arab Spring," particularly as this impacted Egypt, Iran, Libya, and Syria. In place of sophisticated, deep-context analysis, too many scholars jumped aboard a media-created, irrelevant narrative of Twitter and Facebook "liberation," grievously failing to recognize in such shallow interpretations the telltale signs of western regime change operations that had already played out in clear daylight in Gorbachev's Soviet Union, then in Washington's promotion of Yeltsin to the Russian presidency and, later, through various territories of the former Soviet Union and communist world, notable among them Yugoslavia, Chechnya, Ukraine, and Georgia.

This desert of neglect and distraction notwithstanding, empirical scholarship has revealed a treasure trove of evidence clearly tying mainstream western media networks – directly representative and constitutive of corporate power – to the imperial ambitions of their respective states. Boyd-Barrett highlighted this in his 2015 book on media imperialism. This was dedicated to two themes: (1) the integral relationship between strong, globalized but predominantly US media apparatuses for capital accumulation and twenty-first-century manifestations of aggressive US and NATO imperialism in Iraq, Libya, Syria, and Iran, while (2) confirming that despite the significant growth of a few non-western power-houses, including China and India, global hardware and software markets continued to be dominated by US-based corporations such as Apple, Cisco, Dell, IBM, and Intel. US-based corporations remained exceptionally strong in computer software and Internet services (including Amazon, Apple, Facebook, Google, and Twitter), nurtured as many of these are by the concentration of talent and capital in the US Boyd-Barrett subsequently developed these themes further with reference to US and NATO intervention in Ukraine (Boyd-Barrett 2017) and the "fake news" wars between Washington and (Boyd-Barrett 2019).

Early in the twenty-first century, Toby Miller disclosed how Hollywood, supposedly the supreme manifestation of the partnership between capitalism, immense profit, and globally popular entertainment, depended for its influence on an array of federal and state subsidies. Alford (2010), Alford and Secker (2017), Boyd-Barrett et al. (2011), Jenkins (2016), Mirrlees (2013, 2016), Robb (2004), and Stahl (2010) have unpacked the voluminous ties that link the Pentagon, the CIA, and other state agencies of war to Hollywood's (movies and television) choice of plots, dependence on state subsidy, wording of scripts, and favorable representations of the USA and of US military forces, targeting the industry's most important, most susceptible and possibly most gullible audiences, the young. This influence process apparently does not stop at the assassination of uncooperative screenwriters

(Alford 2016). Moody (2017) has chronicled what he describes as the integral role played by US State Department embassies in boosting and serving American media imperialism around the world and demonstrates a mutually beneficial relationship between the network of global US embassies and global Hollywood, arguing that this connection provides substantial evidence for a continuance of US media imperialism in the twenty-first century. Stahl refers to a long history of DOD supported war films – from Saving Private Ryan (1998) to Act of Valor (2012) – that reinforces what he calls the war-as-soldier-protection frame by depicting rescue operation after rescue operation. He suggests that officially sponsored "militainment" has come to penetrate reality TV, talk shows, sporting events, video games, documentary films, etc. This mirrors the imperial strategy of multiplying granular theaters of war through the world for the benefit of domestic public opinion while playing a vital role in maintaining American empire overseas. Dale Yong Jin has chronicled the rise of a US-centric platform imperialism, using the example of Facebook, the largest social media company in the world. He demonstrates that the USA's global dominance is being helped by digital platforms, with Facebook the world's leading platform imperialist. This perspective is increasingly reinforced by evidence of enhanced integration of leading electronic platform oligopolists and the US security establishment, and their eager participation in efforts to censor public speech in the name of a pseudo establishment war against "fake news," too often information and opinion that is robustly critical of western foreign policy.

Conclusion

While never disappearing, despite triumphal assertions to the contrary from their opponents, media imperialism discourses fell out of favor for a period in the 1990s. They had always been a matter of controversy, particularly divisive within media studies between those on the right, inclined to trust the feigned humility of "former" imperial powers and their snake oil encouragement to post-colonial regimes to feel part of the big boys' club, and those on the left, whose principal lesson from Marxism was to keep focused on the dialectical trajectories of history and the interests of capitalist classes. On the surface, the relative decline of media imperialism discourses appeared as an organic intellectual transition toward seductive but ultimately deceptive discourses of globalization – now better described as neoliberal hegemony and whose actual outcomes at the time of writing are ever more intense capitalist competition, unprecedented capital accumulation in fewer hands, extreme inequality, planetary destruction and war – and cultural globalization (whose similar sirens of seduction suggest colorful, joyful hybridity, and diversity in place of a reality of ever shallower infotainment pabulum at the service of consumerism and capital).

For a brief while, concepts of globalization and cultural globalization seemed to offer more promising explanatory power, friendlier to the corporate world, less aggressively provocative toward the state and state-subsidized intellectual production, and more congenial to academic careerism. They emerged against a backdrop of epochal political change, including the demise of the Soviet Union, that was particularly threatening to the left. Even as the illusions of globalization discourse became harder to disguise, intellectuals were ever ready with euphemisms to temper the worst. The term "soft power," coined by an intimate of US intellectual hegemony, stood in to substitute for the reality of ever more violent assertions of imperial power detached from cultural niceties. In place of the sophistication of Wallestein's center-periphery dependency models of distributed global power, simplistic "BRICS" discourses were forcibly nurtured with little or no heed to the absence of substantial shared interest between different members of the BRICS club, the close affiliations between some of their members and the USA and its allies, the absence of a unified BRICS media platform, and the reality, instead of a multicentered world, of an intensification of the threat of nuclear war between Sino-Russian axis on the one hand, and the US-NATO axis on the other.

Mexican Revolution and Anti-imperialism

Camilo Pérez-Bustillo
Autonomous University of Mexico City,
Mexico City, Mexico

Definition

The Mexican Revolution (1910–20) was the first great social revolution of the twentieth century. It combined elements of nationalist, anti-colonialist, and anti-imperialist struggle with populist demands and support centred on peasants, working people, and the poor, including the convergence of such factors in the context of Mexico's and Latin America's indigenous peoples.

The Mexican Revolution (1910–20) was the first great social revolution of the twentieth century, and a precursor to both the Russian and Chinese revolutions of 1917 and 1949. It also became a key referent for other revolutionary processes later in the Latin American context, including Cuba in 1959 and Nicaragua in 1979, and elsewhere in Asia and Africa in the context of processes of decolonisation.

Like all of these examples, the Mexican Revolution combined elements of nationalist, anti-colonialist, and anti-imperialist struggle with populist demands and support centred on peasants, working people, and the poor, including the convergence of such factors in the context of Mexico's and Latin America's indigenous peoples. A major focus of US policy during the 1920s and 1930s was to prevent the emergence of another Mexico elsewhere in Latin America, first through intensified intervention (including overlapping interventions and/or Marine occupations in Nicaragua, the Dominican Republic, Haiti, and Cuba), and later through President Franklin Delano Roosevelt's Good Neighbor Policy.

The eventual defeat of the most radical currents within the Mexican Revolution led by Francisco Pancho Villa, Emiliano Zapata, and Ricardo Flores Magón, and those they inspired, culminated in the consolidation of an authoritarian one-party regime (headed between 1929 and 2000 by the Partido Revolucionario Institucional, PRI [Institutional Revolutionary Party] and its previous incarnations). As the Revolution's supposed guardian and successor, the PRI sought to legitimise its monopolisation of the ostensible ruling ideology of revolutionary nationalism and its own power, repressiveness, and corruption. It did so in a similar manner to that of other states that formed bureaucratic leadership structures in the twentieth century.

Protagonists, Activists and Leaders

The Mexican Revolution's key leaders (and martyrs) such as Villa, Zapata, and Flores Magón became symbols of its widespread and continuing influence on equivalent leaders and processes elsewhere in Latin America with similar characteristics in the 1920s and 1930s; such as those led by Augusto César Sandino of Nicaragua, Farabundo Martí of El Salvador, Víctor Raúl Haya de la Torre of Peru (founder of the Alianza Popular Revolucionaria Americana [APRA]

M

party, established during Haya de la Torre's exile in Mexico in 1924). Sandino was greatly influenced by the nationalist orientation of the Mexican Revolution and its emphasis on workers' rights as a result of his experiences in exile there as an oil worker in Tampico and Veracruz between 1923 and 1926. Much of this legacy is still evident today in contexts such as Venezuela's Bolivarian Revolution and its equivalents in Bolivia and Ecuador, which identify with the framework of twenty-first-century socialism.

The origins of the Mexican Revolution lay in a popular revolt against the longstanding dictatorship (or Porfiriato) of Porfirio Díaz, which began to take shape between 1905 and 1907, and finally caught fire in late 1910, culminating finally in his overthrow in May 1911. Key initial steps which laid the basis for wider opposition later included the founding of the Mexican Liberal Party, in September 1905, in St Louis, Missouri, by political exiles led by Ricardo Flores Magón.

The Magonistas intensified the pressure on the Díaz regime from within, by consolidating a Mexican exile community in the US that continued to be engaged with opposition to Díaz, and by organising several armed incursions along the border with increasing regularity between 1906 and 1910. They also became in effect the founders of a left tradition within communities of Mexican origin in the US which became forerunners of the Mexican-American civil rights, Chicano, and contemporary immigrant rights movements.

Flores Magón was born in 1873, and died as a political soldier in Leavenworth Prison in Kansas in 1922, after his arrest in 1918 pursuant to the same repressive policies that led to the imprisonment of Eugene Debs and many others. Flores Magón lived in exile in the US for 18 years, from 1904–22, and was a fiery independent journalist and anarcho-communist activist of indigenous origin from Oaxaca who focused on the need for agrarian reform together with support for labour rights in key industries dominated by foreign capital (Lomnitz 2014).

Flores Magón's journal *Regeneratión*, eventually based in Los Angeles, played a key role in spreading news of the intensifying efforts within Mexico and from exile against the Díaz regime,

and in connecting these struggles to similar struggles elsewhere in the world from a radical internationalist perspective. This included close collaboration between Flores Magón and his associates with the Industrial Workers of the World (IWW), key sectors of the US Socialist Party, fellow activists and theorists such as Emma Goldman, and independent journalists such as John Kenneth Turner and John Reed. Goldman and Reed were among those at various different stages between 1905 and 1917 who helped connect contemporaneous and ultimately convergent revolutionary processes underway under analogous conditions in Mexico and Russia; these potential convergences were also explicitly present in the writings of Zapata. Goldman eventually headed the campaign to free Flores Magón after his arrests in 1916 and 1918, prior to her own imprisonment and deportation to Russia along with hundreds of others in November 1919 during the initial stages of the Red Scare.

It was Flores Magón who coined *Tierra y Libertad* (Land and Freedom) as a phrase to summarise the demands of the popular revolution that he believed was necessary to overthrow Díaz, and who exerted great influence on Zapata. This influence included Zapata's adoption of this slogan as the framework for his Plan de Ayala, which in turn became the basis for Article 27 of the Mexican Constitution of 1917 (one of the Revolution's most concrete achievements), which for the first time recognised and instituted protections for communal and indigenous forms of property.

Foreign Imperial Domination

Diaz's ruling cabal was dominated by advisors with Social Darwinist pretensions known as Científicos (scientists), such as Franco-Mexican financier Yves Limantour (Diaz's finance minister from 1893–1911, who accompanied him in exile to France in May 1911), who were imbued with the positivist ethos of scientific racism promoted by Herbert Spencer that was very influential during the same period in Brazil and Argentina. Limantour played a key role in the alignment of

the Díaz regime with European financial interests at the same time that US investment in Mexico was becoming increasingly predominant (with US control by 1910 of 27% of Mexico's land and 45% of all industrial investment).

Henry Lane Wilson served as US ambassador to Mexico during some of the most conflictive moments in US–Mexican relations and came to epitomise recurrent US intervention in Mexico's internal politics and its worst extremes during the period of the Revolution, which included reiterated armed interventions between 1913 and 1917. As Lane Wilson himself noted in his testimony to the US Congress in 1920:

Practically all of the railways belonged to foreigners; practically all of the mines. Practically all of the banks and all of the factories were owned by the French. A very considerable part of the soil of Mexico, probably over a third, was in the hands of foreign-born elements, and practically all the public utilities were in the hands of the Americans or British. Naturally this foreign ownership excited hostility, which was not lessened by the circumstance that these interests, or whatever they may have been, had been honestly acquired. (Welsome 2006, p. 16)

Inter-imperialist rivalries played a key role during the Mexican Revolution and preceded it in terms of jockeying for position among US and European interests. These manoeuvres were also rooted in broader phenomena, as historian Friedrich Katz has emphasised in his classic book *The Secret War in Mexico* (1984, p. x):

The term secret war . . . refers to a new strategy of alliances and understandings that the great powers and the business interests linked to them developed early in the twentieth century as a response to the wave of revolutions that swept some of what are now called the developing countries. The United States applied this strategy with great success in Cuba in 1898, when it used elements of the Cuban independence movement to obtain the expulsion of Spain's forces from Cuba and to establish American supremacy in their place.

Katz then situates the Mexican Revolution in a broader context:

The new strategy of exploiting social conflicts and anti-colonial struggles was not adopted by European powers until World War I, when each side tried to aid revolutionary movements that were directed at its rivals. The Germans attempted to support revolutionary liberation movements against the British in Ireland and India; and they allowed Lenin to return to Russia through Germany. The British sent Lawrence of Arabia to lead an Arab revolt against Germany's ally, Turkey; and together with the United States, the British supported nationalist movements, above all the Czech nationalist movement led by Thomas Masayrk, against the Austro-Hungarian Empire . . .. (ibid.)

What forms did such stratagems take in the Mexican context?

Direct and indirect military intervention, diplomatic and economic pressures, destabilization, attempts to play off one faction against the other – all these tactics were used by at least one of the great powers in Mexico between 1910 and 1920. (ibid.)

Popular repudiation and resistance against foreign domination during the Díaz regime was exemplified by a strike in the mines of Cananea in the northern border state of Sonora in 1906, followed by massive worker resistance to an owner's lock-out in the textile factories of Rio Blanco (the largest of their kind in Latin America) in Veracruz in 1907; both outbreaks were violently repressed with direct involvement by Díaz, and hundreds of workers detained and massacred. These incidents led in turn to an intensification of repression throughout the country. Associates of Flores Magón played major roles in both of these struggles.

By March 1908 Díaz felt it necessary to signal his supposed acceptance of the need for him to finally leave office. He did this in an interview with US journalist James Creelman in *Pearson's Magazine* by announcing his promise not to seek re-election in the next round of presidential elections, scheduled for June 1910. He eventually reneged on this pledge, but meanwhile exiled civic opposition leader Francisco Madero, a wealthy member of the local landed elite in the border state of Coahuila, who had run against Díaz in 1910 in elections widely recognised for their fraudulent character.

All of this laid the groundwork for Madero's call from his exile in Texas for a national uprising against Díaz on 20 November 1910 (to this day commemorated as a national holiday in Mexico, the Day of the Revolution). Villa and Zapata became key leaders of local rebellions in the

M

north and south respectively which, together with initially convergent efforts by the followers of Flores Magón and several others, produced several key military defeats that finally convinced Díaz to leave power and depart for exile in May 1911. The tipping point was Pancho Villa's taking of Ciudad Juárez in support of Madero on 9 May 1911 (Katz 1998). Zapata quickly became disenchanted with Madero's reluctance to undertake any significant measures of land reform, and by his increasing reliance on the hated army inherited from the Díaz regime, whose commander Victoriano Huerta led Madero's attempted extermination of Zapata's forces in Morelos, which had refused to disarm. Huerta eventually overthrew Madero in a bloody military coup in February 1913 which included the murder of Madero and several of his key associates, and which was actively encouraged and supported from the US Embassy by Henry Lane Wilson, in a scenario which foreshadowed that pursued later by Nixon and Kissinger in support of Pinochet against Allende, in Chile, in September 1973.

Huerta's coup outraged Villa and helped spark the crucial alliance between Zapata and Villa and broader Constitutionalist forces during 1913–14 which intensified the popular turn of the Revolution from Madero's vacillating moderation towards much more radical alternatives which both Zapata and Villa came to embody and symbolise between 1913 and 1915. This alliance combined Villa's extraordinary military prowess at the head of the cavalry of his División del Norte (Northern Division, notable for its victories at successive battles during 1914 in Torreón, Gómez Palacio, and Zacatecas) with Zapata's political clarity and deep support among Mexico's poorest indigenous communities. Both Villa and Zapata implemented key social reforms in Chihuahua and Morelos respectively during this period which helped shape and influence those included later in the 1917 Constitution.

US Military Intervention and Resistance

Leading supporters of Villa and Zapata collaborated during the National Convention of the Revolution's most radical forces in Aguascalientes in October 1914. The National Convention (modelled after the body of the same name which played a key role during the French Revolution) in turn led to the high point of their convergence which was their joint taking and occupation of Mexico City in December 1914. This continues to capture and shape the imagination of Mexico's most radical sectors today as a glimmer of their still unfulfilled dreams. Much of this history and imagery was invoked by the Zapatista National Liberation Army (EZLN) during 1994 and thereafter, including their caravan to Mexico City in March 2001.

The vacuum left by Madero as a representative of northern élites opposed to Zapata and Villa's insistence on land reform eventually came to be filled by forces led by Venustiano Carranza of Coahuila (Madero's home state) and Alvaro Obregón of Sonora. Carranza initially became dominant during the period between 1917 and 1920 as a result of his success in exploiting Villa's and Zapata's failures to consolidate unity and co-ordinate military and political initiatives among the most radical sectors. Both Carranza and Obregón even exploited the cultural and political distance between Villa's and Zapata's rural bases of support and sectors of radicalised urban workers whom they successfully co-opted. This included their emphasis on incorporating carefully controlled sectors of organised labour into the PRI's governing corporatist coalition.

The emergence of Carranza and Obregón as more moderate alternatives to the much greater perceived threats to US interests represented by Villa and Zapata was also a consequence of increased US intervention reflected in the overthrow of Madero, and its aftermath. Neither Carranza nor Obregón inspired US confidence, but each time intensified US intervention weakened Villa and Zapata, it at least indirectly strengthened Carranza and Obregón. Diplomatic relations between the US and Mexico were actually severed between 1914 and 1917, during the period of greatest US intervention on the ground in Mexico.

These interventions included US occupation of the port of Veracruz for 7 months between April

and November 1913, which also enabled US support to Carranza, who was based in that region during this period, which helped neutralise the potential strength of the emerging alliance between Villa and Zapata. The de facto alliance between the US and Carranza helped spur Villa's raid on Columbus, New Mexico in March 1916, which was the only attack carried out by a foreign foe on the continental US until the events of 9/11 (11 September 2001).

The US response included an invasion of Mexico by between 5,000 and 10,000 troops for 11 months between March 1916 and February 1917 as part of a punitive expedition in pursuit of Villa commanded by US general John Black Jack Pershing, who later became the commander of US forces in Europe following US intervention in the First World War in April 1917. One of his chief adjutants during this campaign was future general George S. Patton. Many of the units, officers, and soldiers involved in Pershing's expedition had combat experience in the War of 1898 and in the so-called Indian Wars. It is not surprising within this context that many Mexican civilians became the victims of US atrocities during this period that were shaped by racist assumptions as to their dangerousness, duplicity, and/or racial inferiority, along the same lines as numerous similar incidents during the US-Mexico war between 1845 and 1848.

Advance detachments penetrated at least 400 miles within Mexican territory, as far as Parral, Chihuahua (Villa's home base). Villa eluded capture repeatedly by employing classic tactics of guerrilla warfare which were later emulated by Fidel Castro in Cuba and by Mexico's EZLN in the 1990s. Villa lured Pershing's troops into several pitched battles with Mexican Army units (such as the Battle of Carrizal in June 1916) which, according to several scholars, might have triggered another full-scale war between the US and Mexico had it not been for the pressing distractions of the First World War. Similar skirmishes continued throughout the border region, especially in the environs of Texas and Arizona, between December 1917 and June 1919. Many of the tactics later employed by US troops in Europe in the First and Second World Wars were first tested in Mexico during this period.

There were also attempts at German intervention into the complex balance of forces during the Mexican Revolution, including the role of the S.S. *Ypringa* (the same German-registered vessel which had taken Díaz into exile) in bringing German arms to Huerta in Veracruz in April 1914, leading to US bombardment and occupation of the port later that same month. It also included the so-called Zimmermann Telegram, sent by the German foreign minister of that name to the German ambassador in Mexico City, which proposed an alliance between Germany and Mexico that would have included the return of the Mexican territory annexed by the US as a result of the war between 1845 and 1848.

Neo-colonisation

By 1919, Carranza had succeeded in isolating and killing Zapata, and in neutralising Villa (who was forced to live under virtual house arrest from his surrender in June 1920 until his assassination with Obregón's complicity in July 1923). Carranza himself was ultimately betrayed by Obregón and murdered in May 1920. Obregón in turn became the country's president from 1920–24 and was assassinated following his re-election to the presidency in 1928. Carranza's murder in May 1920 and Villa's surrender to Obregón a month later together are generally recognised as moments which mark the end of the Revolution and the inception of its consolidation as an authoritarian regime under Obregón and Plutarco Eliás Calles, and eventually Lázaro Cárdenas.

The president who best embodied the most classic expression of the revolutionary nationalist phase of the PRI was Lázaro Cárdenas (1934–40). Cárdenas, a general in Mexico's revolutionary army, became renowned for his extensive land redistribution programme, defence of the rights of the country's (and Latin America's) indigenous peoples, and armed support of the Republican side during the Spanish Civil War and granting of asylum to Leon Trotsky and to thousands of Spanish refugees fleeing the triumph of the fascist regime led by dictator Francisco Franco. This tradition was later reflected in Mexico's

M

welcoming of thousands of political exiles fleeing dictatorships and civil conflicts in Latin America throughout the 1970s and 1980s. Sadly much of this has been betrayed recently as the PRI has become the most assiduous defender of US interests, such as NAFTA (North American Free Trade Agreement) in Latin America from 1994–2015, including the so-called drug war and ongoing state terror against migrants in transit heading north to the US from Central America.

Cárdenas is perhaps most remembered for his anti-imperialist defiance epitomised by the nationalisation of US oil interests in 1938. This led to very tense relations between the US (under President Franklin D. Roosevelt) and Mexico, including widespread speculation as to possible US military intervention, which was likely neutralised by Roosevelt's increasing concentration on the imminent Second World War in Europe and the Pacific Basin. The ambiguities of Mexico's PRI are reflected both in Cárdenas's own role in forging the corporatist unity of the PRI between sectors such as the military and official government-backed trade union and peasant federations, and in the fact that in 2013 it is the PRI which promotes opening Mexico's state-owned oil industry (PEMEX, founded by Cárdenas) to foreign investment for the first time since 1938.

There continues to be widespread scholarly debate regarding how to characterise Mexico's evolving regime during the period of its domination between 1929 and 2000, and about the extent to which the country has experienced elements of a still incomplete democratic transition since the PRI's acceptance of its first acknowledged national electoral defeat in July 2000. Unlike other such cases in Latin America (e.g. in Argentina, Chile, Guatemala, El Salvador, Peru), Mexico has not taken meaningful steps to dismantle the PRI regime (e.g. a national Truth Commission and prosecution of serious human rights crimes) nor undertaken trials regarding key crimes or former leaders. All of this has been exacerbated by the PRI's return to power under current president Enrique Peña Nieto in a hotly disputed, closely contested election in 2012.

Key forces within Mexico's left continue to dispute the PRI's supposed legitimacy as an heir to the legacy of the Mexican Revolution. This includes some of the country's most radical movements such as the EZLN, based among some of Mexico's poorest Mayan indigenous communities in the jungle and highlands regions of Chiapas, which explicitly invokes the name and ideals of Zapata, and urban groups of slum dwellers in the environs of Mexico City who describe themselves as Villistas – followers of Francisco Pancho Villa. It is difficult to conceive of a revolutionary movement today in Mexico that does not in one way or another position itself in terms of the legacy of the most progressive features of the Mexican Revolution and at the same time in terms of the critique of its most evident errors (e.g. authoritarianism, centralism, corruption, etc.).

The disputed legacy of the Mexican Revolution also includes much more moderate centre-left forces focused on the electoral arena such as the Party of the Democratic Revolution (PRD) which was founded in 1990 as a fusion between nationalist sectors of the ruling PRI and several left parties and currents including the successor to Mexico's Communist Party. Its principal founder was Cuauhtémoc Cárdenas, a major opposition presidential candidate in 1988, 1994, and 2000, and son of former president Lázaro Cárdenas (1934–40), who was himself the founder of the PRI. The PRD has recently split as the result of the founding of MORENA (the Movement for National Renovation) led by former PRD chair and presidential candidate Andrés Manuel López Obrador, which has sought to draw on the legacy of Flores Magón by, for example, naming its journal *Regenerción.*

The PRI has taken a sharp neo-liberal turn from a longstanding at least rhetorical loyalty to revolutionary nationalism since its regime accepted the conditions of structural adjustment necessary for its rescue by the IMF and US Treasury following serious economic crises in 1982–83 and 1994–95. Meanwhile thousands of peasant, labour, indigenous, and human rights activists and independent journalists have been killed, forcibly disappeared, tortured, or exiled since the 1950s by the PRI regime and its initial successors from the rightist Partido de Acción Nacional.

Historical Influence of the Mexican Revolution

The Mexican Revolution's key elements included an emphasis on economic, social, and cultural rights such as agrarian reform and land redistribution, labour rights, and the expansion of public education, social security, and public health, combined with nationalism and anti-clericalism, which were reflected in the Mexican Constitution of 1917. These elements influenced and preceded similar provisions in the pioneering constitutions of Weimar Germany and of the USSR in 1918. All of this in turn foreshadowed the national-colonial turn promoted among non-Western Communist parties by the Third International after the Baku Congress of the Peoples of the East in September 1920, which had great influence on anti-colonial movements confronting similar challenges in contexts such as China, India, and colonial Africa (particularly South Africa, for example), and the emergence of the Comintern-backed League Against Imperialism in 1927, whose international leadership included Mexican revolutionary and painter Diego Rivera.

Many of the key characteristics of the Mexican Revolution are also present to varying degrees in modernising, nationalist, and populist regimes (often classified as corporatist or even fascist-leaning) such as: that of Ataturk (1920–38) in Turkey; the presidencies of Gétulio Vargas in Brazil (1930–45 and 1951–54); that which came to power as the result of the 1952 Egyptian Revolution led by Nasser and was pursued by his followers elsewhere in the Arab World; as well as Mossadegh's nationalist regime in Iran which nationalised the country's oil industry in 1951 and was eventually removed by a US-backed military coup in 1953.

In the Latin American context, Guatemala's Democratic Revolution between 1944 and 1954 and that of Bolivia in 1952 sought to emulate many of the Mexican Revolution's principal characteristics such as democratisation, the promotion of land reform, and defence of workers' rights in the face of US domination. The Mexican Revolution's emphasis on agrarian reform and peasant activism was also reflected in experiences

such as: the populist Gaitanista movement in Colombia between 1929 and 1948 (eventually repressed through that country's period of civil conflict between 1948 and 1962 known as La Violencia); and the Peasant Leagues of Francisco Juliao in north-east Brazil in the late 1950s and early 1960s, which in turn laid the groundwork for the emergence of contemporary expressions such as Brazil's Movement of Landless Workers (MST).

It is not surprising, given this framework, that Mexico became a key contributor to the International Brigades which fought on the side of the Spanish Republic during the Spanish Civil War, or that it was later the place of political refuge where Fidel Castro met Che Guevara in 1955 and from where their expedition on the retooled yacht known as the *Granma* launched what became the Cuban Revolution in December 1956.

Conclusion

The influence of the Mexican Revolution and its diverse interpretations are also evident in efforts on the left (and beyond) to theorise about the complexity of peasant and indigenous movements in Latin America and elsewhere. We see it in the work of historians such as Eric Hobsbawm (*Primitive Rebels* 1959) and E.P Thompson (in his conceptualisation of the moral economy, 1971), drawing in turn on analyses such as those of Antonio Gramsci regarding the ideological, cultural, and political dimensions of capitalist hegemony.

The impact of the Mexican Revolution and its internationalist implications are reflected in the journalism of John Kenneth Turner (*Barbarous Mexico* 1910) and John Reed (*Insurgent Mexico* 1910), whose books helped position the Revolution as a process with global implications, capable of awakening diverse expressions of solidarity and support in the US and beyond. John Reed's *Insurgent Mexico* focused on his experiences accompanying Villa, served as a precursor to his *Ten Days that Shook the World* (1919) documenting the triumph of the Bolshevik Revolution, and together suggest additional

M

dimensions of the relationship between the Mexican and Russian Revolutions as historically and politically related phenomena.

John Kenneth Turner's *Barbarous Mexico* (1910), which dramatically conveyed the worst abuses of the Díaz regime, has been compared to *Uncle Tom's Cabin* in terms of its analogous impact on public opinion. It was based on his research in Mexico during two trips in 1908 and 1909, vividly documenting the most repressive aspects of Diaz's dictatorial rule in Mexico. It played a key role in influencing US public opinion against Diaz's regime, and helped prepare progressive sectors in the US for active solidarity with Flores Magón, Madero, Zapata, and Villa during the next decade. Turner himself was co-ordinator of the English language version of *Regeneración,* and he participated directly in raising money and in purchasing and supplying weapons to Flores Magón's Liberal Party which helped make possible their seizure of Tijuana and several other towns in the northern states of Chihuahua and Sonora during 1910–11. This included the establishment of an anarcho-communist commune by Magonistas in Mexicali in Baja California between January and June 1911. Dozens of active US members of the IWW participated in this takeover, including Joe Hill and Frank Little. Emma Goldman lauded this episode as the Mexican equivalent of the Paris Commune.

Initial instalments of Turner's book were published in *The American Magazine* (founded in 1906 by Lincoln Steffens, Ida Tarbell, and others as an offshoot of the renowned *McClure's Magazine,* home of the original muckrakers), between October and December 1909, then throughout 1910 in seven additional instalments in journals such as *The Appeal to Reason* (based in Girard, Kansas; close to the Socialist Party, with a circulation of over 500,000 by 1910, the largest circulation of any socialist periodical in US history), *The International Socialist Review*, and *The Pacific Monthly*. The book was not published in Spanish, in Mexico, until 1955 (Turner 1910, pp. xvi, xxii, xxviii). Turner returned to Mexico several times during the Revolution, which

included his arrest in March 1913 as part of the generalised repression which followed Huerta's US-backed coup against Madero in February of that year. Mexican revolutionary painter and communist activist David Alfaro Siquieros included Turner in his mural honouring of the most important heroes of the Revolution, along with Zapata and Villa (xxviii–ix).

The Mexican Revolution was also, and remains, an extraordinary cultural phenomenon. This includes its presence in chronicles such as *The Eagle and the Serpent* by Martín Luis Guzman; in the novels of Carlos Fuentes; the poetry and essays of Octavio Paz; writings by José Revueltas; in music (as reflected in the specific narrative form known as *corridos*; in the nationalist movement in music projected in the work of Silvestre Revueltas, one of José's brothers); and of course in the country's renowned muralists Diego Rivera, Siquieros, José Clemente Orozco; the surrealist, feminist paintings of Frida Kahlo; and in the photography of Edward Weston and Tina Modotti, among many other possible examples. As in the case of Weston and Modotti, Mexico also became a place of pilgrimage for artists with social sensibilities from across the world, including: the film-maker Luis Buñuel and poet León Felipe (both Spanish exiles), D.H. Lawrence, Antonin Artaud, and André Breton. Such influences transcend the physical boundaries of Mexico through the vital presence of communities of Mexican origin throughout the US, and of murals such as those by Rivera in Detroit and San Francisco.

Middle East

Middle East Wars

Middle East: Socialism and Anti-imperialism

Cenk Ağcabay[1] and Ulaş Taştekin[2]
[1]International Politics, Zurich, Switzerland
[2]Ufuk University, Ankara, Turkey

In 1902, Alfred Thayer Mahan, American Naval Officer and geopolitics expert, wrote that:

> The Middle East, if I may adopt a term which I have not seen, will someday need its Malta, as well as its Gibraltar; it does not follow that either will be in the Persian Gulf. Naval force has the quality of mobility which carries with it the privilege of temporary absences; but it needs to find on every scene of operation established bases of refit, of supply, and in case of disaster, of security. The British Navy should have the facility to concentrate in force if occasion arise, about Aden, India, and the Persian Gulf. (cited in Adelson 1995, p. 22)

Thus, Mahan provided a new concept and defined a certain part of the geography which had been called as "Orient, The Near East, Turkish Asia" by the West until that day.

As the foreign news editor of *The Times* which was one of the loudest advocates of Britain imperialism, Sir Valentine Chirol wrote 20 articles under the main title of *The Middle Eastern Question* after the Eastern trip they took with Lord Curzon, then Viceroy of India, in 1903. The book composed of Chirol's articles was published in 1903 by the name of *The Middle East Question or Some Political Problems of Indian Defense*. During the trip, Chirol heard several times "less of Russia and more of Germany as the Power whose growing influence threatened to displace our own," and he considered "the Berlin-to-Baghdad railway and its planned extension to the Persian Gulf" as a "part of the Kaiser's [Emperor Willhelm] plan to use Turkey as 'a bridgehead to German world dominion'" (cited in Meyer and Brysac 2009, p. 37). Chirol had cited the concept of *The Middle East* from Mahan. Just as the states and borders to be created within the geography after some time, the concept of *The Middle East* was born as a requisite of

M

geostrategic priorities determined by British imperialism during the period in which imperialist struggle for the partition get intensified and progressed to turn into the Great War.

Mandate Governments

The Middle East became a territory that hosted bloody scenes of The First Imperialist War. Britain, France, Germany and Russia had demands and plans over the Middle East conflicting with each other. Demands and plans of Tsarist Russia turned into an affair of history due to the October Revolution. Germany lost both the war and its previous zone of influence. The winners of the War, Britain and France, divided the region within the framework of their own zones of influence through the Sykes-Picot Agreement they signed in 1916. After the war, the first draft sketching out the partition of the region came to light at Versailles Peace Conference. The region had great importance to protect the road from Britain to India and direct access to oil fields. On the basis of the structure of its colonial empire, France had to get a predominant position to safeguard its influence over Mediterranean and North Africa, economic interests in the Levant, and access to oil fields.

The decree to establish mandate governments was formulated by the Supreme Council of Versailles Conference on 30 January 1919 as follows:

> the Ottoman Middle East and the former German colonies, being inhabited by 'peoples not yet able to stand by themselves under the strenuous conditions of the modern world', would be administered by 'advanced nations' on the principle 'that the well-being and development of such peoples form a sacred trust of civilization.' (cited in Pedersen 2015, p. 29)

The territories within the scope of mandate government were classified in three, and "A" mandates included the Ottoman Middle East. After having been framed at the Paris Peace Conference and been decided to establish at the San Remo Conference at the end of First Imperialist War, mandate governments were a "fig leaf" to cover colonialist domination, as historian Leonard V. Smith cited in. The statement in the establishment text of the

mandate governments was an ornate expression of the "civilizing mission" (*mission civilisatrice*) that colonialist powers of the Europe had developed since the invasion of America and used to legitimate their colonial expeditions. When Lord Curzon "told the House of Lords, the gift of mandates lay not with the League [of Nations], but 'with the powers who have conquered the territories, which it then falls to them to distribute'" (Mangold 2016, p. 93), he revealed that the essence was the colonial domination provided by bayonets which was also the very thing covered by this ornate expression. Robert D. Caix, France Prime Minister Clemencau's consultant and special envoy, framed the general project agreed by Britain and France to reshape the region as follows:

> the peace of the world would be better served if there were in the Orient a number of small states, with relations under the control of France or England, that would be administered with the fullest domestic autonomy and would not have the aggressive tendencies of the big national unitary states. (cited in Bozarslan 2010, p. 53; also see de Dreuzy 2016, p. 207)

The Great Syria (which once used to include today's Syria, Lebanon, Palestine, Israel, Jordan and a part of Southern Anatolia) was divided within the frame of British-France consensus; whereas Syria and Lebanon were allocated to French mandate, Britain mandate was established in Palestine. Abdullah from Hashimi family under the total domination of Britain was appointed head of the newly founded Jordan. Establishment of an Iraq state under the British mandate was decided to contain Basra, Mosul, and Baghdad provinces of Ottomans. On November 2, 1917, in the advance of this partition, then Britain Foreign Affairs Minister Arthur Balfour promised to build a "national homeland for Jewish people" in Palestine through a document he sent to Walter Rothschild's house at Piccadily, 148 in London. France, the USA, and Italy expressed their support a short while ago before that declaration.

Iraq
The Balfour Declaration and the partition of the region by the imperialists after the war triggered a

wave of anti-imperialist revolts within the region. "Muslim-Christian Association," the first political party of Palestine, was established after the revelation of the Balfour Declaration. The first anniversary of the declaration was determined as the day of national rage, and thousands of Muslim and Christian Palestinian attended to the protests arm in arm. Inconveniences growing within Iraq against British invasion and the establishment of mandate government turned into a significant revolt in summer 1919. The revolt started with clashes as a result of some attacks to British military officers in Shiite and Kurdish regions and inspired large masses. The response of the occupying British government was fatal air strikes embodied in the document by the name of "On the Power of the Air Force and the Application of That Power to Hold and Police Mesopotamia" (Satia 2006, p. 26). The Royal Air Force carried out massive massacres. Iraqi peoples jointly resisted with participation of Shiites, Sunnis, Kurds, and Christians.

In Batatu's (1978, pp. 173–178) words, "the revolt (...), by bringing the Shiites and Sunnis closer together, strengthened national sentiment which, as it grew in intensity and wide masses became seized of it" far from deepening the cleavages between the sects, and "a great deal of fraternizing between Sunnis and Shiites took place in 1919 and 1920 at joint religious-political gatherings in Baghdad's mosques an event without precedent in the annals of Iraq."

The revolt in Iraq directly targeted British imperialism and spread to a large area of the country. Among the feeding supplies of the revolt, an important dimension was the political initiatives developed by the Soviets toward the Peoples of the East after the October Revolution. The most comprehensive form of this political initiative was embodied in "Draft Theses on National and Colonial Questions" presented by Lenin to the Second Congress of the Communist International. The first political outcome of this initiative became the Congress of the Peoples of the East held between September 1 and 8, 1920, in Baku. The Congress aimed at developing a perspective for the joint struggle of the peoples under the yoke of imperialism.

Turkey

After the 1920 Treaty of Sevres, the resistance initiated by popular forces in Anatolia against the harsh destruction and invasion of Ottoman Empire by the victorious imperialists became intensified. Mustafa Kemal, a commander of Ottoman Army, gathered resistant groups formed in various regions of Anatolia under his political and military leadership. He made an alliance with the Bolsheviks and, thanks to the support against the imperialism, accomplished successive military victories. The struggle under the leadership of Mustafa Kemal evolved in the establishment of the republic in 1923 which introduced modern Turkey.

Syria and Lebanon

France, which accrued Syria and Lebanon as a result of imperialist partition, initially divided Syria and Lebanon in pursuant to imperial *divide et empera* principle and established mandate governments in 1922 in Syria and in 1921 in Lebanon. After a short while, she divided Syria on the basis of ethnic and religious basis and established "ministates" under the names of Aleppo Administration, Damascus Administration, Druse Administration, and Alawite Administration all of which hinged upon French Viceroy. While French colonial administration carried out such regulations, Arab Alawites, mainly living in Mediterranean coasts of Syria, revolted. Aleppo branch of secret "national defense committees" which were established in all parts of Syria got in touch with this revolt of Alawites. The tendency to jointly resist was adopted rapidly. Armed groups in Aleppo under the leadership of İbrahim Hananu started a joint struggle together with the insurgents in the Alevi region. The principal demand of the insurgents was the abolition of partition and invasion of the country. France sent more troops to the region and initiated a campaign to disable resistant forces.

In an article dated 1932, Yusuf İbrahim Yazbek, historian and among founders of Lebanese Communist Party, indicated that he knew Hananu personally and got some significant information about the relationship between Hananu

and Lenin, i.e., the Soviets, during the revolt. Lenin sent messages to Hananu promising to support Syrian Revolution against French invasion (Ismael 2005, pp. 11–12). As a result of that French campaign inflicted a heavy blow on the resistance, the relationship with the Soviets could not be promoted further. French mandate practices which were the most infuriating for Syrians were directly interrelated with her "civilizing mission." The government's wish was to construct new railways and highways in order to "civilize" Syria and apply compulsory labor policy to execute this will. In addition to compulsory work, new taxes were also levied on in addition to compulsory work. There was an outrage in the country arising from the numerous losses of lives as a result of the blockade that Britain and France applied to Syrian harbors during the Imperialist War. The revolt went on until the end of 1922, and, because of unchained violence of French troops, villages were destroyed, and crops were fired. When the French could not capture insurgents, who had a grasp over the geography, they tortured the local community and massacred to suppress the resistance.

Egypt

Another country in which anti-imperialist resistance in the aftermath of the Imperialist War triggered a great revolt was Egypt that had been under the occupation of the British army since 1882. A committee of seven people who established a political party targeting Egypt's independency in November 1918 wanted to participate in the Paris Conference on behalf of their country. Britain High Commission rejected this request, and the members of Egyptian committee protested this rejection and decided to launch a countrywide political campaign. Saad Zaglul, in the position of the committee leader, and two other members were punished by being exiled in Maltha.

One week after the exile of Zaglul, demonstrations that sprang in Cairo, Alexandria, and other cities extended to Delta region, and enormous strikes followed. Railways were sabotaged at important points; railway and telegraph line from Cairo to the Canal and Upper Egypt was cut off. Egypt rapidly turned into the center of rebellion.

The report by British officials in Egypt stated that the revolt was supported by all groups in the country and influenced by Bolsheviks. The report also drew attention to the fact that Coptic Christians and Muslims, students from religious schools and secular ones, and women and men from upper classes participated demonstrations together (Fromkin 2013, p. 349). The revolt in Egypt was a bourgeois-democratic movement where a young Egyptian bourgeoisie, of which development channels had been clogged by Britain, was backed by all fractions of the people. The labor class that had just started to activate in social and political terms also became influential in this revolt.

The violence applied by British forces was comprehensive in the 1919 Revolution; at least 3000 Egyptian died, many villages were fired, lands were ravaged, railway stations were demolished, and railways were devastated. Upon the fact that the violence did not cause to go back and a new wave of strikes burst, the demand of Zaglul was accepted by British officials. WAFD Members joined to the Egyptian committee to participate in Paris Conference. According to the information provided by Peter Mangold, passivation campaign of British forces in Egypt (1919) was one of the cruelest operations in the colonies after the violence applied against Sepoy revolt in India (1857).

Upon the revolt, Britain accepted to launch a negotiation process over political status of Egypt. When WAFD commission indicated that they were insistent on the demand of independency, Britain pursued a different tactic. In pursuant to this tactic, Britain exiled Zaglul again in 1921 and declared dependency unilaterally and promoted Egypt Khedive to the King from the Governorship through a declaration in 1922.

Communist parties in the Middle East were established under the inspiring influence of Communist International just after the Imperialist War. Communist parties of Egypt, Iraq, Syria, Lebanon, Palestine, and Turkey took shape between 1919 and 1925 in the atmosphere generated by the October Revolution and anti-imperialist stream rising in the region. Lebanese and Syrian Communist Parties were established in December

1925 and took a set of decisions on actual political affairs in their establishment meeting: (1) to defend Syrian Revolution, (2) to strengthen the struggle against imperialism, (3) to struggle for democratic rights and national liberation, (4) to struggle for the rights of Syrian and Lebanese workers, and (5) to defend appropriation of landlords' properties who were not for the revolution.

Communist Parties and Resistances

During the days that conference held, Syria was shaken by a recent wave of revolts against Syria French Mandate Government, and that is why the first article of the decisions on actual political affairs was "To defend Syrian Revolution" in Lebanese and Syrian Communist Parties establishment conference. The revolt sprang in Druse region that time. A Druse warrior, Sultan el-Atrash, led the rebellion. The reason of the rebellion in Druse region, which is one of the "ministates" of the French, was the fact that newly appointed French officials enforced compulsory works to the local community for the road and building construction with no wages and brought shifting toward private property policies on the land forward by eliminating deep-rooted common property tradition of Druses. Local leaders of Druse people submitted their complaints through petitions sent to Damascus in June 1925. The high commissioner invited complainants to Damascus; all of them with the exception of Sultan Atrash accepted the invitation and were arrested.

Atrash took action after learning the arrests, and a French plane was shot down by the warriors on July 18, 1925, while flying above Druse Mountain (*Jabal al-Druze*). Four days later, Warriors at Atrash's command carried out an attack to the largest French military base located near Suwayda, the biggest Druse city around. Almost all of French soldiers in the base were killed. The victories of Atrash excited all Syrians for Suwayda was enveloped. Three thousand French soldiers at the command of General Roger Michaud were sent to the region in order to lift the envelopment and terminate the rebellion, but

they were ambushed as soon as they burst on the scene and had to retreat by suffering heavy losses. Atrash's such military successes brought warriors belonging to various national and religious groups from different parts of the country into the fold.

On the date of August 23, 1925, Atrash,

> as the 'Commander of the Syrian Revolutionary Armies', issued a general call to arms. Appealing to all Syrians to 'remember your forefathers, your history, your heroes, your martyrs, and your national honour... remember that civilized nations that are united cannot be destroyed', al-Atrash called for the complete independence of Syria, the institution of free elections, and a popular government, the expulsion of foreign armies from Syria soil, and -an interesting touch- 'the application of the principles of the French Revolution and the Rights of Man'. (Pedersen 2015, pp. 144–145)

People's Party which was established under the leadership of Abdurrahman Şahbender and adopted secularism and national independency as the main principles was among prominent supporters of the revolt. The party hastened agitation and propaganda in Damascus and some other cities so as to favor the revolt. In October, the forces led by Fevzi Kavukçu, a veteran soldier, attacked the French forces in Hama and surrounded the French base there. French planes launched a bomb attack to the region. Due to the heavy shelling over the settlements in the region, there occurred a civilian massacre. As a result, new rebellious groups occurred in many regions of the country during the autumn. French forces lost the control of Ghouta, in Damascus countryside, and serious attacks were carried out against French forces in Homs.

Anti-rebellious paramilitary brigades composed of Circassians, Kurds, and Armenians by the French initiative started operations together with the colonial French army. These groups were utilized in anti-guerilla operations in rural and urban areas and submitted hundred young men that they arrested in countryside of Ghouta to the Frenches by claiming that they were rebellious. Frenches executed these men in the most centralized square of Damascus and exhibited their corpses for days in order to spread fear.

In the early morning of October 18, 1925, there were attacks by armed groups against French

M

troops and demonstrations against the French governing by unarmed crowds at many points of Damascus. Anti-guerilla brigades took action against both armed forces and unarmed crowds in the city together with colonial French soldiers. After the intensification of the conflict, the large part of Damascus was controlled by the rebellious group. Even though French tanks entered in even the narrowest streets and bombed the city, this did not break the resistance. In the evening, rebellions were in front of the magnificent residence of High Commissioner Sarrail, but he was not there. The residence burnt up, while the weather was getting dark. French Mandate Government officials decided to a show of force as a result of their assessments. In the evening of October 18, all French troops and armored vehicles retreated from the central Damascus. The next morning, a heavy shelling by warplanes and artillery batteries simultaneously targeted Damascus. It lasted 2 days and demolished many parts of the city.

The French Mandate Government had to propel 80,000 additional colonial soldiers further from Morocco, Senegal, Algeria, and Madagascar to Syria together with heavy weapons in order to suppress the revolt. "The Great Revolt" was a bourgeois-democratic revolution movement that rose on the basis of struggle against French domination. Class composition of the crowds triggered by the revolt and demands embodied in Atrash's declaration points out a framework fitting the political program of a bourgeois-democratic revolution. "The Great Revolt" was an offspring of the revolutionary wave that started to shake the East by 1919–1920s. That fact was also why Syrian and Lebanese Communist Parties listed "To defend Syrian Revolution" first in the political agenda of the establishment meeting. Thousands of people were destroyed in the great attack toward Damascus, and these numerous losses became influential in the slowdown of the struggle. However, the fight of Syrian people continued with ups and downs. In May 1926, French planes were above Al-Midan, an outskirt of Damascus. The region was ravaged once more as a result of heavy bombardment. According to a source referred by McHugo, a thousand people died just in this bombardment. Only 50 of them were in

rebellion, and most of the dead were women and children (McHugo 2001, p. 87). French government dictated that people should not be assisted, when they wanted to shelter in inner cities after leaving the razed Al-Midan with injuries and without water and food. French Mandate Government carried out a passivation campaign in order to break the revolt by employing heavy bombardments, attacks of anti-rebellious paramilitary groups, and regular operations of colonial army. The rebellion went on until the end of 1927.

On the date of July 20, 1925, Syrian and Lebanese Communist Parties organized a demonstration in Beirut in order to protest removal of rental control policy, and numerous people marched. Rise of inflation and prices of consumption goods enhanced inconvenience in Lebanon. When protestors were in front of the government building to utter their demands, the police fired on the crowd. The people disbanded in panic, 10 died and 40 got injured, while many of them were arrested. The party issued a declaration in Arabic, French, and Armenian on July 22 condemning the bloody attack and supporting the revolt in Syria. The party also declared the intention to build coordination with international communist movement in order to defend the Great Syrian Revolution.

Palestine

The first political challenge against British Mandate Government in Palestine occurred in 1920 after the conflict arising from provocations against Palestinians by Zionist settler groups having close relationships with British governing. For British troops used force against Palestinians, the conflicts grew and caused great losses for Palestinians. During the conflicts, British government developed relations with a moderate group trying to soothe Palestinians led by Amin al-Husseini, member of an influential family in Jerusalem. British officials granted some privileges and attempted control Palestinians through this group. Zionist movement took significant steps toward its specific targets in close cooperation with British government thanks to

outstanding financial sources as well as well-disciplined and centralized political leadership.

Mandate government allocated 90% of state privileges in Palestine to the Jewish capital. This enabled Zionists to obtain the control of economic infrastructure (road projects, mineral deposits under the Dead Sea, electricity, ports, etc.). Zionists got the control of 872 industrial companies out of 1212 in Palestine till 1935. Industrial import belonging to Zionists was exempt from tax. By means of remarkable external support, Zionist movement could provide money in the amount of that mandate government could do for education. This considerable support enabled them to establish the first university in 1925, and Balfour participated in the opening ceremony as the guest of honor. Strong educational institutions were built in line with Zionist political targets and historical perception and played an important role in imposing Zionist ideology to next-generation settlers. Zionist Executive Board was established in 1921 and developed close relationships with mandate government as the representative of the Zionist movement. Zionist movement simultaneously carried settlers to Palestine while purchasing lands from Arabic dominant groups and driving Arab villagers out of these lands. In this frame, 425,000 decares land in 1914 escalated to 1,250,000 decares in 1930. This was one-third of agricultural lands in Palestine, and this expansion worked to the detriment of local community.

A new wave of protests started in Palestine and spread to Syria, Iraq, and Egypt after Balfour's arrival to Palestine for the opening ceremony. Masses around the Middle East protested British imperialism, Zionism, and Balfour. Histadrut, a Jewish Labor Federation, was among the prominent actors playing a role in colonization of Palestine. By virtue of its activities in accordance with "Hebrew labor" maxim, Histadrut forbade employment of Arabic workers in the projects held by Jews. Meanwhile, Histadrut became the largest Zionist organization in Palestine and get the position of the most effective actor in the establishment of Israel. First secretary general of Histadrut, David Ben-Gurion, was going to make the speech declaring the establishment of Israel and become the first prime minister of it. Even though Histadrut has the

name of labor federation, its field of activity extended from capitalist entrepreneurship, banking, insurance companies, and landowning to social insurance activities, enormous educational institutions, armed organization, and the cooperative operations. In this respect, it was much more like the "embryo of a state" rather than a labor federation. Mandate government divided unitary economic system which had been existing in Palestine through a policy enforced in 1929 in favor of Zionist movement. The practices foretelling this division started in 1928. The tension between Zionist settlers and Palestinians got intensified in Summer 1928 because of disagreements over sacred spaces in Jerusalem. The new practice was enforced during these days and enhanced rage among Palestinians more. Intensification of conflicts in 1929 caused uprising of Palestinians once more against British imperialism. The response was again a high-level violence campaign targeting Palestinians. The revolt was repressed. London Government sent a commission to Palestine to investigate the events and reasons on site. The commission arrived in Palestine in September and prepared a report after completing the investigation. In the report, it was stated that "the main source of tension within the mandate was the creation of a landless class of discontented Arabs and the widespread Arab fear that continued Jewish immigration would result in a Jewish-dominated Palestine" (Cleveland and Bunton 2008, p. 257).

Zionist Movement and the 1930s

Having shaped a strong institutional structure, Zionist movement built a powerful armed body named Haganah which would turn into the army of Israel in future. Such armed body was shaped and strengthened through silent approval of mandate government and drew attention by its aggression against Palestinians. Upon the domination of Zionists, flow of settlers toward Palestine and purchase of lands increasingly went on. Jewish population between 1931 and 1936 in Palestine escalated to 370,000 from 175,000. In the year of 1933, a demonstration with the participation of nearly 7000 people in Jaffa was attacked by

M

British forces, and 12 Palestinians were killed, whereas more than 70 were injured. Upon the hearing of this massacre, attacks targeted British entities in many cities. British government activated its abettor, the Arab Higher Committee, to terminate the revolt. In spite of the Arab Higher Committee's attempts to break, the movement spread to Haifa, Nablus, and Jerusalem. Serving a report to Britain, a British official stated that "there was no attack towards the Jews" during the revolt and

> It would be wrong to consider migration and establishment of a Jewish nation-state as the only reason for the revolt. Afterwards, a genuine national sensation developed. Such sensation subsisted in Palestine more than any other things, and it was accompanied by a violent attitude against British government. (Sakar 1991, p. 151)

After 1935, the Arab Higher Committee made a set of interviews in order to provide a consensus with Zionist Jewish Agent officials and a proper agreement between the parties through the guidance of British officials. The negotiations did not come up with result because of strict attitudes of Zionist delegates. In May 1936, Palestinian executives faced an obligation to decide: they had been forced both by Palestinians to achieve something and by British government to make serious concessions. On May 7, the decision not to pay tax to mandate government was taken with the participation of 150 delegates. The Arab Higher Committee went on a general strike in May 1936 thanks to the pressure of people and organized countrywide demonstrations.

While the demonstrations to which upper dominant class members of Palestine also participated spread to many parts of the country, conflicts occurred between Haganah members and Arab committees. A gigantic attack was organized by British forces toward Palestinians in Jaffa on June 18. Most of the dwellings in the city were destroyed by British soldiers by the means of dynamites. Mandate government declared a state of siege on July 30 and harshly started a passivation campaign against Palestinian rioters. British forces occupying Palestine were not only supported by 20,000 additional soldiers to carry out the campaign but also benefited from another

source. It was a local power which collaborate British colonialism and immensely mobilized against the local community: Zionists, which once performed many retaliation operations, would take a greater role hereafter in the environment of a condensed pressure through massive arrests, assassinations, and executions. Zionist militias which were integrated into British army and police forces launched a relentless violence campaign against the Palestinians.

1936 revolt mainly developed against British domination and Zionist project. However, after rapidly getting out of control of its initiator, the Arab Higher Committee, it gained the character of a "peasantry social revolution." There were a significant number of participants from Egypt, Syria, Jordan, and Iraq. The thing combining volunteers from various ideological and political positions was the anti-colonial struggle of Palestine. The revolt went on until 1939 and left behind approximately 5000 Palestinians dead, thousands imprisoned, and nearly 5000 houses destroyed. Some Zionist militias which were integrated in British entities during the revolt were going to take important roles in Israel army and state afterward.

After the Second Imperialist War

Palestinian revolt withered away during the days in which the world was drifted to an oncoming imperialist war. When the Second Imperialist War started, imperialist domination in the Middle East was existing in different ways. With the exception of Turkey, on which imperialists could not have a grip directly, and Saudi Arabia, a quasi-independent state even the name of which was determined in London, all countries were under the domination of Britain and France though various means of control. Second Imperialist War caused destructive results in the Middle East. Cairo was one of the main military bases of Britain during the war. Britain and France imposed a war economy on the Middle East countries for foodstuff and military articles they need to. During the war, Middle Eastern peoples' rage against imperialism and desire to eradicate the imperialist yoke grew much stronger.

After the war and in 1945, Ernest Bevin, British Foreign Affairs Minister, determined that an unprecedented social transformation was taking place in the Middle East. According to Bevin, Britain had taken a side on the wrong hand of the history:

> Britain allied with previous gangs and generals rather than peasantry. Britain must encourage social and political reforms in the region, cooperate with moderate nationalists in order to balance extremists. Britain cannot cling on to the Middle East through bayonets. (Mangold 2016, p. 193)

Actually, the evaluation of Bevin on the basis of protection of his country's interests pointed out his uneasiness about the growing anti-imperialist political and social opposition.

The USA, which was a new hegemonic power within the imperialist camp after the war, was not delayed in gravitating to the region having rich energy resources and a geostrategic urgency. Thanks to an agreement concluded in 1944, it already established its first military base in Saudi Arabia, and American oil companies made important agreements with the country. Britain and the USA established a strong political and economic control over reactionary oil-rich monarchies in the region. Growing anti-imperialist wave of the era revealed that colonialist domination could not be maintained in previous forms anymore. Independency demands in the colonies gained momentum after India achieved its independence in 1947. The USA took action in order to build economic, political, and military mechanisms of the new colonialism in place of weakening British and French colonial empires.

During the 1950s, various movements rose against imperialist domination in the Middle East and were welcomed by large masses. The intersection point of these movements based on different social class force combinations and various ideological orientations was the demands of national independency against political domination of imperialism and termination of imperialist control over the local resources. These common targets consisted meeting point of progressive bourgeoisie-nationalist movements and revolutionary-communist movements of the region.

Nasserism

Communist parties in Arabic countries had responsibility to develop a political struggle framework fitting specific conditions of the countries having typical qualities of a capitalist mode of development belonging to the geographies under the colonialist domination. One of the most prominent experiences occurred in Egypt so as to reflect the hardship of this responsibility and specificities of capitalist mode of development under the colonialist domination. A group of young officers, named themselves "free officers," seized the power under the leadership of Gamal Abdel Nasser on July 23, 1952, and overthrew the British puppet king. This attempt had a determinant influence over the political struggles in the Middle East after the second imperialist war and made a tremendous impact in many Arabic countries. 1952 Egyptian Revolution became the first flare of oncoming anti-imperialist revolution wave in the Middle East.

Upon the decision on nationalization of the Suez Canal Company by Egyptian government in 1956, Britain, France, and Israel took action. After the invasion of Sinai by Israel, Britain and France launched a bombardment toward Cairo and military operations. As a result, they established a military superiority against Egypt. The Soviet Union took a position on the side of Egypt, and the USA did not support aggressive trio for it winced from the break of regional balances to its detriment and isolation from Arabic geography. Aggressors had to withdraw from Egypt: it had a political victory even though it degraded in military terms. This buoyed up anti-imperialist forces in the region.

Nasser, pioneer of Egyptian Revolution, had always kept the experiences of 1948 Arab-Israeli War, to which he participated as a juvenile officer, on the agenda. Arabic countries like Egypt, Syria, Lebanon, Jordan, and Iraq declared a war against Israel which was established in 1948 thanks to strong support of imperialist countries, but they were defeated. The main reason of the defeat was economic and military deficiency arising from imperialist domination over Arabic countries and

M

the competition between abettor political administrations. Israel went to war with a strong army trained and equipped by imperialist countries. Through the war, Israel not only expanded its borders but also drove 700,000 Palestinians out of their lands by relentlessly terrorizing and seized these areas. So, the Nakba (catastrophe) started for Palestinians.

The war also convinced Nasser that the "near enemy" – the king and the British occupier – had to take priority over the "far enemy," Israel, since fighting the former could ultimately lead to victory over the latter.

Gamal Abdel Nasser, who took part in the war, wrote that they had trouble mostly for the deficiency of heavy weapons, ammunition, and intelligence and considered Britain, domestic monarchy, and political elites of the country as responsible. After the war, Nasser was convinced that taking action against "'near enemy' – the king and the British occupier – had to take priority over the 'far enemy' – Israel – " (Gerges 2018, p. 171). The movement led by Nasser attracted a great attention in the whole Middle East. The US imperialism was in the effort of building a military alliance in parallel to NATO in the Middle East just before the war. The main constitutive elements of such an alliance were Turkey – which shifted toward Western axis after the war and became a NATO member, Iraq and Jordan, of which Kings were the members of British puppet Hashimi family.

On October 13, 1951, the USA, Britain, France, and Turkey invited Egypt to the studies targeting the establishment of a joint military commandership. Egypt government could not reply in the affirmative due to the intensive public pressure. The same day, Western officials also visited Syria, informed Syrian government about the project, and expressed how the threat of communism was crucial: the demand was the enfranchisement of Syrian port utilization in the case of a potential war against Soviets. After the hearing of visit and the content of the subjects, a great mobility occurred in Syria. Syrian people made demonstration with slogans against the USA and Western imperialism. Discussions on a Middle Eastern NATO and the demand of port usage

rights were met by a great reaction. As a result of the visit that caused a political crisis in Syria, the prime minister had to resign. The magnitude of Syrian people's reaction meant that they were aware of the repercussions of Western colonial domination by considering the previous experiences. The memories were fresh in the minds: Palestinians were driven out of their lands; Zionist Israel state was established through the support of Western imperialism, and abettor Arabic administrations had to declare a war and got defeated. Such heavy weights were added onto other fresh memories of deep-rooted history of colonialism.

At the end of the imperialist war, another Middle Eastern country under the influence of Britain was Iran and had great amount of oil reserves and a long border with Soviet Union. In the country, there was a strong communist party and masses had anti-imperialist sensation. Iranian prime minister Mosaddegh won the political struggle against the Shah of Iran under the influence of Western imperialism after the war. Mosaddegh had massive popular support and had the intention to carry out political and economic reforms. Nationalization of oil was the first name on the list. Upon the failure of military coup organized against Mosaddegh, Shah Reza Pahlavi escaped to Italy. Then, American and British secret services stepped in and overthrew Mosaddegh through a coup d'état. Shah turned back to the country on August 24, 1953, as a "hero" and took his place as a trustworthy abettor of the USA in the region.

National Front Tactic

The increasing interest of Soviet Unions in the 1950s toward the Middle East as well as political, economic, and military relations established with Nasser government expedited political confrontations in the region. Juvenile officers and intellectuals triggered by Egyptian Revolution overthrew British puppet king Hashimi in Iraq through 1958 Revolution. Officers led by General Qasim took a radical decision and withdrew from the Western alliance, nationalized key industrial sectors, enabled landless peasantry to access the lands through land reform, launched an extensive

educational campaign, and made reforms so as to make health services accessible.

Juvenile officers seized power in Syria in 1961 under the influence of the developments in the region. Revolutionary forces caused by the revolutionary wave influencing the region developed economic and military relations with the Soviet Union. Egyptian, Iraqi, and Syrian Communist Parties were the most effective communist organization around the region. They supported the policies of these new governments within the scope of anti-imperialist "national front" tactic. Communist parties made alliances with the governments within the frame of national-democratic front policy. The main confrontation in the Middle East was composed of this frame: Egypt, Iraq, and Syria axes based on national independency, social and economic progression, and secularism on the one hand and reactionary axis in collaboration with imperialism constituted by Turkey, Iran, and Gulf monarchies led by Saudi Arabia, Jordan, and Israel on the other.

Palestine, the constantly bleeding wound of the Middle East, maintained its determinant significance during the process. Imperialism benefited from Israel as a battering ram for its attacks against progressive-democratic forces in the Middle East. As a result of imperialism-backed aggression of Israel, progressive-democratic countries in the Middle East had to constantly live in a warfare atmosphere and allocate an important part of resources to the military field. Thanks to certain reform policies in the countries from anti-imperialist axis, significant transformations occurred in agricultural, industrial, educational, and medical areas in favor of working classes. Women gained a momentum in terms of participating to social and economic life. Egypt and Syria governments supported anti-imperialist and progressive movements from Yemen to Congo and Palestine and built solidarity with revolutionary movements in those countries. Six-Day War in 1967 was an important example of that the US imperialism benefited from Israel in order to downgrade anti-imperialist front in the region. Egypt, Syria, and Jordan got defeated against Israel which was predominantly supported by European and American imperialists in military

and financial terms. At the end of the war, Israel quadrupled its lands by occupying Sinai Peninsula, Golan Heights, Gaza Strip, and Western Bank.

The 1967 War caused a remarkable loss of prestige for anti-imperialist governments, and that was just what imperialism wants. Such a defeat of these widely supported movements provides a basis for propaganda of conservative Islamic forces which opposes Israel demagogically. Palestine National Council gathered on May 29, 1964, and declared the establishment of Palestine Liberation Organization (PLO); this was a new page for Palestinian struggle. The organization, which was significantly supported by Egypt and Syria, rapidly grew. PLO formed as an umbrella organization for Palestinian political groups, and the biggest group was Fatah led by Yasser Arafat. Marxist organizations such as the Popular Front for the Liberation of Palestine (PFLP) and the Democratic Front for the Liberation of Palestine (DFLP) also took part in PLO. After 1967 defeat, a new leap was observed in Palestinian organizations' struggle. To prevent this progression, the USA and Israel employed their abettor Hussein, King of Jordan.

The strong support by Palestinian refugees in Jordan to PLO provided an important operational basis to the organization. Significant attacks toward Israel targets were organized from here. The straight abettor King Hussein gave an attack order toward PLO in September 1970. PLO had to move essential units of the organization to Lebanon because of noteworthy losses during the conflicts, and this relieved Israel in military terms. Nasser died because of a heart attack in September 1970 and was replaced by his vice, Anwar Sadat.

Not long after the move of PLO to Lebanon, the new war between Egypt and Syria and Israel started on October 6, 1973, called Yom Kippur. Israel strengthened its gains provided by previous wars through winning Yom Kippur thanks to comprehensive intelligence and military support by the USA. The most important result of the war was the departure of Egypt from the anti-imperialist axis as the most important country of the axis and approximation to US imperialism under the leadership of Anwar Sadat. The aim of these wars was to strengthen Israel's position in

M

the region and weaken anti-imperialist front; the tactic became successful. The most important indication of this success was the Camp David Accords signed in the USA on September 17, 1978, witnessed by President Carter. This was the first time that an Arabic country officially recognized the Israel. The most prominent country in the region yielded to imperialism for its resistance had been broken as a result of nasty blows.

The Role of Political Islam

Another movement that imperialists allied against rising anti-imperialist movements during 1950s was Political Islam which was still powerless then. Saudi Arabia gained a strategical significance thanks to rapidly increasing oil requirement in imperialist metropoles just after the Second Imperialist War. Wahhabi-Islam also provided a unique position to the country as Saudi dynasty employed this ideology to legitimize their power. Muslim Brotherhood had been established in Egypt, 1928, and was the main source of all Political Islamist movements to occur in the region afterward. The organization was supported by British imperialism and its puppet Egyptian King since its establishment in 1928 by Hassan al-Banna as a political alternative to progressive bourgeois nationalist movement that WAFD party represents. Muslim Brotherhood had close relations with Saudi Arabia. Muslim Brotherhood built organizations at not only national level but also regional level through the strong support provided. The organization attracted supporters among angry young masses in countries in the region as it developed a discourse owning the Palestinian struggle. Muslim Brotherhood militants crusaded on the side of Arabic armies in 1948 War, and the organization attracted attention through a violence campaign in Egypt after the war. The government harshly cracked down on the organization; the conflict intensified; and the organization carried out attacks against government officials, restaurants, bars, and women that they did not dress in compliance with Islamic proceedings allegedly. Al-Banna, leader of the

movement, was killed by an attack supposedly performed by Egyptian secret service; some other leaders were arrested.

Muslim Brotherhood developed certain relations with juvenile officers who took power in Egypt after the 1952 revolution. The new leader of the organization, Hassan al-Hudaybi, visited Nasser with a delegation. The group delivered their demands in the meeting. As Nasser publicly expressed after the meeting, the organization desired implementation of a model based on Sharia law in state and society relations by the new revolutionary government. The government rejected this demand, while Muslim Brotherhood was developing close relations with the USA and Saudi Arabia during the era. The negotiations that new government conducted with Britain resulted in 1954, and Britain accepted to withdraw all armies from Egypt. This was an important success that the government gained. Hence, massive demonstrations and meetings were organized in various cities of the country to celebrate withdrawal of British armies. In Alexandria, a Muslim Brotherhood member performed an armed attack to Nasser while he was making a speech at the meeting. Nasser survived and launched rigid operations against the organization. Significant Muslim Brotherhood leaders were discharged from Egypt by a CIA operation and taken to Saudi Arabia.

The leaders gained important governmental positions in Saudi Arabia; some of them were assigned to management of financial institutions while some others to educational ones. A press information center was established in Riyadh to execute propaganda and organizing activities all around the Middle East. The organization of this activity was closely related to political function that Saudi Arabia attained under the guidance of the USA. Saudi dynasty would propagate and organize "Islamic unity against communism" in Muslim geographies through funds provided by ARAMCO oil company of which majority of managers were composed of Americans. US imperialism took the action to employ Political Islam as a weapon against communism, and Saudi dynasty played a significant role for it presented itself as the protector of holy cities of Islam. As for Muslim

Brotherhood, it was the most proper apparatus for the task with its extensive network-type organization and grown cadres in the region. Egyptian labor movement growing in 1946 and expanding wave of strikes in addition to anti-imperialist student movement encountered Muslim Brotherhood as the most decisive force. Militants performed harsh attacks to striking workers and anti-imperialist students. The organization's counter-revolutionary performance and ability to rapidly adapt the war against communism launched by the USA made it a suitable partner for imperialism. Alignment of Muslim peoples in the axis of "Islamic unity" ideology was an important strategic goal for the war against communism by the USA in a geography from Morocco to Indonesia. The Soviet Union should have been surrounded by a "green belt." Activities conducted on the basis of this strategy caused important political results in the Middle East countries in subsequent years.

Anti-imperialism in Turkey and Iran

Turkey

Turkey and Iran were the Middle Eastern countries in which anti-imperialist and socialist struggle gained momentum during the 1960s. Ruling classes of these countries were among the closest alliances of American imperialism in the region. However, growing dynamics provided basis for a popular socialist movement with the participation of labor class, peasantry, and intellectuals. American and European imperialists launched an intensified campaign in order to strengthen state apparatus in these countries, to link trade unions to abettor international union organizations, and to mobilize conservative political forces during the 1960s. Shah regime in Iran left training and equipment of police and army to the supervision of US counselors. Anti-imperialist and socialist opposition was tried to be oppressed through relentless terror of this apparatus.

Growing anti-imperialist and socialist movement in Turkey was enhanced by the enormous labor revolt on June 15 and 16, 1970, in important industrial cities such as İstanbul and İzmit. Against the revolt, a state of siege was declared,

and a severe passivation campaign started. A progressive military intervention attempted by juvenile officers was repressed on March 12, 1971, and a fascist-military intervention was carried out under the guidance of the USA to oppress socialist and labor movement. The juvenile officers' attempt had relations with representatives of socialist and labor movement; and their demands included exodus from NATO, cancelation of bilateral agreements with the USA, closing US military basis in the country, and nationalization of main industrial sectors and banks. Prominent goal of fascist-military intervention was to destroy leaders of rapidly growing anti-imperialist and socialist movement. Accordingly, revolutionary flag bearers of rising generation – Mahir Çayan, Deniz Gezmiş, Hüseyin İnan, Yusuf Arslan, and Ulaş Bardakçı – were murdered through counterinsurgency operations.

Socialist movement in Turkey had a strong anti-imperialist basis. As a result of anti-imperialist campaigns since 1968 and active participation of rising revolutionary generation to Palestinian struggle on the side of local organizations, imperialist forces focused on Turkey in terms of intelligence and military activities. The fascist movement of Gray Wolves, which was organized by one of the first Turkish officers who took part in NATO – Alparslan Türkeş – was among the most important apparatuses of NATO's secret services. Its activities started with attacks to socialist student leaders and turned into all-out slaughters in the 1970s. In the second half of the 1970s, labor and socialist movement in Turkey met with larger masses, and its development could not be prevented. As a result, armed attacks of Gray Wolves and state terror simultaneously became the issue in order to oppress the movement. However, when the socialist responded to those attacks with a strong self-defense, the result was a precursor of civil war in the country. In the conflicts, 30–40 people died per day, but socialist movement proceeded through expanding its influence in prominent cities of the country. The imperialist and local ruling forces would prepare a plan to ensure a more persistent and bloodier fascist rule. A movement organized in the army's chain of command seized the power on September 12, 1980. Five generals at the top of the army declared that the parliament was closed, the government was overthrown, and "they

M

took over the power until the establishment of security and stability." First practices of the fascist rule were declaration of a state of siege, prohibition of strikes, and protests in addition to all revolutionary-democratic institutions, trade unions, and associations. The event in Turkey was conveyed to President Carter by the vice president, while he was in a concert hall, and Carter's response was "Our boys done." The military rule was substantially backed by the USA and European countries. Eight hundred thousand people were detained in several years, and physical and psychological torture was employed as the main method during the custodies apart from executions. The main target was to oppress anti-imperialist socialist movement and cut off its ties with poor people. Fascist rule was very successful in this target; development channels of socialist movement were plugged, and ties with peasantry and working classes got weakened. Moreover, it lost its extensive influence in urban parts of the country.

Iran

In Iran, the first mass reaction against Shah rule driven by imperialism occurred in January 1963. Economic and social program presented by Shah as "reform program" and called as "White Revolution" targeted a higher level of integration with imperialist capital. The voting for "reform program" propounded by Shah enabled alignment of various popular classes, workers, poor peasantry, a part of clergy, and civil servants on the basis of common demands. There were two main ideological orientations to affect rapidly growing demonstrations. Socialists had recently started to become influential in ideological terms, and they made an impact over the masses along with religious Shia leaders through different channels. The remarkable name was Ayatollah Khomeini with his ideological domain. The movement was repressed by the violence applied by the Shah. Socialist movement had to withdraw, and Khomeini was exiled to Iraq.

One of the common traits between Iran and Turkey was the birth of capitalist industrialization centers within the frame of uneven development of capitalist relations and subsequent buildup of working classes in those centers. The rest of capitalist centers was a large rural area composed of a small group of landowners and a crowd of poor landless peasantry. A semi-proletarian unemployed population accumulated in metropoles, and this was the embodiment of continuous discontent. In parallel with constant increase in educational institutions, educated young population coming from poor families constituted the prominent elements of opposition against the Shah regime.

The main channel of the socialist movement in Iran was Soviet-sided TUDEH party. New generations who joined the movement after 1963 were much more open to new elements of international movements, and divisions occurring in international socialist movement had repercussions in Iran as well. The very same tendency was also pertinent in Turkey; Chinese, Vietnamese, and Cuban experiences constituted basis for the divisions of socialist movement in Iran and Turkey. The difference in Iran was the organization named People's Mujahedin of Iran which was born on a Marxist basis but adopted a religious discourse. The determinant element for Iran left was the strong anti-imperialist basis of the movement. Organizations of Iranian People's Fedaian and People's Mujahedin of Iran emerged as strong leftist movements and took armed struggle as the basis. Shia Islamist movement was based on historical references and had a strong anti-colonial discourse. It was against "Islamist unity" approach developed by the USA and Saudi Arabia. Shiism had always been on the side of opposition during the history and "has a nature convenient to attract oppressed and humiliated communities and highlighting indispensability for believers to oppose illicit rulers, tyranny and injustice through either its message or rituals and practices" (Luizard 2016, p. 52). Thus, Shia religious movement was able to develop proper discourse and practices so as to mobilize lower oppressed classes. Anti-imperialist discourse and messages of the movement for the paupers provided a basis for coming side by side with the socialist movement with a joint struggle perspective against the Shah regime. In the second half of the 1970s, a crowded, though divided, socialist movement and a strong movement iconizing Shiism were hand in hand within the frame of "national front" perspective. CIA-backed police terror against socialist movement was of high

level; nearly 200 leaders of Iran socialist movement were murdered by either torturing or assassination during the 1970s.

The Iranian revolution that exploded in February 1979 rapidly inspired large masses in the country. Albeit divided and disjointed, socialists actively took part in the revolution and organized bold actions, but it was rapidly revealed that they did not have sufficient institutional and political capacity to lead the revolution. Shiite movement developed a strict anti-Zionist and anti-imperialist discourse while lunging toward the leadership of the movement with its cohesive structure and strong mass support. Such discourses and the ability to mobilize working classes caused differentiations among the socialists in terms of the attitude toward Islamist movement. Majority of the movement defended making alliance with Islamist movement. In March 1979, The Islamic Republic was approved, and presidential election was held in January 1980. Parliament elections were organized in March and May. After the 1979 constitutional voting, nationalization of main industrial sectors, banks, and insurance companies along with foreign trade was the step which weakened socialists' opposition and evoked desire to expand the alliance. Actions such as occupying US embassy strengthened anti-imperialist discourse of the government. On the other hand, the new government started to limit political influence of socialist movement thanks to such policies and discourses. Oppression started to increase over socialist movement opposing the government by 1979 August. Conflicts occurred in some cities and some socialist leaders were executed. Tensions between Islamist government and some socialist groups continued during the 1980. Meanwhile, Iraq government declared the cancelation of Algiers Agreement, which had been previously concluded with Iran, on September 16, 1980, and Iraq troops crossed Iran border to occupy.

Iraq and Saddam Hussein

The disagreement between Iran and Iraq dated back to history, and there are several reasons underlying this action of Iraq after the Iranian Revolution. Majority of Iraq population was Shiite and had close relations with Iran. Governing Ba'ath Party had seized the power in 1963 at the end of successive coup d'états following 1958 revolution. Saddam Hussein was the strong man of the rule, but he was able to come into office as the head of state in 1979. Perturbation arising from potential effects of Iranian Revolution over crowded Shiite population and expectation to get financial, military, and political support from imperialism and Gulf kingdoms through a war against Islamic Republic were the main factors that triggered Saddam Hussein. Close economic and military relations established between the Soviets and officers who took power in Iraq after 1958 revolution increased the concerns of the USA toward the country. It is known that the Ba'ath Party was supported by CIA in the change of power in 1963 and Saddam Hussein actively took part in assassinations against the leaders of Iraqi Communist Party then (Ahmad 2011, p. 19). The cadres of the Communist Party who actively struggled against Ba'ath coup of 1963 were murdered at the end of conflicts continuing for days. Prior goal of Ba'ath power in Iraq was to destroy cadres affiliated to the Nasserist project. Saddam Hussein was one of the crucial characters in such operations. Contact between Soviet Union and Iraq Ba'ath ruling in 1973 revived communists again, and the pressure over the movement decreased as well. In 1978, a new wave of oppression under the leadership of Saddam Hussein inflicted the communist a fatal blow; communist cadres were executed.

The war initiated by Saddam Hussein against Iran was supported by American and European imperialists and their vassals in the Gulf. In spite of early successes of Iraq, Iran rapidly recovered and vigorously counterattacked. In the forthcoming years of the war that lasted 8 years, Iran achieved superiority. By 1987, Iran Army built up and was preparing an enormous attack in Basrah. The report, "At the Gates of Basrah", prepared by US Defense Intelligence Agency revealed detailed information about the circumstances at the front and warned that potential Iran attack might have caused the collapse of Iraq army in Spring. Upon the report, US National Security Council decided to convey intelligence by

M

Defense Intelligence Agency to Iraq Army about the actions of Iran Army. In this frame, US experts forwarded to tell military targets of Iran. Iraq Army abundantly employed chemical weapons targeting these points (Harris and Aid 2013).

> The Reagan administration handed Saddam Hussein the cutting-edge dual-use military and civilian technology, including chemicals that would be used to make the weapons against the Iranian Basij-e Mostaz'afin, the great mobilization of the oppressed whose human waves were cut down by Iraqi chemical weapons. In 1986, the UN Security Council proposed to censure Iraq for its use of chemical weapons, illegal since the 1925 Geneva Protocol; the United States was alone in its vote against the statement. Reagans National Security Council staffer Geoffrey Kemp recalled the sentiment toward Saddam, the mercenary for the United States and the Gulf Arabs, 'We knew he was an S. O. B., but he was our S. O. B.' (Prashad 2012, p. 84)

The Iran War of Saddam Hussein was welcomed by the imperialist world to that extent. The main aim of the imperialists was to weaken Islamic Republic that they had lost their hope to control. The target was achieved at the expense of lives more than a million and large amount of destructions. Iran was weakened, but neither the regime changed nor Iran government kneeled down. War conditions enabled suitable mechanisms for Islamic government to get a more extensive support from the society. Saddam Hussein claimed that Iran War was on behalf of all Sunni Arabs and the forces for which he fought should have paid the price. Hussein required Kuwait to erase the Iraq's debts borrowed during the war upon the advice of the USA and to grant new loans. There was a border dispute between Iraq and Kuwait dating back to the past, and Kuwait used to drill oil from an area to which Iraq laid claim. Saddam Hussein also argued that Kuwait made over-production of oil violating OPEC oil quotas, and this gave harm to Iraq economy by decreasing oil prices. Saddam met with the US Ambassador, April Glaspie, in the advance of occupying Kuwait and listed his complaints. The Ambassador adopted a neutral position. After Iran War, Washington intended to increase American influence over Iraq through economic and political incentives. However, 1 year before Saddam's order to occupy Kuwait, Berlin Wall fell by declaring an end of an era in international politics and opening a new one. This provided the USA a great extent of global mobility. In this new era, the Middle East was of great importance for the USA to reshape the global scene, and Saddam Hussein serves the "reason" that the USA desperately wants on a silver platter, while he was "claiming his rights."

Destruction of the Capacity to Resist

The occupation of Kuwait was ordered on August 2, 1990. The invasion of Kuwait by Iraq enabled Iraq to have a great influence over the Middle Eastern oil reserves, and this was considered as an unwarrantable crime which endangers US policy based on "oil safety" in the Middle East. In the post-cold war era, this invasion attempt was valuable for it would enable the USA to show its power to the region and the world, to settle its army in a crucial region in terms of geostrategy thanks to a "legitimate" reason and to have mobility so as to gain momentum in reshaping the region. Upon US attempt, United Nations Security Council took a decision advising immediate withdrawal of Iraq troops from Kuwait lands with no condition, and the decision would be applied through US military forces in actual fact. The First Gulf War started in this way and caused a great extent of destruction. The determinant power in the war coalition composed of 33 countries was the USA. The USA had the chance to exhibit its military capacity in the operation named Desert Storm, hence, the process of "destroying the capacity to resist" started in the Middle East (Amin 2016. p. 62). The real message of this easy victory of the USA was delivered by Chief Commander Bush in his State of the Union Address, January 1992:

> A world once divided into two armed camps now recognizes one sole and preeminent superpower: The United States of America. And they regard this with no dread. For the world trusts us with power – and the world is right. They trust us to be fair and restrained; they trust us to be on the side of decency. They trust us to do what's right. (Anderson 2015, p. 105)

The easy victory was the thing that made Bush speak in this way. The USA settled in the region with a strong "legitimacy shield." President Bush also emphasized another important point for them in the words of that "the specter of Vietnam has been buried forever in the desert sands of the

Arabian Peninsula." The USA did not march toward Baghdad and overthrow Saddam even though it made air strikes which destroyed vital resources of Iraqis. The reason was the foundation of long-term US strategy. In the radio broadcasts of the USA from the Gulf, Shiites and Kurds were invited to revolt for a long time. However, when they rose, there was no US support. They were left to their fate, while Saddam's chemical bombs were dropping out of the sky. The USA was not in a hurry but has the desire to link the opposition against the dictatorship to itself a little bit more as the first step of the long-term strategy. New massacres of Saddam would strengthen the "legitimacy shield" worn by the USA, and revolt dynamics emerging against the dictatorship would be much more open to US influence. Unfortunately, it worked; Colin Powell, Chief of the Staff, would explain the second step why the USA did not march toward Baghdad and overthrow Saddam: "Our practical intention was to leave Baghdad enough power to survive as a threat to an Iran that remained bitterly hostile to the US" (Meyer and Brysac 2009, p. 387).

Disintegration of the Soviet Union made a great impact over the Middle East. Countries which were previously in the Soviet axis encountered existential crisis. After the military intervention of the Soviets to Afghanistan, militants coming from the Middle Eastern countries to the Jihad conducted by the cooperation of the USA, Saudi Arabia, and Pakistan returned to their countries much more self-confident thanks to the victory. Political Islam rapidly filled the gap left by anti-imperialist and socialist movements that got defeated and regressed. Discontents emerging among the peoples who lost their financial and military support after the collapse of the Soviets tended toward this channel. Political Islam became the rising political movement in many countries of the region by means of strong support provided by imperialism.

The thing determining the Middle East after the First Gulf War was political and military activities of the USA to reshape the "Greater Middle East." Iraq was of highest importance in this respect. "Destruction of the capacity to resist" against the imperialism in the Middle East was the main element of the reshaping project. "Iraq Liberation Act" was signed on October 31, 1998, by President Bill Clinton and

became the symbol of launching US aggression. In his article, "Imperial America," in November 2000, Richard Haass, who is still the head of Council on Foreign Relations and was counselor in the US National Security Council during the George W. Bush era, defended that "United States should use the exceptional opportunity that it now enjoyed to reshape the world in order to enhance its global strategic assets" (Foster 2006, p. 146). The neocon group which would become really effective in forthcoming years had stated the following ideas in their manifest written in 1997 Spring:

> America's strategic goal used to be containment of the Soviet Union; today the task is to preserve an international security environment conducive to American interests and ideals. The military's job during the Cold War was to deter Soviet expansionism. Today its task is to secure and expand the 'zones of democratic peace;' to deter the rise of a new great power competitor; defend key regions of Europe, East Asia and the Middle East; and to preserve American preeminence through the coming transformation of war made possible by new technologies. (cited in Donnelly 2004, p. 49)

9/11 was the justification that ruling neocons needed, and the war of the USA to shape the "Greater Middle East" started then. Neocons needed just a justification because the former US Treasury Secretary, Paul O'Neill, "went public that there had been a memorandum preparing for 'regime change' in Iraq almost from 'day one' of the Bush Administration – and well before the September 11 attacks (...) which O'Neill attended and at which an invasion of Iraq was discussed" (Cook 2008, p. 30). Energy Task Force, a group managed by Vice President Dick Cheney, had started to produce documents regarding oil fields of Iraq since March 2001. One of them was entitled *Foreign Suitors for Iraqi Oilfield Contracts* and included the discussion on the ways to carve up Iraq's crude reserves between Western oil companies. A senior Israeli commentator, Aluf Benn, hosted prominent military and intelligence officials of Israel on the days before the attack on Baghdad, and the issue was a possible consequence of the imminent attack (Cook 2008, p. 35):

> Senior IDF [Israeli army] officers and those close to Prime Minister Ariel Sharon, such as National Security Advisor Ephraim Halevy, paint a rosy

M

picture of the wonderful future Israel can expect after the war. They envision a domino effect, with the fall of Saddam Hussein followed by that of Israel's other enemies: [Yasser] Arafat, Hassan Nasrallah [of Hezbollah], [Syria's President] Bashar Assad, the ayatollah in Iran and maybe even Muhammar Gadhafi [of Libya]. Along with these leaders, will disappear terror and weapons of mass destruction.

The picture depicted by Halevy pointed out the main target of "destruction of the capacity to resist." Iraq, for the imperialist ruling apparatus of the USA, was an important threshold to access the absolute domination target around the world. The security of Israel was also among the main factors determining regional policies of the USA, and the thing encoded as "the security of Israel" was to ensure continuity of Israel's military superiority and expansion policy based on occupation.

Occupation of Afghanistan, invasion of Iraq, NATO attack targeting Libya, and all of other attacks toward Syria, Lebanon, and Gaza by imperialism and its regional partners were the parts of a single war conducted for a common aim: the desire to prevent revival of socialist and anti-imperialist forces in the region which notably regressed after the collapse of the Soviet Union. Accordingly, imperialism enhanced its pressure over especially Iran and its regional allies Syria and Hezbollah in Lebanon. Whereas the tendency to resist that emerged as a result of Syrian War prevents determinant results to be taken by imperialism, Hezbollah's gradual advancement toward a regional power contributed the development of resistant dynamics in the geography. In this sense, Syrian resistance became the strongest obstacle against the redesign of the region by US imperialism. Geopolitical consequences and tendency to resist arising from Syrian resistance would provide significant contributions to anti-imperialism and socialism renaissance to be constructed by Middle Eastern peoples.

In Lieu of Conclusion

The region that denominated *the Middle East* has witnessed numerous bloody massacres. While imperialist forces have always attempted to divide the region into their proxies, local forces somehow have founded a way out to resist against such attempts. During the period after the Great War, mandate governments and local abettors in the region became the main channel of imperialists to rule the countries here. In the era after the second imperialist war, Zionist movement gained momentum and suppressed Palestinians' struggle with help of imperialists. Moreover, political Islamist movements were supported by imperialists so as to dissolve bourgeoisie-nationalist and socialist coalescences in the second half of the twentieth century. For the resistant forces – regardless of bourgeoisie-democratic or socialist – existence of other anti-imperialist and socialist countries in the last century became a leg to stand on and became the most prominent contributor of the long-lasting resistances against imperialist aggression. On the other hand, collapse of the Soviet Bloc was followed by the enhancement of this relentless aggression so as to deliver more poverty, suffering, death, and destruction to the peoples in the region. It can be suggested that the resistant dynamics are still inherent in the region and the consolidation of these dynamics may be even the sole way to break the blockade for the peoples surrounded by the imperialist political conservatism.

Description

The growth of the USA as an empire has been tied to war, and since World War I, the US military has routinely collaborated with the entertainment industries to shape and influence public opinion about war. The relationship between the US State's military propaganda agencies, the entertainment industries, media products, and public opinion is of interest to researchers, and the alliance of the military and the entertainment industries is often conceptualized as a "military-entertainment complex" (MEC). This entry focuses on some relevant concepts for studying the MEC (the military-industrial complex, the military-industrial-communications complex, the military-industrial-media-entertainment network, the media war/virtuous war, and interactive militainment), identifies the political and economic institutions that make up the MEC (the Department of Defense's public affairs office and US media and entertainment corporations), and highlights synergies between the DoD and specific sectors of the entertainment industries that underlie the production of militainment (the DoD-news complex; the DoD-Hollywood complex; the DoD-sports complex; the DoD-digital games complex; and the DoD-social media complex).

Introduction: Militarism and the Military-Entertainment Complex

From 1945 to the present day, the economic, geo-political, and cultural-ideological expansion of the USA as a unique postcolonial empire has relied upon permanent war (Bacevich 2010, 2013; Dower 2017; Johnson 2004; Turse 2012). Following the terrorist attack of September 11, 2001 (9/11), the USA launched a Global War on Terror (GWOT). In 2016, the US Department of Defense's (DoD) operations encompassed 70% of the planet, and its various branches attacked opponents and liquidated threats to US security in Afghanistan, Iraq, Libya, Pakistan, Somalia, Syria, and Yemen. In that same year, US Special Forces deployed to numerous countries for "kill or capture" missions and intelligence gathering and to train allied forces. Recently, the DoD has pivoted to East Asia to try to "contain" China (and its "One Belt, One Road" initiative) and built up its presence in countries bordering Russia. As the DoD globally expanded, so did its budget. In 2018, the DoD's budget was about $700 billion, while the total combined defense budgets of the globe's next top four military spenders – China, Russia, Saudi Arabia, and India – was $343 billion (SIPRI 2018; Stein 2018). In that same year, US defense spending was about 190% of what it was prior to 9/11, and it accounted for approximately 37% of the world's total. The DoD's budget for wars are costly to society, but they are a boon to defense corporations such as Boeing, Lockheed Martin, and General Dynamics, which net billions each year by selling war-servicing weapon commodities to the DoD and US client states. In 2018, the USA was the biggest exporter of arms to the world (Brown 2018). The US empire's global footprint of nearly 1000 military bases spread across an estimated 80 countries was likewise exceptional. In the global system, the USA is the military superpower and without rival.

Given that the American way of life has long been interwoven with a contentious way of war, the state has gone to great lengths to try to get US and transnational publics to think about and perceive war in a specific way; to persuade and push people to accept its wars as necessary, good, and right; and to influence the subjectivities and hearts and minds of millions. The US State's wars abroad always rely upon massive war persuasion campaigns at home, and the production and reproduction of the ideology of militarism in the USA is significant. The ideology of militarism represents the American nation as a unity secured by war as opposed to one divided by class inequality, racism and sexism, and frames "the nation's

strength and well-being" to its subjects "in terms of military preparedness, military action, and the fostering of (or nostalgia for) military ideals" (Bacevich 2010, 2013). Moreover, the ideology of militarism glorifies the state's use of coercion not diplomacy to achieve American security in a world divided between a righteous American "us" and an evil and threatening "them," presents the DoD and its violence as the solution to every problem that seems to vex America, and reduces patriotism to support for the troops (Bacevich 2010, 2013; Johnson 2004). The ideology of militarism is produced and reproduced by a number of actors across a variety of sites, but one source of it is a nexus of the military propagandists employed by DoD public affairs agencies and the media producers paid by the entertainment industries.

From World War I forward, US State elites (and to some extent, their allies in the cultural industries) recognized the importance of shaping, influencing, and steering public opinion about war, and for war. The important US social scientist and communications theorist Harold Lasswell explained this elite acknowledgment, in a 1927 publication entitled *Propaganda Technique in the World War*:

> During the war-period, it came to be recognized that the mobilization of men and means was not sufficient; there must be a mobilization of opinion. Power over opinion, as over life and property, passed into official hands. Indeed, there is no question but that government management of opinion is the unescapable corollary of large-scale modern war. The only question is the degree to which the government should try to conduct its propaganda secretly (15).

From the formation of the Committee on Public Information (CPI) in World War I to the establishment of the Office of War Information in World War II, to the conduct of the United States Information Agency (USIA) and DoD-supported global psychological operations in the Cold War, and to the post-9/11 rise of military-media information operations and cyberwarfare doctrines, the DoD has tried to influence the way the media and entertainment industries and the products they produce and circulate represent the DoD and the wars it fights, so as to influence how the US

empire's wars are perceived by publics in the USA and around the world. Sometimes, these war propaganda campaigns roll out in secret and are only recognized by the public many years after they happen with help from Freedom of Information Act requests. Other times, they are quite belligerent and obvious, but the structural alliance between the DoD and the entertainment industries that support it are ignored or downplayed by the public. In any case, in all war propaganda campaigns, the US State and media-corporate elites routinely work together to intentionally influence the content of entertainment and cultural productions, and many of the products resulting from this alliance support the goal of manufacturing public consent to empire and war as a way of life.

The relationship between the US State's military propaganda agencies, the media and entertainment industries, media products, and public opinion has long been of interest to researchers, and the structural alliance of the military and the entertainment industries is often conceptualized as a "military-entertainment complex" (MEC) (Alford 2010, 2016; Anderson 2006; Anderson and Mirrlees 2014; Boggs and Pollard 2007; Der Derian 2001; Grondin 2014; Martin and Steuter 2010; Mirrlees 2016; Payne 2016; Alford and Secker 2017; Stahl 2010). In the first two decades of the twenty-first century, the MEC rolled out numerous "militainment" products that resulted from a production alliance or partnership between the US military and the US entertainment industries.

This entry focuses on some relevant concepts for studying the MEC, identifies the political and economic institutions that make up the MEC, and highlights synergies between the DoD and specific sectors of the entertainment industries that underlie the production of militainment. The first section reviews some key precursors to and concepts that are useful for studying the MEC: the military-industrial complex (MIC), the military-industrial-communications complex (MICC), the military-industrial-media-entertainment network (MIME-NET), the media war/virtuous war, and interactive militainment. The second section conceptualizes the relationship between the major DoD and corporate actors that constitute the

M

contemporary MEC. The third section explores some specific sectors of the MEC: the DoD-news complex, the DoD-Hollywood complex, the DoD-sports complex, the DoD-digital games complex, and the DoD-social media complex.

Key Concepts for Studying the MEC

In his January 17, 1961, "Farewell Address to the Nation," US President Dwight Eisenhower used the term "military-industrial complex" (MIC) to flag how US government agencies, the DoD, and the titans of industry interlinked to make and maintain a nation that was permanently readied for war. Eisenhower described the "immense military establishment and a large arms industry" as "new in the American experience" and described the MIC's "total influence – economic, political, even spiritual" as being "felt in every city, every statehouse, every office of the federal government." Eisenhower argued that the MIC was necessary to combat mounting threats to US security in the Cold War, but he encouraged US politicians and "an alert and knowledgeable citizenry" to "guard against" the MIC's "acquisition of unwarranted influence" and to contemplate the dangers its development posed to American "liberties" and "democratic processes."

Currently, the MIC describes a symbiotic relationship between the DoD (which aims to maintain a technological cutting-edge over rival militaries in an antagonistic global system), profit-seeking defense corporations (which produce and sell weapons technologies as commodities to the DoD), the US politicians (which increase defense expenditure to look patriotic and please their constituents, many who are employed as waged workers by the defense industry), and academics (which depend upon DoD subvention to support their facilities and research projects). Each of these actors has a real material interest in maintaining or increasing public expenditure on defense and, to some extent, on war. In the absence of a lasting enemy threat, Congress would be less inclined to annually allocate billions of dollars to the DoD to secure the nation. Permanent peace would cut

into the profit margins of the US defense corporations that produced and sold weapons to the DoD, the civilian firms, and the universities that relied on DoD contracts. Throughout the Cold War, the US empire's MIC expanded to equip the US State and US corporations with new tools of violence for buttressing their power around the globe, and in the twenty-first century, the MIC continued to grow and deepen the links between militarism and capitalism (Ruttan 2006; Turse 2008).

Throughout the 1970s, the significance of the communications and media industries to the MIC was examined by the US political economy of communications scholar, Herbert I. Schiller (1969, 1973, 1976, 1992, 2000). Schiller agreed with Eisenhower that "an alert and knowledgeable citizenry" was essential to the existence of American democracy, but he was skeptical that citizens would be alerted to and be able to become sufficiently knowledgeable about the MIC's threat to democracy because the communication system that was supposed to keep the public informed about the MIC's potentially "disastrous rise of misplaced power" was on the DoD's payroll. Schiller (1992, p. 95) observed how the "same forces that have produced the military-industrial-complex in American society-at-large have accounted for the rise of a powerful sub-sector, but by no means miniature, complex in communications." Thus, more than 40 years ago, Schiller conceptualized "the important role of communication corporations in the military-industrial complex" (McChesney 2001, p. 48), as well as the rise of a "military-industrial-communications complex" (Mosco 2001, p. 27), or an "institutional edifice of communications, electronics, and/or cultural industries" that link and connect the DoD to media-corporate power (Maxwell 2003, p. 32). Generally, the MICC, the structural alliances between and the DoD and communications and media corporations, and points to a symbiotic integration between the DoD's war-making exigencies and the media-corporate sector's profit-maximizing goals. Specifically, the MICC points to the three following sites of DoD-communications-media- convergence.

First, the MICC refers to public-private partnerships between the DoD and communications-media corporations that frequently underwrite and

sometimes instigate the research and development (R&D) of new information and communication technologies (ICTs). For example, Schiller (1992, p. 5) described the DoD's channeling of enormous public funds into the private sector's R&D of new ICTs that supported the growth of capitalist communications, industries, and innovations such as computer electronics, TV satellites, and the Internet (Schiller 2008). Schiller (1998) observed how "Astronomical sums have been allocated by the Pentagon, from the public's tax money, to underwrite technological developments" and noted the "fruits of these outlays" have "contributed incalculably to US ascendancy in information technology" and the "underlying infrastructure" of "'the information age'" (Schiller 1998, p. 20). In the twenty-first century, the Pentagon still supports Silicon Valley. In 2015, the DoD allocated $171 million to a consortium of Silicon Valley high-tech companies (including Apple) to support R&D on wearable technology, as part of its newly launched Flexible Hybrid Electronics Manufacturing Innovation Hub.

Second, the MICC concept draws attention to how the DoD supports the existence and growth of major and minor communications and media corporations by acting as a significant consumer of the commodities they produce and sell. For example, Schiller (1992, p. 95) conceptualized DoD largesse as not only supporting the R&D of the new ICTs by corporations (working on contract to the DoD) but also supporting the consumption of these ICT commodities (via procurement contracts with the DoD). Schiller (1991, p. 106) observed how the DoD was an "enormous guaranteed market" for military-ready goods and services" and how the DoD's huge "appropriations" and "expenditures" "offer[ed] a large and secure outlet to some of the nation's most powerful businesses." Some of the MIC's war-ready ICT innovations were later spun off into the civilian market as commodities and reconfigured for civilian uses; the "main beneficiaries of the new capabilities in information production, transmission, and dissemination" continued to be "transnational companies, the intelligence, military and policing agencies" (Schiller 1998, p. 62). In the twenty-first century, numerous US communications and media companies – Walt

Disney, Microsoft, Apple, and Amazon – are recipients of DoD procurement contracts. As one news headline puts it, "Military Contracts are the Destiny of Every Major Technology Company" (Oberhaus 2018). Indeed, private communications and media companies sell the DoD everything from commercialized video production services to radio and TV equipment to telecommunication networks to antennas to processed film to engineering technologies to facial recognition technology to software to iPhones to central processing units to PR services to video games. US companies have accrued millions individually and billions collectively because of the DoD's choice to procure communications and media goods and services from them.

Third, the MICC represents an intertwining of the DoD and communications-media corporations in the co-production of military and war promoting media and entertainment products. For example, Schiller (1991) noted how the DoD operated its own public relations apparatus and used it "to 'inform' and 'persuade' an American public unaware of the character and origin of the messages that are made available to it" (121). He scrutinized DoD efforts to manage the news media's agenda and framing of war (and public opinion of war) by sourcing news journalists with propaganda briefings at press conferences, organizing spectacular media events, and dispatching spin doctors to the news media for interviews (Schiller 1973). Schiller also noted how the DoD, in addition to running its own PR apparatus, outsourced the labor of creating militaristic propaganda to advertising and marketing corporations, whose waged workers helped the DoD "bestow legitimacy and respectability to the entire military program" (Schiller 1992, pp. 121–122). Schiller highlighted how news media corporations participated in the DoD's 1990 Gulf War propaganda campaign, rolling out militaristic media products whose frame of reference was derived from two official sources: the Pentagon and the White House (Schiller 1992, p. 1). Moreover, with DoD assistance, media corporations created militaristic popular culture that "paraded before" global viewers an "army of invaders and secret operatives who perform, in full special

M

effects regalia, dramas that numb the intellect and channel the passions" (Schiller 2000, p. 45). In the twenty-first century, the DoD-popular cultural combines continue to cajole: the US Army alone has appeared in reality TV shows (*American Idol*), on daytime talk shows (*The Oprah Winfrey Show*), in Hollywood blockbusters (*Iron Man* and *Man of Steel*), in popular music videos (Joseph Washington's "We Thank You"), and in video games (EA's *Medal of Honor*) (Mirrlees 2016).

Overall, Schiller's political economy of the MICC continues to be analytically valuable, as it identifies how the DoD supports US communications corporations by contracting the R&D of new ICTs, procuring finished ICT commodities from these corporations, and directly and indirectly collaborating with and sometimes even paying communications and media entertainment corporations to act with or alongside its PR apparatus as surrogate war propagandists. As the MICC grew, political economy of communication research on its structural dimensions was supplemented by new theorizations of how the form and content of its commercial output were transforming the citizen's visual, aesthetic, and cultural experience of war. A few key scholarly concepts that extend Schiller's work on the MICC by exploring and elaborating upon how the MICC's media output is bringing about changes to the civic experience of war are discussed below.

At the turn of the millennium, James Der Derian (2001) contributed to study of the MICC by conceptualizing the "military-industrial-media-entertainment network" (MIME-NET) – a network of US military agencies, the defense industry, news media, and entertainment corporations. Der Derian (2001) described a US-based yet globalizing MIME-NET (xxxii) as leading a "virtual revolution in military and diplomatic affairs" (xiv). According to Der Derian, US warfare is increasingly accompanied by and "based on technological and representational forms of discipline, deterrence, and compulsion" (xv), and US wars are increasingly being "fought in the same matter as they are represented, by military simulations and public dissimulations" (xviii). The MIME-NET "seamlessly merge[s] the production,

representation, and execution of war" (xxxvi) with satellite imagery, computer animations, and real-time broadcasting, and the result is a virtuous war that provides the military personnel controlling computerized weapon systems and the civilian viewers consuming the destruction caused by those weapons with "a vision of bloodless, humanitarian, hygienic wars" (xxxi). These virtuous wars aim "create a fidelity between the representation and reality of war," but they ultimately fail to do so, as they displace and stand in for the real harm that war inflicts on human bodies and minds. "When compared to the real trauma of war" says Der Derian (2001), "the pseudo-trauma of simulation pales." In effect, MIME-NET's virtuous wars legitimize military violence while deceiving citizens about its consequences.

The unfortunate yet inevitable gap between the media representation of war and that reality it belies was conceptualized in the late 1990s by the British historian of propaganda Philip Taylor (1997, p. 119), who coined the term "media war" (which is rhetorically and analytically similar to Der Derian's notion of "virtuous war"). Taylor (1997, p. 119) argued that when militaries prepare for war and wage it, two kinds of war seem to occur: a "real war" and a "media war." Although the former war requires the latter, they are not identical, as these wars happen in different places, are experienced differently by those partaking in them, and have incommensurable consequences. The real war takes place upon the geographies where the fighting, killing, and dying occur (the territorial battlefield); the media war is what civilians see and hear at a safe distance from embodied risk, threat, and harm (a de-territorialized media battle-space). The "real war is about the sound, sight, smell, touch and taste of the nasty brutish business of people killing people" at the point of the war's execution, while the "media war is literally a mediated event which draws on that reality" at the point of media consumption (Taylor 1997, p. 119). Throughout the twentieth century and into the twenty-first, successive developments in communication technologies and media forms shrunk the space between real war and media war rapidly and with greater efficiency, brought distant wars closer to home, and made what's happening "over

there" on deadly battlefields seem audiovisually closer to "here," in safe-mediated battle spaces. In effect, the media war audiovisually represents real wars happening in a different time and place, but it does so in a way that displaces and stands in for the actuality of the real war.

In the first decade of the twenty-first century, Stahl (2010) made a major contribution to the study of militainment products that constitute the media war. Stahl (2010) notes that "entertainment has been part and parcel of military propaganda from the invention of mass media forward," and so in the most literal sense, "militainment" is nothing new"(10). Nonetheless, Stahl conceptualizes militainment as "state violence translated into an object of pleasurable consumption" (6) and argues that it has effected a significant transformation in the civic experience of war, a shift in the audiovisual relationship between war and the citizen. The US empire's early twentieth-century war propaganda aimed to engineer public consent to war by making a rational case for why the US fights and who it must fight (e.g., the persuasive appeal to the nation made by Frank Capra's World War II *Why We Fight* series). The mid-to-late twentieth century's TV war propaganda aimed to distract viewers from the real embodied horrors of war, so as to sanitize war and make death invisible (e.g., the spectacular coverage of the Vietnam War and the Persian Gulf War by major TV networks). Stahl contends that since the late 1990s, a new form of interactive militainment has emerged. Instead of trying to persuade rational citizens about the righteousness of war or inviting media consumers to passively lean back and watch a war unfold on a TV screen with pizza and beer, interactive militainment is more akin to a first-person shooter video game because it audiovisually addresses citizens as first-person participants in the media war and lets them experience war from the point of view of the soldier, the barrel of a gun, or the camera of a predator drone's Hellfire missile. Interactive militainment does not try to justify or conceal war's carnage and death (Stahl 2010, p. 43) but invites citizens to take a "sadistic posture" and derive guilt-free pleasure from virtually killing or witnessing the killing of the other; it does not simply glorify the

DoD's arsenal but enables citizens to virtually play with new weapons technology. Moreover, by giving citizen's night vision goggle eye's view, a tank gunner's sight view, and a drone pilot's eye view, it transforms the public eye into an extension of the military machine and "weaponizes the civic gaze" (Stahl 2010, p. 44). Beyond telling citizens to "support the troops," interactive militainment invites citizens to virtually become, enlist as, and deploy and fight alongside the troops. It pulls citizens, audiovisually at least, into the military's apparatus and war's violent execution, all the while pushing citizens away from the point of public deliberation about state violence (Stahl 2010, p. 64).

Having reviewed some important precursors to and concepts that are useful for studying the MEC and its media output, the following section identifies the real state and corporate institutions that constitute the MEC and conceptualizes the relationship between these different but often entangled actors.

The Department of Defense (DoD) and the Entertainment Industries

The DoD is a US Federal Government agency headquartered at the Pentagon in Washington, DC, and it is headed by a Secretary of Defense, who is a key national security policy advisor to the US President. The DoD controls the Department of the Army, the Department of the Navy, and Department of the Air Force. It also runs the Defense Intelligence Agency (DIA), the National Security Agency (NSA), and R&D agencies that often partner with corporations and universities such as Defense Advanced Research Projects Agency (DARPA) and the Defense Logistics Agency (DLA). The DoD also operates services schools including the National Defense University (NDU) and the National War College (NWC). The DoD employs approximately 1.3 million active duty personnel and 742,000 civilian personnel. The DoD's mission "is to provide the military forces needed to deter war and to protect the security of our country" ("About the Department of Defense"). The DoD spans the planet,

waging war to secure land, air, sea, and space against threats to America and buttressing strategic (and sometimes liberal democratic) interests.

The entertainment industries refer to the privately owned corporations that while mostly headquartered around Los Angeles, California, and New York City, New York, are transnational in their operations. Entertainment corporations are run by chief executive officers (CEOs), who, in conjunction with the presidents of different subsidiary units, exercise decision-making powers over the financing, production, distribution, and exhibition of entertainment products such as TV shows, films, and video games. The mission of an entertainment corporation is generally to produce entertainment commodities for sale in audiovisual markets that provide viewers with some kind of affective or emotionally satisfying experience, all the while turning a profit. Garnering budgets in the hundreds of millions and allocating immense sums of money to the manufacture of globally popular entertainment products, US-based entertainment and media corporations travel the globe, producing, distributing, and exhibiting entertainments and offloading them in numerous commodity forms that intersect with and embed images and stories in and across markets and cultures.

The DoD and entertainment corporations are clearly different types of organizations with different structures and goals. The DoD is part of the political sphere (the US State) and the entertainment industries, the economic one (capitalism). They DoD makes war in world affairs; entertainment companies make experiential commodities for world markets. The DoD serves US national security goals, as authorized by the president and congress; entertainment corporations pursue profit, as expected by financiers and shareholders. Despite these differences, there are many instances and moments, past and present, when these organizations converge and collaborate. The US empire's military-entertainment complex, then, can be defined as a nexus of the border-crossing DoD (seeking to win wars while winning hearts and minds to the wars it wages in many countries) and globalizing US entertainment corporations (seeking to make money by making and selling entertainment commodities in many

markets). This critical concept captures this symbiosis of war making and entertainment making by pointing to the real structural alliances, production partnerships, and mutually beneficial relationships between the DoD and entertainment corporations, two organizations not commonly associated with one another and whose connections are not always apparent. The MEC concept is analytically useful because it encourages studies of how the military and entertainment companies intentionally and routinely work together to make commercial militainments that put the DoD at war in a positive light. This concept also invites researchers to consider how entertainment products ostensibly made just for markets are also made to make the DoD look great in world politics. Furthermore, the concept sheds light on the symbiotic relationships between the DoD and entertainment companies that encourage the production of commodities that affirm the DoD and discourage the making of works that criticize it.

To embed itself in the entertainment industries, the DoD operates a massive Public Affairs Office (PAO) whose mandate is to coordinate "public information, internal information, community relations, information training, and audiovisual matters" for the DoD and produce and provide "defense department information to the public, the Congress and the media." The PAO controls media and cultural production units such as the Defense.gov News and Defense.gov News Photos; the Defense Media Activity; the American Forces Radio and Television Service broadcasters; the American Forces Press Service; the DoD News Channel; the Stars and Stripes news service; and many DoD websites. These units produce and circulate content about the DoD at war across media platforms; source news firms with this prepackaged content in hopes that they will pass it on unfiltered to their readers, viewers, and listeners; and outsource content-generation jobs to media firms with no apparent connections to them, camouflaging their influence. The PAO also runs the DoD's Special Assistant for Entertainment Media (DODSAEM) to support the production of entertainment commodities, such as war-themed news items, TV shows, films, and digital games.

Now that the major political and economic institutions of the MEC have been identified, the next section will examine how the DoD concretely links with specific sectors of the entertainment industries to produce commercial militainment that contributes to the militarization of US society and may maintain public consent to permanent war.

The MEC's Sectors: News, Film, Sports, Video Games, and Social Media

The DoD-News Complex

The US Empire's wars are fought by across distant lands, but these wars are represented to publics by news media products. As an industry, the news is structurally organized to make money for its owners and shareholders by selling subscriptions to readers and viewers and selling audience attention and data to advertisers. But in a democratic society, the news should inform and educate the public about substantive debates surrounding war policy and give expression to the range of clashing positions regarding war. Also, in a democratic society, the news ought to be "watchdog" of the most powerful war decision-making organizations – the state agencies and corporate lobbies that steer the empire's war policy and so often lead the nation into perilous and regrettable wars. The news media should expose war spin, hold the state's decision-makers to account, and support the broadest dialogue about and widest range of dissenting opinions about war in the society. Unfortunately, the DoD's push to manage public opinion about war often combines with the industry's business model to threaten the news media's democracy-nourishing and civically useful role. The DoD attempts to get the public to think about war in a way that aligns with its war policy through the news industry, and news corporations have generally supported the DoD's wartime propaganda. Due to a synergistic relationship between the DoD and the news industry, the news about the US Empire at war often mirrors the US State's official war policy.

From World War I to the present day, the US military has combined persuasion with censorship to try to manage the private news media's coverage of the wars it fights (Andersen 2006; Brewer 2011; Creel 1920; Carruthers 2011; Dimaggio 2009; Fulbright 1970; Hallin 1989, 1997; Herman and Chomsky 1988; Jeffords and Rabinovitz 1994; Knightley 1975, 2003; Mirrlees 2016; Rutherford 2004; Sweeney 2006; Taylor 1997). The lead up to and execution of the US 2003 preemptive invasion and occupation of Iraq was the most recent example of the DoD-news complex's management of public opinion (Dimaggio 2009; Rutherford 2004). The US State's "public justifications for the invasion were nothing but pretexts, and falsified pretexts at that" (Krugman 2015). To lead the American public into war, it manufactured a pretext of lies that framed the framed Saddam Hussein as in cahoots with al-Qaeda's 9/11 terrorist attacks, claimed Iraq possessed weapons of mass destruction and intended to use them against the US and its allies, and depicted Iraqis as wanting Americans to liberate them. The TV news media parroted the state's pretext of lies, telling people what to think about this war and how to think about, legitimizing as opposed to challenging the official story. The lead up to and execution of the "Shock & Awe" campaign were made-for-TV global militainment events, spectacles of mass deception and distraction.

Take the following symbolic manipulations. Colin Powell and Donald Rumsfeld appeared on TV news networks citing Judith Miller's *New York Times* trumped up story about Iraq's possession of weapons of mass destruction. In the time and space not privileged for ads for soft drinks, automobiles, and other commodities, Fox News Channel's pundits beat the military's war drum against Saddam Hussein and presented support for war as patriotic, increasing ratings and ad revenue. The DoD dispatched retired US military generals and lobbyists for munitions corporations to TV news networks to fatten the case for preemptive war in the guise of neutral "analysts" and "experts." When the bombing of Iraq began, TV gave spectators a "clean war" of bombs falling and exploding on Baghdad with no trace of civilian terror, injury, and death (Stahl 2010, p. 25), invited them to relish in "techno-fetishism" by glorifying the power and efficacy of the DoD's

M

weaponry (Stahl 2010, p. 28), and as usual, rallied them to "support the troops" by "equating support for official policy with support for the soldiers" (Stahl 2010, p. 29). When the siege of Baghdad began, hundreds of journalists (carefully vetted according to pro-military political correctness criteria by the Rendon Group, a PR firm) were "embedded" with the troops, living and working with them and covering the war from their point of view. More DoD-serving analysts appeared on TV news networks, talking up the good of the war, the weapons, and the troops and downplaying the war's human consequences. The DoD hired Hollywood to create a soundstage from which military public affairs officers drip fed briefings and videos to reporters. It also censored images taken of dead US soldiers and corpses of Iraqi civilians to prevent them from flowing back to the USA while flacking and sometimes attacking nonaligned media firms like Al-Jazeera. The "Shock & Awe" media spectacle climaxed when a US soldier wrapped the face of a Saddam Hussein statue in the American flag as a few Iraqis gathered in Firdos Square, and attacked and pulled down the statue, with help from US psychological operations personnel. The grand finale? On May 1, 2003, US president George W. Bush, flying in a Lockheed S-3 Viking aircraft with a fighter pilot, landed on the USS Abraham Lincoln. Surrounded by hundreds of sailors, standing and grinning under a star-spangled banner proclaiming "Mission Accomplished," Bush declared: "Major combat operations in Iraq have ended." Hubris followed applause. More hoopla. That was the end of "Shock & Awe," but US forces are still in Iraq.

The DoD-Hollywood Complex

Each year, millions of people all around the world flock to cinemas to take in the spectacles of Hollywood blockbuster films. Hollywood has long been an industry designed to make its owners money by producing and selling films that entertain viewers, and Hollywood is preeminent around the world today. In 2018, Hollywood was behind all but 1 of the 20 highest worldwide grossing films, that being, China's *Operation Red Sea*. While Hollywood's global presence is widely recognized, perhaps less obvious to its consumers is the

confluence of Hollywood's profit-making and the DoD's self-promotion, a long-standing merger of cinematic entertainment with military image-making. Year after year, Hollywood studios produce numerous commercial films that represent the DoD's branches encompassing the globe, warring against and obliterating threats to American security. Many of these are shaped by the DoD, which collaborates with Hollywood to make movies that aim to sell in world markets and support the military's self-image (Alford 2010, 2016; Andersen 2006; Boggs and Pollard 2007; Martin and Steuter 2010; Mirrlees 2013, 2016, 2017a, b; Robb 2004; Alford and Secker 2017; Suid 2002; Valantin 2005).

The formation of the DoD-Hollywood complex stretches back to the early twentieth century. In in the lead up to World War I, David Wark Griffith, a friend of President Woodrow Wilson, started working on the *The Birth of a Nation* (1915) with assistance from the Army's West Point engineers. During World War I, the Committee on Public Information's (CPI) Division of Films worked with Hollywood to make films that supported US war aims as well as American liberal capitalism and carried these works "to every community in the United States and to every corner of the world" (Creel 1920). During World War II, the Office of War Information's (OWI) Bureau of Motion Pictures (BMP) networked with Hollywood, which it regarded as an "Essential War Industry" (Short 1985). "The motion picture," said OWI head Elmer Davis, is "the most powerful instrument of propaganda in the world, whether it tries to be or not" (cited in Koppes and Black 1977, p. 88). Davis continued, "The easiest way to inject a propaganda idea into most people's minds is to let it go through the medium of an entertainment picture when they do not realize that they are being propagandized" (Koppes and Black 1977, p. 88). During World War II, Hollywood made approximately 500 of these pictures, including *Blondie for Victory* and Frank Capra's *Why We Fight*.

During the Cold War, the hitherto exceptional war time cooperative arrangement between the DoD and Hollywood was routinized. In 1948, the DoD's public affairs branch opened the

Motion Picture Production Office (MPPO) and hired Donald Baruch, who worked as the DoD's liaison to Hollywood for the next 40 years, reading, vetting, and co-producing war scripts with Hollywood studios. The MPPO set up film review offices and granted Hollywood filmmakers assistance – access to hardware like tanks, ships or planes, troops, bases, and technical knowledge – so long as they agreed to make films that represented the DoD in a positive way (Suid 2002). Until the mid-1960s, all the major war films produced by Hollywood received technical assistance from the MPPO (Suid 2002, p. xii). The MPPO denied assistance to critically acclaimed Vietnam War films such as *Apocalypse Now* (1979) and *Deer Hunter* (1978), but after brief falling out in the 1970s, the DoD and Hollywood reunited in the 1980s, making films like *Top Gun* (1986). In 1989, Phil Strub replaced Baruch, and throughout the 1990s, Strub helped Hollywood roll out films like *Armageddon* (1998), *Saving Private Ryan* (1998), and *The Siege* (1998) (Robb 2004).

Since 9/11, Strub's DoD Special Assistant for Entertainment Media (DODSAEM) has administered a Hollywood liaison office out of every one of the DoD's branches. DODSAEM oversees the Office of Army Chief of Public Affairs, the Navy Office of Information West, the Air Force's Office of Public Affairs-Entertainment Liaison Office, the Marines' Public Affairs Motion Picture and Television Liaison, and the Coast Guard's Motion Picture and TV Office. Located in Los Angeles, these offices are the go-to place for Hollywood producers looking to get the DoD to assist their war films (Robb 2004). Some of the outcomes include *Pearl Harbor* (2001), *Enemy at the Gates* (2001), *Black Hawk Down* (2001), and *Windtalkers* (2002). The DoD also assisted Marvel comic book films such as *Iron Man* (2008) (Mirrlees 2013), DC superhero flicks such as *Man of Steel* (2013), and science fiction films such as *Transformers* (Mirrlees 2017b). All in all, between 1911 and 2007, the DoD-Hollywood complex shaped 814 war films, and many of these works of "national security cinema" promoted "violent, self-regarding, American-centric solutions to international problems based on twisted readings of history" (Alford and Secker 2017, p. 2).

The DoD-Sports Complex

Sports is a significant form of popular entertainment that millions of people participate in and consume around the world. Sporting events support social bonding, rituals of communal identity formation, escapism from the burdens of waged work, and aspirational identifications with celebrity athletes. Sports is also big business, and in 2018, the US sports industry generated over $70 billion in revenue. The biggest players in this industry are the National Football League (NFL), the Major League Baseball (MLB), the National Basketball Association (NBA), the National Hockey League (NHL), the National Association for Stock Car Auto Racing (NASCAR), and Mixed Martial Arts (MMA). With its popular resonance and vast audience reach, professional sports have long been a significant venue for and vehicle of military propaganda. The DoD and the sports industry have worked together for decades. The DoD's publicity exigencies and the sports industry's bottom line converge in a DoD-sports complex, and the links between war and sport are numerous.

Over the past decade, the DoD has paid athletes, teams, and entire leagues to promote itself to the public. Between 2012 and 2015, the DoD spent over $10.4 million on advertising contracts with US sports corporations. From 2011 to 2014, the DoD paid out nearly $5.4 million to 14 NFL teams in exchange for the opportunity to publicize athletes saluting the military, "military flyovers, flag unfurlings, emotional color guard ceremonies, enlistment campaigns, and – interestingly enough – national anthem performances". The DoD's "paid patriotism" is a boon to the sports business, which also sells DoD-league and DoD-team branded hats and jerseys to fans. The DoD's militarization of sports aims to maintain public support for the wars it fights and the budgets it increases, and most importantly, attempts to increase the number of recruits to its ranks. Since 2008, the DoD has recruited soldiers at Mixed Martial Arts (MMA) events. Some MMA fighters (and their fans) move from Octagon to the Pentagon; others shift from the battlefields of Iraq to Ultimate Fighting Championship (UFC). "The UFC provides a great venue to get the Army name

into the minds of millions of young Americans" said Major Kelly Crigger (cited in Brick 2008).

The DoD-sports complex also links with the military-industrial complex. Bell Helicopter, a US defense corporation that produces and sells helicopters, regularly sponsored the Armed Forces Bowl (AFB) (Butterworth and Moskal 2009). By doing so, Bell Helicopter built up its brand as a patriotic corporation and reminded the DoD procurement officers that its helicopters are on the DoD's team. The DoD's wielding of such commercialized weapons of mass destruction in wars against foreign peoples is often scheduled alongside major global sporting events. The USA started bombing the Taliban in Afghanistan just a half hour before the quarterbacks for the Philadelphia Eagles and Arizona Cardinals began launching "long bombs" in the stadium. The start of the Global War on Terror was blurred into the televised spectacle of football. As an American man watching this big post-9/11 game at a bar commented: "[The Taliban] wanted to play the game, and now the score is tied. It's good. We should [hit them] again" (cited in Stossel 2001).

Chomsky (2002) argues that professional sports teach spectators national chauvinism, irrational competition, and loyalty to power while distracting and steering them away from matters of importance, such as war. Yet, the DoD-sports complex fuses the DoD's war-promotion exigencies with the business logics of the sports industry. This resulting collusion links the field of sports, the players, and the fans to the battlefield of war and the ethos of soldiering. It extols a jingoistic form of militarized patriotism, conceals the human lives destroyed by war, and, as indicated by the State and industry backlash against Colin Kaepernick's choice to kneel during the "The Star-Spangled Banner," suppresses dissent (Astore 2018).

The DoD-Digital Games Complex

Video games are a lot of fun to play, and in the USA, more than half of the population plays video games. Video games are produced by a massive globe-spanning interactive entertainment industry of developers and publishers for a market that in 2018 was worth well over $115 billion. When trying to deflect public criticisms of the real wars

they have embroiled the nation in, US presidents sometimes frame war video games as crass and simple simulations as compared to the real thing. In response to questions about the US State's contentious bombing campaign in Iran, Obama chimed: "These aren't video games that we're playing here." Undoubtedly, real war is not exactly like a war video game, yet, the links between the US DoD's real wars and commercial war game simulations are palatable, thanks in part to the growth of a DoD-digital-games complex.

The DoD-digital games complex refers to the structural alliances and symbiotic relationships between the DoD and US-based digital game firms that produce military shooter games which blur and blend the DoD's war machine with commercial game machines and the labor pains of fighting real wars with the paid for consumer pleasures released when playing interactive simulations of them. A real institutional convergence of the DoD's institutions, policies, and personnel and digital capitalism's developers, publishers, and players, this complex shapes the design, production, promotion, and stories of some commercially available war games (Andersen and Kurti 2011; Halter 2006; Huntemann and Payne 2010; Dyer-Witheford and De Peuter 2009; Lenoir 2000, 2003; Leonard 2004; Mirrlees 2009, 2014; Payne 2016; Stahl 2006, 2010).

The DoD underwrites the R&D of many war simulation games through the Modeling and Simulation Coordination Office (M&S CO). The M&S CO contracts digital game firms to make war simulation games and "procures" the finished war commodities sold by them. Beneath the M&S CO are DoD agencies, each immersed in the business of war simulation R&D. These include the US Army's Project Executive Office Simulation; Training and Instrumentation (PEO-STRI); the Institute for Creative Technologies (ICT); the US Army Simulation, Training, and Instrumentation Command (STRICOM); and the Modeling, Virtual Environments and Simulation Institute (MOVES). Also, located at the University of Southern California (USC), the ICT (established in 1999) receives DoD funding and liaisons with the interactive entertainment industry. Founded by the Naval Postgraduate School at Monterey,

California, in 2000, MOVES bring together US military personnel, digital game firms, and academics. These linkages between the DoD and digital game industry annually channel millions of public dollars into digital war game R&D.

From allocating public dollars to R&D on simulation technologies for war purposes to consuming war-ready software and hardware from private firms to cultivating consumer demand for and cross-promoting war games by waging wars, the DoD is a boon to the digital games industry. In fact, the market power of the US digital war games industry has long been assisted by DoD subvention. In fact, the DoD supported crucial innovations in the history of digital games: the first video game (*SpaceWar!*); the first head-mounted virtual reality display system, the first first-person shooter video game (*Maze Wars*); the first tank simulator arcade game (Panzer PLATO to Atari's *Battlezone*); the first prototype of an online multiplayer game (*Empire* for the PLATO computer network) and then, SIMnet, or "simulation network"; and the first full-fledged Army recruitment game (*America's Army*, which is freely available to play online).

Digital war games are at the forefront of a hugely popular and profitable interactive militainment industry, and these games immerse civilians into first- and third-person battle spaces and virtual theaters of war-fighting. The DoD sees in its military shooters a number of benefits. Permanent war requires an unending recruitment campaign, and starting in 2002, the DoD has used its own online game, *America's Army*, to attract millions of youthful gamers to real careers in the real Army. To reduce overhead costs and mitigate the risk of soldiers dying while training for battle with live ammunition, the DoD uses war games to teach new and existing personnel how to fight. Shortly after 9/11, the Army fashioned Ubisoft's *Tom Clancy's Rainbow Six: Rogue Spear* into a means of training soldiers how to fight terrorists in urban warfare settings and also oversaw the ICT and Pandemic Studios' development of *Full Spectrum Warrior* to prepare the troops for battles in Baghdad. Seated in front of a computer screen, hands on controller, eyes on a mediatized battlefield, drone operators wage wars

increasingly modeled on game play too. Many troops return home from real wars suffering post-traumatic stress disorder (PTSD): to prevent them from killing themselves, the DoD provisions virtual therapy to them in form of games like *Virtual Iraq*.

Furthermore, the DoD leans on war video games to elicit consent to or maintain public morale for real wars. In the years following 9/11, *Fugitive Hunger*: *War on Terror* and *Tom Clancy's Splinter Cell* immersed players in the Global War on Terrorism. *Conflict Desert Storm II: Back to Baghdad* was launched in the same year as the 2003 US invasion of Iraq began, and this game enlisted players in a virtual war to invade Iraq and topple Saddam's Ba'thist regime. Normalizing the US State's past decade of non-congressionally approved violence, and glorifying the DoD's reliance on privatized mercenaries to wage dirty wars, the *Call of Duty: Black Ops* franchise is one of the most popular around the world. 2018's best-selling video game was *Call of Duty Black Ops 4*, the latest addition to a franchise that took over $1 billion in sales in 1 month and put millions of players in the virtual boots of black ops soldiers to fight opponents and zombies too.

War incentivizes the making of war games, yet, not all military shooters are spun out of the DoD-digital games complex. Most often, "game studios hire subject matter experts to advise them on proper tactics, protocols, and battlefield behaviors with the aim of engendering 'authentic' military experiences without having to submit their design choices to the scrutiny of the government's exacting review process" (Payne 2015, p. 6). Nonetheless, whether made by or in partnership with the DoD, all commercial digital war games risk desensitizing players to war's embodied horrors and deterring serious public deliberation about war. Digital war games encourage a militarized view of reality, and they prepare players, ideologically and practically, for the US empire's current and speculative wars. Indeed, in *Battlefield 4* (2003), the US goes to war against China; *Call of Duty: Modern Warfare 3* (2011) simulates World War III between the USA and Russia; *Call of Duty: Ghosts* (2013) pits a declining US Empire against a coalition of Latin American states.

M

The DoD-Social Media Complex

In the early twenty-first century, social media platforms such as Facebook, Twitter, and YouTube are everywhere and used by billions of people for everything from socializing to self-promotion to entertainment. Social media platforms are interwoven with the everyday lives of billions, and they are also paradigmatic of "platform capitalism" (Srnicek 2017), or, "a new business model, capable of extracting and controlling immense amounts of data" (6) that user activity produces. Indeed, platform corporations provide the "infrastructure to intermediate between different groups" (Srnicek 2017, p. 48), and they collect, analyze, process, commoditize, and sell people's private data, often to advertisers (Fuchs 2017). In addition to being a tool and a business model, these Internet-based social media platforms have also become a space of war in which the DoD battles its enemies.

The DoD imagines the Internet and World Wide Web as a "battle space" in which many government, corporate, and non-state actors produce and "deliver critical and influential content in order to shape perceptions, influence opinions, and control behavior" (Armistead 2004, p. xvii). The DoD considers the Internet and social media platforms to be a "cyber domain," and as such, it aspires to command and control it, along with land, sea, air, and space. Rand Waltzman (2015), the former program manager for a $50 million dollar DARPA study of "Social Media in Strategic Communication," said "the use of social media and the Internet is rapidly becoming a powerful weapon for information warfare and changing the nature of conflict worldwide." The DoD uses social media platforms to spread information that enhances its image and counters information that puts it in a negative light.

Take the example of the DoD's foray into YouTube, the world's largest online video sharing site. YouTube enables a plurality of combatants to upload and share first-hand videos about the wars the USA is in. As Naim (2006) observed, "YouTube includes videos posted by terrorists, human rights groups, and US soldiers," and some of these "videos reveal truths," while others "spread disinformation, propaganda, and outright lies." The development of YouTube, the diffusion of low-cost digital cameras and laptop computers within the US military, the desire of American soldiers to film, share, and make public their personal experience of war to civilians, and the efforts of citizens to peel back the veneer of the media war and get somewhat closer to the real thing all drive the production, circulation, and consumption of YouTube war videos. Some of the earliest videos uploaded to YouTube by US soldiers depicted the US occupation of Iraq at its worst. Soldier-generated videos ranged from disgusting ("Apache Kills in Iraq" showed a US gunship firing high powered munitions at Iraqis and exploding their bodies) to dehumanizing ("Iraqi Kids Run for Water" depicted thirsty Iraqi children chasing a US armoured truck full of American soldiers who tease the kids by dangling a bottle of water). These soldier-generated YouTube videos countered the "myths of national glory, macho heroism and clinical warfare manufactured by military and media elites" and "offer[ed] the public uncensored insights into the mundane, violent, and even depraved faces of warfare" (Anden-Papadopoulos 2009, p. 25).

To reign in these unofficial uses of YouTube by US military personnel, and to counter YouTube videos made by the US military's opponents, the DoD started coordinating YouTube publicity campaigns. Lt. Col. Christopher Garver, for example, explained the importance of YouTube: "we understand that it is a battle space in which we have not been active, and this is a media we can use to get our story told" (cited in Zavis 2007). To push official war stories via YouTube, the DoD uses a combination of censorship and self-promotion. In May 2007, the DoD started blocking its Iraq-stationed soldiers' access to YouTube and compelling all soldiers to submit their videos to their supervisors for review prior to publishing them on the web. In that same year, the DoD launched its own YouTube channel, Multi-National Force Iraq (MNFIRAQ) (Christensen 2008). Administered by Brent Walker and Erick Barnes (ex-Marines turned military-contracted social media propagandists), MNFIRAQ claimed to "give viewers around the world a 'boots on the ground' perspective of

Operation Iraqi Freedom from those who are fighting it." Yet, a study of 29 of this channel's videos concluded that it represented a sanitized vision of the US occupation of Iraq (Christensen 2008). Many of the videos display gun battles in streets sans death, acts of "surgical warfare" sans terror, and the "good deeds" of US soldiers sans resentment.

The DoD's partnership with YouTube is but one of many examples of the DoD-social media complex in action. DoD public affairs officers also socially network with users via Facebook pages, manage Twitter accounts, and post photos to Pinterest. By spreading itself across the private social platforms that intersect with the daily lives of billions, the DoD bypasses the gatekeeping powers of the news media and turns the manufacture of consent to war into an interactive DoD-to-public affair.

Conclusion

This chapter highlighted the MEC and the various sub-complexes that produce and circulate militainment in support of war. The DoD's pursuit of strategic supremacy and the entertainment industries' pursuit of profit intertwine in significant ways, bringing the business of war and creativity into a strategic alliance. To prepare for, promote, glorify, and sell the wars of the US empire as a way of life to the public, the DoD has weaponized the entertainment industries and a wide range of media products such as news stories, Hollywood films, sporting events, video games, and social media.

That said, the DoD does not own or exert direct control over the entertainment industries; and the many media products that these industries produce and sell do not always already promote and legitimize the DoD at war. Some entertainments may even offer subtle or full-blown criticisms of the DoD. For example, *Redacted* (2007) and *Green Zone* (2010) represent the 2003 invasion of Iraq as a crime with terrible human consequences; and, *Team America* (2004) and *Tropic Thunder* (2008) parody war as a media spectacle. Digital games like *Special Ops: The Line*

(2012) grapple with war's many horrors (Payne 2014). Furthermore, the recent transformation of the overall communications and media environment by the Internet, World Wide Web and social media platforms has given rise to a "ubiquitous media war," a war read about, seen, listened to, watched, played, debated, and interactively "prosumed," participated in by millions around the world through a range of technological mediums (e.g., TV sets, personal computers, game consoles, smartphones and tablets), and fought, almost anytime, anywhere. In this context, it is doubtful that the DoD possesses the power to command and control the total public opinion of war (Gillan et al. 2008; Mirrlees 2018). Yet, if the MEC and militainment were ineffective, we might see widespread popular cultural opposition to the US Empire and war as way of life. The absence or dearth of this resistance might be explained with regard to the MEC's continuing power.

Moldova: Imperialism and Regime Change

Ari Weinstein
Varna, Bulgaria

Introduction

This entry focuses on what is, arguably, an inadequately studied historico-political phenomenon – the 2009 US-backed regime change in Moldova – and it does so, at least in part, by placing said phenomenon within the broader contexts of Washington's foreign policy record, including its myriad campaigns around the world (successful or otherwise) to overturn foreign governments, its seemingly increasingly tense relations with Moscow during the post-Cold War period in general, and in the East European geopolitical space in particular.

The analysis presented here hinges to a considerable extent on the idea that the pursuit of "regime change" is – whether its executors openly acknowledge this or not – a key element of US foreign policy. Here, I shall demonstrate that,

while certainly less well-known and openly violent than the post-Cold War regime change campaigns that it "successfully" carried out in, say, Afghanistan in 2001 and in Iraq in 2003, Washington – in 2009, and certainly to this day still – was and is committed to ensuring that its central economic and geopolitical interests will be well looked after via the installation and stabilization in power of a new government and state apparatus in Chisinau.

In the present study, a reasonably comprehensive working definition of "regime change" will be provided, as will an explanation about why, specifically during 2009, Moldova happened to become the scene of an eventually "successful" campaign by Washington to push through just such a change. Furthermore, parallels will be drawn between the respective "successful" regime change, and others that, with at least some support from Washington, unfolded in Central and Eastern Europe at one point or another during the post-Cold War period. Due to the critical role that Bucharest undeniably played in assisting both Washington and Brussels in the carrying forward of the 2009 regime change in Moldova, I will also devote some space here to describing not only the character of Romanian domestic and foreign policy ever since the fall in late 1989 of the Ceausescu regime, but also the historical roots and modern-day manifestations of far-right ideology in Romania. I will stress in this entry how, since the end of the Cold War, Romania has emerged as an ever more "weighty" regional political actor whose foreign policies, including certainly vis-à-vis Moldova, are rather closely aligned with Washington's regional and, indeed, global political orientation.

This entry, as its title indicates, is primarily concerned with events that took place in 2009 and in the immediately subsequent 2 years or so; in other words, the focus here is on political developments which took place roughly 20 years after the end of the Cold War (which can be defined as having occurred on December 31, 1989) and about eight years after the terrorist attacks of September 11, 2001. While it is certainly possible to conceptually divide up the conduct and course of US foreign policy following

the conclusion of the Cold War into (at least) two subperiods – one running from January 1, 1990 to September 10, 2001 and the other from September 11, 2001 to present – the notion that this conceptual division isn't, in fact, particularly meaningful is implicit in the arguments that are herein developed. It should also be pointed out that the unfolding, and primarily in 2009, of the historico-political episode that is at the core of this entry, not to mention other post-9/11 gambits, up to and including regime change operations that Washington initiated in Eastern Europe certainly lends support to the notion that the trajectory of geopolitical tensions in said region has been steadily – or perhaps even explosively – ascending for years now with no end in sight and that this state of affairs is attributable to a very significant extent to the activist, not to say openly interventionist, posture that the US government has demonstrably chosen to adopt. Furthermore, the analysis presented here will implicitly provide backing for the argument – articulated with a greater or lesser degree of openness elsewhere – that, in their examination of Washington's conduct of foreign policy, the realist and Marxist schools, paradoxically enough, are broadly in accord. That is, both realist and Marxist analysts of international relations maintain that the pursuit of the "national interest," however defined, is at the core of a given state's, and certainly the US's, process of foreign policy formulation (see, for example, Huntington 1993, 1996; Brzezinski 2000; Gowan 1999). Thus, while the proclaimed selfless motives of overseas human rights and democracy promotion are certainly rejected as false by Marxist analysts, they would also have to be looked upon with some degree of skepticism by many Western realist scholars, despite their general identification with the American state and its role on the international scene.

Another perhaps surprising point of contact between Marxists and at least certain prominent Western adherents of the realist school like, for example, the late Zbigniew Brzezinski that will "come out" in this entry concerns their agreement that US-Russia relations are seemingly inherently (and profoundly) conflictual in nature and that the clearly quite strained relations that exist between

these two states have been in place, with possible modest interruptions, for many years now (see, for example, Brzezinski 2000; Gervasi 1996; North 2016). Thus, in my examination in this entry of both the regime change that took place in Moldova in 2009, as well as its aftermath, I will strive to always maintain some degree of focus on the broader context of rivalrous US-Russia relations.

This broad context will also prove useful in tracing the seemingly sudden zigs and zags which characterized the positions taken by the principal domestic political forces in Moldova during the eight or so years prior to the 2009 regime change which is the main subject of this entry; moreover, reviewing, even if only briefly, said zig and zags can help us better comprehend the relative power and influence in Eastern Europe and the former Soviet space that since, say, the new millennium, Washington and the EU, on the one hand, and Moscow on the other, have been able to effectively exercise. Evidence will also be presented herein indicating that significant shifts in the foreign policy stances that, at various moments over the course of the period from around 2001 through 2009, were adopted by the heads of the Moldovan state tended to occur around – and thus have, at an absolute minimum, a temporal proximity to – the "successful" unfolding of Washington-backed regime change operations in different states that became independent simultaneous with the collapse of the USSR.

Washington's support for regime changes, as various authors have asserted, can manifest itself in various ways, with open, announced, and bloody regime change campaigns, *a la* Iraq in 2003 not necessarily being the most common (see, for example, Blum 2002, 2003; Kinzer 2007). The provision of behind-the-scenes backing for regime change – coordinating with opposition forces, financing them, and possibly even co-opting members of unfavorably regarded political parties, etc. – has been in evidence in innumerable regime change operations that, for decades and decades, Washington has typically served as the primary wire-puller of (Ibid). Another potentially effective tactic towards the realization of regime change which, for example,

M

was utilized in the case of Albania in the mid-1990s revolves around the co-opting of key members of powerful political parties which Washington generally is not favorably disposed towards and which it is largely intent on weakening and/or removing from power (Weinstein 2016).

What Is a "Regime Change," and Why Was Washington Determined to Push One Through in Moldova in 2009?

For the purposes of the present study, it is obviously critical that I advance a useful working definition of the term "regime change," and also explain how this applies to the politico-economic ends that Washington sought to achieve and largely succeeded in achieving in Moldova in 2009 and thereafter. In a discussion of other regime change campaigns that, during the January 1, 1990–September 10, 2001 period, Washington "succeeded" in pushing through, I asserted that: "Regime change, as the term is most frequently understood, is utilized to refer to the replacement, whether by democratic or less-than-wholly democratic means, of a given country's principal political-statal leadership. But it also refers to shifts in institutions, in legal structures, and in economic structures, including [oftentimes in] the ownership of basic resources. . . . the term . . . in this dissertation means a process whereby formal control over a country's central government passes from the hands of one individual or political organization to the hands of others who then implement substantially different economic and geostrategic policies" (Ibid).

There is no question but that such an event did indeed take place in Moldova over the course of a number of months during 2009. In this attempt to further "fill out" my definition, I also emphasized that:

> the term 'regime change' as utilized in this study also signifies that, once carried out, the fundamental revamping of the targeted national government's overarching economic policy orientation and geopolitical posture then will not be, and effectively simply cannot be, 'undone' or reversed in the short or even medium-term. More concretely, once the successor government in a targeted country passed

legislation or took meaningful policy steps towards, for example, significantly more cooperative relations with NATO or the privatization of theretofore collectively-owned assets, said legislation or policy steps would prove to have, whatever the prevailing national political will, an enduring and even quasi-permanent character (Ibid).

Again, a good deal of evidence will be presented here showing that such a change occurred in Moldova in 2009, and that it had (and still has to this day, in fact) significant "staying power." However unpopular various of the (primarily, though not exclusively economic) policies of the successor regime, that regime has – and with the open, obvious, and substantial backing of its Western benefactors – proven to be exceedingly difficult to displace, partial reshufflings of some of its key personnel notwithstanding. Thus, the development whereby in 2009 the theretofore ruling PCRM (in Romanian: "The Party of Communists from the Republic of Moldova") was forced to cede power to a coalition of four more openly neoliberal and pro-EU and pro-NATO parties that together governed as the AIE ("The Alliance for European Integration" in Romanian) served as a clear inflection point in Moldovan political and economic history; this power transfer, which was consciously encouraged, facilitated, and, in general terms, significantly "helped along" by Washington, the EU, and neighboring (and the then relatively newly-inducted) EU member-state Romania should therefore be seen – even if this case is not so widely known – as a "regime change" and as one important example of how Washington continues to actively seek to advance its interests and bolster its influence all around this planet of ours.

To reiterate, a few different analysts, myself included, have studied in some detail, for example, the Washington-backed regime changes that "successfully" unfolded in Bulgaria in 1990, in Albania in 1991–1992, and in the FRY in 2000; these studies generally emphasized the fact that, following the "successful" consummation of these regime changes, the successor regimes adopted – alterations in their outward political colorations and leading personnel notwithstanding – a fundamentally pro-neoliberal economic and pro-"Western" geopolitical orientation that,

to this day in fact, has not only not been reversed but has generally grown more and more "rock-solid" (see, for example, Blum 2002, 2003; Elich 2006; Sussman and Krader 2008; Weinstein 2016). Similarly, various analyses, including one that I developed, at least implicitly advanced the argument that, immediately following the over-turning of the Ceausescu regime during the latter half of December of 1989, Romania not only demonstratively and wholeheartedly "leapt" into Washington's geopolitical camp, but also began and then steadily continued to adopt more and more pro-capitalist and eventually increasingly radical "neoliberal" economic policies (see, for example, Pasti 2006; Weinstein 2005; WSWS 2015, 2016a).

Facilitating the occurrence of a regime change in Moldova thus was, as I shall show here, pro-foundly consistent with the overall geopolitical posture that, ever since the end of the Cold War, Washington had maintained; in other words, Washington wasn't particularly interested in the unique features of Moldova's recent history and, rather, has endeavored to ensure to the greatest degree possible that the government in Chisinau would adopt the same basic geostrategic orienta-tion and push through essentially the same eco-nomic policies that its neighbors had in the wake of the tearing down of the Berlin Wall in late 1989.

After becoming formally independent in late 1991, simultaneous with the dissolution of the Soviet Union in which it had previously been a constituent administrative unit (a republic), Moldova, guided by its heads of state, pursued an economic and geostrategic policy course that, in broad terms, was more-or-less identical to that of the above-mentioned Central and Eastern Euro-pean states.

However, one distinguishing feature in Moldova's recent political history that I have already briefly touched on here and that I will explore in slightly greater depth later on in this study concerns the fact that in 2001, it became the first country in Central and Eastern Europe as well as the entire post-Soviet space to elect – and democratically – a party calling itself "commu-nist" (the PCRM). While, as I shall show a bit further on, the PCRM's eight-year period of

governance was marked by significant geostrate-gic (and also economic policy) vacillations, its actual commitment to the pro-capitalist and pro-"Western" convictions that it then sometimes sought to claim that it maintained was generally viewed by Washington, the EU, and Bucharest as being reduced and likely somewhat less sincere in comparison to that of the more openly right-wing Moldovan parties like the PL (Liberal Party), the PLDM (Liberal Democratic Party), the AMN (The Alliance – Our Moldova), the PD (Democratic Party), etc (see, for example, WSWS 2009b, 2010b).

The importance for Washington and its EU and NATO "partners" of carrying out a regime change in Moldova in 2009 should, it will be argued here, also be seen in the light of the partial resurgence that, geostrategically and, arguably to a somewhat lesser extent, economically, Russia mounted after the collapse that it underwent during the 1990s. Coincidentally or otherwise, said resur-gence seems to begin around the December 31, 1999, move whereby Boris Yeltsin vacated the office of the Presidency of Russia and simulta-neously chose Vladimir Putin to succeed him. The eight-plus years during which Yeltsin had served as the President of Russia had a profoundly dichotomous character: while over the course of said period, he had been the recipient of massive Western economic and political support, he was, by the time that he left office, intensely unpopular among the population of Russia itself. Putin, on the other hand, has adopted a more outwardly nationalist posture and during the last 19-plus years (a time during which he has served as pres-ident and prime minister, before once again assumed the office of the Presidency), he has come to be perceived as something of a bête noire – perhaps even the principal one! – in American ruling circles.

As the very title of this entry makes clear, the "successes" that, at different points over the course of the January 1, 1990–September 10, 2001 period, Washington achieved via the shepherding through of at least three regime changes in Eastern and Central Europe would prove to be something else than mere "one-offs" whose unfolding at least partially defined and was

M

a product of the special circumstances that were characteristic of said period; indeed, the evidence that indicates that Eastern and Central Europe and the post-Soviet space more generally have, from 1990 to present, been the scene of one Washington-sponsored (successful and unsuccessful) regime change campaign after another is very clear and, frankly, rather uncontroversial.

Later on in this entry, I will provide support for this assertion by discussing not only Washington's sponsorship and "guiding forward" of the 2003–2004 "Rose Revolution" in Georgia and the 2004–2005 "Orange Revolution" in Ukraine, but also the ulterior – and not particularly favorable for Washington – evolution of the regimes that resulted from said "revolutions." Finally, I will also draw the reader's attention here to the critical role that Bucharest has played and continues to play in the elaboration of Washington's "grand regional strategy" not only "on the ground" in Moldova but also – and more pivotally still – towards Russia. While, as mentioned above, various scholars, including myself, have demonstrated that, ever since the overturning of Nicolai Ceausescu's regime in 1989, Bucharest has not only pushed through one neoliberal economic measure after another, but has also been an intensely faithful ally of the US government on the international scene, the extent of the changes in those two spheres can be underestimated in analyses which do not (adequately) cover the 10 years (December 20, 2004–December 21, 2014) during which Traian Basescu served as the President of Romania (see, for example, Pasti 2006; RFERL 2005; WSWS 2014b).

The political ascent and subsequent decline of Basescu – a strongly conservative figure whose zealous support for Washington's aspirations for ever-greater global power and influence was only matched by his basically unconcealed antipathy towards Moscow and its regional interests – plausibly constituted another factor which, in early 2009, led the US's then-new Obama administration to "push for a win" in Romania's neighbor, Moldova (see, for example, A1.RO 2011; MID-RU 2011; WSWS 2009b).

In short, – and in correspondence with the central arguments developed by the

aforementioned Zbigniew Brzezinski in his shockingly frank 1997 book "The Grand Chessboard: American Primacy and Its Geostrategic Imperatives" – Washington's actions on the global stage reinforce the view whereby said capital conceives of international politics as a zero-sum game, like Chess or, perhaps, Risk. In other words, attaining de facto control over the basic economic and foreign policy "vectors" of another country – even a relatively small one such as Moldova – is a real and significant desideratum, and probably even more so when such a country happens to be located reasonably close to a state, like Russia, whose interests are regarded by the great majority of the US's foreign policy elites as being essentially diametrically opposed to their own.

Moldova's Far-Right Pan-Romanian Nationalists Prepare for the Elections . . . and for Violence

Strange though it may seem, a rock concert that took place in late March of 2009 in a small club located several hundred meters from the center of Moldova's capital of Chisinau significantly foreshadowed pivotal political events that would begin to unfold in that city and country more-or-less immediately after the polls for the nationwide April 5 Parliamentary elections closed.

What was, for the purposes of this analysis, most significant about this concert were the people in attendance and their generally not terribly well worked-out worldviews; of the maximum 40 or 50 fans who were in attendance, more than one wore a T-shirt which featured the face of the notorious Romanian Nazi from the 1920s and 1930s, Corneliu Zelea Codreanu, superimposed on the Celtic Cross symbol that is intimately associated with numerous ultra-right political movements today (see, for example, Ioanid 1990; Sandache 2010; Schmitt 2017). During the show, drunken kids who were generally in their early 20s shouted things in Romanian to the band like "Boys! Do it for Greater Romania!" During a brief intermission in the show, the long-time political provocateur Oleg Brega got up on the

stage and semi-coherently told the crowd that it was important to vote against the PCRM at the then-imminent elections; this Brega, who was at that time the head of one or another small right-wing NGO (alternately called "Hyde Park" and "Curaj") that sought to cover up its broadly unpopular essential political orientation by posing as an advocate for free speech would, along with a brother of his named Ghenadie, proceed to play a significant role in and then during the aftermath of Moldova's 2009 regime change. One of Oleg and Ghenadie Brega's principal political and "literary" activities revolved around the organization of campaigns in which they not only portrayed the Romanian anti-communist writer Paul Goma as a great talent worthy of the highest literary honors that the Moldovan state bestows, but also demanded that he – who was born in the late 1930s in what was then Romanian territory but which is now a part of the Republic of Moldova – be granted Moldovan citizenship and otherwise recognized as an intellectual of the highest order and a great source of national pride. Goma was probably most notorious for authoring the book "Red Week," which effectively argues that the Romanian military's participation in the Holocaust through its commission of genocidal crimes against the Jewish population in eastern Romania and Moldova in 1941 was precipitated – and therefore *justified* – by those Jews' supposed mistreatment of Romanian soldiers in the preceding year (see, for example, *Adevarul* 2013; Goma 2008).

Also in attendance at this concert were the brothers Basarab, Evelin and Marin. The latter – and older – brother Marin would, shortly following the regime change in focus, begin a still ongoing career as a journalist for the vehemently anti-communist and supposedly "center-right" newspaper *Timpul*, which is also accessible online. *Timpul,* which very shortly after the anti-PCRM "liberal" and "democratic" coalition took power in the latter half of 2009, became in de facto terms said coalition's "house paper," has a long history of promoting Russophobia and, perhaps even more worrying, of justifying the Romanian military-fascist dictator Ion Antonescu's move to join with the Nazi regime in invading the Soviet Union in 1941 (see, for example, *Timpul* 2014, 2016).

Arguably even less concerned than his brother by the possibility that he might come to be seen by broader sections of the population as a nationalist zealot single-mindedly focused on pushing through the reestablishment of a "Greater Romania," Evelin would later be photographed on April 7, 2009, standing together with other (largely young) ultra-rightists in Chisinau's central square (sometimes referred to as PMAN for the first letters of the four words that make up its name in Romanian) and holding up large banners which vehemently condemned both the PCRM, as well as the thousands and thousands of people who had voted for it two days prior (*Timpul* 2010).

Significantly, Evelin was also associated with the Brega brothers' campaigns to try to transform Goma's public image into that of a courageous, dissident intellectual and genuine national treasure and to specifically promote his repugnant *Red Week* as *the truth* about political and military history and ethnic and religious relations in the late 1930s and early 1940s in the border region between Romania and Moldova (then part of the Soviet Union).

The preceding brief history is useful insofar as it demonstrates that numerous individuals, nominally independent Moldovan "NGOs" which more-or-less discreetly advanced a far-right, pan-Romanian nationalist worldview worked fairly smoothly not only with one another but also with the largest – and supposedly "liberal" and "democratic" and "pro-European" – newspapers and media concerns and also parties that took part in and ran on an anti-PCRM platform in the two parliamentary elections (April 5 and July 29) that were held in 2009.

In other words, the parties – including their leaders themselves – that portray themselves as the very embodiment of "European values" and that ended up replacing the PCRM at the head of the Moldovan state in the second half of 2009 had "dense" links to a network of individuals and supposedly "non-governmental" organizations that venerate Romanian ultra-rightists from the 1930s and 1940s, including the blood-soaked military dictator of Romania and ally of Hitler, Ion Antonescu.

While sundry events that took place in Chisinau within the last two weeks before the

M

holding of the April 5, 2009 Parliamentary elections served to reveal clearly enough that, at least in de facto terms, there had been put together a broad and at least somewhat cohesive anti-PCRM "infrastructure," part of which was under the guidance and control of far-right nationalist elements, it became all the more apparent in the hours after the closing of the polls that night that, regardless of how the voting turned out, various constituent elements in said infrastructure would not peacefully acquiesce to another four years (or more) of continued "communist" control over the Moldovan state.

The "Communists" Win the Elections … and the "Liberals," "Democrats," and Far-Right Attempt a Putsch

Shortly after 10 PM local time on April 5, the public television channel Moldova 1 carried a live broadcast from a Chisinau hotel in which leading representatives of a local polling agency presented the preliminary results – gathered up until 7 PM that evening, while polls closed at 9 PM – of the exit poll that their agency had carried out that day. While these pollsters went out of their way to stress the unofficial and merely orientative character of their poll, the preliminary results – which were immediately met with an audible gasp by the largely well-heeled audience – showed that the PCRM would take approximately 56 out of the 101 seats in the Parliament, while the three major anti-communist parties – the Liberal Party (PL), the Liberal-Democratic Party (PLDM), and the Our Moldova Alliance (AMN) – would together take the balance. The updated version of the exit poll, which was broadcast at slightly after 11 that night and which reflected polls taken until the 9 PM close of voting that day, credited the PCRM with 55 seats compared to the combined total of 46 won by the PL, the PLDM, and the AMN.

The official counting of the votes began at 11 PM and, at least in the early hours, went even more favorably for the PCRM than the exit poll results had indicated. (The rolling vote count could be followed in "real time" on the website alegeri.md.)

Virtually immediately after the first official results began to be released that evening, young (generally in their early to mid-20s) people who were certainly more favorably disposed to the various relatively right-wing opposition parties than they were to the PCRM used Facebook to create and promote an "event" that they indicated would take place the following day. Said event, which was visually represented on Facebook primarily by a small (though certainly clearly visible) banner-style photograph in which at least one hand was holding a lit candle, was being held, the accompanying promotional text read, to "mourn" the supposed "death of democracy" in Moldova (see, for example, GBrega).

The "mourning" for the supposed "death of democracy" was, it was entirely evident, being held because all the evidence – both from the first and then final exit poll as well as from the early stages of the official count of the ballots that had been cast – indicated that the PCRM would once again by itself hold a clear majority in the Parliament.

That the announcement of both these exit poll results and the unfolding of the early stages of the official and easily accessible "rolling" vote count wouldn't be pleasing to the supporters of the various relatively right-wing anti-PCRM parties was, to put it mildly, rather unsurprising.

Little by little, it became clear that something resembling a coup attempt was in the works. Shortly after the final exit poll results were released during the evening of April 5, the right-wing and staunchly anti-communist then Mayor of Chisinau, Dorin Chirtoaca (PL), appeared on the Romanian TV network PROTV; when asked by the host what he thought of the poll results, Chirtoaca indicated that he didn't believe them, but that if they did indeed prove to be "of value," then "the anti-communist resistance will have to continue to be prepared to go all the way to the end" so as to bring about "the *demolition* of Communism in the Republic of Moldova. This is the position of the Liberal Party [PL]" (see Youtube).

By the early hours of the morning of April 6, the results – in broad terms – seemed quite clear: the number of votes that the PCRM received

significantly surpassed the aggregate total of the three relatively right-wing parties (the PLDM, the PL, and AMN) that would also be represented in the next Parliament; in fact, by noon or so that day, the only politically meaningful question about the outcome of the election seemed to be whether the PCRM would receive at least 61 of the 101 Parliamentary seats necessary so that it could, just by relying on its own MPs, elect the next President.

Given the relatively lopsided character of the vote, the fact that the very same PROTV that had discussed the results of the final exit poll the night before had opted not to return to Bucharest, but to stay in Chisinau and to continue broadcasting from PMAN into at least the early afternoon on April 6 seemed – and one might add, still seems even today – a bit suspicious. Not only did PROTV keep its camera in PMAN, but it broadcast an interview during the late morning or early afternoon of April 6 there with a young man who was wearing various items of clothing – in his case, a hat and a shirt – which demonstrated his support for and quite possibly affiliation with the far-right Romanian revanchist-nationalist movement: his hat and shirt not only called Moldova "Basarabia" and named it "Romanian Land" but also featured Moldova as a part of Romanian territory, all of which was red, blue, and yellow (the colors of the Romanian flag).

While at the time there was no one protesting in PMAN or, apparently, anywhere else in Moldova against the results of the election, this young man called for just that, and not only invited to the proposed demonstration supporters of the PLDM, PL, and AMN, but also backers of The European Action Movement (MAE), a far-right coalition which had received 1% of the vote and thus not come close to the 4% threshold necessary for Parliamentary representation. He also suggested – though no such evidence in this regard was ever presented – that the election results may have been manipulated, with the PCRM being the implied culprit and beneficiary.

As implied above, an understanding of why the network's continuing election coverage relatively early in the day on April 6 was based largely on interviewing obscure far-right youth dissatisfied

with the outcome of the vote may be easier to come by if one believes that PROTV was either aware that a radical and violent anti-PCRM campaign would soon begin to unfold or, alternatively, that it was somehow involved in the respective campaign.

In any event, somewhat later on during the afternoon of April 6, anti-PCRM protests did indeed begin; a handful – perhaps eventually rising to 50 or so – of far-right Romanian nationalists or "unionists" wearing the above-described clothing and waving Romanian flags grouped together in the part of PMAN that is near the sidewalk which is located below the governmental building. While they were somewhat noisy and attracted a bit of attention to themselves, their protest was not terribly noteworthy and certainly didn't seem likely to lead, directly or indirectly, to the overturning of the just re-elected government.

By perhaps 5:30 in the evening (well prior to sunset) on April 6, the event that had been organized on Facebook the prior night started around the statue of Stefan The Great, which is adjacent to PMAN (and less than 100 m from where the Romanian revanchists had been protesting, but from where they dispersed fairly quickly). Perhaps 200 people or so eventually gathered in the fairly small circular area where the statue is located in order to "mourn" the supposed "death of democracy in Moldova." A disproportionately large number of these "mourners" were young and, as is indicated by the kinds and styles of clothing that they were wearing, relatively well-off economically. While the "mourners" sought to present themselves as calm and dignified defenders of the undermining of a democratic system, fascistic elements wearing the aforementioned shirt in which Corneliu Codreanu's face is overlain on a "Celtic Cross" were also present and moved among the former freely. At this time, the ultra-nationalists increasingly began to make the evidence-free assertion – and this claim was quickly taken up by the self-described "liberals" and "democrats" who were standing side-by-side with them – that the PCRM had massively rigged the previous day's elections.

The next day, all hell broke loose, as they say. Late in the morning, probably hundreds of

M

(again, mainly young) protesters in "messy" column formations slowly made their way to the center of the center; at about the same time, police – who were also organized in comparatively "neat" formations – ran towards the city center in an attempt to forestall what seemed like a possible outbreak of mass disorder and political violence. The character of the April 7 protests as well as of many of those who "demonstrated" that day was evident well before events violently spiraled out of control. For example, prior to the launching of attacks by protesters on the police, the Parliament, and the Presidential building, three clearly intoxicated young men who were probably about 19–23 years of age were seen half-running and half-staggering on the main Stefan Cel Mare Boulevard in front of McDonalds and adjacent to PMAN, shouting "Down with the Communists!" and struggling to lift up a Moldovan flag that was attached to a wooden pole.

The speech given in the mid-afternoon on April 7 by one Vitalia Pavlicenco seems to have served – and almost certainly was intended to have served – as a turning point in the events of that day. Pavlicenco had participated in the April 5 elections as, along with Anatolie Petrenco, one of the two leading candidates of the MAE. Given the party's relatively marginal character, it may seem surprising that such a central political and speaking role was accorded to Pavlicenco in PMAN during the afternoon of April 7; this surprise "melts away" if one understands that the dynamics of the situation made the role of the far-right absolutely pivotal in the campaign to unseat the PCRM.

That the anti-PCRM regime change campaign which developed very quickly (and, indeed, violently) in the immediate aftermath of the closing of the polls on April 5 was headed by profoundly anti-democratic far-right forces was demonstrated – probably despite her own intentions – by the speech that Pavlicenco gave in PMAN on April 7. Shamelessly ignoring the fact that the by-then nearly completed official vote count showed that the PCRM had garnered about 49.5% of all the valid ballots cast, Pavlicenco called for the banning of all "parties of a communist and socialist type." The openness with which she called for the banning of political parties, including what was at that time by far the largest in the country, was matched by the undeniably inflammatory character of her speech as a whole; the effect of her words on a crowd, a significant number of whose members were evidently under the influence of alcohol or some other substances, could only have been – and certainly seemed to have been – expressly designed for just this purpose – to trigger some kind of violent insurrection.

The Geopolitics Underlying the Unholy Alliance Between "the West" and Moldova's "Liberals," "Democrats," and Far-Right "Pan-Romanian" Nationalists

Pavlicenco was, at the time that she gave her speech on April 7, still officially a Member of Parliament (MP), having been elected on AMN's list back in 2005. (From 1998 to 2001, she was an MP representing the Alliance of Democratic Forces or AFD in the original Romanian.)

A quick look over her CV (which she has published on her personal webpage) makes it clear that, from the beginning of her first term in Parliament if not earlier still, she had enjoyed close and positive political ties with high-ranking officials from Washington, Bucharest, and NATO (see Pavlicenco A).

Pavlicenco's membership in nominally democratic Moldovan political organizations and the support that outwardly democratic foreign governments and international institutions have given to her do not somehow make her sympathies for some of the most barbaric, far-right forces from the early-mid twentieth century disappear. More specifically, Pavlicenco has posted numerous articles on her blog which present Marshall Ion Antonescu as either a hero or, alternatively, in a generally positive light.

While this is not the place for exhaustively reviewing the war crimes for which Antonescu was responsible, it is worth mentioning here, if only briefly, that, for example, serious historians of World War II and the Holocaust have conclusively demonstrated that the forces under his

command which joined in the Nazi-led invasion of the Soviet Union murdered close to 300,000 Jews, including in a number of particularly blood-curdling massacres (such as in Iasi, Romania, and in Odessa, Ukraine) (see, for example, Ancel 2010; Kaplan 2016).

In short, there is a wealth of evidence (some of which I've presented in this entry) indicating that Pavlicenco is by no means whatsoever alone in portraying Antonescu as a heroic figure who dedicated his life to the pursuit of the supposedly "noble ideal" of Romanian ethno-national unity; in fact, it would be accurate to say that essentially the entirety of the contemporary "pan-Romanian" nationalist right in both Romania and Moldova is defined by its conviction that if there was anything damnable in Antonescu's life and political-military career, that was surely greatly outweighed by his lifelong commitment to and "selfless" sacrifice in the interests of the Romanian nation (see, for example, Pavlicenco B, C).

There exists a wealth of evidence – certainly far more extensive than can be presented in a paper of this length – which shows that while nominally "liberal," "democratic," "liberal-democratic," and "pro-European" (i.e., pro-European Union or EU) forces and figures did indeed replace the PCRM atop the Moldovan state in the second half of 2009, said forces and figures understood very well that the "success" of their regime change campaign was critically dependent on close collaboration with profoundly reactionary and anti-democratic domestic political movements.

During the height of the regime change campaign and shortly after its eventual completion, the fact that Washington and sundry high-level forces within the EU were serving as the de facto backers of various "liberal" anti-PCRM elements within Moldova became more and more apparent.

Natalia Morari was one such "liberal" who not only played a central role in the anti-PCRM protests-turned-riots of April 7, but who virtually immediately after the removal of the PCRM from power began to work in Moldova both as a journalist for the US government-financed "Radio Europa Libera" multi-media organization, as well

as a prominent political talk-show host; furthermore, in the latter half of January 2010 – that is, less than six months after the consummation of the regime change-process that is here in focus – Morari also met with then US Secretary of State Hillary Clinton during a conference that was based on enhancing Washington's ability to use social media to advance its global objectives (see, for example, Europa Libera 2010; *Jurnal de Chisinau* 2010; VIP Magazin; WSWS 2010a).

Given the ideological character of many of the leaders of the post-April 5, 2009 anti-PCRM movement, Morari's centrality in said movement would, for at least one pivotal reason, seem to be rather incongruous. Unlike the Brega brothers and their websites and NGOs, unlike Vitalia Pavlicenco, unlike the Basarab brothers and the *Timpul* newspaper that the elder one, Marin, would go to work for as a journalist, etc., Morari cannot fairly be described as a pan-Romanian nationalist; in fact, while she was born in Moldova during the last decade or so of the period when it was part of the Soviet Union, she is not ethnically Romanian or Moldovan, but Russian (see, for example, E-Democracy 2015).

Morari's choice of dress – specifically, the T-shirt that she wore on April 7, 2009 – is, paradoxical though it may seem, highly revealing not only about the ideological foundations but also the geopolitical orientation of what were then Moldova's most active anti-PCRM forces. In short, on April 7, a day during which she, using a megaphone, addressed the protesters in PMAN, Morari sported a T-shirt which read: "I 'heart symbol' Obama" (VIP Magazin).

To people not intimately familiar with the contemporary political spectrum in Moldova and various other Central and Eastern European countries, the picture that I am painting here must seem absolutely inexplicable: after all, I have argued – and brought quite a bit of data to bear in this regard – that ultra-right elements were highly active in the movement to bring down the PCRM government, including in the violence that broke out in the center of Chisinau on April 7. In fact, in the article which constitutes the relevant endnote here, Morari can be seen in the above-mentioned T-shirt addressing a crowd, at

M

the very front of which there were people holding up a banner on which the slogan "Better Dead Than Communist!" had been written in Romanian; the photo's utility in this analysis becomes even clearer when it is pointed out that the young man on the left who is holding up a corner of that banner was known to have had genuinely pro-Nazi sympathies (Elldor).

Given that, at least within the spectrum of "official politics" in the United States (i.e., what is currently considered to be the "political mainstream" in that country), Obama was widely regarded as being relatively left, how did it come to pass that a supporter of his spoke in public to and was involved in an obvious de facto political alliance with ultra-right elements?

While considerable internal divisions do indeed exist, the bulk of the Moldovan (and Romanian) far-right not only views "Communism" in its various manifestations negatively but also, certainly, the former Soviet Union and the Russian Federation, which is by far the largest of the successor states to emerge from it. One of the reasons whereby Moldovan and Romanians on the far-right of the political spectrum regard Moscow negatively comes from the Russian state's perceived (and almost certainly actual) hostility to "union," or to the formal incorporation of Moldova into Romania. Romanian nationalists (and those Moldovans who are politically aligned with them) see Moldovans as being virtually indistinguishable – ethnically, linguistically, and culturally – from Romanians and, given the fact that Moldova is poorer and considerably smaller (both in terms of territory and population) than Romania, they believe that it makes far more sense for the former state to become a part of the latter and not vice versa.

To the extent that Moldovan "liberals" (like the open Obama Administration supporter Natalia Morari) differ ideologically from their de facto allies in the pan-Romanian far-right nationalist milieu, this is not so much a product of significantly contrasting visions about the broad geopolitical and economic trajectory that Moldova should follow and, instead, concerns the issues that they choose to publicly emphasize, and the final end destination of Moldova (i.e., should the country be a nominally independent EU member-

state, or a province of EU and NATO-member Romania).

To understand the de facto cooperation between Natalia Morari and Moldovan "liberals" like her with far-right domestic "unionists," and major Western capitals like Washington, it is useful to briefly describe the nature of the political activity prior to and then shortly after her participation in the anti-PCRM protests/riots of April 2009.

Morari's entrance into "big politics" apparently predates by several years her 2007 receipt of a degree in Sociology from Moscow's Lomsonov University. In 2005, as a result of her acceptance of the offer that was made to her by "Open Russia," which at least at that time was the largest Non-Governmental Organization, or NGO, in all of Russia, Morari become said NGO's "Coordinator of the Project of Public Political Schools" for a large number of the regions within that country. "Open Russia" had been founded by Mikhail Khodorkovsky who, immediately prior to his mid-2005 sentencing by a Moscow court to a nine-year prison term, had been a multi-billionaire and the richest Russian citizen.

In 2006, Morari – again per an invitation that had been made to her – became the Spokesperson for the anti-Putin political coalition that was then called "The Other Russia" (VIP Magazin).

While broad overview pieces in the Western mainstream media usually make the claim that "The Other Russia" was a political umbrella coalition whose ideologically heterogeneous constituent parts were held together only by their shared desire to see Putin pushed from power, such accounts are, a fair review of the key data would suggest, wide of the mark. "The Other Russia" was anti-Putin indeed and there were disparate currents at its head, but these disparate currents (and, consequently, the coalition as a whole) were largely right-wing. It is generally accepted that "The Other Russia's" three most prominent leaders were the former Chess World Champion Gary Kasparov, Mikhail Kasyanov, who had served as Prime Minister under Putin from 2000 to 2004, and Eduard Limonov; of these three, Kasparov and Kasyanov are known mainly for their strong support both for "free-

market" economics and the geopolitical stances of the US and the EU, while Limonov may fairly be characterized as a fascistic Russian ultra-nationalist.

It is critical to mention that this unholy alliance – which, again, Morari served as the Spokesperson of – was not just supported by but essentially created or at least midwifed at the 2006 G-8 Summit in Moscow by leading Western government officials, including the then UK Ambassador to Russia Anthony Brenton, and Barry Lowenkron and Daniel Fried, both of whom were serving at that time in the US State Department as Assistant Secretaries of State (i.e., quite high-level positions) (see, for example, RFERL 2006; *The New York Times* 2006; WIKILEAKS 2006).

Over the course of the period from 2005–2008, Morari moved in and out of (and generally in) a wide variety of nationalist and pro-free market groups in Russia, all of which were at that time anti-Putin and many of which enjoyed considerable political support from Washington. For example, in a late 2009 interview with a Moldovan publication, Morari reminisced with evident satisfaction about the time that she had spent as a part of the Russian organization called "The Democratic Alternative Movement"; the respective movement, which had been created by the self-described "national democrat" and Western favorite Alexei Navalny, served as the means through which Morari became personally acquainted with, for example, Yeltsin's strongly pro-"free market" Economy Minister, Yevgeny Yasin, as well as Maria Gaidar, who shares the faith that her father, Russian Prime Minister Yegor Gaidar (1992) had in pro-capitalist economic "shock therapy" (see, for example, VIP Magazin).

In penning articles which suggested that corruption was rife among close associates of Putin, Morari ran afoul of the Russian authorities, who in 2008 moved to bar her from reentering the country (which she is not a citizen of); in the above-mentioned interview, Morari says with pride that, in her dispute with the Russian state, she was supported "very much" not only by the EU's European Parliament but also, among other institutions, by "Freedom House," a supposed NGO which, in fact, receives tens of millions of dollars from the US government and whose political

activities in, for example, Ukraine in 2004 were credibly regarded as being marked by clear bias in favor of the pro-Western then Presidential candidate Viktor Yuschenko (Paul 2004; VIP Magazin; WSWS 2014a).

By extending this analysis to a review of protest leader's Natalia Morari's political activities both in Moldova and especially in Russia, the structure and orientation of the anti-PCRM regime change movement in 2009 come more clearly into focus.

Sundry organizations and individuals advocating some mix of "neo-liberal" economics, an anti-Moscow (and thus strongly pro-Brussels and pro-Washington) geopolitical orientation, and pan-Romanian nationalism collaborated together and enjoyed clear support from the just-mentioned Western capitals in the 2009 campaign to remove the PCRM from power. The US and the EU supported precisely the same kinds of forces in Moldova in 2009 as they did in Ukraine's "Orange Revolution" in 2004 and as they've been doing in Russia more or less since Putin consolidated his grip over the state in the early part of the new millennium (Paul 2004; WSWS 2014a).

Had the anti-PCRM regime change campaign not "successfully" achieved its end goal, the above description of the ideological orientation of several of the forces in that campaign and the relations between them and their foreign (overwhelmingly "Western") supporters would have been, perhaps, interesting mainly for curious academics.

However, the "motley crew" alliance of neo-liberals and sundry "pan-Romanian" nationalists did indeed eventually "succeed," the proof of that being the formation of a fractious four party, anti-PCRM parliamentary majority coalition in the late Summer and early Fall of 2009.

Following the Failure of the Violent Putsch, a "Democratic" Regime Change Takes Place

For all the (evidence-free) claims that it had rigged the April 2009 election and that it was, in broad terms, a totalitarian entity, the PCRM all

M

throughout the regime change process showed considerable deference to its right-wing political rivals, even after they and their supporters had attacked the police and burned and ransacked sections of both the Parliament and the Presidential building in Chisinau on April 7.

The strongest indication that the claims of electoral fraud that were made by wide sections of the Moldovan right – from young fascists and pan-Romanian nationalists on the street to, for example, Dorin Chirtoaca and then PLDM leader Vlad Filat – were lacking in merit came from the number of seats that the Electoral Commission (CEC) had, certainly by noon of April 7, officially determined that the PCRM would receive. While protesters in PMAN on the morning and early afternoon of April 7 were heard decrying the PCRM's receipt of 61 out of 101 Parliamentary seats – exactly enough to elect the President from within the Parliament, – this information was already then out-of-date or false; several hours before the protests on April 7 degenerated into an orgy of violence, the official vote count had shown that, with 97% or 98% of the ballots having been tabulated, the PCRM would only have 60 seats in the next Parliament.

Over the course of the next two months, the 41 members of Parliament from the PL, PLDM, and the AMN would refuse to grant even one vote to the PCRM's candidate for President, a move which triggered the dissolution of the Parliament and the scheduling of early elections in late July.

The turning point in the 50-day or so campaign for the late July 2009 elections came as soon as that campaign officially got underway; in a development worthy of considerably deeper investigation than is possible in the context of this entry, Marian Lupu, the man whom the PCRM had selected as its candidate for Prime Minister (the Prime Minister is selected by the President after he or she has received at least 61 votes in the Parliament), broke from his party and quickly announced his affiliation with the Democratic Party (PDM), an organization which, in receiving under 4% of the vote on April 5, had failed to enter Parliament.

Lupu quickly became the PDM's leading candidate, with his face being plastered on

large billboards that stated that: "The Political War Must Be Stopped!" (see, for example, Peru-Balan 2010). Despite disingenuously advancing this claim of a political "neutrality" which could not and did not exist and similarly being presented by various anti-PCRM media sources as being a reasonable and responsible man on the "center-left," there was very little question that, in the event that Lupu and his new party entered the Parliament, they would immediately work towards the formation of a government from which the PCRM would be entirely excluded (see, for example, Unimedia 2009).

This, of course, is exactly what occurred; the PCRM's receipt of 44.69% of the vote in the July 29, 2009 election entitled it to 48 out of the 101 seats in the next legislature, while the 51.14% share of the vote that the four anti-PCRM parties (the PL, the PDM, the PLDM, and AMN) together took gave the remaining 53 seats to them.

2001–2009: The PCRM "Zigs" Away from Moscow, and then "Zags" Part of the Way Back

The preceding sections should provide some indication as to why certain sections of Moldovan society as well as Washington and Brussels generally wanted to see – and were intent on taking numerous concrete steps that they regarded as likely to facilitate this goal's realization – the PCRM's back. Why, for the respective Western Powers, this goal arguably acquired a somewhat more imperative character in the lead-up to and then in the immediate aftermath of the April 2009 Parliamentary elections in Moldova than had been the case just a few short years before can, one could rather plausibly argue, be significantly better understood by looking at the broad geostrategic orientation that, ever since the dawn of the millennium, Chisinau had been seeking to chart; thus, the constantly shifting and at-least seemingly ever-more volatile regional and geopolitical context in which the elections in question took place – a context which had been powerfully molded by Washington's role in facilitating the "success" of the 2003–2004 regime change in

Georgia, as well as of the one which unfolded in Ukraine in late 2004 and early 2005 – can explain why, for Washington and Brussels, the opportunity which emerged in the Spring and Summer of 2009 to remove the PCRM from power was not to be missed.

Anti-communism has been, certainly since the Bolshevik Revolution, a corner stone of the ideology not only of Washington and the Western European Powers but also – and, it should be mentioned, in particularly ferocious form – of the Romanian right (see, for example, Ioanid 1990; Sandache 2010; Schmitt 2017). This certainly helps explain why, despite the virtually total absence of genuinely socialist policies during the PCRM's eight years as a governing party, there continued to remain a constituency – certainly among sections of the Moldovan elite – for uncompromising opposition to its rule.

Roughly two months after the PCRM received 50.07% of the vote in the Parliamentary elections in late February of 2001 and consequently was awarded with a super-majority of 71 out of 101 seats in the legislature, the party held its Fourth Congress; it should be mentioned here that long-time – and, actually, still current-day – PCRM leader and Moldova's then newly-installed President Vladimir Voronin gave a speech to those in attendance at this congress, telling them (among other things) that, under his leadership and "[w]ith the help of the progressive forces from the entire world, we [the PCRM as Moldova's governing party] will resist until the end, just as Cuba resists in the middle of the imperialist predators" (*Ziarul de Iași* 2001).

Voronin's occasional radical rhetoric notwithstanding, the PCRM proved, from rather early on in its period in power, to not only be susceptible to pressure from, but also rather willing to align itself to a certain degree with Washington.

The PCRM government's proclaimed anti-imperialist orientation was, at least until late 2003, combined with generally friendly relations with Moscow, relations whose largely amicable and constructive character was manifest in the Chisinau's drafting of – and apparent intent to sign –the so-called Kozak Plan (or Memorandum).

In the main, said plan was at least ostensibly aimed at resolving a conflict which to this day is referred to as "frozen," and which first began to emerge as an existential question for Moldova roughly one year prior to that country's formal declaration of independence in late August of 1991!

The conflict in question mainly concerned the status of Transnistria, a territory which, over the course of the existence of the Soviet Union, was part of that administrative sub-unit known as the Moldovan Soviet Socialist Republic (MSSR) and the overwhelming majority of whose territory still lies today in a strip of land which begins on the eastern banks of the Dniester River. Transnistria accounts for about 11% of the territory of Moldova, and roughly the same portion of its population (or perhaps marginally more), though unlike the rest of the country, the majority of its population considers itself to be either Russian or Ukrainian, with Moldovans constituting then and now a large minority.

In the waning days of the Soviet Union, the perceived increase in influence of pan-Romanian nationalists, including in Moldova's Supreme Soviet, their numerical superiority in that body, and their occasional acts of violence against the far less numerous deputies from the Transnistrian region led the latter to declare Transnistria's independence on September 2, 1990. Skirmishes between forces loyal to Chisinau and those to the separatist authorities in Tiraspol broke out shortly thereafter, occurred intermittently in 1991, and then intensified anew in 1992. In the conflict, the new Moldovan state was backed in at least de facto terms by Bucharest, while the Transnistrian separatists received critical support from Moscow which, by the time of the most intense fighting in 1992, was just the capital of the Russian Federation and not of the by-then defunct USSR.

While existing in de facto terms as a strongly pro-Moscow statelet, Transnistria's "independence" has never been formally recognized by any major international or regional actor, including by Moscow. The Kozak Plan – named after Dmitri Kozak, who then was an aide to Russian President Vladimir Putin and who now is Russia's Deputy Prime Minister – would have created a

M

federal political structure in which Moldova proper and Transnistria would both have been members (this plan also stipulated that Gagauzia, a part of Moldova proper that ever since 1994 has enjoyed a certain degree of autonomy, would have been the third "federal subject").

By all indications, Voronin was on the precipice of signing the plan but, at the last moment – when Putin was apparently en route to Chisinau via plane in order to put his signature on it, as well – he backed out, with the evidence suggesting that his about-face was influenced by opposition to the accord that originated not only from Moldova's pan-Romanian nationalist right and its numerous demonstrations in the street, but also from Washington and the EU (see, for example, Interlic 2008; Mihaes 2008).

Voronin's last-minute rejection of the Kozak Plan was apparently followed in short order by Washington's provision of a 42 million dollar grant (i.e., a financial transfer that did not need to be repaid) to his government (Interlic 2008).

A broader view of the context in which Voronin suddenly decided to reverse course and abandon his acceptance of the Kozak Plan is provided by the fact that, while his and Putin's official signing of the memorandum was scheduled for November 25, 2003, the intensely anti-Russian and Washington-supported "Rose Revolution" in Georgia culminated in the toppling of President Eduard Shevardnadze on November 23. (The "Rose Revolution's" principal leader, Mikheil Saakashvili, officially started his term as the country's President on January 25 of the following year.)

Even more significantly for Moldova (and for the larger balance of power between Washington and the EU, on the one hand, and Moscow, on the other), the "Orange Revolution" in Ukraine came to a "successful" conclusion slightly over one year later with the defeat of the relatively pro-Russian candidate Viktor Yanukovych, and the accession to the Ukrainian Presidency of the vehemently anti-Moscow and pro-Western candidate Viktor Yuschenko.

Voronin and the PCRM's apparent at-least temporary shift into Washington's camp was further evidenced when, in January of 2005, the then

newly-installed President of Romania, the fervent supporter of all things "Western" and the enemy of "communism" and the Russian government, Traian Basescu, visited Chisinau. While there, Basescu met with Voronin, who gave him 11,000 bottles of Moldovan wine, sending along with them two specialists who were charged with artfully arranging them in the cellars that are located beneath the Romanian Presidential Palace (*Adevărul* 2017).

Basescu's visit to Chisinau preceded by only roughly six weeks the holding of elections on which not only the entire composition of the next Moldovan Parliament, but also – though indirectly – the identity of the country's Prime Minister and President would depend. As opposed to the indisputable "line" of alliance with Russia which was a major part of its campaign in the buildup to its triumph in the 2001 Parliamentary elections, in early 2005, the PCRM positioned itself as a party with a clear – if not excessively single-minded – focus on integration into the EU. In the 2005 elections, the party not only faced opposition from still more fervently and passionately pro-EU and pro-NATO forces in the form of the "Democratic Moldova Bloc" (BMD in Romanian), and the "Christian Democratic People's Party" (PPCD), but also from an openly pro-Russia and relatively left-wing formation, the "Electoral Bloc – Homeland" (BEPR), which criticized it and the two first-mentioned parties for being "pseudo-communists" and "pseudo-democrats," respectively (E-Democracy 2005a).

In any event, the PCRM received 45.98% of the votes in those elections, a result well above the combined total of the only two other electoral formations that passed the threshold for parliamentary representation at that time: while 28.53% of those who cast a ballot gave their backing to the BMD, 9.07% opted to support the PPCD. (While the BEPR's 4.97% vote share was certainly significant, it was also well below the 9% minimum that electoral blocs then needed in order to enter into the Parliament.)

The PCRM's vote share entitled it to 56 out of the 101 seats in Parliament, a number which was, just as was still the case in the wake of the 2009 elections, shy of the 61 that the party needed to

elect the President (and thus the Prime Minister and his or her Cabinet) by itself. Thus, if new elections were to be avoided, some kind of deal between the "communists" and the vehemently anti-communist deputies in the PPCD and the BEM would have to be worked out.

New elections were avoided, and this was due mainly, though not exclusively, to the decision of the PPCD leadership – whose pro-Western and anti-Moscow credentials were, even in comparison with the similarly strongly anti-communist BMD, beyond reproach – to grant the PCRM the votes in Parliament that it needed in order to give Voronin a second term as the country's President (see, for example, Jamestown 2005).

This move, the evidence strongly suggests, went forward in large measure because it not only received the blessing of, but was positively demanded by, the administration of then US President George W. Bush. (Washington's position in this regard was, not even remotely surprisingly, immediately and reflexively adopted by its local partner Basescu.)

Thus, from the early Spring of 2005 until, ultimately, the late Summer of 2009, the PPCD and its leader, the long-time pan-Romanian nationalist and anti-communist agitator Iurie Rosca would end up serving, in exchange for a number of concessions of a secondary importance, as junior partners in what was, for all intents and purposes, a PCRM-run government. (Interestingly enough, by 2018 – that is, long after the 2009 regime change deprived him and his party of their positions within the government and Parliament, – Rosca had started to polemicize aggressively against the Romanian state, portraying it as a stooge for US imperialism's regional designs and anti-Russian agenda (see Geopolitica).)

While probably regarding the essential result of the 2005 elections – the PCRM's success in extending its rule over the country for another four-year term – as less than absolutely ideal, the relevant and available evidence indicates that not just Washington, but also the EU and Bucharest were, at least at the historical moment in question, still on the whole quite satisfied with developments in Moldovan political life. After all, the country's Parliament now consisted of 101

individuals from three different political formations – the PCRM, the BMD, and the PPCD – which were all on the record as favoring Moldova's (at least eventual) integration into the EU (see, for example, E-Democracy 2005b, c).

In fact, when, on April 4, 2005, the Parliament both formally registered and then gave its backing (with 76 votes in favor) to his candidacy for a second term as President, Voronin gave two speeches in which he emphasized that not only should Russia remove its "peacekeeping" troops from Transnistrian territory, but that the assistance of Washington, the EU, Bucharest, and Kiev, as well, would be extremely useful in ensuring a favorable settlement of the Transnistrian problem (Jamestown 2005).

Voronin's seemingly fairly decisive, though also highly conjunctural turn towards the West, however, would not last forever and, as I argue in this entry, had been broadly reversed well in advance of Moldova's 2009 Parliamentary elections.

As soon as it was apparent that the PCRM had indeed won the March of 2005 Parliamentary elections by a substantial margin, Moscow moved to penalize it for its above-described pro-"Western" zig. The first penalties, which came during March and April of 2005, took the form of a total embargo on the import of Moldovan meat, vegetables, and fruit into Russia (*Adevărul* 2014; *Timpul* 2017). Then, on January 1, 2006, the Russian energy giant Gazprom ceased its deliveries of gas to Moldova, demanding as a condition for their resumption a doubling of the price paid per unit volume (Jamestown 2006a). In March of that same year, Russia refused to purchase any more of Moldova's wine, which was then and is now one of the country's principal exports. In every case, the Russian authorities invoked seemingly legitimate reasons for these restrictions – that the wine and food didn't meet the necessary sanitary or quality standards, that the price that Moldova had been paying for its imported gas hadn't been changed in years, and that it had been kept at a much, much lower level than the one in place on the world market and in Western European countries, etc., – but it is more-or-less universally believed that, behind these

restrictive commercial practices, lay broader geo-political considerations (see, for example, *Adevărul* 2014; Jamestown 2006a, b).

The very fact that, as I have argued throughout this entry, Washington, along with the EU, and Bucharest, "successfully" endeavored to push the PCRM from power during the politically decisive year 2009 constitutes fairly strong *prima facie* evidence that said party's pro-Western and anti-Russian "zig" from around the time of its rejection of the Kozak Memorandum in late 2003 certainly did not last forever. There may well be some nuance in precisely dating the PCRM's (at least partial) "zag" back towards Russia, and away from "the West," but it clearly took place prior to the holding of the April 5, 2009 Moldovan Parliamentary elections. Support for the idea that, some time prior to those elections, the PCRM did indeed carry out some kind of "corrective zag" back towards Moscow is provided by the Romanian political analyst Vladimir Socor who, for well over a decade now, has been intimately involved in seeking to impact on high-level political developments in Moldova.

Socor's efforts in this regard have not been, it should be mentioned, limited to penning (rather subjective) analyses about Moldovan and regional political affairs for the vehemently anti-Moscow think-tank the Jamestown Institute; in fact, in one such article, he admits that, in the immediate aftermath of Moldova's 2005 Parliamentary elections, he brought the conservative former Republican Congressman from Arizona, John Conlan, to that country in order to encourage the incoming deputies from the PPCD and the BMD to reward Voronin for his pro-Western "zig" by granting him at least the five "golden votes" that he needed in order to start his second term as President (Hahn 2018; Jamestown 2005; JConlan).

In an article published on the Jamestown Foundation's website on July 30, 2007, Socor argued that, during the preceding 10 days or so, Voronin had broadly rhetorically lashed out twice at all of the significant political formations in Moldova that were criticizing his then-ongoing and less-than-totally transparent negotiations

with Russia over Transnistria and/or were seeking to form coalitions without the PCRM in various localities around the country. Voronin, Socor notes, collectively referred to all such parties besides his own as: "the opposition," "right-wing," and "enemies," and also stated that they were "in the pay" of forces that sought to do harm to Moldova.

The change in tone, Socor suggests, was connected to the PCRM's relatively poor showing in the local and municipal elections that were held in early and mid-June of 2003 (if no candidate in a Mayoral race received an outright majority when the first round of elections was held on June 3, then a second round between the top two finishers was held on June 17); overall, the party received about 34% of the ballots cast in different races in the country, a result which was significantly worse than its approximate 46.8% vote share when local and municipal elections had last been held back in 2003 (Jamestown 2007).

In retrospect, the beginnings of a partial PCRM "zag" away from the more-or-less exclusively pro-"European" vector that, following right on Voronin's sudden rejection of the Kozak Memorandum, it had adhered to can be traced back to the second half of 2007. Whatever the cause or causes – and primarily electoral calculations certainly cannot be summarily ruled out – it seems that Moscow fairly quickly took notice and sought to reward Chisinau for (again, at least partially) "returning to the fold"; central among such "rewards" was the move during November of 2007 whereby Moscow once again decided to "open the doors" for the importation of Moldovan wine into Russia (BBC 2007).

2009: With Its Regional "Golden Boys" in Crisis, Washington Tries to Score a Compensatory Win in Moldova

The regional political context in the buildup to the April 5, 2009 Parliamentary elections in Moldova was significantly different from that which existed four years or so prior, and Voronin (not to mention, for example, Washington) seems to have

been fairly keenly aware of this. While the regional political context that preceded the March 2005 Parliamentary elections in Moldova was largely defined by the rise to the office of the Presidency of (and the consequent assumption of Executive power by) rock-ribbed anti-communists and lovers of all things American – Saakashvili in Georgia in January 2004, Basescu in Romania in December 2004, and Yushchenko in Ukraine in January 2005 – by early 2009, the bloom most definitely had, as is said, come off the rose in the cases of these three individuals (see, for example, Toal 2017). Saakashvili's regime – in a short war that it had initiated – suffered a humiliating defeat on Georgian territory at the hands of Russia in August 2008, while Yushchenko's term as President had been marked by – among other undesirable developments – constant political instability and inter-elite infighting including, prominently between him and his erstwhile "Orange Revolution" partner from 2004 to 2005, Yulia Tymoshenko. So great was the political chaos that characterized Yushchenko's term as President that, during said time, not only did Tymoshenko serve as Prime Minister for two non-consecutive periods, but those two periods were "sandwiched" around the 16+ months when the post of Prime Minister was held by the "Orange Revolution's" old nemesis, the relatively pro-Moscow politician Viktor Yanukovych. By the end of 2008, the economies of all three states were, as a consequence of the outbreak of the global financial crisis, in a state of collapse, a development which certainly had a significantly negative impact on these Presidents' approval ratings.

Voronin was, it is safe to assume, keenly aware of these developments, just as he was regarding the corrosive impact that his "unidirectional," pro-EU stance had, as evidenced by the election results in 2005 and 2007, on his party's significantly Russophile voting base. To Washington's not-insubstantial chagrin (evidenced, again, by an article by its apparently semi-official analyst for Moldovan affairs, Vladimir Socor), Voronin opted to accept an invitation to go to Moscow for meetings on March 18, 2009 that concerned a potential pathway forward for the resolution of

the Transnistrian question. Socor suggests that Voronin saw the meetings – which were hosted by then-Russian President Medvedev, and also attended by Igor Smirnov, who at that time was the President of Transnistria – not only as an attempt to solve the Gordian Knot that was the Transnistrian question, but also as a pre-election photo op (Jamestown 2009).

Socor asserts that Moscow also regarded the meetings as some kind of *quid pro quo* – perhaps not only could they result in making headway towards a potential final settlement of the Transnistria question in a manner consistent with Russian interests, but they might also simultaneously boost Voronin's popularity at home and convince him that his own political future and that of the PCRM as a whole were dependent on a broad alignment with the Kremlin. Socor supports these claims by acknowledging that, however much he may have wished that things were otherwise, the truth was that, at the time of the meetings in question: "It is a measure of Moldova's political underdevelopment that Medvedev and Russian Prime Minister Vladimir Putin hold the first two places in Moldova's political ratings (ahead of Voronin, who holds a distant first place among local personalities) and that Moldova's Orthodox Church, affiliated with the Russian Orthodox Church's Moscow Patriarchate, enjoys the highest confidence rating among Moldova's institutions" (Ibid).

With its maximally faithful "regional golden boys" Saakashvili, Basescu, and Yushchenko in evident political retreat, and with its erstwhile "man with whom we can do business," Voronin, now again "zagging" away from it to some extent, Washington clearly regarded "a win" in the April 5, 2009 Parliamentary elections in Moldova as being even more imperative than would otherwise normally have been the case. When, in the more-or-less immediate wake of those elections, the opportunity to push the insufficiently "dependable" PCRM from power presented itself, Washington did not hesitate to bring to bear various policy instruments at its disposal towards the end of facilitating a "successful" regime change in Moldova.

M

The Regime Change Is Complete . . . and the Austerity Is Intensified

Several of the economic and political implications of the PCRM's loss of its parliamentary majority and the transfer of power to four anti-communist parties became visible even before that transfer was formalized.

For example, just five days before PLDM leader Vlad Filat formally became Prime Minister on September 20, the anti-PCRM majority on the Chisinau City Council, in alliance with Mayor Chirtoaca (PL), not only increased the price of drinking water for consumers in residences in the city by 80%, but also bus fares by 50%, as well as the cost of trolley tickets by 100% (OMG 2009a, b).

The elimination of price-reducing subsidies for things like drinking water, public transportation, and energy is invariably one of the elements of "bailout" packages that the International Monetary Fund (IMF), operating on strict "neo-liberal" principles, offers to countries which are economically struggling and having difficulties with the payment of their foreign debts.
