However, Rodney was active mainly in Guyana. Travelling around the country to teach history and to meet the bauxite miners (mostly Africans) and the sugar cane workers (mostly Indians), he tried to weaken the ideology of the regime, which politicised the ethnic division between these two communities, both of whom were working in a capitalist system which regulated their competition for better wages and living conditions. In one of his speeches, 'People's Power, No Dictator' (1981b, pp. 76–77), Rodney warned against the illusions of governmental policies of nationalisation by saying that 'the highest expression of modern capitalism is found in the multinational companies. The power of the modern capitalist is tremendous because it is on such a scale that it dominates entire nations and sustains imperialist exploitations.' These political rallies formed the public side of his scholarly investigations published posthumously in *A History of the Guyanese Working People, 1881–1905* (1981a).

In the late 1970s, Rodney understood that his fight against the regime would not conclude as long as the masses did not organise and rise up. In 1979, he was arrested in the investigation of the criminal arson of an official building. He gained the status of a political prisoner when he was released but prohibited from leaving the country before the trial opened. However, in April 1980 he managed to enter Zimbabwe in April 1980, where he was warmly received by Robert Mugabe after the celebration of independence. While his unexpected presence humiliated Forbes Burnham, Rodney was offered a post as head of the department of history in the newly founded University of Zimbabwe. After he declined this opportunity – like many others emanating from African and Western universities – he returned to Guyana. A few weeks later, on Friday, 13 June 1980,

Walter Rodney was killed by a bomb in Georgetown, Guyana. His death remains unexplained, but his works and his life as an organic intellectual still inspire many people fighting imperialism all over the world.

Rome and Imperialism

Greg Woolf
School of Advanced Study, London, UK

Synonyms

Ancient Rome; Classical history; Imperialism; Tributary empires

Definition

This essay outlines the nature of the tributary imperialism of ancient Rome, and explores the various phases of its expansion, contraction, and ultimate collapse. It examines the ways in which contemporary writers understood Roman imperialism, and how later historians have explained its central dynamics. The essay describes how all sections of Roman society benefited from imperialism in different ways and to varying degrees.

Rome in the History of Imperialism

Rome has long occupied a central place in the theorisation of empire. One reason is that imperial symbols and language – eagles, fasces, laurel wreaths, and the Latin titulature of empire – have been repeatedly appropriated in the Western tradition by expanding powers and states. The Frankish King Charlemagne had himself crowned emperor by the Pope in Rome in 800. The title Kaisar (Caesar) was used by the rulers of successive German emperors in the Middle Ages, and Czar by various Eastern European powers up to and including the rulers of Russia. Medieval appropriations related as much to the contemporary presence of the emperors of Byzantium (who continued to be Caesars and to rule a Roman Empire into the fifteenth century) as to any close connection with earlier periods. But the increased interest in the classical past across Europe from the early modern period meant that Rome was

R

repeatedly a mode. After the French Revolution and Napoleon's abolition of the Holy Roman (German) Empire, Roman titulature was adopted by French, Austrian, and British rulers. Many titles and symbols of Roman origin remained current until the middle of the twentieth century.

That reception history has been a mixed blessing for the study of ancient Rome (Harrison 2008). While it has meant that Rome has received much closer attention than many other early empires – such as Achaemenid Persia, the Hellenistic kingdoms of the Abbasid Caliphate – the repeated comparisons have introduced many anachronisms. Among these have been debates over the economic motors and costs of Roman imperialism, and over its civilising or brutalising effects. To some extent this remains the case in contemporary comparisons between Rome and America and even with postcolonial interpretations of ancient Rome, which sometimes seem tinged with postcolonial guilt. The best comparisons have in fact repeatedly drawn out contrasts between ancient Roman and modern European imperialism, and exposed the ideological component of claims to the contrary (Brunt 1965; Malamud 2009). It has even been suggested that we should not employ the term "imperialism" to describe Roman expansion, so as to avoid importing connotations of competing hegemonies led by modernising nation states (Veyne 1975): those who follow Lenin's notion of imperialism as a distinct stage of capitalism (1934) would also have to reject the label as it applied to Rome.

In practice it is not feasible to dispense with the labels "empire" and "imperialism," as similar problems face any alternative terminology. The most thoughtful recent approaches treat Rome as one of number of similar political entities often termed early empires. Depending on the focus of the analysis these are often qualified as tributary empires (in relation to their political economy) or pre-capitalist or pre-industrial if their economic life or technology seems more important. Broadly similar to Rome would be the sequence of Chinese empires that began in 221 BCE with the creation of the Qin dynasty, a series of empires based on the Iranian plateau including those of the Achaemenid, Parthian, and Sassanian dynasties,

probably the Neo-Assyrian Empire that controlled Mesopotamia and surrounding states in the first half of the last millennium BCE, a series of empires based on the Indo-Gangetic plain beginning with the Maurya dynasty of 322–185 BCE, the larger Macedonian-ruled kingdoms that divided the territory of the former Achaemenid Empire in roughly the same period, and a series of much later New World empires including those of the Aztec and the Inka. Each of these represented a system of political domination created by one people through the conquest and intimidation of a number of other peoples and often by the absorption of a number of earlier states. Typically they were sustained by exactions of labour (military and other), of agricultural produce, and of metals, and typically much of this was spent on rewarding various privileged populations or classes and supporting military forces. Most of these entities invested in infrastructure – roads, canals, fortifications, storehouses, and ports – and in ceremonial and monuments. Almost all were ruled by autocrats. Most (with the exception of the New World examples) had iron metallurgy; most used writing and had imperial systems of weights and measures. None had any source of energy beyond human and animal labour, and none had any system of communications faster than a sailing vessel or a relay of riders or runners could provide.

There is disagreement on the most appropriate boundaries of this analytical category. Some scholars would include some of the earlier and generally smaller expansionist states of the Bronze Age Near East, including New Kingdom Egypt, and analogous states in Central and South America like that of Wari, and some would include the shortlived hegemonies exercised by powerful city states over their neighbours in city state civilisations (see Hansen 2000, 2002). Whether medieval and early modern empires were essentially similar is also debated. A number of recent synoptic studies deal with these questions (Alcock et al. 2001; Bang and Bayly 2003, 2011; Morris and Scheidel 2009). Some of these draw on historical sociologies of empire (Doyle 1986; Eisenstadt 1963; Hardt and Negri 2000; Kautsky 1982). Despite these

disagreements over the proper limits of comparison, consideration of at least some other early empires provides a useful perspective on Roman imperialism. In particular, comparative analysis often reveals what was unique or unusual in the solutions Romans adopted to problems that were widely faced by early imperial powers, such as peripheral revolts, the integration of minorities, or the formidable limitations on long-distance communications before the industrial revolution.

The Phases of Roman Expansion

The full story of the growth, stabilisation, and collapse of Roman political domination can only be sketched out here (see Champion 2004; Nicolet 1977; Woolf 2012). Roman tradition dated the foundation of the city to the middle of the eighth century BCE, and archaeological research suggests that the site of Rome was at least occupied by that point. The institutions of a city state emerged around the seventh and sixth centuries BCE, probably a little later than in Etruria (Tuscany) just to the north or in the areas to the south where Greek cities were created. During the first half of the last millennium BCE, urban settlements and archaic states were created all around the Mediterranean and Black Seas. By the fifth century BCE some larger states – Athens, Sparta, Syracuse, and Carthage are the most famous – were coming to dominate their neighbours. Rome was not in quite the same league as these powers, but was probably already expanding at the expense of its immediate neighbours. During the fourth century BCE Rome first defeated the largest of the cities of southern Etruria, Veii, and then extended its control over its Latin-speaking neighbours and the hill tribes of central Italy. Wars fought almost every year, supported by contingents from its defeated "allies," extended a hegemony over most of Italy south of the Apennines, although this was not expressed in regular extraction of tribute, and most of the cities and people of the peninsula remained autonomous even if they had lost effective control of their foreign relations. A demonstration of the resilience of Roman control came in 280–275 BCE when Tarentum, one of the largest Greek cities of southern Italy, persuaded Pyrrhus, King of Epirus, to cross the Adriatic and challenge Rome. Although successful in several battles, Pyrrhus was unable to establish a power base, and his retreat in effect solidified Roman control of Italy. This was also the period in which Greek writers noticed the rise of Rome, and from this point on a more precise and accurate kind of history can be written.

The Mediterranean world in the third and second centuries BCE was dominated by a small number of political hegemonies. In the east the Achaemenid Empire conquered by Alexander the Great had been divided between three large kingdoms – Seleukid Syria, Ptolemaic Egypt, and Antigonid Macedon – and a number of smaller states that aspired to the same status, among them the kingdoms of Bithynia, Pontus, and Pergamum in Asia Minor and that of Epirus in the Balkans. Between and around them were cities, leagues of cities, and tribal peoples like the Thracians, variously allies, suppliers of mercenaries, and victims of the wars between the Great Powers. Some cities, like Cyrene, Corinth, Athens, and Rhodes, were larger players than others. West of the Adriatic Rome had only one serious rival, the city of Carthage close to modern Tunis, which exercised a loose control over other Phoenician foundations in north Africa, western Sicily and southern Spain. Sardinia and Corsica, the remainder of Mediterranean Spain, and most of southern France outside the small area controlled by the Greek city of Marseilles and her colonies were settled by tribal peoples with little resembling cities or states. By the middle of the second century BCE Rome had established effective hegemony over the entirety of these regions.

A series of wars with Carthage (the Punic Wars) in 264–241 BCE, 218–201 BCE, and 149–146 BCE gave Rome control of the western Mediterranean. The first Punic war was fought largely over Sicily and resulted in Rome becoming a naval power, as well as the creation of the first overseas provinces in Sicily, Sardinia, and Corsica. The second Punic war saw Hannibal cross the Alps but then be driven out of Italy, and Rome assert control over the entirety of Mediterranean Spain. Carthage was destroyed in

R

146 BCE and Rome established a foothold in north Africa; the Macedonian kingdom was defeated in 197 BCE and the Syrian kingdom in 188 BCE. Rome did not immediately annex any territory east of the Adriatic, and to begin with seemed content to extract plunder, disrupt local hegemonies, and leave the region in the control of its allies. This proved unsustainable or at least unstable. Macedon was again defeated in 168 BCE and the kingdom was abolished, to be replaced with four city states. Rome soon fell out with most of its east Mediterranean allies. The last king of Pergamum left his kingdom to Rome in his will, and so by the end of the second century Rome had provinces in the Balkans and western Asia Minor, had obliterated the ancient city of Corinth as an example of what happened to defiant allies, and seemed to contemporary observers like the Greek historian Polybius to be the undisputed ruler of the civilised world. Rome had not, however, developed very efficient institutions of control and relied on public contractors to extract revenue, basing no troops and very few officials in the east, and expecting both conquered territories and other powers (like Egypt) to accept orders from Roman envoys. When Mithradates, King of Pontus, invaded first the Roman province of Asia and then southern Greece he was able to exploit Rome's unpopularity, and Rome briefly lost control of all her possessions east of the Adriatic. That crisis coincided with a major rebellion by most of Rome's Italian allies. The first half of the last century BCE was largely spent re-establishing Roman control (Morstein Kallet-Marx 1995).

The instruments through which the Roman Republic took its empire in hand included armies serving for long periods overseas, the beginnings of a tributary structure, and the concentration of power into the hands of a small number of generals. Some of these were successful in using that power to extend Roman control well beyond the Mediterranean littoral. Between 67 and 62 BCE Pompey first co-ordinated a Mediterranean-wide elimination of piracy and then campaigned throughout the Near East: his armies reached the Caspian and in Mesopotamia the boundaries of the Parthian (Persian) Empire. Between 58 and

52 BCE Julius Caesar took control of all non-Mediterranean France, campaigning up to and beyond the English Channel and the Rhine. Civil wars, drawing on the same resources as conquest, interrupted campaigns but also fuelled the competition for glory and booty and led to the acquisition of new territory, most notably Egypt in 30 BCE. Caesar's great-nephew Augustus, the first emperor of Rome, masterminded campaigns that between 15 BCE and 9 CE extended Roman control to the Rhine and Danube. Other campaigns took place in Armenia, Spain, Africa, and Arabia. On Augustus's death in 14 CE the entire Mediterranean basin and much of its hinterlands were controlled either by provinces or through client kings. Some of those kingdoms were converted into provinces in the course of the first century CE. Wars of conquest in Britain began in 43 CE, continuing sporadically but never taking permanent control of more than the lowlands of Scotland. The German frontier was advanced from the Rhine to the Neckar at the end of the first century AD, and most of modern Romania (Roman Dacia) was conquered soon after.

The early second century CE marked the highwater mark of Roman power. A series of attempts to conquer Mesopotamia (modern Iraq) were made, and there were successful campaigns on several occasions through to the end of the fourth century, but a permanent presence was never established. From the last second century CE the empire came under more pressure. A 50-year period of chaos in the third century was marked by invasions, rebellions, a short-lived fragmentation, and an exceptionally rapid turnover of empires. The empire survived but lost the most recently conquered territories on the northern frontier. At the end of the fourth century large numbers of Goths crossed the Danube, and they were followed in the next two generations by more tribes, some coming across the Rhine. Control over first Britain and then northern Gaul was lost during the fifth century, and Spain and Africa followed. By the sixth century all territories west of the Adriatic were controlled by Germanic kingdoms, some making use of Roman institutions and bureaucrats. An attempt by the eastern emperor, now based in Constantinople, to reconquer parts

of the west later in the century met with limited success. Meanwhile Roman frontiers in the east were under intermittent pressure from the Persians. Around the middle of the sixth century, while eastern Roman armies were campaigning in Italy, the Persians sacked Antioch in Syria. Fresh invasions of Italy and the Balkans from the north followed, and in the early seventh century Rome lost Jerusalem and Egypt to Persia. The Persians did not enjoy their control of the Near East for long. In 636 Arab armies defeated the Romans at the battle of Yarmuk, but by 651 they had destroyed the Persian Empire and by 711 they had conquered all of north Africa and invaded Visigothic Spain. Byzantium survived as a micro-empire surrounding the Aegean Sea.

The key stages of Roman expansion may be summarised as follows:

1. c.500–275 BCE: Slow incremental extension of power within Italian peninsula.
2. 275–73 BCE: Progressive elimination of rival hegemonies within the Mediterranean basin.
3. 73 BCE–9 CE: Period of accelerating expansion including conquest of half of temperate Europe, Egypt, and most of the Near East.
4. 9–132 CE: Period of general consolidation with limited conquests and the absorption of client states into provinces.
5. 132–378 CE: Period of pressure largely survived with only some territorial losses.
6. 378–717 CE: Period of accelerating contraction.

The first part of this pattern closely resembles a trajectory followed by some other empires. The rise of Qin during the Warring States period was slow until the last generation, when it accelerated rapidly and then stopped in a moment of institutional consolidation that laid the foundations for Han China. The creation of the Achaemenid Empire too began with a slow rise to power of the Medes and Persians followed by the rapid conquest of Assyrian, Babylonian, Egyptian, and Lydian kingdoms and a period of institutionalisation under Darius. The Inka created their empire in less than a century, again by absorbing a series of well-established polities

and connecting them up with a new infrastructure. Historical sociologists sometimes describe this as a shift from "conquest state" to "tributary empire": that is, a set of institutions based on and supporting expansion came to be replaced – often after a crisis – with a new set of institutions invested in sustainable dominion. The current scholarly focus is on the expansion-bearing structures of the Republican period, and for the Principate on the means by which consent was secured from the empire's subjects. These emphases have largely replaced approaches that sought to understand the reasons for Roman expansion in the Republic and for Roman "stagnation" under the emperors, in terms of the motivations of leading political actors, and/ or else in terms of institutional or cultural exceptionalism. Those earlier approaches reflected ancient understandings of the rise of Rome.

Ancient Understandings

Ancient explanations of the rise of Rome tended to invoke the virtue and piety of the Romans, the excellence of their civic institutions, and the favour of the gods (Ferrary 1988; North 1993). So Ennius, the great epic poet of the second century BCE, wrote in *Annals* (a fragment cited in Cicero, *Republic* 5.1), "Moribus antiquis res stat Romana virisque" ("The Roman state depends on ancient customs and on its men" – or "... on its manhood," since virtue and manliness are denoted by the same word in Latin). This tended to be understood in terms of the cumulative virtue of individual Romans, especially of members of the propertied classes who supplied civil magistrates, priests, and generals. The first emperor, Augustus, represented this tradition when he filled the forum built around the temple of Mars Ultor (Mars the Avenger) with more than 100 images of *summi viri,* great Romans of the past who had extended the power (*imperium*) of the Roman people. Each statue was accompanied by a label that listed the individual's magistracies and priesthoods and the victories he had achieved. Alongside these were statues of the founders of Rome, Romulus and Aeneas, of the divine ancestors of the Romans

R

and of Augustus' family, and of Augustus himself (Geiger 2008). A separate monument in the forum Romanum bore lists (*fasti*) that named all the Romans who had held the supreme magistracy – the consulship – and separately all those who had ever celebrated a triumph. Public monuments of this kind picked up a much older tradition. The family tomb of the Scipiones on the via Appia includes a series of sarcophagi with labels that for each prominent member of the family list their greatest (generally military) achievements. The announcements that Augustus made at the inauguration of his forum and the temple of Mars Ultor proclaimed that the deeds of the greatest Romans of the past would be a model for him and his successors to follow: young male members of the aristocracy underwent many of their rites of passage against the backdrop of these monuments.

The relationship between the Romans and their gods was thought of more collectively. Prodigies and omens were reported to the senate; colleges of senatorial priests were charged with devising and carrying out rituals to ensure the gods remained supportive; wars had to be declared according to particular rituals; generals consulted the heavens before going to war, made battlefield vows for success, and on their return set up temples to the gods concerned to acknowledge their help. The ever-evolving ceremony of the triumph brought the entire city together in a collective restoration of the peaceful order and a display of honour shared by the aristocratic general, the citizen army, and the gods themselves (Beard 2007; Östenberg 2009). Yet even in these collective ceremonies, individuals asserted themselves. Successful generals added the names of defeated peoples or places to their own, both in ordinary usage and on monuments (so Fabius Maximus Allobrogicus after the Allobroges he defeated in the middle Rhône valley, and Publius Cornelius Scipio Africanus for his victories in the Punic Wars). The streets of Republican Rome came to be lined with victory temples, often fulfilling vows made on the battlefield by generals who paid for them from their share of the booty, and were eventually decorated with art works that commemorated the triumphs of the Roman

people (Holliday 2002). Temples of this kind were often maintained by the aristocratic descendants of the dedicator, and at noble funerals distinguished ancestors were animated by actors who wore effigies of the dead and robes appropriate to their status, while the military exploits of the deceased were rehearsed in speeches.

More generally, warfare was a central location for building fame. Wars lay at the centre of the epic poetry of Ennius and his predecessors, and then of Latin historiography. When Ennius's patron Fulvius Nobilior returned in triumph from campaigns in the Balkans, he created a great temple and precinct where plundered statuary was displayed, and sponsored a play about his victories. Individual achievements and the interests of the Roman people were repeatedly elided. Conversely when things went wrong it was often the result of inadequate ritual preparation on the part of the generals, or occasionally of other members of the senatorial order: a Vestal Virgin who broke her vow of chastity was sometime identified and punished with death. During the civil wars of the late Republic some orators and historians began to blame military and civil disasters on a general falling away of moral standards, the corrupting effects of luxury, contamination by alien values, and the like (Lintott 1972).

Institutional explanations for the rise of Rome were produced in parallel to these internal moralising debates. The Greek historian Polybius, who spent much of his adult life in Rome as an honoured hostage, attributed Roman success to what we would term the comparative advantage of its institutions. The Roman political system was a judicious blend of monarchical, aristocratic, and democratic elements, and its military and religious institutions were superior to those of its rivals. The concepts Polybius employed were derived ultimately from the political philosophy of Aristotle and Plato, but they were not felt to be in conflict with native Roman ideas about the importance of virtue. Greek thinkers did not see political institutions in the way Hobbes did as a remedy for the brutalities of the state of nature, but rather as means of establishing ways of life in which humans naturally reached their full

potential. Although often ascribed to Aristotle, this idea was traditional: Xenophon had ascribed Spartan success to the perfection of its institutions and the habits they inculcated, and so it was natural for Polybius to move from the Roman constitution to Roman conduct. At least some of his Roman contemporaries would have agreed, even if others might have stressed the particular favour the gods showed to peoples of particular piety. Roman leaders were, on the whole, careful to establish that their wars were justified, both to ensure divine favour and to win the support of the popular assemblies that voted on war and peace. But these justifications, achieved by rhetoric and ritual, were focused on individual conflicts. Only in the last generation of the Republic did the notion emerge that Romans had a general mandate to conquer the world and rule it well (Brunt 1978; Ferrary 1988).

Ancient writers spent much less time trying to explain why Romans fought so many wars. One reason is that most ancient states were both warlike and engaged in sporadic disputes with their neighbours. City states generally fielded citizen armies, and military training was often a key part of the process by which young men became full citizens. Tribal communities seem also to have embraced a warrior ethos, to judge from grave goods and art works like Situla-Art of the Alps or the Gundestrup cauldron from Denmark. The question was not so much why cities and peoples came to blows, but rather why some did so more successfully than others. Thucydides had dramatised a debate on this theme between the Athenians and the Melians in the second book of his *Peloponnesian War*: the Athenians refuse to spare the Melians, on the ground that the strong always do what they can and the weak suffer what they must. A Roman legend told how when the Gauls were extracting indemnities from the Romans they were caught using false measures to weigh out gold. When challenged a Gallic chief pressed down the scale with his sword exclaiming, "Vae victis!" (Woe to the vanquished!; Livy, *History of Rome* 5.48.9). War was a normal state of affairs, and what was special about the Romans was not that they fought wars, but that they were so successful at doing so.

Explaining Expansion

The modern debate over the origins of Republican imperialism has taken a more tortuous route than that followed by ancient explanations. On the basis of the Roman notion that only just wars received divine support and on Roman accounts of the origins of several conflicts, it was for a while argued that Rome expanded accidentally, along the lines of Sir John Robert Seeley's quip that the British "conquered and peopled half the world in a fit of absence of mind" (1914, p. 10). Romans, according to some, practised "defensive imperialism," responding only to external threats and finding themselves rather surprisingly in command of the world as a result. Support for this view was found in the supposed slowness of Romans to convert victories in the east into territorial provinces or to assume the imperial responsibilities to which their military success seemed to entitle them.

That view was comprehensively demolished by the demonstration that Romans consistently displayed attitudes that supported warfare, celebrated victory, and rewarded successful generals (Harris 1979, 1984). Among the institutions that cohered well with expansion were the practice of requiring defeated peoples to supply troops for further campaigns (Gabba 1976); the ritual of the triumph that marked the end of a successful war (Beard 2007); and a series of devices for expanding the citizen body, and so the citizen army (Raaflaub 1996). Warfare was not an absolute constant: there were periods of greater and less mobilisation. If Roman warfare was not primarily defensive there were certainly some wars that Rome did not choose, as when the King of Pontus invaded Rome's eastern provinces in the early last century BCE or when migrations penetrated the Mediterranean world from temperate Europe (Rich 1993). But in general it is fair to characterise the Roman Republic as a society geared for war, and in some respects dependent on warfare to satisfy the demands of its aristocracy and people for glory and booty.

That gearing naturally encompassed economic activity of various kinds. Rome had no independent mercantile class that might lobby for

R

annexation. Indeed annexation reduced some opportunities for profiteering, as in the case of the slave trade (enslavement was in principle illegal within the empire), and because provincials had from the middle of the second century BCE some recourse to Roman justice that those outside the empire did not. There were no ancient equivalents of the chartered joint-stock companies that played such prominent parts in British, Dutch, and other European imperialisms from the seventeenth century on. Corporations had very little place in Roman law, the closest equivalent being short-lived *societates* – partnerships – which tendered for public contracts. The economic basis of pre-capitalist and capitalist imperialism was naturally very different.

All the same most sectors of Roman society benefited from expansion, directly or indirectly. Successful generals brought back great amounts of booty, and their personal share of it was not limited to what was spent on the gods or on triumphal feasts and games. Citizen soldiers and allies alike also received shares of the booty. The proceeds of conquest were spread more widely. The defeat of Macedon in 168 BCE was followed by the abandonment of direct taxation of Roman citizens in Italy. The sacks of Carthage and Corinth in 146 BCE were followed by a great aqueduct-building project, and monuments were set up in Italian allied cities as well as in Rome. Public building did not only benefit citizens by creating a more splendid built environment and sponsoring festivals within it. Army supply, the extraction of revenue, and its expenditure in building projects all came to rely on public contracts, generally issued by the censors in Rome. These contracts included the construction of public basilicas, paved forums, and roads, in Roman colonies as well as in the city itself. Only citizens could take public contracts, and in principle senators were forbidden to be principals. But great amounts of property were needed to guarantee larger contracts, and it is clear that behind the main contractors (*publicani*), who were often members of Rome's junior aristocracy, the equestrian order, there were senatorial backers. Polybius claimed in his Histories (6.17) that as early as the first half of the second century BCE "everyone" in Rome was involved. For a brief period in the last century BCE, when some contracts were very large, especially that for gathering the taxes of Asia, these bids and their five-yearly renewals did have political ramifications. But in general the propertied classes all benefited from empire.

Provincial populations bore the brunt. During the last century BCE in particular Roman power was exercised at the expense of provincial populations in many ways. Through plunder and purchase, the wealthy extracted cultural products from the Greek world – books and educated slaves as well as bronze and marble statuary and craftsmen. Caesar's campaigns in Gaul removed so much bullion from the region that silver and gold coinages were effectively extinguished north of the Alps. Large sums of money were occasionally lent to provincials at extortionate rates of interest, in the knowledge that the governors would allow the creditors to use Roman soldiers to recover what they were owed if borrowers defaulted. All this paid for grand villas and town houses, and also the bribery of electors and jurors. Verres, prosecuted by Cicero for corruption while governor of Sicily, was quoted as saying that he needed to extract three fortunes from his province, one to repay those who had elected him, another to bribe those who would try him on his return, and a third for himself (Cicero, *Against Verres* 1.1.40). Cicero's speeches allude to many other corruption trials, and a series of laws were passed from 149 BCE onwards aimed at recovering money embezzled by governors. Stories of violence and torture also circulated, and the cruelty and greed of Roman officials and tax-farmers form a regular part of the explanations offered in this period for revolts and anti-Roman movements. At the beginning of his *Annales*, Tacitus wrote that the provinces were unperturbed by the fall of the Republic because they had suffered so much from the feuding generals and corrupt officials and had no faith in legal redress in Rome (Levick 1994).

One other group which seems to have lost out in the process was the free peasantry of Italy, some at least of whom found their small holdings swallowed up by large estates, worked in part by

slaves. The absence of peasants on long campaigns and the enrichment of the generals that led them have been seen to be contributory factors, but the scale and timing of these changes are disputed (Hopkins 1978; Rosenstein 2004). Slaves never completely replaced free peasants, who still played a part in the agricultural regimes of Italy during the principate, and few subscribe to the thesis that imperial expansion was driven by the demands of a "Slave Mode of Production" (Rathbone 1983).

It is unsurprising, of course, that Rome in its expansionist phases had the institutions and ideologies that cohered with expansion (North 1981). But it is less obvious that those institutions and ideologies actually explain expansion as Polybius argued. A full explanation in terms of comparative advantage would have to look at Rome's rivals – Veii, Carthage, Macedon, and so on – and assess differences in institutions and how they fitted with differences in success or policy objectives. Multistate analysis of this kind, making use of political theory, has only just begun (Eckstein 2006, 2007). Besides, Roman institutions and ideas were in constant flux. Most importantly, innovations often seem to have been *reactions* to expansion, not preparations for it. Broadening access to citizenship came in practice as response to a series of crises in Rome's relations with her allies. The balance of power between magistrates and civil institutions that Polybius praised had in fact to shift over time as generals served further and further away from Rome and for longer periods. Perhaps the best illustration is provided by recent studies of the language of Roman imperialism (Richardson 2008). Romans developed territorial senses of *provincia* and *imperium* only in the last century BCE, long after they had *de facto* acquired first foreign possessions and then an identifiable sphere under permanent control. The same time lag is evident in the development of provincial taxation, in the elaboration of the role of governor from simply a military commander to a judicial official and plenipotentiary representative of Rome in the provinces, and in the gradual shift from annual citizen levies to what were in effect professional armies that might serve for years on end and needed to be re-integrated into

society when they were disbanded. In each case these changes responded to expansion rather than being designed to facilitate it.

The period of fastest expansion was partly driven by the failure of annual campaigns around the Mediterranean basin to stabilise Roman hegemony. The victories of the second century were followed by the return and disbanding of Roman armies. No garrisons and no administrations were left behind. A system of military commands that emanated from a competitive political system meant that even when there were a number of armies and generals in the field at the same time there was no guarantee that they would co-operate. Rome depended for information on embassies sent by her allies, who were often rivals. Much of the history of the second century BCE seems to have been driven by competition in the periphery, and when that became engaged with factionalism in the centre the effects could be very disruptive. Finally, there were some intrinsic difficulties facing any power that wished to control the Mediterranean world. One was a high incidence of piracy and banditry, which thrived in periods of political fragmentation: Hellenistic kingdoms had struggled to maintain some order and their defeat by Rome made the situation worse. A second problem was ecological in origin: strong economic and demographic ties existed between the societies of the Mediterranean littoral and those of its mountainous hinterlands. This meant that it was in practice impossible to control what is now Aegean Turkey without exercising influence over the Anatolian plateau; that Provence and could be governed if only the populations of the middle and upper Rhône were subjects or allies; and so on. From the late second century BCE onwards Roman armies were repeatedly drawn into the hinterlands of the Mediterranean World, and this required larger armies and greater co-ordination. Once these were supplied the results were at first impressive. During the last century BCE a series of generals, beginning with Marius and Sulla, showed what one general could achieve given very large forces for a substantial period of time and more or less freedom of action to make war and peace on whom he saw fit. "Peripheral imperialism" enabled Pompey to

conquer and settle much of Anatolia, the southern Black Sea coast, and the Near East, and allowed Caesar to make similar conquests in the north-west (Richardson 1986). Yet neither these large armies nor their generals could easily be contained with the institutions of the city of Rome. The logic of these developments was the shift from Republic to monarchy. One of the first acts of the first emperor was to create a professional army bound to himself and his family, and paid for from hypothecated tax income and a military treasury. In that sense the Roman Empire was a product of Roman imperialism.

None of this helps to explain, however, Rome's *initial* success. If it did not depend on extraordinary institutions or the virtue of generations of Roman aristocrats how are we to explain it? One answer is to set it in the context of wider histories of political growth in the Mediterranean world (Garnsey and Whittaker 1978). The size of political systems was increasing and their number decreasing over the last millennium BCE, presumably as a result of competition within an open system, economic growth and some advances in communications. The question then becomes why was Rome one of the eventual winners? Geopolitics might help. Rome benefited from a central position first within Italy, and later within the Mediterranean basin. Perhaps too Rome's position on the margin of politically plural systems helped: it was on the edge of the Etruscan city state civilisation, and later on the edge of the Hellenistic kingdoms, and that position (also enjoyed by Qin in the Warring States period, or Macedon in the fourth century BCE) seems to sometimes confer an advantage. Complexes of peer-polities often advance together, but sometimes tend to limit the rise of any one polity, through alliances of the others (Ma 2003; Renfrew and Cherry 1986). Change, or contingency, played a part too. Roman schoolchildren liked to debate what would have happened had Hannibal marched on Rome after Cannae, and Greek writers occasionally wondered what would have happened had Alexander marched west. We might also wonder how close Rome came to defeat in the Mithradatic Wars, or much later in the third-century crisis.

The Tributary Empire

If a conquest state is a polity dependent on constant expansion, a tributary empire is similarly invested in more sustainable and stable institutions (Bang and Bayly 2011; Crone 1989). Its political economy is based on regular exactions which are largely redistributed to the military, to officials, and to those who occupy privileged positions in the hierarchy of power. The rulers of tributary empires typically seek to reduce their transaction costs – imposing the running costs of empire on local elites, tax farmers, and the like – and they have few ambitions beyond retaining and passing on their power. Empires of this kind have been among the most stable political in world history, often enduring for centuries (Arnason and Raaflaub 2011). Typically they are characterised by universalising ideologies, and their rulers actively suppress signs of change and information about opposition (Bang and Kolodziejczyz 2012; Yuge and Doi 1988).

Rome extracted no revenue from its military supremacy until after it dominated the whole of the Italian peninsula. Campaigns paid for themselves, and the defeated contributed levies to future campaigns. Hellenistic kingdoms, by contrast, most of which were in effect successor states to the Achaemenid Persian Empire, had complex taxation systems. Once Rome began to extend its power overseas it encountered and incorporated some of these systems, and also began to need (or desire) greater revenues. One of the first fiscal systems taken over by Rome was a tithe levied on the cities of the kingdom of Syracuse by the third-century king Hiero II. After the second Punic war this system (the *Lex Hieronica*) was extended to the whole island province, and its revenues redirected to Rome. The same war brought Rome control of much of Mediterranean Spain, including silver mines near Cartagena. That conquest, and a need to provision Roman armies based for long periods in Spain, led in the second century to a regular levy on subject communities, the first provincial tax system devised by Rome (Richardson 1976). When the kingdom of Pergamum was acquired in 133 BCE the royal tax system was incorporated in the same way as the

Syracusan one had been (Cottier et al. 2008). The administration of Roman Egypt owed much to Ptolemaic precedents, which in turn drew on a deep sedimentation of Persian and Pharaonic systems. Probably there were other examples of this that are simply less well documented.

The transition from conquest state to tributary empire was not a sudden one. Roman armies of conquest never stopped extracting booty from conquered peoples. The Romans' initial response to the defeats of Carthage and Macedon was to impose indemnities to be paid in annual instalments over long but not indefinite periods. Only when those states were abolished was more regular taxation substituted. The tributary empire grew up within the body of a conquest state. The crucial period of change was the reign of Augustus, the first emperor, when provincial censuses were conducted across the empire with the aim of fixing permanent tax obligations. Ordering the empire was by no means a dry, bureaucratic process but was intimately linked to the creation of new universalising ideology of power, expressed in poetry and public monuments (Galinsky 1996; Gros 1976; Nicolet 1988; Zanker 1987). By the time of Augustus's death in 14 CE most of the empire was subject to taxation, only Italy and a few privileged cities enjoying exemptions from the land tax. Local civic elites collected most of the land tax, overseen by imperial exslaves and junior aristocrats named procurators, who also managed the emperors' own extensive provincial possessions and helped supply the army. Soldiers assisted the procurators where necessary, for example in escorting tax grain or bullion. There were also indirect taxes, for example on freeing slaves and on sales, many of them still managed by tax farmers (Brunt 1990). There were internal tariffs on trade between groups of provinces (France 2001). Over time tax-farmers seem to have been replaced by officials but it was a slow and patchy process, more a sign of a shift in imperial attitudes to government than of any global reorganisation. Bizarrely as it seems to us – but quite normally for a patrimonial empire – the whole was co-ordinated not by some central agency, but within the emperor's own household (Suetonius, *Divus Augustus* 101).

If the main lines of a tributary empire had emerged during the penultimate decade of the last millennium BCE with the first great provincial censuses, Rome continued to behave in some ways as a conquest state for some time longer. Augustus himself followed up this reorganisation with a long series of campaigns in temperate Europe that consolidated Roman control of Caesar's conquests and the Balkans and advanced armies up to and temporarily beyond the Rhine and the Danube. A series of defeats, culminating in a major disaster in 9 CE, slowed expansion. But there were further wars in Germany under his successor Tiberius and on the English Channel under Gaius, and under Claudius Britain was invaded. Later in the first century CE there were campaigns in south-west Germany as well as in Britain, before Trajan's spectacular wars in metal-rich Dacia in the early second century on the basis of which he created the greatest of the imperial forums in Rome, equipped with libraries, monumental statues, and the column that bears his name. One reason for these occasional expeditions – often undertaken by emperors who needed to demonstrate their ability – was that even if Rome's political economy was no longer geared to war, Roman public ideology could not dispense with the connection between virtue and warfare. All emperors were represented on statues, on coinage, and on monuments in military dress, all tried to maintain a close relation with the troops, and serious instability occurred only (in the third century) when emperors seemed no longer able to be effective war leaders. Another reason was that in many areas there was no obvious natural frontier: several expeditions in Britain and Germany do seem to have been designed to find limits that might be more cheaply and efficiently controlled. Yet the fact that the empire barely expanded beyond its Augustan limits indicates that on some level emperors understood that they had more to lose than gain by reckless and expensive campaigning. Tiberius understood the bottom line when he told one governor that he wanted his sheep shorn, not flayed.

Much remains unclear about early imperial tax systems. Taxes might be levied in cash or kind, and although kind presumably mostly meant

R

agricultural produce examples are known of levies of other materials such as hides. But it is difficult to estimate the scale of monetised taxation. There was certainly wide variation in taxes and in mechanisms for their extraction: wherever we can see local arrangements in detail they are peculiar to that province or region. Everywhere the burden fell disproportionately on the poor and on those who were not Roman citizens. Evidently the emperors had no interest in creating empirewide systems, standards, or even tax rates. To the end of the third century CE, the tax system was really an agglomeration of local systems designed in different periods according to different principles, subsequently emended and supplemented, and run in a range of traditional ways (Brunt 1981). A number of inscriptions which stated exactly which taxes were current show that the system confused contemporaries as much as it does us.

If the emperors were not interested in rationalising systems there were nevertheless some consistencies in the kind of order they created through this mixture of violence and institutional bricolage. Most obviously they enlisted the help in all parts of their empire of the local ruling classes (Brunt 1976). Tribal chiefs in Gaul and Palestine, the priests of Egyptian temples, the wealthier members of Greek cities, kings in the Alps, the Atlas, and Anatolia, all were brought into a great coalition of interest, and tied through marriage, ceremony, and honours to the rulers of Rome. The pattern is familiar from other imperial systems (Cannadine 2001; Galtung 1971). This was a key difference from the Republican empire, which first in Italy and then around the Mediterranean had failed to include local rulers among the beneficiaries of empire.

Control and Its Limits

The Roman Empire at its peak contained around 60 million people, perhaps 20% of the global population. Its army never exceeded 500,000 men and was usually much smaller. It is evident that control could not depend on coercion alone.

It is widely agreed that a fundamental factor stabilising the empire was the fact that it served the propertied classes of the societies within it. Not only were they partners in extracting revenue. Many enjoyed the status of citizens, and by the second century the "better sort of people" (termed *honestiores*) enjoyed privileged legal status too, being treated better than others in investigations and, if found guilty, in terms of penalty (Garnsey 1970). Many found it easy to participate in the governance of the empire, becoming auxiliary commanders, members of the equestrian order, and even members of the senate. A few enjoyed the friendship and patronage of prominent Romans and even the emperor (Saller 1982). Interest was converted, at least among some of them, into a sense of membership and adherence to the imperial order. When dynasties collapsed new ones were put into place by alliances of courtiers, senators, and soldiers, all of whom had vested interests in the status quo. Beyond the wealthy it is difficult to gauge allegiances or opinion. Ceremony, ideology, monumentality, and governmentality together formed willing subjects in many places (Ando 2000). We know most about urban populations, especially those of Italy, but in those locations at least there are no real signs of disaffection. Urban populations, and not just their rulers, participated with enthusiasm in ruler cults of all sorts (Cancik and Hitzl 2003; Price 1984; Small 1996). More generally it is evident that a set of empire-wide cultural practices, styles, and habits became routine (Woolf 1998). How often participation in this was experienced consciously as political adherence is very difficult to say.

The alternative is to concentrate on episodes of unrest (Bowersock 1987; Momigliano 1987; Shaw 2000; Woolf 2011). Relatively few are well documented, and although this probably partly reflects deliberate under-reporting, those that are mentioned occurred in broadly similar circumstances. A number of conflicts took place in the generation immediately after conquest, and seem to have been fuelled in part by the social convulsions and transformations that affected many societies (Dyson 1971, 1975). Areas close to the edge of the empire – whether the northern frontier or the Romano-Parthian borderlands – were more likely to experience revolts than other

regions. Revolts were more common in time of Roman civil war. Mountainous areas were more difficult to control than plains or coasts. None of this is surprising. Attempts to link these outbreaks of opposition to cultural differences (e.g., Bénabou 1976) have not convinced many. A number of local disturbances seem to have had mainly local roots (Goodman 1987): perhaps this would be true of most if we had better information. Few were serious: the main threats to the authority of emperors came either from their intimate circle (from which assassinations emerged) or from armies led by their rivals. There were surprisingly few military revolts of that kind before the early third century CE (Shaw 1983; Woolf 1993). In all these respects Roman imperialism seems very like that of other early empires.

Roy, Arundhati (1961–)

Rina Arya
University of Wolverhampton,
Wolverhampton, Staffordshire, UK

Definition

Arundhati Roy is an Indian novelist, essayist, scriptwriter, and political campaigner who is best known for her novel *The God of Small Things* (1997), for which she won the Booker Prize for Fiction. Since then she has concentrated on developing her interest in politics, as manifested in her essays and novel on a range of political subjects, some of which are specific to India while others are more global in outlook.

Arundhati Roy is an Indian novelist, essayist, scriptwriter, and political campaigner who is best known for her novel *The God of Small Things* (1997), for which she won the Booker Prize for Fiction. Since then she has concentrated on developing her interest in politics, as manifested in her essays and novel on a range of political subjects, some of which are specific to India while others are more global in outlook. Since the late 1990s she has maintained an active presence in the media through her contributions to newspapers such as *The Guardian*, where she has written about issues including the plight of oppressed groups in India, the Mumbai terror attacks, Kashmir, India's nuclear weapons programme, ecosystems, and violence against women. She has been described as a spokesperson but believes that this is a misrepresentation of her intentions, which are to raise awareness about inequality and advocate the right to freedom but not to represent or speak for any particular group. Although esteemed in the academy, Roy is reluctant to be allied to elitist institutions because she thinks that those in power exploit the powerless in such a way that the latter are simply unaware of what is happening to them (Roy 2004, p. 120).

Biography

Suzanna Arundhati Roy was born on 24 November 1961 in Shillong in Meghalaya, a state in the north-east of India, to a Syrian Christian mother, Mary Roy, and a Bengali father, Ranjit Roy. Roy's parents divorced when she was young and her mother took both her and her brother to live in her home town of Ayemenem in Kerala, a coastal state in the south-west of India. One of Kerala's most distinctive features is its relatively high percentage of Christians: while Christians make up only a tiny minority of the total population of India as a whole (about 3–4%), Syrian Christians in Kerala comprise 20% of the population of the state. The inter-caste marriage of Mary and Ranjit Roy and their subsequent divorce meant that neither she nor her children would be wholly accepted back into her community. Moreover, Mary Roy had jeopardised

the *tharavad* (the family lineage that is passed down from the father's side): 'If you don't have a father, you don't have a *tharavad* [sic]. You're a person without address' (Roy 2004, p. 5). Undeterred by these attitudes, Mary Roy, an ardent feminist, was determined to make the best start for her children by giving them a good education. In 1986 she won a legal case in the Indian Supreme Court challenging the Syrian Christian inheritance law that stated that a woman can inherit at most a quarter of her father's property (or 5000 rupees, whichever was less). Her case made history and changed the law to give women equal inheritance; furthermore the law was backdated to 1956. Passionate about education, Roy's mother founded two schools: a small primary school, and in 1967 Corpus Christi (now called Pallikoodam School) in the town of Kottayam. Roy benefited from attending her mother's schools, where she was encouraged to learn without the restraints of conventional schooling, a trait that would influence her throughout her life.

Roy left her mother's school in Kottayam when she was 16 to attend the Lawrence boarding school in Tamil Nadu. From there she moved to Delhi to study architecture at the college of architecture, where she met a fellow student, Gerard Da Cunha, who would become her first husband. After engaging in architectural projects, Roy and her husband decided to abandon their professional lives and moved to Goa, where they made a simple living selling hand-made goods on the beach. Within 6 months or so Roy had tired of this life and moved to Delhi, separating from Da Cunha after a four-year marriage. It was here that she began her creative life as a writer. In 1984 Roy met and married the film-maker Pradip Krishen. Roy wrote screenplays for some of her husband's films, including *In Which Annie Glues it Those Ones* (1989, published 2003) and *Electric Moon* (1992).

Although Roy never pursued a professional career in architecture, the influence that the subject had on her sensibilities and outlook cannot be underestimated. From an academic point of view, it developed her understanding of the sociological aspects of housing. As a discipline architecture enabled her to develop her ideas structurally, on many different spatial and temporal levels.

Through a multilayered framework she was able to explore the hybridity of different cultures, a characteristic that was displayed in her first novel. By her own admission, '[s]tudying architecture taught me to apply my understanding of structure, of design and of minute observation of detail to things other than buildings. To novels, to screenplays, to essays. It was an invaluable training' (Roy 2003, p. xii).

Another aspect of her life that continues to underpin her work is the quest for liberation. Her family circumstances meant that she was not fully accepted in society and had to struggle against conventional Indian society, which some 50 years ago was opposed to inter-caste marriage and divorce. Being displaced was a double-edged sword because, although it meant that she was made to feel like an outsider because of her background, it also freed her from the expectations placed on women to prepare themselves for marriage. By not belonging to a caste or religion and being exempt from pressure to conform, she was free to explore her own identity on her own terms.

The God of Small Things

Roy's novel is semi-autobiographical and excels in its powers of observation and imagination. Set in Ayemenem, a village in Kerala, it draws on Roy's own life experiences while using the symbolic power of nature, and in particular the changing of seasons, as a backdrop. The plot centres on a relationship between a low-caste carpenter, Velutha, and a Syrian-Christian divorcee, Ammu, and the narrative is told from the perspective of Ammu's twins Estha and Rahel. The key events concern the visit of their half-English cousin Sophie Mol and her mother. At the beginning of the novel we learn that Sophie Mol has drowned in the river by the family's house. The text shifts between the past and present registers, moving from 1969 to 1993; meaning is created through the knowledge generated by memory, flashbacks, and flash-forwards. The non-linearity is one of the most distinctive features of the novel and means that the reader has to avidly connect with Estha and Rahel, who tell and re-tell the story at different points in their lives: when they are seven as they observe things around then, and

then at the age of 31 when they are reflecting on the past and trying to make sense of it.

One of the most characteristic features of the novel is the attention to detail; seemingly trivial actions or aspects of nature are connected with larger political and social issues, such as pollution, class struggles, and immigration. We learn that society is still shaped by the caste system, which defined the position that people would occupy in life; even though it was outlawed in the Indian constitution in 1949, it continued to dominate society in a real and pressing way. The depth of her world view, coupled with the intricacy of her writing style means, that Roy is able to forge a connection between the different levels of social, geographical, and economic reality, an ideal that reflects the sensory richness of India. Roy states that in the book she:

> connects the very smallest things to the biggest. Whether it's the dent that a baby spider makes on the surface of water in a pond or the quality of the moonlight on a river or how history and politics intrude into your life, your house, your bedroom, your bed, into the most intimate relationships between people – parents and children and siblings and so on. (Roy 2004, p. 11)

The above quotation conveys a more central and ongoing aim in Roy's writing, irrespective of its type: 'all of her writing shares the aim of telling a story, building bridges between the small realities of people's lives and the immense social forces that affect them' (Higgs 2004, p. 17).

The novel's richness means that it can be discussed on many different levels. A popular strand of interpretation examines it as an example of post-colonial discourse, which sets out to contest ideas of universality and to impose singular frameworks of meaning. We hear instead the voices of the silenced others, who are given platforms on which to speak. By focusing on the Christian community, rather than the Hindu or Islamic communities, Roy presents a fresh perspective of postcolonialism in South Asia.

Since its publication *The God of Small Things* has continued to be enormously successful, having sold more than six million copies worldwide and been translated into more than 40 languages. However, it has also divided critics into those who

lauded Roy's rich use of language and intricate plot and those who were bemused by the somewhat convoluted narrative. The award of the Booker Prize in 1997 was not only an individual victory for Roy but also marked the growing significance of writers from former colonial states, including Salman Rushdie (*Midnight's Children,* 1981), Keri Hulme (*The Bone People,* 1985), and Ben Okri (*The Famished Road*, 1991).

Political Activism

Both before and after her critically acclaimed novel, Roy was active in the writing of political essays, which raises the question whether she should be primarily defined as a novelist or whether her novel simply represented a literary excursion from her central objective. For the purposes of classification a writer's works are often divided into categories of fiction and non-fiction, of which the latter involves discussion of social, political and economic ideas often relating to projects or initiatives that have been or are currently being carried out. However, Roy does not believe in a clear-cut distinction between the purposes of non-fiction and fiction. In her opinion, although fiction is rooted in the imagination and may not be fact-based, it still has the capacity to truth-tell; indeed non-fiction and fiction simply represent two different forms of storytelling. *The God of Small Things* is a case in point, where the reader learns as much about religious, ethnic, and cultural practices and traditions as she or he does about the characters in the story and their complicated family life.

Roy's intellectual energy and wide political interests explain the extent of her commentaries on subjects that she is passionate about. Broadly speaking, she is interested in factors that have shaped the identity of India, including its colonial past and more recently the impact of neoliberalism. At the heart of her interpretation is the struggle between power structures and how this is played out between states, societies, and people. Roy's principles about social activism govern her approach to her work in general, and she strives 'to never complicate what is simple, to never simplify what is complicated'. In addition, she aspires

R

'to be able to communicate to ordinary people what is happening in the world' (Roy 2004, p. 120).

Much of her criticism is levelled at what she deems to be pernicious practices of the Indian Government in exercising corporate control and militarisation. Capitalism has swept India with the government's active collusion, which is done under the aegis of globalisation and the global economy. Roy has defended the position of the Naxalite-Maoist insurgents, who she believes have been treated reprehensibly by a government which should recognise that these indigenous groups are trying to protect their land from corporate takeover, and should not view them as an internal security threat.

One of her main projects is the Narmada Bachao Andolan (NBA), a social and grassroots movement opposed to the construction of dams across the Narmada river and consisting of groups of people from different strata of society including adivasis (tribal groups throughout India), farmers, and human rights activists. In spite of the Indian Government's insistence that the dams will benefit the population, many communities have been displaced since the building of them began in the 1980s. The construction of the dams has threatened the homes and livelihoods of a vast number of people. The campaigning has been nonviolent, in keeping with Gandhian principles, or truth (*satya*) being attained through nonviolent means. Roy has been an active participant in the protests, and was arrested at the site of one of the proposed dams in the village of Sulgaon, but she escaped a jail sentence after paying a fine. Her donation of her Booker Prize money (about £50,000) to the organisation reflects her continuing commitment.

Like many other post-colonial writers, Roy is an active proponent of anti-globalisation and believes that modernity should not be incompatible with the preservation of traditions, arguing for the importance of sustainability. Roy argues:

> It's as though the people of India have been rounded up and loaded onto two convoys of trucks (a huge big one and a tiny little one) that have set off resolutely in opposite directions. The tiny convoy is on its way to a glittering destination somewhere near the top of the world. The other convoy just melts into the darkness and disappears. (2002, pp. 2–3)

Some critics may view her desire to write in English as inconsistent with the efforts to preserve the numerous vernacular languages in India, and as contrary to the objective, following Independence, to preserve Hindi as the national language of India. This is especially striking given that Roy is not an expatriate. An alternative view is that Roy intended to show the effects that colonialism had on the Indian psyche whereby English became synonymous with everything that was cultured and elite. In *The God of Small Things* she intersperses Malayalam words in the text to give a sense of the cultural exchange between different languages and dialects which is a trademark of communication in India even today.

One of Roy's most recent books, *Broken Republic: Three Essays* (2011), analyses the effects of India's economic policies on its people and the environment. The first essay is about the government's war on the forest-dwelling people in the state of Chhattisgarh as it attempts to mine the land's mineral supply. The second essay, 'Waking with Comrades', is a poignant piece about Roy's three-week journey into the Chhattisgarh forest and her time with the Maoist rebels who befriended her. This excursion symbolises her shift from her earlier position of nonviolent resistance. She discusses problematic cases where violence is justifiable: a violence of resistance, or type of counter-violence, as when defending human rights against the brutalism of governmental policies. Like other texts, *Broken Republic* combines Roy's allegiance to the people of India with her poetic mindset.

Roy's denunciation of the caste system is implicit in many of her texts, and is more explicit in her recent introduction 'The Doctor and the Saint' to B.R. Ambedkar's *The Annihilation of Caste* of 1936 (2014b). Ambedkar was a politician and social reformer who campaigned against caste discrimination and for rights for the Dalits. In a radical but undelivered speech, which was self-published, he criticised many ideas that were sacrosanct to Hindu values including the caste system, the effects of which he believed were ubiquitous in society. His radicalism stemmed from his advocacy of breaking up the caste

system, which he believed meant tackling it at its heart, that is, destroying religious ideas that upheld that tradition. Roy's support for his efforts to expose such systemic injustice is conveyed in her introduction to his book, which was published in 2014 by Navayana. The same year also marked the publication of Roy's stark examination of the invisible masses of Indians who, in their power-lessness, go unnoticed. *Capitalism: A Ghost Story* (2014a) is an examination of the real nature of democracy in contemporary India. Focusing on the gross inequality of the distribution of wealth, Roy tells the story of a nation of 1.2 billion people where there are pockets of wealth but also legions of 'ghosts' – the poor and the oppressed.

Controversy

Although it has not been Roy's intention to court controversy and it is certainly not her wish to be regarded as a celebrity, there have been occasions when she has been thrust into the spotlight. This is mainly because of her forthright views on develop-ment and class politics, which have offended the Indian upper classes and nationalists and marked her out as a dissenter. She came under scrutiny after the publication of *The God of Small Things* on a charge of obscenity because of the graphic sex scenes, which caused offence in India. All her campaigns have in common the need to expose the internal corruption in India, which purports to be a democracy, the world's largest democracy in fact, an ideal that is not reflected in the invidious split between those in power who make the deci-sions and those who are disempowered on the basis of caste and class. Roy speaks up for the rights of under-represented and disenfranchised communi-ties. In 'The Great Indian Rape Trick' (1994) Roy writes about Shekhar Kapur's 1994 film *Bandit Queen,* criticising the fact that he did not approach the real-life protagonist for her consent to the rep-resentation of her rape. In 'The Greater Common Good' (1999) she expresses her dissatisfaction with the Indian Government's neglect of the dev-astation done to the lives of its citizens by the building of the dams. Its lack of concern is reflected

in the inadequate official records kept of the people affected. Since most of the displaced people were the *adivasis* and the Dalits, who are treated as 'non-persons' anyway and are not granted the same human rights as other groups, the government did not take their plight seriously. Systems such as the caste system that are integral to Indian society perpetuate the structural inequalities and the con-tinued oppression of the underclasses, a fact that is explained by the problematic concept of karmic justice.

Contribution

Roy is an important figure in post-colonial and women's writing, following writers such as Jean Rhys, Anita Desai, and Nadine Gordimer. Focusing on questions of identity and history, she discusses India in the post-Independence era, which has an evolving identity that is defining itself against its colonialist legacy by considering its mythic past and ideals. Her contribution to women's writing is in the acknowledgement and articulation in her narratives of women's experi-ences in their individuality and diversity, thus recognising their impact as agents of history and transformation, rather than as passive recipients. The public attention to *The God of Small Things*, and the eager anticipation of her next novel (if indeed there is going to be one), should not overshadow her continued commitment to politics, and awards such as the 2002 Lannan Prize for Cultural Freedom testify to her work in this area. Although Roy's status as a novelist contributed to her initial success, the impact of her subsequent projects, which include political essays and cam-paign work, should not be underestimated. Roy remains fiercely committed to combating the cor-ruption caused by imperialism, in particular the realignment of the Indian Government with the US at the end of the Cold War and the concomitant rise of Hindu nationalism. She describes the militarisation and corporatisation of the govern-ment as contributing to the 'hollowing out' of democracy, and is focused on articulating the plight of the oppressed in her home country and beyond.

Rule of Law and Imperialism

Christopher May
Department of Politics, Philosophy and Religion, Lancaster University, Lancaster, UK

Definition

The rule of law can be defined as the existance of a system of laws that provide both predictability and stability in regulatory governance; it is best understood as the opposite of the rule of men, which is to say the rule of law indicates a governance system that is independent of the views, opinions or interests of any specific member of the ruling class or organisation.

The rule of law is often contrasted with the rule of men, to suggest that *law*-based *governance* removes (or at least constrains) arbitrary and capricious *government*. In the (contested) history of *imperialism*, the rule of law is often presented as a key social benefit gained by countries and societies ruled from the *metropole*; whatever the other costs of imperialism, the introduction of the rule of law, it is suggested, has had significant subsequent benefits for these societies. The continuing and contemporary "encouragement" to adopt the rule of law is also sometimes seen as an imperialistic project itself, driven by an *epistemic community of lawyers* who promote a specific form of westernized liberal *legality*.

The rule of law has become to a large extent the common sense of global politics in the new millennium, even if it remains politically contested especially by populist nationalists in Europe and elsewhere. The rule of law also has a contested relationship with the history of imperialism, with some commentators seeking to argue that whatever its other faults, one of the key benefits of imperialism was to bring the civilizing force of the rule of law to countries and cultures that previously had lacked a rounded and developed appreciation for, and practice of, legality; others are not so sure. In this essay I briefly introduce the idea of the rule of law and then assess the arguments about its links with the imperialistic project from two angles: firstly relating the rule of law to the international history of imperialism and colonialism and secondly examining the more recent suggestion that the "support" for the strengthening of the rule of law across the global system is a contemporary form of (legal) imperialism.

The Rule of Law

There is an extensive literature that seeks to establish and justify particular definitions of the rule of law; it usually centers on a well-established distinction (utilized in jurisprudential discussions but also in political and socioeconomic analysis) which divides contending definitions between the "thin" and "thick" versions of the norm. However, given the range of definitions, it is easier to think of these arrayed along a continuum between *thinnest* and *thickest* version, rather than merely falling into one or other broad groups (May 2014: Chapter 2). For ease, while there is a clear distinction between common law and civil law, as far as the global norm of the rule of law is concerned, this is perhaps of less immediate consequence, and so here I will only be concerned with this more generalized depiction.

If Pierre Bourdieu and Loïc Wacquant are correct that the "new planetary vulgate rests on a series of oppositions and equivalences which support and reinforce one another to depict the contemporary transformations that advanced societies are undergoing" (Bourdieu and Wacquant 2001: 4), then the central defining opposition that grounds the rule of law norm is the contrast between the rule of men *and* the (preferred) rule of law. This is reflected in much of the contemporary jurisprudential debate about the norm which starts by asserting the need to remove the rule of individuals, before differing on how this might be best accomplished.

Such discussions usually take place on the terrain of the distinction between the thick rule of law, encompassing a wide set of legal/social norms such as equity and justice, and a narrower thin rule of law limited to procedural and organizational matters. These contrasting depictions are both ideal types with competing definitions of legality facing in one direction or another; the division between thick and thin conceptions is best seen as a continuum between nodal points, rather than two clearly distinguishable (essentialized) positions.

It is worth stressing that even the thinner procedural notion of the rule of law is, of course, normative in the sense that it supports a view about good and proper modes of procedure that

cannot be said to be natural or pre-/nonsocial. The rule of law's thick-thin continuum is a range of normative positions, and while tendencies and relative positions can be identified, it is unlikely that one would find anyone expressing the ideal typical endpoints themselves.

While, as noted, there are many definitions of the rule of law to choose from, here I deploy Lord Bingham's specification. This is an inclusive statement of the current (popular/general) characterization of the rule of law; it depicts the rule of law in its role as the common sense of (global) politics in a manner that was easily recognized in both legal and political communities (May 2014: Chapter 2). This is clearly a British view of the rule of law and thus sits within a specific set of jurisprudential debates and cannot in any sense be regarded as definitive (not least as no view has gained sufficient traction to be so regarded). However, when introduced to the elements Bingham proposes, most people (in western capitalist societies, at least) would recognize them as being parallel to their own more casual assumptions about the legitimate operation of the system of law.

Any depiction of the thin norm is nested within the wider/thicker rule of law, and as such thicker readings of the norm often set out the thin elements as part of their overall depiction. Lord Bingham's book length discussion of the rule of law does this particularly well, and as such I reproduce the eight elements he sets out – the first four being broadly the basis of a thin reading of the norm, while the addition of the second four expands the definition toward the thicker end of the normative continuum (although Bingham does not offer such a bipartite distinction).

Following Bingham, the rule of law's central characteristics can be described in the following manner:

1. "The law must be accessible and so far as possible intelligible, clear and predictable": law-abiding behavior requires those governed to be able to ascertain what the law actually is (Bingham 2010: 37–47).
2. "Questions of legal right and liability should ordinarily be resolved by application of the law

and not the exercise of discretion": discretion must be exercised within the bounds of the law, and therefore no decisions should be arbitrary or without recourse to some law or another (Bingham 2010: 48–54).

3. "The laws of the land should apply equally to all, save to the extent that objective differences justify differentiation": all must be equal before the law, with no distinction between, for instance, the rich and the poor or the weak and the powerful. Where the law distinguishes responsibility by age, there may be some reason to treat people differently but only when these differences are "objective" and not social, political, or economic (Bingham 2010: 55–59).

4. "Ministers and public officers at all levels must exercise the powers conferred on them in good faith, fairly, for the purpose for which the power were conferred, without exceeding the limits of such powers and not unreasonably": Bingham actually intends this to underpin judicial review, so that the state can be held accountable to the laws parliament has enacted and does not go beyond that democratically grounded intent (Bingham 2010: 60–65).

Up until this point, Bingham's elements are essentially procedural, requiring little or no judgment of the content of the law. Even the invocation of objective differences under three can hardly be said to be normative toward a liberal sense of equality, as "objective" differences are often in the eye of the (political) beholder, for instance, racists see differences between ethnicities as objective (although for Bingham this would have been unacceptable). The following four characteristics move Bingham firmly toward a thicker reading of the rule of law.

5. "The law must afford adequate attention to fundamental human rights": spending some time exploring various articles of the European Convention on Human Rights, Bingham argues, as do many supporters of the thick norm, that the rule of law cannot be said to obtain where there the procedures of law explicitly are intended to maintain injustice(s) (Bingham 2010: 66–84).

6. "Means must be provided for resolving, without prohibitive cost or inordinate delay, bona fide civil disputes which the parties themselves are unable to resolve": if effective representation is blocked by costs to all but the wealthiest defendants, then the law is not treating all equally. Bingham offers a clear defense of legal aid and expeditious legal process as crucial to the maintenance of the rule of law, reflecting a political position about the good society and the amelioration of extralegal inequality (Bingham 2010: 85–89).

7. "Adjudicative procedures provided by the state should be fair": the judiciary and legal profession must be independent of the state, allowing both sides (prosecution and defense) a fair trial, with defendants knowing the charges against them (through a writ of habeas corpus if necessary). In supporting a particular norm of independence, Bingham identifies the danger of politicization which would then require a judgment about political organization rather than the procedures of the law themselves (Bingham 2010: 90–109).

8. "The rule of law requires compliance by the state with its obligations in international law as in national law": the state's obligations do not end with its own law, but rather extend to the realm of global politics including as noted above, human rights, but also the rules of war and other international regulatory arrangements (Bingham 2010: 110–129).

Bingham's discussion of the rule of law is intended to demonstrate that the norm itself is multifaceted but also that merely recognizing procedural norms should not be sufficient for any state to be accorded the recognition of being governed by the rule of law. For Bingham the political standard is higher than merely acting in line with basic legal norms; it is more than just rule *by* law.

A thin reading of the rule of law can be a generalized (largely non-political) yardstick for gauging social organization, but for Bingham the problem with a thin conception is that it reduces law to its positive legal characteristics. This then suggests that the legitimate agency of government is the source of law, and it is difficult to conceive

of how such a system can effectively hold rulers to legal limits, as they are also its source. Moreover, whatever the formal and/or normative considerations, governments tend to attempt to reserve for themselves the power to decide what the limits to the rule of law are and when other values (most obviously, national security) should be privileged. However, even if the question of states' ability to define the condition of legal exception looms over the exercise of the rule of law (Agamben 2005), actually many states (and many other global actors), for much of the time, do seem to accept some version of the (thicker) rule of law, rather than merely a procedural and thinner form, and so the norm in use seems to be more substantive than its thinner depiction might indicate.

Having now stipulated a multifaceted definition of the rule of law drawn from Bingham's account, I will review the claims that have been made about the impact of this norm through the practice of imperialism and its aftermath. It is also worth noting that the norm itself really only solidified in the late nineteenth and early twentieth centuries (despite elements having a much longer pedigree), so to some extent, all projections of the norm back into the history of imperialism have an element of anachronism about them while also retaining some salience due to the norms extensive prehistory.

Contested Claims About the Rule of Law and Imperialism

Having defined the rule of law at some length, it is likely less necessary to define imperialism in quite such detail. Nevertheless, given how I will use the term later in this essay, it is worth setting out briefly how I understand it. Here I will use imperialism as a term to capture the external imposition of (elements of) a political economy on another society. Crucially, for reasons that will become clear, I expand this from being only a function of interstate relations or relations patterned by a strong organized state on one side and a society without a similar formally institutionalized political structure on the other to one that includes relations of power and domination between

non-state groupings (albeit groupings that have considerable coherence and political resources). Nevertheless, I also recognize that the term itself finds its origins in the relations between dominating state and subject populations (however organized), and the wider definition that I deploy later can sometimes become a very loose and unfocused critical trope (a failing I hope to avoid below).

While certainly not the universal experience of imperialism, for many societies subject to the rule of the metropole during the decades (or even centuries) of imperialist control, the key mechanism utilized was the imposition of a legal system which either replaced local law or so dominated it to render prior legal systems marginal to the practices of governance. One way to understand this process is the establishment of a new space of law – a nomosphere – which displaced other spaces of governance to establish new forms of social relations (typically) focused on western notions or property rights (Delaney 2010: Chapter 5). This is not a process of displacement, or overlaying, but rather the dismantling by imperial powers of the prior customary or traditional legal systems that stood in their way.

This experience has, however, been presented not as the destruction of prior social practices but rather the introduction of the rule of law as a key civilizing mechanism. The reason that the thin to thick continuum has some analytical utility here is that often what we find is the value of the rule of law "sold" on the basis of its justice and democratic (thick) elements (the introduction of "western values"), but when we look at legal structures themselves, what is often more obvious is that only the thinner elements, which is to say the procedural elements of the norm, are operative. Thus, for instance, in nineteenth-century India, in an attempt to recognize the continuing relevance of local legal mores, the British explicitly referred to introducing the procedures or modes of law but not necessarily all its English substance (Hussain 2003: 63–66). This far from isolated example helps explain why subsequently across the political spectrum the rule of law has become a common sense (May 2014); it is sufficiently imprecise and flexible to cover a range of legal settlements

while supposing all are constituent of an emerging global society that has put behind it the histories, exploitations, and violence of imperialism.

This positive account of the rule of law under imperialism runs through much of Niall Ferguson's revisionist celebration of the British Empire (a book and TV series). Here, the British concern with law and the introduction of common law procedures and practices is presented as having had a significant developmental payoff for postcolonial states "lucky" enough to have been part of the Empire; indeed he concludes that "we should not underestimate the benefits conferred by British law and administration" (Ferguson 2003: 361). He argues that due to the increasing liberal character of Imperial policy, the "rule of law had to take precedence, regardless of skin colour" (Ferguson 2003: 195), and as such the imposition of this norm led to the establishment of legal systems that would subsequently be advantageous to societies in the post-imperial period.

This presentation of the rule of law's centrality was expanded 8 years later in his account of civilization where (in a triumph of anachronism) the rule of law is presented as one of the "killer aps" for the achievement of a modern civilized society (Ferguson 2011). That the beneficial rule of law in this view had a specific set of advantages is also attested by discussions of how the Middle East has been held back (economically) by the particularities of Islamic law(s) (Kurran 2011). In other words, the advantage of western imperialism for the colonized countries was that this introduced not just the rule of law but the *right* laws. However, as a number of colonial examples attest, the introduction of the rule of law by an imperial power was not the handmaiden of "civilization" (so-called) and democracy but mostly entrenched the power of existing elites with whom the imperial power was most engaged with (Brown 1995; McBride 2016). The subsequent political value to dominated societies of the introduction of the rule of law (often by force) was considerably compromised by the partiality of its deployment – often expectations raised by an understanding of the thicker aspects of the norm were undermined when elites maintained their power and position by utilizing the procedures

of the law but not its (supposed) support for equality or even "fairness."

It is notable that during the nineteenth century, political commentary on the legal facets of imperialism (the manner in which the law was used to suppress colonial populations) was actually far more widely discussed and criticized than its current celebrants might allow (Kostal 2005). Even then the divergence in the value of the rule of law depends on the form in which it appeared (broadly whether it was a thick or more usually thin version). As Nasser Hussain argues at some length, one of the key aspects of the rule of law under imperialism was to legitimize the use of emergency powers to deal with dissent and resistance. While this was frequently contested by indigenous populations, nevertheless, it was this legal and political order that was (re)produced in the new constitutions of independence (largely built on the legal foundations inherited from the colonial era) and as such has seen the continued normalization of the recourse to the state of emergency in many postcolonial states (Hussain 2003: 133–144). However, this is not to say that all postcolonial states have experienced similar legacies in the legal sphere from their experience(s) of imperialism.

There is some evidence that there are different effects depending on whether the colonial rule was direct or indirect (which is to say whether the institutions of government were staffed by colonial officers – direct rule – or by locals – indirect rule). Where British officers ran the state, it seems to have resulted in a legacy more like that which Fergusson and others have claimed, but where locals were more involved, the imperial introduction of the rule of law seems to have had less "beneficial" effect (Lange 2004). This suggests that the "value" rule of law *was*, as British colonial officers had claimed, more than just the procedures but rather involved the inculcation into its modes of operation. This "value" may also differ depending on whether the colonial power introduced a system of common law or one based on civil law; there may be a range of reasons for this, but Sandra Fullerton Joireman has argued that the more extensive bureaucratic demands in civil law systems may

have led to a divergence of postcolonial societies' legal institutionalization (Joireman 2001). The legal legacy of imperialism is variable and subject to a number of factors.

However, in the case of African colonialism, it is not clear that the introduction of the rule of law was universalized; Mahmood Mamdani argues that there was a frequent distinction drawn between the colonizers whose lives were ruled by law and the indigenous population whose lives remained rule by custom(s). Thus:

> The language of rights bounded law. It claimed to set limits to power. For civic power was to be exercised within the rule of law, and had to observe the sanctity of the domain of rights. The language of custom, in contrast, did not circumscribe power, for custom was enforced. The language of custom enabled power instead of checking it by drawing boundaries around it. In such an arrangement, no rule of law was possible. (Mamdani 2001: 654)

Only by according recognition to the non-indigenous civil society did locals find themselves within the purview of the rule of law; this clearly violates the thicker norm (around non-discrimination, for instance), even it might plausibly deliver a thin rule of law. The introduction of the rule of law and its institutions therefore was often not a mechanism of general social development (as presented in the positive imperialist narrative); rather it was a mechanism by which a minority could rule by co-opting a ruling elite into the ways of legality as citizens while excluding the majority, left to be "so many custom-driven ethnicities" (Mamdani 2001: 663). This leads Ugo Mattei and Laura Nader (2008) to conclude more generally that the (pretended) universality of the rule of law, by excluding much that is local/regional and established under different legal norms, is undermined by the actual imposition of a westernized rule of law that seeks to structure societies to enhance and facilitate the plunder of the local resources.

Mattei and Nader therefore argue that the "ideological construction of the rule of law protecting private property as a desirable aspect of human civilisation *per se* has been very successful" (Mattei and Nader 2008: 196). Moreover, their argument is that the imposition of a westernized rule of law through a process of legal imperialism has closed off a range of developmental

strategies and allowed the political economic relations of nineteenth-century imperialism to be maintained and reproduced across the contemporary global system. This leads Anthony Anghie to observe that it is clear that the history of international law is one in which it "continuously disempowers the non-European world, even while sanctioning intervention within it," but international law itself "remains oblivious to its imperial structures even when continuing to reproduce them" (Anghie 2005: 312). Moreover by regarding imperialism as a thing of the past, the international legal community often seems blind to it continuing imperialist practices and affordances. Therefore, it makes sense to move beyond an understanding of law and imperialism that merely focuses on the history of colonialization to ask what forms does legal imperialism take in the new millennium.

Debates About the Rule of Law as an (Imperialistic) Imposition

The discussion of the rule of law's link with imperialism tends to move toward a singular position on the rule of law; there is a relatively universal norm that societies need to approach if they are to be prosperous, democratic, and successful. Indeed, the contemporary linking of human rights and the rule of law has underpinned the re-inscribing of the "civilizing mission" of legal aid, technical support, and "capacity building" to allow societies to escape from the prelegal systems patterned by customary legal traditions that lack the formality of the westernized model (Hussain 2003: 142). As this suggests there is a general acceptance by policymakers and in the wider academic community that the rule of law is central to the successful establishment of market societies (See the survey of literature in Trebilcock and Prado (2011: 41–79) and/or in Trubek (2006).). This link between the rule of law and economic development is central to the account of the norm's continuing link with imperialism.

As Svetozar Pejovich puts the standard development position:

> Private property rights and the law of contract generate efficiency-friendly incentives that move resources to their highest-values uses. An

R

independent judiciary and a constitution protect those incentives from decision makers in government, rent-seeking coalitions, and majority rule. (Pejovich 2008: 165)

This focus on property and contract and the downplaying of democracy (protection from "majority rule") has also been stressed by Judge Richard Posner (an influential proponent of the law and economics perspective):

Legal reform is an important part of the modernisation process of poor countries, but the focus of such reform should be on creating substantive and procedurally efficient rules of contract and property *rather than on creating a first-class judiciary or an extensive system of civil liberties.* (Posner 1998: 9, emphasis added)

Here law is instrumental in promoting economic growth but only if relatively unencumbered by demands emanating from noneconomic interests. Immediately we can see a parallel with the discrimination between those benefitting from the rule of law and those excluded under imperialism or under the call for the rule of law as a key aspect of economic development policy and practice. In this sense once again, the thicker rule of law is the public face of the thinner rule of law as supported by foreign aid.

Certainly, it is also the case that while other authors agree that the property rights/contract rights development nexus is important, they may also recognize the need for a wider set of laws to be considered as part of the underpinnings of successful development (Trebilcock and Prado 2011). Nevertheless, in general terms the economic development approach to the rule of law might be best summarized as good law + good enforcement = improved economic outcomes (Milhaupt and Pistor 2008: 5). The reflects a view of the history of capitalism that draws from Max Weber's analysis of the rise of legalism in Europe; it was the development of a law that was largely autonomous and which was (relatively) unchallenged as a social authority, which (it is proposed) lay behind the successful expansion of European capitalism.

The reduction (or obstructing) of other normative schemes in society allowed rationalization (parallel to the professionalization of the law) to underpin the development of capitalist society (Trubek 1972), and as such only as legalism became widespread did capitalism prosper in Weber's view. Thus, the move to reduce the role of local practices and customs (which encompass competing norms) draws at least some sustenance as an analytical position from Weber's work. The rule of law facilitates economic development by diluting social barriers to the deployment of resources and through *formalization* reduces the impact of prior social constraints. The rule of law removes socially obstructive local customs and practices, replacing them with a universal economic rationalism.

Although the rule of law may be necessary for (capitalist) economic development, it is unlikely to be sufficient, with law interacting with other aspects of society to either promote (or hinder) development (Dam 2006). There may be considerable interaction (and thus hybridization) between a rule of law culture and other socially evident culture(s) that inform social practices and norms, especially in the economic realm. However, analyses that link law and development often start from the proposition that if it doesn't look like the liberal and western rule of law, then it cannot support economic development *properly.* And it is here, in the totalizing approach to the specific rule of law favored for capitalist development, that we can best see the new imperialism of the rule of law, an imperialism that while involving states is perhaps most clearly prosecuted by the epistemic community of lawyers.

Elsewhere I have suggested that the global society of lawyers (including those only involved in national legal affairs) constitute an epistemic community of lawyers (May 2014: 67–74). Like an epistemic community, lawyers as a group exhibit a relatively high level of coherence and professionalism, work in an area where in-depth knowledge and expertise are at a premium leading to considerable uncertainty by non-adepts about how to proceed, and have a highly developed set of formal and informal networks through which their influence flows.

This epistemic community of law has "promoted" a legal mode of thought. Like other transnational networks identified by Margaret Keck

and Kathryn Sikkink, lawyers "try to frame issues in ways that make them fit into particular institutional venues" (Keck and Sikkink 1998: 201), and their preferred venue, unsurprisingly, is the legal system. This is to say that law is waiting in the wings always ready to be deployed on demand. This is what the legalization of global politics has wrought: the recourse to law as a tool for resolution of a wide range of social tensions, conflicts, and decisions is always available and legitimate. The "legal episteme" is spread by the actions and practices of lawyers and their sympathetic political interlocutors throughout the global system. For many this is an analogue to previous forms of imperialism; the external imposition of a mode of regulation and governance importing mores and values that are far from indigenous yet are presented as both necessary and a move toward civilization.

Thus, one of the major effects of the mainstream legal episteme is the acceptance of the rule of law as a technology, where law can be treated in Martin Krygier's words, as "technical equipment, social machinery, which can be transported and plugged in wherever the need for them arises" (Krygier 1999: 82). Of course, this foregrounds the procedural aspect of a thinner view of the rule of law and tends to sideline the thicker elements that require a set of social and normative commitments that (while valuable to liberals) may be antagonistic to the leaders and elites of countries receiving rule of law-related assistance. This form of assistance is not necessarily a recent development with the ICJ already identifying the lawyer as a social engineer in 1965 (ICJ 1965: 72) and was an important contributory factor in the World Bank's expansion of its program of legal technical assistance.

At the international level (beyond particular states), the epistemic (sub)community of international public lawyers has taken command of the "technology" to promote the expansion of international customary law with less regard to particular state interests than might be found in international treaty law. Andy Olson observes that this community has forcefully argued that "customary international law is *created* through the convergence of the opinions of members of that community" (Olson 2000: 24), dividing law off from its subjects. Here, the professional project of the epistemic community is surely pushed to its extreme limits, and as such it is no surprise that this has been termed imperialism by those on the receiving end.

More generally as Shirley Scott has argued, because the legal realm is perceived or perhaps presented as having considerable autonomy from politics, international lawyers now often "serve as guardians of the relative autonomy, cohesion and consistency of international law" (Scott 2007: 420). As with legal argument more generally, this is not to say that such opinions are wholly indeterminate, but it *is* the epistemic community itself that informs and shapes the boundaries of the acceptable and unacceptable reach of legal opinion (even if these boundaries may move through dynamic processes within this community) (Scott 2007: 417). This helps explain why while particular laws may be subject to change and shifting political pressures, the underlying (globalized) logic of the rule of law remains remarkably constant as a political foundation and why given its particular western or European character it can be perceived as an imposition rather than a negotiated joining.

Increasingly the exploration of legal pluralism suggests that this process of legal imperialism may mistakenly marginalize non-western legalities. A pluralist approach to the rule of law requires recognition of the different forms the rule of law might take and in the terms utilized in the first section may well push the threshold for recognition toward a thin (which is to say the more procedural) characterization of the norm. There are a number of taxonomic strategies that can be used to make sense of this plurality, but Ugo Mattei's classification system for the plurality of legal systems is clear and concise. Mattei presents three elements which are always present but differently weighted in specific legal systems: the rule of professional law, the rule of political law, and the rule of traditional law. Each pattern of "social incentives (or social constraints) are at play in all legal systems simultaneously. The only difference is in terms of quantity, acceptability and, most importantly, hegemony" (Mattei

R

1997: 16). This leads him to argue that all legal systems can be recognized as belonging to one or other of these groups of families (where their defining aspect is hegemonic).

Once there is something that might be recognized as a system of (legal like) rules, then what captures that extent and character of the pluralism in the global system is the balance between these three aspects of rule. Most explicitly, he seeks to reject a classificatory scheme that privileges the "Western Legal Tradition" (Mattei 1997: 19). This classification is concerned with the normative grounds for a legal system not the specific institutionalization of those norms (Mattei 1997: 20). For Mattei these three interpenetrated rule of law types are not absolutes but points on a triangle between which actual legal systems (the real rule of law) can be located. As this implies, understanding the legacy of imperialist and colonial imposition can be framed as a (forced) shift across this triangle, as can the differently understood imperialism of the epistemic community of lawyers. The triangle is the political realm (or in Delaney's terms, the nomosphere) in which fraught (and in the past violent) disputes about legal practice(s), rights, and empowerment(s) have taken place and continue to do so.

The rule of professional law is broadly coterminous with the western legal tradition (where the distinction between common and civil law is treated as a variation within the type). Key aspects of this type of legal system are that it is clearly distinguishable from the political arena, the legal process is essentially secular, and therefore decisions are taken on their technical and legal merits as interpreted by (legal) professionals and (rhetorically at least) claim legitimacy through democracy (Mattei 1997: 23–27). Much of its character is encompassed by Bingham's characterization introduced above. *The rule of political law* is typified by the lack of separation between law and politics, with the legal process often determined by political relationships, and as such the notion of limiting government's actions through the legal system is inconsistent with how the purpose of law is understood. Certainly, most of the time, the government and its agencies may

rule by law, but this is not regarded as a strong limitation on their activity. As Mattei points out, for those looking at this system from the perspective of the rule of professional law "many aspects of the rule of political law are labelled "corruption", are considered a pathology, and in general are not accepted or regarded by the social actors as structural elements of the social order" (Mattei 1997: 29). However, these concerns are less important within these systems as they are formally focused on a "political target, be it free market and privatisation, be it self-sufficiency, or be it development [which] determines, justifies and makes socially acceptable the outcome of most decision making" (Mattei 1997: 31). The rule of political law is often self-defined as being part of a transitional phase; at some point the legal and political structures may change (more democracy may be allowed), but only when the political goals have been reached (Mattei 1997: 35). From outside there may be a question about how and when the assessment of the completion might be made, but this of course emphasizes that it is the rule of political law; this will also be familiar from how the imperial rule of law has been presented by those who imposed it as part of the colonial project.

The third type that Mattei identifies is *the rule of traditional law*. Here there is no division between the system of law and a society's religious (or other belief) system, and as such the "individual's internal dimension and the societal dimension are not separated" (Mattei 1997: 36). To stress the religious and philosophical/transcendental beliefs that might govern such a legal system, he labels this the Eastern Legal Tradition. While the role of religious and other values plays an important role here, nevertheless, there is also often considerable structural similarity between this group and societies where professional law obtains. Thus, Mattei stresses that one should not confuse the rule of traditional law with the absence of law or even the absence of formal legal institutions. In the rule of traditional law, formal legal institutions do exist, but the working rule is different from what we are used to in western societies (Mattei 1997: 39).

> Rather than seeking to justify the system by appeals to democracy, in the rule of traditional law hierarchy, including deference to religious opinion (and elders), is crucial for the making of decisions with the 'strong, very ancient and respected rhetoric' of supernatural legitimisation playing a major role. (Mattei 1997: 40)

This is the form of "law" that imperialism sought to dismantle as not being law at all.

Most importantly, Mattei's argument stresses that while systems may tend toward one or other of these points (on a taxonomic triangle), no system completely excludes the characteristic aspects of the other two. This is why it may be possible, as Gosalbo-Bono suggests, that a very basic (very thin) form of the rule of law can support a claim that there is a universally accepted idea of the rule of law, even if it is only a sliver of what those who propose a thicker reading of the norm would accept. However, one of the key insights of pluralism is that law, in Paul Schiff Berman's words, is "an ongoing process of articulation, adaptation, re-articulation, absorption, resistance, deployment and on and on. It is a process that never ends" (Berman 2009: 239). As such, the interaction and interpenetration of Mattei's three "families" of law may indicate how new forms of the rule of law may emerge. The imperialism of the epistemic community of lawyers can be then seen as a strong push toward the professional law point of the triangle even as the notion that social values might be included in a thicker rule of law tugs the rule of law toward the traditional point.

Conclusion

Using Mattei's framing we can locate both the historical processes of imperialism and the new imperialism of the epistemic community of lawyers within the same (contested) realm of legality. The imperialism of the rule of law has moved from the physical to the normative, but using this depiction of the wider realm of contested legality, this shift can be located into a more general understanding of how the rule of law has historically interacted with the politics of imperialism. Any claim that the rule of law is merely a technical and neutral form of governance has to contend with this history and recognize that the rule of law and imperialism remain intertwined.

Said, Edward W. (1936–2003)

Patrick Williams
Nottingham Trent University, Nottingham, UK

Definition

Said first achieved prominence with the publication in 1978 of *Orientalism*. He is acknowledged as one of the major intellectuals of the end of the twentieth century, a figure of personal and intellectual courage and integrity.

In a manner which would no doubt have afforded him some wry amusement, Edward Said's standing in the academic world and beyond typifies the fickle, and ultimately rather shallow, nature of fashion in an area which ought to be above it. Said first achieved prominence with the publication in 1978 of *Orientalism*. Such was the effect that the book created that it was often (incorrectly) regarded as the single foundational text of the emergent field of post-colonial studies. At the same time, Said was often (incorrectly) hailed as the founder of that same emergent field. After this initial (over-)enthusiasm, Said's status declined in various quarters as he was considered insufficiently 'theoretical' in comparison to the other major figures in postcolonial theory, such as Gayatri Spivak and Homi Bhabha. Over the next couple of decades, however, in the period up to his death and since, his standing has never ceased to grow, to the point where he is acknowledged as one of the major intellectuals of the end of the twentieth century, a figure of personal and intellectual courage and integrity.

Said was born in Jerusalem to Palestinian Christian parents (Anglican on his father's side, and Baptist on his mother's) and brought up in Cairo where his father's successful stationary equipment business was located. As a result, Said was able to attend fee-paying English schools, including the prestigious Victoria College, where, as well as the assumed benefits of a 'good' education, he acquired an awareness of the pretentiousness, hypocrisy, and frequent downright racism of his colonial 'masters'. The same financial background, as well as his father's adopted American citizenship, saw Said sent to complete his secondary education and attend university in the US, which became his home for the rest of his life. While many might have seen this as a smooth and comfortable progression, Said nevertheless felt that his was a life characterised by 'the many displacements from countries, cities, abodes, languages, environments that have kept me in motion all these years' (1999, p. 217).

That sense of displacement came to be epitomised by the condition of, and Said's

relationship to, the country of his birth, Palestine. In 1948, the *nakba* (disaster) occurred: the brutal occupation of Palestinian land by the Israelis and the concomitant expulsion of the majority of the Palestinian population from their homeland, which meant that henceforth Said's life would be lived as one of the millions in the diaspora. The Israeli victory in the June war of 1967 saw the loss of the remaining Palestinian territory. It also deepened Said's sense of displacement, since there was now no Palestine left to return to, as well as marking his political awakening. Henceforth, Palestine would form the focus (implicit or explicit, partial or whole) of much of his work, particularly in his later years, and he would become one of the most eloquent spokesmen for his country and his people. Despite the degree of his attachment to Palestine, his feelings for the country were not altogether straightforward, as he expressed in his memoir *Out Of Place*:

> Even now the unreconciled duality I feel about the place, its intricate wrenching, tearing, sorrowful status as exemplified in so many distorted lives, including mine, and its status as an admirable country for *them* (but of course not for us) always gives me pain and a discouraging sense of being solitary, undefended, open to the assaults of trivial things that seem important and threatening, against which I have no weapons. (142)

In view of this sense of repeated displacement and loss of homeland, it is no surprise that the idea of exile came, as we will see, to play an increasingly important part in Said's thought.

In the same memoir, Said comments that during his time as an undergraduate at Princeton he developed 'a fascination with complexity and unpredictability' (277), and although 'complexity' did not translate into the way in which he wrote about complex issues (arguably quite the reverse) a certain 'unpredictability' could be held to characterise his performance as theorist. One finds this above all in his existence as a traditionally formed professor of literature who at one point champions radical theory but subsequently turns away from it, but also as a literary theorist who argues that the point of theory is to engage the experiential and the social; in his terms, 'the worldly'. Indeed, the manner in which theory

approaches the world, or not, became for Said one of its most important qualities. In addition, a form of 'unpredictability' as resistant, transgressive, or in Saidian terms 'unco-opted', intellectual practice typifies much of his approach to theory.

Although for many readers Said is principally associated with post-colonial theory, his engagement with theory is earlier, and different, and it is worth briefly examining his changing relationship with its different forms. His book *Beginnings: Intention and Method* (1975) is notable for its inclusion of a range of structuralist and post-structuralist theorists (Roland Barthes, Claude Lévi-Strauss, Ferdinand de Saussure, Michel Foucault and Jacques Derrida), and he was subsequently known as an advocate and populariser of continental theory. It therefore came as a surprise to many when, less than a decade later in his 1984 collection *The World, the Text, the Critic,* he subjected Derrida and Foucault, the most substantial of the theorists in *Beginnings,* to stringent critique in 'Criticism between Culture and System'. Of the two, it is Derrida who comes off worse, but even Foucault is seen to epitomise many of the problems which Said had come to regard as vitiating theory. In particular, they both espouse theory which insufficiently engages the world. Derrida's theory, as Said says, leads us *into* the text; Foucault's *in* and *out*. While Derrida's approach thus leaves the reader trapped in the realm of the textual, even Foucault's putative re-emergence into the world is insufficient. His theory of power/knowledge, for example, perhaps his most 'worldly' in Saidian terms, and one which Said made some early use of, still fails to display an appropriate sense of historical change or, more significantly, a recognition of what Said, in an echo of Walter Benjamin, calls the 'coarse items' (1984, p. 221): class struggle, military coercion, wealth, and privilege.

In addition to what theory does (neglecting the social, 'textualising' itself), there is also the problem of what can happen to theory. In the essay 'Travelling Theory' in *The World, the Text, the Critic,* Said identifies a pattern of rise and fall, whereby a dynamic, perhaps oppositional, theory emerges, flourishes, but through a process of

repetition becomes tame and ineffectual. Part of that repetition may involve a trajectory of transmission, from one theorist and one socio-historical location to another, and the example Said uses is the incremental diluting of the radicalism in Georg Lukacs's *History and Class Consciousness* (1923) as it passes through the work of Lucien Goldmann in Paris in the 1950s, and that of Raymond Williams in Cambridge in the 1970s. A different kind of trajectory, but no less negative, is that taken by theory as it loses radical energy, becomes increasingly institutionalised, co-opted, part of the system it originally aimed to oppose. A final element in what Said calls 'the systematic degradation of theory' (1984, p. 243), with its echoes of 'the seductive degradation of knowledge' from the final page of *Orientalism,* is the shift from theory as progressive intervention to theory as, in Said's terms, 'cult' with its chief priests and hordes of disciples.

The question arises whether Said is offering a general account of the (inevitable) problems of theory, or one which is historically specific, particularly to the US academy in the 1970s and 1980s, which he analyses in a number of essays. One of the clearest answers is provided by 'Travelling Theory Reconsidered' in *Reflections on Exile* (2000a), an important example of Said rethinking concepts and locating them in appropriate social and historical contexts. Here, despite the previously identified problems, all is not lost: the degradation of theory, in its over-specialisation and professionalisation, and as a result of 'travelling', is not inevitable. The same Lukacsian theory now goes in the opposite direction, towards a better, more resistant intellectual practice in the person of Theodor Adorno, and, most importantly, towards the world and the political in Frantz Fanon's anti-colonialism, internationalism and visionary humanism. If theory's journey was previously a marker of its flaws, degradation, and decline, now, interestingly, 'The point of theory ... is to travel, always to move beyond its confinements, to emigrate, to remain in a sense in exile'. (2000a, p. 451) Also, the situating of theory 'in exile', as a worldly location, is no coincidence.

Despite what might look like a form of redemption in the previous example, one of the results of the perceived failure of theory as a general intellectual and cultural project is that Said increasingly distances himself from it, though this is nothing like the simple, wholesale rejection of theory that some have portrayed it as being: as he commented, 'to say that we are against theory ... is to be blind and trivial' (2000a, p. 383). Nevertheless, he is concerned to rethink and rename his practice, and the term chosen, for a variety of different reasons, is criticism, above all, 'secular criticism': humanistic, socially grounded, and embodied in a 'critical consciousness'.

Said's first major 'worldly' intervention came in 1978 with the publication of *Orientalism.* The impact of the book has been such that it merits its own separate entry, and discussion of it here will be accordingly brief. Importantly, it made strategic and eclectic use of theory to demonstrate the way in which ideas (from the commonsensical to the philosophical, from the literary to the scientific) individually and, more significantly, collectively worked to produce the demeaning representations of other cultures that served to legitimise colonial occupation and oppression.

Although *Orientalism* remains Said's best known work, *Culture and Imperialism* (1993) has a claim to at least equal importance. It is in many ways an even more 'worldly' text than its predecessor, of which it is a continuation and extension, as well as its opposite, Other, face. For instance, if *Orientalism* is a study in the construction and maintenance of hierarchical and oppressive cultural divisions by means of ideas, images, and texts, *Culture and Imperialism* is an argument for recognising the many possible connections which bridge those divides. One of the sections of the book is entitled 'Overlapping territories, intertwined histories', which indicates how far Said is from the conventional view of the gulf separating coloniser and colonised. Here, we enter that space of 'complexity and unpredictability' mentioned earlier, as Said challenges received wisdom, even its radical forms, in setting out a more complex view of colonial and post-colonial relations. At the same time,

Orientalism's thesis about the material impact of ideas remains central to the new study: 'For the enterprise of empire depends upon the *idea* of *having an empire* ...' (1993, p. 10, emphasis in the original).

To a certain extent, *Culture and Imperialism* looks like a more Saidian book than *Orientalism*, since it devotes a great deal of space to discussing the classic European novel, the subject he taught for the whole of his career. The approach adopted is modest and iconoclastic: in addition to (modestly) noting the connections between the European novel and imperial expansion, Said argues for the mutually constitutive nature of those connections, which outraged various literary scholars, as well as drawing accusations of 'culturalism' from certain, especially Marxist, quarters. At the heart of the analysis is Said's own strategy of 'contrapuntal reading'. Derived from musical counterpoint, where various themes or voices interweave without dominance or necessarily any overall resolution, the contrapuntal aims to show the 'overlapping territories, intertwined histories' in text and world.

In addition to reading these great novelistic assertions of colonial cultural authority in contrapuntal fashion, Said also sets them in a different counterpoint alongside their antithesis, *Orientalism's* significantly (if appropriately) absent Other: anti-colonial resistance. The opposition of Fanon, Yeats, Césaire, C.L.R. James, Ngugi wa Thiong'o and others to colonial oppression, as well as their complex relation to colonial culture, is examined. The latter is embodied in the ambivalence of the 'Voyage in' to the metropolitan centre, which, despite the possibilities it creates for assimilation, more usually functions as 'a sign of adversarial internationalism in an age of continued imperial structures' (1993, p. 295).

One of the available forms of resistance (as well as classic expression of colonial power) is narrative, and in *Orientalism* Said had already noted its ability to disrupt the reifying power of the imperial 'vision'. Here, in terms which prefigure his essay on the politics of narrative in relation to Palestine ('Permission to Narrate', in Said 1995), he says: 'The power to narrate, or to

block other narratives from forming and emerging, is very important to culture and imperialism, and constitutes one of the main connections between them' (2003, p. xiii). In that context, the struggle to tell one's own story has implications, and effects, far beyond the aesthetic.

The combined battle to resist the blocking of the Palestinian narrative (by Israel, the US and others), to recognise, encourage, and discuss the various attempts at the creation of such a narrative, and, finally, to play his own part in the creation, occupied Said in many different ways over the course of many years. It was his most worldly, and most important, intervention. Although *Orientalism* made occasional mention of Palestine, it was the book which immediately followed it, *The Question of Palestine* (1979), that marked his determination to bring the condition of his people and his homeland to the world's attention. Between its publication and the second edition in 1992, there were, as Said points out in his Preface, momentous events across the world, but nothing had changed for the Palestinians: 'the main aspects of Palestinian life remain dispossession, exile, dispersion, disenfranchisement (under Israeli military occupation), and, by no means least, an extraordinarily widespread and stubborn resistance to these travails.' (1992, 1979, p. vii). While it was difficult enough to focus people's attention on the 'negative' dimension of the narrative (dispossession, exile, and the rest), the 'positive' aspect, embodied in the numerous forms and strategies of Palestinian resistance (many of them peaceful, progressive, non-violent; completely removed from the convenient stereotype of Palestinian terrorism) tended to disappear completely. Said could confidently say, 'Palestine is the last great cause of the twentieth century with roots going back to the period of classical imperialism' (1992, 1979, p. 243), but adequate recognition of the fact and, even more so, anything resembling appropriate action consequent upon the recognition, could be hard to spot.

Part of the reason for the widespread refusal either to recognise or to act lies in the fact that, as Said put it, the Palestinians are 'the victims of the victims': 'We are clearly anti-colonialist and

antiracist in our struggle but for the fact that our opponents are the greatest victims of racism in history, and perhaps our struggle is waged at an awkward, postcolonial period in the modern world's history' (1992, 1979, p. 122). The repeated distorted representations in media and political discourse of Israelis as permanently vulnerable potential victims, always threatened by the possibility of a second Holocaust, and the Palestinians as aggressors, if not terrorists, help to maintain the oppressive status quo; and this despite the fact that 'there is nothing in Palestinian history, absolutely nothing at all to rival the record of Zionist terror against Arabs, against other Jews, against United Nations officials, against the British' (1992, 1979, p. 172).

Opposing such distortions is a task for anyone concerned with truth and justice, but it is particularly a task for intellectuals, a group Said spoke and wrote about on many occasions in the last decade of his life, most famously in his (variously controversial) BBC Reith Lectures in 1993, subsequently published as *Representations of the Intellectual* (1994). Speaking out on behalf of the Palestinians is, however, nothing like special pleading, since it introduces another intellectual-specific function: 'For the intellectual the task, I believe, is explicitly to universalise the crisis, to give greater human scope to what a particular race or nation suffered, to associate that experience with the sufferings of others' (1994, p. 33). In this particular context, the specific example of Palestine takes its place in the ongoing and dreadful history of oppressed communities (alongside, among others, the Jews), but given due weight, understanding, and human sympathy, rather than the routine dismissals or demonising perpetrated by the media or antagonistic politicians. An additional aspect of the universal is that of universal values (which intellectuals are to fight for and instantiate) as well as universal human rights. Once again, Palestine is central: 'Palestine, I believe, is today the touchstone case for human rights, not because the argument for it can be made as elegantly simple as the case for South Africa liberation, but because it *cannot* be made simple' (2000b, p. 435). In part, that

absence of simplicity is the result of the deeply implicated human situation of Israelis and Palestinians, the product of 'Overlapping yet irreconcilable experiences ...' (2004, p. 143). This is a reminder that the more positively inflected 'overlapping territories, intertwined histories' of a decade earlier are no guarantee of a positive outcome.

There are other ways in which Palestine has a representative function. Said and the majority of Palestinians live a life of exile. That material fact is then extended to the position of contemporary intellectuals, creating the duality that 'while it is *an actual* condition, exile is also for my purposes a *metaphorical* condition. . . . Exile for the intellectual in this metaphysical sense is restlessness, movement, constantly being unsettled, and unsettling others' (1994, p. 39, emphasis in the original). This restless, unsettled and unsettling intellectual clearly has something of the displaced, complex, and unpredictable figure we encountered earlier.

A final area of intellectual endeavour, which requires very much more space than is available for discussion here, is humanism. Said, never a follower of fashion, remained an unrepentant humanist throughout his career, while humanism became one of the most unfashionable areas in academe. He was, however, fully aware of the failings of traditional humanism and in the final book completed before his death, *Humanism and Democratic Criticism*, he discusses at length what humanism ought to be, and how humanist intellectuals ought to act. As a first step, and completely contrary to how it is typically viewed, 'humanism is not a way of consolidating and affirming what "we" have always known and felt, but rather a means of questioning, upsetting, and reformulating so much of what is presented to us as commodified, packaged, uncontroversial, and uncritically codified certainties, including those contained in the masterpieces herded under the rubric of "the classics"' (2004, p. 28). On that terrain of oppositional activity, 'the intellectual's provisional home is the domain of an exigent, resistant, intransigent art into which, alas, one can neither retreat nor search for solutions. But only in that precarious exilic realm can one

first truly grasp the difficulty of what cannot be grasped and then go forth to try anyway' (2004, p. 144). It is impossible not to imagine Edward Said going forth and trying.

Samir Amin (1931–2018)

Timothy Kerswell
Department of Government and Public Administration, University of Macau, Macau, China

Definition

This entry evaluates Samir Amin's contribution to the understanding of and the struggle against imperialism along with his contributions to Marxism.

Introduction

Samir Amin stands out as perhaps the greatest and most influential African Marxist theorist of the twentieth century. In this essay, I will try to evaluate Samir Amin's contributions to the understanding of and struggle against imperialism. To this end I propose that Amin made two major contributions to Marxism. Firstly, he undermined what can be characterised as the linear interpretation of Marxism which sees human history as necessarily passing through five definite stages of production, a theory which Amin saw as the product of a Eurocentric Marxism. Secondly, Amin contributed to the broad tradition of dependency theory and, in particular, the theory of unequal exchange in order to explain the way in which imperialism operates under conditions of world trade.

While this essay is primarily oriented towards the major theoretical contributions of Samir Amin, as a biographical essay it will also touch on some of the experiences that appear to have shaped his political thought so as to try and get a grasp of the man behind the theory. In the concluding part of the essay, I will provide an overview of the political demands to which Samir Amin feels the radical left should pay attention in the twenty-first century.

The Life of Samir Amin

Born in 1931, Samir Amin spent his formative years in Cairo, then a British colony. He studied within the French education system in Egypt before studying at the Institut d'Études Politiques de Paris in France, obtaining a diploma in political science in 1952. He then studied at the Institut National de la Statistique et des Études Économiques, where he obtained his PhD in 1957. During his time in France, Amin became involved with the French Communist Party and developed networks in various communist and anti-colonial groups, in particular through the National Union of French Students.

Amin, along with the rest of the anti-colonial student movement in France, generally supported national liberation movements in the Third World, a position that led them into tension with the French Communist Party. It was this experience that led him towards Maoism, and Amin himself would note that 'from 1957 to 1960 I almost fully shared the positions of the Chinese Communist Party, whereas after 1980 I had a more critical view of the Chinese openings to capitalism' (2014a, p. 1). Amin would later drift from this position, developing a critique of the limits of Maoism based on the experience of the defeat of socialism in China (Amin 2014a, p. 4).

Amin's early professional experience involved working as part of Egypt's planning agency immediately after the end of British colonisation. Simultaneously he worked underground for the Egyptian Communist Party. As President Gamal Abdel Nasser stepped up the persecution of communists in Egypt, Amin was forced to leave his homeland (Amin 2014b, p. 6). After staying in France for some time working for the department of economic and financial studies, Amin shunned a First-World existence in favour of giving service to the newly independent government of Mali as part of the ministry of planning (Amin 2014b, pp. 6–7).

Amin's experience in Mali would help to shape his theoretical work, in particular the noted obsession of the government with a plan to 'close the gap' with the West, a policy objective which led Mali (and as he would later argue, other countries) to pursuit a ruthless growth-oriented policy at the expense of both political and social democracy (Amin 2014b). Against this, Amin's position amounted to the argument that it is impossible to 'catch up' with the West through integration in the global capitalist economy. Amin and the rest of the dependency school argued that the basic structure of the global political economy had been established along imperialist lines. Accordingly, the more integrated a newly independent or otherwise Third-World country became with global capitalism, the worse off it would be.

By 1963, Amin had taken up a position with the United Nations' Institut Africain de Développement Économique et de Planification (IDEP), where he worked along with part-time academic roles in universities in both France and Senegal (Amin 2014b, p. 8). In 1970, Amin became superintendent of the IDEP; this position allowed him to launch various non-governmental organisations, the most memorable of which would be the Third World Forum, an organisation devoted to the development and promotion of policy alternatives in which Amin plays a leading role to this day.

Amin's Theoretical Work

Samir Amin has written over 30 books in both English and French, alongside numerous articles. Within such a short biographical essay it is impossible to even scratch the surface of the work of such a prolific writer. Despite this, I will attempt to introduce the reader to what I believe to be some of Amin's key theoretical contributions. In summary these are the rejection of a stagiest view of history; the promotion of an unequal-exchange or dependency perspective of political economy; and an analysis of monopoly capitalism in the twentieth and twenty-first centuries. I will provide a basic introduction to Amin's contributions to each of these areas in turn.

The Tributary Mode of Production and a Rejection of Stageism

One of the central tendencies of Amin's thought was the rejection of stageist theories of development, whether liberal or Marxist. The majority of Marxism after Marx has remained committed to the idea that every society must strictly pass through the same stages of development experienced by Europe. One of Amin's main contributions was to debunk this conclusion, and one of the important ways in which he did this was through the development of his concept of the 'tributary mode of production'.

Amin posed a number of difficult questions for orthodox understandings of Marxism, such as why certain countries like China developed far earlier than those in Europe, but did not develop a capitalist mode of production until it was brought on exogenously by imperialist intervention. The conclusion reached by Amin is that there are five basic modes of production which have defined the majority of human history, namely the following (Amin 1974, pp. 57–58):

1. The 'primitive' community mode of production, the only one which antedates all the others;
2. The tribute-paying mode of production, juxtaposing the persistence of the village community and that of a social and political apparatus exploiting the latter in the form of exacting tribute. This tribute-paying mode of production is the most common and most general form characterising pre-capitalist class formation; I propose to distinguish between the early forms and the advanced forms, such as the feudal mode of production in which the village community loses the eminent domain of the land to the benefit of the feudal lords, the community persisting as a community of families;
3. The slave mode of production, which is a relatively rare form although widely scattered;
4. The simple petty-commodity mode of production, a frequent form but one which practically never constitutes the dominant mode of a social formation; and finally
5. The capitalist mode of production in its 'pure state'.

Contrary to many historical and contemporary Marxist and modernisation theory analyses, Amin argued that feudalism was a phenomenon specific to Europe, rather than being a universal stage of development. Importantly, Amin would argue that the majority of the Third World was not characterised by feudalism, but instead by his tributary mode of production.

For Amin, the primary difference between the tributary mode of production and the capitalist mode of production is not the development of productive forces. Instead Amin argues that the primary difference lies in the way in which value is extracted. Amin argues that Marx's law of value applies under capitalism's generalised commodity production, and surplus value as such is generated. By contrast, under the tributary mode of production, 'tribute' is extracted using non-economic means. The historical conclusion to which this leads Amin flies in the face of the majority of criticisms of Marxism, the argument that it is an economic determinist theory. Contrary to this position, Amin argues that for the majority of human history the political has dominated the economic. Only under capitalism does the economic base begin to subvert (let alone determine) the political and cultural superstructure.

The Law of Worldwide Value

The basic argument advanced in Amin's *The Law of Worldwide Value* (2010) is that the division between the First World and Third World is the defining contradiction of global capitalism. Accordingly, the primary locus of struggle against global capitalism is in the Third World. Amin's *The Law of Worldwide Value* describes a system of unequal exchange whereby the imperialist countries are the beneficiaries of what he terms imperialist rent.

Amin's *The Law of Worldwide Value* serves as an important counterweight to what can be termed the 'globalisation thesis', the argument that globalisation has led to the free flow of capital, thus weakening the role of the nation state. For Amin, the state plays an important role in either restricting or promoting the mobility of labour, and utilising state power in service of local capitalist interests (Amin 2011). The end result of this process is a

system of Third-World super-exploitation. Amin demonstrates that wage differentials between the First and Third Worlds are not completely explained by productivity but rather by the political and historical factors he describes.

Amin for the most part skirted the edge of the thorny question of what is variously referred to as either the 'labour aristocracy' or the 'majority exploiter' thesis, the argument that most First-World workers are actually net beneficiaries of the global capitalist system. Brolin (2006, p. 243) even argues that the 'popularity of Samir Amin, who was a prominent participant in French debates, is largely explained not only by attempting to place unequal exchange in a perspective where productivity differences matter more, but also – so it is suggested – by the theoretical vagueness on this point, and by his drawing the politically correct conclusion. In line both with the "state capitalist" interpretation popular in France at the time, but more so the general dependency stance in France and elsewhere.' Amin's argument is largely limited to an observation that at the very minimum there is a significantly different rate of exploitation of labour between the First World and the Third World, and that this difference is one of the primary obstacles to unity between the working classes of the First World and the Third World. In place of Marx's 'workers of the world unite', Amin contends that the reality of the global class structure and its associated politics is far more complex (2010, pp. 92–93).

The political conclusion drawn from the above, namely that there is only one imperialist world system of which all countries are part, is of great significance for the international struggle against capitalism. The key actors in this world system are the forces of international capital, but also importantly the 'triad' (the concerted state power of the US, the European Union, and Japan).

Within the imperialist world system, however, Amin is critical of a narrow reading of imperialism as if it were constituted purely at the economic level. In Amin's own words:

As if the world were fashioned purely by economic laws, expressions of the technical demands of the reproduction of capital. As if the state and politics,

diplomacy and armies had disappeared from the scene! Imperialism is precisely the amalgamation of the requirements and laws for the reproduction of capital; the social, national and international alliances that underlie them; and the political strategies employed by these alliances. (1989, p. 141)

The culmination of Amin's political thought and analysis can be seen in the book *Capitalism in the Age of Globalization.* In this work he distils what he sees as the five major monopolies underpinning the world capitalist system, namely 'the monopoly of technology generated by the military expenditures of the imperialist centres, the monopoly of access to natural resources, the monopoly over international communication and the media, and the monopoly over the means of mass destruction' (1997, p. 3). For Amin, the fight against global capitalism boils down to the fight against these five monopolies.

Following the global financial crisis of 2008, Amin published *The Implosion of Global Capitalism* (2013a), documenting the self-destruction of the capitalist system and the way in which the presents a unique opportunity to the political left. In this work, Amin issues a challenge to the radical left, asking for 'audacity' in its political demands. Specifically, Amin recommends the socialisation of the monopolies, the de-financialisation of the management of the economy, and the de-globalisation of international relations (2013a, p. 136). I will briefly outline these demands as I believe that they represent examples of Amin's late-career thought; they are also important examples of his ongoing contribution to left politics in terms of not only critiquing the global capitalist system but also providing alternatives for which it is possible to fight.

For Amin, the socialisation of the monopolies involves far more than nationalisation. He is arguing for a complex political restructuring of the monopolies, not just their control by the state. Amin (2013a, p. 137) imagines 'Public institutions working within a legal framework that would set the mode of governance must replace the monopolies. These would be constituted of representatives of (1) farmers (the principal interests); (2) upstream units (manufacturers of inputs, banks) and downstream (food industry,

retail chains); (3) consumers; (4) local authorities (interested in natural and social environments – schools, hospitals, urban planning and housing, transportation); and (5) the state (citizens).' At the early stages of Amin's socialism, we see a form of syndicalist political system where the monopolies created by global capitalism are brought under the control and management of democratically governed, representative interest groups.

A major exception to Amin's generally syndicalist approach to governance comes in his discussion of the banking system. Amin notes the conflict of interest between the banks and the rest of the economy, even under conditions of nationalisation or socialisation. This is the result of what he terms the financialisation of the economic system, which he argues has occurred as a result of the past 40 years of neoliberal politics (2013a, p. 141). As a counter to this, Amin argues for de-financialisation in order to unpack this legacy. While he argues for a 'World without Wall Street' it is notable that Amin is nonetheless arguing for a form of market socialism:

> In a world without Wall Street, the economy is still largely controlled by the 'market.' But these markets are for the first time truly transparent, regulated by democratic negotiation among genuine social partners (for the first time they are no longer adversaries as they are necessarily under capitalism). It is the financial 'market' – opaque by nature and subjected to the requirements of management for the benefit of the monopolies – that is abolished. (2013a, pp. 142–143)

For Amin, definancialisation and the world without Wall Street amount to the end of an economic system geared to the maximisation of monopoly rents. In its place, he envisions that the 'state and markets [would be] regulated by the democratic negotiation of social partners' (2013a, p. 143).

The final component of Amin's political argument is one that he has advocated consistently throughout much of his theoretical work, that of 'delinking'. While the concept of delinking is often quick to be branded as autarky, Amin has always been at pains to argue that this is not the case. Instead, delinking really amounts to self-determination in development, or 'the reconstruction of a globalization based on negotiation,

rather than submission to the exclusive interests of the imperialist monopolies' (ibid.).

It is in his argument about delinking that Amin not only makes the case for the most advanced development of his challenge to the radical left, but also lays out a basic narrative of twentieth-century industrialisation. Amin argues that the response to dependency, where imperialist countries monopolised industry, was that twentieth-century national liberation movements industrialised the Third World. Despite this, modern imperialism led by the triad of the US, European Union, and Japan has monopolised Amin's big five monopolies, which remain the key obstacles to progress for the Third World.

In the late stage of his career, Amin has issued a call for audacity from the radical left. Rejecting compromise and social democracy in favour of the road to socialism, Amin has argued that it is 'necessary to propose strategies not "out of the crisis of capitalism," but "out of capitalism in crisis"' (2013a, p. 146). Amin suggests that the radical left can be the political vehicle for this transition, and that in particular a coalition between anti-monopoly coalitions in the First World and anti-comprador coalitions in the Third World can achieve this. Here we see Amin's reaffirmation of the potential of political forces in the First World to play a role in the end of global capitalism, a popular position within the radical left, but one that has yet to be proved effective.

The one major blot on Amin's record as an anti-imperialist comes in the form of his public position on the French intervention in Mali. Amin chose to support the French intervention against the Tuareg rebellion, largely because of his opposition to political Islam, which he describes as follows:

> You need a good deal of naivety to believe that the political Islam of some – described on account of this as 'moderate' – would be soluble in democracy. There is of course a sharing out of chores between them and the 'Salafists' who they say exceed them with a false naivety by their fanatic, criminal and even terrorist excesses. But their project is the same – an archaic theocracy that by definition is the polar opposite of even minimal democracy. (Amin 2013b)

In the absence of the space to go deeply into Amin's analysis of the situation, it can be said that the basic terms of his conclusion are twofold. Firstly, Amin as we have seen is extremely hostile to all forms of political Islam. There are shades of the late Christopher Hitchens in this kind of late-career support of imperialism. Secondly, it can be seen that Amin felt France capable of breaking away from the 'triad' (the US, European Union, and Japan), the monopoly imperialist bloc, by providing an alternative pole. This turned out to be a fairly ill-conceived position, as the US was quick to praise France for its intervention and keep it firmly within the 'triad' camp (Boerma 2013).

While it is possible to direct criticism at elements of his work, and in particular his late-career position on the French imperialist intervention in Mali, in the broad analysis this can probably be written off as an aberration, one that should not be seen at the expense of Amin's overall career. Samir Amin has proved to be a lifelong radical, a steadfast supporter of revolutionary socialism and of the rights of peoples to self-determination in both a political and an economic sense. A prolific writer and a tireless activist, Samir Amin has made a massive contribution to anti-imperialism.

Sanctuary Movement, United States, 1981–1992

Simon Behrman
Department of Law and Criminology, Royal Holloway, University of London, Surrey, UK

Origins

The Sanctuary Movement arose in response to the millions of refugees who fled the civil wars that gripped Central America during the 1980s. The overwhelming majority of those who made it across the border into the US were denied asylum. At best, the US authorities dumped the refugees back across the border into Mexico and, at worst, deported them back to their home countries, where they faced further persecution. This was in contrast to the welcome offered to those fleeing communist regimes in Eastern Europe and Cuba. The US government faced a contradiction between, on the one hand, supporting, funding, and arming the right-wing governments in El Salvador and Guatemala and, on the other hand, having to accept the testimony of the refugees from those countries alleging persecution, torture and killings by those governments.

The Sanctuary Movement was initiated by Quakers and Christians in Tucson, Arizona.

They had first-hand experience of witnessing the plight of these refugees as they crossed the border. After exhausting all the legal routes to gaining asylum for the refugees, the activists in the Sanctuary Movement began to deliberately evade the law by assisting them in various ways. At first this mainly involved hosting refugees in their homes, providing them with donations of food and clothes, and assisting the refugees to cross the border without being detected by the Border Patrol. In response to the swelling numbers of refugee arrivals and threats from the authorities to prosecute the activists for illegally transporting and sheltering aliens, activists began to rehabilitate the ancient notion of sanctuary. This involved declaring churches to be spaces in which refugees could seek shelter from persecution, and also from the secular authorities wishing to deport them. One leading figure in the Sanctuary Movement declared: '[The Church's] reasoning was based on Christian hospitality. We decided that we had always helped people before on the basis of human need, and that we'd never asked anyone for their IDs, or green cards' (quoted in Bibler Coutin 1993, p. 29).

On 24 March 1982, the second anniversary of the assassination of Archbishop Oscar Romero in San Salvador, the first public declaration of sanctuary was made by the Southside Presbyterian Church in Tucson. Slogans hung on banners outside Southside Church declared: *La Migra No Profana El Sanctuario* (INS, Don't Profane the Sanctuary) and *Este es El Sanctuario de Dios Para Los Oprimidos de Centro America* (This is a Sanctuary of God for the Oppressed of Central America). On the same day a further five churches in the Bay Area around San Francisco declared themselves as sanctuaries. The Bay Area churches had earlier been part of a sanctuary movement during the Vietnam War. They had provided sanctuary to draft-resisters and others who refused to fight and who were evading arrest by the government for their refusal. Indeed, there are a number of continuities between the anti-Vietnam War movement and the Sanctuary Movement, both in terms of the people involved and the concern with peace, and resistance to US imperialist intervention. The decision to go public was based partly, at

least, on the potential to raise public awareness of the plight of the refugees and to force the government to acknowledge the veracity of their claims for asylum. As such, the Sanctuary Movement made a decisive turn from Christian charity and humanitarianism towards political agitation. Arguably, the judgement of a government undercover agent who attended the public declaration in Tucson was accurate when he reported: 'It seems that this movement is more political than religious' (quoted in Cunningham 1995, pp. 33–34).

Growth of the Movement

During the first year alone, Southside Church provided sanctuary for over 1,600 refugees (Smith 1996, p. 68) The movement quickly spread. By the end of 1982, 15 churches had declared sanctuary, with another 150 churches supporting refugees in various ways, such as raising money, and providing food and clothes for them (Crittenden 1988, p. 100). In addition to the public declarations, an 'underground railroad' developed linking together churches, private homes, and other spaces all the way from the Mexico/Guatemala border north across the US/Mexico border and onwards throughout the US and up into Canada. By the end of 1982, the Sanctuary Movement remained 'by any measure … tiny. But it was beginning to irritate the colossal United States government' (Ibid.) At the end of February 1983, less than a year after the public declaration, the Tucson Ecumenical Council (TEC), an official body comprising local churches and synagogues, agreed that its employees could engage in actively assisting refugees to reach sanctuary churches. In effect, the Tucson churches were endorsing and paying for refugees to be smuggled illegally across the border.

By the autumn of 1982 the numbers of refugees arriving across the border had increased exponentially, and the existing sanctuary activists struggled to cope. So they approached the Chicago Religious Task Force on Central America (CRTFCA) for help. The CRTFCA had been founded in January 1981 by a group of political activists based in a variety of local churches in response to the rape and murder of four US nuns

by right-wing paramilitaries in El Salvador. CRTFCA's goals were to raise awareness of the conditions that war and dictatorship were imposing on the people of Central America, mobilise opposition to the US government's support for repressive regimes in the region, and build solidarity for Central Americans both in their own countries and with those who had fled as refugees to the US. The CRTFCA helped set up a national network of sanctuaries across the US and 'refined the concept of public sanctuary' by developing the practice of getting the refugees to give public testimony in churches and to the press about what was going on in Central America, and the experiences that had led to their flight (Crittenden 1988, p. 90) This emphasis on getting refugees to speak publicly gave them a voice and created a human story that allowed others to identify with them. It was also deemed necessary to educate the US public about their government's involvement in wars that were being little reported in the media at the time.

By 1984 there were some 3,000 linked sanctuaries across the US, including, as well as churches, private homes, monasteries, Native American reservations, farms in Iowa, and synagogues (Golden and McConnell 1986, pp. 52–53). All the major Protestant denominations had endorsed sanctuary nationally, except for the Evangelicals, and many Catholic bishops had also endorsed it (Davidson 1988, p. 84). The Union of American Hebrew Congregations and the Central Confederation of American Rabbis supported the movement (Lorentzen 1991, p. 29). At its peak a total of over 70,000 activists took part in the Sanctuary Movement, and its network extended into 34 states (Golden and McConnell 1986, p. 3; Lorentzen 1991, p. 14). About two-thirds of the movement were women, with many of the key activists 'housewives and nuns' (Lorentzen 1991, p. 3).

Prosecution

On 10 January 1985 a Federal Grand Jury indicted many of the leading Sanctuary Movement activists on charges of illegally transporting and harbouring aliens. When the case came to trial the judge prohibited defences based on international law, necessity, or religious or moral belief. Further, the question of whether the people helped by the defendants were refugees, or not, was deemed to be irrelevant. Instead the defendants were depicted as 'coyotes', slang for people smugglers. A further set of rulings banned the use of certain words, including describing the people being given sanctuary as 'refugees', along with terms such as 'tortured' or 'killed' when describing their experiences (Crittenden 1988, p. 271; Davidson 1988, p. 123) In May 1986, all but one of the defendants were found guilty, although they only received suspended sentences.

After the trial, one of the defendants and a founder of the movement, Jim Corbett, said: 'We'll stand trial as often as we have to. It'll continue as it has because the refugees and their needs actually set the agenda' (quoted in Guzder 2011, p. 115). Following the trial, the Sanctuary Movement was more or less left alone by the government, in spite of continuing sanctuary activities. The Border Patrol even pledged not to enter places of worship to make arrests. On a number of occasions a 'hot pursuit' of refugees by INS agents was terminated once they entered a church (Corbett 1992, p. 177).

Splits and Decline

However, the trial represented a turning point for the Sanctuary Movement in a number of respects. The profile of the movement was significantly raised through sustained media coverage of the trial. Over $1 million was raised to support the defendants, and over the course of the trial the number of publicly declared sanctuaries doubled. Yet it also proved to be the high-water mark of the movement. The decline can be attributed to two related developments: a split, and by a turn towards a much more legalistic approach by those activists working along the border. The movement divided between what became known as the 'Tucson' and 'Chicago' wings. 'Tucson' wanted the Sanctuary Movement to be guided by humanitarian aims based on the legal definition of

the refugee. They prioritised helping the refugees, irrespective of their politics, or of the politics that caused their flight. One controversial aspect of this, in practice, was that the Tucson activists assisted refugees who had previously been members of death squads and parties supportive of the right-wing governments in El Salvador and Guatemala, as well as *campesinos* and other victims of the governments and the death squads.

'Chicago' framed sanctuary within a wider movement dedicated to political solidarity with the oppressed in Central America and to resisting US imperialism in the region. The CRTFCA's Statement of Faith was clear in staking out their position: 'The sanctuary movement seeks to uncover and name the connections between the US government and the Salvadoran death squads, and the connection between US business interests and the denial of human and economic rights of the vast majority of people. We believe that to stop short of this is to betray the Central American people and the refugees we now harbor' (quoted in Allitt 2003, pp. 177–178).

A further result of the trial was that those involved in bringing the refugees across the border, mainly those in the 'Tucson' faction, adopted an increasingly legalistic approach. '[T]hose returning from the [Sanctuary] trial had been profoundly influenced by court arguments and wished to implement procedures that would underscore the "legality" of Sanctuary work. Among these was the adoption of the United Nations High Commissioner on Refugees (UNHCR) guidelines regarding refugee determination' (Cunningham 1995, p. 168). A theory of 'civil initiative' was developed in contrast to that of 'civil disobedience'. Whereas the latter involved breaking unjust laws, Corbett, speaking at Harvard in 1987, explained that: 'As civil initiative, sanctuary extends the rule of law by instituting a way for our society to comply with human rights and humanitarian laws when the government violates them' (quoted in Crittenden 1988, p. 345). In practice, this meant that members of the Sanctuary Movement would routinely screen those seeking help at the Mexican border, and if they failed to meet the strict definition of refugee according to international law then they were refused help in crossing the border. This led to a further split within the 'Tucson' group, with some believing that this corrupted the original, more open approach to sanctuary. One of the activists critical of this legalistic approach felt that the experience of the trial – 'trial trauma' – was responsible for this (Cunningham 1995, p. 169). It was also, perhaps, a result of these particular activists ignoring the political aspects of sanctuary.

Another problem identified by some commentators cut across the Chicago/Tucson divide. The refugees, it has been argued, were often perceived by the North American activists as '"objects" rather than empowered "subjects" of Sanctuary', or as subjects of 'pastoral' care rather than fellow activists engaged in a political struggle (Cunningham 1995, pp. 141–142; Lippert 2005). Even leading participants within the movement have claimed that refugee communities in urban centres took in many more refugees and provided far more sustenance than the Sanctuary Movement itself did (Golden and McConnell 1986: 61). During one sanctuary conference, the refugees demanded that the primary aim of the movement should be stopping US involvement in Central America. A Salvadoran refugee declared: 'We want to go back home. We want El Salvador and Guatemala to be sanctuaries' (quoted in Golden and McConnell 1986, p. 165). Although there were organisations of Central American refugees that worked closely with the Sanctuary Movement, it was the case that: 'Sanctuary itself . . . remained a movement about, rather than of, Central Americans' (Bibler Coutin 1993, p. 11).

Legacy

In the early 1990s the Sanctuary Movement began to wind down. Peace agreements were reached in El Salvador and Guatemala, which greatly reduced the numbers of refugees. Some legal victories were won giving greater rights to the refugees to seek asylum in the US. Many of them were allowed to have their cases heard again by newly trained officers, and they were allowed to work whilst their case was pending. The 1990

Immigration Act put in place a statutory basis for 'temporary protected status', which allowed more than 200,000 Salvadorans and Guatemalans to remain within the US. In the view of many of its activists, this meant that the Sanctuary Movement had effectively won.

The Sanctuary Movement spawned a more long-lasting legacy in the form of 'sanctuary cities'. Over 50 cities in the US have passed 'sanctuary city' legislation that prohibits any municipal resources or employees from being utilised to enforce federal immigration laws. Some have gone even further by barring all municipal employees from enquiring as to someone's citizenship status. And inspired by the US Sanctuary Movement, churches in Canada, Great Britain, Norway, Holland, Switzerland, Italy, and West Germany began giving sanctuary to asylum seekers from the mid-1980s onwards. The movement inspired the agitation for regularisation of undocumented migrants in the US beginning in 2007, with the creation of the New Sanctuary Movement. Today, many of the activists based in Arizona have moved on to providing assistance and help to the many irregular migrants crossing the US/Mexico border in organisations such as No More Deaths and *Humane Borders*.

Definition

This essay explores the life and work of Burkinabé revolutionary, Marxist, pan-Africanist, and President of Burkina Faso from 1983 to 1987, Thomas Sankara (1949–1987).

On 4 August 1983, Thomas Sankara led a coup d'état against President Jean-Baptiste Ouédraogo and Colonel Somé Yoryan in the West African country of Burkina Faso (at the time known as Upper Volta or Haute-Volta). In the early 1980s, Burkina Faso, like many African nations, was deeply in debt. At the same time, global commodity prices had declined significantly, agricultural exports had decreased, and a sweeping financial crisis resulted in the retrenchment of poverty, joblessness, and precarity across Burkinabé society. The infant mortality rate was the highest in the world, estimated at 280 deaths per 1,000 infants. In this context, there was a growing popular dissatisfaction with the repressive neo-colonial political regime, evidenced by a series of labour-union strikes and military coups in these years.

Sankara described the state of Burkina Faso during this period, saying, "The diagnosis was clearly somber. The root of the disease was political. The treatment could only be political."

Sankara ambitiously set-out to de-link Burkina from this debilitating political disease by enacting programmes for auto-centric development, creating wide-sweeping reforestation programmes, implementing new educational models, transforming the national army, and working towards the emancipation of women. His radical political thought is known as Sankarism or Sankarist tradition: a Pan-African, anti-imperialist, and communist-inspired political praxis that emphasises holistic social transformation through the permanent dismantling of (neo-)imperial structures of dispossession. According to Sankarist tradition, this emancipatory social transformation is possible only through the collective energies and everyday actions of the Burkinabé.

Biography

Thomas Isidore Noël Sankara was born on 21 December 1949 in the town of Yako in northern Burkina Faso. In an interview with Swiss journalist Jean-Philippe Rapp in 1985, he reflected on his experiences growing up during the end of the colonial period in Gaoua. He vividly remembered how, as a child, he yearned to ride a bicycle that belonged to his European primary-school principal's children, a bicycle which none of the neighbourhood children was allowed to use:

> The other children dreamed about this bicycle for months and months. We woke up thinking about it; we drew pictures of it; we tried to suppress the longing that kept welling up inside of us. We did just about everything to try to convince them to lend it to us. If the principal's children wanted sand to build sand castles, we brought them sand ... One day, I realized all of our efforts were in vain. I grabbed the bike and said to myself, "Too bad, I'm going to treat myself to this pleasure no matter what the consequences." (Sankara 2007c/1985)

For this act, Sankara's father was arrested and Sankara was expelled from school. This early encounter with colonial injustice and inequality shaped Sankara's worldview. It was reaffirmed when his father was arrested again when Sankara's sister was caught throwing rocks to dislodge some wild fruit and some of the rocks fell onto the principal's house. Sankara reflected

years later: "[These falling stones] disturbed [the principal's] wife's nap. I understand that after a wonderful, refreshing meal, she wanted to rest, and it was irritating to be disturbed like this. But we wanted to eat." These encounters with the systems of oppression (where a father was arrested, in essence, for his child's hunger) can be seen as an early impetus for Sankara's political consciousness. He was deeply troubled by the gap between the people living in relative luxury, whose primary concern was leisure, and those living in uncertainty, whose primary concern was food. The struggle for dignity and sustenance would remain at the centre of his political project.

In 1970, Sankara attended officer training in Madagascar. There he witnessed the popular uprising of students, farmers, and labourers against the French-appointed leader Philibert Tsiranana. Two years later, he attended parachute academy in France and was exposed to some of the philosophies that would become the foundation for his revolutionary leadership, including Marxist political economy and development theory. At the age of 33, Sankara had risen as a military leader in the Upper Volta army. By 1980, he was speaking out against imperialism and building a network of allies within the ranks of the military. He was appointed minister of information in 1981, but quickly resigned after exposing high-level corruption to local journalists (Harsch 2013).

His anti-imperial political stance was not well received by Burkinabé elites and, as a result, Sankara and a handful of his supporters were arrested in Ouagadougou, the capital of Burkina, by the Ouédraogo regime. Thousands of Burkinabés took to the streets to protest and demand his release. Sankara's long-time friend and military ally Blaise Compaoré marched with 250 men on Ouagadougou, overtook the old regime and released Sankara. This insurrection became known as the August Revolution. Sankara describes the movement as a culmination of years of struggle and demonstration against neo-imperial domination. For the next four years, the National Council of the Revolution (CNR), under Sankara's leadership, ambitiously undertook one of the most radical collectivist and anti-imperialist projects on the African continent.

Sankarism and Contributions to Anti-imperialism

Sankara's emancipatory project was founded on a conviction that a radical transformation of the relationship between the people and the State in the post-colony was needed. He strove to dismantle the post-colonial Burkinabé State as an extension of neo-colonial power interests, one which facilitated the ongoing plunder of Burkina's resources for a small native elite while the majority of the population lived in poverty. He abandoned the use of wealth and status symbols, which had become a component of the post-colonial African elite, stipulating that his ministers must drive modest vehicles rather than the preferred Mercedes Benz. Breaking with a globalised political culture that idolises political leaders, Sankara refused to have his portrait on display. He advocated the consumption of locally produced goods for the self-sustainability of Burkina Faso.

Indeed, Sankara dressed modestly and boasted that his clothing, often a traditional Faso Dan-Fani, was made from materials woven in Burkina. Much like the name he selected for the country, Burkina Faso (the land of upright people), he encouraged and cultivated a love for country, for community and for self. This was a radical shift in consciousness for a post-colony that continued to draw upon the colonial education system, in which ideas of African selfhood were shaped and narrated through the colonial gaze. Twenty-three years after the formal end of colonial rule in Burkina, students continued to be instructed in French, the former colonial language, and in Western cultural, political, and social ontologies and epistemologies. Sankara described this system: "The colonial schools were replaced by neo-colonial schools, which pursued the same goals of alienating the children of our country and reproducing a society fundamentally serving imperialist interests" (2007b/1983, pp. 81–82). At the time he came into power, 98% of rural Burkinabés were unable to read or write and only 16% of school-age children attended. He recognised the need for a radical re-education of Burkinabés, one that made necessary the building of a foundational respect for Burkinabé history, culture, and selfhood. In response, Sankara launched an educational campaign to begin the project of building and sustaining a critical political consciousness.

Sankara spoke with conviction, persuasion, and charm to argue for a holistic approach to social change, one that considered women's emancipation to be essential to the anti-imperial project. His contributions to women's emancipation are not focused on equality in the Euro-American sense; instead they articulate a gender complementarity approach, one which recognises that "Women hold up the other half of the sky" (Sankara 2007e/1983, p. 66). He did not replicate colonial or patriarchal power dynamics by professing to speak for women. Instead, he spoke *with* them, reflecting his abiding respect for the dynamic and diverse roles of women in social and political life. He said, "We do not talk of women's emancipation as an act of charity or out of a surge of human compassion. It is a basic necessity for the revolution to triumph" (ibid.). He envisioned the movement for social transformation as "one that entrusts responsibilities to women, that involves them in productive activity and in the different fights the people face" (ibid.). He implemented a national day of solidarity with housewives, encouraging men to adopt the work of women for a day as a means of cultivating recognition for women's essential roles in Burkinabé society. Sankara's commitment to the emancipation of women was a radical contribution to Pan-African politics, one that named patriarchy and male privilege as detrimental to the struggle for African empowerment.

Sankara's speeches often included direct confrontations with neo-imperial powers and reactionary forces. At the 39th Session of the United Nations General Assembly in New York in 1984, for example, Sankara described the state of international politics as "A world in which nations, eluding international law, command groups of outlaws who, guns in hand, live by plunder and organize sordid trafficking" (2007d/1984, p. 155). He pronounced the indigenous Burkinabé elite as "a passive and pathetic consumer" (157). Sankara's goal of total emancipation and empowerment for every Burkinabé challenged the foundations of the neo-imperial capitalist system and threatened foreign and domestic elites. On

S

15 October 1987, Sankara and 12 of his comrades were assassinated on the order of his political associate and deputy Captain Blaise Compaoré. On 17 January 1988, a death certificate was issued by the Compaoré regime, claiming that Sankara died of "natural causes." International political elites, including Guy Penne in France, the CIA in the US, Houphouet Boigney in the Ivory Coast and Charles Taylor in Liberia (Montanaro 2009; Ray 2008), are suspected of having been involved in the movement to violently remove Sankara from power and to stop his political momentum, which had gained significant international attention and support. A comprehensive investigation into the events of his death has never been carried out and the United Nations Committee for Human Rights closed its file on the assassination on 21 April 2008. After Sankara's assassination, Compaoré immediately set-out on a 'rectification' programme that opened Burkina Faso to the neoliberal economic reforms that have had devastating consequences for the Burkinabé population. Compaoré remains president of Burkina, after nearly 27 years in power.

Sankara's contributions to the anti-imperial struggle cannot be overstated. He led one of the world's poorest nations in one of the world's most radically egalitarian political projects. He emphatically refused to pay back debts that had been incurred during colonialism and by the neocolonial regimes that followed. He urged African leaders to unite in their refusal to repay. His courage and conviction were founded on an abiding respect for ordinary people and in his recognition of their intellectual, creative, and political contributions. He fearlessly critiqued the destructive and exploitative forces of global empire.

In moments that seem to be deeply reflective and anticipatory of his own assassination, he spoke of death, meaning, and the return to homeland. It is difficult not to read his tribute to Che Guevara, "You cannot kill ideas," as foreboding his own death. He said, "Che Guevara was cut down by bullets, imperialist bullets, under Bolivian skies. And we say that for us, Che Guevara is not dead … you cannot kill ideas. Ideas do not die" (2007a/1987, p. 421). A week later, he was assassinated by machine-gun fire. "La patrie ou la mort, nous vaincrons" (Homeland or death, we will win), Sankara declared triumphantly at the end of each of his speeches. Although there are powerful forces that would erase Sankara's memory and heritage, African youth, activists, and students across the continent continue to draw upon the tenets of Sankarism to criticise political corruption, to advocate political change, and to draw inspiration and hope for a better future.

Postscript

Under pressure from a popular youth-led movement, which drew inspiration from Sankara's political heritage and organised under the slogan "enough is enough," Blaise Compaoré resigned as president of Burkina Faso on 31 October 2014.

Sembène, Ousmane (1923–2007)

Sérgio Dias Branco
Film Studies, University of Coimbra, Coimbra, Portugal

Definition

Senegalese Sembène Ousmane was one of the key African artists of the twentieth century as a writer and a film director.

Sembène Ousmane was born 9 years after Blaise Diagne was elected as Senegal's first African deputy to the French parliament. In the late nineteenth century, France had gained control over the territory of Senegal after the British had left. It became part of French West Africa. Over the centuries, this region had been exploited for slave and goods trade by the Portuguese and the Dutch. In 1946, Senegal became part of the French Union. Some 12 years later, it became a republic and part of the French Community.

Sembène saw all these changes, but also how they resulted from the struggle of the Senegalese people for emancipation. Hope for self-determination would soon be realised. In June 1960, Senegal became independent and a constituent of the Mali Federation, which it abandoned later that year. Leopold Senghor was the first president of the new republic, whom Sembène, as a communist and internationalist, criticised along with 'African socialism', particularly Senghor's Négritude and the endorsement of a Francophone Commonwealth. After a failed coup led by prime minister Mamadou Dia, a constitution was drawn up and approved. In 1966, Senghor's Senegalese Progressive Union became the country's sole political party and remained so until 1978. Abdou Diouf became president in 1981. Senegal and neighbouring Gambia aimed to combine military and security forces and so the next year they formed the Senegambian Confederation. It was dissolved 7 years later. The separatist movement in the southern province of Casamance gained momentum at the beginning of the 1980s. In 2000, the opposition leader Abdoulaye Wade won the second round of the presidential election and ended 40 years of Socialist Party rule, introducing political changes such as giving the president power to dissolve the parliament. Wade's Senegalese Democratic Party won an overwhelming majority in parliamentary elections in 2001. When 1863 passengers died in a ferry disaster off the coast of Gambia, the incident had a political impact that led to the government's resignation. In October 2005, a dispute with Gambia over ferry tariffs on the border resulted in a transport blockade. The economies of both countries suffered. Nigerian president Olusegun Obasanjo organised talks to resolve the issue. In 2006, the Senegalese army launched an offensive against rebels from a faction

S

of the Casamance Movement of Democratic Forces. Senegal and Spain agreed to jointly patrol the Senegalese coast so as to curb the exodus of so-called illegal migrants heading for Europe, particularly for the Canary Islands. Senegal was and still is a common starting point for poor and desperate migrants setting out in rickety boats.

The Senegalese Sembène Ousmane, one of the key African artists of the twentieth century as a writer and a film director, was attentive to this historical process. As Pfaff states, his originality 'as a filmmaker lies in his having managed successfully to adapt film, a primarily Western medium, to the needs, pace, and rhythm of African culture', and, specifically, Senegalese culture (1993, p. 14). In the vein of the African tradition of telling and transmitting stories that creatively reflect the situation of its peoples, Sembène opted for fiction instead of documentary filmmaking. His novels, short stories, and films adopt a social-realist aesthetics and mode of narration, limpid and spare. His movies strengthened the cause of the liberation from colonial oppression. With a sharp political conscience rooted in knowledge of the history, culture, and reality of Senegal, these works portrayed the tensions generated by economic factors, the social classes, the racial statuses, the religious degeneration, and the gender conditions in the country. He was an African filmmaker and a political artist who criticised Négritude (the unreflective affirmation of the value of black or African culture, heritage, and identity) because Africa before the arrival of white colonisers was not an idyllic place.

David Murphy points out that a fundamental element for the understanding of Sembène's view of art is his paper 'Man Is Culture' (2000, p. 29). In this presentation as a Hans Wolff Memorial Lecture at Indiana University-Bloomington, Sembène explained that the concept of art as an adornment is unknown in West Africa. Humanity is art. Humanity is culture. That is, culture (of which art is a part) cannot be abstracted from the historical roots and human conscience that are at its origin and are produced by it.

Sembène was born in Ziguinchor, Casamance to a Lebou family, and he initially followed the path of his father and became a fisherman.

Working in plumbing and masonry gave him an inside perspective of the problems and challenges of the working class. His maternal grandmother reared him and greatly influenced him; she is arguably the reason why women play a major role in his works. Wolof was his mother tongue. He learned basic Arabic at a madrasa and French at a French school until he clashed with the principal in 1936. During the Second World War, Sembène was drafted into the Senegalese Tirailleurs, a corps of colonial infantry in the French army. Later he served with the Free French Forces, the resistance organisation founded by Charles de Gaulle in 1940 in London to continue the campaign against the Nazis and their allies. After the war, he returned to his home country. In 1947, he participated in a long railroad strike. *God's Bits of Wood* (1995/1960) is inspired by this courageous strike of the Dakar–Niger railroad workers, from October 1947 to March 1948. It is a portrait of post-Second World War French West Africa, set in today's Senegal and Mali (French Sudan), in the moment that the African working class became organised. It has no protagonist, much less a hero, except for a community of nearly 50 characters who band together in the face of hardship and oppression to defend their rights.

Late in 1947, he went again to France, where he worked at a Citroën factory in Paris, and then on the docks at Marseille, where he started writing. His first novel bears the title *The Black Docker* (1987a/1956), and is about an African immigrant who faces racism and mistreatment on the same docks. He witnesses the oppression of Arab and Spanish workers, making it clear that their problems have to do with labour despite the fact that they are experienced as racism and xenophobia. Sembène became active in the French trade union movement and joined the General Confederation of Labour and the French Communist Party (PCF), helping to organise a strike to hinder the shipment of weapons for the Indochina War, which he saw as a resistance war against French colonisation. During this time, he discovered two men who became major influences in his work: Claude McKay and Jacques Roumain. McKay was the author of *Home* to *Harlem*

(1928), which looked among the ordinary people for a distinctive black identity. The Haitian Marxist Roumain had been actively opposed to the US occupation of Haiti between 1915 and 1934, the year when he founded the Haitian Communist Party with other comrades. It is clear that Sembène saw his artistic work and political activism as not merely a personal desire, but as a social necessity (Gadjigo 2010, p. 115).

He left the PCF in 1960, never leaving the communist ideal and continuing to be a militant through his art, which made use of historical materialism to interpret and intervene in Senegalese society. In his exchange with ethnographic filmmaker Jean Rouch, who had made films about African culture, he contrasted their approaches in a clear manner:

> You say seeing. But in the domain of cinema, it is not enough to see, one must analyze. I am interested in what is before and after that which we see. What I do not like about ethnography, I'm sorry to say, is that it is not enough to say that a man we see is walking; we must know where he comes from, where he is going. (Busch and Annas 2008, p. 4)

In order to discuss an artist, we usually discuss his work and its context. At times, we also consider his life and its connection with his art. Yet in this case we must examine his name as well. Should we write 'Sembène Ousmane' or 'Ousmane Sembène'? This is not a futile question. The first, which was adopted by the artist in his films and books, is written in the style used in official French documents, with 'Sembène', a patronymic surname, first. It bears the mark of history, therefore calling attention to the persistence of colonialism after the ending of colonisation. The second erases these associations.

Sembène's art gives voice to revolutionary Africa. Despite the individuated characters, the true protagonist of his fictions is the Senegalese people, catapulted by the historical development and the production relations of colonialism to the centre of the contemporary class struggle. His works unmask the new bourgeoisie and critique the persistence of feudalistic structures and cultural obscurantism. For him, the autonomy from colonial powers in Africa was often merely formal. It did not change the economic and social structures in place.

He realised that films could reach a wider African audience that did not have the means or the education to read his writings. In 1962, he went to study at the Soviet Gorky Film Institute in Moscow with a scholarship, where he studied with the Ukrainian filmmaker Mark Donskoy. After returning to Senegal, he directed two short films on 16 mm: the documentary *The Sonhrai Empire* (*L'Empire sonhrai*, 1963) and the drama *Cart Driver* (*Borom Sarret*, 1963). *The Sonhrai Empire* (produced by the Republic of Mali) depicts the history of the Islamic Songhai Empire. *Cart Driver* introduces an unidealised style that Sembène would develop later, portraying economic exploitation through the perceptive rendering of a cart driver's everyday in Dakar. His third short film, *Niaye* (1964), based on one of his short stories – 'White Genesis', later included in *The Money-Order and White Genesis* (1966) – is the tale of a pregnant young girl who faces the judgment of her community, which tries to prevent the scandal from reaching the French colonial administration. *Black Girl* (*La noire de . . .*, 1966) was his first feature and it adapts one of the short stories that can be found in *Tribal Scars* (1981/1974). It won the Prix Jean Vigo in France, because it was a French-language film, calling attention to African cinema and Sembène. The film's main character, Diouanna, is a Senegalese maid who is taken to the south coast of France by her French employers. It is only in this exiled condition that she realises what being colonised and African means; the same process that Sembène had gone through. The success of this film gave him an opportunity to make *The Money-Order* (*Mandabi*, 1968) in his native dialect Wolof. Once again, the film was based on one of his short stories, 'The Money-Order' (1987b/1966), about a village man, used to ordering around his wives, who receives a money-order from his nephew in Paris and helplessly attempts to cash it. Sembène exposes the vanity and cold ambitions of the petite bourgeoisie. It is not just the language that is important, but the power and history of oral communication in its public and private dimensions (Niang 1996: 67–68). In the late 1960s, the filmmaker developed two small projects for public television, *Employment*

S

Problem (*Les Dérives du chômage,* 1969) and Polygamy (*Traumatisme de la femme face à la polygamie,* 1969), both focusing on social and cultural problems, which have roots in human exploitation.

The Money-Order had marked the adoption of a critical stance towards the corrupt African elites that followed the racial and economic oppression of the colonial government. *Xala*, as a novel (1974) and a film (1975), would prolong this analysis of the social and moral collapse of post-independence Africa, followed by the books *Niiwam and Taaw: Two Novellas* (1992/1974) and *The Last of the Empire: A Senegalese Novel* (1983/1981). It is the story of El Hadji, a rich businessman struck by what he believes to be a curse of impotence, *xala* in Wolof, on the night of the wedding to his beautiful, young third wife. Only after losing most of his money and reputation does he discover the source of the problem to be the beggar who lives outside his offices, whom he had wronged to acquire his fortune. The story satirises modern African bourgeoisie, exposing the corruption at the heart of post-independence governments, as if white colonialists had merely been replaced by a black elite who promote capitalism and imperialism. The man's erectile dysfunction is an image of this failure, the postponing of African emancipation. The short film *Taaw* (1970) is about an unemployed young man in modern Senegal. Although accused of being lazy, he is able to help his pregnant girlfriend who has been abandoned by her family. *God of Thunder* (*Emitaï,* 1971) is a film in the Diola language and French portraying the confrontation between French Gaullist colonists and the Diola people of Senegal in the last days of the Second World War. The women are at the forefront of the resistance and the film conveys their social power as keepers, preservers, and enhancers of myths, rituals, and stories. It was banned throughout French West Africa, and was showed at the seventh Moscow International Film Festival, where it won a Silver Prize. Sembène's films were always welcomed at this Soviet festival, which awarded him an honorary prize for his contribution to cinema in 1979. *African Basketball at the Munich Olympic Games* (*Basket africain aux Jeux olympiques de Munich,* 1972) was shot during the 1972 Summer Olympics that took place in the Federal Republic of Germany, but it was never commercially released due to the Munich massacre in which six Israeli coaches, five Israeli athletes, one German police officer, and five members of the Black September group died.

West African spirituality and religion are crucial topics in Sembène's work. As a child, he came into contact with the Serer religion, whose followers believe in a Creative Divine Spirit called *Roog.* Sembène often helped in the rituals of offerings to ancient saints and ancestral spirits that the Serer people call *Pangool*. Then he was attracted to the Layene brotherhood, a small Senegalese Muslim community in Senegal. Some of his artworks draw parallels with Serer themes, even if he opposed religion on the grounds that it mainly had been a social force, superstructurally connected with economic relations of domination and exploitation. His films stated and restated that it is the people who make their history, not the gods. *Outsiders* (*Ceddo*, 1976) is his most relevant film on the subject, laying bare the onslaught of Islam, Christianity, and the Atlantic and Arab slave trades in African history. It shows that the representation of history has been changed by the elimination of older beliefs, but also that the new religions integrated elements from the local culture. This is the reason why the film jumps from the conflict in the seventeenth century to the present to make connections. This was a narrative structure and editing pattern already employed in his first feature film, *Black* Girl. It was heavily censored in Senegal, apparently because of a problem with the required paperwork, but more probably because of its perspective on religion; in particular, its depiction of the killing of an imam by a tribal princess who resists forceful conversion to Islam. Sembène was able to release an uncut version for international distribution.

The Camp at Thiaroye (*Camp de Thiaroye,* 1988) was the only film that he made in the 1980s and it is a vigorous indictment of European imperialism in West Africa. The film focuses on an event that was a turning point in the fight for Senegalese independence: the Thiaroye massacre. In 1944, West African soldiers who had fought against Fascism in Europe were waiting for better living conditions and severance pay in a transit

camp in Senegal. In the film, the French officer in charge is at first diplomatic, but then tries to cheat them, which provokes a mass revolt. The French response is to open fire on them, killing 35 soldiers. The movie won the Special Jury Prize at the 45th Venice International Film Festival.

Guelwaar (1992) initiated a trilogy on daily bravery that goes unnoticed, which continued with Faat *Kiné* (1999) and *Moolaadé* (2004). *Guelwaar* opened the 13th Pan-African Film Festival in Ouagadougou, Burkina Faso, which honoured Sembène as a father of African cinema. It was based on the events around the interment of Henri Thioune, a Christian Catholic who was a popular member of the anti-establishment resistance and whose body was mistakenly buried in a Muslim cemetery. This allows the filmmaker to analyse religious conflict as something that masks real economic and social problems. *Faat Kiné* dissects post-colonial Senegal, focusing on the day-to-day existence of a single mother of two children, whose name is the film's title, struggling for independence and equality. Her life of opulence and flashy female friends is at odds with the lives of other Senegalese women, but the present power and commodity relations inherited from the past shape both groups. *Moolaadé* won the Prix Un Certain Regard at the Cannes Film Festival, a prize that rewards cinematic originality and distinctiveness. Set in a small village in Burkina Faso, it denounces female genital mutilation. The last image of Faat Kiné's shows her feet curling in pleasure. The woman who protects young girls from genital cutting in *Moolaad*é is asserting the right to such pleasure.

All of Sembène's films were made under severe technical and financial constraints. Distribution was a challenge throughout his career, especially since he insisted, from *Mandabi* on, that his films be spoken in Wolof. He wanted the movies to be true to their subject matter and to their primary audience members, making them aware of their history (Busch and Annas 2008, p. 217) and situation (109). In other words, his cinema was a critical and popular narrative art, an activist art that was not simply made for the people, but came from them, out of their striving to be unshackled. Sembène's convictions were clearly embodied in his films and articulated in his public discourse:

Culture is political, but it's another type of politics. You're not in art to be chosen. You're not involved in its politics to say 'I am.' In art, you are political, but you say, 'We are. We are' and not 'I am'. (Cited in Busch and Annas 2008, p. xx)

S

Semi-colonialism in China

Nicholas Zeller
Department of History, University of Wisconsin-Madison, Madison, WI, USA

Definition

In China, the concept of semi-colonialism led two lives. In its usage by Mao and the Chinese Communist Party, it was overtly political and spoke to the types of class alliances necessary under

conditions of imperialism to confront foreign and domestic oppression as well as the nature of that oppression. In its usage by some Chinese academics (and by a small number of contemporary Western China scholars), it spoke to a more complicated assessment of how capital spread geographically and the level of deviation its forms of exploitation could assume from the classical case put forward by Marx in *Capital*.

Introduction

The problem of large-scale historical change has been a source of heated debate within Marxism since Karl Marx's own lifetime. In a now frequently cited exchange between Marx and the Russian socialist Vera Zasulich in 1881, the latter asked whether, as many Russian socialists were arguing, the Russian commune was "an archaic form condemned to perish by history, scientific socialism, and, in short, everything above debate" or could it be developed in a socialist direction (Zasulich, quoted in Shanin 1983, p. 99). In his response, Marx referred Zasulich to a passage from the French edition of *Capital* in which he states that the basis of the capitalist system was the total separation of the producer from the means of production. While this separation had only been accomplished "in a radical manner" in England, Marx believed that "all the other countries of Western Europe are following the same course" (Marx, quoted in Shanin 1983, p. 124 emphasis in original). He clarified that the historical inevitability of this developmental path was restricted to Western Europe where the private property of the small producer was transformed into the private property of the capitalist. The communal nature of property among the Russian peasants meant that *Capital* pointed neither to the abolition nor possible socialist development of the commune. The commune could, however, serve as "the fulcrum for social regeneration" if the pressures put upon it by capitalism were eliminated (Marx, quoted in Shanin 1983, p. 124).

This exchange anticipated the debates that emerged among Chinese Marxists in the 1930s and 1940s concerning China's social formation –

its mode of production. If, as the universalist, mechanistic laws of Soviet dialectical materialism prescribed, there were "[f]ive main types of relations of production" corresponding to five stages of sociohistorical development – "primitive communal, slave, feudal, capitalist and socialist" – then it was necessary to locate China in this evolutionary chain in order to plan the course of the revolution (Stalin [1938] 1975, p. 29). Like their Russian counterparts of the 1880s, many Chinese Marxists assumed that elements of Chinese society, such as the landed gentry, corresponding to what they identified as China's feudal stage would need to be destroyed so that society could move into the capitalist stage as a stepping stone toward socialism. The results of these debates were a general agreement, at least within the Chinese Communist Party (CCP), that China's development had been arrested in a type of transitional stage. On the one hand, because so much production took the form of landlords exploiting peasant households, yet without the older imperial political structures, China was considered semifeudal (Dirlik 1978, p. 96). On the other hand, because the majority of China's industrial production was controlled by Western and Japanese imperialist powers who, in turn, suppressed the development of a national bourgeoisie and supported "feudal" landlord-peasant relations, China was also semi-colonial (Su 1933). As Rebecca Karl (2017a, b) and Harry Harootunian (2015) have recently observed, however, there were also substantial efforts from Chinese Marxists outside the CCP, specifically the economist Wang Yanan, to use semi-feudalism and semi-colonialism not as covers for a transitional period in the inevitable march toward European-style, industrial capitalism and beyond but, rather, as a way of theorizing how imperialism in the nineteenth and twentieth centuries had successfully spread the structures of capitalism by making use of already existing forms of exploitation in the East. To put it another way, they focused on the vast array of forms of exploitation that capital could accommodate without necessarily revolutionizing them. Although landlord-peasant relations did not operate like capitalist-worker relations, and although the labor process

employed by peasants took an immiserated form of traditional practices instead of becoming industrialized, all elements were nonetheless subject to the global structures of capital. The daily lives of Chinese peasants were directly connected to, for example, global textile markets.

Thus, in China, the concept of semi-colonialism led two lives. In its usage by Mao and the CCP, it was overtly political and spoke to the types of class alliances necessary to confront foreign and domestic oppression as well as the nature of that oppression. In its usage by some Chinese academics (and by a small number of contemporary Western China scholars), it spoke to a more complicated assessment of how capital spread geographically and the level of deviation its forms of exploitation could assume from the classical case put forward by Marx in *Capital*. This essay begins by providing the theoretical context for the importance of this concept through a discussion of Marx's concept of a mode of production. It then traces the usage of the term semi-colonialism by Lenin through his debates with M.N. Roy at the second Congress of the Comintern in 1920 to its use by Chinese Marxists in the 1930s and finally to Mao's integration of semi-colonialism into his own writing in 1939 and 1940.

The Concept of a Mode of Production

Academic opponents of Marxism are often quick to highlight what they see as the spuriousness of a universalist teleology within Marxism regarding the inevitability of societies (generally understood as nation-states) to develop toward industrial capitalism. Broadly, these scholars object to the idea of an "advanced" Europe during the Industrial Revolution that brought the "backward" places of the globe into the modern world, and they see within certain iterations of Marxism an overlap with modernization theory. During the period of decolonization in the twentieth century, both spoke of newly formed nation-states in Asia, Africa, and Latin America "catching up" to Europe and the United States in terms of economic and cultural development. The West was

"ahead," while societies of the East/South were "behind" (for an example of this type of criticism, see Chakrabarty (2000)). The impetus for such criticism is not only to confront the racist assumptions underlying the "progress" of the West but to point out that the very foundations for such progress depend upon processes of colonization. Colonial places were no less modern than their European oppressors, because colonization and imperialism, the exploitative relations between the West and the rest, are what made the "modern" possible.

Many Marxists have made similar criticisms, referring to those variants that maintain a teleological view of history as "vulgar" Marxism. Indeed, as Marx's later writings were discovered and translated throughout the early and mid-twentieth century, it became increasingly difficult to use Marxism to defend a view of history as nation-states moving through predetermined stages (Anderson 2010). There is a marked and important difference between the way Marx presented the laws of motion in capitalist society and events leading to major historical change. The latter allowed far more room for contingency and variation than the law-like dynamics explicated in his economic writing. Marx's acceptance of historical contingency is perhaps most famously reflected in the following lines from *The Eighteenth Brumaire of Louis Bonaparte*: "Men make their own history, but they do not make it just as they please in circumstances they choose for themselves; rather they make it in present circumstances, given and inherited" (Marx [1852] 1996a, p. 32). However, this allowance for contingency in politics serves just as well for the spread of the relations of capital to new geographic areas or sectors of production. Throughout the *Grundrisse* and the three volumes of *Capital*, Marx makes repeated statements about the flexibility of capital to make do with "the labour process as it finds it...developed by different and more archaic modes of production" ([1867] 1990, p. 1021) and forms of exploitation that exist within capitalism yet "relate to the mode of production from the outside" ([1894] 1991, p. 745).

Far and away, the force most responsible for advancing the modernizationist, teleological

S

version of Marxism was Soviet dialectical materialism and its adherents, many Chinese Marxists, and official CCP doctrine among them. This version of Marxism conceived of historical change as unfolding through a fixed series of modes of production (or historical stages) defined by the relationship between the forces of production (the level of technological and scientific development employed in production) and the relations of production (the relations between those who directly worked to produce goods and those who had the power to appropriate production surpluses). The concepts of semi-feudalism and semi-colonialism in China were born, on the one hand, of a sincere attempt to apply dialectical materialist philosophy to China's history and relationship to imperialism and, on the other hand, the impossibility of neatly fitting Chinese society into preapproved categories like slave society or feudalism.

The Frankfurt School Marxist Theodor Adorno described dialectical materialism as "the inversion of Marxism into a static dogma, deadened to its own contents" (2005, pp. 13–14). Among other things, Adorno's criticism was that Marx would never "tear thought free from the real movement of history" the way dialectical materialism had through its application of universal categories to all epochs of the human and natural worlds (2005, p. 14). This inversion of Marxism is clear in Stalin's *Dialectical and Historical Materialism*. In explaining the importance of production to historical change, he writes that "its changes and development always begin with changes and development of the productive forces, and in the first place, with changes and development of the instruments of production...First the productive forces of society change and develop, and then, depending on these changes and in conformity with them, men's relations of production, their economic relations, change" ([1938] 1975, p. 26). This was held to be true for all societies regardless of anything that might differentiate them from the West, which itself did not fit this model. On this view, historical research was reduced to the verification of theory, to asking questions for which the answer was already known. All one needed to do was periodize a given society along the five

approved stages by identifying the forces and relations of production corresponding to each stage. Preached in the name of Marxism, dialectical materialism became a form of metaphysics through its use of the dialectic as a "cosmological principle prior to, and independent of," historical research (Banaji [1977] 2010, p. 48). Yet, it was exactly this approach to history that Marx and Engels criticized as early as *The German Ideology*, in which they contrast the materialist conception of history with the idealist conception, stating that the former "has not, like the idealistic view of history, in every period to look for a category, but remains constantly on the real ground of history" ([1846] 1947, p. 28).

For Marx, although the investigation of the "real ground of history" meant uncovering its abstract laws of motion, these laws were historically determined and specific to a given epoch rather than transhistorical. Furthermore, the abstractions he employed were concretized through historical research. While, for example, the concept of labor has a transhistorical dimension as the creative interaction between humans and their environment, in *Capital*, it also has a historically specific dimension as a commodity. Jairus Banaji ([1977] 2010) argues that this notion of an epoch with identifiable, historically specific laws of motion is one of two meanings given to the term "mode of production" in Marx. The second is roughly equivalent to "labor process" or "production process."

In the appendix to *Capital*, Vol. 1, Marx notes a distinction between the formal and real subsumption of labor, which correspond to the accumulation of absolute and relative surplus value, respectively. Labor is formally subsumed by capital once it is directed by capitalists toward the production of surplus value or, as Marx writes, once production becomes a process "involving the *factors of the labour process* into which the capitalist's money has been converted and which proceeds under his direction with the sole purpose of using money to make more money" ([1867] 1990, p. 1020). He notes that while these conditions mean production has become part of the relations of capital, "this change does not in itself imply a fundamental modification in the real

nature of the labour process" ([1867] 1990, p. 1021). For example, in the early twentieth century, Shanghai and its hinterlands were an important site of textile production in China. Although textile production itself took place through factory labor, the agricultural processes involved in producing cotton continued to rely on peasant labor operating according to traditional agricultural methods (Walker 1999). The only change to the labor process of the cotton-producing peasants was an increase in the amount of time dedicated to agricultural work. This increase resulted from demands for surplus production created by factories in Shanghai which in turn connected Chinese peasant labor to the world. Here, peasant labor is formally subsumed by capital in the production of absolute surplus value, which "turns exclusively on the length of the working day" (Marx [1867] 1990, p. 645). That is, it is a form of surplus value produced through the intensification of an old, inherited labor process.

The formal subsumption of labor under capital, according to Marx, is the "general form of every capitalist process of production," meaning that all capitalist production involves investment by the capitalist in the factors of the labor process for the accumulation of surplus value ([1867] 1990, p. 1019). Yet, "at the same time, however, it can be found as a *particular* form alongside the *specifically capitalist mode of production* in its developed form, because although the latter entails the former, the converse does not necessarily obtain [i.e. the formal subsumption can be found in the absence of the specifically capitalist mode of production]" ([1867] 1990, p. 1019, emphasis in original). This passage reveals the difficulty in understanding the term "mode of production" solely as epoch or historical stage. It would make little sense for Marx to claim that the formal subsumption of labor is the general form of capitalist production while stating that it may or may not exist alongside the capitalist epoch. To return to textile production, identifying "mode of production" with a historical stage would mean that peasant labor formally subsumed in cotton production existed in a different era than the labor of contemporary workers in factories in Shanghai, which had undergone a process of real

subsumption – meaning the labor process had been revolutionized through the introduction of machine technology. However, this is exactly the claim that both imperialist powers and members of the Comintern would make when they referred to the backward places of the world compared to the West or to urban centers in the East developed through capitalist imperialism.

This problem occurs again in *Capital*, vol. 3 in the discussion on usurer's capital (interest-bearing capital). Marx believed that usury existed in two forms prior to the capitalist era: (1) the lending of money to landed proprietors and lords and (2) the lending of money to small producers who possessed their own means of production. Its collection of production surpluses through interest, therefore, contributed to both the concertation of wealth and the impoverishment of small producers. He writes that usury, along with merchant's capital, belongs to the "antediluvian forms of capital which long precede the capitalist mode of production and [is] to be found in the most diverse socio-economic formations" ([1894] 1991, p. 728). This form of lending, "just like trade, exploits a given mode of production but does not create it"; instead, usury attempts to maintain the given mode of production "so as constantly to exploit it anew; it is conservative, and simply makes the mode of production wretched" ([1894] 1991, p. 745). Although the wretchedness created by usury aided in the passage from feudalism to capitalism in Western Europe, Marx saw the ruin it brought to small farmers in the Roman Empire playing a role in the transition to the general use of slave labor. In instances where usurer's capital appropriates all of the direct producer's surplus labor, where the producer owns the means of production, and "where capital therefore does not directly subordinate labour, and thus does not confront it as industrial capital," usury "impoverishes the mode of production, cripples the productive forces instead of developing them, and simultaneously perpetuates these lamentable conditions" ([1894] 1991, pp. 730–731). Yet, archaic as it might be, usury also "has capital's mode of exploitation without its mode of production" and "recurs within the bourgeois economy in backward branches of industry,

or those that are struggling against the transition to the modern mode of production" ([1894] 1991, p. 732).

On the one hand, given the references Marx makes to epochal social formations like the Roman Empire and feudalism, it is likely that when usury "impoverishes the mode of production," this could point to both a sociohistorical epoch and the labor processes which predominate in it. On the other hand, usury's recurrence within the bourgeois economy among branches of industry, resisting the "modern mode of production," harkens back to Marx's discussion of the formal and real subsumption of labor by capital. In either case, what should be clear is that Marx's use of terms like "capitalist mode of production" does not point to a cleanly delineated, inevitable moment in every nation-state's history defined by forms of exploitation of labor homogenous with every other capitalist nation-state. Rather, the social relations in capital which lead to the production and accumulation of surplus value can tolerate a high degree of variability in the forms of exploitation by which accumulation takes place.

The adaptability of capital to older forms of exploitation, older labor processes, created a major problem for Chinese Marxists attempting to apply dialectical materialism to Chinese society. As Banaji writes, "one of the most widespread and persistent illusions of vulgar Marxism" was that "modes of production were deducible, by a relation of 'virtual identity', from the given forms of exploitation of labour" ([1977] 2010, p. 53). The idea ran thusly: if wage labor is the form of exploitation proper to capital, then the absence of wage labor is equivalent to the absence of capitalist mode of production in the epochal sense. That is, the society has not yet reached the capitalist stage. Following this logic, prior to the Civil War, the Southern United States was a prefeudal slave society. Yet, Marx wrote that while "the slavery of Negroes precludes free wage labor, which is the basis of capitalist production," it was nonetheless true that "the business in which slaves are used is conducted by capitalists. The mode of production that they introduce has not arisen out of slavery but is grafted onto it. In this case the same person is capitalist and landowner" (quoted in Anderson 2010, p. 169).

The point of this discussion is not to demonstrate that Chinese Marxists were "bad" Marxists. Many of Marx's texts cited above were unavailable in China during the 1930s and 1940s, and many Marxists, especially those in the CCP, were writing under the impossible conditions of revolutionary war using what Soviet texts had been translated and made available. Marx's more philosophic writings only became available in the late 1920s and 1930s, by which time Soviet dialectical materialism had hardened into dogma. Elements of Marx's writing that contradicted their stagist view of historical change or cosmological application of dialectics would not have been included in their textbooks, which served as a major source for Chinese Marxists including Mao Zedong (Knight 1990). Rather, the point of this discussion is to demonstrate that Marx himself was acutely aware of the malleability of capital's forms of exploitation, its willingness to accommodate labor processes outside of the "classical" form of factory labor. Older forms of exploitation were outside the capitalist mode of production in the labor process sense but were not sufficient evidence that a society existed outside of the capitalist epoch. Furthermore, the emergence of concepts like semi-feudalism and semi-colonialism in Chinese Marxist debates serves as testimony to the historical fact of this malleability. Despite the inaccessibility of Marx's scattered writing on the subject, Chinese Marxists, building on the work of Lenin and others, confronted the nonidentity between the dialectical materialist concept of history and the lived experience of capitalist imperialism.

Semi-colonialism and the Second Congress of the Comintern, 1920

The Communist International (Comintern) was founded in March 1919 at a small congress of only 51 delegates. Its predecessor, the Socialist International, in which Friedrich Engels was an active participant, had collapsed after the outbreak of World War I when its leaders voiced staunch support for the chauvinist policies of their respective national governments. Little was discussed at

the First Congress beyond debates over whether to establish a new revolutionary international organization (Riddell 1991). Although the Communist Party of Germany felt the timing was not right, the First Congress voted in favor of its creation, and the Second Congress was quickly scheduled to be held in July 1920. Comintern leadership felt that the success of revolutionary parties in the "advanced" countries of Western Europe and the United States required alliances with oppressed people in Asia, Africa, and Latin America, and Lenin was tasked with writing a draft resolution on how this was to be accomplished. Among his original theses, he stated that in "the more backward states and nations, in which feudal or patriarchal and patriarchal-peasant relations predominate," the duty of Communist parties was to "assist the bourgeois-democratic liberation movement" (quoted in Riddell 1991, p. 51). This sparked a debate between Lenin and M.N. Roy, a delegate from India and founder of the Mexican Communist Party and the Communist Party of India. The exchange resulted in two sets of theses adopted at the Second Congress that would shape a great deal of how Marxists in China understood the significance of the term semi-colonialism in national revolutions.

The general parameters for how semi-colonialism was understood by congress delegates were already set by Lenin in his 1916 pamphlet *Imperialism, the Highest Stage of Capitalism*. There, Lenin used semi-colonial states to "provide an example of the transitional forms which are to be found in all spheres of nature and society" ([1916] 1970, p. 240). They were transitional because they had neither won national sovereignty through revolution nor had finance capital succeeded in stripping away their political independence. He wrote that semi-colonies were a "typical example of the 'middle stage'" of a "form of subjection" by finance capital that threatened to turn them into full colonies ([1916] 1970, p. 240). Because of their shared position under imperialist oppression, however, Lenin frequently referred to places like India, Indo-China, and China together as a set of "colonial and semicolonial countries" ([1916] 1970, p. 276). The term semi-colonialism, therefore, served only to describe the diminished

national sovereignty of such countries, which placed their political interests in line with the rest of the colonial world.

Lenin and Roy both participated in the Second Congress's Commission on the National and Colonial Questions. During the proceedings, they presented their respective theses, which had already been unanimously approved by the Commission prior to the Second Congress. According to Lenin, the three basic ideas of the theses he and Roy presented were (1) that the imperialism had now divided the entire world such that 70% of the global population consisted of oppressed peoples living in countries that were "in a state of direct colonial dependence or are semi-colonies"; (2) that the world political struggle as a whole was determined by a small number of Western imperialist powers against Soviet Russia and its allies; and (3) that the Comintern could no longer speak of the bourgeois-democratic movement but should rather speak of national-revolutionary movements (quoted in Riddell 1991, p. 212). The final point was most significant. Through their debates, Lenin and Roy concluded that there were two movements for national independence in colonial and semi-colonial counties. The first was a bourgeois-democratic nationalist movement "with a program of political independence under the bourgeois order," and the second was a potentially revolutionary movement formed by the "mass action of the ignorant and poor peasants and workers for their liberation from all sorts of exploitation" (Roy, quoted in Riddell 1991, p. 220). Working with bourgeois-nationalist elements could serve among the means of overthrowing imperialism, but the ends for colonial and semi-colonial places had dramatically changed.

In its investigations, the Commission posed itself a question not unlike what Zasulich had asked of Marx 40 years prior: Was it the case that "the capitalist stage of economic development is inevitable for backward nations now on the road to emancipation and among whom a certain advance toward progress is to be seen since the war?" (Lenin, quoted in Riddell 1991, p. 215). The answer, they decided, was "no." If the nationalist revolution were guided by a Communist

Party of the Proletariat, it would be able to initiate a system of soviets and move toward communism "without having to pass through the capitalist stage" (Lenin, quoted in Riddell 1991, p. 215). Roy confirmed this as well, noting while the revolution in the colonies (and semi-colonies) would not be communist in its initial stages, a Communist vanguard could keep the masses from being "led astray" and help them move "forward through the successive periods of development" (quoted in Riddell 1991, p. 221). Lenin and Roy's assessment differed slightly from Marx's thinking presented above. It retained a teleological notion of history moving through stages of development, but it allowed that the proper historical development of colonial and semi-colonial societies could be "hindered" by imperialism. According to Roy, India and China had not developed thriving national capitalism because the forces of imperialism "prevented them from developing socially and economically side by side with their fellows in Europe and America" (quoted in Riddell 1991, p. 220). The development of the forces of production that *should have* occurred under the capitalist stage had been foreclosed by imperialism, but it could be guided by the Party.

This concept of derailed historical development continued within the Comintern throughout the 1920s. In 1928, 7 years after the founding of the Chinese Communist Party, the Sixth Congress reaffirmed the validity of the Theses on the National and Colonial Questions adopted by the Second Congress and noted that the significance of the colonies and semi-colonies to global capitalism had only increased (Communist International Congress 1929). Along with other colonial and semi-colonial places, China's alliance with the Soviet Union provided the possibility of sovereign economic and cultural development "avoiding the stage of the domination of the capitalist system or even the development of capitalist relations in general" (Communist International Congress 1929, p. 8). Here, however, this was possible because the stagist understanding of history had switched from a national to a global scale, claiming that capitalism had "already fulfilled its progressive historical role" (1929, p. 8). "In the final analysis," the Congress

concluded colonial forms of capitalist exploitation "hinder the development of the productive forces of the colonies concerned" (1929, p. 31). Regarding the struggle in China, the Sixth Congress declared that the immediate tasks for the Party were the completion of the bourgeois-democratic revolution through armed insurrection and the simultaneous overthrow of three forces: the imperialists, the landlords, and the national bourgeoisie in the form of the Guomindang (Nationalist Party). This would bring about a revolution against China's status as a semi-colony, its semi-feudal relations of production in the countryside, and its domestic capitalist classes, respectively.

Semi-colonialism in China

Semi-colonialism was a hotly debated concept in China in the 1930s. It was part of larger debates around how to define China's social formation (mode of production in the epochal sense) and was closely connected to simultaneous debates about the periodization of China's feudal stage and the problem of feudal remnants. The first major attempt to periodize all of Chinese history according to a Marxist schema was Guo Moruo's *Research on Ancient Chinese Society* (*Zhongguo gudai shehui yanjiu*). Relying heavily on works by Friedrich Engels and Lewis Morgan on primitive societies, Guo combined their technology-based ideas of progress with Marx's periodization of social formations in *A Contribution to the Critique of Political Economy* (Dirlik 1978, p. 141). There, Marx wrote, "A social formation never comes to an end before all the forces of production which it can accommodate are developed, and new, higher relations of production never come into place before the material conditions of their existence have gestated in the womb of the old society" ([1859] 1996b, p. 160). The social formations Marx identified as "progressive epochs in the economic development of society" were Asiatic, ancient, feudal, and modern ([1859] 1996b, p. 160). From these works, Guo surmised a theory of historical change similar to that proposed by Stalin above: "The entire structure of society is

built on its economic foundations. As the mode of production (*shengchan de fangshi*) changes, the foundation of the economy develops to a new stage. As the economic foundation develops to a new stage, the entire society must necessarily form new relations, new organizations" (Guo [1930] 1982, p. 153). Guo believed that the Western Zhou dynasty (1046–771 BCE) constituted Chinese society's slave stage. The transition to feudalism began during the middle part of the Spring and Autumn period (771–476 BCE) and was completed by the emergence of the Qin dynasty (221–206 BCE), and Chinese society remained feudal until roughly the First Opium War (1839–1842) between the Qing dynasty and the British Empire ([1930] 1982, p. 154). Arif Dirlik (1978, pp. 187–190) has demonstrated that this periodization was mostly shared by other Chinese scholars of the 1930s with heated debates emerging around what amounted to minor differences. How one understood the period after the Opium War, however, differed based on political affiliation and had immediate consequences for the organization of Chinese society. Guomindang scholars like Tao Xisheng spoke of China's "feudal remnants" to address a perceived agrarian backwardness of the central state which conflicted with the advanced political economy of urban areas like Shanghai. Communist scholars used terms like semi-feudalism to describe the dual appropriation of surplus value by landlords and Western and Japanese imperialists (Karl 2017a, p. 116).

The century between the war and the establishment of the People's Republic of China in 1949 was one of the intense social upheavals. The Treaty of Nanjing, which ended the war, was signed on August 29, 1842 and granted the British Empire five treaty ports – Shanghai, Ningbo, Fuzhou, Xiamen, and Canton. By signing the treaty, the Qing government agreed to allow British subjects to live in these cities "for the purpose of carrying on their mercantile pursuits, without molestation or restraint," and these cities, especially Shanghai, became the main centers for all industrial, commercial, and banking enterprises in China (quoted in Spence 1990, p. 159). According to Kathy Le Mons Walker, by 1920, the

imperialist powers "controlled 99 percent of China's iron ore and pig iron, 93 percent of the railways, 76 percent of the coal, 83 percent of the steam tonnage cleared through maritime customs, and 73 percent of the steam tonnage on the Yangzi [River]" (1999, p. 14). Peasants working in the hinterlands of these cities were incorporated into global capitalist production by the comprador bourgeoisie, a class category that, as Karl (2017b) notes, is conventionally seen as a non-revolutionary group representing the interests of foreign capital in the local society while also creating linkages of consumption and exchange between urban and rural areas. Through their access to global capital and local bureaucratic privileges, compradors maintained the older forms of exploitation upon which imperialist accumulation of value depended. They may, therefore, be understood as a form of exploitation not dissimilar from Marx's assessment of usury. Compradors profited from the immiseration of peasants in traditional labor processes and were a largely conservative force.

In a 1933 article in the journal *Chinese Economy* (*Zhongguo Jingji*), Su Hua identified two broad schools of thought on China's social formation. The first, which included Guo Moruo, claimed that China was already becoming capitalist and went as far as to say that China's feudal economy was a "remnant of a remnant" (*canyu de canyu*) (1933, p. 1). The second claimed that China was still stuck in the feudal stage. The capitalist economy was in its infancy, and the feudal economy still occupied the dominant position in society. In Su's view, whether China was capitalist or feudalist was the wrong question. The key to understanding China's social formation was to understand the mutual relationship between imperialist capital and Chinese national capital. "From the standpoint of the destruction of China's older relations of production," Su wrote, "the development of China's capitalist economy and the development of the imperialist economy in China are producing the same effects" (1933, p. 3). That is, both were eroding the political and economic structures of China's feudal stage. However, these two forms of capital were not equal. Imperialist capital placed Chinese national

capital in a position of dependency. Su's summary of this contradiction is worth quoting at length:

> The imperialist economy and the national economy have...formed an organic relationship, but it is a relationship between the dominator and the dominated – between a sovereign nation and a vassal. This is not only a formal difference but an essential one. The development of communication facilities, the digging of mines, etc. unconsciously created the objective conditions for development of the Chinese national capitalist economy. Therefore, the national capitalist economy develops evermore abnormally. But, on the other hand, in order to turn China into a full colony, and keep its economy from developing to the point of clashes with sovereign interests [of the imperial powers], imperialism consciously makes use of the remnants of feudal power (chiefly the warlord system!) to destroy and obstruct national capitalist development. That is, the development of the imperialist economy in China has also become a burden on the development of the national capitalism. (1933, p. 17)

Su argued that the results of this underdevelopment of the Chinese national capitalist economy created a "transitional period" of semi-colonialism and semi-feudalism (1933, p. 18). His concluding remarks echo Lenin's original assessment of semi-colonies: "Chinese social and economic development has been subjected to the oppression of international imperialism, and the fetters of feudal relations of production...*almost to the point that it is impossible for it to complete the transition from the precapitalist to the capitalist stage*; what we are faced with is this: a completely colonial, non-capitalist future!" (1933, pp. 18–19, emphasis in original). The Japanese-occupied areas of Manchuria and Inner Mongolia had already entered a stage of complete colonization and offered a vision of the future for the rest of China if the revolutionary movement was not successful.

Writing in 1937, Chen Hongjin characterized semi-colonial countries as places where the social formation was dominated by precapitalist relations and imperialist forces took a controlling position in national politics and economics. Beyond this, the particularities of semi-colonial countries included formal political sovereignty, capital export via imperialism, demands for national unification and state capitalism, politics that wavered between democratic and dictatorial,

and the important role they play in the global revolution against capitalism (Karl 2017a, p. 117). Both Chen and Su were clear that semi-colonialism was impermanent. All semi-colonies are characterized in some way by the struggle for national sovereignty against imperialism, leaving full colonization as the only other option. While the former would allow a revolutionary party to guide society through successive economic stages, the latter would doom the new colony to backwardness.

Recent studies of the work of Marxist economist Wang Yanan have uncovered a more nuanced approach to China's social formation during this period. In some respects, Wang's view of the situation confronting China was similar to his contemporaries. Wang noted the destruction of the natural economy in agriculture (production for direct consumption) in favor of the production of cash crops, commenting that, along with cotton, tobacco, sugarcane, and hemp, even grain had been drawn into production for the market through urban population growth and commercial usury. Household and handicraft production that had formally been inseparable from agricultural production had left rural areas and become a "component part of modern industrial capitalism outside the factory" ([1946] 2007, p. 852). Such changes indicated the complete breakdown of feudal relations of production. However, the great imperialist powers had no intention of allowing China to become a fully capitalist country. Although the new means of transportation, new financial structures, and new capitalist enterprises brought to China via imperialism had stimulated the birth and advancement of Chinese national capitalism, past a certain point, "the development of Chinese national capitalism signifies the loss of a market for manufactured goods and the loss of the imperialists' special rights to Chinese cheap labor and natural resources" ([1946] 2007, p. 852).

Wang differed from theorists like Su in one important respect. Semi-colonialism pointed to capital's inability to fully subsume older social formations, not a transitional period along the road to nation-state or colony. As Karl writes, Wang argued that "the particular historical

formation of capitalism in its sem-icolonial form had demanded structural revisions *in capitalism itself* at the same time as it forced structural revisions in China's relations of production/social formation" (2017a, p. 120 emphasis in original). Wang's work anticipated contemporary theorization of imperialism by Marxists like David Harvey (2003) and Ellen Meiksins Wood (2003) by highlighting how the Chinese experience demonstrated that the extra-economic exploitation of primitive accumulation was not a preparatory process prior to and distinguishable from the standard operating practices of capitalism. Instead, capitalism in its imperialist form was adapting to the forms of exploitation it found already in place. The comprador bourgeoisie that many Chinese Marxists identified as remnants of feudal relations of production were, in fact, and to use Marx's language, a product of the formal subsumption of labor by capital. "Imperialist capital/economy in China" (*diguozhuyi zai hua de jingji*) and the "Chinese national capitalist economy" (*Zhongguo minzu zibenzhuyi jingji*) were not two contending chronologies, one advanced and one behind. They were mutually constitutive. For semi-colonial places like China, the awaited transition to capitalist production in the "classical" sense was not coming. This was not because China's development had been hindered but because global capitalism itself had transformed to create a potentially permanent state of primitive capital accumulation in colonial and semi-colonial places. The uneven development created through the relationship between imperialist capital operating in treaty ports like Shanghai and the comprador bourgeoisie and landlords directly guiding production of raw materials in the countryside had become a core feature of capitalism, not an aberration.

Semi-colonialism and the Chinese Revolution

Of course, no discussion of Marxism in China is complete without addressing how the given topics factored in the writings of Mao Zedong. His writing on semi-colonialism and semi-feudalism

cemented their usage by members of the CCP and guaranteed their direct political significance for the course of the revolution. In keeping with the statements published after the Sixth Congress of the Comintern, Mao used a comparatively simpler concept of China's social formation to determine the enemies of the revolution and possible class alliances on the road to national liberation. The first use of the term semi-colonialism in *Selected Works* appears in *Analysis of the Classes in Chinese Society* ([1926] 1965a). There, Mao explains the impossibility of the alliances with the landlord and comprador classes who "represent the most backward and most reactionary relations of production in China and hinder the development of her productive forces" ([1926] 1965a, p. 13). These classes, Mao predicted, would invariably side with the imperialists from whom they drew power and, therefore, constituted an extreme counter-revolutionary class. In line with the Theses on the National and Colonial Questions written by Lenin and Roy, however, Mao saw within China's semi-colonial condition the possibility for other alliances not strictly born of a proletarian revolution against capitalism.

While at the CCP base at Yanan in the late 1930s, Mao studied a series of recently translated Soviet works on dialectical materialism and composed two of his most famous philosophical essays: *On Practice* and *On Contradiction*. In the latter, Mao applied the cosmological view of the dialectic to the struggles faced by the CCP in the revolution. All things, including society, are in the process of motion and development fueled by an unending series of internal contradictions. However, not all contradictions carry equal weight. Mao wrote that in capitalist society, the principal contradiction was between the bourgeoisie and the proletariat. This contradiction "determined or influenced" all other contradictions in capitalist society, "such as those between the remnant feudal class and the bourgeoisie, between the peasant petty bourgeoisie and the bourgeoisie...between bourgeois democracy and bourgeois fascism, among the capitalist countries and between imperialism and the colonies" ([1937] 1965b, p. 331). China's semi-colonial status complicated the relationship between principal and

non-principal contradictions. After imperialists launch a war of aggression, all but the most traitorous classes can come together in a war for national liberation. The principal contradiction becomes that between the imperialists and the country under attack, and the former principal contradiction, that between "the feudal system and the great masses of the people," takes a secondary position ([1937] 1965b, p. 331). Such a scenario theoretically justified alliances like the second United Front between the CCP and the Guomindang (1936–1945) to fight back against Japanese invasion despite Guomindang attempts to eradicate the CCP beginning in April 1927. However, if imperialism operated through different means (e.g., those explored by theorists of semi-colonialism), then the primary contradiction may take the form of a civil war between, on the one hand, the imperialists and their allies among the feudal classes and, on the other hand, the masses – proletarian and peasant alike. This second scenario provided theoretical justification for the Agrarian Revolutionary War between the Guomindang and the CCP in the decade between the first and second United Fronts.

Mao's understanding of China's history and current social formation can be found in *The Chinese Revolution and the Chinese Communist Party*, the first chapter of which was written by other party members but edited and revised by Mao himself. This work confirms the periodization of China's feudal stage proposed by Guo Moruo and lists its four primary features: (1) the predominance of a natural economy of peasants producing for their own consumption; (2) a feudal ruling class "composed of landlords, the nobility and the emperor" who "owned most of the land, while the peasants had very little or none at all"; (3) the landlords and other nobility lived off surpluses extorted from peasants in the form of rent and other services which were used to support the state and military; and (4) a centralized feudal state that protected this system of exploitation ([1939] 1965c, p. 307). Post-Opium War China "gradually changed into a semi-colonial and semi-feudal society," and, after the Japanese invasion of Manchuria in September 1931, "China changed

further into a colonial, semi-colonial, and semi-feudal society" ([1939] 1965c, p. 309). Mao repeated this idea the following year in his essay *On New Democracy*, describing China as "colonial in the Japanese-occupied areas and basically semi-colonial in the [Guomindang] areas, and it is predominantly feudal or semi-feudal in both" ([1940] 1965d, p. 341). The latter work marks one of Mao's clearest arguments for why China need not pass through a capitalist stage so long as the development of the forces of production is properly guided by the CCP. Citing the resolutions of the Sixth Congress of the Comintern, Mao wrote that the 1917 October Revolution in Russia and the establishment of socialism demonstrated that the phase of bourgeois-democratic revolutions has already passed on a global scale. China and the Soviet Union were involved in a new type of world revolution that "has the proletariat of the capitalist countries as its main force and the oppressed peoples of the colonies and semi-colonies as its allies" ([1940] 1965d, p. 346). This revolution would use the technological forces of production developed under capitalism to rebalance the uneven temporalities of the world, the difference between advanced and backward countries, under socialism.

Conclusion

In the *Grundrisse*, Marx writes, "The positing of the individual as a *worker*, in this nakedness, is itself a product of *history*" (1993, p. 472, emphasis in original). That is, the separation of small producers, who had previously labored largely for their own consumption, from the land and other means of production is not a natural condition of the individual, as bourgeois economics teaches. Rather, it was the result of long, bloody struggles waged by the capitalist classes against both the old political order and peasant populations. As capitalism spread from Europe to Asia, Africa, and Latin America via imperialism, the ways in which this separation took place followed a set of *tendential* laws of accumulation that found ways to accommodate older production processes and

repurpose traditional political structures. In this sense, semi-colonialism in China, despite the particularities of historical events like the Opium Wars or Japanese invasions, shared much with the experiences of colonies and semi-colonies the world over. All were subject to a process of perpetual primitive accumulation and the emergence of structures of global capitalism that depended upon and continuously recreated conditions of uneven development between the (semi-) colonies and the metropole.

Recent interest in the writing of Chinese Marxists on the subject has sparked debates within Asian History about the ability of capitalism to ever fully subsume a society and bring it into alignment with what is taken to be the archetype of industrialization and liberal democracy provided by Europe and America. On this view, the "transition" to capitalism is never complete because the structures of capital depend upon older forms of exploitation for the accumulation of value. Among these scholars, whether to use semi-colonialism as an analytic category or take its emergence as a symptomatic event in the history of capitalist imperialism has yet to be decided, and valuable work for understanding imperialism is being produced on both sides (for the former, see Walker (1999); for the latter, see Karl (2017a, b) and Harootunian (2015)). In either case, the persistent use of the term by Marxists of the early twentieth century speaks to the impossibility of the mechanistic, stagist view of history produced by dialectical materialism as much as it does to the malleability of the structures of capital.

Communist Party of Peru – Shining Path; Imperialism; Maoism; Peru

Definition

Sendero Luminoso, or Shining Path, emerged in 1980 as a guerrilla organisation in the south-

central highland department of Ayacucho, Peru. Espousing a radical Maoist ideological line of people's war from a part of the country that was both quite isolated and largely rural and indigenous seemed at the time to be quixotic in the extreme, given the larger national context at that very moment of an unprecedented democratic transition. Yet over the course of the next decade or so, political violence in Peru delivered death and destruction to large swathes of the country and brought central government virtually to its knees. Just when it appeared that Sendero was poised for victory, however, the tables abruptly turned with the September 1992 capture of the group's founder and "maximum leader" Abimael Guzmán Reynoso. Within months, government forces had regained the advantage, and, by the mid-1990s the guerrillas were a spent force. Although no longer a threat to the state, scattered armed cadre remnants remained which, beginning in 2006, gradually regenerated a modest operational capacity in coca growing and cocaine-producing enclaves of the Upper Huallaga and Apurímac river valleys. Some Sendero sympathisers also retained influence within the national teachers union, while others established a popular-front-type political wing based in Lima in an effort to influence national politics. While it is unlikely that what remains of Shining Path in its most recent manifestations will become a significant guerrilla or political force in the future, its violent past continues to affect Peru in multiple ways.

Sendero Luminoso, or Shining Path, emerged in 1980 as a guerrilla organisation in the southcentral highland department of Ayacucho, Peru. Espousing a radical Maoist ideological line of people's war from a part of the country that was both quite isolated and largely rural and indigenous seemed at the time to be quixotic in the extreme, given the larger national context at that very moment of an unprecedented democratic transition. Yet over the course of the next decade or so, political violence in Peru delivered death and destruction to large swathes of the country and brought central government virtually to its knees. Just when it appeared that Sendero was poised for victory, however, the tables abruptly

turned with the September 1992 capture of the group's founder and "maximum leader" Abimael Guzmán Reynoso. Within months, government forces had regained the advantage, and, by the mid- 1990s the guerrillas were a spent force.

Although no longer a threat to the state, scattered armed cadre remnants remained which, beginning in 2006, gradually regenerated a modest operational capacity in coca growing and cocaine-producing enclaves of the Upper Huallaga and Apurímac river valleys. Some Sendero sympathisers also retained influence within the national teachers union, while others established a popular-front-type political wing based in Lima in an effort to influence national politics. While it is unlikely that what remains of Shining Path in its most recent manifestations will become a significant guerrilla or political force in the future, its violent past continues to affect Peru in multiple ways.

Explaining the Origins and Rise of Sendero Luminoso

Guerrilla movements usually emerge in response to some combination of repressive dictatorship, systematic exploitation, and sustained economic crisis. The case of Peru and Shining Path, however, was in a number of ways the product of a somewhat different and more complex set of forces. The military regime in power there between 1968 and 1980 was authoritarian, to be sure, but at the same time was arguably, also, the most reformist government in Peru's post-independence history. This self-titled "Revolutionary Military Government" carried out a major agrarian reform, nationalised the country's most important mining companies, began the reorganisation of private industry into worker-managed enterprises, and became a leader in the international non-aligned movement. The stated goal of the military leaders was, at root, focused on national security. They wanted to reduce or even eliminate the possibility of a guerrilla insurgency by overcoming extreme poverty and exploitation through a "revolution from above" under their direction for the benefit of peasants and workers.

However, for a variety of reasons, the military in power gradually lost its reformist momentum. First, it was unable to generate from the domestic economy the large quantity of new resources needed to finance its ambitious initiatives, so it turned to shortterm foreign loans. Second, the expected revenues from exports of significant oil deposits discovered in 1972 were delayed for several critical years by problems in developing the infrastructure which would bring them to market. Third, the regime lost its most ardent reformer with the illness, replacement, and death of head of state (1968–1975) General Juan Velasco Alvarado. Fourth, an economic crisis which included stagnation in economic growth, rising inflation, and significant arrears in repayment of the ballooning foreign debt gripped Peru in 1977 and 1978.

In addition, the implementation of the agrarian reform in the highlands, or sierra, turned out to be ill suited to the dominant pattern there of large numbers of indigenous communities and few prosperous private estates subject to expropriation. As a result, the heightened expectations generated by the official rhetoric of "land to the tiller" were dashed with the implementation of the agrarian reform, as the already modest pre-reform livelihoods of most highland peasants deteriorated even further.

In combination, then, a significant, unintended, and totally counter-productive consequence of the military's multiple initiatives to change the structure of economic, social, and political power in Peru was the gradual fostering of a reality that was more rather than less favourable for guerrilla activity, particularly in parts of the Peruvian sierra.

Other factors, both historical and contemporary, also help to explain the emergence of Sendero Luminoso as a guerrilla force in the sierra more generally and in Ayacucho in particular. One relates to the Spanish conquest of the Inca Empire, centred in the Andean highlands, and almost 300 years of Spanish administrative control of the region under a viceroyalty from its capital, Lima, on the coast. This introduced a centuries-long period of coastal domination of the largely indigenous sierra, a pattern of

S

centralised control which continued for almost 200 more years, from independence in the 1820s all the way through the twentieth century. As a result, government resources as well as economic activity were concentrated in Lima and the coast, leaving most of the sierra population poor and marginalised, and progressively reinforcing over time an ethnic cleavage as well as the profound natural geographic cleavage between the two regions.

A more contemporary factor specific to Ayacucho was the refounding of the colonial university there in 1959, some 80 years after its closure due to Peru's economic collapse with its loss to Chile in the War of the Pacific (1879–83). The National University of San Cristóbal de Huamanga (UNSCH) was reopened with the lofty goal, unique at the time, of serving as an incubator and promoter of local development and of providing an opportunity for first-generation Spanish speakers from the indigenous communities predominating in the region to receive a university education. During its first few years, with an ample budget and a unique vision among Peruvian universities of the day, it attracted some of the country's leading scholars with a diversity of ideological perspectives, along with a few recent graduates of other institutions, including, in mid-1962, Abimael Guzmán Reynoso.

Although no-one could have predicted it at the time, Guzmán turned out to be another critical factor in laying a foundation for the armed struggle in Peru; the key figure any potential revolutionary movement must have to organise, inspire, and lead a guerrilla campaign against established authority. Originally appointed as a professor of philosophy in the Education Programme, he had soon revitalised the Communist Party of Ayacucho and established himself as a leading Marxist at UNSCH as well. A charismatic teacher, strategist, and organiser, he attracted many students and a number of fellow professors as well with his Marxist-Leninist and then Maoist rhetoric after the 1962–1963 Sino-Soviet split. He became the head of the teacher-training school, where he helped to prepare a generation of elementary school teachers, many of whom returned to the primary schools in their home indigenous communities of rural Ayacucho. After his supporters won university-wide elections in 1968, he was named UNSCH secretary-general, with control over most appointments. Over time, he became a dominant figure in the Maoist movement and then its undisputed leader by the early 1970s. In the name of ideological purity, he gradually undermined the early academic diversity of the university and turned its original regional development role into a vehicle for expanding a Maoist world view throughout the Ayacucho hinterlands.

With the financial support of the Beijing government, Guzmán made at least three extended trips to China for training between 1965 and 1976, along with most of the other members of his party's central committee, which was drawn largely from former UNSCH students and faculty. Their trips coincided with the Chinese Cultural Revolution (1966–1976). Over time, the Peruvian contingent progressively identified with the Cultural Revolution's most radical faction, led by Madame Mao as the head of the so-called Gang of Four, which advocated permanent revolution in the name of ideological purity. When this faction eventually lost out within China to the more moderate elements led by Deng Xiaoping, Chinese support for Guzmán and Peru's Maoists ended and they were left to fend for themselves.

This unanticipated event marked a historical turning point in the development of Sendero Luminoso over the next four years. Guzmán's analysis of successful Communist revolutions, including those in the Soviet Union, China, and Cuba, concluded that all had betrayed the Marxist, Leninist, and Maoist ideological principles upon which they had been founded. As a result, he believed, the only way to sweep away the forces of capitalism as well as the now corrupted socialist states was through a new world Communist revolution which would lead in time to the establishment of more pure "New Democracies." Given such a betrayal, it would be necessary, Guzmán believed, to begin anew with a true revolution that would start in Peru under his leadership.

Having been cast aside by China, his erstwhile outside mentor and supporter, Guzmán was

determined to build a revolutionary force with resources drawn totally from within the country. He would lead the guerrilla struggle with the group that he had been slowly building for more than a decade. He considered it to be the only truly revolutionary communist party, which he insisted in calling the Communist Party of Peru (PCP) even though those outside the movement continued to label it Sendero Luminoso or Shining Path. With the foundations of local organisation and support already well established under his guidance in Ayacucho, Guzmán concluded that the Maoist people's war would begin there. Since this region remained quite isolated from the rest of the country both geographically and administratively, the preparation of armed cadres and organisational capacity took place over time mostly unperceived by central government. As the military regime lost momentum and legitimacy in the late 1970s and began the transition to national elections and civilian government, Guzmán decided that this was the right moment to launch the people's war, a decision ratified in an April 1980 PCP assembly.

The initial action took place on 17 May 1980 in Chuschi, a small district capital in Ayacucho, with the burning of ballot boxes which had been readied for the next day's national elections, Peru's first since 1963. There was no way of knowing at the time that this act would presage years of guerrilla war and military response and produce close to 70,000 deaths and the destruction of over $20 billion in property and infrastructure, along with some 650,000 internal refugees and more than 1 million emigrants. Although the department of Ayacucho bore the brunt of the violence, over the course of the next dozen years political violence and physical destruction spread to almost every part of the country, and for a time threatened the very foundations of the Peruvian state.

Explaining Sendero Luminoso guerrilla Advances

Several factors help to explain why Sendero Luminoso's people's war advanced as far as it did. They include both the nature of the Peruvian state's response and the way the Shining Path pursued the armed struggle. As far as the role of the state was concerned, an important consideration was the initial reluctance of the newly elected civilian government to take the group seriously and to respond when it was still a small, weak, and localised guerrilla force. Ayacucho was remote and far removed from the capital in Lima, and the early actions of Sendero were seen as nothing more than those of local cattle rustlers and their ilk. In addition, newly elected president Fernando Belaúnde Terry (1963–1968 and 1980–1985) had been removed from office by a military coup during his first term. As a result, he was very sensitive to any initiative he might take at the outset of his second term, which would expand the role of the armed forces and quite possibly put his presidency at risk once again.

President Belaúnde delayed issuing a presidential order to commit the military to engage Sendero in Ayacucho and the surrounding area until December 1982, more than a year-and-a-half after the first guerrilla actions. As a result, the insurgents had time to grow and to establish a presence in much of rural Ayacucho as well as in the neighbouring sierra departments of Huancavelica and Apurímac. They attacked the small police stations scattered throughout the provincial capitals, seizing the weapons and ammunition stored there and forcing the virtually complete withdrawal of their personnel to the department capital. With the countryside then bereft of government presence, Sendero cadres and sympathisers were able to gain control of scores of indigenous communities in the region. The one action Belaúnde *did* take, in 1981, was a disaster. He ordered a specialised contingent of police, called Sinchi, to Ayacucho, but when their actions included pillage, rape, and drunken brawls, he was forced to remove them in disgrace.

Under the Peruvian Constitution of 1979, provinces under significant natural or manmade threat could be declared Emergency Zones, which included suspension of constitutional guarantees and the supplanting of civilian authority with military control. President Belaúnde finally invoked this provision in seven provinces of Ayacucho, Apurímac, and Huancavelica at the end of 1982.

Over the course of the following decade as political violence spread, about one-third of Peru's 185 provinces, containing over half the national population, became subject to military authority.

Unfortunately, throughout the 1980s, central government's response to the expanding threat of Shining Path was almost exclusively military in nature, and as such, it actually made the situation worse by often indiscriminate killings and repression of local populations, more often than not indigenous ones. The first two years of major military operations to deal with the guerrillas, 1983 and 1984, were also among those marked by the highest numbers of civilian casualties (well over 4,000 each year) during the entire conflict. There was a lack of awareness or understanding of sierra mores and customs, made even worse by central military authority's unwillingness to send troops from the area to their regions of origin. Such levels of violence against citizens by forces ostensibly sent to protect them from Sendero wound up pushing many into the arms of the very group the state was trying to eliminate.

By the end of the decade, Shining Path was in effective control of large areas of rural Ayacucho, where its operatives had established between 700 and 800 "generated organisations" at the community level. There was an approximate total of 1,100 such building blocks sierra-wide in what was to become the group's "New Democracy." With a central committee headed by Guzmán and six regional committees under his guidance but with operational autonomy, guerrilla violence spread throughout most of the sierra. Annihilation squads targeted local figures for elimination, focusing primarily on elected officials and judges, which dissuaded many others from running for office. In the 1988 local elections, hundreds of districts lacked candidates and turnout was dramatically reduced. At about the same time, Guzmán, believing the moment had arrived to "encircle the cities," began a campaign to cut off Lima's access to food, water, and electricity from the sierra and to take the guerrilla war to the capital. With access to new sources of revenue after 1987 in the coca-producing Upper Huallaga Valley in the north central highland

department of San Martín (from "taxes" levied on the cocaine paste carried by planes flying out of the valley to Colombia), Shining Path was becoming an even more formidable adversary. By the end of a decade of "people's war," Sendero was estimated to have between 7,000 and 10,000 armed cadres operating in all but one of Peru's 24 departments, and between 200,000 and 300,000 supporters and sympathisers nationwide.

At the same time, the so-called "heterodox" economic policies pursued by the elected government of Alan García Pérez (1985–1990) were producing rapidly increasing inflation and negative growth which generated a significant erosion of central government capacity and popular support. With hyperinflation gripping Peru and Lima facing greater and greater shortages provoked by a combination of foreign debt default and Sendero's urban campaign, hundreds of thousands of Peruvians fled the country. As the 1990 national elections approached, Peru's situation appeared to be increasingly dire. Given the successive failures of two successive traditional parties to govern effectively in office (Belaúnde's Acción Popular, AP; and García's Alianza Popular Revolucionaria Americana, APRA), it is not surprising that an increasingly desperate electorate turned to an outsider with no prior political experience or the backing of an organised political party, Alberto Fujimori (1990–2000).

In the short run, the situation worsened. Inflation peaked in 1990 at 7,650%, an economic shock programme created even greater hardships among an already beleaguered population, and government institutions verged on collapse. Guzmán declared the guerrilla war at a stage of "strategic equilibrium" in its battle against government forces and began to predict victory in the very near future. President Fujimori appeared to play into Sendero hands in April 1992 when he suspended congress, the judiciary, and constitutional guarantees in an *autogolpe* or self-coup that ended democratic process. In the months that followed, Guzmán and his Central Committee drew up plans for a "final offensive" scheduled to begin in October and culminate with a guerrilla triumph in December, the month of Mao's birthday.

Explaining Sendero Luminoso's Failure

Yet just when Sendero appeared to be on the verge of a stunning triumph, Guzmán and several key subordinates were captured, along with the guerrilla organisation's master files, blows from which it never recovered. The explanation for such a dramatic and apparently sudden turnaround relates to a number of factors involving both government and the guerrillas.

Beginning in 1989, the armed forces, belatedly recognising the failure of their long-standing approach to fighting Sendero which focused almost exclusively on military actions, conducted a comprehensive review that produced a new counter-insurgency doctrine. Core tactics now began to emphasise civic action, human rights training, the use of military personnel from the localities of operations, and, for the first time, the training and equipping of community civil defence groups (*rondas campesinas*) as the first line of defence against guerrilla attacks. At about the same time, the Interior Ministry, responsible for the national police, established a small autonomous unit with the task of locating and tracking Sendero leadership. Both of these significant initiatives, begun near the end of the García Administration, were continued and reinforced by President Fujimori.

In 1991 and 1992, the Fujimori Government also established several micro-development organisations explicitly designed to provide small-scale assistance to the poorest districts in Peru, almost all of which were rural and were affected by political violence. Communities chose the projects, which included potable water, electrification, roads, schools, irrigation, soil conservation, and reforestation. They provided the labour and the oversight, while the organisations, each comprising no more than 300 well-qualified professionals with substantial regional autonomy, gave materials and technical assistance. Between 1992 and 1998, these small micro-development programmes, though averaging about $2,000 each, in combination delivered over $1 billion in projects to poor districts and contributed to a reduction in extreme poverty of more than 50 per cent.

A more controversial initiative, but one born of necessity, was the establishment of "faceless" judges to protect officials from threats and assassination while they oversaw trials of captured guerrillas. Since between 1988 and 1992 Shining Path cadres had killed over 100 judges and had threatened hundreds of others, this appeared at the time to be the only way to protect judicial-system personnel while fostering greater efficiency and effectiveness. Though later declared void by the Inter-American Commission on Human Rights (IACHR), thereby requiring new trials in the early 2000s, the unorthodox judicial procedures helped to re-establish a semblance of the rule of law and governmental capacity in the eyes of the Peruvian public.

Another measure, instituted after the capture and trial of Guzmán and the rounding-up of hundreds of upper and middle-level guerrillas, was a government-decreed repentance law. It was designed to encourage Shining Path members and sympathisers to turn themselves in with whatever weapons and information they possessed, in exchange for government-sponsored rehabilitation, job training, and a stipend, followed by their return to their home communities. During the two years the law was in effect, over 5,000 availed themselves of this opportunity, effectively draining Sendero of much of its remaining support.

While this array of government initiatives, however belated, contributed in various ways to help overcome the very real threat that Shining Path posed to the continued existence of the state, other factors relating to the guerrilla organisation itself also played a significant role in its demise.

One of the most important was the remarkably hydrocephalic structure of Sendero. Abimael Guzmán Reynoso was not only the founder, but also the key interpreter of Marxist-Leninist-Maoist ideology as well as the organiser and strategist. From his earliest years at the University of Huamanga in the 1960s through the 12 years of "people's war," Guzmán embraced a cult of personality towards himself far beyond that of any previous successful revolutionary leaders elsewhere during the course of their guerrilla struggles. Given his overwhelmingly dominant role, then, his capture effectively cut off the head of

S

the movement, left no legitimate successor, and dealt a devastating psychological blow from which Sendero never recovered. "The capture of the century," as Peruvian media called it, was the definitive turning point in the guerrilla war; besides vindicating official counter-insurgency strategy, it also gave government the public support it so desperately needed at that critical juncture in its struggle to survive.

Another key factor was Guzmán's obsession with ideological purity in his quest for a true revolution that would not fall into revisionism once successful, as he believed had occurred in the Soviet Union, China, and Cuba, among others. His writings are replete with laboured analyses of the ideology of leading Marxists in his search for ideological correctness. Such an obsession led him to totally misinterpret the actual reality of Peru as he prepared for and then led his guerrilla war – the military's reforms, however incomplete, had ended any vestiges of feudalism and landlord domination in the countryside, while hundreds of centuries-old indigenous communities retained their presence throughout the sierra. Peru in the 1980s bore little resemblance to China of the 1930s in spite of Guzmán's insistence that they were at similar stages of pre-capitalist and capitalist development.

He also failed to follow Mao's dictum that the rural-based guerrilla movement must be like "fish in the water" during the struggle and respond to peasant priorities to gain their support. Instead, he insisted on ending ubiquitous indigenous markets because they were capitalist manifestations and also imposed a new structure of ideologically correct "generated organisms" in communities where indigenous structures of *ayllu* and *varyoc* had prevailed for centuries. As a result of the local resistance created by such initiatives in areas under Sendero influence, guerrilla cadres resorted to increasingly repressive measures to retain control. When the government finally changed its counter-insurgency approach, beginning in 1989–1990, local populations increased their efforts to take on Shining Path forces with community-based rondas, and progressively abandoned guerrilla control as government presence increased across the sierra.

Another significant factor in Sendero's demise was Guzmán's decision to apply Maoist tactics of "surrounding the cities from the countryside," specifically Lima, beginning in 1988. This campaign experienced initial successes by cutting off two of the three major electrical transmission lines from the sierra into Lima, as well as sabotaging the most important aqueduct, the railway line, and the one paved highway from the highlands to the capital. In addition, the urban campaign included targeted assassinations of some key popular neighbourhood leaders, along with regular bombings of banks, commercial establishments, and even apartment buildings in middle-class neighbourhoods. As the guerrilla campaign began to seriously affect the daily lives of the capital city's eight million people for the first time, the realisation grew that this struggle was not limited to remote areas of the highlands, and public pressure grew for central government to take effective action. Such pressure contributed to the major review of official approaches to the insurgency in 1989 and 1990 and to the significant adjustments that occurred as a result. These played major roles in defeating Shining Path in the early 1990s.

In addition to provoking the large urban population, the decision to take the guerrilla war to Lima as a prelude to the "final offensive" had the unintended consequence of giving Peru's intelligence services an advantage they had not had in the sierra. They were much more familiar with the urban setting and had a much stronger presence in the capital. As a result, government intelligence operatives were better equipped to track down guerrillas there, and had a number of successes even before locating and capturing Sendero's supreme leader in the Lima suburb of Surco in September 1992. This operation was a model of urban counterinsurgency, which included several weeks of placing police intelligence personnel in key locations around Guzmán's "safe" house and disguising them as neighbours, vendors, and rubbish collectors. When one of the guerrilla leader's subordinates went out to buy wine and cigarettes at the corner store, they followed her back into the house and, without firing a shot, captured Guzmán, four other members of the Central Committee, and the master plans for the "final offensive."

Conclusion

Although it took some time for the political violence to subside, the blow to Sendero caused by the dramatic capture of its leader signalled that the government's victory over the guerrillas was all but inevitable. In combination with economic recovery and the restoration of sustained growth without inflation, as well as the re-establishment of democratic procedures under pressure from the Organisation of American States (OAS), Peru gradually regained its equilibrium. Although President Fujimori was removed from office by congress in 2000 for pursuing an increasingly corrupt and authoritarian political agenda, a combination of elected presidents and economic growth since then have gradually helped to consolidate democracy in Peru. A Truth and Reconciliation Commission produced a comprehensive study of the conflict in 2004 which documented abuses by both Shining Path and the military and made recommendations for reparations to the most affected communities and individuals, overwhelmingly concentrated in Ayacucho and surrounding districts. After long delays, remuneration for some 1,500 communities was provided in 2011, and for more than 17,000 individuals by late 2013.

Remnants of Shining Path re-emerged in the Apurímac and Upper Huallaga river valleys after 2006, both financed by coca and cocaine production, but, after some years of official missteps, were significantly weakened by police (2012, Upper Huallaga) and combined military-police (2013, Apurímac) responses and represent no threat to the state. A political group based in Lima, the Movement for Amnesty and Fundamental Human Rights (MOVADEF) is sympathetic to a variation of Sendero ideology but espouses protest rather than violence and tried unsuccessfully to register as a political party for either the 2011 national or the 2014 local elections. Guzmán remains in jail, serving a life sentence, and now asserts that this is not a moment to pursue revolutionary violence in Peru.

While the effects of the 1980–1992 "people's war" linger, especially in those parts of the sierra which experienced most of the violence, the nation was able to overcome the most serious internal threat ever faced in its history as an independent republic.

Definition

This essay explores the life and work of Senegalese political activist, Sengalese nationalist, and French Communist Party member Lamine Senghor (1889–1927).

In the mid-1920s, Lamine Senghor (1889–1927), a Senegalese veteran of the First World War, was one of the most celebrated figures in the emerging, global, anti-colonial movement. However, he was also a very sick man: during the war, his battalion of *tirailleurs sénégalais* (colonial infantrymen drawn from across French West Africa) had been gassed near Verdun, and Senghor suffered terrible injuries from which he never fully recovered. In the summer of 1927 his health failed rapidly, and the movement he had launched began to crumble. After his premature death that November, aged just 38, his reputation quickly faded, and the inter-war period later came to be seen as a 'failed' one for the anticolonial struggle. However, since the 1990s, there has been renewed interest in his career and the movements he led.

In the autumn of 1924, Senghor joined the Union Intercoloniale (UIC), an organisation created by the French Communist Party (PCF) with the aim of providing a forum in which different colonised groups could join together in opposition to empire (Nguyen Ai Quoc, the future Ho Chi Minh, was one of the most active members of the group in the early 1920s). The UIC was perceived as a threat to colonial interests, for the Communist International (Comintern) of 1920 had adopted a resolutely anti-imperial stance. In practice, this led to little concrete anti-colonial activity but, in 1924, the Comintern called on communists to seek alliances with anticolonial nationalist movements. This united anti-colonial front would only last a few years but it is in this context that we must situate Senghor's activism.

Senghor quickly became a mainstay of UIC activities and a regular contributor to its firebrand newspaper *The Pariah.* In 1924–25, the PCF carried out its most sustained anticolonial campaign when it organised opposition to the war in the Rif Mountains of Morocco. Senghor threw himself into the campaign, speaking at countless rallies, and developing his extraordinary skills as an orator. He adopted the 'official' Comintern line and promoted an alliance between all those engaged in anti-colonial struggle. Whereas Jacques Doriot 'translated' the actions of the Rif rebels into a proto-communism, Senghor regarded the sense of despair and oppression felt by the Islamic world as sufficient motivation for revolt: the Rif war was not the result of a Samuel Huntington-style clash of civilisations but rather the understandable resistance of a colonised people to external domination.

After loyally serving the PCF/UIC throughout the Rif campaign, Senghor gradually came to resent the limited space devoted by the communist movement to black questions in general, as well as

to his own marginalised status in particular. He decided that in order to promote the interests of black people, it was necessary to create independent black organisations, and in March 1926 he launched the Committee for the Defence of the Negro Race (CDRN), a less revolutionary, more reformist-minded group (initially at least). He immediately embarked on a tour of France's port cities in order to try and convince the small, largely working-class, black community to join the CDRN: his skills as a public speaker served him well and by the summer it was estimated by the secret police of the Ministry of the Colonies that he had recruited over 500 members (in a black population numbered at less than 20,000).

The most original aspect of the CDRN was its critical reflection on the language of race and its exploration of the modes of self-definition available to black people. In his article 'The Negroes have Awoken' (published in *The Pariah* in April 1926), Senghor articulates a black identity that is based not on shared racial characteristics but on a shared sense of oppression. To call for 'the awakening of the negro' was immediately to evoke a set of ideas and a vocabulary that had been rendered popular by Marcus Garvey in the early 1920s. In the course of his seemingly inexorable rise as a major leader of black America, Garvey had consistently called for the black world to wake from its long sleep, and his appeals for black people to take pride in themselves had resonated around the world (even though his influence in French contexts has generally been underplayed). The most striking aspect of this influence was the CDRN's use of the term *'nègre'* [negro] as a badge of self-identification, just as Garvey proudly proclaimed himself a 'negro'. In an era when the term '*noir*' [black] was widely gaining prominence as a more dignified replacement for '*nègre*', seen as derogatory and demeaning, Senghor and the CDRN deliberately chose *'nègre'* as the term that encompassed all black people. In CDRN discourse, the *'nègre'* is an individual who has been downtrodden and oppressed through slavery, colonialism, segregation: the terms '*noir*' and '*homme de couleur*' [coloured] are seen merely as escape routes for educated blacks seeking a minor role in a dominant white society. The first step towards liberation is to embrace one's identity as a '*nègre*': for that allows one to perceive the true nature of Western oppression of the black world.

Even as the first issue of *The Voice of the Negroes* proudly and insistently proclaimed the unity of '*les nègres*' (negroes), the CDRN was in fact in the middle of a protracted schism. Much of the rancour centred on Senghor's ongoing clandestine links to the PCF; this would soon lead to the break-up of the organisation, with Senghor and his fellow radicals deserting en masse to create the *League for the Defence of the Negro Race*. In the midst of the CDRN in-fighting, he enjoyed one final moment of glory, when he was invited to speak at the inaugural meeting of the League against Imperialism (LAI) in Brussels in February 1927: the LAI was largely a communist initiative, but in its initial phase it sought to unite all anti-colonial forces. In Brussels, Senghor shared a platform with prominent nationalist leaders from India (Jawaharlal Nehru), Indonesia (Mohammed Hatta), and other parts of the colonised world, and his speech was widely greeted as one of the highlights of the Congress: it was almost immediately translated into English and published in the US. He launched a vehement attack on imperialism as a renewed form of slavery, denounced violence against the colonised, forced labour, as well as the iniquity and double standards of the pensions paid to colonial veterans of the First World War. In the final stages of the Congress, the LAI placed Senghor at the head of the working party asked to draft the 'Resolution on the negro question'. Little more than two years after his first public appearance, he had carved out a position as a radical spokesman not only for black people in France but also internationally.

The final act in Senghor's career was the publication of *La Violation d'un pays* [The rape/violation of a land] in June 1927. This slim volume relates, in polemical fashion, the bloody history of slavery and colonialism. It is a deeply hybrid text that mixes the form of the fable with a highly didactic approach, utilising the political language of revolutionary communism: the text is also accompanied by five simple line drawings that reinforce the political message.

S

In many ways, *La Violation d'un pays* might be seen as a founding text in a tradition of hybrid pamphlets-essays that would later become a dominant form for black anti-colonial thought in French (from Aimé Césaire to Frantz Fanon to Achille Mbembe). It concludes with the overthrow of the colonial regime by a world revolution that liberates not only the colonies but also the metropolitan centre from the yoke of capitalist imperialism. This resolution is obviously unrealistic in the context of the 1920s, but it acts, within the context of Senghor's story, as a form of ideological wish fulfilment. For the first time under the French imperial nation state, an author sought to give narrative form to the independence of the colonised world. Within a month of the volume's publication, however, his health faltered, and he passed away just a few months later.

At the heart of Senghor's writings and his activism is an attempt to reconcile the claims of race and class (Was the exploitation of the 'black world' the result of racial or economic exploitation or both?), questions that would be central to the careers of later black writers/militants from Richard Wright to George Padmore to Aimé Césaire. Unlike them, Senghor was not forced to make a choice between pan-Africanism and communism, but he appeared to believe that these ideologies could complement each other in the quest for black liberation. On the evidence of his activism and his writings, Senghor might thus be situated within a lineage of left-leaning pan-Africanists (from his compatriot Ousmane Sembene to C.L.R. James and Frantz Fanon) for whom both pan-Africanism and Marxism remained throughout their lives crucial to constructing a transnational politics as well as transnational forms of identification.

Definition

This article is a biography of Leopold Sedar Senghor who was one of the pioneers of the Negritude movement. His contributions in Senegalese and African politics and culture are put into perspective with postcolonial theories, literary movements such as Creoleness and the current socio-political events in the contemporary world.

Léopold Sédar Senghor was born on 9 October 1906, to a family of wealthy tradesmen, in Joal, Senegal. Like most Senegalese children, his education was a colonial one, overseen by missionary priests. After spending his early years at Father Léon Du Bois's Catholic mission school, which he entered in 1913, and the Fathers of the Holy Spirit school in Ngazobil, he went on to attend the Collège Libermann in Dakar. In 1928, he was to

win a scholarship to the prestigious Lycée Louis-le-Grand in Paris, after which he continued his studies at the Sorbonne. At Louis-le-Grand, he befriended the future French president Georges Pompidou (1911–74), and, more importantly, the Martiniquan student Aimé Césaire (1913–2008), with whom, together with his Guyanese friend Léon-Gontran Damas (1912–78), he was to found the Négritude movement, influenced by contemporary civil rights movements in the US. The 1931 colonial exhibition in Paris, designed to celebrate France's 'civilising' mission and colonial power, represented an opportunity for the young movement to question this ideology and its explicit erasure of colonised peoples' cultures.

Négritude and Its Critics

In 1932, together with Césaire and Damas, Senghor outlined the concept of Négritude, defining this cultural and political movement as 'the combination of all the cultural values of the black world' (Senghor 1964: 9). According to Césaire, even though the political struggle for black peoples' independence and development was to continue, the cultural battle would be over once Négritude was recognised and valued as equal to French culture, for Négritude was a 'realisation of difference as memory, fidelity and solidarity' (Césaire 2004: 83). With Senghor, Césaire was a member of the editorial board of the short-lived journal *L'Etudiant* noir (1934), dedicated to expounding the movement's theses and violently condemning colonialism.

In 1936, Senghor's interest in the humanist theories of socialism motivated him to join the Section Française de l'Internationale Ouvrière (SFIO). His commitment to acknowledging the value of African cultures is powerfully expressed in a 1937 lecture on 'The Cultural Problem in French West Africa', which is included in *Liberté I. Négritude et Humanisme* and is summed up by the following:

> Intellectuals have a mission to restore *black values* in all their truth and excellence, to awaken within their people the taste for bread and games of the mind, which makes us *human*. Especially through the arts.

> There is no civilisation without a literature to express and illustrate its values, as a jeweller hones and polishes the jewels for a crown. (Senghor 1964: 19; this and subsequent translations by the author)

Senghor broadened and developed his definition of Négritude in *Liberté V. Le Dialogue des cultures*: 'Négritude was, traditionally, for scholars and ethnologists, what Maurice Delafosse called the "black soul", and Leo Frobenius "African civilisation", or, to borrow from his own vocabulary, "Ethiopian civilisation"' (Senghor 1993: 17). He was later to expand this definition by evoking a 'negro being' endowed with a specific *Weltanschauung.* Many African writers and intellectuals of African origin criticised these aspects of the definition, which they saw as being rooted in the ethnological myths used to validate the colonial system.

Among the intellectuals reluctant to embrace Négritude were many West Indian writers, such as Frantz Fanon (1925–61), who, in his *Wretched of the Earth* (1961), warned that the movement was heading for a dead-end and chose to fight instead for political independence. African authors – for example, the Cameroonian Marcien Towa (1931–) and the Beninese Stanislas Adotevi (1934–) – harshly criticised the movement in works such as *Négritude ou Servitude* (1971) and *Négritude et Nécrologues* (1972). Anglophone writers and intellectuals from Ghana and Nigeria were also to voice their disapproval, as with the famous phrase from Nigerian Nobel Prize winner Wole Soyinka (1934–), at the 1964 Berlin Conference on African Arts: 'A tiger does not proclaim his tigritude, he pounces' (Jahn 1968: 266).

As far as post-colonial writers are concerned, they seem to favour Césaire, who inscribes the concept in a more global dimension, seeing it as 'one of the historical forms of the human condition' (Mbembe 2013: 230). Even today, many critics blame Senghor for the essentialist tendency that continues to lend a mythical quality to the French vision of Africa. Thus, the speech made by the former French president Nicolas Sarkozy (1955–) in Dakar on 26 July 2007, considered by many to be a milestone in the African continent's recent history, contained numerous *faux-pas* which some argue are a direct legacy of Senghor's Négritude.

S

The Cameroonian intellectual Achille Mbembe (1957–) reacts strongly against this speech written by Sarkozy's adviser Henri Guaino, who evokes 'the main sources of Senghor's thought mobilised by Henri Guaino in the hope that he will give the presidential words a native stamp. Isn't he aware of the inestimable debt that the Senegalese poet, in his formulation of the concept of Négritude or of the notions of culture, civilisation, even *métissage,* owes to the most racist, essentialist and biologising theories of his time?' (Mbembe 2007). Mbembe's reaction shows just how vigorously the idea of Négritude is still criticised, as it has been since Francophone African countries became independent. This is not to say, however, that Senghor did not attempt to inscribe his movement in a pragmatic setting, underlining its cultural and political implications in *Liberté* V:

> It is a project insofar as we wish to anchor ourselves to traditional ideas of Négritude so that we may play our part in the Civilisation of the Universal. It is an action insofar as we take concrete action to carry out our project in all fields, particularly the fields of literature and the arts. (Senghor 1993: 17).

Senghor's humanist vision aims at the collaborative coexistence of the world's civilizations as a means of achieving what the poet calls 'cultural symbioses'. It was from this perspective that he was, after the Second World War, to write *La Communauté impériale française*, in which he condemns colonisation and its rejection of foreign cultures, while putting forward the idea of a great community in which people, motivated by a shared ideal, would strive for a mutual development that would respect their differences and safeguard cultural equality.

Senghor's poetry is also oriented toward the universal, evoking the realm of childhood. He started publishing collections of poetry in 1945 with *Chants d'ombre,* followed by *Hosties noires* (1948), *Ethiopiques* (1956), *Nocturnes* (1961), *Lettres d'Hivernage* (1972) and *Elégies majeures* (1979). In a text entitled 'Ce que l'homme noir apporte', Senghor was to coin his now-famous phrase: 'Emotion is Negro, as reason is Hellenic' (Senghor 1964: 24). Facing criticism in Senegal and Africa, he attempted to clarify it in his subsequent writing. In his article 'Senghor: Raison Hellène,

Emotion Nègre', Jean Bernabé tries to 'mitigate the misunderstanding' surrounding Senghor's phrase. According to him, '[r]e-calling the "Greek miracle", the Négritude poet aims, symmetrically, through words, to define the essential part that Africa has played in the development of humanity. He therefore suggests, through his much-maligned phrase, the possibility of a form of "African miracle"' (Bernabé 2011: 123). Despite his adversaries' attacks, the president-poet continued to fight for the rehabilitation of the black world's cultural values. Hence, in collaboration with the journal *Présence Africaine*, he organised the first World Festival of Negro Arts in Dakar in April 1966, to which dignitaries from across the globe were invited. France was represented by André Malraux (1901–76), minister of culture under General Charles de Gaulle (1890–1970). In strong contrast to Sarkozy some 40 years later, Malraux's speech referred to Africa's contribution to world heritage through its dance, music, symbolic sculptures, and 'furiously emotional' poetry (Malraux 1966). For Senghor, this key event in African cultural history held the promise of a new humanism, whose lessons were to be drawn from African art – an art whose sheer imagination and symbolism exceeds the measure of man. Senghor's aim was to promote the black man's contribution to humanity through his very being-in-the-world (*être-au-monde*), as it is illustrated in his philosophy and works of art. By mastering the symbolic, the Senegalese poet believed, the Negro aesthetic embodied an egalitarian vision, in which culture is made by all and for all. The festival's objective was also to allow Africa's voice to be heard, thus contributing to the construction of the Civilisation of the Universal, so close to Senghor's heart. For him, as for Césaire, 'the universal exists only insofar as it is a community of singularities and differences, a sharing which is at the same time a pooling and a separation', as Mbembe puts it (Mbembe 2013: 228).

Politics: Successes, Controversies, and Pluralism

Returning to Senegal in 1945, Senghor was encouraged to enter politics by Lamine Guèye

(1891–1968), then mayor of Dakar. The political side of his humanist vision was to come to the fore when he was elected to the French National Assembly in 1945 as the representative of Senegal-Mauritania. He left the SFIO, convinced that it no longer represented the interests of African people, and in 1948, joined forces with Mamadou Dia (1910–2009) to create his own political party, the Bloc Démocratique Sénégalais (BDS). He went on to be elected mayor of Thiès in 1956, president of the Federal Assembly of Mali (which included today's Mali and Senegal) in 1959, and finally president of the Senegalese Republic in 1960, following the dissolution of the Federation of Mali.

The dismantling of the latter led Senghor and Dia to establish a dyarchical system (a political regime where power is held jointly by two persons or two groups), which was to cause a serious crisis among the Senegalese leadership. The conviviality and friendship that the two men shared was to be seriously compromised in the wake of political differences and Senghor's desire to see the political system evolve into a presidential regime. Accused by Senghor of preparing a coup against him, Dia and several of his ministers were arrested; the High Court of Justice arbitrarily sentenced him to be deported and jailed for life in a fortress prison. This political injustice left its mark on the Senegalese national consciousness, which increasingly saw Dia as a pillar of its developing statehood and the heir to Senegal's democratic legacy. Even though a proportion of the Senegalese population remains unaware of Dia's activism to this day, the sacrificial dimension of his fight for his country's greater good has contributed greatly to his progressive rehabilitation as a national figure.

After organising a vote for a new constitution in March 1963, Senghor exercised power alone. His party's victory at the general election was contested by opposition parties and the degradation of the terms of trade weakened the country significantly, making it difficult to overcome the economic challenges it faced. Senghor tried to unite all of the political factions in order to face the situation. Thus, in 1966, Senghor and Dia's party, the Union Progressiste Sénégalaise (UPS)

embraced all of the existing political organisations. But differences of opinion were to divide the coalition and, against a backdrop of increasing violence, a coup was organised against Senghor, from which he escaped unharmed. The political upheaval in Senegal was, partially only, a knock-on effect of the events of May 1968 in France. Senegalese politician and professor Abdoulaye Bathily (1947–) experienced the social upheaval of May 1968 first hand in his country, dedicated his *Mai 68 à Dakar* (1992) to showing how events in Dakar antedated the French upheavals. Indeed, since 1966, a 'creeping May 68' was at work in Senegal, with student protests, agricultural crises, dramatic decreases in purchasing power, and the rallying of workers and economic players. Students seized the opportunity to condemn corruption and accuse the president of being an accomplice to neocolonialism and the 'lackey' of French imperialism. Senghor responded positively to these protests by creating a new regime which delegated power to the prime minister and moved towards greater democratisation. During the transition, he appointed the young executive Abdou Diouf (1935–) as prime minister on 26 February 1970, after revising the constitution via a referendum.

In 1970, the UPS held all of the seats in the National Assembly. Student unrest followed Pompidou's visit to Dakar in 1971, which progressively led Senghor to consider opening up the political system in 1973. On 31 July 1974, lawyer Abdoulaye Wade (1926–) founded the Parti Démocratique Sénégalais (PDS), and, in 1976, reforms designed to usher in a multiparty political system were implemented. They also guaranteed the separation of powers and the freedom of the press. On 31 December 1980, Senghor announced his intention to stand down; a step that he had been planning for the previous 10 years. He nominated Diouf as his successor and left for France with his wife to avoid impeding the young president's work, as he put it. His election, in 1983, to the Académie Française elicited renewed criticism from his adversaries in Africa, who once again accused him of Francophilia, but it helped him to achieve global renown, ensuring that he was invited to speak at international universities.

Cultural and Political Legacy

The death of his son Philippe-Maguilen Senghor in a car crash in 1981 in Dakar was to haunt him for the rest of his life. He turned increasingly to his writing, perhaps finding in it new forms of resilience. He published *Liberté 4* in 1983, subtitled *Socialisme et planification.* In 1988 his *Ce que je crois* appeared: a defence of Négritude and an optimistic discourse on the Francophone world. In 1993, he published his final book, *Liberté 5. Le dialogue des cultures.*

Senghor passed away on 20 December 2001 in Verson (France), aged 95, after years of ill health. The Senegalese people reacted to news of his death with great emotion, and numerous national and international delegations came to pay their last respects in front of the National Assembly in Dakar, where his body lay in state. A Latin mass was held at Dakar cathedral, in the presence of his wife Colette Hubert and numerous dignitaries from across the world.

Because of the quasi-systematic way in which a number of African countries hijacked power and implemented dictatorships following their independence in 1960, the process of democratic transition initiated by Senghor is still viewed favourably by Senegalese and African people today. His reforms, facilitating democracy through the devolution of power, put Senegal on the path to good governance despite the troubled times experienced under Abdou Diouf's successor President Abdoulaye Wade. The years from 2000–12, marred by nepotism and corruption, were happily brought to a close in an exemplary fashion by a highly educated civil society which has Senghor to thank for its democratic culture. By investing massively in the education sector when he headed the country, Senghor's foremost aim was to produce citizens who would be able to understand the issues facing their country, Africa, and the world. While Senghor has on occasion been accused of favouring men of letters over engineers and scientists, one cannot overlook the fact that the large numbers of Senegalese intellectuals and executives, and an ever-expanding student body, have laid the foundations for a society capable of expressing concrete demands regarding its national interests.

When assessing Senghor's achievements, we tend to remember his humanism rather than his politics. By claiming his own biological and cultural *métissage,* he was to become the advocate of an Africa rooted in its values but open to the world. It was in this role that he appealed for the creation of political and cultural partnerships between Africa and Europe, which was to spawn an economic community and a Francophone movement, which he defined as '[. . .] this integral Humanism, which spins its web around the earth: this symbiosis of "sleeping energies" from all continents, all races, awakening to their complementary warmth' (Senghor 1962).

Today, the Organisation Internationale de la Francophonie (OIF) comprises 57 member states, and it was chaired by the former Senegalese President Abdou Diouf from 2002 to 2014 in a tacit homage to one of its founding fathers. Louise Mushikiwabo, a politician from Rwanda, is the leader of the organization since 2018. The core missions of the OIF include the defense of human rights, the promotion of democracy and dialogue between cultures, as well as possible interventions in political crises affecting member states.

The organisation now includes Eastern European and former communist countries, and intercultural dialogue is increasingly becoming a reality. Yet it has also come under fire for being an avatar of French colonialism, at the very least a decoy used by France to encourage its Francophone members to preserve its language, now overshadowed by English. Many Francophone intellectuals and writers have called for it to be replaced by a concept of French-language world literature. A manifesto appeared in the newspaper *Le Monde* on 15 March 2007, followed by the book *Pour une littérature-monde,* edited by Michel Le Bris and Jean Rouaud.

Today, Négritude is often seen as an obsolete, essentialist concept that fails to reflect the world we live in; a world in which black diasporas can be found across the globe. The current consensus that identity is, in fact, made up of multiple identities invalidates any exclusivist approach to what Patricia Donatien-Yssa calls 'the image of the self' (Donatien-Yssa 2006: 16). In the context of the definition of West Indian identity,

in which Césaire and Damas both participated, Francophone West Indian writers thus view Négritude as retrograde. Considering Africa to be just one of their multiple origins and Négritude as one side only of an identity dependent on interrelations, West Indian writers have gone beyond Senghor's concept by identifying additional traces or *tracées* (Chamoiseau and Confiant 1991: 12), leading to the concepts of *Antillanité* and *Créolité.* As a consequence, the concept of Négritude has now been completely absorbed into postcolonial studies and replaced by Edouard Glissant's (1928–2011) philosophy of Relation and new approaches to plural, multicultural, and transnational identities.

Nonetheless, Senghor's ideas are today more relevant than one might suppose, in the links he establishes between the actual conditions in which we exist in today's world and his vision of a *presence* of that world, a beauty which 'is not a matter of essence or transcendence, but of the ephemeral plenitude of a series of evolving processes' (Chamoiseau 2013: 45–46). His politics are a *poetical intention,* a true *Relation* that he anticipated throughout his life: dialogues and exchanges without domination, where only cultural enrichment matters, as well as fraternity between whole civilisations, to strive for a better future. Senghor's voice reaffirms the –'inflexible beauty of the world'– in all its diversity. The path he chose is etched with the *tracées* of resistance against all forms of imperialism; the same *tracées* that herald the advent of a richly multifaceted world.

Synonyms

Colonization; Settler imperialism; Settlement

Definition

Settler colonialism is a specific mode of domination where a community of exogenous settlers permanently displace to a new locale, eliminate or displace indigenous populations and sovereignties, and constitute an autonomous political body.

The outcome of settler colonialism is a sociopolitical body that reproduces in the place of another. As a specific mode of domination, it is especially concerned with space. It is significant that the "inventor" of modern geopolitics, William Gilpin, should have been a committed and prominent settler colonialist of the nineteenth century and that Carl Schmitt should have developed his theory of "large spaces" with reference to US President Monroe's enunciation of the ultimate incompatibility between colonial and settler colonial forms (see Karnes 2014, 341–343; Legg 2011, esp. chaps. 3 and 6). On the basis of the distinction between "Europe" and "America" and their "essentially different [. . .] systems" of rule overseas, Monroe had proclaimed to Congress: "the occasion has been judged proper for asserting, as a principle [. . .] that the American continents [. . .] are henceforth not to be considered as subjects for future colonization by any European powers" (Monroe Doctrine 1823). Later, future US president Theodore Roosevelt wrote in *The Winning of the West*: "It is of incalculable importance that America, Australia, and Siberia should pass out of the hands of their red, black, and yellow

aboriginal owners, and become the heritage of the dominant world races" (1889, 45).

Settler projects are typically defined in continental terms, colonial ones in oceanic ones. The rebelling settlers of what would become the USA built a "continental" army, their representatives met in a "continental" congress, and the settlers of South Africa met undifferentiated "Africans" and self-defined their collective and language as "Afrikaner." Similarly, US President James Monroe developed his doctrine to fence off clearly defined *continental* limits, Australian Federation united an "island-continent" and invited the "Australasian" settler colonists from across the Tasman to join, and Canada was built around a "continental" railroad from "sea to sea."

Coherently, when it comes to the prospect of decolonization, settlers generally prefer that a "blue water" definition be adopted: the latter does not apply to them and the ways in which the boundaries of their polities are drawn. Considering the similarities and differences of British and American imperialisms, Bernard Porter commented that to "exclude the colonisation of the American West from the rubric "imperialism" simply because it didn't involve getting into boats is tendentious, to say the least" (Porter 2006, n.p.). Quite tellingly, the USA insisted in the 1960s on a "blue water" definition of colonialism in order to exempt its ongoing settler colonialism from the purview of developing international law on decolonization. The UN General Assembly Resolution 1541 (passed after the "Declaration on the Granting of Independence to Colonial Countries and Peoples") was premised on this definition of colonialism (see, e.g., Goldstein 2014, 13). When the UN finally caught up with settler colonialism as a mode of domination in 2007 and "declared" the inherent rights of the world's indigenous peoples, the settler polities were unsurprisingly skeptical (see, e.g., Merlan 2009; on the global rise of indigeneity as a political category, see Niezen 2003). Nonetheless, the study of settler colonialism is necessarily premised on the realization that colonialism does not always arrive on boats and that settlers typically act on their own behalf, not as agents of distant metropoles. Settlers characteristically arrive in their wagon trains, and the study of

their colonialism is premised on the parallel realization that they rarely sail away.

The study of settler colonialism as a specific mode of domination only consolidated during the last two decades. The study of colonial phenomena is much older. After the initial inception of colonial studies during the "age of decolonization" in the 1950s and 1960s, the study of colonialism fragmented in a variety of discourses, methodological approaches, and associated terminologies (for founding statements, see Memmi 1957; Fanon 1961). "Neocolonialism" emerged almost immediately to denounce relations that ostensibly acknowledged the equality of former colonizer and former colonized but did not actually affect structuring inequalities (Nkrumah 1965; Sartre 1964). "Internal colonialism" emerged in the 1970s, focusing on the resilience of colonial relationships *within* a specific polity – a predicament that could not be approached by envisaging the ultimate sovereign independence of the colonized (see, e.g., Casanova 1965; Hechter 1975). It was eventually applied to a remarkable variety of polities and realities, including Apartheid South Africa, Appalachia, the position of African Americans, and the Celtic "fringe." "Postcolonialism," or "post-colonialism," emerged as a scholarly approach in the 1980s to emphasize the enduring legacy of colonial regimes and the ways in which these legacies continue to inform relationships and representational strategies after the end of formal colonial subjection (on Orientalism as discourse, see Said 1978; on "othering" as the inevitable outcome of colonial relationships, see Spivak 1985; on "hybridity," "ambivalence," and "mimicry" as subversive strategies, see Bhabha 1994). The "new imperial history" followed in the 1990s; today the study of imperial and colonial formations is a lively and remarkable scholarly field (see, e.g., Aldrich & McKenzie 2014; Howe 2009).

All of these methodological approaches centered on what historian Partha Chatterjee insightfully defined as "the colonial rule of difference" (Chatterjee 1993, 19, 33). As such, they all related to colonialism as a set of social phenomena that is characterized by the ability to reproduce itself, that is, by the ability to maintain the fundamental inequality that separates colonizer and colonized. On the other hand, analyses that adopted "settler colonialism" as paradigm emphasized circumstances primarily characterized by a determination to erase colonized subjectivities rather than reproduce their subordination (Veracini 2010). Unlike the other colonial formations, settler colonialism supersedes rather than reproduces the colonial rule of difference; settlers win by discontinuing unequal relationships rather than maintaining them.

The consolidation of settler colonial studies as a scholarly subfield relied crucially on Patrick Wolfe's seminal theorization of settler colonialism:

> But what if the colonizers are not dependent on native labour? – indeed, what if the natives themselves have been reduced to a small minority whose survival can hardly be seen to furnish the colonizing society with more than remission from ideological embarrassment? [...] In contrast to the kind of colonial formation that Cabral or Fanon confronted [i.e.: 'franchise' or 'dependent'], settler colonies were not primarily established to extract surplus value from indigenous labour. (Wolfe 1999, 1)

A focus on land and a relative neglect of the labor of the colonized set settler colonialism as a mode of domination apart. Like the scholars of "internal colonialism," the scholars contributing to settler colonial studies have emphasized the *continuing* operation of an unchanged set of unequal relations. Indeed, settler colonialism as a mode of domination, it was often noted, has typically resisted formal decolonization. As a result, postcolonial approaches were deemed unsuitable to the analysis of the settler societies and the ongoing subjection of indigenous collectives. Australian poet and militant Bobby Sikes had ironically captured this incongruity: "What? Postcolonialism? Have they left?" (cited in Tuhiwai Smith 1999, 24).

The distinction between colonial and settler colonial formations, however, is much older than settler colonial studies. Karl Marx, for example (who had an ongoing interest in colonial questions and even pondered as a young man whether he should emigrate as a settler to the USA), defined them as the only "real colonies, virgin soils colonised by free labour" (Marx 1867, 931). Similarly, Friedrich Engels defined in a letter to Karl Kautsky the settler colonies as the "colonies

S

proper." They were the opposite of what he defined as "the countries inhabited by a native population, which are simply subjugated – India, Algeria, the Dutch, the Portuguese, and Spanish possessions" (Engels 1882, n.p.). Marx was responding to the theory of "systematic colonization" advanced by Edward Gibbon Wakefield, who had originally "discovered" primitive accumulation while noting the ways in which the presence of "free lands" in settler colonial peripheries enabled servants to abscond and rely independently on a subsistence economy that undid their previous subjugation (Piterberg and Veracini 2015). But liberalism as a set of political traditions was also fundamentally shaped by ongoing and sustained reflection on settler colonial issues (see Bell 2016). The scholars of the evolution of socialism and liberalism ignore settler colonialism at their peril.

Indeed, during the nineteenth century, the difference between what we now define as colonialism and settler colonialism as distinct modes of domination was clear to most observers (Foley 2011). Influential British historian J. R. Seeley had aptly encapsulated this sociopolitical distinction in the nineteenth century: the settler "colonies" and "India" are "in opposite extremes." He concluded: "Whatever political maxims are most applicable to one, are most inapplicable to the other" (cited in Bell 2009, 8). The distinction was also abundantly clear in the USA, as epitomized by the distinct ways in which different conquered areas were dealt with during the Mexican War of 1846–1848: temporary "occupation" south of the Rio Grande and organic incorporation north of it. The turn of the century US anti-imperialists based their opposition to the prospect of further expansion on this distinction (see, e.g., Kramer 2002; Cullinane 2012). For a very long time, one could approve of one mode of domination and *precisely for that reason* dislike the other. John A. Hobson, for example, approved of "settlement" as much as he disliked "imperialism" (Bell 2016, esp. 341–362). His ideas about "imperialism" would transform the world; his ideas about settler colonialism were common place.

These interpretative traditions developed in the context of what James Belich has called the global "settler revolution" (Belich 2009). The ideology that accompanied and propelled this "revolution" in the nineteenth century comprehensively reformed the generalized perception of settlers and their societies. From undefined places where "rebarbarized" demi-savage Europeans lived at the margins of civilization, the "frontiers" of settlement eventually became sites of political experimentation and, typically, "manly" regeneration. A revolution in the imagination was premised on a revolution in colonial politics.

As a specific term, settler colonialism was first used in the 1920s to indicate a particular type of British colonialism in an Australian context, to distinguish it from convict colonialism, and to differentiate between South Australia and New South Wales (Veracini 2013). The former had been originally settled by "free" settlers. As a compound term, however, it had originally developed in relation to what were generally called "bona fide" or "actual" settlers. In the USA and in the British Empire during the nineteenth century, these widely used expressions identified a particular constituency of "migrants" or "colonists": those who, unlike mere colonial sojourners, had displaced with an intention to remain in a particular locality or colony.

During the 1970s, and in the presence of bitter anticolonial insurgencies in Africa, "settler colonialism" was used to identify a type of "ultra-colonialism" whereby settlers held power without a demographic majority (Emmanuel 1972; Anderson 1962; Good 1976). However, beginning with Donald Denoon's seminal work on the settler economies of the southern hemisphere, "settler colonialism" eventually became associated (again) with the polities where settlers and their descendants were in power *and* a normalized majority (Denoon 1983). Thereafter, settler colonial studies progressively expanded its geographical scope. An inherently comparative approach defied recurring claims pertaining to local national exceptionalisms. While the USA and Israel were for some time not included within the bounds of settler colonial studies as an emerging transnational field, they eventually became important sites for the exploration of settler colonialism as a specific mode of domination (Hixson 2013; Shafir 2005). Today, the concept is applied to

analyze a vast variety of locales beyond the settler societies of the world, including postcolonial African nations, Latin America, Taiwan, and even Pakistan, a polity established by settlers endowed with a particular political ideology and a mandate that did not recognize the political autonomy of existing populations. As a scholarly field and as paradigm for analysis, settler colonial studies have gone global.

Settler colonialism is a relationship. It is related to colonialism but also inherently distinct from it. As a system defined by unequal relationships (like colonialism) where an exogenous collective aims to locally and permanently replace indigenous ones (unlike colonialism), settler colonialism has no geographical, cultural, or chronological bounds. It is culturally nonspecific. It can happen at any time, and everyone is a settler if she is part of a collective and sovereign displacement that moves to stay, that moves to establish a permanent homeland by way of displacement.

Settler colonialism is also an exercise in the deliberate alteration of time and space. Triumphant settler colonialism is a violent act against geography: settler colonialism turns someone else's place into space and then into place again. The latter place looks like the one the settlers left behind or should. When it doesn't, the settler project needs to compensate (see, e.g., Lynch 2015). Settlers exchange countries but also change countries; they literally transform them, aiming for greater productivity and recognizable patterns of land use. They often dream of other locations, places as they could be, and places that are other. Settler structures of feelings are in many ways defined by what Australian historian Geoffrey Blainey called the "tyranny of distance." That was the negative definition; more positively, but underwritten by the same determination to disavow distance, Australian arch-settler Prime Minister Robert Menzies famously proclaimed a sense of Britishness stretching from "Cape York to Invercargill" (on the profound ecological transformation associated with settler colonialism, see, e.g., Cronon 1983 and Griffiths and Robin 1997; on Robert Menzies, see Brett 1993; on the "Tyranny of Distance," see Blainey 1966). Settlers often wish their places were somewhere else:

modern-day Israel, for example, is in "Asia," not in "the West." It is one side of Suez and not the other, one side of Istanbul and not the other, and one side of the sea and not the other.

Settlers see both time and space as inherently malleable. Indeed, even if settlers often represent their activities in a "new" land as absolute beginnings (this is why they often call the peoples they encounter "Aborigines" – people that were there *ab origine*, at the beginning), they do not begin from scratch. They are endowed with what Patrick Wolfe has called, talking about the Zionist conquest of Palestine, as "preaccumulation" (Wolfe 2012). The settlers traveled with their preaccumulated social, technical, and other capital with them. Resulting from a specifically settler colonial type of uneven and combined development, during the high tide of the settler revolution, their polities were immediately autonomous and ultramodern. John Stuart Mill was enthusiastic about their collective capacity for social experimentation (see Bell 2016, esp. 211–236). But settlers also manipulate time in the other direction, and often move to return (see Piterberg 2008). They move back in time as they move forward through space: return to a pristine social order disturbed by modernity, return to appropriate social mores disturbed by gender and other revolutions, return to the land, and return to the ability of genuinely own it, an ability that had been disturbed by enclosures and other dispossessions.

Settler Colonialism and the Communist International

Oleksa Drachewych
Department of History, Western University, London, ON, Canada

Synonyms

Anti-imperialism; Comintern; International communism; Settler colonialism; Soviet Union; Third International

Description

The Bolsheviks led international communism through the Third International (also known as the Communist International or the Comintern), which operated from 1919 to 1943. A major target for the Comintern was world imperialism. The Comintern proclaimed itself as a partner of all oppressed peoples and supported colonial liberation. As part of its efforts, it gradually grew to appreciate the differences in the colonial world and developed some consideration of settler colonialism and its effects. Communist parties around the world attempted to create platforms in their local contexts which dealt with their understanding of their country's history and the treatment of Indigenous peoples. Despite realizing that settler colonies had different aims than exploitative colonies, the Comintern tended to still treat the colonial world uniformly.

Introduction

In March 1919, the Bolsheviks sought to form the revolutionary International they and their sympathizers felt was needed in the post-First World War world. The Communist International, also known as the Third International or the Comintern, responded to the ideological bankruptcy of the Second International, which had splintered and dissolved during the war as many socialists had supported the war effort of their respective nations. The Comintern also represented an opportunity for the left to respond to the national movements which gained prominence and momentum, inspired by Woodrow Wilson's Fourteen Points, and calls for self-determination. It operated until its dissolution in 1943.

Traditionally, the left had dealt poorly with the non-European world. Indeed, many members of the Communist International would make clear that the Comintern represented an evolution of Marxism which was truly internationalist, even if it fell short of those goals. In doing so, it accepted V.I. Lenin's *Imperialism: The Highest Stage of Capitalism*, written in 1916, as a key part of its worldview. The Comintern attacked Wilsonianism and social democracy for falling short of their aims and instead tricking the non-imperialist world into thinking that things would change. From the Comintern's inception, the Bolsheviks and their supporters emphasized colonial affairs and emphasized their support of colonized peoples alongside those of the proletariat. By 1920, the Comintern had formed a set of theses to guide communists in colonial liberation efforts. Two years later, communists started to notice differences in the development of some colonies and the problems of a generalized program. Despite not referring to it as such, one notable change was a reflection on settler colonialism.

This appreciation for settler colonialism as a subcategory of leftist colonial analysis was not new to the Bolsheviks. Fredrik Engels noted in 1892 that settler colonies were "the colonies proper" (Veracini 2010). Historian Lorenzo Veracini has noted that settler colonialism was not the same as colonialism itself, highlighting that settler colonies "'tame' a variety of

S

wildernesses, end up establishing independent nations, effectively repress, co-opt, and extinguish Indigenous alterities, and productively manage ethnic diversity...whereas colonialism *reinforces* the distinction between colony and metropole, settler colonialism *erases* it" (Veracini 2011). Communists developed their own differentiation based on their appreciation of the world situation at the time and more generally saw a difference between what they termed to be "colonies" and "semicolonies." By the Sixth Congress of the Comintern, which took place in 1928, these were tiered further, based on a colony's economic development. Furthermore, these definitions fell into lines that would appear awkward to a casual observer. To take one example, the Comintern defined Australia and Canada as part of one tier; New Zealand and South Africa were part of another. Finally, local variations in the application of Comintern doctrine led to unique responses to settler colonialism and often without direct guidance from the centralized organization.

To explain the Comintern's approach to settler colonialism, this article will first outline how communists saw the colonial world and how at the First and Second Comintern Congresses they originally defined the battle for colonial liberation and the role communists were to play. It will next explore how from the Fourth to Sixth Congresses the Comintern started to differentiate between different colonies and how it defined those categories. Following an explanation of how the Comintern perceived settler colonialism, this article will outline how communists in a number of settler colonies dealt with their past and the ideological perspective the Comintern had developed.

Overview

The Comintern made clear from its inception in 1919 that the colonial world would not be ignored by its member parties. The Manifesto of the Comintern, written by Bolshevik leader Leon Trotsky, listed the peoples of the world, highlighting specifically the colonized peoples in Asia and Africa, and stated that communists would stand with them (Riddell 1987). The Second Comintern Congress,

taking place in July–August 1920, approved a set of tactics, the Theses on the National and Colonial Question. Lenin wrote the preliminary theses and led the discussion, emphasizing the importance of the issue to the Comintern. The theses themselves were only a start and perceived the colonial world as a singular mass, making little differentiation between different regions or forms of colonialism. Stressing the dimension of capitalist development as the key characteristic of the colonial world, Lenin referred to them as "backward" and highlighted colonialism's "feudal" nature. The Comintern saw colonized people as akin to the proletariat, victims of the imperialism all the same, and required communists to fight on their behalf. The biggest disagreements among communists on the issue stemmed from the general tactics the Comintern recommended. Lenin argued that communists should align with "bourgeois-democratic liberation movements" in the colonies. Lenin ultimately saw a value in working with any nationalist movement in order to help bring communism to the "East," the term frequently used in Bolshevik circles to describe Asia and Africa. Indian communist Manabendra Nath Roy, representing the Mexican Communist Party, took issue with this approach, and Lenin recommended that Roy write his own theses to complement his. Roy argued that communists should work with "national-revolutionary" forces which reflected the will of the people instead of just any national movement, highlighting that bourgeois forces would seek to maintain their control. Lenin accepted these alterations, and both Lenin and Roy's theses became the basis for Comintern tactics from then on regarding colonial liberation (Riddell 2013).

Differentiating Colonies

Roy remained an important figure in the Comintern for the remainder of the 1920s until he was excommunicated from the movement due to clashes during the Stalinization of the Comintern in the late 1920s. In 1922, he became the first figure to distinguish between different colonies and their capitalist development, requiring

communists to consider the implementation of unique tactics to each subgroup. Stressing that the colonial world was not a "politically, economically, or socially homogeneous entity," he elucidated three tiers. The first included countries where industrialization and capitalism had taken hold, developing a "native bourgeoisie" with a proletariat. The second category included colonies where capitalism had started to grow but remained "feudal" in character. Finally, the third group included nations where "patriarchal feudalism" remained in place and capitalism had not yet taken any firm hold. At the Fourth Congress, Roy stressed a need to appreciate these distinctions (Riddell 2012).

The Theses on the Eastern Question, the set of tactics that stemmed from the discussion which included Roy's arguments, equivocated on many of the distinctions, still tending to treat colonies and semicolonies as a mass in which communists should continue to apply generalized tactics. That said there was some differentiation, largely stemming from regional differences. A curious example came in the realm of the Pacific and the emphasis on immigration issues. Placed alongside the United States, Japan, and Great Britain as imperialist countries of the Pacific were Australia and Canada, the first time the Comintern placed two dominions alongside major imperial powers. Their inclusion came because of their harsh immigration laws which targeted cheap and racialized labor, predominantly from Asia (Riddell 2012; Gupta 2017).

The Fifth Congress regressed on colonial issues, with Ukrainian Bolshevik Dmitry Manuilsky, in his report on the topic, calling for generalized platforms instead of considering the uniqueness of different regions, colonies, or development (Gupta 2017). But the Sixth Congress in 1928 saw colonial affairs return to the forefront. The Congress came a year after the disastrous end to the communist alliance with the Chinese nationalist group, the Kuomintang (KMT). After years of recommending that the Chinese Communist Party work with the KMT, including having Communists join the party and offering Soviet military advice, in hopes that the communists could take the leadership of the

movement in the future, KMT leader Chiang Kai-shek violently broke with the communists (Pantsov 2017). Furthermore, more colonial communist parties joined the Comintern and attended the Sixth Congress. As a result, the Comintern reconsidered its approach and officially accepted the categorization of different colonies, which included its own acknowledgment of the distinct character of settler colonialism. In point 10 of the Theses on the Revolutionary Movement in the Colonies and Semi-Colonies, the Comintern declared "it is necessary to distinguish between those colonies of the capitalist countries which have served them as colonising regions for their surplus population, and which in this way have become a continuation of their capitalist system..." and exploitative colonies, which imperial powers used for raw materials or to augment their economies. The first category contained dominions, albeit with some caveats (Theses on the Revolutionary Movement in the Colonies and Semicolonies 1928). These were settler colonies, where whites implanted "the class structure of the metropolis." Indigenous peoples were "exterminated" (Theses on the Revolutionary Movement in the Colonies and Semicolonies 1928). These countries would be considered secondary, imperialist nations from the Comintern perspective and notably had graduated entirely from colonial status. Canada and Australia were two explicit examples, although they still were not wholly independent from British rule. Communists then noted there was a transitionary status afforded to some colonies, such as South Africa, New Zealand, and the French colony Algeria, where a substantial white settler population lived alongside the majority Indigenous population. They were "emigrant colonies" or a "colonial 'prolongation' of the bourgeoisie of the metropolis" (Theses on the Revolutionary Movement in the Colonies and Semicolonies 1928). Another important characteristic of the communist view of settler colonies included their role in imperialist conflict; these autonomous colonies could side with alternate imperial powers than that which originally colonized them for their own economic reasons. Notably, the consideration of settler colonialism, in this limited form,

S

did not include the United States in its discussion. Instead, the Comintern focused on the relationship with the African-American population, particularly in the south. These distinguishing characteristics reflected the reality of the 1920s and the international situation with which communists interacted. Meanwhile, the second category of colonies focused on exploitative colonies with varying levels of capitalist development and included China, India, and much of Africa (Theses on the Revolutionary Movement in the Colonies and Semicolonies 1928).

The United States and Latin America

The Comintern had already accepted the United States as an imperialist power, especially by 1928 and the Sixth Congress, but it did not mean ignorance of its settler colonial past. In the Latin American Secretariat, one of the regional organizational bodies of the Comintern, a discussion took place that clarified how some Comintern bureaucrats, such as Jules Humbert-Droz, saw the history of the Americas. Humbert-Droz suggested that the development of North America was unique compared to the Latin American case. Spanish and Portuguese settlers arriving in Central and South America focused on extracting anything useful from the region while subjugating Indigenous peoples. They developed exploitative colonies in the region. In the United States, however, British and French settlers arrived with the aim of transplanting their way of life to the new world, exterminating any Indigenous peoples. Directly applying the same worldview established at the Sixth Comintern Congress, Humbert-Droz reaffirmed it in the Latin American Secretariat, adding that the United States, and its early development, was the same as that of the British dominions (Drachewych 2018).

But whereas the Latin American Secretariat did make that difference theoretically, communists in the United States and in Latin America dealt with Indigenous peoples differently in practice. For the American communists, attention generally was placed on African-Americans as the colonized people that required the application of

self-determination. Over the course of the 1920s, black communists traveled to Moscow, and many became important figures in driving the Comintern to support self-determination for African-Americans, seeing blacks, especially in the Southern United States, as an oppressed nation, similar to how communists viewed the Irish in the British Isles. Communists defined the American Civil War and Reconstruction as the unfinished bourgeois revolution and emphasized the shared culture, identity, and socioeconomic position of African-Americans in the South as creating a national sentiment. In response, the Comintern promoted the Black Belt Thesis which called for an African-American republic in the Southern United States and which became a prominent feature of American communism in the 1930s (Cottle 2011; Adi 2013; Zumoff 2015; Drachewych 2018, 2019).

The settler colonial history of the United States was largely circumstantial, and irrelevant, now that the United States was one of the leading imperial powers. Indigenous people were not ignored, although they were not a prominent theme for the party in the interwar period and the Comintern gave no guidance from its end (Cottle 2011; Drachewych 2018). That said, communists in the Western United States did inform workers about the plight of Indigenous peoples and the exploitation and atrocities they had suffered throughout the history of the United States, publishing pieces on these subjects in the *Western Worker*. Some Indigenous Americans even wrote to the party organ, sharing their reasons for following communism. The party ran Raymond Francis Gray, a Metis leader, for a senate seat in Montana in 1934. In its most vociferous condemnation of the United States' settler colonial past, articles in the *Western Worker* emphasized illegal land claims and settler attempts to exterminate Indigenous peoples in the Southwestern United States (Balthaser 2014).

Communists stressed Indigenous self-determination in Latin America more frequently. Following the advent of the Third Period at the Sixth Comintern Congress in 1928, the Comintern began to support the Black Belt Thesis, referred to as the Native Republic Thesis in South Africa,

and encouraged its application in other regions, such as Latin America. Here, it was hoped that Indigenous peoples would gravitate to the movement and would see an opportunity to retain their own territorial rights. Peruvian Marxist Jose Mariategui had already started to criticize the evils of European imperialism and white settler colonialism in Latin America. Seeing the Spanish, Portuguese, British, and French all as imperial powers seeking to exploit and continue exploiting Latin American Indigenous peoples, even after independence, Mariategui argued that displacing established landholders with Indigenous peoples was necessary to achieve communism (Becker 2006, 2019; Mosquera 2018). Mariategui ended up being on one side of the discussion as the "Indian Question," and, with Comintern urging, the establishment of Indigenous republics to solve that problem became the topic du jour for Latin American communists. In Peru, Mariategui took a class-based approach to the problem and saw this push for "native republics" as unhelpful, compounding their economic impoverishment. Instead, he promoted the reform of the land tenure system in Latin America. To him, focusing on race was only taking a bourgeois approach to the problem and Mariategui was steadfast in his classical Marxism. Mariategui's position carried great weight as an ideological leader in the region. In Ecuador, however, communist leader Ricardo Paredes embraced Indigenous nationalism, agreeing with the platform because of his personal interaction with Indigenous peoples and his presence at the Sixth Congress in Moscow. At the Sixth Congress, Paredes even weighed in on the categorization of colonies, adding that a class of "dependent countries," autonomous countries that still are influenced by imperialism, was needed. Seeing Indigenous peoples of Latin America as naturally inclined to socialism, he saw them as a key pillar to any hopes for revolution. However, Ecuadorian communists did little to advance self-determination, instead using Indigenous nationalism to underpin their efforts in rural activism. Other communist parties, such as the Bolivian party, also followed the Comintern's lead in placing emphasis on the Indigenous national struggle (Becker 2006, 2019).

Canada and Australia

Canada and Australia undoubtedly, in Comintern rhetoric, had a settler colonial past. They also had higher stages of capitalist development, and after the Sixth Comintern Congress, the simplistic view, that white settlers arrived and had "exterminated" all Indigenous or Aboriginal peoples, was the accepted worldview. Prior to that though, both the Canadian and Australian communist parties saw their respective dominions as colonies under British control. Their efforts predominantly focused on independence from the greater imperial power, and if there was any discussion of Indigenous peoples, it was only in passing, if at all.

Following the Sixth Comintern Congress, Canada and Australia took very different approaches to dealing with the newfound imperialist categorization that the Comintern had placed on them. In this reimagining of the world, Canada and Australia were secondary, imperialist nations, still dealing with holdovers from their colonial past, but the bourgeoisie of each individual nation was engaged in its own exploitation of the proletariat and had its own colonial affairs. Canada, through the Royal Bank of Canada, had investments in Cuba and in Latin America, whereas Australia had mandate control over New Guinea (Drachewych 2018). The Communist Party of Australia (CPA) accepted the new status relatively quickly and included condemnations of Australian imperialism in its pamphlets, speeches, and platforms. Beginning in 1931, the CPA published "Communist Party's Fight for Aborigines" in its party organ, *Worker's Weekly*. This piece detailed the horrible living conditions and historical exploitation and atrocities suffered by Aboriginal peoples in Australia, emphasizing that they were "slaves of slaves" and pointing the finger at Australian and British imperialists. The party called for the extension of equal rights to Aboriginal peoples, which included the defense of their culture, political autonomy, and land rights in Central, Northern, and North West Australia. This piece was the first of what became a generalized campaign in CPA publications for the first half of the 1930s. A brief pause in 1935, potentially because of a growing desire by the Comintern to

limit attacks on potential allies in its fight against fascism, occurred, before the campaign was revived and took on a more vociferous tone heading into the Second World War (Boughton 2001; Drachewych 2018, 2019; Piccini and Smith 2018).

In 1939, CPA party leader Tom Wright published "A New Deal for Aborigines," inspired by American president Franklin Delano Roosevelt's New Deal, which sought to establish a full campaign for Aboriginal rights. Directly mentioning the settler colonial nature of Australia's development and its impact on Aboriginal peoples, he sought to call out the Australian Government's continued oppression of, while developing a legitimate plan for, Aboriginal peoples. Focusing on "full-blooded" Aboriginal peoples, he demanded inviolable reserves which respected tribal differences; full access to the land they were given, including the right to extract resources; the end to religious intervention; and a nationwide Aboriginal policy, ending the existing state-by-state approach in use at the time. He added that any mixed-raced Aboriginals should be given full rights as Australian citizens. Wright's New Deal was republished in 1944 and enjoyed significant support from the CPA, making it widely available and reproducing excerpts in its party organs (Wright 1944). It precipitated another publication campaign which took an informational tone, describing everything from the way of life of Aboriginal peoples in Australia to government appointments relevant to Aboriginal affairs. But the campaign still had some problematic holdovers, reflecting civilizing mission rhetoric, notably on the need to help Aboriginal peoples reach the same status as white Australians, or expressing a concern that financial assistance would be spent on vices such as alcohol. The party developed a similar platform for Melanesian workers working in New Guinea and Queensland (Boughton 2001; Drachewych 2018, 2019).

The CPA's platform was not dictated by the Comintern; instead it was created in-house by Australian communists who felt a need to expose the exploitation suffered by Aboriginal peoples. The Comintern did little to encourage the platform, making it all more remarkable that the CPA was able to develop a platform that considered Australia settler colonialism at its heart, regardless of the antiquated rhetoric it would revert to later. Urged to consider Australian imperialism and emphasize it in its rhetoric and propaganda, the party took the additional step of tying Australia's imperialist past and present to its continued poor treatment of Indigenous people, making it one of the only platforms communists developed during the interwar period directly speaking to settler colonialism in a given nation.

Its efforts are even more notable when compared to those of the Communist Party of Canada (CPC). Until 1928, the CPC called for independence from the British Empire, while also highlighting its proximity to the United States, arguing it was a potential battleground between the two largest imperial powers. When the Comintern changed Canada's status in its rhetoric to being a secondary, imperialist nation in 1928 and called on the party to reflect this shift in 1929, the CPC hesitated and disagreed leading to a particularly embarrassing clash with Comintern officials. After being reprimanded, the party leadership accepted the new designation and moved forward, accepting Canada's imperial nature. Parts of the leadership attempted to revert back to asserting Canada's colonial status during the Second World War, suggesting that some Canadian communists did not see Canada as an imperial power and instead had always been under the thrall of British imperialism (Angus 1981; Penner 1988; Drachewych 2018).

Canadian communism's struggles with its position as a colonial or an imperialist power also were compounded by the CPC's lack of any real platform regarding Indigenous peoples until 1937. At its Eighth Party Convention, the party attacked the poor living conditions of Indigenous peoples. It said the Canadian Government had ignored treaties with Indigenous peoples and the protection of Indigenous traditions. The CPC passed a resolution asking for government support and the extension of equal rights to Indigenous peoples. Another resolution, this time regarding Metis people, was passed in 1943 (Drachewych 2018, 2019). Otherwise, the party generally supported some nascent efforts by activists, such

as Malcolm Nurse and James Brady, in the Prairies during the 1930s (Dobbin 1981). The limited engagement with this settler colonial past could also be a result of the party taking to heart the worldview promoted by the Comintern in 1928, where Indigenous peoples were "exterminated" and their population considered to be largely decimated. This same evaluation was repeated in Communist Party of Canada training schools as late as 1938 (Drachewych 2018, 2019).

Where the CPA developed its own platform on Aboriginal peoples reflecting its settler colonial past, the CPC failed to do so until the 1950s, well after the Comintern's dissolution. Notably, both parties received little, if any, instruction from the Comintern, despite the Comintern initiating the reflection of each party on its nation's past. It showed that individual communist parties could develop their own local solutions but that communists did not necessarily fully grasp settler colonialism and its effects on society.

South Africa

The situation in South Africa was more critical to communists. Although the Comintern considered South Africa to be a transitionary colony, it prioritized communist tactics in the region, forcing upon the Communist Party of South Africa (CPSA) its most well-known policy, the Native Republic Thesis, in 1928. The Native Republic Thesis called on the party to emphasize the creation of an independent black African state in South Africa. It treated black Africans as colonized people and sought to extend self-determination to them. The thesis was intended to win over the black African population, radicalize them, and show them that communism was their best chance to end their oppression.

Beforehand, however, the CPSA had tended to downplay racial difference. Its leadership, led by Sidney Bunting, was classical Marxists and, as a result, took two approaches relevant to this overview. The first was that it called for racial unity but realized it needed to win over white workers to this position. The second, relevant to a consideration of communist responses to settler colonialism during the interwar period, was that the CPSA tended to downplay South Africa's colonial position. The CPSA did not call for independence, nor see it worth prioritizing, instead focusing on domestic and racial labor issues. It sought to stand for all workers. This approach led the party, and the Comintern, to issue problematic statements in the aftermath of the Rand Revolt of 1922. At Rand, white workers sought to defend their privileges, at the expense of nonwhite workers. The strikes turned violent, with slogans such as "White Workers of the World, Unite!" appearing on banners. In the aftermath of the event, the Comintern and the CPSA supported arrested workers, many of whom were white, showing a naiveté or a blindness to certain racial problems which required a more careful solution. When trade unionist James La Guma arrived in Moscow in 1927 and provided the Comintern with firsthand information that suggested a need for its intervention and a radical policy, the Comintern called for the new line (Davidson et al. 2003; Drew 2003, 2004; Riddell 2012; Adi 2013; Filatova and Davidson 2013; Drachewych 2018, 2019).

Under the Native Republic Thesis, the Comintern assumed South Africa's colonial position, forcing the CPSA to call for independence, under the guise of a black African independent state. The new line was not very successful for a number of reasons. New leaders of the party, backed by the Comintern, forced the old, popular leadership, including Bunting, out. A significant faction developed that criticized the new leadership for speaking plenty about what needed to be done, but actually doing little. Party membership dwindled as many left the embattled party. Despite these issues, the new line did encourage more black Africans to head to the Soviet Union to learn at some of the Comintern schools, and the CPSA saw more black Africans join its leadership (Drew 2004; Drachewych 2018).

When, beginning in 1935, the Comintern relented and agreed that the Native Republic Thesis needed to be amended, it expanded the platform to become a call for an end to exploitation of the racialized groups of South Africa. It maintained a focus on the black African

population, keeping the foundational principle of the Native Republic Thesis. The Comintern expanded the thesis to include CPSA agitation on behalf of the colored and Asian immigrant communities who also were prominent features of the demography of South Africa. Most notably, Afrikaners were also highlighted as another group that needed to be won over to the cause. This last point suggests that the Comintern focused more on undermining the white, British settler bourgeoisie, and therefore, its reimagining of the Native Republic Thesis, the call for South African independence, was not steeped in a strong condemnation of settler colonialism. Regardless of this flaw, and limitation of Comintern consideration of South Africa's settler colonial past, the Native Republic Thesis and the focus on the racialized, colonized, Indigenous community in South Africa made it international communism's most prominent and prioritized platform in attacking settler colonialism and racial oppression (Drachewych 2018). The thesis did prove influential; the African National Congress and South African Communist Party revived it in a reconsidered form in their tactics to fight apartheid in the 1960s (Filatova and Davidson 2013).

Other Settler Colonies

In other settler colonies, the Comintern tended to focus more on combatting imperialism generally than on making any grand statement on settler colonies. If interwar communists did use some messaging that is reminiscent of an understanding of settler colonialism, it was unintended. Nowhere was this more evident than with the Comintern's approach to Ireland and other Celtic nations. Ireland was an important battleground for communism's attack on imperialism, particularly British imperialism. Its close proximity to the metropole and the extensive diaspora of Irish peoples throughout the Anglophone world made it a coveted target for the spread of world revolution (O'Connor 2004, 2005).

Comintern attention focused on protecting the Irish nation and supporting its independence from British influence while also building a communist

movement. Since communism was still in its nascent stages in Ireland, the movement aligned with other powerful national forces, with Irish communist leader Roddy Connolly hoping to convert them to the movement. Therefore, supporting republicanism, which the Comintern suggested only out of necessity, and especially the Irish Republican Army (IRA) had practical benefits for the communists. The IRA also saw potential benefits, seeking weapons from the Soviet Union and traveling to Moscow to shore up potential deals multiple times in the early 1920s. The Irish communist movement in the 1920s was also unstable, especially with Jim Larkin taking over the leadership of it. Larkin had nationalist aspirations too, but his personality drew the ire of Irish communists and leaders in Moscow alike. The Comintern turned to the IRA to provide information about the Irish situation and potentially to spearhead the movement. By the late 1920s, and Larkin having left the moment, the Comintern did what it felt was best for its prospects in supporting the movement on the British Isles generally; it focused on empowering the Communist Party of Great Britain (CPGB) to take the lead on many of these issues and mentor whatever Irish communist movement there was. Perhaps in the clearest sense that the Comintern had no consistent understanding of settler colonialism, it mirrored the original imperial framework it hoped to undermine. Furthermore, the CPGB tended to take a paternalistic attitude toward their Irish comrades, what historian David Convery has labelled "culturally imperialist." Although there certainly were some interested communists who sought to make it an important issue, the Irish question tended to be downplayed in British circles (O'Connor 2004, 2005; Jones 2017; Convery 2018).

At the same time, Irish communist attempts to undermine the Catholic Church caused a rift with the IRA. Furthermore, changes in Comintern tactics during the Third Period, namely, an end to working with other nationalist groups in favor of communist-led ones, led to moments where Irish republicanism was no longer considered useful. Further problems occurred due to the mistakes of the CPI. When the Republican Congress, led by leftist IRA members, took place in 1934, the CPI

disagreed with calls for the congress becoming a party and its republican aims. As a result, a split occurred, preventing the concept from gaining further traction. Following the Popular Front in 1935, the CPI turned down the volume on its calls for revolution in Ireland and, with the lack of any strong partnerships with other groups, quietly disappeared from the political scene (O'Connor 2004, 2005; Jones 2017; Convery 2018).

Unlike Ireland, however, the Scottish and Welsh national movements were always directly under CPGB control, with national factions being directly tied to the party. Both had slow developing movements, owing to the British party opting for a general British workers' movement, ignoring national divisions. One leader, John MacLean, had attempted to start a Communist Party of Scotland, separate from the CPGB, in the early 1920s, but never was able to get it off the ground. It would not be until the mid to late 1930s that the CPGB started to explicitly call for self-determination for Welsh and Scottish peoples, spurred on by the Popular Front and Comintern demands to consider more strongly national elements of the domestic struggle (Kristjansdottir 2002; Jones 2017).

In Scotland's case, communists debated whether England economically exploited the Scots. In the early 1930s, spurred on by concern about nationalism as a force of fascism, a series of articles appeared in CPGB publications on the topic of Scottish nationalism. There seemed to be disagreement about whether Gaelic could be considered still in use and whether Scotland was really exploited by Britain; these arguments appear to have been made and supported by the CPGB largely to downplay Scottish nationalism and maintain a general unified British movement. When the Comintern instituted the Popular Front in 1935, it wanted parties to be more aware of the strength of national questions, ideally taking advantage of national sympathies to draw people to communism. In doing so, communists hoped nationalists would ignore fascism. Following this lead, the party encouraged the adoption of a progressive response to the Scottish national question and sought a response from the Scottish District Party, the Scottish section of the CPGB. After

some delay, the CPGB approved the Scottish communists' plan and adopted the call for self-determination for Scotland. As part of this platform, the CPGB would work with Scottish nationalists, but such a partnership failed to develop with the outbreak of the Second World War (Kristjansdottir 2002; Jones 2017).

Welsh communists seemed more willing to support Welsh self-determination, beginning in 1937. They defined the nationalist struggle around three issues. The first surrounded the Welsh Nationalist Party. Although working with them was rejected, the CPGB did seek to draw nationalists into communism, while also criticizing any fascist tendencies as part of the international campaign against fascism. The other two issues were intertwined. The first was Welsh self-government, initially autonomy, similar to that of British dominions. The second focused on the defense of Welsh culture and language. Again, concepts that defined settler colonialism, namely, the attack on Indigenous languages and culture, came to the fore, and this latter problem was a prominent theme in any propaganda on Welsh self-determination. That said, it took a different tact; the Anglicization of Wales was the work of British capitalists, thus blaming the Welsh bourgeoisie and English capitalists equally. This approach would ensure that English and Welsh workers would still be allies, instead of placing the Welsh proletariat against England itself. Also in 1938, the CPGB agreed to the Welsh program, including the call for self-government. Unfortunately, much like the Scottish Question, the Second World War derailed these efforts until after the war (Jones 2017).

In both cases, the focus was on undermining British imperialism and its exploitation of Celtic peoples. In each case, the Great Depression added to the material realities of each nation and its industry. Including Ireland further in the discussion, there was little discussion of settler colonialism in terms of its stamping out of the Celtic peoples or when discussing cultural or linguistic Anglicization. Emphasis was on British capitalism instead of solely England. Although the Scottish and Welsh movements did stress their individual national culture and, to a lesser extent,

language, all three Celtic national questions, through the Comintern, through the CPGB, and through the Irish communist movement, were placed in the paradigm of exploitative colonialism and a need to attack British imperialism writ large.

The assault on British imperialism defined the worldview and campaigns communist parties in other settler colonies employed. Take the example of Palestine. Led by their understanding of Leninist principles, the Communist Party of Palestine (PKP) ignored the differences between the Jewish and Palestinian peoples in its approach, instead gravitating to a unified struggle of all exploited peoples of both nations. Although the concept of Zionist settler colonialism is still under debate, it was a discussion communists tended to ignore. Instead, PKP members, Jewish and Palestinian, focused on fighting British imperialism and its efforts in the colony. At most, Zionists were seen as partners of the British, who were perpetuating the colonial project similar to other settler colonial bourgeoisie. Communists also tended to discount the strength of any Palestinian national movement (Locker-Biletzki 2018). These positions become all the more complicated when considering the Soviet Union's support for the Israeli state following the Second World War.

The Comintern denied New Zealand's position as a settler colony in 1928, declaring it to be a transitionary state, similar to South Africa, in its worldview. Evidence of the inconsistency of approach from the Comintern itself was its deep interest in the Indigenous peoples of New Zealand, the Maori, and Samoans. When the Communist Party of New Zealand (CPNZ) officially formed in 1928, the Comintern urged it to draw them into the party. Communism saw the Maori and Samoans as colonized people and therefore under the purview of the National and Colonial Question and self-determination was the correct course of action. The leadership of the Comintern encouraged the CPNZ to work with the Mau movement, the Samoan nationalist movement, and kept pressing the CPNZ to gain more Samoan and Maori membership well into the 1930s. The New Zealand party however dealt with these issues inconsistently, having a small publication campaign, similar to that of their Australian counterpart, highlighting the poor living conditions and oppression suffered by the Maori. It attempted to make the Maori question a general election issue in 1935, but the pamphlets printed were released too late, thereby not having the desired effect (Taylor 2002; Drachewych 2019).

The communist focus on fighting imperialism broadly was felt in the settler colonies of other imperial powers. In Algeria, one of the examples mentioned as a transitionary colony alongside South Africa and New Zealand at the Sixth Congress, Algerian communists were a subparty, directly under the supervision and control of the Communist Party of France (PCF). Early on, this arrangement led to Algerian communist publications being geared to a European readership and downplaying Algerian issues. Some sections argued that national liberation was premature for Algeria. Following Bolshevization of the PCF, the party started to focus more on Algerian affairs and to draw more Algerians into the party, although with great difficulty. This drive toward indigenization led to Algerians running in elections, including Hadj Ali Abdelkader in Paris, spurring further Algerians, both in France and in Northern Africa, to become involved. The Rif War offered an opportunity for more anti-colonial work in Northern Africa but also increased repression which curbed communist efforts. That said, the connection of the Algerian movement to the French movement had other effects. Whereas the CPGB in Ireland understood the strength of Irish independence, French communists were less convinced, and local communists in Algeria, in part because of the arrangement of the movement, called for proletariat unity and equality instead of national liberation. Some communists wanted to convince their peers of the value of pursuing national independence in Northern Africa. One author asked European communists to spurn their own views of racial superiority in hopes of seeing the merits of liberation, a nod to settler colonial attitudes that still existed in European parties. In 1926, communists voted to support national independence. The tensions of settler colonialism are evident in the French-Algerian partnership (Drew 2003).

Conclusion

The Communist International had some sense that there was a difference between white settler colonies and exploitative colonies, although it struggled to develop a consistent program that prevented a reversion to the generalized program, that of self-determination for any exploited peoples. It had no real Indigenous program, and many parties were left to their own devices in determining whether to do anything for those peoples' plight. For every Australian or Ecuadorian party, there were others who struggled to find a way to deal with their nation's settler colonial past. In some cases, communists deemed other oppressed nationalities more important, such as African-American peoples in the United States, devoting more attention to solving their problems and calling for their autonomy. During the interwar period, communists were still figuring out how to make sense of the world they sought to change. While they understood that white settler colonies developed capitalist structures quicker than their exploited colonial counterparts and caused great devastation to Indigenous peoples, oversimplifications and inconsistency from Moscow often became a problem. Furthermore there was a failure to deal with Russia's (or the Soviet Union's continued) settler colonialism in Siberia and in Central Asia giving the Comintern-led communist movements a hypocritical bent. Communists, however, developed what they felt were the best practices to overcome past and continued exploitations, whether through the development of native republics or full campaigns to give Indigenous peoples autonomy or cultural protections. Combined with its broader efforts to fight imperialism, despite the Soviet Union's faults, international communism's efforts marked a significant campaign to change a global reality.

Synonyms

Bedouins; Development; Dispossession; Israel; Land disputes; Law; Modernization; Progress; Settler colonialism

Definition

Of all the varieties of settler colonialism, the form it takes in the Negev desert and its role in the dispossession of the Negev Bedouin is arguably one of the most interesting. The reason for this is that it illustrates the complex intersection and convergence of different forms of rationality, ideology and discourse that operate in a settler colonial context. Through interrogating these forms, we can come to a better understanding of the relationship between economic development and colonialism not as competing but as complementary projects that follow a similar logic. In this process, law proved to be a useful instrument.

Introduction

In an interview with the *Jerusalem Post*, Israel's minister of agriculture Yair Shamir declared his intention to find a resolution to the decades-long land rights dispute between the State of Israel and the Negev Bedouin. Shamir explained that, in formulating his plan, he will consult the Bedouin and try to reach an understanding with them. However, Shamir went on to explain that, failing that, his plan would be carried out anyway 'by force' (Ben Solomon 2014). These comments are characteristic of the State's attitude towards the Negev Bedouins throughout the decades. Shamir

was tasked with solving the decades-long dispute in early January 2014, after the Prawer Plan was halted as a result of a successful campaign of protest by Bedouin activists, non-governmental organisations, human rights groups, and international condemnation of the plan. Shamir's goal is to make amendments to the Prawer Plan before implementing it. It is unclear how many Bedouins would be dispossessed, but projected numbers are from 30,000–70,000 (Amara 2013, p. 42). While for the time being the Prawer Plan is on ice, its revival or the introduction of a new similar plan for the relocation and dispossession of the Negev Bedouin is on the horizon, rendering their future uncertain. Even without the Prawer Plan, the threat of dispossession for the Bedouin due to development plans in the Negev region is ever present (Negev Coexistence Forum for Civil Equality 2014a).

Of course, the situation facing the Bedouin has a history and can thus only be understood in context. This means looking firstly at the historical context of the dispute between the Negev Bedouin and the State of Israel as well as the wider historical context of colonisation. Secondly, this also means looking at the contemporary context where other groups share a similar fate with the Bedouin in other development settings worldwide. In this essay I examine certain aspects of the history of the dispute between the Negev Bedouin and the State of Israel and I reach the conclusion that there exists a certain continuity and overlap between the projects of colonialism and economic development, and that the law and its interpretation are immensely important as a vehicle for the achievement of these projects. I conclude that the dispute between the Negev Bedouin and the State of Israel is in a sense unique because the genesis of the dispute happened at a unique historical juncture that provides a clear example of the intimate relationship between the projects of colonialism and development.

The Negev Region and the Bedouin

Today, Israel's Negev Bedouin population numbers approximately 210,000, with 90,000 living in unrecognised villages (Israel Ministry of Foreign Affairs 2013) and laying claim to 800,000 dunums of land of which the Prawer Plan would recognise only 200,000 dunums as belonging to the Bedouin (Nasasra 2014, p. 50). Those living in unrecognised villages are under the perpetual fear of having their homes and other structures demolished (Human Rights Watch 2008, pp. 54–88). A recent report by the Negev Coexistence Forum for Civil Equality (2014b, p. 19) documented 1,261 home demolitions in Bedouin villages in the Negev between January 2012 and July 2013, with demolitions continuing through 2014 (Negev Coexistence Forum for Civil Equality 2014c).

The importance of the Negev desert as a site for Zionist settlement and development was recognised early in the twentieth century, even though this did not lead to the establishment of a significant Jewish presence in the area (Oren 1989, p. 198). However, by the early 1940s, the Jewish National Fund, the most important vehicle for the acquisition and development of land in Mandate Palestine, placed the purchase and development of land in the Negev high on its agenda (Tuten 2005, p. 22). For the Zionist leadership, economic, ideological, political, and strategic considerations converged and made the settlement and development of the Negev a priority. This was particularly true in the case of David Ben-Gurion, who would later become Israel's first prime minister (Oren 1989, p. 197; Tuten 2005, p. 22). This is also evident in the fact that since the founding of the State of Israel, the settlement and development of the Negev has been used as a way for the state to assert its sovereignty, and in pursuing this goal the state has provided strong financial incentives to attract investment for development to the region (Evans 2006, p. 585).

The Ideology of Economic Development

The Bedouin have historically been seen as an impediment to economic development. This was the case even before the founding of the State of Israel, during the Mandate period. For example, in the Hope Simpson Report (Simpson 1930), after

the seemingly indeterminate nature of Bedouin land rights was considered, they were described as 'an anachronism wherever close development is possible and is desired'. Similarly, the assistant district commissioner of Nablus (quoted in Atran 1989, p. 734) described the presence of Bedouin in the area as a 'nuisance and only serves to impede the proper development of a very valuable area'. In general, Zionist discourse during the Mandate period seeking to advance the cause of Jewish settlement in Palestine was dominated by arguments about the benefits of modernisation, development and progress that would be achieved by Jewish immigration and colonisation, and about how Arabs would benefit as well from these progressive changes and be freed from the fetters of traditionalism (Bisharat 1994, pp. 484–486). Another significant and related part of Zionist discourse at the time bore a strong affinity to John Locke's labour theory of value: right to land ownership stems from the agricultural development of land, and while the Arabs neglected the land, according to this argument, Jews and Jewish settlers developed it (Kapitan 1997, pp. 20–21).

Shortly after the State of Israel was established, prime minister Ben Gurion called for the relocation of the Bedouin to the North of the Negev 'in order not to disturb development plans' (quoted in McGreal 2003). Not only were the Bedouins seen as an obstacle to development but, as former prime minister Yitzhak Shamir put it, at the same time they were to be made 'civilis[ed]' (ibid.). Similarly, Moshe Dayan in 1963, at the time serving as minister of agriculture, said '[w]e should transform the Bedouins into an urban proletariat. . . this phenomenon of the Bedouins will disappear' (quoted in Shamir 1996). As Sa'Di (1997, p. 38) showed, themes relating to progress, modernisation, and development feature heavily in discussions on the relationship between Zionists and Palestinians, which portray the former as the benevolent and enlightened 'agents of modernization' and the latter as the beneficiaries of the resulting progressive changes.

Nisbet (1994, p. 334) has demonstrated that 'there has been close relationship between belief in the general progress of mankind and belief in

the necessity of economic growth and development'. The origins of development theory, the so-called 'era of development', and the notion of development in general are commonly traced back to the end of the Second World War (Arndt 1987, p. 49; Esteva 2010, p. 1; Leys 1996, p. 5). However, Cowen and Shenton (2005, p. 26) dispute this standard genealogical account of the idea of development and instead trace it to the nineteenth-century notion of 'trusteeship' when 'those who saw themselves as developed believed that they could act to determine the process of development for others deemed less-developed'. The fact that the history of the notion of development – even though it underwent many changes and redefinitions and at any given time had slightly different meanings – goes back to the period of colonisation merits more attention when it comes to considering the relationship between colonialism and development today. For example, Edward Goldsmith (1997, p. 69) finds a 'disquieting continuity between the colonial era and the era of development'. Indeed, the old notion of bringing 'civilisation' to the colonised has now been supplanted by the notion of bringing 'economic development' to Third World countries (Collier 1998, p. 184).

Law, Progress and Development

Interestingly, Western law has had a history whose evolution parallels that of the notion of development and embodies similar concepts and assumptions. The association of 'Western-type' law with moral and civilisational progress has a long history. This understanding of modern Western law and its association with notions of progress, order, development, and modernisation has its origins in the Enlightenment and has in fact had an enabling role in colonialism and was projected as a force of 'civilization' opposed to 'savagery' (Fitzpatrick 2002, pp. 72–111).

Law of course, played a central part in the processes of modernisation and development, and this can be seen in the prehistory of Israel, during the Mandate period. In his study of law during that period, Shamir (2000, p. 08) notes that

'[t]he establishment of a functioning, "Western-type" state apparatus in general and the reconstruction of the legal system in particular, enhanced a general rationalization process that was perceived by most Zionists as a blessed mark of progress and order'.

When considering the dispossession of the Negev Bedouin by the State of Israel, the relationship between law, colonialism, and economic development is important for two reasons. Firstly, in can be argued that the State of Israel can be placed within the colonial context and be properly understood as a settler-colonial state. Indeed, many academics have made this case convincingly (Rodinson 1973; Veracini 2006, pp. 1–2; Yiftachel 2003). Secondly, as mentioned above, Zionist accounts of the relationship between the settlers and the state on the one hand and Palestinian Arabs on the other are guided by notions of modernisation. This also holds true particularly in relation to the Negev Bedouin. As Rosen-Zvi (2004, p. 50) explains, according to official accounts, which find support from planners and some academics, the state's handling of the situation of the Bedouin is 'based on notions of development, modernization'. Considering the above, the way in which the Negev Bedouin came to be dispossessed can only be properly understood if placed within the historical context of colonisation. To be more precise, the relationship between the State of Israel and the Negev Bedouin can be best understood as internal colonialism (Yiftachel 2012). The reason why the colonial paradigm is important when studying the dispossession of the Negev Bedouin is that a particular mode of land acquisition of land using law, and the legal justifications, are characteristic of colonialism. These can be clearly seen at work in the dispossession of the Bedouin in the process of developing the Negev region.

The Beginnings

Traditionally, the Negev Bedouin did not hold formal title for their lands as they saw themselves as autonomous and they were wary of outside authorities (Kram 2012, p. 141). Instead, their claims concerning ownership, use, and occupation of land emanated from traditional law and custom (Bailey 2009, pp. 263–271; Shamir 1996, p. 235). This was the case under both the administration of the Ottoman Empire and later during the Mandate government when the British created the Department of Land in order to formalise land rights (Hussein and McKay 2003, pp. 107–108). The Bedouins showed no interest in having their lands registered as their rights over the land they occupied had not been contested yet (113). The consequence of this was that the failure to register the land meant that it was classified as *mawat*, that is, state land (110). *Mawat* (Arabic for 'dead') was a land classification under the Ottoman Land Law 1858 referring to 'undeveloped or unused land not owned or possessed by anybody' (106). *Mawat* land could be 'revived' through cultivation with permission, in which case payment was not required, or without permission, in which case payment was required before title of the land could be passed to the applicant (109). Even though the *mawat* classification was abolished by the 1969 Real Estate Law along with other antiquated Ottoman land classifications and all *mawat* land passed to the state, the classification was later resurrected by the State of Israel and used in such a way so as to deny the claims the Bedouin had over their lands partly by arguing that since the vast majority of the Bedouin had failed to register those interests, the land therefore passed to the state (Fields 2010, pp. 73–74).

Following the creation of the State of Israel and after the War of Independence broke out, many Palestinian Arabs either escaped the hostilities or were expelled from their homes forcibly. The Negev Bedouin shared the same fate, with the vast majority of them either making their way to Jordan or to Gaza and the West Bank with only 11,000 of them remaining in the Negev (Abu-Saad 2008, p. 1725). Eventually, the majority of those remaining were expelled as well and were transferred to a small area called the 'Siyag', a previous sparsely populated area in the northeast Negev, designated by the Israeli government (1726). Now, under military government, they were prohibited and cut off from most of the Negev and not allowed to visit their lands to

tend to or cultivate them, nor to graze their herds (1725–1726).

Following the forced concentration of the Bedouin from most of the Negev to the 'Siyag', the state used the 1950 Transfer of Property Law and the 1950 Absentees' Property Law to nationalise their lands, and later the 1953 Land Acquisition (Validation of Acts and Compensation) Law placing them under the control of the Development Authority which was established in 1952 in order to manage them for state-initiated development projects (1729). While the military government came to an end in 1966, the Bedouin who attempted to leave the 'Siyag' and make their way back to their lands found that they were forbidden to do so, and those who tried found themselves to be trespassers on state land (Hussein and McKay 2003, pp. 128). In their absence, the lands that the Bedouin had previously occupied had begun to be developed by the state and with numerous development projects taking place the Bedouin were completely left out of the picture (ibid.). This process of exclusion continued immediately after with the development of a forced sedentarisation scheme in combination with the Planning and Building Law of 1965 which rendered construction that did not conform with the official planning zones (such as residential and agricultural zones) to be illegal. This meant that the Bedouin now lived in unrecognised villages (Hussein and McKay 2003, pp. 258–259). Moreover, the application of the law discriminated against Palestinians, who were ignored by the planning authorities (259). The aim of the sedentarisation scheme was to concentrate the Bedouin and settle them in an even smaller area of the 'Siyag', in townships (Abu-Saad 2008, pp. 1730–1734). It appears that the motive behind the forced sedentarisation schemes for the Bedouin was the acquisition of their lands by the state (Falah 1983, 1989, p. 88). The provision of services in these townships is substandard compared to that in Jewish towns (Abu-Saad 2008, pp. 1733–1734).

The state's policies led to a situation today where those Bedouins, approximately 70,000, refusing to settle by moving to these towns live in 'unrecognised villages' and are under the constant fear of having their homes demolished. The process of dispossession continues to this day and is as dire as it was, as they continue to be marginalised by and excluded from development projects (Humphries 2009, pp. 511–512).

As mentioned above, *mawat* (dead) land was a legal classification of the Ottoman Land Law 1858 referring to land that is not cultivated and is neither owned nor possessed by anyone. The 1858 law provided that the cultivation of *mawat* land constituted 'revival' of the land and, thus, the persons responsible were eligible to acquire formal title to the land (Hussein and McKay 2003, p. 109). However, as Forman and Kedar (2003, p. 502) argued, the *mawat* category during the Mandate was interpreted on the basis of 'Western concepts of land use and colonial exigencies'.

Not only that, the British Mandate government made a number of amendments to the Ottoman Land Law 1858. These included issuing the 1921 Mawat Land Ordinance which gave an unrealistic two-month deadline from the day of its passing for anyone claiming any claims over *mawat* land to formalise them with the administration by way of registration. Once those two months had elapsed, title to the land in question would immediately pass to the government. However, in practice, this did not interfere with the traditional rights and usage of land for those who failed to register their claims (Forman and Kedar 2003, pp. 514–515). But, as noted above, after the State of Israel was founded, in the process of dispossessing the Negev Bedouin, it seized upon this fact to argue that since they had failed to register their interests, the land had passed to the state.

Shamir (1996, p. 232), in his analysis of a series of decisions by the supreme court of Israel dealing with Bedouin land claims, argues that the process of dispossession cannot be explained solely by reference to conscious and calculated attempts to seize Bedouin lands by the instrumental use of the law. He emphasises the influence of British colonialism on the development of Israel's legal system, which was important in 'asserting Zionism's identity as a modern Western project that resists a backward-looking and chaotic East' (237). According to Shamir (232), in the Negev

'as in other colonial settings, a cultural vision complements the physical extraction of land and the domestication of the local labour force and... the law of the colonizers creates an infrastructure for the advancement of such goals'.

Modern law, argues Shamir (233), is characterised by an obsession with order and as such its operation is premised on the idea 'that the most accurate and reliable way for knowing reality (hence 'truth') depends on the ability to single out the clearest and most distinct elements that constitute a given phenomenon'. He shows how the Bedouin have been conceived as 'rootless nomads' by the supreme court, with the effect of their claims to their lands being denied on the grounds that they had not registered them during the Mandate, thus causing them to fall under the *mawat* classification. As they had allegedly not cultivated the *mawat* lands, they were not revived, therefore remaining the property of the state (238–242). However, contrary to these claims, the Negev Bedouin had been cultivating their lands (Marx 1967, pp. 18–23, 81–88, 91–100; Meir 2009, pp. 826–827). However, Israeli courts interpreted the notion of 'cultivation' of *mawat* land so narrowly as to cause all the horticultural or agricultural activities engaged in by the Bedouin to fall short (Amara and Miller 2012, p. 86; Shamir 1996, p. 241).

Unlike Shamir, Kedar (2001, p. 964) finds more room for legal instrumentalism in the process of dispossession; as he explains, 'as in many other settler societies, the quest for land served as a major motivating force that influenced the law's development'. Indeed, it is hard not to notice the immense similarities in how the classification of *mawat* land was used in dispossessing the Bedouin with conscious colonial justifications based on John Locke's labour theory of value for dispossessing native populations from their lands, most notably in the Americas in relation to the Native Americans (Arneil 1996a, b, pp. 132–167; Fitzpatrick 2002, p. 82). Bisharat (1994, p. 483) has noted how in the case of the Bedouin and their lands, the colonial justification provided by Locke could actually be applied (as it could not apply in the case of the rest of the Arab population), but he does not go on to consider how the *mawat* land classification and the

fact that *mawat* land could only be vivified through cultivation were used to dispossess them and the similarities of the process with the Lockean labour theory of value.

Bedouin and Dispossession in International Perspective

The legal arguments that the State of Israel and its institutions utilised in order to dispossess the Negev Bedouin bear a striking similarity to the doctrine of *terra nullius* (Champagne 2012, p. 278). The doctrine of *terra nullius*, a staple justification in the dispossession of indigenous peoples by colonial powers, was successfully challenged and rejected before the International Court of Justice in 1975 and more recently before the High Court of Australia in 1992 in relation to aboriginal land rights (Sheehan 2012). While significant progress has been made in relation to the land rights of indigenous peoples as a result of such legal developments, Sheehan (231) notes that 'the State of Israel has been unwilling to reach an accommodation similar to that demonstrated by other comparable jurisdictions, such as Australia'.

Changing focus from the colonial paradigm to the paradigm of development-induced dispossession, the experience of the Negev Bedouin is not unique and definitely not the most severe. Development-induced displacement is a worldwide phenomenon with severe consequences. For example, in the span of four decades, 2,550,000 people were internally displaced in India due to mining projects (Downing 2002, p. 3). Another example, according to the World Commission on Dams (2000, p. 104) is the development of dams in India and China which may have dispossessed a combined 26,000,000–58,000,000 people. It is estimated that development-induced displacement accounts for the dispossession of 15,000,000 people per year (Cernea 2006, p. 26).

However, in a sense it can be argued that the situation of the Negev Bedouin remains unique. The on-going land disputes between them and the State of Israel came into being at a historical juncture where in the process of their

dispossession, the colonial paradigm and the development-induced internal displacement paradigm overlapped. In other words, there can be observed an immediate continuity in the method of their dispossession, which is identical and illustrates perfectly the continuity between the projects of colonialism and development.

Conclusion

Considering the above analysis, it is not hard to notice the continuity and overlap between colonialism and development, especially in the case of the Negev Bedouin where regional development is taking place in a colonial context. Both colonialism and development advance similar claims as to the alleged benefits of their respective projects, and both justify and rationalise their actions by recourse to notions of progress, modernisation, and order. Additionally, both use the law in order to implement their goals. The law may appear neutral, but its interpretation is not neutral. As was shown above, legal categories and even everyday words like 'cultivation' are interpreted narrowly by the state and the courts so as to achieve policy goals relating to regional development. The history of dispossession of the Negev Bedouin serves as an example and a warning to approach claims of benevolent and beneficial development targeting an unwilling and reluctant group with a degree of scepticism, particularly when that group is marginalised and the balance of power is against it.

Settler Imperialism

▶ Settler Colonialism

Settler Imperialism and Indigenous Peoples in Australia

Eva Bischoff
International History, University of Trier,
Trier, Germany

Definition

Settler colonies operate within the larger framework of colonial projects, at times intersecting or overlapping with, at times subverting, other forms of colonisation or empire building. In contrast to other colonisers, settlers superimpose a new social, economic, and ecological order, aiming at the permanent transformation of their new home.

'Settlers come to stay' (Wolfe 2006, p. 388). These four words characterise the central characteristic of a particular colonial formation: the settler colony. It operates within the larger framework of colonial projects, at times intersecting or overlapping with, at times subverting, other forms of colonisation or empire building. In contrast to other colonisers, however, settlers superimpose a new social, economic, and ecological order, aiming at the permanent transformation of their new home. Indigenous populations are therefore to vanish either by assimilation, dislocation, or physical annihilation. As such, settler colonialism is an inherently genocidal, open-ended process to establish and maintain settler supremacy.

Critical approaches to analyse the particularities of settler colonisation have varied over time. Recent understandings of the phenomenon developed in the context of the twentieth-century anti-colonial movement, and strive for self-determination of Indigenous peoples. They have demonstrated that settler colonialism is as a

larger, global phenomenon of imperialist expansion which manifests in multiple forms in different colonial situations: Algeria, Argentina, Manchuria, German South-West Africa, and Palestine are considered prominent examples (Veracini 2010). The interest in the topic has intensified over the last few years and crystallised into an academic journal, *Settler Colonial Studies*, first published in 2011.

Due to the extent and impact of nineteenth-century British overseas settlement, the analysis of past and present settlerism in the 'Anglo-world' (Belich 2009, p. 6), i.e. Canada, US, South Africa, Australia, Aotearoa/New Zealand) plays a prominent role in current debates. Recent scholarship is led by a strong interest in the transnational aspects of the history of British settler colonies, investigating how colonial knowledge gained at different sites was exchanged, and the cultural, juridical, and political characteristics they shared. In doing so, many scholars focus particularly on the process of land acquisition, dispossession, and removal of Indigenous populations. Their findings stress the shared legacy of the common law and the vital role notions of individual proprietorship and improvement played in legitimising the appropriation of Indigenous land. They highlight the dynamic relationship between settlers, colonial administrations, and capital interests in the metropoles, such as Chicago or London, and emphasise the influence of common concepts of 'improvement', collective imaginary geographies of 'empty lands', and racist discourses of Indigenous peoples and cultures on settler policies and actions. Environmental and economic histories have made significant contributions to this debate. As Norbert Finzsch has demonstrated, it is vital to analyse the interconnectedness between economic, social, cultural, and ecological dimensions of Australian settlerism. Employing socioecological system theory, he argues that settler expansion is 'achieved in the context of a democratic and egalitarian society of white, predominantly Protestant Anglo-Saxon settlers organized in farms and family households', and is directed against an Indigenous Other (Finzsch 2010, p. 253). Economically, it 'rests on a link between agrarian

home production on the frontier and rentier capitalism in the cities' and has thus 'no periphery and no core, since the capital-owning elites in the cities and the social actors on the frontier form one complex interactive community' (253–254). Finzsch chose the term 'settler imperialism' to designate this particular form of settler colonisation. Settlers play a vital role in this model: their small-scale, local, mundane actions such as squatting, clearing, fencing or tilling the land generated a rhizomatic series of events which transformed the landscape, driving Indigenous people into uninhabitable areas, destroying the material basis of their livelihood and culture (254).

The Australian Case

In 1788, when the 1,483 men, women, and children of the first British convict transport landed at Sydney Cove, the Australian continent was inhabited by approximately 750,000 people, who were organised in a complex network of nations, clans, and families. Their ancestors had migrated to Australia 45,000 years earlier and had cultivated and cared for the landscape ever since. Aboriginal societies had developed a multi-layered system of land ownership and usage based on the principle that different groups held custodianship for particular sacred sites, and with an intricate set of rules managing the access to resources by hunting, foraging, or travelling. Each group developed highly specialised technologies to secure food supplies in adaption to their specific environment. They were interconnected by long distance trade routes along which people, goods, and information travelled across the continent. This diversity is reflected by today's terminology, which explicitly addresses the variety of Indigenous communities living on Australian territory at the beginning of the twenty-first century as Australian Aborigines, Torres Strait Islanders, Papua New Guineans, and Timorese. Each nation, in fact each community, was affected individually by the European settlement. Yet, they all share experiences of violence, dispossession, resistance, and survival. In the following, I will focus on three select aspects of these shared experiences: land rights, violence, and assimilation. Each represents a particular moment in the double sense of the word: a historical moment in terms of a historical key situation or bifurcation and a *momentum*, the driving force of the unresolved conflict of colonial invasion.

Taking the Land: The Doctrine of *Terra nullius*

The captain of the First Fleet, Governor Arthur Phillip, had been issued very specific orders by the Crown concerning the management of the new British outpost. These included directions regarding British–Aboriginal relations: after landing, he had to protect the settlement from possible attacks. He was to establish 'an Intercourse with the Natives and to conciliate their affections'. If any of the Crown's subjects killed an Aborigine or unnecessarily interrupted 'the exercise of their several occupations', Phillips was to punish the perpetrator accordingly. His instructions were less specific regarding the question of Indigenous consent to the establishment of a British outpost and the occupancy of Aboriginal territory. Philips was informed that the Crown intended to provide the project with additional supplies and material which would enable Phillips 'to barter with the Natives either on the Territory of New South Wales, or the Islands adjacent in those Seas' (Commonwealth of Australia 2011a). Yet, the document did not mention Indigenous sovereignty, land occupancy, or tenure that preceded British claims.

This absence, regardless of whether it was by neglect or choice, opened the door for a divergence from established British colonial policy regarding Indigenous land rights that had evolved from the encounter with American Indians over the course of the previous 150 years. Starting with local trade and peace agreements, it had gradually become customary to negotiate with Indigenous inhabitants of a colonial territory for land cession, offering material compensation in return. The Royal Proclamation of 1763 enshrined this practice in British law, stipulating that only the Crown and her

S

representatives were entitled to sign such a contract. It also aimed at limiting settler encroachment on Indigenous territory: colonists were forbidden to settle beyond contractual established boundaries. Illegal squats were to be abandoned. Although British colonial administrations often lacked the resources or the political resolve to enforce this stipulation, the Proclamation acknowledged the existence of Indigenous claims and land rights. In the newly established colony of New South Wales (NSW), by contrast, settlers and officials acted on the assumption that no Aboriginal land title existed since the Australian landscape lacked the most significant marker of proprietorship: agricultural usage or 'improvement' of the land, as for instance stipulated in John Locke's famous *Two Treatises of Government* (1689). The territory was considered 'desert and uninhabited' or, in terms of Roman law, a *res nullius,* a land supposedly without a sovereign or a proprietor which was taken into possession by the British Crown by right of discovery, not conquered or acquired by cession (Blackstone 2008/1765–69). By the beginning of the twentieth century, it had become common in international law to refer to this notion as the doctrine of *terra nullius.*

Yet, from the early beginning of colonisation, settlers found ample evidence of Aboriginal land usage. But empirical observation did not suffice to question the doctrine of *terra nullius.* On the contrary, a series of juridical and political decisions bolstered the myth of the empty land. The most prominent among them was the reaction of Governor Richard Bourke when John Batman signed a treaty with a group of Wurundjeri elders on 6 June 1835 in which he acquired 600,000 acres around Port Phillip and along the Yarra River, today the location of the city of Melbourne. Bourke declared this treaty to be 'void and of no effect' in August 1835. The Governor reaffirmed the notion that all 'vacant Lands' were the Crown's property. Only governmental licence could establish a legitimate land title (Commonwealth of Australia 2011b). His decision was approved by the Colonial Office the following October, affirming the concept of *terra nullius.* It took until the end of the twentieth century to overturn it.

Many Aborigines and Torres Strait Islanders fought for the recognition of their traditional land titles since the 1940s. They employed strikes, demonstrations, and other forms of political protest to make their demands heard. One of the most effective tools of this struggle was the court procedure: in 1982, three activists (Eddie Mabo, David Passi, and James Rice) filed an action in the Australian High Court in response to the Queensland Amendment Act. They argued that their people, the Meriam, were the traditional owners and proprietors of the islands of Mer (Murray Island), Dauar and Waier, located in the Torres Strait and annexed by Queensland in 1879. These proceedings, Mabo v. Queensland (No 2) also known as Mabo, served as a test case to determine the land rights of Indigenous peoples throughout Australia. In a landmark decision, the court rejected the doctrine of *terra nullius* and recognised the Meriam people's land title on 3 June 1992. The juridical concept used to describe their proprietorship, 'native title', acknowledges the persistence of Aboriginal land rights after settlement. Conceptually, it draws upon earlier decisions in other British settler colonies concerning Aboriginal land rights, e.g. the US (1831) and Nigeria (1921), and was fleshed out in the Native Title Act, passed by the Australian Parliament in 1993 (amended in 1998, 2007, and 2009). The act regulates its recognition, protection, and 'co-existence with the national land management system', installing the National Native Title Tribunal to mediate conflicting interests and claims (National Native Title Tribunal 2013). Subsequent court decisions, such as the Wik case in 1996, established that in case of a conflict of rights, native title would be extinguished by privileges acquired by a pastoral lease.

Although a huge success in abolishing *terra nullius,* the concept and practice of native title were soon criticised, especially after the dismissal of the claims of the Yorta-Yorta nation in a series of trials between 1998 and 2002. During these proceedings, it became obvious that the burden of proof lay exclusively on the Aborigines' side. Continued land usage, according to traditional customs, the central criteria to establish native

title, was interpreted within a rigid framework that did not allow for cultural change. According to this view, strategies of survival and resilience, such as adaptation or acculturation, are seen as abandonment and discontinuity, cancelling out all legitimate land claims. The 'tide of history', to use the words of Justice Olney in his original ruling of 1998, was presumed to have washed away traditional laws and customs. As a result, the doctrine of *terra nullius* was replaced by the 'doctrine of extinguishment' (Anaya 2004, pp. 198–199).

Slow Violence and Low-Level Warfare

Initially, the British settlement was boxed in between the Blue Mountains and the ocean. But as soon as, with the help of Aboriginal guides, a passage across the topographical obstacle was found in 1813 and governmental efforts to contain settlement within the prescribed 'Limits of Location' were dropped, the colonists quickly spread across the continent. In contrast to the US, the most commonly known model of settler expansion in the Angloworld, Australian settlement did not proceed unidirectionally from South-East to North-West but inwards, starting from several beachheads at the rim of the continent such as Sydney, Port Phillip, and Adelaide.

Based on the legal fiction of *terra nullius,* the Crown acted as the sole proprietor and its representatives handed out land grants to reward services or to encourage the emigration of wealthy and respectable free settlers during the early years of colonisation. After 1831, land titles were sold and the revenue used to finance a very successful scheme of assisted immigration: in NSW alone, the number of free immigrants rose from 8,000 persons during the 1820s, to 30,000 and 80,000 in the 1830s and 1840s respectively (Macintyre 2006, p. 73). As the Australasian colonies were successively granted responsible government, starting with NSW in 1855, the control of land policies and responsibilities of revenue from land sales transferred to the colonial legislatures. Concomitantly, landed property, the sign of social status, of wealth, of freedom and respectability during early colonial times, became the key to

building a settler democracy as the franchise was linked to land ownership (as well as male gender and age).Thus, the financial interests of the ruling elite and the political interests of male settlers became intertwined with the dispossession of Aboriginal peoples. The strongest motivation, however, was the individual desire to gain wealth, be it as farmer, miner, or entrepreneur. The largest source of revenue throughout the long nineteenth century, the era of settlement expansion, was wool. In 1850, sheep pastoralists' sales exceeded £20 million per year, amounting to more than 90% of all the colonies' exports. In NSW alone, sheep numbering 4 million in 1840 and 13 million in 1850 grazed on former Aboriginal hunting grounds (Macintyre 2006, p. 57).

The impact on local ecosystems was severe: billabongs were depleted and habitats of marsupials ruined by introducing new herbivores and pasture, massive overgrazing, and erecting fences. The ecologically highly integrated Aboriginal foraging practices were similarly affected as access to water and food was denied. Being cut off from sacred sites corrupted the social cohesion of Aboriginal communities. Thus, environmental changes resulted in a form of 'slow violence' (Nixon 2011, p. 2), which destroyed spiritual and cultural bonds, displaced communities, and killed Aboriginal people. In a similar manner, the destructive power of contagious diseases unfolded. The most important among them was smallpox. It travelled along trade routes, familial and social bonds beyond the limits of European settlement. Settlers often mistook the symptoms for an endogenic Aboriginal illness which rendered the disease and its effects invisible. We know from similar colonial scenarios that the average mortality rate of Indigenous populations lay between one-half and two-thirds, with incidents of whole communities being wiped out. Smallpox also had devastating longterm effects for the survivors: causing blindness, sterilising women, and starving those who were unable to hunt, fish, or gather sustenance.

From the beginning, Australian Aboriginal nations fought against colonisation. As Henry Reynolds demonstrated, motivation, methods, and forms of indigenous opposition against

S

the settler invasion were multiple and varied over time. One of its characteristics, however, stands out: in contrast to other Indigenous peoples, Australian Aborigines did not organise in larger political confederacies or alliances. Corresponding to their decentralised way of social organisation, they operated in small, independent groups on a local level. Aboriginal warriors adapted their tactics to the new circumstances, targeting cattle, farms, and infrastructure by relying on their tracking skills and the element of surprise. Instead of incorporating new technologies, such as the use of firearms, Aborigines developed a new form of economic warfare. They abandoned the cycle of foraging and fighting for a combination of raiding and securing resources: the 'Australian frontier warfare' (Connor 2003, p. 21).

During the early phases of settlement, Aboriginal attacks often posed a serious threat to the lives and economic success of the colonies. By the end of the 1820s, for instance, the attacks of the Tasmanian Aboriginal nations had engendered large-scale fear among the white population and provoked thoughts of giving up the colony entirely. James Ross, editor of the *Hobart Town Courier,* declared: '[i]f the outrages of the Blacks be not put down [...] we must abandon the island, we must look for safety only to our ships that will carry us to another shore' (Ross 1830, p. 3). In response to the Aboriginal resistance, Lieutenant-Governor George Arthur declared martial law in 1826 and organised one of the largest counter-insurgency operations in Australian history: the so-called Black Line. From 7 October to 30 November 1830, about 2,200 men (among them approximately 550 soldiers, 440 free men, 800 assigned convicts) joined up to form a line or rather several lines to drive the Tasmanian Aborigines out of their hiding places to the South end of the Island to be shipped to an offshore reservation. The outcome of the £30,000 operation was unexpected: only two Aboriginal Australians were captured, two more reported killed. The overwhelming majority slipped through during the cover of night and/or hid in more inaccessible areas of the island. But it succeeded in forcing the Big River and the Oyster Bay nations to surrender in 1831 (Clements 2013, pp. 21, 27–28).

As a form of governmentally organised violence, the Line was, however, the exception. Decentralised, local, low level acts of violence were much more common as the rhizomatic expansion proceeded: settlers shot Aboriginals they considered to be 'trespassing' on their land, poisoned wells to murder clans living nearby, and organised counter-raids to kill Aborigines, exerting vengeance and striking terror into the hearts of those whom they believed to be their subhuman enemies (see e.g. the cases documented by Ryan 2008). Among the best-known cases is the massacre at Myall Creek in 1838. Here, 12 stockmen, in pursuit of Aboriginal warriors who had carried out a successful attack on the whites' cattle, encountered a group of Wirrayaraay, mainly women and children, who had sought refuge with local hut keepers and shepherds. Under pretence, the stockmen led the Aborigines away and murdered them. Myall Creek is unusually well documented as seven of the massacre's perpetrators were not only convicted of murder but also executed; a singularity in Australian history.

Settler violence escalated in the second half of the nineteenth century once the army withdrew from punitive expeditions after 1838. Factors responsible were: the rise in immigrants increasing demographic and economic pressure on the land; land-consuming exploitation initiated by the discovery of valuable minerals such as gold or copper; self-governance giving settler interests more and more influence on politics. Additionally, new strategies and methods were applied to counter Aboriginal tactics and skills: rifles instead of muskets, and a fast, mounted pursuit assisted by Aboriginal trackers. In Queensland, Victoria, South Australia, and the Northern Territory, this took the form of establishing native police forces.

Survival and Assimilation

Violent resistance was not the only response of Aboriginal communities to British colonisation. Numerous instances of creative adaption, co-operation, and acculturation are documented in the historical records. Their exact form

depended on the economic and demographic circumstances Aboriginal people were confronted with. Aboriginal Australians were, for instance, part of urban life right from the beginning of settlement. Starting in the 1830s and 1840s, Aboriginal men and women worked as farm hands, shepherds, and shearers on pastoral farms. Often, they would accept only seasonal labour, 'going in' to obtain money or valued commodities, and leaving as soon as their interests had been fulfilled. The most lasting impact of Aboriginal adaptation, however, can be found in the Bass Strait area where Indigenous women from Tasmania as well as Southern Mainland and a group of sealers established a 'creole society' during the first three decades of the nineteenth century (Ryan 2012, p. 58). As 13% of the men were of a non-European background, this community was not only bi- but multicultural in its origins. Initially abducted, or acquired from Aboriginal clansmen in exchange for the highly valued hunting dogs, the so-called tyereelore women were often sexually and economically exploited. Yet, they also gained considerable influence as the sealers relied on their hunting skills to catch seals and muttonbirds. They kept their cultural heritage alive and created new traditions by inventing their own corroboree songs and dances. Due to their cultural and economic influence, they became the guardians of a new and predominantly matriarchal society.

These forms of resilience were, however, overshadowed by the colonisers' relentless efforts to eliminate Aboriginal traditions and culture by forced assimilation. The means applied varied over time, but most often included governmental schemes to restrain their movement, to settle and compel them to subsistence farming. As in many other colonial contexts, missionaries played a crucial yet ambiguous role in these programmes, as did Christianisation. The most devastating effect on Aboriginal communities, though, was the continued practice of child removal. It began during the colonial era when children, who had been orphaned by European diseases or violent conflicts, were taken into settlers' homes. Some of them were kept in wealthy households as curiosities or, in the spirit of humanitarianism and enlightenment, as living experiments to explore

the transformative power of education. Other motivations were of a more prosaic nature: Aboriginal children were abducted and exploited as unpaid labour. Girls were often not only trained as household servants but also forced into concubinage. Government agencies employed removal on a large scale from the turn of the twentieth century to sever the children's familial and cultural ties in order to integrate them into white Australian mainstream society. These policies explicitly targeted the descendants of mixed relationships. Raised in white foster families, they were encouraged to intermarry with non-Aboriginals to 'breed out' Indigenous cultural and genetic characteristics. According to the report of the *Human Rights and Equal Opportunity Commission*, published in 1997, no fewer than 100,000 children were displaced in this manner between 1909 und 1969. The report also revealed that although the official programmes had been abandoned, Aboriginal children were still preferably transferred into the care of white families for foster care or adoption (Commonwealth of Australia 1997).

Forced assimilation can be considered as the biopolitical flipside of the 'logic of elimination' (Wolfe 2006, p. 387) that structured Aboriginal–settler relations. As the productive element of settler colonial governmentality, it complements dispossession and annihilation by paternalistic policies of protection, education, and amalgamation. On 13 February 2008, Kevin Rudd, as newly elected prime minister, apologised for 'the laws and policies of successive Parliaments and governments that have inflicted profound grief, suffering and loss on' Aboriginal Australians. His speech put particular emphasis on 'the removal of Aboriginal and Torres Strait Islander children from their families, their communities and their country' and 'the pain, suffering and hurt of these Stolen Generations, their descendants and for their families left behind' (quoted in Barta 2008, pp. 204–205). In his carefully phrased apology, Rudd focused on the human dimension of suffering, thereby, as critics point out, playing down the systematic, genocidal character of assimilation policies, including first and foremost child removal.

S

Ways of Conclusion

Despite this important gesture, Australian settler imperialism and its genocidal history remain unresolved. Under the conservative administration of prime minister John Howard (in office 1996–2007), governmental support of the reconciliation process waned. A move away from what was contemptuously called 'black armband history' was encouraged and central findings of the Commission criticised. Conservative journalists, most prominently Keith Windschuttle, stipulated that the decline of Aboriginal societies was not the result of settler violence. Again, the fate of Aboriginal Tasmanians was utilised as a case study, echoing nineteenth-century 'extinction discourse' (Brantlinger 2003, p. 1). The resulting debate, also known as 'History Wars', has inspired an even more critical inquiry into the history of settler imperialism in Australia and has broadened our understanding of the dimensions of settler–Aboriginal interaction. Yet, as Larrissa Behrendt has emphasised, 'the History Wars are not about Aboriginal history at all, but about a growing crisis in white identity in Australia' in the face of economic globalisation and increasing nonwhite immigration (Paisley 2003, p. 5).

Access to land and its resources has lain at the heart of the conflict between Aboriginal peoples and settlers right from the beginning of colonisation. It generated a particular kind of violence, systematic in its aim to dispossess and dislocate the traditional custodians of the land, driven by converging economic and political interests yet without a master plan, executed in unspectacular everyday practices but also erupting in bursts of localised guerrilla warfare and vigilantism. Assimilation politics disrupted families and shattered identities. The repercussions of these events are still felt today: according to the 2006 Census, about three-quarters of the approximate 464,000 persons identifying as Aboriginal Australians live in urban areas. As a group, they are highly overrepresented in prisons, unemployment, crime, drug and alcohol abuse statistics. Simultaneously, however, more Aboriginal Australians than ever before have seized the opportunities offered by access to higher education and to modern media to reclaim their land and to improve the situation of their communities.

Settler-Colonialism and the New Afrikan Liberation Struggle

Akinyele O. Umoja
Department of African-American Studies,
Georgia State University, Atlanta, GA, USA

Overview

Most elementary students in the United States are instructed that the United States is "one nation, under God with liberty and justice for all." This notion has been historically challenged by Black revolutionaries, particularly the New Afrikan Independence Movement (NAIM) The New Afrikan Independence Movement (NAIM) is an ideological trend in the Black freedom struggle that has sought independent statehood for African descendants in the United States. The distinguishing event for the modern manifestation of the NAIM is when 100 Black nationalists declared their independence from the United States in 1968 and identified the states of Mississippi, Alabama, Georgia, Louisiana, and South Carolina as their national territory. The New Afrikans demanded reparations, including their national territory, as reparations from the United States (Provisional Government of the Republic of New Africa 1969). The New Afrikan movement has asserted that the United States is not "one nation under God," but an empire whose foundation is based on annexation of the land and genocide of indigenous peoples and the captivity and exploitation of the labors of Afrikan (The author spells Afrika with a "k." This spelling has been consistently used by Black nationalists as a form of self-determination since the 1970s) people. This position argues the United States was founded as a white settler colony of European (particularly Anglo) settlers that occupied the territories of indigenous nations of North America, Alaska, Hawaii, the Virgin Islands, and Puerto Rico. Captive Afrikan people were forcibly transported to the western hemisphere and forced to work within the US empire in the system of racial slavery, which was fundamental to the development of the United

States and its capitalist economy. Revolutionary nationalists have defined the United States as an "imperialist state" since its very origin and foundation was the occupation of the land and the genocide of the indigenous population, as well as the enslavement and super-exploitation of captive Afrikan labor (Muhammad n.d.).

Colonial History

From the sixteenth through the nineteenth century, western European imperialists invaded the western hemisphere in search of gold, wealth, and new territories for settlement and exploitation. The Dutch, French, Spanish, Portuguese, and British spearheaded the invasion of the Americas and competed to establish their presence and dominance in the hemisphere. European imperialists viewed the vast land of North America as a territory with great potential for settler colonies. The European imperialists ignored and disrespected the relationship that indigenous people had with the land they lived on since the origins of humanity and claimed these territories for themselves. European monarchies and commercial interests were involved in the establishment of settler colonies in North America. The establishment of settler colonies meant the removal and genocide of indigenous populations.

The British imperialists and their Anglo offspring in the US empire ultimately outmaneuvered their European competitors for dominance in North America. The Dutch lost their claim to New Netherlands settler colony (which includes the contemporary states of New York, New Jersey, Delaware, and Connecticut) to England as a result of two wars between the two colonial powers. The Spanish established a settlement in what is now coastal South Carolina and Georgia in 1526, which was overthrown by captive Afrikans and indigenous people the same year. The Spanish did maintain a presence in Florida for nearly two centuries. With the exception of its settlement in Saint Augustine (founded in 1565), the Spanish primarily used Florida as a buffer between British colonial expansion in the southern territories of North America and Spanish colonies in the Caribbean

(e.g., Cuba, Santo Domingo). The Spanish ultimately surrendered claim of Florida first to the British in 1763 and later to the US empire in 1819. The French established a presence in the Louisiana territory and arrogantly made claim to nearly a third of the North American mainland. The Louisiana territory included the coastal region north of the Gulf of Mexico. France granted the city of New Orleans and surrounding parishes to Spain in 1762, but reclaimed these colonial possessions in 1800. The US empire purchased the Louisiana territory from France in 1803. This sale of the European claim to a third of North America was necessary due to financial losses suffered by France in defeat of its colonial war in San Dominque (Haiti). The white settlers' thirst for indigenous land, now claimed by the US imperialist state, accelerated the drive for "Manifest Destiny."

The Virginia and the South Carolina colonies served as the basis for racial slavery for the lands occupied by the Anglo settlers in North America. The British established the Jamestown settlement in Virginia in 1607. The Virgina colony was the first to introduce captive African labor into Anglo North America in 1619 with 20 Afrikans from West-Central Afrika. The initial group of captive Afrikans in the Virginia colony had the status of indentured servants. The indentured servants assumed lives as independent laborers, even landowners, after working off their sentences. In the decades to come, the Virginia colony would institute the policy of racial slavery assigning Afrikans the status of perpetual captivity. White indentured servants and other Anglo settlers aligned themselves with captive Afrikans during Bacon's Rebellion of 1676. Bacon's Rebellion was ostensibly an attempted insurrection of Anglo settlers against their rulers in order to break agreements with indigenous people to seize more Indian land. The rebellious Anglo settlers aligned themselves with white indentured servants and captive Afrikans in their insurgency against the British crown. This motivated Virginia's settler colonial ruling class to employ "divide and conquer" strategies between marginalized white settlers and captive Afrikans. White supremacist ideology was emphasized to create solidarity between all white settlers. The practice of white indentured servitude was

gradually ended and captive Afrikans became the primary labor force in the colony.

Unlike Virginia, the South Carolina settler colony did not transit into racial slavery but instituted the policy of racial slavery from its foundation. Anglo slaveholders from the British colony of Barbados led the establishment of the colony in the 1670s. The English slaveholders brought the slave code and other policies and practices of oppressing captive Afrikans of the Caribbean sugar colony. Establishing indigo and rice plantations utilizing captive African labor, the white settler colony of South Carolina had a Black majority by 1750. In 1739, the Stono Rebellion, led by enslaved Afrikans from West-Central Afrika, motivated the white settlers to reinforce the measures of its initial slave code. The South Carolina code would be modeled in subsequent slave societies in the southern colonies, particularly in the Georgia colony founded in 1733 and embracing racial slavery in 1751.

Settler Colonialism and the Founding of the White "American" Republic

North American white settler nationalists sought independence from British imperialism in the eighteenth century. The white settler bourgeoisie organized resistance to the British empire to assert their economic independence. Rebelling against the British crown, the white settler war of independence was a bourgeoise democratic revolution seeking a republican form of government opposed to monarchy. While a person of Afrikan descent and fugitive from captivity, Crispus Attucks, was the first to die in the American revolt against the British empire, the "American Revolution" was ostensibly pro-slavery, anti-Afrikan, and hostile to indigenous nations, who they considered "savages." For example, one of the charges the white settlers made of England's King George in their Declaration of Independence was:

> He has excited domestic insurrections amongst us, and has endeavoured to bring on the inhabitants of our frontiers, the merciless Indian Savages, whose known rule of warfare, is an undistinguished destruction of all ages, sexes and conditions (National Archives 2019).

The founders of the white settler "American Revolution" were divided on the question of slavery. In an essay titled "The Founding Fathers and Slavery," historian Anthony Iacarrino states a significant number of the most prominent "founding fathers" were slaveholders (2019). The British empire and their loyalists exploited the contradiction of the exclusion of Afrikan and indigenous people from the white settler rebellion. To undermine the American white settler economy, the British would offer emancipation to enslaved Afrikans who escaped to British-controlled territory in the conflict. The British also offered arms to captive Afrikans and formed alliances with indigenous nations and with outlying New Afrikan resistance communities (so-called maroons or kilombos). The crisis created by the conflict also provided captive Afrikans, particularly in South Carolina and Georgia, to escape to the woods and swamps in the frontier. Captive Afrikans seeking refuge formed alliances with indigenous nations in Florida to form the Seminole confederation. After the British incorporated Afrikans in their military, the American settler nationalists in some cases conscripted Afrikans into the "patriot" military. Slaveholders even required captive Afrikans to replace them on the battlefield.

The new Euro-American settler republic would extend full democratic rights to the white bourgeoisie and privileged property owners fearing common laborers and small farmers among the settler population. White women, indigenous people, and Afrikans, enslaved and "free," found themselves in a subordinate position. The subject status of people of Afrikan descent was codified in the Constitution of the US imperialist state, which was a pro-slavery document. The US Constitution counted captive Afrikans as "three-fifths (3/5) of person" for the sake of counting the population for representation in the national legislature and determining what each state owed for taxation to the federal government. The Constitution also declared Afrikan runaways as property that had to be returned to slaveholders (a "fugitive slave" provision), and continued the traffic in Afrikan humanity (the so-called slave trade) for 20 years from 1787 to 1807. The "fugitive slave" provision was reinforced in Congressional legislation in 1793 and 1850. The

provision to maintain the international traffic in Afrikan labor was a compromise. Georgia and South Carolina advocated maintaining the traffic to replace the loss of captive Afrikan laborers who escaped during the white settler war of independence. Other states wanted to end the traffic fearing the increased importation of enslaved African within the United States may produce a majority New Afrikan population in North America similar to Caribbean nations. These states didn't want the demand for African labor to result in the rest of the United States going the way of South Carolina and its Black majority.

The innovation of the cotton gin in 1793 made the cultivation and production of the crop more profitable and would drive the US economy for the next 130 years. The potential of profits from cotton increase the demand for land for its cultivation. Removal of indigenous peoples from the southeastern territory of the US empire and the expansion of the system of racial slavery became primary objectives of the white settler interests and the imperialist states. Indian removal from Georgia, Alabama, Mississippi, and Louisiana and massive genocide of indigenous nations led to the period known as the "Trail of Tears." Particularly, as the legal international traffic in Afrikan labor was ending, to meet the demand for Black labor in the new, acquired occupied territory, the exporting of captive African laborers from the original settler colonies to cotton-producing states in the deep south. The domestic exportation of captive Afrikan workers meant the inhumane separation of captive Afrikan families, as spouses were separated and parents were severed from children. The new demand for captive Afrikans also motivated breeding enslaved Afrikans to export in the domestic traffic of Black labor.

Resistance and the Formation of a New Afrikan Nation

The New Afrikan Independence Movement argues that the descendants of captive Afrikans exist as a colonized people or nation within the US empire. They argue that the ethnic groups from West and West-Central Afrika who were forcibly transported to North America as captive labor merged culturally into one people, a New Afrikan people. The initial group of captive Afrikans were born in Afrika and established the foundation of the culture, including the language, food ways, and spirituality, for the New Afrikan nation. The majority of the Afrikan population, "free" and captive, were born in North America by the first decades of the nineteenth century. They no longer identified themselves by their Afrikan ethnic identities (e.g., Igbo, Mandinka, Mende, Bamana, Wolof, or Kongo) but generally saw themselves as one people (Gomez 1998). The heart of this New Afrikan nation was located in the southeastern section of the US empire. The New Afrikan people interacted with indigenous nations often receiving refuge and forging political and military relationships. Some New Afrikan and indigenous people married and produced and joined lineages.

The northern states of the newly formed white settler republic did not see an economy based on chattel slavery as the best direction for its economic development. The white settler states in the north gradually eliminated chattel slavery after gaining their independence from England. While eliminating chattel slavery, the emancipated Afrikans in the northern states still found themselves subject to discrimination and often disenfranchisement. Some emancipated Afrikans formed mutual aid societies, social organizations, churches, and other forms of solidarity to build community and protection in a hostile environment.

Indigenous Afrikan philosophy defined a people's land by where their ancestors were buried. New Afrikans began to identify with land in North America, particularly in the south where the majority lived and labored after generations of captive and "free" Afrikans were buried in the soil of North America. In his book *There is a River: The Black Struggle for Freedom in America*, historian Vincent Harding documented an example of this New Afrikan national consciousness in a song sung by Black insurgents on the South Carolina Sea Islands:

> Hail! all hail! Ye Afric clan! Hail! ye oppressed ye Afric band! (Repeat).
>
> Who toil and sweat in slavery bound, And when your health and strength are gone, Are left to hunger

and to mourn. Let independence be your aim, Ever mindful what 'tis worth;

Pledge your bodies for the prize, Pile them even to the skies!

Chorus: Firm, united let us be, Resolved on death or liberty! As a band of patriots joined, Peace and plenty we shall find.

Look to heaven with manly trust. And swear by Him that's always just. That no white foe, with impious hand. (Repeat).

Shall slave your wives and daughters more, or rob them of their virtue dear! Be armed with valor firm and true, their hopes are fixed on Heaven and you, That Truth and Justice will prevail.

Chorus.—Firm, united, etc.!

Arise! Arise! shake off your chains. Your cause is just, so Heaven ordains; To you shall freedom be proclaimed! (Repeat).

Raise your arms and bare your breasts. Almighty God will do the rest. Blow the clarion's warlike blast; Call every negro from his task; Wrest the scourge from Buckra's (New Afrikan term for white oppressors) hand. And drive each tyrant from the land! (Harding 1993)

This anthem demonstrates a clear insurgent, national consciousness and desire for self-determination and national liberation in the early nineteenth century. Their identification with their Afrikan ancestry (Afric clan), call for independence, and desire to be free from the tyranny of white oppressors are similar to the revolutionaries in Haiti nearly a decade earlier. The 1811 March to New Orleans led by Charles Deslondes in Louisiana reflected similar revolutionary nationalism and desire for freeing territory to establish an independent state.

Captive Afrikans organized insurrections to free themselves from enslavement. Historian Herbert Aptheker documented over 250 attempted insurrections and conspiracies by captive Afrikans in North America. The most notable are the New York conspiracy of 1712; the Stono (South Carolina) Rebellion of 1739; the Gabriel Prosser-led uprising of 1800 in Henrico County, Virginia; the March to New Orleans of 1811; the Denmark Vesey-led conspiracy of 1821 in Charleston, South Carolina; and the rebellion led by Nat Turner in Southampton, Virginia, in 1831.

Another form of collective resistance was the organization of kilombo communities and networks in the frontier. The Seminole Wars (1817–1818 and 1835–1842) represented one of the best examples of resistance to white settler colonialism and the system of racial slavery. White settler demand for land coupled with the existence of New Afrikan kilombo communities aligned with the Seminole nation represented a motivation to expand into Florida and led to the Seminole Wars. Afrikan runaways constituted a critical population in the Seminole confederation. Afrikan experience with tropical warfare was very applicable to the military conflict in Florida. The agricultural skills of Afrikan people and their knowledge of the language and culture of the white settlers were also assets to the resistance of the Seminole nation versus white settler invasion. While considered an "Indian war," US military command stated the engagement as a "Negro war." The conflict in Florida ended with the indigenous Seminoles and "Freedmen" provided free passage to Indian territory in Oklahoma. After discerning that they were betrayed, several of the Afrikan Seminoles escaped to Texas and Mexico to form new kilombo communities.

The Afrikans also established kilombos in other parts of the US empire. The largest population of runaways were in the Great Dismal Swamp of southeast Virginia and northeast North Carolina. The Swamp was originally occupied by indigenous people and marginalized white settler who formed communities in the middle and late seventeenth century. Afrikan fugitives established outlier communities in the eighteenth century and ultimately became the majority residents of the Swamp by 1750. Scholars agree that thousands of Afrikans sought refuge in the Swamp, while no definite number has been determined. The fugitive rebels of the Dismal Swamp maintained their autonomy from slaveholders in Virginia and North Carolina until the end of the US Civil War.

One People: Multiple Political Cultures

The works of historians Michael Gomez and Cedric Robinson established the heterogeneous character of Afrikan descendant political culture and consciousness in the United States. Gomez asserts that by 1830 "two distinct and divergent visions of the African presence in America" emerged. One vision was the desire to seek

inclusion within the white setter institutions and civil society of the United States as "full participants in the American political experiment" (Robinson 1997). The other was less hopeful of inclusion as equal partners within the US power structure, seeking more autonomous direction and held "close to the bosom of Africa as they could get" (Gomez 1998).

In his book *Black Movements in America*, Cedric Robinson also argued that "two alternate Black political cultures" emerged by the 1850s, one assimilationist and elitist, another separatist (or nationalistic) and communitarian. The Afrikan political experience in the United States has diverse ideological currents ranging from assimilation, pluralism, autonomy, radical transformation, and nationalism. The desire for "first-class" US citizenship became one political objective of Afrikan descendants. Others had greater desires for self-determination and autonomy. The desire for self-determination has a variety of expressions, particularly seeking a distinct identity from the United States and an autonomous or independent political existence. The impulses for inclusion and self-determination competed with each other and co-existed within Afrikan descendant communities within the United States.

Manifest Destiny, Occupied Territory, Leading to Civil War

The desire of white settlers to occupy more indigenous and Mexican land westward led to the concept of "Manifest Destiny," which was basically the belief that white settlers had a "God-given" right to seize and occupy all the territory in the North American continent. The conflict between two different economies within the US settler colony led to civil war. This concept further accelerated indigenous genocide and the white American occupation of northern Mexico. White settler slaveholders were motivated to occupy northern Mexico, ignoring the sovereignty of the Mexican people and seizing their territory for cotton production based on captive Afrikan labor in Texas, ultimately to expand in other lands in the territory.

The newly acquired lands of the US imperialist state increased the contradiction between the slave-holding economy and the growing manufacturing economy backed by finance capitalists based in the northern states of the empire. One issue was the northern finance capitalist advocacy for tariffs on imported commodities from French and British to capitalists to eliminate competition with US-based products from the manufacturing industry. Newly white settler-occupied territories seeking to enter the United States as states within the union also became a political issue. Would the new state enter the US legislature supporting the policies and economic interests of the pro-slave holding or pro-manufacturing and finance capital dominant development? With the political factor of the abolitionist movement entering the fray, this contradiction led to armed conflict, particularly in the struggle for the Kansas territory becoming a state within the United States.

The relationship of Afrikan descendants to the US imperialist state would be raised in the empire's national legislature and judiciary. The Fugitive Slave provision of the US Constitution was reinforced in 1850. This provision made the liberty of Afrikans who escaped from racial slavery in the "free" states in the north and western regions. Black communities organized vigilance committees to protect runaways from slave catchers.

A captive Afrikan sued for freedom against his slaveholder and took his case all the way to the US Supreme Court. Dred Scott lived over a year in the "free" state of Illinois and challenged the legal jurisdiction of his slaveholder, who wanted Scott to return to a slaveholding state. The Supreme Court ruled in Scott case that citizenship in the United States only applied to white people, not people of Afrikan descent. This ruling questioned the status of "free" people of Afrikan descent in nonslaveholding territories.

The 1850 Fugitive Slave bill and the Dred Scott decision increased numbers considered emigration to Africa or other territories. Others considered insurrection as a possibility. One Black minister and political activist quoted in Sterling Stuckey's *Slave Culture*, Henry Highland Garnet envisioned Black self-determination emerging in the southern region of the US empire. At a public meeting,

Garnet advocated for a "grand center of Negro nationality, from which will flow the streams of commerce, intellectual, and political power." Garnet identified the southern United States when asked the location of the center of Afrikan nationality. He argued, "Hayti is ours. . .Cuba will be ours soon, and we shall have every island in the Caribbean Sea." He concluded, "If we do not form a Negro nationality" in the South ". . .I am mistaken in the spirit of my people" (Garnet quoted in Stuckey 1987).

Civil War Between White Settlers

The US Civil War was initiated by the majority of the states who depended on captive Afrikans as the primary labor source. The pro-slavery Confederate States of America wanted to import goods from European manufacturing economies, particularly England and France, with tariffs by the federal government. They also wanted to expand the policy of slaveholding into new territories in the west and considered re-opening the trans-Atlantic traffic of African labor. The Confederate States included Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Texas, Arkansas, and Tennessee.

In the initial years of the settler colonial civil war neither side supported the emancipation of captive Afrikans. The Confederates clearly unambiguously supported the system of racial slavery. US President Lincoln's priority was the maintenance of the unity of white settler colonial republic. Lincoln stated:

My paramount object in this struggle is to save the Union, and is not either to save or destroy Slavery. If I could save the Union without freeing any slave, I would do it, and if I could save it by freeing all the slaves, I would do it, and if I could save it by freeing some and leaving others alone, I would also do that. What I do about Slavery and the colored race, I do because I believe it helps to save this Union, and what I forbear, I forbear because I do not believe it would help to save the Union (Vorenberg 1993).

Advocates of the emancipation of captive Afrikans saw the war as an opportunity to eliminate racial slavery. They lobbied President Lincoln to arm Blacks willing to join the Union Army

and to emancipate enslaved Afrikans. Lincoln was clear that his decision to emancipate captive Afrikans in the states of rebellion was a "fit and necessary war measure for ending the rebellion" (Lincoln 1863). Lincoln's Emancipation Proclamation was utilized to encourage escape of captive Afrikans from southern plantations to undermine the Confederate economy. Lincoln would state his emancipation policy and recruitment of Black people into the Union war effort were the key elements in defeating the Confederacy. In his classic work *Black Reconstruction*, W. E.B. DuBois labeled the self-activity of captive Afrikans to undermine the Confederate economy as the "General Strike" (DuBois 2007).

Reconstruction: Self-Determination or Subjugation

The end of the US Civil War was an opportunity for the United States to end its colonial relationship with captive Afrikans. The US government had to decide whether it could offer Afrikan descendants the right to self-determination or to further subjugate them. The founders of the Provisional Government of the Republic of New Afrika (PGRNA) argued in 1968 that the United States denied the Afrikan descendant population their right to self-determination by making Black people US citizens without their consent after emancipation. New York activist attorney Joan Franklin utilized international law to develop the PGRNA's argument that Black people in the United States, the descendants of captive Afrikans, were denied the right to self-determination. The PGRNA founders argued:

Black People have never had legal citizenship in the United States. To begin with, when our ancestors were set free from slavery they should been allowed to choose what they wanted to do. They should have been allowed to choose whether they wanted (1) to be United States citizens (2) to go back to Africa or somewhere else, or (3) to set up their own nation. This is international law (Provisional Government of the Republic of New Africa 1969).

They also argued that Afrikan descendants were also not treated as US citizens after emancipation. The 13th amendment to the US Constitution

formally ended chattel slavery (except for punishment for crime) in 1865. This act legally brought emancipation to captive Afrikans in the United States. The PGRNA and New Afrikan Independence Movement's position is that the United States had to make an offer to the emancipated African community to determine their political destinies and relationship with the United States.

The closest thing to an inquiry of what Afrikan desires were after their captivity ended was when Union General William Sherman convened a meeting of 20 Black clergymen in Savannah, Georgia, in January 1865. Sherman's troops conquered coastal South Carolina and Georgia. This region was predominately Afrikan descendants prior to the Civil War, and was even a greater New Afrikan ratio to whites, with many pro-Confederate whites leaving the region with Sherman's army victories on the coast. Sherman ordered one of his generals, Edwin Stanton, to convene a meeting with Black leaders to determine their desires. All but one of the Black leaders wanted to live in their own communities and engage in agriculture. They pledged their allegiance to support the US war effort in return for the promise of land acquisition. On January 16, 1865, Sherman issued his Field Order #15 after the gathering offering lands in 40-acre plots to any emancipated Afrikan family residing on or moving to coastal Georgia and South Carolina, including the Sea Islands. No white person was to enter this territory without the permission of the Union military and the New Afrikan population would be allowed to have local autonomy, governing themselves in this area.

Tunis Campbell was a New Jersey-born free person of Afrikan descendant. He was appointed to be an administrator of the federal Freedman's Bureau. Campbell was assigned by the federal government to manage the emancipated Afrikans in coastal Georgia Sea Islands, particularly Sapelo, Saint Catherine's, and Ossabaw. He organized an autonomous government on these islands with a legislative body and court system and a militia of 275 Afrikan men. The Union Army would force Campbell off of the Sea Islands to the mainland after being made aware of his efforts toward self-governance.

One option for the United States was to send emancipated Blacks outside of the United States.

Lincoln did not believe that Afrikans and white American settler descendants could live in peace. Supporters of Lincoln's position actually allocated funds in Congress to settle emancipated Afrikans in another territory outside the United States. Lincoln believed transportation of millions of Blacks to Liberia to be too expensive. He investigated possibilities of re-settling emancipated Afrikans to the Caribbean and Central America and posed this idea to Black leaders in 1862 (Vorenberg 1993). Some like Frederick Douglass opposed the idea of Black colonization outside the United States. Henry Highland Garnet supported the proposal.

Another option was to offer citizenship to emancipated Afrikans. The federal government was controlled by the Republican Party. The former Confederates were concentrated in the Democratic Party. To gain political control in the southern states, the Republicans aligned themselves with the political leaders of the newly emancipated Afrikan descendant communities. The Republican Party proposed the emancipation of the New Afrikan population through the 13th Amendment of the US Constitution, which eliminated involuntary servitude (except for punishment of crimes). Citizenship to Afrikan descendants through the 14th Amendment made any person born in the United States a citizen. The 14th Amendment legally reversed the Dred Scott decision. Furthermore, adult males of Afrikan descent were given the right to vote under the 15th Amendment. A century later, New Afrikan nationalists would argue that citizenship could only be offered to emancipated Afrikans, not declared by Congress. The U.S. federal legislature had no Black representation in 1868, when the 14th Amendment was ratified and other than Sherman's gathering in Savannah, Black people had not been formally consulted.

The citizenship, human rights, and relationship of Black people with the United States were tenuous and contested. Immediately after the war, the Republican policy toward the emancipated people of Afrikan descent was not uniform. Texan Andrew Johnson was sworn in as President after Lincoln's assassination in 1865. Johnson was conciliatory toward the former Confederates and allowed the institution of the "Black codes" or laws meant to

maintain white social and political control of Afrikan descendants in southern states. Republicans in Congress exercised their power to take over reconstruction from the President with the Reconstruction Act of 1867. This divided the old Confederacy into five military districts, empowered and armed Blacks and Republicans in the south to form militias to protect themselves and the Reconstruction state governments, and stipulated former Confederate states must ratify the 14th and 15th Amendments to regain status in the Union. A minority of Republicans wanted radical redistribution of land in the south to provide economic empowerment for emancipated Afrikans. The majority favored a more paternal policy that encouraged Black people were laborers in a servile position. The later policy was consistent with industrial capitalism, as the cultivation of cotton was still necessary for the textile industry and Afrikans were still needed to pick it.

Black leaders made an alliance with the Republican Party in local, state, and federal politics. Black participation in Reconstruction governments instituted public education and other reforms. Besides advocacy of their political agenda through the Democratic Party, the former Confederates also formed paramilitary groups utilizing violent terror to intimidate, brutalize, and kill Black people and their leadership and to maintain white supremacy. Terrorist violence was also essential to maintain Black people as a servile labor force. With racial slavery eliminated, southern capitalist instituted policies to create a system of peonage, utilizing Blacks convicted of petty and major criminal offenses as a labor force. The Republican Party needed Black votes and participation to build its presence in the South. Defending Black civil and human rights were temporarily consistent with its Reconstruction political agenda.

Unfortunately, the Republican alliance with Black people ended in the 1870s. The federal government ultimately betrayed Black people at the conclusion of Reconstruction. Historians agree the Hayes-Tilden compromise in the Presidential Election of 1876 marks the end of Reconstruction. None of the candidates for President in the election of 1876 possessed the majority of the Electoral College. A compromise was negotiated in the House of Representatives in 1877 to install the Republican candidate Rutherford Hayes as President with the Democratic Party could regain political power in the southern states. The compromise allowed former Confederate states to disenfranchise Black voters and the consolidation segregation or racial apartheid (aka Jim Crow) laws relegating Black people to an inferior status in civil society. The organization and presence of the Ku Klux Klan and other terrorist paramilitary groups and the use of mob rule to maintain social control became part of the social order. The end of Reconstruction meant the end of democracy and the legitimization of white settler colonial rule in the southern United States. While Blacks were "citizens" in US law, they were denied the rights and privileges of citizenship accorded to white Americans.

Nadir Period

The federal government ignored the 14th and 15th Amendment and other civil rights legislation after the Compromise of 1877. Southern state governments exercise white supremacy in matters of policy, and terrorism was utilized to enforce the policy. The decades following the end of Reconstruction were labeled by historians as the nadir of the Black experience in the United States. Historian Rayford Logan argued the post-Reconstruction era was the lowest point in the status of the Afrikan descendants in the United States. The policies and practice implemented to enforce white supremacy were similar to other settler-colonial regimes in apartheid South Africa, white minority rule in Rhodesia (Zimbabwe), and zionist Israel.

Southern local governments and states moved quickly to institute Jim Crow segregation laws. Racial segregation was established in areas of public spheres, including education, transportation, dining, and recreation. The US Supreme Court endorsed these segregationist practices in 1896 in the Plessey v. Ferguson case, arguing "separate but equal" policies in public facilities were legal under the US Constitution. Lynchings as a means of social control of Black people became a common practice in US political culture. For example, in the decade between 1890 and 1899, there were 1200

S

documented lynchings, an average of 120 a year. The campaign against lynchings would be the primary work of activists like Ida Barnett Wells.

Southern states had high percentages of Afrikan descendants due to their role in agricultural production in the labor system of racial slavery in the region. Black disenfranchisement was essential to the establishment of white supremacy in the South. From 1890 to 1910, southern legislatures developed new constitutions to disenfranchise Black voters in nine of the ten former Confederate states. Gerrymandering, poll taxes, literacy tests, white-only primaries, and denying the right to vote for criminal offenses were all implemented as means to suppress Black participation in southern elections.

Southern states and municipalities also maintained a servile Black labor force through peonage to replace racial slavery as a labor system. Black agricultural households agreed to work on white plantations in order to pay off debts owed for tools, seeds, land, and commodities necessary for survival. Black prisoners constructed roads, buildings, and other infrastructure development and engaged in agriculture through the convict-lease system.

Black Migration North and West

Ninety percent of the Afrikan descendant population in the United States lived in the southern states, with a concentration in the Black Belt South. The Black Belt South is a contiguous region of counties with a Black majority in the southern United States. It ranged from Maryland and Virginia to the east to Arkansas and eastern Texas to the west, and runs through the states of North Carolina, South Carolina, Georgia, northern Florida, Alabama, Mississippi, Tennessee, and Louisiana. The population of this region became predominately Black due to the dependence on Black labor during racial slavery with the states of Mississippi and South Carolina possessing Black majorities at the end of the Civil War.

White supremacist violence, the conditions of labor and peonage in the south, and demand for Black labor in the north and western states of the US empire drove an intense migration of people of Afrikan descent out of the south. The mechanization of agriculture and the impact of boll weevil infestation greatly affected the cotton production in the region, thus decreasing the demand for Black agricultural workers. Six million Afrikan descendants migrated from the Black Belt and other area of the rural south to urban centers in the US empire between 1916 and 1970. Historians call this movement of people the Great Migration.

Black Resistance During the Nadir Period

Black people continued to challenge white supremacy through the variety of elements of its diverse political culture. Some resisted through the prism of inclusion. Ida Barnett Wells was the spearhead of exposing the numbers and white supremacist motivations of lynching and other forms of racial violence. Wells' journalism had an impact internationally. Scholar–activist W.E.B. DuBois and political agitator Monroe Trotter brought together other activists to form the Niagara Movement in response to white supremacist violence, disenfranchisement, and denial of civil rights of Black people. A multiracial group formed the National Association for the Advancement of Colored People (NAACP) in 1909.

The pro-self-determination tradition had its own response to the white supremacist assault on Black humanity in the United States. Prominent Colored Methodist Episcopal clergyman Lucius Holsey called for the independent state for Black people after the 1899 lynching of Sam Hose in Georgia. African Methodist Episcopal Bishop Henry McNeal Turner advocated the United States pay reparations to Afrikan descendants through repatriation to the Afrikan continent.

Black Nationalists and Pan-Africanists of the early twentieth century aspired to have independent nationhood for African descendants in the United States. In 1914, Egyptian Pan-Africanist Duse Muhammad Ali envisioned the possibility of the organization of an "Afro-American army" to form an "Afro-American nation" in the Black Belt territory in the south (Ali 1914). Ali was the founder of a Pan-Africanist and anti-imperialist periodical published in London, England titled

the *African and Orient Review*. He joined radical nationalists from the Caribbean and the United States to form the Hamitic League of the World founded by southern-born and Nebraska-bred historian and organic intellectual George Wells Parker in 1917. Other co-founding members of the Hamitic League included St. Kitts born-journalist Cyril Briggs and armed resistance advocate and writer John Edward Bruce. The Hamitic League was a Pan-Afrikan nationalist organization promoting pride in Afrikan heritage. Parker stated the purpose of the organization was to:

> To inspire the Negro with new hopes; to make him openly proud of his race and of its great contributions to the religious development and civilization of mankind and to place in the hands of every race man and woman and child the facts which support the League's claim that the Negro Race is the greatest race the world has ever known (Wikipedia 2019).

Briggs would edit the Hamitic League's publication *The Crusader* and later organize a revolutionary nationalist secret society, the African Blood Brotherhood (ABB). Briggs stated in 1918 that the solution to white supremacy and oppression was, "nothing more or less than independent, separate existence" and a "Government of the (Negro) people, for the (Negro) people and by the (Negro) people" (Briggs 1918). Ali, Briggs, and Bruce joined with the most massive Afrikan descendant mass movement in history, the Universal Negro Improvement Association (UNIA) founded by Jamaican-born Marcus Garvey. Garvey initiated the UNIA in Jamaica in 1914 and it grew to millions of members internationally by the early 1920s. In the United States, it had members in major urban centers like New York, Chicago, New Orleans, and Los Angeles, as well as Black Belt communities in Mississippi, Georgia, and Louisiana. While much is made of Garvey's conciliatory relationship with white supremacists like the Ku Klux Klan, UNIA members in the south were concerned about organizing self-defense networks to combat white racists (Rolinson 2007). The US repressive apparatus was effectively utilized to dismantle the UNIA through infiltrating the organization's leadership and incarcerating and deporting Garvey.

The ABB and other Black radicals were inspired by the 1917 Bolshevik Revolution in Czarist Russia and V.I. Lenin's position on self-determination for oppressed nations. The position advocating self-determination for the "Negro people" for "self-determination in the Black Belt South" developed from the relationship of the ABB with the Communist International, headquartered in Moscow. Key ABB members, including Briggs and Black Belt thesis architect Harry Haywood, joined the Communist Party of the United States of America (CPUSA). Black membership in the CPUSA increased from 50 to 500 within 5 years of its advocacy of self-determination in the Black Belt position. CPUSA organizer also organized the Sharecroppers Union in the Black Belt counties of Alabama and advocated Black self-determination in its publication *The Negro Liberator*.

Civil Rights Movement Emerges

Similar to other colonized people in Africa and Asia, the Black freedom struggle gained momentum in the 1940s and 1950s as Black people challenging racial discrimination. The focus of the Black freedom struggle was to eliminate segregation and white supremacist violence. Labor organizer A. Philip Randolph negotiated desegregation of the US defense industry in order to his mobilization of an all-Black march to Washington D.C. during World War II. The Committee for Equal Justice for the Rights of Mrs. Recy Taylor was founded in 1944 in Alabama by Rosa Parks and Taylor to pressure state officials to investigate a prosecute six white males accused of sexually assaulting Taylor. The Committee did wage a vigilant national campaign that forced a grand jury for the accused white rapists, who were not indicted. The Regional Council for Negro Leadership (RCNL) organized a "Don't Buy Gas Where You Can't Use the Restroom" campaign in the Mississippi Delta in the 1950s. The RCNL and the NAACP sponsored an investigation of the murder of 13-year-old Emmett Till. Till was kidnapped, tortured, and murdered by two white men, Roy Bryant and J.W. Milam, for the "crime" of whistling a Bryant's wife in a grocery store. The 13-year-old corpse was found days later in Mississippi's Tallahatchie River. Till's mother,

Mamie Till-Mobley, decided to have an "open casket" funeral to show the world how her son's body was violated. Till's murder would motivate a generation of young people to enter the Black freedom struggle (Umoja 2013).

The Afrikan descendant community of Montgomery, Alabama took the Black freedom struggle to a new level by sustaining a boycott of segregated buses for 3 months. The boycott was sparked by the arrest of Mrs. Rosa Parks who refused to give up her seat to a white male on a segregated bus. The Reverend Martin Luther King Jr. emerged as a national leader and spokesperson for the Black freedom struggle due to the example of the boycott of a Black community standing united against white supremacy. King also became an advocate for nonviolent direct action. King would unite with leaders of other activist Black ministers and laypersons to form the Southern Christian Leadership Conference.

An important development occurred in Monroe, North Carolina in 1957 when the local NAACP led by Robert F. Williams organized the armed, paramilitary Black Guard to repel Ku Klux Klan from invading the local Black community. Williams would publicly advocate meeting "violence with violence" and along with his wife Mabel Williams and their neighbor, Ethel Azalea Johnson produced a newsletter *The Crusader*, which advocated armed resistance within the Black freedom struggle. Supporters of the Monroe movement and Williams public advocacy of armed self-defense circulated *The Crusader* and raised funds around the US empire. Due to trumped-up charges, Williams and his family would be forced into exile in Cuba. Robert and Mabel Williams continued to promote armed self-defense through *The Crusader* and radio broadcasts from Cuba (Williams 2005).

The strategy of nonviolent direct action was bolstered when Black students from historically Black colleges in Greensboro, North Carolina staged sit-in protests at segregated lunch counters. Sit-in protests initiated by Black college students proliferated throughout the south. Veteran activists Ella Baker invited Black college activists to a convening at Shaw University in Raleigh, North Carolina to organize the Student Nonviolent

Coordinating Committee (SNCC). SNCC and the Congress of Racial Equality (CORE) organized voter registration campaigns in Black Belt counties in Georgia, Alabama, Mississippi, and Louisiana.

SCLC organized a dynamic nonviolent direct-action campaign in Birmingham, Alabama in 1963. Birmingham was known as "Bombingham" due to the bombings of institutions and residences in the Black community by white supremacists. The international community was shocked at the inhumanity of white supremacists after a bombing of 16th Street Baptist Church in Birmingham killing four Black female children.

SNCC, CORE, and local NAACP chapters formed the Freedom Democratic Party (MFDP) in Mississippi to challenge the white-only primary practices of the Democratic Party in the state. The white-only primary had already been ruled unconstitutional by the US Supreme Court. The MFDP organized to challenge the credentials of the Mississippi delegation at the Democratic National Convention in 1964. The leaders of the Democratic Party were afraid to alienate white supremacist voters in the south by seating the Black-led MFDP. The MFDP refused to accept a compromise by the National Democratic Party to accept representation of only two of its members within the white supremacist Democratic Party. The betrayal of northern liberals at the Democratic National Convention demonstrated they were not reliable allies to the Black freedom struggle. The possibility of bringing about substantive change within the context of liberal frameworks for social change seemed unrealistic. For many a radical alternative became a rational choice.

Pro-Self-Determination Sentiments in the 1950s and Early 1960s

One critic of integrationist and Black liberal politics during the Civil Rights movement was the Nation of Islam (NOI). The NOI was gaining membership and influence in the northern urban centers in the 1950s and early 1960s. Under the leadership of rural Georgia-born Elijah Muhammad, the NOI taught that Blacks needed to separate from the

white "devils" and needed a land of their own. Muhammad encouraged NOI members to start Black enterprises and "do for self" rather than strive for integration. Called "Black Muslims," NOI also refrained from participation in desegregation protests. The NOI was aided in its popularly through Muhammad's charismatic spokesperson, Malcolm X Shabazz. Shabazz was adept speaking to working class and poor Blacks, as well as college students. The United States and the international community took note when Malcolm X recruited boxing's heavyweight World Champion Cassius Clay to the NOI. Clay was named "Muhammad Ali" by Elijah Muhammad after winning his boxing championship. Ali's refusal to be inducted into the US military during the Vietnam War had a major impact on Black resistance and the anti-war movement in the United States.

Malcolm X would leave the NOI due to internal conflicts within the organization and start two groups, the religious Muslim Mosque, Inc. and the secular Organization of Afro-American Unity. Malcolm's ideas and promotion of Pan-Africanism, Black Nationalism, internationalism, and armed self-defense were embraced by a significant number of activists in the Black Freedom struggle, including members of SNCC and CORE.

Some young activists were influenced by the activism of the Civil Rights movement, the nationalism of Malcolm X and the Nation of Islam, and the armed resistance position of Robert F. Williams. They agreed with the analysis of Black political theorist Harold Cruse that Black people in the United States were a domestic colony. Young Black radicals formed the Revolutionary Action Movement (RAM). One of RAM's advisors was Queen Mother Audley Moore, who called Afrikans in the United States a "captive nation" and organized Blacks to call for reparations.

Toward Black Power: Self-Determination, Self-Respect, and Self-Defense

The ideological thrust of Black autonomy and self-determination began to assert itself as the dominant theme of the Black freedom struggle in 1965. This new thrust was identified by Black activists as the Black Power movement. According to historian and scholar–activist John Bracey, by 1965 the term "Black power" was popular among the Black masses in US cities as a response to white racism. Black activists from Chicago, Detroit, and other Midwestern cities came together to form the Organization for Black Power (OBP). Black worker, organic intellectual, and socialist theoretician James Boggs made the inaugural address to the OBP citing the potential of Black people to achieve political control of US urban centers. Boggs encouraged his fellow activists to develop a movement to take political power, not to make appeals to the moral conscience of "America" as the integrationist Civil Rights movement proposed (Ward 2011; Boggs 2012).

A spontaneous rebellion occurred in the Watts community of Los Angeles, California, in August 1965. An incident of political brutality against a Black motorist, Marquette Frye, and his mother and brother, resulted in 6 days of upheaval, 34 fatalities and damages estimated in the tens of millions. The uprising was considered a Black rebellion and became a national symbol of resistance, labeled a "riot" by the media and power structure. Moderate leaders call for calm was rejected by grassroots Black resistors of Watts. New, more militant spokespersons surfaced to articulate the rage of the oppressed Black masses. Hakim Jamal's Malcolm X Foundation and Maulana Karenga's Us Organization were two of the groups that emerged "like a phoenix" from the flames of the Watts revolt. Members of street organizations and neighborhood clubs (a.k.a. gangs) were politicized from the resistance of Watts and joined helped form new groups like the Community Alert Patrol and the Southern California chapter of the Black Panther Party. Watts served as an inspiration to Blacks radicals throughout the US empire. From exile in Cuba, Robert Williams stated Watts was, "the beginning of a ferrous and devastating firestorm. . .. We are living in an age. . .of revolution." Spontaneous rebellion became routine events in cities around the United States in the 1960s. These uprisings reflect the militant consciousness of the period and a rejected of integration, nonviolence, and the politics of respectability in the Black freedom struggle. Black Power

activists like Stokely Carmichael and H. Rap Brown became spokespersons to interpret and articulate the rage of the spontaneous resistance.

Black nationalist spokesman Malcolm X was assassinated on February 21, 1965. Prominent author and playwright Leroi Jones (later called Amiri Baraka) was extremely affected by Malcolm's death. Weeks after Malcolm's assassination Jones move his base of creation and operations from predominately white, "avantgarde" Greenwich Village to the Black community of Harlem to initiate the Black Arts Repertory Theatre (BART). Jones connected with activist and radical nationalist Black writers, particularly Rolland Snellings (AskiaToure) and Larry Neal in Harlem to found the Black Arts Movement. The Black Arts Movement became a national phenomenon and the artistic wing of the Black Power Movement, primarily producing poetry, plays, music, and visual art.

The creation of the Lowndes County Freedom Organization (LCFO) in rural Alabama was another development that sparked the emergence of a new movement. This SNCC-organized group was developed as an alternative to the Democrat and Republican Party and represented a move toward independent Black politics. The following year SNCC's Chairman and former LCFO organizer would make the call for "Black Power" at a rally in Greenwood, Mississippi. The press coverage of the rally served to popularize the "Black Power" slogan.

The LCFO's symbol was an image of a black panther. Inspired by the LCFO, members of RAM and SNCC sought to build Black Panther political parties in northern urban areas like Harlem, Chicago, Detroit, Los Angeles, and San Francisco as a political party for the Black Power movement. Two northern California college students, Huey Newton and Bobby Seale, developed the Black Panther Party for Self-Defense (BPP). This radical Black group based in Oakland, California, grew to a national organization promoting armed self-defense, political power, and organizing "serve the people" programs, including free breakfast for children and free medical, legal and clothing services. Ultimately, the BPP became the largest

and most feared group in the Black Power movement. The BPP would call for a plebiscite to determine the relationship of Black colonial subjects to the US empire.

These events, which included the Watts uprising, the initiation of the Black Arts Movement, the development of the Organization of Black Power, the organization of Lowndes County Freedom Organization, and establishment of the BPP, were all a part of a new generation of resistance. By the nature of these manifestations, a national movement came into existence that represented the emergence of new social forces interrelated by an ideology distinct from the integrationist Civil Rights movement. Black Power would represent a challenge and even dominated the Civil Rights orientation of the Black freedom struggle, from the mid-1960s through the middle of the next decade.

Conclusion

Defining the political reality of the relationship of Afrikan descendants with the US empire as a colonial situation or not will determine what types of solutions one see to bring a resolution to the problem. Intellectuals have moved away from this analysis after the decline of the Black Power movement in the 1970s in favor of liberal and or classical Marxist paradigms. The liberal and classical Marxist paradigms see the borders of the United States as sacred and legitimate, which buys into notions of Manifest Destiny and white supremacy and denies the humanity of indigenous nations, and the peoples of Mexicano, Hawaiian, Virgin Islands, and Puerto Rico. Liberal and classical Marxist analysis also deny the right of New Afrikan people to self-determination and national liberation. Revolutionary New Afrikan nationalists have been consistent in defining the United States as an empire based upon settler colonialism (Green 1977). Insurgent scholarship is now re-examining this question as radical intellectuals are beginning to define structural racism in the United States as settler colonialism. Issues as the extrajudicial killing of Black people by police,

security guards, and white vigilantes; gentrification and land grabs of Black neighborhoods by corporate interests; mass incarceration; and the "achievement gap" in education are now being connected to the legacy of settler colonialism.

Social Costs of US Imperialism

Norman Markowitz
Rutgers University, Newark, NJ, USA

Synonyms

Military spending; Social policy; US history; US imperialism

Definition

This essay attempts to assess the social costs of US imperialism borne by the American people themselves. It argues that when the cumulative effect of military spending is combined with the cumulative national debt, they show the diversion of trillions of dollars in capital from socially useful policies and the accruing of a debt whose annual interest payments provide further super profits for creditors in the US and abroad. It concludes that the cumulative effects of imperialist policies serves as a deterrent to the funding of programmes to raise the living standards and improve the quality of life for the American people, not to exporting death and destruction in the name of national security and defence throughout the world.

The 'American Way' of Imperialism

The terms 'imperialism' and 'colonialism' are often used interchangeably but they are not the same. Formal colonies based on direct control of territories are the best-known form associated with imperialism, a form which covered large parts of the world until its collapse after the Second World War. Two forms of indirect control, the establishment of what now are usually called 'client states' (formerly called 'protectorates' or 'satellites') and spheres of influence, together often called 'neo-colonialism' in Africa and other former colonial regions, are the leading expressions of imperialism today. This indirect control functions through bilateral and multilateral military alliances, and bilateral and multilateral trade agreements on the model of the North American Free Trade Agreement (NAFTA).

The American anti-colonial revolution of the eighteenth century established a republic which began to call itself a democracy in the 1830s before any other modern nation did. Thomas Jefferson, revolutionary leader and author of the Declaration of Independence, advocated an 'empire for liberty', a continental empire which through territorial expansion would enable farmers and artisans to live in peaceful and prosperous coexistence with the merchant capitalists, slaveholders, and large landowners – the ruling elites of the new republic. Jefferson as president advanced this policy through the Louisiana Purchase, the purchase of France's land claims in North America.

US expansion through the nineteenth century was to contiguous territories. Indigenous people, called 'Indians', were the first direct victims of this 'empire for liberty'. They signed treaties which US governments routinely broke, and were forced onto reservations after many bloody wars by the end of the nineteenth century.

It would not be until the early 1930s that the first serious reforms in US government policy toward indigenous peoples would be enacted under the leadership of John Collyer, director of the Bureau of Indian Affairs, in the New Deal Government of Franklin Roosevelt.

The indigenous peoples were defined as 'savages', whether they were land-owning and even slave-owning Cherokees in Georgia, warring Apaches in the South West, Sioux horseman in the Dakotas, or buffalo herders on the plains. And 'savages' had no rights to land because they could not develop the land.

The most important long-term social cost of this policy to the American people perhaps was the connection of these policies with concepts of 'democracy'; a 'democracy' based on exclusion of 'Indians', slaves, Spanish-speaking Mexicans seen as inferior to Anglo-Saxons, a policy which by the 1840s was called 'manifest destiny'.

Manifest destiny was often associated with anti-colonial rhetoric. The conquest of much of northern Mexico in the Mexican-American war (1845–49) was, for example, seen by some as a war to destroy the last vestige of the Spanish Empire in North America. The slave states were among the strongest supporters of manifest destiny and abolitionists opposed the Mexican War as a slaveholders' conspiracy to expand slavery, seeking unsuccessfully to have Congress block war appropriations and also pass the abolitionist-inspired Wilmot Proviso, a congressional resolution which would have barred slavery on all territories taken as a result of the war.

Manifest destiny in the hands of pro-slavery politicians led the slave states to attempt to expand their system into the western territories through the brutal Fugitive Slave Act (1850), the failed 'Ostend Manifesto' calling for the purchase of Cuba, Spain's major slave colony (1854), the Kansas-Nebraska Act (1854), repeal of the Missouri Compromise of 1819 which restricted slavery geographically, and the subsequent use of force to impose a pro-slavery constitution in the Kansas territory. The slave states also demanded total compliance with the slaveholder-dominated Supreme Court's Dred Scott decision (1857), which would have declared slavery to be legal everywhere in North America and deprived all free Blacks of citizenship rights.

The final and necessary social cost of the antebellum 'empire for liberty' was a revolutionary civil war, whose losses counting both sides would be greater than US losses in the two world wars combined. It was a war that devastated large areas of the former slave states and led to both the end of slavery and the establishment of a new political party system and power structure which would advance industrial/financial capitalism.

US Imperialism in the Age of Industrial/Financial Capitalism

In the last decades of the nineteenth century, the major European powers began to extend colonial imperialism and fight with each other for colonies, protectorates, and spheres of influence around the globe. This was the imperialism of industrial/financial capital, an imperialism which sought markets and raw materials like the earlier commercial capitalist imperialism, but now began to export capital itself to find cheaper and cheaper labour for an expanding world market which needed in quantity and variety more raw materials, larger markets, and much greater military and naval forces to defeat imperialist competitors and subjugate people.

By the 1880s, the US began to strengthen its naval power (a policy endorsed by the steel Industry) as its industrial capacity grew by leaps and bounds. US investors bought sugar and other plantations in Spanish Cuba and the Independent Kingdom of Hawaii, and competed for commercial gain and influence against European imperial powers and the Japanese Empire in China and the Pacific.

In Hawaii, American planters, faced with economic ruin thanks to the McKinley tariff of 1890, colluded with US officials to launch a 'revolution' in the islands and annex them to the US. This policy was implemented paradoxically by President McKinley (1897), whose tariff (in the interest of the stateside industrialists who generally supported the Republican Party) threatened the American planters in Hawaii, who were also strong supporters of the Republican Party. For

S

the indigenous population of Hawaii, territorial status meant, as Jawarlal Nehru would say famously about British imperialism in India, living as servants in their own homes. As Britain sent indentured Indian labour to its African colonies, the US would, through negotiations with Japan and China, import Japanese and Chinese labour to the Hawaiian Islands.

Spanish-American War and the 'Cuban Model' of US Imperialism

Faced with an uprising in Cuba against Spanish colonial control which threatened US investments, the McKinley Administration declared war on Spain in 1898, ostensibly to liberate Cuba. Very soon, the US navy destroyed the Spanish Pacific Fleet and occupied the Spanish colonial Philippines in the Western Pacific. When the smoke had cleared, the McKinley Administration, in the face of substantial opposition, annexed the Philippines and Guam in the Pacific and Puerto Rico in the Caribbean as colonies.

While this was 'minor' compared to British, French, German, and Belgian colonisation in Africa, and British and French colonisation in Asia, it was the first overseas colonial intervention by US military forces. The US in the first years of the twentieth century fought a bloody counter-insurgent war against Filipinos who had initially welcomed them as liberators, losing many more troops then they had in the Spanish-American war itself, destroying whole villages, and taking the lives of an estimated 250,000 Filipinos.

In Cuba, the US first refused to permit the Cuban revolutionary army to participate in the surrender of the Spanish colonial forces in 1898, and then refused to end its occupation of the island until the Cubans had written into their constitution the Platt Amendment, a resolution drafted by Senator Orville Platt of Connecticut. The amendment demanded Cuban acceptance of the US government's right to determine Cuba's economic relations with foreign powers and intervene militarily in Cuban affairs to 'protect Cuban self-determination'. To back this up, Cuba also ceded a naval base at Guantanamo Bay to the US.

The 'Cuban model', accurately called by American anti-imperialists 'gunboat diplomacy', was rapidly extended to many nations in Central America and the Caribbean, the Dominican Republic, Haiti, Honduras, Guatemala, Nicaragua, and beyond. Just as Britain had played the leading role in the development of the Suez Canal and then used defence of the canal to extend its empire, President Theodore Roosevelt bought out the assets of a bankrupt French company seeking to build a canal through the Columbian province of Panama and then conspired with the CEO of the company to stage a 'revolution' supported by the US navy to establish an 'independent Panama' which would permit the US to build the canal. The existence of the canal and its defence then became a rationale for scores of US interventions mostly carried out by the Marines, whose actions were romanticised in US popular media in ways similar to those of British Grenadiers and other colonial forces elsewhere.

The direct relationship of US corporations and investors with the US government was deepened and US military and civilian authorities both exported racism across the Caribbean, Central America, and the Pacific and through those actions intensified racism at home. Two examples highlight this. At a time when European colonialists were contending that colonies would serve as a way to export socially disruptive surplus populations from the imperialist countries, Senator John T. Morgan of Alabama, leader of the Democratic minority on the Senate Foreign Relations Committee, wrote to the State Department suggesting the possibility of resettling Southern Blacks in the Philippines and giving them land that would be taken from the Filipinos (the State Department didn't reply). African-Americans, fighting in the segregated units of the US army against the Filipino uprising, faced for the first time appeals from Filipinos not to fight for whites who oppressed them against a dark-skinned people. Also, there were reports that both white and black US soldiers, in burning Filipino villages, would shout 'Nigger', long established as the most pre-eminent hate word in the US, at the Filipinos. From their letters back home to family, friends, and ministers, it is

clear that many African-American troops were particularly traumatised by the open and extensive racism of a war in which they were fighting in the army of the racists.

Under the Platt Amendment, there would be major and minor US military interventions until Franklin Roosevelt formally repudiated it, rejecting US direct military intervention to protect US economic interests and proclaiming a hemispheric 'Good Neighbor policy'.

Here are a few highlights nation by nation of that policy, called gunboat and dollar diplomacy in the US and 'Yankee imperialism' by most Latin Americans. The US applied Platt Amendment principles to turn the Dominican Republic into a protectorate (1905) and Marines occupied the Dominican Republic (1916–24) to maintain order and protect US investments. When US-trained National Guard leader Rafael Trujillo became dictator of the Dominican Republic in the mid-1930s without direct US intervention, Franklin Roosevelt said famously 'he's a son of a bitch but he is our son of bitch', a frank admission of what the US policy of gunboat/dollar diplomacy meant, even after the gunboats were withdrawn.

The administration of President William Howard Taft further developed this policy, encouraging US investment banks to invest in China and Caribbean nations to strengthen US interests against imperialist rivals The US also enlarged its naval military power to protect these growing investments. Under Taft, this was known as 'dollar diplomacy'. Under what should be called gunboat/dollar diplomacy, Marines occupied Nicaragua in support of President Diaz, former treasurer of a US mining company (1910), and then reoccupied the country to crush anti-Diaz forces as he held an election with 4,000 eligible voters and himself as the only candidate The US kept troops in Nicaragua until 1925. The following year, Marines returned to battle the radical reformer Augusto Sandino, whom the Coolidge Administration called an agent of a 'Nicaraguan-Mexican-Soviet' conspiracy to establish 'Mexican-Bolshevist hegemony' over Nicaragua as a springboard to attack the Panama Canal (1926), a Monty Pythonesque early expression of what was later known as the Domino Theory.

US Marines left Nicaragua in line with the Good Neighbor Policy (1933) but National Guard Commander Anastasio Somoza murdered Sandino and established a family dictatorship which lasted from 1934–78. While FDR expressed no sympathy for Somoza, he somewhat disingenuously contended that intervention against him would be a return to the Platt Amendment in violation of the Good Neighbor Policy.

Interventions might also be 'private'. The overthrow of a liberal regime in Honduras was funded by banana company tycoon, Sam Zemurray, and directed by US mercenary Lee Christmas, whom new conservative president Manuel Bonilla made head of the Honduran army (1911). The Harding Administration brokered a deal with Guatemalan elites to oust a liberal government for the United Fruit Company (1921).

Racism, always present, sometimes took strange turns. Under Woodrow Wilson, who rejected 'dollar diplomacy' verbally but increased US military interventions in the Caribbean, the US occupied and turned Haiti into a protectorate (1915). US troops remained until 1934. During the First World War, Franklin Roosevelt, assistant secretary of the Navy, actually wrote the Haitian Constitution. In 1919, the US Marines ruthlessly suppressed a Haitian uprising, During the occupation, Haitian presidents and other prominent Haitians were barred from the elite US Officers Club on the island because they were black!

Gunboat/dollar diplomacy continued unabated in Cuba. A Cuban uprising against the Platt Amendment led to an invasion/occupation by Marines (1906–09). US Marines intervened again under Taft to smash a strike of sugar workers which threatened US, investors (1912). US Marines re occupied Cuba (1917–22) under Wilson and Harding until 'stability' (protection of US economic interests) was restored. These policies created enmity toward 'Yankees' and 'Gringos' throughout Latin America.

But the Marines were often glorified in US media under such slogans as 'the Marines have landed' and 'the Marines are here to clean house'. Such headlines were similar to media portrayals of British Grenadiers and French Foreign

Legionnaires in the British and French Empires, creating mutual hostilities that undermined positive relationships.

The New Deal Government inherited these policies in the midst of a global depression. As in other areas, Roosevelt, a major reformer in the US context but no revolutionary, sought to reshape this policy in ways that would win over the people of Latin America without abandoning US business interests. First, Roosevelt announced a Good Neighbor Policy and abrogated the Platt Amendment (1933–34). He surprised many by sending US warships to support democratic forces which in 1933 ousted the brutal Cuban tyrant Gerardo Machado (toasted by Coolidge and Wall Street in the 1920s). This was a rarity in history, where the US intervened against a right-wing dictator.

But then, faced with a reformist government and a powerful left, the US supported strongman Fulgencio Batista behind the scenes in establishing his first dictatorship to protect US investments on the island. Mexico was a much greater problem which FDR responded to in a creative way, making his fullest break with gunboat/dollar diplomacy and advancing a policy of Pan-American co-operation.

Under Woodrow Wilson, the US launched a naval assault and occupation of Vera Cruz, Mexico, in opposition to military strongman Valeriano Huerta, whom Taft had supported in the overthrow and murder of the reformer Francisco Madero as the Mexican Revolution ended the 40-year dictatorship of Porfirio Diaz (1914). Wilson's subsequent interventions, first for and then against North Mexican leader Pancho Villa, led Villa to launch raids against US territory as the First World War raged in Europe. Wilson sent the US army into Mexico to catch him. This ended disastrously, as US troops clashed with anti-Villa Mexican forces and never caught their target. In the aftermath of the Coolidge intervention in Nicaragua (defined as a defence against the expansion of 'Mexican Bolshevism' which would threaten the Panama Canal but in part a ploy against Mexico's threat to nationalise US oil holdings), the Hoover Administration sent warships to support the defeat of an uprising in El Salvador of workers and peasants led by communist Faribundo Marti, the first real communist-led

revolutionary uprising in the Western hemisphere, resulting in the killing of Marti and the massacre of over 8,000 peasants and workers (1932).

When Mexican President Lazaro Cardenas nationalised the Mexican oil industry and US investors, led by the Hearst Press demanded military intervention of the kind that Coolidge had used against Nicaragua, Roosevelt responded by having the Import Export Bank give Mexico a $25 million loan to compensate US investors. US–Mexican relations sharply improved under the Roosevelt Administration even though Cardenas was by far the most socialist-oriented president that Mexico would have in its history.

As a complement to its Good Neighbor Policy, the administration fostered a broader vision of Pan-Americanism based on co-operative hemispheric economic development. However, these policies would not survive the beginnings of the Cold War. An attempt was made by left New Dealers in the Board of Economic Warfare (BEW), chaired by vice president Henry Wallace, to extend the New Deal through Latin America. They sought to have firms with US government contracts provide their workers with minimum wages, trade union rights and other benefits the New Deal had established for American workers, but the initiative was defeated by conservative elements within the administration backed strongly by Wall Street.

Under the Truman Administration, the US Army established the School of the Americas (1946) an upgrading and major extension of the Hoover policy of training and making into middlemen the Latin American military elites whose principal role would be to fight their own people. The school remains in existence today, having trained thousands of future military and police authorities including officers who would lead in the overthrow of democratically elected governments and advance policies that would lead to the deaths of tens of thousands of their own people.

Globalisation of Gunboat/Dollar Diplomacy

When the Second World War ended, US prestige among progressive and revolutionary forces through the world was never greater. Under the

New Deal Government of Franklin Roosevelt, the US had served as the centre of the 'Allied Powers', holding the British Empire, under conservative leadership seeking to maintain its empire, and the Soviet Union, under Communist leadership fighting a war of survival and liberation for its own people and the people of Europe together, to defeat the fascist imperialist Axis powers.

The US had also used its influence to establish a United Nations organisation, and under the New Deal Government (itself relying on a domestic centre-left coalition of labour and political forces) advanced policies to make the UN serve through its social agencies as the force to implement global policies to increase food production, sanitation and health care, international labour standards that address the economic and social inequalities that produced war and past imperialist policies which had greatly increased all of those inequalities.

But the balance of political forces in the US had changed significantly during the war. Wartime economic expansion connected to the creation of what would later be called the military-industrial complex strengthened corporate and conservative forces. They would recycle and update US policies of gunboat/dollar diplomacy and seek to apply these to the whole world.

The Big Picture of US Imperialism and the Cold War

First, the Truman Administration expressed hostility to the Soviet Union from its very first days in April 1945, as the Red Army fought the last Battle of Berlin and the European War ended. Then the Truman Administration, initially fearful of the Red Army's military power and the influence of the Soviets and Communists throughout Europe and Asia, began to see in the atomic bomb a weapon that could enable it to frighten the Soviets into complying with its demands for the economic and political organisation of post-war Europe and Asia.

Even before the Second World War ended, the Truman Administration had adopted the policy that Churchill in the last years of the war sought to have FDR adopt: to abandon anti-fascist co-operation with the Soviets and 'Big Three Unity' and

move toward a policy of undermining communist-led insurgent movements, even if that meant quietly embracing fascist collaborator forces, as the British army did in the fall of 1944 when they invaded Nazi-occupied Greece and opened fire on the communist-led insurgents who had led the fight against the Nazis since the German invasion.

The US also began this policy in the Asia Pacific region even before the end of the war. In the bloody fighting for control of the Philippines, General MacArthur's Intelligence staff put down its most important grass-roots ally, the communist-led people's army (HUKs) which had saved the lives of Americans and worked with American troops, as the British had in Greece months before. After the Japanese surrender, the Truman Administration used the large Japanese armies on the Chinese mainland as a police force to keep, as Truman admitted in his memoirs, the Chinese Communist Party, whose influence had grown tremendously during the war, from leading the Chinese people to victory.

Also, the Truman Administration retained the Japanese emperor, Hirohito, whom Americans during the war had seen along with Hitler and Mussolini as the third member of an 'Axis of Evil', and gave him and all members of an extended royal family immunity from war crimes prosecution, even though a number were directly involved in atrocities against the peoples of China and other Asian nations.

When the war ended, Korea was 'temporarily divided' into US and Soviet zones of occupation. In the South, Syngman Rhee, a conservative who had spent most of the previous 35 years on US soil, was brought in by the US occupation. Rhee was soon to become 'our son of a bitch', the first of many local tyrants whom the US would establish and/or keep in power. In Korea, the US occupation employed well-known Japanese collaborators in the police to suppress student and worker opposition to Rhee and the American Military Government (AMG).

US policy was deeply influenced by its closest ally the British Empire, mixing and matching old British imperialist policies of creating balances of power, now in the name of 'freedom' and 'democracy' as against the British 'progress' and 'civilisation'. After the British army attacked

the anti-Nazi resistance movement in Greece in 1944 (a centre of its 'traditional sphere of influence in the eastern Mediterranean) and installed a conservative monarchist regime filled with many Nazi collaborators and pre-war Greek fascists, a bloody civil war ensued. But by the winter of 1947, the British Empire, bankrupt ideologically and financially, was withdrawing everywhere.

The Truman Administration, already using threats against the Soviets in Europe and recruiting former Nazis from the Intelligence and police services of Axis Europe, 'experts' in anti-Communism and anti-Sovietism, leaped in with a 'Greek Turkish Aid bill' to replace Britain in the Greek Civil War. Along with this specific policy, Truman called for a US commitment to 'aid free peoples' who are fighting against 'subjugation' by 'armed minorities' or 'outside pressure.'

Former vice president Henry Wallace called this 'Truman Doctrine' a 'world Monroe Doctrine'. One could also call it an extension of gunboat/dollar diplomacy imperialism from the Caribbean and the Western Hemisphere to the whole world, with a new version of the Platt Amendment giving the US the 'right' to intervene in the affairs of all nations in defence of their rights to 'self-determination' and 'independence' as the US government defined these terms.

In the years to come the earlier invasions of Cuba, Nicaragua, the Dominican Republic, the failed interventions in Mexico, would be repeated in Greece, Korea, Vietnam, Taiwan, Lebanon, Iraq, directly; and in France, Italy, Indonesia, the Congo, Brazil, Chile Angola, Mozambique, East Pakistan, Afghanistan, Iraq, and today Syria, indirectly. These direct and indirect interventions were in support of 'our sons of bitches' around the world with military and economic 'aid'; the training of military and police forces; the advance of 'free-market' policies that aided foreign investors and local elites; and the fomenting of economic crises and internal subversion against those governments which resisted US Cold War policies. The process was ritualistically defended as a major part of an unending war against a Soviet-directed 'world Communist conspiracy', a perpetual Cold War to prevent a nuclear hot war.

The Big Picture of Cold War and 'Post-Cold War': Consequences for the US

The distinguished historian of US foreign policy Walter LaFeber estimated that US military spending during the period from the Truman Doctrine to the dismemberment of the Soviet Union, with all of its hidden and ancillary costs, amounted to 10 trillion dollars. By a conservative estimate, given military spending over the last 22 two years in the 'post-Cold war period', spending has been even greater than that. The pattern of expansion (Korean War), plateau (post-Korean War), expansion (Vietnam War) very short inflation limited plateau (post-Vietnam War) great expansion (Reagan Hollywood 'virtual wars'), plateau ('post-Cold war'), G.W. Bush expansion, called by historian James Reed 'Reagan on steroids' ('wars and occupations against terrorism' Afghanistan, Syria, Ukraine, and who knows where next) continues to this day, regardless of the administration.

The pre-Cold War policy of US imperialism (the use of protectorates, satellites, client states and spheres of influence as against formal colonies) had both avoided the high overhead costs of the former Great Powers' colonial imperialism and the politically disadvantageous loss of life that their colonial military interventions had led to. This was its 'strength' as it developed its control over the Western Hemisphere and campaigned to open up the colonial regions, protectorates, and spheres of influence of its imperialist rivals.

The' globalisation' of this policy with the Truman Doctrine, the formation of NATO and subsequent multilateral military alliances (SEATo, CENTo) and numerous bilateral military alliances, meant that from 1947 to the present the US would spend much more on the global Cold War and its sequel, the global war against terrorism, than all of its allies and enemies combined. Also, the US would in the name of 'containment,' 'counter-insurgency,' 'low-intensity wars' and 'proxy wars' do among the great powers most of the fighting and suffer most of the casualties in the large Cold-War Korean and Vietnam Wars and later 'wars against international terrorism' in Afghanistan and Iraq.

Some Speculation About the Costs of Roads not Taken

In calculating the 'price' of American imperialism to the American people, the overwhelming majority of whom are workers and salaried employees, retirees (former workers and salaried employees) students (future workers and salaried employees), many of the costs are incalculable, because of what did not occur. How much higher would general social security benefits have been over the last 66 years if general revenues had been added to the regressive payroll taxes (which Roosevelt showed sympathy for and progressives put forward in legislation), if the social-security-based national health system that was the subject of a fierce legislative battle after the war had been enacted, if the large public power projects on the TVA model for the Columbia and Missouri Rivers had been enacted, along with public housing legislation on the model of the original United States Housing Authority and federal aid to education in the model of the National Youth Administration.

Given the wartime economic expansion, the establishment during the war of a system of progressive taxation, the fact that one-third all workers outside of agriculture were unionised and (even with the divisions between the conservative exclusionist AFL and the inclusionist CIO), the organisational support to establish this postwar programme, to which public opinion was sympathetic, existed on paper in 1945.

The Cold War was not the only reason why groups like the American Medical Association, the National Association of Manufacturers, the US Chamber of Commerce, and the private power companies were able to bury this programme, but it was a central reason.

The association of this programme (a social-security-based system of national health care, public power expansion on the TVA model, federal aid to education, housing, and transportation,) with 'creeping socialism,' the purges in the trade union movement and the arts, sciences and professions of its most militant advocates, all in the name of Cold War anti-Communism, systematically doomed the programme. And there were other costs that could not easily be calculated in dollars and cents.

For example: the cost to the trade union movement over the last 66 years of tens of millions of real and potential members as the number of workers in private-sector unions dropped from 35 per cent in 1947 to single digits today; the cost to hundreds to millions of Americans over that period of many billions of dollars in out-of-pocket health-care expenses that working people in the rest of the developed world do not have to pay; the high rate of infant mortality relative to other developed countries that exists in the US; and the emergence from the Reagan era to today of children as the largest group living in poverty.

Interventions and Their Concrete Social Costs

Here are some of the most important Cold-War interventions and their social costs.

In China, the Truman Administration spent over $3 billion in military aid to Chiang Kaishek's Kuomintang regime (1945–49), organised the regime's 'elite divisions', and only ended its formal aid when the revolutionary forces had clearly gained the upper hand. The US then refused to recognise the Peoples Republic of China, blocked its admission to the UN until 1972, and did not establish full diplomatic relations with it until 1978, providing over time many billions of dollars in military aid to 'the Republic of China' (Chiang's rump regime in Taiwan). Also, the US helped to train Chiang's commandos for raids of the Chinese mainland, threatened war with China in the 1950s over the islands of Quemoy and Matsu in the Formosa Strait, provided financial and indirect military aid to feudal-religious elements for an uprising in Tibet against the People's Republic of China (1959), and subsequently, as it came to recognise China, manoeuvred to create conflicts between China and India and use China as a 'strategic ally' against the Soviet Union.

For the American people, the costs were real-war dangers as US paratroops prepared to attack the Chinese mainland in the event of full-scale war in the Formosa Strait in the mid-1950s, a peacetime draft that undermined working-class communities by taking from those who could

not be deferred for medical reasons or were enrolled in colleges or were unacceptable due to criminal records.

In Italy, the new CIA 'passed' its first 'test'. The agency (called by its members 'the company') spent millions of dollars to defeat a united front of Communist and Socialist Parties which had been expected to win the 1948 elections. It also used the Democratic Party to mobilise Italian Americans to send telegrams to relatives, provided both Marshall Plan aid and other forms of aid to the Italian government, funded Mafia elements in Sicily and southern Italy to undermine a free election, and continued over the next four decades with limited success to try to defeat and isolate the Italian Communist Party, supporting both former and neo-fascists, traditional conservatives, and anti-communist factions of the Socialist Party to achieve those ends.

The CIA's activities began a pattern of involvement with organised crime groups who would use their increased wealth and connections to develop in the 1950s the heroin market in US working-class communities, destroying hundreds of thousands of lives and increasing crime significantly in US cities.

After independence in the Philippines (1946), which the New Deal Government had promised in the 1930s, US 'military advisors' organised the campaign to crush the communist-led anti-Japanese Huk army, electing and then removing Filipino presidents until the 1960s when one of their 'assets', Ferdinand Marcos, realising that the US was turning against him, made himself 'president for life'.

US agribusiness corporations, Dole especially, participated in and profited greatly from the exploitation of the Filipino people in alliance with terroristic regimes and local right-wing gangs to murder peasant organisers and drive poor peasants from their land.

Edward Landsdale, a classic imperialist adventurer in the tradition of Britain's Chinese Gordon and Lawrence of Arabia, organised the post-war political campaign to elect Ramon Magsaysay as president of the Philippines, then led the US military mission to French colonial Indochina (1953) to remove the French and bring in Ngo

Dinh Diem, a US 'asset' to establish a dictatorship, and finally served as director of the CIA's Operation Mongoose (1961), the largest and most expensive CIA operation in the world aimed at overthrowing the revolutionary government of Cuba and murdering Fidel Castro and its other leaders.

Lansdale, an advertising man from San Francisco before the Second World War, was the stuff of which nineteenth-century imperialist 'heroes' were made. He even used his influence to have Hollywood change the screenplay of Graham Greene's novel *The Quiet American,* turning a character widely believed to be based on him from a villain to a hero.

The US intervention first in the French colonial war and then in its own version of a colonial war (1950-–75) would eventually cost directly 58,000 lives, hundreds of thousands wounded, and the psychic trauma that many experienced because of the atrocities that were and are the reality of 'counter-insurgency' as against the rhetoric of winning the hearts and minds of the people. Of course, it also cost the people of Indochina over 3 million lives. For millions of Americans, the great struggles unleashed by the Civil Rights movement and enacted in Great Society legislation brought with them the possibility of winning decisive victories against poverty and racism in the US. The intervention in Vietnam, when all the slogans were stripped away, was, like the dozens of interventions in Latin America before and during the Cold War, a war against the poor with a large racist subtext.

US involvement in the Korean civil war (1950–53) was explained to Americans as a UN 'police action' (US interventions in the Caribbean had been defined as the use of 'the international police power' under the Platt Amendment to 'maintain order' and protect 'independence'). The Korean War produced a 'truce,' a devastated Korea (an estimated 3 million dead) with the US creating the largest 'protectorate/satellite' in its history, establishing a large military presence and forward bases against North Korea, China, and potentially the Soviet Union, supporting repressive regimes and the military over the decades, and doing nothing to resolve either the

Korean national question or the threat of war that its large and costly military presence represented and continues to represent.

Full globalisation of the Truman Doctrine after Korea meant spending trillions of dollars over time on military-industrial complex corporate subsidies, a 'warfare state' that would prevent the development of a modern 'welfare state' social system in the US.

Over subsequent decades, US life expectancy declined in relation to other developed countries, public education and child-care services both stagnated, and the US developed a much higher level of income and wealth inequality.

And a phenomenon the CIA called 'blow-back', that is, disastrous unintended consequences, became a result of US policy.

The US intervened indirectly in Iran (1946) against a Soviet-supported uprising by the Azerbaijani minority in northern Iran (Azerbaijan was a Soviet republic at the time) threatening the Soviets indirectly with nuclear blackmail, which led the Soviets to withdraw their support. The Iranian government followed with widespread repression against the Azerbaijani minority.

After Mohammed Mossadegh, democratically elected prime minister, nationalised what was a private monopoly of the Anglo- Iranian Oil Company, Britain launched a blockade of Iranian oil. When the US government refused him any assistance, Mossadegh turned to the Soviet Union to break the blockade. The Eisenhower Administration then declared Mossadegh a 'communist' and orchestrated his overthrow (1953), replacing him with the Shah, previously a constitutional monarch, who established a brutal terroristic dictatorship in which the US was the principal backer and beneficiary. The oil was then privatised and, in a classic imperialist 're-division,' US oil companies received 40 per cent, other US-influenced companies 20 per cent, and the former Anglo-Iranian oil company, now calling itself British Petroleum (BP), more famous today in the US for spilling oil than spilling blood, received the remaining 40 per cent.

US corporations did very profitable business with and in Iran for the next 25 years, selling arms, engaging in construction projects, and taking their

cut of the oil. Secular liberal forces, the Tudeh (Communist) Party, and all other opponents of the regime were ruthlessly suppressed, leaving the Islamic clergy as the only major venue for opposition.

The 1979 revolution, in which millions took to the streets, millions who understood the history of 1953 and all that had followed, was taken over by a section of the Islamic clergy to establish a clerical 'Islamic Republic' which channelled mass opposition to imperialism into portrayals of the US and its people as 'the great Satan' and secular 'Western society' as at war with all Muslims. US corporations lost billions in Iran, although the US froze Iranian assets in US securities valued at over $20 billion in 1980. (They remain frozen, and their present value is unknown.) The Reagan Administration did 'receive' over $50 million dollars from the Iranian government in the illegal 'arms for hostages' deal in order to provide the Iranian military, which had received arms from the US until the revolution, with weapons to use in their war against Iraq, which the Reagan Administration had supported.

Most of this money 'disappeared', although some was siphoned off to support the Nicaraguan Contras, an expression in the 1980s of old-fashioned Platt Amendment gunboat diplomacy.

Among the most important social costs of the 'warfare state' in the US was a labour movement whose leadership supported all of these policies and did nothing to resist the massive export of capital abroad, which was in effect the domestic policy of imperialism in the US, producing chronic economic crisis and a political vacuum on the labour left which, with the blowback of the Iran Hostage crisis, provided the background to the Reagan presidency.

Gunboat/dollar diplomacy also returned with a vengeance to Central America when the CIA overthrew the democratically elected Arbenz Government in Guatemala (1954) and brought to power a brutal dictatorship under Carlos Castillo Armas (a US-trained officer) which would take thousands of lives: the most terroristic regime in the region to date.

When the Cuban revolution triumphed in 1959, the National Security Council and the CIA

S

were initially confident that Cuba would be another Guatemala After a steady escalation of attacks on the revolutionary government and an embargo which compelled it to turn to the Soviet Union for aid, Eisenhower and then Kennedy authorised the CIA to create a Cuban exile military force to launch an invasion of Cuba to establish a regime that would suppress all pro-revolutionary forces and restore all US property (on the Guatemalan model).

Continued CIA actions after the failure of this Bay of Pigs invasion to overthrow the Cuban government, raids against Cuba, use of bacteriological warfare to destroy Cuban swine herds, organised sabotage campaigns against the Cuban economy, and plots to murder Fidel Castro (the last documented one in Angola in the mid-1970s) went on for the next three decades. Finally, the economic blockade was intensified against Cuba following the dismemberment of the Soviet Union.

The cost to the American people was first the spending over the last 54 years of billions of dollars of public funds in a futile attempt to destroy the Cuban revolution.

One must factor in the suffering of the Cuban people that these policies continue to produce. Finally, one might look at the loss to all of Latin America of what a policy of Cuban-American friendship and solidarity could have meant for the development of the region, given the outstanding achievements of Cuba in education and health care, connected to what the US has to offer in terms of technology, capital, and its own technical and professional workers. Also, the American people suffered a major blowback from the Cuban policy in the Watergate conspiracy (1971–74), in which former FBI and CIA agents organised a group of Cuban criminals who had worked in CIA terrorist actions against Cuba throughout the 1960s to wiretap phones and microfilm documents at the headquarters of the National Democratic Party in Washington. And the policy produced its spin-offs.

Indirect CIA intervention in the Dominican Republic to support Juan Bosch as a 'democratic alternative' to Fidel Castro and the Cuban revolution was then transformed into support for a right-wing military junta's overthrow of Bosch when his government moved in a socialist direction and threatened the interests of US corporations. This was followed by an invasion by 25,000 US Marines in the name of defeating 'communists' after constitutionalist military officers sought to restore Bosch to the presidency he had won (1965). This was the largest direct military intervention by the US in Latin America in history, 32 years after FDR had formally repudiated the Platt Amendment.

The US also provided indirect support for a military coup in Brazil (1964), ousting a democratically elected progressive-oriented government. Finally, there was active support for military junta regimes in Venezuela, Argentina, Paraguay, etc., and either support for or opposition to civilian governments based on their subservience to US economic interests, all in the name of 'containing' the spread of 'Soviet-directed Cuban communism'. Starting a year before the Cuban revolution, the CIA intervened in the Chilean elections of 1958, 1964, and 1970, funding opposition to the Popular Unity (Peoples Front) coalition of Socialist and Communist Parties and liberal groups led by Socialist Party leader Dr. Salvador Allende. Unlike many Latin American countries, Chile had a history of free elections and an independent trade-union movement.

The Nixon Administration launched economic/political war against Allende after his coalition won the 1970 elections, fomenting strikes and inflation, supporting rightist and ultra-left groups to destabilise the government, and creating the context for the bloody Pinochet coup and massacre of thousands of Popular Unity partisans. This was followed by economic aid and political support for the Pinochet regime as it destroyed trade unions, privatised Chilean social security, established with the 'advice' of economists associated with Milton Friedman a regime of 'free-market fascism', regarded by scholars of Latin America as the most brutal and repressive regime in Latin American history.

The return of gunboat diplomacy was seen most dramatically in the Reagan years by the 'Contra War' (Contras were elements of the

former Somoza dictatorship, first established in 1934) against the revolutionary Sandinista government (established in 1978 and named after the martyred Augusto Sandino) in Nicaragua. The US also supported the more traditional ultra-right Salvadorian government against the revolutionary FSLN (Salvadorian National Liberation Front), thus running two 'low-intensity wars' (the new term of the 1980s) that claimed in excess of 120,000 lives in two small countries throughout the 1980s.

Blowback here came in the form of the Reagan Administration's continued support for the Contra War, following the murder of US nuns in Nicaragua and passage of the Boland Amendment. This barred direct US aid to the Contras. Reagan also intensified surveillance of the US peace movement, especially The Committee in Solidarity with the People of El Salvador (CISPES).

In the twenty-first century, oil-rich Venezuela has been the target of US imperialist policies. The Bush Administration's support for a failed coup against the government of Hugo Chavez (2002) was then followed by harassment as it moved in a socialist direction. Venezuela's oil wealth and location offered and continues to offer its socialist-oriented government protection from direct gunboat diplomacy intervention, even after Chavez's death, though US media continues to demonise his successors and does what it can to support the political opposition. Very recently, the Obama Administration has called for the normalisation of US–Cuban relations, something that is long overdue. The blockade, though, remains in tact and relations have in effect worsened, limiting expectations for a 'new Good Neighbor Policy' in the region.

In the Pacific, the US government was to be complicit in events that would claim an estimated 1 million lives in Indonesia in 1965. At first the US refused to aid the restoration of Dutch colonialism after the Second World War and supported Sukarno, a Japanese collaborator, as leader of an independent Indonesia, because of his opposition to the country's Communist Party (1948).

This policy changed as Sukarno formed an informal alliance with the Communist Party of Indonesia (PKI) against both Islamic

conservatives and the military. The CIA supported assassination attempts against Sukarno in the 1950s and worked with conservative elements of the military against the Indonesian left in the fifth largest country in the world in terms of population at the time.

The US involved itself directly in the massacres of 1965, in which an estimated 1 million PKI activists, workers, peasants, and members of the ethnic Chinese minority were killed by the military and vigilantes linked to right-wing Islamic groups, as a countercoup in response to an alleged PKI-supported coup.

The CIA would boast of its list of 10,000 key PKI cadres provided to the military, all of whom were allegedly murdered. US support for the brutal corrupt Suharto regime lasted for decades. Subsequently, the US denied all involvement in this sordid history after Suharto's removal in 1998, claiming since the 9/11 attacks to represent the forces of liberty and democracy against 'Islamic terrorism' in Indonesia, although such groups are the successors to the Islamic vigilante groups that the CIA supported indirectly in 1965.

While most of this was then minimised in the US and the US/NATO bloc countries, in large part because the people massacred were communists and people of the left, Indonesia's invasion and occupation of the former Portuguese colony of East Timor, supported by the US in 1975, became the source of an international protest movement.

East Timor, whose population is primarily Christian, had before the Indonesian invasion declared its independence from Portugal. Amnesty International has estimated that the Suharto Government murdered, with US-supplied weapons, as many as 200,000 of East Timor's population of 700,000, while the US continued to support Indonesia's 'sovereignty' over East Timor in the United Nations and blocked attempts to punish it for its crimes.

All Americans suffer in the eyes of history the costs of their government's actions in funding, aiding and abetting what were two genocidal campaigns.

In the post-Second World War Middle East, the Cold War context was largely a distraction from what was and is the real issue: oil. First, the US

S

replaced the British and French Empires, supporting British-installed monarchies in Egypt, Jordan, and Iraq. Working closely with the Saudi Arabian monarchy, centre of the world's largest concentration of oil deposits, US oil companies established the Arab-American Oil Company (ARAMCO), a consortium to develop the oil.

The US was initially cool toward Israel in the multi-faceted conflict between Arab nations, Israel, and the Palestinian population of the former British mandate/colony (1948–present), favouring an 'Arabist policy' of support for conservative monarchist regimes in Jordan, Iraq, Egypt, and Saudi Arabia to protect the oil. However, nationalist and socialist-oriented revolutions in Egypt (1952) and Iraq (1958) undermined this policy. Even though the Soviet Union supported those developments, both the US and the Soviets opposed the British-French-Israeli invasion in the Suez Crisis (1956) as a message to the old colonial powers that US imperialism was calling the shots in the region in competition with the USSR and would not tolerate any restoration of British and French power. The following year, the Eisenhower Doctrine pledged US military intervention in the region against 'Communist influence'. US Marines then intervened under the doctrine in Lebanon against Pan-Arab pro-Syrian and Egyptian forces which had nothing to do with the communist movement.

After socialist-oriented military officers overthrew the monarchy in Iraq (1958), the CIA involved itself in plots with the nationalist Pan-Arab Baath Party of Iraq in attempts to assassinate government leaders, using anti-communism and opposition to Soviet influence as pretexts. In the 1970s, Baath Party leader Saddam Hussein (previously a CIA 'asset' in the struggle against the revolutionary military government) played the Soviets against the Americans, established a personality-cult based dictatorship and, to the chagrin of the US, nationalised oil holdings. Hussein became a CIA asset again when, seeing the US–Iran conflict, he seized an opportunity to attack Iran and gain rich oil lands, launching an eight-year war which cost hundreds of thousands of lives and bankrupted Iraq.

During the war, the Reagan Administration acted to cover up Hussein's use of poison gas and other atrocities against Iran, encouraged its oil-rich protectorates to provide him with loans to finance the war, and resisted Iranian overtures to end the war contingent upon his removal. In the aftermath of the war, Hussein, believing the US would not oppose him (it hadn't in the past) invaded oil-rich Kuwait, leading to the First Gulf War (1991) as the Pentagon and Bush Administration sought to sustain military spending as the Soviet Union collapsed. After an easy decisive victory in the First Gulf War, the Bush Administration decided to keep Hussein in power after his regime's total military defeat as a pawn to be used against Iran. His subsequent massacres of Muslims of the Shia religious denomination and people of the Kurdish ethnic minority, both long-time enemies and victims of his regime, were ignored by the Bush I and Clinton Administrations in the 'post-Cold War era'.

In the tradition of the old colonial imperialism, nothing that Hussein did to his own people was ever an issue for the US. His nationalisation of oil in the 1970s and invasion of oil-rich Kuwait in 1989 were the only reasons that he lost US support.

The post 9/11 invasion and occupation of Iraq was based on contentions above and beyond anything that the US government had advanced in the Cold War era: that Hussein's regime was the ally of Al Qaida, which his government had sworn to destroy and whose members it had hunted down and killed; that the regime was hiding 'weapons of mass destruction', even through more than a decade of UN inspections showed this to be false; that the regime was a military threat in the region even though its military forces and strength were less than half of what it had been during the 1991, First Gulf War.

The subsequent occupation highlighted as nothing else would Reagan-Bush 'neo Robber Baron' capitalism. Private construction contractors, private food providers to the military, private security forces, robbed the US taxpayer of billions of dollars, outraging millions of unemployed Iraqis who saw foreigners taking their jobs, and placing the US military occupation forces in

greater danger. The American people pay and continue to pay the price of a 60-year policy recycling largely old British Empire policies in the interests of US-based transnational energy corporations, making the incomes and jobs of millions of American workers subject to the conflicts and crises in this region and the manipulations of the transnational energy corporations in alliance with various governments for their profit. The American people and the people of the world also pay the environmental costs of these policies to land, water, and air as alternative 'green' energy sources remain underdeveloped.

The US had not been involved in the colonial carving up of sub-Saharan Africa, although American firms like Firestone Rubber were involved in the exploitation of Europe's African colonies through various transnational corporations. Cold War US governments both supported the colonial powers as they sought to hold on to their African colonies and, as a plan B position, conservative nationalists, separatists, and military protégées of the colonial powers who would turn their nations into protectorates of the US and its allies on the old 'Cuban model', or 'neocolonies' as this kind of control were known widely in Africa.

Using the UN as a cover, the US and France intervened in the collapsing Belgian Congo (1960), scene of some of the worst genocidal crimes in human history at the end of the nineteenth century, to defeat the leader of the national liberation movement, Patrice Lumumba, whom the CIA and the National Security Council compared to Fidel Castro as a socialist revolutionary menace. The CIA helped orchestrate the murder of Lumumba, spent millions to keep his supporters from gaining power democratically, and supported Joseph Mobuto, who established what international observers regarded as one of the world's most corrupt regimes. Mobuto's regime looted billions while the overwhelming majority of the people were malnourished and plagued by the old diseases of poverty and a new one, AIDS, without the most rudimentary forms of medical care.

The US also supported Portuguese colonialism in Angola and Mozambique in the 1960s and 1970s. When a revolution in Portugal ended its empire, the CIA employed a plan B strategy in Angola of supporting Holden Roberto, corrupt nationalist brother-in-law of Joseph Mobuto, against the Marxist-influenced and socialist-oriented Popular Movement for the Liberation of Angola (MPLA). The CIA allied itself with the South African apartheid government, first to use force to keep the MPLA from taking power and then, to support a rightist separatist guerrilla war led by the adventurer Jonas Savimbi. Similar developments in Mozambique took place with much greater South African participation. US escalation of these actions under the Reagan Administration, supporting and protecting South African military incursions and the wars of Savimbi in Angola and Renamo (the group made up of former Portuguese colonial forces under the direction of South Africa) in Mozambique led to endless war. Hundreds of thousands died and a greater number were made homeless through these interventions, which continued into the twenty-first century, largely destroying the possibility for progressive social development and socialist construction advanced by the MPLA in the 1970s.

In South Africa, the US supported under both Democratic and Republican administrations the apartheid regime, led from 1948 to its downfall by the Nationalist Party, whose leaders had been imprisoned by the British during the Second World War because of their support for and connections with Nazi Germany. Coming to power in an election in which the Africans (roughly 75 per cent of the population) were completely disenfranchised, the Nationalist regime wrote 'race laws' which were modelled and in some instance copied in regard to language from the Hitlerite Nuremburg race laws. The crimes and atrocities of the apartheid government were known and condemned through the world, including the US. This did not stop the major imperialist powers from continuing to invest in and profit from the apartheid regime, selling it weapons and protecting it from various political sanctions at the United Nations and other international organizations.

Whatever occasional negative comments US political leaders made about the apartheid state,

the CIA worked closely with its South African counterparts from the 1950s to the 1980s. The CIA helped to capture African National Congress leader Nelson Mandela in the early 1960s. It joined South Africa to advance the Savimbi forces in the 'Contra war' in Angola. It indirectly supported the South Africans as they occupied South-West Africa (Namibia) and sought to turn it into something between a colony and a protectorate. Under the Reagan Administration, the African National Congress was, because of its historic alliance with the South African Communist Party (SACP), seen as an agent of Soviet and communist world domination. Furthermore, South Africa itself, as the most developed region of the continent with its abundant resources, was seen by the Reagan Administration as a potential Soviet Union of Africa if an 'ANC-Communist' government were to expand northward to put the entire continent under 'South African communist control'.

To counter this, the Reagan Administration put forward a policy of 'constructive engagement', a more extreme version of the appeasement policy the British Empire had directed toward Nazi Germany in the 1930s, encouraging and apologising for South African military aggression in Southern Africa as against refusing to act against Nazi aggression in Central and Eastern Europe, resisting in the United Nations and in the US movements for sanctions against the South African regime. People's movements in the US and globally eventually did compel both international and US sanctions and, through disinvestment campaigns, significant withdrawals of investment from the apartheid state. Its military defeats in Angola especially (where Cuban-MPLA forces won a decisive victory against South African-Savimbi forces) and the intensification of resistance by the South African masses led to the release of Nelson Mandela, the legalisation of the African National Congress, the South African Communist Party and other political groups, and the establishment of a parliamentary democracy from the ruins of apartheid South Africa, itself a monstrous relic of the Hitler fascism that had been defeated in Second World War.

Although President George H.W. Bush welcomed Nelson Mandela, now leader of a liberated South Africa, to the US (and lectured him about the superiority of capitalism over socialism), no major power in the world had done more to support the apartheid state since its inception, something that should be a source of both shame and outrage for all anti-racists in the US.

In the immediate aftermath of Mandela's death, the release of information that as part of the ANC-SACP alliance he had been a member of the SACP's central committee, led to attacks on his memory by rightist and old and new red-baiters through the world, an example of the old definition of a 'reactionary': someone who learns nothing and forgets nothing from history, compelled to do the same thing over and other again.

Conclusions on 'Cost Benefits' of the US Brand of Imperialism

When the cumulative effect of military spending is combined with the cumulative national debt, they show to all willing to see both the diversion of trillions of dollars in capital from socially useful policies and the accruing of a debt whose annual interest payments provide further super profits for creditors in the US and abroad. Today, the cumulative effects of these policies serves as a deterrent to the funding of programmes to raise the living standards and improve the quality of life for the American people, not to exporting death and destruction in the name of national security and defence throughout the world.

Even conservatives who have actively opposed both existing and proposed public-sector and social welfare policies in the name of opposition to 'big government' and 'waste and inefficiency' (not to mention most of the points made in this essay) might ponder the effects of the national debt and military-industrial complex expenditures on their hopes for an unregulated free-market economy and an expanding and prosperous middle-class mass society.

And, of course, there are the hundreds of thousands who were killed and wounded in the not so cold Korean and Vietnam Wars, the Americans

who were killed and wounded in the invasion and occupation of Iraq, US service men and women being killed and wounded in Afghanistan today, and all of the possibilities of interventions in the near future in the name of the 'war against terrorism', humanitarian intervention, and future catchphrases. Those in power in the US who use contemporary imperialist jargon about 'nation building' are examples of the old adage that those who learn nothing from history are condemned to repeat it.

Finally, for both Americans and peoples throughout the world, there are the cumulative costs of all the interventions, the endless 'trails of tears' (as the forced removal of Native peoples under Jackson's Indian Removal policy of the 1830s came to be known), the repeated direct invasions and indirect interventions in various forms through the Western Hemisphere and the Pacific in the pre-Cold War era under the banner of gunboat/dollar Diplomacy and then recycled through the Truman Doctrine and its many spinoffs. Those costs for North Americans, Latin Americans, Asians, Africans, Pacific Islanders, all people, are truly incalculable.

Imperialism, the cross-national social class heading the process of capitalist accumulation on a world scale in the era of monopoly/finance capitalism, articulates different modes of production with the view of extracting surplus value and ever higher rates of profits. It does so by exercising varying degrees of violence and immiseration meant to strip the masses of their command over their labor and their resources. The degree of violence varies with whether imperialism engages the weaker formation through super-exploitation, the long working hours in Third World sweatshops, or through commercial exploitation, the wars of encroachment that hijack peoples' will

en masse, only to snatch their resources, portions of their lives and the value with which they enjoy better lives. Human life is a resource, either mobilized or immobilized, but awaiting engagement in some domain of accumulation. Immobilized labor is potential labor power. Extinguishing human life in war occurs through militarism, a significant domain of accumulation. The demise of humans before their historically determined time lessens the social cost of labor reproduction and contributes to surplus value formation by the degree it reduces necessary labor. Although the practice of violence in various forms is necessary for the reproduction of all sorts of capitalist relations, more violence is associated with the encroachment wars that lay the groundwork for commercial or slave-like forms of exploitation.

In much of the world, imperialism, the imperialist class constituted of central industrial/financial circles and comprador capitalists, superexploits labor in mining, plantations, manufacturing and militaristic concerns. In the Arab World, as per the definition of the Arab League (hereinafter AW), oil and war are the principal industries with which the imperialist class engrosses itself, and the principal channels through which the AW cointegrates with the global economy. It is through the residual revenues, the revenues remaining after the imperialist class usurps its share of the total Arab product that the AW sustains or, as per its observed degenerative condition, de-sustains itself.

As a result of the combined effect of war and attendant neoliberal austerity, the AW has since c. 1980 deindustrialized (UNIDO 2015), exhibited some of the highest global rates of unemployment and income inequality (ILO various years; TIID various years), and the highest rate of food-import dependency (UN-Survey various years; FAOSTAT 2016; (UNIDO 2014; ILO various issues; FAOSTAT; UTIP 2008; UN 2012) The AW exports precious little other than low value-added products, raw materials, especially oil (UN-Survey various years). While between 1980 and 2011, the average annual growth rate oscillated between 2% and 3%, which is roughly equivalent to the population growth rate, the labor share fell from around 50% in the mid-1980s to around 25% in 2010 (ILO 2011; Marquetti and Foley 2011;

Guerriero 2012). Through control of the AW, the imperialist class amasses astronomical rents. It liquidates Arab national assets, raises the profit share of the Arab comprador class through neoliberal tax and monetary policy, and, most crucially, it belligerently hollows the Arab state while fortifying US-led power over the region. It should come as no surprise that over the last four decades, the AW has held many of the global poor development records. Not surprisingly, it also endures the highest frequency of conflicts (SIPRI various years; SIPRI 2015) Combining the immediate war dead numbers with the numbers of people whose lives are piecemeal shortened by the fallout of war and its austerity, the AW can practically compete with the Congo in terms of degree of immiseration and outflux of refugees.

Oil is a strategic commodity whose *control* offers the US-empire unique powers. Control is a de facto transfer of oil ownership from the purview of the national masses to the imperialist class. Such a transfer occurs by the violent suppression of the masses or the co-optation of states upon whose lands oil is found. The encroachment wars, the bloody processes of stripping peoples of their will and resources, are also blatant violations of human rights as per the first article of the International Covenant on Economic, Social, and Cultural Rights. One is reminded that the first article of that covenant says that all peoples may, for their own ends, freely dispose of their natural wealth and resources, and in no case may they be deprived of their own means of subsistence (OHCHR 1966).

The history of the AW, the rise of its modern states, colonially designed and fragmented to ensure inter-Arab dividedness, its continued debilitation and deprivation of resources by imperialist aggression, the ethnic cleansing of Palestine by Israel, an expansionary colonial settler state whose Zionist ethos promotes imperialist interests far afield, all add up to the crushing power of history "that weighs like a nightmare upon the shoulders" of the Arab masses. The same history is also a history of heroic national liberation struggles that have often been quelled by the technical superiority and savagery of European war culture and weaponry. The current famines and wars in

Yemen, Somalia, Sudan, malnutrition in Egypt and Morocco, and wars in Libya, Iraq, Occupied Gaza and Syria are symptoms of that outstanding history.

While the control of oil requires war, war itself is a source of control and an industry in its own right. Imperialist war, a subcategory of accumulation by militarism, is an enterprise of violence whose product is *waste* and especially, the wasted lives *qua* absolute and relative depopulation.

> Capitalist production, when considered in isolation from the process of circulation and the excesses of competition, is very economical with the materialised labour incorporated in commodities. Yet, more than any other mode of production, it squanders human lives, or living-labour, and not only blood and flesh, but also nerve and brain. Indeed, it is only by dint of the most extravagant waste of individual development that the development of the human race is at all safeguarded and maintained in the epoch of history immediately preceding the conscious reorganisation of society. Since all of the economising here discussed arises from the social nature of labour, *it is indeed just this directly social nature of labour which causes the waste of life and health.* (Marx 1893)

In a world plagued by constant crises of overproduction and in line with demands for underutilizing resources, war disengages resources. It thwarts the coming of new Third World industries onto the world stage, especially, those which could compete with the occidental monopoly over the production of high value-added products. Concomitantly, imperialist war disciplines the labor process. It pacifies labor and levels the social grounds for production to the desires of capital and its more intensified form, imperialism. Beheld as the practice of the law of value, war imparts the power to regulate social time and lowers input prices below value. In terms of its role in international relations, imperialist war serves as a show of power through its demonstration effect, which in turn feeds its ideological strength. It imposes its own vernacular as the science of social reproduction and, more often than not, it disarms nations and/or resisting masses without firing a shot.

The encroachment side of imperialist war enforces the agenda of the victors upon the conquered nations. It dismantles the economic safeguards of the vanquished state, especially its

S

capital and trade accounts. The deregulation removes the measures that recirculate the wealth of the nation within the subdued nation. It also dismounts the social programs that prop up the quality and longevity of people lives. As a matter of priority, it spares no effort to undermine any social model as an alternative to the reign of free capital. Iraq's occupation, de-facto dismemberment first by military assault and then de jure by the Bremer constitution, its continued debilitation by neoliberalism, are outstanding examples of imperialism as practiced in the AW. In the last moment however, all imperialist assaults upon weaker Third World formations lubricate the mechanisms for value usurpation by coordinating the function and the reproduction of labor, including, population growth to the requirements of central capital.

Apart from its egregious side, war can be thought of just as any other run of the mill industry. It engages waged labor with advanced machinery and/or forces labor to produce ruin and the deaths of other humans. Just as many deleterious commodities are consumed by society, the loss of life and the loss of nature and resources that support life, otherwise social nature, are themselves the highly valued products and consumption items of war. Waste accumulation and its waste product, either in its pollution that reduces lives or immediate human deaths, is a valuable commodity that undergirds the whole of capital's metabolic order. Capital's ideological apparatuses and its dominant ideas are also its accumulated historical surplus value, a constituent of its wealth, and these in turn condition the desire for the consumption of useful as well as harmful commodities. Capital produces the commodity, its first product, and the social man, its second product, who is willing to consume any of its commodities (Lebowitz 2003), no matter how poisonous, and still be consumed by capital in a lifespan earlier than that accorded by the prevailing development of the productive forces (Kadri 2019; Lebowitz 2003).

Another ideological impact of war, one desperately desired by capital, is to stamp out revolutionary consciousness and attendant forms of labor organization that give strength to the working class. War is unadulterated waste. The fervor of war's ultra-sectarianism or nationalisms foments inter-working class divisions and recreates the worker who is willing to consume the life of another worker. It accentuates the waste side of accumulation, which is already the inherent predisposition of capital. In capital's metabolic order, which grows by devouring man and nature, the rate of destruction to human life and the natural environment, the latter's end is to support the reproduction of human life, is the technical measure of the productive efficiency of war. In the oneness of man and nature, it has to be recalled that it is not the trees that have to be reduced to objects but it is the human who recognizes capital's symbols of power.

To be sure, imperialism is an intensification of capital's relationship in the age of monopoly in combination with finance. It resolves capital's contradiction, the disparity between the development of productive forces and the accumulation of capital on the one side, and the division of colonies and spheres of influence for finance capital on the other, by means of expansion through war (Lenin 1916). The violent forms by which imperialism demolishes man and nature, accumulation by a higher degree of waste, characterize the highly entropic tendency of the capitalist system. Imperialism compresses the chronological time in which the consumption of labor in production occurs. In more holistic terms, one may add, both necessary and unnecessary labor, the one-sided historical abstractions used to develop a particular in a universal condition, or logically the latter labor serves a predicate of the former and vice versa; hence, there is only one labor, living labor, neither necessary or productive nor unnecessary or unproductive, which forms value.

Both man and nature, together in unison as social nature, are engaged as the cheap inputs behind the making of the momentarily low prices of consumables sold on the market. Prices are the epiphenomena of mediated value relations given as *immediacy.* The emphasis on *immediate* prices is to underscore the fact that over its life cycle society lays out in real value upon a commodity, in objectified necessary labor time, far in excess of the price paid for it during the instance of

purchase. The price is the appearance of value whose essence is social production. The costs to nature and man, the taxes to repair nature and pay for war, are the value outlays on production shifted upon the shoulders of the consumerist working class in a social time-defined, open-ended turnover, and realization cycle. Imperialism contributes to the monolithic power that blinds people from the real costs of capitalist production. These not-so-exposed value inputs may be imputed in their corresponding price manifestations during the manifold exchange processes or may materialize with a time lag determined by the social forces that regulate the social nature of time, as in the recent appearance of the carbon tax.

So far, the historically accumulated costs of destructed man and nature exceed the wealth or the sum of the dollar-prices of the heap of commodities grouped together; capitalism's existentialist debacle. That many input costs can remain apparently un-priced, underpriced, or hidden, while "autophagous society" auto-destructs, proves the dissolution of labor's revolutionary consciousness. The culture, the accumulated stock of knowledge of humanity hijacked by Western civilization, is an integral part of the historical surplus value. The deleterious wealth stock as social matter has also a deleterious social relation associated with it, a substance with subjectivity, which reproduces it. (I use the descriptors European, Western, Southern, or Northern in the ideological sense, in contrast to the geographic one.) The grip of Eurocentrism, especially the state of consciousness of capital's floated Marxists, the self-appointed interlocutors of the Northern working class, a class whose wages contain a rent component arising from imperialist pillage, investigate the alleged crimes of Stalin not to pursue the virtue of truth, but to prop up the power of the ideological avalanche of capital as it devours what is left of the planet. Invariably, the study of history serves a contemporaneous class position. History, the surrogate capital, is an immense ideological power structure and a daily genocide. It is this power structure, the historical moment, which often escapes enquiry by scholars deeply besotted with Western democracy and capitalism as progress. Even what appears as critique of capital in

Western philosophy and science, including many of its Marxist strands, have been allowed to surface freely, without the usual repression, because they intoxicate and co-opt the anti-systemic process, indeed doing so at a rate and efficacy surpassing that of the fascist right, which has historically represented a false anti-systemic alternative in its own right.

The de-subjectification, equally objectification, of labor, the failure of labor to come to terms with its historical identity and agency, its failure to negate capital and reorganize and socialize the natural reproduction order, is a form of slavery. Under capitalism, chattel slavery initially served as a pedestal that supported the industrialization and the wage-slave worker of the North. As per Malcom X, capital preferred *the pliant house negroes to the field negroes*; the former were slaves who revered their white masters, much like Marxists adhering to bourgeois democracy. In latent capitalism, the introjection of capital's "bourgeois democratic" ideal by Northern working classes *living off the avails of imperialist procuring*, generalized the house negro's state of submission to the masses. In his chez-d'oeuvre, One Dimensional Man, Herbert Marcuse (1964) labels the Northern formation as totalitarian by virtue of its self-alienated labor, or the labor that has internalized the ethos of capital and identified with it. Slavery is the disempowerment of labor by ideological or physical coercion. Unlike the predominant forms of slavery in the North, imperialism bombs, disempowers, and enslaves whole nations and masses in the South. Thus, inasmuch as early Southern slavery served as a pedestal for the industrial North (Marx 1867), the modern forms of Northern labor's de-subjectification *qua* slavery, the support for bourgeois democratic governments that colonies and imperialize, inversely serve as pedestals for the industry of war that enslaves the South.

With the certainty of hindsight, the negative dialectic of capital, the spiral that develops from bad to worse, has prevailed. *Ex post facto,* there is and there was nothing progressive about capitalism. Lenin's dictum "imperialism will be last stage of capitalism" is already borne out by the facts, but not because of the world revolution he

S

envisaged, because the unfettered capital has been consuming so much of social nature and nature to the point that the losses to life in general have become irreparable.

For imperialism as practiced in the AW, it is necessary but not sufficient to only neutralize revolutionary consciousness or for the masses to introject defeatism. Sufficiency arises from the practice and the impact of war in the literal sense, that is in the premature ending of human lives. Through its bombings and imposed austerity, war reduces the population or the life span of an allegedly superfluous population to an average age that falls below the historically determined level of life expectancies. The Arab value making process unfolds upon two principal channels: first, the cutting down of lives is waste produced by value outlays in militarism; and, secondly, the undue reduction of the population reduces the social cost of reproduction of Arab labor. To reemphasize: the Arab share of wages is determined residually after the imperialist cross-national class determines its priorities and profit shares, as opposed to nationally. The Arab working-class struggle is a struggle against their own comprador and the many regional US military bases and proxy armies.

In an already overproducing world, absolute or relative depopulation reduces the costs of the reproduction of labor over the lifecycle of the laborer as a result of reduction in the value outlays on labor, the social cost of reproduction, and its form given in the *immediate price category* known as the wage bill. Hence, a primary objective of imperialism is to depopulate. For Arabs and Africans, the anti-imperialist struggle is more than just a war of cultural preservation or resistance. It is plainly a war of physical existence. It is necessary and sufficient for imperialism to eviscerate the consciousness of resistance and mow down people. Capital ontologically aggresses even its own sub-circles in a process of waste accumulation determined by auto-negation.

To illustrate the war of existence, the ontology of capital, let us now consider the case of the Arabs in Palestine. Regardless of the myths of Jewish supremacy or racism, or for that matter national supremacy or whether a monotheistic deity condoned the ethnic cleansing of Palestinian towns and villages or not, that is to say no matter the justification for the settler colonial assault visited upon the Palestinians, all these concocted explanations remain excessive because, at a sedimentary level, imperialism assuming its chauvinist form in Zionism must *industriously* depopulate the Palestinians as well as others. It must cut short lives or waste lives as values consumed in a lifecycle of waste *qua* surplus value creation. The Marxist refrain that "nothing is constant but change" should be put instead as "nothing is constant but war." Under capital, depopulation abounds by the diktat of commodities, assuming fetish qualities, proxying for humans, whose exchange governs the modality of social reproduction. War is a primary industry and a final realization stage for commodities. It produces the death/waste commodities. It mobilizes excess moneyed surpluses under monopoly capital. The power garnered through war is a crucial link in the realization process of civilian-end use commodities, their manifestation in the money form, and that is so because imperialist war cum ideology disembowels the consciousness of labor, the human whose consent inversely founds the substance of power. It creates the labor who recognizes and reveres the money form of value as imposed by capital.

Depopulation, a component of the waste industry in its imperialist war practice, of which there is plenty in the AW, represents the determining moment in the negative dialectic of capital. As a reminder, war, the concrete implementation of militarism, falls under the more general category of accumulation by waste. Capital targets nature not only to acquire cheap raw material but also to target the reproduction of man, because it is man who fathoms the money and power symbols and not the trees. To de-reproduce society by war or by the immiserating aftereffects of austerity, capital redresses its profitability and steadies its rule.

For a capital commanded by commodities that have assumed godly status through the market, war is a boon. It drives publicly funded R&D to be privately appropriated, redeploys the monopoly/financial surplus in military industry, as opposed to areas that could provide autonomy to

labor like health and education, and, ultimately, it regulates the reproduction of the labor force. War, as the practical manifestation of the law of value, situates the US-empire atop the global technological pyramid and lodges new investments in waste concerns. It taxes the working class and deprives it of the living security required for autonomy. Either by its national zeal, its so-called "purifying power," or by the outright diminution of labor's numbers, revolutionary consciousness, and organization, war elevates the principal repressive organ of capital, the state, to a divine position. By masking over the criminality of the labor process, war legitimates the otherwise fictitious construct of capital. Positing that the value category under capitalism is *immanently* unethical and ugly, war's products, the wasted lives, are then the surplus value that emerges by the act of consuming human lives as inputs in waste production. By *immanent*, I mean that capital necessarily but not exclusively emits *ugly* surplus value (ugly as in the aesthetic category) as a result of its inner workings, an issue that cannot be gauged by question of degree.

The "war for war's sake" and the "war for oil" nexus robs the Arab masses of their power and, hence, the right to their resources and development. The little remaining oil revenues, after the US-led imperialist class grabs its share, is deployed by the comprador in Saudi and other Gulf states to sow identity divisions amongst the Arab masses. As every country becomes a tinderbox of various sects vying for their share of the imperialist imposed scarcity in resources, either development goes into a tailspin as a result weaponizing cultural identity against the working class or the US-led military intervenes to dismantle the productive order of society.

Scarcity is a derived condition of central overproduction. Upon such constructed scarcity, a "lifebuoy ethic" is mounted. Because the world is sinking in its fight for supposedly scarce resources, and because the West cannot accommodate refugees dipping into its scarce resources, sinking refugee boats at sea is not all that unethical. However, the degree of perceived scarcity as self-evident truth corresponds to the degree of development or the degree to which the masses own and control their resources. Development is

thusly a resultant of the class struggle. In its ideological stance, it is the demystification of the fetishes of capital alongside the strengthening of the global working class front contra imperialism.

By the time of the Arab Spring in 2011, it had become pellucidly clear that the masses in the AW have lost the momentum of the class struggle and, correspondingly, the AW experienced lumpen development or de-development (Kadri 2014). Standards of living fell below subsistence – that is below the historically determined level of the living wage, and the numbers of war dead since the launch of the USA's war on terror, not counting earlier wars, has reached anywhere between two and four million people, mostly Arabs, while the number of internally and externally displaced refugees is several times this figure (Physicians for Social Responsibility as quoted by MintPress News. Do The Math: Global War On Terror Has Killed 4 Million Muslims Or More A recent study suggests the "War on Terror" has had two million victims, but reporter Nafeez Ahmed claims this may be only a fraction of the total dead from Western wars. https://www.mintpressnews.com/do-the-math-global-war-on-terror-has-killed-4-million-muslims-or-more/208225/).

These imperialist wars created trillions in US debts to be redeemed by the working class or, on the flip side of the accounting identity, an equal amount of risk-free credit to the US-led financial class. At the same time, these wars are part and parcel of the global production process. Their relative and absolute depopulation, or the act of trimming down the costs of the immense reserve army of labor to the requirements of underutilization under crisis of overproduction, is both a production sphere of waste and a stage of anachronic realization for other spheres of production. Anachronic is used here in the sense that in a continuous cycle of production there is no particular sequence in chronological time to follow. At any rate, the making of surplus value does not occur in the limited space of the single factory floor. Nor does the commodity that such a factory produces realizes represents the final stage in the chronological order in which it was sold on some market. In an interconnected global production process, the whole of the input-output chain is the real factory. The social product,

the incremental additions to the physical instantiations of the surplus value, begins with the making of people and ends with the remaking of people. The turnover cycle, the time in which the first commodity, labor power is produced until the time depopulation regulates the production of the stock of labor power for the production process, is a recurrent cycle occurring in social time, or the class-struggle *cum* power-derived time.

The contribution of social nature, the nature that reproduces man, and much unpaid or underpaid labor to the making of surplus value are unnoticed until power balances, including the fluctuations in the self-realization of revolutionary consciousness, shift and assign market prices to the past value inputs, such as the environmental taxes paid today. Social or abstract time is the concomitant of the forces that own and controls the means to compress or decompress the necessary labor time in production while managing unutilized resources by disengagement or, in the case of people, by outright depopulation.

Although un-developing and disarming the Arab masses has always bestowed Europe with power over much of space and time, the discovery of oil early in the twentieth century and its pursuit for strategic control has turned the Arab region into a furnace for the war-industry. In particular, the USA's reign over the Gulf region's Hormuz or Bab al-Mandeb Straits, channels where much of world trade and nearly a third of all seaborne oil passes, is an immediate lever of power over much of the globe and a pillar of imperial rents. Oil is the principal commodity backing global dollarization (Patnaik 2009); however, the strategic control of oil is what ensures that oil sales continue to be dollarized while holding energy insecure nations hostages to US policy (Kadri 2016a). The proximity of the AW to Europe and later its strategic oil reserves have qualified and distinguished the practice of imperialism in this region and the features of Arab struggles.

The Postindependence and Arab Socialist Experience

As the rest of the developing world, the Arab world emerged from colonial rule burdened with underdevelopment. Colonists ensured the national bourgeoisie remained tied down in merchant activity as opposed to industrialization. The reshaping of the then budding Arab bourgeoisie into a subordinate merchant partner of Europe can be dated to European and, specifically, to early nineteenth-century Napoleonic changes to landholding laws empowering individual capitalists (Abdel-Malek 1968). In Egypt, the rise of the Egyptian bourgeoisie in its commercial form corresponds to the Napoleonic law of 16 July 1798, which allowed Egyptians to own land, and to the steps taken by Mohammad Ali to distribute two million acres between 1813 and 1816 to state officials. Similar reforms to land ownership boosting cash crop production occurred in the Levant (the Silk cocoons) as well as the Maghreb (subtropical crops).

The postindependence national bourgeoisie exhibited a shortage of finance and real capital and had shady ties to the previous colonist. As such, it has then become possible for a coalition of classes to constitute a surrogate bourgeoisie, a state bourgeoisie, and fill the class power vacuum (Hussein 1971). However, the embryonic formation of the intermediate stratum (the state bourgeois class) took hold as Arab industry in the early twentieth century grew under the shadow of European industry and war (Abdel-Malek 1968). The intermediate strata, bureaucracy, and professionals grouped around the state represented the state bourgeoisie. In terms of structure, the intermediate stratum comprises skilled professionals – such as schoolteachers, university professors, civil servants, accountants, military officers, medical doctors, engineers, and lawyers – whose status is not dependent on the ownership of property and wealth but on their training and performance. The intermediate stratum refers to a differentiated relationship within the working class distinguished from the less-privileged working-class on the basis of salary, education, skill, and, more decisively, by the degree of control over the means of production delegated to it by the military. Note that in a war context with weak institutions resulting from the potential insecurity of the state, the military emerged as the key player on the Arab political scene. In these new social relationships of production, the state bourgeoisie

maintained not only its relation to the means of production through the state itself but also distributional arrangements that reinforced the pace of capital accumulation. This was the organized dimension of capital under the class of Arab socialist regimes: a political process safeguarding capital as a social relationship and the inevitable capitalistic growth of the state bourgeois class.

The Arab bourgeoisie remained in its weak and subordinate state until the time of independence in the mid-twentieth century. The struggle for independence was a combination of national and class struggle against the colonial powers and its comprador sections of the bourgeoisie. The history of modern Arab states, like European history in the nineteenth and twentieth centuries, is a history of national movements (Rodinson 1978). Alongside the national struggle for liberation, there existed a social struggle against a national bourgeoisie tailing Western colonial interests and industry.

After independence, the design of the state and its constitution mirrored the degree to which the power of the comprador was extirpated during the wars of national liberation struggles. In Algeria where the comprador was eliminated, for instance, a people's socialist republic followed, whereas in Lebanon, a deal was struck to leave the comprador and its sectarian social constellation in power in return for French withdrawal (El-Solh 2004). In Lebanon, France left behind a superb working class-dividing state and a comprador that suppresses anti-imperialist resistance. Jordan's buffer state model and other Arab monarchies function similarly to the Lebanese model. However, the undercurrent function of these compradors is to lay the groundwork for militarism and set alight their own social formations.

As elsewhere after the end of the Second Great War and in the postindependence period, the AW experienced a bout of development, which rested on the then prevailing policy order of industrialization alongside protective and regulatory finance and trade measures. Of all the Arab countries, the socialist Arab states such as Iraq, Syria, Egypt, Algeria, Libya, and, somewhat later, Communist South Yemen exhibited a healthy growth and developmental record. These were blurred copies of the USSR's model combining, security, development, and industrialization. Although it is

difficult to compare two processes across different time periods, still in terms of real measures that are weighted historically, the Arab socialist model has outperformed the ongoing neoliberal model in terms of growth, productivity, and rate of employment generation (Kadri 2016a). These states undertook massive land reform measures, nationalized industry, and financial institutions, provided universal healthcare and education, and clamped down on the cycle of resource usurpation. This class of Arab states adopted a policy of self-reliance and sought self-sufficiency in production, endorsed import-substituting industrialization, and effected public investments in heavy industry while synchronizing the demands of a growing industry with adequate human skills. These states relied on technology transfers while endogenizing know-how through linkages. To be sure, standards of living are historically determined, that is they are a subset of a continuously rising wealth level, the period 1960–1980 represented an epoch in which Arab countries displayed a more dynamic performance in terms of real wage growth, more equal income distribution, and sturdier improvements in infant mortality and life expectancy, as well as many other social indicators (Kadri 2016a, 2017).

Accounts of the detailed aspects of the interface between national policies and their developmental outcomes show that the broad determinants of the relative success of the Arab socialist regimes stem from the fact that they tackled security and developmental concerns jointly. In terms of definitions, development policies remain the resource-channelling mechanisms that direct wealth flows to the social class in command. Security is a totality that encompasses communal and national securities, knowledge-related productive capacity, including health and education, with working-class security the backbone of national sovereignty.

Despite the fact that the Arab socialist model has been an engine of growth, the twist of the mainstream in explaining the shift away from Arab socialism remained stuck in a fictitious story of rising debt associated with war effort or a failure of import substitution policy, which had put the brakes on the advance of government spending. To be sure, this is the same spin tale

that was developed with the rise of finance and neoliberalism to arrest the development of state supported social programs elsewhere. However, the debt to GDP ratio under Arab socialism was lower than at any other stage in the neoliberal phase. The debts of Arab socialist countries were principally associated with Soviet weaponry purchase against loans handed at concessional rates. Moreover, industrialization proceeded at very high rates under import substitution policies, unlike the de-industrialization experienced under neoliberalism. The turn away from socialism was the by-product of an anti-socialist ideological slide gripping the world, to which Arab defeats in Arab-Israeli wars acted as catalyst in the transition to neoliberalism.

At a further remove, the emphasis in Arab socialist policy was on industrialization supported by agricultural land reform and rising productivity. A sort of harmonious development in which rising agricultural productivity freed the state to supply credit to industry and social endeavors. In the mid-1960s, the Syrian Ba'ath carried out massive land reforms. In Iraq, the Ba'ath nationalized oil in the 1970s and redistributed land and oil revenues in more equitable ways. In Egypt, state-owned enterprises accounted for about 60% of value-added in manufacturing, and in Syria they accounted for about 55%. The output of these newly established public enterprises recorded 13% of GDP in Egypt and 11% of GDP in Syria (Richards and Waterbury 1990). In every case, land reform accompanied industrialization, and increasing agricultural productivity partly stemmed rural–urban migration. Until 2006, Syria was exporting cereals (AMF 2007). With extensive social investment, standards of living rose significantly (Ayubi 1995; Anderson 1987). In the uncertain immediate post-independence war-threatened environment, the state acted as a guarantor of long-term investments in plants and equipment. State-owned industrial and agricultural banks lent to national projects at low long-term rates. A so-called blacklist protected national industry from foreign competition. A tightening of the capital account and a multiple interest and exchange rate policy galvanized national resources and provided exchange

rate stability. Subsidies and price controls in essentials raised the standard of living for the rural population, while increasing agricultural productivity lowered the costs of basic commodities for the working classes.

There are no factual grounds to support the thesis of the imperialist corpus, which blamed debts, import substitution policy and war fatigue for the failure of Arab socialism. It is the class as agent of history that does and not the procedures it takes to self-reproduce, its instrumentalization of policy, which do. The latter mode of thought is utter reification. Given the failure of the neoliberal model, it is not difficult to prove that socialism had outperformed the neoliberal model on economic dynamics and social measures. Deficits, inflation, and unemployment were all at lower and tolerable levels. What was intolerable was the state of military and ideological defeats that shifted the allegiances of bourgeois, military, and sections of the intermediate strata, the state bourgeoisie, from the national base to foreign class alliances and pursuits.

At any rate, the shift in policy is a symptom of a class and ideological swerve to the right that was taking place on a global scale. The defeat of socialism was associated with socialist ideological defeat across the globe. Imperialist Anti-Arab belligerence, especially the devastation of Iraq in 1991, coincided with global retreat in socialist ideology. The alignment of national defeats with the collapse of internationalism resulted in more than mere destruction of assets; the AW introjected defeatism and lost its ideology of resistance, Arabism, and its related socialism. Larger scale imperialist inflicted carnage, hunger and malnutrition followed. One substantive reason, which shows that Arab socialist regimes were not wholeheartidly committed to the working class cause is the absence of organised popular armies. A peoples' army would have mitigated much of the losses incurred by the working class once the transition to neoliberlaism occurred.

Imperialism does not rest while the Third World develops. Its anti-Arab wars, in Suez 1956, against a debilitated Algeria by the Moroccan proxy in 1963, the wars visited upon the Yemen in 1962, and the 1967 and 1973 Israeli

aggressions and occupation of new Arab lands are but few examples. Imperialist interventions such as the crushing of the Dhofar revolution in Oman, the manipulation of the Kurdish people struggle for self-determination in Iraq, and above all the infiltration and subjugation of the Fatah-Palestinian leadership, which ended up as a proxy army for Israel policing Palestinian resistance, are landmarks of imperialist sabotage.

Why emphasize Palestine? Because forfeiting the Palestinian historical rights is not only a land issue, it is a recognition of the power of US-led imperialism. Such step is the doorway through which the comprador across the globe can further submit to the USA's demand of value usurpation by the Alibi of a conforming Palestinian leadership. As Mao Zedong noted "it is not just a question of Israel but of who stands behind Israel." (Quoted from Democracy and Class Struggle http://democracyandclasstruggle.blogspot.com/2011/02/chairman-mao-zedong-on-palestine-and.html) Colloquially put, if the indigenous people of Palestine accepted the terms of imperialism and its offshoot in Zionism, then why should anyone else Don Quixote the hegemon or be a last-ditch resister against an uncrushable US power. Such is the weight of the Palestinian question in the international class struggle.

The Weight of History

Capitalism, the historical period characterized by the rule of the capital relationship, dawned at around AD 1500. Forms of waged work in navigation and soldiery began to take shape prior to the sixteenth century. As the planet recovered from its demographic slump, circa 1450, and as China grew inwards with its land Silk road encumbered by Tatar invasions splitting the far from the near East, Europe was the only space set to lead by the practice of capitalism. Apart from the global shortage of labor during the pre-sixteenth century decline, which made labor dear and boosted agricultural productivity (Wallerstein 1974), the Crusaders hiring of Venetian ships and traders hiring their own armies to impose their trade conditions (Edwards and Ogilvie 2008) are

circumstances of capitalist wage processes (Kadri 2016b; Edwards and Ogilvie 2008). Merchant wealth was the precursor to capitalism and it grew by the practice of European piracy, pillage, and control of sea trading routes. (The warring Ottomans, Mamluk, and Timurids, including the latter's occupation of the Levant and severing the land Silk road plus the mass transfer of the Levantine artisanal workforce, were all factors at play to Central Asia represent some of the early conditions of Oriental lapse vis-à-vis a victorious Spanish Kingdom empire. Taqoush 2002.)

> The discovery of gold and silver in America, the extirpation, enslavement and entombment in mines of the aboriginal population, the beginning of the conquest and looting of the East Indies, the turning of Africa into a warren for the commercial hunting of black-skins, Signalised the rosy dawn of the era of capitalist production. These idyllic proceedings are the chief momenta of primitive accumulation. (Marx 1867, Ch. 31)

The early manifestations of capitalist accumulation, its primitive accumulation, were waged work in the practice of colonial butchery and genocide, as opposed to the rise of procrustean model of capitalism in the English agriculture as per Brenner (1977) and Woods (1998). The latter internalist view is logical, as in formal, but not historical. The world's history cannot be confined to the English countryside unless one's perspective of history, specifically, the universal *culture* necessary as subject for development in the productive forces, the stock of humanity's knowledge cannot be limited to that countryside. In its decisive moment, capital is a waste-producing social relationship (Kadri 2019). The growth in merchant wealth alongside rising global demand necessarily expedited rising productivity associated with new forms in the social division of labor.

Shoots of capitalist development were in evidence in many parts of the globe; however, as is necessary for capital in its course of development, the industrialization of one part requires the deindustrialization of another weaker part. The slowly incubating capitalist relations in the AW picked up speed in the late nineteenth and early twentieth century, but these were the sort of capitalist relations that undermined indigenous productivity. They commodified all forms of social relations

S

but stunted the capability of society to meet the basic subsistence requirements by local means. It is the sort of asphyxiating measures that regulate social, including demographic, reproduction. The practice of the Napoleonic French invasion of Egypt exemplified in the destruction of local sources of knowledge, the burning of Al-Azhar University, the infusion of sectarian divisions, and the theft of archaeological sites, all of which are prelude to the more austere measures to follow upon by the colonial forces to arrest Egyptian development (Al-Duri 1969).

In Ottoman times, neither the grip of the state over its expansive territory nor the level of development in capitalist social relations, technology, and production know-how could regiment resources, especially human resources, to potentially socialize them. The Arab peasants were unlike the more sedentary European serfs (more bonded to the land), and they enjoyed more freedom of movement (El Kodsi 1970). Despite nearly half a million people employed by the Ottoman states in various social functions (numbers from Gelvin 2004, p. 80), the empire's capacity to engage technological change and productivity was still lagging in comparison to Europe. While the modern nation-state was already an instrument of European capital and advances in wage-driven production were afoot, the few Arab experiments that attempted to uncap production potential wealth via capitalist development – Mohammed Ali of Egypt and the industrial southern belt of the Ottoman Empire linking Tripoli, Aleppo, and Mosul – were strangled in the cradle (Al-Duri 1969). The shaping of capitalist development by colonialism selectively reinforced repressive precapitalist relations as the ruling relations of the colonies for ease of control. Colonialism institutionalized designated cultural identity making it the principal form of organization and means by which such ascriptive groups could access their rent/share acquisition of the social product. The newly politicized cultural identity, imposed by capital through the constitution as the purveyor of rent, crushed the old social order and splintered the potential for the formation of a cohesive, identity-subsuming, working class. The inter-working class fragmentation, often leading to inter-working class conflict, is itself

foundational for the regimentation of the labor process and the nonfictitious disasters of a fictitiously constructed capital.

Once outlying social formations and their resources come within reach of European colonialism, they fall under the rule of the capital relationship. They become capitalist irrespective of their outdated technology. Their resources will be actually or potentially commodified, as in consummated, or awaiting consummation, in the circuit of capital. The same capital relationship that encourages productivity in Europe, established that while there was a secular trend of population growth globally, the developing world's industrial expansion and productivity should remain sluggish. The developing world should not modernize nor meet the demands of population growth. Its growth should be tied to the demands of central capital. The imposition of de-modernization upon the South founds the contradiction between capital and demographic growth resolved in measures of absolute and relative depopulation. It is the political rule of capital and not the level of advancement in machinery, which determined the rates of depopulation and accumulation of capital as well as ascribe capitalism to a social formation.

Salient accounts on the rise of Arab capitalism pin it down to the high rate of expansion of European capital as it hitched Arab formations to colonialism (as in Owen 2004). But just as the degree of advanced machinery alone does not signify the onset of capitalism, the same could be said for a higher degree of integration by trade volume with Europe. The empirically constructed concept of machinery, its material substance alone, informs little without the social relations setting into process the progress of machine development.

Prior to European colonial ventures, the Ottoman Empire was experiencing a dual course of development towards capitalism: firstly, by the development of its own capacities, and, secondly, by its desultory ties to European capital. Capital as a social relationship arose in the AW as it did on much of the planet, via the exigencies of development in the productive forces, but its hold over social processes was cemented as the power of Europe weighed-in structurally, that is by the

perceived mass of its rising European power, or actually as Europe became the de facto colonial power. The Ottoman Empire was shifting its property laws by the outside pressure of Europe even before Europe set foot in the AW (Lutsky 1969). This differentiation is key because it responds to the Eurocentric argument that capitalism was purely a European phenomenon related to its liberal values whereas its fast pace of development was co-integrated with the de-development of hegemonized Southern formations. The capitalist rupture between the forces and relations of production is an overdetermined historical condition, a collision of coincidence and necessity in the historical event, whose subject assumes the structure of European capital. It is the rising power of Europe that charted the redesign of older forms of political organizations into nation-states, the type of civil administrative service governing social life processes. As Europe's power rose, the historical process dominating the AW became a product of colonialism.

To be sure, there were cash crop cultures across the AW. Palestine exported half a million boxes of oranges to the UK in the late nineteenth century (Scholch 1982). However, much of Arab agriculture remained at subsistence level with immense numbers of demobilized labor. As trade volume with Europe rose, colonial capital further subsumed the Arab subsistence agriculture. It hegemonically articulated the Arab mode of production into what Mahdi Amel dubbed the colonial mode of production (Amel 1990/1972). Although enjoying some textile industries and dozens of commercial sea trading posts prior to European colonialism, the AW could not leap ahead of Europe in developing its productive forces because its subject assuming an autonomous political structure had already been stymied by rising Europe. In addition to political subjugation, the AW lacked a centralized political authority. There was no "precapitalist" Arab formation being assimilated by the Europeans; once capitalism arrives on the world stage, the world that falls under the real and ideological dominion of Europe becomes capitalist. As such, while the manifestations of capital in Europe assumes rising productivity with advanced machinery, it assumes forms of slavery or genocide in the colonies, where the principal product of capital centers around the premature consumption of human lives.

Once under colonialism, the colonial power implanted itself in the nascent Arab states as the ultimate power broker. The surplus peasant population, although apparently delinked from capitalist production, it represented a mass of workers that predicated the capitalist labor process and maintained downward pressure on national and international wages. The social cost of colonial labor reproduction was regulated by severe austerity and war, resulting in constant depopulation. The rate of premature deaths relative to historically determined life expectancy mirrored the trends in the rate of surplus value and value drain.

Capital after all is a social relationship of control, *an ideology arising upon a social relationship tout court whose dynamic of profit making drives the movement in the material substance supporting or, more appropriately, un-supporting life*. As a class relation, it has straddled the Arab historical process. It is not therefore possible for a hybrid mode of production, half capitalist and half precapitalist, to have emerged when capital is defined as a social relationship, a subject to object relationship, as opposed to capital being just the object, a pile of commodities or a mass of money. Adjacently, there is no such a thing as good or bad capitalism. Capitalism, the history in the making, is an objective and impersonal historical process. In the AW, capitalist relations sublated (preserved and negated) noncapitalist relations to the extent that their impact on the social regimentation of labor served the desire of the stronger European capital circle. As a matter of primacy, debilitated by European military incursions from the outset, national capitalism germinating in the AW, the accumulation of knowledge setting on course a rise in endogenous productivity could not have possibly pursued its own route to development. Once "a world economy becomes the economy of the world" as per Braudel, capital's law of value governs the labor process, its associated reserve army of labor, and wage system emerge. The wage system transforms precapitalist social relationships. They, however, do not become ancillary to the central labor process, serving to deliver inputs into the

"final" commodity that the Western world produces with better machinery. They become the determining moment of capital and its accumulation process, the beginning and the end of the turnover cycle at once, and the order that is maintained by the shape and substance of the political form of organization, *the state or pan-statal forms whose principal function is to differentiate labor.* Unpretentiously, there is more in the sale of human deaths by capital's machination, in real value and corresponding price form, than there is in the sale of a BMW.

In colonized formations, the colonial power chooses the measures of distribution by which value emerges from the labor of the subjugated working class, but more importantly, it designs how the distribution impacts all the joints of social and political domination. The newly erected Arab state gestated socially in a colonial anti-developmental context, and the forces opposing indigenous development were reinforced by the discovery of oil qua oil control. The inertia of colonial underdevelopment and its unequal exchange lingering from colonial days still affords the postcolonial imperialist forces with the authority to dictate the terms of exchange. Here I am using unequal exchange to mean the totality of interactions and value relations and not the narrow declining barter terms of trade dictum of dependency theory.

Following the success of the early and mostly socialist-leaning postcolonial development project, Arab capitalism has relapsed into severe crisis since 1980. Its rate of build-up in productive capacity generated from within has been sluggish. Instead of social transformation and institutions mediating local development requirements with their global contexts – including knowledge exchange and trade that could galvanize local production – the militarized side of global capital seized upon the opportunity presented by social retrogression and unemployment and shattered the Arab social entities with a paraphernalia of identity politics. In resource-deprived formations, the schism between social being and social consciousness, between what living conditions are and what revolutionary ideas engage people in a development project, gaped wide.

After Colonialism

After decolonization, many Arab states, weakened under military or neoliberal assaults, were dubbed "failed" or semi-failed states. In its social impact, the neoliberal package is not too distinct from military assaults; in the AW at least, neoliberalism is itself an outcome of Arab defeat, the defeatism accruing to revolutionary consciousness, and waning sovereignty. By the latter, I mean popular democracy gauged by the control of the masses over the means and channels of value creation and transmission. Neoliberalism in the developing world is synonymous with the tribute transfer channel to empire. No cohesive working class represented in a state would tolerate surplus drain under neoliberalism unless it were in a state of surrender. Arab military defeats imposed the neoliberal wealth-draining policies and restructured national classes to imperialist terms. More recently, many Arab states, such as Sudan, Yemen, Libya, and Syria, have splintered. These fractures are not a one-time occurrence after which states are resurrected in better form. There are no Marshall plans here. By the imperatives of militarism, the domain of accumulation, imperialism incites and rears outstanding proxy wars as means and ends at the same time. Arab states may retain the outward display of national symbols and borders, but they are steadily collapsing, and their process of collapse is the desired end that imperialism seeks to maintain. As a matter of building national development, it is not only the Arab state effectiveness in development that is receding but it is also health, education, life expectancy, and the social costs of the reproduction of labor alongside the productive infrastructure.

The old colonial powers left the AW but did not leave it much freedom to develop. Apart from the Zionist-imperialist wars and other covert measures of destabilization against the progressive Arab states, the comprador represented mostly in the Gulf states used oil revenues to fund reactionary Salafism. As socialist ideology retreated globally, the doctrine of Salafist Islam mystified living conditions. The obscurantist Gulf comprador reinvented and weaponized the colonially constructed identity forms, such as Sunni/Shiite, as means to polarize the working class. Arab

migrant workers returning from the Gulf to the protected economies of Syria and Egypt in the early 1980s were holding on to high-purchasing-power US dollars exchanged on the clandestine market for several folds the official exchange rate and acquiring social assets cheap along with the ideals of anti-socialism. It may be as well to note that political Islam was the Trojan horse of colonialism, first reared by the British and then by the USA as its sponsored hordes of the Mujahedeen who fought to Soviets in Afghanistan. Between defeats in war imparting defeatism and the crushing of the spirit of resistance and the inculcation of purely formalized modes of comprehending reality, a logic unrelated to all that is real, the general state of consciousness mimicked a schizophrenic way of perception – a confounding of the causes of underdevelopment, the imperialism at play, for its symptoms embodied in reactionary regimes, sectarian working class divisions, and immiseration (Matar and Kadri 2015).

Hegemony over the AW served as both, a logical and a historical *sine qua non* for US-led capital to contain other rising powers. Imperialism in the AW can best be explained with politics first and economics second – literally in that order. Merchant accounts that US-led capital's ultimate goal is to own all the oil wells, as if by title deed, or to trade with this poorer part of the world whose total working class income is less than 1% of world income, conceal the fact that capital is primarily about control, hegemony, and regimentation, and that without these conditions neither appropriating the rents from oil nor drawing the strategic control necessary to set oil as the commodity standard of the dollar are viable. When in control, imperialism practically owns the resources, regulates the social production process, and controls the value transfer channels.

Conclusion

On the face of it, the imperialism visited upon the AW appears to fulfil capital's insatiable thirst for cheapened resources and the power it takes to command the circuit of capital. At its core, imperialism is an intensification of the law of value, especially its militarism, a subcategory of accumulation by waste, *and* the practice of violence. The Western corpus narrowly perceives the law of value as the measures that regiment and discipline workers on the factory floor. These are mostly workers slotted under the category of productive labor, engaged alongside advanced machinery, creating supposedly high rates of surplus value, and producing a rather expensive product. Surplus value is not value added. Productive labor is not living labor, and it is living labor, which is the source of surplus value. The organization of living labor is an exercise in dictating the length and the quality of life. '*Since the labourer passes the greater portion of his life in the process of production, the conditions of the production process are largely the conditions of his active living process, or his living conditions, and economy in these living conditions is a method of raising the rate of profit'* (Marx 1893).

A broader more global view of accumulation constructs the law of value as the mainly violent measures undertaken by imperialism to regulate the reproduction of global labor. An offshoot of such understanding follows from the fact that militarism is a domain of accumulation and, hence, war is a market whose death or waste products are value in their own right. Arab formations provide a vibrant space upon which the war industry thrives and realizes its end in destruction. Arab states are also imperialist pawns whose control boosts inter-capitalist positioning and financially accrued imperialist rents. Conversely, Arab autonomy with respect to territory, resources and policy becomes anathema to imperialism. Subsequently, Arab reverse of development or the lumpen development under neoliberalism correlates with the structural terms of surrender to imperialism.

Sources of Surplus Value and Imperialism

Richard Krooth
Social Sciences Division, University of California, Santa Cruz, CA, USA

Definition

Empire turns on prime forces: a stronger power's initial siege and pillage of material values from a weaker one, followed by a yoke of tyranny imposed upon resisting populations and extraction of surplus-value from their labour.

Here we sketch these contours, framing each historically, concentrating on Britain's evolving global empire and its ideological foundations, crisis of capital accumulation, and expanding colonial system.

Material Value

The underlying sources of *material value* are not generally known or recognised as being associated with the Sun's irradiation of Earth that, over the last 4.8 billion years, created and stored energy in rock, soil, water and atmosphere; energy ultimately used by plants and animals.

As living varieties, these sustained and gave life to our species to gather, hunt, and domesticate the means of existence, providing the sources of energy that populations require for survival and shaping materials for personal consumption and exchange (Krooth 2009).

Over the stretch of millenniums, these initial sources of use-and exchange-values fused as *accumulated wealth* (linked to other forms taken through pillage, wars, and conquests; mercantilism and the extraction of labour-effort from those in bondage) in peonage or slavery, *ecomienda* or serfdom, wage-work or under the head-right system of tribal leaders providing community labour for the coin of empire.

Ancient and Modern Imperial Ruin

To one degree or another, all these sources of accumulated wealth came to centre in emergent primitive communities, feudal estates, enlarging cities, and imperial helotries: controlling, exploiting, and impoverishing populations and the natural world.

Failing agricultural output, internal social conflict, and military build-up often bred crises of too little food and resources to support local populations and maintain the power position of an elite among the discontented many. Failing legitimacy of the elite might then be offset by foreign conquests to replace diminishing domestic resources used to pacify home populations.

More intensive exploitation domestically and abroad foretold environmental tragedies: terrain denuded of forests; soil fertility declining and eviscerated; food production plummeting and putrefied; resources and raw materials in short supply; skills and crafts undermined; and attempts at foreign conquest meeting resistance and sometimes defeat.

S

Imperial ruin then set up new equations of power between social classes and between them and the natural domain, producing stresses that might only be lessened by conscious measures to secure both populations and the remains of the natural order. Yet most empires rose and fell without such resolution, leaving behind weakened, dispersed peoples and environmental degradation (29–33, 191–192).

Use-Values and Merchant Capital

Empires and their precursors nonetheless varied; and the nature of each left a unique footprint of collected resources and material wealth, still seen in ancient cities and museums.

Marx wrote that the merchant capital carrying trade of *use-values* practised among the Venetians, Genoese, and Dutch merely circulated commodities and money to accumulate profit. 'No matter what the basis on which commodities are produced, which are thrown into circulation as commodities – whether the basis of the primitive community, or small peasants or petty bourgeois, or the capitalist basis, the character of products as commodities is not altered, and as commodities they must pass through the process of exchange and its attendant changes of form' (Marx 1961a, p. 320).

Money or goods would be exchanged for products in one location at one price, then the products would be sold for more money or wares at another location, with the merchant taking the profit; next the process would be repeated, taking products to others buyers elsewhere 'where the principal gains were not made by exporting domestic products, but by promoting the exchange of products of commercially and otherwise economically underdeveloped societies, and by exploiting both producing countries' (323).

European Expansion

The future foundation for comparable merchant trade in use-values evolved as Europeans expanded their reach into the Americas.

Led by the discovery of the New World and driven by European drives to appropriate wealth, initial Spanish and Portuguese conquests in the Americas encompassed genocide and brigandage; followed by brutalising labour mining gold and silver; then agricultural field slavery; and, lacking biological immunities to European diseases, plague, from all of which the indigenes lost 81–90 million of their populations over the next 500 years (Krooth 2009, pp. 218–223; 237–238, 244).

Designed by Catholic popes an ocean away, issuing edicts dividing America into viceroy-alities to satiate a handful of crowned heads, noblemen and courtiers, they planned the importation of African slaves to mine bullion, to colonise food production under labour *ecomienda;* and thereafter by mercantilism to impose inequitable trade.

These were the sometime overlapping steps of the invaders.

By the opening years of the sixteenth century, the Spanish had contracted with the Portuguese to supply slaves for their New World colonies. And the Spanish sovereigns then began a system of special contracts (called 'Assiento') with foreign nations, corporations, or their subcontractors to bestow from time to time a monopoly to supply Africans for their American possessions (Krooth 2013, pp. 32–33; Morel 1969/1920, pp. 15–19, 153–155).

Early records vary recording this lucrative commerce in human flesh and labour. But from 1776–1800 an average of 74,000 slaves each year were imported into all the South and North American colonies and territories, totalling 1,850,000. The Portuguese annual average alone was 10,000 (Morel 1969/1920, pp. 15–19). On went the carnage until more than 10 million souls were chained in the Middle Passage, more than half of them dying in wretchedness of starvation and sickness en route.

From the Sundered

From the sundered was torn labour's toil, transformed into ingots fulfilling the mercantile system's conception of wealth (Krooth 1975, p. 2, 2013, pp. 33–35).

Thereby, between the European discovery of America and the acceleration of Britain's initial

industrial revolution about 1760, some $1,859 million in gold and $3,994 million in silver were produced by enslaved populations throughout the world. As the periodic production of bullion rose steadily eight-and-a-half times, the major European sea powers accumulated metallic wealth in order to pay past debts to the leading Italian banking families, the Lombards and Fuggers, the remainder to buy foreign wares and to lay the base for new capitalist industries (Krooth 2013, pp. 35–36).

The Spanish concentrated on Mexican slave mines, eventually becoming the principal colony for extracting gold and silver, shipping one-fifth to the Spanish Crown in Madrid. Under occupation, the population meanwhile plummeted from 11 million in 1519 to some 1.5 million around 1650. (36; Wallerstein 1974, p. 189, fn 74).

From Mexico, Father Mololina openly denounced the Spaniards' cruelty, fulminating that 'countless' natives were killed in labour in the mines; that forced service at Oaxaca was so destructive that for half a league around it one could not walk except on dead bodies or bones; that so many birds flocked there to scavenge that they darkened the sky. Only he who could count the drops of water in a rainstorm or the grains of sand in the sea could count the dead Indians in the ruined lands of the Caribbean Islands (Hanke 1959, p. 22).

With brutalising efficiency, the *ecomienda* system also enslaved native peoples and chained millions to the land. Miguel de Salamanca, the oldest and most authoritative of the Spanish clerics, described the system as 'Indians … being allotted for life in order that, working as they are worked, all the profit deriving from their work goes to those who hold them in *ecomienda*; whereas this form of *ecomienda* and the manner to which it is executed is contrary to the well-being of the Indian Republic' (Hanke 1960, p. 56).

Little bullion was discovered north of the Rio Grande however, Britain gradually turning towards establishing mercantile colonies, changing policies from seeking to accumulate wealth by raiding gold from the Spanish Main to establishing colonial trading territories from which emergent British industries could draw low-price raw materials to manufacture and return them at a high-price to the colonial market (Krooth 2009, pp. 215–217; Lewis 1841: passim; Smith 1937, pp. 531; 555–556).

Mercantile Capital Accumulation

Starting in 1660, the British mercantile or colonial system moved beyond accumulating profits by pure merchant trade. Copied from Dutch merchants and adapted in Charles II's first Parliament as a *Navigation Act* (renewing and extending one passed nine years earlier), its object was to exclude the ubiquitous Dutch and other foreign shippers plying the North American colonial trade at a moment when barely half of England's 13 North American colonies had been established.

Britain was determined to completely regulate mercantile trade.

As the colonies were viewed as vast 'plantations' existing for the welfare of the Mother Country, they were to supply what the Mother Country could not produce herself, and to take in exchange the surplus produce and manufactures of the Mother Country. Colonial industry was to be stimulated or not along the lines of this policy. While the welfare of the colonies themselves was a secondary consideration, it could be generously measured when it produced no conflict with the welfare of the Mother Country.

It thus was to be a closed commercial system. No goods were to be imported into or exported from British possessions save in British or colonial ships. And under a system of 'enumerated articles' covered by more than 100 acts of Parliament, Britain admitted to her ports colonial foods and raw materials at a lower duty than was levied on similar goods from foreign nations.

The system also concentrated on mercantile colonies as a vent to sell at a high price varieties of British manufactured textiles, tools, and other factory products. Colonies were to sell to England at low prices their foods and produce to feed the Mother Country's emergent working class; to supply British factories with low-cost raw materials so that the manufacturers might secure for

themselves all the advantages arising from their further improvement at elevated prices – also prohibiting the colonies from manufacturing goods (not even a nail for a horseshoe railed the Earl of Chatham in Parliament) for their own markets, effectively keeping colonies and their labourers as permanent debtors (Krooth 1975, p. 3; Lewis 1841, pp. 206–208, and passim). The resulting trade balance favouring Britain actually reflected more labour-toil drawn from the colonised exchanged for less labour-effort drawn from Britain's factory proletariat using machines driven by steam-power.

When the North American colonies had grown into large and flourishing communities able to mine resources, to manufacture, and to ship commodities, however, the British government required them to contribute to its expenses to subjugate them by arms; and though they had the means of payment, they also had acquired the power and disposition to resist. Describing themselves as Americans, anti-colonialism successfully began, leading to the 1776 revolt, victorious in 1783, eventually creating an unbroken continental nation from the Atlantic to the Pacific which was able to export commodities and, two centuries later, financial capital (Krooth 1975, pp. 3–6, 28; Lewis 1841, pp. 206–208; Sides (2006, p. 209, 214, 308).

Tracing the Past

Such expansive continental futures could hardly be successful in a geographically partitioned Europe of nation states, though after 1751 the wages system had become central to the British political economy, turning on increased factory production, employment of a dispossessed proletarian army, and expansive overseas markets.

As the Industrial Revolution took hold, the basic sources of surplus-value expropriated by capital and elaborated by empire were variously described by Scottish free-trader Adam Smith as being values created from workers' exertion over and above the value of the wages paid to them, seen as the underlying source of the wealth of all nations.

And yet by 1832, vis-á-vis surplus-value, English workers could no longer win higher

relative wages or improvements under the existing social order; they proved themselves unable to overturn and take charge of the production forces then in the hands of a determined owning class dominating parliament (Engels 1940, p. 14: Thompson 1963: passim),

Marx and Engels insisted nonetheless that this was the only path for labour to secure the full labour-value of its whole output.

Marx railed that: 'A forcing up of wages . . . would therefore be nothing but better payment for the slave, and would not conquer for either the worker or for labour their human status and dignity' (Marx 1961b, p. 81).

Engels more pointedly explained:

> It is not the highness or lowness of wages which constitutes the economical degradation of the working class: this degradation is comprised in the fact that, instead of receiving for its labour the full produce of this labour, the working class has to be satisfied with a portion of its own produce called wages. The capitalist pockets the whole produce (paying the laborer out of it) because he is the owner of the means of labour. And, therefore, there is no redemption for the working class until it becomes the owner of the means of work — land, raw material, machinery, etc. — and thereby also the owner of the whole produce of its own labour. (Engels 1940, p. 14)

Thomas T. Malthus held another view, emphasising natural restrictions on population growth by lack of the means of subsistence to maintain the multiplying millions.

Malthus had come to this conclusion in his 'Essay on Population' (1798) by drawing on Sir James Steuart, De Foe, and others to attack the French revolutionary teachings of Condorset. Rather than focus on the workers' lack of control of the means of production and inability to purchase their whole output, Malthus simply ignored the capitalists' appropriation of the entire product from which wages were paid. Rather, he said that the causes of labour's lack of sustenance were due to the population's reproduction on a geometric scale, while the landlords directed a peasantry that could only produce increasing quantities of food on a mathematical scale:

> Taking the whole earth and supposing the present population to be equal to a thousand millions, the human species would increase 1, 2, 4, 8, 16, 32,

64, 128, 256 and subsistence as 1, 2, 3, 4, 5, 6, 7, 8, 9. In two centuries, the ratio of the world's population to means of subsistence would be 256 to 9; in three centuries, it would be 4096 to 13, and in two thousand years, the difference would be incalculable. (Malthus 1926, pp. 13–16)

With such a dismal comparison, Malthus concluded that the only remaining alternatives were depopulation: 'positive checks' associated with famine, starvation, epidemics and plagues; general pestilence, other natural disasters, and the 'vices of mankind' such as murder and wars.

But at root, Malthus's system rested on a theory of landlordism in which under-consumption in society could be alleviated by calling on the landlords to take up any excess of production.

Malthus revealed he actually understood capital's exploitation of labour: the excess of production was due to the lack of consumers, given the capitalist class had little incentive to continue to employ workers to produce goods that could not be sold, clearing the market. Labour's wages would only buy subsistence, with capital's surplus equal to the balance of commodity values workers created over and above wages paid. Even the capitalists themselves did not purchase enough to take up the excess supply of commodities, for they sought to accumulate their savings.

With the market glutted, only the landlords were able to take up the excess output and keep the system operating smoothly. Malthus insisted that it was essential that a nation 'with great powers of production should possess a body of unproductive consumers' (Malthus 1836, pp. 38–39, 463). Here was a way to avoid the disastrous fluctuations of market overproduction.

Relations of Production

Adam Smith was alive to these and other changes in the source of value over time, viewing a nation's capital stock as equivalent to our present-day meaning of 'accumulated capital'.

Pointing to its sources from the ever changing relationship between investors of capital in workshop production on one side of the social equation, and on the other side, the employment of workers with nothing to sell save their labour-

power, Smith judged that a rise in wages paid by capital to those workers would necessarily follow when demand for labour exceeded its supply.

'The reward of labour, therefore, as it is necessary effect,' he wrote, 'is the natural symptom of increasing national wealth. The scanty maintenance of the laboring poor, on the other hand, is the natural symptom that things are at a stand, and their starving condition that they [the conditions sustaining national wealth] are going fast backwards' (Smith 1937, pp. 73–74).

When a nation's industrial ownership classes were *accumulating capital,* wages were increasing because employers tended to put everyone to work and there were more jobs offered than workers available. At mid-point in a nation's economic life (when the *capital accumulation* process slowed), employers tended to cut wages to lower the cost of production, in order to lower market prices and thereby stabilise or elevate profit accumulation. When the point of the *disaccumulation of captal* was reached, however, employers grew anxious to reimburse themselves for losses and pressured the labour force to accept lower wages for increased efforts.

Workers thereafter could no longer win a greater share of the value of their own output under the rigid social order; and to win the full value of their labour would have to strive to control the production forces still held by the capitalist class.

Class Entitlements to Surplus-Value

The distribution of surplus-value to the different sectors of the ownership class of capitalists and others ultimately bred a struggle between its claimants. Those who argued for their own class entitlements to portions of surplus-value variously supported, attacked, or sought destruction of the wage system.

Petty capitalist engaged in craft and petty workshop production wanted to destroy not only the wage system and the instruments of labour, but also the inventors who created the technology and methods which threw them out of craft labour by competitively superseding their workshop output;

the hallmark of the petty commodity form. They initially responded by hanging inventors of the machines that had put them out of work, burning and idling factories, and destroying the very commodities factory workers had made. As these methods failed to relieve the market crisis, they then variously moved to take over factories and to appropriate manufactured commodities. And a pending revolution possible, the owners responded by mobilising hired guards and state police to destroy the power of both anarchistic and organised labour (Mantoux 1978, pp. 23–42).

Socialists also wanted to destroy the wage system; but they were determined to capture the means of production as their own, not to destroy them.

Supporting the wage system, preserving the production relationship between capital and labour, were reformers like: John Stuart Mill, who believed that the market *redistribution of output* could be altered in favour of labour (Mill 1909, pp. 199–201, ff.); and Nassau Senior, representing the interests of manufacturers, who sought to annually pay workers subsistence from a fixed, invariable wage-fund and, as a residual, to reward capital's investment in production (rather than their use of it for personal consumption) with profits earned during the last hour of a 12-h workday (Senior 1836, p. 153, 168 ff., and passim).

David Ricardo: Protector of the Manufacturing Class

But the whole fault with capital's lack of a proper return on its investment lay at the doorstep of the landlords, insisted David Ricardo in his *Principles of Political Economy,* at base designed to protect the industrial class.

He argued that, as the land put into agricultural use produced diminishing returns and more labour was required to produce the same bushel of corn (that is, wheat), the landlords would receive higher prices. With the corn supply limited, and the Corn Laws keeping out cheaper foreign grain, high demand would raise corn prices. Land rents would reflect such prices as the

landlords parasitically cut deeper into what was rightly due to labour for subsistence and reproduction of its social class, and thereafter to capital. Thus were the landlords raising the price of bread that workers paid for subsistence, in turn raising their demand for wages, thereby reducing capital's residual share of surplus, causing the falling rate of profit on capital invested – though no additional quantity of manufacturing labour was required that independently would raise the price of manufactured goods (Ricardo n.d., p. 64).

Thereby the landlords were receiving rent as unearned income. And since they added to the cost of production by increasing the price of corn and other necessities workers purchased, driving labour's upward pressure on wages, the landlord's unearned surplus was at the expense of the residual share due capital *after* wages were paid. The landlords' appropriation of rents was thus opposed to the interests of both labourers and manufacturers.

A bitter argument broke out concerning the Corn Laws of 1815. The great landowning families had isolated themselves from every other social class by using the Corn Laws for their own selfish profit. And in 1838 the workers and owners united in the Anti-Corn League against their mutual oppressors, agitating for repeal of the duties on imported grain. Reaching a head in 1845–46, repeal of the Corn Laws initiated the golden age of free trade for the manufacturers, with their import of cheaper raw materials for manufacture in heavily tooled industries, and after 1850 cheaper foodstuffs for the working class (Krooth 1980, pp. 11–13).

Lines of Demarcation

Meanwhile, in Britain, how social classes were properly demarcated depended upon the way in which surplus-value was taken, distributed, and redistributed.

The free market was hardly free to the workers selling their labour-power, faced as they were with landlords and manufacturers monopolising the market prices that workers paid for subsistence and other commodities.

British landlords had long since kept their workers in check by turning the countryside into sheep-runs, driving serfs into parishes under the Speedhamland System and Poor Laws to labour in workshops under severe conditions in return for so-much bread and wine. When the labourers refused to work at capacity, the outraged parish ratepayers then abolished the subsidies, and the mill-owners carted them off to factories as slaves, there to labour and die.

The British mill-owners who drove the enslaved, then paid them in subsistence or not at all, carried their output to domestic markets at whatever price they could secure above their labour-value; then dumped the excess output in foreign markets, spreading their original investment in the fixed costs of factory machinery over the increased number of *all* units their workers produced. In so doing, they lowered unit costs, captured world markets, and maximised overall profits.

Between 1840 and 1880, market shares held by world traders changed. Though the United Kingdom controlled 32% of the volume of international trade in 1840, her share had fallen to 23% by 1880. And although the overall world market had vastly enlarged, with France's share barely increasing (from 10% to 11%), the upstart US post-Civil-War manufacturers had enlarged their share from 8% to 10%, and from 1871 the ongoing consolidation of Germany 'blood and iron' empire raised its share of global trade from zero in 1840 to 9% in 1880 (Ministère du Travail 1925, pp. 339–342; *Statistical Abstract of the US* 1921, p. 923; *Statistical Abstract of the US* 1928, p. 447, 450; *Statistische Jahrbuecher fuer das Deutsche Reich* 1880–1914: passim).

To prevent the domestic disaccumulation of surplus-value, free-trade Britain quickly: moved to protect its home market with tariffs just high enough to keep out foreign manufactured goods; undercut its competitors by dumping manufactured commodities at slightly lower prices; mercilessly driving its workers to outperform competitor nations, providing them with imperial imports of subsidised foods and five high-powered stimulants: sugar, tea, coffee, tobacco, and opium.

Thereafter, until 1880–82, foreign revenues became British manufacturers' (and the nation's) major source of accumulated surplus.

From Mercantilism and Free Trade to Financial Capital Exports and Colonies

The wages system and free trade were locked together in an unholy dance that periodically led to a larger body of workers than available wage jobs; the vast accumulation of surplus wealth from labour-toil at home; nonetheless falling profit returns on capital; the bank centralisation of previous forms of assets and revenues; the accelerating export of finance capital, iron, steel, and machines; as well as administrative oversight of colonial production (Krooth 1980, pp. 19–20; see also Andrew 1910, p. 3, Table 1; 17, Table 7; 18, Table 8).

Though the population of England and Wales increased about 20% from 1861 (28,927,485) to 1881 (34,884,848), Britain still had to import food as agricultural employment and production did not keep pace. Per capita consumption of foodstuffs, as well as stimulants like tea and sugar, meanwhile went up (3.68 tea/sugar lb per capita in 1867, and 5.02 lb in 1887), helping to drive the workforce to greater production of coal (1877, 14,610,763 tn; but 1887, 162,119,812 tn); pig iron (1877, 6,608,064 tn; but 1887, 7,471,000 tn) and steel ingots (1877, 904,567 tn; but 1887, 3,1916,778). As the basic ingredients for manufacturing abroad, iron and steel exports jumped, doubling from 1,355,128 tn in 1867 to 2,695,542 in 1887.

Along with these essentials, a labour force was also sent abroad. To sidestep domestic economic stagnation and the rise of unemployed people, debtors and the dangerous-idle stealing bread and horses, the 'excess' population was put in workhouses, or sent to the gallows, or shipped to colonies to extract surplus-value from their own and indigenous people's toil at mining, agriculture, and commercial activities. This temporarily 'solved' the crisis of too many people and too little food in Britain.

The bond was not to be broken, as the most rapid expansion of colonies and export of finance

capital came in the 1880s (when, as already said, British goods quickly lost markets to German and US competitor wares), threatening the further accumulation of profits at home. As an offset, Britain again shifted its imperial posture, now sending financial capital, pig iron, steel ingots and machinery for production, and consumer goods to other industrial nations and colonies, thus tying its future success to exogenous wealth accumulation (Krooth 1980, pp. 20–21; see also Andrew 1910, p. 19, Table 9, for the continuous increase in global imperial revenues: £69,600,218 in 1867–68; £77,730,671 in 1877–78; £89,802,254 in 1887–88; £106,614,004 in 1897–98; and £146,541,737 in 1907–08).

Meanwhile, between 1884 and 1900, Britain acquired 3,700,000 square miles of new colonial territories. By 1914 the British Empire covered 12.7 million square miles, of which the United Kingdom represented 121,000 or less than one-hundredth. In terms of population, moreover, of the 410 million British subjects, constituting about one-fifth of the people of the globe, 44 million resided in the United Kingdom; only a little more than one-tenth of the Empire's inhabitants.

From this empire ruled by the few came total trade of about £180,000,000 a year, bringing to Britain revenues amounting to approximately £19,500,000 sterling. And to this empire, British capital investors had sent £4 billion by 1913 (UK billions throughout this essay).

In returns, between 1880 and 1910, overseas investment earnings tripled (£57,700 in 1880 but £170,000 million in 1910), and other income from shipping, insurance, and services increased by more than a half (£96,400,000 in 1880 but £146,700,000 in1910).

Together, the sum of trade and earnings abroad was reflected in the accelerated accumulation of capital. In the 63-year period 1812–75, British wealth increased by £5.848 billion, as compared to the total accumulation of £7.924 billion in the following 37 years (1876–1912).

The more rapid accumulation of capital came from the large-scale expansion of colonies after 1875 and especially after 1882. For the colonies where British manufactured goods were exported

and raw materials and foodstuffs were obtained offered investment and loan rewards for British capital, while seeking reinvestment abroad.

Dividing Line: Export of Finance Capital

An expanded, more rigid colonial system and a vast effusion of finance capital now supplemented the free-trade commerce of earlier years. Finance capital export became the dividing line between mercantilism and free trade on one side, and, on the other, the imperial outgo of capital and machinery for production abroad.

This fundamental change turned on large-scale industrial techniques; the integration of finance with other forms of capital and industry; the monopolisation of production; and their combined influence over state policies, pushing finance capital exports and the export of capital goods and enhancing the foundation for accelerated gross imperial revenues (Krooth 1980, pp. 20–21, passim).

Toward the end of the nineteenth century, then, the wages system producing surplus-value and its vast accumulation transformed mere capital into financial means, neglecting investments within Britain, exporting it to multiplying colonies and dominions. It reached an historic *apogée* that in the future would outlast two world wars and dozens of smaller ones.

The Great Powers would again realign global territories to divide resources and working populations producing both commodities and surplus-values, overcoming the welfare of people at home and abroad; spreading ever new technologies of production and using fossil fuels that today threaten environmental conditions handed down from millenniums past and essential for the existence of species (Krooth 2009, pp. xxi–xxiv, 1–28, 549–648).

Definition/Description

This chapter reviews the growing cooperation among Southern states in trade, economic assistance, and forms of economic sustenance for the mutual benefit of undeveloped countries and developing countries in Asia, Africa, and Latin America. Even as economic trade among states in the global South with the West is growing in an unequal manner, the chapter demonstrates that new more equitable economic relationships are developing among emerging countries of the South, for example, China and Africa. These new forms of trade are providing expanding opportunities which may reduce dependence on the imperialist core.

South–South Co-operation

South–South co-operation (SSC) refers to formal and informal co-operation between developing countries as well as the increasing economic ties (of trade, investment, aid, etc.) that are both cause and consequence of such co-operation. (This essay uses the terms 'South', 'global South', 'developing countries', and 'Third World' interchangeably.) The term was first used officially only in 2004 when the United Nations Development Programme (UNDP) decided to change the name of its special unit on Technical Cooperation among Developing Countries (TCDC, mooted in 1974 and created in 1978) to the Special Unit for South–South Cooperation, which would later became the United Nations Office for South–South Cooperation. However, the ideas and practices of SSC have a much longer history.

This essay first outlines the terms in which the contemporary relevance of SSC is discussed and the questions about its true extent, sustainability, and political significance for the world economy which have emerged in it. It then traces SSC's history from its origins in anti-imperialist struggles and places it within a wider understanding of the uneven and combined development (UCD) of the capitalist world so that SSC's significance in the multipolar twenty first century can be fully appreciated. Then the extent of SSC in key areas is surveyed. After this, the conclusion returns to the questions raised in contemporary discussions to attempt some answers.

Understanding SSC: Overblown? Unsustainable? Sub-imperialist?

Time was when the dozen of newly independent countries in Asia and Africa, along with Latin American countries seeking to break out of the informal domination of their economies by the advanced industrial imperial countries, professed a common anti-imperialist aspiration towards mutual co-operation and solidarity. However, it remained little more than a pious platitude, regularly affirmed with appropriate fanfare on various platforms by Third-World leaders who would then go back to the business-as-usual of North–South economic links that had been formed under formal and informal colonialism and kept them in the position assigned to them in the international division of labour that imperialism had built: 'hewers of wood and drawers of water'. The development performance of these countries was universally

regarded as less than spectacular in the early post-war decades and they were followed by a couple of lost decades of development in the 1980s and 1990s. By this time, most thought that, barring a small 'tiger' economy here or there, development in the Third World was a lost cause and SSC no more than a casstle in the air. However, things then began to change.

Beginning in the late 1990s and even more since the economic and financial crises of 2007 and 2008, growth in the Third World in general and among the emerging and BRIC (Brazil, Russia, India, and China) economies in particular began to accelerate and overtook that in the developed world (O'Neill 2001). The economic centre of gravity of the world economy began to shift away from the advanced industrial countries for the first time since the birth of capitalism. Talk of 'US hegemony', 'globalisation' and 'empire' gave way to that of multipolarity. Now SSC began to be realised as never before. Developing countries began trading more with one another, investing in one another's economies, and even gave one another aid on a previously unimaginable scale. If this were not enough, they were also co-operating to present challenges to the power of the US and other developed countries on various issues of international economic governance, whether in the WTO or on climate policy (Desai 2013b, c; Hallding et al. 2013; Narlikar 2010).

These developments have been unsettling to many in the advanced industrial world, and its dominant discourse about SSC and the growth of the emerging economies on which it rests tends to yo-yo between disbelief and fear. Let us deal with the disbelief first. Many question the sustainability of the growth of the BRICs. However, apart from this or that temporary setback to growth, their best evidence is the BRIC and emerging economies' post-crisis growth slowdown. However, even the new slower growth rates remain many times higher than the near zero rates of the advanced industrial countries, and the trend towards an increasingly multipolar economy has, if anything, accelerated in the wake of the economic and financial crises. Others question the viability of the associated rise in SSC pointing mainly to political conflicts between the major

BRICs, not least the two most important among them, China and India. However, if these conflicts were indeed make-or-break matters, SSC would not have attained the levels it already has.

Rather than such blanket dismissals we are better advised to undertake a closer examination of these developments and possible roadblocks they may encounter. The 2013 *Trade and Development Report* of the United Nations Conference on Trade and Development (UNCTAD) puts it most clearly:

> The continuing expansion of developing economies as a group (in particular the largest economy among them, China) has led to their gaining increasing weight in the world economy, which suggests the possible emergence of a new pattern of global growth. While developed countries remain the main export markets for developing countries as a group, the share of the latter's contribution to growth in the world economy has risen from 28 per cent in the 1990s to about 40 per cent in the period 2003–2007, and close to 75 per cent since 2008. However, more recently, growth in these economies has decelerated. They may continue to grow at a relatively fast pace *if they are able to strengthen domestic demand and if they can rely more on each other for the expansion of aggregate demand through greater South–South trade.* (UNCTAD 2013a, p. 4, emphasis added)

Both the slower growth of the developed economies and the faster growth of the developing ones means that in the new pattern of growth the former can no longer be relied on to provide the markets that will power growth from here on. They will only come from an expansion of the domestic markets and increased trade and SSC between them. This can only be a good thing given that an expansion of domestic markets would mean increasing domestic incomes. But here also lies the rub.

The growth spurt in the BRIC and emerging economies since the 1990s coincided with the general ideological drift towards neoliberalism worldwide and a shift among the BRIC and emerging economy governments towards progressively liberalising their hitherto state-directed economies and orienting them more towards exports to the US and Europe than they had been hitherto when there were pushing for import-substituting industrialisation. However, coincidence was not

cause. In fact, this growth spurt was, in fact, critically reliant on the economic base created during the more state-directed phase of their development and by such expansion of domestic demand as it had permitted (as I argue in the case of India in Desai 2007, 2010). However, many policymakers and opinion makers attribute it to economic liberalisation, and appear set to liberalise further. To the extent that they are successful, however, they will achieve the opposite of what is really necessary to sustain their growth: a restriction of incomes and demand at home and a reliance on slower-growing export markets.

In the wake of the recent crises, while there is some evidence that the Chinese government has read the writing on the wall and replaced lost export demand first with a vast investment boom and then with an expansion of domestic consumption demand, in particular by letting wages rise. And governments in South America had turned away from neo-liberalism much earlier. However, many other emerging-economy governments and policymakers remain too wedded to neo-liberal policy and its reliance on First-World markets when their continued growth depends on ending this reliance. There is no guarantee that they will see the light. Only when they do can the growth of the emerging economies and SSC be considered sustainable.

So much for the disbelief, now we come to the fear. Some regard rising SSC as a significant departure from the ideals of anti-imperialist solidarity proclaimed in earlier times (Nel and Taylor 2013) and others go further and argue that SSC may simply be the sanctimonious verbiage which shrouds relationships between the stronger-developing economies and weaker ones which are as bad as, if not worse than, North–South imperial relationships (see e.g. Bond 2012, 2014). After all, the imperialisms of the past were also cloaked in mystifying discourse, whether of the 'civilising mission' of the imperial countries, the 'white man's burden', or coloniser and colonised constituting a 'co-prosperity sphere'. Particular attention is paid to the allegedly predatory trade, aid, and investment activities of the BRIC countries in Africa.

If there is a rational kernel to these observations it is this. While the countries of the Third World were always more differentiated than their lumping into a single category allowed, the growth acceleration since the late 1990s was making the Third World even more disparate. The BRIC countries, including two of the Third World's most populous countries, and the wider set of emerging economies, were growing strongly but they were leaving the countries containing the 'bottom billion' farther behind (Collier 2007). While the idea of SSC was formatively connected with the ideals of anti-imperialist solidarity, it was finally growing on practically all fronts in this very different Third World in which power differentials between emerging economies were significantly greater.

Settling these questions about the true extent, sustainability, and political character of SSC requires a closer examination of the history and contemporary dimensions of the phenomenon.

South–South Co-operation in Historical Perspective

The core idea of SSC is a rejection of an unfavourable international division of labour and the economic relationships (between some countries that specialise in producing higher-value, mostly industrial good, and are thus rich, and others which specialise in producing lower-value largely agricultural good, and thus are poor [Reinert 2007]) which sustain it.

This rejection goes back to the nineteenth-century architects of the modern developmental state. Policymakers and intellectuals such as Alexander Hamilton in the US and Friedrich List in Germany saw the real rationale of *laissez faire* and *laissez passer* rhetoric. Its *raison d'être* was to maintain the international division of labour unfavourable to them and favourable to the first and at the time most competitive industrial capitalist country, the UK. Against this, they constructed and theorised the first developmental states (Woo-Cumings 1999), which employed a battery of policies, including trade protection, to foster industrialisation, first and foremost by substituting imports.

Uneven and Combined Development

This dialectic of international competition in which the industrialisation of some countries prompted others to hothouse industrial development was dubbed 'uneven and combined development' (UCD) by the Bolsheviks, and it framed their understanding of their own revolution. As outlined by Trotsky in the first chapter of his *The History of the Russian Revolution*, UCD was an international dynamic specific to capitalism. Like all human advance, capitalist development was always uneven. However, in previous phases of human history, backward countries 'assimilat [ed] the material and intellectual advancements of the advanced countries' by repeating the stages through which the advanced society had passed in a 'provincial and episodic' manner. The capitalist phase, by contrast, 'prepares and in a certain sense realises the permanence of man's development' and rules repetition out (Trotsky 1934, p. 26). Instead, it 'compels' backward countries 'to make leaps'. Thus, 'a backward country does not take things in the same order' as an advanced one. Instead, it exercises the 'privilege of historic backwardness' by 'skipping a whole series of intermediate stages', as Germany and the US had recently done while the United Kingdom was paying the price for its early lead (26). Such skipping compressed 'the different stages of the journey' in 'an amalgam of archaic with more contemporary forms' (1934, p. 27). Such combined development was the distinctive feature of capitalism. While it had taken capitalist forms in the US and Germany, it could also take communist forms, as it did in the USSR. Both forms constituted a rejection by particular countries of the unfavourable position they had been assigned in the international division of labour.

As I have argued elsewhere (Desai 2013a), contrary to neo-classical views that productive capacity has spread around the world through markets, or the view in certain Marxist quarters that it has spread through imperialism (Warren 1980), it has actually spread as a result of the operation of the dialectic of UCD. This dialectic has characterised capitalism since its origins. The first instances of combined development were the US and Germany which industrialised to challenge the United Kingdom's industrial supremacy as the first capitalist industrial power, and the most recent ones are the BRIC countries and other emerging powers. This is why the development and industrialisation of today's developing countries must be seen within the historical perspective that encompasses that of the 'now developed countries' (Chang 2002; Desai 2011).

Specificities of Post-war Combined Development

While the rejection of existing positions in the international division of labour had deep historical roots, which connect our understanding of the experience of developing countries today to that of the now developed countries, the associated idea that this might be promoted by anti-imperialist solidarity and cooperation among developing countries was the product of the specificity of the post-war conjuncture in which Third-World countries embarked on their development. SSC can best be understood if it is seen as having gone through two distinct phases. In the first phase, which culminated in the demand for a New International Economic Order (NIEO) in 1974, SSC emerged as a powerful motivation and aspiration but its realisation left much to be desired. Indeed, the developments that followed the demand for the NIEO, including two 'lost decades' of development, seemed to suggest that it was roundly defeated. In retrospect, however, the second and contemporary phase, in which SSC was realised much more substantially and the discourse about it was considerably more pragmatic and muted, can clearly be seen to rest on the gains of that first phase.

The idea of SSC as an alternative to North–South linkages emerged in the post-war period rather than in conjunction with earlier attempts at combined development because of three new factors. There was, first, the sheer number of countries that now sought to industrialise. This was a radically novel situation, contrasting starkly with the relatively isolated cases of industrialisation hitherto. It created special circumstances and

S

these had to be understood by new theories. One of the most important was the Prebisch-Singer Hypothesis (Prebisch 1950; Singer 1975/1950) about deteriorating terms of trade for agricultural production. It contradicted the neoclassical expectation that they would, over time, rise because productivity would increase in manufacturing faster than in agriculture. This could not happen precisely because of the sheer number of hitherto agricultural economies which now sought to increase their export earnings to industrialise.

There was, second, the fact that with decolonisation and the resulting gain in policy autonomy by the newly independent countries, the formerly imperial developed countries lost the access to colonial markets that they had once secured by imposing 'one way free trade' on their colonies. In place of colonial markets, they now had to expand their own markets by increasing domestic working-class consumption to a hitherto unprecedented extent (Desai 2013a, 2015). Though forced on capitalist countries, this was in itself an entirely salutary development for Western working classes. However, it also created a new international pattern of demand in which developing countries' gains in policy autonomy and their ability to protect domestic markets were offset by the small size of their markets, shrunk by decades of colonialism. So they were put in a position of competing with one another for the far deeper First-World markets, and the idea of SSC was in part a way of replacing this competition with co-operation.

The Transition from an Imperial to an International World . . .

The third factor affecting the timing of SSC's emergence was post-war multilateralism. While it was, as most claim, an idea, it was more than that: it was a necessity, and understanding this and how it was not fulfilled in the post-war period is critical for our purposes as it is shrouded in misunderstandings.

The structures of international trade and finance which had worked, in a manner of speaking, before 1914 had broken down in the course of the Thirty Years Crisis of 1914–45. Indeed, their breakdown was a major component of that crisis. The broken-down structures were not, as the widely accepted Hegemony Stability Theory (which originated in Kindleberger 1973) would have it, a stable gold-sterling standard regime presided over by the UK and eventually replaced in the postwar period by one centred on the dollar and the US. In reality, the so-called gold standard was always less stable than generally believed (De Cecco 1984) and US attempts to effect a replacement were bound to be even less so (as I argue in Desai 2013a), not least because the gold-sterling regime, such as it was, rested on Britain's vast formal empire, something which the post-war US patently lacked.

Indeed, what had broken down in the Thirty Years' Crisis was the imperial order, and by the end of that crisis it was replaced by an international one. This new order would be overwhelmingly governed by international relations between its constituent independent nation states, not imperial ones between mother countries and their colonies and war-inducing imperial competition between the imperial powers. The international governance and international economic governance of this new order could only be based on multilateral structures. Needless to say, the nation states that would be the collective authors of such structures would not be willing to settle for arrangements in which they were not free to pursue national economic goals – including, pre-eminently, those of development, industrialisation, and full employment. This would mean, above all, a rejection of free markets and free trade (Block 1977).

. . .and the US Attempt to Turn Back the Clock

This was recognised by all parties but such recognition was at best grudging on the part of the US. For it had set its heart on having its turn at being the 'managing segment' of the world economy, with its currency serving as that of the world as, it imagined, the UK had been before 1914 (Parrini 1969). Its power to attempt to realise

this impossible goal had been magnified by the war, which had destroyed rival powers' economies while boosting its own to an extent unknown before or since. So the US sought on the one hand to advance its agenda, which was antithetical to the very conception of multilateral economic governance, under the camouflage of its rhetoric. On the other, it attempted to compromise the multilateral structures that had been created – the famous Bretton Woods quartet of the United Nations (UN), the General Agreement on Tariffs and Trade (GATT), the World Bank, and the International Monetary Fund (IMF) – by biasing them towards free markets and free trade, and by securing for itself and the dollar a privileged position in them (Block 1977; Desai 2013a).

In doing so, the US ensured that Keynes's idea of a multilaterally managed super-sovereign currency would not come to fruition (Desai 2009, 2013a, and 2012, which details the cost the world in general and the Third World in particular have paid and continue to pay for these arrangements, and reviews the possibilities for alternatives to them). Instead, the US dollar would have a privileged world role. It also ensured that the three main institutions of international economic governance would be biased towards free trade, which would initially exclude most developing countries from participating in them (Block 1977; Hudson 1972; Murphy 1983).

By contrast, the newly independent countries of the Third World needed and were always more committed to and earnest about multilateral international economic governance of a sort which left individual nation states with the policy autonomy to regulate their economies. Here lay the crux of the battles that would be fought out in coming decades between North and South.

As the emergence of multipolarity encourages us to look at the recent and more distant history of the capitalist world order afresh, the history of the post-war tussle between the developed capitalist countries and the developing and communist countries (and we should remember that China continues to be ruled by the Communist Party) will come into clearer focus as the key axis of tension and struggle. As so many of the most prescient critics of the US world role have long

recognised, the Cold War was waged as much against developing countries attempting to break out of relations of 'complementarity' with the US and the West as against communism. Along this axis of UCD, developing and communist countries, combined developers all, attempted to counteract US and developing country influence and power to create more truly multilateral structures of international economic governance which would permit sufficient variety of economic forms so both forms of combined development, capitalist and communist, could be accommodated. Indeed, this is where SSC first emerged as an idea and a set of practices *avant la lettre*.

SSC Mark I

If SSC was less than adequately realised in the first phase, it was certainly not due to any lack of understanding of its necessity. Such necessity was underscored by reams of critical scholarship on development; much of it produced by UNCTAD, itself arguably one of the earliest and most important of the products of SSC. UNCTAD's analysis pointed out that, by remaining imbricated in their hub-and-spoke economic links of trade and investment with the developed world, developing countries were simply perpetuating the unfavourable international division of labour.

The problem for many decades after the Second World War, however, was that North–South links formed when the developing countries were (formal or informal) colonies of the developed world seemed inescapable. The formerly imperial, advanced, industrial countries recovering from wartime devastation were the growth powerhouses of the post-war period. Without substantial industrialisation in developing countries, their trade complementarities were strongest with the developed countries and, indeed, very weak with other developing countries whose productive structures were far too similar. And not only did North–South trade have the strongest prospects for the export earnings that could finance the investment in industrialisation necessary to break out of North–South linkages, they were also the chief sources of the necessary capital

and technology. It seemed a Catch-22. If, over the following decades, some substantial industrialisation was nevertheless achieved in the Third World, it was thanks to a combination of the ability of many developing countries to take the high and hard road of attempting industrialisation in these difficult circumstances, and to their willingness to stand up to the inevitable pressures from the developed world to which these attempts were inevitably subject, and to key SSC initiatives.

The Bandung Afro-Asian Conference of 1955, the launch of the Non-Aligned Movement (NAM) in 1977, creation of the Group of 77 and UNCTAD in 1964, and the demand for a NIEO a decade later were probably the greatest milestones in this early phase of SSC. Craig Murphy's carefully researched study of *The Emergence of the NIEO Ideology* traces them to the widely shared agreement about the need for multilateral international economic governance at the end of the Thirty Years' Crisis of 1914–45 (Murphy 1983, pp. 28–29).

The conflict between the developed world and the rest was slow to emerge in the early post-war years not least because the North–South economic divide was considerably less sharp than it would later become. The size of many Latin American economies, for instance, was not only fairly large, especially when considered against the background of the devastation of Europe and Japan, but many among them could point to their contribution to European recovery, as indeed could India (34). These contributions had been made in the name of international solidarity and collective international responsibility for restoring the world economy to health, and the contributors expected a certain reciprocity once the immediate problems of the war-devastated economies were addressed.

However 'as soon as industrialization became an openly discussed topic, the ideological split between north and south became obvious' (43). Third-World countries interpreted Chapter 9 of the UN charter, which spoke, inter alia, of 'respecting "equal rights" of nations large and small, of promoting better standards of living, full employment, and development' (quoted in Murphy 1983, p. 29) as giving them the right to

violate the principles of free markets, free trade and even property (in cases of nationalisation of foreign-owned enterprises, for example) in the interest of promoting development and asserting sovereign rights over resources and productive capacity. It also, according to them, imposed upon the developed countries the duty to aid developing countries in their efforts to industrialise (28–29). These efforts were, moreover, justified in terms of the widely accepted goals of expanding production, employment, and trade worldwide. However, it soon became clear that US and developed countries generally had no intention of aiding Third- World industrialisation to anywhere near the extent that European recovery had been aided; and worse, they even justified the existing international division of labour in neo-classical terms as 'specialisation' and, for good measure, rationalised the lack of industrialisation in the Third World as a 'cultural' matter (44).

The critique of such ideas, which would soon take the form of a fully fledged 'modernisation theory' (Gillman 2003), by intellectuals from the Third World was now inaugurated by the work of Raul Prebisch on terms of trade between industrial and agricultural countries. The unfairness of the developed countries' position was further underlined when these intellectuals were able to point to a range of practices of developed countries and their corporations which violated their own free-market principles. These included the role of northern monopoly corporations in fixing prices, and high military spending as a form of economic stimulus (Murphy 1983, p. 45).

These grievances led governments of the newly independent Asian and African countries to cement a new solidarity, which climaxed in the Bandung Afro-Asian Conference in 1955. Sino–Indian relations paved the way, particularly the 'Panchsheel' or five principles of peaceful co-existence: mutual respect for each other's territorial integrity and sovereignty, non-aggression, non-interference, and co-operation. Together, these amounted to 'a recognition of the rights of states to have different economic and political systems' (37) and were adumbrated in treaties between the two countries. While Third-World

states, not least India and China, have had their conflicts and even wars, '[w]ith inconsequential modifications [these principles] have been included in all the key agreements among Third World countries that became the background for the New International Economic Order proposals' (37).

The initial emphasis of Third-World solidarity amid rising East–West tensions was on support for the principles of the UN Charter, in particular equal sovereignty and noninterference. Following a conference in Cairo in 1957, they created the Non Aligned Movement (NAM) at Belgrade in 1961. Though its proclaimed goal was to steer a middle path between the capitalist and communist blocs, the logics of UCD ensured that the NAM would always sail closer to the communist countries than to the capitalist ones.

Economic dissatisfactions were also emerging. The developing world had long complained about monopoly pricing of manufactured goods and the lack of an equivalent structure in relation to the prices of primary commodities. One answer was a commodity producers' cartel, and the first and most successful of these, the Organisation of Petroleum Exporting Countries (OPEC), was created in 1960. Broader southern unity found an initial expression in the creation of the Group of 77 and UNCTAD by the UN in 1964 on the strength of Second- and Third- World votes in the United Nations General Assembly and on the basis of a rival understanding of world trade issues to that embodied in the GATT. UNCTAD was charged with the responsibility of developing that understanding on a range of fronts which eventually included the role of trade in the widening North–South income gap, transnational corporations, commodity prices, technology transfer, tied aid, international debt, the international monetary system, and the international financial system. Over the decades, UNCTAD has been at the forefront of developing critical perspectives that challenge the Northern views on all these issues (UNCTAD 2004). This role has not, naturally, been uncontroversial: witness the Northern countries' attack on UNCTAD for its prescient analysis of the housing bubble and the 2008 financial crisis that ensued when it burst (Prashad 2012).

These developments climaxed in the proposals for a NIEO in 1974. It represented the fruition of the foundational intellectual work done by UNCTAD as well as a range of other agencies such as the Economic Commission for Latin America (ECLA) and intellectuals, particularly the Dependency School. It came at a time when the larger international system that the US had attempted to construct and which was the target of the developing world's critique entered its most serious crisis.

Given the apparent (and only apparent) restoration of the system in the 1980s and 1990s, it is often hard today to appreciate the gravity of that crisis. The dollar-gold system had collapsed in 1971 and practically the entire world (Europe, the South, and OPEC) was in revolt (Hudson 1977, p. 59 ff.) against the US and in 'a movement ... to become independent of the U.S. economic orbit and more closely integrated economically and politically with one another' (Hudson 1977, p. 1). In this contest, the call for a NIEO 'based on equity, sovereign equality, interdependence, common interest and co-operation among all States, irrespective of their economic and social systems which shall correct inequalities and redress existing injustices, make it possible to eliminate the widening gap between the developed and the developing countries and ensure steadily accelerating economic and social development and peace and justice for present and future generations' (United Nations 1974) constituted a frontal challenge to the broken-down Bretton Woods system. It was 'a defiant call for international trade, finance and monetary systems that would amend or replace those that were already existing' (Murphy 1983, p. 113). It also represented an unprecedented state of unity among Third-World countries based on the recognition that they all suffered from 'the same international structural impediments to development' (110).

South–South Co-operation Today

The call for a NIEO would constitute the high point of a common Southern front for decades as the crisis of the 1970s appeared to be resolved

S

(though only apparently and temporarily) on capitalist and First-World terms which also consigned the developing world to two lost decades of development. During this time, Third-World unity fell into disarray, and when South–South co-operation re-emerged in a new form, beginning in the late 1990s, it was connected with the emergence of the BRIC countries and other emerging economies which widened the income gaps within the Third World, raising the new questions about the meaning of SSC mentioned earlier. To put these in context, we must first survey the nature and dimensions of the linkages between developing countries today.

Trade

With the post-war shift in the pattern of demand towards first-world working class consumption, and the widening divergence in incomes between first and Third Worlds, the major problem for developing countries was their low and decreasing role in international trade, in particular when measured by value (rather than volume). This began to be reversed in the current century. Developing countries began to account for an increasing contribution to world growth, and an increasing share of world trade, going from about 25% in 1985 to about 45% in 2012 (UNCTAD 2013c, p. 2). Moreover, within this, South–South trade accounted for about 25% of global trade, having doubled over 20 years. This increase was led by trade between Asian developing countries and Chinese exports in particular accounted for nearly 20% of South–South trade. In terms of products, though fuels accounted for 25 of South–South trade, manufactured goods came in second at 19% and parts and components for electrical and electronic goods, at 15% (UNCTAD 2013d).

Aid

Depending on how aid is counted, Southern countries are changing the aid regime slightly but significantly, or massively. If aid is counted in the hitherto conventional way, South–South aid constitutes only 6.3% of the world total (Centre for

Policy Dialogue 2014, p. 12). However, 'when the external financing from the national development banks and state export–import banks of the BRICs to the developing world are added into the mix, the numbers get much larger and exceed the lending totals from the World Bank' (Chin and Quadir 2012, p. 494). This amounts to a veritable 'silent revolution' in aid (Woods 2008).

This quantitative change is magnified when one considers the changing aid scenario more generally. On the one hand, traditional donors (the developed countries) have been scaling back their aid thanks to austerity, making it more targeted towards the poorest and shifting it away from broader development goals of increasing production and productivity. The focus has increasingly been on 'humanitarian aid' within the wider framework of humanitarian intervention and its inevitable less savoury accompaniment, regime change. On the other hand, new and newly important donors from the South are emphasising broader development goals, including infrastructure and industrialisation, re-labelling aid as 'partnership for development' and steering clear of political conditionalities. China, in particular, which is a 'net donor', has attempted to remain a recipient of aid in a larger effort to retain its identity as a Third-World country, though how long donors will allow this to continue is another matter (Chin 2012).

Foreign Direct Investment

The growth of the BRICs and emerging economies is also transforming the world of international production. Foreign direct investment (FDI) is no longer the preserve of developed countries as it was until very recently. Flows of FDI as well as stocks from developing countries in general, and the BRICs in particular, are growing: the share of developing economies in FDI has risen from 12% in 2000 to 35% in 2012 (UNCTAD 2013b, p. 4). The share of the four BRICs countries rose from 1% of the total in 2000 to 10% in 2012 (UNCTAD 2013b, p. 5). In the context of crisis and austerity in the developed world, these shares are likely to grow. In 2012, nearly half of the BRICs investments went to

other developing economies while 42% went to the developed world and the rest to transition economies (UNCTAD 2013b, p. 5).

The pattern of FDI from the BRICs focuses on acquiring locational assets such as workforce skills or access to international markets to increase competitiveness, on investment within the home region, and on investment further afield to access new markets or resources. Such FDI is characterised by strategic considerations rather than short-term profits, something the corporations can do more easily because so many of them are state-owned, such as the majority of Chinese TNCs and those from the other BRICs such as Petrobras, ONGC Videsh and Gazprom. These TNCs 'have become truly global players, as they possess – among other things – global brand names, management skills, and competitive business models. Some of them, ranked by foreign assets, are: CITIC (China), COSCO (China), Lukoil (Russian Federation), Gazprom (Russian Federation), Vale S.A. (Brazil), Tata (India) and ONGC Videsh (India)' (UNCTAD 2010, p. 7). While there have always been state-owned TNCs from the developed world, such as France Telecom, the increased profile of the BRICs in FDI has increased their number. Both state-owned and private TNCs from the BRICs enjoy considerable state backing.

International Economic Governance

As we have seen, deep differences between developed and developing countries over the nature and shape of international economic governance have existed from the beginning of the post-war era, and they culminated in the demand for a NIEO by the developing and communist countries in the 1970s. It appeared for a long time thereafter that the matter had been settled in favour of the developed world for good. However, the underlying issues have never gone away and in the new century the BRICs and emerging economies have begun to pose a powerful challenge in and to the inherited institutions of international economic governance. This is evident in a number of ways. The G7 has been replaced by the G20 as the chief forum for international economic policy co-ordination, so that this is no longer the preserve of Western countries but includes a majority of developing countries as well as Russia. In the WTO (notwithstanding its launch, amid great fanfare, as the flagship of 'globalisation'), the clash between Northern and Southern demands ensured that negotiations of the first round of WTO talks, the Doha Development Round, would remain stalled. More generally, thanks to the increasing problems of the developed world and the structures of international economic governance they have created, combined with the increasing assertion and importance of the developing world, a 'productive incoherence' has emerged in the established institutions of international economic governance, widening the 'policy space' for the developing world through a series of bilateral and multilateral and regional initiatives (Grabel 2010, 2011; Tussie 2010) as well as some grander ones like planned BRICs development bank and reserve pooling initiatives (Desai 2013b, c).

And there are at least some indications that a deeper and broader challenge to the flawed Bretton Woods and dollar-centred institutions of international economic governance might be afoot. Within months of the collapse of Lehman Brothers, the governor of the People's Bank of China was calling for what amounted to a revolution in the international monetary system: the creation of a supersovereign currency on the model of Keynes's original proposals for the Bretton Woods conference (Desai 2009, 2010; Zhou 2009). At the same time, the BRICs, in the van of the developing countries in general, are calling for a reform of the IMF and the World Bank and are outflanking the inevitable resistance from the developed world by moving towards building alternative institutions of international economic governance such as a BRICS development bank.

Conclusion

We can now return to the questions about the extent, sustainability, and political character of SSC raised earlier. The above survey of SSC should make it clear that both the growth of emerging economies and co-operation between

S

them are not only considerable, but are changing the nature of the world economy and its governance. The question of whether these trends are sustainable is more complex and the answer depends on whether emerging-economy governments are able to see the writing on the wall that sustaining their growth requires a U-turn from the neo-liberal path they have embarked upon, even if this may not be particularly palatable to powerful interests within their respective jurisdictions.

As was pointed out earlier, there is no guarantee that they will. However, three factors may force their hand. There is, first, the example of China, which not only remains the most important and fastest growing among the major emerging economies, but also appears to have read this writing on the wall most clearly. Increasingly, governments aiming for growth will be taking their lessons from the demonstrated success of China rather than neo-liberal preaching from stagnant Western countries. Secondly, stagnant Western economies can no longer support neo-liberal export-led growth with their demand as they did before 2008. Finally, emerging-economy governments are today, more than ever, under pressure to accelerate growth from their own restive middle classes whose revolts across the developing world, from Venezuela to Egypt and from Turkey to Thailand, are in response to slowing growth. These pressures can be expected to lead them eventually, that is after a longer or shorter period during which their attempts to achieve growth along neo-liberal lines are finally proved to be in vain, to a more developmental path.

Finally, there are questions about the political character of SSC today: Is it simply a replication of Northern imperialism on a smaller shabbier scale? There is certainly no doubt that, as Jayati Ghosh has pointed out, 'much of the cross-border economic interaction has been driven by corporate interests rather than broader interests of the citizenry in general' and that this is why 'many recent South–South trade and investment agreements (and the resulting processes) have been similar in unfortunate ways to North–South ones, not just in terms of the protection they afford to corporate investors but even in guarding intellectual property rights' (Ghosh 2013). And

certainly a shift towards more progressive policies will require a greater democratisation of economies as well as international economic linkages. Such a democratisation is, one should note, more likely if the emerging economies shift away from the neo-liberal agenda, as their continued growth requires.

However, even as things stand, there is an increasing number of studies now about Chinese trade and investment with Africa, and while none is entirely uncritical of its effects, the weight of the evidence seems to point to a qualitatively more equal relationship between China and the African countries it deals with than the relationships between African and Western countries (e.g. Brautigam 2009). Not only do the emerging economies come with histories of anti-imperialism rather than imperialism, but the increase in the sources of trade, aid, and investment that they have generated has, in itself, expanded the options for any canny government much as the existence of the USSR in the twentieth century expanded opportunities for the developing countries. This was ever the promise of UCD.

Definition

This essay explores the life and work of Indian scholar, literary theorist, and feminist and post-colonial critic Gayatri Chakravorty Spivak (1942-).

Born on 24 February 1942 to the middle-class family of Pares Chandra and Sivani Chakravorty in Calcutta, Gayatri Chakravorti Spivak is a self-styled philosopher and literary theorist. As a professor at Columbia University and the founder of the Institute for Comparative Literature and Society, Spivak became known for her essay 'Can the Subaltern Speak?' of 1985 and for her translation of and introduction to Jacques Derrida's *De la grammatologie* (*Of Grammatology*) of 1976. She is widely associated with debates on cultural imperialism and the survival of colonial legacies in non-European domains. Best known as a post-colonial theorist and a prolific writer advocating the subaltern and other marginalised social groups such as women (Sharp 2008), Spivak describes herself as a 'para-disciplinary ethical philosopher' with a 'reactive' attitude towards various socio-cultural arguments, but her beginnings are unmistakably situated in post-modern analysis, post-structuralism and the deconstructionism of post-war philosophers such as Derrida (Kilburn 1996).

Personal Life and Education

Spivak graduated from the Presidency College at the University of Calcutta in 1959 with first-class

honours and awards in English and Bengali litera-
ture. In an interview with Alfred Arteaga of 1993–
94, she stresses the political atmosphere in which
she grew up and the ways this fostered a polemics
that deconstructed colonial hegemonies from within
(Landry and MacLean 1996: 16–18). The term
'deconstructionism' acts as a key word in Spivak's
work and has influenced both European and trans-
antlantic academies. It refers to a theoretical move-
ment inspired by Derrida that seeks to question and
destabilise the logic of binary or dualistic thinking
underpinning Western traditions of thought.
Recognising herself as one of the first Indian intel-
lectuals born free by 'chronological accident'
(Landry and MacLean 1996: 17), Spivak attained
most of her higher qualifications in the US: on
borrowed money she completed her master's
degree in English at Cornell University, where she
also served as the second female member of the
Telluride Association, and she undertook a PhD at
Iowa under Paul de Man. Her thesis, published
under the title *Myself Must I Remake: The Life
and Poetry of W.B. Yeats* (1974b), signalled the
completion of her 'apprenticeship' in structuralism
and post-modern deconstructionism. In 1967 she
had already started working on a translation of *Of
Grammatology;* during this period she married and
divorced the novelist Talbot Spivak, known for *The
Bride Wore the Traditional Gold*, an autobiograph-
ical novel dealing with the early period of this
marriage. Spivak became the first non-white female
professor at Columbia University in 2007, and in
2012 she was awarded the Kyoto Prize in Arts
and Philosophy. She is founder of the Pares
Chakravorty Memorial Literacy Project Inc.
(1997) – a non-profit organisation dedicated to pro-
viding primary education for poor children – and
continues to be active in international charity
projects.

Theoretical Milestones and Contributions

Spivak became known for her preface to Derrida's
Of Grammatology, which was hailed for its self-
reflexive quality (Spivak 1976) and was a product
of several years of work about the politics and

poetics of language (Spivak 1974a). Between
1967 and 1985, as a member of the Subaltern
Studies Collective, she produced several essays
on feminist politics and cultural imperialism. Dur-
ing those years she developed a theoretical orien-
tation focusing on subaltern subjects, especially
women, who are caught in the cogs of Western
discursive institutions. Her ethics were defined by
herself as Marxist, deconstructionist, and practical
feminist but her overall work figures today among
notable 'cultural imperialism' contributions that
debate Western hegemonisations of powerless
cultures. Marxists have viewed her as 'too
codic', feminists as 'too male-identified', and
indigenous theorists as too committed to Western
theory, and this puzzlement continues to consign
her to an outsider's liminality.

'Can the Subaltern Speak?', which debates
how racial discourse contributed to the banning
of sati, has a distinctive feminist undertone. In
Hindi and Sanskrit texts sati appears as a funeral
practice among some Indian communities, dictat-
ing that a recently widowed woman ought to
immolate herself on her husband's funeral pyre.
Spivak (1988) debates the practice as a form of
gendered regulation in pre-colonial India, to
which British colonial rule and the colonial ban-
ning of sati were superimposed as a 'civilising
process'. Subsequently, she argues, Indian
women experienced a form of twin imprisonment
that 'muted' them both in the native community
and in the eyes of foreign rulers, and which fos-
tered social rejection, mental illness, and even
suicide. Through archival research and theoretical
analysis Spivak promoted an extensive decon-
struction of Western scholarly representations in
the works of Derrida, Michel Foucault, and Giles
Deleuze that renewed the plane of feminist critical
scholarship: the 'subaltern', she claimed, is not
silenced only by bureaucratic institutions but
also in Western scholarship.

Although Spivak's writings have been pre-
sented as fragmented or incoherent, the epistemo-
logical themes she introduced in this essay run
through her work with great consistency. In *Out-
side the Teaching Machine* (1993) Spivak ques-
tions the ways in which power is structured
through a collection of works of literature such

S

as Salman Rushdie's *Satanic Verses*, Karl Marx's writings, and the work of twentieth-century thinkers such as Derrida. In doing so she provides a voice for those who cannot speak, proving that the true work of resistance takes place in the cultural margins. In *A Critique of Postcolonial Reason: Toward a History of the Vanishing Present* (1999) Spivak also provides an analysis of Western (European) metaphysics to suggest that notable philosophical contributions deny non-European subjects their humanity. She argues that the figure of the 'native informant' emerges through various cultural practices and domains (philosophy, history, literature) as a metropolitan hybrid. The text addresses feminists, philosophers, critics, and interventionist intellectuals through the ways in which the notion of the 'Third World interloper' as the victim of a colonial oppressor is sharply suspect. In this book she introduced the term 'strategic essentialism', which also appears in anthropological literature – though Spivak does little to acknowledge this. Reminiscent of the thought of Leon Trotsky (1879–1940), strategic essentialism allows the subaltern to act under structural constrictions by temporarily aligning with hegemonic representations. However, strategic essentialism also debates how subordinate or marginalised social or ethnic groups may put aside 'local' differences in order to forge a sense of a collective identity, usually for political means (for example, uses of the term 'Black British' in the 1980s and 1990s by immigrant groups, and those groups' accompanying rituals and sub-cultural performances are a form of strategic essentialism). The concept resonates with post-colonial theorists such as Homi Bhabha (1994), who pioneered 'colonial mimicry' as the subaltern's twin strategy of colonial parody and emulation. Both Bhabha and Spivak coincide with the Foucaultian argument of the post-colonial critic Edward Said (1935–2003) on the insidious nature that colonial power relationships can attain. More a *topos* or abstracted and homogenised space than a place for the Europeans, the 'Orient' served as a tabula rasa for conceptualizations of non-European otherness that were placed in the service of Western colonial bureaucrats and artistic apparatuses alike,

allowing Western European hegemons to produce and subject natives as irrational, 'backward', and subaltern beings (Said 1978).

The turn of the century found Spivak addressing issues pertaining to the globalisation of culture, language, and literary traditions with renewed emphasis on global cultural flows. *Death of a Discipline* (2003) declares the death of comparative literature as we know it and sounds an urgent call for a 'new comparative literature' that is not appropriated and determined by the market. Spivak asks how in this new era we should protect the multiplicity of languages and literatures at the university. Closer to debates on cultural imperialism, *Other Asias* (2005) prompts readers to rethink Asia, in its political and cultural complexity, by focusing on the Global South and the metropolitan centres – broadly speaking a theoretical convergence between Spivak and the British cultural theorist Raymond Williams (1974). Between 2005 and 2010 Spivak's theoretical interventions were mostly confined to short essays and interviews, in which she further elaborated on sub-alternity. An exception is a collection of her reflections on distributions of socio-cultural action between 'public' and 'private' spheres, which was published as a book. In *Nationalism and the Imagination* (2010) she discerned a collusion of nationalism with the private sphere of the imagination in order to command the public sphere. The argument resonates with Partha Chatterjee's work on Indian nationalism (1986, 1993), which Spivak debates in *An Aesthetic Education in the Era of Globalization* (2012), but also prominently with the Harvard anthropologist Michael Herzfeld's thesis in *Cultural Intimacy* (2005, first published 1997). In *An Aesthetic Education* she declares the old polarities of tradition and modernity or colonialism and post-colonialism insufficient for interpreting the globalised present, proposing aesthetic education as the last available instrument for implementing global justice and democracy. Her argument focuses on the role of 'linguistic imperialism' in the production of the new 'corporate university' education and the power of literary theory to cancel such developments.

Spivak's work is dedicated to the articulation of an ethical discourse that borrows from different

theoretical traditions. Both her personal activism and her critical theoretical contributions work towards what she has termed 'ethical singularity', our willingness to engage with the Other in non-essentialist terms. This reciprocal flow of responsibility and 'accountability' ('How to Teach a "Culturally Different" Book', in Landry and MacLean 1996: 256) matches Mikhail Bakhtin's conception of 'answerability' in which 'I-for-myself' exists in public only as an 'I-for-others' (Bakhtin 1990: 32). It was in fact on the basis of this ethical commitment that Spivak gained the badge of 'pretentious eclecticism': certain theorists suggested that her representations of the Other and 'working out one's subject position' became for her 'more important than the activist struggle of universal socialism' (Wallace 1999). The following section revisits this controversy alongside the scholarly network in which one can evaluate Spivak's work as an interdisciplinary contribution to social and theory.

Scholarly Connections and Critical Evaluations

Subalternity is a theme that occupied space in post-colonial and other adjacent anthropological debates extensively. Spivak's introduction of the 'subaltern' as the subject that cannot achieve successful dialogical utterance is mirrored in the works of the sociologist Bonaventura de Sousa Santos (2002), who uses the term more loosely to denote the oppressed groups living at the social margins and struggling against hegemonic globalisation. Spivak herself has stressed that the concept of the subaltern should not be used indiscriminately to describe any marginalised group, a practice often adopted by such groups. Hence, for her the working class does not necessarily become subaltern when it is oppressed. Others claim that in post-colonial terms, 'everything that has . . . no access to the cultural imperialism is subaltern – a space of difference' (de Kock 1992: 45). It is worth stressing that her examination of the effects of subalternity is not very dissimilar from the argument developed by Paul Gilroy (1987), who claims that cultural

difference emerges as resistance to hegemonic modes of representation. Working from post-Hegelian and Marxist theory, Gilroy examines cultural difference in the context of dialogical role-making, of fostering an intersubjective engagement of black performance and other-observation. For Gilroy, black culture's own voice offers an alternative to dominant cultural practices. Because the voice of difference comes from within the black community, it generates the predicament of collective self-narration: others are an inescapable condition of collective self-recognition, and they cannot be ignored, as public (self-) presentation needs an audience to be meaningful (Tzanelli 2008: 11–12).

Studies from the European margins attest to 'crypto-colonial' overlaps of social (working-class) and cultural (subaltern) identities. The term 'crypto-colonialism' was coined by the Harvard anthropologist Michael Herzfeld in his mid-career essay 'The Absent Presence: Discourses of Crypto-Colonialism' (2002). Like Santos (1999; see Barreira 2011: 154), Herzfeld debates the ability of institutional frameworks to erase or amplify disenfranchised voices that escape through the cracks of officialdom into global spheres. While preserving a distinctive Derridian sentiment in his argument, Herzfeld focuses, however, on countries such as Greece and Thailand, which, though never colonised by the West, were steeped in colonial ideas that enforced an inferiority complex in both domestic cultural practices and international political discourse. Although Santos and Herzfeld do not figure as Spivak's interlocutors, they share with her a distinctive cosmological sentiment (e.g. protection of the disenfranchised in post-colonial domains) and the potential for her work to be connected to a feminist poetics.

Spivak was (inaccurately) criticised by Dipesh Chakrabarty, Professor of History and South Asian Languages and Civilizations at the University of Chicago, for being 'inauthentic' because she engages with Western thinkers and publishes in English (Wallace 1999: 2). Ironically, Spivak and Chakrabarty share views on the harmful effects of European colonialism in the production of ideal forms of 'human'. As a historian, Chakrabarty (2000) has recourse to precisely

S

those essentialisations of subjectivity that condition theoretical lapses to identity-production – a move he also appears to perform in his criticism of Spivak. The suspicion that such criticisms pertain to a para-nationalist feeling of betrayal (of one's native language and culture) by one of the few famous female Indian scholars may be closer to the truth. A similar rift emerged when Terry Eagleton, then Professor of English Literature at the University of Oxford, attacked Spivak for her radicalism, which 'tends to grow unpleasantly narcissistic' and 'guilt-ridden' while simultaneously being 'deprived of a political outlet' (Eagleton 1999). Rejecting her theories as 'opaque' and 'a kind of intellectual version of Attention Deficit Disorder', Eagleton set himself against Spivak's supporters from postcolonial and feminist studies alike.

Judith Butler (1999), then professor at the University of California, Berkeley, stressed Spivak's contribution to 'Third-World' feminism, casting Eagleton's 'polemics' as a specimen of covert sexism. Although the 'Third-World' concept emerged as a category of representation in the post-Second World War and Cold War contexts to embrace women from developing countries (usually black and oppressed by local patriarchy), feminist activism in them assumed a life of its own as a counter-polemic to 'First-World' hegemonic representations of subalternity: these women have a voice that has to be heard and understood separately from what 'First- World' activism has to say about them. Spivak and Butler share in theoretical analysis: Butler uses the term 'performativity' (1990, 1993) to analyse the ways in which subjects are both subjected to discursive manifestations of power and 'emerging'. Just as Spivak considers strategic essentialism to be a double-edged sword, Butler does not consider the creation of the human subjects outside the confines of power. Significantly, in *A Critique of Postcolonial Reason* Spivak recognises that even feminist activists have to temporarily adopt an essentialist position in order to act, especially in the face of a fragmented feminist agenda. Though coming closer to the distinction of 'strategy' from 'tactics' made by Michel de Certeau (1984, 1985), Spivak's strategic essentialism does not neglect

'feelings of doing' and individual ontological knowledge tied to bodily practices, as her conception of the subaltern (1988) shows. Nevertheless, the unresolved tension in her work between epistemologies of otherness (this she consigns to 'the domain of law': Spivak 2003: 83) and the 'eruption of the ethical' as an epistemological interruption (ibid.) continue to invite criticism as much as they bring her closer to established conceptions of cosmopolitanism as a project of world solidarity. Her declaration that one has to unlearn one's privilege does not match her philosophical resolution to respect one's difference intact – a post-war philosophical position that we encounter in Emmanuel Levinas (1969) – and clashes with her support of strategic essentialism that is rooted in practical ethics. This dissonance is yet to be resolved in her work.

Spivak's work has gained in interdisciplinary popularity across fields as disparate as those of media and visual studies, tourism, and literary political theory and post-colonialism (Elkins 2013; Moynagh 2008). Her borrowing from diverse European and non-European traditions and their application to the social realities in post-colonial settings invite openness and a fusion of cultural horizons once monopolised by overwhelmingly white male hermeneuticians – a prominent point in Spivak's writings. It is ironic that she has been simultaneously accused of leaps from 'allegory to the Internet' and 'US market philosophy' (Eagleton 1999: 3–4). True to her beliefs, Spivak has highlighted with reference to her philanthropic activism the significance of developing 'rituals of democratic habits' (McMillen 2007) even where democracies appear to be in place. And even though she insists that the human imagination cannot be digitised but is enlarged instead through embodied classroom interactions (ibid.), her writings and her activism appear to assume a life of their own on the World Wide Web and the new digital humanities. Examples have been the recent debates on the whiteness of new digital humanities, that is, how the digital divide between developed and developing countries should be assessed by considering how social inequalities thrive on combinations of 'race' and colour.

Definition

This essay includes a short biography of the man with a particular focus on his contribution to anti-imperialism (and by proxy the contribution of the Soviet Union under his leadership).

Introduction

Stalin is a polarising figure no doubt, but one who it is essential to discuss in considering the history of imperialism and anti-imperialism. For this reason I was glad to accept the task of writing this essay about him, and hope to have done the subject justice. (Special thanks to Dr Zak Cope, Scott Horne, and Prerna Bakshi for their comments.) In the space I have available, it is impossible to comprehensively study a figure of Stalin's significance. As such, this will not be an essay that discusses in depth his general contribution to Marxism, to socialist politics and history, or his role as the leader of the USSR beyond the anti-imperialist context. Owing to his significance as a

world historical leader, much has been written about Stalin along these lines, which can be found elsewhere. (For a friendly reading of Stalin, readers would be well advised to consult Anna Louise Strong, Ian Grey or Ludo Martens. There is no shortage of critical readings of Stalin in Western scholarship.) Instead, this essay includes a short biography of the man with a particular focus on his contribution to anti-imperialism (and by proxy the contribution of the Soviet Union under his leadership).

This essay will begin with a brief introduction and description of Stalin's life. While it would be surprising if readers' first encounter with Stalin were through these pages, I include it nonetheless due to both the biographical nature of this essay and as a way of introducing Stalin the man as well as Stalin the anti-imperialist. Stalin's contribution to anti-imperialism will then be assessed through historical analysis of the role of the Soviet Union in the decolonisation of the Russian Empire as well as support to antiimperialist movements, and the defeat of imperialism during the Second World War.

A Short Biography

Stalin was born Iosif Vissarionovich Dzhugashvili on 18 December 1878 in the city of Gori in what was then part of the Russian Empire, but is now part of Georgia. His parents, Georgians, were of humble backgrounds. His father, Besarion Dzhugashvili was a cobbler and his mother, Ketevan Geladze, was a domestic labourer. Stalin's early upbringing was difficult with the Dzhugashvili household suffering from domestic violence. It would not be until Stalin's mother left her husband that Stalin would find any semblance of stability.

Devoutly religious and with the aim of her son joining the clergy, Stalin's mother arranged for him to be sent to a seminary to train as a priest. This experience, according to Stalin, was one of the first major motivations for him to become a revolutionary activist. In an interview with German author Emil Ludwig, Ludwig suggested that Stalin's revolutionary turn might have been

motivated by his difficult upbringing. Stalin suggested otherwise:

> No. My parents were uneducated, but they did not treat me badly by any means. But it was a different matter at the Orthodox theological seminary which I was then attending. In protest against the outrageous regime and the Jesuitical methods prevalent at the seminary, I was ready to become, and actually did become, a revolutionary, a believer in Marxism as a really revolutionary teaching. (Stalin 1954, p. 115)

Stalin joined the Russian Social Democratic Labour Party (RSDLP), part of which would become the Bolshevik Party, in 1903 and worked as an organiser in the Caucasus. During this time he led a strike of oil workers which resulted in the first collective bargaining agreement between the workers and the oil owners (Marx-Engels-Lenin Institute 1949, p. 14). In addition to organising, Stalin was active in illegal work to raise money for the Bolshevik faction of the RSDLP in defiance of the orders of the party. Stalin was a noted organiser of the 1907 Tiflis Bank Robbery, which was planned and organised with many of his later comrades including Vladimir Lenin and Maxim Litvinov. As a result of his activities, Stalin spent a great deal of time in Siberian exile on no less than seven occasions. Upon his final release, he would go on to play various important roles in the Bolshevik Party and the Russian Revolution, becoming the editor of *Pravda,* a member of the Central Committee, and played a key role in helping Lenin avoid capture.

Following the Russian Revolution, Stalin was appointed people's commissar for nationalities affairs as a result of his theoretical contribution on the relationship between nationality and Marxism as conceptualised in 'Marxism and the National Question' in 1913. Under Stalin's leadership, the Soviet government introduced a policy of equality between all Soviet citizens, the official recognition of the mother tongues of all the nations of the Soviet Union, and the formation of the soviet of nationality affairs, the Narkomnats. Though he would later be criticised for being an agent of 'Russification', it is notable that Stalin was key in shifting Soviet policy away from opposition to national autonomy during his tenure. Early Soviet nationality and language policies would include the development of written languages (if lacking), attempts at national language planning for minority nationalities, and the development of native language presses and books (Slezkine 1994, p. 431).

In 1922, Stalin would be appointed general secretary of the Communist Party of the Soviet Union, a position he would hold for life. During the early period of his leadership, and following the death of Lenin, he became embroiled in a series of power struggles centred around which personalities and which political lines would be decisive in the post-Lenin leadership of the Soviet Union. After outmanoeuvring his opponents politically, Stalin would emerge victorious as the undisputed leader of the Soviet Union until his death in 1953. The period of Stalin's leadership of the Soviet Union is the most critical with regard to his contribution to anti-imperialism, and will be assessed in greater detail in the following sections of this essay.

Stalin's Theoretical Contributions to Anti-imperialism

The following section presents a review of Stalin's key theoretical contributions on the subject of anti-imperialism. The shortest way to summarise Stalin's contribution to Marxist-Leninist theory is that his work addressed a key weakness in Marxist theory, namely the complex relationship between nation and class. Prior to Stalin's work on the national question, and indeed even in Stalin's early work on the subject, Marxist theory had assumed the impossibility of identification between the bourgeoisie and the proletariat of any given nation on questions of culture, language, or territory (Van Ree 1994, p. 227). This position amounted to an effective denial of the role of nationality, culture, or language in terms of the political behaviour or aspirations of peoples. This clearly unsustainable position flew in the face of historical experience of multiclass national alliances, and would continue to be disproven throughout the twentieth century and the experience of anti-colonial and anti-imperialist movements.

In *Marxism and the National Question*, Stalin laid out a definition of the nation that was key to establishing the Bolshevik position on national self-determination. In this work, Stalin (1955, p. 307) defined a nation as 'a historically constituted, stable community of people, formed on the basis of a common language, territory, economic life, and psychological make-up manifested in a common culture'.

Stalin's theory of the nation was critical to Marxist thinking around anti-imperialism. The core contribution of Stalin's thinking was to recognise firstly that national oppression impacted the exploited classes more than the exploiters, as can be seen in his statement that:

> Restriction of freedom of movement, disfranchisement, repression of language, closing of schools, and other forms of persecution affect the workers no less, if not more, than the bourgeoisie. Such a state of affairs can only serve to retard the free development of the intellectual forces of the proletariat of subject nations. One cannot speak seriously of a full development of the intellectual faculties of the Tatar or Jewish worker if he is not allowed to use his native language at meetings and lectures, and if his schools are closed down. (1955, p. 316)

Secondly, Stalin noted that at historically contingent moments, national oppression creates a temporary identity of interest between classes that would otherwise be engaged in struggle with one another. Stalin noted that:

> . . . the policy of nationalist persecution is dangerous to the cause of the proletariat also on another account. It diverts the attention of large strata from social questions, questions of the class struggle, to national questions, questions 'common' to the proletariat and the bourgeoisie. And this creates a favourable soil for lying propaganda about 'harmony of interests,' for glossing over the class interests of the proletariat and for the intellectual enslavement of the workers. (1955, p. 319)

Implicit in this understanding is that the resolution of questions of national liberation is a necessary precursor to the advancement of socialism and the class interests of the proletariat. In this respect, Stalin departed from most Marxist theory at that time.

In assessing the contribution of Stalin to the Marxist theory of nations, Van Ree summarises Stalin's contribution like this: 'Stalin was the Marxist who finally destroyed the traditional Social-Democratic concept, to which even Lenin had stuck, that the victory of socialism implied the quick demise of the nation' (Van Ree: 1994, p. 230). In the chapter 'The National Question and Leninism', Stalin made the fairly obvious suggestion that various aspects of nationality, such as language and culture, had historical roots prior to capitalism (Stalin 1955, p. 351). In making this suggestion, Stalin implied that these would continue to be important even under socialism (Van Ree 1994, p. 226).

The centrality of the national question extended beyond Stalin's views about life in the Soviet Union and would play a key role in his understanding of imperialism and contribution to anti-imperialism. In 'The Foundations of Leninism', Stalin noted that:

> the struggle that the Egyptian merchants and bourgeois intellectuals are waging for the independence of Egypt is objectively a revolutionary struggle, despite the bourgeois origin and bourgeois title of the leaders of the Egyptian national movement, despite the fact that they are opposed to socialism; whereas the struggle that the British 'Labour' movement is waging to preserve Egypt's dependent position is for the same reasons a reactionary struggle, despite the proletarian origins and the proletarian title of the members of that government, despite the fact that they are 'for' socialism. (Stalin 1924: Chap. 6)

In contrast to most Marxist theorists of his day, who were disdainful of the role of the peasantry and other non-proletarian classes in waging struggles for liberation, Stalin placed great faith and saw great strategic significance in the world's national liberation movements. While most of Marxism was looking towards the advanced countries of Europe for socialism, Stalin correctly looked to Asia, Africa, and Latin America; and therefore to anti-imperialism as being the centre of gravity for socialist revolution.

The USSR and Anti-imperialism Before the Second World War

The role of the USSR under Stalin and its contribution to anti-imperialism prior to the Second World War can be divided into two main parts,

namely the contribution to antiimperialism inside and outside the Soviet Union. As will be demonstrated in this section, these efforts were not unproblematic and achieved mixed results. They were, however, attempts and achievements that were without parallel for their time.

It should be stressed that the history of decolonisation in the twentieth century began with the Soviet Union. In accord with Stalin's theories as laid out in *Marxism and the National Question*, the Soviet Union began decolonising the former Russian Empire based on the principle of the right of nations to self-determination up to and including secession. Padmore (1946, p. 48) notes that the decolonisation process began despite the ongoing Russian civil war in which the interventionist forces of the various imperialist powers were aligning themselves with various social forces in Russia's former colonies (51).

The political system established by the Soviet Union was based on national delimitation into constituent republics on the basis of Stalin's definition of the nation. Writing on this administrative division, Padmore notes that 'this structural form of administration' enabled 'each national and racial minority living within another ethnographic area to maintain its own identity, if it so wishes, and helps to nurture the many distinctive cultures of the several peoples' (67). The structure of the Soviet political system was designed to avoid the dominance of one national delimitation over another, with the soviet of nationalities being represented by an equal number of delegates from each republic (69–70).

Beyond the design of the political system was an active attempt by the central Soviet leadership to develop the political and institutional capacities of the former colonial republics. This strategic policy was known as Korenisatsiya (nativisation or indigenisation). Korenisatsiya entailed the 'full recognition of the national languages on par with Russian' (Grenoble 2003, p. 44) and ensured that the language of local administration and education would be the local language. In addition to this, 'new national elites were trained and promoted to leadership positions in the government, schools, and industrial enterprises of these newly

formed territories' (Martin 2001, p. 1). Stalin's policy intent can be seen in his comment that:

> it would be an error if anyone thought that in relation to the development of the national cultures of the backward nationalities, central workers should maintain a policy of neutrality ... Such a view would be incorrect. We stand for protective policy in relation to the development of national cultures of the backward nationalities. I emphasise this so that it will be understood that we are not indifferent, but actively protecting the development of national culture. (Stalin [1929, 9] RTsKhlDNI 558/1/4490, cited in Martin 2001a)

As will be demonstrated, Korenisatsiya (and by extension, Stalin's nationalities policy) was contested from its very inception, reflecting forces internal to the Soviet Union that either directly or indirectly supported the Russification of the Union. These will be discussed in the following section, and Stalin's role (whether in favour of anti-imperialism within the Soviet Union or otherwise) will be evaluated. A number of critics, for example Marsden (2002, p. 106) and Van Ree (1994, p. 164), identify Stalin as a Great Russian nationalist (or even a chauvinist), determined to assimilate minorities and 'Russify' the Soviet Union, and turn the Soviet republics into dependencies of Russia. These claims will be evaluated in this section.

The starting point for the discussion of Stalin's possible role in the Russification of the Soviet Union can be seen in Lenin's criticism of Stalin, Ordzhonikidze, and Dzerzhinskii as 'great Russian chauvinists' in the political debate that surrounded the framing of the Soviet constitution (Martin 1998, p. 100). Martin criticises the position taken by Lenin thus:

> with regard to the rights of the non-Russians, there was little difference between their rival constitutional proposals. Both plans had the identical three tier commissariat structure. Lenin's proposal was slightly more favourable to the independent republics and raised them above the autonomous republics in status ... Stalin's plan however was more favourable to the existing autonomous republics, such as Tatarstan and Turkestan who would be given the same status as Georgia and the Ukraine. (101)

In fact, Stalin debated furiously with both Lenin and the Tatar Communist Mirsaid Sultan-

Galiev against the creation of a specifically ethnically Russian Soviet in place of the Russian Soviet Federative Socialist Republic, as he believed that Russians had historically benefited from their position as the imperial nation, and even contemporarily benefited from being the 'state-bearing nationality' of the Soviet Union (ibid.).

In response to the policy of Korenisatsiya, there was a backlash from both the Russian population and Russian figures within the Russian Communist Party and the Soviet state apparatus. These political considerations weighed on the ability of Stalin to pursue the affirmative action policies based on his theory of the national question. This can be seen, for instance, in the comments of the soviet secretary of nationalities, Tadzhiev, who suggested that:

> Local misunderstandings develop because we observe an opposition to assimilation. One sometimes even observes this among communists. In fact, we should not oppose assimilation. Our nationalities policy is absolutely clear and we can never permit forced assimilation. We won't allow that, but we should by all means welcome natural assimilation, we should welcome natural assimilation which takes place at its own pace. This is good as it leads to the formation of a single nation, a single language. (Martin 1998, p. 109)

Tadzhiev was by no means an isolated political voice as can be seen by the comments of Khatskevich, his successor in the soviet of nationalities, that:

> many incorrectly understand the rights of national minorities in their economic and cultural development . . . More attention must be given to realizing the right of free choice to use any language according to the choice of the population itself and each citizen individually . . . Each *natsmen* [national minority within the Soviet Union] should have the right to liquidate their illiteracy in their native language, but if they want to liquidate it in Russian, living somewhere in the *kraia* and *oblasti* of the RSFSR, then one must give them that right and possibility. (ibid.)

As noted by Martin (Ibid.), the liberal positions of both Tadzhiev and Khatskevich acted in a way that was oblivious to the historical power structure of the former Russian Empire, which carried over into the modern Soviet Union. A liberal position

such as the one they took is simply a softer way of supporting Russian nationalism, remaining neutral while the stronger force decides the power struggle.

Beyond the fact that these positions were allowed to develop under Stalin, it is difficult to point to Stalin as the motive force behind the kind of soft assimilationist policies proposed by elements of the Soviet leadership. The extent to which these pronouncements contradicted Stalin's own position on nationalities and policies up to this period of Soviet history suggests that these forces existed despite and not because of Stalin. They were part of a political landscape within which he had the space to govern, and they can be seen as a reaction to the Korenisatsiya framework that suppressed Russia, Russian, and Russians in favour of minority nationalities, their leaders, and their languages. What can be said is that as a result of the balance of forces, the 1930s became a period of compromise between Russian nationalism and minority nationalisms in the Soviet Union. The question remains then to what extent Stalin contributed to or supported Russification in the Soviet Union, and to what extent he opposed the forces that were in favour of ending Korenisatsiya.

A key point in Soviet nationalities policy came in 1938 when Russian became a mandatory subject of study in all Soviet schools (Kirkwood: 1991, pp. 63–64). While scholars such as Kirkwood (ibid) consider this policy to be evidence supporting Stalin's desire for Russification, the political context of the time suggests otherwise. In 1938, the People's Commissar for Education, Tiurkin, proposed to introduce Russian as a subject from the first grade on a par with the local language, a policy that was rejected by Stalin (Suny and Martin: 2001, p. 258). Zhdanov (259), paraphrasing Stalin, noted that he thought 'what Comrade Stalin pointed out must be included in the draft – that there must be no suppression of, or limitation on, the native language, so as to warn all organizations that Russian is to be a subject of study, not a medium of instruction'. Blitstein notes that the decision to mandate Russian language instruction was mostly tactical and on the basis of '(1) the need for a common language in a multinational state seeking further economic

and cultural development; (2) the importance of Russian for the advanced training of non-Russian cadres; and (3) the requirements of defense' (258).

It appears that the rehabilitation and elevation of certain pre-revolutionary political and cultural figures occurring during Stalin's leadership can be viewed in the context of a tactical compromise in light of the impending struggle against fascism. In addition to this, however, is the difficulty in resolving the discord between the leading role played by Russian workers in the Russian revolution (and later the leading role played by Russians in the Great Patriotic War of 1941–45), and the strategic objectives of Soviet nationalities policy under Stalin. Often, Stalin could be seen as torn between these two poles. On a number of occasions, he was seen to refer to the Russian people as the leading force, or the first amongst equals in the Soviet Union (Martin 2001b, pp. 271–272).

The rehabilitation of political figures such as Peter the Great, Ivan the Terrible, and Alexander Nevsky, and cultural figures such as Pushkin and Tchaikovsky, can be seen in this light, as can the rehabilitation of the Russian Orthodox Church. In addition to this, overtures toward Russian nationalism can be seen in wartime propaganda materials, in the invocation of 'Mother Russia' (Lieven 2000, pp. 305–306). These comments and the associated political decisions should be placed in their correct historical (the lead-up to the Second World War) and political (the need to accommodate Russian nationalism whilst simultaneously combating chauvinism based on the historic experience of the Russian revolution) contexts.

While the Soviet Union under Stalin would continue to provide significant support for the development of minority cultures, the period of compromise represented the passing of the high point of the decolonization efforts of the former Russian Empire. The Soviet Union had moved from an aggressive policy of affirmative action to a position of support for minority nationalities alongside the promotion of Russian as a lingua franca for the purpose of multinational state building and defence, to the temporary acceptance of Russian nationalism in the face of the Nazi onslaught. The problem with some tactical compromises is that they can evolve into strategic

shifts, and this appears to have occurred under the post-Stalinist leadership of the Soviet Union.

The evidence suggests that rather than Stalin, Khrushchev, the Soviet leader most responsible for unpacking and reversing Stalin's legacy, was primarily responsible for the Russification of the Soviet Union. Capitalising on the tactical compromises made by Stalin in education and in cultural policies, the post-Stalin leadership steered Russia in the direction of its former imperial past. Suny and Martin note that:

> it was only in the post-Stalin period, with the school reform of 1958, that non-Russians were given the *choice* to educate their children in Russian, rather than in their native languages. Whereas during Stalin's rule, educational policy probably acted as a brake on linguistic Russification, in the Khrushchev and the Brezhnev periods hundreds of thousands of non-Russian parents sent their children to Russian-language schools in order to ease the path to social advancement. (2001, p. 12)

To summarise Stalin's contribution to decolonisation within the Soviet Union, then, the Stalin period witnessed an attempt at maintaining and reviving national and minority cultures that was attempted on a scale that had never been seen before, and has not been seen since. The existence and vibrancy of the cultures of many nationalities that were part of the Soviet Union is to a large extent explicable by Stalinist policy. Due to significant internal and external pressure, there was a limit to how far and for how long these aggressive nationality policies could be pursued. Stalin found himself in a position where he needed to maintain unity in the face of external aggression. Following Stalin's leadership, the active 'de-Stalinisation' campaign of Khrushchev would see Stalin's work on the national question and its associated policies buried.

Anti-imperialism Outside the Pre-war Soviet Union

Outside the Soviet Union, a critical historical question about Stalin's anti-imperialism concerns the influence of the Comintern on the Chinese revolution and its war of national liberation, and on the Spanish Civil War.

One of the most notable criticisms of Stalin and the Comintern comes in relation to their influence on the strategy and tactics of the Chinese Communist Party. Indeed, even the Chinese Communist Party criticised the errors of Stalin and the Comintern in terms of their influence in China, suggesting that:

Long ago the Chinese Communists had first-hand experience of some of his [Stalin's] mistakes. Of the erroneous 'Left' and Right opportunist lines which emerged in the Chinese Communist Party at one time or another, some arose under the influence of certain mistakes of Stalin's, insofar as their international sources were concerned. In the late twenties, the thirties and the early and middle forties, the Chinese Marxist-Leninists represented by Comrades Mao Tse-tung and Liu Shao-chi resisted the influence of Stalin's mistakes; they gradually overcame the erroneous lines of 'Left' and Right opportunism and finally led the Chinese revolution to victory. (Communist Party of China 1963, pp. 123–124)

Here Mao is referring to a number of political lines suggested by the Comintern and implemented by figures in the Chinese Communist Party, namely those centring the Chinese struggle around Urban Insurrection (Li Lisan), Frontal Confrontation between the armies of the Chinese Communist Party and the Nationalist Party (Otto Braun alias Li De), and the influence of the 28 Bolsheviks group, most notably Wang Ming whom Mao criticised for a dogmatic application of the Soviet experience to Chinese circumstances.

Nonetheless, the Chinese Communist Party resisted an over-attribution of power to Stalin, suggesting instead that as much as Stalin or the Comintern made theoretical errors in their analysis of the Chinese situation, the real weakness was of elements in the Chinese party who uncritically implemented these ideas.

But since some of the wrong ideas put forward by Stalin were accepted and applied by certain Chinese comrades, we Chinese should bear the responsibility. In its struggle against 'Left' and Right opportunism, therefore, our Party criticised only its own erring comrades and never put the blame on Stalin. The purpose of our criticism was to distinguish between right and wrong, learn the appropriate lessons and advance the revolutionary cause. We merely asked the erring comrades that they

should correct their mistakes. If they failed to do so, we waited until they were gradually awakened by their own practical experience, provided they did not organise secret groups for clandestine and disruptive activities. (ibid.)

What this analysis suggests is that while Stalin and the Comintern's line during the pre-war period was, according to the Chinese Communist Party, incorrect, the impact of this should not be overstated. Mavrakis (1976, pp. 127–128) similarly disputes the 'command and control' view of the Comintern's role in China, arguing that

how can Stalin be held responsible for the mistakes made by the CCP in the period 1928–35 when we know: 1. that an exchange of messages between the Kiangsi bases and Moscow required six to eight months; 2. that, whenever he had knowledge of them, Stalin upheld the positions of Mao Tse-tung and not those of the CCP leadership which he is supposed to have put in the saddle. 3. that the latter carried out the Comintern's instructions only when it suited it to do so.

This logic suggests that even if incorrect, the ability of Stalin and the Comintern to negatively impact the political line of the Chinese Communist Party, let alone its day-to-day operations, should not be overstated.

The question remains as to what if anything was the contribution of Stalin and the Comintern to anti-imperialism.

Along with Mexico, the Soviet Union was the only state to provide assistance to the Spanish republic during the Spanish Civil War. The Falange under General Francisco Franco received substantial support from Hitler and Mussolini to bring down the elected government (see Whealey 2004). During this period, it is notable that the Western powers maintained a policy of 'neutrality' in the face of the fascist takeover of Spain. According to Sir Basil Henry Liddell Hart, a leading British military adviser to Lloyd George, Anthony Eden (British foreign secretary) and Winston Churchill, 'Whitehall circles were very largely pro-Franco'.

Despite hugely superior naval power, instead of blockading the German and Italian intervention, illegal under the 1919 Versailles Treaty and the 1925 Treaty of Locarno, Hart was 'saddened that so many leading lights of his society 'desired

the [Spanish Nationalist] rebels' success' and correctly concluded that '[class] sentiment and property sense would seem to have blinded their strategic sense'. Thus, a non-Intervention Committee under League of Nations auspices was set up, to which Germany and Italy were a part. This prohibited the supply of arms to the Spanish Republic. However, even with France having its own Popular Front government under 'Socialist' premier Leon Blum, it did nothing effective to prevent German and Italian soldiers and materiel from reaching Franco's army (Leibowitz and Finkel 1998, pp. 53–58).

It was clear that nothing was being done to stem the fascist involvement in Spain's affairs. Concerned to contain fascism, and particularly to prevent its encirclement of military ally France, the Soviet Union weighed in on the Republican or 'loyalist' side. The first cases of rifles and ammunition – labelled 'pressed meat' – left the Black Sea coast of Russia on 18 September 1936 (Haslam: 1984, p. 115). In total the USSR provided Spain with 806 planes, 362 tanks, and 1,555 artillery pieces; it was the Republic's only important source of major weapons, without which, the Republic would not have lasted a week. British historian Helen Graham (2002, p. 153) writes:

> In 1936 the Soviet government would dispatch at least 50% (and probably more) of its precious total annual production of military aircraft to Republican Spain. Later in the war too the Soviet government would provide substantial credits to the Republic when it knew that it had virtually no chance of recouping them.

Soviet anti-imperialist assistance was not however limited to contexts where aid would provide immediate assistance to a communist party. One example of this includes Soviet military aid provided to Nationalist China in the war against Japan. As a result of the Sino-Soviet Non-Aggression Pact and Mutual Assistance treaty, China was the recipient of military material and advisors, all of which were provided on credit. Additionally, the Soviet Union supported Nationalist China against Japan through Operation Zet, which consisted of a cover Soviet volunteer air force (Demin 2000).

While this is not a comprehensive account of all assistance provided by the Soviet Union to anti-imperialist efforts worldwide, these examples demonstrate the willingness of the Soviet Union under Stalin to provide internationalist aid and assistance, in particular where no benefit to the national interest of the Soviet Union could be obtained. Stalin thus made significant contributions to antiimperialism prior to the Second World War.

The USSR in the Second World War

The contribution of the USSR in the Second World War constitutes one of the principal contributions against both fascism and imperialism in the twentieth century. While victory in the 'Great Patriotic War' cannot be wholly attributed to Stalin, a significant degree of credit is owed for a number of reasons, many of which have their origins in Stalin's pre-war policies. This section will assess the contributions of Stalin to the victory in the Great Patriotic War and the impact which this had on broader anti-imperialism.

First, the ability of the USSR to respond militarily to the might of fascist Germany is a vindication of Soviet industrialisation policies during the pre-war Stalinist leadership. In the words of Hitler himself, 'If I had known about the Russian tank's strength in 1941, I would not have attacked' (Barnett 1989, p. 456).

Second, the development of the Soviet military between 1939 and 1941 is a vindication of the tactical delay encompassed by the Nazi-Soviet non-aggression pact. Meltyukhov (2000, 446) notes that between 1939 and 1941, the Soviet Union expanded its military strength significantly, growing its overall number of: divisions by 140.7%; military personnel by 132.4%; guns and mortars by 110.7%; tanks by 21.8%; and aircraft by 142.8%. The ability to pursue this dramatic expansion of the Soviet military shows the positive effects of both industrialisation and the delay of the outbreak of hostilities that resulted from the pact (itself forced on the USSR by the failure of its consistent efforts to secure a Collective Security alliance with Britain and France).

Third, the contribution made by the Soviet Union against Nazi Germany was far greater than that of all the other powers combined.

> The length of the Soviet-German front differed in different years, varying from 2,200 to 6,200 km, whilst the Allies front never exceeded 800 km after the landing in Normandy and 300 km in Italy. Active hostilities were conducted on the Soviet-German front for 1,320 days out of a total of 1,418 days (93% of the total fighting time), the corresponding figure for the North African, Italian and West European fronts being 1,094 days out of a total of 2,069 days (53%). The third Reich suffered its heaviest losses on the Soviet German front: more than 73% in manpower, 75% in tanks and aircraft and 74% in artillery. (Zhilin 1985, p. 40)

The Soviet victory over fascist imperialism is one of the most important contributions of Stalin's period of leadership to the cause of anti-imperialism. The result of this conflict was the defeat of major imperialist powers in Europe, and a restructuring of international relations that laid the groundwork for the spread of decolonisation in the twentieth century. The example of the Soviet Union demonstrated to liberation movements worldwide that victory over highly advanced imperialist powers was indeed possible.

The USSR and Post-war Anti-imperialism

Despite the crippling effects of the Second World War, as a result of the industrialisation process of the previous two decades under Stalin's leadership, the Soviet Union emerged from the war in a position to offer assistance to newly liberated countries. This section will discuss some key examples of aid provided to such countries in the post-war period through the leadership of Stalin, including aid to Albania, Korea, and China, as well as the establishment of peoples' republics in Eastern Europe. Following this there will be some discussion of the Soviet role in denazification in Germany. It is important to note that these subjects are entire research questions in themselves and as such the discussion will be a fairly superficial introduction due to space constraints. However, the reader is encouraged to explore these anti-imperialist achievements further.

The Soviet Union under Stalin provided significant support to anti-imperialist political forces. Some examples of this include the role of the USSR in arming the Democratic People's Republic of Korea (DPRK; Anthony 1998, p. 151). Beyond the mere arming of the DPRK, however, the USSR provided broad economic assistance to it through the provision of scientific and technical personnel and equipment, the majority of which was provided on the basis of credit (Wilson Centre Digital Archive 1949). Under an agreement between Stalin and Kim Il-Sung, the DPRK was provided with significant military assistance as well.

It is notable that only the strength of the Soviet Union was able to prevent the wholesale US imperialist takeover of Korea in the immediate aftermath of the Second World War. During this time, Stalin played an important role in checking the military adventurism of Kim Il-Sung who was advocating a war of national liberation in US-occupied Korea. Stalin's position would change after the liberation of China in 1949 and the withdrawal of US troops from the Republic of Korea in the same year, at which time the balance of forces had changed sufficiently in Asia to allow Kim Il-Sung to proceed with his attempt to unify Korea (Wilson Centre Digital Archive 1950).

An additional case of the internationalist anti-imperialist solidarity of the Soviet Union under Stalin came in the form of assistance to the newly formed Albanian People's Republic. Walters (1970, p. 91) estimates that between 1945 and 1966, a reported US$246 million in aid was provided to Albania. Given that the Soviet Union withdrew support entirely from Albania in 1961 owing to the Albanian–Soviet Split in 1961 (167), this aid can be seen as even more significant, and the majority of it was provided under Stalin's leadership.

The establishment of peoples' republics in Eastern Europe under Stalin's leadership is another critical contribution by Stalin to antiimperialism (Minc 1950). The consolidation of these republics and the extraction of reparations from defeated Germany were crucial in preventing further aggression against the countries in question as well as against the Soviet Union. In evaluating Stalin's contribution in this respect it is important to differentiate between Stalin safeguarding Eastern

Europe from imperialist expansion, and the way that subsequent Soviet leaders would turn Eastern Europe into economic dependencies in what is generally conceptualised as Soviet social-imperialism (Xhuvani and Hana 1981).

In 1950, the Soviet Union under Stalin would engage in a key piece of anti-imperialist foreign policy, safeguarding the newly established People's Republic of China (Ministry of Foreign Affairs of the People's Republic of China 2000). The Sino-Soviet Treaty of Friendship, Alliance and Mutual Assistance shielded China from the possibility of imperialist intervention. The alliance between China and the Soviet Union began a period of significant co-operation between the two powers, which ended with the Soviet withdrawal of assistance during the Sino-Soviet split beginning in 1960.

While Stalin would only outlive the Second World War by eight years, and would become increasingly marginalised politically, during this period he made a number of valuable contributions to anti-imperialism. The assistance provided in Eastern Europe, China, and Korea is by no means an exhaustive list, however, these examples demonstrate that even in the context of post-war devastation, the Soviet Union under Stalin was willing to provide significant assistance to other countries in the name of anti-imperialism.

Conclusion

This essay has assessed the contribution of Stalin to anti-imperialism in three major phases: the period before the Second World War, the war itself, and the period following the Second World War up to Stalin's death in 1953. It has been argued that Stalin made major contributions to the decolonisation of the Soviet Union itself through his analysis of the National Question and the implementation of his theories in policy terms. While Stalin faced significant opposition to the implementation of affirmative-action policies which benefited minority nationalities within the Soviet Union, the policy of Korenisatsiya was unprecedented and has yet to be matched in modern history as an example of support for the rights of national self-determination.

This essay has attempted to explain the reasoning behind the retreat from the heights of Korenisatsiya in the late 1930s. Both this and the overtures made to Russian nationalism were seen as the result of both the external pressure due to the threat of imperialist invasion of the Soviet Union and internal pressure from various social forces including a significant number of the Soviet leadership who took up Russian nationalist positions. It has been argued that these tactical compromises evolved into strategic shifts toward the Russification of the Soviet Union under Khrushchev and Brezhnev.

Outside the Soviet Union, Stalin provided important contributions to anti-imperialism by providing support to the Spanish Republic and to Nationalist China. Following the Second World War, Stalin continued to contribute to anti-imperialism through his support of various countries in Eastern Europe and Asia.

Overall, therefore, Stalin's contribution to anti-imperialism is a major one. By no means can it be considered perfect or flawless. However, the fact that Stalin was able to contribute so much to the cause of anti-imperialism in difficult circumstances, and in the face of both internal and external pressures within the Soviet Union, speaks volumes for his status both as a historical figure and as a Marxist.

Stratification in the World-Economy: Semiperiphery and Periphery

Marilyn Grell-Brisk
Institute for Research on World-Systems,
University of California, Riverside, Riverside,
CA, USA

Introduction

The idea that we live in a highly unequal global political economy is hardly insightful; yet, the

suggestion that given its mode of accumulation the *modern capitalist world-system* cannot exist without this inequality might seem controversial. Still, the exploitative practices of those at the top (core) of the world-system hierarchy, on those at the very bottom (periphery) and middle (semi-periphery) are hard to ignore. In the world-system, *core* countries benefit the greatest from the surplus derived from *global commodity chains* while *peripheral zones* see no benefit. The economic activities of core countries are capital-intensive as opposed to the labor-intensive ones of peripheral areas. Factoring into this, is the fact that the *core* countries engage in reproductive accumulative strategies compared to the primary accumulation strategies of the periphery.

However, conceptualizing the modern capitalist world-system in terms of core-periphery can be misleading as it overlooks the *semiperiphery*, which engages with both types of accumulation strategies and capable of profiting from global commodity chains. The semiperiphery is exploited by the core but also engages in the exploitation of the periphery through *unequal exchange* (Wallerstein 1974a). According to Immanuel Wallerstein, there is a small group of core states at the top of the stratified world-system, a medium-sized semiperipheral zone, and a large peripheral zone exploited by both strata at the top (see Fig. 1).

In this global structure and system, unequal exchange is enforced by the strong states on the weak. Furthermore, unequal exploitative trade practices by the core that are masked by market

Stratification in the World-Economy: Semiperiphery and Periphery, Fig. 1 Tripartite organization of the world-system

processes and backed by existing military and political systems facilitate a semi-stable world-system, at least, according to Immanuel Wallerstein. Conversely, Albert Bergeson (1990) contends that unequal exchange in trade (and/or long commodity chains) do not construct the core-periphery hierarchy, but rather, it is the core-periphery domination relationship that makes unequal exchange possible and reproduced throughout the system (1990, p. 74).

Still, this system of unequal exchange in the world-economy means that core countries maintain their position by taking advantage of low labor cost in the periphery and the semiperiphery with a net effect of increased capital resources in the core. If the goal of capitalism is to continuously expand a system of production to maximize profit, then Wallerstein's thesis that unequal exchange is necessary for the proper functioning of the modern capitalist world-system is plausible. Although one of the implications of all of this is a semi-rigid system, none of the above means that peripheral and semiperipheral zones are completely devoid of agency.

In fact, this chapter will advance the idea that despite empirical evidence to support a strong structural pull toward a tripartite world-system, (a) over the last 50 years there has been a particular type of mobility within the trimodal system – a growing semiperiphery, and declining periphery; (b) the semiperiphery, which participates in exploitative practices like core countries, continues to maintain the tripartite system, while at the same time being the zone in which significant technological and organizational change has historically occurred; (c) there is still a certain amount of unevenness, with peripheralization and semiperipheralization occurring throughout the tripartite world-system. This is called *nestedness*, an example of which is found in the work of Wilma Dunnaway (1996). Who exploits whom, then, becomes an interesting starting point to discuss the stratified world-economy.

The chapter begins with a discussion of stratification in the modern world-system, building on the idea of system hierarchy; followed by an examination of the semiperiphery in the context of a rising China; and periphery with sub-Saharan
African region as an example. Then the discussion is broadened to discuss the unevenness of peripheral and semiperipheral development as exemplified by the Appalachian region of the United States.

Stratification

In the context of this chapter, we propose that global stratification implies a hierarchical system. Yet, peripheral, semiperipheral, and core zones do exist outside of hierarchical systems. Hierarchical core-periphery systems involve domination and exploitation, as opposed to core-periphery differentiation which implies networks of systemic inter-polity interaction (Chase-Dunn and Grell-Brisk 2016; Chase-Dunn and Hall 1997). For hierarchy to emerge, the capability of domination and exploitation must be present and the modern capitalist world-system offers such a situation. Therefore, this chapter's focus is primarily on the modern world-system but does acknowledge that world-systems did exist in the pre-modern world as described by Christopher Chase-Dunn (1989) and Chase-Dunn and Thomas Hall (1995).

According to Wallerstein, hierarchy emerged in the long sixteenth century because of the capitalist system that developed in Europe. However, other scholars have long argued that the modern capitalist world-system and historical political economy as conceived by Wallerstein was historically limited (Abu-lughod 1989, 1993; Gunder Frank and Gills 1993a), even Eurocentric (Gunder Frank 1998; Gunder Frank and Gills 1993b), and asserted that the world-system(s), *even capitalist ones*, existed prior to the sixteenth century and outside of Europe (Abu-lughod 1989, 1993; Anievas and Niancolu 2015; Chase-Dunn and Hall 1995; Gunder Frank and Gills 1993a). As an example, using primary and secondary source evidence, Janet Abu-lughod (1989) describes the emergence of an extensive trade and capitalist world system between 1250 and 1350 long before Wallerstein's modern capitalist world-system.

Andre Gunder Frank, like Abu-lughod, conceived of a capitalist world system that was acutely different than Wallerstein's. He maintained that a

world system existed much earlier than the long sixteenth century, with China occupying the center. His *World Accumulation* (1978) laid the groundwork for much of his later scholarship (although he later levies claims of Eurocentrism at that particular work). In it, he maintained that there has been *one* continuous process of capital accumulation in recent centuries including the preindustrial capitalist societies. Feudal modes of accumulation or concepts such as primary accumulation were not useful. He reasoned that preindustrial capitalism generated long economic cycles in which a geographical external expansion phase occurred, including the extension of trade and commerce. However, this eventually led to a crisis phase. The expansion phase induced external transformation and the crisis phase led to internal transformation leading to development or underdevelopment in particular regions. In *ReOrient*, Gunder Frank took Abu-lughod's claims about the world-system a bit further, noting that the world economic system was centered in Asia; and not only was China at the center, but that Europe occupied the peripheral economic zone (Gunder Frank 1998). He argued that this was due to the size of China's economy relative to all the other world regions and the fact that for centuries, China held a trade surplus and most of the world's silver.

This was not a new argument for Gunder Frank, who had made earlier similar claims, along with his colleague Barry Gills (Gunder Frank and Gills 1993a). Gunder Frank also expressed another particular point that echoed and expanded earlier arguments made by Abu-lughod: that the rise of the West only occurred after the decline of the East and only due to Europe's exploitation of American money/silver and Europe buying into Asian wealth. Therefore, for Gunder Frank, the rise of contemporary China was simply a return to a Sinocentric world system (Gunder Frank 1998).

In any case, conceptions of world-system hierarchy is based on the idea of unequal exchange originally put forth by Arghiri Emmanuel (1972) and Ernst Mandel (1975) –suppressing wages in peripheral regions allowed for exploitative trade practices by the core. Furthermore, market processes mask these exploitative practices which are

further reinforced by the political systems in both the core and the periphery but also by the semiperiphery. For Wallerstein, the mode of accumulation in capitalist countries is profit maximization which requires the continued expansion of the size of the division of labor and that requires unequal exchange. Giovanni Arrighi (1990) notes that Emmanuel (1972), Mandel (1975), and Wallerstein's (1974c) unequal exchange was not so much about where a country was located in networks of trade (as advanced by network analysis scholars), as it is about trade that is based on different wage levels for the same rate of productivity and profit. This means that the regions with the higher wage levels will benefit the most from these trade activities giving rise to a hierarchy comprising of a small core, middle semiperiphery, and bottom large periphery. To put it in other words, in the populous periphery, laborers work long hours with extremely low wages compared to the core and even the semiperiphery.

Although Wallerstein, like many other development and modernization theorists in the 1970s, held that unequal exchange was the primary means with which the world-system structure remained highly differentiated; Arrighi (1990) has argued that unequal exchange was only the start. He contends that unilateral transfers of labor, both voluntary (immigration) and involuntary (labor of slaves and prisoners of war), contributed to the formation and continued reproduction of the world-economic system and structural hierarchy. So did unilateral transfers of capital resources both voluntary (financialization) and involuntary (extortion of capital from colonies) (Arrighi 1990). Using the example of Japan and Korea, Arrighi notes that unequal exchange and unilateral transfers of labor and capital resources work both to polarize and depolarize the world-system hierarchy.

Arrighi raises a salient point. Even in a highly unequal and stratified world-system, there is some ability to move both up and down the hierarchy. However, this movement is limited particularly in terms of mobility from periphery to semiperiphery (and vice versa) or semiperiphery to core (and vice versa). It was previously held that industrialization could cause upward mobility in the world-

system. However, historically, as more countries embraced the movement toward industrialization, the payoff became less significant. Empirically, countries in the periphery were able to modernize/industrialize (measured using the percentage of gross domestic product generated through manufacturing) to the point of catching up or even surpassing the levels of industrialization of core countries (Arrighi 2007; Arrighi et al. 2003, 2005). This, however, did not result in the leveling of the difference in global economic power or even income distribution between the core and periphery (Arrighi et al. 2003, 2005) as was initially imagined by development scholars like Bell (1973). Yet, this push for industrialization continues, particularly in the discussions regarding sub-Saharan Africa and its engagement with China.

Most world-systems scholars acknowledge that states are able to move from one position to another in the world-economic hierarchy over time. Nonetheless, Wallerstein has held that "the fact that particular states change their position in the world-economy...[however] does not itself change the nature of the system... the key factor to note is that within the capitalist world-economy, all states cannot 'develop' simultaneously by definition, since the system functions by virtue of having unequal core and peripheral regions" (Wallerstein 1974a, p. 24). This reiterates the intrinsic inequality of, and challenge of upward mobility in, the modern capitalist world-system.

Marilyn Grell-Brisk (2017, 2019) empirically demonstrates the persistence of the tripartite distribution in the world-system or to say it differently, the tendency for clustering or formation of "convergence clubs" in the distribution of global wealth. This is consistent with previous studies of global income/wealth distributions (that cut across disciplines and methodological approaches) by Arrighi and Drangel (1986), Bianchi (1997), Babones (2005), Henderson et al. (2008), Pittau et al. (2010), Grell-Brisk (2017), and Karatasli (2017). More importantly, the scholars all found persistent gaps between the core-semiperiphery-periphery that could be interpreted as pseudo-boundaries between core-semiperiphery-periphery zones. These gaps are

incredibly difficult to overcome. Chase-Dunn (2014) contends that the gaps exists because of the primarily economic indicator (gross national product, gross domestic product etc.) used in these studies. He argues that a multidimensional set of power hierarchies would render a more continuous hierarchy.

Jeffrey Kentor (2008) measured a country's place in the world-system; i.e., whether a country fell into the core, periphery, or semiperiphery, based on economic and military power with three dimensions – a country's economic power (gross domestic product per capita; gross domestic product; total exports; ratio of external foreign investment to internal foreign investment), a country's military capacity (gross military spending, military exports, ratio of military exports to military imports), and a country's global dependence (export commodity variety, foreign debt as a percentage of total GDP, military imports as a percentage of GDP). Pointing to Kentor (2008), Chase-Dunn writes, "But another way to look at the core/periphery hierarchy is as a multi-dimensional set of power hierarchies, that includes economic, political and military power forming a continuous hierarchy that is a relatively stable stratification hierarchy in the sense that most of national societies stay in the same position over time, but that also experiences occasional instances of upward and downward mobility?" (Chase-Dunn 2014). However, Grell-Brisk and Chase-Dunn's (2019) most recent work show that, even with military data, the gaps between core-semiperiphery and periphery are still present and possibly more pronounced than in the economic data.
Semiperiphery

Structural inequality persists and according to Wallerstein, the semiperiphery plays a significant role in this. Indeed, he theorizes that the semi-periphery is absolutely necessary for the stability of this unequal system. The semiperiphery is not a phase in development. It is not a transitional point. It is a permanent fixture of the modern capitalist world-system. In fact, the world-system includes a large periphery, a smaller middle semi-periphery, and an even smaller core (again, see Fig. 1). "Neither [military] force nor ideological commitment. . . would suffice were it not for the division of the majority into the lower stratum and a smaller middle stratum (Wallerstein 1974b)."

According to Wallerstein, the semiperiphery is essential to the proper functioning of the system for two reasons, political and political-economic. The political reasons go back to the idea of *cultural stratification* (Wallerstein 1974c). A dichotomized and highly unequal world-system is more likely to be volatile and lead to revolts. Therefore, in some ways, the semiperiphery acts as police for the system. Small in comparison to the periphery, the countries in the semiperiphery tend to consider themselves somehow better than the periphery; if the periphery rose in rebellion against the core's unremitting exploitation, the semiperiphery would support the core and manage and suppress any insurrection on the part of the periphery (Wallerstein 1974c).

Antonio Gelis-Filho presents cultural stratifi-cation in a slightly different way, renaming the semiperiphery the "abandonat" – a loose, semi-peripheral social group characterized by its strong support and identification with the values of the countries in the core. *Abandonat* describes "the psychological process. . . characterized by the geocultural connection between a set of people in the semiperiphery and the values of the core countries. That connection results in a disconnection from the local sociological reality, something that can be describes as a feeling of being "aban-doned" in the semiperiphery by. . . the core" (Gelis-Filho 2017, p. 36). The abandonat is not only the core's geocultural, "world-system police force"(Gelis-Filho 2017, p. 36), it also serves as its cheerleader.

Still, Grell-Brisk (2017, 2018) and Sahan Karatasli (2017) have both shown that within the last 50 years, there has been an increasing change in the structure of the world-system, with Grell-Brisk contending a continued tripartite structure with a movement toward a larger semiperiphery (see Fig. 2), and Karatasli arguing that we are moving away from a tripartite structure to a quad-modal form of stratification. In either case,

Stratification in the World-Economy: Semiperiphery and Periphery, Fig. 2 The dismantling of the tripartite world-economic distribution of wealth. (Source: Adapted from Grell-Brisk and Chase-Dunn (2019))

these studies present a different look to the world-economic distribution than that of Wallerstein's.

For Grell-Brisk, unlike Wallerstein and Gelis-Filho, the idea that semiperipheral countries would automatically fall in line with core states when there is systemic conflict, seem out of place in today's political economic atmosphere. China, which is often classified as *the* semiperipheral state with the most global economic and political clout, tirelessly sells itself as being a voice for both the developing and underdeveloped world. It claims that its motives for trade and foreign aid and investments are guided by "post-colonial solidarity" (which has a certain anti-core sentiment) and principles of equality and mutual benefit; touting multipolarity as the way of the future. The decline of the American hegemony has also fostered a general ambivalence toward core states, with semiperipheral and peripheral states seeking to come together against the growing systemic crises.

Within the last couple decades, we have witnessed an increasing number of regional (such as ALBA) and multilateral state cooperative efforts (such as BRICS or AFTA) that are economic as well as noneconomic responses to pressures from core countries (Grell-Brisk 2017). China's *Belt and Road Initiative* (the latest rebranding of the *One Belt One Road*

development strategy initiated by China) which admittedly, like most Chinese policies is opaque, is a development strategy that attempts to link periphery and semiperiphery as well as some core countries. This is a bold move toward a cooperative approach to development. Still, with the declining number of countries identified as being in the periphery, we might see an increase in conflict within the semiperiphery itself. However, there is the issue of the time horizon – not enough time has passed to make a definitive empirical statement. For now, we can point to the increasing military budget of semiperipheral states and China in particular; China's increasingly aggressive stance in the South China Sea; and its growing military presence in Africa.

Wallerstein's political-economic reason for the existence of the semiperiphery (1974a) is much more convincing. One of the characteristics of a core state is its strong state apparatus coupled with strong sense of cultural national identity. This serves to mask and justify disparities between the core states and global economic zones (Wallerstein 1974b). It also helps maintain the wage-productivity squeeze (essential to unequal exchange) in the core which allows them to reap the most benefit from the international division of labor. But, this also forces capitalists to shift focus

S

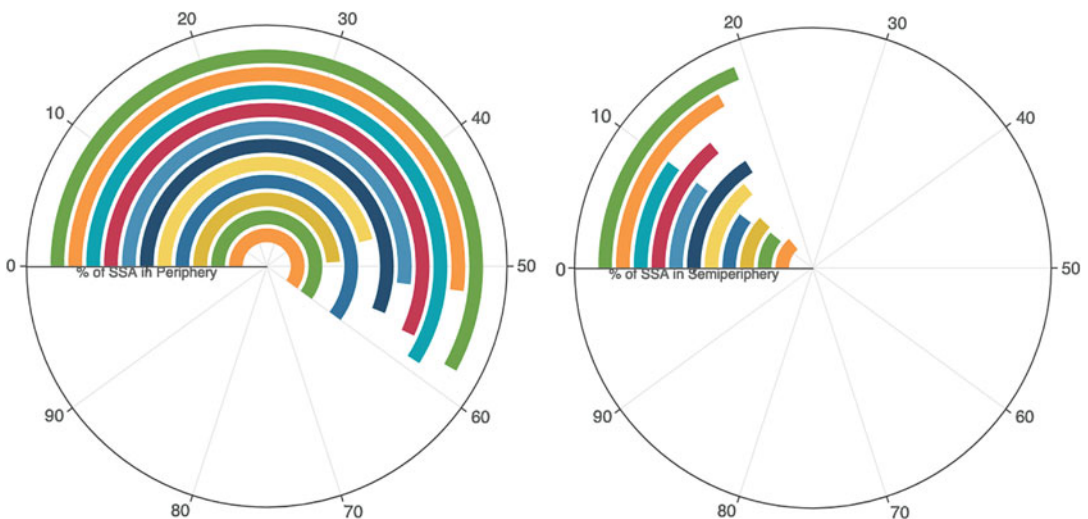
to the semiperiphery. Semiperipheral zones are always seeking to trade with both core and periphery and so their economic decisions tend to follow the logic of state-based methods of market control. The BRICS countries, which typically fall in the semiperipheral bracket, conform to this thesis, particularly in the case of China (Grell-Brisk 2017). Hung (2016) demonstrates the level with which China has maintained state control and management of its economy since the 1990s, with what many have dubbed its "state-based capitalism." From the opening of its market to its major economic reforms, China has operated as a strong state machinery, and a particularly state-centric culture (Canton 2015; Grell-Brisk 2017; Hung 2016).

Unlike Wallerstein, who argues that the semiperiphery acts a stabilizing factor that moderates the contradictions of core/periphery polarization, Christopher Chase-Dunn contends that the semiperiphery is in actuality, a locus of change in the world-system (1988). It is the zone in which we see the implementation of new organizational and technological features that transform the world-system (Chase-Dunn and Grell-Brisk 2016). Chase-Dunn and Thomas Hall have also contend that although in some cases the semiperiphery may stabilize the existing hierarchy (Arrighi and Drangel 1986; Goldfrank 1990;

Martin 1990; Silver 1990), semiperipheral and peripheral marcher states have also been a force of change, challenging core powers to form larger empires and spread the commodification of production across the whole regions (Chase-Dunn and Hall 1997).

Periphery

The periphery, characterized by a weak state apparatus and where raw materials and natural resources are plentiful, is generally exploited by the semiperiphery and core states. Further, the peripheral zone receives very little from the benefits of the global division of labor.

Wallerstein has argued that the core-periphery hierarchy is a condition of the world-economy, undergirded by unequal exchange. Yet, much of the periphery is former colonial regions where weakened or nonexistent state apparatuses were created by the core states themselves. This is particularly apparent with the sub-Saharan African region. Majority of the empirical studies place the countries in the region at the peripheral level (Arrighi and Drangel 1986; Karatasli 2017; Smith and White 1992; Snyder and Kick 1979). In Fig. 3, Grell-Brisk demonstrates how starkly


Stratification in the World-Economy: Semiperiphery and Periphery, Fig. 3 Percent of Sub-Saharan Africa in the Periphery and Semiperiphery from 1965 through 2015

(from left to right). Source: Adapted from Grell-Brisk (2019)

sub-Saharan Africa performs in comparison to the rest of the world.

Despite the fact that a vast majority of sub-Saharan Africa falls into the peripheral zone, individual countries within the region have made considerable gains in the world-economic hierarchy. Grell-Brisk (2018) notes that sub-Saharan countries' position in the stratified world-economy is significantly influenced by their political economic condition at the time of decolonization. So, countries like South Africa or Seychelles entered the world-economy in a qualitatively better position than most sub-Saharan countries. These countries also tended to maintain their position.

Given China's growing influence in the world-system, claims of neo-colonialist tendencies have been lodged against it. Heavily criticized in the Occident, China's involvement in the Global South has been claimed as exploitative, even "neoimperialistic" or "neocolonialistic" (Lyman 2005; Norberg 2006), sometimes even colonialist (Bergeson 2013). And some of these criticisms of Chinese engagement in Africa are not unfounded. For example, in terms of foreign aid, China spends $354.4 billion on overseas finance but only $81.1 billion on overseas aid or official development assistance (ODA). ODA is finance for local economic development that does not profit the donor country. Contrast this to the United States which spends $394.6 billion on overseas finance and $4366.4 billion in overseas aid (Dreher et al. 2017). Or, in terms of resource extraction, one third of the world's cobalt (used in electric vehicle batteries) supply come from the Democratic Republic of Congo (DRC); and eight of the fourteen largest cobalt mines in the DRC are owned by a single Chinese company, Huayou. There is no cobalt processing in the DRC despite talks in 2018 of creating a special economic zone for cobalt processing, which preceded talks of partnering with Tanzania to process cobalt. And then, there is the question of China creating a debt trap for Africa countries. Starting at 2% in 2005, China now owns a full 15% of sub-Saharan Africa's external debt as of 2015 (Dreher et al. 2017). In 2018, 72% of Kenya's bilateral debt is to China up from 57% in 2016 (Dahir 2018; Eom

et al. 2018). In Cameroon, China is the largest single creditor but holds 1/3rd of the total debt; in Djibouti, Chinese financiers hold 77% of debt (Eom et al. 2018).

Still, loaded terms and vague concepts such as neocolonialism or neoimperialism do not always clearly capture the relationship between China and its Global South counterparts. Furthermore, in a hierarchical world-system, is it even possible for a semiperipheral state like China to be imperialist? Both John Smith and David Harvey have addressed this specific question, spurring an interesting intellectual debate (Harvey 2018; Smith 2016).

Nonetheless, the upward mobility of some sub-Saharan African countries has been tied to their increased interactions with China. Its engagement with Africa has garnered much discussion in academia and was initially viewed as an effort to gain access to natural resources to support a growing China economy (Brautigam 2008, 2010, 2011; Kaplinsky et al. 2010; Kaplinsky and Morris 2009). This is because the structure of China's import from Africa was very biased toward oil-rich and other natural resource-strong African countries (Grell-Brisk 2016; Sandrey 2006). Yet, the relationship has been beneficial for Africa not only in terms of increasing aid and investment from China but also the fact that other countries (Japan, India, Brazil, and Singapore, to name a few) have begun seeking and gaining entry into the African market and that could mean better terms of trade for African countries. African countries that vote with China at the United Nations, receive 86% more in aid from China (Dreher et al. 2015). Not only this, but Dreher et al. (2017) have also found that development (using nighttime light as a proxy for development) is positively related to receipt of aid from China. And, for every percentage point increase in Chinese aid, African countries received 15% fewer conditions from the World Bank (Hernandez 2017). Therefore, it is good politics to continue to engage with China. Xiaojun Li has also argued that African countries now realize that when it comes to aid, they need options, not conditions (2017).

Africa is, on the one hand, particularly appealing as a market for technology, foodstuffs, other

capital goods, consumer products, and services, but conversely, a supplier of raw materials and commodities, as well as a potential source of cheap labor for Asia. One must remain cognizant that despite the uproar surrounding China's involvement with Africa, the United States remains one of the African regions' most important trade partners. The United States' total goods traded bilaterally with sub-Saharan Africa were $39 billion for 2017 which was an increase from 2016. The top markets the US exported to were South Africa, Nigeria, Ghana, Ethiopia, and Angola and the top import suppliers to the US were South Africa, Nigeria, Angola, Cote D'Ivoire, and Botswana [mostly mineral fuels, platinum and diamonds, cocoa, iron and steel] (Office of the United States Trade Representative 2017). But with China's increasing engagement with sub-Saharan Africa, the United States now feels added pressure to engage more fully with the region. The United States' International Development Finance Corporation now plans to distribute some of the 60 billion dollar at its disposal in Africa (Olander 2018).

World-System upward mobility by sub-Saharan Africa is directly tied to those countries with high levels of natural resources (particularly oil and minerals). This type of upward mobility is typically minimized and theorized around questions of resource-curse and the feasibility of maintaining growth and mobility. Understandably so – Zambia's difficulties with the rise and fall of copper prices is a classic example. Without getting into the specifics of natural-resource type (re: gold vs. copper or diamonds vs. oil) and examples of countries whose economies have remained stable despite being completely dependent on a natural-resource, Volker Bornschier and Bruno Trezzini (1996) offer a way to conceptualize the gains made by resource-rich dependent countries. They argue that resource-rich semiperipheral states behave like, and are similar to, peripheral ones. Bornschier and Trezzini contend that in resource-rich semiperipheral states, the income received from the natural resources go to and are kept by the elites; there is little to no investment or incentive to invest in infrastructure; and government legitimacy is obtained through coercive measures. However, this implies that these countries are really not semiperipheral, but some other category. This highlights the problematic conceptualization of the semiperiphery as "we will know a semiperipheral state when we see one." It makes the determination of semiperiphery somewhat arbitrary. As far as sub-Saharan Africa, Grell-Brisk (2019) showed empirically that the countries in the region that were upwardly mobile did so slowly, over long periods of time, and tended to hold to their gains.

Uneven Peripheralization and Semiperipheralization

The unit of analysis of the world-systems paradigm is the world-system itself. This does not mean that world-systems scholars completely ignore the internal dynamics of nation-states. Scholars have pointed out that even within the core countries, we find certain regions of peripheral-ness and semiperipheral-ness. This is referred to as nestedness. Given the way the United States is organized politically (with states and a federal government), it is easy to observe the ways in which different geographic regions fall into core-semiperiphery-periphery hierarchy. A well-studied region in terms of internal state stratification in the United States is Appalachia, particularly Southern and Central Appalachia.

Wilma Dunaway (1996) presents historical evidence to demonstrate that despite participating in the global economy (via the slave and fur trade), the Appalachian region did not benefit much from the international division of labor. This was notably a consequence of landless workers and absentee investors, a concentration on agriculture and the overuse of natural resources as the primary source of economic activity. As such, the region did not undergo the typically linear advance to modernity and was a frontier peripheral zone. The complete decline of Appalachia happened with the decreasing demand for large-scale agriculture.

Other scholars (Eller 1978; Lewis 1978; Lewis et al. 1978) previously viewed the Appalachian region more as a colony precisely for some of the

reasons Dunaway claims – predominance of absentee landowners and the extractive coal and agricultural industries. Hellen M. Lewis notes that "[Appalachia's] history also demonstrates the concerted efforts of the exploiters to label their work as 'progress' and to blame any of the obvious problems it causes on the ignorance or deficiencies of the Appalachian people. We believe that there are peoples all over the world who have experienced this sort of 'development'… and who can easily identify with… the colonization of Appalachia" (Lewis 1978, p. 2). John A. Williams (1979) rejects this framing of Appalachia as a colony pointing out that nation-hood was never an option for the region and neither did they have the ability to throw out the so-called invaders. At the same time, David Walls provide a slightly different conceptualization of Appalachia, presenting Central Appalachia as being spatially and institutionally between core and periphery; i.e., semiperipheral. He notes, "the internal colonialism model applied to Central Appalachia needs to be superseded by a model of peripheral regions within an advanced capitalist society" (Walls 1978, p. 339). Although he does not completely throw out the colonial framing of Appalachia, he sees the region from a more world-economy perspective.

Similarly, a newer study documents the role of the coal industry in the reproduction of Central Appalachia as an internal periphery within the United States (Wishart 2014). It outlines the economic, ecological, and human inequalities that entailed this peripheralization of the region. William R. Wishart argues that the area's designation as "extractive periphery" in the United States is due to the processes of unequal exchange contributing to the development of the nation at large while degrading the region and its people. He again mentions the extractive policies with regards to coal – the center of the region's economy.

Final Remarks

The concepts outlined above are only part of a rich interdisciplinary discourse on global stratification and the tripartite world-economy. World-Systems analysis is typically seen as particular to Immanuel Wallerstein. Yet, a close reading of the literature reveals that the world-systems perspective has evolved to include multiple approaches and methodologies, including but not limited to, surveying global commodity chains (including Wallerstein himself or Dunaway and Clelland (2016)), global economic stratification (including Arrighi (1986)), transnationalization processes (including Robinson (2004)), the historical semiperipheral processes which generate movement to core or toward technological innovation (including Chase-Dunn (1997)) or even world systems as a study of holistic social systems that include those of the premodern capitalist system (including Günder-Frank (1993b)).

The concepts of global stratification, periphery, and semiperiphery are not limited to the work of world-systems scholars and have found adherents in economics, political science, anthropology, history, and even entomology. A proponent of interdisciplinary work, for Wallerstein (2003) this is as it should be.

Notes

1. World-system is an inter-societal system with a self-contained division of labor. It is a system that is a world, and is a fundamental unit of analysis (Wallerstein 1993). The modern capitalist world-system is a world-system whose mode of accumulation is capitalist, interacts politically, economically, socially, and culturally but is not dominated by one political system (Wallerstein 2005). One state can dominate the world-system without **overt** coercion (hegemony) but the whole modern world-system has never been united under one political system.
2. According to Hopkins and Wallerstein (1986), a commodity chain refers to a network, of labor and production processes whose end result is a finished commodity. The majority of products consumed in the capitalist world-economy cross national boundaries linking core and non-core.

Definition

Peace is humanity's much sought-after goal. However, conflicts and the ensuing violence are also pervasive features of domestic and foreign affairs. Regarding the latter, imperialism is hard perennial in international relations. The Norwegian mathematician and sociologist Johan Galtung has made important contributions regarding the studies of peace and conflict, from which his approaches to violence and imperialism were derived. He first discussed structural violence. In his view, there are violent situations that cannot be evaluated and mitigated in terms of a perpetrator and a clearly defined intention. These situations are usually invisible, which makes them repeatable, and therefore long-lasting. Violence implies a condition where a potential stage cannot be achieved, creating a gap between actual and potential. This difference is due to violence, not only direct or visible violence, but invisible and structural. By analogy, imperialism cannot always be fully understood in relational terms alone, that is, as a power relation between a dominant power and a dominated country or region, usually by direct military means. Imperialism creates a long-lasting, but not monolithic, structure of inequality which persists and prevents underdeveloped countries or regions to fulfill their potential. Structural imperialism is therefore a form of structural violence.

Introduction

Structural violence and imperialism must be understood as parts of a major research project about Peace and Conflict Studies. In order to achieve durable peace, violence must be diagnosed and engaged. But what if violence cannot be seen or perceived as such? Direct, visible, or explicit violence causes wide social rejection and punishment. There are different forms of violence, even though they all have the same consequence in terms of impairment of human capacity to achieve her goals. These invisible forms of violence, without a clear and identifiable actor or agent and motivation, is what Galtung denominates structural. This form of violence can be ingrained in society and repeated over the long haul.

Using the same structural approach, Galtung addresses the issue of imperialism. The classic theory of imperialism, in the writings of Hobson, Lenin, Hilferding, Bukharin, Rosa Luxemburg, among many others, has a strong economic bias, even thought militarism is a frequent companion. Economic differentiation among countries and regions explains the likelihood of imperialist inclinations. Politics and military aggression appear as necessary consequences. Galtung develops a new approach in the 1970s and 1980s. For him, economic imperialism is not more important than political, military, communicating, and cultural in fostering inequalities. As part of the world capitalist system, the former Soviet Union also engaged in what Galtung calls social imperialism. In his treatment of imperialism, he divides the world system into centers and peripheries. Yet, he discusses imperialism in terms of divisions that take place both between and also within countries, where the same dual structure is proposed. This allows the concept of structural imperialism to cope with interdependence situations that are far more complex in terms of interactions between different centers and peripheries.

This entry presents and discusses these two fundamental contributions of Galtung for his humanitarian project of peace-building and conflict-resolution.

The Theory of Structural Violence

As part of his overarching project about Peace and Conflict Studies, Galtung (1969) distinguishes between personal or direct and indirect or structural violence – sometimes he also labels it social injustice. The distinction matters because he defines peace as the absence of violence, but this is valid as long as an analytical treatment and definition of the latter is available. He argues that, in defining violence, it is important to go beyond the relational approach that places emphasis on situations in which an actor intentionally inflicts somatic incapacitation on others, influencing the latter to be below their potential concerning a specific goal. In this regard, violence in general is always the cause of an avoidable shortfall between actual and potential outcomes. Indirect violence is built in the social structure, working as a background condition, and appears as unequal power, being invisible, more pervasive, and stable over time when compared to direct forms. It is more difficult to determine the explicit source of damage, and therefore to build peace by eliminating or mitigating this form of violence. Therefore, agency alone is insufficient to define situations where violence exists but no purposeful actor can be clearly identified or even when no such actor exists. There is also a fundamental difference in the velocity of outcomes regarding direct (quick) and structural (slow) violence that also contributes to the persistence of the latter. In another work (Galtung 1990), the author develops the concept of cultural or symbolic violence, understood as a means, including religion and ideology, art and language, and empirical and formal science, or aspects of culture in general, to legitimize the two other forms of violence. Galtung and Höivik (1971) compares direct and structural violence in terms of killing, the former quickly and the latter slowly, showing how the difference between the two types could be operationalized. They propose using as unit of measurement for empirical works the number of years of life lost due to kills. The difference would then be due to structural violence.

Regarding the connections between violence and imperialism, against a background where

peace is the ultimate goal, Galtung argues that advanced imperialism is structural rather than directly violent. He characterizes the pervasive inequalities between and within countries, intrinsic features of structural imperialism, as forms of structural violence. Yet, it is a matter of degree, with imperial domination combining the ability to exert structural violence with the retention of directly violent military imperialism as a major resource for exploiting and reproducing existing inequalities. The periphery can never achieve the higher performance or potential of the center as a result, experiencing a situation of permanent under-performance and therefore violence. Structural imperialism is always a form of structural violence, because it is embedded in the structure of the world system.

The work of Galtung on structural violence remains a fruitful source of discussion, debates, and mobilizations for changing the social order towards a more equal one. Webb (1986) and Weigert (2008) provide useful syntheses of the concept and its applications. Winter (2012) organized a symposium to revisit the theory in face of current political developments. The articles show that the breadth of Galtung's concept is vast, illuminating the multiplicity of forms of violence, but also it has important limitations when contrasted to other forms of violence. Winter (2012) argues that structural violence is still relevant to understand experiences that cannot be properly dealt with by relational approaches emphasizing the role of agency. The articles included in the symposium suggest that even situations characterized by an apparent lack of explicit violence cannot, nonetheless, be peaceful. The issues tackled include, for example, the visibility of violence, when it is openly and tragically repeated so many times that it becomes naturalized or normalized, changing the perception of what is and what is not violent. If this were the case, though, Galtung's concept of cultural violence would be less relevant to legitimize episodes of violence. By the same token, another contribution shows that the term 'catastrophe' is relegated to episodic, discrete moments or events. But capitalism, colonialism, and other modes of domination are permanent and continuous catastrophes, a form of

persistent violence similar to Galtung's concept. Also, it is argued that Neoliberalism has an embedded or endemic structural violence in the form of a necessary unequal distribution of resources. This means that Neoliberalism and Imperialism could be considered similar concepts, which raises semantic, epistemological, and ontological questions. Structural violence is then compared to foundational violence, at the same time secret and transparent, that arises when new orders or arrangements come into being at the violent expense of previous forms of political and social organization. This may happen even with the help of liberal instruments such as contracts and deliberation.

It is therefore clear that the concept of structural violence is still useful and valid to understand many recent situations and experiences and also structural historical changes.

The Theory of Structural Imperialism

Galtung coined the term 'structural imperialism' for the first time in a paper published in the *Journal of Peace Research* (Galtung 1971), established by Galtung himself in 1964. The theory of structural imperialism seeks to explain both the existence and the persistence of inequalities of all sorts between countries, assuming that equality should be a major goal of humankind. These inequalities are the result of a structural dichotomy in the world system between imperialist and dependent countries, in which the former dominates and exploits the latter. Similarly, within each country there is a class structure which is divided between 'center' and 'periphery', and therefore the world system mirrors the national cleavages and vice-versa.

In a subsequent article (1980), Galtung explains and highlights some issues raised by the original paper, assessing and evaluating how the world system, as it then existed, could still be understood using the structural theory devised ten years before, and whether the theory should be changed to cope with new challenges. Like the idea of structural violence, the concept of structural imperialism provides an interpretation of

international domination without essentially appealing to specific actors or specific motivations. That is, Galtung also downplays, but does not ignore, the role of agency and therefore of relational analyses in his account of imperialism. In the structural theory, imperialism is a special type of domination between nations and not merely an outright exercise of relational power. The existing structural division in the world system creates varying degrees of harmony among centers, including the 'centers' in the periphery of the world system. Similarly, there are varying degrees of conflicts of interests, defined as countries pursuing incompatible objectives, such as reducing a broadly defined 'living condition gap' between center and periphery. Inequality is therefore a structural feature of capitalism, and there cannot be capitalism without imperialism, as argued by, for example, Schumpeter (1951), who considers capitalism to be intrinsically anti-imperialist.

Formally, the approach of structural imperialism also provides explanations for relational situations in which a country in the center of the world system exerts power over a peripheral country, creating an overall conflict or disharmony of interests, at the same time as harmony between the centers in both countries increases. Consequently, this requires a strong disharmony between the peripheries, similar to the effects of a labor aristocracy on the workers' struggles in Lenin's classical theory of imperialism. Thus, the transference of wealth and resources from the periphery to the center of the world system creates inequality, with both centers improving their positions or living conditions at the expense of the periphery in the periphery, but not necessarily of the periphery in the center. This causes some degree of cohesion in the center of the world system, at the same time as the periphery is strangled by different types of conflicts. Structural imperialism is therefore an international system of domination, yet with substantial intra-national repercussions that feed and are fed by the international structure.

Galtung argues that structural imperialism has two mechanisms, five types, and three phases. The two mechanisms are the vertical interaction between center and periphery (between and within countries) and the feudal structure of interactions between centers and peripheries in the world system. The former relates to exchanges between center and periphery, mainly in economic and financial terms, but with different international and intra-national, positive and negative, effects. Galtung assumes some sort of unequal exchange, but in an evolving world structure that changes both countries permanently (in the 1980 article, he argues that there are no fixed poles in the world system). The theory emphasizes the existence of a processing gap in production, a disparity between center and periphery that is paramount to the theory of structural imperialism. This gap, mainly technological, is responsible for the inequality between countries even under conditions of equal exchange. Yet, the most important effect of imperialism is a cumulative asymmetric interaction in which the living condition gap increases, reinforcing the initial inequality. Consequently, the periphery in the world system suffers from persistent or structural poverty.

The feudal structure of interactions explains the persistence of inequality. This structure precludes the likelihood of interactions between peripheries in the periphery of the world system, and of connections between peripheries linked to a specific center with other centers. Therefore, a possible political organization of peripheral countries is avoided. The feudal structure imposes upon the periphery the asymmetric vertical interaction based on trade relations, with peripheral countries exporting commodities and raw materials, in a process that generates dependency and vulnerability, and center countries exporting manufactured goods. Structural imperialism is hence similar, for the center, to a policy of divide and conquer.

There are five types of imperialism. These types cannot be easily distinguished and are different dimensions of the same structural imperialism. The first type is economic imperialism, stressing vertical interactions and the processing gap. The second is political imperialism, associated with decision-making in the centers and obedience in the periphery, given the power difference. Military imperialism is the third type, characterized by differences in terms of the machines and technology available to build means of destruction in the center, discipline the

S

periphery, and allow the acquisition of only traditional hardware. Next, communications imperialism includes communications and transport, controlling the interactions that enhance the feudal structure between centers and periphery. This type of imperialism has influenced the area of communications studies and media imperialism (Thussu 2006). Finally, cultural imperialism imposes a separation between masters in the centre and apprentices in the periphery, creating monopolized structures of scientific knowledge, creative activity, and learning.

Regarding the phases of structural imperialism, the theory posits that domination is stable over time, but that it depends on the existence of different degrees of harmony between center and periphery in the world system. With underdeveloped means of transportation and communications, colonialism requires a physical military presence. The second phase, neo-colonialism, starts with communications and transportation improvements. In this phase, there are international organizations physically present in the periphery, such as multinationals, political groups, military alliances, news corporations, and non-governmental organizations. These institutions, which establish identities between the centers in the center and the centers in the periphery of the system, can change over time, creating five stages or sub-phases. In the first sub-phase, national frontiers make their presence difficult. In the second, the foreign elements become subversive regarding national governments. The third sub-phase has organizations created in the periphery of the system, controlled by the center in the periphery, but directed by the center in the center. During the fourth sub-phase, the nation states in the periphery become less important and the asymmetry of power between the world structures becomes clear. The fifth sub-phase presents the possibility of globalization without states.

In the third phase of imperialism, neo-neocolonialism, instantaneous and flexible communications networks make physical presence less important, and the centers can co-ordinate their domination tactics more effectively without relocating to the periphery. The theory claims that military intervention is not the same as military invasion.

The next issue regards the convertibility of one type of structural imperialism into another. Structural imperialism is not hierarchical, but characterized by multiple effects, spin-offs, and spill-overs that reinforce each other. Co-operation and agreement among elites, in the various centers, generalize imperialism, requiring it to be convertible: from the economic to the military type, from political to economic, from military to communications, from communications to cultural, and so on. Liberal democracies assume the equal distribution of all different attributes or types, but the only locus in which they can all co-exist is in the center of the world system. Moreover, this concentration makes possible the domination of peripheral countries. A perfect structural imperialism would require, however, satisfying all the conditions described for harmonizing the class interests at the center.

Empirical Evaluations

The theory of structural imperialism has a strongly empirical nature, and Galtung proceeds to evaluate the economic gap between nations in terms of development, inequality, vertical trade, and feudal interactions, accepting the positivist methodology with reservations. The results obtained by Galtung cannot disprove the theory, but cannot shed light on how structural imperialism works either.

Gidengil (1978) carried out another empirical test, using the cluster analysis approach. She found a group of 20 countries, in a sample of 68, displaying characteristics of center, 13 characterized as periphery, and other countries considered intermediate. The results support the claim that vertical interaction is the major source of inequality. Youngblood (1982) applied the theory in order to understand the interactions between church and state in the Philippines and equally found empirical support for it.

Extensions

Galtung (1976) introduces the concepts of social imperialism and imperialism by delegation or sub-imperialism as synonyms of structural

imperialism, in order to understand emerging rivalries, conflicts, and relations of domination within the then Soviet Bloc and between the imperialist structure or system (capitalist and socialist) and the periphery. He tackles the disputes between China and the Soviet Union, with the former complaining about the capitalist nature of the latter, and the consequent economic imperialism in its external relations. Galtung rejects the explanation for lack of evidence, but agrees that social imperialism, being a feature neutral regarding capitalism or socialism, is an appropriate term. Thus, social imperialism is a relationship between a center country and a periphery country, with the former imposing a model social structure on the latter (Galtung names this phenomenon penetration), including a center to work as bridge between them to establish exploitative connections and dependency relations. Thus, the periphery subject to this domination is deprived of an autonomous development, just replicating the social structure of the center. This replication has an important role in legitimizing and confirming the validity of the center' social structure. As a consequence, Galtung sees this expansionism as social more than as economic or political imperialism.

The issue of sub-imperialism is at the same time empirical and political. Galtung considers the imperialist powers of the time (the United States, European Community, Japan, and the Soviet Union) and their similarities and differences in terms of domain (countries and regions dominated) and scope (types and mechanisms of imperialism). Since imperialism is expansive, all the above powers would have to compete for areas of influence. However, they also need to combine and coordinate to survive and avoid disruptions in the imperialist structure. The United States would play the role of coordinator. The relevant rivalry here is with the periphery of the system and its resistance to centrist domination. Sub-imperialism could be accomplished by using the existing structure, with the support of an existing imperial country, or even one aspiring to become imperialist in a given peripheral region that is an ally of a powerful country at the center. As a reaction, the periphery would coordinate their revolts in response.

Criticisms

Vorobej (2008) argues that the theory of structural violence has been subject to apparently unfair criticisms. For example, the concept has been considered theoretically unsound. Also, Galtung's work has been criticized for having not recognized nor addressed the problems raised by his definition of structural violence, that it boils down to absurdities in some circumstances, is vague and ambiguous, conflating personal and structural features, is propagandist or has a hidden manipulative political agenda, has different moralities, and has problematic practical outcomes. Vorobej (2008) addresses all these critiques in detail, and shows that they are incorrect and invalid.

In contrast to the structural violence approach, which has become a widely influential concept, it seems that the theory of structural imperialism has not been adequately appreciated. There are not many studies criticizing or testing it in this regard, despite its shortcomings. One exception is Van den Bergh (1972), who raises several criticisms against Galtung' structural theory of imperialism. First, it has been considered static, and there is no explanatory power of processes such as changes in the phases of imperialism identified, relying excessively on transportation and communication technologies. Also, the use of a two-nation model for definition and theory cannot capture more complex intra- and inter-national relations. It is only useful for a classification scheme or taxonomy of attributes of and relations between actors. It requires a consideration of the development of the global configuration of power relations and inter-dependencies in a context of international competition. Van den Bergh also criticizes the convertibility of one type of imperialism into another. This argument, he claims, is a-historical and cannot account for conflicts within and between ruling groups in each type of imperialism, that is, the connections between inter-dependence relations. The fundamental weakness in Galtung's theory, according to Van den Bergh, is the lack of precise criteria for defining the living conditions gap, since this difference between them explains the harmony and conflict of interests that underscores the theory. That is, Galtung's taxonomy has not a well defined criteria for

S

classification. Finally, Van der Bergh chastises the concept of interaction, arguing that it is based on physics, not society. He proposes instead using interdependence, which allows understanding the pattern of and changes in interaction.

One a more historical evaluation, considering the developments and transformations in the capitalist world system since the 1970s and 1980s when the theory was proposed, it is clear that Galtung's approach downplays the role of capital exports emphasized by Lenin and the Marxist scholars, mainly in its modern form of multinational enterprises, as depicted by Petras and Veltmeyer (2007), or Foreign Direct Investment. Furthermore, social classes are only implicit in the theory of structural imperialism, not connected to property or contractual rights to the surplus. The theory equally underrates the role of resistance against domination in the periphery. The claim that globalization could move forward without an active role for the state, at least in the center, is doubtful, if one considers the issues brought about by the work of Panitch and Gindin (2012).

Perhaps the theory has fallen down along with the structuralist approach in the social sciences, with the rise of post-structuralism and post-modernism. Nonetheless, it provides a wide variety of insights and tools to understand the international relations of domination and national conflicts. The need for horizontal interactions that it calls for as a way to weaken the domination of the center over periphery anticipates today's South–South co-operation (Bartels and Vinanchiarachi 2009). Inequality is persistent and has been widening (Milanović 2005), as foreseen by the theory. The most important contribution of the theory of structural imperialism, however, is perhaps its method. The theory provides a powerful analytical perspective and therefore offers an alternative to agent-based relational perspectives, mainly the rational choice school. The structural approach regarding nations can incorporate the dynamics of social class in the center and in the periphery, since it is implicitly there. The approach has the potential, to this date unfulfilled, to combine and unify the recent scholarship in the theory of imperialism and the most important components of imperialism into a single systematic and dynamic account of the fundamental issues of capitalist international and national relations.

A Proposed Generalization for Action

Galtung was concerned not only with theoretical issues, but also with a political agenda for changing the world. In this regard, it is possible to generalize the theory of structural imperialism in different ways for highlighting the political possibilities of alliances. First, it is possible to include three types of nation (center, periphery, and intermediate) and three types of social classes. Second, it can cope with the existence of more than one imperialism and include extra-territorial actors. The main conclusions would still obtain. Nonetheless, the strategic implications of the theory of structural imperialism are clear. There is an international and intra-national system of domination, and in order to overcome it structural changes are required. The strategy regarding the international part must involve horizontal interactions, fostering equal exchange and autonomy, and de-feudalizing interactions, enhancing equal exchange and developing institutions in the periphery to manage class conflicts and disharmony of interests. Multinational and symmetric organizations must contribute to multilateral interactions among centers and peripheries, while destroying asymmetric organizations. In order to change intra-national domination structurally, it is important to reduce harmony and increase disharmony among the centers in the center, by means of decreased contacts that force changes in objectives, and to reduce disharmony among the peripheries by means of violent and non-violent revolutions and co-operation.

Conclusion

After exposing the theories' main tenets, it is possible to evaluate Galtung's contribution to our knowledge about violence and imperialism.

The concept of structural violence is very useful. Violence can be perpetrated in several forms, not always clearly distinguishable by the analysts. Pursuing peace requires paying close attention to this invisible threat. The theory of structural imperialism is also rich, and sheds light on the existence of pervasive inequalities in the capitalist world system. More important, it stresses the different forces and interactions that reproduce vertical structures, and how they could change overtime. The mechanisms that contribute to this state of affairs, however, must be updated. The theory must engage with historical patterns and face the challenge of grasping dynamic situations. It seems that the theory is flexible enough to incorporate those criticisms. This is an important research agenda that should not be forgotten.

Superexploitation

Super-Exploitation, the Race to the Bottom, and the Missing International

Definition

While notionally at the edges of Marx's labor theory of value, the concept of superexploitation was first theoretically elaborated by Ruy Mauro Marini. Superexploitation manifests in a variety of low-wage, physically exhausting, and often dangerous work. It involves the extraction of an "extra" degree of surplus value from expended labor power, which manifests as the lowering of wages below the level necessary for the worker to reproduce their labor power. In the context of nineteenth century and later neoliberal free trade, superexploitation occurs in sectors of dependent economies tied to the global economy by export-led models, which do not rely on workers to act as consumers of the use values they produce. In the nineteenth century, superexploitation of Brazilian labor substituted for the development of worker productivity. Nonetheless, the products of Latin American labor, in the form of cheap raw materials and foodstuffs, did support a qualitative shift in worker productivity in the English industrial revolution.

One way to understand the current crisis of the global working class is to examine the revival of superexploitation in the most dynamic and globally integrated sectors of countries like Brazil. Attention to superexploitation by Marxist dependency theorists has helped to reposition the

capital-labor relation in the context of global strategies of accumulation that rely on unequal rates of exploitation, or forms of labor segmentation. Labor segmentation, in turn, suggests an expansion of Marx's general law of capital accumulation, to clarify the underlying relations between sections of the global working class, tied to one another in a downward spiral of working terms, conditions, and living standards.

There have been many opportunities for people with radically different conceptions of the world system to see their basic suppositions and truths, often untouched by the conjuncture, reborn in the face of the post-2008 world. This has been particularly stark in recent accounts of the apparent flip in fortunes of 'the West and the rest', as the layers of the structurally unemployed and precariously employed historically associated with the Southern periphery now appear to be regular features of advanced capitalist societies, particularly in Europe (see Breman 2013); while at least initially, the full effects of the global financial crisis seemed to be forestalled in emerging economies, particularly those rich in natural resources.

In crude relief, consider two recent national anecdotes back to back. In December 2010, with the official unemployment rate at the historical low of 5.7%, Brazil's outgoing president Lula da Silva declared the country to be on the verge of reaching full employment (IBGE 2010; Partido dos Trabalhadores 2010). The discourse that followed has linked the country's relatively healthy rates of GDP growth to the growing purchasing power of a burgeoning young workforce; millions of workers having ostensibly joined the ranks of a new 'middle class' on the back of rising real wages, labour market participation, and formalisation (e.g. Maia Junior 2012; cf. ILO 2013). While emphasising favourable conjunctural elements including the global sellers' markets for Brazil's main commodities and auspicious macroeconomic conditions, this discourse downplays continuing structural contradictions that become clear once this 'new middle class' is put back into the context of Brazil's class structure overall; one which continues to be characterised by historical problems associated with Brazilian dependent development, including

structural unemployment, a massive relative surplus population, low wages (and more recently, an over-reliance on household credit), income inequality (Duarte 2013), and new degrees of displacement from, and denationalisation of, land (Teixeira and Gomes 2013, particularly the essays by Teixeira and Sauer).

Meanwhile in Europe, certain commentators see even an imperialist power like Britain on the road to becoming a 'developing country', as it slips down the rankings of key competitiveness indicators in relation to Asia (Chakrabortty 2013). Conveniently ignoring the historical and continuing provenance of the City of London's 'natural resources' in value transfers from the global South (Norfield 2013), the head of the *Guardian's* economics desk writes that:

> In Britain, we have become used to having our resources skimmed off by a small cadre of the international elite, who often don't feel obliged to leave much behind for our tax officials. An Africa specialist could look at the City and recognise in it a 21st-century version of a resource curse: something generating oodles of money for a tiny group of people, often foreign, yet whose demands distort the rest of the economy.

These blinkered accounts of the forward march of history (in the latter case, suddenly going into reverse) have found widespread expression on the left. In Western Europe, many sections have proposed a renewal of the post-war Keynesian social consensus to preserve historical working terms, conditions, and living standards in an extremely hostile environment, and as an exit to the current crisis more generally. What have been lost in this appeal are the global dimensions of accumulation that sustained the original post-war consensus, even following the end of formal empire, and the social contradictions between sections of the working class globally through which such accumulation continues.

This has cropped up, for example, in the concerns voiced by various trade unions that an eventual trade and investment agreement between the European Union and US (the Transatlantic Trade and Investment Partnership, or TTIP) may threaten labour, environmental, healthcare and education standards associated with an already beleaguered social Europe; very legitimate fears

S

which stand in stark contrast to the general silence (with some exceptions) that greeted the negotiations of similar, but many would argue neo-colonial, treaties that the EU has carried out with the periphery over the last 20 years (including the Africa-Caribbean- Pacific Islands [ACP] group, Latin America and India, amongst others). Similarly, the latest wave of criminalisation and deportation of migrant workers from Western Europe has been marked by an unfortunate lack of outrage and meaningful action by the traditional left as, either overtly or *soto voce,* it retreats into protectionism over jobs and housing for its own, 'native' working class; rather than, alternatively, fighting the very mechanisms which are driving the crisis faced by workers everywhere. Over the last generation, increasing numbers of workers have become 'free trade refugees': people moving from Southern countries devastated by neo-liberal trade and investment agreements to the very co-signatories to these agreements which, in partnership with their national bourgeoisies, have facilitated a new, neo-liberal phase of underdevelopment. Hence, the recent revival of a slogan from anti-colonial struggle in the UK in relation to the horrifying story of Colombian Isabella Acevedo, the former cleaner of a one-time Tory immigration minister, who was criminalised and deported in July 2014: "'We are here because you are still there'" (see Oldfield and Naik 2014; Ordoñez 2014). The inaction surrounding global structures like trade agreements and immigration controls that pit the interests of workers and oppressed classes (rather than nations, per se) against one another would seem to signal a tacit acceptance that working-class interests in the North are in fact served by these structures; in other words, of an alignment of working-class interests with those of 'their' national capital. In the imperialist nations of the North, this can only be reactionary.

The objective of this essay is to locate an alternative starting point from which to speak about the global crisis of labour in the current phase of imperialism; that is, not from the standpoint of the neo-liberal crisis of work, labour rights, trade unions, and living standards in the global North (and indeed, around the world), but by reflecting on the resurgence of super-exploitation in the global South. Theoretical treatments of the phenomenon emerged in the context of the Marxist strand of dependency theory, whose use is still largely confined to Latin America, the Caribbean, Africa, and South Asia. The reasons, in turn, for the continuing significance (or in some quarters, revival) of the dependency perspective stem from its ability to provide conceptual tools for reckoning capital–labour relations (and so, struggle) within a nation, regional and global framework. Such tools are badly needed to overcome the limitations of anti-capitalist strategies that remain tied to the trope of the local or nation in the imperialist age; and particularly those emanating from the global North.

The essay is broken into three sections. It begins by reviewing the episodic treatment of *super-exploitation* and a related phenomenon, *labour segmentation,* in *Marx's Capital.* While Marx noted that the retention of super-exploitation in the midst of higher degrees of labour productivity was central to the development of the prototypical English industrial revolution, he neglected to incorporate either super-exploitation, or labour segmentation more broadly, into his labour theory of value. With this issue unresolved in Marx, two important issues have subsequently been glossed over by much of the Marxist left. First, the role of difference – conceived not simply as a series of mystifying ideologies (of race, gender, sexuality, immigration status, etc.) that obfuscate the unity of the working class, but as a feature of core social relations under globalised capitalism – in structuring the highly unequal ways that labour power is valued within both national and global markets. Secondly, as we saw in the two earlier anecdotes, there has also been a tendency to abstract the life chances, working terms, and conditions enjoyed by workers in a given *national* social setting from the *global* patterns of accumulation upon which they today depend.

The essay then moves on to consider the work of the Brazilian Marxist dependency theorist Ruy Mauro Marini. Marini (1978, 2005a, b) examined one example of labour segmentation established under the imperialist division of labour of the classical free trade era and, in this context,

developed the arguably most rigorous treatment of dependency from a labour (or production) standpoint in the context of works such as *Dialéctica de la dependencia* (or The Dialectics of Dependency, originally published in 1973). Recovering a key contribution of the dependency perspective, the essay argues that accumulation in the imperialist age, rather than creating conditions for the emergence and generalisation of 'modern' modes of labour productivity, has driven the reproduction of labour super-exploitation in dependent economies like Brazil. It suggests more generally that what unifies imperialism as a period (whether we think of captured trade under mercantilism and settler-colonialism to formal empire, the ascendant finance and monopoly capital of the late nineteenth–early twentieth century, or the hegemonic circuits of productive and financial capital following the Second World War) are two things. First, the degree to which core social relations in countries of the global South (despite being formally independent since the early nineteenth to twentieth century, depending on the region) have been reproduced to sustain the extraction and external accumulation of surplus value (Bresser Pereira 1984, pp. 50–54; Latimer 2014, p. 2). And secondly, the degree to which this global accumulation takes place on the basis of the combination of different rates of exploitation. By way of example, the essay turns to examine the resurgence of super-exploitation in one of the most dynamic and globally integrated sectors of the so-called new 'Brazilian Miracle': the sugar/ethanol industry. Here, despite recent improvements in real wages and job formalisation, higher rates of profit were in fact made possible by the general lowering of labour costs a decade earlier, following trade liberalisation and neo-liberal restructuring of the labour process, job markets and regional production; what I would identify as the neoliberal crisis of labour (Latimer 2014).

The final section returns to Marx, and to the implications of this argument for class struggle. It revisits the discussion of the general law of accumulation in *Capital Volume I* (Marx 1974: ch. 25) to comment on particular and general forms of exploitation in the global crisis of labour. The essay ends by arguing that the structural divisions within and contradictions between sections of the global working class need to be at the core of anti-capitalist strategy, if the global left is to be able to construct an international capable of effectively challenging global capitalism.

Super-Exploitation in the Labour Theory of Value: From Marx to Marini

Super-exploitation, broadly defined as a mode of extracting an 'extra' degree of surplus value involving recourse to extreme exploitation, is best understood in the context of a division of labour involving *differential* rates of exploitation, or labour segmentation. With few exceptions, neither super-exploitation nor labour segmentation has been addressed in the labour theory of value in any systematic way. Rather, in many ways, the phenomenon is caught in the empirical realm. In anthropology and cognate disciplines, for example, recourse to systematically higher rates of exploitation in Southern economies is often explained in cultural terms; for example, with the argument that capital in the exportprocessing zones embeds forms of exploitation in existing culturally specific forms of inequality (based, for example, on gender, kinship, and regional hierarchies) to order and control highly exploitative labour processes (e.g. Granovetter 1985; Pun 2005; Ong 1987; cf. Heyman 1998).

Throughout *Capital I*, Marx himself (1974) observed the continuing use of outmoded, exhaustive forms of exploitation in the shift from absolute to relative surplus value that underpinned the industrial revolution in England: in the gendered and age-related division of labour that saw women and children performing labour-intensive tasks in early industrial factories (ch. 15, 422); and in the production and leveraging of the relative surplus population to increase the rate of exploitation in formal labour settings (ch. 25). In the latter, for example, Marx observed that young men were 'drained of their strength while still at a tender age, after which they were treated as useless and left to perish' as members of a floating surplus population (Catephores 1981, pp. 275–276). Illustrating how segmentation

S

may constitute 'a barrier to the expansion of the productive forces to the extent that it restricts the supply of labour, [and] limits the development of labour power' (Bowles and Gintis 1977, p. 179), this took place at the very life stage when, in earlier forms of industry, young men might have been taken on as journeymen and apprentices and trained for adult tasks. (For recent efforts to mediate the often overwrought distinction between exploitation and oppression in advanced capitalist societies, see Dixon 1977; Heyman 1998; Ness 2005; Valiani 2012; Walia 2010. Their works examine the role of segmented labour markets in the super-exploitation of gendered, racialised and/or migrant labour.)

In both instances, Marx noted that the segmentation of the workforce (in the first instance, 'forms of organization of labour rendered obsolete by the very development of capitalist production', and in the second, the periodic cycling of workers through formal employment and out again) was crucial to accumulation (Catephores 1981, p. 274).

> Although then, technically speaking, the old system of division of labour is thrown overboard by machinery, it hangs on in the factory, as a traditional habit handed down from Manufacture, and is afterwards systematically re-moulded and established in a more hideous form by capital, as a means of exploiting labour-power. (ch. 15, quoted in Catephores 1981, p. 274)

However, Marx neglected to elevate these instances of super-exploitation (and more generally, of the combination of differentiated rates of exploitation) to a high level of abstraction in *Capital,* and ultimately assumed that the rate of exploitation would equalise across a given society (Catephores 1981; Higginbottom 2012; Sotelo Valencia 2014, p. 541; cf. Marx 1974, pp. 212, 235). As others have suggested, this is arguably one of many heuristic devices Marx used in the course of elaborating the labour theory of value; crucially, for example:

> *Assuming that labour-power is paid for at its value,* we are confronted by this alternative: given the productiveness of labour and its normal intensity, the rate of surplus-value can be raised only by the actual prolongation of the working-day; on the other hand, given the length of the working-day,

that rise can be effected only by a change in the relative magnitudes of the components of the working-day, viz., necessary labour and surplus-labour; a change which, *if the wages are not to fall below the value of labour-power,* presupposes a change either in the productiveness or in the intensity of the labour. (Marx 1974, p. 511, emphases added; cf. Bueno and Seabra 2010, p. 71; Marini 2005b, p. 187)

While perhaps a valid analytical step, as Bowles and Gintis (1977) argue in an otherwise problematic analysis of labour segmentation, 'the assumption of equal rates of exploitation is in no way required by historical materialism and is inconsistent with a critical Marxian concept: uneven development' (176; also Rosdolsky, in Foster and McChesney 2012, p. 131). This elision was also historically problematic in the setting of the original industrial revolution, during the extension of global capitalist relations in the same period (the 'classical' phase of global accumulation, c.1769–c.1880), and in the imperialist phase which followed (Cope 2012: part I). If we understand imperialist expansion in the latter as a response to contradictions between capital's drive to expand production and stagnating rates of profit in the last quarter of the nineteenth century, then the ordering and articulation of a new division of labour between diverse sections of slaves (until 1888 in Brazil), other forms of unfree labour, unpaid domestic labour, rural and urban workers, and peasants in the colonial (and, in relation to Latin America, neo-colonial) periphery and those in the metropolitan core should be understood as an epochal key to their resolution. (In this sense, this essay is conceived in part as a contribution to a broader research project that explores the role of differentiated rates of exploitation in global accumulation strategies under imperialism, which to date counts such valuable works as Cope 2012; Nash and Fernández-Kelly 1983, particularly the essays by Nash, and Bonilla and Campos; Rodney 1981; Sanderson 1985; Tomba 2007.) In the context of formal empire, for example, both Lenin and Bukharin observed that the division of labour enabled the production of super-profits in the colonies through the super-exploitation of colonial labour (Higginbottom 2012, p. 253). Decades later, a key contribution of the Marxist strand of

dependency theory would be to illustrate this dynamic in a division of labour now organised around formally independent nation states. In this vein, I would suggest that the combination of differentiated rates of exploitation (including super-exploitation) is a key characteristic of class formation and accumulation under the consecutive stages of imperialism, including neo-liberalism.

From the genocidal displacement of Indigenous communities in the early sixteenth century and the equally genocidal trade in and exploitation of enslaved Africans, to the marginalisation of freed Africans in the transition to a wage-based economy and their displacement by immigrant labour, super-exploitation and labour segmentation have been intrinsic to the formation of Brazilian capitalism, which itself 'cannot be understood separately from its globally-informed structure and function' (Marini 2005a, p. 138, my translation; also Duarte 2013, pp. 196–199; Lockhart and Schwartz 1984, pp. 198–201). In a description of the racial economy of colonial Brazil, Lockhart and Schwartz (1984) quantify the subhuman valuation of African life in arguably the harshest plantation economy of the day which, despite unceasing slave uprisings and republican movements, would last until abolition in 1888.

> Slave owners estimated that a slave could produce on the average about three-quarters of a ton of sugar a year. At the prices of the period, this meant in effect that slave would produce in two or three years an amount of sugar equal to the slave's original purchase price and the cost of maintenance. Thus if the slave lived only five or six years, the investment of the planter would be doubled, and a new and vigorous replacement could be bought. (218)

Likewise, Souza (1974) would comment on the revival of super-exploitation a century later in the highly competitive auto sector of greater São Paulo during the so-called Brazilian Miracle (1968–72), in a passage that closely echoes Marx's observations of modern industry above:

> In all its stages, the economic process instituted in Brazil was based on the coexistence of advanced forms of capitalist exploitation and the most backward forms of production. The basis ... of this development was the intensive exploitation of

labour power and not the utilization of technology. However, these two forms complemented each other, and only when the world system required the more advanced forms of production (agricultural or industrial) were they introduced. (See also Humphrey 1980; Pinto 1965; Sotelo Valencia 2014, p. 543)

It is in this context that the contribution of Ruy Mauro Marini (2005a, b) to the labour theory of value, in the form of his thesis on super-exploitation, is significant, insofar as it offers one of the most rigorous treatments of this apparent 'backwardness' to date (see also Bueno and Seabra 2010; Osorio in Almeida Filho 2013; Sotelo Valencia 2014; on the significance of this thesis to historical and contemporary debates within Marxist dependency theory, see Kay 1989; Prado 2011; Sotelo Valencia 2014). While many use the term figuratively or descriptively to talk about a variety of low-wage, physically exhausting and often dangerous work, Marini examined the historical function of super-exploited Brazilian labour, unfree *and* free, in the production of particular use values for consumption in the metropolitan core during the nineteenth century. On this basis, he began to theorise a new modality, if not a discrete form, of extracting surplus value; one which Marx might have observed in concrete settings but which he declined to fully integrate in the labour theory of value, as illustrated above.

Super-exploitation involves the extraction of an extra degree of surplus value through any combination of techniques (for example, the extension of tasks or hours in the working day, the intensification of the labour-process) which amount to qualitatively higher degrees of exploitation, rather than through the development of the worker's productive capacity per se (Marini 2005a, p. 156; b, p. 189; cf. Furtado 2007, pp. 232–233); that is, without an increase to the technical composition of capital (or the proportion of capital invested in the purchase of labour power, or wages, to that of constant capital, or machinery). In other words, the improvement of productivity through new technology and techniques of production is neglected in favour of intensifying the physical labour process, often to the point of complete exhaustion.

The relation of super-exploitation to the two modes of surplus value identified in *Capital* is a current subject of debate. In Marini's work, the concept cannot be reduced to either absolute surplus value, with which it is often conflated (Marini 1978; cf. Salama 2009; Cardoso and Faletto 1979), or to relative surplus value, although it may occur in combination with either. Starting from Marini's original texts, Bueno and Seabra (2010) argue that superexploitation 'brings together diverse modalities of extracting surplus value, centred on the evasion of the law of value in relation to the labour-power commodity' (74) in so far as it bypasses the exchange of commodities of equal value (71, my translation). For Higginbottom (2009), super-exploitation constitutes a third mode of extracting surplus value that arose under, and has come to characterise, surplus value extraction from the global South during the imperialist phase of capitalism. I accept the position of Sotelo Valencia (2014) which positions superexploitation as an imminent mechanism that conditions the development (or, perhaps better, limits the generalisation) of relative surplus value in low-wage and 'emerging' economies like Brazil: 'Super-exploitation as a production regime is not negated in dependent countries when relative surplus value emerges, even to a limited extent, and imposes its logic – though not its hegemony – in the production and accumulation of capital' (5).

However, super-exploitation also by definition involves a reduction or suppression of wages to the point where it falls below the value of the worker's labour power, or the level necessary to reproduce her or his labour power in a given social formation. This rendered section of the worker's wages is thus converted into an extra source of surplus value that is appropriated by the capitalist (Bueno and Seabra 2010; Marini 2005a, pp. 154–155). This element in fact arises later in *Capital Volume* I, where Marx amends one of the problematic working assumptions flagged earlier and so makes conceptual space for super-exploitation as a general tendency of capitalist development:

> In the chapters on the production of surplus-value it was constantly pre-supposed that wages are at least equal to the value of labour-power. Forcible reduction of wages below this value plays, however, in practice too important a part, for us not to pause upon it for a moment. It, in fact, transforms, within certain limits, the labourer's necessary consumption-fund into a fund for the accumulation of capital. (Marx 1974, p. 599; see Higginbottom 2012, pp. 263–264)

Finally, Marini (2005a) locates super-exploitation at a specific position in the global system shaped by imperialism, rather than as a universal historical stage: specifically, as a characteristic of capitalist development specific to dependent economies, such as the export-oriented economies of Latin America (and elsewhere) where, in contrast to advanced capitalist countries, workers were not expected to fulfil their second function as consumers of the use values they produced (154–155, 165). Rather, this kind of exploitation marked sectors that relied on the extensive and intensive use of labour (namely, extractive industries and plantation agriculture) and, consequently, in which there was little need for high or continuing reinvestment of constant capital. Marini suggests that the tendency of local oligarchies at the periphery of the global system to resort to super-exploitation explains why the supply of prime materials and foodstuffs from Latin America increased in the very period that their terms of trade diminished (153, 156).

Crucially, this systemic reliance on super-exploitation in the nineteenth-century division of labour draws our attention to some of the structural contradictions which shaped the global working class in this period. Marini (2005a) argues that the super-exploitation of Brazilian labour underwrote a qualitative shift in English industrial development from 1840 onwards, with the provision of cheap foodstuffs and raw materials (142–147). This flow (amongst others, of course) supported the shift from absolute to relative surplus value; in other words, to the generalisation of a stage of expanded production based on higher rates of labour productivity, or a higher technical composition of capital (Marx 1977, p. 145). This shift would only be approximated in Brazil itself a century later and never, to date, in a generalised way. Marini's argument is that this shift took place (in part) not only due to higher national rates of labour productivity in England,

but also to its reliance upon cheaper imported raw materials and foodstuffs; in other words, upon a lowering of the costs of production and social reproduction respectively in the core economy on the basis of super-exploitation in the periphery. Thus, in the bid to develop the productive forces of one core region, he illustrates how imperialism accentuated and relied upon different rates of exploitation overall: '. . . the combination of forms of capitalist exploitation are carried out unevenly throughout the system, engendering distinct social formations according to the predominance of one form or another' (Marini 2005b, p. 189).

With echoes of Marx's deconstruction of the bourgeois origin myth of primitive accumulation, this element of Marini's work undermines yet another origin myth: that the shift to relative surplus value in England was entirely the product of *national* class struggle by its working class, a common theme of Eurocentric histories of the classical Industrial Revolution. There is both an historical and geographical (or system-level) point to be made here. Where Marx (1977) argues that the increased degree of labour productivity reached in the shift to the production of relative surplus value 'rests on a technical basis, and must be regarded as given at a certain stage of development of the productive forces' (145), Marini illustrates that this moment of industrial 'progress' was paid for (in part) by the super-exploitation of unfree and free workers elsewhere in the global system. This contrasts with traditional Marxist narratives that assume (more or less explicitly) that the national frame is the most appropriate scope with which to interpret capitalist development (and the social, democratic progress), even within imperialist countries, and that capitalist development will ultimately progress from stage to stage in all national economies of the capitalist world. Rather, this case illustrates how, when adjusted to the global frame (or within the nation state, a framework that encapsulates all workers, active and reserve), capitalist development drives backwardness; it is not its cure. What Marini offers is a single case (for now, abstracted from a more general picture of the global system of the period) that illustrates the continuing reliance of core industrial development on accumulation by means of super-exploitation, albeit now through the arm's-length relations afforded by free trade and dependency.

Super-Exploitation Under the New Brazilian Miracle

Adding to the effort of those attempting to revive Marini's contribution in analyses of this latest phase of imperialism (e.g. Almeida Filho 2013; Amaral and Carcanholo 2009; Bueno and Seabra 2010, 2012; Duarte 2013; Higginbottom 2012; Marini 2008; Martins 2011; Osorio Urbina 2004; Sader et al. 2009; Sotelo Valencia 2009, 2014), I suggest that labour segmentation has became one of the key challenges to Brazilian class struggle over the past generation, in the context of the restructuring of production, of labour processes, and of labour markets; in other words, in the context of the neo-liberal crisis of labour (Latimer 2014; cf. Duarte 2013). Certain elements of this crisis are not new. However, the perennial tension of structural divisions within the working class have taken front-and-centre stage in the neo-liberal period. The deepening of divisions within the working class (writ large to include rural and urban wage earners, informal-sector workers, semi-proletarianised peasants, and the increasingly complex reserve army) have enabled the resurgence of super-exploitation in already labour-intensive sectors, and particularly those which benefited from the opening to deregulated trade and direct investment flows in the 1990s, financial deregulation, and constant demand for minerals and raw materials in the new century (Duarte 2013, pp. 198–201).

Perhaps nowhere is this trend clearer than in agribusiness, the sector now celebrated as the core of a new 'Brazilian Miracle' (cf. Amann and Baer 2012). According to the Economist (2010), the source of this sector's success lies in its smart use of the country's abundant land base and resources; in the state's attention to developing new technologies rather than to subsidies, regardless of the new monopolies that have developed around them; the successful introduction of

S

genetically modified crops, championed by capital and the central government after a protracted battle with land-based social movements, non-governmental organisations and dissident state governments throughout the 1990s; and the embracing of trade liberalisation, competition, and capital-intensive farming through economies of scale.

Echoing similarly myopic visions of the previous 'Miracle', the new conditions of labour and land relations which have made this boom possible have been sidelined altogether in this account. Take, for example, the conditions faced by day labourers in the sugarcane fields of São Paulo state, which came to light following a series of work-related deaths. Brazil is now the largest global producer and exporter of sugarcane and sugar-based ethanol, and one of the largest domestic markets for biofuels. In 2006, the highly modernised sugar/ethanol sector of São Paulo state accounted for 55% of the value of sugarcane production in the country (DIEESE 2007, p. 2; IBGE 2009, p. 734). The *paulista* sector saw heavy investment in fixed capital throughout the 1990s, accounting for 75% of all mechanisation in the sector, while 32% of the national workforce in the sector was discarded in the same period (DIEESE 2007, pp. 19–20). Traditional sugar oligarchs, now in partnership with multinational subsidiaries in sectors that use sugar(-based) inputs, claim that the new technology has allowed them to move from production on the extensive margin (that is, bringing in additional land under cultivation, often through recourse to the illegal but established habits associated with *grilagem,* or land-grabbing) to intensive production (which includes recovering the *cerrado,* or scrublands, which extends over nine states including São Paulo), thus reducing the social basis of land-related conflict (cf. Mendonça 2009, p. 68; for historical examples of *grilagem* with respect to public and Indigenous lands, and the use of the 1850 Land Law to restrict land access to freed African slaves, see Duarte 2013, pp. 196–197; Lockhart and Schwartz 1984, pp. 402–403). However, increasing productivity margins have allowed agribusiness complexes to push smaller farms out, exacerbating land inequalities and adding to the reserve army (DIEESE 2007, p. 5, 24; IBGE 2009, p. 111).

This is a highly modernised sector which entertains an 'ideology ... that tries to negate the existence of human labour on sugarcane plantations' (Silva 2011, my translation). And yet researchers and activists have pointed to a resurgence of super-exploitation at the interstices of a segmented workforce, falling real wages, and extreme hikes to the physical demands placed on workers (Alves 2006; DIEESE 2007, p. 20; Mendonça 2009; Silva and Martins 2010). A recent study by DIESSE (the Inter-Union Department of Socioeconomic Statistics and Studies, 2007) shows that rural unions have in fact made considerable gains in terms of the overall number of formalised workers in the *paulista* sector; that is, those working as registered workers (with a signed workers' card that provides access to labour rights under federal legislation) and under collective agreements. However, these gains have been offset by the effect of waves of newly arrived migrants from the North-East (most recently, the state of Maranhão) and nearby Minas Gerais, most of whom have been added to the workforce as unregistered workers. Amongst registered workers, average wages fell 26% between 1992 and 2002 to R$310 (US$140) monthly, less than the current minimum wage.

Since 1992, workers harvesting the cane manually have also faced sharp increases to their daily quotas: in contrast to the average national daily quota of 6 tons in the 1980s, workers are now faced with daily quotas of 7.4–10.7 tons just to meet the grade of 'regular to good' productivity, and up to 13.4 tons daily to meet the 'optimal productivity' target. According to DIESSE, this is 37% higher than the daily output expected of workers in the North-East, while workers in the *paulista* sector are paid only 15% more (DIEESE 2007, p. 23). The physical costs to the worker are profound. To meet the medium range target of 10–15 tons daily, workers must deliver '30 strikes [of the machete] per minute for eight hours per day', according to one researcher (Mendonça 2009, p. 72).

> Beyond insufficient dietary conditions – caused by low salaries, from excess heat, from the elevated consumption of energy due to the extremely strenuous tasks involved – the imposition of the quota (that is, the ever-increasing daily amount of cane cut) has set the pace increasing labour productivity since the 1990s, when machine harvesters became employed in increasing numbers. The rate affects not only migrants but also local workers. For this reason, these capitals require a young workforce, gifted with great physical energy to perform this activity. And so, the turnaround has become very high by virtue of the constant replacement of labour consumed during the production process. (Silva and Martins 2010, pp. 213–214, my translation)

All told, heightened rates of exploitation have been observed across the board, often to the point of death (Silva and Martins 2010, pp. 213–214; see also Alves 2006). In 2005 alone, a Regional Labour Delegation registered 416 deaths in the state due to workplace accidents (including burning to death), heart attacks, and cancer (Mendonça 2009, p. 73). It has also resulted in the rise of working conditions which labour activists and the Ministry of Labour and Employment (MTE) identify as de facto debt slavery. Several of the largest exporters of sugar/ethanol have been recently added to the government's 'dirty list' of firms whose operations have been found to use forced labour. These include: the Cosan Group, Copertrading, the Moema Group, Louis Dreyfus Commodities, the Noble Group/Usina Cerradinho (ONG Réporter Brasil 2011; also Instituto Observatório Social 2004).

Industry in São Paulo has seen a threefold increase in the tonnage produced annually between 1991 (144.6 tons) and 2011 (406.5 tons) by these means, rather than simply by technological improvements to productivity alone (Instituto da Economia Agrícola 2012).

The first thing to note here is the significance of transnational class relations in the reproduction of this pattern of exploitation which (despite clear resonances with the description of super-exploitation provided by Lockhart and Schwartz 1984) should be understood not simply as a backward survival of an earlier stage of development, but rather as an inherent feature of accumulation in a *modern,* dependent economy (Marini 2005b:

192). These processes are driven by the demands of northern and 45 emerging' nations for cheap agricultural, energy, and industrial inputs, which include US, EU and Japanese markets for biofuels (Franco et al. 2010; Mendonça 2009). They have also been enabled by trade liberalisation, new speculative markets in land and agricultural commodities (particularly since 2008), measures to facilitate the commodification and marketing of biotech inputs (seeds, fertilisers), and those to facilitate the domestic and foreign concentration of land ownership (Teixeira and Gomes 2013).

While such trends have allowed increasing control over the production chains in question to be centralised by multinational agribusiness giants and finance capital, the externalisation of the most labour-intensive stages of production to subcontractors enables companies to deny knowledge of any rampant human and labour-rights violations taking place in upstream sectors (Instituto Observatório Social 2004, p. 12). In this sense, the logic of outsourcing that shapes transnational capitalist class formation (that is, alliances between Brazilian and northern capital) provides the mirror image of the segmentation of labour (cf. Marini 2008, p. 254); however, *both* are necessary for super-exploitation to occur. Finally, while working communities around the world have experienced some version of the neo-liberal crisis, these rates of exploitation are (generally) not found in countries of the industrialised north. Taken as a whole, these points should put the particularities of Southern labour back on the agenda of class-based, anti-imperialist struggles.

The General Law of Accumulation and the Race to the Bottom

> To-day, thanks to competition on the world-market . . . we have advanced much further. 'If China,' says [John Stapleton MP] to his constituents, 'should become a great manufacturing country, I do not see how the manufacturing population of Europe could sustain the context without descending to the level of their competitors.' . . . The wished-for goal of English capital is no longer Continental wages but Chinese. (Marx 1974, p. 601)

There is one more aspect we can take from Marx (1974) on the issue of labour segmentation; namely its implications for class struggle. This comes, in embryonic form, in the context of his discussion of the general law of accumulation (ch. 25). At moments of accelerated accumulation (rather than crisis), Marx observes that:

> The greater the social wealth, the functioning capital, the extent and energy of its growth, and, therefore, also the absolute mass of the proletariat and the productiveness of its labour, the greater is the industrial reserve army. The same causes which develop the expansive power of capital, develop also the labour-power at its disposal. The relative mass of the industrial reserve army increases therefore with the potential energy of wealth. But the greater this reserve army in proportion to the active labour-army, the greater is the mass of a consolidated surplus-population, whose misery is in inverse ration to its torment of labour. The more extensive, finally, the lazarus-layers of the working-class, and the industrial reserve army, the greater is official pauperism. This is *the absolute general law* of *capitalist accumulation.* Like all other laws it is modified in its working by many circumstances …. (644, emphasis in the original)

Using the concrete example of the shift to a generalised regime of relative surplus value in England, Marx argues that capitalist accumulation tends to produce a population that is contingently and then absolutely unnecessary to its reproduction. Ultimately, in volume 3, Marx (1977) positions this essential, 'immanent contradiction' as a response to the tendency of the rate of profit to fall (ch. 13; Mattick 1983, p. 94), insofar as the weight of the reserve population can be used to temper workers' demands for better wages and working conditions and so, to bolster the rate of profit.

In terms of the issue of what extent the 'general law' of accumulation can be said to constitute an actual law of capitalist development, I agree with Veltmeyer (1983) who sees it as referring to 'certain tendencies rooted in the basic structures of the capitalist mode of production' which can be modified through particular historical circumstances, and certainly by class struggle (218–219; Foster and McChesney 2012, pp. 130–131). Since Marx's time, various authors have highlighted the ways in which such circumstances were created by imperialism, including the welfare legislation established in the post-Second World War

period in core nations (initially paid for with colonial revenue) to offset the potential for social instability in times of long-term hardship (Mattick 1983, p. 97); the leveraging of the rate of profit in manufacturing following its collapse in the 1970s by the internationalisation of production and increased competition between regional workforces (Latimer 2014; Marini 2008, pp. 253–254; Sotelo 2009: ch. 2, 2013, p. 2); and the current appropriation of surplus value from the South through new financial instruments and markets (Norfield 2013). And so, while 'the modifications the system undergoes in the very course of its development may set aside the general law of accumulation … and thus meet the optimistic expectations of the ruling class and raise doubts among the exploited classes about capitalism's vulnerability … [they] do not affect its general validity' (Mattick 1983, pp. 95–96).

It is in this discussion of the general law of accumulation where Marx best captures contradictions between social layers of the working class (in this context, within a single social formation) that actually facilitate capitalist reproduction from one cycle to the next (Latimer 2014). The various layers of the reserve army in Chapter 25 are not, I would argue, significant in and of themselves; nor were they intended to be understood as something extraneous to exploitation and productivity in the formal labour process following capitalist expansion. Rather, the law speaks to the unity of the working classes, or the intrinsic link between the active layers of workers and those so-called 'ex-workers'; in countries like Brazil, many of them also recently, or occasionally, 'ex-peasants'.

In this sense, the general law of accumulation is a good way to think through the contemporary 'race to the bottom'; or the general social relation that links national and subnational segments of workers across borders with 'profound inequalities of labour-powers' (Higginbottom 2012, p. 252); a relation which, rather than leading to an equalisation in rates of exploitation, tends to tie each to the other in a downward spiral of working terms, conditions, and living standards. The previous section illustrated that super-exploitation continues to be a modern feature of class

formation, here as a response to the particular way Brazilian agribusiness has entered the global system in the neo-liberal period. The general law of accumulation helps to clarify the intrinsic connection between such particular forms of exploitation and the general crisis of labour amongst working peoples (of the generalisation of precarious labour arrangements, for example); and so, the capacity of capital to leverage the fortunes and gains of one layer of workers against others (for example, the pitting of jobs in extractive industries against acts of Indigenous sovereignty around land and resources in settler colonies).

Marx himself never developed the general law of accumulation to its logical conclusion – in other words, by exploring its implications for anti-capitalist struggle – but there are kernels.

> As soon, therefore, as the labourers learn the secret, how it comes to pass that in the same measure as they work more, as they produce more wealth for others, and as the productive power of their labour increases, so in the same measure even their function as a means of the self-expansion of capital becomes more and more precarious for them; as soon as they discover that the degree of intensity of the competition among themselves depends wholly on the pressure of the relative surplus population; as soon as, by Trades' Unions, &c., they try to organise a regular co-operation between employed and unemployed in order to destroy or to weaken the ruinous effects of this natural law of capitalistic production on their class, so soon capital and its sycophant, Political Economy, cry out at the infringement of the 'eternal' and so to say 'sacred' law of supply and demand. Every combination of employed and unemployed disturbs the 'harmonious' action of this law. But, on the other hand, as soon as (in the colonies, *for example*) adverse circumstances prevent the creation of an industrial reserve army and, with it, the absolute dependence of the working class upon the capitalist class, capital, along with its commonplace Sancho Panza, rebels against the 'sacred' law of supply and demand, and tries to check its inconvenient action by forcible means and State interference. (Marx 1974, p. 640, italics in the original)

If the general law is the central contradiction of the capitalist mode of production, the only issue of equal importance was that of how workers would address this 'secret'. In other words, it concerned whether workers could achieve means of common struggle predicated on the recognition not of an undifferentiated subject and class interest, but rather of a long-term common fate across vastly different realities (including the violence intrinsic to class formation in a colonial setting; see also Lindberg 2014).

Conclusion

As may already be apparent, there isn't much in this essay that is actually new (see e.g. Veltmeyer 1983), although there is much that has been systematically sidelined or dismissed in contemporary debates on left and left-labour strategy. As exemplified by Chakrabortty (2013) at the outset, the current crisis affecting European workers (expressed in terms of austerity measures, harder and longer working lives, mass unemployment, destitution, and elder neglect, weakened unions, and the end of the welfare state) has given rise to easy comparisons with the plight of workers in the global South under neoliberalism. However, without trivialising the hardships faced by working-class communities in the North (particularly racialised youth, migrant workers, and women), super-exploitation as it appears in an emergent Brazil has not existed in Europe for more than a century (cf. Sotelo Valencia 2014, p. 549). This is not to say, however, that for better or for worse, the conditions and horizons of possibility for jobs, pay, working and living standards in both regions are not tied together, if we are to take a global reading of the general law of accumulation seriously.

Using a case from Brazil, this essay sought to use the resurgence of super-exploitation in the global South as an alternative starting point from which to consider the global crisis amongst working people. It is positioned as a contribution to current efforts to grapple with the particular and general forms of exploitation in the global crisis of labour, and the structural divisions and contradictions between sections of the global working class that have crippled organised labour and communities in resistance to global capitalism. In adopting this tack, the essay is not intended to be a celebration of the fragment, or part of some conspiratorial assault on Marxist analysis by post-structuralism, but simply a call to attend to the ways that workers have been put in order

S

historically and geographically by capitalism in its imperialist phase. In this context, 'backward' forms of exploitation continue to be reproduced, not because of the inadequacies of class struggle in closed social formations in the South, but, in the first instance, because they continue to be profitable and functional to global accumulation at the hands of both national and international capital. In dependent countries, workers are forced to contend not only with 'their' national capital but also the financial, governance and trade-related structures controlled by the capital of advanced capitalism under which they operate; this still holds true, despite the rise of export-capital from so-called 'emerging' economies like Brazil (Bueno and Seabra 2010; Foster and McChesney 2012, p. 139). If the general law of accumulation can be argued to hold beyond national borders, these forms arise because they are possible in the absence of a viable international struggle for socialism, rather than the current forms of accommodation.

Early works from the dependency perspective were often positioned with an eye to understanding why, following the globalisation of capital in the first phase of imperialism, a worker's international capable of challenging capital at a structural level had not followed suit. In the North, it is discouraging to see the degree to which efforts to theorise capitalism in its latest phase of globalisation (it bears rephrasing: theories which emerged in the very moment that global production moved *en* masse to the South) have systematically attempted to sideline both the global (class) dimensions of accumulation and the particular role of Southern labour within it. For this reason, I expect that the challenge of labour segmentation, which this essay argues has become a central challenge to class formation in the neo-liberal age, will be solved through the practical efforts of workers who see internationalism as central to their self-interest and even liberation (Lindberg 2014), not in theoretical debate. No more compromises.

Syria and Imperialist Intervention: Past and Present

Christopher M. Davidson
European Centre for International Affairs, Brussels, Belgium

With its major cities having long served as key centers of cultural and intellectual production and bordered by Israel, Turkey, Lebanon, Iraq, and Jordan, Syria has long been regarded as one of the most strategically important states in the Arab world. Unsurprisingly, therefore, since the mid-twentieth century, two of the most powerful external actors in the region – Britain and then the USA – have repeatedly sought to influence its politics and, in more extreme cases, topple its most uncooperative regimes. Drawing on a range of primary and secondary sources – including archived official documents, published records of diplomatic correspondence, and NGO reports – this chapter attempts to understand the various British- and US-sponsored Syria-focused campaigns by identifying and appraising the tactics and strategies used and by situating them in their correct historical contexts stretching from the rise of Arab nationalism and the Cold War to the 2011 Arab uprisings.

From Arab Nationalism to the Cold War

Although limping through the Second World War as a technical victor, Britain's surviving global empire was nonetheless in retreat. With repeated uprisings and national liberation movements chipping away at overseas possessions, Whitehall officials and planners were already expert in devising strategies aimed at blocking or reversing indigenous challenges. But with increasingly resource-intensive heavy industries requiring vast imports of basic materials at a cheap and stable price from their remaining colonies and protectorates, such counterrevolutionary efforts had to become much more focused on what had become the greatest threat of all: economic nationalism. Certainly, the enemy insurgents Britain was facing by the mid-twentieth century were no longer being measured by their ideology, religion, or barbarity, but quite clearly by their capacity to nationalize resources and industries or, at the very least, build states capable of demanding greater stakes in the local production of wealth.

Since its secret Sykes-Picot agreement with France that effectively carved up the territories of the crumbling Ottoman Empire in the wake of the First World War, Britain's grip over much of the Middle East and its resources had been more or less uncontested. But by the 1950s and certainly the 1960s, a potent pan-Arab movement was threatening to unseat remaining British client rulers in the region and jeopardize lucrative trade arrangements and control over valuable natural resources. With "classic nationalism [having become] impotent" in the Middle East, as veteran correspondent Patrick Seale described, many of the new "Arab nationalist" revolts were effectively military operations, often led by army officers intent on forcibly removing foreign influences from their countries. Described by some as "armed plotters waiting in the wings, legitimized by a third world discourse" (Seale 1987, pp. 3–5; Filiu 2015, p. 32), the Arab nationalist uprisings and revolutions may have had little in common with the progressive movements of mid-nineteenth-century Europe, but, as illiberal as they were, they nonetheless represented one of the

S

most organized and potent challenges to imperial structures Britain had ever faced.

The gravity of the situation was not lost on London: Foreign Office reports warned of Middle Eastern ruling elites "losing their authority to reformist or revolutionary movements which might reject the connexion with Britain"; official references were made to the dangers of "ultra-nationalist maladies"; and the cabinet secretary informed the prime minister in no uncertain terms that "we are fighting a losing battle propping up these reactionary regimes" (Curtis 2003, pp. 256–257). According to a particularly candid 1952 Foreign Office study entitled *The problem of nationalism*, there were two strains to watch out for. The first was "intelligent and satisfied nationalism" which was not very well defined but seemed to involve Britain being able to divert inevitable nationalist sentiments into regimes that would "minimize losses to Britain." The other, however, was likely to be very harmful to British interests as it would lead to new governments that would "insist on managing their own affairs…including the dismissing of British advisers, the appropriation of British assets, unilateral denunciation of treaties with Britain, and claims on British possessions" (Hiers and Wimmer 2013, p. 239; Curtis 2003, pp. 237–238). Declassified documents from 1961 have shown that British officials were even wary of the "force of liberalism" in such countries for much the same reason (Curtis 2003, p. 256).

Despite some muted discomfort over the imperialist practices of its British and French allies, the USA of the mid-twentieth century was rapidly waking up to the demands of its own resource-hungry industries and the realities of its Cold War stalemate with the Soviet Union. Ensuring vacuums left in the wake of the retrenching European empires were not filled by antagonistic forces bent on nationalizing assets or – equally dangerously – liberation movements likely to align themselves with Soviet-sponsored international communism, the US government and its intelligence agencies soon found themselves at the very forefront of counterrevolutionary action. As Karl Korsch put it, the USA may have been based on the ideals of revolutionary France, but by this stage, it was fast losing its "capitalist infancy" (Korsch 1940).

Soon advancing into the void left by Britain's retreat and quickly overcoming their initial fence-sitting on Gamal Abdel Nasser's Egypt, by the mid-1950s, US planners acknowledged that securing the Middle East was going to be vital to the future prosperity of Western industries and, in turn, for holding the Soviet Union in check. As it was in the rest of the world, the extraction of natural resources was once again an obvious priority, so all indigenous attempts to nationalize economic assets – regardless of any progressive, liberal, or even democratic agendas – needed to be intimidated or destroyed by the USA. In 1955, according to secret correspondence between British officials, President Dwight Eisenhower had even called for a "high-class Machiavellian plan to achieve a situation in the Middle East favourable to our interests which could split the Arabs and defeat the aims of our enemies" (Kyle 2011, p. 552; Curtis 2012, p. 62).

Just 2 years later, the region got its own "Eisenhower Doctrine," an evolution of the earlier Truman and Monroe doctrines that had sought to secure US interests against international communism and foreign encroachment on the American continents. Stating that "the US regards as vital to the national interest and world peace the preservation of the independence and integrity of the nations of the Middle East," Eisenhower effectively made the Middle East a special zone of US control. Moreover, as with Truman's more global declaration, Eisenhower sought to tie the Cold War to all threats to the Middle Eastern status quo by claiming he was "prepared to use armed forces to assist [any Middle Eastern country] requesting assistance against armed aggression from any country controlled by international communism" (Blum 2014, p. 89). He also proclaimed that "the existing vacuum in the Middle East must be filled by the United States before it is filled by Russia" (Dreyfuss 2006, p. 121).

Thus, in this context the USA and its nascent intelligence organizations soon started to look beyond Nasser's Egypt and effectively began to assume prime responsibility for countering most of the other Arab nationalist movements in the

Middle East and North Africa. Worryingly for Washington, its enemies had even reached Israel's gates as a series of ineffective military dictatorships in Syria came to an end in 1954 when Syrian "free officers" restored free and fair elections. With the nationalist People's Party and the Arab Socialist Renaissance Party – the *Ba'ath* – winning a combined 55 out of 140 seats and thus representing the biggest bloc in parliament, the former French protectorate seemed finally poised to pursue an independent foreign policy (Nohlen et al. 2001, pp. 54–5; Filiu 2015, pp. 32–35).

Refusing all US aid and staking out its Cold War neutrality, the new Syrian government confirmed the Department of State's fears, with embassy cables from Damascus warning that "if the popular leftward trend in Syria continues . . . there is a real danger that Syria will fall completely under left-wing control." Unsurprisingly, given the still gestating Eisenhower doctrine, the embassy also made multiple claims that the Syrian Communist Party was actively penetrating the government and the army, even though the party had won only one seat in the general election (Nohlen et al. 2001, pp. 54–55; Blum 2014, p. 85). Without evidence, one cable stated: "If the present trend continues there is a strong possibility that a communist-dominated Syria will result, threatening the peace and stability of the area and endangering the achievement of our objectives in the Near East." On this basis it recommended that "we should give priority consideration to developing courses of action in the Near East designed to affect the situation in Syria." But even within the embassy, there was confusion, as another cable stated: "In fact the [Syrian] Communist Party does not appear to have as its immediate objective seizure of power. Rather it seeks to destroy national unity . . . and to exacerbate tension in the Arab World" (Blum 2014, pp. 85–86). British government reports were much the same, warning that "[Syria's] army is deeply engaged in politics and increasingly under the influence of the extreme left; and there's much communist penetration." Foreign Office records also reveal that the British cabinet agreed an attempt should be made to "swing Syria on the right path" (Curtis 2012, pp. 70–71; Public Records Office 1956a, c).

Keeping it in the family, the CIA's Archibald Roosevelt – a cousin of Kermit, the officer who had played a major role in the CIA's covert operation in Iran a few years earlier – took the lead after a meeting with the leader of Syria's conservative Populist Party. The memoirs of a former National Security Council official indicate that, after a discussion of what aid the USA could supply to bring them to power, money was given to the party so that it could buy off military officers, radio stations, and newspapers (Blum 2014, pp. 86–87). MI6 meanwhile arranged for a Turkish border incident to take place: serving as a distraction for the Syrian military, it was to allow British-funded Iraqi tribes to rise up and cross Syria's eastern border while Lebanese elements would come in from the west. Moreover, in the same vein as its outreach to Egypt's Brotherhood and Iran's ayatollahs, Britain also began to put into effect an Islamist "Plan B" by contacting the Syrian branch of the Muslim Brotherhood and encouraging it to stage simultaneous demonstrations in Syria's cities. The aim, it seems, was for the ensuing confusion to create a state of anarchy requiring intervention from the still pro-British Iraqi armed forces (Curtis 2012, p. 71). Worryingly, British foreign secretary Selwyn Lloyd also wrote to the new prime minister, Anthony Eden, with details of a longer-term plan. According to their correspondence, after the CIA- and MI6-sponsored coup had taken place, an effort would then be made to "attach Syria to the Iraqi state . . . in connection with the development of the fertile crescent" (Public Records Office 1956b). A date for the coup, known as "Operation Straggle," was set for late October 1956, while an aftercare plan was drawn up involving the sealing off of all Syrian border posts and with the USA immediately granting recognition to the new government (Curtis 2012, p. 71; Blum 2014, pp. 86–87).

Although the Suez Canal crisis derailed Straggle, with Eden asking for it to be aborted on the grounds that anti-Western sentiments were running too high in the region, within 3 months Damascus was back in the spotlight after it signed a technical aid agreement with the Soviet Union. According to Department of State reports, "the British [were] believed to favour active

stimulation of a change in the present regime in Syria, in an effort to assure a pro-Western orientation." By summer 1957 a new coup was thus prepared, this time with Kermit Roosevelt back at the helm. Known as the "Preferred Plan," it was again to rely on Brotherhood demonstrations along with the arming of "political factions with paramilitary capabilities." As before, violent border incidents were to be staged, but this time they were to be false flag operations so as to place the blame on the Syrian government. More drastically, Eden also authorized the assassination of a number of Syrian officials including the head of military intelligence and the chief of the general staff. Rather than relying on the Populist Party to take power, the USA and British fell back on the more tried and tested strategy of installing a strongman after the expected collapse of the government (Blum 2014, pp. 87–88; Curtis 2012, pp. 72–73). Opting for Adib Shishakli, London and Washington consciously backed the country's former military dictator who had staged an election in 1953 to install himself as president and had then banned all newspapers critical of him (Torrey 1964).

One of the CIA officers who had been involved in the earlier Iran operation was sent to Damascus, and Shishakli's former chief of security was brought to Lebanon so that he could then be smuggled across the border in a US diplomatic vehicle. The stage was set for the Preferred Plan (Blum 2014, p. 88; Curtis 2012, p. 73). Or so it seemed. In fact a number of the USA's paid informants in the Syrian military had handed over their cash payments to Syrian intelligence along with the names of the CIA agents involved. They also revealed that the USA had promised the Shishakli faction between $300 and $400 million in aid if it made peace with Israel once it had seized power. The idea of a continuing US presence had quickly become untenable. Especially bitter, the expelled US Army attaché ran his Syrian motorbike escort off the road as he reached the Lebanese border, shouting to him that the Syrian chief of intelligence "and his commie friends" would have "the shit beaten out of them by him with one hand tied behind his back if they ever crossed his path again" (Blum 2014, p. 88).

Smarting from failure and forced to gaze in from the outside, the USA's focus on Syria nonetheless remained strong, with the Syrian government repeatedly complaining of "unidentified aircraft flying over Latakia" – the Mediterranean port where most foreign ships docked. As a NATO member since 1952, Turkey also seemed willing to be drawn into the standoff, likely in an attempt to underscore its role as an Eisenhower Doctrine-enforcing state. Indeed, at one point Eisenhower himself stated that the Turks were massing on Syria's border with a "readiness to act" due to "anticipated aggression" from Syria and that "the US would undertake to expedite shipments of arms already committed to the Middle Eastern countries, and further, would replace losses as quickly as possible" (Blum 2014, p. 91).

On top of these pressure-building tactics, the US media continued its campaign to brand Syria a "Soviet satellite," even though there was little evidence to support such assertions. Certainly by 1958 this seemed wholly implausible as under the terms of Syria's merger with Egypt to form the United Arab Republic both states had declared their respective communist parties to be illegal (Blum 2014, p. 94). As a *New York Times* correspondent later described, a number of reports were nevertheless still filed, mostly describing Soviet arms and aircraft arriving in Syria, but these later proved to be false (Blum 2014, pp. 90–91). Even the Department of Defense was reluctant to buy into the ongoing CIA and Department of State Soviet-Syria narrative, with one of its reports stating that "the Soviet Union has shown no intention of direct intervention in any of the previous Middle Eastern crises, and we believe it is unlikely that they would intervene, directly, to assure the success of a leftist coup in Syria" (Blum 2014, p. 91). Furthermore, on the subject of the anti-communist Turkish antagonism, one of Eisenhower's own advisers later wrote of how the undersecretary of state "reviewed in rueful detail . . . some recent clumsy clandestine US attempts to spur Turkish forces to do some vague kind of battle against Syria" (Blum 2014, pp. 91–92; Hughes 1963, pp. 253–254).

Although a glimmer of hope came for the White House in 1961 following an army-led

coup d'état that took Syria out of the short-lived United Arab Republic (with Egypt) and restored Syrian independence, in many ways its only real function was to reverse Egyptian encroachment and end Damascus' subordinate status to Cairo. Weak and lacking popular support, the post-coup regime was soon vulnerable to an increasingly militant wing of the *Ba'ath* and its numerous sympathizers within the armed forces. After seizing power in 1963, the *Ba'ath* renamed Syria the "Syrian Arab Republic" (Oron 1965, pp. 605–607; Filiu 2015, p. 51) and sought to reaffirm its nationalist credentials, albeit outside Nasser's sphere of influence. Pro-*Ba'ath* military officers were promoted, including a prominent lieutenant colonel, Hafez al-Assad, who was made commander of the air force, while his brother Rifaat assumed control over the party's militia (Filiu 2015, pp. 58–59). As this worst-case scenario unfolded, the US and British leaders met but were only able to agree upon a vague path forward that sought the "penetration and cultivation of disruptive elements in the Syrian armed forces . . . so that Syria can be guided by the West" (Blum 2014, p. 89).

From the War on Terror to the Arab Uprisings

In the wake of the "9/11" attacks in 2001 and the subsequent US intervention in Afghanistan, the George W. Bush administration had begun to mark up additional regimes in the region that, like the Taliban, were similarly uncooperative and in command of resource-rich and strategically significant territories. Unable to establish the same sort of links between these states and the purportedly 9/11-linked Al-Qaeda, the USA moved to an effective second stage in its "War on Terror," with Bush's January 2002 State of the Union address declaring that Iraq, Iran, and North Korea were all part of an "Axis of Evil" that more broadly supported terrorism and sought to produce weapons of mass destruction (PBS 2002). Borrowing from Yossef Bodansky's "New Axis Pact" – as described in a 1992 paper prepared for the House Republican Research Committee –

Bush's target list was soon supplemented by his equally neoconservative colleagues. In May 2002 Undersecretary of State John Bolton then announced his "Beyond the Axis of Evil," adding Libya, Cuba, and Syria (by this stage presided over by Hafez al-Assad's son Bashar) as fellow travellers (Bodansky and Forrest 1992; BBC 2002).

Although the failures associated with the 2003 US invasion of Iraq effectively prevented the War on Terror from ever really reaching Bashar al-Assad's Syria or the other members of the two "evil" axes, the 2011 Arab uprisings nonetheless provided the USA and its allies with an invaluable opportunity to again try to dismantle the al-Assad regime and, in parallel, the equally problematic Libyan regime of Muammar Gaddafi. In this sense, the amorphous nature of the so-called Arab Spring was exploited for its strategic silver lining. Although the mass nationwide uprisings in Tunisia, Egypt, and Yemen had clearly knocked out key Western clients, the idea was to give ostensibly similar but evidently much smaller-scale protest movements in Libya and Syria the sort of outside helping hand they needed to become full-blown and state-threatening insurgencies.

Apart from the staunchest of anti-imperialists, few of course would dispute that by this stage the al-Assad and Gaddafi dictatorships were equally if not more venal and repressive than those of Hosni Mubarak, Zine el-Abidine Ben Ali, and Ali Abdullah Saleh. Few also would doubt that their supposed "resistance" to states like Israel was largely for show and primarily a function of their own legitimacy building. As Hamid Dabashi explains, by then both Syria and Libya, along with the Arab world's other authoritarian-socialist states and Iran-aligned powers, were mostly "united in hypocrisy" as they "offered no alternative to domination by imperialism; they are a condition of this domination" (Dabashi 2012, p. 111, 204). But the fact remained that these two regimes, sitting astride vast natural resources and in command of key ports, rivers, and borders, were still significant obstacles that had long frustrated the ambitions of Western governments and their constituent corporations to gain greater access.

With the Western publics still mindful of the disastrous Afghanistan and Iraq campaigns and with the stakes too high for Washington, London, or Tel Aviv to get caught directly supporting opposition movements in Libya and especially Syria (which was not only allied to Iran but had also long been home to a Russian naval facility), the solution appears to have been to use Arab proxy powers. In this sense, the same pro-Western states in the region that had survived the Arab uprisings and were already sponsoring counter-revolutionary activity in Egypt and Tunisia soon took on the concurrent role of funding and weaponizing a more violent and Western-sponsored version of the "Arab Spring." With Saudi Arabia, the UAE, and Qatar duly working together but separately against the Syrian and Libyan governments despite their differences elsewhere on the regional chessboard, a sort of "alliance of rivals" had formed where, as per state cartel theory, the benefits of cooperation were clearly deemed to outweigh the costs (Hobson 1902, p. 301). Sometimes referred to as the "Axis of Moderation," derived from a speech delivered by Tony Blair to the World Affairs Council in 2006 in which he called for an "alliance of moderation" in the Middle East to counter the "arc of extremism," and clearly modelled on Condoleezza Rice's 2007 definition of "centers of moderation" that could fight those "on the other side of that divide . . . that have made their choice to destabilize," these three proxies, along with Kuwait, Jordan, and others, were ready to take on the "Axis of Resistance" (BBC 2006; New Yorker 2007).

The War for Syria

Although as 2011 progressed and Bashar al-Assad soon outlasted Muammar Gaddafi, his long-term survival prospects seemed little better. Despite much fragmentation and a growing jihadist menace, what Syrian blogger Shadia Safwan describes as a "domestic nucleus of opposition" was nonetheless forming (Safwan 2012, p. 121). Even if most of the Syrian population remained loyal to the government, as also initially seemed to be the case in Libya, it became increasingly apparent that

such a nucleus was to serve as the conduit for external support and perhaps even a full-scale intervention. Certainly, with a number of so-called "moderate" opposition groups coalescing into a "Free Syrian Army," their new shadow government – known as the Syrian National Council – seemed well placed to assume the same sort of pro-Western role as the Libyan National Transitional Council had eventually done. Sensing victory, even the Syrian Muslim Brotherhood's several fighting brigades – by then known as the Commission of the Shields of the Revolution – had quickly subordinated themselves to the bigger Western-backed FSA despite many of their preachers continuing to call the USA the "world's leader in terrorism" (Lefevre 2015, pp. 56–57).

With al-Assad's family and many of his key military and security commanders being Alawite, a minority Shia sect which accounted for about 12% of the Syrian population in 2011, it seemed that the quickest way for the Western powers and their regional allies to boost the prospects of both the FSA and the Brotherhood was by adding a stronger sectarian edge to the conflict. In this sense, regardless of the nonsectarian slogans of the original protests in Daraa, Hama, Homs, and elsewhere, it was reasoned that if the regime could be portrayed as a cadre of Shia overlords, then it could more easily be overwhelmed by a full-scale nationwide revolution led by a Syrian Sunni majority. Leading the charge were prominent preachers in the Gulf monarchies, some of whom had online followings in their millions. Kuwait's Nabil al-Audi, Saudi Arabia's Mohamad al-Arefe, and the Saudi-based Syrian cleric Adnan al-Aroor all jumped on the bandwagon by repeatedly describing the Syrian uprising as a jihad against the "polytheist" Alawite regime and, more broadly, as part of an international Sunni struggle against Shia oppression (European Parliament 2013, p. 14; Brownlee et al. 2015, p. 91). Although most US officials were naturally too cautious to offer their opinions, a number of key opinion-makers nonetheless seemed firmly on board. As one of the most influential supporters of the US invasion of Iraq in 2003, Stanford University's Fouad Ajami perhaps unsurprisingly chose to rationalize the Syrian conflict as a "revolt

that fused a sense of economic disinheritance and the wrath of a Sunni majority determined to rid itself of the rule of a godless lot" (Ajami 2012). Similarly, as early as August 2011, the University of Vermont's Gregory Gause had already described "the sectarian element of the Syrian confrontation, with an ostensibly secular and Alawite Shia-dominated regime brutally suppressing the Sunni Muslim majority" (Gause 2011).

Although European government briefings noted how such efforts to sectarianize the conflict were fuelling the image of a "regional Shia conspiracy," the problematic reality in Syria was quite a bit different, helping us understand why the Sunni masses did not immediately shift their allegiances away from the regime to the rebels. As one rebel fighter wistfully told the *New York Times*: "Before the revolution, we never had this feeling toward any sect" (European Parliament 2013, p. 14; New York Times 2016). In Ziauddin Sardar's words, for all its faults, the al-Assad regime was "a bit more inclusive, sharing power between Sunni, Christian, Druze, and Alawite elites." As he has since reflected, this is "perhaps why [Bashar] still has support from members of all communities" (Sardar 2012, p. 7). As others have pointed out, not only is Bashar's wife's family Sunni but so too have been many high-ranking officials in the Syrian government including Walid Muallem who, as foreign minister, is arguably the second most public face of the regime (USA Today 2013; Weiss and Hassan 2015, p. 91). Leading Sunni clerics also remained loyal to the regime, although as Edinburgh University's Thomas Pierret has astutely demonstrated, this was mostly a result of the government having earlier co-opted much of the religious establishment into the political fold (Pierret 2013; European Parliament 2013, p. 11).

Likely hoping US or NATO air strikes could be avoided, not least given Syria's complicating alliances with Iran and Russia, the Western governments sought at first to keep their support for the opposition as discreet and as limited as possible. While some have accused the Western embassies of having stirred up the original uprisings, there is little hard evidence to support this view, although there is no doubt they had made early expressions

of solidarity. In July 2011, for example, the US and French ambassadors had visited the opposition stronghold in Hama which led to a strong condemnation from the Syrian government. According to the interior minister, "Ambassador Ford's visit to the restive central city of Hama was proof that Washington was inciting unrest." He also claimed that "Mr Ford met with saboteurs and incited them to violence, protest, and rejection of dialogue." Defending the episode, US officials have explained that Ford and his French counterpart, Eric Chevallier, had indeed travelled to Hama to meet with demonstrators but had left shortly before the protests began. They claimed that when the two men entered the city "their car was immediately surrounded by friendly protesters who were putting flowers on the windshields, they were putting olive branches on the car, they were chanting down with the regime" (BBC 2011).

But by 2012, with the Syrian uprising still not having evolved into a fully national revolution or even a sectarian civil war, there was a growing realization that much more direct support was required. At the very least, the opposition needed to get more weapons and funding so they could keep fighting, and ideally they needed sufficiently sophisticated battlefield equipment so that they could enjoy a qualitative advantage over the much larger Syrian government forces. According to Seymour Hersh, a CIA- and MI6-sponsored "ratline" for weapons duly began, with arms that had originally been sent to Libyan rebels, mostly supplied by Qatar and the UAE, then being re-exported to the Syrian conflict. As he explains, Australian front companies earlier set up in post-Gaddafi Libya took care of the logistics, while the CIA's inclusion of MI6 as its partner was designed to enable the agency to classify the operation as a "liaison activity" and thus allowed it to circumvent the layers of congressional oversight that had been installed in the wake of the Nicaragua campaign (London Review of Books 2014). As later reports in the *Washington Post* and *IHS Janes* indicate, by 2013 this had evolved into a more comprehensive CIA operation, while in parallel the White House announced a more public $500 million program to train and equip "the right

militants" and the "moderate rebels," a process which apparently involved some sort of screening for extremist views and then the transfer of heavy weapons including US-manufactured anti-tank missiles (Washington Post 2014; Huffington Post 2014; IHS Janes 2014).

The Proxy War Unfolds

In an almost carbon copy of the leading role they had undertaken in Libya, the Gulf monarchies were strongly encouraged to enmesh themselves in the politics and financing of the Syrian opposition. As far as these and other nearby Western proxies were concerned, there seemed little downside to having Bashar al-Assad ousted. Moreover, having witnessed the speed and success of NATO's intervention in Libya, it is likely that even if no promises had been made by Washington, the Gulf rulers nevertheless expected a similar intervention, at least in the form of a no-fly zone. In this scenario, they could be confident that the conflict would be wrapped up within a few months, thus giving Iran and Syria's other allies such as *Hezbollah* as little opportunity as possible to mount a counter-attack.

As they had in Libya with the National Transitional Council, the Gulf monarchies began by using the Arab League as a vehicle to endorse the Syrian National Council and expel the Syrian government. Under Qatari chairmanship the organization had already agreed to do this in November 2011, albeit with Lebanon and Yemen voting no, Iraq abstaining, and Algeria raising serious objections on the basis it would complicate future peaceful solutions. In parallel, the Arab League was also used to lobby the UN Security Council to do the same, but with only limited results given the vetoes of both Russia and China. More successful were Saudi Arabia's efforts to use its UN Human Rights Council membership, which the British government had helped it to secure, to call for "concrete, immediate, and comprehensive reforms" to address the "deplorable situation of human rights" in Syria (Atwan 2015, p. 96; Mann 2012; Ulrichsen 2014, p. 135; Independent 2015b).

Writing soon after the Arab League decision, Columbia University's Joseph Massad made it clear that the "League and imperial powers have taken over the Syrian uprising in order to remove the Al-Assad regime" (Al-Jazeera 2011). Taking a similar position, so it seemed, was the UN and Arab League's joint peace envoy who chose to drop his Arab League affiliation on the basis that it was "backing the opposition at all costs" and preventing key powers such as Iran from participating in negotiations. Nonetheless, by the beginning of 2013, the Arab League had begun inviting the head of the SNC to sit as Syria's representative under the Syrian flag in its meetings, while it succeeded in freezing Syria's assets in most of its member states and blocking further Arab investment in Syria (Atwan 2015, pp. 96–97; Ulrichsen 2014, p. 134). Co-founded by a grandson of the previously described former military dictator who had been backed by the CIA and MI6 in their attempt to overthrow the Syrian government in 1957, the SNC was by this stage running a de facto shadow government from bases in Qatar, the United Arab Emirates, and Turkey (Times of Israel 2013).

On a state-to-state level, the Doha regime certainly began to assume one of the biggest roles, much as it had in Libya. Suspending all diplomatic relations and trade agreements with Damascus and thus abruptly reversing the once burgeoning relationship between the al-Thani and al-Assad dynasties, Qatar and Al-Jazeera soon sought to portray the Syrian uprising as yet another instance of the Arab Spring, just as it had done with the Benghazi protests. Described by al-Assad loyalists as broadcasting "exaggerated and dishonest coverage," Al-Jazeera's intensive coverage of Syria was, as Marc Lynch notes, seen by many as an "energetic media campaign organized outside Syria . . . largely divorced from realities on the ground" (Lynch 2012, p. 181).

More importantly there is compelling evidence that the US CENTCOM-hosting Qatar also became the principal NATO link to the conflict, being best placed to provide substantial levels of funds and weapons to the Syrian rebels far beyond the cautious and modest assistance provided by the CIA and MI6. As with its similar job in Libya,

however, this was initially obscured by attempts to frame Qatar's intervention as an opportunity for Doha to take a stand against "tyrannical rule." Sultan Barakat of the Brookings Doha Center, for example, described it as something of a natural shift to a more interventionist foreign policy due to the opportunities of the Arab Spring, while the *Economist* explained Qatar's actions as part of its "pursuing an aggressively non-aligned foreign policy" (Barakat 2012, p. 36; Economist 2013). Others have even tried to present Qatar's intervention as part of "stepping up to play a role" in the context of Mubarak's demise and "[the] US having lost in a way its central diplomatic partner in the [Arab] world" (NPR 2013).

Much closer to the truth, however, was the investigative reporter Elizabeth Dickinson who wrote in an extensive *Foreign Policy* essay in 2014 that "[Qatar] had such freedom to run its network for the last three years because Washington was looking the other way." Putting it more precisely, she also stated that "in fact, in 2011, the US gave Doha de facto free rein to do what it wasn't willing to do in the Middle East: intervene" (Dickinson 2014). In an article for the BBC, King's College London's David Roberts, who had previously been based in Doha, similarly concluded that "there is no chance that Qatar is doing this alone: the US and Britain governments will certainly be involved in or at least apprised of Qatar's plans" (BBC 2015).

Getting money to the rebels was relatively straightforward, with Qatar having set up a number of funding channels for the Syrian National Council and in some cases directly to the Free Syrian Army. In early 2012, for example, it was reported that the Qatar-backed Libyan National Transitional Council had recycled $100 million to "anti-al-Assad officials" in Syria, ostensibly as Libyan humanitarian aid for Syria. With further donations made, some directly from Qatar, the SNC promised that they would reduce any confusion by serving as the "link between those who want to help and the revolutionaries." Qatar's prime minister gave his public blessing to such assistance on the grounds that the Syrians are "right to defend themselves . . . I think we should help these people by all means" (Guardian 2012).

In late 2012 he further justified his country's support on the basis that Syria was no longer just in a state of civil war but that the government had begun to carry out genocide (Agence France-Presse 2012).

Naturally, as was the case with its Libya strategy, Qatar was not only backing the formal opposition but was also making sure funds reached the more extremist groups, including even Al-Qaeda's *Jabhat al-Nusra* franchise. As brazen as Qatari officials had been about contravening the UN resolution on Libya, by admitting the deployment of their special forces on the ground, so too were they quite open about the sort of groups they were willing to finance in Syria. Speaking at a conference in late 2012, Qatar's deputy foreign minister explained to the audience that "I am very much against excluding anyone at this stage, or bracketing them as terrorists, or bracketing them as Al-Qaeda given Qatar's perceived necessity of removing al-Assad at all costs" (Dickinson 2014). Indeed, in a 2012 interview with a German correspondent, one *Al-Nusra* member stated bluntly that his organization's evocative name was "a great name . . . we get money from the Gulf with it" (Weiss and Hassan 2015, p. 100).

Designated a terror fundraiser by the US Department of the Treasury, an Iraqi cleric had already appeared on Al-Jazeera praying at the opening ceremony of Qatar's state mosque and standing only a few feet away from the Qatari crown prince (New York Times 2014). Similarly, Qatar's ministry for Islamic affairs was understood to have invited a Kuwaiti cleric known for his running of a Syrian opposition support network. Allowed to preach in a Qatari mosque, he argued that mere humanitarian assistance to Syria was insufficient and declared that "the priority is the support for the jihadists and arming them" or, as the *New York Times* reported him saying, "give your money to the ones who will spend it on jihad, not aid" (New York Times 2014; Dickinson 2014). After he had returned to Kuwait, collections were raised on his behalf by an individual whose Twitter biography described himself as "loving Sunni jihadists who hate Shia and infidels" and whose Twitter timeline was "flush with praise for Osama bin Laden." When particularly

S

big donations were received, they tweeted them, including pictures of expensive Qatar-bought jewelry. One Al-Qaeda-linked brigade even released a video in which the Kuwaiti cleric personally appeared to thank "the kind people of Qatar, O people of the Gulf, your money has arrived" (Dickinson 2014).

Some Syrian rebels were also reported to have "[deliberately] grown the long, scraggly beards favoured by hardline salafist Muslims after hearing that Qatar was more inclined to give weapons to Islamists," while others were understood to be using the money to "buy weapons in large quantities and then burying them in caches, to be used after the collapse of the al-Assad government" (New York Times 2012a). The *New York Times* also claimed that members of the Qatari funding and tweeting circle had appeared on Al-Jazeera and had received favorable coverage, while perhaps even more remarkably, others reported that *Al-Nusra*'s leaders had begun to visit Doha in person and, according to both US officials and those of other Arab governments, had held meetings with senior Qatari officials and key financiers (New York Times 2014; Wall Street Journal 2015b; Independent 2015a).

As far as the USA was concerned, there only seemed to be one limit on what Qatar could help supply. Likely fearful of civilian aircraft being brought down, a request was reportedly made that no heat-seeking shoulder-mounted antiaircraft missiles be delivered to Syrian rebels. But by 2013 even this seemed to have been ignored, with US intelligence officials claiming to have knowledge of "Qatar's shadowy arms network," stating to the *New York Times* that at least two batches of such missiles had been sent to Syria since the beginning of the year, one being Chinese-manufactured and the other Eastern European and previously part of Libya's arsenal. A few months later, some of the videos produced by rebel units, including known extremist groups, rather embarrassingly featured such missiles – none of which were known to have been part of the Syrian government's inventory nor to have appeared in the Syrian conflict before (New York Times 2013c).

According to data supplied by the Stockholm International Peace Research Institute, over the course of late 2012 and the first half of 2013, approximately 160 military cargo flights arrived in Turkey and Jordan laden with a total of 3,500 t of weapons and equipment destined for Syria. As the SIPRI has stated, by far the largest number of flights, 85, originated from Qatar (New York Times 2013a). Helping explain this, US officials later confirmed that the CIA had been involved in a "consultative role" and that Qatar's activeness in the "global gray market for arms" had been greatly enhanced by its acquisition of C-17 military transport planes from Boeing. These aircraft, described as "capable of intercontinental flight and landing on short, poorly equipped runways," were understood to be being used for both military and humanitarian missions and had been delivered to Qatar in 2009, making it the only Middle Eastern state at the time in possession of durable long-range aircraft (New York Times 2013b, c; Agence France-Presse 2008).

Going through the motions, as they had done with Qatar's well-known equipping of Libyan militias, a batch of US officials had tried to place some distance between the two countries, stating that the "US had growing concerns that, just as in Libya, the Qataris are equipping some of the wrong militants" (New York Times 2012b). Other officials told the media that "the [Syrian] opposition groups that are receiving most of the lethal aid are exactly the ones we don't want to have it" and claimed that the weaponizing of the Syrian opposition was an operation that was "going awry." Complaining to the *New York Times*, they explained that "hardline Islamists have received the lion's share of the arms shipped to the Syrian opposition through the shadowy pipeline with roots in Qatar, and, to a lesser degree, Saudi Arabia" (New York Times 2012a). More realistically, however, a few months later, a White House official explained that "Syria is [Qatar's] backyard, and they have their own interests they are pursuing" (New York Times 2013c).

Less is known about the extent of arms flowing into Syria from the other Gulf monarchies during this period; however, the SIPRI's data from late 2012 and early 2013 indicates that 37 of the incoming military cargo flights originated from various parts of Saudi Arabia (New York Times

2013a). Jordanian officials also claimed to have seized several shipments of arms destined for Syria that had come from Riyadh, indicating a land route had also been established of which they did not entirely approve (Atwan 2015, p. 102). Raising funds for such equipment seemed to be no problem, with reports circulating of numerous Saudi clerics soliciting donations. In one case, a Syria-based Saudi preacher who was known to be close to Al-Qaeda was discovered to be running a campaign called "Wage jihad with your money." As part of this, donors could earn "silver status" by giving $175 for sniper bullets or "gold status" for giving $350 to help purchase mortar rounds (New York Times 2013d). In another case a Saudi citizen known as Sanafi al-Nasr was reportedly killed in northwestern Syria after having served as an Al-Qaeda recruiter and having "moved funds from the Gulf into Iraq and then to Al-Qaeda leaders in Syria" (Reuters 2015b).

According to a *Wall Street Journal* investigation, the bulk of Syria-destined Saudi weapons seemed to have been procured from third-party countries. Their correspondents explained that, in line with the CIA's long-held preference for false flag signaling, "in September and October [2012], the Saudis approached Croatia to procure more Soviet-era weapons. The Saudis got started distributing these in December and soon saw momentum shift toward the rebels in some areas." Again, as with attempts to establish some distance from Qatar so as to insulate themselves from any possible fallout from such risky moves, US officials were cited as cautioning that "this has the potential to go badly wrong . . . [because of] the risk that weapons will end up in the hands of violent anti-Western Islamists." It was also claimed that "not everyone in the Obama administration is comfortable with the new US partnership with the Saudis on Syria," with some officials apparently balking at the role being played by Saudi intelligence chief Bandar bin Sultan al-Saud. Notably, there was a "fear [Syria] carries the same risk of spinning out of control as an earlier project in which [Saudi Arabia] was involved – the 1980s CIA programme of secretly financing the contras in Nicaragua against a leftist government" (Wall Street Journal 2013).

On top of its clerics visiting Qatar, there are also strong indications that Kuwait itself was serving as a logistical and financing hub for Syrian opposition groups, including extremist organizations. Described in one particularly detailed report as the rebels' "back office" and as one of the main "back channels" for private weapons transfers (Ulrichsen 2014, pp. 138–139; National 2013), the emirate's reputation was not helped when a Kuwaiti preacher openly bragged on a Saudi-owned television station in 2013 of having personally bought up weapons from the "Western-backed councils" in Syria. As he put it, "when the military councils sell the weapons they receive, guess who buys them? It's me." Later identified by US officials as a leading supporter of *Al-Nusra*, he also usefully confirmed on television that "all the Gulf intelligence agencies are competing in Syria and everyone is trying to get the lion's share of the Syrian revolution" (New York Times 2014).

Much of the Kuwaiti funding for such individuals and their networks seems to have come from a mix of informal mosque collections and those held in family-owned *diwan* meeting houses. In 2013, for example, the *New York Times* described how one such Kuwaiti effort raised enough to pay 12,000 rebel fighters $2,500 each. When interviewed about this, one former Kuwaiti soldier reasoned that "now we want to get Bashar out of Syria, so why not cooperate with Al-Qaeda?" (New York Times 2013d). According to Elizabeth Dickinson, social media also played a prominent role in "touting their cause." As she explains, in this way "a deep Rolodex of Kuwaiti business contacts, clerics, and other prominent Kuwaiti Sunnis raised hundreds of millions of dollars for their clients" (Dickinson 2014). As a briefing prepared for the European Parliament alleged, one such preacher was able to raise so much money in this manner that an entire Syrian brigade named itself after him – the *Katibat al-Sheikh Hajaj al-Ajami* (European Parliament 2013, p. 14).

With al-Assad still very much in place by the end of 2013, the Western powers and their regional proxies effectively revamped their strategy of strengthening the rebels on the ground. With Damascus' Iranian allies now clearly playing a pivotal role on the battlefield and with

S

Hezbollah leader Hassan Nasrallah having already declared of Syria that "This battle is ours . . . and I promise you victory" (BBC 2013), the US' fallback option seemed to be a massive and urgent increase in its backing for those opposition groups it still felt were publicly supportable, alongside turning an even blinder eye to the type of Syrian rebels that the Gulf monarchies were continuing to support.

Greatly reinvigorated and expanded, the USA's program of supplying the "right militants" spawned a string of statements over the course of 2014 promising further weapons. In February 2015 the USA announced that teams of such rebels would be brought across to Jordan and Turkey for training and would then be supplied with Toyota Hi-Lux trucks. The Toyotas were to be "outfitted with a machine gun, communications gear and global positioning system trackers enabling them to call in airstrikes. . . along with mortars" (Wall Street Journal 2015a). In October 2015, just days after Russia began to conduct air strikes on behalf of the Syrian government, US officials informed the media that they had begun to make "air drops of small arms ammunition" to unspecified Syrian rebels in northern Syria. They explained this was part of their "revamped strategy" (Reuters 2015a; Al-Jazeera 2015a).

As well as the US-supported units often turning on each other, including the worryingly named "Knights of Righteousness" eventually fighting the "Syrian Democratic Forces," a more serious problem for the USA's renewed efforts was that most of the fighters the CIA had chosen to back had already suffered numerous defeats, with many having had their weapons seized by *Al-Nusra* or other such groups (Washington Post 2014; IHS Janes 2014; Los Angeles Times 2016). According to one Arab intelligence officer, "[extremist organizations] say they are always pleased when sophisticated weapons are sent to anti-al-Assad groups of any kind, because they can always get the arms off them by threats of force or cash payments" (Cockburn 2015, p. 3). Similarly, as per the USA's own intelligence assessments from late 2014, funding from the USA and its allies that was flowing to anti-regime rebels was still "consistently ending up in the

hands of the most virulent extremists" (Middle East Eye 2015). As a former Defense Intelligence Agency official described, once US-backed fighters crossed back over the border into Syria, "you lose a substantial amount of control or ability to control their actions" (Los Angeles Times 2016).

An even bigger issue for the USA, however, was whether its favored "moderates" were ever really moderate to begin with. Department of Defense officials had reportedly been aware for some time that the "vast majority of moderate Free Syrian Army rebels were in fact, Islamist militants" (Middle East Eye 2015). Also critical of the FSA's credentials was Britain's former ambassador to Syria, who stated bluntly in television interviews that the "so-called FSA is just a footnote . . . let's be clear here, we're talking about jihadists, most of the opposition groups are jihadists" (Sky News 2015). Similarly, as a former director of French intelligence warned, either the intelligence services had been "given bad information or it was [the government's] policies that, despite the information, wanted to go in a direction that was not the reality." In particular he worried that "we will be manipulated into helping people, supposedly rebellious, whereas in reality they have been pushed by Al-Qaeda. . ." (Paris Match 2016). Pointing out that well-known FSA commanders had already publicly defected to the Islamic State or "other, more militarily successful extremist groups," Abdel Bari Atwan was equally suspicious (Atwan 2015, p. 104; Al-Jazeera 2013b). Published in summer 2013, a report prepared for the European Parliament stated that *Al-Nusra*'s fighters had "operated many times alongside FSA formations on the battlefield earning public praise from prominent rebel leaders." It also described how "many salafists are believed to fight within FSA units but these rebel formations portray the uprising as a national struggle against an oppressive dictatorship rather than as a Sunni jihad against an Alawite regime" (European Parliament 2013, pp. 16–17). An International Crisis Group report from 2012 made much the same suggestion, arguing that "mainstream rebel groups eager for more effective weapons and tactics likely find that benefits of such collaboration

[with extremist groups] outweigh any long-term political and ideological concerns" (International Crisis Group 2012).

Others also questioned the FSA's ability to police criminality within its own ranks. Writing for *Middle East Policy*, counter-terrorism specialist Ahmad Hashim noted how the "undisciplined and brutal behaviour of the FSA" stood in contrast to the much more disciplined *Al-Nusra*, which often set up efficient food and medicine distribution systems in areas under its control (Hashim 2014, p. 7). Similarly a British journalist familiar with the region accused the FSA of engaging in looting and banditry (Cockburn 2015, p. 85), while Arabic media correspondents reported that former peasants had been enriching themselves through the FSA, allowing them to buy "huge new homes and expensive cars" (Atwan 2015, p. 105). Giving more detail, an extensive *Daily Telegraph* report featured interviewees in Syria describing how FSA commanders had been focused on profiteering, gun-running, and the extracting of tolls from road checkpoints. One interviewee even described how the FSA was taking bribes from the Syrian regime to allow government forces to get supplies to besieged units. The report concluded that in northern Syria at least the FSA "has now become a largely criminal enterprise" (Daily Telegraph 2013). Disturbingly, in 2015 *NBC News* even had to revise its official account of the brief 2012 kidnapping of its chief foreign correspondent Richard Engel (NBC 2015). Having originally stated that Engel was captured by the pro-regime and predominantly Alawite *Shabiha* or "Ghosts" militia before then being rescued by "Sunni rebels," *NBC News'* position dramatically changed following an investigation by the *New York Times*. Having interviewed *NBC News* employees and Syrian activists, it was suggested that "Mr Engel's team was almost certainly taken by a Sunni criminal element affiliated with the FSA, the loose alliance of rebels opposed to Mr Assad." The *New York Times'* correspondents concluded that Engel was likely misled by his captors in order to discredit the Syrian government (New York Times 2015).

To make matters worse, there was considerable evidence that known extremist groups in Syria were actively trying to sanitize their images and present themselves alongside the FSA as suitable candidates for US support. In journalist Patrick Cockburn's assessment of such groups, and especially those close to Damascus, those that had earlier given themselves "Islamic-sounding names to attract Saudi and Gulf financing" had by this stage "opportunistically switched to more secular-sounding titles in a bid to attract US support" (Cockburn 2015, p. 26). According to a European Parliament report, one such organization based close to the Lebanese border had changed its name to the "Rafic Hariri Brigade" in reference to the pro-Western former Lebanese prime minister (European Parliament 2013, p. 13). Moreover, the Yarmouk Brigade and other such groups, which ended up becoming part of the US- and Saudi-sponsored "Southern Front" based out of Jordan and eligible to receive advanced weaponry such as antiaircraft missiles, had frequently been spotted fighting alongside *Al-Nusra* (Cockburn 2015, p. 53). In 2013 the Yarmouk Brigade was also understood to have repeatedly detained UN peacekeepers in the Golan Heights, and in late 2014 a Lebanese newspaper accused it of having already secretly pledged allegiance to the Islamic State (Atwan 2015, p. 109; Al-Jazeera 2013a; As-Safir 2014).

The "Syrian Islamic Liberation Front" seems to have tried to follow the same sort of path, having recognized the FSA and fought with it but then disbanding within a year after many of its ultra-conservative members had joined *Al-Nusra* or the Islamic State (Atwan 2015, p. 107). Moreover, in a widely read January 2014 *Foreign Affairs* article a group called *Harakat Ahrar al-Sham al-Islamiyya* or "The Islamic movement of the free men of the Levant" was openly described as "an Al-Qaeda-linked group worth befriending," with the three US thinktank authors trying to place it temporarily within the US-friendly camp. But although it had cooperated with the FSA in military actions, others have noted how many of its fighters later moved over to the Islamic State and that it was still very much an Al-Qaeda-style organization, having been co-founded by Abu Khalid al-Suri. Indeed, US federal prosecutors have since described it as

"frequently fighting alongside *Jabhat Al-Nusra*" and as having the goal of "installing an Islamic state in Syria." Nonetheless, as recently as July 2015, *Ahrar al-Sham's* spokesman wrote on the *Washington Post*'s website that it still favored "a moderate future for Syria that preserves the state and institutes reforms that benefit all Syrians," while a few months later Qatar's foreign minister claimed in an Al-Jazeera interview that it was not an extremist organization but rather "a Syrian group [looking] for their liberation, and they are working with other moderate groups" (Doran et al. 2014; Atwan 2015, p. 107; Washington Post 2015; Al-Jazeera 2015b; Daily Telegraph 2016).

The most remarkable attempt at a volte-face has, however, been the Saudi-backed *Jaysh al-Islam* or "Army of Islam" – an umbrella for dozens of rebel groups created in late 2013 (Guardian 2013). Giving an interview on its behalf in May 2015, former *Liwa al-Islam* leader Zahran Alloush tried to backtrack completely on his earlier sectarian and anti-democratic statements. As the University of Oklahoma's Joshua Landis observes, this was evidence of Alloush's increasing savviness as "every major player wants to be acceptable to the West and to the international community" (McClatchy 2015). Not all, however, were convinced, as a few months later the Jordan government reaffirmed its designation of the group as a terrorist organization, while *Al-Hayat* newspaper reported that *Jaysh al-Islam*'s fighters in Ghouta were putting Alawite civilians in iron cages and using them as "human shields" (Al-Monitor 2015; Al-Hayat 2015). Since then Russia has attempted to add *Jaysh al-Islam* along with *Ahrar al-Sham* to the UN terror sanctions blacklist, but its efforts have been blocked by the USA, Britain, France, and the Ukraine, with a US spokesman stating that "now is not the time to shift course, but rather double-down on our efforts towards a reduction in violence" and with an anonymous diplomat stating that such a designation would "provide a pretext for yet more moderate groups to come under target" (Agence France-Presse 2016).

More information is slowly coming to light about Britain's support for such Syrian rebels, as it seems to have followed the same trajectory as

the USA, with the definition of "moderate" being stretched extremely widely. Following an investigation by the *Guardian*, it transpired that since 2013 the Foreign Office and the Ministry of Defense had been hiring contractors to "produce videos, photos, military reports, radio broadcasts, print products, and social media posts branded with the logos of fighting groups." According to the investigators, which had seen government contracting documents, Britain was "effectively running a press office for opposition fighters" and that the materials it circulated online were "posted with no indication of British government involvement." The campaign appears to have been funded by the "Conflict and Stability Fund" and to have been based out of Istanbul under the guise of delivering "strategic communications and media operations support to the Syrian moderate armed opposition." Worryingly, the contracts seen by the *Guardian* included references to *Jaysh al-Islam* and a group called *Harakat Hazm* or "Steadfast Movement" which had collapsed in March 2015 with most of its weapons being seized by *Jabhat al-Nusra* (Guardian 2016; Al-Akhbar 2014).

Further light has been cast on British involvement by the circumstances surrounding the collapse of the London trial of a Swedish citizen accused of attending terrorist training camps, receiving weapons, and working with "a group considered to be Al-Qaeda in Syria." With the evidence supplied to the court having reportedly made clear that "Britain's security and intelligence agencies would have been deeply embarrassed if the trial had gone ahead," the suspect's lawyer had stated: "If it is the case that [the British] government was actively involved in supporting armed resistance to the al-Assad regime at a time when the defendant was present in Syria and himself participating in such resistance, it would be unconscionable to allow the prosecution to continue." Another lawyer involved in the case agreed, arguing: "Given that there is a reasonable basis for believing that the British were themselves involved in the supply of arms, if that's so, it would be an utter hypocrisy to prosecute someone who has been involved in the armed resistance" (Guardian 2015).

Syria's Political Economy and Imperialism

Linda Matar
College of Alice and Peter Tan, National
University of Singapore, Singapore, Singapore

Introduction

In 2019, the military imperialist assault on Syria has entered its eighth year. As the political rift widens between the global powers – Sino-Russian versus American – the war ravages Syria's infrastructure, physical assets, people, and cultural heritage. The Syrian uprising began in 2011 calling for civil rights. It has led to territorial disintegration, imperialist blockade, immense losses in life and assets, large population displacements, and the weakening of state autonomy. It is inevitable for internal strife in a geostrategic country like Syria to metastasize into international conflict. As the social unrest unfolded, regional and international players intervened in Syria, following their own political calculations. This is

evidenced by the US and Western backing of the Syrian opposition from the start, along with Qatar's early arming of rebel groups and Turkey's and Saudi Arabia's sponsorship of trans-state movement of non-Syrian militants into Syria. The Gulf countries armed and financed the opposition insurgency. Turkey also organized anti-government forces and provided safe havens through which foreign fighters transported. Salafist-jihadist groups, such as Jabhat al-Nusra (now known as Hayat Tahrir Al-Sham (HTS)) and Ahrar al-Sham, and ISIS played a prominent role in escalating the insurgency of the Syrian conflict (Phillips 2016). On the side of the government, Iran and Hizbullah forces provided backing early on. Since 2015, Russian military support has enabled the Syrian government to conquer much of the rebel strongholds. Moreover, China's global economic rise and support for the national integrity of Syria are the power behind the sustainability of the Russian and Syrian ground and air forces.

Foreign intervention have complicated the overall geopolitical picture and blocked attempts to resolve the crisis diplomatically. At the time of writing, the Syrian government controls nearly three quarters of the country. Various jihadist extremist groups, such as Hayat Tahrir Al-Sham (HTS), National Liberation Front (a Turkish-backed rebel alliance), Hurras al-Din (Guardians of Religion, which is a pro-al-Qaeda HTS splinter group), and Turkistan Islamic Party (TIP) (Chinese Uighur-dominated jihadist group) are now concentrated in the Idlib province in Syria's northwest (BBC 2019). The American-supported Kurdish armed forces are in control of Syria's northeast. The Kurdish minority took advantage of state's loss of territorial control to further its imperialist-backed plans of re-designing borders. It gave rise to a political movement, known as PYD, that sought to some extent federalization and self-governance as compared to the Kurdish Regional Government in Iraq (Hinnebusch 2019).

Imperialism is reattempting a re-division of the region, in a similar fashion to the Sykes-Picot treaty. To be sure, that splintering of the people of the region into colonially divided states has weakened the peoples' control over their fates

and resources. It has facilitated the ethnic cleansing and colonial settlement of historical Palestine. The splintering of the region remains a tinderbox of wars and a big boost for the industry of oil and militarism.

This entry reviews the history of imperialist intervention in Syria. It is structured into three parts. Section "Syria's Historical Struggle for Autonomy" covers post-independence Syria and its struggle to build autonomy amidst post-independence political instability. Section "The Neoliberal Ride" covers the al-Asad rule – father and son – and the subtle deconstructive mechanisms of imperialism that weakened society's institutional safeguards and debilitated the social bases of support. Section "The Current Conflict" tackles the current imperialist intervention, mainly evident through the internationalization of the conflict and the Western siege imposed on Syria. The central thread running through the entry is that Syria has been continuously subjected to imperialist assault in the form of international blockade, sanctions, neoliberal policies, and proxy war, all aimed at undermining Syria's autonomy and national integrity.

Syria's Historical Struggle for Autonomy

Like neighboring Arab states, the Syrian state came into being following the collapse of the Ottoman Empire at the end of WWI and subsequent British and French colonization of the empire's territories in the early twentieth century. The Sykes-Picot treaty was one form of Western meddling that sketched the contours of Syria's and other Middle Eastern nation states, creating unfavorable conditions for subsequent state formation which remained in place after Syria's independence (Hinnebusch 2019). It split Lebanon, Palestine, and Jordan from Syria. The state of Syria, as it is known today, is therefore considered a "residual state" of whatever was left of the previous "natural Syria" (Salama 1987). It was not only then that Syria was subjected to foreign intervention and manipulation. As this entry demonstrates, Syria has since struggled to ensure for itself a

modicum of autonomy. Starting with imperialistically designed treaties and conventions and moving to the armed conflicts and Arab defeat of Israel in the 1967 and 1973 wars, these events represent a fraction of Syria's embattled post-independence history. US labeling of Syria as a supporter of terrorism since the 1980s, followed by US sanctions between 2003 and 2006, and the longstanding US blockade that prohibited Syria's accession into the WTO, all make crystal-clear that imperial powers have spared no effort to undermine Syria's sovereignty (Kadri 2016). For instance, the US Congress passed the Syria Accountability Act in late 2003. It is one of US sanctions levied against Syria, aimed to punish it for its alleged support of international terrorism. The Act prohibits US aid to and investment in Syria and restricts bilateral trade between the two countries so as to pressure Syria to end its relations with Iran, Hizbullah, and Hamas. In 2006, sanctions were imposed in light of the consequences connected to the assassination of Lebanese Prime Minister Rafik Hariri.

Furthermore, imperialist meddling has penetrated Syria through the international financial institutions' propagation of the hegemonic ideology, which influenced Syria's comprador class, leading them to further neo-liberalize Syria. One cannot underestimate the power of neoliberal ideology and the free-market ideal to which many national institutions have succumbed. More recently, imperialist intervention has reached its zenith through the prolonged proxy war on Syrian land, which has now lasted more than 8 years. Syria's complex history, marbled with war, sanctions, and consistent threat, reminds us of Mao's quotation: "In approaching a problem a Marxist should see the whole as well as the parts. A frog in a well says, 'The sky is no bigger than the mouth of the well.' That is untrue, for the sky is not just the size of the mouth of the well. If it said, 'A part of the sky is the size of the mouth of a well,' that would be true, for it tallies with the facts" (Mao 1935: 159). With this in mind, I analyze Syria's political economy against the imperialist context that has played a primary role in degrading Syria's autonomy, gradually enfolding it into monopoly capitalism, and weakening the institutional

safeguards that were once the guarantors for its post-independence security.

Syria gained its independence in 1946. Although it was born a liberal state in the postcolonial period, it remained dependent on external support, bearing in mind the legacy the break-up of the Ottoman Empire had imposed on postcolonial societies (Khoury 1984). The splitting up of Arab provinces then and the creation of national borders was a blow to the nascent national capacities. Colonial powers had severed the three major cities of the Arab Mashreq – Tripoli (the port city), Aleppo, and Mosul, which once formed the industrial heartland of the Mashreq during the early twentieth century – from Syria. The latter fragmentation weakened the industrial capacity of the Arab world and Arab merchants lacked the capacity to act independently of colonial powers during the Mandate period as they remained dependent on European firms (Issawi 1955). Furthermore, the colonial administration in Syria (1920–1946) opposed any serious attempt to enhance economic independence and industrialization.

The old bourgeois class therefore emerged financially weak and dependent on the state, failing to lift the economy out of the fragile conditions that existed in the post-independence period. In the crucible of such structural weaknesses – a poorly capitalized bourgeois class and semi-feudal postcolonial conditions – a different mode of development emerged. The state was the main capital holder, and pursued development independently from colonial powers by guaranteeing funds to building infrastructure, nurturing the national agricultural systems and industrial nuclei, and developing social projects. This ensemble led to the emergence of a state-led economic structure, which essentially prevailed until the late 1980s. The main economic pillars of this economic structure were extensive nationalization, land reform, and social-friendly economic measures (Matar 2016, 2018).

By launching a revolution against the postcolonial structure in 1963, the Ba'athist military officers, who upheld secularist and socialist values, seized control of the state and in turn secured power over resource allocation. By promoting pan-Arabism, the Syrian Ba'ath party,

which was officially founded in 1947, aimed at liberating the Arab world from colonialism and Western dependence. The party mainly constituted of militants who came from rural areas. Their rural origins partly explain their socialist leanings (Batatu 1981). In order to widen their social base, they allied themselves with the educated middle and unprivileged working classes. The government kept its ears close to the ground, ensuring the rules of development met working class aspirations. Thus, there were few unmet demands, and little opportunity for seeds of dissent to germinate. However, economic rights which were granted to the working class in the form of public services and job creation were manifest as a top-down process. They were more grants from on high than the fruit of worker control of government. People were not empowered to participate through political freedoms, even amidst the government decision to expand its social base by providing economic necessities. Through state-guided development and import-substitution investment (ISI), the Ba'athist government allocated a considerable amount of government spending to public investment and social development projects. It tailored fiscal and monetary policies towards achieving its successive economic five-year plans. The process of capital accumulation during the 1960s and early 1970s met rising social needs, generated employment, and wove social safety nets. This occurred amidst unique historical conditions which influenced the radical measures of the Ba'athist government. These occurred against the 1948 creation of Israel as a settler colonial state in Palestine and Israel's regional military superiority. The threat of Israel loomed, casting a shadow over development planning. The Ba'athist government consolidated its social base by incorporating cross-class alliances into its national front. Socially responsible policies and political control underpinned its national security structure. Furthermore, the economic assistance of the former Soviet Union, the paragon of state-led development, fostered Syrian economic dirigisme. The USSR's military assistance boosted Syrian self-defense capacity, in the event of Israel (or US) attack. The Soviets supplied Syria with weapons,

rebuilt its army and air force in the aftermath of the 1967 and 1973 wars, and established a naval base in Tartus. Syria struggled in the post-independence era to build up its autonomy. An expanding Israel, a Western-armed settler colony, to its south threatened its national security, instigating "hot" conflicts and haunting Syria with ongoing military superiority.

Against a backdrop of insistent danger, the dirigiste model led to considerable and beneficial shifts for the Syrian people. Syria became a relatively prosperous and economically self-reliant nation. The land reform, for instance, led to tangible gains for the farmers, eventually leveling much of the old landed notable class and forging mass rural for the Ba'athist government, so solidly rooting the Ba'ath as to preempt political challenge from the old oligarchy. Syria registered significant advances, moving by leaps and bounds out of its post-independence indices of underdevelopment (or colonial development). It vanquished illiteracy, improved healthcare, and lifted other human development indicators. Syria also ensured its economic independence by locking resources in the economy, raising production to secure self-sufficiency, and channeling capital to sectors that exhibited high potential for employment creation. However, despite these *soi-disant* socialist measures, the Ba'athist model was not genuinely socialist. Its class structure remained capitalist as the state capitalist class accrued surplus value through its control of the means of the production and its regimentation of labor. The Ba'athist model did not empower the working class, who lacked political representation in the state. Although economic activities sought to increase output, the distribution of wealth was tilted in favor of the state bourgeois class, which gained privileges through its control of state. The latter process enabled Syria to attain, for a time, relative economic and political stability. But it was not to last. Syria's defeat in the wars against Israel and the subsequent collapse of the Soviet Union have paved the way for it to part with the socialist *dirigiste* model and endorse the dominant ruling ideology – neoliberalism – starting in the late 1980s. One can argue that Syria was not unique in remolding its economy along neoliberal

S

lines. Syria, however, is different. It exists in a war zone. The fall of Iraq in the 2003 invasion further destabilized the region and weakened remaining states facing the American-Israeli alliance, never mind the ongoing aggression of Israel in the lands of historical Palestine. The recent quagmire into which Syria has fallen stands as proof that Syria's adoption of neoliberalism laid waste to its national security.

The Neoliberal Ride

Neoliberal's birth lay in the decision of Syria's ruling elites not to strengthen the Ba'athist model, which ensured that social needs were met via a top-down distributional approach. Syria's military defeat in the 1967 Arab-Israeli War was a turning point. It weakened the Ba'ath party's political agenda, stirring political contention among the party's members. Then-Minister of Defense, Hafiz al-Asad, purged the political strife within the party through a military coup in 1970. His leaning to the right can be exemplified by his containment of the Palestinian Liberation Organization (PLO) in 1976 and the Lebanese National Movement (LNM) and his siding with the Gulf states against Iraq in the Gulf War in the early 1990s (Kadri 2016). His government parted with Ba'athist radicalism and introduced the "corrective movement" which heralded the reversal of the previous era's poor-friendly economic measures. The "corrective movement" of 1970 was a set of economic reforms aimed at achieving high growth using public and private resources at the expense of social considerations (Perthes 1995). It was the conduit through which Syria's bourgeois class pushed for economic liberalization and the private sector gradual takeover of economic decision making. The Ba'ath party since then has functioned as a means for propaganda for the al-Asad government to mobilize the social constituency.

Syria's embarking on the neoliberal journey occurred amidst the collapse of socialist ideology on the international stage (Kadri 2012). Since the 1980s, neoliberalism increasingly became the globally dominant ideology – that of the global financial class. Most developing states adjusted their macroeconomic strategies at the behest of the IFIs. US-led imperialism penetrated the global south, shattering and re-working modes of production of developing states to better fit those of the developed states (Saad-Filho and Johnston 2004). Within this context, Syria's economic policies were overtly and covertly molded by the neoliberal ideology and its price-based resource allocation mechanism – comparative advantage and the law of value. The challenges faced by the Hafiz government and the subsequent strategies should be understood within these historical circumstances. The Hafiz government gradually lifted state control over different sectors of the economy, allowing for free movement of capital, trade, and investment. Its market-friendly economic measures gradually eroded Ba'athist economic planning and protectionism, which had ensured economic resilience at an earlier phase. In terms of class analysis, the post-liberalization commercial bourgeoisie gradually relinquished its alliance with the local industrialists to unite with the international financial class. The newly allied commercial and state bourgeoisie became convinced that they could earn more wealth by joining the imperialist orbit than from building national economic resilience (Kadri 2016). They were keen to guarantee the growth of their nationally produced wealth in dollar-denominated terms, as those circuits fused with those of international finance (Kadri 2012). My computation of the stock pile of Syrian money held abroad, based on data of the Bank for International Settlements, reveals that net Syrian deposits in international banks reached an accumulated average of $24 billion by 2008 (Matar 2019). However, this figure remains an estimate. In my discussions with Syrian policymakers in 2007, they were clearly convinced of the received wisdom: the growth-focused free market model would eventually trickle down, even after a setback of sorts in aggregate welfare. Such distant gains proved to be mirage.

During the process of economic liberalization, investment was directed to commercial activities, ensuring quick returns to the post-liberalization commercial bourgeoisie at the expense of building up productive capacity. The state introduced investment laws to facilitate the restoration of

private property ownership, previously confiscated by the Ba'athist government in the 1960s. In 1990, the Hafiz government introduced investment law No.10 of 1990 that was salient in revitalizing private sector activities. In 2007, the Bashar government then introduced Decree No.8 that removed all remaining state controls that acted as obstacles against private investment (Matar 2016). By reinstating private ownership, the state bourgeoisie formalized their informal ownership of the means of production. By the end of the millennium, they transmogrified into business tycoons who controlled the major economic activities through monopolies and quasi-monopolies (Matar 2016). During my field work in Syria in 2007, the industrialists had expressed dismay about the investment reforms and the state's lifting of protection over national industry. However, the shift away from industry to commerce was accompanied by an ideological shift away from nationalism, pan-Arabism, and radicalism, weakening not only the social base of the government but also loosening the integuments which bound the working class to any broader state project (Kadri and Matar 2019).

One can argue that Bashar government's choices were also influenced by the ideological tendency which the Hafiz government had already crystallized in its policies. After 2005, the Bashar al-Asad government aggressively embraced the mainstream economic strategies under the tutelage of the international financial institutions. The government's five-year plan was socialist in principle but capitalist in practice. It put in place a series of intensified mainstream economic measures between 2006 and 2010. It prioritized macroeconomic stabilization, inflation targeting, fiscal consolidation, and trade and capital account liberalization. These conventional goals were achieved at the expense of building capacity, promoting self-sufficiency in food production, and guaranteeing social safety nets. The interworking of fiscal, monetary, and balance of payment tools contributed to resource misallocation that deepened the misery of the working population (Matar 2019). In 2006, the government ended the exchange rate populism that offered immediate benefits to the poor through cheaper imports and subsidized prices. Goods of first necessity, such as milk and sugar, were no longer exchanged at an overvalued rate against the dollar but placed in the same category as luxury items such as cars (Seifan 2013). In its review of the progress of Syria's neoliberal reforms in 2009, the IMF praised the government's effort in streamlining its expenditure by endorsing contractionary fiscal policy. It advised the government to introduce VAT in 2011 at the expense of lifting subsidies and other public and welfare provision (IMF 2010). By this time, Syria had surrendered its autonomy over its policies. Its orthodoxy in its five-year plan vis-à-vis IMF economic advice evidences Syria's complete divorce from its previously autonomous path. Furthermore, Syrian liberalization of its capital account meant economic regulation was under the aegis of international market forces. With such openness, the government inhibited capital retention and lost sovereignty over issuing credit backed by national assets and capacities. Instead, it built reliance on foreign capital into the architecture of its national financial and economic system.

Accelerating neoliberal reforms misallocated resources and favored capital over labor, eventually widening social polarization. The government allocated less resource to the productive sectors as compared to non-productive ones, which neither created enough job opportunities nor reduced poverty. Real wages' share in total GDP decelerated in the 2000s. It dropped from 32% in 2000 to 25% in 2010 (ILOSTAT database), eroding the income share of labor out of total GDP (Matar 2019). People struggled to earn a living and longed for a bygone time when necessities were affordable. Syrian neoliberalism was not sustainable. The proof of its unsustainability is the destruction that has been wrought upon Syria.

The Syrian state bourgeoisie designed macroeconomic strategies that favored capital and its holders over labor. But that is not all. They also sought rapprochement with US imperialism. While their national plans replicated word-by-word conventional IFI strategies, aiming to appease the global powers, the latter often obstructed reconciliation. Even though Syria's ruling elites endorsed market-friendly reforms to

facilitate Syria's entry to the WTO, since 2001 the US vetoed such accession (Reuters 2010). Syria abandoned state-administrative pricing, lifted price caps, and revoked protectionist measures that safeguarded its national industry in order to meet the economic conditions of the dollarized global market. Despite so many efforts to appease and integrate into the economic channels of imperialism, Syria faced international political blockade, which further subordinated Syria's bourgeois class to US imperialism. It was only 9 years later, in 2010, that the US lifted its veto, allowing Syria to attain observer status in the WTO (Bloomberg 2010). US sanctions were another form of international obstruction, aimed at penalizing Syria for its alleged support of international terrorism. Syria was placed in the US's designated list of State Sponsors of Terrorism in 1979 (Sharp and Blanchard 2012). Since the 1980s, the US has restricted its bilateral trade with and cut off its aid to Syria (Sharp and Blanchard 2012). Since the 2000s, the US has also repeatedly levied individual financial sanctions targeting al-Asad government's inner circle. More recently, the EU and the US imposed an even more rigid and crippling sanctions apparatus, as part and parcel of the current war, as elaborated further below. By following a rhythm of loosening and strengthening such international restrictions, the US has used the carrot and the stick to cajole and pummel Syria, in this way entangling Syria's bourgeois class into international circuits and weakening Syria's national autonomy. In retrospect, we may see plainly that as Syria's bourgeois class, ideologically influenced by neoliberalism, struggled to join global capital, it compromised the economic and social buffers protecting the nation. As argued by Kadri (2016: 119): "class ties of the leading capital interests supersede national interests." It was only when the Syrian working class, quite like others in neighboring states, were persuaded by the crisis of rule and the vulnerability of their governments, began to protest, in this way showing their discontent and unease with the governing order (Kadri and Matar 2019).

The strength of the alliance between Syria's bourgeoisie and the international ruling financial class, with US imperialism at the helm, has been influenced by the vortex of history. As power balances between major global players shifted, Syria's bourgeoisie situated itself within what it thought was a series of safe berths in the global power structure. In the Soviet days, Syria was a Soviet protectorate. After the collapse of the Soviets, it gradually moved into the orbit of US imperialism. The latter's disintegrative mechanisms worked discreetly prior to the conflict. Towards the end of the millennium, they were neither subtle nor difficult to detect. With the beginning of the conflict, imperialism's belligerency became all too apparent, as imperialist forces appeared, ready to bring down the whole of Syria's social formation, as they did to Iraq. The pre-conflict alliance between Syria's bourgeoisie and global capital has also come to an end since the conflict's dawn, because the destruction of Syria is far more crucial to imperialism than the latter's trading in Syrian goods and services (Kadri 2016). As of late, and in consequence of that shift, Syria has re-allied with China and Russia.

The Current Conflict

The imperialist assault on Syria has now reached its apex. The country is now divided between Russian-supported government areas and other imperialist-controlled regions. The war continues as the Syrian Arab Army fights against imperialist-sponsored armed groups and the fragmented "opposition" forces. Throughout the war, Syria's military and political fault lines realigned according to the degree of imperialist support and funding to the warring parties in Syria. A clear manifestation of such processes was the rise of the Islamic State and its seizing major Iraqi and Syria cities. In the words of Hinnebusch (2019): "It was the US invasion of Iraq, dismantling the Ba'athist state, that created the authority vacuum enabling the rise of al-Qaida in Iraq ("AQI"). ISIS was born out of an amalgamation of AQI with ex-Iraqi Ba'athists (displaced by the US invasion) and tribal supporters (trained and armed by the US in the late 2000s but marginalized by the Shia dominated Baghdad government)."

When the central governments lost control in Eastern Syria and Western Iraq, the latter arena became the breeding grounds of trans-state jihadists. Syria therefore has been confronted by an appalling situation, involving war, insurgency, and the shattering of the state's territorial integrity.

Militarism and the wars which compose it and underpin it are fundamental mechanisms of US-led imperialism. Wars underwrite the expansion of the dollar-denominated money supply, leading to the rise in financial wealth of the global financial class. There are basically two channels of value extraction from Syria: first, the heightened tensions that promote militarism and second, the destruction of assets and human lives which are, on their own, a value-creating operation (Kadri 2019). Not so long ago, imperialist intervention in the Arab region was demonstrated in the invasion and occupation of Iraq in 2003 and the NATO intervention in Libya in 2011. These tragedies wrecked the Iraqi and the Libyan states and annihilated their societies. Syria faces a similar threat. Syria's priority now must be to restore its national integrity. This will be a composite effort, which includes the living security of its population, as well as national security broadly understood. In other words, a cohesive and sovereign state is *ipso facto* a fundamental requirement in Syria's national struggle against Western-backed insurgency.

In the last 8 years, the landscape of war has been driven by external tensions and contradictions rather than internal rivalry, thereby adding more complexity to the Syrian conflict. International and regional powers have aimed at settling their scores in Syria, defaulting to military solutions rather than political negotiations. Shifts in the international power balance achieved on Syrian territory in favor of the Russian forces would weaken US global hegemony. China, a global economic power, is a strong advocate of Syrian sovereignty and has consented to the Russian military intervention in Syria. Conversely, Syria's obliteration by US-led Islamist armed groups would also enhance US–Israeli power over the Arab region. Russia has re-confirmed its commitment, amidst its support for the Syrian Arab Army maneuvers to liberate lost territories from armed rebel groups. The result has been a shift in the balance of power – in favor of the al-Asad government and its Russian, Iranian, and Chinese allies. It has also reduced the Islamic State (IS) to small pockets. However, the geopolitical implications remain gloomy as stubborn contradictions between global powers may lead to an unthinkable global war (Chossudovsky 2018). Such is the enormity of the situation evolving in Syria.

War and territorial disintegration have weakened the capabilities of the Syrian economy (Kadri and Matar 2019). The loss of control of oil and agriculture in Syria's northeast to the American-controlled Kurdish forces is an outright confiscation of national resources from the political control of the Syrian state by imperialist aggression and dispossession. Oil output, the main source of revenue to the government, has almost dried up. The economy suffers from fragmentation, ruptured supply chains, and obliteration of infrastructure (roads, factories, electricity, irrigation systems, mills, etc.). War-induced economic and infrastructural disruptions have dampened overall production and weakened national sovereignty. Even worse, a war economy based on looting, pillage, and plunder has emerged, giving rise to war-traders who control food supplies to win allegiance in government-controlled and the "opposition"-controlled areas. Simply put, since the start of the war, Syria has suffered from the deliberate and acute reversal of decades of development.

Imperialist assault against Syria also manifests through the wide-ranging sanctions that have besieged the nation since 2011. The US, the EU, and Turkey have imposed their blockade by sanctioning Syrian individuals, its financial, trade, and energy sectors, and investment companies. While these sanctions are not uniform in range and scope, they seek to cripple Syria's productive capacity and rip its social fabric to shreds. Among the restrictions are severing cooperation with Syria's Central Bank, blocking trade and investment deals, freezing Syrian assets abroad, and prohibiting commercial and banking transactions with Syrian entities. Given that Syria's biggest trading partner is the EU, its sanctions have strangled the Syrian economy following the

S

depletion of Syria's oil exports. Even worse, sanctions have exhausted Syria's foreign currency reserves, adding pressure on the Syrian pound which has faced a speculative attack. The double impact of supply shortages and currency devaluation has taken its toll on the economy as consumer prices rose steeply, further debilitating Syrian purchasing power. According to the UN, the siege on Syria has worsened the calamity by inhibiting the delivery of humanitarian aid and other essential commodities such as foodstuffs, fuel, and healthcare products (UN 2016). The Syrian humanitarian crisis has been described as one of the worst since WWII with nearly half of the population internally displaced, a few million refugees externally displaced, and another several million in desperate need of humanitarian assistance. As argued by Rosen (2019): "The same West that was protesting the sieges imposed by the Syrian army and the humanitarian suffering it caused is now imposing a siege on the Syrian people and hoping that their suffering will lead to political concessions." The humanitarian implications resemble Iraq in the years between 1990 and 2003 when UN sanctions destroyed the Iraqi productive capacity and brought its society to the brink (Gordon 2010). These embargos, first on Iraq, and now on Syria, have collectively punished innocent civilians, including women, children and the elderly. Syria, like Iraq, has suffered from the dire consequences of inhumane sanctions and the international community is blind to this reality.

As the war destroyed hospitals and other medical services, injured people lost their lives due to shortage in necessities like medicines and medical equipment – banned by the siege. In the words of Sen et al. (2012: 198): "Sanctions in general have caused controversy because economic embargoes inevitably affect all parts of an economy including households. They affect the cost of living, the prices of medicines (which households have to purchase) and the price of utilities such as electricity and water... Such actions in principle contravene the charter of the UN Covenant for Economic Social and Cultural Rights because they cause major disruption to food, pharmaceuticals and sanitation supplies." Unless the Syrian state installs a pro-working class economic recovery plan that can absorb the shock of the sanctions, they will perpetuate the conflict, ripping and tearing Syrian society and human capacity.

Conclusion: Building Resilience

As argued above, Syria's historical trajectory has been tangled in the brambles of political instability, sanctions, and war. These facts have not been conducive to developmental growth. Syria's state bourgeoisie, committed to building the national economy to enable a certain degree of autonomy during the state-controlled period, engendered better developmental outcomes than the succeeding neoliberal structure. The state bourgeoisie and the post-liberalization commercial bourgeoisie, influenced by the dominant neoliberal ideology and intrigued by the prospect of safer returns on private investment, aggressively liberalized the economy between 2000 and 2010. In hindsight, the outcome was anything but equitable development. Inequitable development in the Syrian case was manifest in crisis in capital accumulation, contributing to the objective conditions for the onset of the social unrest. The conflict and territorial dismemberment provided the gateways for imperial forces to intensify their intervention in Syria. This time, they would take the course of military aggression.

Nevertheless, Syria has recently regained lost territorial ground. Territory is needed but insufficient. The government should design a national plan for reconstruction and economic recovery that buttresses economic resilience. Reconstruction/economic recovery should allocate resources to the home front. Rehabilitating the social infrastructure and building economic resilience can strengthen the least powerful and most vulnerable elements in Syria, and empower the anti-imperialist resistance, which, in turn, can buttress the national front (Hemesh 2019; Matar and Kadri 2019). Building economic resilience should go hand in hand with a divorce from the neoliberal doctrine that has weakened the national economy over the past two decades, making it subservient to Western imperialism.

By preserving its autonomy over policy, the government can re-establish sovereignty. Previous

Arab experiences (Iraq and Lebanon) reveal that Western-supported recovery plans/constitutions were based on sect or ethnic classification, which has sown the seeds for permanent instability and conflict (Kadri and Matar 2019). Syria should reach out to its allies, especially China, the global economic powerhouse which has safeguarded Syrian integrity, for financial help and investment cooperation, amidst an acute lack of government revenues and foreign reserves. China has expressed interest in contributing to Syria's reconstruction as part of its gigantic outward investment project, the new Silk Road, to the Arab region.

To be sure, China extends loans for infrastructural and construction projects with the aim of furthering mutual economic cooperation with developing states. It may be worthwhile to recall that China's three main points of departure in BRI project-setting include joint discussion, joint venture, and joint benefit. Its conditions are usually limited to the projects themselves. China usually demands projects in host economies be carried out using Chinese construction companies, Chinese material, and Chinese human resources. However, Chinese conditions do not go beyond the projects to revamp national plans and development strategies. This is in contrast with the Washington Consensus program that usually requests developing states to restructure their national policy framework. The Bretton Woods institutions (IMF and World Bank) usually attach conditions to their loans, including a whole set of policy reforms, including fiscal, monetary, investment, capital, and trade measures. Drawing upon the experience of various developing states, the "one-size fits all" strategy has often led to ill-fated socioeconomic outcomes (Stiglitz 2003). The chance now remains for Syria to cultivate its national resilience. There is no other way forward.

Synonyms

Anti-imperialism; Chinese empire; Heavenly kingdom; Qing dynasty

Definition

This essay explores the historical, social, and political background to the Taiping Rebellion waged in China from 1850 to 1864 between the Manchu-led Qing dynasty and the Hakka-led Taiping Heavenly Kingdom. It examines the motivations and goals of the leadership of the revolutionary movement, and its central ideology. It concludes with an assessment of the historical significance of the Rebellion, and its strengths and weaknesses as a social and nation liberation movement.

Background

Chinese history can be characterised by the dynastic cycle. A dynasty would be established by foreign conquest or a native peasant uprising. It would initially be strong, protect China from foreign invaders or raiders, and preside over a degree of economic prosperity. Over time, however, centrifugal forces would assert themselves and provincial power groups would contest rule from the imperial capital. This process would often go hand in hand with decadence in the centre as a series of weak or incompetent emperors replaced the strong founders. A period of chaos would ensue as the ruling dynasty became increasingly unable to maintain order. In the eyes of the Confucian ruling class the dynasty would lose its legitimacy or the 'mandate of heaven' and would be ripe for replacement. The cycle would continue.

The Ming dynasty (1368–1644) was the last dynasty to be ruled by ethnic Chinese. It derived from a peasant revolt against the collapsing and chaotic Mongol Yuan dynasty (1271–1368). Under the Ming the central government established greater control over the population by way of a large standing army, a secret police network, a village control system hampering peasant mobility, and an inspectorate system. Despite this the Ming appear to have achieved a degree of popularity. There was an extended commercial boom, and in the early years the dynasty supported a series of exploratory missions, with the fleet of Zheng He reaching the coast of Africa.

The Ming began to decline with a financial drain resulting from wars with Korea and Japan, which escalated into a crisis with a severe shortage of silver, then used as a medium of exchange,

owing to Japanese and European trade policies. This was compounded by shorter growing seasons connected with the global 'Little Ice Age' of the seventeenth century, which led to a series of famines. Contributing to the crisis was a period of instability created by the influence in the bureaucracy of powerful court eunuchs.

The Ming dynasty was replaced by the Qing dynasty, the last imperial dynasty of China. The Qing (1644–1912) was led by the Manchu, a Sinicised northern people derived from clans of the Jurchen tribe. Early Qing emperors were strong, and during the reign of the Emperor Kangxi the Chinese state consolidated control over border regions, assimilated Taiwan, and repelled Mongol invaders. The Qing, in spite of their foreign origin, saw themselves as guardians of traditional Chinese culture and enforced a deadening conservatism in terms of literature, the role of women, technological innovation, foreign trade, and other areas.

Although gifted with a number of strong emperors, the Qing dynasty was often faced with crises of legitimacy. Corruption was rampant; there was resentment against a perceived foreign dynasty, and nostalgia for the defeated Ming and support for remnants of the dynasty remained strong in south China. After the suicide of the last Ming emperor, Ching Zhen, in 1644, regimes collectively known as the Southern Ming resisted the Qing for another 49 years. The Ming loyalist Zheng Cheng Gong, known as Koxinga, seized Taiwan after defeating the Dutch occupiers, and he and his son used the island as a base for attacking the Qing thoughout the mid- and late seventeenth century. The Qing emperor Kangxi (1654–1722) temporarily evacuated coastal areas in order to deny anti-Qing forces a basis of support. Large numbers of anti-Qing Chinese fled to Burma, Vietnam, and Japan, and many anti-Qing secret societies emerged in the south, some becoming religious or mystical while others moved in a revolutionary direction.

The founder of the sect that became known as the Taiping, and its initial core membership, derived from the Hakka minority, a group living in areas of south China. The Hakka are widely believed to be at least partly descended from Han Chinese from the north, who migrated south during times of political turmoil during the 12th and 13th centuries. After the Qing evacuation of southern coastal areas under Kangxi these areas were repopulated with outsiders descended from such northerners. Families moving to these coastal areas were termed 'guest families', or Hakka. Tensions developed in these regions between Cantonese-speaking people of local origin and the now self-described Hakka. Many Chinese revolutionary leaders have had Hakka ancestry.

From the seventeenth century to the nineteenth century China experienced a rapid growth in its population, which quadrupled from 100 million to 420 million by 1850 (Marks 2002). This reduced the productivity of the land and created changes in the traditional relationship between the Confucian aristocracy and the peasantry. The nineteenth century also saw increased corruption resulting from the opium trade and an increase in banditry and peasant rebellions due to high taxation, high rents, and poor harvests. There were periodic mass famines caused by severe droughts.

During the nineteenth century the Qing suffered a series of defeats at the hands of Western imperialism. Most important of these were the Opium Wars (1839–60), in which the Qing were defeated by the British and were forced to allow the import of opium, to turn over Hong Kong to the British, and to open up ports to foreign trade. The Opium Wars also led to further humiliating defeats and encroachments on Chinese territory.

Hong Xiuquan

Hong Xiuquan (1814–64), originally named Hong Renkun, was born in Fuyuanshui village in Guangdong, in what are now the far northern suburbs of Guangzhou. He was the third son of a Hakka peasant family. From an early age he attempted to work his way up through the brutally competitive Confucian examination system for entering the civil service. By the age of five he could recite the Confucian classics, and by the age of seven he began to study at a preparatory school. When Hong reached the age of 15 his parents could no longer afford his school tuition and he

began working as a tutor in his village while also studying independently. After coming first in the local preliminary examination in 1836, at the age of 22 Hong took the provincial examination in Guangzhou. However, he did not pass the higher imperial examination; he retook this four times but failed because of the extremely stiff competition and his inability to bribe the notoriously corrupt Qing officials.

While on his way to take the imperial examination in 1836 Hong encountered Christian missionaries for the first time, receiving tracts on the Bible and Christianity. He suffered a nervous breakdown after his first failure to pass the imperial examination, and during his recovery in 1837 he had a number of terrifying dreams which he interpreted as mystical visions. In these dreams he would be visited by two figures, an old paternal figure and a middle-aged elder brother figure, both archetypes in Chinese culture: in one dream the older figure complained to Hong about men worshipping demons rather than himself, and in another Hong saw Confucius being punished for faithlessness. Later Hong dreamt of angels carrying him to heaven, where the elder brother figure, wearing a dragon robe and a long beard, gave him a sword and a magic seal and commissioned him to rid China of demons. At this time Hong did not act on his visions.

After failing the imperial examination for the fourth time in 1837 Hong gave up studying and began to work as a teacher at several schools near his home town. In 1843 he became convinced that the religious tracts he had read years earlier were the key to understanding his dreams. He identified the older father figure with both the biblical Jehovah and the mythological 'Yellow Emperor' Shangdi, regarded in Chinese folk religion as the Celestial Emperor or King of Heaven. Hong identified the elder brother figure with Jesus and so now regarded himself as Jesus's younger brother, changing his given name to 'Xiuquan' or 'Younger Brother'. He believed that his 'Elder Brother's' command to rid China of demons meant eliminating both the corrupt Qing rulers and the teachings of Confucius.

Hong began preaching his new religion to fellow Hakka in his village. His two earliest converts were relatives who had also failed their examinations, Feng Yunshan and Hong Rengan. Hong, his two relatives, and their followers then began a campaign to destroy sacred statues in the local villages. Their iconoclasm angered townspeople and local officials, and Hong and his two relatives were forced to leave their jobs as village tutors. In 1844 Hong and Feng Yunshan walked 300 miles to a rugged region of east Guangxi province called Thistle Mountain, where a large Hakka population was more sympathetic to Hong's new religion.

Thistle Mountain

Hong began to preach on Mount Zijing in the village of Jintian (present-day Guiping) to an impoverished, primarily Hakka population. The religious rituals of the movement, at that stage known as the Society of God Worshippers, combined Christianity with Chinese folk religion. Society was to be radically egalitarian, with all wealth shared and class distinctions eliminated. All men and women were equal as 'brothers and sisters'; many posts in what became the Taiping state were assigned to women, although the sect practised strict segregated of the sexes. All wealth was to be shared. In contrast with the shaved forehead and queue (ponytail) required by the Qing rulers, the sect's men wore their hair long.

By 1844 Hong had developed a following of 100. A young illiterate firewood merchant named Yang Xiuqing, who practised faith healing, emerged as a leader in the movement. Another important early convert was Shi Dakai, a member of a wealthy landlord family who was able to persuade most of his family to join the sect and contribute much money to Hong's treasury. Wei Changwei, whose clan controlled Jintian, became an important leader. Local miners skilled in tunnelling and in the use of explosives, important in the rugged terrain of east Guangxi, were also prominent converts. While the class composition of the movement was mixed, the movement attracted poor peasants, small layers of wealthy anti-Qing scholar gentry, and members of minority groups including the Hakka, Yao, and Miao peoples, and river pirates.

T

From 1845 to 1847 Hong stayed in the village of Shiling, where he wrote books and pamphlets expounding his interpretation of the Bible and his social theories. In 1847 he responded to an invitation from the American missionary Issacher Roberts to study Christianity in Guangzhou and remained there for 2 months. Hong is believed to have gained most of his knowledge of Christianity during this time. Roberts, suspicious of people converting to Christianity for financial gain, turned down a request for aid to his sect and refused to baptise him.

Guangxi province at this time was unstable and bandit-ridden. The Qing authorities apparently initially chose to leave Hong and his followers alone. However, the God Worshippers were largely Hakka, and there were growing tensions between the sect and local villages, clans, and other groups. Hong's followers also ran into conflicts with pirates and river bandits in the highly mountainous and riverine province.

The Jintian Uprising and the Heavenly Kingdom

By 1850 the new religion numbered between 10,000 and 30,000 followers. Provincial authorities began to be alarmed at the growth of the sect and ordered it to be dispersed. A local force was sent to subdue it, but the sect defeated the Qing in December 1850. The sect organised a 10,000-strong army which routed a full-scale attack by Qing forces against the sect's base in Jintian; the Manchu commander of the imperial army was beheaded. This victory became known as the Jintian Uprising. The movement was now a force to be reckoned with in south central China.

On 11 January 1851 Hong declared the founding of a new kingdom, the Taiping, or 'Heavenly Kingdom', and gave himself the title of 'Heavenly King'. The political structure of the kingdom was somewhat vague and fluid. In 1848, while in a state of trance, Hong had accepted Yang Xiuqing's claim to be able to act as the 'voice of God' and his right to direct the political wing of the movement. With the founding of the Taiping he named Yang the 'East King' and, despite Yang's lack of military experience, made him supreme commander. Yang was to have supremacy over four other 'kings', the identities of whom varied.

The Taiping was to be a unified theocratic state in which the Heavenly King had absolute power, and a single organisation directed all religious, administrative, and military tasks. China would achieve peace and prosperity when all people worshipped the true God. The Taiping's egalitarianism and strong anti-Qing nationalism provided a powerful attraction to peasants and other oppressed layers.

After the initial victory at Jintian the Taiping remained outnumbered by the local Green Standard army, a Qing provincial army made up of ethnic Han, which together with local river pirates kept the Taiping confined to Jintian. After preparing for a month, the rebels managed to break though the blockade and fought their way to the town of Yongan, which they captured on 25 September 1851.

Hong and his troops remained in Yongan for 3 months. They were supported there by the local elite, who were hostile to the Qing. The imperial army then regrouped and launched another attack on the Taiping. Hong's army ran out of gunpowder, and the rebels fought their way out of Yongan by sword and made their way to Guilen. Guilen, however, had strong defences, and after a 33-day siege the Taiping gave up and went northwards towards Hunan. There the Taiping came up against an elite military force created by Zeng Guofan, a Qing general who was later to be important in the defeat of the Taiping. Zeng's 130,000-man Hunan army defeated the Taiping in June 1852, largely pushing it out of the province. Some 20% of the rebel army were killed, and the Taiping were forced to retreat.

Nanjing

By a stroke of luck, in December 1852 the Taiping army entered the wealthy town of Yuezhou almost unopposed. Here they seized 5000 boats, weapons, and gunpowder. The cities of Hangzhou and Wuzhong surrounding Nanjing fell in

December 1852 and January 1853 respectively, providing the Taiping with a large fleet of boats and money from the provincial treasury. In March 1853 Nanjing, lightly defended by Manchu troops, was conquered by the Taiping. This city, historically China's 'South Capital', was made the Taiping capital and was renamed Tianjing, or 'Heavenly Capital'. After an initial period of pillage and slaughter, Yang Xiuqing disciplined troops by threatening to execute any officer who entered a private home.

The Taiping ruled their state from Nanjing from 1853 to 1864. By this time Hong had withdrawn from active direct control of the movement, preferring to rule indirectly though cryptic proclamations. He appointed Yang Xiuqing prime minister. Opium was outlawed, and an extreme asceticism was practised, with alcohol and dancing prohibited and the sexes strictly segregated. The calendar was reformed, and rules were introduced to promote the equality of the sexes. Property was socialised, with money held in a common treasury, and most trade was suppressed. An examination system was revived, based on the Bible and the Taiping's interpretation of Christianity. This was equally open to men and women. A system of land reform was carried out with a system of family-based military collectivised farms. Polygamy was outlawed except for Hong and other leaders; Hong at one time had a harem of 88 women, and other leaders had similar numbers of consorts.

The Northern Expedition

After it took Nanjing the Taiping army was divided into three parts. One division was to remain in Nanjing to defend the city, another was to hold the cities of the Yangtze valley, and a Northern Expedition was to march north to Beijing. The Northern Expedition, consisting of 70,000 Guangxi veterans and newer recruits, left in May 1853. The march to Beijing proved far more difficult than the earlier march to Nanjing, with many towns putting up a strong resistance. By October 1853 the expedition had reached the outskirts of Tianjin, near the Grand Canal, about

100 miles from Beijing. There it was cut off from its supply train. As southerners, the troops coped poorly with the cold northern winter, and there was a high casualty rate. In May 1854 the Qing army surrounded the exhausted Taiping forces with earthworks and then diverted the Grand Canal, flooding the Taiping camp and destroying the army. The Taiping commander was captured and executed. Meanwhile the Yangtze valley army, commanded by Shi Dakai with the aid of triad forces from Guangdong, conquered most of Jiangxi province. Jiangxi became a major food source for the Taiping.

Tianjing Incident

After receiving recognition of his ability to speak in the name of God, Yang Xiuqing increasingly came to upstage Hong, who was nominally still the supreme leader. Yang proved to be a brilliant military commander and won victories at Yongan, Yuezhou, and Wuzhong. After he defeated an encirclement of Nanjing in 1856 by diverting the Qing to attack relief forces sent to other cities, then sending his own troops against the divided enemy, he became increasingly arrogant and power-hungry, creating tensions in the Taiping leadership. On several occasions he had leaders flogged for disobedience, and in what appeared to be a ploy to seize power he sent the generals Wei Changhui and Shi Dakai out of Nanjing to reinforce the western frontier. After being alerted to suspicions of a coup attempt by Yang, Hong ordered his commanders to move against him. On 1 September 1856 thousands of loyal troops met at the gates of Nanjing; they killed Yang and his 54 wives and concubines, and in the following weeks Wei Changhui waged a campaign to kill all who were believed to be Yang's followers, killing over 27,000 people in all.

In late September tension developed between Shi Dakai and Wei Changhui over the extent of the massacres and suspicions over Wei's own power-seeking. After severely condemning Wei for excesses, Shi fled to Tianjin. Wei had his family and followers killed. Shi attempted to rally the army in a rebellion against Wei. Realising

that Shi had the army on his side, Wei attempted a coup and launched an attack on Hong's palace in Nanjing, but this failed and Wei was executed by Hong's elite bodyguard. Hong ordered Shi Dakai to return to Nanjing and assume leadership, and Shi now helped to restore order and began to rebuild the Taiping's morale. However, Hong grew suspicious of him and sought to undermine his power. In 1857 Shi left Nanjing with an unknown number of followers.

For 6 years Shi Dakai and his followers fought a separate war against the Qing, although Shi continued to claim loyalty to the Taiping; his army was in Sichuan province for most of this period. In June 1862 Shi surrendered to the Qing on the condition that his men would be spared. He was executed by the 'death of a thousand cuts', and 2000 of his men were killed, with 4000 released. The Tianjing incident weakened the Taiping. Many of its most able leaders were killed, and the loss of Shi Dakai's army was a blow to the movement.

Hong Rengan and Victory over the Qing

In 1859 a cousin of Hong Xiuquan, Hong Rengan, joined the Taiping at Nanjing. Hong Rengan was an early follower of Hong Xiuquan who had become separated from the movement. He had spent a period in Hong Kong and had been influenced by Swedish Lutheran missionaries; upon rejoining the movement he sought to introduce elements of Protestant worship into Taiping ritual. Because of his education Hong Xiuquan made him prime minister in place of the defeated Yang Xiuqing. Hong Rengan centralised the Taiping administration and advocated building railways and establishing a banking system. He also attempted to gain the support of the Western powers.

Shanghai was an international port with a large foreign settlement and one of China's most important cities. It had been occupied by the Taiping from 1851 to 1853 and later was briefly occupied in 1860. Since 1858 the Qing Jiangnan army of 200,000 had laid siege to Nanjing, which was then defended by only 20,000 Taiping. Hong Rengan

devised a plan to retake Shanghai by first drawing off Qing forces besieging Nanjing and taking the surrounding cities of Hangzhou and Suzhou. He gave Li Xiucheng, who by this time had emerged as the most important Taiping military commander, the duty of capturing Shanghai. Li was to attack Hangzhou, drawing off Qing troops from Nanjing, and then march back, smash the remaining Qing troops at Nanjing, and take Suzhou. After that he was to take Shanghai. The Taiping expected to be welcomed by the foreign Christians in the city.

Hong Rengan's plan initially worked well. In May 1860 the armies of Li Xiucheng and Shi Dakai attacked and routed the Qing from the rear. The Taiping captured 20,000 horses, making this one of the few times the rebels were able to use cavalry. In a major defeat the Qing lost an estimated 60,000 men and many leading Manchu commanders. Li Xiucheng then encircled the region of Jiangnan, the geographical area to the south of the lower reaches of the Yangtze river, including Shanghai. He took the cities of Suzhou and Hangzhou in 1860; Suzhou was taken without a single shot being fired, and the capture of Hangzhou led to that city's mayor committing suicide. A Taiping army of 20,000 occupied Shanghai for 5 months.

The Qing general Zhang Youliang, commanding a force of 36,000, was ordered to attack Li Xiucheng. The result was a crushing defeat for the Qing in what became known as the 'Second Rout of the Jiangnan Daying', so called because it was the second major defeat of the Jiangnan army.

The defeat of the Jiangnan army and the capture of Hangzhou alarmed the Qing ruling class. By the early 1860s China was under the de facto rule of the Manchu Cixi, the daughter of a Manchu bannerman, who had been chosen to be a concubine to the Emperor Xianfeng. Thanks to her ability to speak and read Mandarin and her diplomatic skills, by 1861 Cixi had worked her way to absolute power, although technically she was still a regent. In the early 1850s General Zeng Guofan, who was a prolific Han scholar and a reform-minded military commander, had built an effective regional army in Hunan by bypassing the

Qing bannerman system and stressing Confucian values and the officer–soldier relationship. After Zeng's army pushed the Taiping forces out of most of Hunan province he came to the notice of Cixi, who appointed him viceroy of Liangjiang (Jiangxi, Anhui, and Jiangsu provinces) and made him supreme military commander. Zeng helped to transform the imperial military system and was important in the eventual defeat of the Taiping.

The Battle of Shanghai

By 1860 the initially sympathetic Western view of the Taiping had changed. Westerners were repelled by what they saw as the eccentricities of the Taiping's Christianity, and they regarded the Taiping as a threat to the lucrative opium trade. The *North China Herald* reported on its atrocities, alarming the large foreign community about the Taiping advance. Issacher Roberts, Hong Xiuquan's former missionary teacher, visited Nanjing and reported that Hong was insane.

In early 1861, the Taiping general Li Xiucheng's army of 600,000 controlled much of the Zhejiang and Jiangsu provinces bordering the Yangtze. At his request Great Britain and France, with their commercial interests in Shanghai, promised to stay neutral. The Taiping began the battle for Shanghai by invading the nearby Pudong area with 20,000 troops.

The Europeans and the Chinese business elite of Shanghai became alarmed at the approach of the Taiping and feared fighting in the city, but the Europeans were reluctant to commit their troops. In 1860 a group of Chinese businessmen hired the American mercenary Frederick Townsend Ward to organise a small Shanghai Foreign Arms Corps (FAC) of 100, initially made up of Western drifters and ship deserters recruited from the wharfs of Shanghai. Later Filipino and other mercenaries were added to the force. In 1861 Ward's group blocked the Taiping's approach to Shanghai at Chingpu, but at huge cost. The 'low-life' nature of Ward's outfit angered Western businessmen in Shanghai, who feared that the Taiping would cut off their trade. The Taiping were initially surprised to be fired on by Europeans.

After a 15-day Christmas cease-fire the Qing sent an army of 20,000 to Jiangnan. In early April 1862 the Qing general Li Hongzhang was made governor of Jiangsu province and took overall military command. A unit of the Green Standard army was sent to attack the city of Taicang, occupied by the Taiping, some 40 miles from Shanghai. Li Xiucheng sent 100,000 men to relieve the city and, after its commander disobeyed orders to withdraw, the entire Qing unit was destroyed. By late April the Taiping occupied Jiading, a town outside Shanghai, which they planned to use as a base to attack Songjiang, today a district of Shanghai, and the city itself. Li Hongzhang ordered a counter-attack. By mid- May the Taiping were pushed out of east and south Shanghai.

The Qing were aided by a greatly enlarged foreign led army. In the summer of 1861 Ward reorganised his force. Financed by wealthy Shanghai merchants, hundreds of Western mercenaries were recruited, and by September 1862 the FAC had over 5000 Chinese troops. Recruitment was aided by increasing peasant resentment of Taiping harassment. Troops were trained in Western drill and military techniques very different from those of traditional Chinese warfare. Ward's force became known as the 'Ever Victorious Army' (EVA).

In January 1862 the Taiping re-entered Jiangnan with 120,000 troops. In September they mounted a second attack on Shanghai with an army of 80,000. Li Xuicheng's 20,000-man army was beaten back by Ward's smaller force of 1500 in Soonjiang, and all 20 Taiping camps were destroyed; Li's army was forced to retreat after suffering heavy losses. Unfamiliar with Westerners and Western military technique, the Taiping often fled. Another Taiping force of 70,000 counterattacked from bases in Taicang and Kunshun and got to within a few miles of the city, managing to surround 20,000 imperial troops, but in a seven-hour battle the imperial troops were relieved and the Taiping's retreat was cut off, with 30,000 troops lost. The Taiping launched four more attacks on Qing forces defending Shanghai before Hong Xiuquan ordered the offensive to be ended.

Until its disbandment in 1864 the EVA continued to win victories against the Taiping. Ward was killed at the battle of Cixi, near Ningbo, in September 1862. Henry Burgevine, another American freebooter, initially took command of the EVA, but his personality and his alcohol and drug use made him unpopular; he was demoted and subsequently changed sides. In March 1863 the British officer and imperialist Charles George Gordon took charge of the EVA. He relieved Chansu, a town 40 miles from Shanghai, and then took Kunshun with heavy losses. He also took Suzhou in November but left the city after a disagreement with Li Hongzhang over the execution of enemy officers. Later Gordon rejoined Li Hongzhang and captured Changzhong, the Taiping headquarters in Jiangnan. The EVA was disbanded by Li and did not play a role in the final siege of Nanjing.

The advance of Qing forces between June and November 1863 cleared the Taiping from the Yangtze valley and cut off Nanjing. Zeng Guofan directed the siege of the Taiping capital. Hong Xiuquan died on 1 June 1864, possibly from poisoning after eating weeds growing near his palace. His son Tiangui Fu took his role. On 19 July a gunpowder blast blew a hole in Nanjing's east wall, allowing the Qing to enter. The city was sacked, and according to some accounts most of its 100,000 inhabitants were killed. Tianqui Fu and Hong Rengan escaped; Li Xiucheng was captured and executed; Hong Rengan and Tiangui Fu were captured in October, and were both executed in November. Between 20 and 30 million people died in this conflict.

The surviving Taiping, under Lai Wenkwok, attempted to link with the concomitant Nien Rebellion, but Lai was captured and executed in 1868. The last remaining Taiping army was defeated in 1871.

The Taiping army was fanatically disciplined, but its ideology and command structure inhibited serious strategic thinking and consolidation of objectives. Leaders gained their authority from God, providing little room for disagreement. Although at their height the Taiping came close to threatening Qing rule, they were ultimately unable to support a sustained drive to control China, and their failure to link up with other anti-Qing rebellions of the time contributed to their eventual failure.

Definition

For tax practitioners and academics, capital flight is an interesting yet protracted area of research and general debate. This Chapter analyses the interlinkages between taxation, capital flight and imperialism. It starts by defining key terms used within the Chapter as well as their significance in the main discourse. A brief introduction of taxation and its basic principles are discussed in the context of state-subject relations. It is within the realm of taxation, usually through the manipulation of tax systems and regulations, that capital flight occurs. Some have linked capital flight to power relations between states, relations which this Chapter explores (to a certain extent) from an imperialist point of view. Throughout its length, the Chapter breaks down the concept of capital flight, delving into the various practical forms in which it presents itself. The role of powerful states and multinational actors in propagating capital flight from poor and developing countries is also discussed. The Chapter concludes by giving solutions to curb capital flight, keeping in mind the role played by both powerful and poor countries in its facilitation.

Introduction

It is estimated that developed and less-developed countries lose a significant amount of capital and assets through capital flight. One of the methods through which capital flows outside these countries is through loopholes in legal and institutional frameworks. While governments of these countries have put safeguards for revenue collection, they still face challenges as individuals and companies find ways to avoid and evade tax while manipulating tax regulations for their own benefit. In Africa, it is estimated that in the last 50 years, the continent has lost approximately $1 trillion in illicit financial flows alone. This figure is on the rise, with estimates being blurred due to inaccurate data on actual capital flight from the continent.

The discourse surrounding taxation and capital flight is not conclusive without the theme of imperialism finding its way in these discussions. Capital flight has been blamed on weak fiscal laws as developed countries continue to syphon capital and assets from their poorer counterparts. While some scholars have analyzed this phenomenon in

the context of imperialism, some have challenged the notion, introducing newer themes such as capitalism into this debate. According to various schools of thought, exploitation of poor countries by their richer counterparts during the colonial period did not end with decolonization. In fact, poor countries still experience economic exploitation, albeit not as a result of imperialism, but as a result of neocolonialism and capitalism.

In order to contextualize the interplay between taxation, capital flight, and imperialism, a breakdown of these themes is important. This chapter attempts an explanation of technical terms in relation to tax, relating this theme to that of capital flight and imperialism. The discussion will also focus on imperialism, its history, and whether it is "alive." The bulk of this chapter will focus on capital flight, analyzing the phenomenon, characteristics, perpetrators, as well as the methods by which it is facilitated. In the end, the chapter will provide possible solutions in curbing capital flight, on the global, regional, and national scale.

Taxation

In order to appreciate the discourse on taxation, imperialism, and capital flight, basic understanding of taxation is important. Taxation is the imposition by taxing authorities, usually governments, of a compulsory levy or charge, referred to as a tax, upon its people. The term "tax" has varied definitions, with all of them denoting an unreciprocated and compulsory payment or contribution of money to a government or a public authority. The objective of tax collection by governments is well captured famous statement made by Justice Oliver Wendell Holmes – that "taxes are the price we pay for a civilised society."

Hugh Dalton (2009) defines a tax as "a compulsory contribution imposed by a public authority, irrespective of the exact amount of service rendered to the tax-payer in return, and not imposed as a penalty for any legal offence." He notes that the centrality of taxation to public finance is occasioned by the lack of equally productive and reliable sources of public finance (Dalton 2009) He observes that if public

authorities and governments, for instance, held vast income generating properties and businesses, perhaps taxation would be necessary only to a small extent (Dalton 2009).

Saleemi's definition of tax as "a compulsory contribution imposed on individuals to meet the expenses which are incurred for a common cause," identifies three characteristics of tax. Accordingly, tax is, firstly, a compulsory payment imposed by the government on its residents; secondly, it is a payment that is subsequently utilized by the government to execute plans, programs and projects that serve the common good; and thirdly, it is not levied in return for any specific services rendered by the government to the taxpayer. The tax payer cannot, in exchange for the payment of tax, claim an entitlement to receive a quid pro quo from the government. In other words, the benefits received by taxpayers from the government are not related to or based on their being taxpayers. A tax is a generalized exaction, which may be levied on one or more criteria upon individuals, groups of individuals, or other legal entities.

The truth in Dalton's (2009) observation of the parallelism between taxation and increased public expenditure is reflected in the history of taxation as a key source of public finance. Throughout history, the introduction of a new form of tax could almost always be traced to a new or an increased demand on available public funds. For instance, colonial authorities introduced taxes in the colonies to finance and sustain the colonial administration. The industrial revolution also led to increased taxes as nations tried to outdo each other in industrial advancement (Hartwell 1981). Income Tax was first established in England in 1799 to support the war against Napoleon (Hartwell 1981). Wars, in fact, were a notable drain on public coffers and a common cause of increased rates of taxation. Hartwell (1981) quotes Sydney Smith as having lamented:

> *We can inform Jonathan what are the inevitable consequences of being too fond of glory; — Taxes upon every article which enters the mouth, or covers the back, or is placed under the foot — taxes upon everything which is pleasant to see, hear, feel, smell, or taste—taxes upon warmth, light, and locomotion— taxes on everything on earth and the waters under the earth— on*

everything that comes from abroad, or is grown at home—taxes on the raw material—taxes on every fresh value that is added to it by the industry of man—taxes on the sauce which pampers man's appetite, and the drug that restores him to health—on the ermine which decorates the judge, and the rope which hangs the criminal—on the poor man's salt, and the rich man's spice—on the brass nails of the coffin, and the ribands of the bride—at bed or board, couchant or levant, we must pay— The schoolboy whips his taxed top— the beardless youth manages his taxed horse, with a taxed bridle on a taxed road: —and the dying Englishman, pouring his medicine, which has paid 7 per cent., into a spoon that has paid 15 per cent., —flings himself upon his chintz bed, which has paid 22 per cent., —and expires in the arms of an apothecary who has paid a license of a hundred pounds for the privilege of putting him to death. His whole property is then immediately taxed from 2 to 10 per cent. Besides the probate, large fees are demanded for burying him in the chancel; his virtues are handed down to posterity on taxed marble; and he is then gathered to his fathers, —to be taxed no more.

Categorization of Taxes

There are different kinds of taxes, with the widest categorization being direct and indirect taxes. Direct taxes are taxes imposed upon and collected directly from the taxpayer, either an individual or entity such as a company (Smith 1776). Examples of direct taxes include income tax which is imposed and collected from the income earner. Property tax is also a form of direct tax which is imposed and collected from the property owner. Indirect taxes, on the other hand, are taxes that can be passed on from the person to whom it is imposed to someone further along the chain (Smith 1776). A good example of indirect tax is value added tax (VAT), which is imposed on the manufacturer but passed on to the purchaser to be paid when an item is purchased.

Imposition of Tax: Principles of Taxation and Best Practice

Though an imposition, taxation is still expected to conform to the rule of law, principles of good governance and general fairness, and to allow for public participation. Adam Smith (1776) developed what are today known as the canons of taxation, which are the basis upon which most tax systems have developed. They can be summarized as follows:

(a) *Canon of equality* – that the subjects of every state ought to contribute towards the support of the government, as nearly as possible, in proportion to their respective abilities, that is, in proportion to the revenue which they respectively enjoy under the protection of the State.

(b) *Canon of certainty* – that the tax which the taxpayer is bound to pay ought to be certain, and not arbitrary. The time of payment, the quantity of payment, the manner of payment ought to be clear to the taxpayer and to everybody else. Uncertainty of taxation would favor the unchecked authority and expose the taxpayer to corruption and insolence.

(c) *Canon of convenience* – that every tax ought to be levied at the time, or in the manner in that is most likely to be convenient for the taxpayer to pay it.

(d) *Canon of economy* – that tax ought to be so contrived so as to take out and keep out of the pockets of the people as little as possible over and above what it brings into government coffers. This is to say that authorities should collect taxes efficiently ensuring that the process of collection does not swallow up all the tax collected and thereby necessitate the imposition of additional taxes. Secondly, taxation should not discourage or disadvantage activities which enable taxpayers to pay tax easily, for instance, authorities should not impose taxes that disable business. Thirdly, punishment for tax evasion should not ruin the income earning capacity or activity of the offending party, therefore making it impossible for them to pay tax in future. Lastly, odious tax collection methods and procedures are likely to be hard on tax payers, even if not financially.

While Smith originally envisioned four canons of taxation, these later developed into more principles in order to suit modern-day economies. These additional principles include: productivity, simplicity, diversity, elasticity, and flexibility.

Imperialism

The term "imperialism" derives its meaning from "empire-building" which dates as far back as the Mesopotamian times (Steinmetz 2005). There are four categories of imperialism, namely, colonial, economic, political, and socio-cultural imperialism. The Britannica Concise Encyclopedia defines imperialism as "the policy of extending a nation's authority by territorial acquisition or by the establishment of economic and political hegemony over other nations." Going by this definition, the discourse on imperialism is usually focused on the colonization narrative, involving rich western countries dominating their poor counterparts. That this is the common conceptualization of imperialism is not odd, considering that colonization combined all forms of imperialism. Apart from the actual conquest and occupation of other territories, colonial powers would impose political ideologies, economic policies, and socio-cultural ideals that favored them to the detriment of the natives.

Imperialism and the African Context

The scramble for Africa in the late nineteenth century and the subsequent colonization of Africa marked the beginning of imperialism in Africa. At that time, the term imperialism was more commonly used than it is now, and it was the norm to refer to colonial masters as imperial masters. During the colonial period, the term colonization was used interchangeably with the term imperialism. The term denoted the systematic subjugation and oppression of African nations and populations, the exercise of absolute executive power over all affairs of the African nation, and the imposition of laws and policies by the colonial masters and all other processes and systems that amounted to colonization.

Though used predominantly to describe colonization in its early manifestations, imperialism survived colonization and it has continued to adopt to the changing political and economic realities so that today, imperialism is a more indirect form of domination exercised over the economy of former colonies, mostly but not exclusively, by their former colonial masters. Post-independence,

political and economic commentators of the time observed that imperialism had survived colonization in the form of neocolonialism. Nkrumah (1965) noted as follows:

> The neo-colonialism of today represents imperialism in its final and perhaps its most dangerous stage. In the past it was possible to convert a country upon which a neo-colonial regime had been imposed into a colonial territory. Today this process is no longer feasible. Old-fashioned colonialism is by no means entirely abolished. It still constitutes an African problem, but it is everywhere on the retreat. Once a territory has become nominally independent it is no longer possible, as it was in the last century, to reverse the process. Existing colonies may linger on, but no new colonies will be created. In place of colonialism as the main instrument of imperialism we have today neo-colonialism. The essence of neo-colonialism is that the State which is subject to it is, in theory, independent and has all the outward trappings of international sovereignty. In reality its economic system and thus its political policy is directed from outside. The result of neo-colonialism is that foreign capital is used for the exploitation rather than for the development of the less-developed parts of the world. Investment under neo-colonialism increases rather than decreases the gap between the rich and the poor countries of the world. (Nkrumah 1965)

Neoliberalism: Structural Adjustment Programs

The transition from colony to independent state came with its own challenges for newly independent African States. In the 1970s, rising oil prices, rising interest rates, and a sharp reduction in the prices of primary commodities which formed the bulk of African exports left many newly independent African countries unable to repay mounting external debt (Kingston and Irikana 2011). By the late 1970s, the growth spurt that accompanied independence had long petered out and most countries were experiencing some form of economic crisis. The crisis revealed itself in drastic declines in the output of key sectors such as agriculture and industry, unsustainable balances of payments and inflationary budget deficits, resulting in reduced government spending on social services as well as overall incapacity of governments to maintain productive infrastructure (Gulati 1998). At the same time, these states were under intense pressure to pay their already

high foreign debt (Kingston and Irikana 2011). The World Bank and the International Monetary Fund stepped in to alleviate the financial crunch by offering loans to meet the immediate domestic needs and to service foreign loans. In order to qualify for these loans, a country had to accept a set of conditions, collectively known as the Structural Adjustment Programs, which were aimed at restructuring the economy of the borrowing country (Kingston and Irikana 2011). The programs were viewed as "a means to address long-term development issues" requiring Sub-Saharan African countries to urgently adjust the structures of their economies to make them less vulnerable to external shocks and to enable them to respond more flexibly to such shocks. Structural adjustment programs were aimed at integrating national and subregional economies, diversifying production, and building infrastructure (Mills 1989).

The structural adjustment programs required nations to adopt free market and neoliberal principles. Privatization was encouraged and government spending on social services was rolled back (Sayson 2006). Market liberalization saw the removal of trade tariffs and currency devaluation. The lending institutions also offered taxation advice, recommending that the main role of tax policy should be to raise revenue and not to direct economic activity, which was to be left to market forces (Kingston and Irikana 2011). Additionally, trade taxation was discouraged and developing countries were encouraged to shift the burden of taxation to consumables (Dom and Miller 2018). In this way, export taxation reduced.

It is worth noting that between 1984 and 1990, when Structural Adjustment Programs were fully in force, countries under the programs transferred about $178 billion to Western commercial banks (Kingston and Irikana 2011). By severely restricting government spending on social services such as health and education in favor of debt repayment, the loan terms of the International Monetary Fund grossly undermined the development of African social infrastructure and the effects of this can be felt even today. During the Ebola Outbreak in West Africa in 2015–2016, there emerged the reality that the health infrastructure of the affected countries, especially Liberia,

was very poor. It was argued that this was a legacy of the Structural Adjustment Programs which were imposed and praised by western institutions as effective, while all the while they were slowing down Africa's development.

Is Imperialism Dead?

Certain aspects of imperialism still manifest themselves in the modern-day world and in the face of globalization and interdependence of states. Today, even in the absence of colonialism, imperialism is seen largely in the economic domination of smaller economies (mostly former colonies) by larger economies (mostly former colonial masters and new and emerging superpowers).

The modern-day strand of imperialism is described by Utsa Patnaik and Prabhat Patnaik (2017) as an element of capitalism which they refer to as income deflation. Central to the modern understanding of imperialism is the operation of the market forces of demand and supply, which are neoliberal principles championed by large capitalist economies (Patnaik and Patnaik 2017). Imperialist thought is informed by the fear of a threat to the value of money, upon which the stability of large economies depends. This threat occurs when local producers in poorer nations are able to consume the goods they produce. This would increase demand for those goods, which, in accordance with the rules of demand and supply, would increase the price of those goods. Importing nations would therefore have to spend more to import those goods, thus threatening the value of the money they hold (Patnaik and Patnaik 2017).

Income deflation existed even during the colonial times. It was instigated through colonial tax systems. The native population, which formed the bulk of the productive labor force, was highly taxed, thus reducing its capacity to consume the goods they produced. The demand for those goods therefore remained relatively low, making it possible for the colonial government to purchase and export those goods at low prices, and with the taxes they had collected from the producers no less (Patnaik and Patnaik 2017). As the local goods were exported, manufactured goods from the colonizing nation were imported into the

colony. This left no room for industry or value addition in the colonies and the local population remained untrained. The only opportunity of raising income was therefore to labor in the limited economic activities supported by the colonial government for its benefit. In this way, colonial governments created a ready pool of labor in the colonies and this kept the cycle going (Patnaik and Patnaik 2017).

In the postcolonial period, income deflation is instigated through a variety of neoliberal market principles, chiefly that of fiscal policies (Patnaik and Patnaik 2017). In order to meet their development goals, developing and less-developed states are always seeking out financing avenues. Financing opportunities present themselves in the form of foreign direct investment, commercial loans, foreign portfolio investment, and official flows. In order to lure investors, countries are often required to make concessions. On the other hand, lenders ordinarily require the adoption of measures that will guarantee repayment of their loans. The outcome is a reduction in public expenditure and in some instances, the introduction of new taxes. In 2016, for instance, the International Monetary Fund offered Rwanda a Standby Credit Facility of $204 Million because the country was facing a shortage of foreign currency due to high imports and low exports. In exchange, Rwanda had to scale down on public expenditure while ongoing projects faced the threat of abandonment (The East African 2016). In September 2018, Kenya, after pressure from the International Monetary Fund, introduced a fuel levy of 16%, causing a sharp increase in the cost of living. The resultant public outcry halved the levy to 8% (Daily Nation 2018).

Capital Flight

It is almost impossible to discuss taxation and imperialism without running into debates relating to capital flight. It is worth noting that there exists no universally accepted definition of capital flight. However, some existing definitions are instructive. Capital flight has been defined by some as unrecorded capital flows between a country and the rest of the world. Others have defined it as widespread currency speculation, especially where this leads to cross-border movement of private funds whose magnitude is large enough to affect national financial markets. Capital flight should be distinguished from normal capital outflows; however, the line is thin as the distinction is usually a matter of degree. Capital flight typically manifests itself in the acquisition of foreign investments by residents of one country in another country, which investment does not generate investment income in the country from which the capital flees (Gulati 1998).

It is also noteworthy that the term "capital flight" has geopolitical connotations, in that it is used mostly in reference to capital outflows from countries with relatively slow economies coupled with high indebtedness but not with regard to large economies. For instance, an American citizen channelling significant capital into African country is viewed as an investor and his money as an investment. If it were an instance whereby an African channeled a significant amount of money into a project in the USA, this would more likely be viewed as capital flight (Gulati 1998).

Possible Causes of Capital Flight

A number of reasons are speculated to be the likely causes of capital flight. First is the likely devaluation of a currency. Any resident will try to take their money and may be tempted to change local investments for foreign ones if there appears a possibility that those local investments will be worth very little in the near future (Gulati 1998). Second, discriminatory taxation policies, whereby a country taxes domestic currency denominated asset but does not tax foreign denominated currency assets, high-wealth individuals are likely to prefer foreign investment over local investment (Gulati 1998). A third reason is financial repression. Residents of a country with traditionally low interest rates are likely to prefer investing in countries with higher interest rates (Gulati 1998). While these are said to be the main causes of capital flight, recent reports indicate that a mounting foreign debt may be a cause of capital flight. This is because the residents of a highly indebted

country stand the risk of having a new tax imposed in order to make timely payments of the debt. Such residents may prefer to take their investment to countries where the likelihood of new taxes or other shocks to the economy is low. All the above factors that promote capital flight are more likely to be present, either singly or in combination, in developing nations.

The obvious result of capital flight is that developing countries are deprived of capital, which would be spent on investment and on other public initiatives. This means that to invest, developing countries have to borrow, which borrowing, as explained above, allows the developed world to impose lending conditions and taxation policies and generally continue the vicious cycle of imperialism.

Characteristics of Capital Flight Within the Realm of Taxation

Capital flight should be distinguished from normal and legal monetary and resource flows. Christensen's breakdown of these characteristics is useful. Firstly, flight capital takes the form of domestic wealth permanently put beyond the reach of appropriate domestic authorities. Oftentimes, this is usually disguised and unrecorded as a result of deliberate misreporting and misinvoicing. Secondly, capital flight is associated with private gain at the expense of public loss. This is obviously because in most cases, little or no tax is collected on capital flight. Thirdly, capital flight represents itself as a form of money laundering due to the fact that illegal capital flight is sanctioned by most jurisdictions; therefore, the management of flight capital is illicit and necessitates money laundering to disguise the source and ownership of transferred capital (Christensen 2009, p. 13).

In contrast, legal and reported capital flows are well-documented, taxed, and form part of everyday commercial transactions. These legal cross-border financial flows usually have the following characteristics: firstly, the source of capital being transferred to another jurisdiction from the country of origin is legal; secondly, fair payment is made in such commercial transactions; thirdly, no laws of the country of origins are

violated in the said transaction, especially those on foreign exchange and capital control; fourthly, all taxes due on the transfer of wealth are duly paid to the country of origin; and lastly, such transactions are properly recorded, documented, and reported, and they form part of the official statistics of the countries involved (Christensen 2009, p. 14).

Perpetrators of Capital Flight

Capital flight is facilitated by different actors, the following being the main perpetrators:

(a) MNCs
(b) Individuals – including corrupt government officials, politicians, and wealthy figures
(c) Professionals such as accountants and lawyers
(d) Banks and other financial institutions

Mechanisms for Capital Flight

As already discussed, the main mechanism through which capital flight is facilitated is through illicit financial flows (IFFs). IFFs constitute funds that are earned, transferred, or used illegally (AU/ECA 2015, p. 9). Considerable research analyzing IFFs has established three main sources through which such funds originate, that is, through commercial activities, criminal activities, and through bribery and theft. Commercial activities through which IFFs is facilitated include tax evasion by companies and other entities, trade misinvoicing as well as through abusive transfer pricing. Examples of criminal activities leading to illicit movement of funds include drug and human trafficking, smuggling, illegal arms dealing, and money laundering. Bribery and theft, on the other hand, are usually facilitated by individuals, especially corrupt government officials.

In order to understand the extent of capital flight from developing countries to their developed counterparts, one has to appreciate the technicalities involved in its perpetration. Governments of developing and less-developed countries have been criticized for allowing loopholes within their legal and institutional frameworks, making the fight against capital flight in its different forms difficult. Another problem

T

facing poor countries is that they lack tax expertise to understand the sources, perpetrators, and the extent of capital flight from their countries. Some have suggested thorough capacity building targeting not only tax authorities but also policymakers as one of the solutions to curbing capital flight from poor states. The following section provides a brief discussion of some of the common terms in taxation and capital flight.

Transfer Pricing

Simply put, transfer pricing is the accounting and taxation-linked practice allowing companies to save on taxes (Investopedia 2018). The transfer price is the price of transactions occurring between related companies, in particular companies within the same multinational group (McNair et al. 2019, p. 3). Where a company operates subsidiaries in various countries, they take advantage of transfer pricing rules set by governments to determine how tax should be apportioned to the entity. While transfer pricing in itself is not an illegal practice, it is linked to illegal capital flight whereby transfer pricing regulations are abused so as to avoid or evade tax (Eden and Murphy 2011). Abusive transfer pricing involves the manipulation of a transfer price so as to shift profit from one country to another – usually from a jurisdiction with higher taxes to a low-tax one (AU/ECA 2015, p. 11).

Money Laundering

Another method used by individuals and companies to facilitate capital flight is through trade-based money laundering. This involves trade mispricing with the intention of disguising income whose source is an illegal activity.

Trade Misinvoicing

Trade mispricing and trade misinvoicing are two almost related but distinct terms. False invoicing involves making false declarations as to the value of imported or exported goods for the main purpose of evading customs duties and taxes, circumventing quotas or laundering money. In this case, it is the value of goods that is understated (in the case of exports) while the value of imported goods is overstated. More often than not,

proceeds from the understated or overstated values are illegally channelled abroad (AU/ECA 2015, p. 10).

Bribery and Other Unscrupulous Payments

While capital light facilitated by commercial entities is largely estimated to use mechanisms such as transfer pricing and trade misinvoicing and mispricing, capital flight by individuals, especially corrupt government officials, is though bribery and unscrupulous payments (Global Financial Integrity 2018).

Tax Evasion Versus Tax Avoidance

Capital flight, specifically illicit financial flows, from Africa has been largely facilitated through tax evasion and tax avoidance. A distinction of the two terms is important, because, while one is legal, the other is illegal. Tax avoidance is defined as the legal practice of seeking to minimize a tax bill by taking advantage of loopholes or exceptions to tax regulations or adopting an unintended interpretation of a country's tax laws. Tax evasion, on the other hand, denotes the action by a taxpayer to escape a tax liability by concealing from the revenue authority the income on which the tax liability has arisen. One of the ways of preventing tax avoidance is by putting in place anti-avoidance laws.

Tax Evasion, Tax Havens, and Capital Flight

As already discussed, capital flight may also present itself in the form of illicit expatriation of capital by persons resident or taxable in a host country. Usually disguised, such expatriation of money negatively impacts on the development of the host country. One of the main factors that encourage capital flight is tax evasion. Tax evasion through tax havens has exacerbated capital flight as well as financial crises and slowed economic growth for poor countries.

Tax evasion and capital flight are interlinked, especially because tax evasion can be looked at as a motive for capital flight. While domestic tax evasion and capital flight impact negatively on

poor economies, flight of capital to another jurisdiction is more detrimental to the host country. Some are of the view that domestic tax evasion is not as detrimental because in this case, the money is still retained in the country. Accordingly, in the latter case, the money would still be subject to other forms of tax, including VAT should it be utilized in the local economy. In contrast, capital that has fled the host country is oftentimes invested in another country, hence not generating revenue for the host country.

It is evident that tax evasion and capital flight present barriers towards financing for development through domestic resources. Developing countries should rethink their fiscal laws in order to strengthen national revenue administration to address capital flight and tax evasion. However, national sovereignty alone is not the key to combating these barriers – international cooperation is useful in ensuring these issues are addressed.

Foreign Investment, MNCs, and Capital Flight

It is noteworthy that there exists no agreed definition of the term "foreign investment." A possible explanation for this is that the term "investment" varies based on the purpose or objective of a particular investment instrument. However, the bottom line is that foreign investment occurs where there is an international flow of capital from one country to another. Investment of this nature can also be manifested through the uptake of management roles by foreigners in their investment in the host country.

In discussing taxation, capital flight, and imperialism, the role of multinational corporations (MNCs) cannot be overlooked. In a globalized world, the place of MNCs in trade and development is central. MNCs have been in existence since colonial times, manifesting themselves in those earlier times as instruments of British imperialism. Some notable MNCs involved in the exploitation of resources in Africa during the colonial times include the Imperial British East African Company (IBEACO) which administered parts of the East African region on behalf of

the colonial master. Though rendered defunct after a short stint, the company was instrumental in developing trade in the regions which it controlled.

Present-Day MNCs and Capital Flight

An MNC is defined as a business entity which has operations in other countries other than its home country, operations which allow the entity to transfer products and capital across borders based on demand and price conditions (Gardner 2014). The term "multinational corporation" is usually used interchangeably with "transnational corporation." The MNC is also defined as the organizational form that defines foreign direct investment (FDI) (Lazarus 2001). Such a corporation may be incorporated in country A and have subsidiaries, branches, and production and retail activities in countries B and C or more.

Foreign investment can be classified under four main categories: FDI, FPI (financial portfolio investment), commercial loans, and official flows. FDI is a financial phenomenon which occurs when a company owns voting stock of more than 10% in a commercial entity incorporated abroad (Cohen 2007a). Many corporations and individuals have chosen to invest abroad for various reasons. For one, foreign investment has been necessitated by less experience, or lack thereof, by host countries in areas such as technology and trade. For some, exploring newer markets abroad is as a consequence of a saturated market back home. While some of these reasons may be so informed, some MNCs invest abroad so as to maintain their market share at home and to stay ahead of their competitors who may have already moved their operations abroad to take advantage of cheap labor. Some MNCs have also been known for exploring and exploiting foreign markets so as to benefit from lower tariffs on production in the foreign country. FDI manifests itself in various forms and is to be distinguished from FPI, otherwise known as indirect investment (Cohen 2007a). While indirect investment may be in the form of share purchase in an already existing company in a foreign country, direct investment involves "the creation of new businesses, and the capital transfers to underwrite them"

(Cohen 2007a). It also means the ownership and control of an enterprise abroad, in the form of a branch or subsidiary. The other two forms of foreign investment are commercial loans, which entail loan facilities issued by domestic banks to the government of a foreign country, and official flows, which entail developmental assistance given by a country to another, the latter usually being a developing country.

Developing states have for a long time relied on foreign investment in its various forms to drive their own development. Whether this is effective or not is a question that has been debated upon for many years now. Apart from the continued allegations of human rights violations perpetrated by MNCs in various parts of the world, there has been evidence of involvement in capital flight by MNCs. Recent reports, such as the Panama and Paradise Papers have exposed the activities of MNCs in illicit financial flows, mostly from resource-rich African countries.

The Extractives Sector: Victim of Capital Flight

Tax avoidance, tax evasion, and profit-shifting by MNCs are rampant in developing and less-developed countries. Out of the various sectors of the economies of these countries, the extractives sector is one of the main sectors that is worst hit by illicit outflows of capital and assets. In Zambia, for example, the government estimates losses of at least $2 billion annually (an equivalent of 15% of its GDP) to tax avoidance by MNCs which operate in the country's copper mines (Curtis 2015).

In most resource-rich developing countries, governments, ironically, do not collect as much revenue as is expected (Ramdoo and Bilal 2014, p. vii). There are possible explanations for this – firstly, that these countries lack technical expertise necessary to exploit their own resources; secondly, that MNCs are given incentives to exploit resources in these countries yet they end up channelling profits back to their own countries, usually through loopholes in the legal and institutional frameworks of the host country; and thirdly, that developing and less-developed states that are rich in mineral resources are not keen on diversifying into other sectors of the economy for growth. In the absences of linkages between

resources and other sectors of the economy, resource-rich countries end up poor in the face of exploitation of its resources by MNCs. Profit-shifting by MNCs is detrimental to the development of developing and less-developed states as it leads to the tax base erosion. The ripple effect is the exposure of these poor countries to financial crises as a result of increased indebtedness.

Curbing Capital Flight: Solutions for Developing and Less-Developed States

As victims on the receiving end of the consequences of capital flight, developing and less-developed countries must rethink their fiscal policies and introduce safeguards to prevent further capital flight from their countries to the developed world. For most developing countries, the main challenge in the fight against capital flight is the lack of foolproof institutional and legal frameworks. However, this is not to say that these countries have not made steps to rectify the issue.

Cooperation Among States

The issue of capital flight is not a national or regional problem, it is a global one. While developing and less-developed states are usually the primary origin of capital flight, mechanisms for capital flight involve actors outside these countries, including both private and public actors. The fight against capital flight should, therefore, be a collective duty of all states, especially involving states which are recipients of flight capital.

Tax Reforms

Another effective way of curbing capital flight from developing and less-developed countries is rethinking fiscal laws. Poor countries must ensure that they reform their laws to make them concise and clear so as to minimize cases of incorrect and inaccurate stating of prices of goods and services. Clarity in regulations governing exports and imports would make it harder for individuals and commercial entities to engage in the manipulation, evasion, or avoidance of taxes including excise and custom duties.

Institutional Reforms

Apart from strengthening laws, countries that are vulnerable to capital flight should consider an overhaul of their taxing authorities and supporting bodies. For example, it would be prudent for revenue authorities in these countries to put in place requirements for institutions in charge of company registration, especially of foreign companies, to require that these companies be also registered for tax purposes. Requiring proof of tax registration prior to company registration would require the linking of databases of both company registrars and tax authorities. Not only would such a mechanism introduce stringent safeguards against capital flight but it would also provide sufficient data to track illegal activities by companies and individuals behind them.

Beneficial Ownership Declarations

Another closely related method of curbing capital flight from poor countries is the requirement that foreign countries should declare their beneficial ownership (AU/ECA 2015). This information should be asked for at the point of registration of companies, trusts, or other business dealings between a foreign entity and a government agency. Such information should be publicly recorded, while false declarations penalized.

The Arm's-Length Principle and Reporting Requirements

In order to curb abusive transfer pricing by companies, one of the globally accepted standards adopted by states is the "arm's length principle." In order to ensure that this principle works effectively in the fight against capital flight, developing and less-developed countries are encouraged to establish transfer pricing units within their revenue authorities. Some African countries have already established transfer pricing units, for example, Kenya. However, one of the challenges facing these units is the lack of capacity and expertise to detect and deal with cases of abusive transfer pricing. Apart from setting up these units, governments should require MNCs operating within their jurisdictions to avail transfer pricing reports in respect of their disaggregated financial reporting. The format of this reporting system should be streamlined so as to ensure acceptability across revenue authorities in other poor countries (AU/ECA 2015).

The OECD-Led BEPS Initiative and Information-Sharing Requirements

The OECD has led an initiative geared towards curbing base-erosion and profit-shifting (BEPS), which poor countries are encouraged to support (OECD 2016). The OECD's response involves improving access to information held by MNCs. The reality is that, while the OECD's response is a good cause, it may not be a foolproof solution for countries that are victims of base erosion and profit-shifting, especially African countries. Perhaps what would work best is an African solution to the African problem of capital flight, whereby these countries rally together to demand better terms in terms of more stringent information-sharing requirements on a global scale. In order for this to work, African governments should consider strengthening their own institutional capacity, especially in respect of data protection so as to maintain confidentiality of relevant business information.

Rethinking DTAs Between States

While double taxation agreements (DTAs) are beneficial to developing and less-developed states, some of the provisions contained in such agreements may be detrimental to domestic resource mobilization efforts by poor countries. DTAs have been known to provide loopholes and avenues for capital flight. Before signing DTAs, countries vulnerable to capital flight should review the terms therein before signing and committing to them. DTAs with countries known for being tax havens should be scrutinized more (AU/ECA 2015).

The Role of Regional Blocs

Regional blocs can play a significant role in ensuring that fellow members do not open their borders to foreign direct investment at the expense of illicit financial outflows. These blocs should be empowered to spearhead and demand for sound tax incentives and standards that would safeguard member countries from FDI-related capital flight.

T

Repatriation of Stolen Assets and Capital

Perhaps one of the most neglected topics of discussion in the capital flight discourse is the treatment of flight capital once detected (Fofack and Ndikumana 2010). While most experts have focussed their discussion on resource mobilization for development in poor countries, the issue of capital flight and the potential gains for affected states has been overlooked. Once detected and investigated, capital flight should be repatriated. Repatriated capital flight would not only boost domestic investment but also increase the taxable base in poor countries. Subsequently, these countries would experience an increase in capital formation translating into long-term economic growth. The big question lies in how to repatriate flight capital. Capital flight repatriation largely depends on the will of states, especially countries to which capital flees. Western governments could play an important role through enforcement of highly transparent banking and financial systems. They could also lend their sophisticated financial and economic intelligence to the recovery of stolen assets and illegally acquired funds. Governments of poor countries, on the other hand, should improve their regulatory systems so as to minimize the attraction of illegally acquired private assets. Additionally, governments of poor countries should improve their governance and leadership to build confidence in asset holders in foreign countries to repatriate their legally acquired assets back home, and that these shall not be subject to discriminary or excessive taxation. Asset repatriation has been successfully done before, for example, in the USA, where the Lacey Act was used to recover illegal fishing proceeds and repatriate them to South Africa (Fofack and Ndikumana2010, p. 16).

Conclusion

Throughout the length of this chapter, the gravity of the issue of capital flight has been highlighted. From a developing country perspective, capital flight is facilitated by rich economies which still yield power over poor economies. Whether this is a continuation of imperialism or an evolution of the same, the bottom line is that capital flight is detrimental to the development of developing and less-developed countries. The answers to most of the issues raised in this chapter lie in the realization that poor countries must do more in terms of strengthening their fiscal laws to ensure that loopholes which facilitate capital flight from their jurisdictions are reduced.

Definition

Third Worldism is a trend in Marxism that uses many traditional Marxist categories while examining global structural disparities, thereby amending many of the key conclusions expressed by popular Marxist analysis. Third Worldism looks at prominent political divisions within the working class created through the history of national oppression and modern wage scaling.

Introduction

In broad terms, Third Worldism is a trend in Marxism that uses many traditional Marxist categories while examining global structural disparities, thereby amending many of the key conclusions expressed by popular Marxist analysis.

Rather than defining the world as principally divided between a working-class proletariat and capital-owning bourgeoisie, Third Worldism looks at prominent political divisions within the working class created through the history of national oppression and modern wage scaling. It highlights how these divisions are not simply the result of 'false consciousness' but are based on the development of a centre–periphery relationship inherent to the capitalist-imperialist world-system, and stresses that revolution against global structural inequalities is a prerequisite component of any socialist revolution. Though elements of Third Worldism can be found in the writing of Karl Marx and Friedrich Engels, the Bolshevik Revolution of 1917 put the ideas of Vladimir Ilyich Lenin and Third Worldism in the spotlight for the first time. In broad form, Third Worldism was a major theme of the twentieth-century revolutionary movements which peaked in the 1960s. Beginning in the 1970s, influenced by the wave of anti-colonial movements, radical intellectuals began picking up and exploring the major themes of Third Worldism, looking further into the history, political economy, and cultural qualities of capitalist-imperialism. Finally, into the twenty-first century, Third Worldism has taken on an increasingly interventionist role in presenting itself as modern Marxism while critiquing left-wing politics that deny the existence of a significant vertical split in the working class.

Key Concepts and Terms

While using many of the key concepts laid out by Karl Marx (such as proletariat, bourgeoisie, class struggle, etc.), Third Worldism has throughout its history employed additional language and terms to advance concepts related to the stratification of labour, the transfer of surplus value, qualitative

developments of capitalism as a mode of production, and strategies for social change.

Among the foremost terms employed by Third Worldists are 'First World' and 'Third World'. While many additional terms are used in their place, some more technical and some more literary, the basic concept remains the same, reflecting a relationship in which 'the [preferential] conditions of life for the working class in the countries of the Global North are predicated upon the immiseration, national oppression, and exploitation of the workers and farmers of the Global South' (Cope 2012: iv). Additionally, Third Worldism tends to place stress on the national dimensions by which the proletariat is cast in the modern world, using terms like 'oppressed' and 'oppressor' nations. (Lenin 1976/1916; Sakai 1989) At the heart of Third Worldism is the tendency to look at how divisions imposed by capitalist-imperialism affect structures of class relations in modern society.

Imperialism is a central category of Third Worldist analysis, as it underpins the basic relationship between the First and Third Worlds. As Lenin notes, imperialism is 'the monopoly stage of capitalism' (1974a/1916: 265). More recently, Samir Amin described capitalism as 'inseparable from imperialist exploitation of its dominated peripheries by its dominant centers' (2012: 83). In both cases, exploitation increasingly takes the form of imperialist rent (profits derived from monopoly power) accumulated by multinational corporations at the expense of dependent sections of an integrated world-economy. Also central to Third Worldist analysis is wage scaling; that is, the different rates of income and life expectancies that different groups of workers can reasonably hope to achieve and work toward under the present system. Terms like super-exploitation, (Lenin 1979/1919: 15) super-profits, and super-wages are employed with qualitative regard to labour, reflecting contrasting general relationships of labour to global capital accumulation (Edwards 1978: 20; Emmanuel 1972b: 110–120). Third Worldists also use terms such as 'neo-colonialism' to describe the political characteristics of modern class rule and terms such as 'comprador' and 'labour aristocracy' as archetypal

political and economic subsets to the bourgeoisie and working classes, respectively.

A major theme of Third Worldism is the strategic significance of the relations imposed by capitalist-imperialism. Ernesto 'Che' Guevara, for example, explained in his 1967 'Message to the Tri-Continental':

> Let us sum up our hopes for victory: total destruction of imperialism by eliminating its firmest bulwark: the oppression exercised by the United States of America. To carry out, as a tactical method, the peoples' gradual liberation, one by one or in groups: driving the enemy into a difficult fight away from its own territory; dismantling all its sustenance bases, that is, its dependent territories. (1967)

Similar convictions on the need for an international united front and global people's war against imperialism were expressed in the same period by Lin Biao, a leading leftist during the early half of China's 'Great Proletarian Cultural Revolution' (1967: 42–58). In the same period or soon after, groups like the Revolutionary Action Movement and May 19th Communist Organization in the United States took up similar political lines, adding that groups within imperialist centres could act in unity with a global anti-imperialist revolutionary movement.

In more recent times, Third Worldists have looked more closely at how global contradictions might affect any global socialist revolution. The Maoist Internationalist Ministry of Prisons ('FAQ') describes a 'Joint Dictatorship of the Proletariat of the Oppressed Nations' over imperialist countries as the first major step toward communism. Samir Amin (2006) has described the immediate task as twofold: defeating the US's military hegemony over the world and overcoming the 'economic liberalism' imposed by the various institutions of 'collective imperialism'. The Revolutionary Anti-Imperialist Movement (2013 ['12 Point Program']) has described the necessity of a global new democratic revolution, in which global political and economic power are redistributed on an egalitarian basis, as the first step of socialism.

Additionally, Third Worldists have occasionally used modifications of words and phrases to reflect political meaning, or used indigenous

names of locations instead of their common ones. Examples of this include 'united $tates' instead of 'the United States of America', thus denoting the oppressive and illegitimate qualities of the subject, or Boricua instead of Puerto Rico and Azania instead of South Africa. This, Third Worldists claim, is part of challenging the cultural hegemony of imperialism (Maoist Internationalist Movement 1999).

Differences with Other Marxisms

Three World's Theory, the governing ideology of China's foreign policy in the late 1970s and 1980s, uses similar language as Third Worldism to offer dissimilar analyses of the categorisation of countries.

Third Worldism differentiates the world based on economic relationships of capital accumulation. Prototypical Third World countries are, for Third Worldists, countries that export surplus value, while First World countries are importers of surplus value (Amin 2010: 89). The Three Worlds Theory used First, Second, and Third World to characterise the international political power of various sovereign states. For the Chinese Communist Party (CCP) beginning in the 1970s, the First World was the US and Soviet Union, the Second World included perceived 'middle elements' such as Canada, Western Europe, and Japan, while the Third World included states with little or no power in the world-system, including China (Mao 1974).

In its polemical form, Third Worldism often counter-poises itself to opportunism, social chauvinism, and First Worldism, which are all seen by Third Worldists as having a material basis in the existence of a large labour aristocracy (Lenin 1979/1916: 5). Recently, Zak Cope defined First Worldism as: 'The governing ideology of the rule of entirely parasitic nations over the whole of the dependent Third World. First Worldism is the sense of entitlement to a standard of living predicated on superexploitation as felt by the vast majority in the advanced industrial countries' (2012: 119). Third Worldists claim First Worldism ignores historical structural divides among the

working class, the effect this has on working-class solidarity, and mistakenly pursues strategies based on the interest and consciousness of middle classes, including an elite section of the global workforce (299).

Historically, Third Worldism has been more associated with Maoism than Trotskyism. For example, as early as 1952, Chen Boda, who would later be a prominent leftist during China's Cultural Revolution, declared that 'Mao Tse Tung Thought' – and more specifically the policies of people's war and the united front – had universal significance for 'the entire world struggle' (1953/1952: 86). However, a recent essay published by the Trotskyist Socialist Economic Bulletin (Burke 2014) examines imperialism as a material factor for shaping public opinion in the First World.

While much of contemporary Third Worldism shares many ideas with Immanuel Wallerstein's treatise on world-systems analysis (2004), many Third Worldists take a more classically Leninist approach to strategies for social change, stressing the necessity of a vanguard party that organises a popular movement in order to seize power and institute a centrally planned economy with new social relations.

Differences from Other Critiques of Imperialism

As a radical ideology rooted in Marxism, Third Worldism goes beyond many other critiques of imperialism. These include: liberal populist strands of anti-imperialism as represented by the short-lived Anti-Imperialist League, founded in 1898 as a response to the US annexation of the Philippines, Guam, and Puerto Rico following the Spanish-America War, and modern strands of the same ideas usually found in libertarianism; analyses of the cultural aspects of imperialism, such as those expressed by Edward Said (1979, 1994); and modern critical expositions on the crimes of imperialism such as those written by Ward Churchill (2003), William Blum (2000), Jean-Betrand Aristide (2002), and John Perkins (2004). Third Worldism is more thoroughgoing, examining imperialism as a system of social relationships of

T

production that manifest in historical economic disparities and cultural qualities (Cope 2012: 41–136), while highlighting the features of imperialism as being significant for the potentialities of revolutionary struggles (Amin 2010: 127–130).

Within Marxism, Third Worldism entails more than support for the economic and political agendas of nominally independent Third-World social democracies, such as India in the 1950s or Venezuela today, but rather includes support for popular national struggles led by communists against rule by imperialism (Amin 2012: 124; Lin 1966: 19).

History of Third Worldism in Marxism

The first examples of a Third Worldist trend within Marxism emerged from Marx and Engels themselves.

Engels, writing to Marx in 1858, noted that:

> The English proletariat is actually becoming more and more bourgeois, so that this most bourgeois of all nations is apparently aiming ultimately at the possession of a bourgeois aristocracy and a bourgeois proletariat *alongside* the bourgeoisie. For a nation which exploits the whole world this is of course to a certain extent justifiable. (quoted in Lenin 1979/1916]: 12)

Speaking on imperialism and the working class, Engels explained:

> The truth is this: during the period of England's industrial monopoly the English working-class have, to a certain extent, shared in the benefits of the monopoly. These benefits were very unequally parceled out amongst them; the privileged minority pocketed most, but even the great mass had, at least, a temporary share now and then. And that is the reason why, since the dying-out of Owenism, there has been no Socialism in England. With the breakdown of that monopoly, the English working-class will lose that privileged position. (1977/1844)

And, writing to Engels in 1869, Marx commented:

> For a long time I believed that it would be possible to overthrow the Irish regime by English working class ascendancy. I always expressed this point of view in the *New York Tribune.* Deeper study has now convinced me of the opposite. The English working class will *never accomplish anything* before it has got rid of Ireland. The lever must be applied in Ireland. That is why the Irish question is so important for the social movement in general. (1988/1869)

These statements contain the kernel concepts within Third Worldism regarding the effect of imperialism on working-class unity and the necessity for a 'lever' of struggle to be applied among the nations oppressed by imperialism.

These ideas would also become themes in Lenin's later writing. Writing in 1918 about various strands of reformism in Europe and the US, he noted:

> [I]n all the civilized, advanced countries, the bourgeoisie rob – either by colonial oppression or by financially extracting 'gain' from formally independent weak countries – they rob a population many times larger than that of 'their own' country. This is the economic factor that enables the imperialist bourgeoisie to obtain super profits, part of which is used to bribe the top section of the proletariat and convert it into a reformist, opportunist petty bourgeoisie that fears revolution. (1974c/1918: 433)

Lenin's tone was often polemical, including in his writings about imperialism and the labour aristocracy that developed within it a class subset he believed was a basis of opportunism within the working-class movement (1966b/1920: 193). This polemical characteristic would continue to be a lingering trait of Third Worldism, and Lenin himself would take an increasingly Third Worldist stance in the latter part of his life. In 1923, months before his death, he remarked:

> In the last analysis, the outcome of the struggle will be determined by the fact that Russia, India, China, etc., account for the overwhelming majority of the population of the globe. And during the past few years it is this majority that has been drawn into the struggle for emancipation with extraordinary rapidity, so that in this respect there cannot be the slightest doubt what the final outcome of the world struggle will be. In this sense, the complete victory of socialism is fully and absolutely assured. (1973/1923: 500)

Lenin's view was shaped by the fact that socialist revolution failed to occur in Western Europe and the US during the First World War. Instead, many social-democratic parties with which he had previously aligned took positions in favour of their own countries' war efforts. To make matters worse, the victorious Western imperialist countries experienced a period of post-war economic growth and social stability, in part, Lenin believed, due to a 'labour aristocracy' which had

seized the reigns of working-class movements (1966a/1920: 230). Thus, in its first years, the Comintern sought to combat the influence of the labour aristocracy over the workers' movement, declaring in 1921:

> Those who promote the interests of the labour aristocracy, either counterposing or simply ignoring the interests of the unemployed, destroy the unity of the working classes and are pursuing a policy that has counter-revolutionary consequences. The Communist Party as the representative of the interests of the working class as a whole, cannot merely recognize these common interests verbally and argue for them in its propaganda. It can only effectively represent these interests if it disregards the opposition of the labour aristocracy and, when opportunities arise, leads the most oppressed and downtrodden workers into action. (Communist International 1983/1921: 287–288)

With the growth and success of anti-colonial movements following the Second World War, the impact and influence of Third Worldism grew as well. A landmark in this early revival of Third Worldism was the 1949 victory of China's New Democratic Revolution led by Mao Zedong and the CCP.

In synthesising Marxism with the conditions of China at the onset of the Japanese occupation, Mao outlined successive aims for popular revolutionary movements in 'semifeudal, semi-colonial' countries that encompassed most of the Third World:

> The first step is to change the colonial, semicolonial and semi-feudal form of society into an independent, democratic society. The second is to carry the revolution forward and build a socialist society. (Mao 1955/1940]: 110)

Mao's theory and practice of new democratic revolution were connected to his theory and practice of protracted people's war, described by CCP leftist Chen Boda as a concrete development of Marxism-Leninism directly applicable to the 'East' and of 'universal significance' to the 'entire world struggle as a whole' (1953: 85–86). Ten years later, in 1963, the CCP began openly criticising the leadership of the Communist Party of the Soviet Union for its failure to strategically support and defend the right of oppressed peoples to engage in struggles against imperialism (Communist Party of China, Central Committee 1963).

Inspired by the success and development of anti-colonial revolutionary movements, the Bandung Movement took shape in the mid-1950s, launching the first Afro-Asian Conference in 1955. The conference, sponsored by the governments of India, Indonesia, Pakistan, Burma (modern Myanmar), and Ceylon (modern Sri Lanka), was attended by representatives of 24 other countries, and sought to discuss matters of co-operation between the formerly colonised peoples. Decades later, Samir Amin remarked on its origins that:

> Bandung did not originate in the heads of the nationalist leaders (Nehru and Sukarno particularly, Nasser rather less) as is implied by contemporary writers. It was the product of a radical left-wing critique that was at the time conducted within the communist parties. The common conclusion of these groups of reflection could be summed up in one sentence: the fight against imperialism brings together, at the world level, the social and political forces whose victories are decisive in opening up the possible socialist advances in the contemporary world. (2010: 123)

While the African-Asian Solidarity Conferences of 1955, 1957, and 1961 brought together states, the Organisation for the Solidarity of Africa, Asia, and Latin America, founded after the Tri-Continental Conference in Havana in 1966, assembled organisations and parties from 82 countries, a majority of whom jointly supported a mutual cause of anti-imperialist struggle (Hsinhua Correspondent 1966: 19–25).

The 1960s itself was a decade of intense struggle around the world. Revolutionary figures such as Dipa Aidat (1964), Kwame Nkrumah (1965), Amilcar Cabral (1966), and Ernesto 'Che' Guevara (1967) put forward various theses on the nature and significance of the ongoing struggles in the global South. Franz Fanon's *Wretched of the Earth* (1963), which examined the condition of the colonised, has since become part of the academic canon on anti-colonial resistance.

In the tumultuous 1960s, the influence of Third Worldism was even felt in the US. In 1965, the US sent ground troops to Vietnam, setting off student protests led by the Students for a Democratic Society (SDS), which three years previously had begun exploring more radical positions and

rejecting a hegemonic anti-communist Cold War narrative (in its 'Port Huron Statement'). By 1968, SDS had upwards of 100,000 active members, and different factions had developed within the organisation (Rudd n.d.). The principal factions advocated two dissimilar strategies, one based on developing a 'worker-student alliance' and another on building a 'revolutionary youth movement' in unity with the struggles of oppressed nations. In the 1968 document 'You Don't Need a Weatherman to Know Which Way the Wind Blows' (Weathermen 1968) the leaders of the latter trend explained, in an implicit retort to the former: 'any conception of "socialist revolution" simply in terms of the working people of the United States, failing to recognize the full scope of interests of the most oppressed peoples of the world, is a conception of a fight for a particular privileged interest, and is a very dangerous ideology'. The same document went on to note: 'Virtually all of the white working class also has short-range privileges from imperialism, which are not false privileges but very real ones which give them an edge of vested interest and tie them to a certain extent to the imperialists, especially when the latter are in a relatively prosperous phase'.

Following the 1968 split between the two principal trends inside SDS, members of the latter went on to form the Weather Underground Organization in the 1970s (which had Third Worldist leanings) and the May 19th Communist Organization in the 1980s (which was more Third Worldist).

Third Worldism also appeared in the radical movements spearheaded by African Americans during the same period. The Revolutionary Action Movement, which was founded in 1962 and heavily influenced by Malcolm X and Robert F. Williams, published its own 1966 manifesto, *World Black Revolution*, which advocated for a black insurgency within the US as part of a larger world revolution against 'white' imperialism (Ahmad 2007: 95–165). As its founder, Muhammad Ahmad (then known as Maxwell Stanford Jr), recounted decades later, RAM was an 'anti imperialist, anti-capitalist, anti-colonial, and anti-racist' 'revolutionary Black nationalist organization' which believed the 'major contradiction in

the world was between western imperialism and the revolutionary people of color, the Bandung World' (Stanford 1989: 145).

Explaining RAM ideology, Ahmad goes on:

The US was hopelessly corrupt and racist. Reform was impossible [. . .] Black people in the US were part of the Bandung world which is [sic] made up of all people of color from Asia, Africa, Latin America, Central America, the Caribbean, North America, the Indian sub-continent, and the Pacific Islands. The Bandung world's historical relationship to the West was based on the exploitation of people for the labour and the raw materials the colony could export to the metropolitan country. Bandung people shared the same enemy. (ibid.)

In the immediate wake of the Bandung period (and emboldened by the existing challenge to Marxist orthodoxy as represented by the Sino-Soviet split), another strand of Third Worldism began to emerge. Rather than being founded in political activism and movement building, independent Marxist economists began to challenge existing understandings of the development of capitalism by placing a greater emphasis on imperialism in shaping the contemporary world. While this new trend was hardly homogenous, it contained a common belief that imperialist countries were enriching themselves at the expense of the masses of Third World countries. Less concerned with directing political movements, instead this group focused on a rigorous analysis of imperialism as a set of social relations and economic processes, thus examining imperialism as a historically developed system.

In the US, the growth of such academic Third Worldism owed a great deal to *Monthly Review,* founded in 1949 in New York City as an independent socialist magazine, and its editors Paul Sweezy, Leo Huberman, and, beginning in 1969, Harry Magdoff, a public acquaintance of Che Guevara and author of the 1969 book *The Age of Imperialism.*

The positions put forward by various authors in this academic Third Worldist trend were typically nuanced and well developed. For example, in the introduction to his *Imperialism and Unequal Development,* Samir Amin takes issue with crude Third Worldism, positing it as a Western response to dominant social-democratic ideology:

It is not surprising that the repercussions of this situation are causing the extreme left in the West to react by executing 180-degree turns. Social-imperialist collusion gives way to Third Worldist outbursts. For Third Worldism is a strictly European phenomenon. Its proponents seize on literary expressions, such as 'the East wind will prevail over the West wind' or 'the storm centers,' to illustrate the impossibility of struggle for socialism in the West, rather than grasping the fact that the necessary struggle for socialism passes, in the West, also by way of anti-imperialist struggle in Western society itself. They sway between extremes without understanding the crux of the matter – the significance of imperialist hegemony. (Amin 1977: 11)

Nonetheless, paragraphs later, Amin also reasserts some of the main notions behind Third Worldism while offering his own take on revolutionary strategy in the form of 'de-linking':

The current crisis reminds us forcefully of the chief characteristics of the capitalist system in its imperialist phases – the transfer of the contradictions of the capitalist mode of production from its dominant imperialist centers to its dominated periphery; the revolutionary and socialist potential of the struggle for national liberation; the social-democratic ideological domination of the working classes in the centers. This is not a question of prophecy, but merely of an analysis of forces that have been operative for almost a century. The detachment of the periphery from the capitalist system, to be sure, would alter the conditions of class struggle in the center. It is not excluded that if the current crisis should deepen and lead to new revolutions in the periphery, the weight of the contradictions of capitalism would have an impact on the metropolitan laboring classes such as to radically alter the pattern of the socialist transformation of the world. (14)

Underpinning this new academic Third Worldist analysis was a challenge to normative accounting of the Third World as merely 'underdeveloped' or lagging behind 'advanced capitalist countries' (Amin 2010: 90). As Andre Gunder Frank explains in *The Development of Underdevelopment* (1966) and Walter Rodney in *How Europe Underdeveloped Africa* (1981), 'underdevelopment' in the global South is the result of centuries of participation in world capitalist development. In order to better illustrate how imperialism structures local economies in the Third World, academic Third Worldists such as Samir Amin have used the term 'lumpen-' and 'mal-development' (Amin 2013: 47).

Going further than many other academic Third Worldists, Arghiri Emmanuel (1972a) questioned the existence of a material basis for working-class solidarity across the 'north–south division':

While all the working classes were subjected to exploitation, no matter how disparate its degree, even when one was 90% exploited and the other 10%, they had an interest in uniting and fighting arm-in-arm, and together expropriating their exploiters, despite the fact that this expropriation improved the situation for some considerably more than for others. But from the moment the workers of certain countries ceased to be the suppliers of surplus-value (no matter how little) and became recipients, the situation was reversed and the positions of the working classes became antagonistic to one another.

It might be maintained that this comparison in terms of dollars or surplus-value rates is too abstract and illusory. I will suggest another, in physical terms. Today, the citizen of America consumes an extraordinary amount of basic raw materials. Were all the inhabitants of this planet to follow his example and consume the same amount per person, all known deposits of iron ore would be exhausted in forty years, copper deposits in eight years, tin deposits in six years, and petroleum in five and a half years! [...]

It follows from this that apart from all other considerations and all other antagonisms, under today's objective natural and technological conditions, and in the foreseeable future, the people of today's rich countries can consume all the things that make up their material well-being and which they seem to value, only because others use them either very little or not at all. They can reprocess their wastes simply because others have nothing much to reprocess. Otherwise, the ecological balance would be fatally imperiled. This is what makes the antagonism between the center and the periphery irresolvable and transforms the entire working class of certain countries into the worker aristocracy of the earth.

While Emmanuel's line of thinking may have been unfamiliar to traditional Marxism, the same could be said for many in the academic Third Worldist trend. Paul Baran (2012), for example, reintroduced the notion of 'economic surplus' (as distinct from surplus-value) as a means of analysing and understanding existing and emergent economic processes and social structures in the world economy. In Baran's view, economic surplus (i.e. the portion of the economic product above the material requirements of the labouring classes) made up not just profit and surplus-value

but also part or all of the income for some sections of the working class (43).

Lastly, academic Third Worldists stressed the role of trade in the functioning of imperialism, thus giving rise to theories on 'unequal exchange' as a means of imperialist exploitation. In this sense, the academic Third Worldism which emerged primarily in the 1960s implicitly challenged Lenin's notion that imperialism amounted to the export of capital, instead understanding it more as the import of surplus-value owing to the unequal exchange of commodities embodying different quanties of value (Emmanuel 1972b: 187).

Following and developing separately from the Third Worldist academic trend (though to some degree influenced by it), a contemporary interventionist trend of Third Worldism emerged. This latter contemporary trend, more polemical in nature, challenges what it sees as chauvinism within left-leaning ideologies while claiming that a correct analysis of modern political-economy and class structure is of central importance for Marxism.

This trend was spurred on by the Maoist Internationalist Movement (MIM), an organisation which existed between 1984 and 2005 in the US (Maoist International Movement 1994, 2005). MIM saw the 'North American white working class' as 'primarily a non-revolutionary worker elite' (1992). Throughout its existence, MIM would devote a large proportion of its efforts toward debating this matter with other members of the left in the US. MIM's stance regarding the 'white working class' was greatly influenced in the late 1980s by *Settlers, the Mythology of the White Proletariat* by J. Sakai (1989), and *Labour Aristocracy, Mass Base of Social Democracy* by H.W. Edwards (1978). The former title, a damning look at US history and critique of the American left, is still popular among Third Worldist and other sections of the radical left.

Following MIM's 2005 dissolution, the interventionist Third Worldist trend continued via different independent efforts. The Maoist Internationalist Ministry of Prisons (MIMP), an organisational descendent of MIM, today describes itself as 'a cell of revolutionaries serving the oppressed masses inside U.$. prisons' (n.d.).

Explaining its focus on prisoners in terms of Third Worldism, MIMP states:

> Since we live within an imperialist country, there is no real proletariat – the class of economically exploited workers. Yet there is a significant class excluded from the economic relations of production under modern imperialism that we call the lumpen. Within the United $tates, a massive prison system has developed to manage large populations, primarily from oppressed nations and many of whom come from the lumpen class. (ibid.)

As part of MIMP's strategic practice, it sees 'prisoners in [the US] as being at the forefront of any anti-imperialist and revolutionary movement' (ibid.).

Separately from MIMP, the Revolutionary Anti-Imperialist Movement (RAIM) is 'a collective of revolutionary communist organizers, activists, artists, and technical workers based mainly in the imperialist countries' (n.d. ['What is RAIM?']). Echoing Emmanuel, RAIM believes:

> The masses of the First World are typically net-exploiters whose incomes are above the value they create. This is accomplished primarily through global wage scaling and imperialist exploitation of Third World peoples. 'Super-wages' for a minority of the global workforce has the economic function of saturating wealth in First World corezone economies and an ideological function of transforming the masses in these economies into agents of global oppression and capitalist-imperialism. (Revolutionary Anti-Imperialist Movement 2013)

For RAIM, this creates the historical necessity of a 'global new democratic revolution': 'the hemming in and wide-ranging defeat of imperialism by an international proletariatled coalition of progressive classes, and the building of the requisite productive forces, class alliances, and consciousness to continue the struggle for socialism and communism' (Revolutionary Anti-Imperialist Movement n.d. ['What is Maoism']: 3).

Additionally, RAIM has been openly critical of a pervasive influence of 'First Worldism' within the international communist movement, describing it as 'a trademark of reformism, revisionism, and chauvinism' (Revolutionary Anti-Imperialist Movement 2014: 64).

Zak Cope's academic work also fits into the interventionist trend of Third Worldism. In his 2012 book *Divided World, Divided Class: Global*

Political Economy and the Stratification of Labour, he describes 'First Worldist left-populism' as 'distinguishable from its rightwing variant only by its less openly racist appeal and its greater approval of public spending', elaborating that, 'In neglecting the reality of superexploitation, imperialist-country parties and organizations calling themselves "socialist" are socialist only in the sense that Goebbels and the Strasser brothers were – that is, in advocating a larger share of superprofits, whether in relative or absolute terms, for their own nation's workers' (2012: 296, 297). More recently, in 'Global Wage Scaling and Left Ideology' (2013), Cope responds to an academic dismissal of the labour aristocracy featured in the Marxian journal *Historical Materialism.*

Contemporary Trends in Third Worldism

Relative to Third Worldism as an analysis of global productive relationships order via imperialism along with the basic implications this has for the Marxist conception of revolution, emergent trends within Third Worldism have begun examining shifts in the social composition of privilege and changes to the very nature of the world-economy.

While maintaining the First and Third Worlds as central categories of analysis, Cope notes the political significance of changes in the contemporary labour aristocracy: a growing proportion of 'unproductive labour' it performs and its predominance in tertiary sectors of the economy (2012: 130).

Still writing with lucidity and creativity in 2010, Samir Amin articulates in *The Law of Worldwide Value* a tendency in which, owing to a high productiveness of labour, no more than a tiny fraction of the labour force is set in motion for the creation of the social product. Under such a situation, class rule is principally expressed in an unequal distribution of the total income. Moreover, the maintenance of the existing hierarchies through physical coercion and imposed ideologies of consent would supplant the expansion of capital (i.e. the exploitation of labour) as the governing principle of the world-economy. Such a

system, Amin contends, would no longer be capitalist, but better described as 'neo-tributary'. Not only is such a system possible, Amin maintains, but it is being built right now, expressed by growing socio-economic polarisation characterised as 'apartheid on a global scale' (2010: 52–53). Implied in such a concept of 'neo-tributary' political economy is a shift from a capitalist-imperialism driven by the quest for profit toward a wholly reactionary imperialism chiefly devoted to maintaining and expanding the extant social features of class rule. Due to their recent introduction, no apparent consensus or general view on these topics exists among Third Worldists.

Conclusion

Rather than being confined to a single worldview or interpretation of Marxism, Third Worldism encompasses a historical trend within Marxism centred on the significance of imperialism. Rather than being marginal or ineffective, Third Worldism has been a persistent element in the revolutionary history of Marxism.

Marx and Engels set the fundamental foundations of Third Worldism in place, noting the embourgeoisement of a minority of the working class (made possible by imperialist super-exploitation of a broader section of workers) and also realising its significance as a relevant countervailing tendency to their normal pronouncements on working-class solidarity. The Third Worldist trend took further historical shape in the struggles waged by V.I. Lenin, the leader of the first major socialist revolution, against the opportunism of the social-democratic parties. Lenin's latter views on the revolutionary potential of the 'East' turned out to be correct. Third World countries became the major sites of revolutionary struggles, and Third Worldism became a prominent theme of Marxism during the Bandung period. In the wake of these anticolonial upheavals, intellectuals carried the trend forward, examined additional features of capitalist-imperialism as a predominant mode of production, and often added to or amended orthodox Marxist verdicts. Finally, as a trend, Third

T

Worldism has most recently developed in an interventionist manner which seeks to more directly challenge the influence of 'First Worldism' within Marxism.

Given its penchant for creatively adapting to existing situations and its sense of urgency in relating to questions of economic structure and political super-structure, Third Worldism will assuredly continue to develop, especially as the subjects of its focus – capitalist-imperialism and class struggle – take further shape. Conversely, while class struggle will continue for some time in accordance with the ongoing relationships characterising capitalist-imperialism, the revolutionary quality of such struggles (i.e. their long-term progressive impacts) will depend in part upon the degree to which oppositional forces accurately come to grips with the same questions historically driving Third Worldism forward. Though not homogenous in time and space, the Third Worldist trend of Marxism is broadly implicative, suggesting not simply who will make revolution but, perhaps more importantly, what revolution will substantively look like. In this manner, Third Worldist Marxism is at once comprehensive and concise, incisive and critical, and firmly rooted in the internationalist trend which has broadly characterized revolutionary Marxism throughout history.

Three Worlds Theory

Trade

Trade Liberalisation in the Caribbean

Kevin Edmonds
University of Toronto,
Toronto, ON, Canada

Definition

Trade liberalisation is premised on the universalising assumptions of neoclassical economics, which provides a 'one size fits all' solution to all countries, regardless of their particular histories or their political and social contexts. It can best be understood as a series of policy reforms whereby free trade is encouraged through the reduction of tariffs, subsidies, and quotas which will in theory allow countries to focus on their respective comparative advantages. Yet, despite the insistence of the economists at the World Trade Organization (WTO), World Bank, and International Monetary Fund (IMF), trade liberalisation has not benefited the Caribbean, and because of the inherent imbalance in power relations in many ways it has become collateral damage.

Introduction

Trade liberalisation is premised on the universalising assumptions of neoclassical economics, which provides a 'one size fits all' solution to all countries, regardless of their particular histories or their political and social contexts. It can best be understood as a series of policy reforms whereby free trade is encouraged through the reduction of tariffs, subsidies, and quotas which will in theory allow countries to focus on their respective comparative advantages. Yet, despite the insistence of the economists at the World Trade Organization (WTO), World Bank, and International Monetary Fund (IMF), trade liberalisation has not benefited the Caribbean, and because of the inherent imbalance in power relations in many ways it has become collateral damage. In contrast to the claims of the international financial institutions, the Caribbean provides a stark and troubling example how globalisation and trade liberalisation can play havoc with a region's traditional economic base, dismantling it and as a result tearing apart the social fabric in order to satisfy the interests of American multinational corporations such as Chiquita and Riceland Foods.

When contrasted with the modest but important developmental gains in the post-independence period, particularly in the areas of healthcare and education, the increases over the last 30 years in poverty, inequality, unemployment, and lack of opportunity and the erosion of social services as a result of trade liberalisation have provided the conditions in which the majority of the population are leading lives of increased hardship. The impediments to the achievement of genuine, self-directed development are so numerous and wide-ranging that in 2012, the St Lucian prime minister, Kenny Anthony, remarked, 'Make no mistake about it. Our region is in the throes of the greatest crisis since independence. The specter of evolving into failed societies is no longer a subject of imagination. How our societies crawl out of this vicious vortex of persistent low growth, crippling debt, huge fiscal deficits and high unemployment is the single most important question facing us at this time' (Sanders 2012).

This essay will make clear using the examples of Haiti and the islands of the Eastern Caribbean that the current crisis facing the Caribbean is not one of hyperbole or exaggeration. Despite the

grand promises made about the benefits of trade liberalisation, it has become an unfortunate reality that for many, survival in the modern Caribbean consists in three major strategies: migrating abroad (either permanently or for seasonal labour), dependence on remittances, and supplementing their reduced incomes by working in the informal sector – be it legal or illegal.

Historical Context

When neoliberalism made its initial contact with the Caribbean in the early 1980s, the region had just witnessed the ending of three important, differing, but ultimately unsuccessful experiments with socialism. In Jamaica, Michael Manley's attempt at building democratic socialism was undermined by massive capital flight, political destabilisation, and significant external debt due to the two oil price shocks in 1973 when Arab oil producers in the Organization of Petroleum Exporting Countries (OPEC) cut back production in order to punish the US and Israel's allies for their support of the 'Yom Kippur War' against Egypt. This led to a quadrupling of oil prices, triggering fiscal crises throughout the world. For small, energy-dependent states like Jamaica, this crippled the domestic economy and led to skyrocketing debt. In Grenada, Maurice Bishop and the New Jewel Movement's Grenadian revolution was violently cut short by an internal coup and US invasion. Lastly, Guyana's co-operative socialism led by the high-flown rhetoric of Forbes Burnham became politically and economically isolated because of his descent into dictatorship fuelled by a mix of coercion, corruption, and racial violence.

While the commitment to revolutionary change varied among the three nations, there was an overall rejection of the possibility of self-determination and meaningful growth under capitalism. All three of these political experiments sought to reorganise their societies and economies in order to overcome the legacies of slavery, the colonial plantation economy, and imperialism which had kept them in a condition of economic dependence and persistent underdevelopment.

Despite their respective failures due to a myriad of internal and external factors, the Caribbean was still regarded by the administration of Ronald Reagan as a very real hotspot for 'communist subversion. In his 1982 speech to the Organization of American States, Reagan remarked that 'A new kind of colonialism stalks the world today and threatens our independence. It is brutal and totalitarian. It is not of our hemisphere, but it threatens our hemisphere and has established footholds on American soil for the expansion of its colonialist ambitions' (Dallek 1984, p. 177).

In order to temper the revolutionary and nationalist sentiments in the region, in 1983, Reagan and the United States Agency for International Development (USAID) launched the 'Caribbean Basin Initiative' (CBI) whereby Haiti, Jamaica, and other islands were encouraged to start exporting light manufactured goods while accepting subsidised agricultural products from the US. True to neoclassical economic theory, the CBI argued that a reduction of tariffs combined with an increase in trade would allow for specialisation and lead to a more efficient use of resources. Thus the protections on agriculture were to be eliminated, and market forces would eventually remake the Caribbean in accordance with an export-oriented development model which would reproduce the 'Asian Miracles' of Singapore, Taiwan, and South Korea (Rosen 2002, p. 132).

During this time, much of the Caribbean was still largely dependent on agriculture as a primary source of employment, government revenue, local food requirements, and exports. Thus trade liberalisation would displace significant proportions of the population which made their livelihood in the agricultural sector. Evidence of this can be seen in the example of Haiti, where in the late 1970s an estimated 70% of the population was engaged in agriculture (Dolisca et al. 2007). Furthermore, during the peak of banana production in the late 1980s, an estimated 50% of the labour force of the Eastern Caribbean (St Lucia, St Vincent, Dominica, and Grenada) was directly engaged in the cultivation of bananas (Thomson 1987, p. 61). The CBI argued that those displaced from agriculture would be able to find

employment in the new export processing zones, which were dominated by the textile and apparel assembly industries.

While the stated goal of the initiative was to reduce poverty through developing export-oriented economies and deeper economic integration with the US, it was primarily a way to combat and contain the 'growing influence' of progressive leadership in the region, as witnessed by the rise of Manley and Bishop. As a result, the stage was set for trade liberalisation with the eventual reduction of tariffs, subsidies, and taxes occurring across the majority of the Caribbean. While it is possible to generalise on the negative outcomes related to trade liberalisation, an analysis of Haiti and the Eastern Caribbean provides a much more detailed understanding of how each respective society was negatively affected by the implementation of policies which ultimately benefited US multinational corporations.

Trade Liberalisation and Haiti's Rice Industry

The grim statistics describing Haiti's poverty have been repeated ad nauseam to the point that the nation has become widely known as 'the poorest nation in the Western Hemisphere'. Nationally, 76% of the Haitian people live on less than US$2 per day and 56% on less than US$1 per day (World Food Program 2010). The most recent reliable statistical data indicate that the average gross domestic product (GDP) per capita in 2004 was US$400, nearly half of the US$750 per capita reported in the late 1960s (Hallward 2007). Of Haiti's 9.3 million people, between 2.5 and 3.3 million are estimated to experience food insecurity, with chronic malnutrition affecting 24% of children under five (FAO 2012). Despite the alarming situation, however, things were not always this way.

Despite Haiti's close ties to the US under the Duvalier dictatorships from 1957 to 1986, Haiti was similar to many Latin American countries in pursuing a mixture of import substitution industrialisation polices, with the agricultural sector largely protected behind tariff barriers.

Because of the geopolitical climate of the Cold War, the agricultural tariffs were not seen as a hindrance as long as Haiti remained a political and military ally of the US and acted as a regional counterbalance to Cuba.

Because of this geopolitical situation, the Duvaliers were able to resist demands to remove the 50% tariffs on imports of food, especially rice. These policies enabled Haitian farmers to continue producing the vast majority of the rice consumed in Haiti while limiting other food imports. Prior to the IMF's push towards agricultural tariff liberalisation in 1986, Haiti was largely self-sufficient in the small-scale production of major food staples such as rice, meat, cassava, beans, and corn (Chavla 2010). According to Alex Dupuy (2011), 'All that changed after Jean Claude Duvalier was overthrown in February 1986. The US government successfully pressured the government of General Henri Namphy to "liberalize" the Haitian economy by, among other things, slashing import tariffs and reducing subsidies to domestic agriculture.'

The results that these reforms had on the Haitian agricultural sector are horrific. Haiti imported 16,000 metric tonnes of rice in 1980 and 340,000 tonnes by 2009 – a 21-fold increase in 30 years (Chavla 2010). In 1987 Haiti met over 75% of its domestic rice consumption, but today that number is reversed, with 80% of the nation's 400,000 tons of consumption coming from the US, making Haiti the third largest importer of American-grown rice (Holt-Gimenez 2009). Bill Reed of the Arkansas-based Riceland Foods Inc. (the world's largest marketer and miller of rice) regarded this as a logical situation, as 'Haiti doesn't have the land nor the climate ... to produce enough rice. The productivity of U.S. farmers helps feed countries which cannot feed themselves' (Katz 2010).

The matter of the Haitian rice industry was much more complex than what Reed was arguing. Because of the massive subsidies to producers in the US, Haitian farmers could not compete, according to a 2004 Oxfam report; these subsidies totalled approximately US$1.3 billion in 2003 alone, amounting to more than double Haiti's entire budget for the year (Oxfam International

2004). The former President of Haiti and agronomist Rene Preval stated, 'In 1987 when we allowed cheap rice to enter the country applauded "Bravo" . . . But cheap imported rice destroyed the Artibonite rice. Today, imported rice has become expensive, and our national production is in ruins' (Lindsay 2008).

With the destruction of Haiti's rice industry and the accompanying loss of employment and income, there was a massive exodus from rural communities to Port au Prince, where the migrants sought jobs in low-wage garment assembly plants. With the passage of time it has become apparent that USAID officials actually knew beforehand that trade liberalisation policies would 'increase poverty and contribute to a decline in average Haitian income and health standards' (Chavla 2010). Despite this knowledge, the CBI went ahead, opening the door to the dismantling of the rural economy and the massive dependency that we now witness in Haiti. A Grassroots International report stated that:

> As recently as 2007, a USAID agronomist told Grassroots International that there simply was no future for Haiti's small farm sector – a callous prognosis for the nation's three million-plus small farmers (of a population of 9 million). In a nutshell, USAID's plan for Haiti and many other poor countries is to push small farmers out of subsistence agriculture as quickly as possible. (Grassroots International 2010)

Thus it was decided in Washington that Haitian agriculture was to be dismantled, as self-sufficient agricultural practices would not lead to the growth of agribusiness markets or develop pools of excess cheap labour needed for industrialisation. To make matters worse, in 2009 a report from the World Bank-affiliated group, Nathan Associates, acknowledged that for low-wage factory workers, 'the costs of transportation to and from work and food purchased away from home eat up a substantial share of that minimum wage' (Nathan Associates Group 2009). Thus the implementation of trade liberalisation policies opened the floodgates to cheap, highly subsidised rice, known as 'Miami Rice', into the country and to exploitative sweatshop jobs with minimal contribution to the domestic economy.

After the devastation of the 2010 earthquake, the United Nations Special Envoy to Haiti and co-chair of the Interim Haiti Reconstruction Committee (IHRC), Bill Clinton, admitted that US free market agricultural policy towards Haiti has not worked for the Haitian people, but had been profitable for US agribusiness. In a meeting with the Senate Foreign Relations Committee on 10 March 2010 the former president stated that '[i]t [Haitian trade policies that cut tariffs on imported US rice] may have been good for some of my farmers in Arkansas, but it has not worked. It was a mistake' (Dupuy 2011). Clinton further reflected on his role in undermining Haitian agriculture by stating, 'I have to live everyday with the consequences of the loss of capacity to produce a rice crop in Haiti to feed those people because of what I did; nobody else' (Chavla 2010).

In another interview at the International Donors' Conference in New York on 31 March 2010 the confession of lessons learned continued as Clinton told reporters that '. . . [w]e made this devil's bargain on rice. And it wasn't the right thing to do. We should have continued to work to help them be self-sufficient in agriculture' (Ives 2011). However, when asked how the Interim Haiti Reconstruction Committee planned to revive the Haitian agricultural sector and selfsufficiency, Clinton quickly reverted to the implementation of more of the very same failed policies which had devastated local producers, undermined the nation's food security, and called for increased employment in foreign-owned sweatshops.

Trade Liberalisation and the Eastern Caribbean Banana Industry

In 1957, a preferential trading system was established between the Windward Islands of the Eastern Caribbean (St Lucia, Dominica, St Vincent and Grenada) and the United Kingdom. This was expanded upon in 1976 when the Lomé Convention was signed between the European Community and ACP (African, Caribbean and Pacific) nations, in an extension of preferential

trading policies to former colonies to serve as a form of aid and reparations to ACP nations for centuries of European terror rooted in colonialism, exploitation, and slavery (Payne 2006). The Lomé Convention was the key article in the development of a European banana regime which would ensure that banana growers in the Eastern Caribbean and other ACP nations would have a guaranteed market for their produce in an industry that was otherwise dominated by Latin America.

With such policies in place, the banana industry quickly became the backbone of the Eastern Caribbean economy. The World Bank estimated that during the steady period of production in the 1980s, the banana industry injected almost €1 million into the St Lucian economy every week (Thomson 1987). This infusion of money into the hands of small farmers had a tremendous multiplier effect on the economy, in contrast to tourism or manufacturing based in export processing zones.

Despite being an industry historically rooted in highly unequal terms of trade, the banana trade did bring forth a degree of stability and genuine economic development to a significant portion of the Eastern Caribbean and supplied the governments with their primary source of income. Bananas affectionately became known as 'Green Gold' among the small farmers as the steady prices enabled them to raise their humble standard of living. For the first time, the state was receiving enough money to begin nationwide infrastructure programs, bringing paved roads, running water, and electricity to those located outside the capital cities.

Shortly after the introduction of the European Union's new banana regime in 1993, it was challenged at the General Agreement on Tariffs and Trade (GATT) by five Latin American nations (Ecuador, Guatemala, Nicaragua, Panama, and Costa Rica) for contravening free trade rules. The Latin American nations claimed that the European Union was unfairly discriminating against them by implementing tariffs, which limited the competitive advantage of Latin American bananas. While the Windward Islands as a whole contributed only 4.6% of the world's total banana exports in 1995, this did not prevent the US Trade

Representative and corporations such as Dole, Del Monte, and Chiquita from continually portraying these tiny islands as a threat to the global economic order and the hegemony of free trade (Myers 2004).

Despite contributing only 2% of the global banana trade, the tiny Windward Islands of the Caribbean and their protected trade with England became the primary battle-ground for sanctity of free trade with the WTO leading an all-out assault on the nearly 50-year-old protected trade arrangement (Myers 2004). The WTO's rulings turned the uncertainty surrounding the Eastern Caribbean banana trade into a foregone conclusion that despite being the economic backbone of the region, in the new era of free market fundamentalism it was too inefficient to exist. Therefore from 1993 to 2012, the Eastern Caribbean would become engulfed in the largest and longest-running trade war in the history of the WTO.

The key figure pushing for the dismantling of the protected banana trade was Chiquita's Carl Linder. Between 1990 and 1997 Linder donated over $2 million to both parties to purchase as many allies as possible for his assault on the Caribbean banana trade. In order to set things right for Chiquita, Linder arranged for a meeting with Bill Clinton's trade representative and pleaded his case for trade sanctions against Europe in retaliation to their protected markets. Chiquita claimed that the protected trade 'establishes arbitrary and disruptive sourcing requirements; authorizes confiscatory and discriminatory licences and fees; and, since its signing, has worked a substantial incremental hardship on US commercial interests' (Myers 2004, p. 77). In order to prove this, Chiquita filed a petition under section 301 of the US Trade Act of 1974, claiming that the Hawaii Banana Industry Association had been negatively affected, even though Hawaii had never exported any bananas. This manipulation of the trade law was not based on knowledge of the law alone, but was also due to the significant power Linder had in the White House.

Finally, the influence of Carl Linder and his money also overpowered the statements of the Commander-in-Chief of the US Atlantic

Command, General John Sheehan, who publicly expressed his fear of 'regional destabilization and increased drug flows if US policy on bananas did not change' (Myers 2004, p. 107). Furthermore, in 1996 an International Narcotics Control Strategy Report by the US State Department warned that 'the terrain in the Windward Islands was most attractive to South American transhipping of cocaine and that struggling farmers had been turning to marijuana as a cash crop to replace lost earnings' (ibid.). By ignoring these statements, it revealed that the motivation for US policy clearly came from corporate board rooms, where profit maximisation and 'strategic geopolitical interests' were simply one and the same.

Over the course of the 21-year dispute the Caribbean has seen a dramatic decline in its agricultural output as the region can no longer rely on traditional markets for its produce. As Professor Thomas Klak of the University of Miami stated, the Caribbean banana trade has gone from 'riches to rags' (Klak et al. 2009, p. 34). For example, in 1988 Dominica and St Lucia produced 76,872 and 168,060 tonnes of bananas respectively; by 2011 Dominica produced 23,039 tonnes of bananas, with St Lucia managing 23,810 tonnes – a drop of nearly 70 and 85% in 23 years (FAO STAT 2013).

In St Lucia, the unemployment rate stands at over 20%, with the youth unemployment rate reaching a staggering 32% ('Unemployed Youth can Take Hope' 2012). International financial institutions have openly stated that St Vincent's unemployment rate is difficult to discern, but agree that annually fluctuates between 25% and 30% (IMF 2011).

One of the primary challenges of demonstrating the negative impacts of globalisation is that progress and development are measured simply by a rise or fall in the GDP. In St Lucia, by GDP alone, the country stands as a middle-income country with a per capita GDP of US$6626. However, this statistic – often the backbone of most neoliberal arguments – does not tell us anything regarding how income is distributed within the nation. A closer look at St Lucia reveals that while the GDP is steadily rising, so is the income inequality between different segments of society. In its 2009 Population Data Sheet, it was revealed that 41% of the St Lucian population lived on less than $2 per day, which put it second in the region only to Haiti, where 72% of the population fall in this category (Population Reference Bureau 2009).

Commenting on the economic devastation that neoliberal trade policy had upon the island, St Lucia's minister of foreign affairs and international trade commented to the United Nations General Assembly in 1998: 'Mr. President, international terrorism can take many forms – to destroy a country's economic base and thrust its people into unemployment, poverty and despair, is as horrendous as blowing up its citizens with bombs' (Odlum 1998).

The Caribbean in the Contemporary Context

Because of their small size and the structural legacies of colonialism, the countries of the Caribbean were already some of the most vulnerable economies in the world and were marginalised on the periphery of the global economy. Despite the foundational assumptions of free trade, the spread of trade liberalisation to the Caribbean has revealed that the supposedly 'neutral' idea of free trade is used as a vehicle to further the interests of the most powerful nations and their respective corporations. While this essay has dealt specifically with the case studies of Haiti and the Eastern Caribbean, a similar narrative about the predatory role that multinational corporations have in the region has also played out across the region.

Indeed the economic restructuring of the Caribbean has taken on troubling neo-colonial characteristics. Despite reassurances that the region would find new and effective substitutes for the lost sectors, nothing comparable has emerged. Under the current global trading system, the Caribbean has been coerced into the liberalisation of trade; into the opening of its economies while at the same time the developed world – the same promoters of free trade – engages in protectionism and other unfair trading practices.

T

While tourism is now the largest contributor of income in the Caribbean, its current structure does little to stimulate the local economy, as links to other industries such as agriculture must be created. For instance a 2011 World Bank report on Jamaica revealed that as much as 80% of tourism earnings do not stay in the Caribbean region, one of the highest 'leakage' rates in the world (Jackson 2012; World Bank 2011). According to Victor Bulmer-Thomas of London University, 'In all-inclusive Caribbean hotels it is common for only 20% of revenue to be returned to the local economy' (McFadden 2012). Thus as a result of trade liberalisation, the governments of the Caribbean have seen their primary sources of revenue disappear – with new industries such as tourism, garment manufacturing, and financial services demanding low or no tax concessions. This has resulted in a decrease of government spending in healthcare, education, and infrastructure across the region.

Given the erosion of the region's economic base it should not come as a surprise that according to a 2006 study by the IMF, the Caribbean had the highest emigration rates in the world (Mishra 2006). In May 2013, the *Jamaica Gleaner* reported that because of a lack of opportunity on the island an estimated 85% of university-educated Jamaicans migrate to find jobs elsewhere (Haughton 2013). While Jamaica's experience is shockingly high, it does not even lead the region, as Guyana occupies that position with 89%. Haiti and Trinidad follow with respective rates of 84, and 79%. Furthermore, most Caribbean countries rank among the top 30 countries in the world with the highest remittances as a percentage of GDP. The Caribbean is the world's largest recipient of remittances as a share of GDP (Mishra 2006).

Commenting on the inability of enclave industries such as tourism and garment assembly to bring about tangible benefits to the Caribbean, together with the increased rates of emigration and the higher cost of living, a 2012 report published by the Economic Commission on Latin America and the Caribbean revealed that poverty and inequality were on the rise throughout the region, leading to increases in crime and social dysfunction (ECLAC 2012). Thus it is no coincidence that trade liberalisation and the resulting collapse of the Caribbean's agricultural industries have provided fertile ground for the drug trade to expand and intensify across the region. The scale of crime has coincided with the area being declared by the United Nations Office on Drugs and Crime in 2007 as the most violent region on earth (UNODC 2007).

Overall, the restructuring of the Caribbean's economic base has had a very sharp neo-colonial character to it, as the shift towards tourism and low-wage garment manufacturing means that once again the Caribbean is primarily a region organised in order to serve and cater to the demands of Western economic interests. Indeed given the experience of the Caribbean, trade liberalisation must be regarded as a negative economic shock from which the region has yet to recover almost 30 years later. Throughout the region financially strapped governments lack the ability to fund social programmes or infrastructure, and are unable to effectively counter the increasing rates of poverty, inequality, and crime. The 2008 financial crisis and resulting decline in development assistance from the US and the European Union has threatened to accelerate the erosion of the important developmental gains made in the region. In many ways, the Caribbean is experiencing its own extended version of Latin America's lost developmental decade of the 1980s.

However, because of nearly two decades in which the neoliberal trade agenda has torn apart the social fabric and economic base of many Caribbean nations, the region is increasingly forging closer ties with nontraditional allies opposed to US hegemony such as Venezuela. The primary institutions which anchor this new relationship against US hegemony and free trade in the region are Petrocaribe, the Bolivarian Alternative for the Americas (ALBA), and the newly formed Community of Latin American and Caribbean States (CELAC). While there are indeed undeniable pragmatic motivations behind the Caribbean's shift towards Caracas, it also highlights the potential of regional integration within the Caribbean and the benefits of increased South–South

co-operation. Previously fragmented and highly vulnerable to external shocks, the Caribbean's new partnership with Venezuela has provided a progressive breathing space for re-imagining regional integration and the possibilities of national self-determination.

Transnational Ireland: Political Economy, Colonialism, and Resistance in the Global Context

Introduction

Colonial polities do not exist within a vacuum, nor are they connected only to their metropole. Imperial powers either directly or indirectly link their colonies to one another in multiple ways in order to allow for the constant evolution of their tactics of colonial control. The case of British colonialism in Ireland is no different: for centuries, British control over Ireland did not just impact the island itself. From the early settler colonization of Australia with Irish convicts to the use of the Black and Tans to put down Palestine's Great Revolt of 1936–1939, Irish history has long been linked to colonial histories across the globe. Therefore, it does Irish history a disservice to limit its telling to events which occurred exclusively on the island itself.

This chapter seeks to tell the story of British colonization and Irish resistance through a transnational lens. It first sets the stage by detailing the early years of colonization and showing how settler colonialism in the seventeenth and eighteenth centuries impact dynamics on the island to this day. Second, it explains the transition from direct settler colonialism to the incorporation of Ireland into the United Kingdom via the Act of Union with an explicit focus on the ways in which the evolution of British control on the island shaped how the tragedy of the Great Famine unfolded. Bringing Ireland into the global context, it connects the British convict system that forcibly removed thousands of Irish from their homeland with the settler colonization of Australia. Third, it contextualizes the Easter Rising and War of Independence within the changing face of colonialism globally in the early twentieth century. Fourth, it argues that partition of the island was no decolonization, even for the south; through a detailed economic history of the early years of the Free State (and later the Republic), it makes clear the ways in which Britain has retained a neocolonial hold on Ireland through economic dependency. Fifth, it links the most recent anticolonial rising on the island – the Troubles in the North – to the decolonization processes and global civil rights movement of the 1960s as well as the struggle in Palestine, reframing the Troubles as anti-imperial resistance with impact beyond the six counties. Finally, it looks to the future, examining the possible impacts of Brexit and detailing what the current geopolitical environment means for the possibility of a united, socialist Ireland.

Setting the Scene: British Conquest and Settlement, 1606–1778

From the time of the Norman invasion and conquest of the island in 1169, the English utilized tactics of both colonialism and settler colonialism to maintain control over Ireland. The early years of colonization saw the English struggling for control as power vacillated between the English colonizers and native Irish chieftains. To address this, the English introduced settler colonial tactics as a means by which to keep the island under their control. The Plantations of Ulster – the first official, policy-based instance of settler colonialism in Ireland – were settled in the early seventeenth century, a full century before the Act of Union (1707) which incorporated Scotland into Great Britain and nearly two centuries before a similar act brought Ireland into the United Kingdom (1800). Between the invasion of the Normans in the late twelfth century and the Elizabethan wars of the mid sixteenth century, the English maintained a presence in Ireland, but their power fluctuated with that of the native Gaelic chieftains (Connolly 2017). By the time of the Protestant Reformation in the mid-late sixteenth century, however, the English solidified their control, instituting a centralized government and disarming the native lords on the island. They utilized settler colonialism to maintain this control, dispossessing natives who attacked the crown and replacing them with thousands of Scottish settlers (Beggan and Indurthy 1999). Britain had effectively integrated Scotland only a few years prior, in 1707, and King James I utilized the newly-integrated Scots as settlers in the North of Ireland. The king approved the dispossession of rebellious landowners and claimed that only loyal landowners with legitimate claims to their lands had the right to keep them. However, the British government subjectively determined the categories of "rebellious" and "loyal" landowners.

On the stolen land, the British government and government-sponsored companies build plantations. The first plantation was set up by Scottish Protestants in north Down in 1606, and quickly spread into Belfast and across the rest of county Down and county Antrim (Connolly 2017). In 1607, Catholic leaders began to flee for fear of persecution from the colonial government as settlement of their land in Donegal, Tyrone, Derry, and Armagh began (Mitchell 2000). The official, government-funded plan for the "Plantation of Ulster" was formally put into place in County Derry in 1610. London-based companies, which claimed the settlers were "civilizing" Derry, predominantly funded the seizure of land by settlers (Connolly 2017). The companies divided the land between Scottish and English settlers who were prohibited to rent to Irish tenants. The native Irish were pushed to the less fertile lands both outside and on the fringes of the province of Ulster – for

which they often paid double rent. By 1622, settlers constituted 10% of the island's population, numbering approximately 14,000 (Connolly 2017). Irish resistance was limited, primarily as a result of both legal limitations and the island's history of colonization, but the settlers failed to take complete control of even the northernmost regions of Ireland. This was in part due to the fact that fewer settlers emigrated to Ireland than had been anticipated (Mitchell 2000). Tensions also played a role: Protestant settlers were fearful of the dispossessed natives, while the native Irish Catholics were resentful of the violence under which they were displaced, expelled, and continued to suffer.

Over the following 150 years, tactics of British settler colonialism in Ireland would evolve from the active seizure of land to legal restrictions on the civil, political, and economic rights of Irish Catholics. These restrictions were harshest in their limits on land ownership across the island, and, as a result of them, by 1778 barely 5% of the land on the island was legally held by its native inhabitants. Many of the native Irish were forced to become tenant farmers on the lands which they used to own in order to survive (Connolly 2017).

Legacies of Settlement, Realities of Colonialism: Incorporation of the Island and the Great Famine, 1800–1900

In 1801, following nearly 200 years of de facto British rule, the Act of Union was passed to legally incorporate Ireland into the Kingdom of Great Britain. While the power of the Irish legislature over the island had been largely ceremonial under English colonial control, its dissolution under the Act of Union was the final nail in the coffin of Irish home rule. During this period, the Royal Irish Constabulary (RIC) was set up to police rural areas where unrest grew following the Act of Union; the RIC would be the primary force of colonial counterinsurgency in Ireland until the force's post-partition dissolution. Additionally, in the nineteenth century, the structures of land ownership and renting which had begun to take shape in the late eighteenth century were well

established. Ireland was predominantly owned by absentee landlords living in Britain who ran their estates via the middleman system, wherein landowners left rent collection up to middlemen who were in a position to exploit the native Irish – the majority of whom lived in poverty on ever-shrinking plots of land, where potatoes were the only crop which could be grown in a high enough quantity to feed a family – before returning rent revenues to their bosses back in Britain. This wealth extraction was economically disastrous for Ireland; in 1842, it was estimated that £6,000,000 (accounting for inflation, this amount would be worth nearly £700 million today) was extracted from Ireland just in rents (Woodham-Smith 1962). The privatization of land via enclosure was vital in allowing this process to develop, as it allowed those who could afford to own land to extort those who could not by accumulating more and more acreage while locking the poor into exploitative rental agreements. As a result of this system, primarily Irish Catholic tenants paid exorbitant rents and received minimal wages to raise crops, the vast majority of which were exported to Britain. In this way, the absentee landlord system provided an additional means of British colonial control in its structural exploitation of the Irish workforce and extraction of resources in the form of Irish agricultural products. It was in this context that, in 1845, the disease *Phytophthora infestans* arrived on the island, destroying anywhere from one-third to half of that year's potato crop (Ó Gráda 2005).

Because the Irish peasantry – who made up the vast majority of the Irish population – was dependent on the potato as their primary source of food, they were the main victims of the famine. When the blight destroyed over three-quarters of the potato crop in 1846 while other foodstuffs were still being exported to Britain and mainland Europe, the dying Irish began looking for answers (Kennedy et al. 1999). They first looked to the colonial government for a response to the quickly-snowballing crisis. Long before the start of the famine, colonialism had taken Irish economic prosperity out of the hands of the Irish and put it under the control of British landlords and the colonial regime. The Tory government which was in power in Westminster at the start of the

famine did little to abate its early impacts; by the time a public works program was set up and tariffs on grain were repealed in 1846, the response was too little too late. The Whig government which took power in late 1846 were no better. Their policies were deeply based in laissez-faire economics, and therefore they continued to encourage food exports from Ireland while also ending the limited food and relief programs put into place by the Tories (Ross 2002). Though they ended these programs in mid-1847 and replaced them with the Irish Poor Laws in an attempt to abate the widespread starvation, the costs of the laws were borne primarily by the landlords and middlemen whose predatory practices had contributed significantly to the famine's devastation. As a result, landlords began to evict renters on smaller plots in order to combine them and rent them at higher prices. It is estimated that between 1846 and 1854, over half a million people were either evicted or pressured into "voluntarily" surrendering their land (Póirtéir 1995). Devastated by starvation, disease, and landlessness, the Irish lower classes had little choice over their fate. By the end of the famine in 1851, it is estimated that nearly 1.5 million had died while another million had emigrated since the blight struck in 1846 (Mokyr 1983; Census of Ireland 1851).

Many Irish who left the island during the famine period found their way to Australia, either voluntarily or not. Some voluntarily emigrated, while others were sent under the convict system to serve their sentences. The liberalization of penal codes in the early nineteenth century turned British society against both the death penalty and the wide range of crimes for which it was the punishment, and, as a result, British lawmakers found themselves facing a sharp increase in the volume of convicts entering the empire's jails (Hughes 1986). In an attempt to address this situation, lawmakers broadened the category of "transportable" offenses, which were punished by shipment to Australia. Seen as a more humane tactic of punishment as opposed to death, transportation to Australia became the fate of nearly 149,000 convicts of the British Empire between 1788 and 1868 (Hughes 1986). As one of the largest single ethnic groups within the population of convicts, Irishmen constituted nearly a quarter of this total number (Hughes 1986). As the primary means by which the British settled Australia, the convict system served as a link between Britain's settler colonies of Australia and Ireland. The settler population was essentially made up of the undesirables – the convicts, the poor, and the colonized – of the metropole (Hughes 1986). The elimination of the Aborigines of Australia began with the arrival and subsequent actions of settlers, who held significant power over the Aborigines, in stark contrast to their lack of such power back home. The settlers were given complete control over the Aborigine populations. Seemingly without concern for their shared past as colonized subjects, they implemented devastating strategies of settler governance alongside tactics of elimination, all while the transfer of settlers continued.

The connections between settler colonialism in Ireland and Australia are relevant to understanding why settler colonialism in Australia led to an elimination of the Aborigines even in the face of Aboriginal resistance. The tactics of population transfer used to colonize Australia did not just appear out of thin air. Settlers landing in Australia employed – with the support of Great Britain – evolved versions of the tactics used to settle Ireland. In addition to the tactics of settlement, strategies of counterinsurgency also moved from Ireland to Australia. The RIC – Britain's counterinsurgency force in Ireland from 1822 until 1922 – provided both officers and strategic guidance to Australia's fledgling Victoria Police (Herlihy 1997). After the famine, however, the RIC became quite busy at home. The growth of organized Republicanism in the latter part of the nineteenth century provided the structure needed for the Fenian Rising of 1867, the Easter Rising of 1916, and the outbreak of the Irish War of Independence, which shook the very roots of British control over Ireland.

Rebellion and "Independence": Fracturing the Union, 1916–1922

The early part of the twentieth century saw the Irish fight for independence intensify both in the

legislature and in the streets. The Third Home Rule Bill was passed through Westminster in mid-1914, but the outbreak of World War I led to its suspension almost immediately. In 1916, the Irish Citizen Army and the Irish Volunteers – both newly created militant Republican organizations – rose up against British rule in Ireland in the Easter Rising. They targeted strategic sites of British control across the island, particularly in Dublin. Due to limited public support and the sheer size and technological prowess of the RIC and British military, the rising was crushed within the week. However, the execution of the rising's leaders, internment of hundreds of its participants, and imposition of martial law in its aftermath drew a large portion of the Irish public towards Republicanism (Coleman 2013). In 1919, after Sinn Féin won three-quarters of the Irish seats in Westminster, a group of the newly elected representatives gathered to form the first Dáil Éireann, declaring themselves the parliament of a 32 county Irish Republic with sovereignty over the entire island. When the British refused to negotiate with the Dáil Éireann or recognize Irish independence, the War of Independence broke out between the Irish Republican Army (IRA) and the British military.

The years immediately following World War I saw the beginning of the end of formal colonialism, with many colonies particularly in the Middle East and North Africa turning into mandates or protectorates under European powers. Although the Western powers maintained colonial control over the mandates, they were set up with the stated intention of eventually becoming independent states. Within this global context, Britain recognized that it could not maintain its control over Ireland. In light of this and in order to end the War of Independence, the British government agreed to negotiations with representatives of the newly declared Dáil Éireann, out of which came the Anglo-Irish Treaty that partitioned Ireland into the southern 26 counties, which became the Irish Free State, and the six northeastern counties, which remained a part of the United Kingdom. Immediately following the partition of the island, a civil war broke out across the island between those who supported the Anglo-Irish Treaty and

those who thought that supporters of the treaty were sellouts to the British government and had given up the goal of unified Irish independence. Additionally, there were tensions as to whether the new state should become a capitalist or socialist republic. Because a significant portion of those who had fought for independence were a part of the Irish Citizen Army – an avowed socialist republican organization – there was sympathy for the new Irish state to become a socialist republic. Some, such as renowned socialist republican James Connolly, went so far as to suggest that Ireland existing as a capitalist state would allow it to continue to be dominated by England, despite achieving formal independence. He argued, "if you remove the English army tomorrow and hoist the green flag over Dublin Castle, unless you set about the organisation of the Socialist Republic your efforts would be in vain. England would still rule you…through her capitalists, through her landlords, through her financiers, through the whole array of commercial and individualist institutions she has planted in this country" (Connolly 1897). Despite Connolly's warning, the 26-county Irish Free State was established as a capitalist republic. As Connolly predicted, it remained deeply tied to the British economy, which allowed Britain to maintain neo-colonial power over the Irish state. Additionally, while the Free State government attempted to build a new state and repair its relationship with Great Britain, Irish Catholics in the newly established Northern Ireland grew more intensely oppressed politically, economically, and socially.

Building the New Nation: 1922–1970

Formally established in 1922, the Irish Free State's economy benefited from the post-war boom that had increased profits for both agriculture and industry across the island. The Irish economy still had significant financial issues. Namely, it was very reliant on Irish banks for loans in its early months, in part as a result of the challenges that tax avoidance and evasion posed to increasing the new state's revenues (McLaughlin 2015). The government had to

continually ensure that its income tax rates were below those of Britain in order to keep hold of the limited number of taxpayers who contributed to its revenues; while this prevented population loss and draining of capital, it also decreased the possible revenues of the government. As a result of this limited revenue, the Free State also had to cut welfare spending, much of which it had inherited via British programs. In the area of monetary policy, the new government actively chose to put off establishing a new currency and instead pegged the Irish pound to the pound Sterling (McLaughlin 2015). This directly tied Irish monetary policy to that of Britain, which allowed Britain to retain some control over the health and policies of the Irish economy. Additionally, due to rising inflation across Europe, the new Irish state feared that changing currencies would lead to unpredictable financial fluctuations that could harm both the salience of and confidence in the new government and economy (McLaughlin 2015).

In the agricultural sector, output prices were falling as international competitors who had dropped out of the market during World War I reentered it. Growth in the Irish agricultural market was primarily dependent on exports, a significant portion of which went to Britain (Hynes 2014). As William Hynes notes, "75% of aggregate money receipts of Irish free state farmers came from sales of livestock, livestock products and crops to export markets," which made agricultural export development vital to the health of the Irish economy (Hynes 2014). In an effort to boost growth in the agricultural sector, Cumann na nGael put policy regulations into place in an attempt to improve the quality of Irish produce in order to make it more competitive in the international market (McLaughlin 2015). In the industrial sector, the primary aim of the Free State was to create a strong industrial capacity, as the predominance of Irish industrial capabilities had been concentrated in the northeastern six counties, which had remained a part of the United Kingdom and were no longer contributing to the Irish economy following partition. Significant foreign direct investment by American and German companies such as Ford and Siemens-Schuckert boosted the

industrial sector in the Free State, but it still failed to compare to the pre-partition production (McLaughlin 2015). Following the global market crash in 1929, in an attempt to boost the Irish economy, Cumann na nGael introduced limited import tariffs in 1931. These efforts were not seen as strong enough to combat rising unemployment and decreasing opportunities for emigration, and paved the way for the 1932 election of Fianna Fáil, whose economic platform was known for its far-reaching protectionism.

Fianna Fáil argued that rising Republican paramilitary activity on the island was in part a consequence of economic deprivation which had resulted from Cumann na nGael's failed economic response to the depression (Daly 1992). Thus, when Eamon de Valera – an Easter Rising leader and known Anti-Treaty activist – and Fianna Fáil won the election of 1932, they radically shifted economic policy and ramped up the Free State's protectionist policies in order to develop Irish industry and cut remaining links between the Irish state and Great Britain. When the new government suspended payments on land annuities to Britain and thus defaulted on loans and obligations of the Anglo-Irish Treaty in mid-1932, the British government put tariffs in place in order to recover their losses, and the Irish government responded with counter-tariffs. This back-and-forth led into the Anglo-Irish Trade War of 1933–1939.

The first sector which fell victim to British tariffs was agriculture, where the British primarily targeted Irish cattle exports with a 68–88% customs duty (O'Rourke 1991). This severe response – though economic in nature – was based upon political interests. As Kevin O'Rourke explains, "de Valera's move was seen as a first step toward the eventual demolition of the many constitutional ties still linking the Irish Free State with the United Kingdom. British ministers hoped that trade sanctions, by damaging the interests of Irish farmers, would make de Valera's minority government unpopular and lead to his replacement by the more cooperative Cumann na nGael party" (O'Rourke 1991). Nevertheless, the Fianna Fáil government dug in their heels, and by 1937, the average Irish tariff was 45% and nearly 2000 articles were subject to import controls

T

(O'Rourke 1991). Irish tariffs exceeded British tariffs by one-third, and while they were initially implemented as a reactionary measure, they became a tool of development and protectionism of Irish industries (Daly 1992). While the British had hoped the trade war would hurt Fianna Fáil politically, by the middle of the 1930s, Cumann na nGael publicly supported Fianna Fáil's economic policy decisions, and this in part led to the settlement of the trade war.

Irish neutrality in World War II was supported by all major political parties, and instead of entering the war, de Valera called a state of emergency. As a result, restrictions were placed on movement, particularly for farmers. Nevertheless, emigration doubled in the 1940s compared to the years during and after the Great Depression (McCann 2011). The primary impact of the state of emergency, and partly the reason for increased emigration, was scarcity and the resulting decrease in living standards. In addition to scarcity, wages for workers in the Free State – unlike those in the North, whose economy and industrial sector benefitted from British involvement in the war – decreased by 30% (McCann 2011). Despite these temporary economic difficulties, the Free State emerged from World War II with a per capita GNP which was equivalent to that of the pre-war period as well as a blossoming tourism sector which had developed during the war as an escape from the conflict, primarily for residents of Britain and Northern Ireland.

In the years immediately following the war, the Irish Free State formally became a republic via the Republic of Ireland Act of 1948, which was implemented in early 1949. In naming itself as the Republic of Ireland, the former Free State formally exited the British Commonwealth, thus putting the power which had previously belonged to the British monarchy in the hands of a President, the new head of state. This declaration cut the last political linkages between Great Britain and Ireland, and while the functional changes were minimal, the early years of the republic were fraught with economic difficulty.

At this stage, the Republic became even more economically differentiated from the North, which was primarily shown in the significantly lower living standards in the Republic. Additionally, the Irish economy remained dependent on its agricultural exports, which constituted 80% of total exports (Daly 2016). Britain remained one of the few countries still importing agricultural products to a significant extent, and it held a large portion of Ireland's economic salience in its hands due to Irish dependence on British demand (Daly 2016). As markets contracted globally, the Irish government responded by cutting public spending even more than in 1922, which only compounded the Republic's economic troubles. One of the main issues that arose when "government spending...was reduced by 15 per cent and the public sector's percentage of national income dropped from 35 per cent to 30 per cent" was that public sector employment was no longer an option for many new entrants to the workforce (McCann 2011). This, unsurprisingly, only worsened the Republic's already severe emigration crisis. With economic crisis looming, Ireland turned to the European Economic Community (EEC) as a chance to improve their economic prospects.

In their first attempt to gain entry into the EEC in 1961, the Irish government began to significantly cut tariffs and move towards free trade for the first time in over 30 years by investing more in the public sector while also implementing tax incentives and other tactics to attract multinational corporations and foreign direct investment in order to internationalize the Irish economy. This was a major shift from the protectionist policies which had defined much of Irish economic policy since partition, and pushed it further along the track towards joining the EEC. This membership would be vital, as "the EEC route provided something new for the Irish government that would eventually locate it in a dynamic developmental process which would, significantly, be outside the orbit of and dependency on the British economy" (McCann 2011). Primarily, it would give Ireland more open access to European markets in order to reduce its dependence on British demand and consumption, particularly within the agricultural sector. Ireland did not end up joining the EEC at this stage, however, as a French veto of Britain's concurrent application led the Irish government to withdraw its own.

However, in 1965, the Irish government shifted its policies. While Ireland's Central Bank attempted to reduce imports, exports fell significantly, and the government attempted to regain control over the economy by introducing tax hikes compounded by cuts to public spending (Daly 2016). In a response, the Republic signed the Anglo-Irish Free Trade Area Agreement in 1965. This agreement opened Irish markets to British manufacturing imports while also opening British markets to Irish agricultural goods. While it was promising for Irish agricultural producers at the beginning, Daly argues that the agreement held limited agricultural export gains for the Irish and kept them dependent on British consumption while allowing the British to increasingly restrict Irish market opportunities (Daly 2016).

Much of the period following the transition from Free State to Republic was also characterized by Irish Republican Army (IRA) activity along the border with the North. Harsh security measures put in place in the early years of the Republic crushed most IRA activity until the mid-1950s, when a reinvigorated and re-armed IRA began a series of border campaigns against military and infrastructural targets in the North. As Séan Cronin, the primary organizer of the border campaigns, wrote, the aim was to "break down the enemy's administration in the occupied area until he is forced to withdraw his forces. . .in time as we build up our forces, we hope to be in a position to liberate large areas and tie these in with other liberated areas – that is areas where the enemy's writ no longer runs" (General Directive for Guerrilla Campaign, 1957). The campaign was launched in late 1956 and remained active for 5 years primarily attacking barracks of the Royal Ulster Constabulary (RUC) and other key military targets. The introduction of internment in mid-1957 by the Fianna Fáil government made IRA activity even more difficult, and diminishing popular support in the following years led the IRA to abandon the campaigns in late 1961. The failure of the border campaigns provided a stark example of the difficulty of post-partition resistance to British control over the North. While militant Republicanism maintained a presence in the south, the complications of having to navigate two different regimes of internment in addition to a hostile government and nonsympathetic public made resistance nearly impossible. The end of the border campaigns was by no means the death of the Republican movement or even just its armed wing. When the Troubles broke out in the North shortly thereafter, the Provisional IRA – a successor to the IRA of the border campaigns – came to the forefront of the Republican struggle.

The Troubles: Colonial Legacies and Realities, 1969–1998

As global movements for civil rights and decolonization began to strengthen during the 1960s, Irish civil rights activists joined the struggle for their comrades in the North. Civil rights activists, including those who spearheaded the Northern Ireland Civil Rights Association (NICRA), found solidarity particularly with African-Americans who were fighting for their rights in the USA. As human rights activist Brian Dooley explains, "as early as 1963, civil rights protesters in Northern Ireland had compared themselves to blacks in Alabama and Little Rock. . .They sang 'We Shall Overcome' at their marches and in early 1969 deliberately modeled a protest march on the lines of the Selma-Montgomery march" (Tewksbury 2008). Their solidarity was not unmatched, however; just as police and white communities did in the USA, the British military and settler Unionists increasingly unleashed violence against Irish Catholics as their political rights remained stifled. By 1968, confrontations between civil rights activists and their oppressors ushered in the era known as "the Troubles" as Irish Catholics rose up once more to fight for their rights.

On 5 October 1968, police in Derry injured over 30 people when they unleashed indiscriminate violence in the form of batons and water cannons to break up a civil rights protest in Derry (Purdie 1990). In response, local paramilitaries on each side reemerged – the Ulster Volunteer Force (UVF) and Ulster Defense Association (UDA) for the Unionists and the IRA for the Republicans. In mid-1969, the British

government granted the RUC's request for more troops on the ground in Belfast and Derry. By this time, 7000 Catholic refugees had crossed the border into the Republic of Ireland (Kennedy-Pipe 2006). As the IRA recommitted to armed struggle and launched a campaign against the British Army, the Parliament of Northern Ireland at Stormont (which at this point functioned as a devolved governing body that controlled regional affairs but continued to answer to Westminster) passed emergency legislation to introduce internment without trial against those suspected of insurgency. This order angered Catholics specifically, as they were targeted for in-depth interrogations and were disproportionately interned in the special prisons set up under the internment regime. This all occurred while house searches, curfews, and other British military campaigns, which had been facts of life in the North prior to the Troubles, spiked with the return of British forces. Divisions within the Unionist and Republican sides fractured the system of shared governance, and on March 20, 1972 – following mass demonstrations against the January murder of 13 civil rights demonstrators by a parachute regiment of the British Army in Derry – the British government closed Stormont, introducing direct rule (Purdie 1990).

Direct rule contributed to some of the highest levels of violence seen throughout the Troubles; the deaths of 480 people in 1972 is the highest casualty rate of the conflict by far, with the next highest occurring in 1976 with 297 deaths (Sutton 2002). Following the failure of a 1973 referendum as to whether the North should remain a part of the United Kingdom, the British government released a White Paper that created a power-sharing executive and the Council of Ireland, which was meant to promote cooperation between the North and the South as well as foster the development of a devolved government (Kennedy-Pipe 2006). This policy collapsed in mid-1974 as a result of blowback from Unionists, who claimed that the Council of Ireland was little more than a back channel in favor of Irish unity.

Following the dissolution of Stormont in 1972, the British government made a clear point to avoid announcing a state of emergency or declaring war on the IRA in order to emphasize that the situation was one of criminal activity rather than an anticolonial struggle. The British goal was to not legitimize the IRA or endorse the grievances of the colonized majority (Kennedy-Pipe 2006). This decision was compounded by the removal of special category status. Paramilitary prisoners convicted of terrorism were considered criminals, which prevented them from wearing their own clothes and freely associating with other prisoners. These were rights they had enjoyed when they were classified as political prisoners (Kennedy-Pipe 2006).

Hunger strikes against this policy change, led by Bobby Sands, were met with a harsh response from the British government that was widely condemned by both the European Commission on Human Rights as well as the US government. The strikers received substantial global solidarity, most notably from Palestinians in Israeli prisons who affirmed that prisoners in Nafha and the H-Blocks as well as the PLO and the IRA were engaged in a common struggle. Specifically, the message of solidarity was expressed by Palestinians in Nafha prison, who wrote to the Irish hunger strikers in 1981 expressing support for their "cause of freedom against English domination, against Zionism and against fascism in the world" (Samidoun 2012). Irish-Palestinian solidarity in the fight against settler colonialism persists to this day.

At this point, the Republican movement began its "ballot box and armalite" strategy of resistance – this referred to its plan to both run candidates in elections to local governing bodies and the Dáil as well as use armed struggle. In a surge of support that Sinn Féin received following the 1981 hunger strikes, the Social Democratic and Labour Party (SDLP) attempted to arrange the New Ireland Forum (to which Sinn Féin was not invited) in order to gain some form of a unitary position among the Irish nationalist parties. The three options offered in 1984 – a unitary state, a federal system, and a joint Anglo-Irish authority – were rejected by British Prime Minister Margaret Thatcher. The New Ireland Forum published a report that became the foundation for creating the Anglo-Irish Agreement of 1985, which provided a discussion forum for both British and Irish

ministers as well as closer collaboration on security issues. In 1987, the IRA began a two-year campaign of violence in England itself, specifically targeting British military personnel. The British responded with harsh crackdowns by way of internment and violent "policing" that led the IRA to doubt the possibility of armed struggle succeeding in pushing the British out of Ireland. Sinn Féin began backchannel negotiations with John Hume of the SDLP and the Dublin government. Key to these negotiations were talks of decommissioning weapons.

The IRA was wary of decommissioning their arms, however, because while the British Army was no longer a major risk to the lives of Republicans, Unionist paramilitaries increasingly were (Kennedy-Pipe 2006). The peace process resumed, however, especially after the election of Tony Blair and a Labor government in Britain. Blair, though still reaffirming his support for the union, broke from previous British policy in reopening inquiries into the events of Bloody Sunday in 1972 and seeking outside intervention from then-President Bill Clinton and his special envoy to Northern Ireland, Senator George Mitchell (Kennedy-Pipe 2006). The Good Friday Agreement was signed by the conflicting parties in 1998 as framework meant to reduce violent attacks rather than build a peace around co-existence and equal rights in the region.

As Sutton (2002) reports, of the over 3500 casualties over the 30 years of the conflict, Republican paramilitaries were responsible for 2000, while Unionist paramilitaries and British state forces combined were responsible for just over 1300. Because of this, Unionists often claim victimhood. Over a third of the total killed in the Troubles were members of British security forces, however, and nearly double the number of Catholic civilians were killed as Protestant, which upends Unionist claims by showing that Republicans tended to target actors directly involved in the violence, while Unionists targeted more civilians (Sutton 2002).

Thirty years of violence also took a toll on the North's economy. As Teague (2016) argues, the years of the conflict were characterized by severe deindustrialization as well as substantial public sector growth, which led to the North's increased reliance on the British economy. The violence posed a risk to businesses, and as a result many firms pulled out of the North or did not newly invest in the area. Public sector employment in the North grew at more than double the rate of the rest of the United Kingdom, supported by a subvention from the British government. Teague (2016) explains that "the subvention...indemnified the British Government from the risk of an economic crisis emerging alongside the political crisis in the region, running the danger of pushing Northern Ireland into full scale civil war." While this expansion of public sector employment may have prevented complete economic collapse, it also made the economy dependent on a large public sector. This dependency remains to the present day.

Looking Forward: Brexit and the Possibility of a United, Socialist Ireland, 2015–Present

The outcome of the British referendum to leave the EU came as a shock to the world, and while Brexit certainly already has impacted the global economy, there is no place outside Britain where its effects will be more pervasively felt than the island of Ireland. Politically, Brexit threatens the tentative peace in the North due to the threat of an imposition of either a hard border between the North and the Republic or an effective unification of the island. At the same time, however, the Brexit debacle has brought to light once again the sheer depth of continued British involvement in the politics and economics of the Republic. As Brigid Laffan explains, "Brexit threatens Ireland's core geo-political and geo-economic interests...Of the remaining twenty-seven EU member states, Ireland is most affected because of Northern Ireland, the intensity of the economic relationship and the common travel area. Put simply, Brexit is high politics for Ireland" (Laffan 2018). The chaos caused by Brexit illustrates the ways in which Britain's neocolonial hold on Ireland remains strong; the two economies remain deeply intertwined and British political choices consistently have significant impacts on the Republic,

T

though they are often made without consideration for the impact on Ireland and its residents. Brexit provides a moment of opportunity that Ireland has not had since 1916. With a majority of British citizens in the North having voted to remain in the European Union and considering the risks that Brexit poses to the economy and political stability of the island, the possibility of a united Ireland appears more realistic than ever. However, the question remains – what would a united Ireland look like?

This analysis does not seek to put forward particular policy proposals regarding which aspects of British or Irish government policy should be adopted into the North, but rather aims to build a political imaginary of what a united Ireland could be. A united Ireland should not just be the absorption of the North into the currently existing Republic of Ireland, but rather the reimagining of what Ireland is and what it could be. It is naïve to think that a unity poll will be won through mere demographic shifts; even if there are more Republicans than Unionists in the North and a unity vote is won, the united republic would replicate the same sectarian divisions built and maintained by British imperialism. The struggle for a united Ireland is not merely creating one state on the island, but rather it is a political struggle for freedom from the chains of imperialism that have held Ireland and its people in bondage for centuries. Even after the south gained de jure independence, it remained deeply dependent on Britain via its capitalist class. As James Connolly argues, the Irish upper classes are "tied by a thousand economic strings in the shape of investments binding them to English capitalism" and therefore, the working class must be the "incorruptible inheritors of the fight for Irish freedom" (Connolly 1910). Therefore, a political struggle for Irish unity ought to be built by a broad coalition of the working class. Such a struggle should seek to bring about equality for all on the island built upon an anti-imperialist workers' movement that aims to root out the remnants of British colonialism on the island. It should uplift migrants and workers and society's most vulnerable. As the Provisional Government of the Irish Republic proclaimed in 1916, "we declare the right of the people of Ireland to the ownership of Ireland and to the unfettered control of Irish destinies, to be sovereign and

indefeasible" (Proclamation of the Irish Republic 1916). Though the future remains uncertain, this principle ought to remain at the heart of the fight for a united Ireland, as the island ought to belong to its people – not to its imperial masters, not to its neocolonial capitalists, but to all those whose destinies have been stolen from them by British imperialism and neoliberal capitalism.

Anti-imperialism; Caribbean; George Weekes; Imperialism; Oil; Oilfields Workers Trade Union; Trade unions

Definition

Trinidad and Tobago has one of the oldest oil industries in the Western Hemisphere, dating back to 1857. From 1908, oil was produced in commercial quantities and, as a result, multinational oil corporations such as BP, Shell, Texaco,

Tesoro, and AMOCO became major investors in the industry. Additionally, Trinidad and Tobago attracted other multinational corporations such as Nestle, Haliburton, Dunlop, W.R. Grace, Alcoa, Cable and Wireless, and BATA. These entities took advantage of the generous investment incentives and concessions offered by the People's National Movement (PNM) Government's 'Industrialisation by Invitation' policy that was implemented in the late 1950s. However, in their quest to exploit the natural and human resources of the nation, these multinational corporations met massive resistance from progressive trade unions, especially the Oilfields Workers' Trade Union (OWTU). Under the leadership of George Hilton Weekes, the union took the leadership role in the working-class struggles against the multinational corporations.

Trinidad and Tobago has one of the oldest oil industries in the Western Hemisphere, dating back to 1857. From 1908, oil was produced in commercial quantities and, as a result, multinational oil corporations such as BP, Shell, Texaco, Tesoro, and AMOCO became major investors in the industry. Additionally, Trinidad and Tobago attracted other multinational corporations such as Nestle, Haliburton, Dunlop, W.R. Grace, Alcoa, Cable and Wireless, and BATA. These entities took advantage of the generous investment incentives and concessions offered by the People's National Movement (PNM) Government's 'Industrialisation by Invitation' policy that was implemented in the late 1950s. However, in their quest to exploit the natural and human resources of the nation, these multinational corporations met massive resistance from progressive trade unions, especially the Oilfields Workers' Trade Union (OWTU). Under the leadership of George Hilton Weekes, the union took the leadership role in the working-class struggles against the multinational corporations.

Emergence of George Weekes (27 April 1921–2 February 1995)

On 25 June 1962, George Hilton Weekes emerged as the third president general of the OWTU (1962–87). In trade union and political circles, he was called George 'PG' Weekes. A former senator and government minister, Weekes was awarded the Trinity Cross and the OWTU Labour Star. His ascendancy into the leadership position dramatically changed how the OWTU viewed the relationship between trade unionism and politics. Moreover, because of his political influence, Weekes was able to galvanise a new social movement that challenged the Eric Williams regime and the multinational corporations that operated in Trinidad and Tobago.

Weekes's entrance into the OWTU's leadership and his emergence into Trinidad and Tobago's politics were not isolated events but were directly related to the emergence of other radical elements within the worldwide trade union movement. The shift in the OWTU's approach from Rojas's style to Weekes's more agitative stance must be viewed in the context of the struggles various nationalist groups waged against British and French colonial rule in Africa and Asia. These struggles (which included peaceful protest, mass insurrection, and military action) caught Weekes's attention, and they helped to shape his growing political consciousness to seek justice for workers. In relation to Africa, Weekes held a deep affinity for the political and economic aspirations of the continent, and he became a member of the African Nationalist Movement (ANM) that was formed in 1947 and later renamed the Pan African League in 1948. Moreover, he was actively involved in the Port of Spain-based Universal African Nationalist Movement (UANM), an organisation that was influenced by the Universal Negro Improvement Association (UNIA). By identifying with the struggles for freedom and independence, Weekes, in his early years, expressed solidarity with the oppressed peoples of the continent and other nations.

Second, the ascension of Weekes and his more confrontational approach must also be viewed in the context of the presence of the US multinational corporations in the country that had supplanted the influence of British commercial interests in the post-Second World War period. In the Latin American and Caribbean regions, US imperialism through the multinational corporations had invested heavily in the region by

expanding into various sectors such as the agricultural, bauxite, oil and manufacturing industries. For example, in the 1960s, US foreign direct investment (FDI) stood at $9.8 billion. In the case of Trinidad and Tobago, Weekes saw the arrival of Texaco, W.R. Grace (Federation Chemicals) and Alcoa. Working at Texaco Point-a-Pierre, Weekes had first-hand experience of the industrial relations practices of the company and its effects on the oil workers.

Third, the rise to power of the 'Rebels' must also be viewed in the context of the rise of radical nationalism and anti-imperialism that occurred in Cuba as a result of the Fidel Castro-led Cuban revolution in 1959. This revolution offered hope to the Caribbean peoples and pointed to other alternative means of attaining independence and reorganizing a country's economy. By 1960, the Castro regime had nationalised all foreign and most large Cuban enterprises; this measure coincided with the OWTU's first strike against Texaco. Khafra Kambon noted that the Cuban experience inspired George Weekes and other militants who had been agitating for the PNM Government to adopt similar policies.

Fourth, the Rebels' rise to power must also be analysed in the context of the influence of revolutionary ideologies such as Marxism, socialism and Trotskyism. George Weekes fought in the Second World War and returned to Trinidad in 1943 a changed young man, imbued with a high level of political consciousness. Marxism and socialism fascinated him, and he developed an intellectual passion for these two political philosophies. Moreover, the Negro Welfare Cultural and Social Association (NWCSA), which was founded in 1934 by Elma Francois, Jim Barrette, and Christina King, also played a key role in the advancement of socialist ideas among the working class by engaging in political education throughout the trade union movement and in various communities in Trinidad and Tobago. With regard to dissemination of socialist ideology, activists like Bernard Primus, Lennox Pierre, John La Rose, Kack Kelshall and George Bowrin were instrumental in the process within the OWTU. These individuals played a very influential role in Weekes's socialist ideological development and also in shaping the OWTU into a powerful anti-

governmental organisation. As for Trotskyism and its influence on the Rebel movement, one has to look at C.L.R. James and the critical role he played in developing this ideology on his return to Trinidad to assist the Peoples National Movement. James adhered to the Trotskyist perspective as opposed to the views of the Communist Party led by Stalin. He was highly instrumental in organising the Workers and Farmers Party, of which George Weekes was a very active member.

Finally, from a local standpoint, the Rebels' quest to transform the OWTU and provide new leadership to the members must also be viewed in the light of the problems that confronted the working class of Trinidad and Tobago. In 1958, the labour force totalled 297,000 workers. However, of this active figure, some 28,000 were unemployed and by 1962 unemployment would surpass the 1958 figure by 100%. In addition, the scale of wages in various industries was very low. The 1958 Budget figures revealed that workers with paid jobs in 1956 earned less than $50.00 a month. In addition, it painted a grim reality that 'seven out of ten paid workers with jobs in Trinidad and Tobago in 1956 did not earn enough to bring them within the income tax net. Furthermore, the average wage earning of the lowest-paid unskilled workers in large non-agricultural firms employing ten persons or more in 1958 was $632 per year in services and commerce; $641 per year in manufacturing (clothing), and in many other areas it did not go above $725 per year. In oil, transport, communications, and ports, it stood slightly above $1,200. Even though oil workers received higher comparable wages, Weekes and the Rebel team were not only concerned about the welfare of the oil workers but viewed themselves as part of a new grass-roots movement that rose up in defence of the working class to challenge the PNM's political and socioeconomic independence paradigm.

OWTU and Resistance to Imperialism (1963–69)

Shortly after Weekes and the Rebels took control of the leadership, British Petroleum, a British

multinational corporation, served notice to the OWTU of its intention to retrench hundreds of workers at the Point Fortin refinery. Understanding the lessons of the 1962 struggle against BP, the new OWTU leadership mobilised the workers at the refinery under the slogan 'Not A Man Must Go'. On 17 February 1963, 2,600 BP workers took strike action which lasted for 57 days and forced the company to rescind its plans. This strike was significant because it occurred six months after Trinidad and Tobago had obtained constitutional independence from Great Britain. Moreover, in the same year, the OWTU, through the collective bargaining process with Texaco, negotiated the first pension plan in Trinidad and Tobago for workers. Prior to this, only expatriate managers and supervisors at Texaco received pensions. This concession, extracted from a giant multinational corporation, was a victory for the working class and became a model for other unions in their collective bargaining agreements with private companies. Furthermore, in 1965, George Weekes and other progressive trade unionists vigorously opposed the passage of the Industrial Stabilisation Act.

This piece of repressive legislation was aimed at taking away the unions' right to take strike action. The progressive trade unions opposed it because it favoured the rights of the multinational corporations over the workers. Additionally, in 1967, almost five years into his leadership of the OWTU, George Weekes faced a crisis when British Petroleum announced its intention to reduce the number of oil workers at its plants. By 1967, British Petroleum was locked in a struggle with the OWTU over the attempts of the company to reduce manpower. However, at the same time, the company was witnessing its oil fortunes increase dramatically with large discoveries of oil in the Prudhoe Bay and Forties in the North Sea that boosted the company's reserves outside of the Middle East. As a result of these large deposits of oil being found, the company's board of directors unanimously agreed to rid BP of unprofitable operations and steer its exploration funds to these two new areas. Meanwhile, BP's Trinidad and Tobago operations witnessed a dramatic decline from 40,913 million barrels in 1967 to 29,716

million barrels in 1969. The company claimed that this drastic fall affected its profit margins and, as a result, ceased its exploration activities, embarked on a redundancy programme, and invited Shell and Texaco to purchase its assets. However, both companies declined BP's offer.

This action created political problems for the government. Although the oil workers were members of the militant OWTU, the vast majority were also PNM party supporters who were in danger of losing their jobs with dire socioeconomic consequences for their families. On 30 March 1967, the union held a mass membership meeting at Palo Seco and called on the PNM Government to acquire the assets of BP and establish a National Petroleum Company. The union's leadership felt that nationalisation of the foreign-owned oil company had the capacity to generate jobs and boost the national economy. Furthermore, the union requested that the government block Texaco from purchasing BP's assets. Following the public meeting, the OWTU, on 4 April 1967, presented to the PNM Government a memorandum entitled 'Oil in Turmoil and OWTU Memorandum on the Formation of a National Oil Company'. In response, George Weekes wrote acknowledging receipt of the Memorandum and also the Resolution. OWTU's memorandum was divided into two parts: 'Oil in Turmoil' and the 'OWTU Memorandum'. The former examined the state of the industry, its importance to Trinidad and Tobago's economy, the global control of the industry, competition, prices and markets, production costs, the true state of oil production, the establishment of a National Oil Company, internal competence, and funding.

In its conclusion, the OWTU pledged to commit monetary and human resources towards the purchase of BP's assets. In the latter part of the document, the union presented a 15-point memorandum that detailed all aspects of BP's local and international operations that included holdings in Trinidad Northern Areas, Trinmar Ltd, BP Caribbean Ltd, Kern Trinidad Oilfields Ltd, Apex (Trinidad) Oilfields Ltd, Trinidad Petroleum Development Ltd, and BP (Trinidad) Ltd, the holding company. In addition, the OWTU offered a number of practical solutions to the PNM

Government on purchase of and payments for BP's assets. For example, the union proposed a series of methods that included amortised payments over a 15–20-year period, National Bonds bearing 2.5% interest rates redeemed over 15–20 years, and government takeover whereby the state purchase 4% of the shares and the remaining 96% were offered to the public. Although the government rejected many of the proposals contained in the OWTU's memorandum, it purchased BP's assets in 1969 and formed a joint-venture company with Tesero, an American oil company. While the government did not follow the detailed demands of the OWTU, the union's action clearly influenced its approach in dealing with the oil industry. The anti-imperialist struggles waged in the 19760s cemented George Weekes's leadership in the trade union movement and pushed the OWTU to play a vanguard role in the 1970s.

OWTU and Resistance to Imperialism (1970–79)

By 1970, the militant mood of the working class had intensified with their support of the Black Power Revolution that called for the nationalisation of oil and sugar industries that were controlled by multinational corporations. This wave of militancy against the proliferation of multinational corporations and economic dependency was not limited only to Trinidad and Tobago but was part of the growing radical social movements all over the Third World, whether it was expressed as Black Power, socialism, Pan Africanism, Black Nationalism or Radical Nationalism. It was in this context that OWTU members waged struggles against multinational corporations. In 1965, the OWTU won recognition to represent workers at Federation Chemicals, a subsidiary of W.R. Grace, N.A. Late in 1970, the OWTU and the company entered into negotiations for a new collective bargaining agreement over wages and other workers' related benefits, compensation, and working conditions. Due to the slow pace of the negotiations coupled with the firing of six workers, the entire workforce

went on strike. In support of the strike, the OWTU, in July 1971, mobilised other branches from oil, electricity, and agriculture to support the striking workers at Federation Chemicals. Moreover, in October 1970, workers at Halliburton, an American oil contracting company, downed their tools and took protest action over the dismissal of their coworkers and racist management practices. Additionally, in the same year, oil workers at Texaco Guayaguayare went on strike over the hiring of scab labour. These two strikes were significant because workers did not consult the union leadership. Moreover, in 1971, workers at Dunlop went on strike over management's policy of hiring white South African managers. Furthermore, from 27 March 1975–28 April 1975, workers at Texaco went on strike to protest against Texaco's failure to negotiate wage increases. After several meetings, union called off the prolonged strike because workers were losing wages. However, the union secured recognition for the monthly paid staff, and it became a bargaining unit within the OWTU.

In 1978, Texaco celebrated 22 years of operations in Trinidad and Tobago; however, this celebration did not prevent the company from launching an attack on the OWTU by dismissing safety officer Victor Singh and suspending branch officer Glen Walcott, the entire pump department and 13 waterfront workers. Therefore, it was against this background that the OWTU went into the negotiations to bargain on behalf of the Texaco workers. Using a strategy that involved comprehensive research into Texaco's local and global operations that was prepared by Trevor Farrell, a lecturer in Economics at the University of the West Indies, St Augustine Campus, and a specialist in Petroleum Economics, the OWTU entered the negotiations seeking 120% but was willing, in the interest of time, to settle for a compromise increase of 100% in wages. The claim was based on a number of factors including: the contribution of oil workers to the country's economy and the wealth of the company; the impact of inflation on the workers' real wages; the impact of projected inflation; the increase in workers' productivity; the modern industrial relations practice as it related to employee welfare;

T

and the beneficial impact of a settlement on the country's welfare. In terms of the oil workers' contribution to the economy, the union, utilising official government statistical figures, pointed out that between 1973 and 1977, oil workers had contributed some $2.676 billion to government's recurrent revenue. Percentage wise, this meant that oil workers' contribution to the economy grew by 62% between 1974 and 1976, and government's revenue increased by 81% between 1974 and 1977. Moreover, on the issue of inflation and its relation to real wages, the OWTU argued that Texaco should increase the oil workers' wages because the cost of living index had increased from 241.2 points in February 1975 to 326.6 points by December 1977, an increase of 85.4 points or 35.4%. Additionally, the union argued that the old Cost of Living Allowance (COLA), based on the 1975–78 collective bargaining agreement, needed to be adjusted because on average wages had been eroded by 22% over the three-year period. Therefore, on the basis of the negotiating team's calculations, the union requested an increase of 14.7% to restore the workers' real wages. Moreover, the OWTU, in its attempt to protect the workers from any anticipated rise in the rate of inflation, proposed an increase of 17.59% as a hedge against future inflation as it related to COLA.

All these positions were made to counter the claims of Texaco's negotiating team that 'the company lost money; that it had an onerous tax burden; that its cost of production was relatively high; that its competitive position was weak and that further increased cost would erode its competitive position in the world market'. For example, on the company's claim that it made losses, the union's negotiating team exposed the company's position by providing figures that showed among other things that Texaco had gross income sales of $64.63 billion in 1975; net income profit of $2,087.28 million in 1976; profits totalling $1,747.92 million, an increase of 14% over the first nine months of 1976. Based on the above data, Texaco was certainly in a position to pay a living wage to the oil workers because (following OPEC's decision) oil prices at that time had skyrocketed and all the oil companies, including

Texaco, reaped profit 'windfalls'. This certainly caught OWTU's attention as it prepared its position to defend the oil workers' interests.

Clearly understanding what was at stake, the OWTU leadership printed thousands of copies of the booklet titled, *In Defense of Our Members and the People of Trinago against Global Texaco-Exploiter of Labour and Natural Resources: Negotiations 1978* to educate the oil workers in particular and public in general on the international oil industry, Texaco's operations in Trinidad and the relationship between the oil companies and the country's economy and the union's justification of its wage claims. This tactic was a key weapon in the union's mass mobilisation drive to ensure that the workers knew the issues at hand, what was at stake, and how their participation by way of discussions at the workplace, at union branch meetings, and mass meetings were important to the process. The leadership positioned the 1978 negotiations as a class war between the workers and the capitalists in which the future of their children, their grandchildren, and the workers' freedom, dignity and selfrespect were at stake.

Moreover on 1–2 July 1978, the OWTU held a special conference of delegates at Paramount Building, the union headquarters, to discuss 'International Policy and the OWTU'. The conference was called to educate the rank and file of the importance of supporting the union's position against Texaco. In this case, a group of workers violated the directive of the General Council that placed an embargo on Antigua. The OWTU took this action because the Vere Bird regime that governed Antigua allowed its country to be used as a trans-shipment point for arms to the South African government that used a policy of apartheid to oppress and marginalise the majority black South African population. Additionally, the conference educated the members on the need to adopt new strategies to survive the dominance of the multinational corporations. Moreover, it called for international trade union solidarity to combat the destruction of trade unions in a world dominated by global capitalism.

These struggles of the 1970s clearly showed that the OWTU was up against formidable

adversaries that had enormous financial resources and political connections that made it difficult for the union to wring maximum benefits for its workers. On the other hand, the OWTU showed great resolve in defending the interests of the workers and the country against exploitation of its resources. However, these struggles would intensify during the 1980s as the union continued to protect the interests of its members and fight for further nationalisation of the oil industry.

OWTU and Resistance to Imperialism (1980–87)

From 1981–86, Trinidad and Tobago's economy experienced severe economic crisis as a result of the worldwide recession. During this crisis, the capitalist class launched many attacks on the working class by way of plant shutdowns, massive retrenchment, and privatisation. During this period, many workers took strike action. Once again, the OWTU, under George Weekes's leadership, waged serious struggles against the multinational corporations such as Dunlop and Federation Chemicals. Additionally, the union spent considerable time in pressing for the nationalisation of Texaco and AMOCO (American Oil Company).

Not satisfied with it the outcome of the 1972 collective bargaining agreement, Dunlop's management made another concerted attempt in 1984 to defeat the union. One of the objectives of any multinational corporation is to make profits both in the short run and the long run. In terms of Dunlop, this view was expressed clearly by one of its former managing directors John Crittenden, who outlandishly proclaimed: 'Not because I carry a grey beard, you would take me for a Santa Claus; I have no money bag on my back …. Dunlop is here to make money!!' One of the methods that companies utilise to cut cost is retrenchment or layoffs. In October 1983, Dunlop's management put its strategy into operation by stockpiling tyres to justify its position of retrenching both permanent and casual workers. Unaware of the company's grand scheme, the workers continued their productivity drive to meet Dunlop's required productivity quota for the given period. This strategy had a twofold aim of cutting costs and making profits in the short run with a reduced staff. However, Dunlop workers were not to be fooled by this age-old capitalist trick. United in their efforts to save their jobs, on 6 October 1983, both hourly and monthly workers took a unanimous decision to vigorously oppose the company's retrenchment programme.

However, despite the workers' show of unity, Dunlop's management retrenched over 75 casual workers. In any given retrenchment situation, casual workers are always the first in line to be fired and this was no exception at Dunlop. Therefore, sensing that permanent workers were next in line for possible retrenchment, Dunlop workers took strike action against the company on 10 May 1984. Following a meeting between the union's executive, the Ministry of Labour, and the company, the workers returned to their jobs 'to demonstrate good faith and on the perception that the Company would have seen the wisdom in withdrawing the warning notices at that meeting'. However, Dunlop's management was in no mood for reconciliation, and on 17 May 1984, they increased security, padlocked the gates and issued over 250 suspension notices to all the workers from the two shifts.

Undaunted by Dunlop management's actions, the workers erected a strike camp and dug in because they knew that not only were their jobs at stake but also the Point Fortin community would be affected. Under the militant leadership of branch president Martin Woods and secretary Winston James, the workers began a mobilisation drive to sensitise the Point Fortin Community concerning the strike and the effects it would have on the workers, their families, and the entire community. The workers received support from wives and girlfriends who supplied the striking workers with food throughout the strike's duration. Moreover, the workers kept the unity among them by organising rap sessions and other activities that kept a constant flow of workers to the camp. Furthermore, they printed bulletins and held a public meeting in the 'heart' of Point Fortin where Martin Woods connected the workers'

struggle with the wider struggle against retrenchment, wage-cuts, and roll-backs that employers unleashed on the workforce. In addition, the Dunlop workers received the support of various branch leaders, area labour relations officers and executives. Because of this show of solidarity and the workers' resolve, the union and company met at the Ministry of Labour on 23 May 1985 and hammered out a settlement. The parties agreed to: the withdrawal of all warning notices; withdrawal of letters of suspension plus compensation pay for workers; no victimisation of workers; and that both parties would co-operate towards restoring a good industrial relations climate. Faced with this militant action of the Dunlop workers, the government intervened to contain the spate of industrial unrest that had engulfed many parts of the country. However, if the government felt that the industrial relations climate at Dunlop had improved, the workers felt otherwise and resorted to further strike actions in April 1985.

One year after the 1984 strike, the workers at Caribbean Tire Company (formerly Dunlop) reverted to strike action in their attempt to force the company to make 54 casual workers permanent. When the permanent workers took strike action in 1984, the casual workers gave them their unwavering support. In their support for the casual workers, the permanent workers made the permanent job security of the casual workers a priority by placing it at the top of the list of grievances. The permanent workers had just cause because it formed part of the 1984 Collective Bargaining Agreement. The specific clause stated that as long as casual workers held down permanent jobs, they would be classified as permanent workers effective from 16 December 1984. In April 1985 when the permanent workers decided to strike, they included the casual workers and other negotiated issues that the company had failed to honour as justification for the strike. Faced with warning notices and the threat of suspensions and dismissals, the workers downed their tools on 1 April 1985 and walked off the job. Just as they had held their ground during the 1984 strike, the workers stood firm and resolute for their demands this time. The company maintained a hardline position on the issues until

a meeting was convened with Errol McLeod (OWTU's first-vice president) and the branch officers at the San Fernando office of the Ministry of Labour on 5 April 1983. At that meeting, the parties arrived at a resolution that the company's management would begin the process of classifying the 54 casual workers as permanent workers. However, this industrial peace at the plant was short-lived; the economic climate of the country favoured the Employers Consultative Association and the Manufacturers Association which had wanted to break the unions, especially the OWTU. The management of Caribbean Tire joined the chorus and took action once more against the workforce.

In September 1985, Dunlop management locked out the workers, dismissed the great majority of them, and resorted to police attacks and court injunctions against the workers. Both parties took the industrial dispute to the Industrial Court and the judges found Dunlop guilty of engaging in an illegal lockout and fined it $25,000. Instead of heeding the Court's directive, the company resorted to delaying tactics hoping that workers would drop their demands and return to work. However, the situation worsened and the company appealed the judgment. As 1985 drew to a close and this case headed for the Industrial Court, the OWTU executives and its members would be faced with more challenges in 1986 as the capitalist class took the fight to the workers and their trade unions.

By 1986, the political mood of the electorate had swung against the PNM Government in favour of the National Alliance for Reconstruction (NAR), a three-party coalition composed of the Organisation for National Reconstruction, the Tapia House Movement and the Democratic Action Congress, and the United Labour Front. While these two parties battled for political supremacy to determine which section of the capitalist class would rule the country, the working class did not let up with its struggles against the onslaught of the ECA. By late January/early February 1986, Federation Chemical's management locked out its monthly paid workers, whom the OWTU had recently organised into a bargaining unit. After three weeks of holding

out, the workers eventually signed individual contracts. Sensing that the monthly paid workers had caved in, management decided to target its hourly paid workers into signing individual contracts; however, the daily paid workers did not fall for the bait. Rightly so, they understood that if they signed the contracts in effect they would have lost their Cost of Living Allowances (COLA). Failing to convince the daily paid workers to sign the agreement, management resorted to locking out all hourly paid workers in August 1986.

Compared to the previous strikes, the workers adopted new tactics. Rather than just set up a strike camp and protest, they developed a massive public-relations and education campaign whereby they went into all the major population centres throughout the country and interfaced with the citizens about the company's action. The workers understood that the issue of COLA had major implications for all workers in Trinidad and Tobago, and they wanted to educate the nation on the issue. As 1986 was also an election year, the workers reminded politicians concerning the attacks on the working class. They signed petitions and picketed the offices of George Chambers and Errol Mahabir (two senior cabinet members of the People's National Movement Government), along with Parliament, and organised vigils at the Queen's Park Savannah and Woodford Square. In addition, they took their campaign to the NAR Government that had defeated the PNM at the December polls; they waged a campaign to get it to invoke Section 65 of the Industrial Relations Act to end the lock-out in the national interest. When this failed, the workers resumed picketing the Parliament and the Ministry of Labour. Even though the NAR had swept the polls, the working class did not give them any holiday but pressured them to take action on issues affecting the working class. Eventually, in January 1987, the OWTU and the workers succeeded in convincing the NAR Government to pass the amendment that sent the workers back to work. This decision came at a time when the OWTU was in a period of transition. On 5 September 1987, George Weekes, who had led the organisation since 1962, passed the leadership mantle on to Errol McLeod, the union's first-vice-president. In his

address, McLeod noted that this transition had commenced in 1984 and the process was a smooth one. Whether or not the leadership transition went smoothly, McLeod promised to continue Weekes's legacy. While the OWTU fought to save the jobs of workers, it renewed its struggle for full nationalisation of the petroleum industry.

The call for the nationalisation of the petroleum industry did not begin with George Weekes and the Rebels but can be dated to as early as 6 October 1936 when Tubal Uriah 'Buzz' Butler, in his capacity as leader of the British Empire Workers and Citizens Home Rule Party, wrote a letter to Governor Murchison Fletcher expressing the oil workers' desire for state control of the local petroleum industry. In the aftermath of the OWTU receiving official recognition as a trade union in July 1937, its new leader Adrian Cola Rienzi appeared before the Arbitration Tribunal in December 1937 to deal with a dispute with the Petroleum Association which fell under the Trade Disputes Ordinance of 1938. At the hearing of the dispute, Rienzi called for nationalisation of the oil industry, arguing that nationalisation had the effect of saving costs, reducing competition and wild-catting, and would increase overall productivity in the industry. However, when Rienzi made this statement, the oil companies regarded him as a 'dangerous communist'. During the aftermath of the 1937 labour uprising in the British West Indies, the British government stepped up its campaign to stop the spread of socialist ideas in the trade union movement, and progressive leaders who identified with socialism became the primary victims of attacks. It took another 19 years for the OWTU to make another push for nationalisation of the oil industry.

During 1956 under John Rojas's leadership, the union together with the Trade Union Congress (TUC) and the Caribbean National Labour Party (CNLP) passed a joint resolution that attempted to block Texaco's entrance into Trinidad and Tobago's oil industry. The resolution stated that, 'If the ownership of the Trinidad Oil Company is transferred to the British Government as Trustees for the Trinidad Government or the new proposed Federal Union, after the purchase price for the same will have been liquidated, it would assist

tremendously in enabling the country to achieve national economic stability. ...' While the resolution was unsuccessful, it did not prevent the OWTU's leadership from agitating for local ownership of the industry. This agitation intensified under the leadership of George Weekes, especially in the 1980s.

By 1982, the government found itself in a precarious position when Patrick Manning, minister of Energy and Natural Resources, reported to cabinet that Texaco had slashed its production. This had implications for the government's D-plan for the industry which involved multimillion-dollar investment in expansion and upgrading of the Trintoc refinery. Troubled by this new development, Manning submitted a cabinet note dated 24 March 1982 in which he stated, among other things, that government should seriously consider a policy of rationalisation of existing refinery capacity in Trinidad and Tobago as representing the best possible solution to increase the profitability of both the Texaco and the TRINTOC refineries.

On 20 September 1982, the union presented a memorandum on the oil industry entitled *Our Fight for People's Ownership and Control of the Oil Industry* to the government of Trinidad and Tobago. Consisting of 80 pages, the memorandum laid out the state of the international oil industry, Texaco's position on the industry in Trinidad and Tobago, the government's position on the industry, the OWTU's position, the petroleum industry and the national interest, and a proposal for change. Essentially, the OWTU called on the government to acquire Tesoro, Texaco, and Amoco, and offered its services to the government to bring the acquisitions to fruition. Citing the Mexican case study of the nationalisation of its oil industry in 1938, the union proclaimed that ownership of the industry would enable Trinidad and Tobago to obtain significant economic independence. Moreover, it called on the government to adopt a new approach to decision making in its position on the oil industry by involving the citizens of the country and in particular the OWTU and the oil workers. However, instead of accepting the union's recommendations, the PNM Government made further adjustments to the tax structure.

In 1983, in order to meet the demands of oil companies, especially those of Texaco, the government amended the Petroleum Taxes Act of 1974; it reduced the Supplemental Tax Rate for land production tax from 35% to 15%. From Texaco's standpoint, it appeared that the reduction in the tax was insufficient to offset the cost of operating the Point-a-Pierre refinery. Rather than adjust its expectations, Texaco reacted by: closing down non-essential operations; adjusting retirement ages and provisions; reducing the workforce; and cutting expenditure. Texaco took these measures even while negotiating with the government for a possible take-over of the company. After nearly two years of intense negotiations, the government and Texaco's negotiating teams met in March 1985 to negotiate on the purchase of Texaco's operations in Trinidad and Tobago, which included the Point-a-Pierre refinery, the harbour facilities, the landing producing assets, Brighton offshore, the company's interest in SECC (South East Coast Consortium) and in Block I, and the Belpetco blocks in the Gulf of Paria plus certain other assets.

At the signing ceremony, Elton G. Yates, chairman of Textrin's board of directors, represented Texaco and George Chambers, prime minister of Trinidad and Tobago, represented the government. The parties agreed that Textrin retain its one-third interest in Trinmar and in the offshore East Coast Productionsharing Contract in Block 6 with Tenneco (i.e. Dolphin Gas). The purchase consideration was US$189.2 million (TT$454 million) and on signing, the government agreed to pay Textrin US$98 million (TT$235.2 million) of which the government agreed to provide TT$174.7 million and TRINTOC (Trinidad and Tobago Oil Company) to provide TT$60.5 million. In terms of the balance that amounted to US$91.2 million, the government agreed to pay Textrin over a ten-month period in the form of petroleum products at the rate of approximately 9,800 bpd.

By agreeing to pay Texaco this price for a refinery that had lost its technological edge, the government demonstrated its inability to effectively deal with the oil multinationals. The refinery no longer served Texaco's global strategic needs and this meant that the government had to

import crude to keep the refinery running. More-over, the payments were made in the post-oil boom period when the economy went into a deep recession. Even though the purchase of Texaco was a step in the right direction, the industry remained firmly entrenched under the control of the multinational oil companies, and this helped to explain government's failure to successfully own and control the entire petroleum industry. This inability to achieve its original objectives in dealing with the Texaco oil company strengthened the OWTU's argument for the nationalisation of the nation's petroleum industry.

In 1987, with the NAR Government in control of the state, the OWTU presented the new government with a memorandum that covered: the economy, the oil industry; divestment/privatisation; industrial relations; health and safety legislation; the media; and the democratic process in Trinidad and Tobago. In terms of ownership and control of the industry, the OWTU proposed that the government: purchase Texaco's one-third share; initiate a six-month time frame to merge all existing state oil companies; reconsider its new Draft Energy Policy; upgrade Trintoc's refinery to make it more efficient; revamp the Ministry of Energy and Natural Resources and make it the energy sector's central policymaking body; explore all the alternatives to take control of AMOCO; oppose the private sector's proposal on the oil industry; and create a research and development unit that would cater for the needs of the oil industry. Unlike the previous administration that had at least committed to some aspects of control of the oil industry, the NAR Government pursued a programme of divestment and privatisation of the oil industry.

Turkey and Imperialism (1923–2018)

Ekin Oyan-Altuntaş
Abant Izzet Baysal Universtity, Ankara, Turkey

Synonyms

Capitalism; Dependency; Imperialism; Neoliberalism; Ottoman Empire; Turkey

Definition

This entry chronicles the incorporation of the Ottoman Empire into the wider imperialist trade and investment networks dominated by Britain and other Western capitalists. It describes how Turkey failed to extricate itself from asymmetrical dependency relations of imperialism after 1946 despite its emphasis on antiimperialism and indep/endency from the outset of the republic (1923) to 1946. It proceeds to examine the economic ramifications of Turkey's extraverted national development, and its impact on the country's class structure and foreign policy. This entry discusses the radical neoliberal transformation of Turkey in 1980 after developing relatively autonomous policies between 1960 and 1980. Finally, the consequences of Turkey's growing dependency (particularly after 2002) on foreign capital inflows and the close ties between the neoliberal Islamic model of the Justice and Development Party (AKP) and the imperialist interventions in the Middle East are examined.

Introduction

The roots of imperialism in Turkey can be traced back to the nineteenth-century Ottoman Empire. The Ottoman Empire starting with the sixteenth century entered into an economic dependency relationship with European countries via continuous and widespread capitulations. However, it was the "Balta Limanı Treaty" (1838) concluded between the Ottoman Empire and Britain that culminated with the Empire entering into the domination of imperialism via abolishing its monopoly over the domestic market, removing restrictions on foreign capital, and allowing British capitalists to establish their network (banks, and insurance agencies) (Kasaba 1993). The Ottoman Empire, which made similar agreements with other European countries over time, was connected to the world economy, within a short period becoming a semi-colonial country exporting raw materials and importing industrial products while raising massive external debts. The Ottoman Empire declared Moratorium in 1876, and in 1881, was obliged to accept the creditors' taking control of the Empire's sovereign right of collecting taxes for the payment of debts via establishing an international commission the Ottoman Public Debt Administration (OPDA)

(Köymen 2007). Although the Ottoman Empire maintained its independence on paper, it came under the institutionalized control of imperialism before the end of the nineteenth century.

The first attempts to break the dependent relations with European imperialist states commenced with the establishment of the Government of "Committee of Union and Progress" (CUP) that came into power with the proclamation of the Second Constitutional in 1908. The CUP, which was mainly composed of "the petty-bourgeois intellectuals" (Boratav 2011), failed to cut the structural ties with imperialism, although its leaders had aimed to establish an independent and nationalized capitalism by abolishing economic concessions (Gürcan and Mete 2017).

The Ottoman Empire, which was defeated in the First World War, became history with the conclusion of the Treaty of Lausanne (July 24, 1923). The Turkish Republic was established on October, 29, 1923 after the victory of the national liberation war (1919–1923) under the command of Mustafa Kemal Atatürk. With a monumental progressive process of political revolution, the Turkish Republic transformed itself into a secular and modern country from a feudal Ottoman society.

The political cadres, who established the Republic, without considering the organic link between imperialism and capitalism, assumed that a politically independent and economically industrialized country with a nationalized bourgeoisie could be released from the asymmetric equilibrium of imperialist relations. That is why one of the main objectives of the Kemalist was to create a national bourgeoisie, which would be a driving force for industrialization, modernization, and integration of the country to the advanced Western civilization. However, it was the non-Muslim merchants (Greek, Armenian, and Jewish) in the pre-capitalist economic structure of the Ottoman Empire (and under the tutelage of Western capitalists) who accumulated capital, benefited from capitulations and free trade agreements, and prevailed in trade (compared to Muslim business) (Gürcan and Mete 2017). Thus, there was an attempt to build a national capitalist class through the alliance of Muslim landowners and relatively small and powerless Muslim merchants in cities (Savran 2004). However, as an objective consequence of the expansionist character of capitalism, this state-protected capitalist ruling class soon started basing its political ascendancy upon building cross-class alliances with the dominant capitalist classes and the institutions of the metropolitan economies. In this regard, despite its emphasis on anti-imperialism and attempt to articulate the international capitalism as an independent country, Turkey would not make a radical break with imperialism.

1946–1960: Installing Ties with Imperialism and Proxy Foreign Policy

Turkey remained a nonbelligerent state during the Second World War thanks to the statist and protectionist industrialization policies that followed the 1929 Great Depression. The planned economic strategies in the statist period were financed by national savings instead of external borrowing, which helped the young Republic to maintain its distance from asymmetric dependency relations of imperialism. On the other hand, the major amounts of national savings were mostly obtained at the expense of exploitation of the working class and peasants and thus, class conflicts have dramatically escalated in the detrimental conditions of the war. However, any kind of protest was suppressed by repressive measures of the government.

To comply with the new standards of Western capitalism, the government of the Republican People's Party (CHP) adopted the multiparty democracy of the capitalist system (1946 first elections) (Gürcan and Mete 2017). Starting in 1946, it became a requisite for the political parties to get the consent of subordinated classes in elections (Boratav 2011). From that point onward, the more the governments ran policies in the interest of capital, the more they implemented populist policies together with counterrevolution strategies such as imaginary security threats (internal and external), nationalism, and re-Islamization.

In 1946, the CHP (Prime Minister İsmet İnönü) with the support of the dominant class

(bourgeoisie and landowners) played the security threat card for the coming elections. The perception of "Soviet threat" and "communist danger" was constructed using the state means and media power to discredit the left-wing opposition, to weaken the class struggle, and to divide the opposition front (Özkan 2017).

İnönü's move was in line with the interests of the Turkish bourgeoisie who were eager to participate in the institutional, legal, political, and military establishment of the postwar capitalist accumulation model and rising US global hegemony. To become a member of the International Monetary Fund (IMF), on September 7, 1946 Turkey devaluated the Turkish Lira (TL) at a rate of 54%. Turkey tried to intensify its relations with the US via concluding bilateral agreements. An agreement between two sides was concluded on May 7, 1946 concerning the debts of Turkey received in wartime through land-lease agreements. The US wiped off the debts of Turkey and in return Turkey accepted to reduce customs tariffs and quotas and liberalize its foreign trade regulations (Sander 1979). The relations of Turkey and the US gained momentum with the declaration of the Truman Doctrine (March 12, 1947); in fact, the main target of the Doctrine was not Turkey but Greece. This is why $300 million worth of military aid was allocated to Greece while Turkey received just $100 million. A possible victory of communist guerillas in the civil war of Greece might have paved the way for communist parties to come to power in Western European countries (particularly in Italy and France). The Truman Doctrine aimed to prevent an alternative socialist model from attaining political power in Western Europe that might preclude the realization of an open market model. As Sakkas pointed out: "Imaginary communist, Soviet-back threat contributed to the right-ward swing of Greece's politics and facilitated the establishment of an extreme conservative-monarchist regime" (Sakkas 2013). The Truman Doctrine succeeded in building an imaginary threat of "Soviet expansionism" and a "common enemy" in the Western Bloc and bound them up with military pacts, aid programs and institutions (North Atlantic Treaty Organization-NATO), which were orientated toward an American hegemonic system.

American imperialism came into Turkey via the Truman Doctrine, which was followed by the Marshall Plan. In accordance, Turkey concluded the Economic Cooperation Agreement (July 4, 1948) with the US. In the ongoing process, an American delegation committee came to Turkey and settled in Ankara to monitor the aid program, prepare advisory reports, and settle the necessary conditions for the furtherance of the aid (Ünlü 2015). The common focus of the reports (1948 Hilts Report, Neumark Report (1949), Thornburg Report 1949–1950) prepared by the American experts was to persuade Turkey to renounce its industrialization objectives and to integrate into the international capitalist system as a country that exports agricultural and mineral goods while importing industrial goods, in the same vein as in the last period of the Ottoman Empire. The Democrat Party (DP), headed by Adnan Menderes, which came to power in the elections of 1950 tried to fulfill this role attributed to Turkey. Turkey substantially abandoned the statist development policies and launched a rapid liberalization through import-led strategies (Gürcan and Mete 2017) and enacted laws such as "Foreign Investment Encouragement Law" (1951) and "Petroleum Law" (1954), which set the ground for the implication of an extreme liberal economy.

The foreign trade deficit, which emerged with the removal of protection in foreign trade and transition to open economy, tried to be supplied with US aids and external loans (Boratav 2011). From 1948 to 1956, the total amount of direct and indirect aids reached $600 million (Baba and Ertan 2016). However, it became increasingly difficult to reach the necessary external resources in the second half of the 1950s. The budget deficit of Turkey was 29 million TL in 1953 and reached 107 million TL in 1959 (Gürcan and Mete 2017). The American delegation in Ankara did not allow the allocation of American aid to nonagricultural and public industrial investments (Ekzen 2009) and opposed protectionist policies. Ultimately, as of 1958, Turkey became unable to pay its external debts. In 1958, at the IMF and the US insistence, Turkey carried out a large-scale devaluation. Ultimately, after its declaration of a moratorium on May 11, 1959, Turkey was forced to conclude a

consolidation agreement with the Organization for Economic Cooperation and Development (OECD) and the US.

Proxy Foreign Policy of the Democrat Party

Turkey's subordinated position in the imperialist hierarchy in regard to the economy was accompanied by proxy foreign policies, based on anti-communism, which pursued the interests of Western imperialism.

In 1950, the Menderes Government, without the approval of Parliament, sent troops (4,500) to the Korean War to join NATO. The Balkan Pact was established on February 28, 1953 between Turkey, Greece, and Yugoslavia, with the encouragement of the US to link Yugoslavia to NATO via Turkey and Greece (Baba and Ertan 2016). With the Military Facilities Agreement on June 23, 1954, Turkey allowed the US to build military bases-airports on its territory. Several American bases and facilities have been established with this agreement including Adana Incirlik Air Base (1955), which is still being used as the most important operational military base of the US in the Middle East.

The Foreign Minister of Turkey, Fatih Rüştü Zorlu, attending the Bandung Conference (1955), criticized the emerging nonalignment movement, referred to the Soviet Union as a real threat to Europe and Asia (Gerger 2012), and invited the Conference attendees to participate in the Western bloc (Baba and Ertan 2016). Consistent with this rhetoric, Turkey took sides with the official French position during the UN voting held for the independence of Algeria and Tunisia throughout the 1950s. Turkey had abstained on the recognition of Algeria's independence in 1958 and the one vote difference caused by Turkey was an important factor in the further 3-year extension of Algeria's war of independence (1954–1962).

The Baghdad Pact was established in the same year as the Bandung Conference (comprising of Iraq, Pakistan, Turkey, and the UK, which later joined) with the coordination of the US against Arab nationalists in Egypt and Syria, both of which were striking to implement autonomous industrialization strategies and trying to create their own national capital while developing good relations with the Soviet Union and pursuing non-alignment neutral policies. The Baghdad Pact had such a negative impact on Arab countries that Turkey was accused of acting as an imperialist collaborator (The Trojan horse of imperialism), with demonstrations held in many Arab cities (Gerger 2012). In 1958, the Arab nationalist Ba'ath Party seized power and shortly afterward the Pact dissolved. The Pact was replaced by the Central Treaty Organization (CENTO) in 1959, but it was also dismissed in 1979 after the Islamic Revolution of Iran.

During the Suez crises in 1956, Turkey took sides with the occupying powers (the UK and France). In 1958, Turkey, which became involved in the "Preferred Plan" that the US put into effect for regime change in Syria, massed troops on the Syrian border upon US request (Jones 2004). At the end it was the USSR support to Syria that averted war. After the USSR's putting the Sputnik satellite into orbit in 1957, the Dwight Eisenhower Administration began to place medium-range missiles capable of hitting the USSR territories via Europe (England, Italy, and Turkey). By a technical agreement that was not disclosed to the public and Parliament, the government of Menderes deployed Jupiter missiles in Turkey. The existence of these missiles played a crucial role in the Cuban Crisis (1962), one of the rare confrontations of the Cold War.

As a result, during the years of 1946–1960, Turkey maintained a stance close to economic and foreign policy interests of the capitalist core and hegemony. A military coup took place on May 27, 1960 in Turkey, but this did not lead to a fundamental change in Turkey's main axis. Nevertheless, the first announcement of the coup plotters was that Turkey would stay connected to NATO and CENTO (Gerger 2012).

1960–1980: Import-Substitution Model and Relative Autonomous Foreign Policy

The period of 1946–1974 was the Golden Age era of the postwar capitalist accumulation model. In

T

that period, the over-accumulation problem had not yet arisen, the movements of finance capital were kept under control of the Bretton Woods regime, the tendency of falling rates of profits had not yet occurred, a consensus between classes still existed in the Keynesian welfare state model, international monopolies had not yet grown enough to launch a competition for sharing the world, and lastly, real socialism was still a limiting factor in preventing hot conflicts in the strategic parts of the world. There was still no need for a structural transformation in the capitalist accumulation model and as Boratav put it: "During this period the aggressive characteristics of imperialism became relatively milder" (Boratav 2010).

During this period, similar to other peripheral economies, Turkey was integrated into the international capitalist accumulation regime with an import-substitution industrialization model and this model complied with the interests of advanced capitalists (Boratav 2010). Manufactured goods (durable consumer goods) whose high technology and basic intermediate inputs imported from the capitalist core were montaged within the country and sold in the domestic market. Produced industrial goods were not for exportation and real wages were relatively high due to there being an element of demand in the reproduction of capital (Boratav 2011). At that juncture, the 1960s and 1970s (despite the military memorandum in 1971) were characterized by the rise of anti-imperialist, left-wing student movements and labor mobilizations in Turkey. Although the alliance between bankers, industrial capitalists, and merchant elites in the politics still constituted the ruling bloc, the ruling governments (mostly in the form of coalitions) were obliged to take the growing strength of left-wing movements into consideration. In the same vein, the state bureaucracy that prepared the three 5-year economic development plans gained a relative autonomy from the ruling bloc.

In these circumstances, coalition governments in two decades had the ground to develop relatively autonomous policies from organized Turkish bourgeoisie and also the US as compared to the period of the 1950s. For instance, despite the US opposition, Turkey restarted opium production in 1974 and intervened militarily in Cyprus (against unanimous Western bloc opposition), and transferred control of 21 US military bases into the direct charge of Turkish Armed Forces in response to the US arms sale embargo. However, it wouldn't be right to claim that Turkey pursued an anti-imperialist foreign policy during this period. Neither that period nor after did Turkey cancel its NATO membership nor make any changes in its capitalist accumulation model and always stayed loyal to the Western bloc.

The economy of Turkey continued to expand and enjoyed relatively high growth rates in Gross National Product (GNP) throughout the 1960s. Nevertheless, this economic expansion constantly created a chronic current account deficit problem (overreliance on imports and oil). Imports rose from $468 million in 1960 to $7.9 billion in 1980 while foreign debts increased from $992 million in 1960 to $16 billion in 1980 (Gürcan and Mete 2017). During 1961–1970, Turkey had to conclude standby agreements annually with the IMF and eventually obliged to devalue TL at a rate of 66% in 1970 (Sönmez 2013). Following the oil crisis in the 1970s, Turkey entered into a full-fledged economic crisis (foreign exchange shortage) in 1978. The State Planning Organization prepared the Fourth Industrial Development Plan, which aimed to stimulate industrialization with public investment (Ekzen 2009). However, the external financing required for the implementation of the plan failed to get the approval of the IMF and the World Bank. These two institutions evidently had a different plan for Turkey; a radical transformation to neoliberalism.

Concomitant to these developments, the organized industrial monopolies in Turkey (particularly, Turkish Industry and Business Allocation-TUSIAD) had begun to exert pressure on coalition governments for a shift from import-substitution model to the outward-oriented (export-led) open market model and financial liberalization as well as suppression of wages, privatization, removing of bureaucratic obstacles (autonomy), deregulation, and reduction in corporate taxations. Turkey's transformation to an export-oriented model was initiated by the decree of January 24, 1980, announcing the Stabilisation Programme, which

was prepared by the IMF and Turgut Özal the then undersecretary of the Prime Minister Süleyman Demirel (Gürcan and Mete 2017). The stabilization program was impossible to be implemented within the existing political conditions of Turkey in which trade unions resisted impoverishing economic adjustments, worker strikes increased to record highs, and the unstable minority government of Demirel lacked the capacity to carry out a large-scale transformation of the economic structure. The program was made applicable on September 12, 1980 with the leverage of the military coup d'état. As Friedrich von Hayek highlighted once: "Free markets may require a dictatorship" (Quoted in Coşar and Yeğenoğlu 2009).

1980–1997: Integration to International Neoliberal System

The neoliberal macroeconomic transformation of Turkey and market-based policies were put into full force after the military takeover and gained momentum with the civil Government of Motherland Party (ANAP), which won the 1982 general elections and established a single-party majority government. ANAP, headed by Özal, embarked upon a major liberalization program (Öniş 1991).

Under the hegemony of ANAP, the import-substitution model was transformed to an export-oriented model, exporters-importers were promoted with tax exemptions, restrictions on imports were mostly lifted, subsidies to agriculture were reduced, and incentives were guaranteed for foreign investment (Boratav and Yeldan 2006). The export-oriented model required wage suppression and suppressed the organized workforce. Thus, the share of labor, which accounted for 35% of manufacturing value added in industrial production between 1977 and 1980, fell to 20.6% in 1988 (Boratav and Yeldan 2006).

The foreign currency trade regime was liberalized in 1984 and the full convertibility of the Turkish Lira was realized under the guidelines of the IMF (Gürcan and Mete 2017). In 1989, with the Decree No. 32, Turkey liberalized capital accounts, which enabled the free movement of capital inflows and outflows (Akçay 2018).

From that point onward, Turkey's economy has increasingly become dependent on financial cycles and hot-money movements (Boratav and Yeldan 2006). Hereafter, the beginning and the end of the crises of 1994, 1998–1999, 2001, 2008–2009, and 2018 in Turkey would be determined by the decline and rise of finance capital inflows and outflows (Boratav 2019).

The high cost of imports, a steady debt-creating bill of finance capital, negative public savings, high incentives to capitalists, and allocation of tax revenues to the interest payments (Boratav and Yeldan 2006) resulted in the growth of the budget deficit. There was an attempt to solve the deficit problem by public borrowing via government bonds offering high interest rates. In 1999, 43% of the budget was allocated just for the payment of interest (Oyan 2010). In 2000, even the allocation of whole tax revenues remained insufficient to meet the interest resulting from public and foreign debts (Oyan 2010). The commercial banks focused on marketing Treasure Bills to private investors through short-term borrowing-repurchase agreement (repo) operations and the repo-reverse repo trading volume reached $221 billion in 2000 (110% of the GNP), which was $5 billion in 1997 (Boratav and Yeldan 2006). Turkeys' dependency on finance capital deepened substantially. Gaining access to external credit resources became crucial for Turkey and the impact of international finance capital and imperialist institutions (particularly IMF, World Bank, and European Union-EU) on Turkey's decision-making process increased dramatically.

Throughout the 1990s, due to the regained strength of the working class, coalition governments again began to rule Turkey. Although they failed to accelerate the neoliberal marketization process, all of these coalition governments were committed to the neoliberal agenda (Akçay 2018).

Turkey became a party to the agreements – General Agreement on Services (GATS), Trade-Related Aspects of Intellectual Property Rights (TRIPS), and Trade-Related Investment Measures (TRIMS). In accordance with these agreements, Turkey committed to giving full market access to international capital including sectors from the hospital services education, banking, finance,

T

insurance business, and hotel-restaurant-tourism (Güzelsarı 2003). Furthermore, in line with the "national treatment rule" and "most-favored nation rule" Turkey accepted to avert discrimination between imported and domestically produced goods.

Turkey's accession into the EU Customs Union (CU) on March 6, 1995 in accordance with the association process launched by the "Ankara Agreement" (1963) was the last nail in the coffin of Turkey's independent trade regime. It can be claimed that the CU is the best indicator in revealing the asymmetric dependency relations of imperialism and Turkey. This is not just because Turkey removed all customs duties, quantitative restrictions, quotas, and other technical obstacles on trade for the industrial goods with the EU, which led to a constantly soaring trade deficit for Turkey, but also because Turkey has been obliged to adjust to the EU's (present and future) common tariffs and trade regimes applied for third countries. Turkey has to obey and adopt all the Free Trade Agreements (FTA) or Preferential Trade Agreements (PTA) that the EU concludes with non-member states (currently more than 100 states). Although Turkey, as a CU member, is bound by the trade agreements that the EU concludes, the contracting parties (non-member) do not have the same obligation to include Turkey in the trade concessions (tariff reductions) that they provide to EU members. Beyond the neo-capitulations undertaken, Turkey has to harmonize its legal system non-interruptedly with the EU legislation including competition law, intellectual property rights, subventions, and other technical issues. Despite all the obligations that Turkey has to meet, Turkey (since it is not a member of the Union) is not included in the decision-making or dispute settlement mechanism of the EU.

The subordinating character of the CU has never been openly criticized (beyond some update requests) by the subsequent governments of Turkey. This is not only because the Turkish oligopolies have developed organic ties and close alliances with their EU counterparts (such as, European Roundtable of Industrialist, BusinessEurope, or Eurochambers) and the continuation of the CU has been in their interest but also because the CU has marked the commitment of Turkey to integrate with and become bound up in the international capitalist system and its institutions or put simply, imperialism itself.

Turkey's New Commitments to Imperialism

The military coup in 1980 not only articulated Turkey to the neoliberal world economy but at the same time it bound Turkey to the new imperialist attacks of the West.

In 1979, the Soviet Union intervened in Afghanistan, and the Iran Islamic Revolution caused the US-Western world to lose its principal military ally in the Persian Gulf-Middle Eastern region. As a consequence of these international developments, the geostrategic importance of Turkey increased dramatically. The US remodeled its twin pillar policy based on Saudi Arabia and Iran (Uzgel 2013) and this new policy culminated with the declaration of the Carter Doctrine (January 24, 1980), which proclaimed the Persian Gulf as a vital area for the US national interest. In the following year, the US established the Rapid Deployment Joint Task Force (RDJTF) for the Middle East region in March 1980, which converted to Central Command (CENTCOM) in 1983. Turkey, did not not allow the deployment of RDJTF from Incirlik airbase and did not allow the use of existing air bases for American U-2 spy plane flights conducting espionage activities over the Soviet Union. In the same vein, Turkey also recognized the new regime of Iran immediately after the revolution (Uzgel 2013).

Turkey had pursued a relatively autonomous foreign policy during 1960–1980; however, the developments in the late 1970s indicated that a new era of imperialist expansionism (including the Soviet Union and the Eastern bloc) was about to launch and Turkey's multifaceted or semi-independent foreign policy could no longer survive within the tolerant limits of imperialism. The junta regime in Turkey committed itself to meeting the demands of the US-Western bloc,

which were not accepted by the governments of Turkey before the coup (Uzgel 2013). In this regard, it was neither surprising nor coincidence that Paul Henze who was the then Central Intelligence Agency (CIA) station chief in Turkey (assisting Zbigniew Brzezinski in the US National Security Council) gave the news of the coup to President Jimmy Carter by saying "Our boys have done it" (Uzgel 2013).

The junta regime in Turkey, just 2 months after the coup (November 29, 1982) concluded the Defense and Economic Cooperation Agreement (DECA) with the US and the US military regained access to military facilities and intelligence installations in Turkey The (Defense and Economic Cooperation Agreement 1982). In 1982, with a Memorandum of Understanding signed between the two and it was agreed that the US would modernize ten air bases in Turkey while constructing two more in Muş and Batman (Gerger 2012). These military bases particularly Incirlik would become the main operational base for the upcoming imperialist operations of the West in Iraq, Syria and other targets in the Middle East.

In the 1980s, the junta and ANAP were both compliant with the Green Belt-Crescent project, which was put into force by the US in the late 1970s. The project aimed to facilitate militarized political Sunni Islam movements to spread all around the Middle East and Turkey with the financial leverage of the Gulf States (particularly Saudi Arabia). The Islamic neo-containment project seemed to target Shia Iran and the Soviet Union in Afghanistan but in reality the basic concern of the project was to ensure the continuity of collaborative regimes and control mass mobilizations that might lead to regime changes, like it did in Iran. The political conditions in Turkey (strong trade unions, general strikes, and social unrest) in the late 1970s raised alarms in the US for a possible revolution in Turkey, which would have been disastrous after having lost Iran. Thus, consistent with the objectives of the Green Belt Project, Turkish-Islamic synthesized ideology turned into a state-led, organized identity-building policy starting with the military regime and followed by subsequent right-wing political parties.

The US maintained its regulatory leadership during the 1990s, in opening up new spheres for capital accumulation, if necessary by use of force, for the benefit of all metropole economies. Germany, Japan, and the Gulf countries accepted to pay the $54 billion (Arrighi 2005) heavy bill of the Gulf War in 1991, while France, the UK, Italy, Germany, and other NATO members actively participated in the dissolution of Yugoslavia under the pretext of "humanitarian intervention." Immediately after the dissolution of the Soviet Union, the relatively autonomous capitalist countries that benefited from the stability of the bipolar system became direct targets of the US-led imperialist interventions. Most of these countries were geographically close to Turkey (Yugoslavia, Syria, Iraq, Iran).

At the beginning of the 1990s, the imperialists expected Turkey to use its historical-cultural relations (Ottoman heritage) with the Turkic-Muslim Republics in Caucasus, in the Balkans, and in the Middle East as leverage to establish close relations (as a model) with states in the region thereby paving the way for the entrance of foreign finance capital and easing the integration of these countries into global capitalist markets. This is why imperial discourses such as the establishment of the "Turkish World (hegemony) from the Adriatic to the Great Wall in China" were abundantly used by the Turkish politics in the first half of the 1990s without taking into consideration the real imperialist actors behind them. However, Turkey's imperial ambitions or dreams would rapidly meet the reality of the political economy. Turkey was itself a subordinated country ranked at the lower levels of imperialist hierarchy and its economic, military, political, and cultural capacities were structurally insufficient to achieve hegemonic goals. Turkey held the same ambitions while attempting to gain a share from Syria after 2010 via Neo-Ottoman policies, yet encountered the same reality.

In the second half of the 1990s, the coalition governments in Turkey had pursued more cautious foreign policies and although they supported and to some extent provided military contributions to US-led imperialist intervention policies in Iraq and Yugoslavia, they attempted to keep a low profile in international relations.

T

1997–2018: Triumph of Neoliberalism Under IMF Programs and AKP Rule

The global fiscal expansion in the 1990s was incredibly large; it was even described as "irrational exuberance" by Alan Greenspan who was chairman of the Federal Reserve (FED) in 1996 (Brenner 2000). In the 1970s, the global movement of financial capital was $59 billion annually, this figure reached $3.2 trillion by the end of the 1990s (Allen 2000) and more than 300 trillion dollars by 2018. This explosive growth of global finance transactions went hand-in-hand with chronic financial crises first in the peripheral economies (in the emerging markets, by neoliberal expression) throughout the 1990s and secondly, in the metropolitan countries after 2008.

The "first generation crises of financialization" (Yeldan 2009) wave (Mexico, Russia, Thailand, South Korea, Malaysia, and Indonesia) hit Turkey twice between 1994 and 2001. This crisis wave, which remained limited in peripheral economies, was controlled by the hegemonic repression by the US and the cruel austerity measures of the IMF and World Bank and resulted in net resource transfers from periphery economies to the centers of imperialism. The burden of imperialism on peripheral countries aggravated with the second half of the 1990s (Boratav 2010).

The first-generation crisis wave had some consequences in re-approaching the role of the state in peripheral economies. In the 1980s and early 1990s, the role of state was defined by the Washington Consensus as "deregulation," which involved the minimizing of government expenditures and interference while securing property rights, privatizing state enterprises, ensuring fiscal discipline, liberalizing trade and finance, suppressing wages, carrying out policies to flexibilize labor, and removing restrictions on capital transactions (Williamson 2005). However, after the aforementioned crises, a new approach, the Post-Washington Consensus, was developed for the states of emerging markets (peripheral economies) referred to as "institutionalism," which involved accepting the "collective global surveillance" (Soederberg 2002) of the

institutions of the international financial capital (under the coordination of the IMF and the World Bank) and transforming national monetary institutions into autonomous institutions in which international capital could represent its interests. The Post-Washington Consensus aimed to improve the regulation capacity of governments in order to prevent de-valuation of capital (disinflation policies) and to set "flexible" and "soft" measures to keep class conflicts and mass mobilizations under control. In accordance with these new approaches, an institutional strategy was adopted in the Group of seven (G-7) Summit meetings in the late 1990s (particularly in the Cologne summit of 1999) to integrate the emerging markets more tightly into the global finance system (Soederberg 2002). For this purpose, the leaders of the G-7 selected Turkey, Argentina, Brazil, China, India, South Korea, Australia, Mexico, Saudi Arabia, South Africa, and Indonesia as "strategically important" emerging markets and established Group 20 (G-20) in which the representatives of the EU, IMF, the World Bank, and the G-7 countries were included (Soederberg 2002). The basic goal of establishing G-20 was to integrate these strategically important markets into the "official rules and standards of the core alliance" (Soederberg 2002).

Turkey was defined as a "strategically important" market by the centers of imperialism and it was also included in the enlargement process of the EU as an official candidate state in the EU Helsinki summit in December 1999. In addition, Turkey concluded a standby agreement with the IMF in 2000, which was a follow-up of the staff monitored program (1998) put into force to authorize a closer IMF supervision on the economy of Turkey (Boratav and Yeldan 2006). The stabilization and restructuring programs of the IMF and the World Bank continued uninterrupted for 10 years between 1998 and 2008 and put Turkey under the supervision of the financial capital core. The "experimental" and "risky" (Boratav 2011) IMF-led disinflation program that Turkey fully adopted from 1999 to 2001 resulted in a major economic crisis creating severe social consequences in Turkey. As a result of the early general

elections held in 2002, the three political parties who held seats in the Turkish Parliament failed to pass 10% thresholds and the Justice and Development Party (AKP), which was founded in 2001 and had no link to the deteriorating IMF programs, won the elections and established a single-party majority government and embarked upon building a neoliberal Islamic regime.

AKP was founded by the politicians, mainly Tayyip Erdoğan and Abdullah Gül, estranged from the Islamist "Welfare Party" (RP), which was forced to leave power as a result of the "National Security Council" decisions on February 28, 1997 and subsequently dissolved by the verdict of the "Constitutional Court" in 1998. The AKP-Erdoğan regime (after 2016, gaining control of all state apparatuses under Erdoğan's authority) came into power with more favorable conditions than any other political party in the history of Turkey. In the period of 2002–2013 (excepting 2008–2009), in favorable financial conditions of massive international fiscal expansion, the AKP found the opportunity to build a model based on Islamic "neoliberal-populism" (Akçay 2018) which was consistent with the standards of the post-Washington Consensus.

AKP rose to power and established its hegemony with the leverage of the broad imperialist alliance bloc: institutions of financial capital (the IMF-the World Bank-the G-(7) and the G20); hegemony and semi-hegemony (the US and the EU); oligarchic corporations – the Turkish Industry and Business Association (TUSIAD) and the Islamic rural "Independent Industrialists and Businessmen's Association" (MUSIAD); the bourgeoisie in Turkey. AKP successfully disguised its affiliation with neoliberalism and obtained the consent of mass majority through criticizing IMF programs at first and after 2002 through "widening of financial inclusiveness" (Akçay 2018), transforming class conflicts to religious-national identity conflicts and constructing national security threats which went hand-in-hand with changing necessities of the new regime-building process of the AKP-Erdoğan. The AKP also received the support of a highly instrumental and organized Islamist organization, the "Cemaat," headed by Fethullah Gülen, from 2002 to 2013. Their alliance mostly focused on inducing series of lawsuits and criminal operations against civil and military bureaucrats (mostly right-wing Kemalists) who were in high ranking or critical positions in military, judiciary, security or intelligence services and posing threat to the construction of the new regime. The alliance of the AKP and the Cemaat came to an end with the attempt of the "Cemaat" to topple the AKP-Erdoğan regime in a failed coup on July 15, 2016.

The AKP's majoritarian rule provided political stability for the implementation of the IMF's "Strong Economy Program" prepared by Kemal Derviş, the former Minister of Economic Affairs (also former vice president of the World Bank) and IMF experts. The AKP totally fulfilled the liberalization program based on: tight monetary policy, free movement of capital, liberalization of labor markets, disinflation-price stability policies, and privatization of state enterprises (Boratav 2016; Akçay 2018). In 2005, AKP signed another standby with the IMF for three more years. The neoliberal economic policies of the AKP are characterized by: large-scale privatizations, net capital imports (speculative hot money), high net resource transfers (profit and interest revenues), import-dependent exports, a steady increase in external and households indebtedness, debt-led consumption, dependent economic growth based on foreign capital inflows, a boost in the construction sector, and large-scale infrastructure projects (Boratav 2016).

The neoliberal policies of the AKP have scored high marks from the top cores of imperialism. The Accession Partnership documents and the progressive reports that the EU has prepared for Turkey have several times commended Turkey for its good functioning in privatization processes or for opening up unlimited access to financial capital. The IMF was also pleased with the neoliberal policies of the AKP, which extraordinarily provided $10 billion credit to Turkey in the 2005 standby agreement. The IMF revealed that this credit was given within the "exceptional circumstances" context aimed to support the AKP in the then upcoming 2007 elections (Boratav 2011).

Privatization of State Economic Enterprises and New Labor Regime

The AKP has accomplished a record-high level of privatization in Turkey's economy (Akçay 2018). The total revenue of privatization was $8 billion during 1986–2002 in Turkey and it shifted tremendously to $62 billion between 2002 and 2018 (Republic of Turkey Ministry of Treasury and Finance 2018). The privatizations achieved by AKP were consistent with the standards of the Post-Washington Consensus because privatizations did not just function for public debt-cleaning but they also served to facilitate the dissolution of the State Economic Enterprises (SEEs). Shutting down SEEs was conducive to a comprehensive neoliberal transformation such as through the weakening of organized labor (a large percentage of organized labor was working in SEEs), the commodification of cheap public goods and services (Akçay 2018), and the liquidation of small peasantry while opening spheres to transnational agricultural corporations (Oyan 2013).

In a similar vein, AKP issued legislations concerning agriculture, such as the "Law Regarding the Protection of Plant Bleeders" (2004) and the "Seed Growing Law" (2006), and made it compulsory for farmers to buy conventional seeds solely from registered firms (Aydın and Biber 2014). Non-coincidentally, 99% of these firms operating in Turkey were multinational corporations and they were acting as dealers of six worldwide monopolies, namely, Novartis, Monsanto, Cargil, Dupont, ADN, and Bayer (Aydın and Biber 2014). The legislations on agriculture simply demonstrates how imperialism ("exploitation and dependency" Boratav 2010) works in Turkey under the hegemony of the AKP.

AKP issued four legislative regulations for the neoliberalization of the labor market: Labor Act No 4857 (2003), "Private Employment Agencies Regulations" (2004), "Omnibus Act of 2011," and in 2016 another regulation for private agencies but known as "Slavery Act" concerning the renting of workers (2016) (Gürcan and Mete 2017). All of these regulations laid the legal groundwork of flexible, subcontractual, and unorganized employment with reduced job security, which complied with the demands of big capital in Turkey (Akçay 2018). Concomitantly, the trade unionization density in Turkey, which was around 30% in 2001 declined to 6% in 2013, and the ratio of workers working under a collective contract fell to 6% of the total employment levels in Turkey (EU Commission Final Report 2016).

Dependency on Foreign Capital Inflow and Net Resource Transfers

The Foreign Direct Investment Law No. 4875 facilitated the legal conditions with regard to the inflows of foreign direct investments and enhanced the rights protecting investors. The total foreign capital inflows to Turkey during 2002–2017 exceeded $600 billion and $193 billion of the total amount were net foreign direct investments (Presidency Investment Office 2018) The number of companies in Turkey with foreign capital in 2002 was 5600, which rose to 58,400 in 2017 (Presidency Investment Office 2018). The annual average of foreign capital inflows to Turkey was $2.2 billion in the period 1995–2005; it reached $20.7 billion in the period 2006–2008 due to the augmentation of privatizations, $9 billion in the period 2009–2010 during which the effects of the crisis continued, $14.2 billion in 2011–2016, and then $10.8 billion in 2017 (Uluslararası Yatırımcılar Derneği 2018). The massive inflows of foreign capital to Turkey were mostly used for the finance and construction sectors and for the purchase of real estate. Only limited portions of foreign capital inflows were invested in the productive sectors (e.g., the manufacturing industry). For instance, in 2013, $5.4 billion out of the total $13.6 billion in capital inflow were invested in the productive sectors (manufacturing industry, energy, mining, etc.), $5.1 billion were invested in the service sectors (finance insurance, transportation, storage, etc.), and $3 billion were invested in real estate purchases. In 2017, $2.6 billion of the total foreign capital inflow of $10.8 billion were invested in the productive industry, $4.8 billion in the service sectors, and $4.6 billion in real estate purchases (Uluslararası Yatırımcılar Derneği 2018).

Industrial production in Turkey has specialized on low and medium-low technology industrial goods such as textiles, food, vehicles, machine parts, and iron and steel products. According to data from the Istanbul Chamber of Industry (Istanbul Sanayi Odası 2016), in 2016, 39.3% of the added value created in the manufacturing industry relied heavily on medium-low technology productions, while 37.4% relied on low-technology; 19.5% relied on medium-high technology and just 3.7% relied on the high-tech industry group (Istanbul Sanayi Odası 2016). According to the same data, as of 2016, 123 companies out of the 500 largest industrial corporations in Turkey were foreign share capital enterprises and the total amount of exports of these 123 corporations reached 47.8% of total exportation (Istanbul Sanayi Odası 2016). According to data provided by the State Institute of Statistics, the rate of exports meeting imports was 67.1% in 2017 (Türkiye İstatistik Kurumu 2017), and this rate indicates the dependency of the manufacturing industry on imports.

The sum of "net profit-interest remittances" (Boratav 2010) or net resource transfers of international financial capital from Turkey during 2010–2015 equal $77 billion (Boratav 2017). The ratio of international capital asset acquisitions in Turkey and all foreign gross assets within national income was 52.9% in 2008, and it soared up to 82.7% in 2014 (Boratav 2016). To conclude, Turkey's attribution to international capitalism took the form of importing net capital while transferring net resource to international financial capital.

External Debts and Fragile Economy

One of the most apparent indicators of Turkey's dependency on imperialist composition is its high sensitivity to hot money inflows and outflows as well as steady growth in its external debt stock. During the 2008–2009 crisis, the hot money inflows to Turkey stopped abruptly and turned into a net foreign capital outflow reaching $10.9 billion between October 2008 and October 2009 (compared to $75.7 billion in the same time period

the previous year) (Boratav 2016). In the same year, Turkey made net foreign debt payments of $26.4 billion to international financial capital and was concomitantly dragged into a severe crisis wherein its economy shrank by 7.9% (Boratav 2016). The quantitative easing policy initiated by the US, which was then followed by the EU and Japan in 2008, rescued Turkey from entering a deep recession since the inflows of short-term foreign capital into peripheral economies resumed again. However, reliance on debt-creating outsourcing contributed to the foreign debt burden of Turkey. The amount of external debts, which was $129 billion in 2002, increased sharply to $453 billion in 2018. In addition, as a consequence of the cheap credit-based consumption model of the AKP (as a part of their "financial inclusion policies"), the percentage of household debt in Gross Domestic Product (GDP) increased to 19.6% in 2013, up from 1.8% in 2002 (Akçay 2018). During the periods 1997–2007 and 2008–2015, the rate of increase of household debts in GDP reached a record high rate of 329.8% (Bedirhaoğlu 2019).

Alignment with Imperialism

In the second half of the1990s, the global control capacity of the US hegemony was in a relative decline concomitantly with an escalation in structural defects of the capitalist accumulation model on which the US hegemony was built. On the other hand, other regional actors, such as Russia, Germany, and China, were extending their impact power. To maintain leadership of the imperialist system, containment strategies, geostrategic deployments, and alliances with collaborative local actors became important for the US.

The dual policy of the US concerning the Middle East began forming in the late 1990s. The first pillar of this policy focused on initiating new security architecture in the Middle East through military interventions, occupations, forced regime changes, and velvet revolutions (Yeşilyurt and Akdevelioğlu 2009; Uzgel 2009). The second pillar, aimed to integrate authoritarian Arab regimes with low legitimacy into a neoliberal

T

capitalist democracy Post-Washington Consensus with a comprehensive transformation in politics and society; this was announced as the Greater Middle East Partnership Initiative (GMEI) in 2004. Further, these policies aimed to prevent uncontrolled radical Islamists from seizing power. In this context, the US supported moderate Islamic movements, such as the "Society of Muslim Brotherhood," which has been the most organized and expanded Islamic movement in the region and the most eager to collaborate with the US.

The neoliberal moderate Islam-democracy of Turkey, which has close ties with the West, would be an inspiring model for the region. However, the RP (Refah Partisi, or Welfare Party emerging from the National View Movement), which came into power in Turkey in 1996, did not meet the expectations of the United States when its leader and co-founder Prime Minister Necmettin Erbakan made his first official foreign visit to Iran, attempted to establish an international Islamic organization (Developing 8, or D8), raised the opportunity of an Islamic common market, made appeals to save the Turkish economy from Western domination (Uzgel 2009), and called for "Just Order," which resembled "protectionist economic nationalism" (Madra and Yılmaz 2019). At the end, as mentioned before, Erbakan had to step down as a result of "National Security Council" decisions on February, 28, 1997 (mostly referred to as a postmodern coup) and the RP resigned from government. The RP was shut down by the Constitutional Court and its successor, Virtue Party (FP), was later dissolved on June 22, 2001.

The AKP was founded on August 14, 2001 and its founders Erdoğan and Gül visited the US immediately after the dissolution of the FP and attended several meetings held in influential organizations, such as the Council on Foreign Relations, the Center for Strategic and International Studies, and the American Enterprise Institute. In both Erdoğan's and Gül's speeches presented during their visit, they emphasized their willingness to improve relations between Turkey and the US and support Turkey's commitment to the EU accession process. They also stated on every occasion that they cut ties with the RP-FP's "National View Movement" (Uzgel

2009). In short, before the AKP came into power, its founding cadres made it clear that the AKP would pursue pro-American, pro-EU, and pro-liberal policies, and it would not come into conflict with the structural interests of imperialist centers.

As mentioned before, the AKP came into power in 2002 under very favorable conditions. The leader of the "Kurdistan Workers' Party" (PKK) organization, Abdullah Öcalan, was delivered to Turkey via an operation of the CIA in February 1999. The US was in need of Turkey's military and logistic corroboration for the planned Iraq invasion and did not want Turkey to be distracted with a PKK threat. After the capture of Öcalan, the PKK withdrew its armed forces outside of the Turkish border and declared a one-sided ceasefire (1999–2004). As such, the AKP came into power in a relatively peaceful environment without developing a policy on the Kurdish question in Turkey.

After the 2002 elections, the officials of the AKP government and the US agreed on Memoranda of Understanding for the deployment of US soldiers (in addition to the use of airports and seaports) for launching the invasion of Iraq from the north via Turkish territory (Yılmaz and Özdemir 2017). Nevertheless, the AKP government failed to pass the bill on March 1, 2003 in parliament as a result of resistance from the Republican People's Party (CHP), the only opposition party in parliament, along with unfavorable votes from some AKP members. The then US President George W. Bush and the neo-conservative team were stunned with the rejection of the bill because they had assumed that the AKP government would play a key role in both pillars of the US Middle East Policy (Yeşilyurt and Akdevelioğlu 2009).

The defeat of the bill had severely affected the relations of the US and the AKP government at the beginning. In order to restore the relations, Erdoğan wrote an article in the *Wall Street Journal* titled "My Country is Your Faithful Ally and Friend" on March 31, 2003 (Erdoğan 2003) to remind that Turkey and the AKP have both been in line with US interests. Soon after, the AKP government became actively involved in the

second pillar of the US policy (Yeşilyurt and Akdevelioğlu 2009) and made several visits to Arab countries, where they presented Turkey as a moderate-Islamist model successfully integrated into the international system and promoted GMEI objectives, such as transformation to multiparty democracy and the necessity of social change or freedom of opinion (Uzgel 2009). The GMEI objectives were not welcomed by the authoritative rulers of the Middle East and the project discontinued after 2006. However, the contribution of the AKP to the second pillar of the US policy continued in a different manner.

In the second half of 2000s, Erdoğan began to emphasize the Ottoman heritage of Turkey and gave speeches as if he was the defender of Muslims in former Ottoman territories. In 2009 at the Davos meeting, Erdoğan explicitly accused the then Israel Prime Minister Simon Peres as murdering Palestinians and became the most popular political figure in the Arab public. Erdoğan developed close relations with political figures such as Bashar al-Assad, Khaled Mashal, Muammar Gaddafi, and Omar-al-Bashir. Erdoğan's reputation created the illusion that Turkey could be the guardian of Sunni masses. On the other hand, Erdoğan as a prime minister allowed the use of Incirlik airbase and Turkish airspace for imperialist operations of the US in Iraq and Syria and the NATO Radar Base in Malatya was established in 2011 for the surveillance of Iran.

The Trojan horse role that Turkey played on behalf of imperialism ended in 2011 with the beginning of the Arab Revolts. In 2011, Izmir became the command center of NATO for Libya's intervention, and the jihadist terrorists passed to Syria via Turkey borders and they have received logistic, military, and diplomatic help from Turkey (Ozkan 2018; Chivers and Schmitt, 2013). From 2011 to 2013, the AKP government was backed by the Atlantic front and dreamed of becoming an Islamic hegemon power in the Middle East. When the political parties of the Muslim Brotherhood (Ihvan) came into power, the Ennahda Movement in Tunisia and Muhammad Mursi in Egypt, the AKP, which had close relations with that Islamic movement, presented itself as a mentor; this

position soon turned into a fantasy of becoming the leader of the "Sunni Muslim Belt from Sudan to Syria" (Ozkan 2018). However, the wide-ranging Turkish protest movements beginning in June 2013 with the Gezi uprisings exposed the Islamist authoritative character of Erdoğan, which effectively tarnished his image as a democratic-Islamist liberal and globally exposed that he did not possess the popular support. Further, Mursi and the Ennahda lost their ruling power in 2012 and 2014, respectively.

The 2012 assassination of Christopher Stephens, the US ambassador to Libya, by fundamentalist Islamic groups and pressure from Saudi Arabia-Gulf countries (except Qatar) on the US to retract its support for Ihvan parties led the US to alter its "moderate Islam" politics (Ozkan, 2018) that had been in place since late 1990s.

The military inclusion of Russia into the ongoing war in Syria in September 2015 in order to help the Assad regime decisively ended Turkey's dream of becoming a regional hegemon power in the Middle East. Turkey, at the end of 2016, obliged to make a compromise with the Russia-Iran-Syria front via the Astana Process launched by the leadership of Russia. Even though Turkey has tried to maintain its influence in the region by benefiting from the contradictions between the global powers, the title of President Erdoğan's article written to the *New York Times* on January 7, 2019 portrays the idea that Turkey has been cooperating since 1946: "Trump Is Right on Syria. Turkey Can Get the Job Done" (Erdoğan 2019).

Concluding Remarks

The organic link between capitalism and imperialism connecting comprador bourgeoisie of Turkey to capitalist classes-institutions of the metropole economies officially established in 1946 with the articulation of Turkey into the Atlantic bloc and Bretton Woods institutions. The integration of Turkey to the asymmetric dependency relations of imperialism gained momentum in 1989 when Turkey removed the

restrictions on capital inflows and outflows. From that point onward, Turkey's economy has increasingly become dependent on financial cycles and hot-money movement. By 2018, Turkey's economy may be characterized as net capital importing and net resourse transferring in respect to international financial capital, that is, imperialism. Regardless of the rise and fall in Turkey's relations with the US or the West, it has always maintained a stance close to economic and foreign policy interests of the capitalist core and hegemony.

Turkish Left and Anti-imperialism in the 1970s

Emre Eren Korkmaz
Department of International Relations, Altınbaş University, Istanbul, Turkey

Synonyms

Anti-imperialism; Communist Party of Turkey; Kemalism; Leninism; Maoism; Sino-Soviet split; Soviet imperialism; Turkey

Definition

This essay examines the many factors involved in the deep polarisation of the socialist movement in Turkey in the 1970s as fundamentally predicated on the Sino-Soviet split of the previous decade. However, to understand the "local" significance of polemics between pro-China and pro-USSR factions, the essay analyses the historical legacy of the anti-imperialist movement in the political history of Turkey. The socialist movement in the

1960s had a strongly anti-imperialist character, and the essay argues that it is possible to observe the evolution from a Kemalist version of anti-imperialism to one based on various versions of Marxism-Leninism.

Introduction

The 1970s were marked by the rise of the left-wing and anti-imperialist movement in Turkey. This was the Turkish revolutionary movement's strongest period in its history, during which the Turkish left in general was able to engage with extensive popular segments. While left-wing and anti-imperialist groups were mobilising millions, the mainstream Republican People's Party (CHP) adopted a leftist, social-democrat position in the 1970s with the change of its leadership from Inonu to Ecevit in 1972. It became the first party in the 1973 general election with 33 per cent of the vote, and it received 41 per cent of the vote in the 1977 general election. This period witnessed the flourishing of many parties and democratic organisations. The labour movement, student movement, peasant movement, women's movement along with illegal or semi-legal armed groups and resistance organisations acted throughout the country. On 12 September 1980, this period came to an end with the military coup d'état and subsequent dictatorship of General Kenan Evren. This crushed all organisations and suppressed the movement.

Despite the existence of the Communist Party of Turkey (TKP) since 1920, the socialist movement consisted of a small group of intellectuals and workers that permanently faced state repression until the 1970s. Following the rise of the people's movement in the 1960s, the youth movement radicalised, Marxist publications attracted the interest of intellectuals, and strong labour confederations and student organisations were formed. Many revolutionary parties and organisations emerged at the dawn of the 1970s. Despite the 1971 military memorandum and the elimination of the revolutionary movement's leaders through a series of political murders in 1972 and 1973, the socialist movement was able to

strengthen between 1975 and 1980. On 12 March 1971, a military memorandum was signed by the Turkish generals and given to the president. It demanded that the Turkish government should resign, which it duly did for fear of a coup d'état. The military accused the elected government of failing to overcome the social and economic unrest. This was the second successful military intervention in the Republican period after the 1960 coup (Ersan 2013). The left-wing movement not only organised large mobilisations of masses for political, economic, and social purposes, and organised campaigns, but also tried to counter the state oppression, political murders, and paramilitary-fascist terror that began to turn into a civil war in the late 1970s. Turkey was a highly polarised society during this decade.

This polarisation was not just on the left–right axis. There was also a strong polarisation within the revolutionary movement of Turkey. This polarisation was a result of the international dispute and consequent struggle within the international socialist movement led by the confrontation between the Communist Party of China (CPC) and the Communist Party of the Soviet Union (CPSU). Revolutionary/socialist parties and organisations in Turkey determined their position within this conflict and began to struggle with each other, mainly in the form of political and theoretical debates and not without some forms of violent clashes. A weak socialist tradition along with intense state oppression coincided with the Polemics within the international socialist movement, and despite the rising mass support for the revolutionary movement, it could not succeed in uniting to counter the fascist terror and the military junta.

Apart from the ideological debates between the CPC and CPSU, anti-imperialist thought also contributed to how the revolutionary organisations positioned themselves. There was continuity between the 1970s movement and the 1960s anti-imperialist movement. The anti-imperialist consciousness that developed in the 1960s influenced the revolutionaries of the 1970s. In addition, the historical confrontation between the Turkish and Russian states, in view of the latter's historical imperialist ambitions, should be taken into

consideration. In the context of the USSR's super-power position and Turkey's affiliation with NATO in the post-war period, this antiimperialist historical consciousness had an impact on the Turkish left, especially with regard to the acceptance of the Maoist 'social-imperialism' theory and its adoption in the contemporary politics of the 1970s.

This essay argues that the domination of the critique of the 'modern revisionism of the USSR' and the influence of the Maoist approach in the 1970s was the consequence of the strong anti-imperialist movement.

The Left in the 1970s and Positions towards the 'Polemics'

Brief Historical Background

The TKP was formed in 1920 at Baku by the unification of three socialist groups under the leadership of Mustafa Suphi, who had been a prisoner of war (POW) during the First World War. One of these socialist groups was formed by former Turkish POWs who had been held by the Tsarist Russian army and met with socialist ideas during the October Revolution. The other group was established by Marxist students who were politically active during their university lives in Germany (Turkish Spartakists) and France, and who aimed to wage the revolutionary struggle in their own country. The third group belonged to the local revolutionaries and socialists organising in Istanbul and other Anatolian cities, participating in the local resistance groups against occupying forces after the surrender of the Ottoman Empire (Ağcabay 2009).

Mustafa Suphi and his comrades formed the Turkish Red Militias, a nucleus of the Turkish Red Army formed by former POWs. Their strategy was to join the resistance movement led in Ankara by the Government of Mustapha Kemal. By forming a wellfunctioning party and an organised armed group, they aimed to form a United Front with the Kemalist Government for the independence of the country against the British, French, and Italian imperialist interventions and the Greek occupation. This proposal was accepted by the Kemalist Government. However, on the way to

Ankara from Baku, Mustafa Suphi and his 14 comrades (members of the Central Committee) were murdered in Trabzon in 1921. There are claims, but not any certain evidence, that link this massacre with the Kemalist Government. Later, the Turkish Red Militias were mobilised for the Bolshevik victory in Caucasia and could not return to Turkey as an organised group (Ağcabay 2009).

The period from the 1930s to the 1950s was marked by the continuous attempts of the TKP cadres to organise and reorganise against the unending government pressure. The secretary general Dr. Şefik (Shefik) Hüsnü, Dr. Hikmet Kıvılcımlı, and the world-famous poet Nazim Hikmet spent decades of their life in prisons. TKP aimed to organise workers and students; they formed the first examples of trade unions and labour associations in the Republican period. There had been labour organisations in the nineteenth century in the main industrial and commercial cities of the Ottoman Empire such as Istanbul, Salonika, Izmir, and some Macedonian towns. However, as a result of the Ottoman Empire's collapse, the emergence of new independent states in the Balkans, mass migrations, and deportations during the Balkan Wars and the First World War, these labour organisations, formed by workers of various nationalities, were dissolved. TKP was operating illegally, but tried to form legal socialist parties and labour organisations and to publish legal magazines, but these were not permitted by the Kemalist Government. There was also a TKP radio station, based in Bulgaria. Until the end of the Second World War, TKP had a relatively positive approach to the Kemalist Government despite the ongoing pressure which the latter applied to them. TKP defined the new system as a bourgeois state against feudalism and reactionary forces, backed its modern reforms in superstructure, and supported armed suppression of the Kurdish rebellions, which it analysed as reactionary responses of the feudal forces. TKP strictly followed the official directives of the USSR and the Comintern (Ağcabay 2009).

In the 1960s, TKP benefited politically and organisationally from the rising, antiimperialist, youth movement and also contributed to the

anti-imperialist movement. TKP cadres were active in forming the first legal trade unions in the 1950s, and they were one of the main forces in organising the split from the central labour confederation (Türk-I·s, The Confederation of Turkish Trade Unions formed in 1950) and establishing DISK (Confederation of Progressive Trade Unions of Turkey) in 1967. As an illegal party, TKP also supported the legal Workers Party of Turkey (TIP), which had been founded in 1961 by a group of trade unionists (Babalik 2005). TIP was the first socialist party in Turkey to win representation in the parliament. In the 1965 general election it got 3 per cent of the vote and won 15 seats in the parliament. The activities of the socialist members of parliament earned the sympathy and support of the rising anti-imperialist student movement as well as the labour and peasant movements. TIP was banned after the 1971 military memorandum and re-established in 1974. It was banned once again by the 1980 military junta.

Another main left-wing approach was defending the National Democratic Revolution (NDR) theory. This was a left-Kemalist theory defended by a periodical (YON) and some former TKP cadres such as Mihri Belli. Mihri Belli was the son of a commander during the War of Liberation in the Thrace Region. He studied in the US at Mississippi University where he was introduced to Marxism, and joined the labour and student movement in organising black peasants. When he returned to Turkey, he joined TKP in 1940. During the Greek Civil War, he participated as a guerrilla in 1946 and became a commander, known as 'Kapetan Kemal'. Until his death in 2011, he was an active leader within the socialist movement. The National Democratic Revolution theory advocated the alliance of progressive army officers and intellectuals in seizing power via a kind of leftist coup d'état. Its adherents proposed a planned economy with state control aimed at rapid development and industrialisation (Kaypakkaya 2013). Anti-imperialism was the focal point of this theory, mainly criticising the US dominance over Turkish politics, and the NATO affiliation.

These two main approaches benefited from, and contributed to, the anti-imperialist student movement of the 1960s. This campaigned against the European Common Market ('they are common, we are market') and demanded the nationalisation of petroleum. The student movement also campaigned against Turkish-based US bases and attacked US soldiers. On 16 February 1969, students protested against the Sixth Fleet of the US Navy visiting Istanbul, and two students were killed after a provocative fascist attack against the students. There were demonstrations to support Vietnamese revolutionaries and anti-colonial struggles against imperialist states. In 1968, students in the Middle Eastern Technical University burned the automobile of US ambassador Kommer who was known as the 'Vietnam butcher' (Behram 2005; Karadeniz 2006).

The 1970s

The anti-imperialist movement of the 1960s radicalised and shifted towards Marxism during the first years of the 1970s. From an anti-imperialist opposition, it began to focus on the power relations and searched for ways to achieve an independent and socialist system via revolution. The leaders of the 1970s had been active in the movement of the 1960s. So at this conjuncture, they found themselves in a position to understand the Polemics within the international socialist movement and to choose 'the real Marxist-truly revolutionary' way to continue the struggle in Turkey (Müftüoğlu 1990).

Political Actors

There are three important revolutionary leaders who had great impact over the next generations, and who were killed by the state very early, shortly after their establishment of organisations.

Deniz Gezmiş is considered to be the most popular Turkish leader of that period, and his appeal may be compared with that of Che Guevara. He was the founder leader of THKO (Peoples Liberation Army of Turkey). After the military memorandum in 1971, along with his comrades, he initiated a rural guerrilla struggle, but was captured by the army after a short while.

He was executed on 6 May 1972 together with his two comrades, Hüseyin İnan and Yusuf Aslan. He had a pioneer position within the anti-imperialist youth movement. He joined the Palestinian resistance and had an armed training at Palestinian camps. He was a member of TIP and he was defending the NDR theory in the 1960s. Thus, he found the Kemalist revolution to be a progressive development. He aimed at fulfilling this progress by an anti-imperialist revolution against the ruling class, which had taken power by a counter-revolution and aligned Turkey with the US imperialism. Many organisations have claimed to be successors to his cause. For instance, one of the most important was called 'People's Liberation' in the 1970s, 'Revolutionary Communist Party of Turkey (TDKP)' in the 1980s, and the legal 'Labour Party' (EMEP) from the 1990s to today. These parties generally positioned themselves with Maoism in the 1970s and then aligned with Enver Hoxha, the leader of the Albanian socialists (Behram 2005; Ersan 2013).

Mahir Çayan (Chayan) was the founder leader of THKP-C (People's Liberation Party of Turkey-Front). He initiated urban guerrilla warfare and then shifted to rural guerrilla fighting. After kidnapping three technicians (two British and one Canadian) from a NATO base in order to liberate Deniz Gezmiş and his comrades from execution, he was killed on 30 March 1972 together with ten of his comrades. He also defended the NDR in the 1960s and then, after studying Marxism, rejected the positive role of the military given by that theory and advocated the necessity for armed propaganda for an anti-imperialist, democratic revolution. He was influenced by the Chinese and Cuban revolutions (Çayan 2008).

There have also been many organisations claiming to be successors of Mahir Çayan. The two main ones are Dev-Yol (Revolutionary Way), which has been one of the strongest organisations from the 1970s and until today, and has mainly adopted legal ways of struggle. The other was Dev-Sol (Revolutionary Left) in the 1970s and 1980s, which changed its name to Revolutionary People's Liberation Party-Front (DHKP-C) in the 1990s and has mainly followed illegal and armed means of struggle (Ersan 2013).

The successors of Çayan did not align themselves with any of the sides of the Polemics within the socialist movement and criticised both parties, but their position was closer to Maoism. They accepted the main arguments of the Communist Party of China (CPC), accusing the USSR for being modern revisionists, but also criticised it as following narrow nationalist policies which prioritised their state interests while engaging in ideological debates. They also rejected the social imperialism theory proposed by the CPC as far as the USSR's character was concerned. They defended that even though the leadership of the USSR was modern revisionist, claiming it to be a result of the socialist economy and socialist superstructure. They argued that there was an ongoing struggle among Marxists and revisionists and it was not possible for a socialist state to be imperialist just after revisionists had captured power (Devrimci Gençlik 1978; Müftüoğlu 1990).

Ibrahim Kaypakkaya was the founder of the Communist Party of Turkey/Marxist-Leninist, Worker's Peasant's Liberation Army of Turkey. Kaypakkaya was captured by the army while he was waging rural armed struggle in 1973. After almost 4 months of torture, he was killed on 18 May 1973 without giving any information about his party. This organisation is still active with the same name, operating illegally and mainly through armed rural guerrilla groups following Mao's strategy of People's War. It has clearly been a Maoist party since its establishment, defending Maoist principles and struggling for the NDR, which is anti-imperialist in essence. The NDR theory of Mao demonstrated the way to achieve socialism for the semi-colonial and semi-feudal countries. This requires a democratic transition period (Kaypakkaya 2013).

Another organisation defending policies of the CPC was led by Doğu Perinçek, who has remained active in politics since the 1960s. He founded the Revolutionary Worker Peasant Party of Turkey (TIIKP-İllegal) in the early 1970s, and he then founded legal parties, successively the Worker Peasant Party of Turkey (TIKP) in the late 1970s (one of the strongest in that decade), the Socialist Party in the 1980s, and the Worker Party (IP) in the 1990s. He followed the official

policies of the CPC in both Mao's period and post-Mao. He defends Kemalist principles and uses Kemalist and Maoist terminology together by focusing on anti-imperialism (Perinçek 2011).

Within the pro-Soviet parties, the main and strongest one was TKP. TKP was a small party until the 1970s, but as a result of a campaigning period which is known as the '1971 Leap' in TKP's history, it became a strong organisation. TKP was following the policies of the USSR, demanding reforms for progress from the government. It was in the leadership of the leftist trade union confederation, DISK. TKP was against the NDR theory of the 1960s, and actively debated against Maoism in the 1970s. Maoist organisations accused TKP members of being 'social fascists' and agents of the social imperialism. After the dissolution of the USSR, TKP also dissolved itself and its cadres played active roles in the formation of various legal socialist parties during the 1990s (Babalik 2005). One of these groups of former TKP cadres re-established TKP as a legal party in 2012.

Anti-Imperialism and the Polemics: Anti-Imperialism and its Historical Legacy

In Turkey, there is a strong anti-imperialist tradition. This was mainly rooted in the National Liberation War after the First World War between 1919 and 1922 under the leadership of Mustafa Kemal Pasha. The Kemalist Government in Ankara succeeded in becoming recognised by the Great Powers, and declared independence in 1923. According to the official historical narrative and the Kemalist ideology, this was an anti-imperialist war and Turkey earned its independence against the occupational forces. This argument is also accepted in official histories, giving inspiration to all other oppressed nations in colonies and encouraging them to initiate their independence wars as well.

The left in general agreed with these main arguments but criticised some aspects of the official historical narrative. In general, the National Liberation War was considered as a progressive and anti-imperialist war. Additionally, the left in

general hailed and stressed the importance of Soviet aid during that war, which helped the Kemalist Government to organise the resistance movement against the occupation forces in its first phase. Lenin supported the Kemalist Government to maintain peace on the Caucasian border in order that he could focus on the civil war at home. In addition, the Soviet Government recognised the Kemalist Government as an ally against the imperialist interests of Britain (Avcıoğlu 1998).

However there are different approaches towards Kemalism in the post-Liberation War era. The TKP and the pro-Soviet left defended it as a progressive bourgeois movement until the end of the Second World War. Turkey's shift to the US camp in the first phase of the Cold War, under the Democrat Party Government, Turkey's participation in the Korean War and affiliation to NATO were considered as a break from the authentic Kemalist policy making which had been given importance to friendly relations with the USSR (Babalık 2005).

Deniz Gezmiş supported Kemalism as a progressive force and called for the Second Liberation War to achieve socialism; but, according to Mahir Çayan, Kemalism was a movement of the radical petty bourgeoisie, had a limited progressive role, and positioned itself within the capitalist world after independence. Perinçek also credited an anti-imperialist role to Kemalism and called for the fulfilment of the Kemalist revolution. These opinions converge in addressing Kemalism and the War of Independence as anti-imperialist progressive developments, and claim that a kind of counter-revolution occurred at the beginning of the Cold War when Turkey became a semi-colony of US imperialism. Due to the latter, they argue in favour of another anti-imperialist struggle for an independent socialist system.

Ibrahim Kaypakkaya had a different position on Kemalism. Kaypakkaya found a limited anti-imperialist factor in the War of Independence. He claimed that while the Kemalist Government was resisting the occupation, it aimed to reach an agreement with the imperialist powers even in unequal conditions, and by accepting the semi-colony status from the first days of the Republic,

the Kemalist Government moved towards imperialist interests (Kaypakkaya 2013). However, this analysis did not receive much support from the mainstream left movement.

Therefore the official historical narrative and the mainstream left agree on the importance of anti-imperialism for the foundation of the new regime after the collapse of the Ottoman Empire. All reactionary, semi-colonial, premodern characteristics began to be symbolised by the Ottoman Empire; modern, progressive, and anti-imperialist ideas were associated favourably with the Republican period.

The Leftist historical assessment was also influenced by the student movement of the 1960s against the US bases and fleet, Turkey's affiliation to NATO and the European Common Market, and protests/attacks against US soldiers visiting the cities. Almost all left-wing leaders and intellectuals of the 1970s had been part of the 1960s movement, sharing strong nationalist and anti-imperialist sentiments, and demanding full independence from imperialist domination. This period was also one of transition from a leftist version of Kemalism to an understanding and application of Marxist ideology and concepts to the concrete conditions of Turkey.

It is also necessary to mention the historical anti-Russian sentiments within Turkish society that had an impact on the left in how it adopted the theory of social-imperialism. In the official historical narrative, only the first phase of the Soviet Revolution under the leadership of Lenin is analysed in a positive sense, while both the histories of Tsarist Russia history that preceded it and the Stalin/post-Stalin USSR that followed have a negative image. From the sixteenth century to the end of the First World War, in four centuries, the Ottoman Empire waged 14 wars against Tsarist Russia. Russia is considered to be an imperialist state, claiming rights in the Balkans, Caucasia and Bosphorus and aiming to reach the Mediterranean. Therefore, during the Second World War, when Stalin demanded Turkey should join the war against Germany, and after the Second World War, when Stalin put forward proposals for a new regime for the Bosphorus by claiming more rights for the USSR and surrounding Turkey from

the Balkans in the West to Caucasia in the East, once again the historical concerns about the expansionism of the Russian state emerged. The signs of this consciousness may be seen in the famous slogan of the pro-China groups accusing TKP and other pro-Soviet associations: 'TKP wants US to go and Russia to come'. Also these groups tend to use 'Russia' instead of 'the Soviet Union' in order to separate the Leninist and Stalinist period from the rest, and to recall traditional anti-Russian sentiments.

The anti-imperialist youth movement, influenced by the official Kemalist ideology as well as traditional historical consciousness, led many socialist/revolutionary organisations and intellectuals to adopt the social imperialism theory in the course of the Cold War in the 1970s. Sympathy towards Maoism and the Chinese Revolution may be seen as stemming from both the characteristics of the Chinese Revolution and the contemporary national liberation/anti-colonial movements of the 1970s in Asia and Africa, mainly symbolised by the Vietnamese anti-colonialism. However, the historical reasons should be taken account as well.

Effects of the Chinese Revolution and the Vietnam War

The left in Turkey found many common characteristics between the Chinese Revolution and its own struggles. It was characterised by anti-imperialism, influenced by the official Kemalist ideology, and just beginning to learn about Marxism and socialist struggles worldwide.

In the 1960s and early 1970s, the teachings and experiences of Lenin and the Bolshevik Revolution were studied and debated carefully. It was generally considered to have been the revolution of an industrialised, imperialist/capitalist state which succeeded through an uprising in city centres and then moved towards the rural areas. However, the socioeconomic characteristics of Turkey were generally analysed as semi-colonial, and for many organisations Turkey was considered to be semi-feudal. In this sense, it was considered closer to the Chinese conditions than to Russian ones.

Turkey was a peasant country and industry was not yet developed. During the course of the 1970s, as a result of the Import Substitution Industrialisation (ISI) policies, rapid development of capitalist enterprises, massive migration from rural areas to city centres, and formation of strong labour confederations were observed. Many organisations therefore shifted from their analysis of Turkey as semi-feudal to redetermine it as a dependent capitalist country.

However, in the early 1970s, the majority of leftist organisations and intellectuals had drawn parallels between the Chinese Revolution and the revolutionary programme and goals of the revolution in Turkey. The peasant's movement in Turkey and land occupations of the landless peasants in many parts of the country in the late 1960s in a peasant-dominated country influenced revolutionaries' decision to initiate a similar struggle in Turkey as well. An anti-imperialist struggle with armed peasants under the leadership of revolutionary youth leaders was an attractive idea for revolutionaries. It mobilised three revolutionary leaders of that period (namely Gezmiş, Çayan, and Kaypakkaya) to leave the cities to form armed groups in rural areas after the military memorandum of 1971. The Chinese Revolution was inspiring for young revolutionaries of that time, and Mao's writings on the People's War were very popular.

Yet there were other similar examples. Apart from the Chinese Revolution, the revolutionary movement in Turkey was greatly influenced by the Cuban Revolution, where young revolutionaries had mobilised peasants, swept away the US collaborators, and liberated their countries. Another inspiration was Palestine, and many young revolutionaries, including Deniz Gezmiş, directly participated in the Palestinian resistance, trained in Palestinian camps, and fought against the Israeli Army. They would learn the guerrilla struggle in practice and also witness the Chinese support for such struggles (Bulut 2000).

Socio-economic conditions and direct observation of the anti-imperialist struggles therefore brought the revolutionary movement in Turkey closer to the Chinese experience. Additionally, the Chinese Revolution was an anti-imperialist struggle both against the Japanese occupation during the Second World War and against the Kuomintang Government, perceived as lackeys of imperialism. Secondly, the NDR theory of Mao that emphasised the necessity of a democratic transition period to socialism for semi-colonial and semi-feudal countries was an attractive political programme for the revolutionaries in Turkey in comparison to the Russian experience of the Revolution. A left Kemalist theory of the NDR, which defended a 'left junta' by an alliance of progressive army officers and intellectuals, was very popular in the 1960s within the student movement, and the NDR theory as a Marxist approach was attractive for those who were beginning to learn and apply Marxist politics in the search for concrete solutions to the concrete conditions of Turkey.

For the revolutionary youth of Turkey, the great struggles of the 1917 Bolshevik Revolution, the 1922 National Liberation War, and the 1949 Chinese Revolution were studied and debated carefully in order to shape the future of their own country. The Cuban Revolution and its resistance to US imperialism was also a contemporary struggle that had an impact on them. However, the deepest effect for the revolutionary movement that demonstrated the possibility of defeating imperialist powers under Cold War conditions was the Vietnamese Revolution. As in other parts of the world, the Vietnam War was an important agenda of the antiimperialist movement of Turkey. For instance, the car of the so-called 'Vietnam Butcher' Robert William Kommer was burned by revolutionary students during his visit to the Middle East Technical University in 1969. 'More Vietnam, Salutation to the Ho Chi Min' was an important slogan for youth of the day (Karadeniz 2006). The Vietnamese Revolution was conceived of as another confirmation of Mao's People's War theory, which was supposed to be the unchallengeable war theory of the proletarian revolutionaries against imperialists and their lackeys.

Conclusion

Many factors contributed to the deep polarisation within the socialist movement in Turkey in the 1970s on the axis of the Polemics in the

international socialist movement. However in understanding the reasons behind 'nationalisation' of these Polemics, there is a need to focus on the anti-imperialist movement and the historical legacy in the political history of Turkey.

The official historical narrative and Turkish Republic's Kemalist ideology had a great influence on the left movement. In the 1960s, it mainly had an anti-imperialist character and it is possible to observe an evolution from the Kemalist version of anti-imperialism to the international Leninist approach of antiimperialism. Apart from the Marxist-Leninist literature, the contemporary struggles in the 1960s and 1970s were also concrete practices and perceived as consequences of the Marxist revolutionary theory. Therefore, for the antiimperialist youth of Turkey, there were both national and international experiences and the historical legacy of revolutions that could guide them in the course of the liberation of their country from the imperialist exploitation.

At this period, the Chinese Revolution and Mao's teachings were attractive for the anti-imperialist movement in Turkey. Many common characteristics towards the programme and prospects of the Revolutions in both countries were found and this coincided with Turkey's foreign relations with the USSR and the historical sentiments towards Russian expansionism. Therefore many organisations in Turkey tend to accept the social imperialism theory without seeing much need to focus on the details of this theory.

It is possible to observe such debates and splits in all parts of the world within the socialist movement according to the Polemics, but without understanding the political and historical context of Turkey, it may not be easy to analyse the deep effects of this polarisation within the left-wing movement there.

Two Pillars of US Global Hegemony: Middle Eastern Oil and the Petrodollar

Bülent Gökay
Keele University, Keele, UK

Definition

Throughout recent history, the oil-rich regions of the Middle East have played a key role in determining US foreign policy. This is simply because the Middle Eastern oil regions currently account for 65% of the world's proven oil reserves, and 30% of its day-to-day production, and therefore the Middle East has been the geographic centre of gravity of the world oil industry (Renner 2003).

Introduction

> [W]hoever controls the Middle East controls the global oil spigot and whoever controls the global oil spigot can control the global economy, at least for the near future. (Harvey 2005: 19)

Throughout recent history, the oil-rich regions of the Middle East have played a key role in determining US foreign policy. This is simply because

T

the Middle Eastern oil regions currently account for 65% of the world's proven oil reserves, and 30% of its day-to-day production, and therefore the Middle East has been the geographic centre of gravity of the world oil industry (Renner 2003). They are therefore a truly vital strategic US interest. Since the new and bountiful discoveries of cheaper oil in the Persian Gulf just after the Second World War, oil from the Middle East has gradually come to displace US oil. Without direct and secure access to this resource, the world economy would fall into a very serious crisis, and the position of the leading power, the US, would be dealt a mortal blow. In order to continue growing, the US-dominated world capitalist economy needs plenty of cheap and readily available oil. The Middle East supplied 22% of US oil imports, 36% of OECD Europe's, 40% of China's, 60% of India's, and 80% of Japan's and South Korea's in 2006 (Energy Information Administration 2006).

But this dimension cannot be reduced solely to matters of economic prosperity, even though it represents a part. Above all, the oil dimension in US foreign policy is a strategic one which mainly concerns exercising global power, a central part of US global hegemony. The purpose of this essay is to seek some understanding of how and why the oil of the Middle East came to play a central role in the rise and continuation of the hegemonic position of the US.

When a hegemonic power imposes its political and economic authority over a region, it does so in relation to its allies and its local protégés. Gramsci used the term 'hegemony' to signify that the dominant power leads the system in a direction that not only serves the dominant group's interests but is also perceived by subordinate groups as serving a more general interest (Gramsci 1971, pp. 106–120, 161). Harvey's usage of the term is similar: 'the particular mix of coercion and consent embedded in the exercise of political power' (Harvey 2005, p. 36). US ally Japan and West European economies are dependent on oil imports from the Middle East, and US protégés in that region, the oil monarchies, require US protection and military and political support. Through its influence over the oil-rich regimes in the region, the US has consolidated its strategic

presence in the Middle East by effectively controlling the 'global oil spigot'. This seems also an effective way to ward off any competition for top position in the global hierarchy as all its competitors are heavily dependent on this essential source, oil, coming from the Middle East.

It was during the First World War that the US accorded to the Middle East region a strategic importance due to its rich oil resources. At that time, Britain's declining global empire was controlled by key oil-producing regions of the Middle East. During the First World War, keeping those oil-rich lands under British control was a crucial goal for the British government. Sir Maurice Hankey, the powerful secretary of the British War Cabinet, wrote to the foreign secretary, Arthur Balfour, during the war's final stage, that 'oil in the next war will occupy the place of coal or at least a parallel to coal'. Therefore, Hankey said, 'control over these [Middle Eastern] oil supplies becomes a first-class British war aim' (given in Yergin 1991, pp. 185–188). For a detailed analysis of Great Power rivalry over Middle Eastern oil, see James A. Paul's summary (2002).

Oil surpluses of the 1930s quickly disappeared during the Second World War, and the US, the new hegemonic state within the capitalist world, began to rely on foreign oil in the 1940s. With only 6% of the world's population, the US accounted for one-third of global oil consumption. Energy security, since then, has become an essential dimension of US state security, meaning the uninterrupted availability of energy sources at an affordable price and unwavering access to foreign oil reserves. The question of US influence over Middle Eastern oil-rich countries has become increasingly important since the Second World War. Between 1940 and 1967, US companies increased their control of Middle Eastern oil from a mere 10% to over 60%. (Monthly Review 2002). The so-called 'Carter Doctrine' of January 1980 perhaps symbolises this heightened significance of the region's oil for the US state more than anything else: 'Let our position be absolutely clear: An attempt by any outside force to gain control of the Persian Gulf region will be regarded as an assault on the vital interests of the United States of America, and such an assault will be

repelled by any means necessary, including military force' (given in Klare 2004, pp. 45–47). President Jimmy Carter, in his annual State of the Union Address to Congress, also reiterated his plans to increase military spending by 5%, with special emphasis on developing a 100,000-man 'rapid deployment force' capable of intervention in the region. President Carter himself did not use the term 'Carter Doctrine' to refer to his policies in the Middle East in any public statement during his term in office. However, the label was used later in official US documents (see Meiertons 2010).

More than 30 years have passed since the first expression of the Carter Doctrine, and the significance of the oil-rich Middle East for the global position of the US remains as one of the central pillars of world politics. It ensures, with the use of violence if necessary, that Middle Eastern oil remains accessible, free-flowing, cheap, and under US control.

In the rest of this essay, I will focus on three interrelated issues in order to appreciate this complex relationship, and to explain the role played by Middle Eastern oil, pricing of oil, and links between the region's oil trade and arms trade in sustaining the unique position of the US as supplier of the world's reserve currency.

The Emergence of the US as Global Hegemonic Power

During the early part of the twentieth century, the US patiently put key stepping stones in place to build its state as a modern imperial power. Once the dominance of the industrial North over the agrarian South was established soon after the American Civil War, the US government initiated essential foundations of its world system of control, first in Latin America and the Philippines, and then in Western and Central Europe, Japan, Korea, and the Middle East. Its superior army, high-tech weapons systems, and globetrotting military and intelligence networks have of course been central to this project. But equally important, if not more so, has been its strong grip on the world economy, trade, and financial markets, mainly through the role played by the

US dollar as the world's universal currency or reserve currency.

Reserve currencies are held by governments and institutions outside the country of issue and are used to finance international economic transactions, including trade and the payment of debts. Reserve currency status is not just an international status symbol. It brings international *seigniorage*, benefits for financial institutions of the issuing country, relaxation of the external constraints on macroeconomic policy, and wider geopolitical consequences of exercising currency hegemony. How did the US currency achieve this status?

During the war, the dollar became a world currency, equal in strength to the British pound. Among others, Eichengreen (2008) explains this process in detail. In one of his recent volumes, he traces the rise and fall of the dollar system with more recent data (Eichengreen 2011). Eichengreen sees, in particular, the Suez crisis of 1956 as the landmark event undermining once and for all the importance of the British pound sterling.

During the war, European economies were short of capital, which meant high rates of return for the US loans, which further strengthened the dollar, and pushed the French and the British to peg their currencies against the dollar at depreciated rates during the 1940s and 1950s (Kennan 2000, pp. 449–454).

Dollar hegemony has always been critical to the future of the US-dominated global hierarchy, and due to its extensive financial and political consequences even more so than the US' overwhelming military power. In turn, the US economy is intimately tied to the dollar's status as a reserve currency for dealing with trade deficits and keeping the interest rates low at home. The continuing dominance of the US dollar was not only a matter of simple economics and finance, but was also 'deeply rooted in the geopolitical role of the United States' (for a detailed explanation, see Gökay and Whitman 2004, pp. 65–69).

The central place that the US superpower, 'actually existing American empire' in David Harvey's words, has come to occupy in the global system rests on a particular convergence of

structure and history (Harvey 2005, p. 6). The most crucial and conclusive phase in this process occurred during and after the Second World War. Only after the twin disasters of the 1929–30 Depression and the Second World War did the world capitalist system obtain a new lease under the hegemonic leadership of the US. This reorganisation of capitalism could not have been accomplished without the uneven development of certain structural characteristics that also shaped the post-war leadership of the US imperial state. This process was well examined by Peter Gowan under the apt title *Contemporary Intra-Core Relations*: 'the empire-state offers a mechanism for managing the world economy and world politics which is sufficiently cognisant of trans-core business interests' (Gowan 2004, p. 490). This required that the US create a new international monetary system advocating new trade regimes and imposing new development strategies. US-dominated international institutions, the International Monetary Fund (IMF) and the World Bank, came to dictate and conduct the modus operandi of such development strategies. The post-war state of ruin, in both physical and economic senses, in much of Europe, Asia, and parts of Africa, which created a power vacuum in the world system, provided conditions for this total restructuring of international trade and finance under the leading role of the US and its multinational companies. The economic and financial system in France was exhausted, the whole of the German state was disintegrated, Britain was on the brink of bankruptcy, and the Japanese economic system was completely shattered and disorganised after the collapse of its imperial state. All these countries needed urgent economic assistance of some kind and they looked to the US for that. With the crumbling of international competitive capital, only the US remained as a secure capitalist state capable of determining the terms of a new world economic order. For the next two decades, the American economy was able to produce and sell all the vital industrial products so much more efficiently than other industrial powers that it could outperform producers in these other countries' home markets. Hence, the world system had entered a new phase in which the

conditions were ripe for the US, the only superpower capable of re-structuring the capitalist world economy according to its own vision.

The first task in rescuing the global capitalist order was to reorganise the nation states of Europe and Asia as willing members, while placing the US at the command centre of the world system. Hence emerged the *Pax Americana,* a historically specific inter-state system; in other words, what Peter Gowan fittingly referred to as the 'protectorate system', a US-centred global 'hub-and-spokes' arrangement (Gowan 2002). Economically, this required the creation of a new international monetary system that could provide the necessary movement of capital for the reconstruction process, and the construction of a system of world trade that could eliminate the persisting effects of the Depression and the war. The post-war restructuring began at the Bretton Woods Conference in 1944, which adopted a gold standard for world currency, and encouraged the rapid expansion of direct foreign investment and world trade. The Bretton Woods system was an international monetary framework of fixed exchange rates. Drawn up by two leading powers, the US and Britain, John Maynard Keynes was one of the architects (Gökay and Whitman 2009). The pre-war gold-exchange system remained in place as the currency standard, except that it substituted the dollar for the British pound as the key reserve currency. This meant that all economies that were to be part of this system would be required to recognise dollars as their basic reserve currency and link their own currency to its value. The US dollar, however, enjoyed immunity from any currency instability, because it was, as the universal/reserve currency, pegged to the value of gold, which was fixed at $35.00 an ounce. The Bretton Woods system was a natural consequence of the already obvious, global, economic supremacy of the US. Huge amounts of gold were accumulated by the US, primarily from Britain and the Soviet Union through the Lend-Lease programme, which required payment in gold for war-time assistance, to both military and civilian sectors. Lend-Lease agreements were first formulated in December 1940, and then formally set up seven months later. By the end of the war, the bulk

of the world's gold supply was held by the US in Fort Knox, Kentucky, and the massive supremacy of US industrial production guaranteed that it would enjoy huge surpluses in its balance of trade (IMF, March 2006).

In the wake of the so-called economic miracles of the 1950s and 1960s ('the Golden Age of Capitalism', as Eric Hobsbawm called it [1994: 285ff.]), the high growth rates, technological innovation, social and geopolitical peace, and rapid development of US-led Western capitalist economies enabled them to accumulate millions of dollars as reserves (Mann 1995, pp. 104–105). As a result, these years witnessed steadily rising levels of investment, and a continual boom.

As the 1950s and 1960s passed, an inequitable distribution of power and wealth within the Bretton Woods system led the US to overreach the advantages offered by the dollar's reserve currency role. The US became more and more inflationist with regard to the value of the dollar, particularly with respect to Japanese and West European economies. As the dollars accumulated in foreign banks, the actual value of the dollar sank against gold. Gold flowed progressively out of the US during this period: US gold stock dropped from over $20 billion in the early 1950s to less than $9 billion by 1970. Nervousness about this gold depletion was expressed in the early years of the Kennedy Administration, but it didn't become a crisis until the late 1960s and early 1970s when the US balance of trade became negative (Gökay and Whitman 2010).

In parallel with the decline in gold stocks and competitive trade, US corporate profits also begin to decline in the face of competition from Germany and Japan. After this, the US lost some of its power over global trade and finance. Collectively, these trends indicated the beginning of a long decline in the comparative dominance of the US economy. The late 1960s and early 1970s were particularly harsh times for US finance: the dollar was weakened further, which opened the door for other central banks to diversify and start keeping alternative currencies as a hedge against any steep decline in the value of the dollar. French president de Gaulle, witnessing the sharp decline of confidence in the US

economy and currency, happily sold US dollars, eventually accumulating more gold than Fort Knox (Time Magazine 1965). The Bank of England joined the French in demanding gold for dollars, which accelerated a run on the dollar, provoking a currency crisis that lasted until the middle of 1971. At that point, bowing to a tripling of the US balance of trade deficit and an increasing outflow of capital, President Nixon announced a series of drastic changes in the world's currency arrangements. In a dramatic televised address to the nation on 15 August 1971, Nixon declared an end to the Bretton Woods fixed dollar–gold link, which meant that the US would no longer honour the dollars for gold valued at a fixed rate, but would only agree to a system of floating exchange rates, whereby each currency would be valued according to world demand (El-Gamal and Jaffe 2010, p. 4). At one stroke, the US president invalidated 25 years of currency agreements, and introduced a prolonged period of currency instability (Fouskas and Gokay 2012, pp. 65–68).

The US administration's spectacular end to the convertibility of the dollar reinstated the economic autonomy of the US state. The US dollar, however, no longer convertible into gold at a fixed price, entered into a process of prolonged decline. The devaluation led almost immediately to an explosion of global price inflation and a collapse of share values on equity markets, which in turn restored the US balance of trade. With this radical shift, the dollar became an irredeemable currency, no longer defined or measured in terms of gold, and no longer restrained in its printing.

From the early 1970s onwards, the unspoken objective of all US administrations has been to slow down the decline of the US economy. First and foremost, it was a serious crisis inspired by a significant loss of confidence in the dollar. As a result, the dollar was left 'floated' in the international monetary market, which weakened its position as the hegemonic currency. Now the dollar had no firm backing other than the 'full faith and credit' of the US government. From that point on, the US had to find a way convincing the rest of the world to continue accepting every devaluated dollar in exchange for economic goods and

T

services the US required getting from the others. It had to find an economic reason for the rest of the world to hold US dollars: oil provided that reason and the term *petrodollar* became the crucial link in this. Since the 1971 devaluation, the petrodollar has been at the heart of US dollar hegemony (Fouskas and Gokay 2005, pp. 16–19).

Petrodollar System

After 1971, the US economy entered into a long period of instability. During this period there were a number of recessions, including a mini recession in 1971, a deeper and larger recession from 1973 to 1975, a period of hyperinflation from 1979 to 1980, a severe recession in 1981–82, a real-estate bubble and stock market panic in 1987, and a deep recession in 1992–93. Nine of the 22 years from 1971 to 1993 were 'economically troubled', together with the years in-between reflecting uneasy transitions from one crisis to another. The one persistent effort that marks this volatile period was a forceful attempt by the US to restore the role of the dollar as the universal reserve currency by linking the dollar to yet another commodity: petroleum, thus creating the petrodollar. The petrodollar system provided some strength and prestige to the US currency, and shifted the focus of global politics to the oil-rich Middle East.

A petrodollar is a dollar earned by a country through the sale of oil. The term 'petrodollar system' derives from the way the diplomatic relations between the US and Saudi Arabia linked the sale of oil to the dollar through a series of negotiations and agreements concluded during the 1972–74 period. As a result, the US government reached a series of agreements with Saudi Arabia, known as the US-Saudi Arabian Joint Economic Commission, to provide technical support and military assistance to the power of the House of Saud in exchange for accepting only US dollars for its oil (Department of the Treasury 2002). This understanding, much of it never publicised and little understood by the public, provided the Saudi ruling family the security it craved in a dangerous neighbourhood while assuring the US a reliable and important ally in the

Middle East (Kaiser and Ottaway 2002). Saudi Arabia was and remains the largest oil producer in the world and the leader of the Organisation of Petroleum Exporting Countries, OPEC (US Energy Information Administration 2014a). It is also the only member of the cartel that does not have an allotted production quota, which makes it the 'swing producer', meaning that it can increase or decrease oil production to bring about an oil drought or glut in the world market. Saudi Arabia hence practically determines, or has the means to determine, oil prices. Soon after the agreement with the Saudi government, an OPEC agreement consented to this, and since then all oil has been traded in US dollars (Klare 2004, pp. 40–45).

Now Why Would this Matter So Much?

Oil is not just the most important commodity traded internationally. It is the key industrial mineral; it has a central role in modern economies, without which no modern economy works. If you don't have oil, you have to buy it, and if you need to buy it on the world markets, you commonly have to purchase it with dollars. This provides an essential base for the dollar's reserve currency status: other countries buy and hold large reserves of dollars (in the same way they buy and hold gold) because they cannot purchase oil without dollars. This made the 'petrodollar' a de facto replacement for the pre-1971 gold-dollar standard, guaranteeing a constant demand for dollars whose value was linked to oil through the OPEC pricing standards. In 2002, a former US ambassador to Saudi Arabia told a committee of the US Congress: 'One of the major things the Saudis have historically done, in part out of friendship with the US, is to insist that oil continues to be priced in dollars. Therefore the US Treasury can print money and buy oil, which is an advantage no other country has' (Nixon 2003).

This system of the US dollar acting as global reserve currency in oil trade keeps the demand for the dollar 'artificially' high. This allows the US to print dollars at next to no cost to subsidise increased military spending and consumer spending on imports. As long as the US has no significant challengers and the other states have faith in

the US dollar, the system operates well (Spiro 1999, p. 121). This has been the situation and the crucial basis for the US economic hegemony since the 1970s. Needless to say, this system also empowers the US administration to compellingly control the world oil market. The dominance of the dollar is not simply the result of the size of the US economy; it is also the result of two other things: global politics and finance. In this scheme, the industrialised countries had to purchase oil, either from OPEC or from one of the smaller oil producers, but they could conduct these purchases only by pricing and buying oil in dollars, thus restoring the dollar's role as a required reserve currency (see among others Gökay and Whitman 2004, pp. 64–65).

So long as OPEC oil was priced in US dollars, the US government benefited from a double loan. The first portion of the loan was for oil. The government could print dollars to pay for oil, and the US economy did not have to generate goods and services in exchange for the oil since OPEC used the dollars for all traded goods and services. Obviously, the strategy could not work if dollars were not a means of exchange for oil. The second part of the loan was from all other economies that had to pay dollars for oil but could not print currency. Those economies had to trade their goods and services for dollars in order to pay their oil imports to OPEC producers (Spiro 1999, p. 121).

In this situation, dollars rapidly accumulated in foreign banks, particularly those serving petroleum-exporting countries. This petrodollar overhang created an additional financial issue: unlike Western Europe and Japan, most of the oil-exporting countries had limited possibilities for domestic development and consumption, and therefore they could not invest most of this money. Many of these economies in the region are structured strictly on 'rents' from oil, which provide most of the export earnings and state revenues. Despite their extensive oil wealth, the oil-rich countries of the Middle East have failed to develop a diversified economic base. All finished manufactured goods as well as financial and hightech services are imported and controlled by Western multinationals. Adam Smith once

commented that the Tartars and other Asian nations may be rich precisely because they are resource poor. 'In the Middle East, . . . the political process is that the rulers do not tax citizens or businesses, but hand out selective privileges, financed by oil revenues, against loyalty and support from a largely parasitic private sector' (Noreng 2006, pp. 87–88). Some efforts were made to redistribute oil revenues across the populations by subsidising housing, education, and health care. But mostly, oil money was used to support excessive consumption, corruption, and gross waste. The Nixon Administration responded 'creatively' by coaxing these countries into purchasing US Treasury bills and bonds, which performed as yet another subsidy for the US economy. This has, since that time, been the primary strategy for the US administration to deal with its colossal trade deficits by keeping domestic interest rates low (Kaiser and Ottaway 2002). The cash balances of oil exporters soon found their way into the US-controlled international banking system, and these petrodollars went straight back into the US economy at zero currency risk. Some of this cash was recycled as loans, with some interest of course, to oilimporting countries, mainly by US-controlled international financial institutions.

For a long time everything worked smoothly. But the end of the Soviet-controlled socialist bloc economies in Eastern Europe and the emergence of a new single Europe and the European Monetary Union in the early 1990s began to present an entirely new challenge to the global position of the US economy. In particular with the creation of the euro in late 1999, a totally new factor was added to the global financial system. Within a relatively short period, the euro has emerged as a realistic alternative, establishing itself as the second most influential currency in the world's financial markets. If a considerable part of petroleum trade were to use euros instead of dollars, many more countries would have to hold a greater part of their currency reserves in euros. According to a June 2003 HSBC report, even a moderate shift, as small as 15%, away from dollars, or a change in the flow, would create considerable changes (HSBC 2003). The dollar

would then have to openly battle with the euro for global trade and financial markets. Not only would Europe not require dollars anymore, but also Japan, which imports more than 80% of its oil from the Middle East, would have to switch most of its dollar assets to euros. The US, too, currently being the world's second largest oil importer after China, would have to retain a significant amount of euro reserves. This would be catastrophic for US efforts at monetary management: the US administration would be compelled to drastically change its current tax, debt, and trade policies, all of which are relentlessly volatile.

Today, US citizens spend $700 billion (US) a year more than they generate, so they require a reserve of an additional $700 billion. This means that, on average, each US citizen benefits from $3,000 more imported products per year than he/she earns (US National Debt Clock 2006). They acquire this large amount of money from the Central Banks of China, Japan and European countries, thanks to the US dollar's status as global reserve currency and the simple fact that all other central banks hold dollar reserves. China is the principal holder of US currency reserves with $853.7 billion, and Japan is the second biggest with over $850 billion in dollar assets (Bloomberg 2006; Mainichi News 2006). So the rest of the world are producers and sellers: Japan, China, India, Brazil, the EU, and the rest. The rest of the world invests, produces, and exports to the US. They lend more and more to the US. This situation is, however, considered unstable and very risky by experts. The increasing instability of the US economy is emphasised by a major 2005 report from the IMF (IMF 2006) which pointed out that the US economy is increasingly being maintained by what it described as 'unprecedented borrowing' from foreigners. The report went on to describe the US deficit as unmanageable and risky in the long term.

Weapondollar-Petrodollar Circulation

The politicisation and concentration in the Middle East of the oil business went hand in glove with the region's commercialisation, privatisation, and concentration of the global arms trade. In the 1950s, some 95% of US armament exports had been provided as foreign aid, whereas by 1980 the foreign aid as armaments had fallen to 45% and by 2000 to less than 25%. From the early 1970s onwards, when the petrodollar became an essential dimension of the US global hegemony, US defence production experienced a high degree of privatisation and internationalisation, followed by an unprecedented degree of mergers, acquisitions, and consolidations according to the pattern of 'new multinational corporations'. From the early 1970s onwards, the Middle East became the world's chief importer of weaponry, taking the lead from South-East Asia. In this way, a large amount of that oil income, petrodollars, started to be spent on buying armaments and hence turned into weapondollars. Tensions in the region, in particular the escalation of Arab-Israeli conflict, created the necessary conditions for a type of dollar recycling based on arms trade. Since the 1940s, the role of the Middle East in world accumulation had been intimately linked to oil exports, and from the 1970s onwards, this trade became the basis of the petrodollar system, which was then accompanied by another dimension: turning a large amount of this oil income into weapondollars (Nitzan and Bichler 2002, p. 25). These two flows provided a powerful new lease of life for the US economy, inasmuch as their combination was associated with the generation of substantial profits for the US arms manufacturing industry, American-British giant oil companies, and of course the US Department of the Treasury. Most importantly, these two flows (oil going out, and weapons coming in) were dollarised. Thus, for example, in 1974, Saudi Arabia's arms imports were worth $2.6 billion in 1974, whereas between 1985 and 1992 this figure increased ten times and reached $25.4 billion. Throughout the 1970s and 1980s, the US increased its arms sales to Middle Eastern states, in particular during the Iraq-Iran war of 1980–88. The amount of arms sales to the region reached its peak in 1988 when 'the Administration suggested increasing US arms exports by $3.3 billion, to a

level exceeding $15 billion – with proposed shipments worth $3.6 billion to Israel, $2.7 billion to Egypt, 4950 million to Saudi Arabia, and $1.3 billion to other Middle Eastern countries' (Nitzan and Bichler 2002, p. 261, f.n. 26). Sharply intensified armed conflict and quickly rising tensions in the Gulf region and (with the end of the Cold War) Central Asia and North Africa, including the Pakistani/Indian conflict, meant much greater US military involvement in the region, and greater consolidation of the alliance between US arms manufacturing/weapons trade and energy interests.

Did any of these policies reverse the longterm relative historical decline of the US? The short answer is plainly no.

It did not take long for the contradictions of the system to break down. The entire system of petrodollar-weapondollar coalition managed to keep demand for dollars artificially high, and as the price of oil went up following the 1973 Arab-Israeli war, the demand for dollars intensified even further, raising the value of the dollar sharply and, as a result, once again subsidising US domestic and military spending. This form of speculative dollarisation, however, enhanced further the inflationary trends in the US, Europe, and Japan, intensifying the stagnation of the global economic system. The yin and yang of this petrodollar/weapondollar system also meant that US benefits were counterweighed by rising costs inflicted on other members of the world economic system. These were predominantly those countries recently emerged from post-colonialism, other weak economies, and periphery states, as the US practically exported its own economic and financial problems. Thus, when the system was faced with various crises (such as the 1973–75 recession, the hyperinflation of the late 1970s, and the sharp global recession of 1981–82), the US administration could successfully shift the negative effects onto its lesser partners, which then suffered the greater burden as world oil prices rose sharply after 1974. William Greider (1989) effectively demonstrates how the US shifted the effects of the 1979–83 crises were shifted to the periphery.

At the same time, rather than promoting sensible social investments in its allies in the Middle East, the US continued to encourage using the petrodollar/weapondollar overhang as an opportunity to promote the purchase of US Treasury bonds and bills, to deal with its current account deficit. As a result, the US increasingly came to depend on foreign investors as the prime financial source for domestic account management, which had the effect of artificially increasing prices, leading to an inflationary surge that eventually weakened the perceived value of the dollar, triggering an acute fall in demand for dollars and a resultant upward spike in US interest rates (Kaiser and Ottaway 2002).

All this was an unsteady attempt by the US administration(s) to restore the global role of the dollar and US economic supremacy by linking the dollar to two key commodities of the world economy: petroleum and weapons. There were clear reasons underpinning the functionality of this weapondollar-petrodollar system. The first was economic, in that the Bretton Woods system never found a way to effectively recycle the massive profits and extensive speculation the global oil trade produced; the second was political, in that the administration(s) transferred the focus of global politics to weapons procurement and built-up, as well as to the petroleum production and conflict in the Middle Eastern region (Gökay 2005, pp. 40–56).

Understanding how that system was first constructed and advanced with all those existing flaws and contradictions reveals important insights into the current state of the US hegemony and the root causes of its direct military involvement in the region since the end of the Cold War. What emerges is that all the wars and acts of military aggression conducted by the US since 1991 have been those of an economically declining power, rather than an indication of superiority. Andre Gunder Frank identified this strategic trend in post-Cold War US foreign policy as 'Washington sees its military might as a trump card that can be employed to prevail over all its rivals in the coming struggle for resources' (Frank 1999).

Impending Scenarios: Hegemonic Reversal

Since the end of the Cold War, the US has waged four wars in the region (two in Iraq, one in Afghanistan, and one in Libya) and is currently threatening more. Each conflict has of course its own specific reasons related to local conditions. However, there is a common denominator: the need to keep the oil of the region ample and inexpensive, and most importantly, under firm US control, so that the US-led system of global capitalist economies can continue to grow. US strategists do not simply want to obtain oil, which is a simple matter if one has money. They also want to eliminate all potential competitors, safeguarding the region politically and militarily so that the flow of oil from the Middle East to world markets can happen under its direct control.

The US military is now dominant and its limitations are minimal. Its spending is almost as much as that of the next 11 countries combined ranked beneath it (SIPRI 2013, pp. 6–7, 9.). Yet the economic power of the US has been in stagnation since the 1970s and has declined since the end of the Cold War. The world economic landscape is rapidly changing and a very different world is emerging. In particular, the US share of world trade and manufacturing is substantially less than it was just prior to the end of the Cold War, and its relative economic strength measured against the EU and the East Asian economic group of China, India, and the 'South-East Asian tigers' is similarly in retreat. The persistent use of US military power can therefore be viewed as a reaction to its declining economic power and not merely as a response to the post-Cold War geopolitical picture. US leaders see their superior military power as the key weapon that can be employed effectively to prevail over all rivals, and thus to stop this decline. The expansion of the Chinese economy, so far the closest contender for a global hegemonic position, is directly dependent on access to petroleum, and therefore securing access to the oil reserves in the region is a cornerstone of Chinese policy (Roberts 2005: 158–164). In September 2013, China's net imports of petroleum and other liquids exceeded those of the US on a monthly basis, making it the largest net importer of crude oil and other liquids in the world (US Energy Information Administration 2014a).

In the Middle East, control of the region's oil resources, keeping the US dollar as the only currency used in the world oil trade, and using these effectively to prevent any challenge to the hegemonic position of the US are all interlinked and cannot be separated from each other. On 22 March 2003, at the beginning of the US-led war against Iraq, General Tommy Franks, chief commander of the US forces in Iraq, was explaining one of the key objectives of the Operation Iraqi Freedom as 'to secure Iraq's oil fields and resources' (CNN.com 2003). Securing US interests regarding the oil resources of the Middle East is not as simple as just going and militarily capturing key positions of a country. Political events since 2001 have clearly demonstrated that superior military forces of the US and its Western allies may take but cannot hold Iraq's, Libya's, or other Middle Eastern countries' oil. Far from staving off the downfall of the US economic and financial hegemony, the continuing military aggression and arrogance of the US state may instead push the regional powers to distance themselves from its strategic goals. Member countries of OPEC, for instance, have sharply increased deposits in other currencies including the euro and the Japanese yen, and placed less in dollars starting from 2001 and the Afghan War. OPEC members cut the proportion of deposits held in dollars from 75% in the third quarter of 2001 to 61.5%. US dollar-denominated deposits fell from 75% of total deposits in the third quarter of 2001 to 61.5% in the last quarter of 2004. During the same period, the share of euro-denominated deposits rose from 12% to 20% (FT.com 2004).

Competition for the rich oil resources of the Middle East played a central role in the twentieth-century's key military and political conflicts. Even the two major world wars, which happened in the first half of the twentieth century, were intrinsically linked to competition for access to the energy-rich Middle East. If history provides any reliable guide to the future, the present century

will more and more be marked by new wars for this still very significant but increasingly scarce natural resource in the region. 'This is the secret ticking bomb under the global economic system in the twenty-first century. The only long-term solution is to significantly reduce our energy usage' (Fouskas and Gokay 2012, pp. 139–140).

Definition

This entry charts the development of US imperialism in the Western hemisphere in the context of the evolving world system. It examines how British colonies in North America first entered the world economy in a semi-peripheral position. Yet by the end of the nineteenth century, the United States had become one of the core nations, with high levels of manufacturing and capital and a high standard of living. The entry argues that from this time, the capitalist world economy entered the stage of monopoly, characterized by highly concentrated industry and finance. With the colonial domination of the world nearing completion, and with anti-colonial movements among the colonized beginning to emerge, new forms of core penetration into peripheral and semi-peripheral zones came into being, including control of financial institutions and indirect political control with the support of national bourgeoisies. This new imperialist stage would preserve the core–periphery relationship, even while maintaining earlier mechanisms of core domination such as direct political control and military force. This essay focuses on the diverse military, political, and ideological strategies designed to ensure access to raw materials and control of foreign markets by US capital.

The modern world-system emerged as a consequence of the Spanish and Portuguese conquest of America, where forced labour was imposed on the indigenous populations in order to obtain gold and silver. The precious metals were used to purchase products from north-western Europe, thus stimulating the modernisation of agriculture and the expansion of industry. Thus emerged a world economy, in which north-western Europe functioned as a manufacturing centre, and Latin America and eastern Europe became peripheral zones, supplying raw materials to the centre, on a foundation of forced labour (Wallerstein 1974–2011: vol. 1; Wallerstein 1979).

During the period from 1815 to 1917, Great Britain, France, and other European nations

conquered and colonised vast regions of Africa and Asia, incorporating them into peripheral zones, which acted as suppliers of raw materials to the core on a base of forced labour. During this period, most of the nations of Latin America became independent republics, but the core–peripheral relation was maintained, so that the republics were functioning as semi-colonies (Arboleya 2008; Frank 1979; Regalado 2007; Wallerstein 1974–2011: Vol. 3).

The structures of the world-system establish limited possibilities for ascent, and the most spectacular case of ascent has been that of the US. The British colonies in North America entered the world economy with a semi-peripheral role, purchasing manufactured goods from Great Britain and supplying a diversity of food and animal products for the slave plantations of the Caribbean. This lucrative West Indian trade facilitated the accumulation of capital in New England and the mid-Atlantic colonies. During the nineteenth-century expansion of the world-system, the US South was converted into a peripheral region, producing cotton and other raw materials on a base of African slave labour. The north-eastern US utilised capital accumulated from the West Indian trade to develop industries that supplied manufactured goods to the South, thus establishing a North–South core–peripheral relation, which further fuelled the ascent of the north-eastern region. By the end of the nineteenth century, the US had become one of the core nations of the world-system, with high levels of manufacturing and capital and a high standard of living (Frank 1979: 64–68; Galeano 2004: 87; Genovese 1967).

By the end of the nineteenth century, the capitalist world economy entered a stage of monopoly capital, characterised by concentrated industry and banking (Lenin 1996). With the colonial domination of the world nearing completion, and with anti-colonial movements among the colonised beginning to emerge, the stage was set for the evolution of new forms of core penetration into peripheral and semi-peripheral zones, including control of financial institutions and indirect political control with the support of a national bourgeoisie. This new imperialist stage would preserve the core–periphery relation, and it would maintain earlier mechanisms of core domination, such as direct political control and military force. Thus the imperialist stage is characterised by a diversity of military, political, and ideological strategies designed to ensure access to raw materials and control of markets by core corporations.

The Origin of US Imperialist Policies

With the concentration of industry and the emergence of a few large companies that controlled the market in several key industries, productive capacity in the US reached a level that overextended the capacity of its domestic market. This could give rise to a surplus of goods and a fall in prices. Periodic crises of over-production had been a pattern of capitalism, but the problem was deepened by the arrival of the system to this new phase of large-scale and concentrated production. Therefore, in order to maintain or increase levels of profit, US companies would have to find new markets for their products beyond the frontiers of the US.

In the 1890s, there was consciousness among US producers of the need for new markets as a result of the economic crisis of 1892–93, which was widely interpreted as having been caused by over-production. This situation gave rise to the formulation of a new expansionist foreign policy by the US Government. The new foreign policy was called 'imperialism' by its promoters. The basic goal was to find new markets outside the US for US manufactured and agricultural products. Strategies were proposed by the platform of the Republican Party in 1896. They included the expansion of the army and the establishment of military bases abroad; control of Hawaii and the purchase of the Danish Virgin Islands; support of Cubans in their war of liberation from Spanish colonial rule; and the construction of a canal across Nicaragua to connect the Atlantic and Pacific oceans. Control of the Caribbean and the Far East was considered central, and thus the Philippines, Hawaii, and Cuba were viewed as having high strategic value as locations for US

military bases. The election of William McKinley in 1896 was a political victory for the promoters of the new imperialist policy (Arboleya [2008]: 35–37).

The first practical implementation of the new expansionist policy was US intervention in Cuba in 1898, launching what US historians have called the Spanish–American War, Cubans call the Cuban–Hispanic–American War, and Lenin considered the first imperialist war. The war resulted in Spain ceding to the US the Caribbean islands of Cuba and Puerto Rico and the Pacific islands of the Philippines and Guam (Arboleya [2008]: 37, 40).

With the acquisition of these territories, the US was becoming a colonial power like those of Western Europe. However, in justifying the expansionist policy to the people of the US, the government obscured its colonial character and sought to present the policy as fulfilling a civilising mission consistent with the values of democracy, liberty, and justice. The discourse of the political elite was effective in convincing the people that the expansionist policies were defending freedom and were the fulfilment of a 'new manifest destiny', in contrast to the decadent European empires (Arboleya [2008]: 41–42).

US Imperialism from 1903 to 1932

The development of US imperialist policy took a significant step forward during the presidency of Theodore Roosevelt (1901–09). Although the US had intervened in Cuba in 1898 in response to the challenge to its economic interests and imperialist intentions posed by the Cuban revolutionary war of independence, non-intervention continued to be the norm that guided US foreign policy. But 'Roosevelt broke with this tradition and promoted interventionism without reserve' (Arboleya [2008]: 73). As the Cuban scholar Roberto Regalado has written:

> During Roosevelt's term in office, Washington sponsored the forcible secession of Panama (1903), enabling it to refuse to recognize the Columbian Congress's rejection of the proposal to construct the Panama Canal; intervened militarily in

the Dominican Republic (1904), which led to control over that country's customs policy (1905–12); occupied Cuba for the second time (1906–09); sent in the marines in order to obtain political dividends in the wars that broke out between Guatemala and El Salvador (1906) and between Honduras and Nicaragua (1907); and applied interventionist policies that led to the resignation of President Santos Zelaya in Nicaragua (1909). (Regalado [2007]: 116–117)

The imperialist policies of Theodore Roosevelt continued under his successor, William Howard Taft (1909–13). Taft adopted different rhetoric, replacing Roosevelt's 'big stick' with 'dollar diplomacy', thus promoting a policy of facilitating US economic and financial penetration through the buying of politicians in the neo-colony (Arboleya [2008]: 74–75). But the military interventions and aggressive policy continued, with military interventions in Honduras and Nicaragua and threats designed to hinder the Mexican Revolution (Regalado [2007]: 117).

The foreign policy of Woodrow Wilson 'was equally expansionist in relation to the Caribbean and Central America, and he developed a policy as interventionist as his predecessors' (Arboleya [2008]: 82). Although he was critical of 'dollar diplomacy' because of its ethical implications, he expressed a similar view when he affirmed that dollars 'ought to be reserved for the ministers of the state, even if the sovereignty of the reluctant nation is mistreated in the process' (quoted in ibid.). In addition, military interventions continued in a way consistent with the policies of Roosevelt and Taft. Between 1913 and 1921, under the pretext of 'promoting democracy' and 'stopping German intervention', the US Government interfered in Mexican international affairs, occupied Haiti (1915–34) and the Dominican Republic (1916–24), intervened in Panama (1918), and supported *coups d'état* and dictatorships in Central and South America (Regalado [2007]: 117).

Wilson, however, developed a more advanced ideological formulation of imperialism. Roosevelt and Taft had proclaimed imperialist policies to be consistent with the values of democracy and freedom, but in the implementation of the policy, the emphasis was on the application of military force (the 'big stick') and economic pressure ('dollar

U

diplomacy'). But Wilson sought to establish a new international order on a foundation of US political values, thus facilitating greater global acceptance of US intervention and economic penetration and reducing the need for the application of force and pressure. As Arboleya has written, Wilson believed that US national interests would be served best by 'the establishment of an international order that would universalize North American political values. A mixture of divine mission, democratic crusade, and expansionist will constituted the ingredients of this international project, which in reality was no more than a modernized version of "manifest destiny"' (2008: 82).

However, national and international conditions had not yet arrived at a point that would make possible the implementation of the Wilsonian vision. Following the First World War, Wilson encountered opposition from Britain and France, who objected to those components of Wilson's policy that would involve a reduction of their spheres of influence. The US was not yet able to impose international rules of conduct on the nations of Western Europe. At the same time, Wilson's goals for the post-war era also encountered opposition in the US. US capitalism and political culture had not yet developed sufficiently, and important sectors of the capitalist class were not convinced that the 'new world order' proposed by Wilson would provide sufficient guarantees for the protection of their capital. The US Government therefore did not enter the League of Nations that had been promoted by Wilson (Arboleya 2008: 82–86). The presidential administrations of Warren Harding (1921–23), Calvin Coolidge (1923–29), and Herbert Hoover (1929–33) continued US imperialist policies towards Latin America, supporting military dictatorships in order to constrain popular struggles in opposition to the neo-colonial system and initiating new interventions in Panama, Honduras, and Nicaragua (Regalado 2007: 118).

Imperialism and the New Deal

During the administration of Franklin Delano Roosevelt (1933–45), domestic political factors worked against the continuation of the military interventions in Latin America that had been central to US policy since 1903. Keynesian economic policies made necessary a more democratic discourse, placing ideological constraints on the capacity of the government to act aggressively in other lands. Moreover, there had emerged a renewal of isolationist tendencies and a rejection of armed interventions, expressed in new laws on neutrality that limited the possible participation of the US in future armed conflicts; armed interventions in Latin America came to be viewed as unconstitutional. At the same time, there had emerged in Latin America during the 1920s an anti-imperialist popular movement, which had been able to develop popular nationalist consciousness in opposition to US interventions, requiring even elite sectors in alliance with the US to adopt a nationalist rhetoric. Such opposition to interventionism both nationally and internationally required the US to adopt a non-interventionist foreign policy (Arboleya 2008: 104).

So the US turned to a 'Good Neighbor' policy of non-intervention, seeking to pursue its imperialist goals through means other than direct military intervention. The strategy was to strengthen the military in the Latin American nation, in order that it could play a more active role in maintaining social control. In some cases, this involved supporting military dictatorships that had been established through previous interventions during the period 1898–1926. In other cases, it involved establishing military dictatorships through diplomatic manoeuvring and economic pressure. In still other cases, the system worked with constitutional and even progressive governments in power.

In addition, it was necessary to give more economic space to what the Cuban scholar and former diplomat Jesús Arboleya (2008: 8) has called the figurehead bourgeoisie, which he defines as a national bourgeoisie that conforms to the interests of international capital. In providing the figurehead bourgeoisie with more possibilities to pursue its particular interests, albeit in a context limited by the neo-colonial system, this class would have a stronger commitment to the

world-system and a greater capacity to develop mechanisms of social control.

These new policies represented the pursuit of an imperialist agenda through alternative means, and as such they signified a more advanced and sophisticated form of neo-colonialism, under which US corporations continued to control the labour, the raw materials, the financial and productive structures, and the markets of the neo-colony. The 'Good Neighbor' policy of the New Deal does not represent the abandonment of imperialist goals, but the adaptation of imperialist policies to new economic, ideological, and political conditions (Arboleya 2008: 105–107; Regalado 2007: 118).

Imperialism and the Cold War

Following the Second World War, the war industry expanded. The justification for expansion of military expenses in peacetime was provided by the ideological construction of the Cold War, which maintained that the expansion of the US military was necessary in order to contain the expansionism of the Soviet Union. In reality, Soviet foreign policy was not expansionist. It sought to construct a cordon of security around its territory and to peacefully co-exist with the capitalist powers, a policy that created tensions in Soviet relations with the anti-colonial and anti-neo-colonial revolutions in the Third World during the period 1945–89. However, the Cold War ideology served the interests of the arms industries and functioned to justify and legitimate an arms race (Arboleya 2008: 133–134).

Thus militarism came to dominate the US political system. 'In a kind of militarist application of Keynesian theory, defense expenses replaced public spending as the principal driving force of the economy and the scientific development of the country' (Arboleya 2008: 133). Arms production became integrated with other branches of the economy and made possible the expansion of the large corporations, prompting President Eisenhower to warn of a 'military-industrial complex' (Arboleya 2008: 134).

The militarism of US society shaped the cultural and ideological formation of the people. 'Communism was presented as a phantasmagoric force that intended the domination of the world', thus fabricating a climate of fear and insecurity (Arboleya 2008: 134). Anti-communism was an enormously powerful ideological tool, enabling the US to present a distorted image of Third-World anti-colonial and anti-neo-colonial movements as manifestations of the spreading menace of communism, thus justifying imperialist interventions throughout the world. Interventions in defence of neo-colonial interests were presented as the defence of democracy, and this Orwellian inversion was widely accepted by the people. A liberal-conservative consensus emerged. There was wide agreement on the militarist application of Keynesian economic principles, facilitating the growth of the economy and the capacity for military intervention anywhere in the world (Arboleya 2008: 133).

Utilising the Cold War ideological construction, the US presidents Harry Truman (1945–53) and Dwight Eisenhower (1953–60) provided economic and military support to Latin American governments that utilised repressive tactics against communist and socialist parties as well as progressive organisations. Eisenhower's 'Good Partner' policy included Central Intelligence Agency (CIA) support for a counter-revolutionary force in Guatemala in 1954 in opposition to the government of Jacobo Árbenz, a democratically elected president who had nationalised some of the properties of the United Fruit Co. In addition, US policies led to the fall of governments in Brazil (1954), Argentina (1955), and Paraguay (1956), and they undermined the revolutionary governments in Bolivia of 1952–60. The dictatorship of Jean-Claude Duvalier in Haiti also emerged during this period (Regalado 2007: 122).

The Alliance for Progress

The foreign policy of the administration of John F. Kennedy (1961–63) gave greater emphasis to the Third World as the arena of the Cold War

U

conflict between the superpowers, developing a perspective that viewed the national liberation movements and newly independent nationalist governments as expressions of communism and Soviet influence and downplaying their nationalist, anticolonial, and anti-imperialist character. The US strategy included the development of a US capacity for counter-insurgency, involving armed confrontation with the revolutionary movements of the Third World. The Special Forces ('Green Berets') were developed in order to give the armed forces the capacity for a flexible response in any place or circumstance in the world. In addition, the CIA became involved in training military and para-military groups in the neo-colonies of the Third World, developing techniques that included torture, disappearances, assassination, and terrorising the people. Believing that the US and its allies in the neo-colonies were confronted with a supposed 'international communist conspiracy', and assuming that the insurgent revolutionaries were uncivilised and lacking in ethical norms of conduct, the Kennedy Administration excused any excess on the part of the counter-insurgents, including the most brutal forms of behaviour (Arboleya 2008: 151–155).

In Latin America, alongside the development of counter-insurgency as a primary strategy, a secondary strategy of the Kennedy Administration was economic reform of the neo-colonial system.

> The fall of Pérez Jiménez in Venezuela and Fulgencio Batista in Cuba – precisely two of the nations where the US neocolonial model had been most advanced – called into question the capacity of the Latin American oligarchy to continue to guarantee control of the region. Its nearly feudal mechanisms of exploitation tended to reduce the expansion of the market, and the extraordinary reactionary character of its ideology as well as its inclination to the most brutal and generalized repression, were destabilizing factors of the system and a problem for the foreign policy that Kennedy intended to project. (Arboleya 2008: 156)

Kennedy therefore called for social changes, including structural reforms in land tenancy and reforms in the distribution of wealth. His policy involved an abandonment of the traditional land-owning oligarchy that up to then had been considered as sustainer and protector of the neo-colonial

system. Proclaiming a 'revolution of the middle class', the Kennedy strategy was to support the reformist sector of the national bourgeoisie, which up to that point had confronted the powerful obstacle of the traditional oligarchy. The Alliance for Progress committed $20 billion over a decade for concrete projects for the development of this reformist sector, which also would have the consequence of establishing new possibilities for US investment (Arboleya 2008: 156–157).

The proposed reforms in Latin America did not represent fundamental structural changes that would involve a transition from a neocolonial system to an alternative more just and democratic world-system. They were proposed reforms of the neo-colonial system.

> The modernization that Kennedy proposed for Latin America was not based on the development of an independent national bourgeoisie as an alternative to the traditional oligarchy. Rather, it was based on producing a 'new class' that … would form a part of the US transnational corporations and would share their interests. In short, it aspired to consolidate US neocolonialism in the region, through the articulation of a new relation of dependency, which would require a national class organically tied to foreign capital. (Arboleya 2008: 157)

The proposed economic reforms of the neocolonial system did not succeed, and it was not possible for them to succeed. The Kennedy plan encountered political opposition from those sectors of US capital that were historically tied to the traditional oligarchy in Latin America. In addition, the national bourgeoisie did not have sufficient economic and political strength to play the role assigned to it by the plan. There was in this regard a fundamental contradiction: the national bourgeoisie, according to the plan, would transform itself into a class economically dependent on foreign capital, discarding any thought of leading the nation in a project of independent economic development. At the same time, since the plan involved challenging the control of the oligarchy, it would be necessary to mobilise popular support, which could be most effectively attained through the promise of autonomous economic and cultural development. Thus the plan placed the national bourgeoisie in a position of promising to the people what it could not deliver. The

national bourgeoisie would become increasingly discredited by nationalist popular sectors, which would search for more revolutionary approaches and more independent approaches to national development (Arboleya 2008: 157).

US Imperialism from 1963 to 1980

US policy towards Latin America under presidents Lyndon Johnson (1963–68), Richard Nixon (1969–74), and Gerald Ford (1974–76) abandoned efforts at economic reform of the neo-colonial system. They returned to interventionism, alliance with the Latin American estate bourgeoisie, and support of military dictatorships, in reaction to the intensity of anti-imperialist popular movements that pervaded the region during the 1960s and 1970s.

During the Johnson Administration, the US intervened militarily in Panama in 1964 and in the Dominican Republic in 1965. It supported *coups d'état* in Brazil (1964), Bolivia (1964), and Argentina (1966). It provided economic and military assistance to governments that were participating in the US counter-insurgency strategy in Venezuela, Peru, Colombia, El Salvador, and Uruguay (Regalado 2007: 143).

The Latin American dictatorships of the period followed an approach first adopted in Cuba during the 1930s with Batista. They were based on the development of the military as an institution and the strengthening of its capacity to control the population through repression. They were different from 'strongarm or *caudillista* dictatorships' (Regalado 2007: 143) that had been the norm before the 1960s, which were characterised by personal rather than institutional control. The new type of institutional military dictatorship was more able to carry out repression, and violations of human rights became systematic and widespread (Regalado 2007: 144).

Like the Johnson Administration, the Nixon Administration supported the institutional military dictatorships and, when necessary, intervened to establish them. 'In response to the rise in nationalist and revolutionary currents in Latin America, the policy of the Nixon administration was to destabilize and overthrow governments that it considered

a threat to the 'national interest' of the United States, and to install new dictatorships' (Regalado 2007: 147). This occurred in Bolivia in 1971 and in Uruguay in 1973. And on 11 September 1973, the socialist government of Salvador Allende, democratically elected by the people in accordance with widely recognised norms of representative democracy, was overthrown (ibid.).

Jimmy Carter, US president from 1977 to 1981, believed that the US ought to respect human rights in the conduct of its foreign policy. His administration took two important steps that symbolised respect for the autonomy of Latin American governments: negotiating control of the Panama Canal by the government of Panama; and the establishment of limited diplomatic relations with Cuba, through the agreement for a Cuban Interest Section in Washington and a US Interest Section in Havana.

But Carter's moral evaluation of US policy was limited in scope. It did not question the fundamental structures of the neo-colonial world-system that promote underdevelopment and poverty in vast regions of the world. Carter wanted to respect human rights, but he did not discern that the violation of human rights was a necessary component of the core–peripheral relation between the US and the Third World. The functionality of repression in the preservation of the neo-colonial world-system placed practical constraints on the implementation of Carter's human rights policy.

Like Franklin D. Roosevelt and John F. Kennedy, Jimmy Carter envisioned a softer and more humane form of imperialism. He accepted as given that the US policy would continue to promote the economic and financial penetration of US corporations and financial institutions, and that the neocolonial world-system should be preserved. He was seeking moral conduct in the context of immoral social structures.

The Nation Turns to the Right

The administration of Ronald Reagan (1981–89) disdained international organisations, and accordingly it ignored the Organization of American States (OAS), established in 1948 with the

U

intention of institutionalising the cooperation of Latin American and Caribbean states with the structures of neo-colonial domination (Regalado 2007: 123–127). The Reagan Administration violated an important principle of neo-colonial domination, namely, the satisfaction of the interests of the figurehead bourgeoisie.

The unilateralism of US foreign policy after 1980 is illustrated by the US response to the triumph of the Sandinista revolution in Nicaragua in 1979. The measures adopted by the Sandinista government were not radical: it confined nationalisation to those properties of owners who had fled the country after 1979; it did not join the socialist bloc, but merely diversified its economic and diplomatic relations to include the West, the socialist bloc, and the Third World; and its 1984 constitution established structures of representative democracy, and not structures of popular democracy, as had been developed in Cuba. Nevertheless, the US in the 1980s embarked on a campaign to destabilise the Sandinista Government. In 1981, it ended economic relations with the government of Nicaragua and began to provide economic and military assistance to a counter-revolutionary guerrilla army, most of which were stationed in Honduras along the Nicaraguan border (Booth and Walker 1993: 140–146).

In El Salvador, the Reagan Administration gave $6 billion in economic and military assistance to the government. The Salvadoran Government represented the interests of the coffee oligarchy, and it was seeking to maintain itself before the onslaught of the Frente Farabundo Martí para la Liberación Nacional (FMLN, or Farabundo Martí National Liberation Front). Established in 1980, the FMLN was formed by five groups that had taken to armed struggle in the aftermath of government repression of popular protest, and it was allied with a federation of progressive and leftist political and social organisations, the Frente Democrático Revolucionario (FDR, or Revolutionary Democratic Front). During the 1980s, the FMLN constituted the de facto government in many rural communities in the eastern region of the country, and it operated clandestinely in the cities (Harnecker 1998:

32–33, 42–43; Prieto Rozos 2009: 36–43; Regalado 2008: 143–144, 156–157).

The Reagan Administration also initiated neoliberalism, with the rejection of Keynesian policies, cutbacks in domestic programmes, and the first steps towards international financial deregulation. More systematic application of neoliberal policies on a global level was adopted by the administration of George H.W. Bush (1989–93), which sought to restructure the inter-American system of domination on a foundation of three pillars. The first of these pillars is support for representative and parliamentary democracy in Latin America and the Caribbean, replacing the military dictatorships of national security. This so-called 'transition to democracy' was necessary, given the popular struggles against the military dictatorships and their total lack of legitimacy, and was possible, given the increasing concentration of capital, greater dependency of the Latin American elite, the declining autonomy of Latin American governments as a result of the external debt, and the limited organisational capacity of the popular movements as a result of repression by military dictatorships. The second pillar is the economic one, characterised by the imposition of neoliberal polices, efforts to impose a Free Trade Area of the Americas (FTAA), and the signing of free trade agreements with various nations. The third is the military pillar, in which the US seeks to establish a greater military presence in the region, using the 'war against drugs' and the 'war against terrorism' as pretexts (Regalado 2010).

The administration of Bill Clinton (1993–2001) continued to develop the three pillars of the restructured inter-American system of domination that had been established by the Bush Administration. However, the Clinton Administration encountered opposition. On the domestic front, labour organisations were opposed to the free trade agreements because they were concerned with their implications for the job security of US workers. At the same time, there emerged in Latin America during the period 1994–98 popular mass demonstrations in opposition to the free trade agreements and the neoliberal project. This stage of the Latin American popular struggle was inaugurated with the Zapatista

rebellion in Mexico in 1994, launched on the day the North American Free Trade Agreement went into effect. After 1998, beginning with the election of Hugo Chávez as president of Venezuela, the popular struggle would pass to a more advanced stage, transforming the political reality of Latin America (Regalado 2010).

The neoliberal project of the 1980s and 1990s was developed on the basis of the economic theory proposed by Milton Friedman and others at the school of economics of the University of Chicago. Its premises are: (1) the state should not distort the natural and spontaneous economic order; (2) governmental policy should be based on the principle of the unlimited supremacy of the market; (3) states should not interfere with the free play of supply and demand; and (4) governmental interference in the economy ought to be eliminated. Specific neoliberal policies include the elimination of government protection of national currency and the trading of currency at a free market rate; privatisation of government-owned enterprises; reduction of protection for national industry, reducing or eliminating tariffs and taxes on imported goods; facilitation of the free flow of capital into and out of the country; and the elimination of union restrictions on the free play of supply and demand (Prieto Rozos 2009: 108–111).

Osvaldo Martínez Martínez, director of the Center for the Study of the World Economy in Cuba, sees neoliberalism as a strategy of imperialist domination. He maintains that 'free trade' is a rhetorical phrase that is an integral part of a coherent package expressing the interests of the transnational corporations and the governments that represent them. He argues that neoliberalism is full of contradictions, inconsistencies, and myths, and that as a result it is in crisis (1999, 2005, 2006).

The 'Neocons' Take Control

During the 1990s, a number of conservative think tanks financed by international corporations reformulated the conservatism of Reaganism, seeking to adapt to changes occurring at the end of the century, including the end of the Cold War. The neoconservatives, or 'neocons', sought to reverse the decline of US hegemony. They envisioned the establishment through any means necessary, including military force, of the American concept of democracy and American civilisation as the universal world standard. Accordingly, they favoured expansion of military expenditures and the maintenance of US military dominance. In reaction to what they saw as the decadence of Western civilisation, they sought to restore discipline, order, and hierarchy. They were opposed to egalitarianism, feminism, environmentalism, sexual tolerance, and the absence of prayer and the teaching of the theory of evolution in schools. They gave priority to security over civil liberties. They viewed the neoconservative movement as a permanent counter-revolution that would consolidate neoconservative values in the long term. They sought to convert popular insecurity resulting from the structural crisis of the world-system and from the US hegemonic decline into a social fear that would generate support for neoconservative policies. They envisioned strategies of creating enemies and threats in order to establish pretexts for extreme policies. A number of prominent neoconservatives supported the candidacy of George W. Bush, some of them becoming prominent members of his cabinet when he assumed the presidency (Castro 2010: 11–12; Schmitt 2003).

The attacks of 11 September 2001 provoked an opportunity for the neoconservatives to pursue their vision more aggressively. The George W. Bush Administration launched wars in Afghanistan and Iraq and expanded the US's global military presence. US naval ships engaged in manoeuvres near Iran and North Korea, two nations not under US neo-colonial control, with the pretext of the nuclear programmes of these nations. The US's military presence in South America increased, under the pretext of the control of illegal drug trafficking.

The Bush Administration's policy towards Latin America sought to take advantage of the events of 11 September 2001 to overcome the stagnation that had beset the implementation of the new system of inter-American domination.

U

However, from 2003 to 2009, there was increasing Latin American resistance to the implementation of the restructured system of domination that first had been formulated by George H. W. Bush and had been continued by Clinton. Major developments included the defeat suffered by the FTAA at the Ministerial Meeting on Finances and the Economy of the Americas in 2003; the inability of the US to successfully promote its favourite candidates for the position of secretary general of the OAS in 2005; the failure of the US effort to reform the Inter-American Democratic Charter, in order that it could be used against the government of Hugo Chávez, in 2005; the defeat suffered by Bush in the effort to revive the FTAA in the Summit of the America in Mar del Plata in 2005; the entrance of Cuba into the Río Group in 2008; and the repeal of the 1961 decision to expel Cuba from the OAS in 2009 (Regalado 2010).

Obama: More Continuity than Change

Barack Obama won the presidential elections of 2008 with a promise of 'change'. There was indeed a change from the administration of George W. Bush, which had followed a policy of aggressive pursuit of US interests through unilateral military action. In the view of the Obama Administration, this strategy had backfired, because it alienated US allies and thus weakened US influence. So the Obama Administration adopted a new strategy of 'smart power'. However, the new approach was a change more of tone than of policy. Claudia Cinatti writes that the Obama strategy

> is nothing more than the old recipe of combining the use of military and economic power with diplomacy and negotiation in order to attain the support of allies, semi-allies, and partners of convenience in the attaining of the national interests of the US. Concretely, it implies an ordered withdrawal of the US from 'extravagant' objectives – like installing 'democracy' in failed states or dedicating itself to 'nation building' in Iraq or Afghanistan – in order to concentrate on intervening where imperialist interests are truly at stake. (2010: 74–75)

Accordingly, when Obama took office, the aggressive and arrogant tone of Bush was abandoned, and Obama adopted a different rhetoric. But the imperialist policies of the Bush Administration in essence continued, as can be seen in Latin America. As of June 2015, the blockade against Cuba has continued; in December 2014, the US announced its intention to end this universally criticised policy, indicating that it will pursue through other strategies its goal of changing Cuba in accordance with its interests. The US ultimately legitimated the 2009 *coup d'état* in Honduras, and there possibly was US involvement in the failed *coup d'état* in Ecuador in 2010. The US signed an agreement in 2009 with the government of Colombia for the installation of seven new military bases, and subsequent agreements for military bases were made with Panama and Costa Rica. Moreover, the US continues to interfere in the political affairs of Venezuela and Bolivia, seeking to strengthen the opposition. In general, the US under Obama continues to oppose the process of reform and revolution that is under way in Latin America (Ceceña 2010; Cinatti 2010: 76; Regalado 2010).

Trump: Aggressive Imperialism Returns

The Trump Administration has returned to the aggressive imperialism of George W. Bush. It has undertaken a campaign against what it calls the "troika of tyranny," the three countries presently in the vanguard of the anti-imperialist struggle. The campaign has included an unconventional war against Venezuela, including financial, commercial, political, and military dimensions, seeking to overthrow the constitutional government of Nicolás Maduro; the intensification of the economic, commercial, and financial blockade against Cuba; and a destabilization campaign against the Sandinista government in Nicaragua. In addition, the Trump Administration supports a violent *coup d'état* against the constitutionally-elected president Evo Morales in Bolivia; and it has supported the government of Lenin Moreno, who through a Trojan Horse strategy, has removed from power the Citizen Revolution led by Rafael Correa.

Conclusion

The period from 1898 to 1932 saw the consolidation of imperialism as a basic principle of US policy. Imperialism sought the attainment of new markets for surplus US production through military interventions and 'dollar diplomacy'. In establishing itself, imperialism had to overcome a strong tendency towards isolationism in US political culture. In the period from 1933 to 1945, imperialism adopted a softer strategy, seeking to appear as a 'Good Neighbor'. The quest for new markets, for control of existing markets, and for access to cheap raw materials continued, but the forms of intervention in Latin America were more indirect. In the period 1945–79, the US emerged as the hegemonic core power of the neo-colonial world-system, and US imperialist interventions became more global in scope. The Cold War provided a justification for more active intervention than was characteristic of the 'Good Neighbor' era. But important components of the previous period were preserved, such as depending primarily on military repression by the neo-colonial state, with direct US military intervention applied only when necessary. Conservatives promoted an aggressive Cold War approach, but liberals shared the basic premises of the Cold War and imperialist policy, forming a liberal-conservative consensus. Kennedy's Alliance for Progress was a short-lived and unsuccessful reformist approach, but even during the Kennedy Administration the Cold War assumptions that justified indirect and sometimes barbaric interventions in the Third World prevailed.

In the context of the structural crisis of the world-system and the US hegemonic decline, the nation has turned to the right since 1980. The neoliberal project was imposed, taking advantage of external debt, through free trade agreements and international finance agencies. Military intervention in pursuit of US interests has been constant. These policies have been justified on the grounds that they defend democracy, understood in the limited liberal sense of political rights and economic liberty. With the collapse of the Soviet Union and the socialist bloc, US national political leaders struggled to find an enemy that could be portrayed as a threat to democratic values. But the attacks of 11 September 2001 made possible the establishment of the 'war on terrorism' as the prevailing ideological frame for the justification of imperialist interventions. Imperialist policies have continued under Obama, in spite of a vague campaign promise of 'change and under Trump'.

Thus we can see that imperialism has been a policy actively pursued with continuity by US governments from 1898 to the present. Although generally presented with a democratic face, imperialist policies, in essence, have involved the pursuit of markets, raw materials, and sources of profits, without regard for the consequences for the sovereign rights of formally independent nations or for the social and economic rights of their citizens.

Imperialist policies have practical objectives, and they have provided concrete material benefits to the people of the US. They have been a significant factor in providing the US with additional markets, new sources of investment and profit, and access to cheap raw materials, and they therefore were central to the ascent of the US from 1898 to 1968.

However, the imperialist polices of the global powers are no longer practical. When the world-system reached the geographical limits of the earth around the middle of the twentieth century, a new situation was created. In the present historic moment, the aggressive quest for control of the raw materials, labour, and markets of the planet by the global powers creates political instability in the world-system, generating endless conflicts and wars, and it threatens the ecological balance of the earth. The continued pursuit of imperialist objectives by the global powers increases the probability of greater political instability on a global scale, establishing the possibility of the disintegration of the world-system and a global decline into chaos, in which the extinction of the human species as a consequence of environmental factors could occur.

Furthermore, imperialism is no longer in the interests of the people of the US. The expansion of military expenditures, necessary for the implementation of imperialist policies, diverts limited resources away from investments in new and

sustainable forms of economic production that would provide concrete benefits to the people. In addition, financing military expenditures through government debt financed with foreign sources of capital undermines the sovereignty of the nation.

The establishment of political stability requires the economic and cultural development of neo-colonised nations, which is impossible under the structures of the core–peripheral relation. Global political stability requires autonomous national projects for economic and cultural development, which emerge when popular movements in neo-colonies take control of the government and seek to govern in a form that represents the interest of the various popular sectors. Cuba, Chile, Nicaragua, Venezuela, Bolivia, and Ecuador have seen the realisation of this possibility. It is in the interests of the people of the US to co-operate with such autonomous national projects, seeking to participate in the development of a more just, democratic, and sustainable world-system. This is the way to overcome the structural crisis of the world-system and to respond to the challenges that humanity today confronts.

Definition

The post-Soviet space – and Ukraine in particular – is positioned on the crossings of reinvigorated geopolitical rivalries and conflicting agents of the empire of capital with its internal competitions and shifting spatial and social boundaries. It is torn by inequalities, economic crises, predatory capital (home-grown or otherwise), various forms of conflict, and reinvigorated struggle for geopolitical presence between Russia and the new-old West. The empire(s) and imperialisms we discuss in this chapter cannot be reduced to states' boundaries and their assumed associated interests. Yet they do have a geopolitical dimension in global political economy, as Desai thoroughly documents (2013). Ukraine fell victim to the relentless spread of the empire of capital where Russian and Western capitalist geopolitical imperialisms collided.

Any discussion of imperialism needs to commence with a clear statement of how we define the term, as both the essence and the definitions of the phenomenon have been transforming. As Harvey accurately noted, "anyone who sets out to conceptualise a 'new imperialism' is stepping into a cauldron of dissenting views carrying on their backs the huge baggage of past controversies" (2007, p. 60). Empire of capital spreads with historic and deliberate unevenness that involves

(geo)politics, economic, and social relations and produces geographies of dependencies, extraction, and exploitation (Patnaik and Patnaik 2017; Desai 2013) with a dimension of militarism (Foster 2006; van der Pijl 2006). The 2003 US attack on Iraq, its entry into the "naked imperialism" phase (Foster 2006) in turn, provided a whole new boost to the debate on the so-called new imperialism and relationships between the political, the economic, and the warfare in contemporary capitalism (Harvey 2003; Callinicos 2005, 2007; Panitch and Gindin 2006; Wood 2005). Imperialism in the twenty-first century must, therefore, be seen as a combination of competing geopolitical and economic imperialisms (which are more than one), yet ideologically they remain capitalist to the core. As the states and their imperialisms compete in a global capitalist system, so they too become transformed in the process, reproducing that system. In that competition, they rely on a combination of means available to them: social, political, economic, ideological, geopolitical, and military.

The empire of global capital spreads through transforming societies and their institutions by passive revolution and *trasformismo* (Gramsci 1971) where the ruling bloc is often comprised of willing and responsible implementers and beneficiaries of marketization reforms. Market fetishization, i.e., treating marketization as the only viable reform option, is the myth on which holds the neoliberal comprehensive concept of control (Bode 1979) as a combination of an "accumulation strategy" with a "hegemonic project" (Jessop 1983; see also Jessop 2016 for elaboration of the state theory). Crystallized in economic models, the concept of control is then channeled indirectly via international institutions (IMF, EBRD, WTO, the EU/EC, and the like) and directly via interest and lobby groups (Carroll 2010) of which in Ukraine there are four – American Chamber of Commerce (ACC), Center for US-Ukraine Relations (CUSUR), US-Ukraine Business Council (USUBC), and European Business Association (EBA) (Yurchenko 2013, 2018). The concepts of control are articulated in reform prescriptions to transition economies and, particularly, Ukraine, through such mechanisms as

structural adjustment loans, where the myths of growth through neoliberal marketization aim to secure consent (by convincing or fraud; elaborating on Gramsci 1971) to the reform implementation at any cost. Russia and Ukraine both underwent capitalist transformation yet each with its own idiosyncrasies: the first went through shock therapy to become a state-run paternalistic oligarchy; the second became a neoliberal kleptocracy. The crucial differences between the two unfolded in the remaking of the countries' institutional backbone, the state.

Empire of capital relies on the state as an institution that in its turn is a momentary crystallization of social forces and their competing interests in power structures that enable and/or curtail their agencies (Poulantzas 1975, 1978); the state and its institutions then embody those contradictions. The state is "the only non-economic institution truly indispensable to capital" (p. 139); yet, we must acknowledge that the new imperialism needs "a new theory of the capitalist state" (Harvey 2007, p. 67): that one must acknowledge the transforming mechanisms of accumulation and capitalist class structure globally and that there are classes and their fractions in each state that favor policies which go contrary to the interest of the state and/or society as we can see in concrete political decisions globally and frequently – inconsistencies of policies dispensed by Yanukovych, Poroshenko, Putin, and US and various EU's officials. Yurchenko (2018; see also Powell and Yurchenko 2019) suggests resolving these contradictions by treating "capital. . . as a force that is shaped by and shapes the state and society alike yet has its own degree of autonomy." Building on Cox's "state-society complex" (1981, 1986), she redefines it thus to the "state-society-capital complex" and argues that it is the balance of power in that complex and the proportion of capital orientated on transnational accumulation in it that determine the directions and conflict of policy-making on the level of state institutions and geopolitical strategies. Sovereign functioning of Ukraine's state, for example, is impossible when the interests of capital take precedence, when the autonomy of decision-making is compromised by complex economic

dependencies with geopolitical component, and when accumulation interests of transnational capital from Ukraine, West, or Russia are guaranteed by law at the expense of socially oriented investment.

In the following sections, we explicate Ukraine's uneven incorporation into the global capitalist system after the collapse of the Soviet Union. We explore Ukrainian capitalism's internal contradictions and shifts of power between oligarchic blocs, discuss their unfolding in the context of neo-imperialist rivalry between the USA, the EU, and Russia. We zoom in on some of the major outcomes of that dialectic that facilitated a major multilevel crisis of 2013–2014 and led to the overthrow of President Viktor Yanukovych, Russia's annexation of the southern peninsula Crimea, and the war in eastern Ukrainian region of Donbas. We provide a critical review of the major narratives on the nature and role of Western and Russian imperialisms in Ukraine's crisis. We conclude with the discussion that we started in the introduction: the one on the nature and varieties of imperialisms in the system of transforming transnational capitalism and the need for careful (re) theorizations of its workings and effects in Ukraine and elsewhere.

Ukraine's Capitalism with a Twist

Ukraine's integration into global capitalist economy meant abandoning planned economy and welfare functions of the Soviet state for the sake of planning for markets (Gowan 1995). It was premised on a mythological idea that "transition to market" based on IMF, WB, and EBRD modeling had to occur in the ex-USSR republics (Yurchenko 2018). However, politico-economic complexity cannot be captured by that modeling because apart from the (socio-)economic factors there also are their political forms, e.g., institutional, ideological, cultural, etc.; thus, the implementation yields disruptive consequences. Second, the modeling presumes that there must be a transition to neoliberal market capitalism with no reasons given for that choice. Market (mis)planning and the weakening of the state, its

"retreat" from its "essential responsibilities, lack of vision and inability to develop coherent social and macroeconomic policies," were the main factors that led "to perverse economic restructuring and highly undesirable social and economic outcomes on a grand scale" (Ivanova 2007). There was one more decisive component in Ukraine's institutional transformation, and that is the criminal-political nexus, i.e., the kleptocratic network that ran through the state apparatus, security institution, and the judiciary (Godson 2003; Shelley 2003). Since the 1990s, Ukraine's nascent ruling bloc utilized the multiplicity of already available and constantly expanding mechanisms of accumulation in the global capitalist system, legal and extralegal, hastily advised to adopt by the IMF and the EBRD to produce a regime of neoliberal kleptocracy. Through domestic and foreign economic policies of selective liberalization and protectionism that favored oligarchic capital and through the creation of virtual spaces of accumulation for offshoring profits and institutionalized expropriation, "black holes" were designed in the economy (Yurchenko 2012). They materialized in four forms of state asset embezzlement: (1) privatization, from primitive accumulation to concentration and centralization of SOEs in the hands of financial-industrial groups and essentially oligarchs; (2) FDI regulations, overlapping series of reforms and their uneven implications for accumulation by both domestic and foreign capital; (3) the creation and functioning of special economic zones (SEZs) and priority development areas (PDAs); and (4) legislative reform on tender, state purchasing and abuse of procedure (Yurchenko 2012). Creation of SEZs and PDAs was one of the examples of temporary compromise between Dnipropetrovsk "leaders" in Kiev and the ascending Donetsk capital. The areas were established with the adoption of the law of Ukraine "On general positions of establishment and functioning of Special (free) Economic Zones" (SEZs) between 1998 and early 2005 and an array of other laws and bylaws which together regulated the founding and functioning of 12 SEZs and 72 PDAs on October 13, 1992. Two largest and most comprehensive zones in terms of granted privileges – "Donetsk" and

"Azov" – were in the Donetsk oblast with "ferrous metals, coal mining and electric power generation, [or industries associated with oligarchic FIGs, were] included in the list of priority sectors and industries in the law" (Pekhnyk 2007, p. 45 *et passim*; see Yurchenko 2012, 2013, 2018 for more detail).

Neoliberal kleptocracy evolved over five discernible periods. Ukraine's ruling bloc, i.e., historic bloc (Gramsci 1971) with institutional control, has historically been fragmented into a few identifiable dominant fractions. Two major blocs dominated Ukraine's political scene between the early 1990s and 2013 and can be referred to by their regions of origin: Dnipropetrovsk and Donetsk – industrial centers of USSR-level importance, influential economically, and in terms of USSR Communist Party representation. Rivalry over access to power (social, economic, and political) and inability to achieve a consolidated strategy between the dominant and contender blocs shaped Ukraine's post-Soviet history and its turbulence in the following order.

The first post-independence period of 1991–1998(9) was clearly dominated by the Dnipropetrovsk bloc led by Presidents Kravchuk (1991–1994) and Kuchma (since July 1994), and Prime Minister Lazarenko and was composed of neo-nomenklatura and capitalists-in-the-making who emerged from the criminal-political nexus and Komsomol. During that period, the first oligarchic capitalists emerged in the spheres of gas, oil, lubricants, and fuel trade with Lazarenko, Tymoshenko, and Pinchuk in the lead. Simultaneously and often through brutal crime, a rival capitalist class fraction was forming in Donetsk oblast as primitive accumulation unfolded on prescription of the IMF and their structural adjustment loans (since 1992). In 1996, the Constitution of Ukraine was adopted, making it a presidential republic and maintaining centralized control in the hands of the presidential administration, i.e., Kuchma and his cronies from Dnipropetrovsk.

In the second period of 1998(9)–2004, the growing leverage of the Donetsk bloc in economic and political spheres became noticeable. It included a number of top state administration

U

appointments, e.g., prime ministers Azarov and later Yanukovych. Capitalist class fractions formed through primitive accumulation of the SOEs and concentration of capital in the financial-industrial groups with pronounced dominance of the Donetsk forces. By the late 1990s, they emerged as class-fractions-for-themselves and formed the Party of Regions – among others – to pursue their interests through direct participation in the country's legislature. SEZs and PDAs were established and attracted the largest FDI inflow, thus creating the pretense of economic growth by recycling oligarchic money through offshore zones (Pekhnyk 2007, p. 44) – foreign investors tend to "avoid enterprises in branches requiring extensive restructuring, such as steel, coal mining, heavy machinery and basic chemicals" that were FDI targets in Ukraine (Carlin in Lyakh 2007, p. 78). The situation was further aggravated by low availability and high-interest rates on credit combined with low incomes, which inhibited the development of small and medium business. The gradual shift of power from the Dnipropetrovsk neo-nomenklatura to the Donetsk fraction has commenced with Lazarenko's money laundering scandal, Tymoshenko's and YeESU's loss of control over the gas market, and finally – the Kuchma/Pinchuk class fraction compromise with the Donetsk forces. In late 2004, prior to the presidential election, another Constitutional reform shifted power over to the parliament in order to guarantee the Party of Regions/Donetsk leverage on the legislature in case of Yanukovych's potential presidential election defeat.

In the third period (2004–2007), the presidential election power struggle led to the so-called Orange Revolution. The leaders of the protest were the presidential candidate Yushchenko, his backer Tymoshenko/fractions of capital from Donetsk (ISD of Taruta and Mkrtchan) and Dnipropetrovsk (Privat Group FIG of Kolomoyskyi and Boholyubov), and finally Ukraine's Western partners – the USA and the EU. It was a reaction to the electoral fraud by the Donetsk bloc's Yanukovych whose candidacy was supported by the outgoing President Kuchma, Akhmetov (System Capital Management FIG),

Pinchuk (Interpipe Group), and Russia. Subsequently, the rival forces were unable to reach a political compromise. The conflict between the Party of Regions-dominated parliament and the opposition parties, their associated rival capitalist class fractions, and the inability of President Yushchenko to maintain allegiance with his previous backers led to (1) Prime Minister Tymoshenko's loss of office and (2) the subsequent appointment of Yanukovych as the new prime minister. Parties associated with Yushchenko and Tymoshenko were rapidly losing support, and in the Parliamentary election of 2007, the Party of Regions won the majority of seats.

Between 2007 and 2013/2014 (fourth period), the Donetsk bloc centralized political power in the country. Following the Parliamentary election of 2007 and formation of a coalition with Yushchenko's party Our Ukraine, Tymoshenko was appointed prime minister once again. As the global credit crunch hit Ukraine, Tymoshenko's rivalry with Firtash over the gas markets turned into the so-called gas wars with Russia which cost her popular support. That helped Yanukovych secure victory in the presidential election in 2010 that in combination with the Party of Regions' parliamentary majority now gave the Donetsk bloc control over the executive and the legislative branches of power. Centralization of power now accelerated and among other included (1) vertical concentration of power in the hands of the president through the reversal of the Constitutional reform of 2004 and (2) extension of control to include the judiciary through adoption of *The law on the judiciary and the courts from July 2010* (Verkhovna Rada July 2010) that "represented at one and the same time both an instrument for gaining and imposing power over the judiciary [by the president] and an attempt to improve the administration of justice" (Foglesong and Solomon 2001). By August 2012, according to the annual rating of *Korrespondent*, 9 out of 10 most influential people in the country were members of the Party of Regions, and 37 out of the 100 most influential people were also in the list of the top 100 richest oligarchs, which included the son of President Yanukovych, Oleksandr, who joined the list soon after his father assumed office

(*Korrespondent* 2012). Rinat Akhmetov's documented revenue, for example, in 2011 alone – a year of economic crisis – increased from $17.8 billion to $25.6 billion, most of which still remains untaxed (*Korrespondent* 2011). Donetsk centralized power but failed to generate a hegemonic consensus with contender blocs; those, in turn, used the pro-EU protests and anti-Yanukovych sentiments in the populace to facilitate his overthrow and take over the ruling position with reinvigorated inter-bloc rivalry.

The last period started in 2013–2014 with the Maidan uprising, followed by the annexation of Crimea by Russia, intensification of civil, and breakout of the armed conflict with Russia-supported separatists in Donbas – a highly industrial region in eastern Ukraine with a large percentage of ethnic Russian population – culminated from escalating international and domestic contradictions. Dislodging of the Donetsk bloc and Party of Regions top figures not only beheaded their centralized state power pyramid but also effectively intensified rivalry among the contender capitalist fractions. In conditions of intensified rivalry and lack of democratic mandate, the precarious ruling bloc relies increasingly on compartmentalization of society and vilification of oppositional agents and discourses. Below we briefly outline the development of the political crisis in Ukraine – still a highly contested issue in the opposing pro-Ukrainian/pro-Western and pro-Russian narratives.

EU Association Agreement with Ukraine and the Crisis of 2013–2014

Complex political economic and geopolitical reality created conditions where Kuchma, the second president of Ukraine (1994–2004), has opted for the so-called multivector, i.e., multidirectional, approach to foreign and economic policy that unambiguously ceased in 2014. By 2008 political economy of Ukraine was determined by a toxic combination of debt dependency (Kravchuk 2015; Kravchuk et al. 2016), uneven financialization, sectoral unevenness (Birch and Mykhnenko 2009), tax evasion, and state asset embezzlement (Pekhnyk 2007; Yurchenko 2012; Kravchuk 2015). As a result, Ukraine was among those hit hardest by the credit crunch despite the country's relatively modest and uneven integration into the global financial architectures. Even though sporadic borrowing of the early 1990s was partly systematized by the early 2000s, it still kept growing. Poor banking and, specifically, lending regulations allowed unsupported lending based on re-loaning combined with lending in foreign currencies (encouraged by lower interest rates than loans in Ukrainian currency *hryvnia*). In that context, a combination of three key factors conditioned the severity of the crisis: First, a dive in prices coincided with a slumping global demand for steel – an export that the economy heavily relied upon. Second, the persisting endemic problems in the banking sector of Ukraine. And third, the "gas wars" with Russia interfered with the supply, pushed the prices up, and significantly increased production costs in Ukraine's energy-intensive export industries (Doroshenko 2008). Competing pressures from economic deficiencies and dependencies crashed the economy. This contingency caused a deep financial and political crisis in the country that was resolved via added lending from International Financial Institutions with more and stricter conditionality. By December 2016, Ukraine became IMF's third largest borrower going from zero debt in 1991 to $70.97 bn (see more on state debt data here: Minfin 2017).

The signing of the Deep Comprehensive Free Trade Agreement (DCFTA) was to mark the completion of the biggest step in rapprochement with the EU/Western partners yet. The agreement was to replace the earlier framework for collaboration, the Partnership and Cooperation Agreement (PCA), and was unprecedented in its scope and depth due to three particular features: "comprehensiveness, complexity, and conditionality" (Petrov et al. 2015, p. 2 *et passim*). The idea of the agreement was born in 2006 under Yushchenko's pro-Western administration (in office 2005–2010). Following the talks that began in 2008, the agreement was initialed by the EU and Ukraine in 2012 with Yanukovych (Gardner 2017). Loans from the West and

dependency on energy imports from Russia, put into the context of chronic budget deficit, made the government and oligarchs vulnerable to Russia's pressure, which eventually led to President Yanukovych's decision to withdraw from the signing of the DCFTA with the EU, thus triggering the so-called Maidan protests. Meanwhile, the EU – partially succumbing to the USA' pressure – ignored Russia's demands for tripartite negotiations about the terms of the DCFTA agreement with Ukraine, which could help ensure that the agreement does not impede on the parameters of trade between Ukraine and Russia, instead imposing an exclusive choice between free-trade areas with the EU or Customs Union with Russia, Belarus, and Kazakhstan (Hahn 2018, Chapter 6) on Ukraine, thus contributing to the souring relations with Russia.

The protests in support of EU association agreement with Ukraine that started in late November 2013 radicalized both in tactics and demands following escalating repressions and incapacity of the moderate opposition to propose any efficient nonviolent strategy against the government (see for English language extended analysis of the events in Ukraine from leftist perspectives, especially, de Ploeg 2017; Ishchenko 2014a, 2015; Yurchenko 2018). To an extent the opposition was guided by unwillingness to dial down the escalation, as both they and their associated oligarchs saw an opportunity to (re)claim power from Yanukovych's bloc of forces. The Maidan protests spread across the whole country, especially in western and central Ukraine, which is more pro-Western and Ukrainian-speaking. Eastern and southern Ukraine, however, being a more pro-Russian and Russian-speaking region, never demonstrated majority support or significant street mobilization for the Maidan movement (Ishchenko 2016a, p. 458; Kiev International Institute of Sociology 2014b). Despite impressive self-organization and widespread skepticism toward the opposition parties' leaders among regular Maidan protesters, there was a lack of autonomous political organizations and political articulation of their social grievances (PS.Lab 2015; Zhuravlev 2015). The right-wing oligarchic parties, pro-Western (neo)liberal

NGOs, and far right played the role of political and institutional representation of the Maidan movement. The latter – most prominently the major radical nationalist Ukrainian party *Svoboda* ("Freedom") and the Right Sector (*Pravyi Sektor*), an umbrella coalition of smaller and previously little known extreme right groups – were the most active and visible collective agents in the Maidan protests (Ishchenko 2016a). Because of the unique combination of resources – violent skills, revolutionary nationalist ideology, and political organizations – the Right Sector played the role of a violent vanguard in the protests and the armed uprising during the final wave of escalation that started on February 18, 2014 (Ishchenko 2018b). Several days later, Yanukovych left Kiev in a futile hope to lean on the local authorities from the pro-presidential Party of Regions (PoR) in southern and eastern parts of Ukraine, in the end asking for assistance in fleeing from Putin's administration. In the meantime, the parliament – now controlled by the opposition parties – decided to remove Yanukovych from power on doubtful constitutional grounds. Nevertheless, the Western leaders quickly accepted the transfer of power to the opposition, despite the previously mediated agreement between the president and the opposition parties, presupposing Yanukovych in power till at least December 2014, when snap elections were agreed to take place (Hahn 2018, Chapter 7).

The escalation continued with Anti-Maidan counter-mobilization and Russia's annexation of Crimea in March 2014 – the peninsula with Russian naval base in Sevastopol and ethnic Russian majority – boosting support for President Putin above 80% in Russia. His administration's fears of exporting Maidan to Russia were thus precluded. The annexation of Crimea, Russian television propaganda, and possibly Russian agents fueled Anti-Maidan rallies in major cities of southern and eastern Ukrainian regions. These protests were smaller, decentralized, less organized, and more plebeian than Maidan protests before and, therefore, were more vulnerable and susceptible to external manipulation both from Russia and the PoR elites in Donbas, which were hoping to win concessions from the new post-Maidan

government. On April 12, a group of people from Russia led by Igor "Strelkov" Girkin, a former Russian security service officer, started an armed uprising in Donbas with Russian irredentist goals. The disoriented, demotivated, and underfinanced Ukrainian regular army was not capable of suppressing the rebels, so the volunteer battalions stepped in to take this role, with the radical nationalists playing a crucial role in this new formations (Malyarenko and Galbreath 2016). The conflict gradually grew into a full-scale war with a flow of volunteers, supply of arms, and equipment from Russia, and ultimately – an incursion of Russian regular forces during the decisive fighting in August 2014 (Robinson 2016). Two rounds of international negotiations in 2014 and 2015 in Minsk, Belarus, led to a road map for political solution of the conflict; however, even a stable ceasefire failed to be secured.

As a result post-Maidan Kiev government consolidated control over most of Ukrainian territory except for Crimea and parts of Donbas, however, without any radical change in the nature of the oligarchic neopatrimonial regime (Matsiyevsky 2018), further entrenching the neoliberal kleptocracy (Yurchenko 2012, 2013, 2018). Ukrainian government was now dependent, both economically and politically, on the Western states and institutions, and pushing forward with neoliberal reforms while at the same time resisting anti-corruption institutions, radicalizing nationalist, anti-Communist, and antidemocratic trends (Chemerys 2016; Ishchenko 2018a). In Donbas, two Russian puppet states (Donetsk and Lugansk People's Republics [DPR and LPR]) were established. They have gradually consolidated and left even less space for politically relevant opposition than in Ukraine; most of the "wild" rebel warlords have been physically eliminated (Malyarenko and Wolff 2018). The left political groups and progressive elements were marginal in both the Maidan and the Anti-Maidan movements and did not have any realistic chances of competing for political power, let alone for a hegemonic position with much more resourceful right-wing forces, i.e., oligarchic parties, (neo) liberal NGOs, and radical Ukrainian nationalists within the Maidan movement, or with the Russian

nationalists and agents of the Russian government in the Donbas insurgency. Several factors, including the ban of the Communist Party of Ukraine (at least under that name), decommunization laws, repressions, and violent attacks against the left in Ukraine, and finally – very limited space for any independent politics in DPR/LPR – led to the eventual marginalization of the left in all parts of the country (Ishchenko 2016b).

Substitution of the Nation-Making Idea: Architecting False Consciousness

Sociopolitical destabilization of the country would not have been possible without the erosion of the collective mythology that bound the nation together in the boundaries Ukraine had in 1991 (Yurchenko 2018). In its 1991 borders by the Soviets in mid-twentieth century, the multiethnic, multireligious, multilingual nation needed a strong cosmopolitan foundation myth to bring it into a sovereign existence. The country's multiethnic, multireligious, multilingual nation (Sakwa 2015) needed a cosmopolitan constitutional backbone to prop up its survival and cement social cohesion necessary for economic transformation that lied ahead. And its leaders have produced that backbone, if de jure, as the country's Constitution, adopted in 1996. Unfortunately, "marketization and geopolitical games in the post-Soviet space were in contradiction with the potential construction of a cosmopolitan, egalitarian society and thus, different, divisive myths were used to shape public imagination" (Yurchenko 2018, p. 4).

As the empire of transnational capital was spreading with the EBRD, USAID, IMF and WB, neoliberal reforms were planted into the transforming system (in Ukraine and Russia alike, even if with different consequences), undermining the best of intention by their incompatibility with socioeconomic development and exacerbated by the existing and, too, transforming system of economic activity, legal and extralegal. They needed a different backbone, one patchworked from myths that would compartmentalize the society as an effect. They are four: the myth of transition, the myth of democracy, the myth of

"two Ukraines," and the myth of the "Other" (Yurchenko 2018, pp. 10–22 *et passim*). The myth of transition can be summarized in the idea that the "transition to market" based on IMF, WB, and EBRD modeling had to occur in the ex-USSR republics. First of all, politico-economic reality is much more complex than such a model presupposes, seeing that apart from the (socio-)economic factors there also are their political forms, e.g., institutional, ideological, cultural, etc. This means that by default the implementation process is set to have multiple negative consequences. Second, the model is premised upon an assumption that there must be a transition to neoliberal market capitalism in the first place and that it is the only alternative for the post-Soviet states; it is not clear at all why the above is treated as an axiom. Third, the process of "transition" toward a certain mode of production and social reproduction – capitalist or otherwise – is steeped in teleology of itself. Thus, as any social prescription it does not account for, if at all acknowledges, the social dialectic of its target locale. Moreover, the teleology of transition to market fetishizes a fictitious object, i.e., free market, which neither in theory nor in practice was shown to either exist or perform efficiently. No amount of complications nor crises emergent as a result of this ill-conceived policy fixation led to its revision. The myth of democracy helps maintain a façade of the market orientation being an ongoing popular choice, of a functioning democratic system, and of representation politics. Feasibility of a democratic rule in a polity where private interests come before public is one of the more insidious yet resilient myths that allows for authoritarian neoliberalism to survive and spread in Ukraine and elsewhere. Instead, what can be witnessed in Ukraine is the further entrenchment of a regime of neoliberal kleptocracy where political disempowerment of the voter became combined with their economic disempowerment and ideological hollowing out of political discourse.

The myth of "two Ukraines" (Riabchuk (1992) coined the term), east and west, Russian-speaking and Ukrainian-speaking, has been manufactured in what is a diverse and nonhomogeneous society, just like any other country, and its "heterogeneity is a historical norm, not the historical exception" (Menon and Rumer 2015, p. 1 *et passim*). The Yanukovych versus Yushchenko electoral campaign became the main defining moment where the boundary manufactured by political technologists between the two was demarcated in Ukraine's political discourse making Riabchuk's 1992 declaration a materialized prophecy. The myth of "the Other" is the most recent and also the most destabilizing and destructive for the country's social fabric and collective national consciousness. The Ukrainian is now locked in defining itself in opposition to the Russian "other" by the content of the infamous "decommunization laws" that labeled everything Soviet as Russian, i.e., associated with an aggressor country, and as the "other" to the Ukrainian by extension. So, the othering occurs not only on the level of separation of society into "patriots" and separatist/Russia sympathizers but also, intrinsically, on the individual level through rejection of a part of one's cultural, historical, linguistic, and religious identity. The recent manipulations by Poroshenko's administration with the separation of Ukraine's church from the Russian Patriarchy, the Tomos of autocephaly of Ukrainian Orthodox church, i. e., decree on independent functioning, obtained from Constantinople confirm that this tendency is exacerbating, cutting deeper divisions into what was and could be a shared history, all hierarchies and imperialist/colonial narratives considered. In this way (as well as with other divisive nationalist policies, e.g., about language and history), the oligarchic regime is adding another characteristic to the image of the "other" in a divide-and-rule maneuver, pitching the faithful against each other. It is aimed to distract attention from the failures of Poroshenko's administration, adds to his image of liberator from "Russian oppression" – if not in the battlefields of eastern Ukraine than in the church yards – and is used to boost popular support in the upcoming presidential election.

Western Imperialism?

A popular interpretation of the political crisis in Ukraine among many left authors is to blame

Western imperialism for its unfolding (e.g., Amin 2016; Kagarlitsky et al. 2017; Pijl 2018), even when the lack of a consolidated strategy among the countries of the "Western bloc" is acknowledged. The crucial elements of this narrative are the eastward expansion of NATO and the EU, "democracy promotion" via support of pro-Western (neo)liberal NGOs, and support for the Maidan protests and post-Maidan Ukrainian government from Western officials. All these were cumulatively interpreted in Russia as another step toward its encirclement by adversary regimes and encroachment on its spheres of influence. The above served as an excuse to "defensively" react by annexing Crimea and supporting Donbas separatists in order to secure Sevastopol naval base, preclude Ukraine's membership in NATO, and destabilize a hostile post-Maidan government. This narrative builds on important facts and has some merit; however, a number of caveats are necessary to make.

Indeed, the EU association agreement with Ukraine contained certain security clauses (however, quite vague, see Hahn 2018, Chapter 6). Besides, similar kind of agreements was often the first step toward NATO and EU membership for other countries, particularly, in eastern Europe (Nazemroaya 2012, pp. 51–53). Nevertheless, a number of countries (in Africa and Latin America) signed the EU association and free trade agreements without any short-term realistic prospects or even the desire to become NATO and EU members. Despite participating in many NATO partnership programs (pp. 60–62), the closest Ukraine got to prospective engagement with the Alliance was a declaration accepted at the 2008 NATO summit. Back then in Bucharest, it was declared that Ukraine (together with Georgia) will become NATO members in an unspecified time in the future, provoking a harsh reaction from Russia. The fact remains that Ukraine has never been granted a membership action plan, nor even a specific promise to become a member of NATO or the EU. This is happening despite favorable public opinion (Zolkina and Haran 2017) and the position of post-Maidan government and parliament that went as far as changing the Ukrainian constitution to fix the course on integration into Euroatlantic institutions. Many would

argue that Ukraine has never been "ready" for membership because of the poor economic development and lack of democracy, adding the territorial conflicts in Crimea and Donbas it has gotten since 2014 on top of that. Yet, poor ex-Yugoslavia countries with problematic democratic procedures were welcomed into Euroatlantic institutions. Although, it happened only upon NATO intervention into the internal ethnic conflicts that international parties failed to contain, let alone stop. Taking into account political, economic, and geopolitical implications of Ukraine's NATO membership, it is doubtful that similar strategies would or will be deployed in Ukraine as Germany's blocking of NATO exercise near the Kerch strait in February 2019 testifies (Donahue and Jacobs 2019). A multivariate regression analysis by Katchanovski (2011) shows that even if the level of democracy and economic development really mattered for EU membership of eastern European and ex-USSR countries (however, not excluding positive reverse causation of membership prospects), while the level of democracy and lack unsettled territorial conflicts mattered for NATO membership, the simple fact of being a post-Soviet country significantly reduced the prospects of Euroatlantic integration, even taking all other factors into account.

Such inconsistency toward Ukraine challenges a simplified narrative about Western imperialist expansion. After 2014 it became a popular notion to mention Zbigniew Brzezinski's geopolitical analysis that is arguing for Euroatlantic expansion to the post-Soviet space and, particularly, for a crucial role of Ukraine in the weakening of Russia's role in Eurasia (e.g., Hahn 2018; Pijl 2018; Toal 2017). However, such analyses are likely to be making the same kind of mistake as those authors that exaggerate the influence of far-right Eurasianism ideas of Alexander Dugin on Russian foreign policy (March 2018, p. 85). The Western elites have never been consolidated about Euroatlantic integration of Ukraine. Particularly, France and Germany have usually been more cautious than the USA (Pijl 2018, p. 26). Being more dependent on Russian energy resources supply and more vulnerable against a military attack and attempting to assert at least some independence from US foreign policy, they tried to avoid

U

escalation with Russia. Moreover, despite prevalent anti-Russia prejudice among many US foreign policy advisors (Gessen 2018), there has always been a non-negligible voice of opposition to NATO expansion to eastern Europe among "realist" Western policy analysts and decision-makers, starting with George F. Kennan, the famous architect of the policy of containment toward USSR, who took Russian concerns seriously (Hahn 2018, Chapter 2; Toal 2017, pp. 28–33; Wood 2018, Chapter 5). Construction of a plausible argument about Western imperialist expansion needs a thorough address of the contradictions among Western policy-makers and among Western countries regarding post-Soviet space, Russia, and how they have been connected with the interests of the ruling and capitalist class fractions, both their own and Ukraine's.

The popular argument about Maidan as a Western-driven coup d'etat via intentional democracy promotion and color revolution "technology" is so far insufficiently grounded. Indeed, all the "usual suspects" like the National Endowment for Democracy, USAID, and George Soros' International Renaissance Foundation as well as many EU donors have long supported Ukrainian (neo)liberal NGOs. As Victoria Nuland, Assistant Secretary of State for European and Eurasian Affairs, famously recognized in December 2013, the USA spent nearly 5 billion dollars on democracy promotion programs in Ukraine since its independence (de Ploeg 2017, pp. 54–58; Hahn 2018, Chapter 6). And indeed, such programs facilitate *trasformismo* and passive revolution, i.e., they help gradually transform public consciousness toward favoring marketization reforms over state ownership of industry, "free market" versus state regulation of economic activity, and capitalist over socialist politics. However, the actual role of pro-Western NGOs in the Maidan uprising is usually exaggerated in this narrative. The institutionalized civil society in Ukraine has been weak and split because of the detachment from the grassroot protest initiatives and actual concerns of the majority of citizens (Ishchenko 2017, pp. 216–218). During Maidan protests, (neo)

liberal NGOs did not play any outstanding role in mass mobilization of protesters: not more than 9% of protesters in Kiev claimed membership in any civic organization; not more than 14% who came from the provinces to Kiev were organized by any civic organization or movement (Kiev International Institute of Sociology 2014a). The NGOs were not indispensable in maintaining Maidan mobilization and protest camps: the opposition party resources and crowdfunding were more important. Neither have they played any significant role in violent clashes with the riot police – nor enticed these clashes – the radical nationalists played the vanguard role in the armed uprising. Only 17% of protesters in Kiev claimed that when figuring out when and where they should go to join the protests, have they used any form of online TV channels that had appeared on the eve of Maidan protests and were often supported by Western donors (the role of traditional radio/TV, Facebook, and family connections was mentioned far more often) (Onuch 2015, p. 228). Last but not least, NGO activists are not necessarily direct agents of their donors and often possess a high degree of autonomy. With their connections, communication skills and good English, the (neo)liberal NGOs were important primarily in communicating to the Western officials, media, and public opinion an attractive image of "a democratic, diverse, peaceful revolution of Ukrainian people against an authoritarian dictatorship" that helped legitimize international support for Maidan, even though they were only representing a small, and not even the most important, segment of the protest mobilization. The majority of protesters were a mixed (if skewed to western and central regions) demographic of citizens with a complex mix of socioeconomic and anti-authoritarian grievances and pro-EU and anti-Russian nationalist sentiments.

Support for Maidan protesters by Western officials was also inconsistent. Their major official position was a political compromise between Yanukovych and the opposition, presupposing a limitation of the president's power and the opposition's involvement into the government. Western officials supported "European aspirations" of

Maidan protesters and condemned governmental repressions; however, they also criticized the violent radicals from the Right Sector and were skeptical about the far-right *Svoboda* party (US Department of State 2014). A lot of noise has been made about the mid-protest appearances of a number of US and EU officials, members of parliaments at Kiev Maidan camp (see the list, e. g., in de Ploeg 2017, pp. 58–59); however, this presence was limited to symbolic support of the protesters in order to put pressure on the government and prevent repressions. It is also questionable to which extent these symbolic appearances were coordinated with the Western governments. The first visa sanctions against several Ukrainian officials, which the USA believed responsible for the repressions, were introduced only by late January after the first fatalities. Only after the massacre of dozens of protesters and law enforcement officers in Kiev by snipers, who are still unidentified, on February 20, 2014, has the EU decided to freeze assets of Yanukovych associates, while the USA expanded visa sanctions to 20 Ukrainian officials. Of course, the talk about sanctions from Western officials did produce pressure on pro-Yanukovych fraction of the Ukrainian ruling class, likely saving a large part of their assets in Western countries. Moreover, both the EU and the US de facto recognized the unconstitutional vote to remove Yanukovych from his seat on February 22, despite the president-opposition agreement, signed just one day before that. Nonetheless, the inconsistencies and contradictions in Western support of Maidan, cautiousness with sanctions, and skepticism toward the radical wing of the protesters do not fit the narrative about a purposeful Western-driven coup d'etat in Ukraine but rather point toward improvisation and adaptation of the EU and the US officials to the escalating developments in Ukraine, with them eventually seizing an opportunity to get a loyal government in Ukraine.

There are many reasons to call post-Maidan Ukraine a US client state (Dubovyk 2017). Although the famous "F...ck EU" conversation leaked in February 2014 between Victoria Nuland and the US ambassador in Ukraine, Geoffrey Pyatt is often overinterpreted by Maidan critics

as the process of "handpicking" the new Prime Minister Arsenii Yatseniuk rather than discussing the strengths and weaknesses of the opposition leaders (e.g., Pijl 2018, p. 69); he was indeed strongly supported by the USA. In 2014–2015 Geoffrey Pyatt and US Vice-President Joe Biden had a significant, however, informal influence on decision-making and appointing government cadre (de Ploeg 2017, p. 80). Rivaling Ukrainian politicians were typically seeking support from American officials. Western-educated professionals were allowed to join the new post-Maidan government even without Ukrainian citizenship in violation of the law (de Ploeg 2017, pp. 79–80), although not only to please Western governments and pro-Western NGOs but in order to "prove" some changes after the "revolution." Nevertheless, the nature of Ukrainian political regime did not change – it was still dominated by patronal pyramids of local yet competing "oligarchs" (around President Petro Poroshenko elected in May 2014 and his coalition partner People's Front party) – and did not correspond to the cartoonish image of a country ruled from Washington, D.C. When Western neoliberals in the governmental offices helped solve the crisis of representation and strengthen the legitimacy of the new ruling oligarchic groups, they were gradually replaced with people loyal to the dominant oligarchs. Despite strong Western backing, Yatseniuk was ultimately pushed to resign and replaced by a new Prime Minister Volodymyr Groysman, initially more loyal to Poroshenko and coming from the same provincial center of Vinnytsia. The interests of Ukrainian oligarchs and Western governments have clashed most directly around the issue of corruption as far as selective preferential treatment from the state is one of the major competitive advantages of domestic business against transnational capital. Despite the fact that a set of anti-corruption institutions was imposed via a "sandwich model" (Nitsova et al. 2018) – working as a combination of local (neo)liberal NGOs' proposals combined with efficient Western pressure on Ukrainian government due to its critical financial dependency on the IMF – their work has been effectively sabotaged by the government. The notorious

U

nationalist radicalization trends after 2014 were going against the interests of the West, for which they were only discrediting the idea of supporting Ukraine and helping destabilize its already weak state (Ishchenko 2018a). Instead it had much more to do with the ruling oligarchs' interests in splitting the opposition and conceding to the far right that contrary to a widespread denialism of pro-Ukrainian liberals is the segment within Ukraine's civil society with the largest mobilization resource (Ishchenko 2014b; 2018b).

Nevertheless, the argument for Western economic imperialism and an uneven mode of Ukraine's integration into the global capitalist system is sound. After Maidan's victory, the EU association agreement was signed. Poroshenko's administration, backed by the EU funded research, promoted the DCFTA as a treaty that would bring economic stability and prosperity to the country despite evidence from other EU states, and to this day the economic prognoses are not as optimistic (for the best critical analysis of the consequences of the DCFTA with the EU for Ukraine, see Kravchuk et al. 2016). The agreement endangers the most advanced sectors of Ukrainian industry that work primarily for Russian and other post-Soviet markets but are hardly competitive in the EU market and disrupts the import/export landscape with potentially catastrophic effects for relevant sectors. While the import-export landscape is changing, it is also closely intertwined with important partnerships both east and west. Deeper economic cooperation with the EU also means deindustrialization of Ukraine, growth in unemployment, and decrease in state budget income, making it even less possible for the state to invest in the modernization of the economy to improve competitiveness and even out increasing socioeconomic disparities. In the end, it means the integration of Ukraine as a peripheral economy of primarily raw material and cheap labor, moreover, without benefits of the EU membership. It has been estimated that the results of the agreement can also become catastrophic for the labor force of Ukraine, which already bears higher distributional consequences of the financial crisis fallout than in stronger economies (Onaran 2009).

The state of the economy is weakened by the consequences of the armed conflict and loss of industry in the east of Ukraine at the estimated cost of $7–8bl or some 6% of the GDP even by late 2014 (Havlik and Astrov 2014). Ongoing offshoring of profits is also an aggravating factor: according to the State Institute of Statistics, in the first 6 months of 2012, $5810.1 million from Ukraine ended up in offshore accounts of Cyprus alone. Offshoring of profits and recycling of capital continue tainting Ukraine's economy and effectively eroding its budgetary capacity (Antonyuk et al. 2018; Kravchuk 2015). For example, during 2015–2017 iron ore exports alone were under-invoiced by at least 20% – equivalent of a $520 million profit shifting offshore (Antonyuk et al. 2018, p. 21). This calculation indicates that if applied to "the whole of agricultural, iron ore and steel exports (~$14 billion), profit shifting of Ukraine's commodities could be at around $3 billion per year" – equivalent to the macroeconomic assistance Ukraine receives from the EU annually (Ibid). Ukraine's sovereignty is de facto being lost. Multiple dependencies and neoliberal kleptocracy have permeated Ukraine's social reality by manufacturing false consciousness (in a Marxist sense) that in its own turn destabilizes the country further and bears both disempowering and empowering potential for consolidation of a countermovement to the empire of capital.

In sum, although one cannot rule out Western imperialism as a factor of Ukrainian political crisis and especially its role in post-Maidan Ukraine, it is important not to exaggerate them, redefine what is meant by imperialism in the current context, and develop a more empirically based analysis. Transnational capital interests in Ukraine seem to be underestimated in comparison to NATO expansion – even if one is to consider NATO a military arm of Western imperialism – and geopolitical conflict with Russia, which is a point of contradiction even among Western states, elites, and class fractions. There is no sufficient evidence about consistent Western strategy of governmental change in Ukraine, while the role of classical democracy promotion mechanisms is overestimated. The combination of Western state power, power of

international (financial) institutions, embedded interests of transnational capital, and (geopolitical involvement of) NATO in an "accumulation strategy" with "a hegemonic project" (Jessop 1983) is a more convincing argumentation yet still requires a significant amount of conceptual nuance and empirical analysis. The West exploited the opportunity with Yanukovych's overthrow; however, the new oligarchic ruling elites in Ukraine have been capable of defending their interests rather efficiently, with only occasional lost cases, e.g., state takeover of Kolomoiskyi and Boholiubov's Privatbank (Olearchyk and Buckley 2016).

Russian Imperialism?

In case of Russian involvement in the Ukrainian crisis, the question is not about the scale and the strategy. The scale of Russian military intervention and support for Donbas separatists has been far greater than any NATO military support for Ukraine. As estimated in 2016, the USA had given Ukraine $3 bln in loan guarantees and $1.1 bln in nonlethal defense assistance (de Ploeg 2017, p. 224). Only since 2018 has the USA decided to start selling Javelin antitank missiles to Ukraine, although lethal weaponry supply from eastern European NATO countries, comprising of cache remnants from the Eastern bloc era, was likely and occasionally confirmed by Ukrainian officials (p. 225). Besides that, several hundred specialists from NATO countries have been deployed to train Ukrainian forces including radical nationalist volunteer units. In contrast, Russian intervention was not limited to the massive flow of nationalist volunteers to Donbas and a stable supply of weapons and specialists. After all, Russian regular forces have annexed Crimea and intervened directly, although covertly, into the fights with Ukrainian forces in the critical moments of 2014 and 2015 (Robinson 2016). DPR and LPR are fully dependent on Russian military and financial support, being de facto Russian puppet states, in contrast to the very uneasy relations between the US and Ukrainian oligarchs. Although the more aggressive actions of Russia primarily reflect "the necessities on the ground, as well as the larger importance

of the conflict to the Russian state" (de Ploeg 2017, p. 225).

The main question, however, is how to explain Russia's policy toward Ukraine and, particularly, whether "imperialism" is a good concept for this purpose. There are essentialist perspectives on Russian "imperialism" drawing it from some eternally expansionist drive of Russian foreign policy (e.g., Kushnir 2018). As March notes, "that the national interests of an ideological superpower (the USSR), the much smaller and weaker (geopolitically and economically) contemporary Russia and the Tsarist Empire can be reduced to fundamentally continuous great-powerness is more an act of faith rather than a serious analysis" (2018, p. 82). However, Marxist scholars have also hotly debated the concept of imperialism in relation to Russian policy toward Ukraine, attempting to put it in the framework of Russian post-Soviet capitalism. The discussion, nevertheless, has been rather scholastic so far and revolving around the question whether Russia is an imperialist state according to Lenin's theory of imperialism, which in itself is rather limited and needs clarifications and adaptations to the current conditions of analysis as we theoretically posit in this chapter.

Michael Pröbsting made, perhaps, the most systematic argument for Russia as an "emerging imperialist great power" (Pröbsting 2014a, b, 2016):

- Russia's economy is dominated by Russian not transnational financial-industrial groups with strong connection to the ruling elite that have monopoly position in the key sectors of the Russian economy.
- Russia's economy has grown during Putin's rule into a Top-10 world economy (as of GDP based of purchasing power parity). Besides, it has a relatively high ratio of the foreign exchange reserves in the foreign debt.
- Significant export of capital, particularly, to Third World countries.
- Russia is expanding its increasingly global political power (not only in post-Soviet space but also in the Middle East and Sub-Saharan Africa). It is a strong military power with the third military budget in the world.

- There are internal colonies in Russia and oppressed people that are, particularly, residing in the areas with rich deposits of crucial natural resources.
- Russia forms the Eurasian Union, delineates its "sphere of influence," and actively intervenes into the politics of its neighbors.
- Russia exploits migrant workers, primarily from Central Asia (8–10% of Russian labor force, which is a ratio close to some of the Western European states).

However, a number of Marxist scholars and activists criticized the thesis of Russia as an imperialist state (e.g., Buzgalin et al. 2016; Clarke and Annis 2016; Dzarasov 2016a; Smith 2018) pointing primarily to the relative weakness and structural deficiencies of Russian economy in comparison with imperialist states:

- In a global perspective, Russian corporations are only a tiny fraction among the top corporations across the globe. Russian banks and the financial sector are particularly weak. The key economic indicators – such as wealth, GDP per capita, and labor productivity – lag far behind all major Western imperialist nations.
- Russia is exporting primarily raw materials and importing high added-value products from the West.
- There is no basis to the argument that Russia suffers from overaccumulation of capital like the advanced economies of imperialist countries, which are seeking to subjugate foreign markets of semicolonial countries. Russia, just like other post-Soviet states, suffered primarily from underinvestment and capital flight. Russian capital is exported, first of all, to the West and offshores, while Russian investment to the Third World is a tiny fraction of the investment from Western capital. Even Russian investments into the post-Soviet countries and, particularly, Ukraine have not been particularly sizeable. According to Pröbsting's data, only 18% of Russian FDI went to the ex-USSR (non-Baltic) states in 2012 (5% to Ukraine), while

38% went to Western Europe (2016, pp. 99–100). Moreover, Ukrainian oligarchs were also investing into Russia on a significant scale.

As a result, these authors tend to see Russian actions in Ukraine primarily as defense against Western imperialist encroachment and/or as a conflict between two semi-peripheral states – Russia and Ukraine (e.g., Buzgalin et al. 2016). The later, however, ignores not only that Ukraine is incomparably weaker in military strength to a nuclear power. If Ukrainian oligarchs aim at best to get a role of an intermediate in Western imperialist exploitation of peripheralizing Ukraine, Russia aspires in this conflict to be recognized as a great power on a par with Western imperialist states.

Overall, the debate may easily end up in the "half-full or half-empty glass" discussion. The proponents of Russia as an imperialist country thesis can agree that Russian imperialism is significantly weaker than Western, yet it is advancing (unlike Ukraine), while escalating conflict with the Western imperialism imposes a strong imperative for economic development and modernization on Russia. A progressive development of this debate could lie in the direction of recognizing and analyzing the *variety* of imperialisms. Particularly, Lenin (2000 [1916]) already noted that Russian tsarist imperialism was "much more crude, medieval, economically backward, and militarily bureaucratic" compared to Western imperialisms; its contemporary version bears some of those features to this day. Pröbsting emphasizes the necessity to take economic, political, and military power of the states in totality to assess whether they are imperialist or semicolonial (2016, p. 96). One could argue that the Russian military-industrial complex, which is comparatively stronger than other sectors of Russian economy on the global scale, might be naturally interested in expansionist foreign policy. It is also noteworthy that anti-Western views are stronger among the so-called *siloviki* fraction in the Russian ruling elite (connected with security service, army, intelligence and other enforcement

institutions) (Strokan and Taylor 2018, p. 160). Besides, a critical engagement with a concept of sub-imperialism in relation to Russia can be fruitful, even though it was initially coined to explain the expansionism of some Latin American regional powers like Brazil (see Sotelo Valencia 2017). In this perspective, some states can fit all elements of Lenin's definition of imperialism without breaking the structural dependency of their peripheral economies from the core imperialist states.

Similarly to the criticisms of analyses of Western imperialism, one needs to take seriously the inconsistency and contradictions of Russian actions in Ukraine that too were partly caused by the ongoing conflict of interests between Russia's dominating ruling and capitalist blocs. For example, Russia annexed Crimea but only supported Donbas separatists to the extent of preventing their military defeat from Ukrainian forces. Some authors even advocated the idea of a "betrayal" by the Russian government of the "workers' revolt" in Donbas (Clarke 2016; Kagarlitsky 2016). Despite having the opportunity to do so, Russia neither annexed Donbas nor officially recognized the DPR and LPR nor did it attempt to take control of the Ukrainian southeast (so-called Novorossia) and instead signed the Minsk accords, presupposing the return of Donbas under Ukrainian control. The result is a suboptimal situation for Russia with a semi-frozen conflict in Donbas, two subsidized puppet states with an elderly population, and a radical shift in electoral geography of Ukraine where coming to power of a relatively pro-Russian president or political party (as in 1994 and 2010) has become highly unlikely (D'Anieri 2019). A possible explanation lies in contradictions between the more aggressive and anti-Western *siloviki* and the more cautious liberal fraction of Russian ruling class with assets in the Western countries, with Putin playing the role of an "arbiter" between them (Dzarasov 2016b).

Last but not least, a significant tendency among Western and Russian left of justifying Russian actions since 2014 as "defense" or even "defiance" of Western imperialism requires a critical commentary. Russian policies in Ukraine and also Syria were partially driven by domestic causes by boosting the legitimacy of the ruling bloc and marginalizing the opposition. Defending the interests of the Russian ruling class should not be confused with defending the Russian national interests, even when geopolitical leverage is used. It is particularly dubious for the left to accept the "counterrevolutionary" actions of the Russian government in defense of "legitimate" authoritarian regimes as something more justifiable than "revolutionary" democracy promotion by the Western imperialism. Besides, despite the weak economic basis, Putin is very explicit about his ambition of winning a seat at the table among the great powers in the "multipolar world" and of a recognition for Russia's "spheres of influence" – the areas where Russian interests will be assumed as prior to any other great power or that of a domestic government. Russia is challenging US and EU interests in particular areas of global politics, but it is not challenging the global imperialist structure, nor is it challenging its capitalist makeup from which Russia and its oligarchs directly benefit.

Concluding Remarks

The combination of neoliberal marketization and a politically empowered kleptocratic internally heterogeneous ruling bloc of Ukraine has created a combustive atmosphere within the country, which has not gone away with Yanukovych's escape. Instead, the rule of neoliberal kleptocrats entrenched even deeper. Neither political consensus nor hegemonic order has been achieved by competing oligarchic groups. The war in Ukraine's east now serves as legitimation for further antisocial austerity reforms that will further untie the hands of oligarchs while keeping the IMF and the EU satisfied. All this comes at the expense of further state dependence on foreign debt, thus effectively making Ukrainian government more susceptible to external meddling in domestic policy-making in addition to making the economy increasingly vulnerable, more fragile under the wheels of the empire of

U

capital. Volodymyr Zelenskyi who defeated Petro Poroshenko in the presidential election of 2019 is unlikely to question either the neoliberal policy agenda, or reduce Ukraine's Western dependeny - debt, economic or geopolitical.

Amidst the information warfare around the crisis in Ukraine in which "anti-imperialist" arguments are employed one-siddly only against either the West or Russia, the clash of imperialisms thesis could be the most promising and balanced theoretical framework for analyzing international dimension of the conflict in Ukraine. However, it requires certain important elucidations. First, revisiting of the classical Marxist analysis of competing rival imperialisms is needed to overcome the tendency in the recent Marxist theorizing about imperialism analyzing it as singular and effectively equating "the" imperialism with American imperialism (Stathakis 2008), while their limitations – contemporary and in the current context – must be carefully studied. Second, the global empire of capital operates through an increasingly complex system of local, national, and international institutions with overlapping jurisdictions and is driven by competing imperialisms. Thence, specifying and analyzing the contradictions within each imperialist camp (between the USA and the EU, between various fractions of US and Russian ruling class, transnationally oriented and not) is necessary to understand inconsistencies of real imperialist policies. Third, the nature, structure, and institutional power contestations of the capitalist class and its fractions in the conditions of neoliberal transnational capitalism globally must be acknowledged. Transnational capital is increasingly emboldened, legally protected, and freed from state oversight, while labor is increasingly disempowered, dispossessed, and surveilled. Thus, geographies across which class struggles unfold are fundamentally different today than at the time when classical texts where written. And fourth, dialectical causal mechanisms and connections between the ruling class/elite interests and aggressive foreign policy actions must be specified. It is important to build a "new imperialism" theory on classical imperialism theories as they are indispensable (for arguments on Lenin see: Michael-Matsas 2008 and elsewhere in this volume), and it is equally

important to understand their limitations and that the material reality – economic and institutional – has drastically changed (Wood 2005; Harvey 2007, p. 57). Crucially, Harvey stressed that Bukharin, Lenin, Luxemburg, and Kautsky's theorisations were not fully suitable for their time either and engaged instead in "bickering" that was partly due to their "fundamentally different political positions" over the necessary course of action and over "a theoretical failure to find a way to deal with the spatiotemporal dynamics that had long been constructing a global imperialist system" that over the twentieth century produced "the very conditions that Wood describes [in her book *Empire of Capital*]." This system has its (weakening) hegemon, i.e., the USA; its "benevolent empire" at home and abroad, i.e., the EU; and the strengthening rivals, i.e., Russia and China, who have their satellites and occasionally changing allies and whose spheres of interest overlap, sometimes with enough significance for armed conflicts to unravel. Each imperialism has its own idiosyncrasies conditioned by its own historically shaped circumstance and future trajectories determined by the dialectic of social forces and their material conditions. There is one thing that the competing imperialisms and their executing state-society complexes of today have in common: they all peddle variations of neoliberal capitalist system and thus all contribute to the survival of the global empire of capital. Rivalries between Western, eastern, and domestic forces in the process of capital accumulation and its geopolitical expressions are shaping the future of Ukraine and the rest of the post-Soviet states for the years to come.

Synonyms

Balance of emissions embodied in trade; Dark value transfer; Ecologically unequal exchange; Environmental load displacement; Imperialism of trade; Nonequivalent exchange; Physical trade balance

Definition

In the strict sense, an exchange where prices are determined by a rate of profit that tends toward international equalization (mobile capital) and wage rates (or some other factor price) that allow for significant international inequalization (immobile labour), suggested as a theory to explain the evolution in the terms of trade between developed and developing countries in the century after 1870; more generally, an exchange of nonequivalent quantities of value, often expressed in terms of labor values or environmental factors such as land, energy, raw material equivalents, virtual water, emissions embedded in trade, etc., independently of whether they result from differences in population density, affluence, technological efficiency, etc.

The term 'unequal exchange' became widespread in the 1960s and 1970s through Marxist debate on underdeveloped countries and their falling terms of trade. The source and centre of the debate was the Greco-French economist Arghiri Emmanuel, the English translation of whose work described it as 'the imperialism of trade' (Emmanuel 1972a). The terms of trade were central to this kind of imperialism, in contrast to the export of capital in classical Marxist analyses, or the transfers of profit by multinationals underlined within monopoly capitalist and dependency traditions – the 'old imperialism' decried in Truman's Point Four programme.

Emmanuel's theory stated, contrary to the assumptions of the by then conventional Heckscher-Ohlin theory and its recent reformulation by Samuelson, that relative prices depended on wages, not the other way around; and that, contrary to the assumptions of Ricardo's comparative costs, first, labour was sufficiently immobile to allow for significant wage-disparities between countries, and, second, that capital was internationally mobile and tended towards equalisation.

Theoretical novelty apart, controversy was occasioned by the implications for international worker solidarity. In terms of Johan Galtung's (1971: 83) structural theory of imperialism, which it may well have inspired, the equalisation of the rate of profit and non-equalisation of wages translates into a 'harmony of interest' among capitalists and a 'conflict of interest' among centre and periphery workers. The conventional explanation, then and since, of the commonly observed absence of worker solidarity was that a 'labor aristocracy' section of the working class, perhaps even whole nations, had been 'bribed' by capital. Emmanuel, by contrast, made the nationally enclosed workers movements into the principal *cause* of unequal exchange.

Immediately upon publication, there was an avalanche of attempts to reintegrate unequal exchange with more conventional Marxist and monopoly interpretations as a subcategory of a more general inequality in terms of labour transfers, starting with Bettelheim (1962, 1972), but repeated *ad nauseam* in the ensuing debates, and expressed as a difference between labour values and prices of production. The idea that different capital-intensities engender transfers of labour values is an established idea within Marxism. In addressing 'the question of nationalities' in 1907, Otto Bauer (2000) found that the more capital-intense German regions appropriated value from the less capital-intense Czech ones of the Hapsburg Empire. With the break-up of the Empire, by the time of the second edition in 1921, this unwittingly transformed into an *international* rate of profit and transfer of value. Bauer greatly influenced both Evgenii Preobrazhensky's (1965) model of Soviet industrialisation by extracting

surplus through domestic unequal exchange with the peasantry, and Henryk Grossmann's (1967) model where the international equalisation of profits entails an unequal exchange between Asia and Europe helping to offset the fall in the rate of profit. While Emmanuel did not consider these value transfers due to capital-intensities to represent unequal exchange, he did adopt the notion of internationally mobile capital. By contrast, the monopoly and dependency tradition (Sweezy, Baran, Frank; Bettelheim was a notable exception) was highly dismissive of an internationally equalised rate of profit and of international trade as a means of exploitation and transfer. Marxists in general considered interest in the relative prices of goods to be superficial 'circulationism' or commodity fetishism compared to the really heavy stuff such as production, multinationals, and the export of capital (Andersson 1972; Brewer 1990; Brolin 2006a: chs 2, 6; 2006b: chs 5–7, 12; Emmanuel 1972a: 94f; 1972b; Howard and King 1989, 1992).

Indeed, every subsequent alternative formulation to Emmanuel (e.g. Amin 1973, 1974; Andersson 1972, 1976; Braun 1977; Delarue 1973, 1975a, b; Gibson 1977, 1980; Marini 1973, 1978), and almost every critic since Bettelheim (1972), have abandoned wages as the independent variable, preferring to make higher productivity the cause (and thereby justification) of higher wages, and/or 'monopolies' the cause of unequal exchange. Having reviewed many of these (Brolin 2006a, b; Evans 1984; Mainwaring 1980, 1991), it is easy to agree with Koont (1987: 10) that: 'It would be desirable to extricate the concept of unequal exchange from the morass it has sunk into on the terrain of value transfers'. Unfortunately, this is not the path taken in the currently more vociferous ecological revival of unequal exchange, where the transfer of labour is simply supplanted or complemented by transfers of land.

Paradigmatically originating in urban–rural exchange, the idea that exchange of primary products for manufactures is disadvantageous was probably hoary with age already when mercantilists, protectionists, neo-mercantilists, import-substitutionists, and so on made it a cornerstone

of their policy recommendations. It was inherent to the original formulation of the Singer-Prebisch thesis. With its focus on the inherently immobile land factor, ecological criticism of industrial civilisation and globalisation has long demonstrated a certain anti-trade bias (Bramwell 1989: 17). Attempted integration with a critique of world poverty in the post-war era shifted emphasis from overpopulation to inequality, notably in 'centre- periphery' trade of industrial for primary products. Thus, Borgström (1972: 76–83) estimated how Europe imported huge 'ghost acreages' mainly through its overseas trade with European settlements; although focusing on Latin America he chose to see such exports as characterising underdeveloped countries (Brolin 2006a: 280). (Emphasising differently, Hardin [1993] similarly found no net imports into the US.) Borgström's idea of phantom or appropriated carrying capacity was renamed 'ecological footprint' by Rees (1992) under which name it has since become trademarked and calculations made opaque (Brolin 2006a: 285–297). Studies of the British industrial revolution have observed both the 'fossil acreage' (Catton 1982) added by the coal industry (Sieferle 2001; Wrigley 1988: 54f), and in colonial sugar and cotton imports (Pomeranz 2000: 274ff., 313ff.), arguing for their crucial importance in relieving industrial Britain's land constraints (for criticism, see Brenner and Isett 2002; Wrigley 2006). Translating point source fuels and minerals into areal units appears to constrain ecologist historical understanding of industrial civilisation. The identification of raw materials exporting peripheries with exploitation and underdevelopment is the central tenet of ecological unequal exchange (e.g. Bunker 1984, 1985; Cabeza-Gutés and Martinez-Alier 2001; Foster and Holleman 2014; Hornborg 1998, 2009; Martinez-Alier 2002; Odum 1971, 1996; Odum and Odum 1981), not worrying about contradictory North American, Australasian, or Scandinavian examples in the past (Katzman 1987), or, indeed, even the whole world until the post-war consumer society definitely tipped the scale (Bairoch 1993; Brolin 2006a). This disregard for falsifying economies that are both exporters *and* intensive consumers of

energy signals a possible inability to account also for this consumer society.

Thus, where the standard Marxist interpretation speaks of unequal, or non-equivalent, exchange as a net transfer of labour or labour values, ecological unequal exchange is commonly defined in terms of a net transfer of land or land values (natural resources, ecological footprints, energy, or elaborations thereof such as 'exergy' or 'emergy'). Both of these currently popular usages of unequal exchange are highly problematic, and this is what has occasioned me (Brolin 2006a) to try to revive interest in Emmanuel's original theory as well as Lewis's almost wholly neglected one.

While not an accepted concept in mainstream economics, these and other approaches to unequal exchange can be illustrated by reference to traditional Heckscher-Ohlin trade theory based on productive-factor endowments. From this perspective, net transfers of *labour* simply result from exchange between relatively labour-rich (capital and land-poor) regions and labour-scarce (capital-rich and land-rich) regions. Net transfers of *land,* on the other hand, result from exchange between relatively land-abundant (labourscarce and capital-scarce) regions and landscarce (capital-rich and labour-rich) regions. For example, looking at the epoch for which it was conceived (the 19th and early 20th centuries), according to Heckscher-Ohlin theory, we should expect a net transfer of land incorporated in goods exported from relatively land-rich regions, such as Australasia, North and Latin America, to relatively land-scarce (Western) Europe, or conversely net transfers of labour incorporated in goods exported from Europe to the New Worlds. Labour or land inequalities would seem to exhaust almost all of the current literature and debate on unequal exchange/ecological unequal exchange. For the sake of completeness, however, although no such formulation of unequal exchange as yet exists, a net transfer of *capital* results from exchange between relatively capital abundant (labour-scarce and land-scarce) regions, and capital-poor (labour-rich and land-rich) regions. The same would be true for other possible factors, such as knowledge or skilled labour.

In theory, inequality in terms of one factor should be compensated for by inequalities of the others in ways that possibly benefit all participants and increase overall output. That is, however, given that there are no monopolistic distortions on either goods or, especially, factors markets, which brings us to a fundamentally different approach to unequal exchange.

The point of Heckscher-Ohlin is of course to argue that immobility on the factors market can be compensated for by trade in the goods produced by these factors. Even from this perspective, however, it can be admitted (Williamson 2002) that the indirect equalisation of factor remuneration via trade in goods is less efficient than the direct equalisation that would result if, parallel to the free international market for goods, there were an equally free and internationally competitive market for factors. The divergence from this hypothetical 'normal' state, due to monopolistic and other 'institutional' distortions on the factors market, is what constitutes unequal exchange according to Lewis (1954, 1969, 1978a, b) and Emmanuel (1962: 22; 1972a: 64; 1976b: 264; Latouche 1977: 240f).

If unequal exchange in the first view is part of the normal workings of any conceivable economy and not evidently detrimental (on the contrary, commonly beneficial in increasing overall output), unequal exchange in the second view is an aberration from the 'normal' workings and very much detrimental (cf. Bettelheim [1962] on unequal exchange in the 'broad' and 'narrow' senses; Emmanuel [1972a] on 'broad' and 'strict' senses; Brolin [2006a] on 'non-equivalent' and 'unequal' exchange). Similarly, Adam Smith noted how towns gained from monopolising both labour (through guild regulations) and land (through the better access to communications conferred by its location at junctions), occasioning an 'artificial advantage' in exchange with the country that gave townspeople a greater share of the annual produce of society than would otherwise fall to them (Smith 1937: 124f; cf. Andersson 1976: 39; Brolin 2006a: 36f; Raffer 1987: 14).

In the Marxist or ecologist literature on net transfers, it is mainly by denying that one or other of the productive factors (read 'capital') is

really productive that unequal exchange is found, and not always even then. Even when a net transfer of land or labour is found, it is not evident why this in itself should be something bad for the exporter; for example blocking its economic development and/or being detrimental to its ecology. Apart from its questionable explanatory value, approaching unequal exchange from the perspective of net transfers, as is now the case (whether in terms of land, labour, or both), is desperately incomplete, always verging on irrelevance since any true estimate of inequality would have to be made in the composite land-labour-capital-etc. factor, rather than to the exclusion of any particular one (read capital). This point was made by Emmanuel early in the unequal exchange debate.

While Emmanuel (1972a: xxxi) occasionally spoke carelessly of how low-wage countries exchange 'a larger amount of their national labour for a smaller amount of foreign labor', he (1972a: 325) then clarified: 'Since equivalence in capitalist production relations signifies not the exchange of equal quantities of labor, but that of equal aggregates of factors ([e.g.] labor and capital), nonequivalence (unequal exchange) can only signify the exchange of unequal aggregates of these same factors'. Attempts at measuring such aggregates would have to face problems of the incommensurability of its component parts, as well as the conclusions reached in the, so called, 'capital controversies' of the 1960s and 1970s. More precisely, for Emmanuel (1972a: 1f), then, 'the exchange of commodities represents, in the last analysis, an exchange of factors, that is, an exchange of claims [Fr. *droit*] to a primary share in the economic product of society'. Speaking of claims underlines the meaningful part of classical, Marxist, Sraffian, or other so called 'objective' price theories in pointing towards an underlying *social* reality, distributional conflicts, as opposed to the transfer of metaphysical entities embodied in goods: 'Now, as with all economic phenomena, unequal exchange reflects relations among people, in no way relations between things – in the present case the relations of underdeveloped man with developed man' (Emmanuel 1962: 12, my translation). The anomaly of falling terms of trade,

as it was first believed for raw materials, revealed, as it turned out, an underlying social inequality.

The Terms-of-Trade Debate

Development economics emerged as a clearly defined academic subdiscipline only in the early post-war period, very much on the fringe of economic orthodoxy and much more tolerant of radical political suggestions (such as land reform, state control, or even socialism) as necessary preconditions for economic development. One of the most hotly debated issues, and an important origin of unequal exchange theory, was the terms-of-trade debate, or the Singer-Prebisch thesis. Inspired by Amin (1974), Love (1980) even calls Prebisch *the* originator of the debate on unequal exchange but the sense in which this could be true is questionable. This is partly because Love underrates Singer, who made the substantial contribution with respect to the terms-of-trade debate (Toye and Toye 2003), and partly because the only other sense in which 'the' debate on unequal exchange originated would have to have been with Emmanuel (1962, 1972a).

Based on former studies by the League of Nations and Schlote, Singer concluded that average prices of primary commodities relative to manufactured goods had been declining over a period of more than half a century, the relative prices of primary goods deteriorating by about one-third since the 1870s and somewhat less than 30 per cent since 1913 (UN 1949: 23). Schlote's data for the United Kingdom went further back, and the trend up to the 1870s showed, by contrast, a marked increase for the goods imported over those exported. This shift in the trend went counter to the general assertion among classical economists, apparently correct at the time, that the development of productive forces in manufactures and the limited expansive possibilities of raw materials and 'land', would ensure that the terms of trade change in favour of the latter (Findlay 1987: 626).

Now, as evidenced by the rising standards of living in industrialised countries from 1870, there was 'little doubt that productivity increased faster

U

in the industrialized countries than in primary production in underdeveloped countries', Singer explained (UN 1949: 126). 'Hence, the changes observed in terms of trade do not mean that increased productivity in primary production was passed on to industrialized countries; on the contrary, they mean that the underdeveloped countries helped to maintain, in the prices which they paid for their imported manufactures relative to those which they obtained for their own primary products, a rising standard of living in the industrialized countries, without receiving, in the price of their own products, a corresponding equivalent contribution towards their own standards of living' (ibid.).

If there is any single origin for the post-war debate on 'unequal exchange' in Love's (1980) more general sense, this conclusion is a good candidate. It was the report's most controversial implication, in line with Singer's (1949: 2f) slightly earlier recognition that the Marxist view of how rising standards of living for certain groups coincide with general deterioration and impoverishment was much truer for the international scene than for the domestic. Singer's 'clear message of historical injustice' was 'very shortly to be rejected by the subcommission' (Toye and Toye 2003: 450). It was, in fact, the reason why Prebisch avoided the general fate of UN authors to remain anonymous (Toye and Toye: 456f).

Prebisch quoted both Singer's data and his conclusion (ECLA 1950: 10, n. 3) to make the same point, adding only the 'centre-periphery' terminology. Technical progress had been greater in industry than in the primary production of peripheral countries: 'Consequently, if prices had been reduced in proportion to increasing productivity, the reduction should have been less in the case of primary products than in that of manufactures, so that as the disparity between productivities increased, the price relationship between the two should have shown a steady improvement in favour of the countries of the periphery' (ECLA 1950: 8), which would have distributed the benefits of technical progress alike throughout the world. Since the ratio actually had moved against primary products, centre incomes must have increased more than productivity: 'In other

words, while the centers kept the whole benefit of the technical development of their industries, the peripheral countries transferred to them a share of the fruits of their own technical progress' (ECLA 1950: 10). Singer (1950) reiterated these arguments in the context of possible disadvantages in receiving foreign investments that reinforced specialisation on the export of food and raw materials, and the advantages for investing countries in increased dynamism and lower prices of imports, concluding: 'The industrialized countries have had the best of both worlds, both as consumers of primary commodities and as producers of manufactured articles, whereas the underdeveloped countries had the worst of both worlds, as consumers of manufactures and as producers of raw materials. This is perhaps the legitimate germ of truth in the charge that foreign investment of the traditional type formed part of a system of 'economic imperialism' and of 'exploitation' (Singer 1950: 479f).

The most obvious empirical objection in the ensuing debate struck at the identification of primary/agricultural production with underdevelopment or backwardness. Viner (1952: 61ff) pointed to the numerous exceptions to this alleged rule: Denmark exporting butter and bacon; New Zealand exporting lamb, wool, and butter; Australia exporting wool and wheat; similarly with California, Iowa, Nebraska, and so on. Looking at Italy and Spain, neither was it evident that industrialisation was synonymous with prosperity. The problem in poor countries was not to be found in agriculture as such, or in the lack of manufactures as such, but in underdeveloped agriculture and underdeveloped industry. The large share of primary production was not a cause of poverty, but merely an associative characteristic of poverty and low agricultural productivity (Viner 1952: 50).

In fact, Singer himself had already noted as a major limitation of his UN study that it was based on price relations between primary commodities, which formed the major export articles of underdeveloped countries, and manufactured goods (specifically capital goods) which formed an important part of their imports. 'It may, however, be very misleading to conclude that changes in

total terms of trade as they affect under-developed countries follow directly from changes in price relations between these major classes of commodities. In particular, the high prices of food imported into under-developed countries must be considered before conclusions are drawn from simple changes in price relations between primary and manufactured goods' (UN 1949: 4).

The most significant contribution to the debates was made by Kindleberger (1956), concluding that there was no long-run tendency for the terms of trade to move against primary products as such (exemplifying North American wheat or Swedish timber), particularly allowing for changes in quality of manufactures. By contrast, the terms of trade ran heavily against underdeveloped countries. Since productivity presumably had increased more in industry than in agriculture, and obviously more in the developed than in the underdeveloped countries, if the commodity terms of trade ran in favour of developed and against underdeveloped countries, the double factoral terms of trade had done so still more (Kindleberger 1956: 240). That deteriorating commodity terms of trade suggested a more important deterioration in the double factoral terms of trade was of course the point all along. However, as observed by Streeten (1982: 8), the debate had been shunted onto the wrong track by disputing the historical evolution of the actual terms of trade, since the relevant issue was not what the terms of trade were compared to what they had been, but what they were compared to what they should have been.

The Singer-Prebisch theorem involved a renaissance for the age-old mercantilist belief in a 'fundamental inferiority of trade in basic produce as compared with trade in manufactures', later to re-emerge also with ecological unequal exchange. However, replying to Kindleberger's criticism, Singer (1958: 87f) himself largely abandoned this conception in favour of the idea that it was instead the terms of trade of developing countries as such that were deteriorating, whether they produce raw materials or manufactures. 'Singer I assumed the central peripheral relationship to reside in the characteristics of different types of *commodities,* i.e. modern manufactures versus primary commodities. Singer II now feels that the essence of the relationship lies in the different types of countries' (Singer 1974–75: 59). Recollecting the early years, Singer (1984: 292f) wrote of the 'point first made by Charles Kindleberger, that the tendency toward deterioration is more a matter of the characteristics of different countries than of different commodities', dubbing it the 'Kindleberger effect' as supplementing the 'Prebisch-Singer effect.'

According to Singer (1987: 627) the latter was originally explained by differing elasticities for primary products and manufactures (1 and 2), or disproportionate factor incomes in manufacturing (3 and 4): (1) a drop in the price of primary inputs will only mean a proportionately smaller drop in the price of the finished product and no great effect in demand can be expected; (2) demand for primary products is bound to expand less than demand for manufactured products, partly because as incomes rise a smaller share will be spent on agricultural products, partly because of the development of synthetic sub-statutes for primary commodities; (3) monopolistic profits of multinationals in addition to higher prices charged for innovations; (4) both labour and commodity markets are more organised in industrial countries, with trade unions, monopolistic firms and producers' organisations ensuring that 'the results of technical progress and increased productivity are largely absorbed in higher factor incomes rather than lower prices for the consumers' (Singer 1987: 627), whereas in underdeveloped countries increased productivity is likely to show up in lower prices, benefiting the overseas consumer rather than the domestic producer.

Interestingly, Kindleberger (1943a, b) had himself invoked 'Engel's law' of demand to explain why the terms of trade would inexorably move against raw material countries as the world's standard of living increased, arguing for industrialisation based both on the differing elasticities of demand for primary and manufactured products, and on the special institutional organisation of production in industry – arguments with which Prebisch (Love 1994: 421) and possibly Singer were both familiar. Now, however, Kindleberger (1956: 247) observed contradictions

U

between the argument from elasticities and that from organisation of factors, concluding that the latter were supererogatory: 'If it can be conclusively established that the elasticities facing the underdeveloped countries are lower than those facing the developed, there is no lack of forces to explain why the terms of trade work as they do'. Emmanuel (1972a: 82) agreed that 'it is hard to see what a more dynamic posture of the factors could do in the face of a defective structure of external demand, if it is really demand that determines prices'. This led Prebisch ultimately into circular reasoning, 'taking wages sometimes as cause and sometimes as effect': 'Prebisch is looking for a cause for a certain evolution of world prices. He thinks he has found this in a certain evolution of wages, which is in turn conditioned by a certain evolution of productivity. Now, productivity can in no case affect wages except *through prices*' (Emmanuel 1972a: 87).

Of course, Emmanuel's (1972a: 172) declared objective was precisely to challenge the view that demand determined prices and prices wages, following the lead of Arthur Lewis who in 1954 had argued 'that in the long run in the less developed countries (LDCs) it is the factoral terms of trade that determine the commodity terms of trade, and not the other way around' (Lewis 1984: 124f).

Unequal Exchange between Temperate and Tropical Sections of the Dual World Labour Market

In spite of Lewis's 1954 article on the 'unlimited supplies of labor' being 'widely regarded as the single most influential contribution to the establishment of development economics as an academic discipline' (Kirkpatrick and Barrientos 2004: 679), his 'open' model explaining the terms of trade has been largely neglected. This contrasts with the stir created by both Singer-Prebisch and Emmanuel.

In Lewis's (1954, 1969, 1978a, b) basic model, 'unlimited supplies of labor' from the non-capitalist sector ensures that wages are kept down also in the capitalist sector, where profits are thus increased and investments can proceed at

an increased pace. Wages in the non-capitalist sector are basically set by the level of productivity in subsistence agriculture. So far as it concerns the terms of trade, his theory is this: productivities in subsistence agriculture determine the wage differential between the world's two large groups of migrants in the 19th and early 20th centuries, from Europe to temperate regions of settlement, and from China and India to tropical regions, which roughly correspond to the developed and underdeveloped world respectively, and are in turn kept separate by monopolisation of the high-wage labour market. With the wage level fixed or determined 'from the outside', an increase in productivity for tropical exports can only decrease unit prices, thereby explaining, in Lewis's mind, the terms of trade.

Asking why someone growing cocoa earns one-tenth of the income earned by someone making steel ingots, Lewis abandoned the conventional argument based on the relative marginal utilities of cocoa and steel. Since Lewis's model assumes the alternative option of growing food for subsistence, people's 'relative incomes are determined by their relative productivities in growing food; and the relative prices of steel and cocoa are determined by these relative incomes and by productivities in steel and cocoa' (Lewis 1969: 17). Demand was important in the short run, but the long-term determinants were the conditions of supply.

Lewis (1954, 1969) assumed a temperate country producing three units of steel and food respectively, and a tropical country producing one unit of rubber (or coffee) and food respectively. Accordingly, the commodity terms of trade were 1 steel = 1 food = 1 rubber (coffee), while the factoral terms of trade determined by relative productivities in food were 1 temperate wage = 3 tropical wages. Now, if productivity tripled in rubber (coffee) this would be excellent for temperate workers (as consumers), since then 1 steel = 3 rubber (coffee), whereas it would do tropical workers in either line of production 'no good whatsoever' (except as consumers of rubber/coffee) since their wages would continue to be determined by food productivity. If, on the other hand, tropical food productivity were to

triple, then tropical wages would rise correspondingly in both food and rubber (coffee) production, equalising the factoral terms of trade, and ameliorating the commodity terms of trade so that 1 coffee = 3 steel. Thus, temperate workers were better off if productivity increased in what they buy, and worse off if it increased in the tropical food sector. Tropical workers 'are benefited only if productivity increases in their subsistence sector; all other increases in productivity are lost in the terms of trade' (Lewis 1954: 183).

This gave Lewis the key to why tropical produce was so cheap, even in cases such as the sugar industry, where productivity was very high by any biological standard, and had been advancing by leaps and bounds, trebling over the 75 years preceding 1954, outdoing anything comparable in the wheat industry. And yet workers in the sugar industry continued to walk barefooted and to live in shacks, while workers in wheat enjoyed among the highest living standards in the world: 'The reason is that wages in the sugar industry are related to the fact that the subsistence sectors of tropical economies are able to release however many workers the sugar industry may want, at wages which are low, because tropical food production per head is low. However vastly productive the sugar industry may become, the benefit accrues chiefly to industrial purchasers in the form of lower prices for sugar' (Lewis 1954: 183).

The capitalists did not enter the argument, Lewis explained in parenthesis, 'because their earnings are determined ... by the general rate of profit on capital' (Lewis 1954: 183). This (necessary) assumption, vaguely made in passing, of a uniform rate of profit between the countries, was what Emmanuel found most revolutionary. *Somebody* had to benefit from the low wages, Emmanuel (1972a: 89) noted, and this could only be the capitalist (as in Lewis's closed model) or the consumer: 'If it is the capitalist, there may perhaps be exploitation or bad distribution within the nation, but there is no unequal exchange on the international plane. If it is the (foreign) consumer, we have plundering of some nations by others. If the capitalist cannot benefit by it (at least not in the long run), owing to competition of capital and the equalization of

profits, only the consumer is left, and for him to benefit it is necessary that prices fall'. Apart from this vagueness, Emmanuel found nothing to be said against Lewis's model, except that assuming the presence of a self-subsistence sector made it too restricted to serve as a general theory.

In fact, Lewis did not have just any subsistence agriculture in mind, but based his model on the historical example of the first global century before 1913, which saw the emergence of 'the new international order', as he termed it. Lewis's explanation is based on extending his model of unlimited supply of labour to the whole world, and on the politically enforced creation of a dual world labour market, based on farm productivity in Europe and Asia respectively. 'The development of the agricultural countries in the second half of the nineteenth century was promoted by two vast streams of international migration', about 50 or 60 million people leaving Europe for the temperate settlements (USA, Canada, Argentina, Chile, Australia, New Zealand, and South Africa), and about the same number leaving India and China for tropical plantations, mines, or construction projects, largely as indentured labourers (cf. Williamson 2002: 21ff): 'The availability of these two streams set the terms of trade for tropical and temperate agricultural commodities, respectively. For temperate commodities the market forces set prices that could attract European migrants, while for tropical commodities they set prices that would sustain indentured Indians' (Lewis 1978b: 14). The Asians 'came from countries with low agricultural productivity, and were willing to work for a shilling a day or less', whereas Europeans 'expected wages in excess of those earned in Europe', where farm productivity was several times higher than in Asia (Lewis 1978a: 158).

The similar difference between European and tropical wage and agricultural productivity levels suggested a causal relationship. If agricultural output per man was six or seven times greater in Britain, the largest source of European migrants, and even more in the US, the largest recipient of European migrants, than in tropical agriculture, similarly, in the 1880s, the wage of an unskilled construction worker in Australia was nine

shillings a day, compared to the wage of a plantation labourer at one shilling a day (Lewis 1978b: 14ff).

This aspect of his argument is not the most convincing, unnecessarily restricting his theory and neglecting institutional differences that may similarly influence both productivity and wage levels. Lewis *did* mention several such influences, for example the interest of capitalists in certain colonial or imperialist policies directed against increasing productivity of the subsistence workers and thereby wages (Lewis 1954: 149). Thus, plantation owners had no interest in seeing knowledge of techniques or seeds spread to peasants, turned peasants off their lands, opposed land settlement, and would use their influence in government to the same effect. 'Imperialists invest capital and hire workers; it is to their advantage to keep wages low, and even in those cases where they do not actually go out of their way to impoverish the subsistence economy, they will at least very seldom be found doing anything to make it more productive. In actual fact the record of every imperial power in Africa in modern times is one of impoverishing the subsistence economy, either by taking away the people's land, or by demanding forced labor in the capitalist sector, or by imposing taxes to drive people to work for capitalist employers' (Lewis 1954: 149). Nevertheless, if capitalists did not enter his formal argument, neither did landlords, in spite of the prime importance of rents (together with wages) in the distribution of income in the first, although not the second, global century, and despite the various institutional settings and property relations in land necessary for his model to function as predicted. Thus, if land in the temperate settlements was free and abundant, this was an endowment that was partly an institutional or political artefact: 'In many cases the land was sparsely occupied by native peoples (Indians in the Americas, aboriginal Australians, African tribes). There was no hesitation in making war on these peoples, killing them off, or confining them to reservations, so that large acreages could pass into European farming' (Lewis 1978a: 183). Conversely, landownership in tropical regions was more concentrated, even becoming so by long-

term improvement in terms of trade together with short-term fluctuations (Williamson 2011), and could, if necessary, 'populate' them with slaves or indentured labour (Engerman and Sokoloff 1997). In fact, monopolistic concentration of landownership, supported by systems of labour control, will in itself result in, on the one hand, monopsony on the rural labour market and consequent lower wages (so to speak, *creating* unlimited supplies of labour) and, on the other, lower agricultural productivity (of both land and labour) (Griffin et al. 2002).

A crucial point of Lewis's argument, however, is the creation and maintenance of two distinct labour markets, which in turn set the prices of their respective exports, further offering temperate settlements highly divergent prospects from those of the tropics (Lewis 1978a: 158). From the high temperate income per head there came immediately a large demand for manufactures, opportunities for import substitution and rapid urbanisation, large domestic savings per head, with money available to spend on all levels of education, soon creating their own power centres and managerial and administrative élites, independent of and sometimes hostile to the imperial power long before formal independence. Thus, while the 'factoral terms available to them offered the opportunity for full development in every sense of the word', those available to the tropics 'offered the opportunity to stay poor . . . at any rate until such time as the labour reservoirs of India and China might be exhausted' (Lewis 1978a: 192). This was well understood by the working classes in the temperate settlements themselves, including the US, who 'were always adamantly opposed to Indian or Chinese immigration into their countries because they realised that, if unchecked, it must drive wages down close to Indian and Chinese levels' (Lewis 1978a: 192).

Obviously, no-one believes that Indians and Chinese would actually have preferred to move to horrific labour conditions in tropical areas, rather than to what has been called the 'workers' paradises' of temperate areas, had they had the choice. This is a fairly well-known, if unattractive, story of anti-immigration policy, surging with the welfare state and labour organizing against both

local capital and international low-wage competition. Economic recession and unemployment inspired protectionism, social policies and anti-Asian sentiments. Pre-First World War Australia was a pioneer in protecting itself from the flux of workers from Asia and the poorer regions of Europe, starting with Victoria State in the mid-1850s, the first restrictions on immigration appearing in the 1880s, and a federal-level European language test established in 1902, on the instigation of the Australian Labour Party. Restrictions were extended in the inter-war years to promote British settlers and hinder non-Britons, refusing entrance on national, racial, or occupational grounds. New Zealand followed suit already in the 1880s and 1890s; in the four decades from the 1880s to the 1920s, the Chinese population of Oceania actually decreased, while South Africa took measures against Indians and Chinese in 1913. The first restraints in the US were imposed with various Chinese Exclusion Acts from the 1880s onwards, and from 1917 Chinese were simply refused entrance. In the 1920s, a system including several European countries was instigated with quotas for each country of origin of a few per cent of the number having immigrated until 1910 or 1890. Immigration sank drastically in every decade, with new minimums following new restrictions in the depression years. Canada followed its big American brother from the early 1900s, notably Asians in the 1920s and Southern and Eastern Europeans in the 1930s, while at the same time encouraging Britons. Pioneered in the countries of British settlement, antiimmigration restrictions became generalised in the 1920s and 1930s (Bairoch 1997, I: 476ff; II: 176, 483f; III: 26ff; James 2001; McKeown 2008). This closing of national borders and weakening international solidarity just as cheaper travel made movement easier and the spread of knowledge opened up new vistas and horizons was 'frankly one of the most reactionary trends of our time', Myrdal (1964: 95) observed. 'The improved economic status and security of employment of the working classes have given even the labourer vested interests at home as a professional' (Myrdal 1964: 96). While certain types of specialised workers would have an international labour market, the common people were 'tied to their land of birth as firmly as in feudal times the serf was tied to the estate of his lord', allowed to go sightseeing or visit the market but obliged to return (Myrdal 1964: 97).

Picking up Lewis's idea of the dual character of the world labour market, Williamson (2002: 21ff) sees a segmentation of convergence regions in the high-wage West and the low-wage Rest. If, as Williamson argues, labour mobility was the most important force in convergence, monopolisation of the high-wage labour market (its opposite) could equally be treated as the major force in the 'great divergence' between developed and developing countries, but apart from Lewis and Emmanuel this seems never to have been done. If Lewis focused on the late 19th and early 20th centuries, unequal exchange in Emmanuel's perspective has a peculiar role in explaining the 'overdevelopment' of the postwar Golden Years.

Unequal Exchange as a Factor in Capitalist Overdevelopment

Already in the first global century before 1913, 'a well-integrated world capital market insured that risk-adjusted financial capital costs were pretty much equated the world around', Williamson (2006: 37f) has concluded: 'Thus, while capital was mobile internationally, labor and land were not'. Heckscher (1919) observed the great mobility of capital, relative immobility of labour, and complete immobility of land, but as his theory was formulated just after the globalising trends had collapsed in the First World War, the standard Heckscher-Ohlin theory instead assumed complete immobility of factors. Global goods and capital markets more or less recovered after the autocratic World War and Depression interval (Obstfeld and Taylor 2003, 2004), whereas the globalisation backlash of labour markets became a permanent feature not even discussed at the Bretton Woods conference and with only restricted revival in recent decades so as not to risk any 'convergence' (Chiswick and Hatton 2003; Hatton and Williamson 2005; McKeown 2008). These and other differences between

science and the city, underlined by Myrdal (1957, 1964) in his critique of Heckscher-Ohlin assumptions and predictions, became important for Emmanuel.

Emmanuel's theory assumes, on the one hand, a relative mobility of capital, sufficient to give rise to a tendency for global equalisation of the rate of profit, and a relative immobility of labour so that wage rates may differ considerably between countries; on the other, an exogenous (extra-economic, institutional) determination of nominal wages, depending on power relations between social classes in each country and each epoch (Emmanuel 1975a: 36).

The gist of all Emmanuel's demonstrations (1962, 1972a, 1975a), whether in Marxist price of production schemas or Sraffian input-output systems of varying levels of generality, is that an increase in (nominal) wages in any country will be passed on to the prices of the products of that particular country, whereas the corresponding decrease in the rate of profit will be spread out globally, entailing an increase in the relative prices of the products experiencing the wage increase; that is, an amelioration of their terms of trade. (Only then and according to consumption will real wages be determined.)

Less worked out historically than Lewis's model, Emmanuel thus explicitly posits a rate of profit that, unlike other factoral rates of remuneration, is internationally competitive and tends toward equalisation. Just as for Lewis, Emmanuelian unequal exchange is caused by monopolisation of the high-wage labour market, which results in higher prices than would otherwise be the case, and in better terms of trade with the surrounding low-wage market. Wages (the 'independent variable' of his system) are determined externally (not merely by agricultural productivities as for Lewis, but institutionally, politically, historically, etc.), and are, as his definition puts it, 'safeguarded from competitive equalization on the factors market' (Emmanuel 1972a: 64; cf. 1962: 22). Simply put: 'Underpinning unequal exchange there is a monopoly, all right; not, however, a monopoly of goods . . . but the monopoly position held by the workers in the advanced countries' (Emmanuel 1972a: 169).

While there was much controversy and misunderstanding over Emmanuel's Marxist price of production schemas (which he abandoned in 1970, along with arguments in terms of labour value, as soon as he was no longer obliged to relate to Bettelheim as his thesis supervisor), the real issues appear to have been the political conclusions on the lacking basis for international worker solidarity, and its theoretical counterpart in the choice of wages as the independent variable, something which every subsequent alternative unequal exchange theory discarded, but without resolving the theoretical problems thereby created (Brolin 2006a, b; Emmanuel 1985: 153ff; Evans 1980, 1984; Mainwaring 1980, 1991).

Emmanuel's view on wages as exogenously determined is arguably common to both classical and Marxist economics, where the baseline is set by subsistence agriculture as in Lewis, but with 'subsistence' consumption levels given an added variable historical and cultural element. Thus, apart from any initial wage differences (whether due to environmental factors, agricultural productivity, or other factors), Emmanuel (1972a, ch. 3; 1975a: 36) pointed to efficient developed-country trade unions and political mobilisation since the late nineteenth century, coinciding with successful repression of similar activities in the underdeveloped countries under colonial or semi-colonial regimes, plus the drain of means which could have enabled wage negotiations in these countries. Because of his emphasis, Emmanuel is perhaps not sufficiently alert either to how rising European emigration in the late nineteenth century might have helped political mobilisation, or to how domestic power relations might be affected by shifting commodity terms of trade, such as the century-long boom in tropical agriculture (in spite of the Singer-Prebisch thesis) that, along with short-term swings, contributed to deindustrialisation, concentration of land ownership, and lower wages (Williamson 2006, 2011). Just as the globalisation of goods and factor markets is related to the global extension of communications, Emmanuel's argument on nationally 'fenced' political organisation could profitably be linked to the 'globalisation backlash' as well

as an extensive literature linking nationalism and the press.

It was not unequal exchange or the terms of trade, but wage disparity in itself that gave rise to unequal development or the Great Divergence. The link between the variations in wages, or especially the foreseeable *increase* in wages, and those of development was based directly on international specialisation and choice of technology, on capital movements, and on investment incentives (Emmanuel 1972a: 371f; 1975b: 54f).

Perhaps inspired by Habakkuk (1962; cf. Allen 2009), Emmanuel (1972a: 174) saw high wages as the cause of technological development rather than the other way around, by their necessitating increased capital intensity and encouraging investment through expanding the market. This had further implications for the international division of labour, where it became relatively cheaper for investors in low-wage countries to choose branches of production with low capital intensity and little qualified work (Emmanuel 1975b: 56). 'Thus, low-paid laborers keep machines and engineers out of the underdeveloped countries, while machines and engineers take the place of highly paid laborers in the advanced ones', Emmanuel (1972a: 374) argued, concluding that this 'substitution of one factor for another, caused by market forces alone, is the most dynamic element in the blocking of subsequent development in the first group of countries and in the accelerated growth in the second group'.

The 'perverse' movements of capital (more recently revived as the 'Lucas paradox' after Lucas [1990]) from low-wage areas where there is a shortage of capital to high-wage areas where it is plentiful, had been generally observed in the early post-war development debate (Bettelheim 1962: 7ff; Lewis 1954: 440; 1978a: 177; Myrdal 1957, 1964; Nurkse 1952: 574; 1953; cf. Brolin 2006a: 205ff). Emmanuel (1972a: 372) observed: 'Since the prime problem for capitalism is not to produce but to sell, capital moves toward countries and regions where there are extensive outlets and expanding markets, that is, where the population's standard of living is high, rather than toward countries and regions where the cost of production is low. It thus moves toward high-

wage countries, neglecting those where wages are low'. Because of the lack of investment opportunities in poor countries, what little surplus was formed was either wasted in luxury consumption or expatriated and invested abroad.

Already Adam Smith (1937: 406f) and Tugan-Baranowsky (1913: 189) had observed that in a capitalist economy it is easier to buy than to sell. Emmanuel's explanation (1966: 1198; 1984) is based on the fact that revenue does not equal the produced but the realised value, only part of which, notably that corresponding to wages, is transformed into revenue before the sale and independently of its results, whereas profit (of enterprise) is not acquired as revenue until after the sale and according to its results. So long as there are unsold goods (which is always), the value of aggregate supply will exceed that of the aggregate purchasing power standing against it, making the market price tendentially inferior to the equilibrium price of production. This makes the system dependent on spending artificially created credit, creating a contradiction between the will and the power to invest, and giving the system a tendency to produce below full capacity in inherently unstable business cycles (Brolin 2006a: 217–230).

If depression in this sense was capitalism's normal state, the only way to explain the crisis-free post-war Golden Years (with unprecedented growth-rates, wage increases, and all but full employment) was by the partial or total reabsorption of the excess of production/supply over revenues/demand. While redistribution from profit of enterprise to other sources of income (that were partitioned before the sale) could alleviate the perceived disequilibrium, ultimately, some extraneously induced demand was needed, either in the form of a surplus balance of payments, a budget deficit, or 'overtrading', in the sense of purchasing beyond one's means.

A balance of payments in excess had been a lasting preoccupation of policymakers since mercantilist times, particularly in depressed times when they outweighed improving the terms of trade, as if 'the luxury of optimising the terms of trade can only be afforded once the maximisation of exports in particular and the marketing of the

social product in general have been more or less achieved' (Emmanuel 1984: 346). Their compatibility was evidenced by the fact that 'for almost a century, the terms of trade of the developed countries as a whole have been improving spectacularly, while the overall balance of payments of the same group has not been in deficit' (Emmanuel 1984: 350). This said, neither could a surplus balance of payment explain post-war development. Budget deficits also realised part of the social product with purchasing power from outside production, and their importance has certainly increased since Emmanuel's time (notably in the US), but in his view could not explain the Golden Age.

This leaves 'overtrading', meaning 'to spend a virtual revenue by anticipating its realisation' (Emmanuel 1984: 352), something which obviously presumes a type of credit (well-known to economists) which not only transfers purchasing power in space from saver to investor, but also in time from the future to the present. However, such *ex nihilo* generation of bank money was merely a necessary, not sufficient, condition. For overtrading to result there must also be perceived opportunities for profitable investments. Emmanuel (1978: 59f; 1984) distinguished three kinds of incentives to overtrade:

1. *Erratic and momentary,* by consequence of certain accidental ruptures such as technical or commercial innovations, discoveries, opening of external markets. While referring to an extensive literature ever since Schumpeter on the long-wave consequences of interlinked innovations, it seems that Emmanuel nevertheless may have underestimated this factor in postwar economic growth and stagnation.
2. *Recurrent,* linked to the upward phase of the business cycle, and, thus, while crucial for capitalist development in general, not the explanation behind the crisis-free growth of the Golden Age.
3. *Chronic,* following from certain modifications of structure, the most important in the developed countries being, on the one hand, an institutionalised inflation; on the other, a regular rhythm of augmenting wages which, in

turn, had 'been made possible by external resources originating in the exploitation of the Third World, and made effective by trade union struggle and, more generally, the political promotion of working-class aristocracies in Occidental societies' (Emmanuel 1978: 59, my translation).

If the general problem is one of the relative demand for money and for every other good, it is easy to see how a depreciation of the currency could act as a stimulant facilitating sale and as an incitement to overtrade, but while the flight from money was meant to stimulate domestic activity and commodities, it risked favouring the commodities and currencies of competitors. In modern capitalism of the post-war era, Emmanuel (1984: 384–394; 1985: 225–252) argued, the stimulus arising from inflation was closely related to that of wage increases, where the latter urge on the former in so-called cost-push inflation. This presumed either goldmines in countries not hit by the wage increase (as was generally the case), or universal inconvertibility of currencies, which became official in 1971 but was the unofficial practice before that. As a consequence, the rate of profit could vary independently of wages, by making wage increases wholly or partly nominal after they had occurred. In this way, the late capitalist system had managed to create double stimulation, partly through the expansion of the market for consumer goods due to any residual real-wage increase, and partly through the expansion of the market for means of production through overtrading, which had the important side-effect of lessening resistance to wage claims, thus restarting the process. Seemingly, this cornucopia could go on forever, but its limits revealed themselves when the rise in oil price put in doubt the continued growth of nominal wages at a rate faster than retail prices.

For Emmanuel, there was nothing as important as the variations of wages. Unlike any other mode of production, capitalism stood all the natural functions of human society on their heads, began with the end, with the actual or potential consumption downstream attracting production and capital upstream, as if 'it is the possibility of

clearing the estuary of a river that determines the volume of its tributaries' (Emmanuel 1974: 72). Production can only take place as a function of prior real or expected markets, but left to itself, capitalism's own laws of motion tend to prevent the expansion of this river mouth (Emmanuel 1984: 372).

In a closed system, an exogenous growth of wages would diminish the rate of profit at an alarming rate, but in a system open to trade with low-wage regions the cost of wage increases could be transferred to foreigners and the decline in the rate of profit be halted, thus simultaneously allowing high wages and a high rate of profit – Emmanuel's definition of the consumer society (Emmanuel 1985: 171–198). Unequal exchange was thus offered as the solution to the problem of the fall in the rate of profit, in a way similar to that suggested by Grossmann in the 1920s, although, by contrast, in Emmanuel's case the rise in wages was the source both of unequal exchange and the fall in the rate of profit (Andersson 1976: 41; Brolin 2006a: 69; 182f; Howard and King 1989: 316; Loxley 1990: 717).

In Emmanuel's (1972a: 172) view, for a country in a competitive system to derive an advantage from its foreign trade, paradoxically, it must consume more than the others do, whether in the form of direct wages or other forms of consumption. While seemingly natural that one can only spend as much as one earns, the object of his study on unequal exchange was 'to prove that under capitalist production relations one earns as much as one spends, and that prices depend upon wages'. Noting that what his critics had found most scandalising was being led to recognise 'that increased consumption brings about greater development and greater enrichment of nations', Emmanuel (1972a: 337f, emphasis in original) challenged his adversaries' astonishment with a Popperian generalisation: '*No capitalist country has ever become poorer for having spent too much*'.

The common basis for the blocking of under-developed countries and the overdeveloped feed-forwarding of consumption lay not primarily in deliberate conspiratorial, or uninformed strategies of great power-holders, or even in peculiarities of social structure and technology, but in freely working market forces. For when the primary problem is not to produce but to sell, 'he who dominates is not the biggest producer but the biggest consumer' (Emmanuel 1974: 72).

For Emmanuel (contrary to his Marxist brethren but much like contemporary ecological critics of overconsumption), exploitation and unequal exchange were not a question of production but of appropriation, and the development of the forces of consumption was more important than development of the forces of production. The unequalisable levels of energy and material consumption (Laulan 1972), and the ecological stress it created, ultimately explained the lack of solidarity between workers of rich and poor countries (Brolin 2006a: 200ff; Emmanuel 1974: 78f; 1975a: 63ff; 1976a: 71ff;). In this sense, unequal exchange is a kind of Maxwell's demon at the borders of countries with wealthy populations, maintaining and enforcing wage and consumption differentials (cf. Martinez-Alier 2002: 204). ('Maxwell's demons were unnatural beings who were supposed to be able to maintain, or even increase, the difference in temperature between communicating gases by sorting out high-speed and low-speed molecules' [Martinez-Alier 1994: 30].)

Directing attention towards the areas that Marx''s projected tomes left unfinished, although addressing economists of all denominations, Emmanuel also tried to integrate some unpredicted developments. Marx's recurrent theme of increasing polarisation of society into workers and capitalists may have been reasonable at a time when domestic inequalities were increasing and exceeded those between nations. Ironically, precisely around the publication of *Capital* in 1867, the secular rise in real wages in England and the developed world began, and the income differences between the West and the Rest exploded, so that today 80 per cent of world inequality is driven by location rather than class (Milanovic 2011: 109ff).

It is perhaps similarly ironic that Emmanuel's and other theories of unequal exchange and unequal development should have been formulated precisely at the moment of East Asia's wholly unpredicted economic rise (Crafts and Venables 2003). In the words of Joyce: 'The

West shall shake the East awake . . . while ye have the night for morn'. Theories of unequal exchange are nevertheless still relevant in interpreting a world economy that has been liberated from the traditional land constraints of an 'organic economy' by point source fossil fuels into a feed-forwarding, high-wage, high-technology spiral (Allen 2012; Wrigley 1988, 2006). Global 'big time' divergence is maintained largely by monopolistic exclusion of the world's poor peoples from rich labour markets in a way that is not only unequal but also increasingly recognised as the world's greatest economic inefficiency (Hamilton and Whalley 1984; Pritchett 1997, 2006).

Definition

Increasingly global trade is dominated by global production networks. The effect of these on developmental outcomes has been substantial but contradictory. In this piece we will identify the ongoing problems with current academic debates on this topic and the limitations of its theoretical approaches for identifying the cause of ongoing uneven development.

The reorganization of global trade developed from several analogous shifts in the structure of global competition from approximately the 1980s onward. The first and most commonly discussed are the deregulation of capital and trade movements, technological improvements in communication, and transportation which facilitated more flexible and smaller shipments – both of which undoubtedly provided the underlying mechanisms through which change could occur. However, more fundamental was the rise of specialization by firms in core economies in response to inter-capitalist competition with the emerging firms in rebuilding Japan and Germany and increasing tension managing large geographically centered manufacturing workforces in the Global North (see Arrighi et al. 1999 for an extensive discussion).

The organizational changes we have seen emerge from this have been complex; however, what remains consistent is the unbundling of specific production processes and the decline of large vertically organized firms producing a single commodity internally. Though "lead" firms which govern the production of specific commodities often still maintain the comparative advantages these vertically organized firms maintained, particularly branding, capacities for innovation, extensive hard to replace retail, or production facilities – what is significant is that the component production, individual inputs, final assembly, and business services necessary to create these products are distributed to independent firm. Though relationships do exist between these firms and are often maintained over time, they remain typically semi-formalized and take on the formal structure of a solely market transaction.

Identifying the effect on uneven development is complex as on aggregate several contradictory trends are ongoing. Firstly, on appearance the effects have been profound and expansive due to the competitiveness of peripheral firms in many individual tasks, as well as rapid cheapening of some capital goods, both of which have allowed substantive industrialization. This is not only a superficial phenomenon either but has involved active increases in the use of capital goods and measurable increases in productivity. Furthermore, the effect of these changes on specific lower-quality valued elements of consumption goods prices has substantially altered consumption in some Global South countries (Kaplinsky 2013).

This does remain starkly unequal though. Inside countries it has tended to privilege specific groups of labor and capital, it is highly centered in specific regions, and it has completely missed many countries where production networks have not become embedded. However, it is a process worth taking seriously as the impact is not insignificant and has certainly appeared as strong growth across key areas of the Global South.

In spite of significant change, Brewer (2011) and Hickel (2017) have correctly identified that there has been no closing of the developmental gap over this period of change. The benefits that regions and firms in the Global South have gained represent absolute change but remain relative to their starting point even when replacing complex highly productive elements of global production. Indeed, even the much-lauded changes toward "convergence" in GDP per capita only emerge if we weight GDP in a way which assumes all consumption is of equal quality and ignores the complex ways in which often necessary elements of consumption come to be priced differently. It is still just as difficult for a country in the Global South to directly purchase goods produced in the Global North (Freeman 2009).

In the face of this, analysis of global production networks as a distinct set of academic debates attempting to categorize these informal trade relationships is useful. Providing an understanding how this specific change in uneven development is taking place as well as its wider systematic outcomes.

In this contribution, we will be outlining two key points. The first is the substantial capacity for even mainstream research to open up analysis of uneven development using an approach which focuses on global production networks. Identifying that the development of this field from specifically radical foundations, in particular, the world-systems approach is impactful. It has helped integrate an emphasis on the directly exploitative elements of the relationship between firms in the North and South and due to its focus on concrete complex trading networks offers several novel insights which theories of imperialism should not ignore.

The second point we will be addressing is how value is understood in this approach, this underpins how it understands uneven development and furthermore has provided significant empirical depth to the concept. However, simultaneously we will show the limitations of a continual emphasis solely on value capture in this approach due to its legacy in developing the world-system approach through Schumpeterian analysis.

From World-Systems Theory to Global Production Networks

In this section we will identify the way in which the global production network developed as a way to understand the specific phenomenon identified above, in doing so a brief intellectual history will be sketched in which the specific terminology of global production networks emerged as part of a critique against the initial approach and has been later joined by more critical perspectives. Throughout, what is worthwhile recognizing is the continuity across critiques – largely due to the focus on expanding the approaches, understanding of power rather than a systematic challenge to how global production networks should be understood.

Building on the notion of "commodity chains" from world-systems theory, the initial attempts to theorize how global production networks operated emerged from the work of Gereffi (2005) as the global value chains approach. This form underpins much of the engagement with the concept by global capitalist institutions such as the World Bank (Bair 2005), occouring early in the emergence of global production networks to identify the potential developmental opportunities and challenges from a decrease in control over industrialization.

On the one hand, this modification not the world-systems approach came with a clear notion of how firms in the Global South could improve their position through the notion of upgrading and thus begun to challenge its pessimism on development. However, this only emerged within the context of a view that current problems with industrialization were rooted primarily in the power Global North firms had over their suppliers. Thus, increasingly focusing on forms of development which emerged from the relationships between sites rather than simply internally, a key theoretical claim of uneven development being formed through power became embedded in the analysis.

To operationalize this form of power the global value chains, key theoretical concept is the notion of governance. This is understood as the structure around which the potential development

U

outcomes from engagement with global production networks become distributed between actors within a production network – reflecting the power of individual firms to discipline others and, in particular, the power to determine other firms' prices (Kaplinsky 2000). This framework remains broadly uncontested throughout all further discussions of global production networks and underpins its role in introducing a more radical understanding of how uneven development is structured into mainstream development analysis. However, in itself, it is insufficient as the final cause of differences in power remains contested and can still be considered internal to Global South countries even, while there is a recognition that the Global North takes advantage.

The first form of power considered by this approach was developed through an analysis of industry-specific mechanisms which could be exerted as mechanisms of control between buyers and suppliers. This included the complexity of information shared between firms within a production network as reflective of the trust required to ensure advance purchases would be met, if the information could be codified and therefore set out as strict standards or if it required relying on specific internal skills of partners, and finally the extent to which suppliers required further investment to maintain their position. Together, this allows a schema to be developed of the extent to which active coordination, long-term relationships, and investments are required to support production networks, with each providing certain opportunities for firms in the Global South to advance their position by leveraging the needs of other firms while simultaneously remaining dependent.

This approach faced several problems; foremost, its emphasis on a singular "chain" concept tended to over assume power was effectively only occurring in singular hierarchical relationships. Subsequently, although there were ways to compare chains through identifying high-value activities, it was not apparent how the power to be a lead firm or to take advantage of a position was created outside of chains. Confronting this, the notion of global production networks approach developed from the work of Henderson et al.

(2002) and sought to increasingly include geographical and thinking beyond chains between firms to the networks which organize global production as required for understanding how power was created.

The primary outcome of this critique is not to necessarily challenge a focus on the organization of production for specific use of goods (see Bair 2005 for an overview of the evolution of views on global production networks). Instead, it expands the actors relevant to the determination of power and begins to recognize the role of regional inter-network connections and shared resources. In practice, this largely functioned as a discussion of institutions role in shaping interfirm relationships. This occurs as territorial institutions define firm organization, ownership, and conditions of production are shaped, both within defined territories and across them as regional institutions are formed, and different institutions co-shape one another. In contrast to rents produced at the firm-level, regionally supported rents are geographically and historically contingent, rather than being formed by tangible skills, technology, laws, or forms of power. In contrast to tangible assets, these are both harder to replicate but also more vulnerable as state-level institutions are generated by multiple actors to support social as well as economic aims. Consequently, they tend to be self-reproducing and are difficult to actively change. This introduces a range of novel limitations and path dependencies which can derive from a range of actors which are not recognized with a focus solely on interfirm power (Dicken and Malmberg 2001).

The specific institutions that a territory engages in are also considered impactful and have been increasingly centered in the global production networks 2.0 approach by Coe and Yeung (2015). The further development of this approach has identified several cases in which the development of institutions which can both adapt to and develop innovation is crucial to the emergence of longer-term relationships. In contrast to other regional assets which maintain a certain degree of temporality, labor market regulation may be useful to maintain a skilled workforce till a skilled workforce is not needed, for example, innovation

represents a specific skillset requiring relatively developed institutions and long local experience and subsequently allows interdependent relationships within production networks to be maintained over time. The coupling of regions through anchor firms with deep reliance on one another for their competitive advantages, therefore, represents an important form of power particularly when it allows others in a network to create new markets, involves optimization of costs between two firms, and allows substantial access to capital and support (MacKinnon 2011).

The last element of governance power which has begun to be recognized is historical and actor-driven definitions of local assets. This form has drawn heavily on Marxist and feminist perspectives by Werner and Bair (2011) and argued that the way specific the Global South is brought into global markets is crucial for understanding how institutional development emerges from the historically specific actors that create a market. In this approach, the histories which shape inclusion define specific capitalist aims and labors integration with local markets. Firms and regions were not integrated in an ordered rational way but instead by concrete relationships between actually existing capitalists of which only some survived due to factors often outside of any individual capitalists' control.

This process does not represent a form of power but instead shapes how power is used in both positive and negative ways. On the one hand, Pickles and Smith (2016) taking a regionally defined market such as the European Union firms within Eastern Europe may find themselves in advantageous positions due to their relatively unique status as developing economies with a Global North led regulatory unit. Though it may not continue to be competitive in all areas, as capital is already invested and regulations for trade are well developed, they remain in a strong position even as investment slows, and new investments are not continually found. In contrast, Havice and Campling (2013) have provided an archetypical example of how Global South firms face processes of exclusion due to the same phenomenon. In the past firms in the global south relied on specific compacts between both local and global capitalists and between local capitalists and workers to create semi-unique forms of specialisation even with limited resources. Though this provided advantages with specific buyers, they dependended on these specific personal relationships as markets changed to retain any inclusion in global production networks. The shift in supermarkets from branded to non-branded Tuna undermined the value of ecologically friendly line-caught Tuna as a skillset among Oceanic island workers; however, local capital had already developed infrastructure with several buyers and subsequently withdrew from canning its brands to lower value loin processing.

This view posits a deeper discussion of why value is created, proposing market formation as a process as shaping long-term outcomes by defining actor intents which shapes which assets are developed and how they can develop. However, in focusing on a novel empirical element of production networks, its contribution to discussion of value continues to emphasize rents, albeit, while seeing them as dependent on the way social relations create dependencies on specific forms of production rather than viewing them as simply a feature of specific constellations of institutions, markets, and firms.

In sum, the discussion on global production networks has identified a critique of the power relations that govern global trade and made mainstream a view that developmental outcomes are not purely the fault of Global South countries failure to develop. The embedding of this development approach has been important for shifting the emphasis of developmental organizations toward some beneficial areas and tying in with the generalized changes toward a post-Washington consensus with an increased focus on market failures and industrial policy (Werner et al. 2014).

There are substantial limits to this, the World Bank (2017), for example, recognizes all these forms of power as relevant for the participation of developing country firms in global production networks. They also recognize this as being determined by rules drawn from Global North power and directly changing how increased industrialization. However, their advice remains focused on

demand from the Global North and emphasizes the potential win-win of engagement with production networks, emphasizing absolute change, and only superficially recognizing exploitation. In line with this, much of their advice focuses on domestic reform in Global South countries as well as increasingly freeing up trade as ways to expand production networks potential.

Capturing Value and Upgrading

Connecting this literature even further to radical debates is the direct usage of a notion of value capture as central to the mechanism which determines how developmental outcomes are understood and the exact way in which uneven development is restructured. The emergence of the initial specific debate on global production networks from its earliest days embedded the world-system approaches use of Schumpeter. This model draws significant on the notion of rents as a return to the management of competition – and in particular scarcity. Thus, the forms of power identified act as mechanisms in which scarcity is maintained, managed, produced, and shared.

This has significant effects on how changes in industrial capacity are understood as developmental and underpin the global production networks understanding of change as being defined by upgrading. In contrast to typical focuses on productivity, upgrading defines change by the extent to which it affects the ability of firms to change their power to influence competition relative to other firms. Improving productivity may allow two firms to gain equally as the savings generated are shared. Producing increasingly sophisticated products, or using experience to move into other production networks, may allow access to different buyers or to take on more functions within a production network but fundamentally does not necessitate any change in power unless this is less common or easier to protect. The only way in which power therefore changes is the movement into activities which are less common or rely on an internally protectable set of assets.

This focus has remained through all approaches to global production networks, even

as the simplicity of this model has been questioned. For example, it is often difficult to identify these individual forms of upgrading in reality. Often becoming more productive is a protectable asset – requiring significant labor skill and organizational capacity. Similarly, the development of more complex products often directly allowed the movement into entirely different production networks due to the separation of production networks by the quality and starkly different interdependencies required when dealing with more complex luxury products (Ponte and Ewert 2009).

The notion of upgrading as allowing increased value capture, as a theoretical approach to both explain uneven development and in general as a developmental process, runs into significant further problems due to its explicit emphasis on profits as a ratio. The focus on extra profits appearing as a ratio is a consequence of the litreature drawing largely on Schumpeterian analysis. In this approach product prices are soley market-determined, while the sale price in which value is realized is modified by a capitalists ability to realize rents as a return to scarce assets. This appears as a ratio between the markets tendency to equalise prices and reduce profits to zero and the ability of capital to protect and maintain innovation and unique asssets as an additional entrepreneurial profit.

Though this remains a useful theoretical apparatus for identifying the relationship between power and outcomes, the aim of capital as an actor is to produce with any profit not just a higher ratio to investment. This can also involve simply an absolute increase in capital invested and returned. Thus, in many cases firms may not be interested in the risky investment required to upgrade. Indeed, Blazek (2015) found substantial evidence that downgrading is a common strategy – why face increased competition in high-profit low-volume sectors, challenging innovative firms, or trying to replace functions currently held by core economies with deeper institutional support when the mass scale lower-quality global production networks offer the chance of large-scale investment.

This problem underpins a gap in evidence on the effect of upgrading on development

understood as social conditions and outcomes for labor. There is evidence that around many sites of upgrading we do see increases in wages; however, they do not parallel the apparent forms of upgrading which increase value capture and are often highly localized. The increasing need for specialized labor is linked to beneficial changes. However, a crucial division is that the need for more specialized labor is not a necessary feature of increased value capture. Increasing productivity does tend to require an increasingly specialized workforce although at a regional scale, this may result in unskilled workers being removed from production and thus not result in an aggregate change. Firms moving into higher value-added activities within a production network follow a similar process; however, as they maintain an ability to capture value and often need to protect their position within chains, they are more likely to retain unskilled workers to support higher skilled activities. In contrast, movement between production networks producing goods of different qualities or different goods entirely is highly dependent on the extent to which this requires the use of new assets and skill composition rather than simply altering inputs (Tokatli 2012).

The problem in this approach is not that value capture is an irrelevant process but it is incomplete. How much value is ever captured is unexplained and thus a ratio of ongoing change between two firms supporting each other in altering global valuation becomes meaningless in absolute terms, instead we just know that it does not involve the direct replacement of core activities value due to change occouring as a consequence of savings. This problem is paticularly evident in the difficulties of explaining high and low value activites simply as a derivative of the amount of rents they can maintain and is clear when we see firms from the Global South directly taking on previously core functions. Their is evidence that many firms the ability to generate rents is common, even routine, as a feature of the competition. This is a challenge to the typical view that the core difference between low and high value activities is effectively representative of how more complex products provide more extensive opportunities for rents.

Tokatlis (2012) work on Turkish apparel firms identified that they have maintained a competitive position for European retailers. Indeed, many cannot neatly be called "suppliers" as they often engaged in activities such as marketing, branding, and retailing, which are understood as high value-added, alongside assembly and component production. This did not always involve the firm becoming a buyer and often represented peripheral firms engaging in diversification strategies in which these activities supported lower-value activities for core-oriented production networks, while, on appearance, high value-added activities were used to compete within peripheral markets. Furthermore, although peripheral firms used these advances to support value capture in peripheral production networks, in core production networks it often appeared as a risk, as core firms expected them to utilize these capabilities to directly design items to be sold in core economies for little additional return. Here then, the ability to overcome barriers to entry and even protect them to produce rents appears secondary to the scale of these rents reflecting the specific production networks they are utilized in.

The global market moving success of global peripheral suppliers shows similar evidence. Though rarer, and largely only existing in larger Global South economies, these firms consolidated their role in multiple sectors due to their support for the sustained expansion of core consumer product markets. In doing so they not only developed increasing power in these markets but actively contributed to their creation. These firms have been able to rapidly outcompete peripheral rivals and have substantially upgraded as the scale of their production acted as a scarce asset allowing them further expansion into activities understood as high value-added. Similar dynamics as Turkish firms are, however, evident. For example, Yue Yuen, the core supplier for Nike, has dominated its suppliers by vertically integrating subcontractors and design and has even produced its innovative logistics services which directly manage lead firms' stock rooms. This has allowed it to generate its particular rents as it has sought greater control over its suppliers and maintain its lead firm role over them. In spite of this, its ability to pass on

U

price increases to its buyers is limited, and even in its domestic market, it cannot command similar prices to Nike despite its extensive role in a range of their products.

In the absence of a clear approach to understanding how individual activities move from being low to high value, several problems emerge as the advantages of being in a high-value production network are substantial. The scale of value generated provides an ability to lead production networks; the scope of production networks as final product scale determines the range of inputs that can be included and provides territories with the ability to continually support themselves through large-scale investment. This depth is significant for differentiating the features of similar commodities quality. For example, the ability of core supermarkets to cushion food prices from fluctuations in global commodity markets relies on the scale of their production due to working in high-consumption markets requiring extensive integration with financial and commodities markets.

The process we can identify here does explain the initial statistical evidence presented at the start of this section. These cases all represent genuine changes in the productive capacity of some areas of the Global South through engagement with global production networks – this has often involved extensive capitalization and upgrading. However, underpinning it is a failure to engage with the process of devaluation that is intertwined with this. For example, the genuine changes in consumption we have identified have emerged in part through Global South firms increasingly being capable of producing lower-quality consumer goods for cheap through the benefits gained from this process. However, without an engagement with how value is created, it is not clear how this process will produce actual commensurability between the production of the Global North and Global South.

Limitations of Value Capture

Value capture is a valuable concept for understanding a specific mechanism of uneven development for several reasons. It represents a direct transfer between two sites and provides a succinct way of understanding how the production activities in one country actively contribute to another. It is also directly visible in many specific cases. Firstly, there are numerous mechanisms for foreign-owned firms to directly transfer the profits they make to other locations. This is also a problem for considering the extraction of profit in core economies through their primary role in the globalized financial sector.

These represent clear cases in which value produced in one territory is moved to another. We can also understand how they reflect incredibly difficult to represent features of Global North markets deriving from their sheer scale compared to the Global South, such as the ability to wield sufficient historical wealth to invest on good terms and to be sites for complex financial markets with global influence. However, although this is understood as a form of power and an ability to lead global production the direct role differences in the size of domestic markets play in shaping production is not emphasised in a focus on capture. The scope of domestic markets of the Global North define not only the higher quality requirements due consumption in these markets being led by high wages but, furthermore, create the need for extensive local innovation to maintain this competition and investment capacity to reflect the massive scales of capital required to match these markets depth. There is therefore a constant space in these markets for opportunities in which rents can be generated as a territorial feature of markets bounded by specific markets for consumption. This exists even as individual capitalists from the Global South can readily invest in firms and financial markets operating in these areas.

The argument that value capture is the primary way in which uneven development is maintained becomes more difficult when we are dealing with the direct changes caused by taking advantage of low-cost wages though, as in this instance it is not evident that direct transfers take place. This certainly creates a situation which firms in the Global North can take advantage of and can be understood in some instances as a scarce asset in

itself, as the ability to take extensive risks, afford choosing between and keeping multiple suppliers simultaneously, access to the extensive business services required to manage the massive information and organizational capacities to maintain complex production networks. However, outside of the depressingly common but often temporary cases in which particularly brutal methods are utilized to push Global South suppliers and labor below their socially acceptable reproduction rates, which may represent abject poverty, the normalization of specific value for certain forms of labor should be considered a permanent change in how capitalism values the skills required to create a specific use-value (see Smith 2016 for several accounts of this process and a discussion of it as a form of value capture).

This distinction between direct and indirect requires a careful approach. In over-relying on the view that the only advantages from global production networks for the Global North require rents, it is possible to overly associate uneven development with a distortion of "true capitalism" in which imperfections caused by power and protected the hierarchy between states are the sole reason for continued failures of development. This problem is common in approaches which draw heavily on the monopoly capital thesis, such as world-systems theory, and the subsequent rewriting by more mainstream scholars such as Schumpeter (Dunn 2017). In these approaches, the role of power in structuring completion was taken as the central organizing factor of firm success. In contrast, although price changes governed by other elements such as labor costs, changing technology, and reorganization of social relations are relevant, they are considered secondary influences.

In contrast to relying solely on an understanding of power, what is crucial in identifying the scale of value created is reshaped by the processes that govern average costs of production. Though individual firms may pay more or less than the average cost of production in making an initial investment in concrete labor, capital, and inputs, they will only realize a return in monetary value equal to the amount of labor that is realized as abstract labor equal to average production costs.

This often requires complex combinations of labor skill and specific capital to achieve adequate levels of productivity, however, on a global scale labor remains unique not only in its contribution to value but also in its immobility and relatively sticky pricing at a territorial level. Thus, the way in which new forms of production are introduced and come to be competitive when increasingly organised within the Global South is crucial as not all elements of production will converge.

In the circumstances in which we see initial reorganisations of production, this may represent instances of direct transfer through the deliberate underpricing of novel Global South firms competing with firms in the Global North. However, as new producers in the Global South become the norm and begin to specialised in the production of specific tradable goods, that is commonly exported rather than solely produced domestically, there is typically a reversion in the average costs toward the lowest value labor required to put the right capital and skills into motion. The competition between Global South suppliers and potential for access to some nonprotected elements of capital further supports this process of devaluation to, as the rules of competition continue to operate in mobile elements of production to and subsequently the ability to and need to increased productivity remain in place and often with the enthusiastic support from Global North capital.

Historically in radical theories, the political implications of value capture have been crucial for identifying a direct mechanism in which the exploitation of the Global North provides systematic benefits for the Global North. However, the limitations we can identify do not undermine this as a conclusion, but instead make the mechanism through which occurs less direct and more market-driven part of the routine historical development of capitalist accumulation rather than just political power. Due to their being no intrinsic dconcrete differences existing between labor in the Global North and South, except the capital which hires them, the structure in which valuation takes place being systematically advantageous to the Global North is meaningful. Both capital,

U

through the ability to lower the cost of specific skills, and consumers, who can realize lower consumer prices while their own skills remain relatively less pressured, gain systematic advantages while the revaluation of production is led by markets in the Global North.

The Relevance of a Global Production Network Focus

Identifying devaluation as an intrinsic process of how global production networks effect how the Global South can grow through engagement in global capitalism, alongside real processes of value capture, offers a fertile area for further analysis of the contradictory way in which they change rather than end uneven development. Though approaching this problem through a critical reappraisal of the global production networks approach is nessescary the approach already contributes three crucial insights due to its focus on identifying the complexity of concrete production networks and the variety in how power can be utilized by individual actors.

The first interjection of the global production network approach is that it moves beyond viewing the global economy as made up of easily distinguishable sectors understood by their industrial form. Instead, production networks represent the combination of both generalisable activities and the specific inter-firm relationships in which they are embedded. Together these define qualitative norms for the production of specific use-values across sectors as specific industries which can be further divided by the specific markets they support. This shift in the scale of analysis from sectors to industries, and indeed to specific production networks within these, has wide consequences.

This change in scale is not often emphasized by global production scholars despite representing its core division from world-systems theory in the initial formulation of the approach by global value chain scholars and the starting point from which its analytical differentiation to a focus on specific chain relationships proceeds. However, it also produces a tension around the extent to which this causes industries to become removed from

their sectors and the market insitutions, such as labour markets for specific skills which cross sectors, they are embedded in.

Focusing on the specific nature of industries has allowed the introduction of several mechanisms which have become central to analyzing governance. This has been especially important for understanding how the consolidation of specific activities which drive the valuation of differentiated uses of similar sectors creates forms of power and control only visibile in the production of specific goods, such as the ability to organize production networks and the apparently "insubstantial" elements of this such as controlling technological processes and branding.

The presence of these elements also allows recognition of production networks as often meeting a specific derivation of sectoral demand, representing how they organize production which matches qualitative measures of quality. In contrast to apparently subjective measures of industries producing to match the quality of specific markets often require starkly different combinations: requiring the ability to codify and translate the requirements to match specific cultural norms, different economy of scale requirements in to match the scale of different markets including large portfolios of similar goods, or the ability to manage intensive divisions of production to facilitate customization.

Focusing on this scale of analysis is the central way in which the global production network approaches an understanding of how competition is organized. Furthermore, this scale is largely ignored in radical political economy which tends to abstract it to sectors determined generally. Though radical political economy should not exclude systemic analysis, and indeed it remains crucial to fixing the global production networks approaches overwhelming focus on individual production networks, identifying how this codetermines one another is essential to taking the actual structure of global trade seriously and preventing a view that problems simply represent different productive capacities to create easily understood use-values.

The second interjection of the global production network approach is a recognition of the

additional costs that involvement in production networks involves as a feature of cross-sector relationships. These represent the element of productions cost which are explicit, however, as they derive from the agglomeration of individual firms in different sectors as specialized forms of specific production facilities producing for what we understand as industries their role in shaping the costs of meeting certain needs is often ignored. Though typically the current global trading system is understood as driven by labor arbitrage in production, the importance of this needs to be weighed against the actual costing and construction of functional production networks which also allow secondary territorial advantages to be secured by the Global North and determine actual patterns of investment.

Often several costs essential to successful transactions are negotiated between lead and supplier firms. Examples of this include access to finance, paying for the costs of technological licensing, investment in infrastructure, and the costs of engaging in the social networks in which information can be effectively shared; together representing the massive expansion of infrastructure necessary for ensuring commodities can be made, moved, sold, and stored. These costs are often non-tradable and supported by specific regional agreements but are crucial to the actual structure of costs which lead the Global North to engage in the investment and relationship development required for any positive outcomes for the Global South.

These industry specific costs are also often representative of industry specific requirements of quality in Global North markets. For example, the value of oil production implicitly includes the transportation costs with minimal stoppages and extensive communication of demand. The structure of consumer habits in more complex domestic markets also adds additional costs such as the licensing of technology purchased as services, which although disciplining profitable production costs for sellers in the Global North, are also separated from the purchase of inputs for production itself. These costs often thus represent specific additional required costs for more complex Global North focused firms but are only required to maintain a form of quality rather than representing any intrinsic difference in the production process between higher and lower cost final goods.

These costs are typically understood as being returned to unproductive actors and thus do not create value. However, they often represent a necessary role which must be advanced to ensure capital advanced to match Global North demand is valorized, and subsequently do become an integeral element of costs which firms in the Global North must pay for to survive and thus come to form the higher final price they can realise. How they are organized therefore represents a distinct cost which is subtracted from the created value individual firms realise but is retained in specific sites which can provide these needs rather than being a component that can be captured by others within an industry who are part of the direct production process.

The last element of the debate which the global production network approach can help expand is class struggle. To some extent, this is a relatively limited debate among scholars within this approach. It has emerged primarily in discussion of the actual developmental impact of production networks and in attempts by critical scholars to identify the role that class struggle may play in actually supporting forms of power and maintaining sites of upgrading which would otherwise be lost (notably through Selwyn 2012s work on Brazil). However, by emphasising individual firms global relationships the global production network offers ways to understand class without reducing it simply wider changes in globalisation.

The connection to industries and emphasis on individual development of labor around specific production networks adds a concrete focus to this which can be lost in approaches which focus soley on national labour markets. Though production networks often do not result in development change which alters uneven development for entire countries, their effect on the structure of labor skill and rapid intensification of capital use are crucial areas for further investigation. Firstly, not only to identify how the creation of an increasingly skilled workforce and significant changes in labour demand may provide sites for future struggle. But also, to improve our understanding of

U

how groups of labour who appear to be winning from production networks in the Global South impact wider changes accross the labour markets they are involved in within specific territories and how they shape global regimes for managing labour by capital. Identifying this is important for recognising that the fracturing of global production by increased specialisation in smaller firms may be impactful even if it is not resulting in global convergence between labour with specific skills across borders.

The individual production network focus also provides a way to integrate an understanding of the specific historical class structures which may be underpinning current positions of advantage and disadvantage at a local scale in interaction with global trade which are not immediately identifiable at a state level. Due to the historical nature of individual production networks development, they are often reliant on a scaling up and adaptation of national labor-capital relations rather than their simple replacement by a global model; determining the trajectories of even similar commodities for the same markets as it continually shapes the way resources such as land could be brought into production and formed a part of labors reproduction as well as other vectors of oppression such as Gender. For example, the maintenance of low-cost non union sources of labor within the Sri Lankan apparel industry relies on the maintenance of traditional gender roles and has separated the organization of labor into distinct groups (Goger 2013). The opportunities for understanding how already existing racial dynamics of imperialism are being disrupted by these patterns beyond continued unenven development thus offers a further opportunity to understand changes in global trade as disruptive rather than simply an assertion of a singular global capitalism.

Conclusion

To conclude, the global production network approach offers a way to look at uneven development which centers the flurry of complex inter-capitalist relationships that shape global production, investment decisions and choices over labors management. In this approach class and sectoral composition remain analytically national but interconnected and can only be recognized by identifying the various sites for production and demand which exist. Though this approach currently cannot provide a complete explanation for uneven development the perspective, tools, models of mapping and organizing how to identify specific trade relationships are all vital tools for moving towards more concrete focused analysis of imperialism. Significant problems exist within it, and it is worryingly amenable to co-optation by global capitalist development institutions. However, this reflects its narrow focus theoretical focus and its development as an attempt to produce clear concrete identifiable causes rather than offer an overarching explanation of uneven development. Work to improve it will thus be expansionary, building on its radical roots to identify the wider systemic process of devaluation that shape uneven development and identifying the complex role global trade plays in reshaping class struggle at multiple scales.

Definition

The history of the Pacific islands is in part a history of Western entanglement ranging from voyages of discovery, competition for trade routes, and colonial expansion, to annexation, commercial exploitation, militarisation, population displacement, and nuclear weapons testing. As early as the sixteenth century, Western encounters with Pacific peoples were marked by cultural misunderstandings and frequent violence. By the eighteenth century, European voyages of exploration and scientific documentation established the South Seas both as a real site ripe for economic and territorial expansion, and an ideal space suited to the projection of desires for escape, spatial mastery, and sensual indulgence. By the 1770s, the US had started to bring its free-market values to the Pacific, when ships from the East Coast

sailed around Cape Horn, heading for the trans-oceanic Chinese trade routes laid down by Spain, France, and Britain. Spurred on by an expansionism born in the eighteenth century and soon harnessed to the nineteenth-century ideology of manifest destiny, the history of the "American Pacific," and of today's Pacific Rim and Asia-Pacific are grounded in the interconnected forces of realpolitik, economic imperialism, and mythic invention.

Pacific islands have long figured as idylls – a myth that conceals a history of Western entanglement ranging from voyages of discovery, competition for trade routes, and colonial expansion, to annexation, commercial exploitation, militarisation, population displacement, and dozens of nuclear weapons tests (as recently as 1996).

As early as the sixteenth century, Western encounters with Pacific peoples were marked by cultural misunderstandings and frequent violence, as is well documented in both Antonio Pigafetta's account of Magellan's major exploring voyage (1521) and Pedro Fernández de Quirós's journal relating Mendaña's failed attempt to colonise the Solomons (1595). By the eighteenth century, European voyages of exploration and scientific documentation, with their vivid accounts, established the South Seas both as a real site ripe for economic and territorial expansion, and an ideal space suited to the projection of desires for escape, spatial mastery, and sensual indulgence.

By the 1770s, the US had started to bring its free-market values to the Pacific, when ships from the East Coast sailed around Cape Horn, heading for the trans-oceanic Chinese trade routes laid down by Spain, France, and Britain. David N. Leff notes that the American flag first reached China in 1784, establishing a strategic goal that would dominate US–Pacific relations (Leff 1940, p. 3). Spurred on by an expansionism born in the eighteenth century and soon harnessed to the nineteenth-century ideology of manifest destiny, the roots of the "American Pacific" were grounded in the interconnected forces of real politics and mythic invention.

One of first colonising gestures made by the recently decolonised US nation took place in

1791, when Joseph Ingraham of the *Hope* claimed the northern islands of the Marquesas, naming them after luminaries of the US Enlightenment such as Franklin, Adams, and Hancock. Just three weeks later, Etienne Marchand reclaimed all of the Marquesas for France. Significantly, the Marquesas would become the site of the first major US military conflict in the Pacific, when Captain David Porter – sometimes called "the first American imperialist" (Rowe 2000, p. 83) – stopped at Taiohae harbour in Nukuhiva to refit his ship the *Essex* during the War of 1812. The 1812 war, as Thomas Walter Herbert notes, evinced a desire of the US to be recognised as a legitimate state, one of the "community of nations" (Herbert 1980, p. 79), as Porter's actions in the Marquesas seem to bear out. Following a breakdown of agreements with local people, Porter and his men became embroiled in ongoing conflicts between the Tei'i, Hapa'a, and Taipi peoples, and proceeded to raid Taipivai, burning whole villages and killing many of what Porter later described as its "unhappy and heroic people" (Porter 1822, p. 105). Porter formally took possession of the island, demanding that its people swear allegiance to the American flag. His subsequent "Declaration of Conquest" indicates the paternalism of a US Enlightenment vision:

> Our rights to this island being founded on priority of discovery, conquest, and possession, cannot be disputed. But the natives, to secure themselves that friendly protection which their defenseless situation so much required, have requested to be admitted into the great American family, whose pure republican policy approaches so near their own. (79)

The US government never ratified Porter's occupation, and 30 years later the French again claimed the island group. Still, Porter's "Typee War" marked the fierce impact of *haole* (outsiders) on Pacific locales, and it fascinated and haunted travellers in Polynesia (such as Herman Melville and Paul Gauguin) for years to come.

In spite of Porter's failures, his published account, along with others that appeared around the same time (the German-Russian circumnavigator Adam J. von Krusenstern's *Voyage round the World in the Years 1803 ... 1806* appeared in English in 1813, and his chief scientist, Georg H. von Langsdorff, published *Voyages and Travels in Various Parts of the World* in English in 1813–1814, with a US edition in 1817) helped reinforce a notion that Pacific islands could serve US interests. However, while accounts such as Porter's painted a relatively positive portrait of Pacific cultures and stressed connections between the Marquesas and the "great American family," there were other, more derisive images of Pacific life that undermined any sense of familial inclusion. Missionary reports written under the influence of Calvinist doctrine commonly figured Pacific islanders as cruel, violent, and needing religious conversion. Publications that backed missionary societies (such as the *Massachusetts Baptist Missionary Magazine and Niles Weekly Register*) were dedicated to "evangelizing the heathen," and they portrayed groups such as the Maoris and Society Islanders as indulging in warfare, orgies, cannibalism, and infanticide. These "hard primitivist" notions of barbaric savagery thus accompanied, and in many ways played off, "soft primitivist" concepts of noble savages inherited from European thinkers such as Jean-Jacques Rousseau; together they are emblematic of an underlying duality that has persisted in US representations of the Pacific.

Charles Wilkes's US naval expedition of 1838–1842 further manifested this contradictory stance: purporting to be objective and scientific, Wilkes would become better known for his strong-arm military tactics (much like Porter's before him) than for his contributions to enlightened American progress. During an aggressive campaign in Fiji on Malolo, the villages of Arro (now Yaro) and Sualib were burned to the ground as revenge for the killing of two officers in the midst of a trading dispute. At Wilkes's command, injured survivors crawled on their hands and knees, begging for his pardon. One of Wilkes's crew, Charles Erskine, was so stunned by the events that he wrote: "perhaps I may be pardoned for thinking it would have been better if the islands had never been discovered by Europeans; not that Christianity is a failure, but that our [Western] civilization is" (quoted in Perry 1994, pp. 52–53).

The political and commercial contours of the "American Pacific" era began to emerge with the help of the British-Chinese Opium War and the Treaty of Nanking in 1842. The US found itself in a disadvantaged position regarding Pacific trade routes due to concessions granted to Britain, but lobbied for extended rights and therefore achieved a stake in the Pacific on a par with European powers. Soon after, the signing of the Oregon Treaty in 1846 signalled the coming of the "American Pacific empire," when US freemarket liberalism would supplant established European powers (Dudden 1994, p. xix). In 1850, California was declared the 31st state in the Union, and the vaunted ideology of manifest destiny effectively became a geopolitical reality. As the balance of power shifted west, California became central to Pacific trade, with the west coast now at the heart of "the global space economy of capitalism that would continue for the next century and a half" (Soja 1989, p. 190). Closely linked to these economic shifts was the growth of US whaling routes, which Porter had staunchly defended. By midcentury, the importance of whaling was manifested in the US presence and investment in Hawai'i: the commercial plantation periphery to the emerging global centrality of the US.

The work of the literary figure perhaps most closely associated with the whaling industry, Melville, offers insights into some of the anxieties raised by US expansionism. Melville's *Typee* (1846) gestures towards antiinterventionism, and questions fundamental assumptions behind Western cultural hierarchies:

> The enormities perpetrated in the South Seas upon some of the inoffensive islanders well nigh pass belief. ... We breathe nothing but vengeance, and equip armed vessels to traverse thousands of miles of ocean in order to execute summary punishment on the offenders. On arriving at their destination, they burn, slaughter, and destroy, according to the tenor of written instructions, and sailing away from the scene of devastation, call upon all Christendom to applaud their courage and their justice. How often is the term 'savages' incorrectly applied! (Melville 1996/1846, p. 27)

Melville's ironic reversals threaten to turn the logic of the imperial "civilising mission" on its head. By the time of writing *Moby-Dick* (1851),

Melville had outlined an even clearer sense that the growth of the American Pacific would engender not just tactical violence, but ongoing commercialism, culminating in an Oceanic domination where "new built California towns, but yesterday planted by the recentest race of men" would be directly linked to "low-lying, endless, unknown Archipelagoes, and impenetrable Japans" via islands overrun by the demands of US markets (Melville 1994/1851, p. 456).

Driven by market forces, US expansion after the 1850s was largely linked to demands for guano, a highly profitable commodity used as fertiliser. With the "Guano Wars" and Guano Act of 1856, Washington's leaders declared the legality of claiming territory in the name of commerce:

> Whenever any citizen of the United States discovers a deposit of guano on any island, rock, or key, not within the lawful jurisdiction of any other Government, and not occupied by the citizens of any other Government, and takes peaceable possession thereof, and occupies the same, such island, rock, or key may, at the discretion of the President, be considered as appertaining to the United States. (quoted in Leff 1940, pp. 7–8)

Unincorporated territories such as Baker, Jarvis, Nikumaroro (Gardner), Fakaofo (Bowditch), and Howland islands, along with Kingman Reef and the Kalama (Johnston) Atoll, were taken under this provision. At the same time, copra (dried coconut for producing oil) was emerging as the primary industry in the region, with Germany holding the greatest stake. Increasing commercial competition over the coming decades had substantial effects on Pacific and migrant labourers, with black-birding (kidnapping indigenous peoples into slave labour) increasing through the 1860s.

As the commercial stakes got higher, a more clearly defined agenda emerged under Abraham Lincoln's secretary of state William Henry Seward, who envisioned the Pacific as central to the quest to develop a US "empire" that could gain control of world markets. Seward argued that the US could achieve global power through commercial competition, "depending not on armies nor even on wealth, but directly on invention and industry" (quoted in Paolino 1973, p. 4). Though Seward's wider ambitions were never realised

during his lifetime, shortly after the end of the Civil War, in 1867, he was responsible for bringing both Alaska and the Midway Islands under US control.

It has often been argued that as late as the 1880s, Washington was still exhibiting an ambivalent attitude towards undertaking extensive expansion in the Pacific. The US stake could be seen as meagre compared to European colonial networks', and its interests were largely limited to those of private shippers and traders. Donald Johnson and Gary Dean Best note that in the 1860s, Apia, Lauthala, Suva, and Papeete had US consular representatives, but even these numbers began to dwindle as France, Britain, and later Germany assumed control of various island groups. Though this diminished presence might be attributed more to the recovery period after the Civil War and the economic crash of 1873, rather than to a lack of official interest, Johnson and Best (1995, p. 123) argue that "there simply was no American colonial policy in the 1870s and 1880s, either in Congress or in the executive branch, although occasionally voices might be raised in favor of one or another expansive move."

A closer look, however, indicates that the US was hardly turning away from Pacific speculation but instead shifting focus onto a small number of strategic island sites. For Walter LaFeber, the years 1850–1889 can be viewed as the "roots of empire," a period of preparation for the imperial acquisitions of the 1890s (LaFeber 1998/1963, p. 55). US representatives successfully negotiated in 1872 for the use of the harbour at Pago Pago, and the close involvement of Albert B. Steinberger (a self-styled "special agent" of the US State Department who came to see himself as the future "arch-manipulator" of Samoan affairs) in the formation of a Samoan government in 1875 assured ongoing US influence in the midst of subsequent governmental power shifts (Davidson 1967, p. 60). By 1878, US interests were officially entangled in Samoa, and by the late 1880s the secretary of state, Thomas Bayard, was explicitly linking the US interest in Samoa to the strategic construction of a canal across Central America. It is not really possible, therefore, to separate the interconnected US designs on the

Pacific, Latin America, and the Caribbean. During this period, advocates of "preventive imperialism" urged for the acquisition of territories that were in danger of being taken by other nations, while illicit activities such as black-birding continued unabated.

Historians have contested the once commonly held notion that US imperial expansion during the 1890s should be seen as an aberration amid predominantly isolationist policies. Indeed, the scale of the events that took place over an 18-month period between 1898 and 1899 (when the US took possession of Hawai'i, the eastern islands of Samoa, Wake Island, Guam, the Philippines, Puerto Rico, and Cuba, the latter as an occupied country and protectorate) suggests that these actions were hardly isolated or anomalous. In Hawai'i, Queen Liliuokalani was overthrown in 1893 by American forces as a direct result of increasing commercial exploitation of the sugar industry, but the act was not a fait accompli. Grover Cleveland's investigation, the Blount Report of July 1893, found that US forces had conspired against the monarchy, and Cleveland opposed annexation due to the islanders' resistance. The subsequent Morgan Report of 1894, however, reversed Blount's conclusions and refused Liliuokalani's return to power, leading to an interim colonial administration headed by an open enemy of Hawai'ian self-rule, Sanford B. Dole. President William McKinley, who took office in 1897, also favoured annexation. In 1898, he succeeded, arguing: "we need Hawaii just as much and a good deal more than we did California. It is manifest destiny" (quoted in Morgan 2003, p. 225).

A member of the US Civil Service Commission, John R. Procter, summed up the momentous events:

> The year 1898 will be one of the epoch-marking years in the history of the United States. In this year is to be decided the great question of whether this country is to continue in its policy of political isolation, or is to take its rightful place among the great World-Powers, and assume the unselfish obligations and responsibilities demanded by the enlightened civilizations of the age. (quoted in Welch 1972, p. 21)

Procter invoked a "New Imperialism" rising from the ashes of European imperialism, and the

U

Pacific was seen as the natural extension of manifest destiny. For pro-imperialists such as Procter, the issue was not merely political, but also moral and even explicitly racial. Procter's invocation of battles in the Philippines praises the systems developed by "Teutonic ancestors," finding them regenerated in US beliefs and practices: "from the blood of our heroes, shed at Santiago and Manila, there shall arise a New Imperialism, replacing the waning Imperialism of Old Rome; an Imperialism destined to carry world-wide the principles of Anglo-Saxon peace and justice, liberty and law" (quoted in Welch 1972, p. 26). Indeed, as Peter Hulme argues, "as the nineteenth century progressed, US Americanism increasingly became an ideology based on the supposed moral and political superiority of the Anglo-Saxon peoples" (Hulme 2012, p. 59), a concept reinforced in a closely related notion of "English-speaking peoples." This privileged category was promoted in the writings of Teddy Roosevelt (the first volume of his *The Winning of the West* is titled "The Spread of the English-Speaking Peoples") and later persisted in prominent works such as Winston Churchill's *A History of the English-Speaking Peoples*.

The motives behind expansionism were summed up by McKinley: "there was nothing left for us to do but to take them all and to educate the Filipinos and uplift and civilize and Christianize them, and by God's grace do the very best we could by them as fellowmen for whom Christ also died" (quoted in Dudden 1994, p. 84). With these objectives, the president placed what Kipling had ironically labelled the "white man's burden" firmly into US hands, perpetuating and extending established European colonial networks. Vincent Rafael reminds us that the Philippines mission was characterised by McKinley's policy of "benevolent assimilation," which incorporated a nostalgic vision of manifest destiny while at the same time patronising Filipinos as the colonial children of the US, separating out the good ones from those labelled "insurgents" (Rafael 2000, pp. 21–22). More than 200,000 Filipinos (perhaps as many as a million) were killed during the ensuing Philippine-American war.

Often represented as a benevolent mission, US expansionism was underpinned by political and economic motives. For example, the watershed year of 1898 would see the founding of the American Asiatic Association, with its mission of working to "foster and safeguard American trade and commercial interests" (i.e., to lobby to protect US trade routes across the Pacific) and to "co-operate with religious, educational, and philanthropic agencies designed to remove existing obstacles to the peaceful progress and wellbeing of Asiatic peoples" (American Asiatic Association 1925, p. 709). In 1899, the Association's secretary pushed aside prevailing messages about the "civilising mission" and offered a blunter analysis of the Philippines' annexation: "had we no interests in China," he noted, "the possession of the Philippines would be meaningless" (quoted in LaFeber 1998/1963, p. 410).

There were, nonetheless, open concerns regarding the annexations of 1898–1899. The Philippines conflict, for example, led anti-imperialists such as William James to argue that any possibility of the US retaining a moral advantage in international politics was lost: "now (having puked up our ancient national soul after five minutes reflection, and turned pirate like the rest) we are in the chain of international hatreds, and every atom of our moral prestige lost forever." For James, the debate over expansion in the Pacific was "surely our second slavery question" (James 1972/1900, pp. 108–109), pointedly collapsing the presumed gap between far-flung imperialist aggressions and domestic racial policies by highlighting continuities between "external" and "internal" (or "foreign" and "domestic") subjugations.

Advocates for expansion nonetheless were gaining the upper hand in the war of rhetoric, arguing that what once had appeared to be limitless space for advancement within US borders was filling up. The transcontinental railroad, completed in 1869, had shrunk spatial perceptions of the continent dramatically, reducing the travelling time from the East Coast to California from an arduous journey of months to one that could be done in under a week. Furthermore, by 1890, the US Census Bureau would announce that the

western frontier had officially closed. A range of scholarly and literary works began to lament the loss of free land, indicating that a pervasive "frontier crisis" had entered US consciousness (Wrobel 1993, p. 29). At the same time, rapid industrial expansion contributed to "boom and bust" economics: depression struck in 1873–1878 and 1882–1886, and would return with force in 1893, lasting through 1897. Rekindling the visionary thinking of empire-builders like Seward, historian Hubert Howe Bancroft laid out plans for escaping what appeared an increasingly urbanised and unstable American continent by reinvigorating manifest destiny across "the new Pacific":

> The year 1898 was one of bewildering changes … Almost since yesterday, from the modest attitude of quiet industry the United States assumes the position of a world power, and enters, armed and alert, the arena of international rivalry as a colonizing force, with a willingness to accept the labour and responsibilities thence arising. (Bancroft 1912, pp. 12–13)

Bancroft then envisions the new America: "Thus the old America passes away; behold a new America appears, and her face is toward the Pacific!" (ibid.)

Yet the shift of US military and commercial power towards the Pacific was not merely the logical extension of the westward march of empire; it can be seen as part of the socio-spatial dynamics that Rob Wilson (drawing on Edward Soja) has called "peripheralization," where the spatial mastery and centralisation of one area becomes yoked to the commodification and distribution of power over peripheral areas. Hence Pacific islands like Hawai'i become linked as plantation and tourist resources to the growth of California as part of a closely integrated "global dynamic" (Wilson 2000, p. 94). This period further encompassed the rise of what Emily Rosenberg calls the ideology of liberal-developmentalism in US diplomatic policy: the adaptation of free-market enterprise as a fundamental principle for all nations, coupled with the growing acceptance of government intervention to protect private enterprise and speculation abroad. This ideology was aligning itself with both religious and secular senses of the US "mission" overseas: the Christianisation of non-Christians through radical conversion and the bringing of technological and professional know-how, or "progress," to "underdeveloped" peoples around the globe (Rosenberg 1982, pp. 7–9).

By the start of the twentieth century, New World powers such as Australia, New Zealand, and Japan, like the US, were jockeying for position in the Pacific amidst established European colonial powers. It was thus hardly surprising when, in 1907, a rumour circulated that the US wanted to buy Tahiti from France for $5 million, presaging the "dollar diplomacy" that would shortly hold sway under William Howard Taft's Administration. With the Panama Canal's completion in 1914 (after Panama, backed by the US warship *Nashville*, declared its independence from Colombia in early 1904), the US gained an enormous advantage in the global commercial arena. Powers such as France (their own canal project having foundered) had long held that the canal was the lynchpin to gaining dominance over Pacific trade routes. The French journal *Océanie française* stated: "The Panama Canal is not only an instrument of economic conquest. The Panama Canal will also create incalculable consequences. It will permit an active reaffirmation of the Monroe Doctrine, altered from its original intent now for the sole profit of the Americans" (quoted in Aldrich 1990, p. 261). The French clearly still felt the sting of the Monroe Doctrine's invocation which, starting in 1842, had prevented intervention in protectorates such as Hawai'i.

US investment abroad, both economic and psychic, proceeded apace: between 1897 and 1914 (before the First World War forced a temporary slowdown), US direct investments in overseas companies increased fourfold, while the immense popularity of missionary societies like the YMCA, "rushing to convert the world to American-style Christianity within their lifetimes," continued to gain ground (Rosenberg 1982, p. 28). When the War came, it did not spare the Pacific: in 1914, Australian troops fought German and Melanesian soldiers in New Guinea, while soon after, a German ship

bombarded Tahiti, rather than Samoa, due to the "high esteem" German naval commanders held for its population (Hiery 1995, pp. 23–27). The Pacific, the strategic crossroads of competing powers, would in just over 20 years' time end up as a theatre of war, where the simmering imperial conflicts would be fully acted out.

Robert Aldrich refers to the period between the World Wars as the apogee of colonial power in the Pacific: a time when the *idea* of colonialism reached its zenith, when expansionist lobbyists and new modes of technical reproduction were disseminating images of colonial ideology more widely than ever before (Aldrich 1990, p. 273). But tensions were visible: the policies of New Zealand administrator Brigadier General George Spafford Richardson in Samoa initiated the rise of the anti-colonial movement the *Mau* (Samoan for holding fast), with violent skirmishes between New Zealand police and *Mau* protestors in the late 1920s. The *Mau* movement was also active in American Samoa, which was still under US Navy rule (Margaret Mead, famously, lived in a Naval dispensary with an American family while researching *Coming of Age in Samoa* [1928]). Under US rule, Samoans still faced the prohibition of interracial marriage, and there were disputes relating to pay for workers in the copra trade and Samoan police guard. In 1929, in response to direct Samoan pressures, the US government changed the status of the territory from that of an "illegal" to a "legal" colony (Droessler 2013, p. 62).

As the Great Depression hit, US expansionism appeared to slow in terms of markets and territorial acquisitions, but at the same time tourism was helping to propagate the Pacific idyll in the popular imagination: by the 1930s, unprecedented numbers were embarking on luxury ships for "round the world" cruises. Pacific crossings included stopovers at ports that had long underpinned imperial trade networks. The establishment of Matson Lines' famous "white ships" (the S.S. *Malola* was launched in 1927 and the S.S. *Mariposa* in 1931) linked the east and west coasts of the US, via the Panama Canal, to Hawai'i, Samoa, Fiji, New Zealand, and Australia, reflecting the escalation of mass tourism and a substantial increase in tourist traffic through Pacific ports (the "white ships" perhaps echoing Theodore Roosevelt's Great White Fleet of battleships, also painted white, sent to circumnavigate the globe in 1907 in a show of US military prowess). At the same time, commercial air travel was becoming a feature of modern life: in 1935, Pan American Airlines began services between San Francisco and Manila, with the *China Clipper* airplane becoming a symbol of national pride.

US military expansion also continued. The Panama Canal was widened in the mid-1930s to accommodate larger warships, and military installations on key sites such as Samoa were further developed, with the construction of a naval airbase and advanced fortifications at Pago Pago harbour in 1940. When the Japanese attacked Pearl Harbor on 7 December 1941, the US immediately entered the Second World War; within days, thousands were flooding army recruitment stations to enlist for war, reflecting the powerful military, territorial, and psychic roles that Pacific island territories were playing in US life. Strategic planning in the run-up to war would prove enormously beneficial, when island bases served as supply sites and staging grounds for years of fierce air, sea, and land battles (a period of total militarisation of the "Pacific theater" of war) as the US and its allies battled Japan for Pacific mastery. As Rob Wilson notes, the *idea* of the "American Pacific" began to take root as early as imperialist struggles for Samoa and Hawai'i during the late 19th century, but it was realised only after these Second World War battles, when the US defeated Japan and took control via "strategic trust" in Micronesia and other territories of interest (Wilson 2000, p. 106).

Immediately following the war, the psychic hegemony of the American Pacific was so complete that James Michener's *Tales of the South Pacific* (1947) could represent the Pacific's "trivial islands" as essentially nostalgic playgrounds for American soldiers and their "native" love interests (quoted in Lyons 2006, p. 28). The new "American Pacific" became the sum of a US vision won through commerce, missionary work, and ultimately military conflict on an unprecedented scale. As constructed after the post-war

seizing of territories from Japan, it came to include the Marshall Islands, Belau, the Federated States of Micronesia, the Northern Marianas, Guam, and American Samoa. As of 1990, there were nearly 300,000 US military personnel based in the "Pacific theater," with the Department of Defense spending roughly $16.8 billion (US) to support its presence there (United States Government Accountability Office 1991). This military presence remains the war's most profound and controversial legacy, with whole islands having been used as test sites for nuclear arms, and others (such as Kalama Atoll) becoming military dumps for chemical weapons. At least 66 nuclear tests were conducted in the Bikini Atolls, held under the unprecedented legal arrangement of a "strategic trusteeship." Moved to make way for "Operation Crossroads," the first detonation of a nuclear device since the bombing of Nagasaki, the people of Bikini would experience a series of displacements that enacted severe physical and emotional hardships. They were moved to Rongerik Atoll, where mass starvation ensued, then to Kwajalein Atoll, living in tents alongside a military airstrip, and then finally to Kili Island, a tiny outpost without a lagoon for fishing, hence inadequate for supplying food. The majority remain there due to residual nuclear contamination.

The story of the Bikini islanders exemplifies the economic dependency, environmental degradation, and military dominance that still mark the US presence in the Pacific. In spite of their cultural richness, economic hardship (unemployment in American Samoa approaches 30 per cent) in various territories has led to an unusually high proportion of people seeking work in the US armed forces, with disproportionately high casualties in recent wars as a result (American Samoa has its own military recruiting station in Utulei). In unincorporated territories such as American Samoa and Guam, there are ongoing calls for political representation with full US voting rights, as well as movements calling for greater political autonomy, and independence.

Saleable terms such as the "Pacific Rim" and transnational "Asia-Pacific" markets have begun to absorb and supplant concepts such as the American Pacific. Fijian writer Subramani (1985) has argued that even a seemingly monolithic term like "American Pacific" has nonetheless long formed part of a broader, multicentred Pacific region that speaks to and has confronted a range of imperial centres. Works such as Vanessa Warheit's and Amy Robinson's film (and internet blog) *The Insular Empire* (2010), made in the Marianas, has addressed related issues of the paradoxes of presumed isolation versus actual transnational and transcultural interactions, charting everyday life in the still largely ignored spaces of empire. Barack Obama, raised in Hawai'i and hence, as Holger Droessler puts it, "America's first Pacific President," declared in a speech to Japanese leaders in November 2009 that the United States "is a nation of the Pacific; Asia and the Pacific are not separated by this great ocean, we are bound by it." The centrality of Asia to US foreign policy has thus led to the blurring and renewal of two distinctly twentieth-century terms ("American Pacific" and the "American Century"), with the twenty-first century being labelled as "America's Pacific Century."

US imperialism; History; Nineteenth century; US colonialism; Expansionism; Manifest destiny; Anti-imperialism

Definition

During the nineteenth century, the United States was transformed from a nation mostly hugging the Atlantic coast to an empire stretching across a continent with possessions in the Caribbean and Pacific. Despite the scale of US expansion, at no point was it an inevitable Manifest Destiny. Almost every imperial venture was met with resistance, both from those on the periphery being annexed and from people in the metropole who were opposed to a particular takeover. Some scholars see strong continuity throughout the century, arguing that the motivations and strategies used to suppress Filipino insurgents were in accord with those used to conquer Mexican territory and subdue Indian tribes. Other scholars emphasize the distinctiveness of different phases of American imperialism, arguing that specific political and economic contingencies determined whether the United States was able to assert control over a territory such as Texas in 1846 or

Hawaii in 1898. This entry examines the continuities and ruptures at play in American imperial expansion, with the nineteenth century broken up into three periods: 1800–1836, 1836–1865, and 1865–1898.

During the nineteenth century the US was transformed from a nation mostly hugging the Atlantic coast to an empire stretching across a continent with possessions in the Caribbean and Pacific. Despite the scale of US expansion, at no point was it an inevitable Manifest Destiny. Almost every imperial venture was met with resistance, both from those on the periphery being annexed and from people in the metropole who were opposed to a particular takeover. Some scholars see strong continuity throughout the century, arguing that the motivations and strategies used to suppress Filipino insurgents were in accord with those used to conquer Mexican territory and subdue Indian tribes. Other scholars emphasise the distinctiveness of different phases of American imperialism, arguing that specific political and economic contingencies determined whether the US was able to assert control over a territory such as Texas in 1846 or Hawaii in 1898. This essay will deal with the continuities and ruptures at play in American imperial expansion, with the nineteenth century broken up into three periods: 1800–36, 1836–65, and 1865–98.

Jefferson's 'Empire of Liberty' (1800–36)

In 1800 the US was one empire among many in North America. To the north, the British controlled Canada. In the west, the US faced two imperial competitors, as Spain ruled Mexico (including much of what would become part of the US in the 1846–48 Mexican War), and France had managed to regain Louisiana Territory. To the south, European powers had carved up the Caribbean, and throughout the century American leaders anxiously watched for an opportunity to grab some of these island possessions for themselves. France was eliminated as a major competitor in North America when it sold its territory to the US in the 1803 Louisiana Purchase. For a little over $11 million, the American empire gained

over 800,000 square miles. President Thomas Jefferson recognised this as a major windfall for what he sometimes called an 'empire of liberty', but the purchase also highlighted anxieties over imperial consolidation that would continue throughout the century (Onuf 2000: 3–9). Although most Americans lived in the eastern states, the population of the western territories grew quickly; how to exert influence over such a vast territory was a constant concern among national leaders. The US had been created out of a colonial periphery resentful of an imperial metropole, and many of the former revolutionaries worried that westerners would develop the same of rebellious attitude towards the east (Onuf 2005: 43–45).

The Territorial System

American empire building was a mix of public and private initiative, with governmental authority promoting the spread of settlers. Key to this project was how new territories were politically organised. In the territorial system, the federal government shaped local institutions and had ultimate authority over the populace. Local power cliques of landowners, merchants, and lawyers developed within the territories, but those cliques derived power from their connections with federal officials. The western territories relied on federal law to substantiate their property claims, and on federal troops to protect them from other empires or Native Americans. In the control that it exerted by appointing governors and providing protection, the federal government was following a tradition inherited from the relationship of Britain to its colonies.

The difference between the two relationships was that the territorial system ended in statehood. When the population of an organised territory reached 60,000, the territorial legislature could apply for statehood. The governments and constitutions of these new states tended to be modelled on those of states that had already been admitted, in part because congressional approval was required before a territory could be granted statehood. Once admitted into the Union as a state, a former territory would legally have the same

U

privileges and sovereignty as any other state. In reality, the western states often resented the amount of political and economic strength that the eastern states held over them, but this resentment was rarely large enough to break ties built in the territorial stage (Eblen 1968: 18–23).

This imperial expansion was especially striking given the tiny size of American military forces for most of the century. Fear of standing armies had deep resonance within American culture, with most Americans afraid that a large army would subvert republican institutions. During a conflict such as the American Civil War the military would expand, but it would swiftly contract once the specific war was over. Often imperial missions, such as expeditions against native tribes, were not undertaken by the regular army, but by citizen militias within a given state or territory. Full political citizenship was tied to the potential to serve in the militia, and the exclusion of particular groups, such as women and blacks, from militia service was often used as an argument to exclude them from the ballot box as well.

Imperial Fits and Starts: The War of 1812, Spanish Florida, and the Monroe Doctrine

Many Americans looked to the north as an obvious place to expand the American empire. Resentment towards Great Britain remained strong after the War for Independence, and many hoped to push England off the continent for good. Part of the Continental Army had invaded Canada during the War for Independence, and after war was declared on England in 1812, Americans tried invading again, with no more success than their armies had had in 1775; Canadians had little desire to join the US. Even French Canadians, who often resented the imperial authorities of London, saw the US as a cultural empire deeply hostile to Catholicism (Taylor 2010: 15–30). America's first nineteenth-century attempt at conquering the territory of another empire failed, and the Treaty of Ghent in 1815 restored the antebellum borders between the two empires. Despite this, many Americans throughout the nineteenth century, particularly northerners, hoped that annexation of Canada would be only a matter of time. Surrounding Canada was one intention of Secretary of State William Seward's 1867 treaty to purchase Alaska from Russia; Seward and others believed that the economic ties between the US and Canada made annexation inevitable.

The War of 1812 failed to remove an imperial competitor from the continent, but American leaders continued to try to find opportunities to pick off new territory, often with the aim of securing their borders. In 1817–18, General Andrew Jackson seized much of Florida from Spain during his campaign against the Seminole Indians. Jackson and others argued that the decaying Spanish Empire had failed to police Florida, which had become a haven for criminals, hostile Indian tribes, and runaway slaves. Members of the federal government debated how to respond to Jackson's extralegal venture. Pressured by the US, Spain sold the territory through the Adams–Onís Treaty negotiated in 1819 (Eblen 1968: 5).

The US not only tried to expand at the expense of other empires, but also acted to dismantle those empires in the hemisphere. With the Monroe Doctrine, set out in 1823, the US proclaimed that it would prevent any European attempt to reassert control over the former Spanish and Portuguese territory that had won independence. Despite such an ambitious warning to European powers, the US lacked the economic and military might to enforce such a policy of non-interference. There were also limits to what types of revolution in the Western Hemisphere the US would embrace. When the slaves of Haiti achieved independence from France in the first decade of the century, the US failed to recognise the nation until the American Civil War. Although it claimed to be an empire of liberty, much of the empire had reason to fear the encouraging of a slave revolt (White 2010).

Native American Resistance and Adaptation in the Early Republic

Although the 1815 Treaty of Ghent restored a territorial balance between two North American empires ruled by whites, it undercut the power of

Indian tribes in the northwest and south-west to negotiate their way through imperial squabbles. Since long before American independence, Indian groups such as the Iroquois Confederacy had retained their position through playing European empires off each other. For example, neither France nor Britain was able to gain hegemony in the Great Lakes region during the seventeenth century, and therefore both were forced to co-operate with a variety of Indian tribes (White 1991: 50). This worked as long as one imperial power was unable to assert a monopoly of power over an area without being checked by another.

In the north-west this balance was already breaking down in the years preceding American independence, as Britain had pushed France out of Canada in 1763 and more and more settlers penetrated the west. Most Indian tribes who involved themselves in the struggle between England and her colonists fought for the British, realising that an American empire would promote settlement expansion at the cost of Indian land. After the War for Independence, many north-west Indian tribes continued to resist American expansion, winning victories against the regular US army in Harmar's Campaign in 1790 and St Clair's Defeat in 1791. Still, by the 1800s the north-west tribes were outgunned and vastly outnumbered by American settlers. Some Indian leaders such as Tecumseh of the Shawnee hoped to re-establish the old balance-of-power system, this time with the US and Britain taking the roles that France and Britain had previously filled. In the War of 1812, most of the north-west tribes again fought for Great Britain, and again they found themselves let down by how little their imperial allies were willing to support them. Tecumseh died fighting American troops at the Battle of the Thames in 1813, and soon after this many of the Indians in his alliance surrendered. After the war, the capacity of the north-west Indians to slow down American expansion was greatly reduced (Taylor 2010: 203–235).

Native reaction to American expansion was not monolithic, and military resistance was only one method by which Indian tribes negotiated their position within the American empire. Americans' positions on the status of Indian tribes

within the empire were equally diverse. Western politicians usually took the harshest line, advocating that Indian tribes were an alien influence that should be pushed as far west as possible and that the land that Indians occupied rightfully belonged to settlers. Others argued that Indians did not need to be destroyed, but should be 'civilised' to the point at which they took on the ways of American farmers. President Jefferson himself embodied this ambivalence towards Indians, in that he lauded the possibility of their mixing and becoming blended into white society, while at the same time holding that Indians who resisted such assimilation would have to be destroyed (Wallace 1999).

Some tribes tried to strike a balance between accommodation and tribal integrity, including the so-called Five Civilized Tribes who resided in the south-west: the Cherokee, the Chickasaw, Choctaw, the Seminoles, and the Creek. The Cherokee, who lived primarily in what is now north-west Georgia, adopted many of the cultural badges of southern white society, including a written language, Christianity, republican government, settled agriculture, and slave-owning.

This accommodation did not stop Georgian settlers from demanding their land. One by one the civilised tribes were forced to move west into Indian Territory (now Oklahoma). By the 1830s squatters found support from both the Georgia legislature and the administration of President Andrew Jackson. For years Cherokee leaders such as Chief John Ross tried to maintain their awkward position within the empire not through military resistance, but through court appeals. In the 1832 Worcester v. Georgia decision, the Supreme Court under Chief Justice Marshall ruled that the sovereignty of the Cherokee deserved federal protection. President Jackson ignored the ruling and supported the Treaty of New Echota, which agreed to the selling of Cherokee land, even though the document was signed by only a small number of tribal members unelected to political office. In the resulting Cherokee diaspora, also known as the 'Trail of Tears', several thousand Cherokee died on their way to Indian Territory (Burbank and Cooper 2010: 268).

U

Historians favouring Jackson have held that although the Trail of Tears was tragic, there was little a small federal government could have done in the wake of waves of private US citizens moving into Cherokee lands (Remini 2001: 279–281). However, the mix of private initiative and public support was indicative of US imperialism during the nineteenth century. Like any imperial venture or consolidation of the time, American society was divided on whether or not to support it. Other than in the Supreme Court, the Cherokee found allies among many northerners, including clergymen who hated the idea that a Christian tribe could be targeted for removal. Even some westerners protested against the seizure of Cherokee land, including Congressman David Crockett, who broke with his former ally Andrew Jackson over the issue. The removal treaty itself was passed in the Senate in May 1836 by only a single vote. Just as there was a continual impulse of imperial venture throughout the century, so was there a continual anti-imperialist tradition.

Slavery's Imperial Reach (1836–65)

For much of the nineteenth century, sectional divisions between North and South shaped imperial expansion. At the start of the century, most Americans believed that slavery was a dying institution. The cotton boom changed that. New technological developments like the cotton gin allowed new types of cotton to be grown far away from the coastline. At the same time, demand in Northern and European textile industries increased the profit in producing cotton. Slavery went from being viewed by Southerners as a necessary but dying evil to being seen as a system responsible for the US's most valuable commodity. Although most Northerners and Southerners in the early part of the century agreed that slavery was to be handled on a state level, the federal territorial system meant that slavery's fate was at stake each time Congress supervised the construction of a new area's institutions. With the change of each new territory into a state, the sectional balance between free and slave changed. The Missouri Crisis in 1820 brought sectional

politics to the fore, and the compromise reached provided a line to divide the empire between free and slave territory. From then on, any new imperial acquisition would bring with it the potential of undermining the sectional compromise.

Settler Imperialism: Texas and the US–Mexican War

Many Southern settlers brought their slaves with them when they moved into the Mexican territory of Texas. At first the Mexican authorities encouraged Americans to settlers the sparsely populated north, but they soon realised that the numerous white immigrants were a threat to their control of the region. In 1836 Texas declared independence, with most of the revolutionaries hoping for annexation by the US. Texas won its war, although Mexico refused to recognise the new government. For a decade Texas was an independent country, and during this time annexation was frequently debated in Congress.

In 1844, the Democrat James Polk ran for president on a platform urging the need to both annex Texas and put the majority of the Oregon territory (also claimed by the British) under the American flag. Soon after his election, Texas was officially annexed by the US. US troops under General Zachary Taylor were sent to secure the new border, which Polk had decided was at the Rio Grande. The resulting US–Mexican War (1846–48) ended in US victory as federal armies occupied north and central Mexico, including Mexico City. Although the US won nearly all the conventional battles against the Mexican army, the invading armies faced resistance from Mexican guerrillas and Indian tribes as the war continued.

Although the war had started as a means to annex Texas, the territorial ambitions of President Polk increased further as the US troops moved further into Mexico. In cabinet meetings there was even talk of annexing all of Mexico. Unfortunately for Polk, the emissary whom he had sent to Mexico City to dictate a peace, Nicolas Trist, became more and more disgusted with the war and more sympathetic towards the Mexican people

(Greenberg 2012). From the cables that Trist sent back to Washington, Polk realised that Trist was no longer his man. He recalled him, but Trist refused to leave Mexico before he had finished negotiating the Treaty of Guadalupe Hidalgo. The treaty specified that for $15 million, the US would gain Texas, California, and most of the territory that would eventually become Colorado, Arizona, Wyoming, Utah, New Mexico, and Nevada, but would not annex most of the Mexican territory that the US army now occupied. Polk thought of rejecting the treaty, but growing opposition to the war forced him to recognise that there was little political profit in continuing the war with Mexico.

Even before the war had concluded, Americans were deeply divided about what to do with the newly conquered territory. In August of 1846, Congressman David Wilmot, a member of Polk's party and not in principle opposed to the war, added a proviso to a war bill declaring that slavery would not be permitted to spread to territories conquered from Mexico. Controversy exploded over the bill: Southerners attacked it as undermining the property rights vital to an empire of liberty, while Northerners jumped on Southern opposition to the proviso as evidence that the war had been started only as a way to further the power of slaveholders.

Filibusters in the Caribbean and Central America

After the Mexican War, Manifest Destiny took on a sectional character. Slaveholders worried that they were becoming demographically outnumbered by the population of the free states. The only way to maintain influence over the federal government was to take new territory and reintroduce slavery to those places. Throughout the 1850s groups of individuals known as filibusters raised private military expeditions in attempts to conquer new areas in Latin America, including northern Mexico. Even on the eve of the Civil War, the Texan governor, Sam Houston, seriously considered leading an army into northern Mexico in order to project US power (May 1973).

Filibusters usually hoped that the American flag would follow their new private conquests. Texas served as a model, and Central America and the Caribbean were often the targets of these pro-slavery ventures. In 1856, the American adventurer William Walker invaded and became dictator of Nicaragua for a short time, before an alliance of neighbouring powers along with Nicaraguan opposition overthrew him. Not to be dissuaded, the would-be king returned to the US to raise money and armies. Walker tried on two other occasions to retake Nicaragua, eventually being captured and shot by his supposed subjects. Throughout the South, slaveholders and politicians praised filibusters like Walker.

Cuba was another target for possible expansion of US slavery. By the 1850s, it was one of the few places in the Western hemisphere (along with the US and Brazil) where slavery was still permitted. Many Southerners hoped to annex the island before the Spanish Empire was pressured by the British to abolish slavery. The 1854 Ostend Manifesto, written by US diplomats including the future president James Buchanan, argued that the US should make every effort to buy Cuba from Spain. The diplomats went further. If Spain was unwilling to sell Cuba to the US, then the US should not exclude military takeover of the island (May 2002: 54). The failure of these filibuster movements in the 1850s is a testament less to delusional fantasy than to the determined resistance from the peoples in places such as Nicaragua, combined with a growing coalition of anti-slavery political forces in the North. In the past, private venture had been combined with governmental support for annexation. As the 1850s progressed, North and South could no longer agree on what type of empire the government should promote; the resulting Civil War of 1861–65 can be seen as an imperial crisis.

Consolidation of the West and Pacific Expansion (1865–98)

After the Civil War the relative positions of the main political parties towards imperial expansion switched. Southern Democrats, the same faction

U

that had been ardently expansionist before the Civil War, tended to be suspicious of proposed new conquests in the Gilded Age. Some of this may have come from partisan rivalry, since Republicans held the presidency for most of the time in the decades following the Civil War. The Republican Party included most supporters of imperial expansion, such as Theodore Roosevelt. Many within the party, however, were highly suspicious of empire. Former anti-slavery advocates such as Carl Schurz felt that a republic that had shed hundreds of thousands of lives in the name of demolishing slavery had no business to subjugate new peoples (Beisner 1968: 18–34).

Imperial Consolidation and Eyeing the Caribbean and Pacific

Latin America continued to be an area of interest for American policymakers after the Civil War. Americans continually worried that another empire would take over Mexico if they exerted control over their neighbours. During the Civil War these fears were realised when France set up a puppet regime under Emperor Maximilian. After the Union won the war, an army was sent to the Mexican border in order to both arm rebels fighting against Maximilian and threaten US intervention if France did not withdraw its troops, which it did. As usual, the US's interference in Latin American politics was motivated partially by a wish to prevent other empires from becoming further involved in the New World (Grandin 2007). In 1869, President Ulysses Grant submitted a treaty to the Senate for the annexation of the Dominican Republic, but this time annexation failed to find sufficient congressional support. The failure of the treaty showed that the anti-slavery forces of the antebellum era were divided about whether the US should expand now that the federal government was no longer in the hands of slaveholders.

Advocates of annexation also looked to Asia as a possible direction for the growth of the empire. American involvement in the Pacific predated military annexation: by the early 1800s,

American traders and whalers roamed the Pacific, establishing economic ties with the places where they landed, and missionaries from New England saw Pacific islands as places to spread their culture. In 1854, Commodore Perry had used his naval force to pressure the insular Japanese government to open up markets to Westerners. Places such as the kingdom of Hawaii were accustomed to an active US presence (Cumings 2009: 88).

Americans had looked to Hawaii as a possible conquest since the 1850s, but sectional divisions and British interference had prevented the US from annexing the island chain. In 1893, a group of American citizens, many of them sugar planters, organised a coup against the Hawaiian monarchy. Within a month of the 1893 revolution (or coup), President Harrison submitted a treaty of annexation to the Senate. Harrison put forward the treaty within the last few days of his administration, and for several months his successor, the Democrat Grover Cleveland, was unsure whether he would support it. Upon receiving reports about the heavy US involvement in the 1893 coup from fact-finders sent to the islands, Cleveland withdrew the treaty. His successor, William McKinley, pushed for the annexation of Hawaii, although it took him until the summer of 1898 to persuade enough senators and congressmen to agree to a resolution making the islands a US territory (Osborne 1981).

The US declared war on the Spain in the same year. The immediate cause was the supposed Spanish sinking of the USS *Maine,* which had exploded while in Havana harbour. Despite flimsy evidence that the cause of the explosion was Spanish action, newspapers throughout America demanded that President McKinley avenge the lost American lives. Other reasons had also attracted US attention to the island. For decades groups of Cubans had fought for independence from Spain; many Americans felt sympathy for these rebels. The US was also heavily invested in Cuban infrastructure and agriculture. Some of the investors worried that continued revolutionary bloodshed would put their business at risk, and saw US intervention as the fastest way to stabilise the region. Once war was declared, the US

quickly won after seizing Cuba, the Philippines, and Puerto Rico. Many pro-war Americans downplayed the aid that their armies had received from Filipino and Cuban rebels. Within a short time, the US army found itself in a guerrilla war with Filipino rebels that would continue into the twentieth century.

Debating the Impetus of 1890s Expansion

Expansion was a much-debated issue within 1890s American society, and there was no clear indication of who would back Hawaiian annexation or intervention within Cuba and who would not. Anti-imperialists came from a variety of backgrounds. Labour leaders such as Samuel Gompers thought that cheap colonial labour would demean the value of the American working man and undermine the nascent union movement (Appel 1954). On the other side of the economic spectrum, the steel magnate Andrew Carnegie joined the Anti-Imperialist League and advocated Filipino independence. Racism was one reason for anti-imperialism, as many feared the effects of mingling with the peoples of Asia and the Caribbean. While nativism was always present in American society, in the Gilded Age federal legislation targeted people coming to America from the Pacific Rim, starting with the Page Act of 1875 and culminating with the Chinese Exclusion Act of 1882 (Lee 2003: 30). If such laws were meant to protect American society from alien influences, anti-imperialists asked, what would be the possible benefit in annexing a territory like Hawaii, with tens of thousands of Asian labourers? As in the arguments against expanding the slave empire in the 1850s, antiexpansionist ideologies in the 1890s blended racism and humanitarianism.

Historians remain divided on why it was that in the 1890s, despite the musings of leaders and newspaper editors for decades, the US expanded into the Pacific and Caribbean. One strand of scholarship, exemplified in the work of William Appleman Williams, Walter LaFeber, and

Thomas L. McCormick, points to domestic economic anxiety as a cause. The second half of the nineteenth century was full of economic booms and busts, and many people at the time believed that busts happened whenever production of agricultural goods or manufactured goods outstripped domestic demand (LaFeber 1963: 78). Capitalists hoped to solve the imbalance of production of demand through expansion into foreign markets. The difficulty was finding a large untapped market. By the 1890s, American production already heavily penetrated Latin American markets, and any further expansion into Europe would come with fierce competition. Americans looked increasingly to Asia, and particular China, as a place for crops and manufactures to go. In order to exercise American influence into Asia, colonies would be useful as both trading ports and coaling stations for American ships. Key to reaching these Asian markets would be a canal across the isthmus of Central America (built with American capital), which would connect east coast ports to new areas of the globe. Controlling the canal would require securing the Caribbean, which meant taking Cuba and Puerto Rico. The goal would not be to annex permanently places like the Philippines permanently, but to establish an informal empire of economic and military control, exercised through friendly pro-US governments (McCormick 1967). The scholars who articulated this interpretation were part of the New Left and saw precedents for the Cold War politics of the US in the choices made by Americans in the 1890s.

While the New Left's diplomatic history has had a large degree of influence, criticism of an economic explanation for 1890s imperialism has come from several directions. Some scholars, including Robert Zevin, have emphasised geostrategic reasons for American expansion. Americans of the time such as Theodore Roosevelt or Henry Cabot Lodge saw the US as a young power capable of exerting just as much influence on the world stage as European empires. Such men were influenced by the work of Admiral Alfred Mahan, who argued that throughout history naval power had been what conferred power on the world stage; to compete against other empires, Mahan

U

and his acolytes stated, the US should expand its navy and find outposts like Hawaii and the Philippines to serve as naval bases. Historians focusing on strategic reasons for imperial expansion argue that while Mahan and others occasionally made economic arguments, these were to shield their real motive of building up a strong military (this debate is covered well in Fry 1996).

Other historians such as Kristin Hoganson argue that cultural factors for imperialism must not be discounted in the face of economic or political ones. Hoganson (1998) points to rhetoric of the 1890s that lamented the closing of the western frontier and how this meant that American men no longer had a way to challenge their manliness. This crisis over masculinity translated into jingoistic language. Politicians who were against imperial expansion were open to accusations of effeminacy, which were deadly in a time where manhood was considered essential to having a political voice. Even the president was open to such a criticism; during the Cuban crisis McKinley's perceived hesitance to intervene in Cuba was attacked as indicative that the Civil War veteran had as much manly courage as an old woman. Anti-imperialists also made use of gendered language, arguing that wars in places such as the Philippines would sap the virtue of American males.

While scholarly debates over the particular contingencies of American imperialism continue, our understandings of what motivated imperialists and anti-expansionist have become more complex, and undermine any idea of necessity or Manifest Destiny. Each step of nineteenth-century imperialism was a contest, eschewing any simple explanation of American empire.

▶ Nuclear Imperialism

United States War in Vietnam, 1954–1975

John Marciano
SUNY Cortland, Cortland, NY, USA

Introduction

The US War in Vietnam was a long, horrific attack against the people and land. Nearly four million Vietnamese were killed, thousands of peasant villages and a traditional way of life were destroyed, and millions of acres of cropland and forests were devastated and poisoned from bombing and chemical warfare. More than 58,000 Americans died, and at least 304,000 were wounded in a criminal war that produced the greatest military and citizen dissent in US history.

The Imperialist Roots of the War

For many Americans, historian Gabriel Kolko writes, the war was "the turning point in their perception of the nature of American foreign policy, the traumatic event that required them to look again at the very roots, assumptions, and structure of a policy that is profoundly destructive and dangerous" (Kolko 1969, p. xi).

Imperialist aggression against Vietnam was directed by the elite managers of the US national security state. The historical record confirms Kolko's thesis that "political power in American society is an aspect of economic power." International policies ultimately rest on this economic power, since the USA is "a capitalist society based on a grossly inequitable distribution of wealth and income that has not been altered in any essential manner in this century" (Ibid., p. 6, 9).

Especially since the end of the Second World War, the elite class associated with top corporations and law firms have organized and orchestrated imperialist wars and used "military power . . . to advance their enormous and ever-growing objectives. . . ." They require "a vast Military Establishment that is the logical, necessary effect rather than the cause of the basic objectives . . . of American foreign policy. . . ." (Ibid., p. 27). Fundamental to maintaining US imperialism, therefore, is the "advancement of American capitalism and an open field for development in the Third World. . . ." (Ibid., p. 79).

Historian Michael Parenti asserts that "imperialism" is the active "process whereby the dominant" class of one nation "expropriate for their own enrichment the land, labor, raw materials, and markets of another people." The ultimate aim is to serve the interests of multinational corporations and their owners. Frequent and massive terror is used to "prevent alternative, independent, self-defining nations from emerging" that might threaten the USA, that is, class, control (Parenti 2010).

Noam Chomsky challenges the dominant view that US wars represent the "national interest" or "national security." Following Kolko and Parenti, he asserts that to understand the foreign policy of any state, we must investigate "the domestic social structure. Who sets foreign policy? What interest do these people represent? What is the domestic source of their power?" (Chomsky 2003a, p. 93). It is a "mystification to speak of the nation, with its national purpose, as an agent in world affairs," because US foreign policy "is designed and

U

implemented by narrow groups who derive their power from domestic sources. . .. Top advisory and decision-making positions relating to international affairs are heavily concentrated in the hands of representatives of major corporations, banks, investment firms, the few law firms that cater to corporate interests. . .." (Ibid., p. 98).

US imperialist interventions since 1945, the late former State Department official and historian William Blum writes, have been designed to keep "the world open and hospitable for . . . American-based transnational corporations, . . . preventing the rise of any society that might serve as a success example of an alternative to the capitalist model, and extending [class] hegemony over as much of the globe as possible.. . .." (Blum 2000, pp. 13–14). The "targets of American intervention" that have suffered "the wrath, and often the firepower, of the world's most powerful nation" in virtually every case have been nations in Third World. Their crime has been "a policy of 'self-determination': the desire, born of perceived need and principle, to pursue a path of development independent of U.S. foreign policy objectives" (Blum 1995, p. 15).

The late Carl Oglesby, scholar-activist and a leader of the SDS anti-Vietnam War movement, placed the guiding premises and objectives of US policy (defending "the Free World," democracy, the domino theory) in an economic and political context which argues that the real reasons for US involvement in Vietnam were imperialism and counterrevolution. The "issue of the Vietnam war is not Western freedom versus Eastern slavery but foreign versus local control of Vietnam. . .. [The] war is being fought to determine how and by whom the Vietnamese political economy is going to be developed" (Oglesby 1967, p. 112).

According to historian Roxanne Dunbar-Ortiz, the imperialism that Blum, Chomsky, Kolko, Parenti, and Oglesby critique ultimately rests on white supremacy: It is "the working rationalization and ideology of English theft of Native American lands, and especially the justification for slavery." The history of this imperialism, therefore, cannot be fully understood without confronting the genocide that Washington committed against indigenous peoples. White supremacy has been the core premise of US imperialism "from the origins to the present"; and white-supremacist imperialism is "inseparable from the content of this origin story and the definition of patriotism today" (Dunbar-Ortiz 2014, p. 9). The "very origin of the United States is fundamentally imperialist and racist, rather than imperialism being a divergence from a well-intentioned path" (Dunbar-Ortiz 2003, p. 3–4).

French Colonialism and the Origins of the US War in Vietnam

The roots of the US War in Vietnam are linked to French colonialism, commencing with the French army seizure of Saigon in 1859 and the complete occupation by 1884. Following their long history of struggle against foreign invaders, the Vietnamese resisted the French for the next 70 years.

French colonial rule was built on brutal economic exploitation but was justified on the grounds that it provided "material advancement and moral uplift – by performing . . . a 'civilizing mission.'" It profoundly changed life for the overwhelming majority of Vietnamese while enriching a tiny elite who served France – as the gap between the wealthy few and the many poor grew (Lawrence 2008, pp. 11–12). Out of this oppression, however, arose a Communist-led nationalist movement (the Viet Minh) that would defeat French colonialism.

As Vietnamese resistance increased, the French became the protector of the "free world," a defender against communism. The Truman and Eisenhower administrations supported them and viewed the Viet Minh as a tool of Soviet and Chinese expansion, despite the fact that the Soviet Union "had largely ignored the Vietnamese struggle for independence in its critical early years" and the Viet Minh gained power 4 years before the Chinese revolution "could possibly provide any material assistance" (Marr 1995, p. xvii).

Vietnamese resistance became an organized, powerful force in 1941, when the Indochinese Communist Party (ICP) under the leadership of Ho Chi Minh founded the Vietnamese Independence League (Viet Minh). In 1940, the Japanese

had taken over Vietnam but left local matters in French hands. The Viet Minh led the resistance against the Japanese and worked closely with the Office of Strategic Services (OSS, forerunner to the CIA). By 1945, it had gained control of most of northern Vietnam and was the leading opposition force. Two days after the Japanese surrendered to the Allies, Viet Minh military forces took the city of Hanoi without any resistance, and by September they had defeated the combined Japanese-French colonialists (Kahin and Lewis 1967, pp. 15–17).

On September 2, 1945, President Ho Chi Minh proclaimed the independence of the Democratic Republic of Vietnam (DRV); it did not last long, however, as the Allies allowed British and Chinese troops to occupy Vietnam, and British released and rearmed 5,000 French troops who had been held by the Japanese. They promptly staged a coup that led to military clashes between the Viet Minh and combined British, French, and Japanese (Kahin and Lewis 1967, pp. 23–24). The French forces that would receive US aid included Foreign Legionnaires who had fought for the Nazis (Young 1991, p. 29).

Shortly after VJ (Victory over Japan) Day, US merchant mariners witnessed the sight of "fully armed Japanese soldiers being employed by the British in Vietnam." These members of the National Maritime Union (NMU) protested "the policy of the United States Government in chartering ships, flying the American flag," to transport French troops "in order to subjugate the native population of Vietnam" (Isaacs: 116, 122). The mariners' action was the first organized antiwar protest against Washington's Vietnam policy, 20 years before campus protests began. In May 1954, despite American aid to the French efforts to defeat the Vietnamese struggle, the Viet Minh crushed the French military at the Battle of Dien Bien Phu. It was the first major battlefield defeat of a European colonial power after the Second World War.

The Geneva Accords

After Dien Bien Phu, the Geneva Accords established a temporary line in Vietnam dividing the country into two postwar administrative zones with the Viet Minh governing the North and the Bao Dai regime the South. The French were to withdraw from Vietnam, and by 1956 an election would be held to reunify the country – that even US intelligence sources made clear Ho Chi Minh would win overwhelmingly; therefore, the USA blocked it. All subsequent developments during the Diem Regime, including the rise of the National Liberation Front (NLF) in 1960 and the growing involvement of the USA, are intimately tied to the failure of Washington and the regime to hold the election. Historian George Kahin on this critical decision, "Having chosen not to carry out the heart of the [Accords], Diem made civil war inevitable. For when a military struggle . . . ends on the agreed condition that the competition will be transferred to the political level, the side which repudiates the agreed conditions can hardly expect that the military struggle will not be resumed" (Kahin 1965).

While the nine nations were meeting in Geneva to finalize the Accords, a CIA team under the direction of Colonel Edward Lansdale was sabotaging key installations in Vietnam that were to be turned over to the Viet Minh. He had arrived in Saigon to direct "paramilitary operations against the enemy and to wage political-psychological warfare" (US Cong., House 1971: 10, pp. 274–275). The USA thus used a covert and illegal operation to undermine the Accords that it solemnly pledged it would not disturb. According to CIA veteran Ralph McGehee, the Agency also created a false story out of thin air to justify US involvement: "The Communist North was invading the Free World South" (McGehee 1983, p. 132).

The Diem Regime Under Presidents Eisenhower and Kennedy

The late historian Marilyn Young laid out the regime's repressive reign in the South. In 1955, Diem began a terrorist campaign against former Viet Minh who had fought against the French; tens of thousands were arrested and sent to "reeducation camps"; thousands were executed and jailed. To block Viet Minh sympathizers and other opponents of the regime being elected to

U

village councils, Diem abolished them and appointed his own men (many of whom were Catholic refugees from the North) as village chiefs or leaders (Young 1991, p. 56). "Land reform" under Diem meant that landlords would follow the regime's army to the countryside where it evicted peasants from land that had been seized by the Viet Minh and given over to the latter (Ibid., p. 57). In the late 1950s, he deepened his rule with US support – through political repression that included searches and raids, arrests, interrogations, torture, forced relocation, jail, and executions. All of this repression was fully supported by US officials; and American media "at the time . . . served as a branch of the U.S. enterprise in South Vietnam, cheering Diem's successes and praising his efforts to defeat communism. . ." (Ibid., pp. 60–61).

Eventually, Diem's repressive policies caused former Viet Minh and other opponents of the regime to organize self-defense forces by 1958; it was this group that Diem derisively called the Viet Cong (Viet Communist) (Ibid., p. 63). And in January 1959, North Vietnam's Communist Party approved some armed actions against Diem, establishment of base camps in the South, and a limited return of former Viet Minh southerners there. Small-scale uprisings grew in a number of provinces in the South (Ibid., pp. 65–66).

The rise of what would be NLF resistance against the Diem regime, and ultimately the USA, was rooted in the regime's repression: it was not created by Communist Party directives from Hanoi or the NLF leadership in the South but from "agendas and leaderships that took shape at the grassroots level." By 1960, the NLF in the South worked to overthrow "the entire socioeconomic elite which constituted the foundation of the Saigon regime," attesting to its revolutionary temper as a popular movement (Hunt 2008, p. 6). Despite Washington's assumptions, "all available evidence shows that the revival of the civil war in the South in 1958 was undertaken by Southerners at their own – not Hanoi's – initiative" (Kahin and Lewis 1967, p. 120). This contradicts the US view that the NLF followed direct orders from Ho Chi Minh and Communists in the North, who in turn got their marching orders from the Soviet Union and China.

Diem's terrorism made armed struggle and resistance inevitable; the USA aided this terror through the Michigan State University-CIA effort. In 1955, the MSU School of Police Administration received a $25 million State Department contract to "provide technical assistance and training [and] mass surveillance capable of monitoring subversion and dismantling the political opposition to Diem." This program "expanded the scale of violence" and was headed by Diem's brother Ngo Dinh Nhu. MSU also trained the regime's Bureau of Investigation that served mainly as a "political police" and "political repression organization" (Kuzmarov 2012, pp. 142–143). As the war of resistance against Diem grew, MSU aided "the torture and killing of thousands of [NLF] fighters and civilians" (Ibid., p. 147).

The creation and growth of the revolutionary struggle in South Vietnam during the Diem regime therefore "was the result of indigenous Southern opposition to an oppressive regime . . . that the support for the NLF [was] considerable, particularly among the peasantry, and certainly greater than the support . . . given the Saigon cliques. . ." (Herman and DuBoff 1969, p. 36). The USA, therefore, had to invent the "aggression and subversion" thesis in order to obscure the true origins and support of the resistance against Diem and ultimately itself.

Kennedy and Vietnam

As NLF resistance gained strength and began to defeat Diem forces in 1960 and 1961, the Kennedy administration escalated the conflict with increased military aid, as well as training for Diem's Civil Guard, a brutal paramilitary force that was composed mainly of Catholic refugees from the North. In May 1961, Kennedy approved a plan to send 400 Special Forces troops to engage in covert warfare against North Vietnam. This "marked Kennedy's first major escalation of American involvement in Vietnam. . .. The sending of Green Berets and the program for covert warfare pointed to the conception of a 'subterranean' war, largely hidden from public view" (Miroff 1976, p. 148).

Ralph L. Stavins, who worked with the Institute for Policy Studies, details Kennedy's "private war" against Vietnam. The various programs he approved were kept secret from the public or explained in such a way that most citizens had no knowledge about them. By the time Kennedy was assassinated, the USA had 16,500 troops in South Vietnam "pretending they were not fighting, and the Special Forces were executing a host of covert programs in North Vietnam." All of these programs answered to the White House; all were violations of the 1954 Geneva Accords (Stavins 1971).

Kennedy approved the use of chemical warfare against the Vietnamese that began in 1962. Although limited at first, it soon became a program of crop destruction. "The expanded program received strong financial and political support. . .. Thus, Washington was able both to authorize criminal programs and evade any responsibility for them" (Ibid.). These programs continued under President Johnson.

Beginning in 1962, Kennedy designated a special committee to help run his private war. It supervised and controlled all CIA activities and had jurisdiction over "every important covert program conducted anywhere in the world, including Vietnam." It organized the DeSoto destroyer patrols that operated along the Chinese and North Vietnamese coasts engaging in surveillance and sabotage thus leading to the Gulf of Tonkin crisis in August 1964 (Ibid.).

Kennedy's policies followed Eisenhower's domino theory that was used to convince the public that the USA had to stay the course in Vietnam. "It is fashionable today to deride the domino theory, but in fact it contains an important kernel of plausibility, perhaps truth. National independence and revolutionary social change, if successful, may very well be contagious" (Chomsky 2003b, p. 31). If national liberation movements and revolutionary social change spread, "there would be a serious impact on the global system dominated by the United States and United States–based international corporations" (Ibid., p. 37). Developing countries like Vietnam must not engage in national liberation struggles to escape the US-dominated international system and focus on their own basic needs. "If they are so foolhardy as to disobey the international rules, they will be subjected to subversion, blockade, or even outright destruction by the global judge and executioner" (Ibid., p. 45).

JFK and the Overthrow of Diem

Kennedy officials concerned over the deterioration of the Diem regime were clearly alarmed when, in 1963, it was discovered that Diem's brother Ngo Dinh Nhu contacted North Vietnam and the NLF in the South to propose "a peace settlement that would include a cease-fire, the departure of U.S. forces, the acceptance of N.L.F. representatives in his government, and an election in which the Communists could participate" (Porter 2005, p. 122, 126). Kennedy could never allow a settlement, however, that would force American withdrawal and the inclusion of the NLF and Communists in any South Vietnamese government – even if decided democratically.

The Pentagon Papers state that "the U.S. must accept its full share of responsibility" for the Diem coup, because beginning in August 1963 Washington "authorized, sanctioned and encouraged the coup efforts." Immediate US concern, however, was how to react to the coup in terms of an official public posture – that it be presented "not so much a coup as an expression of national will" (Pentagon Papers, Gravel Edition 1971: Vol. 2, p. 207, 270).

The removal of Diem and his brother Nhu was part of US-orchestrated regime changes in the South. In 1955, it installed Diem through a fraudulent election; in 1963, it removed him because he and Nhu had contacted Hanoi and replaced them with General Minh. In 1964, the USA removed Minh, who opposed bombing the North, and replaced him with General Khanh; in 1965, Khanh was removed from office in a coup because he contacted the NLF for negotiations. He was replaced by Generals Ky and Thieu; the latter would rule through fraudulent elections and repression. The truth is that Saigon regimes were never independent of US control. The conflict, therefore, was not a civil war between North and South but between the Vietnamese and an outside imperialist power (O'Connell 2018).

U

Kennedy's criminal policies in Vietnam were consistent with National Security Doctrine, especially embraced in Latin America under military regimes that engaged in systemic "assassination, torture, disappearance, and sometimes mass murder." He escalated US involvement as he "moved on to armed attack" upon the civilian population in the South that left it "utterly devastated with millions [of Vietnamese] dead, untold numbers maimed, widows and orphans, children being killed to this day by unexploded bombs, deformed fetuses in hospitals in the South … and a record of criminal savagery that would fill many a docket, by the standards of Nuremberg" (Chomsky 1993, pp. 25–26).

Economist Richard DuBoff highlights four major themes in National Security documents that shaped US policy during the French-Indochina War and the Diem-JFK period – all based on capitalist economic premises to maintain American imperialism in the Southeast Asian-Pacific region. Southeast Asia "was viewed as an essential part of a Pacific rim lands political economy…." If any part fell or [were to] "opt out of the free (enterprise] world, the repercussions would be felt throughout the area, particularly in Japan…." The "'Loss' of Indochina would have further grave domino effects . . . on America's power as guarantor of 'order' and 'stability.'" "No negotiations whatever were to be considered with Communists over the future of Southeast Asia" (DuBoff 1971, p. 27).

The USA, in violation of international accords and solemn promises, created and sustained a terrorist regime in South Vietnam against the increasing opposition of its own people. This policy was a continuation of French and Japanese colonialism and spawned a popular resistance movement, led by the Viet Minh and the NLF. This struggle would expand in the post-Diem period and be confronted by a growing US military force – as the war entered yet another historic phase, that of escalation and Vietnamization.

Escalation of the War Under President Johnson

The chronology of the escalation under Johnson led Noam Chomsky to conclude: "The record is clear, then," that when the USA escalated the war in February 1965, "it knew of no regular North Vietnamese units in South Vietnam, and that five months later . . . the Pentagon was still speculating about the possibility that there might be PAVN [People's Army of North Vietnam] forces [there]. In the light of these facts, the discussion of whether the U.S. was defending South Vietnam from an 'armed attack' from the North – the official U.S. government position – is ludicrous" (Chomsky 1972, p. 196).

To justify escalation and the outside aggressor thesis, it was necessary, writes British journalist Felix Greene, "to convince the American people that the war in the South was not a liberation struggle against U.S. forces but an 'invasion,' a 'war of aggression' against the south launched and controlled from Hanoi" (Greene 1966, p. 146). The presence in Vietnam of "a local, U.S. supported, U.S. financed, U.S. armed regime," however, cannot change the central fact that it is "essentially a war by the Vietnamese people against the military invasion of their country by the United States" (Ibid., pp. 150–151).

The Tonkin Gulf Incident

The official story is that on August 4, 1964, North Vietnamese torpedo boats attacked US destroyers on routine patrol in international waters. President Johnson ordered retaliatory bombing raids on North Vietnam and asked Congress for the power to take all necessary measures to repel any armed attack against US forces and prevent further aggression. This "incident" set the stage for the major escalation of the war in early 1965.

Historian Gabriel Kolko, however, shows that "It was known – and immediately documented in Le Monde – that the United States had been sending espionage missions to [North Vietnam] since 1957 . . . and that on July 30th [1964] South Vietnamese and U.S. ships raided and bombarded D. R.V. islands" (Kolko 1969, p. 125). Administration officials lied when asked if the USA had done anything to provoke an attack. In 2005, the National Security Agency finally "revealed that both the NSA and the Navy had suppressed definitive evidence that no enemy vessels could have

been in the vicinity of the U.S. ships, and . . . proved conclusively 'that *no attack* happened that night'" (Franklin 2018, p. 185).

In league with a compliant and passive Congress, no "major American newspaper questioned either the official version of the events or the appropriateness of the American response." The Tonkin incident was presented to Congress and the public as an overt act of hostility by Hanoi, exactly what Johnson's advisers "had told him he needed: a way to justify direct American participation in the war, a 'breakthrough into an irreversible commitment'" (Young 1991, p. 122).

Kolko condemned the US escalation and destruction of Vietnam as "the greatest flood of firepower against a nation known to history. The human suffering was monumental." In South Vietnam, the most conservative estimates were that "at least half of the peasants were forced into refugee camps or urban settlements one or more times, many repeatedly. . . . The result was the urbanization of a rural society in a manner unique in this century, for it was far more brutal and disorienting than. . . any that a Third World nation has ever experienced (Kolko 1985, pp. 200–201).

Agent Orange and Chemical Warfare

Adding to the death and devastation during this escalation period was the chemical warfare that began under President Kennedy. From July 1966 to July 1973, however, Congress did not oppose a single one of the 113 funding bills for the war and never once voted to curtail or deny spending for the Agent Orange program. Writer Fred Wilcox reminds us that some three million Vietnamese, including 500,000 children, continue to suffer from the effects of the toxic chemicals sprayed during the war. By the time defoliation spraying ended in 1971, it had destroyed some 4.5 million acres of the rural countryside in what was then South Vietnam (Wilcox 2011, p. 35). A 2003 study by public health scholar Jeanne Stellman "calculated that between 1961 and 1971 about 20 million gallons of herbicides were dropped on South Vietnam, exposing at many as 4.8 million people to the toxic chemicals" (Quoted in Black 2015).

The Tet Offensive 1968

The Tet (Vietnamese New Year) Offensive in late January 1968 resulted in coordinated attacks throughout South Vietnam; it shattered the illusion that the USA was winning the war. Resistance forces attacked almost every major American base – and every town and city in South Vietnam – and some entered Saigon itself. They opened the jails and liberated the regime's political prisoners. The Offensive had a strong impact upon American public opinion; "for the first time," writer Frances Fitzgerald reported, major news magazines began to "criticize the war overtly" (Fitzgerald 1973, p. 525). This criticism, however, was confined to tactics and strategy; it did not challenge the premises of the war or US foreign policy in general.

Kolko claims that Tet's "most decisive effect was to articulate clearly the fact that the United States was now confronting a potentially grave crisis. The first three months of 1968 were therefore the most important in the history of the entire American aggression in Vietnam" (Kolko 1985, p. 313). Powerful and influential men from "the world of big industry and finance . . . had been for the war because [they] believed in the objectives of American foreign policy which led to the intervention." After Tet, however, they changed their tune and eventually advised Johnson that the war could not be won and the USA had to find a way to change its policy (Ibid., pp. 318–319).

Noam Chomsky asserts that Tet caused a dramatic political shift in the US ideological system: "Virtually everyone suddenly turned out to have been an 'early opponent of the war' – in secret, since no record can be found." Tet was a "turning point for the cultural managers, who now faced several challenging tasks. One was to defuse the opposition. . . . Another was to restore the basic doctrines of the faith: The war must now be understood as a noble effort gone astray" (Chomsky 1993, p. 112).

The Hue Massacre

The official US story is that during Tet "the bodies of more than 3,000 Hue residents were found in

U

mass graves outside the city," having been executed by NLF and North Vietnamese forces. Economist and media critic Edward S. Herman and historian D. Gareth Porter argued that "like so much else which concerns the history of the Vietnam War, this widely accepted 'fact' is a myth, originated by officials of the Saigon and U.S. governments, using phony documentation and plain lies." In their view, the massacre "has never been seriously questioned or investigated by the press" (Herman and Porter 1975, p. 8).

The official version essentially relied on a "captured document" that was released by the US Mission in Saigon in November 1969. This was 21 months after the massacre allegedly took place and about the same time that the public learned of the My Lai Massacre – whose truth is indisputable. Herman and Porter agree that the NLF and North Vietnam troops "killed some civilians during their occupation, but there is no evidence that they executed large numbers. In the massive carnage of the Vietnam War generally, and the battle of Hue in particular, the term 'massacre' applied to [the killing] of civilians at Hue is simply a deceptive propaganda ploy." The media's willingness "to swallow and institutionalize the myth of the Hue Massacre reflects [their] real role in a political and social system adjusted to cold war conflict" (Ibid., p. 13).

The My Lai Massacre

The official and corporate propaganda on the Hue Massacre served a vital purpose: it diverted attention away from the most infamous and publicized massacre of the war in the hamlet of My Lai on March 16, 1968. That same morning another massacre took place in the nearby hamlet of My Khe – to this day virtually unknown to the US public. The My Lai and My Khe massacres resulted in the murders of 504 unarmed Vietnamese civilians; most of the victims were women, children, and infants. Only Lieutenant William Calley Jr. was convicted of a criminal offense by an Army court martial and given a life sentence with hard labor. President Nixon intervened in the case, however, and Calley served only 3.5 years under house arrest and was then pardoned.

Reporter Seymour Hersh, who broke the original story in late 1969, returned to My Lai in December 2014 and at the My Lai Museum witnessed the gruesome details of what happened in those hamlets. "The museum's count, no longer in dispute, is five hundred and four victims, from two hundred and forty-seven families. Twenty-four families obliterated – three generations murdered, with no survivors. Among the dead were a hundred and eighty-two women, seventeen of them pregnant. A hundred and seventy-three children were executed, including fifty-six infants. Sixty older men died. . . . The message was clear: what happened in My Lai was not singular, not an aberration; it was replicated, in lesser numbers" (Hersh 2015, p. 57).

The first official military report from the American Division, however, "found no evidence of excessive civilian deaths." It claimed that "the civilian casualties had resulted from crossfire between the [NLF] defenders of the village and the American soldiers," a mind-numbing lie since there were no NLF forces in My Lai and no one fired on American soldiers. According to the Peers Army Report into the "My Lai Incident," the first Americal Division report started a process that included the disappearance of records and "a pattern of deliberate suppression or withholding of information . . . at every command level from company to division" (Goldstein et al. 1976, p. 33).

The Phoenix Program

The CIA Phoenix Program in South Vietnam operated from 1965 through 1972; it was organized to identify and destroy the organizational and support network of the NLF in South Vietnam. It led to tens of thousands of deaths, injuries, and disappearances. In congressional testimony, two former US military intelligence agents involved with Phoenix stated that Vietnamese "were indiscriminately rounded up, tortured, and murdered in the effort to eliminate" NLF officials (Quoted in Klare 1972, pp. 264–265). Another former agent testified that he "never knew an individual to be detained as [an NLF] suspect who ever lived through an interrogation in a year and a half, and that included quite a

number of individuals" (Quoted in Chomsky and Herman 1973, p. 28).

Douglas Valentine, author of the seminal work on Phoenix, puts the number killed at more than 25,000 in a program that targeted civilians, not soldiers. Under Phoenix, there was no due process, as "civilians whose names appeared on CIA black-lists were kidnapped, tortured, detained without trial, or murdered on the word of an informer." Phoenix's aim was "counter-terror ... in which enemy agents were brutally murdered along with their families and neighbors as a means of terrorizing the people into a state of submission. Such horrendous acts were ... often made to look as if they had been committed by the enemy" (Valentine 2013: www.counterpunch.org/2013/06/07/dirty-wars-and-the cinema-of-self-indulgence/).

The So-Called Bombing "Halt"

In a speech of March 31, 1968, President John announced a "partial" bombing halt over North Vietnam, made a plea for negotiations, and stated he would not run for reelection. The bombing would be restricted below the 20th parallel, but it actually meant a concentration of effort in that region and throughout South Vietnam, with "almost no reduction in total volume" (Littauer and Uphoff 1972, p. 13). At the end of October just prior to the US presidential election, he announced a complete bombing halt over North Vietnam. But as with the earlier halt, the devastation over Vietnam had not ended; it merely followed the earlier pattern. Some planes released from bombing North Vietnam were shifted to Laos; there were increased air strikes in South Vietnam. The result of this bombing, naval, and artillery attacks was catastrophic.

President Nixon, Vietnamization, and the End of the War

Richard Nixon's election in 1968 brought no basic change in the war. He prolonged the violence by continuing Johnson's "Vietnamization" program that was based on withdrawing American ground troops by shifting combat responsibilities to the Thieu/Ky regime – thus replacing American bodies with South Vietnamese and increasing the technical means of destruction. It was "little more than a change of tactics – and a change that originated not with him but with President Johnson. ... And it was the same strategy that led to the situation the United States took over [from the French] in 1954" (Fitzgerald 1973, p. 529). Nixon pursued this strategy to counter the rising antiwar movement, as he searched "for a formula which would permit the United States to survive a protracted war without loss of our Asian empire, and without incurring further upheavals at home" (Klare 1972, pp. 363–364). His adoption of Vietnamization simply involved more death and destruction – all in all, the war's eventual end would cause 3.8 million deaths, combat and civilian, and a total of 14.3 million refugees. In South Vietnam, there were 300,000 orphans and 800,000 children who lost one of both parents. 15.5 million tons of bombs and ground and naval munitions landed on Vietnam, more than double that used by the USA in all of the Second World War; and 20 million gallons of poisonous herbicides were spread over South Vietnam (Shannon 2000).

Having rejected North Vietnam's peace proposals at the end of 1972, Nixon blamed Hanoi and ordered the bombing of Hanoi and Haiphong in the heaviest air raids of the war. Worldwide protest erupted over the large number of civilians killed, and the hospitals and other humanitarian buildings destroyed. The level of US and worldwide protest over the Christmas attacks on Hanoi and Haiphong, however, was far less than the devastating bombing throughout South Vietnam during the war.

Nixon also continued the Johnson policy of "waging a largely covert campaign against prominent [antiwar] critics," using the FBI, NSA, CIA, IRS, and military intelligence that "spied upon, provoked, harassed, audited, entrapped, and slandered opponents" (Hunt and Levine 2012, p. 229). His war policy alone eventually led to the deaths of almost 500,000 NVA and NLF soldiers, over 100,000 Saigon regime troops, and 21,000 Americans and accentuated "already deep societal divisions and political bitterness" (Ibid., p. 236).

Prior to his election in November 1968, Nixon also helped to sabotage the Paris Peace talks that

U

had begun in the spring of 1968 during the Johnson administration; in this effort, he was aided by Henry Kissinger. Just prior to the election, it appeared there might be a ceasefire in Vietnam, but Nixon intervened as a private citizen, violating US law by letting General Thieu know that he would get a better deal if the former became president. Kissinger, allegedly working for Johnson to foster peace talks, secretly passed on information to the Nixon campaign. Conservative columnist George Will has confirmed the facts (Fitrakis and Wasserman 2014). Johnson had secret recordings of Nixon's treasonous actions but chose not to go public with this information.

The POW/MIA Issue

In office, Nixon countered the growing antiwar movement by manipulating the POW/MIA issue. H. Bruce Franklin's seminal book on the POW/MIA myth that caused a majority of Americans to believe that the North Vietnamese still held POWs and MIAs after the Paris Peace Accords was signed in January 1973 describes the cynical orchestrated effort by Nixon and businessman Ross Perot, among others, to use the issue to prolong the shooting war. The issue "would serve mainly as an indispensable device for continuing the war, functioning on the domestic front as a potent counterforce to the antiwar movement while providing an ingenious tool for building insurmountable roadblocks within the peace talks." The issue would become "a major obstacle to normalized relations for more than [two decades] after the 1973 peace accords" (Franklin 1992, p. 48).

Belief in the truth of the POW/MIA claims was not simply based on "political rhetoric, rumors, and the POW rescue movies" but also on material that put forth "a coherent and superficially plausible pseudohistory compounded by self-deception, amateur research, anecdotes, half-truths, phony evidence, slick political and media manipulation, downright lies, and near-religious fervor." The anguish over POWs and MIAs "[permeated] the society, running especially strong in the working class"; it remained

for a long time "the most important concern of many Vietnam veterans, displacing their own problems with unemployment, homelessness, . . . Agent Orange, and inadequate medical care" (Ibid., pp. 5–6).

The late writer Jonathan Schell contrasted the plight of POWs with other US soldiers in Vietnam: "The wounded, the dying, and the dead went virtually unnoticed," because "attention was focused on the prisoners of war." Citizens got in line behind Nixon's lead and "began to speak as though the North Vietnamese had kidnapped four hundred Americans and the United States had gone to war to retrieve them. They became the objects of a virtual cult, and many people were persuaded that the United States was fighting to get its prisoners back" (Schell 1975, p. 76).

The concern for POWs did not extend to the treatment of Vietnamese POWs at the hands of American-backed forces in the South. The US Office of the Army Chief of Staff was forced to admit that the Thieu-Ky regime engaged in "cruel, sophisticated, calculated torture for information" that revealed the "hypocritical . . . pious statements about the treatment of POWs by . . . [Nixon]." According to the Far Eastern Review, "Those released from U.S.-run jails in Saigon were all incurably crippled" (Kuzmarov 2012, pp. 159–160). And concern for US MIAs never translated into even minimal concern for "the estimated 300,000 Vietnamese soldiers . . . still missing from war . . . a heartbreaking statistic that reverberates across thousands of Vietnamese families – mostly in the north." Although Vietnam "has made scattered efforts to search for remains, the resources devoted to finding the missing Vietnamese are a small fraction of those devoted to recovering the 1,600 Americans still listed from the same war" (Babcock 2018).

My Lai: 20 Months Later

When the My Lai story broke in late 1969, thanks to the persistent efforts of Army veteran Ronald Ridenhour and reporter Seymour Hersh, the

Nixon administration organized a campaign to divert attention from the massacre and William Calley's guilty court-martial verdict to continue the war policy and undermine the antiwar movement. It orchestrated media and public responses to smear Ridenhour and Hersh and worked out an elaborate plan to counter the negative news and growing public concern about what had happened. In response to My Lai, in late 1969 the US Army created the Vietnam War Crimes Working Group (WCWG), "a secret Pentagon task force that had been assembled . . . to ensure that the army would never again be caught off guard by a major war crimes scandal" (Turse 2013, p. 14). The WCWG files "alone demonstrate that atrocities were committed by members of every infantry, cavalry, and airborne division . . . that is, *every* major army unit in Vietnam" (Ibid., p. 21).

The Corporate Media and Public Response

When the US military first acknowledged the My Lai massacre and Calley's case in September 1969, the national media "responded with inattention and incuriosity" (Oliver 2006, p. 39). It was not until November 22 that *The New York Times* published its first editorial on the subject, "asserting that reports of the atrocity were so shocking, so contrary to principles for which this country has always stood, as to be beyond belief" (Ibid., p. 48). To what principles did the Times refer, given the sordid history of US massacres against Native Americans, Filipinos, and Koreans?

When it comes to My Lai and the war itself, Noam Chomsky places the ultimate blame where it belongs: "The planners in Washington are the real war criminals, not the soldiers in the field. The chain of command starts with the civilians sitting in Washington. These were the people charged at Nuremberg and Tokyo." Those with privilege, education, and training "are also the decision makers [who are] ones responsible, far more than those who don't have any choices" (Chomsky 2005, p. 130, 132).

The Military Antiwar Movement

US antiwar veterans rose up to challenge Washington, the media, and the public's denial on the war and belief in the essential goodness and honor of the country by providing firsthand evidence of what happened in Vietnam. These veterans used the My Lai Massacre to raise consciousness and demand that powerful civilian officials and the army brass be indicted for their role in the war. A key organization in this effort was the Vietnam Veterans Against the War (VVAW), founded in June 1967. It would challenge, and face hostility from, the strongly pro-war American Legion, Disabled American Veterans, and Veterans of Foreign Wars.

VVAW's first action was a full-page ad in the New York Times in November 1967 just before a major demonstration in Washington. The ad laid out its principles, "all of which emphasized the right of the Vietnamese to self-determination." There was a strong and positive response to the ad but hostile responses from the government, including Secretary of Defense McNamara, who was incensed and demanded that the FBI investigate many of those who had signed the ad. The CIA also investigated the group, in violation of US law (Hunt 1990, pp. 17–18).

Although founded in 1967, VVAW's deepened activism in the late 1960s and early 1970s "had a profound impact on the antiwar movement. . . . [It] transformed the movement by placing Vietnam veterans in the forefront of the nation-wide struggle to end the Vietnam War." Its members included "some of the most talented and perceptive organizers in the antiwar movement," and chapters around the country "offered services . . . that predated similar Veterans administration programs by nine years." While VVAW activists gained support and respect from a growing number of veterans and the public, "they also stirred fears in the highest levels of government" (Ibid., pp. 1–3).

Economist and labor historian Michael Yates asserts that VVAW reinvigorated the antiwar movement in what was an extraordinary moment in US history, as thousands of soldiers "spoke

U

openly, honestly, and publicly about the folly of war and the costs to human beings and societies of allowing young men ... to engage in senseless murder." After the war ended in 1975, small numbers of veterans and other Americans visited Vietnam, "to make common cause with the Vietnamese and do what they could to aid in the rebuilding of the nation. They have been tireless reminders of what was done in the name of the United States" (Yates 2015, p. 10).

It was resistance within the US military, not domestic protest on campuses, that became the most powerful antiwar force against the war and the military hierarchy. In a brutally frank admission, Colonel Robert D. Heinl Jr., Marine combat veteran, historian, and military analyst, captures the ramifications of this resistance: "The morale, discipline and battle worthiness of the U.S. Armed Forces are, with a few salient exceptions, lower and worse than at any time in this century and possibly in the history of the United States. By every conceivable indicator, our army that now remains in Vietnam is in a state approaching collapse.... Sedition ... infests the Armed Forces" (Heinl 1971).

The Antiwar Movement at Home

The domestic antiwar movement was built upon the black struggle for human rights in the 1950s and 1960s. As the war deepened, the black and antiwar movements began to come together to challenge it, creating increased anxiety among Pentagon and civilian officials. It was black civil rights' activists in the South who first critiqued the war on anti-imperialist grounds, with white antiwar activists followed. In July 1965, the Mississippi Freedom Democratic Party urged blacks to oppose the war: "No one has a right to ask us to risk our lives and kill other Colored People in Santo Domingo and Vietnam, so that the White Americans can get richer. We will be looked upon as traitors by all the Colored People of the world if the Negro people continue to fight and die without a cause." Six months later, the Student Nonviolent Coordinating Committee (SNCC) stated: "We believe the U.S. government has been deceptive in claims of concern for the freedom of the Vietnamese people ... just as the government has been deceptive in claiming concern for the freedom of the colored people in ... other countries ..." (Quoted in Grant 1988, p. 416).

The Students for a Democratic Society (SDS) was the most influential New Left organization within the student antiwar movement of the 1960s. In its all-too-brief history, it played a crucial role in raising the civic literacy and political consciousness of that era. SDS activists were often outstanding students at the best universities and the most civically literate youth in the nation, particularly on US foreign policy. Violence by a tiny faction within SDS and the larger antiwar movement received the greatest attention and condemnation from political officials and the mainstream media, which lauded a war that would leave millions of people dead. On the issue of antiwar violence, however, philosopher Herbert Marcuse was right: "Can there be any meaningful comparison, in magnitude and criminality, between the unlawful acts committed by the rebels ... on the campuses ... and the deeds perpetrated by the forces of order in Vietnam...." (Marcuse 1969, p. 77).

The Road to the End of the American War

Paris Peace Conference
On January 27, 1973, in Paris, representatives of the Democratic Republic of Vietnam (DRV, North Vietnam), the Provisional Revolutionary Government (PRG) that emerged out of the NLF and other nationalist groups in the South, the USA, and the Thieu regime signed the Agreement on Ending the War and Restoring Peace in Vietnam. It recognized the Saigon regime and the PRG as co-equal administrations in South Vietnam and committed the USA and the other signatories to respect the independence, sovereignty, unity, and territorial integrity of Vietnam. It required the USA to "stop all its military activities against the territory of the Democratic Republic of Vietnam ... and end the mining of [its] territorial waters, ports, harbors and waterways" (Indochina Resource Center 1973). The Agreement ended US

bombing of Vietnam, led to the withdrawal of American troops, and brought the release of American POWs, but allowed North Vietnamese troops to remain in South Vietnam. The 1973 treaty also reaffirmed the 1954 Geneva Accords' provision that the line between North and South was provisional and temporary. As happened in 1954, however, a US-Saigon alliance subverted the treaty and forced a military settlement. Nixon and Kissinger, therefore, helped orchestrate 4 more unnecessary years of war and suffering for the Vietnamese (O'Connell 2018).

By 1974 most of the American people had become thoroughly disenchanted with the war in Vietnam. The major remaining support came from the Nixon Administration, and after Nixon's departure, the Ford Administration with Secretary of State Henry Kissinger doggedly advising more aid for what some were suggesting had become an obsessional crusade for him. The Pentagon had continued to urge increased support for the rapidly deteriorating military situation, but Congress finally refused to approve increases in funding (Washington Post 1975). Until May 10, 1973, however, *4 months after the Paris Peace Treaty was signed and the withdrawal of American troops*, the House had failed to pass any bill that would reduce or end US military activity in Southeast Asia.

The Collapse of the Thieu Regime and the End of the American War

The last months of the war showed that despite the Thieu regime's massive military, as a fighting force it was worthless and would collapse at the first real sign of battle. That is exactly what happened in the few months leading up to the end of the war in late April 1975. Thieu fled Saigon 9 days before the victory of the North Vietnamese and NFL forces, leaving for exile in Taiwan aboard a CIA-provided transport plane with tons of baggage and two suitcases filled with gold bars. As the regime unraveled near the end, high-ranking officials close to Thieu "were competing with the [South Vietnamese] air force for the dominant position" in drug trafficking (McCoy 2003, p. 203).

The end to the War in Vietnam came swiftly in 1975. In March, Thieu ordered his troops to withdraw from the northern provinces as a result of the defeat there. The "strategic withdrawal" collapsed in a rout. As South Vietnamese soldiers fled, they slaughtered women and children for scarce space on evacuating planes, ships, and motor vehicles; they even stole airplanes rather than utilize them to defend the regime. In contrast to US press reports of a North Vietnam final "offensive" in the South, Wilfred Burchett, the Australian correspondent who had covered the War in Vietnam behind the lines for two decades, contends: "What happened was that guerrilla forces . . . in cooperation with people's organizations inside the towns, won over many soldiers within the enemy's armed forces. Popular uprisings and infiltrations were combined with the operations of the regular Liberation Armed Forces in a coordination of effort for which people and soldiers had all been preparing ever since the National Liberation Front was founded in December I960" (Burchett 1975).

The corporate media and government history of the War in Vietnam continue the massive denial surrounding this epic conflict. When one examines US policy since 1975, it is clear that a fundamental lesson has not been learned: it continues to violently interfere in the internal affairs of other countries. One simply has to look at the historical record of direct and covert US aggression since Vietnam – Angola, Afghanistan, El Salvador, Grenada, Guatemala, Iraq, Libya, Mozambique, Nicaragua, Namibia, Panama, Somalia, Sudan, Syria, and Yemen, among others.

Some Lessons of the War in Vietnam

The following lessons that review the history raised in the essay are powerfully identified by historian Christian Appy:

> If we continue to excuse American conduct in Vietnam as a well-intentioned, if tragic, intervention rather than a purposeful assertion of imperial power, we are less likely to challenge current war managers who have again mired us in apparently endless wars based on false or deeply misleading pretexts. Just as in the Vietnam era, American leaders have ordered troops to distant lands based on boundless

abstractions ("the global war on terror" instead of the global threat of "international Communism"). And once again, their mission is to prop up governments that demonstrate no capacity to gain the necessary support of their people. (Appy 2018)

The USA Committed War Crimes Including Torture

US war crimes in Vietnam were legion; the evidence is overwhelming. The most death-producing and devastating crime was US bombing and artillery attacks against villages, especially in South Vietnam. The USA "made South Vietnam a sea of fire as a matter of policy, turning an entire nation into a target. This is not accidental but intentional and intrinsic to the U.S.'s strategic and political premises. . .." In such an attack "against an entire people . . . barbarism can be the only consequence of the U.S.'s sledgehammer tactics" (Kolko 1971a, pp. 412–413). These are conceived and organized by the "true architects of terror," the "respected men of manners and conventional views who calculate and act behind desks and computers rather than in villages in the field" (Kolko 1971b, p. 15).

The US mistreatment of Vietnamese civilians and prisoners of war was strictly prohibited by the Geneva Convention, which the USA signed. "No exceptional circumstances whatsoever, whether a state of war or a threat of war, internal political instability of any other public emergency, may be invoked as a justification for torture." US officials and mass media pundits, however, continue to assert that torture is a violation of "our values." This is not true: actual values are expressed by what the USA does – not what it says. Torture is as American as apple pie and was widely practiced in Vietnam, as documented by Anthony Russo, the whistleblower at the RAND Corporation who worked with Daniel Ellsberg to leak the Pentagon Papers. Russo's revelations are so explosive that 50 years later, RAND still keeps his report on CIA torture a secret (Myers 2015)

Washington Lied

Government lying was an essential part of the war. Ellsberg exposed perhaps the greatest lie that had a profound impact on the conflict: the official story

of the Tonkin Gulf crisis of August 1964. President Johnson and Secretary of Defense Robert McNamara told the public "that the North Vietnamese, for the second time in two days, had attacked U.S. warships on routine patrol in international waters"; that this was clearly a "deliberate" pattern of "naked aggression"; that the evidence for the second attack . . . was "unequivocal"; that the attack had been "unprovoked"; and that the USA, by responding in order to deter any repetition, intended no wider war. All of these statements are untrue (Ellsberg 2002, pp. 12–13).

The War Was a Crime: Not a Mistake

Since the end of the war in 1975, there has been a concerted effort on the part of US officials, the corporate media, and influential intellectuals to portray US actions as a "Noble Cause" that went astray. Christian Appy profoundly disagrees, arguing that the findings of the Pentagon Papers and other historical documents provide "ample evidence to contradict this interpretation. . .. The United States did not inadvertently slip into the morass of war; it produced the war quite deliberately" (Appy 1993, p. 253).

Dr. Martin Luther King, Jr. Condemned the War: And Was Vilified for It

Dr. King courageously confronted bitter and uncomfortable truths about the war and this nation. He proclaimed that he "could never again raise my voice against the violence of the oppressed in the ghettos without having first spoken clearly to the greatest purveyor of violence in the world today – my own government." The war was "a symptom of a far deeper malady within the American spirit, and if we ignore this sobering reality we will find ourselves organizing" committees to oppose other wars "without end unless there is a significant and profound change in American life and policy" (King 1967).

King's magnificent speech, still virtually unknown in this country, elicited strong attacks by the political and corporate media establishment and civil rights leaders. The New York Times

strongly condemned him for "recklessly comparing American military efforts to those of the Nazis"; the Washington Post claimed that some of his assertions were "sheer inventions of unsupported fantasy" and that he had "diminished his usefulness to his cause, to his country and to his people" (Quoted in Morgan 2012, p. 76). This condemnation actually reflected public sentiment: a Harris poll taken in May 1967 revealed that 73% of Americans opposed his antiwar position, including 50% of African Americans.

The Corporate Media Didn't Oppose the War: Only How It Was Fought

The corporate media did not oppose and undermine the war effort. They endorsed US support of French colonialism and only emerged as tactical critics of Washington's war after the Tet Offensive. They never challenged the fundamental premises of the imperialist "Noble Cause." The essence of their response to Vietnam is similar to what CBS Evening News anchor Dan Rather said about the bombing of the former Yugoslavia in 1999: "I'm an American, and I'm an American reporter. And yes, when there's combat involving Americans, you can criticize me if you must, damn me if you must, but I'm always pulling for us to win" (Quoted in Blum 2000, p. 10).

The First Antiwar Protests Came from the Merchant Marine Services

Opposition to US intervention in Vietnam did not begin with student protests in the mid-1960s but with American merchant mariners in the fall of 1945. They had been diverted from bringing US troops home from Europe to transport French troops to Vietnam to reclaim that colony. These merchant mariners vigorously condemned the transport "to further the imperialist policies of foreign governments" (Gillen 1991, p. 122).

Some two decades later, the most important opposition to the American War would come within the military itself – including criticism by Generals Matthew Ridgeway, David Shoup, James Gavin, and Hugh Hester. They and other military leaders, including Air Force General Lauris Norstad, Army Generals William Wallace Ford and Robert L. Hughes, Marine General Samuel G. Griffith, and Rear Admiral Arnold True, "testified before congressional committees, wrote books and articles, appeared on television and radio programs, and made the front page of American newspapers, always with the message that the Vietnam War was a political, strategic, and moral blunder from which the United States should quickly disengage." These "respected and influential military figures . . . initially spoke out against the war while the domestic consensus in support of American involvement was still strong" (Buzzanco 1986, pp. 561–562). Ridgeway, Shoup, Gavin, and Hester supported veterans' antiwar efforts and signed a New York Times antiwar ad in 1967; Shoup and Hester supported and spoke at rallies sponsored by the Vietnam Veterans Against the War (VVAW), and the FBI investigated them for Presidents Johnson and Nixon (Ibid., p. 574).

Myths and Lies About the Antiwar Movement Would Fill the Rose Bowl

Much understanding of the domestic antiwar movement, sociologist Penny Lewis argues, is based on two fundamental and erroneous premises: it "was largely an upper-middle-class social movement, led by privileged radicals, with college students serving as its troops, and supported by the sentiment of elite doves"; and the working class "distanced itself from or despised the movement, mostly supported the war and its makers, and was growing increasingly conservative during the era." In fact, "Working-class opposition to the war was significantly more widespread than is remembered and parts of the movement found roots in working-class communities and politics. . .." Unknown to most Americans, "the greatest *support* for the war came from the privileged elite.. . ." (Lewis 2013, p. 5). The antiwar movement was the largest in US history, and the October 1969 Moratorium Against the War was the greatest antiwar protest ever recorded in this country.

Adding to this antiwar movement, the late historian Marilyn Young writes, leading activists in

the civil rights movement began making the link between "racial justice at home and the war abroad." For example, in late 1964 Malcolm X condemned the war, as did James Forman, Air Force veteran and executive secretary of SNCC. In May 1967, the FBI noted "with considerable alarm" that there was a growing link between the struggle for racial justice at home and the growing antiwar movement (Young 2004, pp. 245–246).

Appeals to Support the Troops in Time of War Should Be Critically Examined

In 2013, President Obama and the Vietnam Commemoration urged citizens to support and honor those who served in Vietnam – an appeal that certainly does not extend to antiwar veteran activists. This charge to support the military in Vietnam, and all wars since, essentially asks citizens to uncritically support any US conflict. As the war in Vietnam continued, VVAW challenged such a view in the face of condemnation from prominent public officials and the corporate media.

My Lai Was a Massacre, Not an "Incident": And Has Been Virtually Erased from History in the USA

The most publicized US atrocity of the War, the slaughter of unarmed residents of the hamlet of My Lai on March 16, 1968, *was a massacre – not an "incident."* International law scholar Richard A. Falk argues that the My Lai and My Khe (about a mile away the very same morning) massacres must be understood in light of US war crimes committed in Vietnam. Although these massacres "[stand] out as a landmark in the history of warfare," it would be wrong to "isolate [them] from the overall conduct of the war." Policies that could be considered as war crimes include "the Phoenix Program; . . . aerial and naval bombardment of undefended villages; . . . destruction of crops and villages; . . . 'search and destroy' missions; . . . forcible removal of civilian populations; and . . . reliance on a variety of weapons prohibited by treaty" (Falk 1970, p. 80).

My Lai "is simply the foot soldier's direct expression of the . . . fire and terror that his superiors in Washington devise and command from behind desks. . . . The real war criminals in history never fire guns [and] never suffer discomfort. . . . What is illegitimate and immoral, a crime against the Vietnamese . . . is the entire war and its intrinsic character" (Kolko 1971a, p. 414). Regarding the stateside reception to the My Lai Massacre, Gabriel Kolko reminds us that the "rather triumphant welcome various political and veterans organizations gave Lieutenant Calley reveals that terror and barbarism have their followers and admirers at home as well as in Vietnam" (Kolko 1971b, p. 14).

In the USA, the final lesson of My Lai is that it has been repressed and thrown down Orwell's memory hole. According to "one of the most detailed recent accounts of the killing," British historian Kendrick Oliver writes, the massacre is "now almost completely forgotten, erased almost entirely from the national consciousness. What was once an image of incandescent horror has become at most a vague recollection of something unpleasant that happened. . . ." Christian Appy has asserted that My Lai "has virtually disappeared from public debate or memory" (Oliver 2006, p. 3).

Ecocide Is an Essential Legacy of the War

The horrific and illegal chemical warfare against the Vietnamese was condemned by prominent biologist Arthur Galston. At the end of the Second World War "as a result of the Nuremberg trials, we justly condemned the willful destruction of an entire people and its culture, calling this crime against humanity *genocide*. It seems to me that the willful and permanent destruction of environment . . . ought similarly to be considered as a crime against humanity, to be designated by the term *ecocide*" (Quoted in Knoll and McFadden 1970, p. 71).

The devastating environmental health effects of the war continue for Vietnamese and US veterans. Arthur Westing, the leading US authority on ecological damage during the war, addressed these effects: "Damage to the human environment

in a time of war is thus as old as warfare itself. . . . Nonetheless, the Second Indochina of 1961–1975 (the 'Vietnam Conflict'; the 'American War') stands out today as the [model] of war-related environmental abuse." The "massive and sustained expenditure of . . . chemical warfare agents against . . . South Vietnam . . . resulted in a large-scale devastation of crops, to widespread and immediate damage to cropland and . . . forest ecosystems, and in a variety of health problems among exposed human" (Westing 2002).

The USA Doesn't "Hate War": It Loves It

President Obama's 2013 Vietnam Commemoration speech claim – that we "hate war" and "only fight to protect ourselves because it's necessary" – was merely another in a long line of fantastical, historically untrue pronouncements by US officials. The Veterans for Peace website states: "*America has been at war* [224] *out of* [242] *years since 1776. Let that sink in for a moment*" (emphasis added).

Since the end of the war in Vietnam, virtually every calendar year has seen the presence of US military forces abroad (Torreon 2014). The historical record, therefore, reveals a nation wedded to war – organized and orchestrated by an imperialist ruling class and tragically aided by a public that has been disabled by education, the corporate media, and political officials.

The US War Against Vietnam Did Not End in 1975

The imperialist attacks continued for another 25 years. The USA used its domination of global financial institutions to wage economic war against Vietnam, accompanied by propaganda through the media, cultural institutions, and foundations. Immense suffering has continued as a result of unexploded land mines and bombs that have left more than 100,000 Vietnamese dead and maimed since 1975, and the effects of chemical warfare have afflicted millions (O'Connell 2018).

The ideological attacks against Vietnam and the distortion of American views of the conflict include the Burns-Novick 2017 PBS series "The Vietnam War" – based on the profoundly flawed premise that "decent men" pursued it in "good faith." This is one of the greatest lies of a war built on lies. This documentary is yet another effort begun in 1975 to legitimize the imperialist war and US role in the world.

Vietnamese Resistance to US Aggression Was Justified

Madame Nguyen Thi Binh, head of the Vietnamese delegation to the Paris Peace Conference of 1968, called war of resistance against the USA "the fiercest struggle in the history of Vietnam," forced upon a people who did not provoke or threaten the USA. The Vietnamese always believed that "they have the right to choose the political regime for their country without foreign intervention." The USA violated this right; therefore, resistance was justified (Binh 2003, pp. 455–456).

Daniel Ellsberg supports Madame Binh's assertions. "To say that we had 'interfered' in what is 'really a civil war,' as most American academic writers and even liberal critics of the war do to this day . . . was as much as myth of the earlier official one of 'aggression from the North.' In terms of the UN Charter . . . it was a war of foreign aggression, American aggression" (Ellsberg 2002, p. 255).

Advice from a Vietnam Veteran: Read Some Good History Books

A practical lesson of the war is offered by Vietnam veteran and sociologist Jerry Lembcke, author of *Spitting Image: Myth, Memory and the Legacy of Vietnam*. "[The] vast majority of Vietnam War veterans would know more about the war today if they had spent their months of deployment stateside in a classroom with [historian and Second World War bombardier] Howard Zinn" (Lembcke 2013).

U

Final Thoughts

Forty-four years after the US War in Vietnam ended in 1975, the central and most critical issue is the "struggle for memory." Whose story about the conflict will prevail? This struggle will help determine how we, the people, will respond to present and future US international conflicts. It should be clear that the dominant class has crippled citizens' ability to make informed judgments about that war and US international policies, aided by their corporate media and political minions. What Gabriel Kolko argued nearly 50 years ago bears repeating: Most citizens "are still incapable of . . . a searing reappraisal of their cherished assumptions and vision of society" (Kolko 1971b, p. 14).

The dominant view of the War in Vietnam has not called into question a single major premise of US foreign policy that formed the imperialist aggression against that nation. As stated by Noam Chomsky: "The U.S. government is honorable. It may make mistakes, but it does not commit crimes. It is continually deceived and often foolish . . . but it is never wicked. Crucially, it does not act on the basis of perceived self-interest of dominant groups, as other states do" (Chomsky 2003a, p. 157).

United States, Hawaiian Annexation

Glen Olson
The Graduate Center, The City University of New York, New York, NY, USA

Definition

The US annexed the Hawaiian Islands by congressional resolution in the summer of 1898, the same summer in which it gained control of Cuba, Puerto Rico, and the Philippines by defeating Spain. Native Hawaiians negotiated and resisted each step, and studying the relationship between the US and the islands helps to show the contingency and complexity of the path towards annexation.

The US annexed the Hawaiian Islands by congressional resolution in the summer of 1898, the same summer in which it gained control of Cuba, Puerto Rico, and the Philippines by defeating Spain. Although debates about the merits of Hawaii had gained momentum in the 1890s, US involvement with the islands had begun over a century before. Throughout the nineteenth century, the Kingdom of Hawaii became tied politically, culturally, and economically to the US. This by no means meant that annexation was a smooth or inevitable process. Native Hawaiians negotiated and resisted each step, and studying the relationship between the US and the islands helps to show the contingency and complexity of the path towards annexation.

Contact and Initial Ties

Prior to contact with Europe, the Hawaiian Islands were divided among a series of competing kingdoms. Land within a given kingdom was in possession of the monarchy, with commoners earning the right to use it in exchange for labour and agricultural products. Historians disagree about the size of the pre-contact population, but one moderate estimate is that at least 300,000 Hawaiians lived on the islands. An English ship under the command of Captain James Cook discovered the islands in 1778, and soon they became a stopping point for Western ships. Diseases such as measles also travelled with the Westerners, and within a century of contact the native population of Hawaii had dropped below 40,000 (Basson 2005: 582).

The Kingdom of Hawaii was born out of this contact with European empires. In the decades following Captain Cook's voyage, a chieftain named *Kamehameha* unified the islands through a series of bloody campaigns and negotiations. Western technology such as muskets and cannon, along with advice from European consultants, was instrumental to his victories. Kamehameha I sought good relations with the various European powers whose ships came to Hawaii, especially Great Britain. On the basis of a treaty draft negotiated with a British naval officer in 1794, Kamehameha I actually thought that his monarchy was a protectorate of the British Empire, although the British Government denied that this was the case (Coffman 2009: 29). The US was one of the many empires that Kamehameha I encouraged to trade on the islands. Americans started visiting the islands soon after achieving independence from Great Britain in 1783, and Hawaii soon became a vital way station for American ships, particularly whalers.

Despite his willingness to adopt Western technology and ideas in order to unify the islands, Kamehameha I refused to convert to Christianity, arguing that he had no wish to overturn a set of cultural norms that had propped up his regime. Missionaries from the US arrived in 1820 and focused their efforts on reaching out to the royal family. They published the Bible in native Hawaiian and opened schools in order to better spread their message (Okihiro 2008: 187). These missionaries saw themselves as on a civilising mission, and many supported US annexation. Some of their children would take up important posts within the Hawaiian government, for instance as emissaries to other nations. Other descendants of missionaries acquired plantations on the islands, becoming the richest citizens in Hawaii and the leaders of the attempts to force US annexation.

Both missionaries and sailors helped tie Hawaii to the US, but they often found themselves at cross purposes about what Hawaii should become. Several times crews and officers rebelled against the missionaries' projects such as shutting down possible sources of prostitutes. Each faction had a different vision of what the imperial relationship with the US should look like.

Throughout the nineteenth century, the US jockeyed with the British Empire for influence over the islands. Despite the deepening economic ties between Hawaii and the US, it took until 1842 for the US Government to try to assert political authority. Until then it had failed to officially recognise the Kingdom of Hawaii, and it was the kingdom's signing of commercial treaties in that year that made the federal government realise that there was a risk of being marginalised by other imperial powers. President Tyler issued a statement proclaiming that the US had a special relationship with Hawaii and would protest against any other power annexing the islands (Baker 1964: 300).

Adaptation Within a Global Economy

By the 1840s, many of the elite of Hawaii suspected that annexation by the US was imminent. Throughout the 1840s and 1850s, the monarchy tried to handle the situation so that Hawaiian elites would not be dispossessed in the event of annexation. During the 1850s, Kamehameha III let it be known to the US Government that he would be open to annexation as long as certain conditions were met, one of which was that the royal family would be taken care of financially. Another condition was that Hawaii would skip the stage of being a territory, which would mean handing most powers to the federal government, and would be admitted directly as a state. Statehood would help secure the position of local elites. Although the treaty negotiations eventually collapsed on both sides, the demand of immediate statehood ensured that the treaty would have had little chance in a US Senate sceptical of admitting a population of non-whites as citizens (Tate 1962: 2).

Another attempt to mediate the dangers of annexation came in the form of reshaping the property regime that had governed Hawaiian life for centuries. The "Great Mahele" between 1845 and 1855 involved the transformation of the publicly held lands of the islands into individually owned plots; previously property rights had been non-transferable. The historian Stuart Banner has pointed out that Western powers remade traditional indigenous labour regimes in the simple-deed model of Western nations throughout the Pacific Rim in the nineteenth and twentieth centuries. Only in Hawaii was such a transformation undertaken by the native authorities themselves and without direct imperial coercion. Some historians have posited that this was done in an attempt to raise tax revenues during a time of depopulation, but Banner (2005) argues that it was intended to safeguard elite-owned lands in case of annexation, in the hope that imperial authorities would be less likely to seize land held by individual deed than land that was considered communal. It turned out that US annexation was further off than expected, and in the decades between the Mahele and annexation in 1898, the whites were able to consolidate the majority of the most valuable land through individual purchase.

The Hawaiian nobility were not the only ones who tried to negotiate their place in a changing imperial and economic world. Hawaiian emigrants became a labour force throughout the Pacific Rim, working in the gold camps of California alongside Chinese, whites, Hispanics,

U

and everyone else attracted by the Gold Rush (Smith 2013: 10), and working on other Pacific islands during the Guano boom of the mid-nineteenth century. Given their maritime experience, many joined whaling ships and ended up as far away as Nantucket and New Bedford (Okihiro 2008: 130–135).

Although the American Civil War (1861–65) distracted the American Government from the issue of Hawaiian annexation, the conflict tied the islands closer to the American economy. Most domestic sugar in the US was produced in the Southern states, and Hawaiian plantations expanded rapidly to meet the hole in the Northern supply created by secession. As the price of sugar skyrocketed, Hawaii's economy centred more and more on production for US markets. When the war ended and Northerners regained access to Southern sugar, the Hawaiian market crashed, but the economic infrastructure of the islands remained pointed towards finding a way into US markets (Rigby 1988: 222).

The Civil War also touched Hawaiians in more direct ways. The majority of Hawaiians were pro-Union; the Kingdom of Hawaii was firmly anti-slavery, with its 1840 constitution banning the institution. In the 1850s, British emissaries made use of this anti-slavery sentiment when trying to persuade the Hawaiian monarchy to reject US annexation. They pointed out that Hawaii was at a latitude south of the line specified by the Missouri Compromise, and that if admitted as a state it would be forced to be a slave state (Tate 1962: 5). During the Civil War a great number of Hawaiian migrants fought and died for the Union in coloured regiments, and in the latter part of the war a Confederate commerce raider destroyed a huge number of whaling ships in the Central Pacific, including at least one under the flag of the Kingdom of Hawaii. Although it was not officially within the control of the US, Hawaii was close enough to be caught up a war dividing the American empire.

Pulling Towards and Pushing Against Annexation

After the war the bonds of the sugar trade continued to grow with the 1875 Reciprocity Treaty,

which ensured that the vast majority of the sugar produced in Hawaii would be shipped to the US. By 1890, well over 95 per cent of Hawaiian exports went to the US (Osborne 1981a: xii). Hawaii needed the markets of the US in order to survive, while the US had less need of Hawaiian sugar, and domestic sugar producers within the US, especially in Louisiana, were continually seeking to cut out competition from international sources such as Hawaii. This economic pressure translated into diplomatic leverage for the US, as Hawaiians knew that despite the treaty their sugar had precariously little protection.

In exchange for granting Hawaiian sugar a favoured place within the market, the US receiving leasing rights to Pearl Harbor. This harbour had attracted the attention of the US military for years, especially after a visit from General John Schofield in 1872 when he reported that it was the key to controlling the central Pacific (Rigby 1988: 224). The treaty itself did not give the US exclusive rights to the use of the harbour, at least until a revision of the treaty a few years later, but it did ensure that the US military would have a continual presence on the islands. In times of crisis for the Hawaiian monarchy, marines and sailors were in place to either undermine or support whoever was on the throne.

Whites in Hawaii, most of whom were American or descended from Americans, increasingly found themselves in conflict with the Hawaiian monarchy. In 1887 they forced the King of Hawaii to sign a new political constitution, also known as the Bayonet Constitution, which removed most executive power from the throne (Silva 2004: 122). Realising that most native Hawaiians resented the influence they had on the islands, the white leaders insisted that property qualifications for suffrage be introduced in order to disenfranchise the majority of commoners. Historians disagree about the state of the Hawaiian monarchy by the 1890s. Some point to the rapidly declining numbers of native Hawaiians and the support that the king often needed from outsiders in order to prop up his rule as evidence of a leadership vacuum on the islands. Others argue that although her predecessors were weak, Queen Lili'uokalani was deposed not because of the inherent instability of

the Hawaiian monarchy, but rather through US intervention.

Upon ascending the throne, Lili'uokalani tried to renounce the 1887 constitution and reclaim the authority of the monarchy. On 17 January 1893, a group of prominent whites engineered a coup against the monarchy. The American consul, John L. Stevens, encouraged them, promising that the government that they established would be recognised by the US Government. Stevens also deployed American sailors and marines stationed on ships docked at Pearl Harbor. These soldiers were supposedly employed to protect American lives and property, but their functional use was to serve as a buffer between rebels and retaliation from forces loyal to the monarchy. They also secured key government buildings. Realising that the Hawaiian forces would not be able to resist direct US intervention, the queen surrendered power to the organisers.

Within a few weeks of the coup, a treaty for annexation was negotiated, and President Benjamin Harrison submitted it to the US Senate. It came at the end of Harrison's presidential term, and it was his successor, Grover Cleveland, who had to decide whether or not he would back the treaty. Harrison was a Republican, the party that after the Civil War was more likely to support an imperialist venture, while Cleveland was a Democrat. Cleveland sent a fact-finder, James Blount, to Hawaii in order to investigate the 1893 revolution. Blount concluded that the queen had been overthrown without the support of the majority of Hawaiians, and also judged that Stevens had overstepped his authority in providing military aid to the rebels. Cleveland vacillated over what to do next; in one speech he floated the notion that the only honourable path for the US was to support the restoration of the monarchy. The backlash he received came mainly from Republicans, who attacked the idea of the US restoring a monarchy as hostile to the mission of empire of liberty (McWilliams 1988: 39).

Seeing that annexation was not going to happen quickly, the coup leaders organised a new republic, the Republic of Hawaii, which represented the interests of only a small minority of the islanders. Suffrage was determined by landownership, and by the 1890s the majority of the land was in the hands of those descended from Americans. Whites occupied nearly all the senior posts within the government, and the mission of the men in these posts, including President Sanford Dole, was to seek annexation as quickly as possible. Native resistance took several forms, from attempted armed uprisings to a petition campaign that helped to defeat an attempt to pass the annexation treaty in 1897 (Loomis 1976: 3).

Hawaiian annexation had its opponents within the US as well, including many within organised labour. Samuel Gompers, leader of the American Federation of Labor, thought imperial expansion would undermine unions by providing capitalists with ready access to cheap labour sources. The vast majority of labourers on the Hawaiian sugar plantations were contract labourers who served for fixed terms, often of 5 years, rather than working for a free wage. This indentured servitude was a sticking point in the debates over annexation, with congressmen often making references to slavery as a way of criticising the plan to take over the islands. At one point, McKinley suggested that after annexation the institutions of the islands would have to be preserved, since to upset the contract system would be to undermine the entire sugar industry of the islands (Appel 1954: 12). The idea of promoting an unfree labour system horrified critics of empire. Labour unions in the nineteenth century also tended to be extremely hostile towards Chinese immigration, and admitting Hawaii would also mean admitting tens of thousands of Chinese labourers into the Union.

In view of the failure to win annexation in 1897, historians have been divided about why the pro-expansionists won in 1898. The war with Spain provides one explanation. After Admiral Dewey took the Philippines in the spring of 1898, securing a chain of supply by grabbing Hawaii had an air of necessity. On the other hand, historians such as Thomas McCormick and Thomas Osborne (1981b) have argued that Hawaii and the Philippines were appreciated less as possessions in themselves than for the access that they could provide to markets in Asia, particularly China.

A sticking point for annexation was the question of what to do with the people on the islands once they had been annexed. American-born people made up only a small percentage of the populace, and even native Hawaiians composed a minority by the 1890s. The sugar boom, combined with a declining population, had meant that plantation owners had had to import contract labour from other places, particularly China and Japan. Portuguese labourers from the Azores and the Madeira had also been imported, since the people of those island chains had experience of growing sugar.

Would Hawaiians of all types be treated as imperial subjects or granted the benefits of American citizenship, including suffrage? Congress debated the merits of limiting suffrage on the islands by various schemes. Although the states had long since removed their property requirements for male suffrage, some congressmen hoped that the restrictive voting requirements of the Republic of Hawaii could continue when Hawaii became an organised territory. Most congressmen felt that the native Hawaiians themselves should be given the full rights of citizens, but there were sharp divisions over whether the contract labourers should be given such benefits (Basson 2005). Although the immediate debates surrounding who would get the benefits of citizenship within the empire subsided after the 1900s, reservations about the diverse mix of Hawaiians would continue. Hawaii spent over half a century as an organised territory, far longer than most the states which had been territories in previous decades.

United States–Latin American Relations After September 11, 2001: Between Change and Continuity

Kevin Funk
University of the District of Columbia, Washington, DC, USA

Synonyms

China; Dependency; Imperialism; Latin America; New imperialism; United States

Definition

This chapter seeks to analyse the current dynamics in US–Latin American relations, with a particular focus on the region's evolving international

political and economic profile. While the international relations of Latin America have long been viewed as revolving around the US, recent years have borne witness to "new" axes of relations. China is emblematic in this regard, though Latin America has also reached out to other countries and regions. In other words, during the last decade there has been a significant expansion in Latin America's international political and economic footprints. As a result, it has by now become common to refer to "rising" or "emergent" Latin and South America. Yet US influence and imperialist dynamics have in no way disappeared from the region. Further, to the extent that Latin America has indeed emerged from the US shadow, we must interrogate its rise as well, and its implications for how we conceive of imperialism and anti-imperialism vis-à-vis current regional and global geopolitical scenarios.

Introduction

Since the start of the new millennium, fundamentally new dynamics have been at play in US–Latin American relations. Long considered part of Washington's "backyard," and the target of frequent US interventions, Latin America has in recent years fallen from the list of US geopolitical priorities. In response, mainstream analysts – in *Foreign Affairs*, the BBC and elsewhere – have asked whether the US is "losing," or perhaps has even already "lost," South America in particular, and indeed Latin America as a whole. In sum, the region is no longer simply taken for granted as an inalienable part of the US sphere of influence.

This chapter seeks to analyse the current dynamics in US–Latin American relations, with a particular focus on the region's evolving international political and economic profile. While the international relations of Latin America have long been viewed as revolving around the US, recent years have borne witness to "new" axes of relations. China is emblematic in this regard, though Latin America has also reached out to other countries and regions. In other words, during the last decade there has been a significant expansion in Latin America's international political and economic footprints.

As a result, it has by now become common to refer to "rising" or "emergent" Latin and South America. Yet US influence and imperialist dynamics of course have in no way disappeared from the region, as we will see. Further, to the extent that Latin America has indeed emerged from the US shadow, we must interrogate its rise as well, and its implications for how we conceive of imperialism and anti-imperialism vis-à-vis the current regional and global geopolitical scenarios.

"Losing" Latin America?

While the aforementioned rhetoric concerning Washington's "loss" of Latin America is flawed in a number of ways, it does nevertheless contain an important kernel of truth: there has been a general decrease in US influence, involvement, and intervention in the region. The trend is not uniform, and indeed rumours of the death of US sway in Latin America have been greatly exaggerated. However, as indicated by Peter Hakim, president emeritus of the Inter-American Dialogue, there has been a change in the nature (and frequency) of US engagement (and imperialist practices). While policing its "backyard" had traditionally been at the top of its foreign policy agenda, other regions have subsequently become more important to the US. Hakim (2006) comments: "After 9/11, Washington effectively lost interest in Latin America. Since then, the attention the United States has paid to the region has been sporadic and narrowly targeted at particularly troubling or urgent situations."

In contrast, Washington has been directing more of its energies towards engaging in repeated military adventurism in the Middle East as part of the supposed "War on Terror," as well as in countering the rise of China. In regards to the latter, the US is increasing its military presence in Asia as part of what Hillary Clinton has referred to as "America's Pacific Century." It is now commonly argued (both inside and outside of government) that the bilateral US–China relationship is the most important in the world. In turn, Latin America has often been an afterthought for US officials in recent years.

Accordingly, to take a representative example, Latin America played virtually no role in the 2012 presidential campaign. Even in the foreign policy debate, Barack Obama failed to dedicate a single word to the region. For his part, Mitt Romney did call for more attention to trade opportunities in Latin America, and also lambasted Obama for being willing to "meet with all the world's worst actors," among them the leaders of Cuba and Venezuela. Yet neither Brazil nor Mexico (the region's two powers) received even a single mention (see Keppel 2012).

However, this rhetoric concerning the US "losing" (or losing interest in) Latin America is problematic for a number of reasons. First, as Hakim himself suggests, Washington's interest in the region has not been nonexistent. Rather, it has been "sporadic." In certain respects Washington's interest in Latin America during the last decade has been downright intense. Examples include: ongoing efforts to isolate and undermine the region's left-leaning governments, especially in Venezuela and during the "successful" 2009 coup in Honduras against the left-leaning president Manuel Zelaya; the tremendous expansion of free-trade agreements with Latin American countries, specifically with Chile (2004), the Dominican Republic and several Central American countries (2005), Peru (2007), Colombia (2011), and Panama (2011); and steps towards the creation of a "security corridor" from Colombia to Mexico in order to "enlarge the radius of Plan Colombia to create a unified, supra-national counterinsurgent infrastructure" (Grandin 2010).

Periodically, US concerns have also been piqued by fears of Latin America becoming a staging ground for Middle Eastern "terrorist" groups. In this regard, Latin American-Middle Eastern ties (real or imagined) became a hot topic at CNN's "national security" debate during the 2011 Republican Party primary campaign. Addressing a question about "using the United States military," Texas governor Rick Perry's response included the following comments:

> I think it's time for a 21st century Monroe Doctrine . . . We know that Hamas and Hezbollah are working in Mexico, as well as Iran, with their ploy to come into the United States. We know that . . . the Iranian government has one of the largest – I think their largest embassy in the world is in Venezuela. So the idea that we need to have border security with the United States and Mexico is paramount to the entire Western hemisphere.

Later, in response to the question "What national security issue do you worry about that nobody is asking about[?]," former senator Rick Santorum commented: "I've spent a lot of time and concern . . . [thinking] about what's going on in Central and South America. I'm very concerned about the militant socialists and the radical Islamists joining together, bonding together." Romney also got in on the act, adding that, "we have, right now, Hezbollah, which is working throughout Latin America, in Venezuela, in Mexico, throughout Latin America, which poses a very significant and imminent threat to the United States." More specific rumours and accusations launched by US media and political figures include reports concerning Iranian-Cuban-Venezuelan terrorist plots to hack into US nuclear plants (El Universal 2011), the possibility of Iranian bombs exploding in Latin American capitals (Davis 2012), and South American-based agents of the Iranian Revolutionary Guard's elite Quds Force preparing to launch attacks against "US interests" in the region (Warrick 2012). Suspicions have also routinely centred on the activities of Hezbollah and similar groups in the tri-border area, where Brazil, Paraguay, and Argentina meet (Karam 2011). Seeking to address the perceived threat, Obama signed into law the "Countering Iran in the Western Hemisphere Act" in December 2012.

There are further problems with this argument. The idea that the US has lost Latin America implies that, at least insofar as it concerns Washington's involvement, the region is in a post-imperialist phase. This is patently false. US–Latin American relations have of course changed markedly since the heyday of Cold War interventionism. Yet the US has not wavered in its desire to meddle in the region when it perceives its interests to be at stake. This much is clear from its machinations against the Hugo Chávez Government and attempts to further militarise the "War on Drugs."

In addition, the idea that US influence in Latin America is waning is often presented with an undertone of lament. In this narrative, Washington's divine right to play kingmaker in the region is being denied by the entrance of unwanted external actors such as Iran and China. While it is frequently argued, not unfairly, that Chinese and Iranian involvement in Latin America will likely have many negative effects for the region, the US role, past or present, is not often subjected to the same critical analysis. Those who long for the simpler days when Washington's influence went mostly unchallenged in Latin America of course overlook the long and sordid history of US intervention, and its continuing (though more "sporadic") attempts to subjugate the region.

Finally, the notion that it is the US that has lost Latin America suggests that Latin America itself has done nothing to provoke the changes in this relationship. That is, in attributing this shift entirely to the US, instead of in part to actions taken by Latin Americans themselves, this narrative denies the agency of Latin American actors. As noted, there are US-centred factors which help to explain the evolution in US–Latin American relations. These include the 11 September 2001 attacks, as well as Washington's concern with the rise of China, and its turn inward to focus on domestic economic and political crises. Yet Latin America has also been active in pushing for these changes. In short, many Latin American countries have become increasingly independent in recent years due to evolving economic and political circumstances. Respectively, these include greater stability and sustained growth (at least until the recent slowdown in parts of the region, such as Brazil), and a democratising trend that has brought left-leaning and/or nationalist-minded leaders to office in many of the region's countries.

In sum, while Latin America should not properly be anyone's to "lose," except for Latin Americans themselves, there have indeed been fundamental changes in US–Latin American relations in the post-9/11 period. Again: this is not to suggest that Latin America is fighting for or has created a new, post-imperial order, but rather that it has managed to carve out an unprecedented (if still highly insufficient) degree of autonomy

within the existing global power structures and hierarchies. The following section delineates in more precise terms the nature of these changes, and the continuance of imperialist dynamics in the region on behalf of the US as well as other actors. Though the point should not be overstated, as we will see, this analysis requires differentiating between the trajectory of South America and that of the more northern Latin American countries.

Latin America's Growing Autonomy: A "World Historical Event"

As the historian Greg Grandin (2011) observes, so dramatic have been the changes in US–Latin American relations that they constitute "a world historical event as consequential as the fall of the Berlin Wall, though less noticed since it has taken place over a decade rather than all on one night." One striking illustration of this shift concerns Washington's efforts to rally other countries to participate in its post-9/11 "global torture gulag." Grandin (2013) writes:

> All told, of the 190-odd countries on this planet, a staggering 54 participated in various ways in this American torture system, hosting CIA 'black site' prisons, allowing their airspace and airports to be used for secret flights, providing intelligence, kidnapping foreign nationals or their own citizens and handing them over to US agents to be 'rendered' to third-party countries like Egypt and Syria. [. . .]

> No region escapes the stain. Not North America, home to the global gulag's command center. Not Europe, the Middle East, Africa, or Asia. Not even social-democratic Scandinavia. Sweden turned over at least two people to the CIA, who were then rendered to Egypt, where they were subject to electric shocks, among other abuses. No region, that is, except Latin America.

> What's most striking . . . is that no part of its wine-dark horror touches Latin America; that is, not one country in what used to be called Washington's 'backyard' participated in rendition or Washington-directed or supported torture and abuse of 'terror suspects'. Not even Colombia, which throughout the last two decades was as close to a US-client state as existed in the area.

While Washington often used to exercise de facto authority over Latin America's involvement in international politics, in more recent years it has

U

been unable to coax the participation of a single one of the region's countries in its "anti-terror" crusades. This holds even for staunch US allies.

Yet consideration of "Latin America's" relations with the US also calls for disaggregation. For Grandin (2011), what is really occurring is that much of South America is "pull[ing] out of the US orbit" while "Washington is retrenching in what's left of its backyard." This means that while Latin American countries in general are increasingly asserting their autonomy from the US, the trend is especially pronounced in South America; and not just in Venezuela, Bolivia, and Ecuador, but also in Brazil, Argentina, and elsewhere. Even US-friendly Chile, which at the time was negotiating a free-trade agreement with the US, refused to bow to Washington's pressure to authorise the 2003 invasion of Iraq at the UN Security Council (Baeza and Brun 2012). These are indeed different times.

Proceeding apace with this growing autonomy from the US, Latin America has deepened its relations with other countries in the global South. Leaving aside speculation about its political aims in the region, Iran's trade with Latin America has certainly surged in recent years. As of 2011, Iran was the world's largest importer of both Brazilian beef and Argentine corn (Charbonneau 2011; Warrick 2012). China has of course also made headlines for its growing economic interest in Latin America, and has displaced the US as the primary trading partner for a number of the region's countries. It has also become a leading lender and financier of infrastructure projects. One particularly audacious plan (which may or may not come to fruition) concerns a Chinese-financed canal in Nicaragua, to serve as an alternative to the current route through Panama. As *Time Magazine* laments, this suggests that "the can-do spirit Latin America used to expect from the US" now comes from Beijing instead of Washington (Padgett 2011).

South–South relations have also arisen along other, less publicised, axes (Funk 2013). Led by Brazil, South America in particular has greatly increased its presence in both Africa and the Middle East. The Union of South American Nations (UNASUR) – a regional bloc that includes all 12 independent South American countries – has held a series of summits with the Arab League and African Union in recent years. These have provided an unprecedented forum for sustained, high-level contact between these regions. As Al Jazeera notes, then Brazilian president Luiz Inácio Lula da Silva "invested himself and Brazil's overall foreign policy heavily in Africa, maybe more so than any other non-African leader in modern history," thus earning himself the nickname "Secretary General of Africa" (Elizondo 2010). Political engagement with the Middle East has also reached new heights, with the UNASUR–Arab League summits representing the "first time" that "these two parts of the developing world were brought together." As noted by Celso Amorim (2011, pp. 48–49, 52), who served as Lula's foreign affairs minister and is the current defence minister, "Without any hesitation, I can testify that the Middle East was brought, perhaps for the first time, to the center of our diplomatic radar."

Economic relations between these regions have also soared. South American trade with both Africa and the Middle East has increased several times over in recent years. Brazil and Argentina are the primary players in this regard. Tellingly, Arab countries now comprise the second-largest market in the world for Brazilian agricultural goods (dos Santos 2012).

There are other indications of growing Latin American (and particularly South American) autonomy from the US. These include: the formation of regional blocs such as UNASUR and the Community of Latin American and Caribbean States (CELAC), both of which exclude the US from participation; the region's increasing participation as protagonists in the global economic system, as indicated by the rise of Latin-American-based transnational corporations – the "Global Latinas" (Casanova 2009); and the emergence of Brazil as a regional and even global power, including its participation as one of the BRICS countries.

Yet here, caution is in order. It is easy to overstate the "change" that is embodied in Latin America's growing global involvement. For example, though the 2014 founding of the

BRICS' "New Development Bank" was met with much hysteria in the West, the grouping's achievements in this or other areas in actually challenging US hegemony or the primacy of the US dollar have been meagre, to say the least. Given the massive disparities and differences between the BRICS countries (in size, political systems, economic interests, and so forth), there is indeed reason to suspect that the BRICS will produce much counter-systemic rhetoric but perhaps little else.

More fundamentally, Latin America's increasing South–South relations, attempts at regional integration, and willingness to criticise US policies *do not* signify the end of US imperialism in the region. The US is still the world's leading imperial power, still views itself as "the world's indispensable nation," and still sees Latin America as its rightful "backyard." What has changed is not its imperial *intentions* but rather its ability to carry them out (again, prompted in part by Latin America's growing autonomy) in the usual fashion. In the current era of US imperialism in Latin America, the *means* are less the bullet and the military dictatorship than growing surveillance, free-trade agreements, and foreign aid to prosecute the ineffectual and economically destructive "War on Drugs," beef up security forces with extremely problematic human rights records in the name of fighting crime, and support opposition groups in the region's left-leaning states.

Thus, imperial aims toward Latin America are a bipartisan constant; what vary are the chosen tools to bring them about. Obama's would-be rapprochement with Cuba does not reflect a new, post-imperial US–Latin American relationship. The fundamental US goals of regime change and maintaining its colonial enclave in Guantánamo continue. What has changed is the recognition that greater US-Cuban engagement and the spread of capitalist relations will prove more efficient than a quixotic embargo in remaking Cuba in our image.

For their part, Latin America's leading states have indeed become increasingly assertive in recent years, though of course without presenting any fundamental challenges to the existing global order. Nevertheless, in comparison to Latin America's "Cold" War (during which US-backed military coups and interventions leading to widespread carnage were less the exception than the rule) much has indeed changed in the contemporary period.

Evaluating the "New" Latin America

It is at least clear in the current period that we must qualify the seminal International Relations theorist Robert Keohane's argument that Latin Americans "are takers, instead of makers, of international policy" (quoted in Carranza 2006, p. 814). Simply, US influence in the region is no longer as all encompassing as was the case a mere decade or two ago, as the above analysis demonstrates. History is of course contingent, and Latin America's gains in these regards could easily be reversed. Yet at least for now, the region has a degree of autonomy that is without historical precedent.

The prominent Colombian philosopher and legal scholar Oscar Guardiola-Rivera (2011, pp. 13, 18) takes up this point in his suggestively titled *What If Latin America Ruled the World? How the South Will Take the North into the twenty-second Century.* He writes: "Latin America is making world history, and looks set to lead the world into the twenty-second century." He also singles out South America's left-leaning governments for "manag[ing] to challenge the prevalent form of globalisation" through their deviations, real or imagined, from the prevailing neo-liberal model. South and Latin America's rise, then, is not only being concretised in the present but is also a harbinger for the creation of a better world.

Yet three caveats are in order vis-à-vis this sanguine account. First, if anything, capitalist relations and the "extractivist" model have become even more entrenched in Latin America in recent years, even under "left turn" governments (Veltmeyer and Petras 2014). The region's historical inequalities and marginalisation of large sectors of the population have thus in general continued unabated, if not worsened.

Second, this again should not be taken to mean the end of imperialism in Latin America. In fact,

as suggested above, it does not even mean the end of *US* imperialism in the region. While there have indeed been fundamental changes in US–Latin American relations, Washington's attempts to discipline and intervene in the region are not exclusive to the pre-9/11 world.

Further, China's booming relations with Latin America have their own imperialist-style dynamics. The Chinese economic model in Latin America has largely been to import raw materials (from Chilean copper to Venezuelan oil) while exporting cheap manufactured goods that undermine local industry. Thus, there is a risk that Latin American countries are entering into a new "dependency"-style relationship with China, in which they will become trapped as commodity producers. In other words, the same wine, but in a new Chinese-made bottle.

Third, considering Latin American actors as "makers" (i.e., as actors who matter at a regional or global level) also suggests the need for a more critical analysis than Guardiola-Rivera and many progressive commentators present. There is certainly reason to applaud the fact that the US is no longer able to exercise the same stifling control over the external agendas of Latin American countries. But to the extent that Latin American actors (from governments to Global Latinas) are exercising power in international politics and economics, it must be scrutinised. We cannot simply assume that Latin America's rise will necessarily have positive social implications, or will bring into a being a more benign social order, and promote a nicer form of global capitalism. As Branwen Gruffydd Jones (2006, pp. 225–226) puts it, "The anticolonial response ought not to privilege the non-Western as a matter of principle – to do so simply mirrors in reverse the logic of imperial value." Instead, we must interrogate how Latin America is wielding this newfound power and to what ends it is taking advantage of its expanded autonomy.

This suggests a number of questions. For example: Are Latin America's booming trade relations with other areas of the global South actually serving to undermine the global capitalist system or neo-liberal economics in any way? Or are they in fact reinforcing them? What about the tremendous trade imbalances in some of these sets

of relations? For example, in 2011, Argentina exported around $1.7 billion (US) in goods to both Algeria and Egypt, its largest trading partners in the Arab world, while importing only $3.5 million and $74 million, respectively. Does this suggest South–South solidarity, or a quasi-neocolonial relationship?

A prima facie response suggests extreme caution about viewing these relations as the building blocks of a new world order that is significantly different from what we have now. In other words, it is not clear how much the global political and particularly economic systems would actually change "if Latin America ruled the world." This scepticism is further warranted based on Latin America's (and, again, particularly Brazil's) growing participation in the global weapons trade. Indeed, though it of course pales into insignificance in comparison to the US, Brazil is now the world's fourth-largest exporter of light arms, with annual sales tripling between 2005 and 2010. Unsurprisingly, then, Arab Spring protestors in Bahrain found themselves the targets of Brazilian-made tear gas canisters, which are alleged to have killed several infants (Santini and Viana 2012).

Closer to home, Brazil's economic activities within South America have also come under fire. Brazilian-financed infrastructure and mining projects from Ecuador and Peru to Guyana and Argentina have inspired local opposition. In the case of Bolivia, plans for a road through indigenous territories have prompted protestors to denounce the "São Paulo bourgeoisie" and the Brazilian government for "imperialist' tendencies" (Romero 2011).

The point is not to take an overly dim view of the rise of Brazil, or Latin America more generally. Again, to the extent that Latin Americans are now able to exercise greater control in the realms of national and international politics and economics, that is of course a positive development. So is the fact that a region which has long been marginalised and disenfranchised from making decisions at the global level is now increasingly (though only nascently) assuming that role, through institutionalised channels such as the UN and World Trade Organisation and also otherwise.

This could have positive consequences. To take one example, in comparison to China, which has often provoked anger for its heavy-handed approach to resource-extraction on the continent, Africans tend to see Brazil as a "less threatening" alternative partner (Carmody 2011, p. 78). Despite the aforementioned controversies, Brazil is also viewed quite favourably by many in Latin America (BBC 2011). Indeed, though ultimately ineffectual, its leadership in responding to the 2009 coup in Honduras is but one example of the constructive role that the country can play there. The push by Brazil and other regional leaders for the establishment of institutions such as UNASUR and CELAC is another development that could have salutary long-term effects in Latin America. Further, the general respect (at least rhetorically) of Latin American governments for international law, and reticence to support military interventions, may often be a helpful antidote to the rules of the US-led global order. Beyond the region's governments, transnational social movements such as the Latin American-inspired World Social Forum can provide a hopeful vision for a globalisation and international politics "from below" (Smith et al. 2008). Yet the beneficence of the region's actors in these regards must be interrogated, not merely assumed.

Conclusion

The post-9/11 period has borne witness to deep and historic changes in US–Latin American relations, and indeed in the international politics and economics of Latin America more generally. This is especially the case for South America. Meddling by the US and (to a lesser extent) other outside actors of course continues in the region, while China's increasing economic ties with Latin America appear more likely to lead to further dependency than development in the region. Latin America still exists within the prevailing capitalist, neo-liberal order, and we are far from a post-imperialist age in which the US and Latin America interact on anything approaching an equal footing. Nevertheless, it is also true that, on the whole, Latin American actors enjoy

greater autonomy at present than at any period since independence.

This has fed into repeated hand wringing in the US over whether Washington has "lost" Latin America. Yet while this line of argument is troubling for a variety of reasons (e.g., it suggests that Latin America is in a post-imperialist phase, and implicitly denies the agency of Latin American actors), it does hint at an important truth. Namely, as stated in UNASUR's Constitutive Treaty, many of the region's governments are aiming to create a more "multipolar" and "balanced" world (Itamaraty 2008). Regional integration is one manifestation of this desire, as is the diversification of Latin America's economic and political ties. This again does not portend a Latin America that is free of the imperial hand of Washington. But even greater latitude within existing imperial and global hierarchies, at least at the present moment, represents a markedly positive change from the Latin America of the "Cold" War.

As a result, it is important to recognise that despite the continuing imperialist dynamics that characterise US foreign policy, Latin American actors have an unprecedented (though still rather limited) degree of agency in the contemporary period. For a region that has long suffered, and continues to suffer, at the hands of foreign powers, this is a reason for applause. However, instead of merely cheering the region's rise, and Brazil's push for regional and global influence, scholars and activists, as well as the general public in these countries, must also scrutinise how Latin American political and economic actors are exercising this power. It is not enough to celebrate their arrival as makers; we must also enquire as to what they are making.

US History

US Imperialism

US Imperialism and Nazi Germany

Jacques R. Pauwels
Toronto, ON, Canada

Definition

The relationship between the US and Germany from 1933–45, more specifically between the US and the German imperialist systems, was complex and ambiguous. It admittedly involved eager competition, sometimes bitter rivalry, and ultimately war, but also intimate and mutually beneficial collaboration, especially at the level of private enterprise.

This essay challenges the predominant notion that the US was an enemy of Hitler's Third Reich. In reality, the relationship between the US and Germany from 1933–45, more specifically between the US and the German imperialist systems, was complex and ambiguous. It admittedly involved eager competition, sometimes bitter rivalry, and ultimately war, but also intimate and mutually beneficial collaboration, especially at the level of private enterprise. This collaboration was also furthered by a shared antagonism toward the Soviet Union, the incarnation of anti-capitalist revolution and anti-imperialism which, under Hitler's auspices, German imperialism was expected to annihilate. Nevertheless, the US and German imperialist systems did eventually stumble into war against each other, with nothing less than supremacy within the restricted circle of the Great Powers at stake. Ironically, it was the huge sacrifices made by the Soviet Union that ensured US victory in the showdown at imperialism's OK Corral. When the war ended, German imperialism, defeated and therefore down but certainly not

U

out, and henceforth under 'democratic' rather than Nazi management, was reduced to the role of a junior partner of US imperialism, willing and able to help the US establish its supremacy in Europe and to fight and eventually vanquish the Soviet Union in a new, 'cold' war.

Like other imperialist powers, the US is always looking out for ways to serve the interests of its big corporations and banks. In order to keep their profits at an acceptably – perhaps better? – at a desirably high level, important raw materials such as oil must be obtained as cheaply as possible, foreign markets must be opened up, and opportunities must be created everywhere for the profitable investment of excess capital. Access to cheap labour is also crucial, and labour must be kept cheap by combating unions and working-class political parties. The interests of US imperialism in the face of competition in the imperialist 'rat race' must be defended by all means, ranging from forging formal or informal alliances with other imperialist powers to conflict and war. Last but certainly not least, the system of which imperialism is a manifestation, capitalism, must be defended against any kind of unwanted change, above all revolutionary change, throughout the world.

The US, itself a former colony, has traditionally avoided seeking to accomplish all this by establishing direct political control over other countries (in other words, by acquiring colonies), as its European rivals used to do. Its favourite approach has been economic penetration, combined with the greatest possible amount of indirect political control. This strategy has typically required the collaboration of local comprador elites ruling via democratic or, if necessary, dictatorial regimes. Much of Latin America has been penetrated in this manner by US imperialism. Like colonial control, economic penetration has usually been associated with 'developing' countries, especially when it involves crude forms of indirect political control via regimes that could be defined as 'neo-colonial' or 'semi-colonial', such as the Pinochet regime in Chile or the Suharto regime in Indonesia. Economic penetration can also target fully developed countries, however, including other imperialist powers. And this kind

of penetration is of course likely to have a great influence on formal and informal relations, not only at government level, with the affected power. Let us examine the case of the relationship between the imperialisms of the US and Nazi Germany from 1933–45; that is, the dozen years during which, under Hitler's stewardship, German imperialism first flourished, then nearly collapsed, but – with US help – would manage to survive.

The First World War had been an imperialist war, fought by imperialist powers with imperialist objectives in mind: a reality that was semantically obscured by claims that it was a 'war to end all wars', a 'war for democracy', and similar hypocritical nonsense. At the end of that war, Germany's imperialist ambitions received a major setback. On the international stage, however, Germany remained a major player with a considerable imperialist appetite, which was to become obvious for all to see when Hitler came to power in 1933. To the US, this development posed a challenge but also created opportunities. In the context of the ongoing competition among imperialist powers, the US and Germany were competitors engaged in a rivalry that had the potential to explode into war, but they also stood to gain from a close collaboration; if not between their respective governments, then at least between their leading corporations and banks. During the First World War, a huge amount of capital had built up in the vaults and accounts of 'corporate America', which therefore looked out for investment opportunities abroad. For this kind of activity, Germany, which needed to disgorge hefty reparation payments to France and Belgium, proved to be a promised land. The result was that a wave of US direct investment flooded into Germany. In 1929, General Motors (GM) thus took over Germany's largest car manufacturer, Adam Opel AG, based in the town of Rüsselsheim. In the same year, Ford built a huge new factory in Cologne, soon to be known as the Ford-Werke. The result: a large share of the German auto industry was henceforth under US control. Other US corporations formed strategic partnerships with German firms. This arrangement involved joint ventures and understandings concerning access to raw materials, agreements concerning

prices, etc. A spectacular example is provided by the case of Standard Oil of New Jersey (later known as Esso, then Exxon), which went to bed with the German petrochemical trust IG Farben. By the early 1930s, an elite group of about 20 large US companies had some sort of German connection. A number of large US banks were also involved in this German investment offensive, for example J.P. Morgan & Co, which had made a fortune during the Great War. All these banks had their own German partners, such as the Deutsche Bank. US law firms were also involved in investments in Germany. The great specialist in these kinds of legal affairs was Sullivan & Cromwell, a prestigious Wall Street law firm run by the brothers John Foster Dulles and Allen Dulles, whose German-connected clients included the Rockefellers, owners of Standard Oil.

In the early 1930s, things did not go well for US investments in Germany. The reason for this was the Great Depression, whose main characteristic was the disharmony between supply, high because of increased productivity, and slumping demand. This crisis affected all capitalist countries, but it hit Germany particularly hard. At the German branches of US corporations, production and profits dwindled. To make things worse, the political scene became extremely unstable, with Nazis and communists battling each other in the streets of Berlin and other big cities. German industrialists and bankers – and US 'captains of industry' with investments in Germany – feared that the country was ripe for a 'red revolution' like the one which had put the Bolsheviks in power in Russia in 1917. But then a miracle happened: thanks to the generous political and financial support of German industrialists and financiers, including many with partners in the US, Hitler came to power in January 1933, and soon the situation changed politically as well as socially and economically. The German subsidiaries of Ford, GM and others quickly returned to profitability. The reason was that Hitler did what those who had brought him to power, Germany's leading capitalists, expected of him: he eliminated the threat of revolutionary change, embodied by Germany's communists, throwing many of them into concentration camps; and he dissolved other working-class parties and all labour unions, thus transforming the hitherto militant German working class into a flock of impotent sheep, forced to work 'harder and faster' for the benefit of their employers, including the German subsidiaries of foreign corporations. At Ford-Werke, for example, labour expenses declined from 15 per cent of the business volume in 1933, when Hitler came to power, to 11 per cent in 1938. Whenever workers displayed the slightest inclination to protest or strike, the Gestapo intervened with an iron hand in favour of the employer. General Motors' Opel factory at Rüsselsheim benefited from such an intervention in June 1936. The owners and managers of US corporations and banks with investments in Germany were in seventh heaven and publicly sang the praises of Hitler. Among them were William Knudsen, the chairman of the board of General Motors, Sosthenes Behn, the head of ITT, and lawyer John Foster Dulles. (The story of US investments in Nazi Germany is told in detail in Pauwels 2002, 2013.)

Hitler also found a way to lead Germany out of the doldrums of the Great Depression. His remedy was essentially Keynesian or 'demand-side'; that is, he stimulated demand by means of government orders. But Hitler's Keynesianism was of a military nature: at his behest the German state ordered tanks, guns, submarines, trucks, and planes in huge numbers. This was part of his great ambition, shared by Germany's industrialists and bankers, to rearm Germany so that, via a new war, it could finally achieve the grandiose imperialist ambitions for which the Reich had already gone to war in 1914 against its imperialist rivals. (Fritz Fischer first demonstrated this continuity in his famous book *Germany's Aims in the First World War,* published in English in 1967.) War was expected to bring wonderful results in terms of opening up sources of raw materials and markets in the form of overseas colonies, of course, but also of territories in Eastern Europe. It would obviously take quite a few years before Germany would be ready to wage war successfully. In the meantime, Hitler's rearmament revealed itself as a bonanza of profits for Germany's corporations and banks, as has been stressed in studies of the economic history of the Third Reich, such as

U

Adam Tooze's *The Wages of Destruction* (2006). The German subsidiaries of US corporations shared fully in the 'profit explosion' made possible by the armament boom. The Ford-Werke, for example, which had suffered heavy losses in the early 1930s, benefited from massive state orders for trucks. And so the annual profit of Ford's German subsidiary climbed spectacularly between 1935 and 1939. General Motors' Opel factory, which had also suffered losses in the early 1930s, did even better thanks to orders from the Nazi regime. Other big US corporations that made a lot of money in Germany in the 1930s were: IBM, whose German branch, called Dehomag, supplied the Nazis with perforated card machines, the predecessors of the computer, which facilitated the automation of industrial production; and ITT, whose German subsidiaries, including Lorenz AG, produced all kinds of communications equipment for the Nazis, especially for the Luftwaffe. (IBM's happy adventures in the Nazi Wonderland have been described in great detail in a notorious book by Edwin Black [2001].)

Hitler's Germany was not only a low-wage Shangri-La for US investment capital, but also became a significant market for the finished products of US industry. Ford, for example, also exported truck parts from the US to Germany. Other US corporations, for example, Pratt & Whitney, Boeing, and Sperry Gyroscope (now known as Unisys), provided the Third Reich with 'significant quantities of all sorts of material related to aviation' such as 'automatic pilots . . . and artillery devices used in anti-aircraft defence' (Etzold 1975: 78–79). The US also exported raw materials of great strategic importance to Germany, including copper and rubber, for which, in view of its preparations for a 'motorised' war, Hitler's Germany had a great need. In preparation for the kind of motorised war that would be known as blitzkrieg ('lightning war'), involving countless gas-guzzling trucks, tanks, and planes, Germany also stockpiled enormous oil reserves, and much of that oil was supplied by US trusts. The percentage of petroleum products imported by Germany from the US quadrupled between 1933 and 1939. A corporation that earned huge profits from this business was the Texas Oil

Company, renamed Texaco in 1959. The German navy obtained the oil it needed from a Texas oil magnate, William Rhodes Davis. And Standard Oil assisted IG Farben in the production of synthetic fuel.

The profits made by US branches were for the most part reinvested in the 'land of unlimited possibilities' that Hitler's Germany appeared to be at the time, certainly in comparison to the US itself, which remained stuck in the mud of the Great Depression. The 'earnings' were reinvested in the modernisation of existing infrastructure, the building of new plants, and the purchase of government bonds. In 1935, for example, GM built a new Opel plant in Brandenburg, near Berlin; it was the most modern truck factory in the world. The value of US investments in Germany thus grew considerably. The Ford-Werke and IBM's Dehomag virtually doubled in value between 1933 and 1939. As for Opel, by 1939 its worth was estimated at $86.7 million, that is, 2.6 times the value of General Motors' original investment in Germany, which had been $33.3 million. Under Hitler's auspices, the total value of US investments in Germany, involving a total of 553 companies, rose to $450 million at the formal declaration of war against the US in December 1941. In the 1930s, then, US imperialism was profiting handsomely from close collaboration with German imperialism, then under Nazi management.

The fact that Hitler was a racist and a virulent anti-Semite did not trouble the owners and managers of US corporations active in Germany, many of whom were 'white supremacists' and anti-Semites themselves. Henry Ford, for example, had personally written an anti-Semitic tract in 1920 entitled *The International Jew,* which actually had a great influence on Hitler. Both men, like most contemporary anti-Semites on both sides of the Atlantic, subscribed to the theory of 'Judeo-Bolshevism', explained in detail in Damien Amblard's book *Le 'fascisme' américain et le fordisme* (2007). They considered Marxist international socialism to be an invention of 'international Jewry', a strategy developed by that supposedly inferior people to subvert the natural (or God-given) rule of the superior 'Nordic' or

'Aryan' race. The Russian Revolution in particular was seen as the evil work of Jews, and the Soviet Union, the first socialist state and a bastion of anti-imperialism, was despised as 'Russia ruled by Jews'. And it was believed that the Jews would not rest until they had subverted the entire world with their labour-union agitation, their socialism, or, worse, their communism. Ford and many other US industrialists and bankers admired Hitler because he had exorcised this 'red peril' from Germany. And they fervently hoped that he would soon proceed to fulfil his life's big ambition as outlined in *Mein Kampf*: namely, the total destruction of the Soviet Union, source of inspiration and guidance for 'Reds' worldwide, also stateside, where the political left was troublesome enough for the 1930s to be labelled the 'red thirties' by some historians.

And so it happened that US businessmen were unperturbed by Hitler's anti-Semitism and racism in general and happily helped him to prepare for war, a war whose victim was supposed to be the Soviet Union. Indeed, as late as the spring of 1939, Hitler was determined to wage war against the Soviets, as Rolf-Dieter Müller has convincingly demonstrated in his 2011 book *Der Feind steht im Osten*. Hitler was convinced that 'the West' – a codename for the imperialist powers – would not object to such a war and would therefore remain neutral as a *tertius gaudens.* This was not an unreasonable expectation, because the destruction of the Soviet Union was fervently desired by all imperialist powers. After all, that state was perceived as the incarnation of social revolution, a 'counter-system' to the international capitalist order of things, and the wellspring of anti-imperialist agitation worldwide. Moreover, via their infamous appeasement-policy, London and Paris had actually encouraged Hitler's great ambition and facilitated its implementation, providing him with a Czechoslovak 'springboard' pointing east.

The US and German industrialists and bankers who backed Hitler had another reason for looking forward to the war he would unleash. Hitler had to borrow vast sums of money to finance his armament programme. Germany's national debt was mushrooming, and it was clear that only the loot

resulting from a ruthless war of rapine would enable him to pay back the creditors; that is, the banks and other investors and purchasers of German government bonds, including US corporations and banks. Last but not least, it was hoped that the destruction of the Soviet Union would facilitate the recovery of the investments made by US corporations like Singer in the Empire of the Tsar, lost on account of the 1917 Russian Revolution.

Even though he was the dictator of a rival imperialist power, US capitalists were as happy with Hitler as they would have been with any comprador dictator they might have put in charge of some 'banana republic' in South America. Hitler, so the saying went, was 'someone you could do business with'. And great things were expected from him in the future, above all the destruction of the Soviet Union. US and German imperialism were on the same wavelength: they supported each other, they were forming a partnership, admittedly not a formal *political* partnership, but certainly an informal *economic* partnership; not a partnership at government level but a partnership at corporate level. The US government kept a decent distance from the regime in Berlin, which was despised by many ordinary Americans. But Washington certainly saw no reason to go to war against a country where US investment was flourishing. In fact, in the 1930s, the US had plans in the drawer for war against Mexico, Japan, and even Great Britain and Canada, but no plans at all for war against Nazi Germany (Rudmin 2006: 4–6).

The owners and managers of US businesses with branches in Germany were undoubtedly frustrated by the fact that, for reasons which cannot be elucidated here, the war unleashed by Hitler in 1939 turned out to be a war against Poland and the 'Western' powers Great Britain and France, instead of a war against the Soviet Union. But this was not very important. What was important was that this war opened up even more fabulous opportunities for making money. When war broke out on 1 September 1939, the New York Stock Exchange reacted enthusiastically and showed its biggest gains in more than two years. Indeed, in order to wage 'lightning war'

U

(*Blitzkrieg*) and thus achieve 'lightning victories' (*Blitzsiege*) in 1939 and 1940, Hitler relied to a large extent on equipment and fuel provided by US corporations, which made a lot of money supplying these goods. For the benefit of all branches of the German armed forces, Ford-Werke and Opel cranked out not only trucks, but also planes, including the JU-88 bomber; ITT's subsidiaries manufactured radios and radar equipment as well as high-quality fighter aircraft such as the FW-190; IBM's German subsidiary, Dehomag, provided technology that allowed the Nazi war machine to operate 'on a large scale, quickly and efficiently,' as Edwin Black puts it; and the subsidiary of Singer, famous for its sewing machines, mass-produced machine guns. In 1939 and 1940, Texaco and Standard Oil continued to ship oil to Germany, much of it via neutral Spanish ports. Texas oil baron William Rhodes Davis supplied Mexican oil, refining it in his own German subsidiary located in Hamburg.

The military success of the Nazis was also the commercial success of US corporations and banks; the triumphs of Germany's Nazi imperialism were also triumphs of US imperialism. Major players of both sides celebrated the *Wehrmacht's* recent victories in New York on 26 June 1940, during a dinner at the Waldorf-Astoria Hotel. It was organised by Gerhard Westrick, a German lawyer who represented Ford, GM, General Electric, ITT, Standard Oil, and other US corporations with a German connection. Many high-ranking executives of US corporations and banks attended. Five days later the German victories were fêted again, this time during a party organised by Rieber, the boss of Texaco, and attended by more big guns of US industry such as Edsel Ford, Henry Ford's son.

The de facto alliance of US and German imperialisms, not at government level but certainly at the level of 'private enterprise', was also reflected in the happy and optimistic comments of US executives such as Rieber, Thomas Watson, the big boss of IBM, and oil baron William Rhodes Davis. They praised Hitler, his Nazi regime, and fascism in general, and expressed the hope that their great and profitable relationship might continue to yield fruit, for example in the shape of business to be done in the countries occupied by Germany. Conversely, Hitler honoured US industrialists such as Ford and Watson with prestigious decorations.

The fact that Hitler was a dictator and that many of his victims were democracies did not bother these captains of industry. Typical of this attitude was a comment by Alfred P. Sloan, chairman of GM, in June 1940, expressing satisfaction that the era of the democracies with 'their unintelligent, even stupid and limited leaders' was finished, and that the future belonged to Nazism and other forms of fascism, 'an alternative system … with leaders who are strong, intelligent, aggressive, [and] who make people work longer and harder'. Corporate America's spectacular demonstration of enthusiasm and support for fascism in 1940 is one of many historical facts that contradict the 'free-markets-and-democracy' notion; that is, the idea that the natural political partner of the social-economic system of capitalism, often euphemised as the 'free market' system, is democracy.

The war unleashed by Hitler was good for US imperialism, especially for the corporations and banks with German branches. But the war also revealed itself to be good for other corporations, namely all those, usually also 'big boys', that became involved in the stateside production of planes, tanks, and other war equipment. The US itself had been modernising its military for some time – the strategic bombers and aircraft carriers did not wait until the 1940s to be designed and built – and from Washington came increasing orders for trucks, tanks, planes, ships, etc. This increase in military spending by the state bolstered economic demand enough to finally put an end to the Great Depression. Furthermore, thanks to President Roosevelt's famous 'Lend-Lease' programme, US industry was also producing all kinds of military equipment for Great Britain, thereby allowing the latter to continue the war against Hitler after the defeat of France. Contrary to popular myth, Lend-Lease 'aid' did not amount to a free gift, but was a complex system of loans and credits, generating gargantuan profits for the US corporations and banks that were involved.

But Lend-Lease also promised *long-term* benefits for corporate America. The scheme required London to dismantle the protectionist system of 'imperial preference' tariffs, which had not prevented but certainly limited US exports to Great Britain and its dependencies; it served as a weapon for US products to conquer the British market, in other words, to economically penetrate – and thus weaken – an imperialist rival. Conversely, Lend-Lease drastically reduced the British share of the pie of the US market, in that it forced the British to divest themselves of virtually all their considerable stateside investments. Finally, on account of Lend-Lease, Great Britain found itself saddled with a colossal debt, which would not be completely paid off until 29 December 2006. The war unleashed by German imperialism, informally but intimately associated at the time with US imperialism, thus allowed the latter to clip the wings of its British rival in the imperialist rat race. During the Second World War, British imperialism, once so powerful but considerably weakened by the First World War, was reduced to the status of 'junior partner' of US imperialism.

From the perspective of US imperialism, Hitler had been good for business, but his war was nothing less than wonderful for business and strengthened the international position of US imperialism. There was no need for the US to get involved in the war in Europe, and the leaders of corporate America had no desire to see that war end soon. To the contrary, they wanted the war to last as long as possible, as Henry Ford openly admitted on one occasion. About the war in Europe, US industrialists regretted only one thing: namely, that the Soviet Union, the incarnation of anti-capitalism and anti-imperialism and therefore the arch-enemy of all imperialist powers, had not been the victim of the *furor teutonicus*. On 22 June 1941, however, the *Wehrmacht* finally crossed the Soviet border with tanks and trucks made by Ford or GM and with gas tanks brimming with fuel provided by Texaco and other US oil trusts. If Hitler had attacked the Soviet Union ten, five, or even just one year earlier, the leaders of corporate America would have applauded unanimously. But in 1941,

their feelings were mixed. The sales to Great Britain had been the source of unlimited profit for many corporations, and it was obvious that their British customer's chances of survival improved considerably when the Nazis went for the throat of another enemy, especially when that enemy did not collapse after a few weeks, as the experts in Washington, London, and obviously Berlin had expected.

The Nazi regime's economic policy also played an important role in the decline of US enthusiasm for Hitler. US imperialism, like any other imperialism, wanted 'open doors' all over the world for its exports and its investment capital. But, starting in the late 1930s and increasingly in the early 1940s, the Nazis – in other words, the contemporary managers of German imperialism – moved to restrict access to the markets of Germany and the European countries it conquered to all but the most indispensible foreign products and raw materials such as oil. Most of Europe was thus converted into something US businessmen detested, namely a 'closed economic system', difficult if not impossible to penetrate economically. To US corporations with branches in Germany itself, this development did not present a considerable problem, but US corporate leaders who were not so privileged – and the many politicians convinced that US prosperity depended on foreign trade – were very perturbed. Even more irritating was the success of Berlin's aggressive international trade policy in Latin America, considered by US imperialism to be its exclusive commercial bailiwick. During the 1930s, the German share of the import volume of countries such as Brazil and Mexico was growing rapidly at the expense of the hitherto unthreatened US competition. Nazi Germany was rapidly becoming the 'most irksome competitor' of the US in that part of the world, as the German ambassador to Mexico put it in 1938 in a report to Berlin. Corporate America thus lost a lot of the sympathy it had previously had for the Nazi regime. The friendship between the US and German imperialist systems was cooling off rapidly. (Reference is made to Uwe Lübken 2004; the quotation of the ambassador is from Hallgarten and Radkau 1981: 337–338.)

When Nazi Germany attacked the Soviet Union, many US industrialists wished that neither side would win; they hoped that the conflict on the Eastern Front would last very long, until the antagonists were both exhausted. More and more members of the US power elite started to sympathise with the Soviets, if only because they worried that, in case of a Nazi triumph in the East, Hitler 'might be unstoppable' (Smelser and Davies 2008: 9–11); in other words, that such a triumph might crown German imperialism as the supremo of international imperialism – and a major threat to the US. Still, a hard core of US businessmen remained resolutely profascist and anti-Soviet and hoped that Hitler would destroy the cradle of communism. In all likelihood, this was also what the great majority of owners and managers of US corporations with German subsidiaries were looking for, because they produced the war materiel that enabled the Nazi legions to head for Moscow in that hot summer of 1941. To their great regret, the Nazi host was never to march triumphantly onto Moscow's Red Square.

Success in this *Blitzkrieg* was not just a military but also an economic precondition for a German victory in the Second World War. To win the war, Germany had to win fast, lightning-fast. After the campaigns of 1939 and 1940, there was enough fuel left only to wage war for about three or four months. But Berlin was confident that the Red Army could be defeated in six to eight weeks. A lightning-fast victory would make the abundant resources of the defeated Soviet Union available, particularly the oil of the Caucasus, and that would turn Germany into an invincible world power. In other words, victory over the Soviet Union would make German imperialism 'number one', not only in Europe, but in the entire world. But on 5 December 1941, when the Red Army launched a counteroffensive in front of the gates of Moscow, as devastating as it was unexpected, Hitler himself and the generals of the German High Command realised that the 'lightning war' in the East would not produce a 'lightning victory', and that Germany was therefore doomed to lose the war. That day, 5 December 1941, was the real turning point of the Second World War, but other than Hitler and his generals, hardly anyone

was aware of it. (Two 'outsiders' who were in fact aware of it were the Swiss secret services and the Vatican.)

America's 'captains of industry' did not have the vaguest idea what the failure of the *Blitzkrieg* in the Soviet Union really implied, but it was henceforth obvious that the Germans were going to have their hands full on the Eastern Front for quite some time. This would allow the British to stay in the war, which meant that the profitable Lend-Lease trade could continue for the foreseeable future. In other words, the success of the Red Army was good for business. In the autumn of 1941, the New York Stock Exchange recorded higher and higher stock prices as it became increasingly evident that the Nazi crusade in the East was not going to result in the great triumph that had been expected. The situation became even more advantageous when it appeared possible to do business with the Soviets as well. In fact, in November 1941, when it became obvious that the Soviet Union was not going to collapse anytime soon, Washington revealed itself willing to extend credit to the Soviets, and a lend-Lease agreement was signed. Thanks to that wonderful war in Europe, yet another foreign market opened up, at least partially and temporarily, for the benefit of US imperialism. Moreover, via 'reverse Lend-Lease', the Soviet Union also started to supply the US with important raw materials, including chrome and manganese ore as well as platinum; on account of this, the US even became a net beneficiary of wartime trade with the Soviets, at least according to the Soviet historian Pavel Zhilin (1985: 55–56).

Incidentally, it is a myth that the totally unexpected success of the Soviets against Nazi Germany was only possible because of massive US aid. First, US aid never represented more than 4 or 5 per cent of the total Soviet production of war equipment. Second, US supplies to the Soviets only began to make a difference long after the turning point of December 1941. According to Adam Tooze, 'the Soviet miracle owed nothing to western assistance [and] the effects of Lend-Lease had no influence on the balance of forces on the Eastern Front before 1943' (2006: 589). Third, the Soviets themselves manufactured virtually all

of their high-quality weapons, including the excellent T-34 tank. Finally, and perhaps most importantly, Lend-Lease aid to the Soviet Union was at least neutralised by the unofficial, discreet, but nonetheless substantial, assistance provided to the Germans by US corporations. Without these resources, the Nazis would never have been able to attack the Soviet Union.

Viewed from the perspective of US imperialism, the war yielded all sorts of benefits and opportunities but also some problems, challenges, and dilemmas. The defeat of France and the Netherlands in 1940, for example, raised the question of what would happen to their colonies in the Far East, namely Indochina and Indonesia, rich in rubber and petroleum, respectively. With the 'mother countries' occupied by the Germans, these colonies looked like ripe fruits ready to be picked by one of the remaining competitors in the imperialist competition. But by which one? Perhaps the Germans, if they were to win the war and impose a harsh, Versailles-style settlement on the losers. But the prospects of a German triumph were fading fast as the Panzers had to shift into reverse gear in front of Moscow. A more likely candidate was Japan, an imperialist power with great ambitions in the Far East, and a keen appetite for rubber and oil. But the US was also a candidate. With Japan, the USs had had strained relations since the early twentieth century when, following their conquest of the Philippines, the US had become geopolitically interested in the Far East. Both powers had great and conflicting ambitions with respect to China, a huge but powerless country that seemed ripe to be economically penetrated and politically dominated by an imperialist power. To America's displeasure, Japan had already grabbed a sizeable piece of China in the 1930s, namely Manchuria. And now Indochina and Indonesia were up for grabs. The tension was mounting in Tokyo and Washington; who would make the first move?

In Washington, plans for war against the Japanese, underestimated as an inferior yellow race, had been ready for quite some time. They involved the use of aircraft carriers and strategic bombers, providing Uncle Sam with a military arm long enough to reach across the Pacific,

where the Philippines, strategically situated close to Japan as well as China, Indochina, and Indonesia, could serve as a useful base of operations. (Hawaii, annexed by the US in 1898, was of course an equally convenient *pied-à-terre* halfway across the Pacific.) In Washington, the President and his advisors felt it was imperative to act before Tokyo had a chance to beat them to it and create a fait accompli that might be impossible to undo. During the last few decades, more and more evidence has built up indicating that, via measures such as an oil embargo, the US leaders deliberately provoked Japan into bombing Pearl Harbor and knew that a Japanese strike force was on its way to attack the US base there (see Robert B. Stinnett's book *Day of Deceit* [2000].)

It was extremely important to make the Japanese attack the US, rather than vice versa. Indeed, only a defensive war was acceptable to Congress and to the US public. Moreover, an US attack on Japan would also have required Nazi Germany to come to the aid of Japan under the terms of their alliance, while a Japanese attack on the US would not. Tokyo was tricked into attacking Pearl Harbor just days after the strategic aircraft carriers had conveniently sailed away from there, and so President Roosevelt could easily 'sell' the war he wanted against Japan to Congress and to the US public. There would be no need to account for Germany, which had not been involved in Japan's so-called 'surprise' attack, was under no obligation whatsoever to come to the aid of its Japanese ally, and was known to be grimly focused on its war against the Soviet Union.

But on 11 December 1941, a few days after the attack on Pearl Harbor and much to Washington's surprise, Hitler himself declared war on the US. Very likely, he hoped that Tokyo would return the favour by declaring war on the Soviet Union, which would have revived Berlin's moribund hope for a victory on the Eastern Front. However, the Japanese did not declare war on the Soviet Union, undoubtedly figuring that they would have their hands full with their US enemy. Predictably, their armies swarmed out to the south, to resource-rich Indochina and Indonesia and to the Philippines, the major US bridgehead in the Far East.

U

US imperialism was now an enemy of German imperialism, a partner and even friend not so long before, at least of corporate America. It was also an enemy of Japanese imperialism, a long-time rival in imperialism's Far Eastern hunting grounds. On its side was British imperialism, in the process of becoming the 'junior partner' it has remained ever since. And also on its side, rather surprisingly (if not shockingly), was Soviet communism, in principle an arch-enemy of all forms of imperialism, but formally at war only against German imperialism. The Soviet Union was a friend of the US and Great Britain, but only 'for the duration'; that is, on account of the principle that 'the enemy of my enemy is my friend'. That friendship was doomed to end as soon as the common enemy was defeated.

The US and its British partner restricted their active participation in the war against Germany to a minimum, finding excuses for not opening a second front in Western Europe which would have provided considerable relief to the Red Army. While the 'Anglo-Saxons' thus sat on the fence, the Soviets functioned as cannon fodder, fighting titanic battles against the Germans at Stalingrad and elsewhere, inflicting huge losses on the *Wehrmacht.* On the Eastern Front, Germany would end up with no fewer than 10 million of its total 13.5 million men killed, wounded, or taken prisoner during the entire war; and the Red Army would end up with the credit for 90 per cent of all casualties in the German army. That was obviously to the advantage of the US and Britain, which did not care that the Soviets themselves also suffered grievous losses. In fact, it was hoped that the war in the east would end with both sides being totally exhausted, so that the US, together with Britain, could decisively intervene in the end, like a deus ex machina. (In similar fashion, the US had entered the First World War at a very late stage, suffered minimal losses compared to Britain and France, and emerged from the war in a much stronger position vis-à-vis allies who also happened to be imperialist rivals.)

The Soviets would make the biggest contribution by far to the Allied victory over Nazi Germany, but would indeed be bled white in the process. For each American who gave his life, in the Second World War, no fewer than 53 Soviet soldiers gave theirs. And while a total of approximately 300,000 Americans – and also approximately 300,000 British – were killed on all fronts, including the war against Japan, more than 13 million Soviet soldiers were killed, virtually all of them while fighting the Germans on the Eastern Front.

The informal partnership of US imperialism with German imperialism, and the discreet but intimate collaboration between the two, had never existed at the government level, but always at the corporate level, at the level of 'private enterprise'. (Which is why it has been virtually invisible to historians, who conventionally focus on the role of the state, in other words, on events of a political and military nature.) When, in December 1941, their governments suddenly and unexpectedly found themselves at war with each other, this mutually beneficial corporate collaboration did not come to an end; far from it. Business trumped patriotism, and making money proved more important than winning the war. As far as US corporations and their German branches were concerned, it was business as usual: 'profits *über Alles*!'

The German branches of the big US corporations were not confiscated by the Nazis after Pearl Harbor, as has often been suggested. Nazi intervention in their management remained minimal, and the headquarters in the US maintained at least a measure of control via trusted German managers and in some cases via branches in neutral countries such as Switzerland. They continued to crank out the military commodities desperately needed by Hitler to continue his murderous war long after he had abandoned all hope of victory. The US branch plants were specialists in mass production of this kind of material, and the Nazi leaders understood only too well that interference in the management of Opel and others could jeopardise that production. US branch plants continued to supply Nazi Germany not only with a huge quantity but also a high quality of military equipment. This included trucks equipped with all-wheel drive, radar systems, engines for the ME-262, the very first jet fighter, and turbines for the infamous V2 rockets. A US subsidiary also supplied

sophisticated equipment that assisted the Nazis in perpetrating their unprecedented crimes. We refer to the Hollerith calculators, produced by IBM's Dehomag, useful for 'establish[ing] lists of Jews and other victims with a view to deporting them'. Finally, at least some US corporations continued to provide the Third Reich with fuel, without which much of this equipment would have been useless. Via ports in the Caribbean and Spain, Standard Oil shipped not only petroleum products to Germany, but also other raw materials essential for waging war, such as tungsten and cotton.

It is true that, as apologists argue, the US branches in Germany had no choice but to produce for the Nazis. But this defence obviously does not apply to corporations that found ways to export oil and other commodities to Germany. And it is also true that the managers of the branch plants and their stateside bosses did not have to be forced; in fact, they proved very keen to produce for the Nazis. The reason was that producing for the Nazis in Germany remained highly profitable until the very end of the war. (Incidentally, the Nazi authorities paid the bills with money stolen from their Jewish victims, with gold looted from the national banks of occupied countries like Belgium, and with other riches yielded by their conquests and crimes; Swiss and international banks based in Switzerland were happy to make the arrangements.) The earnings of the Ford-Werke, for example, almost doubled between 1939 and 1943. Noteworthy determinants of high profit rates were the regressive employment policy of the Nazi regime and the massive use of forced labour. The Nazis froze the wages of German workers and introduced considerably longer working hours. At Opel and Singer, workers protested in vain as they had to labour 60 hours per week while their wages were reduced. Labour costs were also lowered, and profits thus increased, by the use of forced labour in the form of foreign workers, many of them deported involuntarily to Germany, as well as prisoners of war and concentration camp inmates. This amounted to a form of slavery, of which the branch plants of US corporations were also able to take advantage. Subsidiaries known to have benefited from such slave labour included Coca-Cola, Kodak, Opel, which favoured POWs, and the Ford-Werke, which on one occasion even employed inmates of the Buchenwald concentration camp (Billstein et al. 2000).

The profits made by US branch plants continued to be reinvested mostly in Germany, for example in the expansion of facilities and the acquisition of more modern machinery, which increased the value of the enterprise. The value of the Ford-Werke thus rose officially from Rm60.8 million in 1938 to Rm68.8 million in 1945, but in reality it likely more than doubled during the war. It also seems that profits were repatriated via banks in Switzerland, such as the Bank for International Settlements (BIS) in Basel. This financial institution – dominated and run by US and German bankers, even during the war – is known to have assisted the oil magnate William Rhodes Davis in repatriating some of the profits made by his German subsidiary. Before and after Pearl Harbor, the BIS collaborated with representatives of both German and US corporations. On the US side they included Allen Dulles, the representative in Berne of the US secret service (OSS, forerunner of the CIA). According to a German historian, Jürgen Bruhn, the OSS was 'from a social point of view, an association of executives of big companies, stock brokers and Wall Street lawyers [etc.]'. And indeed, before the war, Dulles, together with his brother, John Foster, had been a partner in Sullivan & Cromwell, a Wall Street law firm specialising in US investments in Germany and German investments in the US. Dulles's boss, the head of the OSS, was William Joseph Donovan, also a former Wall Street lawyer and a good friend of Gerhard Westrick, Ford's and Standard Oil's German lawyer, the man who had hosted the June 1940 celebration of the German victories in New York. During the war, Westrick was the administrator of the German branches of ITT and Kodak. Throughout the war, the BIS functioned as a kind of private club in which German and US businessmen, their eminent lawyers, and their favourite bankers could meet and do business. As the French writer Paul Valéry put it at the end of the First World War, in war 'people who do not know each other massacre each other for the

U

benefit of people who know each other but do not massacre each other'.

In the US, the public was not aware that branch plants of prestigious US corporations were producing all sorts of weapons and other equipment for the Nazi enemy. The US government, on the other hand, knew very well what was going on, but chose to ignore this kind of 'trading with the enemy'. This tolerant attitude had a great deal to do with the fact that 'big business' has always had an enormous influence in the halls of power in Washington and even managed to increase that influence considerably during the war. A host of representatives of big business, including high-profile executives, descended on Washington and took over important positions in the state bureaucracy. They included William S. Knudsen, president of General Motors from 1938 to 1940, an admirer of Hitler, Edward Stettinius Jr., another former senior officer of General Motors, and Charles E. Wilson, president of General Electric, another firm with major investments in Germany. The overwhelming majority of these volunteers proceeded to advance the interests of their corporations, obtaining lucrative state contracts, and, unsurprisingly, safeguarding the interests of their subsidiaries in Germany. Thus, we can understand why the US government chose to piously ignore the fact that the country's big corporations were amassing fortunes in the land of the enemy. There were, however, exceptions to this general rule. Legal action was taken against a small number of corporations whose Nazi connections happened to be a public secret, particularly Standard Oil and IBM, but that led to nothing more than a gentle slap on the wrist. The fact that big business enjoyed unprecedented control over the US government also explains why the German branch plants of US corporations, including the huge Ford-Werke just outside frequently bombed Cologne, were only lightly bombed by the Allies (if at all), despite the fact that they were of vital importance to the Nazi war effort.

The failure of Hitler's *Blitzkrieg* in the Soviet Union in December 1941 had been the real turning point of the war, but until the end of 1942 everything still seemed possible. After the Battles of Stalingrad and Kursk in 1943, however, the whole world knew that the German army had received blows from which recovery was impossible. The Red Army was henceforth on the march to Berlin; slowly, perhaps, but surely. In Washington and London, this caused alarm bells to ring. If nothing were done to prevent it, the Soviets might singlehandedly defeat the Nazis, occupy Germany, and liberate all of Europe. That would mean not only the end of German imperialism, but also a catastrophe to imperialism in general, because the Soviet Union embodied the anti-capitalist, anti-imperialist revolution. Such an outcome would be particularly traumatic to US imperialism, which had invested heavily in German imperialism. US imperialism not only intended to maintain its profitable German connection in the coming post-Nazi era, but also looked forward to using it as a bridgehead for the economic penetration, combined with indirect political control, of the rest of Europe. In other words, US imperialism had a stake in the survival of German imperialism, albeit in a new, non-Nazi reincarnation.

Defeating German imperialism and not destroying it as the Soviets purported to do, but subordinating it to the status of a junior partner, combined with the hoped-for elimination of that pesky competitor in the Far East, Japan, was generally expected to bring about what the publisher of *Life*, Henry Luce, had already predicted in 1941: namely, that the twentieth century would be 'the American century' – one during which, as US writer Lewis Lapham predicted, the US would 'inherit the earth'. On the other hand, it was feared that US imperialism could get into deep trouble if Germany and Europe could not be brought into its orbit. The demand stimulated by war had pulled the US economy out of the slump of the Great Depression and even created a boom, but the war would soon end, so economists, journalists, and politicians expressed fear that the country might slide back into a depression, bringing unemployment and other social problems, and possibly demand for radical change. It was believed that this daunting scenario could be prevented if US industry could find ways to market its products all over the world. Some spokesmen of the US power elite even declared dramatically that the

preservation of the capitalist system in America depended on a considerable expansion of overseas trade and investment. It is in this context that the US sought to achieve a worldwide system of free trade via the Bretton Woods agreements of 1944 and the creation of the International Monetary Fund (IMF) and the World Bank, supposedly *international* organisations that have in fact been dominated from the start by the US. All countries were henceforth supposed to provide an 'open door' to US exports and investment capital, and henceforth Washington actively supported governments that were favourable to such an arrangement and fought – openly or covertly – those that were not. In countries which the US itself liberated, for example Italy and France, the left-leaning resistance, planning all sorts of radical reforms of an anti-capitalist nature, was thus excluded from power in favour of elements embracing economically liberal and politically conservative ideas, often including former fascists such as Italy's Marshal Badoglio. The US hoped, moreover, that in the other countries of Europe, namely not-yet-defeated Germany and the East European states in the process of being liberated by the Red Army, governments would come to power after the war that favoured the kind of liberal economic policies from which the US expected such high dividends.

After the summer of 1943, the Red Army was on the move to Berlin, but it was still fighting deep in Russia itself and continued to face 'the overwhelming bulk' of the German army (Ponting 1995: 130). In order to be able to compete with the Soviets in an unspoken 'race to Berlin' the US and Britain now hastily made plans to land troops in France. This project would be implemented in June 1944 with the landings in Normandy, destined to be wrongly glorified in the West as the great turning point of the Second World War. Later that same summer, Operation Market Garden was launched with the aim of crossing the Rhine, taking Berlin before the Soviets could do so, and defeating and occupying most of Germany before the end of that year. In Germany, a fait accompli favourable to the US (and British) cause was thus supposed to be created, an arrangement which the exhausted Soviets would be

unable to challenge. Similar situations, favourable to the Western powers and unfavourable to the Soviets, local communists, and other anti-fascist and anti-imperialist forces with plans for radical if not revolutionary reforms, had already been created in Italy in 1943 and were created again in France and Belgium in the summer of 1944. But Market Garden was a fiasco, and the Allied advance from Normandy petered out near Germany's western border. In December 1944, the US was even temporarily forced onto the defensive by a German counter-offensive in the Belgian Ardennes, and it was only with difficulty that the ensuing Battle of the Bulge was eventually won. In early 1945, the Western Allies were still stuck more than 500 km from Berlin, while the Red Army resumed its offensive and advanced to Frankfurt (Oder), located a mere stone's throw from the German capital.

The hope of occupying most of Germany before the arrival of the Soviets had to be abandoned. Washington and London were therefore extremely gratified that at the Yalta Conference of 4–11 February 1945, Stalin agreed to a (presumably temporary) post-war division of Germany into occupation zones. This agreement assigned only the smaller and economically less important eastern third of the country, and only the smaller eastern third of Berlin, to the Soviets; however, when, during the last months of the war, the German resistance on the Western Front melted like snow under the sun, allowing US troops to advance across the agreed-upon demarcation lines into the zone assigned to the Soviets, the Yalta agreements were suddenly no longer advantageous to the West, thus generating the myth that at Yalta too many concessions had been made to Stalin.

In any event, it looked as if Washington would have to allow the Soviet Union to reap its fair share of the fruits of a common victory, a victory to which the Soviets had made the greatest contribution and for which they had made the greatest sacrifices. These fruits would include hefty reparation payments from Germany as well as the installation of governments in Eastern European countries like Poland that would not be hostile to the Soviet Union. From the perspective of US

imperialism, this was not a pleasant prospect. Indeed, it meant that the Soviet embodiment of anti-capitalism and anti-imperialism would be able to recuperate from the trauma of Nazi aggression and resume, possibly successfully, its construction of a socialist 'counter system' to capitalism. German reparations to the Soviet Union also meant that, in future, the profits made by the German branch plants of US corporations would flow to the Soviets instead of into the pocketbooks of US shareholders.

And so Washington considered a number ways to prevent this scenario. Serious consideration was given to the 'Junker Option'. This scheme called for the replacement of the Hitler regime in Berlin by a junta of supposedly respectable *Wehrmacht* generals, mostly conservative Prussian aristocrats known as Junkers, who would then make the remainder of the German armed forces available for a joint operation against the Soviets. General Patton enthusiastically advocated such a common 'crusade' and offered to spearhead a drive to Moscow. With an eye on their possible utilisation against the Soviets, hundreds of thousands of German troops who had rushed into US and British captivity were allowed to keep their arms and uniforms and remain under the command of their officers. For the same purpose, countless Nazi spies and other 'experts' on warfare against Russia, many of them war criminals, as well as Ukrainian and other Eastern European Nazi collaborators, were 'debriefed' and then provided with false documents that allowed them to escape to a new life in South (and even North) America. Patton's proposed push to Moscow did not materialise, however, mainly because US soldiers and civilians made it abundantly clear via demonstrations and even strikes that they would not put up with such a cynical *renversement des alliances.*

When the war in Europe ended in early May 1945, US imperialism found itself on top of the world. It had achieved a triumph over German imperialism, originally an informal partner but then formally an enemy, which would have been a formidable rival had it not been defeated – ironically enough by the Soviets, with only minimal help from allies such as the US. It was indeed thanks to the Soviets that US imperialism could eliminate German imperialism as a contender for imperialist supremacy, place it under new and presumably democratic management, turn it into another junior partner, and with its help, economically penetrate and attain indirect political control over all of Western Europe. During the years following the end of the war, this US control would be solidly anchored in international organisations firmly controlled by Washington, such as the IMF and that reliable warhorse NATO, and also the emerging European Union (EU). The emergence of the EU as a US scheme to control Europe indirectly but securely, via a reliable German partner, has been described in detail in a recent book by the French historian Annie Lacroix-Riz (2014). Lacroix-Riz also explains how French imperialism, still a major player before the war but subordinated to German imperialism from 1940 to 1944, was happy to switch allegiance and become a junior partner of US imperialism upon the liberation of the country; it did so to prevent implementation of the plans for radical social-economic change formulated by the predominantly leftwing resistance movement. It was likewise in the context of the contemporary widespread popular support, throughout Europe, for anti-fascist and mostly anti-capitalist political and socio-economic changes, that German imperialism itself – personified by industrialists, bankers, and clerical and conservative elements in general – was happy to settle for the role of junior partner to US imperialism. Indeed, only US imperialism appeared able to rescue German imperialism from obliteration at the hands of Germany's resurgent (and radical) anti-fascist forces and the antiimperialist Soviets.

In any event, by the spring of 1945, German imperialism had been eliminated as a challenger to the US. Great Britain had already been reduced irrevocably to the role of junior partner, and French imperialism had just reported for duty as yet another subservient paladin. Moreover, it was clearly only a matter of time before Japanese imperialism would be vanquished and turned into another moon circling the US Jupiter. The US had become the supremo of international imperialism, the uncontested leading power of

international capitalism. The struggle for hegemony within the imperialist camp, which in many ways had begun in earnest in 1914, was settled.

Nevertheless, imperialism still faced a challenge: the Soviet Union. That irritant state enjoyed influence over an admittedly small part of Germany and over most of Eastern Europe, denying the US an 'open door' for its exports and investment capital as well as any form of political control there. Having emerged from the terrible ordeal of war as the world's second most powerful country, the Soviet Union also enjoyed enormous prestige, even in the 'Western' world. More particularly, it served too as a source of inspiration, guidance, and support for anti-imperialist movements everywhere. Inspired by its example, social and national liberation movements in China and Vietnam would even prevent the US from enjoying an unchallenged hegemony in the Far East, which had been the unspoken US war aim in the conflict against Japan.

The war against Japan ended with mushroom clouds rising over the ruins of Hiroshima and Nagasaki, but it did not have to be that way. Japan would have capitulated without the use of the atom bomb, mainly because on 8 August 1945, a declaration of war by the Soviet Union had robbed Tokyo of its last hope of attaching some minor conditions to its inevitable surrender. The atom bomb was really used to terrorise the Soviet Union into withdrawing from East Germany and Eastern Europe. (The bombing of Dresden in February 1945 had served a similar purpose.) But this 'atomic diplomacy', chronicled in great detail by the US historian Gar Alperovitz (1994), was unsuccessful, because the Soviet leaders responded by entrenching the Red Army in Europe as far west and as close to the US and British troops as possible, and by installing pro-Moscow regimes all over Eastern Europe.

And so, in the heat of the infernos of Dresden, and then Hiroshima and Nagasaki, the Cold War was born. From the perspective of US imperialism, the Second World War had been a war against 'the wrong enemy', Nazi Germany and fascism in general, imperialist rivals but also fellow imperialists and fellow anti-Soviets; and alongside 'the wrong ally', the anti-imperialist Soviet Union. The Cold War would be the 'right' war in the sense that it would be fought against 'the right enemy' of US imperialism, and of imperialism in general: the anti-fascist, anti-capitalist, and anti-imperialist Soviet Union. In that war, the US would arrange to have, as 'the right ally', a supposedly 'new' and 'democratic' state established in the western part of Germany, ruled by an assemblage of deeply conservative men, including many former Nazis, who shared a pro-capitalist and anti-Soviet ideology. We cannot go into the details of the history of the Cold War, but that conflict would end in the early 1990s, after the fall of the Berlin Wall, with the collapse of the Soviet Union and the triumph of US imperialism. The US, since 1945 the undisputed leader of the imperialist camp, was henceforth the only superpower in a 'unipolar' world. But even that triumph would be far from complete, as US imperialism found itself confronted by new challenges such as the greatly increased might of China, a new great rival in the form of Putin's Russia, anti-imperialist movements in Venezuela and elsewhere in Latin America, and huge social, economic, and financial problems in the imperialist metropolises, including those of the US itself.

US Imperialism and the Disintegration of Yugoslavia

Ronald W. Cox
Department of Politics and International Relations, Florida International University, Miami, FL, USA

Introduction

US military intervention in the former Yugoslavia during the 1990s can only be understood in the context of US imperial ambitions at the end of the Cold War. The United States had been engaging in economic and geostrategic intervention in Yugoslavia as early as the 1980s to facilitate the imperialist goals of protecting the profit-making interests of private, US-based commercial banks while further opening Yugoslavia to foreign investment. By the 1990s, the US approach shifted to a US-led NATO intervention to strengthen and expand the purpose of NATO during the post-Cold War period, including changing the mission of the alliance to be directed to "out-of-area" military operations to protect access to oil supplies. The United States also pursued the expansion of NATO, and the utilization of NATO in the former Yugoslavia, to forestall alternative security arrangements being proposed by Germany and France. Therefore, NATO expansion in the post-Cold War period cannot be fully understood without attention to the politics of imperial rivalry and the fusion of state interests with the interests of powerful sectors of global capital (Gibbs 2009).

The geostrategic and economic interests of the United States in Yugoslavia were developed in position papers drafted by the Reagan administration as early as 1984. These documents guided the United States in its Yugoslavian policies from the 1980s through the disintegration of the country in 1992. A now declassified 1984 National Security Decision Directive (NSDD 133), entitled "US Policy Towards Yugoslavia," outlined the goals of the United States in promoting a quiet revolution to overthrow communist governments and parties while reintegrating the countries of Eastern Europe into a market-oriented economy. The US agenda included a reliance on the International Monetary Fund (IMF) to enforce structural adjustment plans in Yugoslavia whose purpose would be to strengthen the position of pro-Western and corporate interests in the country. A closely related objective was to ensure the collection of the debts owed to private (primarily US-based) commercial banks who had lent money to Yugoslavia during the 1970s.

US policymakers, such as Secretary of State James Baker, worked in tandem with international investment groups, including Kissinger Associates, to promote a reduced role for the state in economic planning and a series of cuts in state subsidies for food, heating fuel, gasoline, and transportation. The changes had been promoted by the IMF since 1982, when the Yugoslavian government

dropped food subsidies under IMF direction and, again in 1983, when prices for gasoline, heating fuel, food, and transportation rose by one-third after the elimination of government subsidies (Woodward 1995). During the same period, the Yugoslavian government froze investment in infrastructure and social services. In keeping with the outlines of the original plan, the IMF and the World Bank moved in 1990 to cut off loans to the central Yugoslavian government in favor of direct loans to the republics and provinces (World Bank 1991). This policy was designed to encourage a more rapid move toward private enterprise and Western trade in Yugoslavia by giving export subsidies (mainly through the World Bank), tax incentives, and foreign exchange to firms, sectors, and regions that were in the best position to engage in manufactured exports. Those firms and regions that were dependent on domestic production and had less access to transportation networks to the West were largely shut off from subsidies.

The United States also insisted upon a continuation of IMF-style stabilization programs as part of the 1995 Dayton Accords, which brought the Balkan Wars in Bosnia-Herzegovina to an end. The peace agreement resulted in a constitution that empowered the IMF to appoint the first governor of the Bosnian Central Bank, who, like the High Representative Carl Bildt (appointed by the European Union), was not allowed to be a citizen of Bosnia and Herzegovina or a neighboring state (*Dayton Peace Accords*, Article VII, 1995). This stipulation is consistent with the IMF and US economic objectives of the 1980s, which were designed to promote the creation of a Western-style Central Bank in Yugoslavia that would not be subject to the old-style consensual policymaking of republican representatives (Woodward 1995, pp. 74–81). In addition, the new constitution granted the London-based European Bank for Reconstruction and Development (EBRD) control over the Commission on Public Corporations, authorized to oversee the operations of all public sector enterprises, including water, telecommunications, postal services, energy, and transportation. The EBRD president was allowed to appoint the chair of the commission and to direct the sale of state assets and the acquisition of long-term investment funds (*Dayton Peace Accords*, Agreement on Public Corporations, Article 1.10, 1995).

The US economic objectives toward the former Yugoslavia were interrelated with strategic objectives, most importantly the expansion and utilization of the North Atlantic Treaty Organization as the foremost collective defense organization in the post-Cold War period. In February of 1992, officials from the State Department, the Pentagon, and the National Security Council, in conjunction with the president and his senior foreign policy advisers, drafted a "Defense Planning Guidance document," which laid out the importance of NATO for long-term US economic and security interests. All high-level US advisers expressed agreement that the United States would face new challenges to Cold War international organizations in the wake of the collapse of the Soviet Union and Eastern European communist regimes. The ability of the United States to meet those challenges involved strengthening international institutions in which the United States exercises predominant authority. US planners explicitly identified the maintenance and expansion of NATO as crucial to US economic and political influence in Europe during the post-Cold War period. The drafters of the Defense Planning Guidance document noted that the preservation of NATO could enable the United States to link its military leadership to issues of economic cooperation with Western Europe and help dissuade Europeans from embarking on independent security arrangements which could weaken US influence on the continent:

> NATO continues to provide the indispensable foundation for a stable security environment in Europe. Therefore it is of fundamental importance to preserve NATO as the primary instrument of Western defense and security, as well as the channel for U.S. influence and participation in European security affairs. While the United States supports the goal of European integration, we must seek to prevent the emergence of Europe-only security arrangements which would undermine NATO, particularly the alliance's integrated command structure. (Tyler, *NYTimes*, 1992, p. 14)

The US insistence on a NATO-led military presence to enforce the terms of the Dayton

U

Accords is in keeping with the identification of NATO by high-level US planners as crucial to US objectives in the post-Cold War period. The United States actively discouraged the creation of any European defense organizations that would threaten the position of NATO as the leading international defense organization in Europe. US policymakers also rejected peace proposals prior to the Dayton Accords that called for a UN command structure to supervise peacekeeping operations. In fact, the United States identified the NATO role in Bosnia as crucial to ensure US support for any peacekeeping proposal, a condition satisfied only by the Dayton Accords, whose terms differed from an earlier peace plan by replacing a UN peacekeeping force with a NATO-led mission (Cohen 1995, p. 319). US officials identified NATO expansion as crucial to US military objectives for Europe and subsequently proposed to globalize NATO's defense commitments to include targeting of rogue states, defined by US policymakers as states that possessed weapons of mass destruction and posed a visible threat to the security interests of the United States and its allies.

The following account examines the relationship between US economic and security goals and the breakup of the former Yugoslavia. The analysis begins with an overview of the neoliberal agenda promoted by the IMF, the World Bank, and US officials during the 1980s. Then there will be an examination of how that agenda worked to undermine the Yugoslavian government by encouraging and rewarding politicians, provinces, and regions that successfully implemented neoliberal policies. West Germany furthered the process of disintegration within the United Nations by providing recognition to the breakaway Croatian Republic and by using its influence in the European Community to broker an EC position in favor of a recognition of independence to Croatia and Slovenia. The initial US position was in favor of a loose political union for Yugoslavia, despite that US policies helped promote economic and political destabilization.

After the economic, political, and ethnic tensions mounted and full-scale civil war had begun, US negotiators repeatedly moved to block the earliest efforts by the European Community, the United Nations, and the warring factions to agree to peace terms. In particular, US mediators advised the Bosnian Muslim leadership to reject the Vance-Owen Peace Plan, implying that the United States would back efforts to secure a better negotiated deal for the Muslim coalition. Furthermore, US negotiators worked with high-level US ambassadors and State Department personnel to channel money and arms to the Croatian military to force the Bosnian Serbs to the negotiating table. Throughout a central issue for the United States was that NATO should be employed as the primary entity for the enforcement of any viable peace plan. In addition, the United States wanted certain guarantees in place that would allow multilateral lending institutions to direct and control a central bank that would be independent from Bosnian political control. In short, the United States insisted on a high degree of political and economic control of the terms of the peace plan, conditions which may well have served to prolong a viable settlement in Bosnia.

The Neoliberal Agenda and the Destruction of Yugoslavia

Long-term trends in international political economy during the 1980s provide a crucial context for understanding the mounting economic and political divisions that contributed to the breakup of Yugoslavia during the 1990s. By 1980, the IMF and the World Bank had increased their level of cooperation with private commercial banks in enforcing the political terms of structural adjustment loans to less developed countries. Following a decade of large-scale private bank lending to leading borrowers in the less developed world, including Yugoslavia, Poland, and Hungary within Eastern Europe, the beginning of the 1980s saw a reversal in the terms of indebtedness that proved threatening to the efforts of creditors to collect debts. A persistent fall in commodity and export prices, coupled with mounting interest rates, dramatically increased the debt burden of less developed countries and their governments. Multilateral lending institutions worked more

closely with creditors to enforce the terms and conditions of new loans to the less developed world during the 1980s, insisting upon the implementation of specific government reforms in exchange for the availability of new loans. Such strict conditionality represented an unprecedented level of cooperation between multilateral lending and private commercial banks, who agreed to defer new loans until agreements could be established.

The changing circumstances of the international political economy influenced the patterns of bargaining between the IMF and the Yugoslavian Republics during the 1980s. Those Yugoslavian regions that depended on the production of raw materials and primary commodities were hardest hit by the downturn in international markets. The concentration of agricultural, mining and metallurgy, and defense products in Bosnia and Herzegovina, Macedonia, Serbia, and in the provinces of Kosovo and Vojvodina left these regions especially vulnerable to the economic crisis (Woodward 1995, p. 58). The crisis had dramatically escalated from 1980 to 1985, when as many as one million Yugoslavians were officially registered as unemployed. The official rate of unemployment was above 20% in every republic except Slovenia and Croatia (Woodward 1995, p. 73).

The wealthier Yugoslavian Republics, especially Croatia and Slovenia, emerged as the strongest advocates of a confederated Yugoslavia in which the economic and political powers of the federal government would be gradually weakened or eliminated. Both Croatia and Slovenia had production profiles which allowed them to compete more effectively in international markets than their counterparts in Yugoslavia. Each republic relied more on the production of manufactured exports than primary or agricultural commodities and enjoyed better access to transportation linkages with the West than other Yugoslavian regions. Most importantly, the Slovenian Republic began to restructure and modernize its older industries after 1979 in an effort to take advantage of export opportunities with Western Europe and to reduce its integration with the Yugoslavian economy (Bookman 1990, pp. 93–109).

The economic crisis of the late 1970s and early 1980s opened dramatic fault lines within the institutional structures of Yugoslavia. First, republics such as Croatia and Slovenia, with their relative dependence on manufactured exports, found it much easier than their Yugoslavian counterparts to maintain economic growth by diverting their trade from Yugoslavia and the Eastern Bloc to Western Europe. Slovenian officials took advantage of the decentralized Yugoslavian institutional system to pursue independent economic policies that involved the restructuring and privatization of manufacturing industries to promote increased exports to Western Europe. By the mid-1980s, Slovenian and Croatian officials were using their parliaments to block moves by the federal government to increase federal expenditures for defense and development expenditures in the south. By 1986, Slovenian and Croatian officials justified withholding tax monies from the federal government and opposed moves to strengthen federal capacity (Mastnak 1990, pp. 305–317).

The increased tensions between the Yugoslavian Republics was accelerated by the IMF-backed austerity package of 1982, which proposed an anti-inflationary macroeconomic stabilization policy of radical austerity, trade and price liberalization, and institutional reforms to impose on firms and governments monetary discipline and real price incentives (Woodward 1995, p. 49). The IMF also wanted a stronger central government that was capable of enforcing a broad program of economic austerity by tightening monetary policies across the various republics. The terms of the IMF-led austerity package involved short-term credits from the agency targeted to refinancing the Yugoslavian debt, cutting imports dramatically by allowing for price liberalization, and promoting exports to hard currency markets in the West (Woodward 1995, p. 49). The agency also promoted an independent central bank that would make decisions on the basis of majority votes and would not be bound by consensual decision-making.

The results of the first austerity program were devastating to the Yugoslavian economy. As food and energy subsidies were abandoned, prices for gasoline and heating fuel, food, and transportation

U

rose by one-third in 1983. Two currency devaluations cut the value of the dinar by 90% between 1979 and 1985, which squeezed imports and greatly impacted public sector firms with little or no foreign currency earnings. Government investment in social services, infrastructure, and other projects was frozen, weakening the ability of the federal government to use its economic resources to induce republics to comply with federal regulations, as had been the institutional pattern in the past. Susan Woodward describes the social polarization that followed the first austerity program:

> Firms showing losses were obliged to lay off workers instead of carrying them with lower wages. The small firms in the private sector–the government's primary hope for employing those laid-off workers and those affected by the slow-down in new jobs in the public sector–were cut off from access to credit by its prohibitively high cost under a real-interest rate policy in conditions of rapid price inflation. An underclass of unemployed, unskilled workers emerged, concentrated in urban areas. Wage and income restrictions, price increases, and unemployment among young people and women sent average household incomes plummeting to levels of twenty years before. Savings were rapidly depleted for 80 percent of all households, who found it increasingly difficult to live on their incomes. Official unemployment was at 14 percent by 1984, varying from full employment in Slovenia to 50 percent in Kosovo, 27 percent in Macedonia, and 23 percent in Bosnia and Herzegovina and in large parts of Serbia, including the capital, Belgrade. (Woodward 1995, p. 51)

The disintegration of the Yugoslavian political economy was dramatically uneven, and the dynamics of class polarization explain much more about the breakup of the country than the supposed intractability of ethnic divisions. First, those Yugoslavians with access to hard currency markets in the West largely escaped the economic crisis, and some even profited from it. The political and economic elites of Croatia and Slovenia were in a better position than their counterparts in the other Yugoslavian Republics as a result of a production capacity that allowed each government to promote the export of manufactured goods to the West and to reduce dependence on the Yugoslavian Republic. However, even these republics were faced with mounting inequality between those elites who were able to take advantage of Western export opportunities and the sections of the population that were less skilled and educated. While the 1980s brought economic opportunity for some, the gap between rich and poor widened considerably – with the majority of the Yugoslavian population unable to keep pace with escalating food and energy prices, reduced wages, and, especially important, reduced federal subsidies to the poorest regions of Yugoslavia, including the agricultural sector, where farmers were facing a severe economic crisis originating in the strong drop in international commodity prices during the early 1980s.

By the late 1980s, political leaders and parliamentary elites within Slovenia and Croatia intensified their rejection of federal efforts to strengthen the tax base of the Yugoslavian government. Determined to pursue independent monetary and fiscal policies and critical redistribution efforts that would siphon money from their republics to other localities within Yugoslavia, elites within Slovenia and Croatia began an effort to mobilize support within their republics and internationally for political independence from Yugoslavia. The interesting question is why such political maneuvers for independence generated increased political, economic, and ethnic tension in Croatia (and ultimately between Croatia and Bosnia Herzegovina) without having the same result in Slovenia. A major part of the answer is that while the Slovenian economy had managed a relatively successful economic strategy that emphasized industrial restructuring and export manufacturing, Croatian elites faced a much more uneven economic landscape that made the Croatian political economy a composite of Slovenia and Serbia. Like Slovenia, Croatia had wealthy cities, rich farmlands, and agro-industrial complexes concentrated along the coastlines and the Eastern plains of Slavonia and Baranja. Like Serbia, Croatia had an interior agricultural region that was relatively poor and dependent on domestic production and subsidies for its survival. Whereas Slovenia was able to escape the worst effects of the 1980s recession and austerity, the political economy of Croatia became increasingly polarized between the sections of the republic that were prospering from foreign trade and those

that were falling further and further behind (Woodward 1995, p. 51). The parliamentary leaders in Croatia advocated greater independence and autonomy in economic policy during the 1980s, while the sectors of the Croatian population that were most negatively affected by the economic crisis mobilized themselves in strikes, demonstrations, and work stoppages calling for increased aid to the poorer regions.

Faced with a growing economic and political polarization, Croatian political elites first played the ethnic card to increase support for Croatian nationalism and independence from the Yugoslavian government. Croatian leaders, the most famous and important of which is Franjo Tudjman (elected president of Croatia in 1990), relied on growing ties to Western governments, especially Germany, to legitimize the drive for independence. Domestically, Tudjman encouraged a series of reforms that were designed to appeal to a Croatian national identity and to be used as weapons against the increased demands of workers for higher wages, better working conditions, and subsidies to cover the spiraling costs of living. Tudjman insisted that working class demands for higher wages and better working conditions emanated from his political enemies who wanted to keep the Croats shackled under the thumb of Serbian and Jewish interests. The rhetoric of Tudjman was designed to silence political opponents within the Yugoslavian Communist Party who objected to Croatian independence efforts and preferred a united Yugoslavia. In addition, the escalating anti-Semitic and anti-Serbian racism was used to divert public attention from a widening gap between rich and poor and toward a Serb minority who was soon denied basic rights. In a series of political measures, Tudjman pushed through the Croatian parliament legislation that eliminated Serbs from positions in the Croatian government bureaucracy. Before the spring of 1993 when war broke out between the Muslims and the Croatians in Bosnia, the Tudjman government encouraged the sacking of Serbs from private sector jobs and public intimidation of Serbs who were subject to bombings and evictions by nationalist mobs with government support (Woodward 1986).

The European Community, under strong pressure from Germany, moved to recognize the independence declarations of Slovenia and Croatia as early as 1991 (Glenny 1992). Germany, which had emerged as the leading trading partner of Croatia, joined Austria in arguing against the historical legitimacy of the Yugoslavian federation. German commercial bankers and manufacturing firms were an important source of investment in Croatia, while Austrian-based banks, many of them German owned, and Austrian export firms were linked with Slovenia. The decision of the German and Austrian governments to recognize Croatia and Slovenia arose from their respective economic and political ties to these republics and ultimately helped to fuel political and ethnic warfare in Croatia, where Serbian and Croatian militias clashed in a bloody civil war in 1991.

The Serbian militias were mobilized on the basis of nationalist appeals to Serbian minorities in Croatia and Bosnia. Serbian nationalists argued that the separatist ambitions of Croatians would result in a systematic denial of human rights and a subjugation of Serbian people to the dictates of an expansionist Croatian army. Just as Tudjman had used nationalism to rally support for his policies, the Serbian leadership relied on nationalistic rhetoric to rally support behind a unified Yugoslavia under Serbian domination. Serbian militias were formed in Bosnia and were especially popular in isolated rural areas whose inhabitants came from a combination of agricultural and defense-related occupations. Rural villages that were relatively poor and historically dependent on small-scale farming for the domestic market comprised the majority of the recruits for the emerging Serbian militias, who were also recruited from depressed industrial towns who had seen dramatic increases in public sector layoffs during the 1980s.

Most importantly, the emergence of Slobodan Milosevic as president of Serbia provided added resources to the Serbian cause, as Milosevic used the Yugoslavian People's Army as a vehicle to promote Serbian nationalism, initially via an invasion of Kosovo in 1987 and later as a conduit for the expansion of Serbian militias into Bosnia – first to fight the Croats and then to fight the Bosnian Muslim government. The United States

U

had been one of the strongest international supporters of Milosevic, especially given his brief reincarnation as an economic liberal and political conservative during the late 1970s through the mid-1980s. He was the director of a major Belgrade Bank in 1978–1982, an economic reformer while a Belgrade party boss from 1984 to 1986, and recommended the adoption of a strict IMF-type stabilization/austerity program while chair of the Milosevic Commission in May of 1988. The US government, along with the IMF and the World Bank, saw Milosevic and the federal prime minister Ante Markovic, newly appointed in December 1988, as political allies in an effort to promote a second phase of IMF-backed reforms (Vayrynen 1996, p. 33). The 1988 reform package, supported by US Secretary of State James Baker, US commercial bankers represented by Kissinger Associates, and both Markovic and Milosevic, moved to eliminate the remaining limits on foreign ownership, management, and profit repatriation, to privatize public property, and to encourage full market integration within Yugoslavia.

Both the United States and the international monetary authorities had consistently supported a neoliberal agenda implemented by the federal government of Yugoslavia. However, the attempts of the federal government under Prime Minister Markovic to implement this agenda only fueled the divisions among the Yugoslavian Republics, helping to create a political crisis that was heightened by the early results of the IMF-backed stabilization program of 1990. In autumn of 1989, Markovic met in Washington with US President George H.W. Bush to negotiate the terms of a new financial arrangement that would lead to the most extensive set of IMF-backed reforms. These measures included a new devalued currency, another wage freeze, sharp cuts in government spending, and the elimination of socially owned, worker-managed companies (Cohen 1995, pp. 55–57). By 1990, the IMF supported and helped to implement a tight money policy that placed a priority on servicing the Yugoslavian debt to private commercial bankers based in the Euromarkets of London and Paris. At the same time, the federal government slashed welfare and employment payments to the republics and provinces at the very time that the new stabilization program would accelerate business failures and high rates of unemployment.

In June of 1990, about 6 months after the austerity measures had taken effect, 8,608 enterprises employing 3.2 million persons, in a workforce of approximately 6 million at the time, were in financial crisis (World Bank 1991, pp. 10, 14). From late 1989 to September 1990, more than a thousand companies went bankrupt, and the annual gross domestic product had collapsed to a negative 7.5%. In 1991, the GDP declined by another 15%, while industrial output shrank by 21%. By September of 1990, 600,000 Yugoslavians had already lost their jobs, and another 2,435 industrial enterprises, employing 1.3 million workers, were slated for liquidation (IMF 1990, pp. 576–579). Yugoslav President Borisav Jovic warned that the reforms were having a markedly unfavorable impact on the overall situation in society. The further deepening of the economic crisis and the growth of social tensions has had a vital impact on the deterioration of the political-security situation (Remington 1990, p. 407).

On July 1990, Slovenian and Croatian leaders declared their sovereignty, refusing to adhere to various aspects of the stabilization plan and rejecting the legitimacy of the federal government. Serbian elites, once proponents of neoliberal austerity, were now faced with a strike of 650,000 Serbian workers who sought wage hikes and an end to privatization efforts that would eliminate jobs. Both Slobodan Milosevic and the newly elected Franjo Tudjman deliberately used ethnic mobilization in attempts to consolidate support for their rule of a Greater Serbia and Croatia, respectively. Both Slovenia and Croatia moved to create their own independent armies, which further aggravated the ethnic tensions within Yugoslavia. The Yugoslavian presidency, as a body representing the republics and provinces, was split three ways by 1990, with Slovenia, Croatia, and Kosovo Albanians declaring their independence from the federal government; Macedonia preferring a further devolution of power from the federal government to the republics and provinces; and Serbia, Montenegro,

and the Yugoslavian People's Army wanting to retain a united federation. The move by Croatian and Slovenian elites to create separate army structures proved to be the most extreme threat to the Yugoslavian People's Army, which found itself faced with the possibility of dissolution and without adequate supplies and equipment, whose sources had been arms industries and research and development institutions spread throughout Yugoslavia.

The reaction of the West European governments and the United States to the political and economic crisis only worsened the ethnic warfare. First, Germany, Austria, Great Britain, and the Netherlands all recognized the right of Croatia and Slovenia to secede, with Germany exercising the greatest influence with the European Community in promoting a resolution in favor of succession. By the late 1980s, economic reforms promoted by political elites in Croatia and Slovenia had resulted in closer trading links with Western Europe than with other Yugoslavian Republics. German banks lent money to the Croatian republic and to private export firms in Croatia. In turn Croatian exporters, especially in manufacturing, increased their trade linkages with Germany. Similarly, Slovenia increased its trade with Austria as newly restructured and privatized industries took loans from German-owned banks based in Austria. US bankers based in the Euromarkets of Paris and London sought to collect loans that had been extended to the Republic in the 1970s. Represented by Kissinger Associates, these US banks worked with US government officials to support a neoliberal plan that advanced IMF allocations to individual republics who had made the most progress in restructuring and privatizing their industries for export production to the Western European market. At the same time, the US government promoted the 1990 IMF plan for centralizing the implementation of a tight monetary policy under the direction of the Yugoslavian Central Bank (Gervasi 1992, p. 42). The effects of this policy led to demonstrations throughout Yugoslavia and political pressure mounted on republican governments to address the social and economic problems arising from the structural adjustment programs.

With the threat of disintegration looming, Germany led a coalition of states in the European Community to recognize the sovereignty of Croatia and Slovenia, a move which opened the door for further regional and ethnic conflict. The United States, initially supporting a unified Yugoslavia, lost a political argument to persuade Germany and the European Community to delay recognition of the breakaway republics. At the same time, the United States had backed every phase of the IMF program for Yugoslavia, which contributed to the regional economic disparities and to the political pressures that heightened the likelihood of succession.

The United States began to shift its position toward support for Croatia and the newly formed Bosnian Muslim government as the policies of Slobodan Milosevic continued to shift from the economic liberal reformer of the mid-1980s to an ardent nationalist who began defending rights to a greater Serbia, nationalization of industry under the control of the Yugoslavian State, and the integrity of the Yugoslavian People's Army in an effort to consolidate his power. US officials, alarmed by the extremist rhetoric of their one-time ally, moved toward a closer relationship with the political elites of Croatia and Bosnia, especially as Milosevic sought to channel money, assistance, and military support to Bosnian Serbs in their effort to conquer territory in the name of a Greater Serbian state. The nationalistic posturing of Milosevic presented the United States with a fundamental challenge to a decade-long US effort to promote privatization, economic integration with the West, and centralization of debt payments as the pillars of US economic policy in Yugoslavia.

The United States, NATO, and the United Nations

The decision of Slovenia and Croatia to declare independence from the Yugoslavian federation helped fuel a civil war whose antecedents were becoming increasingly clear. The decision of various foreign powers, led by Germany and Austria but also including Great Britain and the Netherlands, to recognize the independence of

these breakaway republics contributed to the armed mobilization of rival factions within the former Yugoslavia. By 1991, national governments in Bosnia, Slovenia, and Croatia were consolidating their bureaucracies independently of the authority of the Yugoslavian federation, and each of these governments was pouring resources toward an expansion of military capacity. The Yugoslavian People's Army used its stockpile of weapons to help arm Serbian rebels in the Bosnian Republic and to wage a proxy war against Croatia, which under Franjo Tudjman was attempting to seize control of additional territories of Bosnia-Herzegovina and to mobilize Croats behind an ongoing ideological and political assault against Serbs in Croatia and in neighboring Bosnia-Herzegovina. The Bosnia government was dominated by a Muslim faction that attempted to preserve its own power by establishing militias that could counter the dual threat of Croatian and Serbian military expansion. Slobodan Milosevic used his power as president of Serbia to funnel arms to Serb militants so as to support their efforts to create a Greater Serbia, by carving out territorial zones of control in Bosnia against both the Croatian and Muslim militias.

The UN Security Council established the UN Protection Force (UNPROFOR) on February 21, 1991, with the intention of creating a peace plan for Croatia. UNPROFOR quickly expanded its mandate to include support for the provision of humanitarian assistance to Bosnia in order to address what the UN High Commissioner for Refugees called one of the worst humanitarian emergencies of our time (Leurdijk 2003, p. 60). UNPROFOR grew from the initial deployment of 10,000 troops to a force of some 52,000 spread from Croatia to Bosnia-Herzegovina and Macedonia. The Security Council's authorization of these troop deployments was coupled with a series of resolutions covering humanitarian assistance, an arms embargo, economic sanctions, a no-fly zone, safe areas, international humanitarian law, and the mandate of UNPROFOR. As one analyst noted:

> In this almost permanent process of adaptation, the UNPROFOR peacekeeping personnel became involved in such elements of peace-enforcement as

ground monitoring at airfields as part of the no-fly zone; in deterring attacks on safe areas and in the implementation of exclusion zones, including control of the heavy weapons placed by the parties in designated weapons collection points. This mixture caused much conceptual and operational confusion, with serious consequences both for the UN and NATO and for their cooperation. (Leurdijk 1997, p. 462)

During the Yugoslavian crisis, the UN Security Council increasingly turned to Charter VII of the UN Charter to authorize regional organizations to monitor and enforce UN resolutions designed to facilitate the growing mandate extended to UNPROFOR. The Security Council recognized that UNPROFOR would not be able to undertake the full responsibilities and burdens associated with this ambitious peacekeeping effort. As a result, the UN Secretary-General, under the authority of the Security Council, approached NATO about the possibility of using its military resources to help enforce Security Council resolutions in the former Yugoslavia. At the same time, NATO leaders were meeting in June of 1992 to discuss the principle of participation in peacekeeping missions, especially by making available its assets to the Conference on Security and Cooperation in Europe. These deliberations on the part of the NATO leadership represented a strong US effort to recast NATO from a collective defense organization during the cold war to a regional organization that would intervene to quell civil unrest or to prevent regional instability from posing a threat to NATO member states. The willingness of the NATO leadership to redefine its mission so that its forces would be available to the UN Security Council is made clear by a written correspondence from the member states of NATO to a letter from the UNs Secretary-General, who had requested NATO assistance to help UNPROFOR's mission in the former Yugoslavia:

> We confirm today the preparedness of our Alliance to support, on a case-by-case basis and in accordance with our own procedures, peacekeeping operations under the authority of the UN Security Council, which has the primary responsibility for international peace and security. We are ready to respond positively to initiatives that the UN Secretary-General might take to seek Alliance assistance in the implementation of UN Security Council Resolutions. (Leurdijk 1997, p. 459)

As early as July 16, 1992, NATO began its involvement in the Yugoslavian crisis by stationing ships in the Adriatic Sea to monitor compliance with the Security Council resolution authorizing a general and complete embargo on all deliveries of weapons and military equipment to Yugoslavia. Three months after NATO ships begin monitoring compliance by sea, NATO aircraft began a similar monitoring action in the air, after the Security Council had established a ban on military flights in the airspace of Bosnia-Herzegovina. The enforcement operations of NATO were undertaken simultaneously with the ground operations of UNPROFOR, although there were constant episodes of miscommunication and lack of effective coordination between the two organizations. The UN Security Council Resolution 836 authorized UNPROFOR to act in self-defense to protect designated safe areas from attacks that included bombardments against the safe areas, armed incursions into them, and deliberate obstruction in or around those areas to the freedom of movement of UNPROFOR or of protected humanitarian convoys.

At the same time, the Security Council authorized member states, acting nationally or through regional organizations, to take all necessary measures, through the use of air power, in and around the safe areas to support UNPROFOR in the performance of its tasks. This Security Council directive led to clashes between UNPROFOR and NATO over the extent to which UNPROFOR's presence on the ground was compatible with NATO's commitment to airstrikes to defend the safe zones. NATO officials were concerned that UNPROFOR's vulnerability on the ground might be used by the warring militias to deter air operations and to block effective military action against violations of the embargo. UNPROFOR's personnel were concerned that NATO attacks might be counterproductive to their humanitarian efforts to protect the safe areas and to facilitate the delivery of humanitarian relief supplies.

As the UN Security Council authorized resolutions designed to expedite the delivery of humanitarian aid and help bring an end to the civil war in the former Yugoslavia, the UN Secretary-General and the European Community sent mediators to the former Yugoslavia in an effort to negotiate an acceptable peace treaty with the warring parties. The first such peace plan was a set of guidelines for future political and institutional arrangements drafted by United Nation's Representative Cyrus Vance and the EU representative David Owen, under the institutional mechanism of the International Conference on the Former Yugoslavia. The Vance-Owen Peace Plan recommended the division of Bosnia-Herzegovina into ten provinces, with the Croats, Muslims, and Serbs each to have a majority in three provinces. The plan called for Sarajevo to be the seat of government and an open city, with the provinces endowed with most governmental powers, excluding international responsibilities such as negotiations with foreign states. Each province and central government would have its own legislature, chief executive, and judiciary, while the weak central government of Bosnia-Herzegovina would be led by a nine-member presidency.

Once the ethnic warfare escalated among the three primary ethnic groups and military conflict erupted among the republics, the United States encouraged the Bosnian Muslim government and the Croatian Army to reject the early peace initiatives proposed by the European Community and the United Nations. US negotiators, led by Secretary of State Warren Christopher, relied on bilateral overtures to the Bosnian Muslims to encourage them to delay endorsing the Vance-Owen Peace Plan (VOPP), implying that such a delay would be rewarded by a better deal secured with Washington's help. The United States indicated that it would not send peacekeeping troops to defend the partition scheme advanced by the VOPP. The United States insisted that any deployment of US troops in a peacekeeping operation would have to be led by NATO, as opposed to the United Nations and the European Community. US negotiators encouraged the Bosnian Muslims, one party who held out against the VOPP, to wait for a better deal by taking advantage of the US-proposed a lift and strike strategy that recommended lifting the arms embargo and answering any Bosnian Serb ground offensive with air strikes (Owen 1996, 160–197). According to David Owen, the US position helped

U

to doom the VOPP by convincing the Bosnian Muslim government that the United States would help them to withstand further Serbian advances in exchange for delaying any agreement on the peace plan.

The United States took the same position regarding a later proposed peace initiative advanced by a Contact Group that included the United States, Russia, France, Britain, and Germany. The Contact Group plan offered to the warring parties a Muslim-Croat Federation that would receive 51% of Bosnian territory while giving the Serbs 49%. When this plan was proposed, the United States announced that it would no longer participate in efforts to stop arms shipments to Croatia or Bosnia. The United States criticized the efforts of the Contact Group as insufficient and of applying diplomatic pressure which was neither coherent nor constant (Owen 1996, pp. 160–197). The most notable effect of the US action was to harden the position of the Bosnian Serbs, who had rejected the Contact Plan from the beginning. However, the Contact Group, with the exception of the United States, was hopeful about alleviating the political obstacles to Serbian approval by trading Serb recognition of Croatia for Zagreb's willingness to grant the Krajina region substantial political autonomy and self-government. Opposing this policy initiative by the Contact Group, the United States moved forward to press for the elimination of the arms embargo and to work with private organizations, including Executive Outcomes, to funnel weapons to the Bosnian Muslims and the Croatian Army. The US strategy preceded and aided the Croatian ethnic cleansing massacre in Krajina, as well as the launching of an offensive by Bosnian Muslims against the Serbs on three fronts in the autumn of 1994: in the Bihac region, Central Bosnia, and south of Sarajevo. The later offensive received the vociferous support of the United States as the legitimate use of the right of defense by the principal victims of Serbian aggression (Petras and Vieux 1996, p. 21).

The United States only agreed to a peace proposal that would allow NATO to direct the peacekeeping operation, which ensured that the United States would be in a position of leadership in decisions regarding troop deployment and the reconstruction of Bosnia. The Dayton Accords were based on a partition of land that would give the Muslim-Croat Federation 51% of territory and the Serbs 49%. The terms of the Accords were strikingly familiar to the earlier Contact Group proposals with one key difference: the United States had bought time and relied on backing an interim strategy of military offensives against the Serbs as a way of advancing a peace plan that gave the US-NATO command primacy in the final deployment of international troops. In this way the peacekeeping operation played itself out as an international struggle of preferences between foreign powers, represented most notably by the European Community and the United States, who wanted to maximize their authority to direct the terms of the peace.

The US insistence on a NATO-led troop presence in Bosnia reflected a series of long-term goals of US foreign policy strategists, including greater influence within the newly emerging European Monetary Union and the reorientation of NATO toward a global mission that would allow the organization to respond to threats to US interests in Southern Europe, Central Asia, and the Middle East and to the emergence of rogue states that posed a threat to the economic and geostrategic objectives of US policymakers. The remainder of this chapter links the long-term strategic thinking of US policymakers to the goal of ensuring a NATO presence as part of a Bosnian peace settlement. Such a linkage between broader US economic and security objectives formed the outlines of an imperialist US policy in the former Yugoslavia, and such a framework also proves useful in understanding the most recent policies pursued by the United States in Kosovo.

Imperial Competition in the Balkan Wars

There is considerable evidence that the United States has structured its policies toward Western Europe with the goal of preventing the emergence of a rival defense organization that would threaten the influence of NATO. During the first term of the Clinton Administration, the

State and Defense Departments opposed French and German proposals to give the European Council – which consists of community heads of state and government – a role in defense decisions (Petras and Vieux 1996, p. 20). The United States was concerned about the potential for a powerful sub-alliance that could make defense decisions without US input. Instead, following US, British, and Dutch recommendations, the European Community pledged to relegate its discussions of defense policy to the Western European Union and in consultation with NATO. Dissatisfied with these arrangements, the French and German governments moved to develop the Eurocorps, a bilateral military organization open to membership by EC countries (Nelson 1993, p. 83). As Nelson concludes, American opposition to that initiative, at least until France and Germany spelled out the Eurocorps' subordinate relationship to NATO, led some Europeans to conclude that no form of military coordination among EC states was acceptable to the United States (Nelson 1993, p. 83).

The disintegration of Yugoslavia provided US policymakers with an opportunity to expand and redefine the role of NATO in the post-Cold War environment. As early as 1992, NATO sent about 100 personnel to Bosnia-Herzegovina to establish a military headquarters at Kiseliak, only a short distance from Sarajevo. The NATO deployment was part of an effort by US policymakers to gradually position the military alliance to intervene in the Yugoslavian war, which had been defined as part of a wider arc of geostrategic interests by US policymakers. The concern in the earliest phase of the Bosnian war was that the conflict would spread beyond Yugoslavia and bring in US allies on opposite sides of the conflict, including Turkey and Greece. Early US efforts to deploy troops to Macedonia were designed to prevent the war from spreading to the Southern Balkans and thereby destabilizing Turkey, defined by the United States as a vital link to the Middle East due to its borders with Iraq, Iran, and Syria. Robert I. Hunter, senior adviser to the Rand Corporation and US ambassador to NATO from 1993 to 1998, explained the rationale for what had broadly been labeled the Clinton Doctrine:

> It (the former Yugoslavia) is the gateway to areas of intense Western concern the Arab-Israeli conflict, Iraq and Iran, Afghanistan, the Caspian Sea and Transcaucasia. Stability in southeastern Europe must be a precursor to protecting Western interests and reducing threats from farther East. (Shank 1999, p. 12)

The development of the Clinton Doctrine, as well as the 1992 Defense Planning Guidance document, provided the geostrategic underpinnings for US policies in the former Yugoslavia. Contemporary US policies in Europe are rooted in the effort by the United States to maintain its influence as the dominant military power in the region, relying on the continuation and expansion of NATO to forestall any efforts by European powers or the European Union to create a separate defense organization independent of US influence. During the last year of the Bush Administration, US State Department and Treasury Department officials worried that the European move to create the Euro could have serious political and economic consequences for US interests in the region. The political consequences included the possible emergence of a defense organization outside US control. At the same time, US officials were concerned that the Euro could pose an economic threat to the international position of the dollar, a possibility that led the Treasury Department to warn against the establishment of new EC institutions that would bypass the traditional relationship between the US government and the finance ministers of the larger EC states. At the centerpiece of such concern is the importance of US and European trade, which totals about $1 trillion a year, and US direct investment in Western Europe, which accounts for about 40% of all US foreign investment and provides more than three-million US-based jobs (Nelson 1993, pp. 81–84).

The redefinition of NATO's role is connected to US concerns about the loss of US military and political influence in European affairs in the post-Cold War period. As part of the effort to redefine NATO, US Secretary of State Madeleine Albright has worked with the Clinton White House and National Security Adviser Sandy Berger to steadily expand NATO membership and commitments throughout the arc that extends from Bosnia

U

to the Southern Balkans, the Middle East, and Eastern Europe. Richard Holbrooke, the Assistant Secretary of State for European affairs, summarized the outlines of this policy in a 1995 issue of *Foreign Affairs*, coinciding with and directly related to US efforts to promote a NATO-led force to occupy Bosnia to police the Dayton Accords that brought an end (at least temporarily) to the Balkan Wars. Holbrooke insisted that the expansion of NATO is an essential consequence of the raising of the Iron Curtain and that the United States must lead in the creation of a security architecture that includes and thereby stabilizes all of Europe: the West, the former Soviet satellites of Central Europe, and, most critically, Russia and the former republics of the Soviet Union (Holbrooke 1995).

The US push for NATO expansion began in late 1991 with the creation of the North Atlantic Cooperation Council, which fostered military cooperation between NATO and former members of the Warsaw Pact. NATO expanded its efforts to the more ambitious Partnership for Peace in 1994 to involve Warsaw Pact members in actual NATO operations as a prelude to eventual membership for the Czech Republic, Hungary, and Poland, all of which were formally admitted to NATO membership in 1999. The efforts of the Bush and Clinton administrations to expand the military membership of NATO to the East had been seen as essential to provide NATO with the capacity to intervene in the internal affairs of strategically important US allies threatened with instability. The United States would thereby use expanded NATO bases in Eastern Europe to organize the rapid deployment of NATO forces to regions where civil wars or violent uprisings threatened the interests of the West.

Secretary of State Albright articulated the Clinton Administration's position at a December 1998 NATO meeting to discuss the future organizational and political structure of the alliance. In outlining a post-Cold War agenda for NATO, Albright argued for enhancing NATO's capacity to deal with any global crisis that had implications for the defense of common interests of NATO allies (Helms 1998, p. 14). Albright added that NATO was essential to respond to security threats posed by rogue states who possessed chemical, biological, or nuclear weapons. The use of the rogue state terminology to define a role for NATO coincides with the post-Cold War strategic doctrine of the United States, whose military forces have been reequipped to fight two-and-a-half wars simultaneously against rogue states that posed a threat to US strategic and economic interests. The US proposals for an expanded NATO represent a geopolitical effort by the Clinton Administration to expand the capability of the military alliance to rapidly intervene in Central Asia, Southern Europe, and the Middle East, especially given the importance of these regions for the production and delivery of oil.

US Imperial Strategy and Kosovo

The interplay between US geostrategic goals and the emerging globalization of NATO provides insight into the political economy of US policy in the former Yugoslavia, which was soon extended to the war in Kosovo. Throughout the Balkans crisis, US policymakers have been concerned with maintaining the credibility of the alliance in the face of challenges to its authority, first in Bosnia as NATO aircraft dropped bombs on the Bosnian Serb army until the Croatian and Bosnian armies were able to use force to bring the Serbian adversaries to the bargaining table. In the case of Kosovo, the United States and its allies relied on NATO's aircraft to launch a sustained series of aerial bombardments against Serbia to force compliance with a US-negotiated peace plan in Rambouillet, France. The key terms of the peace plan, much like the US-brokered Dayton Accords, involved a central role for NATO in monitoring the removal of Serbian troops from Kosovo. When Serbian President Slobodan Milosevic objected to the presence of NATO on Yugoslavian territory, the United States was unyielding in its insistence that NATO was the only acceptable organization in monitoring the terms of a Serbian-Albanian peace agreement in Kosovo. As part of the Rambouillet Accords, US negotiators insisted on a NATO troop presence in Southern Serbia as well as Kosovo to monitor compliance with the

agreement. When Milosevic rejected these conditions, the United States, without consulting the UN Security Council, worked to convince NATO allies to agree to the use of NATO airpower in Serbia and Kosovo to force Milosevic to accept the US terms for a peace settlement.

On March 24, 1999, the United States took the lead role in a NATO bombing campaign targeted against Serbia for the stated goal of preventing Serbian ethnic cleansing of Kosovar Albanians, who had been described by US political officials as having suffered "crimes against humanity." During NATO's bombing campaign, as many as 900,000 Serbian refugees fled the main cities in Central Serbia, including Belgrade, Nis, and Novi Sad. The NATO campaign had turned Kosovo into a staging ground for advanced US weaponry, including cruise missiles, laser-guided bombs, cluster bombs, and depleted uranium explosives. During the NATO bombing campaign, thousands fled Western Kosovo, on the border with Albania, as Serbian forces clashed with Albanian combatants. By June 1999, the United States had led a contingent of NATO troops into Kosovo to enforce the provisions of an agreement that had been struck between US political elites and Kosovar nationalists as part of the Rambouillet Accord. The Serbian political leadership never signed this agreement, and the United States used its provisions to stake out the postwar goals of the war, which included the following:

> Kosovo would in effect be independent of Serbia, but Serbia would not be independent of Kosovo. Kosovo would be able to influence Yugoslavia as a whole by sending its representatives to both Yugoslav and Serbian parliaments, governments and courts, whereas Yugoslavia would be barred from influencing Kosovo's internal affairs. Kosovo would have its own constitution, making it a "free market economy". Substantial economic aid was promised to Kosovo, while Serbia was to get nothing; the agreement did not even mention suspending economic sanctions against Serbia, much less any help to the 650,000 refugees in Serbia. In contrast to the parliamentary government proposed by the Serbs, "self-governing" Kosovo was to be a Western protectorate whose chief of mission would have the authority to issue binding directives on all important matters, hire and fire officials and security personnel, and overrule election results. (Johnstone 2002, p. 245)

The above details pertain to the US-drafted document, "The Rambouillet Peace Accords," drafted primarily by State Department official Christopher Hill. Prior to the bombing campaign, the US State Department under Madeleine Albright had attempted to broker a deal between Milosevic and the various Kosovo rebel factions that had long been fighting Serbian forces. The aims of the various Kosovar rebel groups included forcing a Serbian exodus from the province and attaining independence for Kosovo. The Rambouillet negotiations opened in France on February 2, 1999, with the United States providing counsel to the Kosovo Albanian delegation during the negotiations with Serbian political leaders. The United States adopted two postures during the negotiations that alienated Serbian officials, leading ultimately to the breakdown in negotiations and the commencement of the bombing campaign.

The first concern of Serbian officials was the open US alliance with leaders of the Kosovo Liberation Army or KLA, a guerrilla group who had engaged in armed violence against Serbian military and police officials, as well as armed attacks against Serbian civilians in Kosovo, during the 1990s. As late as February 23, 1998, the special US representative for former Yugoslavia, Robert Gelbard, had condemned the KLA as a "terrorist group beyond any doubt" and strongly criticized the killing of civilians and the armed attacks on Serbian military and police installations in Kosovo. NATO had condemned both the Serbian military offensive in Kosovo, begun in 1989 in response to the emergence of successionist political movements in Kosovo, and the "terrorist activities" of the KLA. Still, by the time of the Rambouillet Peace Accords, the United States had close ties with the KLA, including welcoming the KLA leader Hashim Thaci as head of the Kosovar delegation to the Rambouillet agreements. This development caught the Serbian political officials by surprise, as they had counted on an isolation of the KLA in favor of nationalist groups that they saw as more responsible and willing to engage in the give-and-take of negotiations. The elevation of the KLA leadership to titular head of the Kosovar delegation seemed designed to provoke confrontation.

Still, by all accounts, the Serbian political leadership would have accepted the Rambouillet Peace Accords had it not been for a series of last-minute changes by the United States regarding the primacy of NATO in the occupation of Kosovo. In a section of the document entitled "Annex B," NATO was to be the primary occupying force in Kosovo and was to be given unlimited and unfettered access to all Yugoslav territory, as well as immunity from all local jurisdiction or legal process. At a Rambouillet Press Conference on February 20, Secretary of State Albright blamed the Serbian failure to reach agreement on their unwillingness to sign off on the NATO provision of the accords. Prior to the insertion of the NATO provision into the Rambouillet Accords, the US State Department was pushing its European allies to expand and redefine NATO's post-Cold War mission. Albright's redefinition of NATO involved utilizing its military structure for the type of operations envisioned in the Rambouillet Peace Accords: intervening in domestic conflicts to promote stability favorable to Western interests. This would involve utilizing NATO's arsenal to go to war against select rogue states whom Washington had identified as a threat to Western security interests. In short, NATO would be incorporated into the US rogue doctrine and would continue to have a leading role to play in the post-Cold War environment. The United States wanted this redefinition of NATO in part to fend off ongoing efforts by France and Germany to develop a military organization independent of NATO, which had been an ongoing subject of tension between the United States and its European allies at the time of the deployment of NATO in Kosovo.

The NATO operation in the former Yugoslavia can be understood only as part of a broader geostrategic effort to expand the purpose and scope of the alliance during the post-Cold War period. This effort resulted in cooperation between the Clinton Administration and US-based multinational corporations intent on expanding their investment opportunities in Central Asia. These multinationals, as well as top Clinton Administration officials, wanted to encourage the expansion of NATO in order to allow for rapid military intervention to protect the security of oil investments in the former Soviet republics, including Kazakhstan, Turkmenistan, and Azerbaijan. In November of 1997, four major US oil companies signed an agreement at the White House to invest $8 billion in Azeri oil, following Chevron Corporation's $20 billion investment in Kazakhstan's Tengiz oil field, one of the world's ten biggest at the time. International oil financier Roger Tamraz has worked with the Clinton Administration's National Security Council to promote the independence of these oil-rich [former Soviet republics] to in essence break Russia's monopoly control over the transportation of oil from that region, according to former National Security Council aide Sheila Heslin in testimony before US Senate investigators (Morgan and Ottaway 1997, p. A01). In 1995, Senate investigators released a document that detailed the involvement of US oil and construction companies such as Amoco, Mobil, Exxon, McDermott, Brown and Root, Bechtel, and Chevron, in contributing $300,000 to the Democratic National Committee for the purposes of gaining the support of the US government for a Caspian oil pipeline that would extend south of Russia through Georgia to the Black Sea (Morgan and Ottaway 1997, p. A01). The US State Department summarized the geostrategic and economic basis for US policy in an April, 1997, report which outlined the US goal to tie the region securely to the West through multiple pipelines and transportation corridors outside Russia (Morgan and Ottaway 1997, p. A01).

The connection between the NATO war in Kosovo and the US efforts to expand NATO to enhance its capacity to intervene in Central Asia and the Middle East was aptly summarized by Robert Hunter, senior adviser to the Rand Corporation and former US ambassador to NATO from 1993 to 1998. According to Hunter, Kosovo is the gateway of intense Western concern in the Arab-Israeli conflict, Iraq and Iran, Afghanistan, the Caspian Sea, and Transcaucasia. Stability in Southeastern Europe must be a precursor to protecting Western interests and reducing threats from farther East (Shank 1999, p. 12). During the deployment of NATO troops in

Kosovo, the United States, without consulting NATO allies, began construction of a large permanent military base called Camp Bondsteel, located near two of the future European transport routes, including Corridor 8, which is part of the projected EU network known as the Pan-European Transport Corridors. The base "commands the most strategically interesting corner of Kosovo, in close proximity to the two main north-south mountain passes allowing traffic to pass from northern Central Europe to the important Greek port of Thessaloniki on the Aegean" (Johnstone 2002, p. 233). Also at the time of the Kosovo intervention, the United States was funding feasibility studies for a billion dollar pipeline to be built by the Albanian, Macedonian, and Bulgarian Oil Corporation of Pound Ridge, New York, along the Corridor 8 transport route. The presence of military troops to guard a key European transport corridor sent a strong signal that the United States and NATO were prepared to utilize its military capability to protect new investments in the region, including the tens of billions of Euros likely to be devoted to various transport and communication projects in the years ahead. But the central role of US troops in Kosovo and Washington's troop presence in the region had various side benefits for US firms hoping to compete in these potentially lucrative contracts:

> Local governments politically indebted to the United States are likely to award construction contracts to major U.S. companies. Washington's support for the Kosovar cause has helped make Albania the most enthusiastically pro-American country in the world, whose leaders constantly plead for establishment of permanent U.S. bases. Albania is one of the rare former communist countries in Europe "where all the political forces, left and right, parliamentary and non-parliamentary, desire such an American military presence." (Johnstone 2002, p. 232)

Conclusion

The USA acted as an imperial state in advancing its geostrategic and economic interests in a policy of NATO expansion designed to reinforce dependency on a US-led military alliance that would be expanded to protect the interests of US-based multinational corporations in accessing foreign

markets. The fact that US policymakers were worried about rival imperial competition from EU powers Germany and France is evident in the calculations made by US policymakers in pushing for a NATO-led intervention. US intervention in the former Yugoslavia had long been tied to protecting the interests of US commercial banks and oil corporations. These imperialist linkages between powerful multinational corporations and the US imperial state are central in explaining the political economy of US military intervention in the Balkan Wars.

US Militarism and US Hegemonic Power

James M. Cypher
Doctoral Program in Development Studies,
Universidad Autonoma de Zacatecas, Zacatecas,
Mexico

This essay analyzes two interrelated key structural phenomena of the current historical epoch. It is largely devoted to an analysis of the rise and consolidation of US militarism, which is understood to be the fulcrum of US global hegemonic power. The condensation of a large body of research, some cited in this essay, demonstrates that far from being a corrosive agent undermining US power, militarism has been a major element in the continuation of US economic power since WW II, often mitigating economic downturns, creating new leading industrial sectors while promoting a vast array of technological innovations – an argument originally advanced by Baran and Sweezy in 1966 (Baran and Sweezy 1966).

All of this has occurred even while the USA was unable to establish stability in the "periphery" – in Korea in the 1950s, in Vietnam in the 1960s and early 1970s, in Iraq since 1990, and in Afghanistan since 2001. Contradictory forces and factors notwithstanding, the significance of US militarism and US hegemonic power continue to be remarkable signifiers of the present order. The first section examines the rise, consolidation, and contemporary scope of US militarism. The emergence and maintenance of global unipolar order under US authority, from WWII to the present, are briefly considered in the second section.

US Militarism

Militarism – here understood to be a socially inculcated, pervasive deference to all apparatuses of the state that project US military power, are associated with it, are institutions that arise from it, or are dependent upon their policies – became a fundamental, unacknowledged, new element of the postwar structure. At any given moment, *militarism* constitutes a socially constructed *institutionalized* structure, including habits of thought and patterns of reflexive action (e.g., "patriotism") as well as tangible entities such as military forces and arms contractors. Militarism finds its expression both as ideology and as national policy exercised through state apparatuses – these two manifestations of militarism are not separable but continually interactive. Meanwhile, *militarization* encompasses the sociopolitical, ideological, and economic *processes* through which the structure of militarism metamorphoses over time.

The National Security State

The National Security State is the "state within the state" that has, on more than one occasion, been the agent setting US national priorities and policies while seemingly remaining invisible (Carroll 2006, pp. 303–304, 307, 429, 433). This "state" is never officially recognized as such. It remains unseen in large part because its activities cannot be documented due to the shroud of official secrecy which envelops it. At minimum it includes the US President (as Commander in

Chief of all armed forces) as well as some of the presidential cabinet – including the Secretary of State whose agency has long been militarized. This "state" is defined by decisions made by the National Security Council (NSC) – an entity whose members fluctuate but whose parameters are defined by the Chairman of the Joint Chiefs of Staff, the National Security Advisor, the Secretary of Defense, and the Director of National Intelligence. The NSC is without question, together with its professional staff of over 200, the most powerful government council ever created. The NSC both forms policy and implements policy.

More broadly, the National Security State includes the 18 intelligence agencies and the members of key Senate and House Committees concerned with national security policy – such as the armed services committees. It exercises a degree of relative autonomy from the national government as conventionally defined, setting the broad outlines for US science policy as it relates to present and future arms development, forming and executing policy with regard to US interventions, and, most importantly, establishing and revising the geopolitics and geo-economics of US "grand strategy." The essence of the National Security State – its *raison d'etre* – is the strategic exercise of state power; it is "the government's principal steering mechanism" always operating under conditions of profound secrecy (Jablonsky 2002–2003, p. 9). As such it is rarely analyzed or even acknowledged. The very concept of this "state" generally eludes theoretical formulation – in the best of circumstances, inquiry remains incipient and largely descriptive (Nelson 2007; Weiss 2014, pp. 1–50).

The National Security State inverts the popular portrayal of the US government – a state based in the overwhelmingly visible edifice of presidential power. Ostensibly, US national public policy arises within a pyramidal institutional structure, with the President and his cabinet occupying the highest positions of authority, exercising their great leverage to determine the trajectory and dynamics of national power. However, in the always undefined and completely mutable area known as "national security" – which is the area that "crowds out" all others when a reformulation

of national security policy occurs – the National Security State opaquely exercises its dominance.

Historical Contextualization

WW II was a climacteric in the trajectory of the political economy and cultural composition of the USA. Simultaneously, due to a plethora of cross-conditioned causal elements, US militarism and US hegemony emerged as two of the greatest constituent elements of the postwar structure: a new international order – the "American Century" of global US hegemony – commenced. The war ended with the US economy fully recovered from the Depression of the 1930s, now bolstered with a vast array of new technological developments that had clustered during the war (or just before), a renewed industrial base and with its rivals and allies abroad largely decimated. The major political economy lesson of the war was that for the USA, both "guns and butter" could be produced simultaneously – there was no "tradeoff," even while orthodox economics taught that such a state of affairs was inconceivable. This unanticipated lesson along with the consolidation of the Cold War in the months immediately after the end of WW II were the essential circumstances which enabled the long era, from 1948 to 1972, often labeled the "Golden Age," where solid economic growth went hand in hand with rising outlays for the military sector. Subsequently, economic growth became problematic with periods of stagnation, while intermittent economic crises became more intense: military expenditures oscillated to some degree, declining modestly and briefly with the end of the Cold War, thereafter generally rising (but not as fast as GDP grew over time) as interventions and regional wars created a propitious climate for arms manufacturers and professional military cadres. During WWII military power and policy emanated from the War Department. Subterfuge, secrecy and mystification regarding the scope and objectives of a newly institutionalized postwar US military structure led to the rechristening of the War Department as the Defense Department with the National Security Act of 1947 (which created the CIA, the crucial

National Security Council, and other institutions of the National Security State). Through this Act the USA systematically organized to *project* military power internationally: The word "defense" – suggesting the maintenance of military systems to protect the US populace from foreign aggression – had virtually no bearing within the vast, ever-evolving, never-defined, "national security" designs of the USA. Focused as it was on *projecting* military power internationally, the military delayed until 1958 the launching of the North American Aerospace Command (NORAD) system designed to secure the protection of the US territory. Always a small sideshow, it was first tested and utterly failed on September 11, 2001 (hereafter cited as 9/11). Even the Pentagon was helpless to avert a crude improvised civilian airline attack. This event starkly revealed to the US populace the magnitude of the massive breaches in the doctrine of "forward defense": Nevertheless, it did not evoke a critical reaction because militarism had long before attained its dominant conceptual status. Instead, bellicose power projection – or the threat thereof – continued to be *the* policy. Indeed, the unconventional attacks on New York and the Pentagon, on 9/11, ushered in a distinct and enduring era of heightened militarization.

Forward defense is the doctrine formed in WWII which established the nodal strategy of US military power projection from foreign bases: By 1946 the USA had already established at least 1 military base in 60 nations. Ostensibly armed forces stationed abroad were there to hold off an unprovoked attack by a then-prostate USSR. By 2018 at least 750 bases were under operation in 80 nations. Forward defense also entails the doctrine of "rapid deployment" from many of the bases located in the USA. Abroad, prepositioned sites dedicated to rapid deployment strategies, such as "Camp Justice" on the island of Diego Garcia – used jointly by the Air Force and the Navy to project power into Central Asia and Africa from the 1980s onward – proliferated. In contrast – revealing the fictitious nature of "defense" – US warfighting capacity within its "homeland," even in the wake of the 9/11, remained deeply subordinated to the enduring doctrines of forward defense, now bristling with post 9/11 preemptive, "first strike" policies (Chairman Joint Chiefs of Staff 2018, pp. I9–I12).

The Ideological Hegemony of Militarism

US militarism – an unconscious deference to all things military on the part of the US populace – was created and almost seamlessly reproduced throughout the Cold War era. Militarism then became the essential ideological prism through which geopolitical events were filtered, perceived, and reproduced. When the Cold War ended, perhaps to the surprise of those who failed to understand the enduring impact it exerted on the consciousness of the populace, US militarism was haltingly reconstructed in the 1990s and then definitively, rapidly, reconsolidated after 9/11.

The term "ideological hegemony" is rooted in the ideas of Antonio Gramsci – in any given society some formulations become so pervasive that they are used without examination; they are, therefore, prevailing ideas or "common sense" (Gramsci 1971, pp. 56, 59, 80, 198). The "common sense" with regard to military strategy from the 1940s until the breakup of the USSR was that a war of total destruction could, and probably would, occur at any moment without the constant protective and expanding presence of the DOD. The accumulation of daily experience throughout the Cold War – as the US populace was inundated by an onslaught of imagery emanating from the entire phalanx of mediums of cohesive cultural expression (radio, television, newspapers, and magazines, as well as presidential discourses and pronouncements), along with the carefully curated lived-experiences during critical national events, such as the Cuban missile crisis – combined to anchor the idea of the "Soviet threat" as an unquestioned reality.

Shortly after the end of WWII, the DOD created its own propaganda agency, the Public Affairs Office (PAO). One of its notable accomplishments was the creation of the Motion Picture Production Office which became the DOD's permanent liaison with the film industry. This subsidiary of the PAO effectively co-produced

hundreds of widely viewed, influential, films that venerated the armed forces (Mirrlees 2017, pp. 8–10). The Public Affairs Office also operates another important entity, the Special Assistant for Entertainment Media, which encourages pro-military propaganda in TV shows, movies, sports spectacles, and music videos. The DOD's annually budgets from $0.5 to $0.8 billion for media-related propaganda and public relations outreach. One of the objectives of this well-funded effort is the promotion of military recruitment. But the larger objectives are (1) the militarization of all varieties of popular cultural expression, (2) the justification and sanitization of the US military's engagements, and, most especially, (3) the molding and mobilization of a militarist "national identity."

The PAO's Manichean portrayals resonated during the Korean War (1950–1953): Events on the Korean Peninsula were decontextualized and then reformulated to produce a "common sense" perception of an inevitably expansionist, perfidious, Soviet Union. Here, the USSR was presented as the puppet master behind invading North Korean military forces. At that time and thereafter, counterarguments were suppressed or marginalize – this was the fate of I.F. Stone's masterful *The Hidden History of the Cold War* (Stone 1953) and the two-volume effort by D. F. Fleming, *The Cold War and its Origins* (Fleming 1961). Pervasive anti-intellectualism – or hostility to *critical* social thought as disguised through the power elite's nebulous "pragmatism" – has long been a known and troubling cultural characteristic of the USA, promulgated throughout its apolitical populace by dogma-spewing status quo institutions, including those of the State and organized religion. Superseding analysis, and demanding that there be none, is the ideological mission of the "exceptional" nation approach often deployed: This trope – sometimes refashioned as "the one essential nation" – mystically asserts that the USA (as the *indispensable* nation) has a right to use its military power as it will because it does so not for its national aggrandizement, but for benevolent, selfless, virtuous, objectives. Here, the USA is uniquely capable of acting on behalf of other nation's interests (Kagan 2014). As such, the complexities and

contradictions regarding the rationales behind US grand strategy are rarely effectively challenged. That is, the strategic application of military force, or threat of that force (i.e., "deterrence"), to revise the status quo in pursuit of objectives as defined by the National Security State (discussed below) as propounded by "defense intellectuals" is normally accepted, often vigorously. The momentous insertion of the PAO's propaganda apparatus has done much to ensure that this continues to be the case.

Any counter narrative regarding US militarism must be sufficiently robust to somehow overcome the "spontaneous" (to use Gramsci's terminology) "popular conceptions" of the underlying population (Gramsci 1971 pp. 198–199). The counter narrative challenging the militarist paradigm contends with the fact that (sometimes avid) consent for this governing construct arises not only, or necessarily, due to the coherence and persuasiveness of the anointed national security narrative as promulgated through the national media but also from *contemporary material interests and those arising from past-determined path-dependent processes*. In the US case, moving beyond the first line of contention requires the disabling of the embedded, "spontaneous," pro-military perceptions of the mass of military veterans and their spouses. While not a completely homogeneous group, these 32 million citizens have been trained within the hierarchical military structure to accept, without critical analysis, the rationales and objectives of US national security policy. Their compliance arises not merely from their prior ideological conditioning – some draw lifetime retirement pay, and others have accessed military-funded educational and training programs and/or subsidized home loans and medical care. Thus, there is a considerable, tangible, *material* basis for their tractability. In addition, as detailed below, there are millions of citizens actively employed by the Pentagon, both military and civilian, at any time, and, obviously, they have a direct material interest in the DOD. Furthermore, other millions are employed directly and indirectly by military contracting corporations whose comfortable survival arises from the lucrative business of provisioning the military. Here then, with spouses probably included, lies another mass

of the citizenry with a strong predilection – based at least partially on their material interests – to vigorously consent to the discourses propounded through the National Security State. Another wellspring of support for and promulgation of US militarism normally exists within the US Congress, composed to a considerable degree of military veterans. Furthermore, the programs and policies supported by the congressional armed services committees are influenced by the political donations and sophisticated lobbying efforts that Pentagon contracting corporations exercise. For these congressional representatives, in particular, and more broadly for the remaining members of congress who have significant levels of military base spending and/or corporate military manufacturing and supply interests in their districts, a militarist posture will help assure reelection or other desired career advancements. In all these instances, the ideological hegemony of US militarism is a result of a coupling of the material with the conceptual – it is not merely produced out of the ether of thought, norms, values, and customs.

Key peak business organizations, such as the powerful Aerospace Industries Association (analyzed below) and the National Defense Industry Association comprised of 1, 600 military contractor which claims it "drives [the] strategic dialogue in national security," play an important role, both ideological and material (National Defense Industries Association 2018). As well, retired military officers and civilians with deep roots in the National Security State (such as those who once thrived in the maze of intelligence agencies) in their role as quoted "experts" ubiquitously and endlessly promote via the public media and the press, the rhetorical tropes of US militarism whenever there is a shift in military policies or the looming opportunity for the USA to project power via foreign military intervention.

Hegemony, as Gramsci maintained, depends on a shifting combination of consent and coercion. Not immediately aligning with the dominant discourse regarding military policies has long carried a heavy price – a price largely unnoticed by those who repeatedly claim that the USA is "the land of the free." Freedom of dissent, to the degree that it can be found, is generally relegated to the special enclaves of academia. Even there, at critical moments, academics have found it necessary to muffle and silence their dissent (as many did after 9/11) less they be cast aside. Individual dissent, however, is often given short shrift because it is ineffective – thus numerous books and articles questioning aspects of US militarism have been published, to little effect, given their small circulation and the grip of the ideology of militarism. On the other hand, *organized* dissent will generally incite a coercive response: For example, the crucial years when US militarism consolidated after WWII were also marked by attempts by labor unions to challenge important elements of the status quo, frequently through waves of strikes in late 1945, 1946, and early 1947. But by early 1947, the USA had embraced the militant Truman Doctrine – effectively committing the USA to unlimited interventions, ostensibly to address the "Soviet threat," and the construction the National Security State was on the agenda. Conveniently, the Truman Doctrine and other similar policies facilitated a split in the then potent US labor movement whose most militant members were also, quite often, sympathetic to the pro-worker ideals championed (but not necessarily practiced) by the USSR. A purge of union leadership now ensued; the coercion of labor was broadly exercised to ensure the stability of Cold War ideological hegemony (Lipsitz 1982).

Yet, the ideological hegemony of US militarism forged in the aftermath of WW II and largely maintained to the present has not provided the political space for *integral*, or uncontested, hegemony: The intractable and meaningless slaughter that was the Vietnam War led directly to the "Vietnam Syndrome" which penetrated the rank and file of the US military and even, at moments, the officer corp. This awkwardly named "syndrome" was not a medical disorder, nor was it psychological in nature; it was an open aversion, particularly within the US military, to the "crackpot realism" that had guided US military doctrine, and military pretensions, in Vietnam. It carried through to much of society at large, but – most crucially – it interrupted the cohesiveness of the military forces.

Advocates of US intervention, including President Bush at the outset of the first Gulf War (1990–1991), believed that a stunning quick victory by US forces would vanquish the "syndrome" which had endured since the closing years of the Vietnam War. Yet, the results of the first Gulf War were vague, and the Iraq regime – the focus of US armed intervention – continued in power. In the aftermath of 9/11, the US populace supported the invasion of Afghanistan in late 2001, which quickly became a long quagmire. Then, the invasion of Iraq in 2003 did not go as planned by the neoconservatives who had ecstatically anticipated the building of a model new society in the Middle East. Resistance in Iraq, much of it arising from the inept occupation policies pursued by the USA, became a critical factor by 2006. Here, as well as in Afghanistan, unconditional public support could not be maintained. Instead, US policymakers were forced to settle for *minimal* hegemony – financial and emotive "support for the troops" was coupled with a deep reluctance to shoulder the burdens of US military fatalities. Instead, every effort was made to reposition US troops as advisors behind the lines of battle, while drones and missiles delivered deadly fire from a distance with mercenaries and local troops, along with their families, carrying the burdens of combat.

Institutional Continuity and Minimal Dislocation: The Legacy System

The deeply path-dependent nature of the US military establishment and its civilian counterparts reveals that attempted periodization formulations – such as the concept of a "new" US militarism after 9/11/ − are difficult to document (Bacevich 2005). Indeed, the Pentagon – tied to its institutionalized methods and perspectives rooted in WWII and the Cold War era – rejected the idea, put forward in 1998, that major policy realignment was necessitated in the aftermath of unconventional Al Qaeda strikes on two US embassies in Africa (The 9/11 Commission 2004, pp. 120–121, 482, note 61). Here, as elsewhere, the concept of "minimal dislocation," with regard to the narrow

parameters within which institutional change occurs, retains its salience (Bush 1994, pp. 294–295).

Thus, the formal shift toward Special Operations Forces (SOF) in 1987 – arising from a failed intervention in Iran in 1980 – has not altered the primary focus on large and costly weapons systems that has characterized the US military-industrial complex. SOF are small fighting units operating clandestinely or with low visibility, often embedded with indigenous military forces – they were deployed in a remarkable 149 countries in 2017 (South 2018). Such forces actually commenced in 1952: They were assigned to engage in counterinsurgency and guerilla warfare but were largely discontinued in the wake of the Vietnam War debacle. In the 1980s such forces were gradually reconstituted, culminating in the creation of the Special Operations Command in 1987: This command was tasked with establishing units worldwide. All deployed forces have multiple military skills along with language and cultural training. In the wake of 9/11, the number of SOF almost doubled to approximately 70,000, with a budget allocation of nearly $13 billion in Fiscal Year (FY) 2018. Yet, in relation to the 1.465 million uniformed US military personnel in 2018 (active duty personnel including full-time reserve support personnel), the SOF are extremely small in number (0.03% of all military personnel) as was their budget (0.02% of total FY 2018 Department of Defense expenditures) (Congressional Research Service 2018).

While recent reliance on SOF suggests that qualitative change in military organization *can occur*, in many other instances – such as the once proffered "Revolution in Military Affairs" popular of the 1990s – change failed to materialize, even as billions were spent (Rodriguez 2014). Such debacles illustrate the determinate weight of past-bound practices that continue to promote "legacy" weapons systems (newer versions of already developed large weapons) and the difficulties of achieving broad-based technological and institutional change at the Pentagon even though some advances in robotics and miniaturization have been realized (O'Hanlon 2015, 2018). The abandonment of the RMA was then followed

by the elimination of the Future Combat Systems program in 2009, after devoting $19 billion to what was once touted as "the Army's most important and transformative modernization effort" (Censer 2011; Pernin et al. 2012).

The failures of these two programs comprise merely a small part of a much larger, repetitive, history indicating that *systemically*, military procurement is often delinked from performance: A self-perpetuating cycle is maintained wherein weapons systems are devised, partially completed and then discarded, while contractors obtain high profits. Then, new weapons systems are planned, promoted, and abandoned, while weapons contracting corporations are generously paid once again. The cycle illustrates that the "defense" program of the USA has a great deal to do with, and is extensively conditioned by, the priorities, needs, and perspectives of military contracting corporations. However, more broadly, "cross-conditional" factors (i.e., the "needs" of the military contracting corporations versus the strategic "objectives" pursued by the professional military cadres) play a major role in shaping the overall dynamic of the entire military sector. This complex synergistic relationship is too rarely highlighted. Adding another layer of complexity is the fact that there is no "firewall" between the contractors and the officials at the highest levels of the Pentagon. Thus there is no clear division between those who putatively represent the government, or the public's collective interests, and those who seek to maximize profits on substandard weapons and supplies bought by the DOD. Rather, there is a "revolving door" whereby even cabinet level policymakers are appointed as a result of their past performance as corporate leaders selling arms to the DOD (such as the 2019 appointment of a former Boeing corporation executive as the US Secretary of Defense). Meanwhile military professionals retire into lucrative employment with the contractors – often the very contractors that they have "supervised" while employed at the Pentagon (Government Accountability Office 2008).

Such studies illustrate the long-established intersection of two powerful spheres – one comprising the interests, objectives, and leverage of the highly specialized and highly dependent military contracting corporations and the other comprising the *National Security State*. The military contracting corporations span a much wider spectrum of corporate interests than those conventionally portrayed. For example, the Pentagon buys approximately 100 million barrels of refined petroleum fuels per year. It employs over 30,000 acquisition staff members per year to process corporate contracts. Like most crucial details regarding the scope of the military contracting corporations' sphere, comprehensive data recording the total number of private companies that relish the opportunity to sell to the Pentagon – frequently under "no-bid," one-firm, selection arrangements and/or "cost plus" contracting that allow contractors to "gold plate" weapons systems – is not available. Nonetheless, it is instructive that *one* "multiple awards" contract, issued on June 20, 2016, by the US Navy, involved 608 individual military contracting firms. An indication of the massive scope of military procurement was that in 2014 the Defense Management Contract Agency supervised 20,000 individual "prime" contracts. However, this number leaves out of account all the "subprime" contractors who operate as first tier and second tier suppliers to the prime contractor. Thus, it could easily be the case that, annually, roughly 60,000 firms are producing for the Pentagon as prime and subprime weapons or parts and service contractors. While some contractors have lamented the procedures and oversight practices of the Pentagon, the lure of high profits, or the opportunity to establish a company's capabilities in order to enjoy decades of "follow-on" contracts, or the opportunity to develop technologies that can be spun-off into civilian production continues to strengthen the allegiance that contractors generally hold for the Department of Defense.

Viewed from the perspective of the Pentagon, the bonanza they provide to US corporations is not a matter that requires remediation. For the Pentagon, cost-maximizing practices pursued by contractors are not a priority. The Pentagon buys on the basis of "performance maximization," a criteria that ignores the issue of cost. This disregard is pervasive: For example, the Pentagon was mandated to conduct a comprehensive audit of its

activities, assets, and liabilities in 1990 but managed to resist this process until 2018, while all other government agencies complied. The first-ever audit (costing over $400 million in 2018) essentially concluded that, overall, the Pentagon could not properly account for all its assets, nor value them with accuracy (Editorial Board 2018, p. SR10). The Pentagon responded with indifference as, seemingly, did the US populace.

Long conditioned to exalt militarism, the US populace devotes little attention to the pratfalls of the military-industrial complex. For example, when an F-35 fighter valued at $100 million crashed in a routine flight over US territory in October 2018, the event was scarcely noticed. In the same month, 22 stealth fighter planes, ironically named F-22s, were insufficiently maintained and unable to fly away when the base where they were located was hit by a hurricane. This created a total loss of $7.5 billion (Philipps 2018). Neither the F-35 nor the F-22 events appeared to be worthy of the attention of the US Congress, the US press, or the US populace. However, in all likelihood, this will create billions of dollars in new "follow-on" contracts for the prime contractors of the F-22, (Lockheed Martin, Boeing, and Pratt & Whitney). It was, literally, an extraordinary windfall for a group of corporations that sold the Pentagon an "advanced" fighter plane that could not fly when a predictable event occurred.

The Enduring Effects of 9/11: More Weapons, New Wars

As conventionally presented the 9/11 incident in New York in 2001 that destroyed the symbolic World Trade Center buildings was an out of context event and a major turning point for the military sector. However, the attack was not out of context; rather, it demonstrated path-dependent effects, or "blowback," long understood by the US Central Intelligence Agency (CIA) as part of an action → reaction cycle (Johnson 2000). It did not evoke a turning point for the military sector – large-scale weapons procurement continued to be the prime preoccupation of the Pentagon and the weapons contractors. Nonetheless, as framed by

the National Security State, 9/11 exercised an outsized impact on the US populace, including their legitimation of preemptive war (Wotjeck 2008). According to a Gallup opinion survey, in 2001 public support for increases in military expenditures reached their highest levels since 1984 (when such polling began). Since 2001 public support for raising military outlays has remained on a very high plateau – while support for reductions ranged between 11% and 13% of respondents. As a result (after adjusting for inflation), DOD expenditures all but doubled between 2001 and 2010, thereafter dropping slightly as the 2009–2012 failed "surge" strategies in Afghanistan were largely abandoned from 2014 through 2018.

Measuring the Government Employment Impact Within the Military Sector

The Pentagon is the largest employer in the USA, with 1.465 million uniformed military personnel employed alongside the DOD's 740,000 civilian Pentagon employees (Blakely 2017). In addition the DOD employed a "shadow" military force along with many others who provide a broad range of skills – including intelligence expertise – of an estimated 640,000 private contract employees. In 2014, these contract employees worked in 41 components of the DOD (Hartung 2015; Hartung 2017). Of these contract forces, there are a large number of combatants, frequently labeled "mercenaries," in war zones. Reliable data for the total number deployed is unavailable. The DOD's motivation for mobilizing such forces is consistent with the "invisibility" hypothesis: When US soldiers die in combat situations, a detailed protocol must be followed, including making the information regarding such deaths widely available to the US populace. Contract combatant deaths, however, receive little official notice and are rarely the subject of widely disseminated information. *More* contractors died in Afghanistan and Iraq from 2009 through early 2016 than did official US military forces (1,540 vs. 1,301), with 68% of such deaths involving contractors who were non-US citizens.

Overall, then, a reliable estimate of the size of the US military in terms of personnel would include the active duty and reserve military units (1.465 million), the civilian employees (740,000), and the "shadow" military of private personnel contractors to staff US military facilities (640,000), for a total of 2.845 million. In addition, the armed forces have 650,000 reserves who receive pay based on limited monthly training. On a full-time equivalent basis, these reserves are estimated at 130,000, pushing the total of the US military force to roughly 3 million (Kapp and Torreon 2018, pp. 3, 5).

Furthermore, outside of the DOD, there are several state agencies that owe their existence to the national security paradigm. Included here are the 240,000 Homeland Security Agency employees, as well as at least 70,000 employed in intelligence agencies that are not directly within the DOD (such as the CIA) bringing the total to 3.155 million employees (Szoldra 2013). Military capacity in space is the underlying objective of the National Aeronautics and Space Administration (NASA), which estimates their employees at 80,000 – including 60,000 contract employees not included in the DOD's contract personnel estimated above (National Aeronautics and Space Administration 2018). Nuclear weapons are built and maintained by the US Department of Energy through its National Nuclear Security Administration. This entity employs at least 52,400 professionals in nuclear weapons development facilities spread across the USA (Woolf and Werner 2018, pp. 13–21.)

Past military programs create massive present-day expenditures, the major one being the Department of Veterans Affairs budget. This document asserts that in 2019, annual expenditures will directly result in the support of "366,358 Full-Time Equivalent employees" (Department of Veterans Affairs 2018). Another employment generator arising from past military programs arises from the military retirement programs. In 2017, 2.1 million military retirees received a total of $54.4 billion. Using the expenditure of funds estimate for the US Social Security system and applying this to this retiree' pension spending, this created approximately 302,000 jobs (USDOD 2018, p. 18; Koenig and Myles 2013, p. 12).

Taking the components listed above, i.e., the estimate for all armed service employees including full-time reserves + a conversion of the part-time reserves to full-time equivalent + civilian Pentagon employees + private personnel contractor employees in the "shadow military" + Homeland Security Agency employees + Intelligence Agencies employees outside of the Pentagon + NASA employees including contracted workers, + Department of Energy nuclear programs employees + Veterans Affairs full-time equivalent employees + employment arising from the military retirement program, the total amounts to an estimated *4.08 million in 2018*. That is, the direct employment of the military sector constituted 3.2% of the full-time US labor force.

The Employment Multiplier Effect of Military Expenditures

It is necessary to account for the direct and indirect employment effect of military employees' spending – the number of jobs sustained by the 4.08 million who are directly employed by the military. In recent years 21 US states have commissioned detailed "input-output" economic impact studies to calculate the "downstream" employment effects of military spending in their perimeters. Using a representative sample of such studies for 6 US states (Arizona, Colorado, Illinois, Louisiana, Massachusetts, and Washington) as compiled by the National Conference of State Legislatures, the "job multiplier" averaged 2.28 full-time jobs sustained for each military employee. Extrapolating to the national level, the 4.08 million government jobs in the military sector resulted in approximately *9.3 million total employed* via *US military spending in the above cited categories in 2018* (National Conference of State Legislatures 2018).

Yet, a portion of the military's budget "leaks" from the US economy due to the fact that roughly 15% of the military's employees are located abroad (Bialik 2017). This "leakage effect" is relatively modest, however, since much of the spending that occurs on US military bases abroad takes place under stipulated conditions requiring

the use of products produced by US-based corporate contractors. They provide a full range of material and services – including military hardware, parts, and maintenance supplies such as fuels. Likewise, the bases have "exchanges" and "commissaries" which offer a complete range of consumer goods (including autos, appliances, food, and household goods all largely produced by US-based corporations and exported to the overseas bases). Thus, the "leakages" from the flow of military spending due to troops and civilians stationed abroad are relatively low, suggesting that a downward adjust of perhaps 5% of total employment would account for funds diverted from the US economy via overseas posting of troops and Pentagon civilian employees. Using the 5% reduction due to "leakages" as a reasonable approximate estimate, total employment summing all categories included above (including the "downstream" direct and indirect effects) would be 8.835 million – approximately 6.9% of the total full-time labor force of the USA in 2018.

Employment Effects of Weapons System Production in the Private Sector

These estimates – as large as they are – fail to capture the *total* employment impact of US military spending because, in 2018, 58% of the basic military budget was dedicated to buying weapons systems or other supply inputs from the private sector. Some of these vast outlays have already been accounted for in the above estimate – the 640,000 contingency contracted personnel who are not included as Pentagon employees and are considered in the category of "Services." Thus, of the 58% of the total budget devoted to military procurement and other outlays, a significant portion is utilized to hire contingency personnel. Subtracting out service contracts for contingency personnel, the net amount remaining which is devoted to military procurement and related supplies sums to approximately $300 billion (Blakeley 2017).

The Aerospace Industries Association (AIA) – the all-important peak business association for all military systems contractors – estimated 2018 direct employment at military contracting corporations as 354,000 with linked "supply chain" employment of 654,9000 (including production for overseas delivery via the DOD's Foreign Military Sales program). Thus, the AIA estimates direct military procurement employment at 1.01 million (Aerospace Industry Association 2018, p. 6). Using the "job multiplier" applied earlier (2.28), *total employment (direct and indirect) sums to approximately 2.3 million*. This brings the total for the employment effects in 2018 for the *entire* US military sector to 11.14 million or 8.83% of all full-time employees in the US economy.

As large as this estimate may appear to be, it does not include State Department employees engaged in military foreign aid programs or others involved with the militarization of US diplomatic functions or those involved in similar activities at the Agency for International Development. Nor does it include the range of financial specialists who are employed due to the fact that a large portion of the national debt is attributable to past budget deficits arising from the need to finance military expenditures via the issuance of public debt. The US public debt reached $21 *trillion* in 2018; roughly 90% of this debt is refinanced annually as old debt matures. This debt is cumulative; it is the sum of the annual deficits (minus surpluses) of the US government's annual budget. As much as 50% of the debt may be traced to military expenditures, when properly defined to include all of the conventionally delinked arms spending categories (such as nuclear bomb-making in the Department of Energy and the pursuit of military dominance in space as funded through NASA). In 2017 the USA employed 367,180 "securities and financial services sales agents" as well as 109,720 accountants and auditors. A large, if undetermined, portion of these employees, as well as a substantial portion of those employed by the US Treasury and the Federal Reserve System, were involved directly or indirectly in all the processes needed to trade and account for the $17.5 trillion in *refinanced* US federal public debt in 2017 (Bureau of Labor Statistics 2017). While the workers trading and recording the US

U

debt arising from past deficits attributable to military expenditures have not been included in the estimates presented here, the purpose of citing the employment effects of debt refinancing is to illustrate that the estimate of total employment arising in the military sector – as calculated above – is likely an *underestimate because it excludes a number of important categories that resist careful quantification*.

At the same time that employment in debt financing and the militarization of foreign affairs at the State Department and the Agency for International Development have been excluded (thereby effectively reducing the employment in the military sector), the estimate also excludes from the full-time labor force any calculation of the efforts of part-time workers (which would serve to lower the share of employment in the military sector as a share of total employment): Median annual wage for these workers was only $281 per week in 2018. The total wage bill for this group of workers was approximately 1.5% of GDP. Of this amount some significant portion of part-time employees were already included as indirectly employed due to military expenditures (US Bureau of Labor Statistics 2018). The excluded elements, then, are effectively mutually canceling, or nearly so.

Summing Up: The Macroeconomic Impact of the Military Sector

Including the estimates for all of the abovementioned, but normally non-calculated elements, indicates that roughly 1 of every 11 full-time employees (i.e., 11.14 million or 8.83% of all full-time employees in the US economy) *is sustained by the military sector* (including Pentagon employees, weapons systems employees, and those employed in "downstream" or indirect, activities). Converting the employment figures into their proportion of the GDP, the military sector accounted for an estimated $1.82 trillion of output in 2018. This conversion estimate is based on the hypothesis that the employment level in the military sector is neither "labor-intensive" nor "capital-intensive" but rather roughly equivalent to that of an "average" mix with regard

to the entire US economy. (Conventionally, military spending is depicted as "capital-intensive" because a large portion of the budget is allocated to "procurement" of weapons systems and a significant portion is devoted to Research and Development. Procurement (19% of the base DOD budget in 2017) may well be capital-intensive in some instances, although some of the most complex weapons systems – such as nuclear weapons or ICBMs – are produced with a large component of labor because production is not usually standardized or produced under large-batch production. Rather, "hand-built" techniques are employed. Clearly, then, there are "labor-intensive" activities in weapons procurement: For example, a RAND study of comparative costs per ton to construct commercial ships and warships, based on a US example, demonstrated that "in every category of work, the military ship required many times the labor required by the commercial ship" (Birkler et al. 2005, p. 45). Wirls found that military buildups in the USA were marked by alternating periods of capital-intensive procurement programs followed by labor-intensive buildups (Wirls 2008, pp. 109–111). Since the end of the Cold War, the shift has been largely toward non-procurement, labor-intensive, operations, and maintenance activities (Snow 2017).)

In effect, the above basing of the estimate of the magnitude of the military sector on full-time employment, and then converting to GDP estimates, takes account not only labor in the sector but also all other income categories of the sector – proprietors' income, rent, interest, and profit. High profits in the military sector effectively increase the weight of this sector in GDP calculations: It is well documented that the military sector sustains high profits, thereby serving to raise the overall rate of profit in the US economy. Recently, Wang and San Miguel examined 110 military contractors operating in 23 standard industrial categories from 1950 to 2010. They concluded that the military contracting corporations' return on capital employed (ROCE) – an accurate measure of the profit rate – was *34% higher* than nonmilitary contracting peer firm (Wang and San Miguel 2012, pp. 388–393). Another significant finding was the trend after 1992 showing even higher profits for the military contractors.

The Military Sector Drives US Innovations

Another special characteristic of the military sector is of a *qualitative* nature. Research and Development spending is high in the military sector in relation to the economy at large – 68% of all federal government R&D in 2016 was military related (National Science Board 2018a, b). The US Corporations which lead in private sector R&D are heavily linked to the military sector, with the bulk of total outlays coming from aerospace, computers, electronics, and software producers. The aviation sector – a leading sector today with a high export capacity – was largely created by the US government during and after WWII and sustained ever since (Kofsky 1995, pp. 47–82). Of particular note since the 1950s has been the close participation of the military sector in the development of electronics, eventually producing the PC and the Internet and then the so-called digital economy – now forming the cutting edge of US economic prowess, with its epicenter focused in the San Francisco Bay area (Leslie 2000; Walker 2018, p. 38). As noted by Weiss, most private sector R&D is short-term and product-oriented, while government R&D is *transformative* (Weiss 2014, pp. 181–183). Numerous examples of such transformative innovations arising from military programs, particularly due to the advanced research of DARPA, have been well analyzed (Block 2011; Weiss 2014; Mazzucato 2013, pp. 74–79, 103–109; Ruttan 2006). Furthermore, the evidence supports the idea that high government R&D stimulates, or "crowds-in," private sector R&D, with the military sector leading the way while also raising US Total Factor Productivity in the process of creating a raft of product "spin-offs" into the civilian economy (Moretti et al. 2016).

Challenging the Conventional Wisdom Regarding "Defense"

The conventional wisdom asserts that the military sector, overall, is quite different than the remainder of the national economy. But, the evidence available suggests that in terms of its "production function" (the relative use of labor and capital), it is not particularly skewed toward capital-intensive activities. The analysis presented above based on estimates of full-time labor activities sustained by the military sector goes well beyond the conventional portrayal of the significance of military expenditures which entails comparing DOD budget outlays against the GDP, wherein the Defense Department budget accounted for 3% of total GDP – or $618 billion – in 2018. The striking difference between the total employment effect estimate, above, and the conventional depiction of the military sector as "small" or "shrinking" (compared to levels from 1950 through 1970) is largely accounted for by the lack of inclusion of the "multiplier" effects arising from military expenditures as well as the important elements left out of the calculation, which have been detailed above. The evidence indicates that the military sector, when adequately defined and measured, constituted roughly 9% of US GDP in 2018. This was roughly equivalent to the GDP of the tenth largest economy in the world.

The Costs of US Interventions

The US military sector should not be understood as arising directly from warfighting activities. Since WW II, the costs of wars and interventions cannot explain most of the outlays: Rather, during any period of active military engagement, such as the two Gulf Wars (1990–1991; 2003–2010), combat provided the occasion for bursts of military spending primarily devoted to building yet more legacy weapons systems and other activities unrelated to the two Gulf interventions.

Nonetheless, active warfighting should be analyzed, particularly due to the very long-term economic impacts involved and more importantly to take into consideration the maiming and killing of combatants and most especially of innocent civilians (sometimes referred to by the Pentagon as "collateral damage"). It must be borne in mind that in spite of the insistence of war planners that modern weapons offer "pinpoint accuracy," the ratio of civilians killed to combatants killed in

U

Afghanistan and Iraq, from 2003 to 2018, was approximately 1:1 (Crawford 2018a). If account could be made of other civilian deaths due to war-related famine, injury, and sickness, the ratio of combatants' deaths to civilian deaths would likely double or more. In addition these US campaigns created eight million civilian refugees.

According to a 2018 estimate produced by Brown University's Costs of War Project, the increases in interventions following the 9/11 episode resulted in massive outlays, including especially those for future veterans' medical payments (through 2059) and future interest payments on the national debt created by the wars in Afghanistan and Iraq. In all, the inclusive, cumulative, costs of these wars had amounted to $4.9 *trillion* by 2019 and will rise to an estimated $5.9 trillion by 2059 (Crawford 2018b). Such estimates pierce the veil of obscurantism spread by Pentagon public relations efforts designed to inhibit the US populace from understanding the extreme financial commitments that arise from "small" wars.

Yet, the focus on financial costs should not overshadow the magnitude of civilian and combatant losses. Unfortunately, the US populace remains riveted only on their combat fatalities. Nonetheless, the brutal brunt of these interventions has been borne by those living in the invaded countries: In Iraq, from March 2003 through October 2018, from 480,000 to 507,000 civilians and combatants perished. In Afghanistan, from October 2001 through October 2018, 147,000 civilians and combatants died (Crawford 2018a). Such estimates exclude an adequate accounting for the ecological devastation of these US interventions – much of it long-lasting. Such an accounting would have to contend with the damages caused by US use of depleted uranium weapons.

The Invisibility Hypothesis: "Out of Sight, Out of Mind"

In the entire period since the end of WWII, only once has the power elite openly lifted the official veil shrouding US militarism: In his remarkable 1961 farewell address, President Eisenhower – the supreme commander of Allied forces in

Western Europe during WW II – decried the enduring power of what he termed the "military-industrial complex." The virtue of this approach was to sever the concept of US militarism from its historically given parameters – the autonomous power of military officers and military institutions to determine the dynamics of civil society – and introduce a vague conceptual dualism which foregrounded industrial objectives (Berghahn 1981). While the President elided "militarism," the term had been powerfully deployed by C. Wright Mills in 1959 and even more so by Martin Luther King in 1967 (Garrow 2017; Mills 1959, pp. 222–224). After delivering a stinging rhetorical denunciation of US militarism in 1967, King, as never before faced searing, and effective, public dismissal – particularly at the hands of *The New York Times*, the power elite's herald. As a towering iconoclast, Mills' allegations and formulations have retained a limited currency among a small cognoscente while leaving no trace in the broader cultural matrix of the US. King's 1967 message highlighting US militarism – "the U.S. is the greatest purveyor of violence in the world today" – was buried in a wave of condemnation as 170 US newspapers denounced his message and his leadership.

Just as former General Eisenhower was grudgingly permitted to cast doubt on the structure of the US public policy of militarism given his warrior credence, so too may a few other military professionals, from time to time. But, even in while controversy over the Vietnam War reached unprecedented height, it was impossible for the most powerful civil rights leader in US history to assail militarism as one of the most potent specters haunting the USA.

The US government has exercised its leverage over print and electronic media sources to prohibit any use of photos of injured or dead US combat military personnel. This policy serves to sanitize US interventions apparently out of fear of the "Vietnam Syndrome." Thus, even in war, militarism remains all but invisible: It is glimpsed only rarely and strictly confined to the small and highly circumscribed political space wherein only war veterans might critically, but only very lightly, tread into the sacrosanct realms of US military affairs.

US Hegemony

Hegemony is the deployment of national power beyond a nation's territory in order to guarantee the hegemon favorable access to the economic and strategic assets of a foreign nation, without imposing direct structured territorial control. By 1900, or shortly thereafter, the USA had consolidated a hegemonic sphere of influence in Latin America, arising from its drive to have unfettered access to its natural resource-based wealth via both direct investments and trade. The building blocks for the attainment of US global hegemony were constructed during WWII when US policy planners began to perceive the imperative need to form a new core geographic area based on complimentary international trade and the imperatives of access to foreign markets able to receive exported US manufactures while other regions provided for the US's growing need for resource-based imports. As well, if not more so, the USA sought unhindered access to export capital – financial capital and most especially agro-mineral and industrial capital. A vague conception of the "Grand Area" that it would dominate (at first entailing Britain and its empire, Japan and oil-rich territories in the Middle East) gradually developed into what would be termed "the Bretton Woods system" – principally defined by its key institutions including the GATT, the IMF, and the World Bank but also through the US's ability to impose the US dollar as the world's key currency. Hegemony, particularly as understood by Gramsci, arises from an ever-dynamic combination of coercion and consent: The latter partially entails components of "soft power" – exercising strategies of persuasion – e.g., promoting the ideology of "free trade" and "comparative advantage" as "economic laws" leading to "mutually beneficial" results (while eliding the asymmetric results pursued by the hegemon). The hegemon is committed to create, maintain, and restructure international institutions, which are officially "neutral" yet inordinately facilitate hegemonic stability. The hegemon bears the stabilizing military and/or economic costs of "collective goods" within the hegemonic sphere, e.g., naval power to maintain merchant ship passage through all international maritime "choke points."

Rivalry, the antithesis of hegemony, has been a constant sub-theme throughout the era of US Hegemony. At every turn, thus far, the USA has been able to subvert the rise of a rival power, or bloc, be it the USSR in the 1950s, the rise of Japan in the 1970s, the rise of the "rest" (economically emerging nations of the global south) from the 1980s, the precursor to the EU in the 1960s, and the consolidation of Eurozone in 1999. At every turn the USA has used "threat inflation" to create a controlled crisis climate in order to recast national power, eventually confirming its unipolar dominance. At every turn theorists have clutched the myth of the impending loss of US hegemony, failing to understand the structures of hegemonic power – that of military dominance being the foremost (Strange 1987).

Today's rival to US hegemony is China. Once again the USA operates within the throes of "threat inflation" actively devising new strategies within another controlled crisis climate. Yet, beyond the consternation expressed in and near the Pentagon over China's rise, this nation suffers from a declining workforce (Wuttke 2017 p. 62). Extreme, growing, overcapacity in resource-intensive manufacturing industries such as steel and oil refining has been a concern since 2008 (Wuttke 2017 p. 64). China's consumers cannot keep pace with the subsidized support of the construction industry: Overproduction is remarkable –65 *million* unsold apartments inundated the market in 2018 (Stevenson and Li 2018). China's military prowess is modest in relation to that of the USA. The US dollar remains the key currency, and Brexit has weakened London as one of the rivals to US financial dominance. Meanwhile, China's currency has a low reserve status in the globe's central banks. As of 2018 less than 2% of all central banks' reserve holdings were denominated in yuan. Another metric of relative power is that US outbound foreign investment was roughly four times larger than that of China's in 2017 (World Bank 2019). China has successfully scaled the value-added production ladder by cross-conditioning technology sharing with foreign firms anxious to have access to China's labor force and infrastructure. But since 2017 US policymakers have targeted this strategy – this is

the actual basis for the US government's aggressive stance regarding tariffs and trade policy. These strategy switches on the part of the US are designed to slow China's efforts to raise its level of technological autonomy.

In 2015 China formulated an extremely ambitious new Industrial Policy, "China Manufacturing 2025," targeting ten technology-intensive industrial activities. One was robotics, an area suffering from overcapacity by 2016. In taking the measure of the problematic "2025" program – which has dismayed US policymakers – it should be kept in mind that the USA has long used military expenditures as its sub-rosa form of Industrial Policy, often achieving remarkable success (Cypher 1987; Weiss 2014).

Control of the world's key commodity, oil, has long been a central issue in theorizing the stability of the hegemonic order. From the 1970s onward, US strategists were bedeviled and heavily constrained due to the US's increasing dependence on foreign oil. In analyzing the many attempts to portray the USA as a nation in decline – a near-constant trope since the 1980s – analysts have been slow to recognize the spectacular recovery of the US's national oil industry. In 2018 the USA became the world's number one petroleum producer as a result of US's unchallenged technological edge in advanced recovery techniques, while China remained the world's largest importer of petroleum, indicating its dependence in a crucial metric of international power (Applebaum and Tankersley 2018). Thus, ignoring the latest round of "threat inflation" emanating from Washington, D.C, a serious challenge to US economic hegemony appears unlikely in spite of China's many economic achievements since entering the WTO in 2001.

Synonyms

Africa; AFRICOM; China; The United States; US military

Definition/Description

This chapter examines the United States military's involvement in Africa, which is a twenty-first century phenomenon. The US military created the US Africa Command (AFRICOM) in 2007, which was motivated by the US War on Terror, access to Africa's natural resources, including oil, and great power rivalry between the United States and China.

Introductory Paragraph

The course of United States' imperialism globally has been – and continues to be – a complex one. US imperial ambitions were evident from its seizure of colonies in the Philippines and Puerto Rico. Later during the Cold War in the twentieth century, the United States conducted aggressive imperial interventions, both overtly, through wars in Korea and Vietnam, and covertly, in CIA operations in South American states and elsewhere (Blum 2002). Perhaps it was the obvious imperial intent manifest in these actions by the United States that has, in contrast, led many historians to the conclusion that "the African continent has remained a backwater of U.S. global strategic thinking" (Bamba 2010). While the United States has not charted a consistent and unbroken path of imperial ambition in relation to Africa, the United States has long had an interest in the continent and

its resources. Together with Britain, Germany, Belgium, Portugal, France, Austria-Hungary, Spain, Italy, Denmark, Sweden, Russia, Norway, Turkey, and the Netherlands, the United States was a participant at the 1884–1885 West African Conference of Berlin (known as "the Berlin Conference"), where the African continent was divided up among Africa's colonial powers (Shepperson 1985). The United States "became fully involved in the proceedings at Berlin in order to protect its perceived actual and mostly potential interests in Africa" (Munene 1990). Although the United States' interest in Africa had arguably been overshadowed by its imperial strategies elsewhere across the globe, US interest in Africa continued into the twentieth century (Bamba 2010). While the relationship between the United States and Africa "has been defined primarily by the slave trade and the Cold War" (Nyang 2005), this chapter seeks to examine the factors that have motivated US military involvement in Africa during the twenty-first century.

The United States and Africa During the Twentieth Century

The twentieth century saw the realization of the United States' ambitions as an imperial power; however, the African continent did not feature prominently in the US grand strategy. By the end of the twentieth century, the United States had become the world's superpower, a feat that may not have been possible without the Second World War. The advent of Second World War presented challenges for the nations which were then the great colonial and imperial powers: Britain, France, Belgium, Germany, Portugal, the Netherlands, and Japan. By the end of the Second World War, Britain and France were in ruins, Germany and Japan were occupied, and these powers had lost control of many of their colonial "possessions." The United States emerged as, arguably, the greatest economic victor from the Second World War, with American goods, services, and Marshall Plan loans enabling the reconstruction of war-ravaged Europe (Kolko 1968). The US dollar was installed as the global reserve currency under

the Bretton Woods agreement and the American economy flourished in the postwar period (Panitch and Gindin 2013). The Cold War that emerged between the United States and the Soviet Union in the immediate aftermath of the Second World War bolstered the US economy too, driving production and vast expenditure on the military-industrial complex. With the collapse of the Soviet Union and the end of the Cold War, the United States was the sole superpower and had also assumed the role of "global policeman."

Africa's experience of the twentieth century was entirely different to that of the United States. Africa's subjugation by colonial rulers from the eighteenth century onward was finally challenged in the mid-twentieth century. Colonization was already underway by the time the 1884–1885 Berlin Conference was held to control this "scramble for Africa" – the frenzied acquisition by Western imperial powers of different regions of Africa (Craven 2015). Between 1885 and 1914, the major and minor European imperial powers "partitioned" Africa. Britain seized much of the eastern half of the African continent from Cairo, Egypt, to Capetown, South Africa. France secured most of West Africa from Morocco in the North, most of the expanse of the Sahara Desert, and regions of Equatorial Africa, including Gabon. Other coastal territories in Equatorial Africa such as Nigeria, Sierra Leone, and Gambia became British possessions. Portugal controlled Guinea, Angola, and Mozambique in Southern Africa. In the Horn of Africa, "Somaliland" was carved up into British, French, and Italian territories. Italy was granted Libya. The Congo became the sole colony of the Belgian king (Chamberlain 1999). The host and sponsor of the 1884–1885 Berlin Conference, Germany, a rising industrial power, took control of the desert land of German West Africa, the tiny equatorial entity of Togo and Tanganyika, or German East Africa. Spain was conceded parts of Morocco and coastal Saharan Africa. The only African territories which Western imperialism did not grasp were Abyssinia, (now known as Ethiopia), and Liberia in Equatorial Africa (Zewde 2001). Liberia was colonized by freed Black slaves from America and the Caribbean from the 1820s and was regarded as a

U

quasi-American protectorate until 1847, when its independence was recognized by America (Schick 1980).

The Western imperial "carve up" of Africa, sanctioned and formalized by the Berlin Conference, was a frantic scramble for the continent's resources: the Congo became the vast rubber tree plantation of Belgium; British South Africa represented a vast gold and diamond mine, and France and Germany's African colonies promised new markets and sources of investment. There was a continuous African resistance to this advance by European colonialism, but it was defeated by industrial military technology (Pakenham 1991).

European colonizers had carved their empires in Africa with little regard for the peoples of Africa. Regions had been divided up arbitrarily by the European colonial powers. In the period that followed the end of the Second World War, the process of decolonization began to take place in Africa. The European colonial powers did not relinquish their African colonies for humanitarian reasons; the Second World War and its economic consequences ensured that many of these European powers were not in a position to maintain control of their colonies.

Unlike the postwar economic boom experienced by the United States, postwar Africa encountered economic problems, with some African regions experiencing a decline post-decolonization, and poverty became entrenched. Some of the greatest problems Africa has confronted since the mid-twentieth century can be attributed to colonialism and its legacy. Decolonization did not erase the colonial legacy in Africa but instead enshrined it, as newly independent African states agreed to maintain the borders that were "the arbitrary creations of colonial happenstance and European agreements" (Fisher 2012). Preserving these colonial borders created postcolonial "artificial states," in which the "borders do not coincide with a division of nationalities desired by the people" within these states (Alesina et al. 2006). This has been particularly problematic as 80% "of African borders follow latitudinal and longitudinal lines and many scholars believe that such artificial (unnatural) borders which create ethnically fragmented countries or, conversely

separate into bordering countries the same people, are at the roots of Africa's economic tragedy" (Ibid.). The legacy of colonialism for Africa has, through the creation of these state borders, "shaped the trajectory of these societies by spurring civil conflict and unrest" (Michalopolous and Papaioannou 2012). In terms of the African economy, it has been argued that European colonizers had forced Africa into specializations in mining and agriculture that served the interests of the colonial powers, not the African population (Frankema 2015). This structuring of the African economy meant that the departure of the European powers during decolonization destabilized the economy and created a "post-independence economic decline in Africa" (Heldring and Robinson 2013).

Forms of Western economic neocolonialism soon replaced formal colonial domination in most African states leaving them in perpetual economic dependency, whether they were oil- and gas-rich Nigeria or resourceless Burundi. From the end of the Cold War, many African states were riven with internal struggles over existing resources, exacerbated by the demands of foreign markets. Despite their abundance of natural resources, most African nations were trapped in a state of perennial underdevelopment and debt peonage, a legacy of colonization. Beginning in the 1980s, they were compelled to adopt the structural adjustment programs of the International Monetary Fund and World Bank which promised social and economic progress and the end of their indebtedness through the extension of existing loans (Moghalu 2013). It has been estimated that between 1980 and 2006, US$675 billion was extorted from the poorest countries of Africa to service their mounting debts to these international finance agencies (Nakatani and Herrera 2007).

However, from the period of their decolonization onward, most of these African states were burdened with the legacy of their colonial past. They were left as their colonizers had intended: weak, debt-ridden, deeply divided and unstable, and plundered by Western corporations for their strategic resources (Jalee 1968). Western neocolonialism replaced direct colonial rule in Africa, leaving it in a state of perennial economic

underdevelopment with its natural resources exploited and most Africans in poverty (Wengraf 2018).

In the twentieth century, relations between the United States and Africa were largely determined by the purview of the Cold War (Nyang 2005). When its interests were seen to be at stake during the Cold War, the United States had covertly intervened in Africa. The CIA organized the assassination of Patrice Lumumba, the Congolese Prime Minister in 1960, after Lumumba had opened diplomatic relations with the Soviet Union and Castro's Cuba (Gerard and Kuklick 2015). In 1973, Amilcar Cabral, the leader of the Liberation Movement of Guinea-Bissau and Cape Verde, was murdered by the Portuguese secret police in coordination with the CIA (Akuno 2014). The United States endorsed the 1984 military coup against Thomas Sankara, Burkina Faso's revolutionary president, who was murdered during the coup. When the Ugandan leader, Milton Obote, threatened to nationalize all Western resource extraction companies operating in Uganda, the CIA responded by engineering the 1971 military coup which ousted Obote and brought the comprador Idi Amin regime to power (Hutton and Block 1979). The coup against Obote followed a similar course to the American-sponsored removal from power of the Pan-Africanist, Kwame Nkrumah, of Ghana in 1966 (Apter 1968; Hutton and Block 1979). During the divisive liberation struggle in Portuguese Angola, the United States provided the military aid and support for proxy forces (Minter 1991). Moreover, during the Cold War, the United States had "labeled all African freedom fighters as terrorists" and was involved in "the propping up of apartheid and destabilization in Africa" (Campbell 2015). Later, during the post-Cold War period, the United States intervened militarily in Somalia under the aegis of the United Nations (Livingstone and Eachus 1995).

The United States had only intervened in Africa when US interests have been viewed as being in jeopardy. Given this record, African nations were skeptical when, in the first decade of the twenty-first century, the United States sought to create a US military command dedicated to African affairs. Some analysts have argued that this US decision was motivated by the quest for control of Africa's wealth of natural resources, as well as the increasing significance of China's role in infrastructure development and other activities on the African continent.

China's Involvement in Africa

China's rapid industrial advance over the last quarter of a century has profoundly affected the global economy. Its search for raw materials to fuel industrial growth has led to the development, extraction, and export of key resources from Eurasia, the Middle East, Latin America, Australia, and Africa. China became involved in Africa in order to extract and exploit its vast reserves of natural resources. The exploitation of raw materials by China in sub-Saharan Africa triggered a resources boom. In 2006, the China-Africa trade, primarily in raw materials, totaled $50 billion. Even after the Global Financial Crisis in 2008, China has continued to represent a pole of growth and expansion in the world economy, albeit at a slower rate (Moghalu 2013). The emergence of China as a major economic force in Africa complicated the struggle between the European Union and the United States "over who controls Africa" (Campbell 2008). The strategic implications for the United States of the growing Chinese presence in Africa remain deeply problematic for Washington (Gill et al. 2007).

China built infrastructural supply chains for oil extracted from Angola and Sudan, copper from Zambia, and timber from Central Africa. The Chinese demand for oil and metals has created a major increase in the gross domestic product of many sub-Saharan economies. The continuing high Chinese demand for African oil and gas has also resulted in the rising cost of oil for African importers. China has brought development, aid, and investment to Africa, as well as cheaper consumer products which displaced many local producers, but has not ended the marginalization of Africa in the world economy (Zafar 2007).

By 2012, China was sub-Saharan Africa's largest trading partner, providing more development investment than the World Bank. Its imports of raw materials from sub-Saharan Africa

represented 17% of Africa's total export trade. Between 2000 and 2010, China provided nearly US$67 billion in loans and infrastructure investment to Africa. During this decade, China funded 50 of 54 infrastructure projects in African countries. It built housing projects in Angola, a new railroad system in Tanzania, all weather highways in the Democratic Republic of the Congo, and a subway system in Addis Ababa, Ethiopia. Many of these infrastructure projects were based on low-interest loans from China. They allowed Chinese companies to operate in African economies and facilitated the development of China's extraction and export of unprocessed raw materials from African countries (Hughes Butts and Bankus 2009). China's drive for Africa's natural resources is based on low-interest loans, aid, and investment projects which has left resource-rich African states such as Angola, Sudan, Nigeria, the Democratic Republic of the Congo, and Ghana in massive debt, which may only be reduced by the continuing rapid export of their raw materials. The countries of sub-Saharan Africa contain, respectively, 50%, 77%, and 85% of the world's proven reserves of cobalt, manganese, and platinum, which are essential minerals for China's manufacture of industrial products (Kelly 2017).

With Africa viewed, in some respects, as the last frontier of the global economy, China's involvement in Africa prompted the United States to take a more active role in relation to the African continent (Moghalu 2013). To this end, the United States has established close military ties with a majority of African states since 2007. The activities of the US military in relation to Africa in the twenty-first century have been interpreted as evidence of America's great power rivalry with China, played out on Africa's soil.

The United States and Africa During the Twenty-First Century: AFRICOM and the War on Terror

The United States turned its attention to Africa in the context of the Bush Administration's global War on Terror. President George W. Bush had launched the War on Terror with the invasion and occupation of Afghanistan in 2001 in response to the 9/11 terror attacks on the United States. From 2003, the United States expanded the War on Terror through the invasion and occupation of Iraq. In addition to destabilizing the war-ravaged states of Iraq and Afghanistan, the US War on Terror either exacerbated existing insurgencies and conflicts or generated new struggles within the Maghreb and sub-Saharan Africa (Thrall and Goepner 2017). Terrorist networks have continued to expand (Schmitt 2018). A key criticism of the US War on Terror is that, especially since 2011, it has "focused the U.S. on terrorist movements and terrorism per se rather than the conditions which helped generate it" (Cordesman 2018). That criticism is particularly relevant to America's militarized relations with Africa since 2007.

US President George W. Bush established a new military structure, the "United States African Command," known as "AFRICOM," in February 2007 (Hanson 2007). However, from its founding to the present, AFRICOM has failed to secure a base for its headquarters within Africa and has instead been located in Stuttgart, Germany. AFRICOM in Stuttgart consists of approximately 1500 employees of the US Defense Department, with a further 500 situated in the United Kingdom and Florida (Shane 2018). The Bush Administration had initially sought to locate AFRICOM's administrative apparatus in a major African state, such as Nigeria, but Africa's "anti-imperialist traditions were so deep that no major African state could offer the U.S. military a base" (Campbell 2015). The United States "encountered unexpectedly stiff African resistance to AFRICOM" and was widely criticized for failing to consult with African leaders about the creation of AFRICOM (Burgess 2008).

AFRICOM's mission states that it, "with partners, disrupts and neutralizes transnational threats, protects U.S. personnel and facilities, prevents and mitigates conflict, and builds African partner defense capability and capacity in order to promote regional security, stability and prosperity" (United States Africa Command 2018). However, in 2007, the then US Deputy Assistant Secretary for the African Affairs of the

Department of Defense, Theresa Whelan, had to refute claims that the United States was "establishing AFRICOM solely to fight terrorism or to secure oil resources or to discourage China" (Kruzel 2007). Skepticism of US motives with regard to the creation of AFRICOM was warranted, given that the Bush Administration had designated that "access to Africa's oil supplies would henceforth be defined as a 'strategic national interest' of the United States" (Volman 2007).

While AFRICOM was not headquartered in Africa, a permanent American military base was established at Camp Lemonnier, Djibouti in 2001. Camp Lemonnier had previously been a garrison of the French Foreign Legion (Bollee 2003). Djibouti leased the base as well as the nearby airport and port facilities to America military forces for an indefinite period. Since 2008, the base has expanded in size and consolidated its presence. The base is the centerpiece of a network of temporary and mobile drone and other surveillance bases which stretch across the African continent. The geographical location of the base is central to American military strategy in Africa. It is situated at the junction of the Bab-el-Mandeb Strait where the Gulf of Aden meets the Red Sea and controls access to the Suez Canal. This location represents a crucial chokepoint for international shipping.

The creation of AFRICOM has been interpreted as a "tool" for the recolonization of Africa and the exploitation of the continent's resources (Pheko 2011). In 2007, Rear Admiral Robert Moeller, then the executive director of AFRICOM's transition team, had asserted that "AFRICOM will focus mainly on humanitarian assistance, disaster relief and crisis response missions" (Wood 2007). However, in 2008 Moeller had "declared that AFRICOM was about preserving 'the free flow of natural resources from Africa to the global market," while citing terrorism, oil disruption and China as major "challenges to US interests" (Demmers and Gould 2018). In addition to Moeller's admissions, another of AFRICOM's strategic purposes is to project US military power into Africa. Military power projection remains the key feature of imperial America in contemporary global politics. In contrast to the projection of US

military power with regard to Africa, China's form of power projection within Africa is unequivocally *economic*. AFRICOM's military operations must be seen in the context of growing regional and internal instability in Africa, the widening and continuing US War on Terror, and as a strategic US response to China's deepening economic power projection in Africa.

The United States in Africa: A New Form of Light Footprint Military Presence?

US military involvement in Africa in the twenty-first century has appeared at times to be escalating. During the Obama presidency, military operations in Africa were estimated to have increased by 200% and included "Airstrikes and commando raids in Libya, black ops missions and drone assassinations in Somalia, a proxy war in Mali, shadowy ops in Chad, antipiracy efforts in the Gulf of Guinea" (Turse 2015). Given the scale of the US military commitment that had been made to Afghanistan and Iraq early in the War on Terror, it may have been anticipated that these twenty-first century developments on the African continent signaled an ever-expanding US military presence within Africa. However, US military involvement in Africa has not mirrored that in Afghanistan or Iraq. In contrast to other regions of the world in which the US military is engaged, Africa has been described as an area where the United States is "weak militarily" and "the least militarized of the continents" (Campbell 2015).

Although the US military commitment to Africa is comparatively small, America's military has "established drone bases in Djibouti, Niger, Kenya, Ethiopia, Somalia, South Sudan, Burkina Faso and the Seychelles, and sent troops to Liberia during the Ebola crisis in 2014" (Al Jazeera 2017). By 2018, it was estimated that US Special Forces were operating in "more than a dozen African nations," while AFRICOM's activities had "resulted in 46 various forms of U.S. bases as well as military-to-military relations between 53 out of the 54 African countries and the United States" (The Black Alliance for Peace 2018).

U

The creation of AFRICOM had occurred during a period of major change for the US military, as it sought to "reduce the presence of large numbers of American troops overseas in order to consolidate or eliminate expensive bases" (Volman 2007). Its prolonged and massive military engagements in Afghanistan and Iraq had caused the United States to radically change its response to any commitment to conflict zones in Africa. No longer will the United States send significant numbers of ground forces for extended periods to these conflicts. Instead, small military squads are deployed, not for direct ground combat but to provide training, air cover, and power and intelligence for African regional forces in struggles against armed insurgents or terrorist groupings. Units of US Special Forces often carry out brief military missions or provide surveillance to direct airstrikes against these enemy forces. This type of military response has been described by Washington as "light footprint warfare" (Karlshoej-Pedersen 2018).

Compared with its military engagement in other regions of the world, Africa has not represented a major investment by the US military. AFRICOM does not have assigned forces and has been described as under-resourced. The American military presence in Africa has consisted of relatively low-cost intelligence, surveillance and reconnaissance, regional operations with African forces, and limited special operations (Hunt Friend and Wise 2018).

AFRICOM's defense posture has been ad hoc and shaped by specific "incidents": the 2012 attack by Libyan militants on the temporary American consular facility in Benghazi; the US military support in 2012–2013 for the French intervention in Mali following a military coup; a Tuareg revolt and the Al-Qaeda in the Maghreb's seizure of the northern half of Mali; the intelligence, surveillance, and reconnaissance support given to the Nigerian state forces in 2014 to hunt down and end the terrorist attacks of Boko Haram; the US air support and deployment of Special Forces in the 2016 defeat and expulsion of the Islamic State of Iraq and the Levant from Sirte, Libya; and the 2017 ambush and death of four American soldiers by Islamic State in the Greater Sahara militants in Niger. These AFRICOM operations by American forces in Africa have been described as reactive, contingent, and episodic (Hunt Friend and Wise 2018). According to the then Chief of AFRICOM's Media Engagement Division, Benjamin Benson, the number of US bases in Africa was difficult to quantify, as the United States had "teams coming in and out of Africa to different locations all the time" (Turse 2015).

While the US War on Terror motivated America to engage militarily in Africa, the counterterrorism and counterinsurgency activities of the United States have been a failure in Africa. Some analysts contend that America's "adoption of an aggressive strategy of military intervention" was both "ineffective and counterproductive" and caused problems "including spawning more anti-American sentiment and creating, rather than diminishing, the conditions that lead to terrorism" (Thrall and Goepner 2017). Others have observed more generally that "counterterrorism is often a form of terrorism and counterinsurgency is often a form of repression" that is used to the advantage of autocratic states and military forces (Cordesman 2018). Hussein Solomon has argued that, in the African context, "the state is often the source of insecurity for ordinary citizens," and he cautions that: "Any military strengthening of an illegitimate African state by the international community not only serves to bolster a predatory state but also undermines the human security of citizens" (Solomon 2013). Military-to-military relations are fundamental to the operations of AFRICOM, which has established military-to-military relationships with 53 African states (The Black Alliance for Peace 2018). Structures such as AFRICOM, which function through military-to-military partnerships, can serve to obscure military repression by their partner states in Africa.

Conclusion

There is no indication that the United States intends to expand its military involvement in Africa to become a long-term and substantial military presence of the kind that has occurred in Iraq

and Afghanistan. Nonetheless, a "light footprint" from the US military does not represent a reduction in the US capacity or capability for military operations or war. With drones and surveillance technology, as well as US troops and bases stationed close by in the Middle East, the US military is no less capable of military intervention in Africa.

The United States' commitment to military involvement in Africa may decrease in the future, as AFRICOM has been targeted by the Trump Administration for reductions, particularly in relation to the estimated 1200 Special Forces troops deployed on missions within Africa (Gibbons-Neff and Schmitt 2018). In January 2018, the Trump Administration's then Secretary of Defense, General James Mattis, announced that the United States "will continue to prosecute the campaign against terrorists, but great power competition – not terrorism – is now the primary focus of U.S. national security" (Cooper and Schmitt 2018).

Whatever the future of AFRICOM may be, as Horace G. Campbell has identified, the "interconnection between imperialism, plunder, racism and primitive accumulation is the foundation to clearly understanding the US and security in Africa" (Campbell 2017). It is an unspoken racism that allows the United States to assume that it has the right to intervene in African affairs and to deny Africans their hard-won independence and self-determination, free from foreign military structures like AFRICOM.

Biography; Bolivarian revolution; Hugo Chávez (1954–2013); US imperialism; Venezuela

Definition

This entry describes the political career of the late President of Venezuela, Hugo Chávez (1954–2013), and the anti-imperialist Bolivarian revolution

that he led. It concludes with a brief examination of his legacy.

That Venezuelans should elect Hugo Chávez, a complete outsider, someone who only 6 years earlier had tried to overthrow a president via a military rebellion, should not have come as much of a surprise given the political and economic crisis the country suffered. In the 20 years prior to Chávez's election, poverty had increased from 15% to over 60%, corruption was perceived to be rampant, and abstention had reached historic proportions. Chávez promised to set the country right again by promising nothing less than a revolution: a Bolivarian revolution, named after Latin American independence hero Simón Bolívar.

While Chávez initially enjoyed support from a broad segment of Venezuela's middle class and from some of the country's elite, such as segments of its domestic business class and even from a key member of its transnational business class (Gustavo Cisneros, Latin America's media mogul), his support shifted dramatically after his first 3 years in office. His middle-class and upper-class support rapidly turned into enmity, so that his support eventually came almost entirely from the country's urban and rural poor. The process by which this shift in support took place was the result of Chávez's rejection of the country's old elite, his identification with the country's poor, and his pursuit of policies that redistributed the country's oil wealth and political power towards the poor.

Rise to Electoral Power

Chávez's promise of radical change appealed to a broad segment of Venezuela's population, including most progressive groups and social movements, leftist and even centrist political parties, and large parts of the middle and even upper class. The reason for this broad support was that the country had been undergoing a 20-year period of steep economic and political decline, which had pushed a large part of the country into poverty and had completely destroyed the old regime's legitimacy. Venezuelans thus were desperate for real

change. However, to get elected, Chávez needed to form a political party. He could not directly transform his clandestine revolutionary organisation that had organised the 1992 coup attempt, the MBR-200 (Movimiento Bolivariano Revolucionario-200; Bolivarian Revolutionary Movement-200) into a political party because it was a loose movement and because Venezuelan electoral law did not allow the use of the name Bolívar for political parties. Chávez's new political party was thus named the Movimiento Quinta República (MVR, Fifth Republic Movement). The party wanted to found a fifth republic (using the Roman numeral 'V') in that it counted four since Venezuela's independence and the fifth would begin with the passage of a new constitution.

Parties that ended up supporting Chávez's bid for the presidency included the Patria para Todos (PPT, Fatherland for All), Movimiento Al Socialismo (MAS, Movement Towards Socialism), Movimiento Electoral del Pueblo (MEP, Electoral Movement of the People), Partido Comunista de Venezuela (PCV, Communist Party of Venezuela), Bandera Roja (Red Flag), and Gente Emergente (Emergent People). Of the parties in the pro-Chávez coalition, only the MVR had some centrist nationalists in it. The others were all parties with a long leftist tradition.

The 1998 presidential contest boiled down to an establishment candidate (Henrique Salas Römer), who was supported by the country's two former governing parties, the social-democratic Acción Democrática and the Christian-democratic Copei, and the antiestablishment candidate Hugo Chávez. Given the country's disgust with the old political establishment, Chávez won easily, with 56.2% of the vote – one of the largest margins in Venezuela's history.

However, even though Chávez had a clear mandate for the task of transforming Venezuela's political system, the country's old political class, once it realised that Chávez could not be co-opted, rejected him as the legitimately elected president. At first, there was not much this former governing class could do except to denounce the new president in the private mass media outlets that it controlled. Eventually, though, the opposition

gained momentum and managed to destabilise the country severely in its all-out effort to oust Chávez. One can divide this battle into four distinct phases: new constitution and consolidation of power; coup attempt and Chávez's retreat; oil industry shutdown and Chávez's comeback; and recall referendum and radicalisation.

Constitution of 1999 and Consolidation of Power

Chávez's landslide election, with crucial support from segments of Venezuela's middle and upper classes, gave him a mandate to convoke a constitutional assembly and to introduce far-reaching changes to Venezuela's political system. At first, those segments of the upper class that supported Chávez assumed he would be just like many politicians before him and would agree to do their bidding by appointing ministers out of their ranks. They presented him with a list of possible appointees, all of whom came from the upper ranks of the country's business and media elite. Chávez rejected all of their suggestions and thus the stage was set for confrontation. Chávez proceeded with his plan to convoke a referendum on whether the country should hold a constitutional assembly. Voters decisively approved the project. Next, a vote was held for who should constitute this assembly. Still riding his wave of popularity, Chávez won this vote overwhelmingly when 95% of the assembly members who were elected were his supporters. Following a relatively accelerated discussion process, the new constitution was put to a vote in December 1999, when it passed with 72% in its favour. With the new constitution in place, all elected offices had to be renewed in August 2000. In the National Assembly election the pro-Chávez coalition won two-thirds of the seats, with Chávez's own party, the MVR, winning just under an absolute majority. Also, in the regional elections for state governors and city mayors, Chávez supporters won a majority. Chávez was also reelected, this time to a six-year term, winning 59% of the vote.

The new 1999 constitution introduced many important changes to Venezuela's political system. One of its main objectives was to create a democracy that was both representative and participatory. The participatory elements included the possibility of organising citizen-initiated referenda to recall any elected official, to rescind or approve laws, and to consult the population on important policy issues. Also, the new constitution opened up the possibility of forms of direct democracy at the local level, via local planning councils and citizen assemblies, which would later become the basis for the creation of communal councils. Another key objective of the 1999 constitution was to include previously marginalised segments of the population, such as: the indigenous population, which received a series of new rights to their lands, culture, and language; and Venezuelan women, who received rights to non-discrimination and to affirmative action in all governmental programmes. Also, in terms of human rights, the new constitution gives constitutional status to all international human rights treaties. Another important change was the creation of two new independent branches of government, the electoral power and the 'citizen' power, which include the attorney general, comptroller general, and human rights ombudsperson. The new constitution's most controversial aspect was that it slightly strengthened the office of the president by increasing the term in office from 5 to 6 years, allowing for one immediate re-election, and giving the president stronger control over the military by allowing him or her to make all upper-level promotions. Finally, in an important departure from most constitutions in the world, it raises the state's commitment to achieve social justice to the same level as the state's commitment to the rule of law (Article 2).

By winning the so-called 'mega-elections' of August 2000, Chávez consolidated his control over the country's executive, with his supporters controlling the other four branches of government: the judiciary, the legislature, the electoral power, and the 'citizen' power. Chávez then had to act fast to introduce social programmes to address some of the most urgent needs of the country's poor. Since state revenues were quite low, largely due to an oil price that had hit rock bottom in 1998 at around $10 per barrel, Chávez

V

immediately set about reconsolidating OPEC, so as to raise international oil prices. Chávez visited all OPEC members in 1999, plus several non-OPEC oil producers, and managed to convince them to lower oil production. The result was immediate and prices started to climb again. However, in order to save money, Chávez also got the military involved in the organisation and provision of a new social programme known as Plan Bolívar 2000. This plan provided free food in the country's poorest neighbourhoods and improved barrio housing, among other issues.

Meanwhile, the Opposition, since it was increasingly locked out of political power for the first time in 40 years, still could not accept Chávez as the legitimately elected president. At first, given Chávez's political momentum, there was little the Opposition could do to stop him. However, as Chávez's honeymoon began to wear off and his approval ratings declined (as they had to) from the unheard of heights of 90% approval, the former political class managed to regain its foothold in Venezuela's middle class by waging a relentless media campaign against the new president. Chávez ignored this development, which took place throughout 2001, and forged ahead with his larger political programme by presenting a set of 49 law decrees in October of that year, which Venezuela's National Assembly had in the previous year given him the authority to pass. The 49 law decrees were supposed to bring Venezuela's legal framework up to date with the new constitution and introduced far-reaching reforms, particularly in terms of a comprehensive land reform and large tax increases for the oil industry.

Heightened Resistance, Coup Attempt, and Retreat

The outcry against these law decrees was immediate. Fedecamaras, the country's largest and most important chamber of commerce, which unites most of Venezuela's big businesses, complained that the laws were anti-business, undermined private property rights, and were passed without consulting them or anyone outside of government

circles. Venezuela's main union federation, the Confederation of Venezuelan Workers (CTV), quickly supported Fedecamaras, arguing that the laws were harmful to Venezuela's business community and therefore harmful to Venezuelan workers. A more likely explanation for the CTV's support, in addition to its ties to the former governing party AD, was that the CTV had just gone through a pitched battle with the government over who would control the organisation. A month earlier Chávez had forced the CTV leadership to submit itself to a grassroots vote, which the federation's old established leadership won amid Chávez supporters' claims of fraud, resulting in the government's non-recognition of the leadership. The result of this vehement CTV/Fedecamaras opposition to the government was that the two organisations called for a general strike on 10 December 2001. The strike met with moderate success, but the private media's bias and the private sector's lockout of employees for a day gave the strike a heightened visible effect.

But it was not only the package of 49 laws that added fire to Venezuela's conflict. Another crucial factor was that the economy abruptly slowed down in the wake of the 11 September terrorist attack on the US. The attack sparked a worldwide recession and with it a drop in the price of oil. This double blow forced the government to adjust its budget and cut back spending in all areas by at least 10%, meaning that Plan Bolívar 2000 had to be abandoned, among other things. The impact was almost immediately noticeable, as unemployment and poverty began inching upwards again after they had declined in 2000 and 2001.

Meanwhile, there was an escalation of verbal attacks between Chávez and the Opposition. The economic downturn, the 49 laws, and Chávez's strongly worded discourse against the 'squalid opposition' and the 'rancid oligarchy' all made it relatively easy for the Opposition to chip away at Chávez's popularity, along with substantial help from the private mass media. Opposition opinion polls indicated that Chávez's popularity declined rapidly in this period, from a rating of around 60–70% to 30–40% between June 2001 and January 2002.

This was the context in which the Opposition became convinced that it could oust Chávez

(whose legitimacy it never truly accepted) before the end of his presidency. Three specific attempts took place between January 2002 and August 2004. The first was the April 2002 coup attempt, whose apparent detonator was the oil industry management's resistance to Chávez's efforts to wrestle control of the state-owned oil industry away from the old management. Crucial to the coup, however, was a disgruntled sector of the military which, for a variety of ideological and opportunistic reasons, believed it could and should get rid of Chávez. The failure of the coup, a mere 47 h after Chávez was removed from office, was emblematic of all subsequent Opposition failures to oust Chávez from the presidency. The Opposition consistently underestimated the president's popularity (especially among the poor), believing instead the mass media's constant claim that Chávez was highly unpopular and incapable as president. It was precisely Chávez's popularity among the country's poor and the military that swept him back into the presidency.

For the Opposition this was a bitter defeat because it lost an important base of its power: the military. With Chávez's election, the country's old elite had already lost the presidency, which in Venezuela's very presidentialist society is by far the most important form of political power. Each subsequent effort to oust Chávez, the oil industry shutdown and the recall referendum, represented the loss of another base of Opposition power.

Chávez's reaction to the coup attempt, after his return, was to moderate his tone and to play it safe. He put a new economic team in charge that appeared to move to the mainstream and promised to include the Opposition more in his policy deliberations. Also, he reinstated the old board of directors and former managers of the state oil company PDVSA, whose replacement had been one of the reasons for the coup.

Oil Industry Shutdown and Chávez's Comeback

Following a brief period of uncertain calm and few policy initiatives, the Opposition interpreted Chávez's retreat as an opportunity for another offensive against him, this time by organising an indefinite shutdown of the country's all-important oil industry in early December 2002. While the Opposition labelled this action a general strike, it was actually a combination of management lockout, administrative and professional employee strike, and general sabotage. Also, it was mostly the US fast food franchises and the upscale shopping malls that were closed for about two months. The rest of the country operated more or less normally during this time, except for food and gasoline shortages throughout the country, mostly because many distribution centres were closed down. Eventually, the shutdown was defeated, once again due to the Opposition's underestimation of Chávez's support. While about 19,000 employees (about half of the oil company's workforce) were eventually fired for abandoning their workplaces, the government nonetheless managed to restart the oil company with the help of blue-collar workers, retired workers, foreign contractors, and the military. The Opposition thus lost another crucial base of power, this time in the oil industry, whose managers were practically all Opposition supporters and were all removed from their jobs.

Despite the oil industry's eventual recovery, the strike represented a severe blow to Venezuela's economy, which shrank an unprecedented 26% in the first quarter of 2003, relative to the same quarter of the previous year. Unemployment skyrocketed to over 22% in March and capital flight caused the currency to plummet. It is estimated that the oil industry shutdown cost the industry over $14 billion in lost revenues. The oil industry's recovery (which was said to be complete by May 2003), along with a dramatically increasing price of oil and thus oil revenues, meant that Chávez gradually had the resources to introduce new social programmes, called missions, to address the desperate needs of the country's poor. The first missions Chávez introduced between late 2003 and early 2004 were for literacy training (Mission Robinson), high-school completion (Mission Ribas), university scholarships (Mission Sucre), community health care (Mission Barrio Adentro), and subsidised food markets (Mission Mercal). The population

V

living in the barrios welcomed these missions with great enthusiasm, contributing to Chávez's renewed rise in opinion polls.

Recall Referendum and Radicalisation

The third and last attempt to oust Chávez during his first full six-year term in office was the August 2004 recall referendum. After having suffered defeat in two consecutive illegal attempts, the Opposition was forced to follow the only democratic and constitutional route for getting rid of the president. The commitment to follow a strictly constitutional route for resolving Venezuela's political crisis was formalised following many months of negotiations in a signed agreement between Opposition and Government that the Organization of American States and the Carter Center facilitated in May 2003. Eventually, once the National Electoral Council (CNE) and the rules governing recall referenda were in place, which took until the end of 2003, the Opposition collected 3.1 million signatures in December of that year. Of these, following much political debate, 2.5 million signatures were validated (a mere 100,000 over the required sum of 20% of registered voters) and a referendum was convoked for 15 August 2004. The vote took place peacefully and the following morning, shortly after 4am on 16 August, the CNE announced the first preliminary results. These gave Chávez a 58% to 42% victory. Immediately after the announcement, Opposition leaders held a press conference in which they stated unequivocally that fraud had been perpetrated. They offered no evidence for this claim, however. Election observer missions of the Organization of American States and of the Carter Center ratified the official result.

For the Opposition, this was perhaps the most bitter defeat of them all. Not only did it no longer have a base of power in the executive, in the military, or in the oil industry, it had also lost perhaps its most important base of power in the middle class. That is, following 3 years of continuous battle with Chávez, promising its supporters that he was on his way out and that Chávez was illegitimate because the Opposition represented the majority, Opposition supporters increasingly saw their leadership as being hollow and incompetent. Polls shortly after the recall referendum documented a dramatic loss of support for the Opposition, so that only 15% of Venezuelans said they identified with it.

While the Opposition leadership managed to win over and then gradually lose middle-class support, between 1999 and 2006 Chávez won over ever more solid support from the country's poor. This can be seen most clearly in the voting pattern of different neighbourhoods with different average incomes. For example, while middle-class neighbourhoods voted for Chávez by around 50–60% in 1998, for the 2004 recall referendum, these neighbourhoods tended to vote against him at a rate of 60–70%. In contrast, although support for Chávez in poor neighbourhoods remained in the range of 60–70% in 1998 and 2004, voter registration and participation increased dramatically in these neighbourhoods, thus giving Chávez a decisive edge in 2004 and 2006.

Chávez and the Bolivarian movement that supported him realised the near total loss of Opposition power and thus saw themselves in a position to further radicalise the government's political programme. In his victory speech following the recall referendum, Chávez announced that a new phase of his government would begin:

> From today until December 2006 begins a new phase of the Bolivarian revolution, to give continuity to the social missions, to the struggle against injustice, exclusion, and poverty. I invite all, including the opposition, to join in the work to make Venezuela a country of justice, with the rule of law and with social justice.

Later, in January 2005, Chávez took this call for a new phase even further by announcing that from now on his Government would seek to build socialism of the twenty-first-century in Venezuela. Thus, the continuous efforts of the Opposition to oust Chávez, based on its non-recognition of his legitimacy, led to a continuous weakening of this opposition and to the concomitant opportunity for Chávez and the Bolivarian movement to radicalise their programme.

The main expression this radicalisation found during this period was in the creation of a

nationwide effort to develop communal councils. These councils, which were first launched in early 2005, consist of 200–400 families in a contiguous neighbourhood. They represented an effort to deepen participatory democracy by giving them power and funds to decide on important infrastructure projects in their neighbourhoods. Also, these councils represented a pooling of grassroots mobilisation that had taken place over the previous 5 years, whereby communities founded health committees to work with the community health programme, water committees to work on improving the water supply, urban land committees to work on acquiring ownership title to barrio homes, and education committees to work with educational missions, etc. With the creation of communal councils all these committees were turned into work committees of the councils, thereby pooling and systematising community organisation. While the Opposition decried the communal councils as tools of patronage and clientelism, the communities themselves largely welcomed them enthusiastically and formed over 20,000 throughout the country by late 2007.

Chávez's call to build twenty-first-century socialism received another boost on 3 December 2006 when he decisively won a second six-year term. He beat the Opposition candidate Manuel Rosales with 62.9% to 37.9% of the vote. This 26 percentage point margin of victory was the largest in Venezuelan history. Also, Chávez managed to nearly double his support from an initial 3.7 million votes in 1998 to 7.1 million in 2006. More significant than the increase in support, though, was that Rosales admitted that Chávez had defeated him. This was the first time that an Opposition leader had conceded defeat in a confrontation with Chávez since he was first elected in 1998. In none of the Opposition's confrontations with him, whether following the 2002 coup attempt, the 2003 oil industry shutdown, or the 2004 recall referendum, had the Opposition admitted defeat. This implies that the 2006 presidential election was the first time in Chávez's presidency that the Opposition recognised Chávez as the legitimately elected president and thus opened the path towards a normalisation of Venezuelan politics in the Chávez era.

Hubris and Renewal of the Bolivarian Movement

At the start of his second term in office in January 2007 Chávez seemed unstoppable. His popularity had reached new highs and his mandate to create twenty-first-century socialism for Venezuela was indisputable. The first thing Chávez announced after his re-election victory was the creation of a new political party for socialism, the reform of the 1999 constitution, a new enabling law that would allow him to nationalise key industries, the politico-territorial reorganisation of the country, and the deepening of communal power.

When the broadcast licence of the oppositional TV station RCTV was up for renewal on 27 May 2007, Chávez decided to let the licence lapse and to give the wavelength to a new state TV channel. This was perhaps the most unpopular decision of his presidency, since RCTV was the country's most widely watched TV station. However, Chávez and his supporters argued that since RCTV participated in the April 2002 coup attempt and since it had continued to violate broadcast regulations, it did not deserve to have its licence renewed. This move gave the Opposition an opening to launch a new movement against Chávez, this time, though, headed by new student leaders mostly coming from the country's private universities.

Many of the other changes Chávez had announced for 2007 depended on the constitutional reform effort, which he presented in August of that year. The National Assembly, which had to pass the president's proposal before it could be put to a national referendum, added another 36 articles to be reformed to Chávez's original proposal of 33 articles. The reform was to address four major areas: strengthening participatory democracy, broadening social inclusion, supporting non-neoliberal economic development, and strengthening central government. The first two of these were relatively uncontroversial, but the second two, which included shortening the working week, strengthening land reform, removing central bank autonomy, and removing the two-term limit on holding presidential office, were far more controversial.

V

The combination of the reform's top-down development, its complexity, well-orchestrated disinformation by the Opposition, the government's neglect of key social programmes, and the defection of prominent Chávez supporters all contributed to the referendum's eventual failure, despite Chávez's continuing popularity. The reform was defeated with a vote of only 50.7% against it, but it was generally interpreted as a major loss for Chávez and the Bolivarian movement. Based on an analysis of the referendum results by voting centre, it was clear that the main reason the referendum failed was because Chávez's supporters did not turn out to vote as strongly as they had done in previous elections. The result prompted Chávez to launch a process of 'reevaluation, revision, and relaunch' of the effort to establish twenty-first-century socialism.

The demise of the constitutional reform project took place in parallel to the effort to start a new party, the Unified Socialist Party of Venezuela (PSUV), which brought together supporters from all parties of the pro-Chávez coalition. By April 2008, PSUV delegates, who had been elected in a grass-roots democratic process, approved of an explicitly anti-capitalist party programme and a new leadership for the Bolivarian movement that came mostly from the country's traditional left (between the centre left and the far left). With the formation of the PSUV it seemed that the Bolivarian movement was gradually developing a structure that would be less dependent on Chávez and thus more long-lasting and better equipped to develop new leadership and to channel debate within the movement.

Economic Crisis, Cancer, and Renewed Destabilisation

The global financial crisis of 2008 affected Venezuela primarily via the sudden drop in the price of oil, which went from a high of nearly $120 per barrel in mid-2008 to less than half that amount by the end of the year. As a result, the Chávez Government had to decrease its budget significantly for 2009, thereby pushing the country into a recession, with GDP shrinking by 3.2% in 2009 and another 1.5% in 2010.

Perhaps even more significant was the effect on the country's fixed exchange rate. The oil price decline reduced the availability of dollars, which, in turn, increased the dollar-bolivar black-market exchange rate. The higher black-market exchange rate created opportunities for arbitrage, whereby those with access to the official exchange rate faced tremendous incentives to take advantage of the growing gap between the official and the black-market exchange rates. The ultimate consequence was a dramatic increase in smuggling; government estimates in 2014 suggested that up to 40% of all subsidised imports (subsidised via the official exchange rate) were being smuggled back out of the country again, where they could fetch a price that was up to ten times higher than in Venezuela. Inflation also shot up during this period because many retailers used the black-market exchange rate to price their products, even when they had imported them with dollars that they had purchased at the official exchange rate. Inflation thus reached 27% in 2009 and even rose to 62% in 2014.

Around the same time that the economy began having difficulties, in June 2011, Chávez announced that he had been diagnosed with and treated for cancer in the previous six months. He underwent chemotherapy for the next year and by July 2012 announced that the cancer was in remission. Subsequently, he engaged in an active campaign for a third six-year term in office and went on to win the 7 October presidential election with 55% of the vote, against Opposition candidate Henrique Capriles Radonsky's 44% (with an 80% participation rate).

Shortly after this victory, on 20 October 2012, Chávez announced that he would institute a turn-about ('Golpe de Timón') to further radicalise his Bolivarian revolution. The announcement was important because it recognised that many goals had not been achieved yet and that more power and a more central role must be given to the communes (groupings of communal councils), both in the economy and in the country's political system.

The 'turnabout' announcement was relatively short-lived, however, because on 8 December that year Chávez made a new momentous declaration, namely that his cancer had returned in a very aggressive form and that he would immediately return to Cuba for more chemotherapy treatment. During this announcement Chávez also said that, should he not survive the cancer, the then vice president Nicolas Maduro should be his successor. Chávez spent the next four months in treatment in Cuba, while speculation and rumours about his medical condition reached unprecedented heights in Venezuela. On 5 March 2013, Maduro addressed the nation with nearly the whole Cabinet behind him, looking very ashenfaced, and announced that Chávez had passed away a little earlier that day.

Chávez's death meant that new presidential elections had to be called within 30 days, which Nicolas Maduro went on to win with 50.6% of the vote.

Legacy

Chávez's legacy as the founder of Venezuela's Bolivarian revolution and as the trailblazer of the resurgence of the left in political office throughout Latin America is unquestioned. Between 1999 and 2012, nine more countries would go on to elect leftist governments in the region (Argentina, Brazil, Bolivia, Ecuador, Chile, Nicaragua, Paraguay, El Salvador, and Uruguay). Furthermore, he inspired a global movement for the creation of '21st-century socialism', one which would later be emulated by political parties in Europe, such as Podemos in Spain and Syriza in Greece.

Definition

This essay examines the life and seminal contributions of US sociologist, economic historian, and world systems theorist Immanuel Wallerstein (1930–2019).

Early Life and Academic Influences

The child of German émigrés to the US, Immanuel Maurice Wallerstein was born in New York on 28 September 1930. Jews who had emigrated to Berlin from elsewhere in the Austro-Hungarian empire earlier in their lives, Wallerstein's mother and father relocated once more to New York as did other members of his extended family to parts far and wide amidst the changing political situation in inter-war Germany (Wallerstein et al. 2012, p. 10). His early youth was imbued with a sense of political consciousness grounded in the polyglot culture of his parents and issues of Jewish nationalism, the rise of fascism and Nazism, and the great split within the global left between the Second and Third Socialist Internationals over support for the First World War (Wallerstein 2000). As a boy, his personal development was also marked by a sense of moral commitment born of a background in the Jewish tradition, an identity as a first-generation American coming of age in New York City, and a brief career from the ages of ten to 15 as a stage actor (Wallerstein et al. 2012, pp. 8, 12).

Wallerstein's formal academic development can be dated to a course taken in high school on Asia, which led to an early interest in newly independent India and its nationalist leaders. In the years that followed, his views matured as he developed a deeper concern for politics, world affairs, and the United Nations. Entering Columbia University in 1947, he earned his BA in 1951. After two years in the US army, Wallerstein

went on to study for an MA at Columbia in 1954, working on a thesis about the political foundations of McCarthyism in the US, the generally positive reception of which work confirmed his self-identification as a 'political sociologist' (Wallerstein 2000, p. xvi). Remaining at Columbia for his PhD (awarded in 1959), Wallerstein re-oriented his intellectual focus (as well as solidarity work) toward Africa, writing a dissertation that compared the development of nationalist movements in Ghana and the Ivory Coast. At Columbia, Wallerstein's interests in European social theory, including the work of Karl Marx, Sigmund Freud, and the Frankfurt school also found fertile ground. By the early 1960s, the great French-Creole Caribbean psychiatrist and supporter of Algerian liberation Frantz Fanon, whom Wallerstein came to know personally, had also become a key influence (Wallerstein et al. 2012, p. 5).

While Africa would remain Wallerstein's empirical focus during the first phase of his academic career until the early 1970s, it was also during this time that the ideas that would culminate in the first volume of *The Modern World-System*, on *Capitalist Agriculture and the Origins of the European World-Economy in the Sixteenth Century* (Wallerstein 1974a), began to take shape. Over the course of the next decade, he came into personal association with two other key influences. The first was the great French historian and leader of the Annales school of history, Fernand Braudel, whom Wallerstein first came to know in the early 1970s. Braudel's ideas about the historical contingency of time and space concepts and the need to understand historical change as unfolding over different time cycles (especially the so-called *longue durée*) were crucial foundations for what became Wallersteinian world-systems analysis. The second was the Belgian physicist and Nobel laureate Illya Prigogine, whom Wallerstein first encountered in 1980. Prigogine's ideas about dissipative structures, indeterminacy, and irreversibility within complex systems have proved especially important to Wallerstein's thinking about the character of the modern world-system *as a system* and his related concerns about epistemology.

The Political Economy of World-Systems

In its capacity as an approach to political economy (and related issues in historical sociology), world-systems analysis starts from an insistence on 'historical social systems' or 'world-systems' rather than nation states as the unit of analysis. For Wallerstein, such systems are defined by their autonomy ('they function primarily in terms of the consequences of processes internal to them') as well as their boundedness in time and space, being held together by an 'integrated network of economic, political, and cultural processes' (Wallerstein 2001, p. 230). With respect to the question of boundaries, as in other approaches to political economy in the Wallersteinian view, it is the social division of labour from which the unity of a historical social system commences. In the political economy of world-systems, however, the social division of labour comprises both an intra-societal class division as well as an inter-regional geographical division. As such, two main types of entities or social formations are defined in world-systems analysis: 'those with a single overarching political structure, the world-empires; and those without one, the world-economies'. World-empires are conceived largely on the model of tribute-siphoning military-bureaucratic hierocracies that extract surplus from within their contiguous territory, albeit in a graded pattern that leaves the peripheral hinterlands of the imperial domain the most intensively exploited. Within the political economy of world-systems, additional allowance is made for a third smaller-scale form as well, that of the mini-system, which is exemplified by entities of more limited geographical expanse and more finite temporal duration than either type of world historical social system (231). The mini-system is best exemplified by the society of the archetypical pastoralist or hunter-gatherer: subsistence-oriented economies that are thought of as being relatively homogenous and based on patterns of production and exchange that are supposed to be largely self-contained. In this tripartite distinction between minisystems, world-empires, and world-economies, Wallersteinian political economy extrapolates and develops Karl Polanyi's

distinction between reciprocal, redistributive, and market modes of exchange (Polanyi 1957, p. 58).

For the greatest part of history since the so-called Neolithic revolution, in the Wallersteinian view, it was the world-empire that remained the predominant form, proving capable of absorbing nearby world-economies. Together, these two varieties of world-systems are said to have comprised a large but countable number between 10,000 BC and AD 1500 (Wallerstein 2001, p. 231). Although more prevalent, world-empires are themselves said to have been constrained by the administrative costs of territorial expansion, which imposed relatively sharper limits – at least in principle – on their spatial and, therefore, temporal extent. Prior to 1500, Wallerstein contends that it was primarily in the void left by the disintegration of some previous world-empire – the larger instances of which persisted for as much as half a millennium – that new world-economies found space to develop, albeit usually so as to have made for systems that proved even more transient and fragile than their imperial counterparts (231).

In Wallerstein's view, there occurred a historically unprecedented reversal in the balance between these two forms during the fifteenth century, and it is in explaining this transition that the political economy of world-systems becomes focused on the origins, growth, and persistence of the particular world-system known as the 'capitalist world-economy'. As a synonym for the modern world-system, the capitalist world-economy is understood to have progressively expanded to its full global extent in three major phases. These can be briefly summarised as follows. From approximately 1450–1650, the modern world-system emerged on the wings of capitalist agriculture and the inability of any particular political hegemon (especially the Habsburgs) to assert dominance over the system so as to domesticate it into a world-empire instead. This first phase of the modern world-system was inclusive of the beginnings of 'mercantilism' and the development of long-distance trade and early European expansion across the Atlantic. In this early period, the system came to be centred in

north-western Europe (England, France, and Holland) while also including at its margins parts of the Americas and most of the rest of the European continent excluding the Russian and Ottoman Empires. In the period from 1750–1850, a second major expansion of the system took place, as the capitalist world-economy came to incorporate Russian and Ottoman territories as well as the South Asian subcontinent (with the decline of the Mughal Empire), parts of South-East Asia, large parts of West Africa and the rest of the Americas. During this second period, power within the system was consolidated inward, with an ongoing struggle taking place within the centre between France and Britain and a concurrent shift occurring from agricultural to industrial capitalism. The third and last expansion of the modern world-system took place in the halfcentury from 1850–1900, which witnessed East Asia, Oceania, and remaining parts of Africa and South-East Asia being brought into the system (Wallerstein 1999, p. 58). Of course, the precise details concerning the exact timing and coverage of the phases of expansion by which the modern world-system came to incorporate different parts of the globe are subject to disagreement. The above snapshot captures only Wallerstein's own particularly influential point of view, as developed at greatest length in the first three volumes of *The Modern World-System* (Wallerstein 1974b, 1980, 1989) and as yet to be developed in the still to be published fifth volume.

As should be apparent from the discussion to this point, exponents of the world-systems perspective proclaim a specifically historical approach to understanding the nature of capitalism. For Wallerstein, the commitment is summarised through the express equivalence that he has drawn between studying the development of the capitalist world-economy and studying 'historical capitalism' (Wallerstein 1995). In contrast to 'Marxist and others on the political left', according to Wallerstein, to study historical capitalism is to disavow a purely 'logico-deductive' analysis that starts 'from definitions of what capitalism' is 'thought to be in essence' in order to then see how it 'had developed in various places

and times' (1). At the same time, the dynamic of expansion through the progressive incorporation of new areas into the capitalist world-economy is suggestive of the lasting influence on the political economy of world-systems of post-war dependency theory, as initially formulated by the German development economist Hans Singer and his neo-Marxian Argentine counterpart Raúl Prebisch at the end of the 1940s. From the outset, Wallerstein thus presumed that the modern world-system comprised a relation between one or several territorial centres constituting the 'core' of the capitalist world economy and their respective 'peripheries'. The overlap with Prebisch's terminology for describing postwar patterns of relation between the 'peripheral' economies of poor countries that were concentrated on the export of primary goods to the 'core' economies of the rich countries (that themselves created value-added secondary products to be sent back in the opposite direction) was not accidental.

Defined as it has been in essentially functional terms, however, the relationship between core and periphery has been subject to significant modification in the world-systems perspective as compared to dependency theory. Most obviously, there is the notable divergence by which core and periphery are made to constitute not two different types of national economy but two different parts of a single historical social system. More importantly, to the extent that the core–periphery relation is coequal with a geographic division of labour, it was very quickly found necessary to supplement the conceptual vocabulary of world-systems analysis by introducing the category of the 'semi-periphery' to designate a third possible type of intra-systemic space. In so doing, world-systems thinkers both increased the explanatory power of their perspective and, at least to some observers, introduced a certain level of arbitrariness into it given the catch-all and/or bet-hedging quality of the notion of the 'semi-periphery' (Washbrook 1990, pp. 482–485).

The emphasis on the intra-systemic geographic division of labour and the importance of trade in generating and fuelling the expansion of 'historical capitalism' that it portends have precipitated other criticisms as well, especially from those working in a more traditionally Marxian vein. Robert Brenner's early critique of Wallerstein on these points (as well as various other related ones, including the latter's implicit criterion for defining capitalism) is suggestive of the larger disagreements that remain at play. In stating his original critique, Brenner not surprisingly completed the re-enactment of the earlier and more celebrated Dobb-Sweezy debate within Marxian theory. (According to Brenner, Wallerstein, like Sweezy, is to be designated a 'neo-Smithian Marxist' who displays a basic 'failure to take into account the differential limitations and potentialities imposed by different class structures' internal to a national economy; like Smith they are said to neglect class and class struggle by instead equating 'capitalism with a trade-based division of labour' [1977, p. 38].)

Be this last criticism as it may, world-systems analysis does not shy away from the implication that capitalism historically turned upon a process of 'not only appropriation of the surplus-value by an owner from a laborer, but an appropriation of surplus of the whole world-economy by core areas' (Wallerstein 1974b, p. 401). The process of 'unequal exchange' is thus at the heart of the master division of space into core, semi-periphery, and periphery (and, in the time before the capitalist world-economy reached its global limit, the parts of the world that were 'external' to the system). This leads to a version of the above-stated summary of the system's historical expansion that can be recast in more generalised terms. States at the core of the system are politically and militarily strong, specialising in production involving 'high skill levels' (ibid.) and capable of appropriating the lion's share of the system's surpluses. The result is the 'concentration of capital in core zones' and the further strengthening of their 'state machineries', thereby ensuring that the state machineries of the periphery become or stay weaker (Wallerstein 1995, p. 32). The latter eventuality further accords with the economic role of the peripheral states, which is defined by the fact that they are forced to specialise 'in tasks lower down the hierarchy of commodity chains' atop which the core states sit, such as through the production of raw materials. So is it that states at

the periphery gravitate toward 'using lower-paid work-forces', in the process 'creating (reinforcing) the relevant household structures to permit such work-forces to survive' (32). True to their categorical designation, the states of the semi-periphery inhabit a 'third structural position' that intermediates between the other two (Wallerstein 1974b, p. 403). The semi-periphery carries out this intermediating function both through its middling role within the order of economic exploitation and as its ideological role as part of a 'middle stratum' to which the most exploited areas can aspire, thus preventing the build-up of revolutionary fervour from below (402, 405).

The overall dynamic that links core, semi-periphery, and periphery thus involves a series of political and economic watchwords. These include the processes of the endless accumulation of capital for its own sake; commodity chains that from the system's first growth phase have been geographically expansive; the crucially important role of income-pooling households for suppressing wage rates, especially in the periphery; the emergence of an inter-state order consisting of strong, weak, and intermediate states; and the major cleavages of ethnicity, race, nation, class, and gender that run through the 'geoculture' that comprises not so much the superstructure as the 'underside' of the system (Wallerstein 1991, pp. 11–12; 2000, pp. 207–289).

A final key watchword is the 'Kondratiev cycle', a concept that has been crucial for Wallerstein in charting the course of the modern world-system, whether during the earlier phases discussed above, the period starting in 1900 after it reached its full global extent, or the 'age of transition' we are said to have been living through in the wake of the Second World War (Hopkins and Wallerstein 1996). Comprising periods of global economic expansion and contraction that are thought to take place at 45–60-year intervals, Kondratiev cycles bespeak an important long-wave dynamic according to which the modern world-system ebbs and flows. As such, they are (and since being postulated always have been) conceived as being distinct from the shorter-term fluctuations of the ordinary business cycle (9). At the same time, Kondratiev cycles also signify the

debt of world-systems analysts to Marx's preoccupation with capitalism's tendency toward boom and bust crises and, mores proximally, to the loose attempt of their namesake – Soviet economist Nikolai Kondratiev – to restate Marxist crisis theory in formal terms during the 1920s. (It was Joseph Schumpeter, another important influence on Wallerstein, who first popularised Kondratiev's notion of 'long waves' and renamed them 'Kondratiev waves'.) In the political economy of world-systems, Kondratiev cycles are to be distinguished from the 'far longer' hegemonic cycles over the course of which predominant power holders within the modern world-system have tended to persist in controlling its core (9).

For many world-systems analysts – Wallerstein chief among them – the turn of the millennium is seen as finding world society on the downside of both a Kondratiev cycle, that started in 1945, and a hegemonic cycle that started in 1870 once Great Britain began to give way to the US and Germany as the key hegemon at the core of the system. By this view, each such cycle peaked during the late 1960s (9), not coincidentally in and around the time of what is seen to have been the 'world revolution' of 1968 (Wallerstein 1989). Ultimately, therefore, Wallerstein has consistently maintained that the long moment of the present that has assembled around the transition to a new millennium is emblematic of a period characterised not by equilibrium but structural crisis. As such, the present comprises a state of a system (in this case a historical social system) whose secular trends – e.g. toward the commodification of everything – have pushed it too close to its asymptotes to continue 'its normal, regular, slow, upward push'. As a consequence, the structural position of the system now leaves it to 'fluctuate wildly and repeatedly'. In turn, the possibilities that this circumstance allows are said to be only twofold. Ongoing fluctuation will either lead to the 'recreati[on] of order out of chaos or [to] a new stable system' (Wallerstein 2011). The vital normative commitments that undergird a perspective like Wallerstein's should make amply clear which way the future is hoped to lie for most adherents to the political economy of world-systems.

Definition

Born on 25 September 1911 in Port of Spain, Eric
Eustace Williams is remembered as the father
of the Trinidadian nation and as a prominent
historian.

Williams was the first child of Eliza and
Henry Williams, a post office worker, and his
wife Eliza. In 1922, thanks to a scholarship, he
entered Queen's Royal College in Port of
Spain. A brilliant scholar and talented footballer,
Williams earned several scholarships during his
years at the college. Influenced by his teacher the
Caribbean historian and writer C. L. R. James
(1901–1989), the young Williams won the sin-
gle School Certificate Island Scholarship in
1932, and then left for Oxford University to
enrol for a degree in history. After graduating
B.A. in 1935, Williams undertook research in
Caribbean and colonial history, highlighting
the connections between the industrial revolu-
tion in England and the economics of slavery
in the West Indies, and in December 1938 he
was awarded the degree of D.Phil. for his dis-
sertation 'The Economic Aspect of the Abolition
of the British West Indian Slave Trade and
Slavery'.

The Historian: On Slavery, Monopoly, and European Capitalism

After earning his doctorate, from 1939 to 1948
Williams held the position of Associate and then
Assistant Professor in Social and Political Science
at Howard University in Washington, DC, the
highly distinguished black university. There he
worked alongside several prominent African-
American leaders such as the philosopher Alain
Locke, the political scientist Ralph Bunche, and
the economist Abram Lincoln Harris Jr, who had
authored the classic *The Negro as Capitalist* in
1936. Williams enlarged his critical vision of the
relationships between race and class in colonial
and Caribbean history and in 1942 published *The
Negro in the Caribbean,* an economic history of the
Caribbean. In 1944 he was invited in Atlanta to give
lectures on British historiography and the Negro
question. There he challenged W. E. B. DuBois,
whose *The Suppression of the African Slave Trade
to the United States of America, 1638–1870*
(1896) and Black Reconstruction (1935) were
pioneering works in the study of the role of eco-
nomic developing forces in ending slavery.

Also in 1944 a revision of Williams's doctoral
dissertation was published under the title *Capital-
ism and Slavery.* Inspired by C. L. R. James and
his *Black Jacobins*, a study which analysed the
political impact of the French Revolution and the
economic consequences of the Haitian Revolution
on the ending of slavery in the Atlantic world, this
was Williams's most influential book; it was
published in the US 20 years before it appeared
in Great Britain as a result of controversies raised
by Williams's emphasis on economic causes
of abolition, while the British historiography
linked the ending of slavery with humanitarian
campaigns.

In *Capitalism and Slavery*, Williams used very
detailed quantitative data and materials to analyse
the rise of the British economy. He analysed the
slave trade and the production of commodities in
minute detail, examining the usual economic,
social, and political assumptions. Williams
asserted that the use of the labour of enslaved
Africans in the Caribbean was neither the conse-
quence of the inability of native Indians and
European indentured workers to adapt to the

W

working conditions in the plantations, nor the proof that Africans were racially inferior and were naturally fit to tolerate the tropical Caribbean climate. Nonetheless, the so-called racial inferiority of Africans was used as a pretext to justify their enslavement, while their enslavement was rather due to the fact that European capitalism needed the cheapest labour to exploit. In this way, Williams argued, modern capitalism is a world-wide system born from the transatlantic slave trade, and racism is a global ideology born from the economic exploitation of a specific category of humankind. Both capitalism and racism formed a structural element of European domination: 'Slavery in the Caribbean has been too narrowly identified with the Negro. A racial twist has thereby been given to what is basically an economic phenomenon. Slavery was not born of racism: rather, racism was the consequence of slavery' (Williams 1944, p. 7). Beyond slavery, the links between racism and capitalism gave birth to a hierarchy in which African peoples were at the bottom of the economic and social ladder. Williams's book described the roots of economic segregation and the reproduction of racial discrimination in the capitalist closed circuit of Caribbean colonial societies.

Secondly, in his book Williams questioned the roots of the capitalist system which produced wealth in England and poverty in the colonies. He claimed that the slave trade and the massive exploitation of Africans in the Caribbean economic system had generated the economic profits which allowed the rise of industrial capitalism in England. Using data from the Royal African Company, *Capitalism and Slavery* outlines the system by which a ship would sail from a British harbour to the African coast with a cargo including firearms, clothes, food, and manufactured goods. Produced through the labour of English workers, the cargo represented capital which was used to buy or capture the labour of Africans, who were then deported across the Atlantic Ocean. On arrival in the Caribbean, the Africans were sold in exchange for raw materials produced in the Americas. Briefly, the Africans imprisoned in the slave trade were both labour and capital, since as human beings, they were bought and sold by slave owners, and as enslaved workers, they produced sugar, tobacco, cotton, rum, and spices which produced the wealth in the colonies. For his emphasis on the concept of 'trade', his claim that the British abolitionists exaggerated the atrocities of the Middle Passage, and his very rational account of an emotional topic, Williams was both acknowledged and criticised by scholars who thought that using the economic paradigm of the 'trade' to talk about slavery paved the way to the assumption that trade is based on a mutual agreement between two parties, each one benefiting from the transaction. Hence Williams's thesis became also central to the revisionist historiography. Was the exchange of human beings for commodities a trade or a crime? What was the method of acquiring African labour?

Finally, in Williams's account, raw materials were transported from the colonies to England, where they were refined and sold. The slave trade led to the development of local industries (producing and refining wool, cotton, sugar, rum, and metal), to the growth of the British seaports (Liverpool, Bristol), and to the modernisation of the shipping industry. The imperial hegemony of the British navy on the worldwide seas was partly due to the Navigation Act and to the fact that the British were supplying rival European colonies with enslaved Africans. However, according to Darity (1985, p. 702), 'it was not profitability or profits from the slave trade that were essential in Williams's theory, but that the American colonies could not have been developed without slavery. Without the colonies mercantilist development would have been crippled'. This mercantilist development was controlled by British merchants, planters, and ship owners who organised the slave trade, British banks which gave credit facilities, and insurance corporations which took the risk for each triangular expedition. Since the West Indian plantations offered an opportunity for social climbing for many British workers, Williams also revealed the direct or indirect participation of several famous economic and financial British institutions and renowned familial dynasties that had benefited from the slave trade. Williams's thesis inspired much research on the impact of slave trade on both Western industrial capitalism

and African societies. Walter Rodney (1972) and Joseph Inikori (1982) explored the post-colonial consequences of the implication of Western capitalism in the making of slave economies, in the transformation of slavery in colonialism, and, finally, the economic dependency which kept independent African and Caribbean states under Western imperialist control.

Lastly, Williams opposed the myth built around the British philanthropists. On the basis of a critical reading of Adam Smith's *Wealth of Nations* and his notion of the 'invisible hand' of the market, Williams claimed that the British did not abolish the slave trade in 1807 and slavery in 1834 for primarily moral and humanitarian reasons: the British abolition of slavery resulted less from the implementation of modernity brought by the Enlightenment (see Beckles 1997) than from economic and political pressures upon an archaic system of exploitation which had reached its limits regarding the accumulation of capital needed for the heavy industry. Alongside the works of Williams, Rodney, and Inikori, the study of the economic impact of slavery nurtured the political debate on the reparations, that is to say the financial compensation and moral contributions that present-day governments of countries formerly engaged in the slave trade had to pay to the descendants of those who were enslaved. (One aspect of this debate was the evaluation of the number of African victims of the slave trade; see Darity 1985.) Williams also detailed the mechanisms which drove capitalism to introduce the system of slavery on a global scale, then the circumstances leading to the reproduction of the capitalist slave system, and finally the need for capitalism to abolish slavery before modernising production processes in order to create a wider market. In his own words, 'the commercial capitalism of the eighteenth century developed the wealth of Europe by means of slavery and monopoly. But in so doing it helped to create the industrial capitalism of the nineteenth century, which turned round and destroyed the power of commercial capitalism, slavery, and all its works' (Williams 1944, p. 210). After the abolition of slavery reduced the production of sugar, the British imperial preference system of buying sugar from the Caribbean colonies ended in 1846.

As a result, Brazilian and Cuban sugar production increased, and some new sugar markets opened in India and South-East Asia.

Williams's analysis of the conflict between monopoly capital, free trade, laissez-faire, smuggling, and state control influencing the development and abolition of the slave trade echoed Karl Polanyi's *The Great Transformation*, also published in 1944. Williams studied this transformation of the economic system, which showed that in England, the first nation to both abolish slavery and accomplish an industrial revolution, the maritime commercial bourgeoisie and the planters in the colonies together influenced political metropolitan life. Thus, from a very early stage, the Caribbean islands served as a laboratory for capitalism, imperialism, and globalisation (see Darity 1997). As Williams wrote, 'the West Indian islands became the hub of the British Empire, of immense importance to the grandeur and prosperity of England. It was the Negro slaves who made these sugar colonies the most precious colonies ever recorded in the whole annals of imperialism' (1944, p. 52). The importance of the Caribbean increased after the 1776 American declaration of independence, which provoked a reconfiguration of overseas trade: 'the Caribbean ceased to be a British lake when the American colonies won their independence. The center of gravity in the British Empire shifted from the Caribbean Sea to the Indian Ocean, from the West Indies to India' (Williams 1944, p. 123).

The Politician: Anti-Imperialist, Pan-Caribbean, Nationalist

While teaching at Howard, Williams had been recruited as a consultant by the Anglo-American Caribbean Commission, an organisation founded during the Second World War to implement the future policies in the West Indies, which had been through massive social unrest since the period of emancipation and again with the riots in the aftermath of the depression of 1929. In his lectures for the commission, Williams highlighted the backwardness of Caribbean economies impacted by the legacy of monoculture, the economic

W

exploitation of colonies during the Second World War, and the American investments in the post-1945 Caribbean economies. When Williams returned to live in Trinidad in 1948, after 17 years abroad, he was appointed deputy chairman and head of the research branch of the commission. He continued to travel and lectured in Trinidad and throughout the Caribbean, making contacts with trade unions, unemployed youth, academics, and political leaders. His open-air lectures given in Woodford Square, the main central square in Port of Spain, received positive feedback. His papers on the legacy of the sugar monoculture upon the Caribbean economies also inspired some supporters of a federation of the British West Indies based on economic cohesiveness. In the end, his enthusiasm in unveiling the forms of dependency put Williams in opposition to the neo-colonial expectations of the commission.

In January 1956, just after the commission had decided not to renew his contract, Williams entered politics. Gaining popularity in the Trinidadian middle-class and educational sector, he launched a successful petition for a constitutional reform which advocated moving from a unicameral to a bicameral legislature so as to enlarge the number of seats for elected representatives. After the petition was refused by the Colonial Office, Williams helped to form the first modern political party of Trinidad and Tobago, the People's National Movement (PNM), which in September 1956 won 13 seats out of 24. Williams was appointed chief minister and formed a new government; his political victory was reinforced at the 1961 elections with about two-thirds of the vote. Williams became one of the new leaders of the Caribbean, pressing for independence and for a federation of the West Indies to escape from American hegemony. After the Jamaican referendum voted against the federation, Williams changed his political orientation, from a Pan-Caribbean to a nationalist perspective. On 31 August 1962, he achieved independence for Trinidad and Tobago.

Holding the title of prime minister from 1962 until his death in office in 1981, Eric Williams was the father of the Trinidadian nation. His contribution was political and intellectual, national and international. His decision to publish a book, *History of the People of Trinidad and Tobago,* in 1962, the same year in which Trinidad and Tobago achieved independence, revealed his entangled vision of the past and the future. While honouring the legacy from before 1962, the book argues that the story of the new Trinidadian nation should be written from the starting point of independence, and should be inserted into a national narrative.

In 1963, Williams achieved the withdrawal of the US from the naval military base of the Chaguaramas peninsula, which fell under Trinidadian sovereignty. In February and March 1964, he made a tour of 11 African countries including Senegal, Sierra Leone, Ghana, Nigeria, Uganda, Tanzania, Ethiopia, Kenya, and Egypt. He held political discussions with African leaders, gave academic lectures on development in African universities, established diplomatic relations on behalf of the Caribbean countries, and promoted a privileged relationship between Africa and the Caribbean. Along with Fidel Castro, Williams was probably the first Caribbean leader to give a strong support to the decolonising process in Africa, to promote non-alignment and anti-imperialism, and to denounce the similarities in the neo-colonial situations in Africa and the Caribbean. He also tried to introduce African and Caribbean topics into the academic institutions and curricula. Serving as pro-vice chancellor of the University of the West Indies (UWI) from 1963 to 1971, Williams worked towards the implementation of these Pan-African relations through the introduction of Afro-Caribbean studies in African universities and of African studies at the UWI.

Conclusion: Growing Conservative?

Although he was regularly re-elected with popular support, Williams faced criticism on account of his paternal style of leadership. In February 1970, in a racially divided country, he stopped a Black Power revolution in Trinidad by declaring a state of emergency and arresting activists and young officers suspected of plotting against him. From

then onwards, he sided with the conservative Caribbean regimes and strengthened his political control. In the early 1970s, he also took a right-wing turn on economic issues and industrialisation when the oil boom put Trinidad in the sphere of North American interests. Although beneficial to a growing black and Indian middle class and financing some social health and education programmes, the dependency on oil also engendered risks of clientelism and corruption, which would put Trinidad's national economy under the control of the foreign monopolistic corporations. Williams died of a heart attack on 29 March 1981. He left a nation endowed with modern institutions, infrastructures, and a dynamic economy, and his legacy remains influential in the academic and political Caribbean area.

Women's Movements, Indian Anti-colonial Struggle

Elena Borghi
Max Weber Center for Advanced Cultural and Social Studies, University of Erfurt, Erfurt, Germany

Definition

The theme of women's participation in the Indian nationalist movement, though having been debated extensively over the last few decades, still draws historians' attention and calls for continuing revision and rethinking. This chapter explores women's contribution to the Indian nationalist cause.

The themes of nationalist consciousness and the birth of the nation have been major concerns for scholars of Indian history since the end of the British Raj and the attainment of independence by India and Pakistan in 1947. Several historiographical perspectives have investigated these topics over time. The Cambridge school described Indian nationalism as an ideology shaped by elite groups to mobilise the masses

W

around their own narrow needs, which finally bargained successfully with the foreign rulers for power. On the other side, Indian nationalist historians have since the colonial period highlighted the mass, idealistic, and libertarian character of the nationalist movement, depicting it as a struggle aimed at freedom from colonial exploitation. This view has often overshadowed class and caste (not to mention gender) contradictions at work within Indian society, as well as the class perspective of the nationalist movement itself. Class became instead, from the early 1980s, the major analytical tool of the Subaltern Studies project. Research carried forward in this framework rejected a reading of the colonial era through the binary opposition between imperialism and the Indian people, rather focusing on the conflicts between elite groups (indigenous and foreign) and subalterns (Chandra et al. 1989, pp. 13–23).

The gender dimension remained marginal in the work of these schools of thought, until the emergence of feminist studies that have provided gender-conscious accounts of nationalist ideology and the anti-imperialist venture. These works have engaged in a critique of previous narratives, complicating the picture of women's involvement in agitational politics, as well as addressing the effects of Gandhian ideology on women's roles. Aparna Basu, one of the first to deal with such critiques, has hinted at how reassuring the Gandhian message sounded to the male guardians of women, something which led husbands and fathers to allow (or even encourage) the participation of their womenfolk in the movement (Basu 1976, p. 37).

Elaborating further on the nature of Gandhian ideology on women, several other scholars have come to define it as a complex set of discourses with contradictory implications. If, on the one hand, it recognised women's subordination and preached their equality and opportunities for self-realisation, on the other it never stepped out of the safe arena of a traditional, religious, and patriarchal sense of the world. Narrating women as unsexed beings, who embodied faith and 'by nature' could endure sacrifice and suffering (like the mythical Sita), Gandhi claimed that they would play a key part in organised passive

resistance and non-co-operation (Jayawardena 1986, pp. 95–97). At the time of the non-co-operation movement (1920–22) Gandhi urged elite women in public speeches to adhere to the swadeshi programme, boycotting foreign goods and devoting some time a day to spinning, thus acting as role models for the women of the lower strata. (Taneja 2005, p. 53).

While this call did receive a response from some elite women, the size and quality of their participation would increase dramatically only in the following decade, during the civil disobedience campaign. Although Gandhi had refused to include women in the 240-mile march from Ahmedabad to Dandi to manufacture salt that inaugurated the movement in March 1930, soon after it he fully incorporated them in the campaign, putting them in charge of the boycott of foreign cloth and liquor shops. Scholars agree on the fact that women responded to Gandhi's call *en masse*, and many studies have detailed the facts and figures of such participation both at the national and regional level (Kasturi and Mazumdar 1994; Menon 2003; Saxena 1988, pp. 2–10; Thapar-Bjorkert 1998, pp. 583–615), producing in some cases enthusiastic descriptions of these 'hordes of women pouring out of their homes . . . to give proof of their will, courage and forbearance' (Rao 1994, p. 38).

However, the so-called 'myth of participation' has universalised women's involvement in nationalist agitations, projecting it as homogeneous (Pearson 1979, p. 80). Such narrative has overshadowed the variety of experiences of those women, considering them as a collectivity rather than as a sum of individuals grouped according to a number of different criteria. The tendency to describe women participants as a homogeneous group is a legacy of the nationalist movement itself, which – in the attempt to become a mass movement and gain cohesiveness – utilised the category of 'woman' as the undifferentiated label it was in public consciousness, 'the sole universal category which cut through divisions and could mean all things to all persons' (Pearson 1981). Such a tendency has brought some historiographical accounts to overlook divisions of class, caste, origin (urban/rural), level of

education, religion, and age, to name but a few. Equally neglected has often been the distinction between the women belonging to preexisting women's organisations and the less educated women who could not boast previous forms of activism or political awareness.

In fact, under the umbrella-category of 'women' stood a number of different motivations to join nationalist agitations, experiences within the movement, practices, and expectations. Although often overshadowed by the Gandhian movement's popularity, other forms of agitations were present on the Indian public scene, and women joined them, too. During the partition of Bengal, in 1905, middle-class Hindu women joined the boycott campaigns at a time when *Bharat Mata* (Mother India) was a powerful symbol within Bengali nationalist rhetoric. (For an analysis of how the mother's body and the map of India came to overlap within nationalist cartography, see Ramaswamy 2010). Many were also the women and girls who later on, having grown dissatisfied with Gandhian politics, decided to side with the revolutionary movement – what the colonial state, some revolutionaries themselves, and much historiography have termed 'terrorism' (on the revolutionaries' self-definition as 'terrorists' and the lack of any negative connotation, see Ghosh 2006, p. 273). Mostly active in the states of Bengal, Uttar Pradesh, Bihar, and Punjab, the revolutionary movements drew upon socialist and Marxist theories for the construction of their ideologies, were influenced by the Russian and Irish revolutions, and inspired by anti-imperialist as well as anticapitalist feelings, reflecting a wide range of local and transnational activities and philosophies (Maclean and Elam 2013, pp. 113–123).

Among the leaders of the revolutionary movement outside India was a woman, Madame Cama, who settled in Paris from the early 1900s and 'became the focus of Indian revolutionary activity in Europe', influencing a number of young Parsi women in Bombay, from where she came (Jayawardena 1986, pp. 103–104). However, it was only from the late 1920s that women joined revolutionary societies in significant numbers. Although such groups had been active in Bengal

and north India since the early twentieth century, for several years their underground activities had been carried out by small cells of men, who took a vow of chastity and were expected to be unquestionably loyal to their leader. Later on, many newly formed groups were eager to include women among their militants, and treated them as equals to men.

It is indeed in the definition of women's role in the anti-colonial struggle that – according to Geraldine Forbes – lies the difference between the Gandhian movement and the revolutionary societies. While the former envisioned a precise role and specific activities for women within the anti-colonial struggle, the latter believed that women revolutionaries could help the cause not only by playing subsidiary roles, but also by carrying out the same tasks as their male comrades, such as killing, sabotaging, or leading the cells' activities (Forbes 1997, pp. 113–115, 127; see also Chatterji 2001, pp. 39–47).

The two movements, however, had two major traits in common. Firstly, they were similar in the way they represented the activist woman, as both constructed their narrative around the same myth of female sacrifice. As a natural predisposition to endurance and self-sacrifice would make women the best satyagrahis, the same virtue would lead women revolutionaries to offer their own body and life to the nation. Secondly, both movements drew upon mythical and religious discourses to recruit members and explain their activities to the less educated. Gandhi's Sitas were the revolutionaries' Kalis and Shaktis, and each regarded these figures as symbols of the motherland; though projecting very different models of femininity, these images were powerful and very effective in mobilising women (Thapar-Bjorkert 2006, pp. 128–129).

The homogeneity of women participating in the nationalist movement, though, was not threatened only by the presence of different ideological subgroups on the Indian political scene, as even within the same group women made for a very heterogeneous lot. Female participants in the Gandhian movement ranged from the respectable 'few brave women' (Forbes 1997, p. 63) adhering to non-co-operation and the Khilafat movement in

the early 1920s, to Tamil prostitutes (Lakshmi 1984, p. 8); from national leaders like Sarojini Naidu, who had taken part in Congress activities since 1904, to women who set up organisations specifically for the purpose of co-ordinating processions, picketing and spinning activities; from those who had been mobilising for women's rights since the start of the century (and wished to see the social, legal, and political status of their lot improved, after their involvement in and support for nationalist agitations), to those 'who responded to their "dual duty" – to their beloved Gandhi . . . and to their guardians . . . [and who] generally followed men' (Forbes 1997, p. 83).

Yet, women participating in Gandhian agitations were not only those who joined the 'public' activities envisioned for them. Indeed, as highlighted by the work of Suruchi Thapar-Bjorkert and pointed out by Vina Mazumdar and Leela Kasturi one decade earlier, there were a number of women who could not access the world outside their homes, either 'women from the peasantry and the working class . . . or the thousands of housewives – mostly mothers and wives – who provided indirect support by shouldering family responsibilities when their men went to jail or got killed' (Kasturi and Mazumdar 1994: xxvi). Drawing upon oral interviews and women's autobiographies, Thapar-Bjorkert found that the lives of women who did not cross the domestic threshold during nationalist agitations were no less impacted by political changes than those of their more visible sisters. Although some of them were constrained by segregating social customs, 'they were more interested in what they did despite such constraints, and for these women the domestic sphere emerged a site of both contestation and subordination', as well as of political practices. These ranged from taking responsibilities for the family's elders when their husbands were imprisoned, to earning a livelihood, from taking independent decisions about their children, to dealing with food shortages; 'the awareness that they had to survive without inhibiting their husbands' commitment to the nationalist cause – the author concluded – helped in the development of their own political consciousness' (Thapar-Bjorkert 2006, pp. 209–210).

Among the protagonists in female involvement with Gandhian and Congress-led nationalist politics, women belonging to the organised women's movement deserve special attention. Although during the nineteenth century a number of women's groups and associations led by women had emerged in various parts of the subcontinent (mainly in Bengal and Maharashtra), it was only in the early 1900s that women's all-India organisations started to be set up by and for women of the urban elites – the first being the Bharat Stri Mahamandal, founded in 1901 by Saraladevi Chaudhurani. Such first experiment proved short-lived, but a few years later a new association was born which would gain greater recognition. It was 1917 when Irish feminists Margaret Cousins and Dorothy Jinarajadasa, and the British Annie Besant – all closely connected to the Theosophical Society – started the Women's Indian Association (WIA) in Madras, with branches all over India. The WIA welcomed members of both Indian and European origins, and engaged from the beginning in the fields of philanthropy, religion, politics, and education, the latter the area to which the association devoted most of its efforts. In 1918 the WIA started editing its mouthpiece, *Stri Dharma,* a monthly journal featuring contributions in English, Tamil, Telugu and – from the late 1920s – Hindi. International in its character, this publication mirrored the advocacy journals edited by British feminists in the late nineteenth century, and soon became 'a strong voice in the international feminist movement, supporting claims that women shared certain concerns *as women* that transcended all other differences' (Tusan 2003, p. 625). Although *Stri Dharma* and the WIA in general acted within a clearly anti-imperialist framework, their main concern was with international feminist politics: they imagined the women of the world as 'sisters in a great family' (Stri Dharma 1918, p. 2), and believed in gender solidarity as a unifying force.

An international aspiration also lay at the core of another all-India organisation, the National Council of Women in India (NCWI), established in 1925 as the Indian branch of the International Council of Women. Counting among its members women belonging to some of India's wealthiest

industrial and royal families, like Mehribai Tata and the Maharani of Baroda, the Council engaged in philanthropy and other activities that, modelled on those of upper-class British women, would seem 'enlightened' to British officials and policy-makers. Elitist in character, close to the British, and socially conservative, the Council never went beyond petition politics aimed mainly at making India reach the internationally accepted standards for health and welfare – an interest shared also by Indian and British men in power (Forbes 2004, pp. 75–78).

Ten years after the WIA, the third pan-Indian organisation was born. The All-India Women's Conference (AIWC) held its first meeting in Pune in 1927, thanks to the efforts of Margaret Cousins and responding to the call of the director of Public Instruction in Bengal, Mr Oaten, who had urged women to raise a unanimous voice and tell the government what kind of education they deemed suitable for Indian girls. The stated focus of the AIWC was thus on female education, although the Conference at the time did not imagine it as a mass phenomenon, nor as equal to the education received by men. From 1928 the Conference widened its scope to include social issues related to women and girls (like child marriage and *pardā*), a focus that would be extended in the following years to labour, rural reconstruction, textbooks, and indigenous industries (80).

From 1930, when civil disobedience broke out, two of these organisations that consistently contributed to create the Indian women's movement, drawing together the country's most active and engaged women, started to face important changes. While the NCWI, due to its social composition and alliances with the British establishment, never joined the struggle for independence, the WIA and the AIWC were more inclined to get closer to the nationalist movement. The AIWC initially chose to remain apolitical, but by the mid-1930s it could no longer ignore that its work was leading towards two directions, for which different and conflicting strategies needed to be put in place. On the one hand, its work for women's rights and equality required co-operation with the British; on the other, its growing commitment to the welfare of the nation and to Gandhian programme of reconstruction involved work at the grass-roots level. Furthermore, the AIWC found it increasingly difficult to counter critiques such as Nehru's, according to whom the association's programme was superficial and did not enquire into 'root causes' – that is, did not (yet) see women's uplift as part of a wider plan for the nation's uplift. The AIWC's priorities were deemed to change, as Margaret Cousins made clear during her presidential address in 1936, urging her audience to 'work first for political liberty, for liberation from subjection both internal and external, and side by side with that supreme task work for all our already expressed ideals and reforms' (81).

The WIA had stated its anti-imperialist feelings since its inception, but these became even clearer in the 1930s in response to the political events agitating the country, and thanks to the presence of Dr Muthulakshmi Reddy as *Stri Dharma*'s editor. Elected in 1927 as first woman member of the Madras Legislative Council, Reddy resigned in 1930 in protest over Gandhi's arrest, and dedicated herself to the nationalist cause. Slowly but surely, the journal's commitment to Gandhian politics started to grow, while the internationalist agenda of the previous years gradually faded away. 'Western' versus 'indigenous' leadership of the women's movement became an issue, as did 'Indian' versus 'universalised liberal female' subjectivity; along these lines political as well as personal conflicts among women activists started to emerge and the WIA, unable to deal with these concerns, finally closed the journal in 1936. In her analysis of *Stri Dharma,* Tusan concluded that the journal's story 'embodied the fragile relationship between Western and non-Western women during the beginning of the decolonization movement' (Tusan 2003, pp. 630–632, 642), thus ascribing the WIA's putting aside its aspirations to 'global sisterhood' (in favour of nationalist politics) to issues among Indian and European women, rather than among Indian women/feminists and Indian men/nationalists.

Previous studies, on the contrary, insisted upon the nationalist movement's interest in maintaining the patriarchal order, and on the incapability of

women themselves to 'use the occasion to raise issues that affected them as women' (Jayawardena 1986, p. 108). Maria Mies claimed that, while the movement could not but include women in the struggle for tactical reasons, it did not envision change in the social order. Having accepted their limited function, women made for excellent instruments in the struggle, but 'did not work out a strategy for their own liberation struggle for their own interests. By subordinating these goals to the national cause they conformed to the traditional *pativrata* or *sati* ideal of the self-sacrificing woman' (Mies 1980, p. 121). Despite the apparent radicalism of the Gandhian nationalist movement, Vina Mazumdar added, under its surface lay an essential conservatism aimed at maintaining women's roles within the family and society unaltered, or even further emphasising them (Mazumdar 1976, p. 76).

Younger scholars found such readings, concentrated exclusively on the coercive role of patriarchy, culpable for shadowing women's conscious agency. As claimed by Charu Gupta, accounts like Partha Chatterji's, according to whom the women's question was 'resolved' by the nationalists and co-opted to the larger project of national liberation, do not necessarily hold true for every context (Chatterji 1990, 1994). Not only was this not the case in several regions outside Bengal, but the various limitations inscribed in the reform and nationalist movement did not prevent many women from 'carv[ing] out spaces for themselves and pav[ing] ways for social and political activism, both in public and private domains, implicitly and explicitly . . . . Reforms and nationalism did signal new opportunities for women, however limited they proved to be' (Gupta 2010, p. 11; see also Gupta 2005).

Gupta highlighted several ways in which initiatives originally planned to control women were appropriated by women themselves, and transformed into instruments of assertion. In the minds of reformers and early nationalists, for instance, female education was meant to instruct a multitude of wives and mothers who would be up to the expectations of their 'modern' husbands, as well as to those of a nation in need of new generations of nationalist citizens. However,

once educated, women became difficult to control – what they read, and how they made use of their education went beyond their mentors' expectations, making them conscious agents (see Nijhawan 2012). Similarly, debates on issue like *satī, pardā*, infant marriages, and widow remarriage, though being more concerned with granting India a place among the 'modern' nations than with women's actual well-being and rights, had unpredicted outcomes, and women gradually became both the subjects and the objects of social reform (on the Sarda Act and women's involvement in debates around it, see Sinha 2006, pp. 152–196; see also Sinha 2000).

Padma Anagol argued that the historical quest for an understanding of patriarchal mechanisms and their effects on women's lives is an indispensable as much as an essentially incomplete project, for it 'obscures the ways in which women resist patriarchy, construct their identities, assert their rights and contest the hierarchical arrangement of societal relationships between the sexes' (Anagol 2005, p. 7). According to her, the theme of the 'creation and recreation of patriarchy' crossing much feminist historiography has prevented the recovery of women's agency, and of its twin aspects of assertion and resistance (14). The task of recovering women's voice and consciousness can be achieved – Anagol argued in her study on Maharashtra – by turning away from the most investigated regions, like Bengal (from where the image of the passive Indian woman has come), in search of different women's experiences and historical paradigms, as well as by concentrating on sources in the local languages.

Even more substantial for the recovery of women's agency is, according to Anagol, the adoption of a new chronology by historians dealing with the gender and women's history of modern India. The dominant 'imperialism-nationalism' frame of thinking has led scholars to privilege the first four decades of the twentieth century; in such readings, women's participation has often been described as a sudden phenomenon, whose credit is to be given primarily to Gandhi. This tendency has led to the obfuscation of continuities between 'the fiery women

nationalists' of the early twentieth century, and an earlier period of women's assertion, whose legacy women of the next generation must have inherited, or benefited from (Anagol 2008a, p. 606).

The real nature of female involvement in nationalist politics could be better retrieved – as Anagol suggested – if the nineteenth century were treated in its own right as the apex of the colonial period, a time during which India faced important changes at the social, economic, juridical, and educational levels. It is back to the social and religious movements of the nineteenth century, according to this author, that the origins of Indian women's activism can be traced. Several scholars analysed this period of reformist zeal through the prism of post-structuralism, showing that behind the efforts for the amelioration of women's conditions lay the needs and contradictions of the newly formed Hindu middle class. Caught between their desire for modernisation (a necessary step towards self-government) and their wish to project Indian culture as an example of morality (in opposition to Western materialism), nineteenth-century reformers were not as concerned about women's status as they were about nationalism and political power (on *satī* see Mani 1999; on conjugality see Sarkar 2008, 2010).

Anagol instead suggested that, far from being silent 'grounds' on which male actors constructed discourses and enacted laws, women took significant and often radical stands during the social-reform era (Anagol 2008b). Such stands were not about nascent nationalism or imperialism, but rather marked the beginning of women's politicisation and mobilisation for their own cause (Anagol 2008a, p. 621).

Conclusions

The theme of women's participation in the Indian nationalist movement, though having been debated extensively over the last few decades, still draws historians' attention and calls for continuing revision and rethinking. Despite the magnificent efforts of recent gender historiography,

the complex relationship between (the diverse segments of) Indian women and the several wings of the anti-imperialist movement requires further investigation. Women's contribution to the nationalist cause cannot be denied; their efforts in both Gandhian and revolutionary agitations, and in less visible roles as supporters of the males of their families, were essential in securing India's independence. Moreover, women as a category provided the symbolic imagery backing the anti-imperialist organisations, coming to embody various aspects of nationalist theoretical thinking: from an essentialised and pure 'Indianess' in the minds of early nationalists, to non-violence and passive resistance in Gandhian philosophy, to extreme sacrifice in revolutionary rhetoric.

However, many facets – which call into question an analysis of female agency, and require that women be studied as conscious subjects in their own right – still remain vague. Among these aspects are the roots of women's involvement in political life; the relationship of feminist organisations with the leadership of Congress-led movements, and the gains and losses that joining the mainstream movement entailed for such women; the strategic (rather than merely sentimental or patriotic) motivations behind such participation; and the changes that it brought about (or did not) in women's everyday lives, as well as in their self-perception.

Definition

From the formation of the Iraqi modern state by the British in the 1920s, the US-backed overthrow of the revolutionary regime in 1963, the Gulf war, and the sanctions in the 1990s to the US-led invasion and occupation of Iraq in 2003, western imperialist interferences have shaped the social, political, and economic trajectory of Iraq and have impacted and shaped Iraqi women's rights, their political activisms, and their feminisms.

Introduction

From the formation of the Iraqi modern state by the British in the 1920s, the US-backed overthrow of the revolutionary regime in 1963, and the Gulf War and the sanctions in the 1990s to the US-led invasion and occupation of Iraq in 2003, western imperialist interferences have shaped the social, political, and economic trajectory of Iraq. This chapter explores the ways in which these interferences have impacted and shaped women's rights and feminist activisms. Contemporary Iraqi women's social and political activisms and feminisms have been modeled by various experiences of nationhood, by the nature of the different political regimes, and by the existence of social movements (e.g., leftists, nationalists, and Islamists). Feminist movements in the 1950s and 1960s were characterized by two main trends: nationalist and communist. The adoption in 1959 of an openly progressive Personal Status Code, a legal framework through which women's legal rights to marriage, divorce, and inheritance are enacted, resulted from the dominance of the leftist anti-imperialist political culture and the strength of feminist movements at the time. However, the emergence of the US-backed authoritarian Baʿthist regime at the end of the 1960s narrowed women's space for political activism. Since the 1980s, the country has been in a state of constant war and has experienced since 1991 harsh economic sanctions that have deeply affected its social and economic realities as well as state gender politics.

The US-led invasion and occupation of the country in 2003 exacerbated the deterioration of the social fabric of Iraqi society initiated by authoritarianism, wars, and UN economic sanctions. Since then, armed violence and identity-driven conflicts have characterized the everyday lives of Iraqis. Women have paid a very harsh price; the normalization of armed violence and the militarization of public spaces have impacted their everyday realities. The emergence of women's social and political organizations and the re-emergence of previously banned women's groups since the fall of the authoritarian Baʿthist regime have been shaped by the specificities of the post-2003 context. It is a context marked by the institutionalization of ethnosectarianism by the administration of the occupation, an invasion that plunged the country into generalized violence, and provoked the rise of conservative social and political forces that have questioned the very basis of women's legal rights enacted in Personal Status Code. The dismantlement of the Iraqi state by the US-led occupation administration in 2003 resulted in the loss of institutions and services for women and a strong dependency on US, UN, and international funds for women's rights activism. However, and against all odds, women's groups and feminist activists are also part of grassroots, social, and political movements denouncing the ethnosectarian, conservative, and corrupt nature of the post-2003 Iraqi regime.

The Colonial State and the Tribalization of Women

The Iraqi population was heterogeneous in its ethnic (Arab, Kurd, Turkmen, Armenian, etc.), sectarian (Sunni, Shiʿa), and religious (Muslim, Christian, Jews, etc.) composition. The Iraqi state established under the British Mandate (1920–1932), which began as a military occupation in 1917, was a contested and weak state. It was born in the face of popular movements, repressing the constitutionalist movement launched by the Shiʿa *ulemas* (religious scholars and clerics) in the first decade of the twentieth century, the movement against British occupation, and the Kurdish refusal to be incorporated into an Arab state. This Iraqi state relied on the ancient elite of the Ottoman Empire; Sunni Arabs

W

exclusively comprised its leadership, administration, and army. In Baghdad, Sunni Arab religious, political, and economic figures – whether *ulemas*, heads of *tariqas* (such as Abd al-Rahman al-Gillani), Saiyyed related to the tribal leadership (such as 'Abdul Muhsin al-Sa'dun), Ashraf, landowners, or wealthy merchants – generally collaborated with and got involved as per wishes of the British occupying authorities. Although some Iraqi Shiʿa families belonged to the wealthy commercial elite, the urban educated elite was dominated by Sunni Arabs, as they benefited from secondary and higher education under both Ottoman and British rule, unlike the Shiʿas. Christians and Jews were also part of the educated urban elite, as they were favored by the British Empire. The power of the new state was effective only in urban areas; the countryside was managed by tribesmen who, at the time, were more heavily armed than the state army (In 1933, tribes possessed more than 115,000 guns, while the army only had 15,000.).

The Ottoman policy in the nineteenth century was to reduce the power of the tribes by settling the tribes in permanent villages, and playing one tribe against the other, many tribesmen resisted in refusing to register their land. While presumably intending to promote the formation of an integrated nation-state, the governments both under the mandate and under the monarchy (1932–1958) perpetuated tribal relations through tribal and land tenure policies. These policies halted the decline and disintegration of tribal leaders' power, which had been occurring toward the end of the Ottoman period, by providing administrative and fiscal powers, as well as land grants, to selected shaikhs (tribal leaders). Such policies enabled the shaikhs to tax and control those who subsequently became "their" tribesmen; thus British policy contributed to the transformation of a free cultivating peasantry into a population of serfs tied to the land of sharecroppers (Davis 2005; Dodge 2003; Farouk-Sluglett and Sluglett 1991, 1987). Under the monarchy, nation-building relied on traditional status groups – ethnic and religious – and overlooked the growth of the new, modern middle and working classes in the cities. The division in Iraqi society between the urban use of civil law

and the rural, predominantly Shiʿa (In 1900, according to Luizard (1991), 75% of tribes were Shiʿa Arab and 25% Sunni Arab.), use of Tribal Criminal and Civil Disputes Regulation (TCCDR), more commonly called the "tribal law," is the most revealing aspect of this reliance (Efrati 2012).

The nascent state divided Iraqis into "original" and "non-original": Nationality Law No. 42 of 1924, which was enacted in the 1925 constitution, deemed "original" Iraqis to be those registered as Ottoman subjects, mainly the Sunnis and the Kurds. Shiʿas were registered as "Iranian dependency" [*tabaʿiyya*] and hence second-class citizens, because they were not Ottoman subjects prior to the establishment of the Iraqi nation-state due to geographical and political reasons (Some Shiʿas lived in areas far from the central administration, and most wanted to avoid military conscription and excessive taxation. More generally, many Shiʿas did not feel related to a Sunni empire that discriminated against and marginalized them.). The Law for the Election of the Constituent Assembly went even further in defining Iraqis as "every Ottoman subject now residing in Iraq and not claiming foreign citizenship" (Luizard 1991, 2006), imparting that any Sunni, even non-Iraqi, had more rights than Iraqi Shiʿas. Most Shiʿas had to apply for Iraqi citizenship, even when they belonged to well-known and established Arab families.

The Constitution also provided a basis for the election system in Iraq that alienated an important segment of the population; the Electoral Law of 1924 provided a two-tiered electoral system in which primary electors were to nominate secondary electors who were in turn to vote for deputies. Only male taxpayers older than 20 could be primary or secondary electors; only male taxpayers older than 30 could become deputies. Thus, the Electoral Law excluded the lower class, men younger than 30 and women serving in Parliament; the system was made in a way that it was difficult for men of the opposition to be elected, while in contrast tribal leaders were well represented.

The Constitution adopted in 1924 divided Iraqi citizens in three different classes regarding the law

and established three different courts: civil and religious courts in the urban areas and Tribal Criminal and Civil Disputes Regulation (TCCDR) for tribesmen in rural areas. The Constitution divided the religious courts into *shari'a* courts for the Muslims and spiritual councils for other religious communities. It affirmed that *shari'a* courts only were to handle matters of personal status – issues of marriage, divorce, and inheritance, thus related to family and women's right – and in accordance to each sect. Thus, under the mandate women's legal rights were divided according to their religion (Muslim, Christian, Jew, etc.), sect (Sunni, Shi'a), and location (rural, urban).

The legal system of colonial Iraq led to the "tribalization of women" (Efrati 2012; Ismael and Ismael 2007). Women were "tribalized" in the rural areas not only in their construction as tribal, subject to separate "tribal law," but also in the British involvement in determining "tribal law." Even in urban areas, people could involve "tribal motives" when it came to crimes committed in "the name of honor." Two main social groups advocated against the very establishment of the TCCDR: urban intellectuals – Sunnis and Shi'as – depicted it as "backward," unfair to women and halting the modernization of the emerging nation, while tribal shaikhs considered it as a direct threat to their power over tribesmen. Although Ismael and Ismael (2007) described tribal law as "inherently misogynous" and its very existence as detrimental to women, Efrati (2012, pp. 30–50) introduced a more nuanced analysis on the matter. The Tribal Code advocated by many shaikhs during the mandate and monarchy period aiming to reduce the power of the state over the tribes was characterized by a certain leniency and pluralism concerning women's issues. This leniency could be a reflection of the reality in the Iraqi countryside where practices regarding women were dynamic and diverse and not necessarily as harsh to women as it was represented by the British and the urban elite. According to Efrati (2012, p. 35), extramarital relations did not automatically mandate a death sentence; in some places murder for adultery was very exceptional, and there was a diversity of views regarding the way to settle blood disputes in which the handing over women was not the rule. The British refused the Tribal Code proposed by the shaikhs and wanted to set their own tribal law. Thus, tribal law tribalized rural women, not only in her construction as tribal, subject to separate "tribal law," but also British involvement in determining "tribal law," affecting rural women as harsh and uncompromising.

In the urban areas, in addition to being exposed to the possibility of the advocacy of "tribal motives," Muslim women were ruled by *shari'a* courts, divided into Sunni and Shi'a courts. Efrati (2012, p. 80) explored the reasons why both the British and the Iraqi monarchy maintained *shari'a* courts in the cities, despite increasing criticism from urban intellectuals, especially leftist, demanding a civil code similar to the secular Turkish judicial system. Examining the argument developed by Charrad on North African countries, which found that the breadth of the state-tribe relation directly correlated to the liberalness and egalitarianism of the Family Law, Efrati highlighted that the state-mosque relationship was central under the monarchy. Thus, although it is tempting to argue that because the Iraqi ruling elite emerged from the mandate period in close alliance with tribal kin groupings, the state was about to adopt a conservative personal status legislation that protected extended male-centered patrilineage. Nevertheless, as the personal status legislation governed only the urban population, the rest of the population was ruled by the TCCDR; in reality, it was the state-*ulemas* relation that was central to debates around personal status legislation. Preserving *shari'a* courts allowed the influential and respected *ulemas* class, from which the *qadis* were drawn, a share in the country's administration and, thus, ensured their loyalty and support to the ruling elite.

The dominant trend of British politics under the mandate and in the following years of the monarchy was to emphasize on the "different needs" of Iraqi society and establish a differentiated legal system in which citizens were granted different "rights" according to their religious and sectarian belonging as well as to their location and gender. Differences existed among women: Muslim and

Christian women were not granted the same rights regarding personal matters, neither Sunni nor Shiʿa, and the gap was even stronger between rural and urban women. This differentiated system was highly criticized among the intelligentsia, and the emergence of women's organizations will challenge the fragmented and uneven colonial system.

Iraqi Feminisms in the 1940s and 1950s

The major feminist organization, the Iraqi Women's Union (IWU, al-Ittiḥād al-Nisāʾī al-ʿIrāqī), was founded in 1945 right after the Arab Women's Congress in Cairo. The IWU was composed mainly of bourgeois women close to the male nationalist elites. It advocated for women's rights in the constitution, marriage, and work, as well as for the development of girls' and women's education. Simultaneously, women's groups linked to the communist party gathered in the League for the Defense of Women's Rights (LDWR, Rabitat al-Difāʿ ʿan Huqūq al-Marʾa) advocated for social justice, anti-imperialism, and women's rights. All organizations that made up what was commonly called the "women's movement" organized literacy and charity programs, including in rural areas, as well as civil and political rights campaigns.

Thus the women's movement was at the time characterized by two main trends: the nationalist feminists and the communist feminists. Although activists belonging to these two trends also worked together as part of the IWU, the government crackdown against left-wing organizations in 1947 shifted their activism. The IWU yielded under this pressure, removing the representatives of the leftist women's groups from its directorate. While the IWU received support from the government and royal family and remained a relatively small, elitist organization loyal to the Iraqi regime, the LDWR acted underground after failed attempts to obtain government permission. The LDWR was composed of leaders from the lower middle classes and was very much influenced by the radical anti-imperialist Iraqi communist party. Two personalities of the time represent these two trends, sometimes aligned and often in competition: Naziha al-Dulaimi, who remained vocal

regarding the repression of the government toward leftist activists, and Sabiha al-Shaikh Daʾud, who in contrast stayed silent regarding the shift in women's activism (due to governmental pressure).

Naziha al-Dulaimi, in *al-Marʾa al-ʿIrāqiyya* (The Iraqi woman 1952), posed the first and dominant competing narrative on Iraqi women's activism. This book is a short study of the conditions of women's lives in Iraq in the 1940s that uses social class as an analytical framework. Al-Dulaimi was a gynecologist, a prominent figure of the LDWR, the first Iraqi (Arab) female minister, and a prominent communist activist. She considered women in the *al-fallāḥīn* (peasants) class as the most deprived of rights. She depicted the "double servitude" of these peasant women: they were enslaved and exploited both by male domination and tribal rules and also by class oppression. Analyzing women of the landowning, bourgeois, and working classes, al-Dulaimi noted that although the conditions of economic oppression vary, women of all classes are oppressed both by marriage in which they are considered possessions rather than individuals and also by social injustice and imperialism. Using a Marxist and early feminist understanding of justice and equality, al-Dulaimi tackled issues of maternal and child protection, marriage, and even prostitution – a subject on which she does not employ a moralizing analysis of sexuality. Al-Dulaimi also situated *qaḍīyat al-marʾa* (the woman question) as a fundamental part of the struggle for class and national liberation. Feminist activists of the radical left rejected the idea of "gradual modernization" promoted by the pro-British nationalist elite in power; they considered that only a radical political change, a revolution that would get rid of the pro-British regime, could put Iraq on the road to modernization. The focus of communist feminists was on less-privileged women and was characterized by a will to address women's everyday, concrete problems.

Sabiha al-Shaikh Daʾud's landmark *Awwal al-ṭarīq* (The beginning of the road, 1958) represents the second competing trend of feminism in Iraq: nationalist feminism. Her book was published 3 months before the revolution that ended the monarchy and is considered one of the first

feminist books in Iraq. It gives interesting insight into the social, economic, and political realities of women under the British Mandate (1920–1932) and monarchy (1932–1958). Al-Shaikh Daʾud, the first female lawyer in Iraq, belonged to a prominent Sunni family and privileged an Arab nationalist version of Iraqi social and political history; her work overlooks underground, especially communist, women's groups. Nevertheless, her study is the first account detailing the gender dimensions of Iraq's modernization in the decades after the establishment of the Iraqi state and that modernization's social, economic, and political realities at the turn of the First Republic (14 July 1958). Al-Shaikh Daʾud's work brings to light the emergence, among urban, educated Iraqi women, of a growing nationalist awareness that placed women and gender issues at the core of aspirations of modernization and national liberation. It gives fascinating details about how women's rights issues – such as access to education and work, veiling, and legal and political rights – structured the emerging nationalist consciousness and the idea of the "new nation" among the elite.

Al-Shaikh Daʾud and IWU activists were more accommodating of the government's "gradual modernization" discourse, which considered that women needed to progress before they could be granted full citizenship rights. As is made clear in *Awwal al-ṭarīq*, women of the IWU used the rhetoric of the "new woman," active and assertive, and the "modern woman," educated, professional, patriotic, and capable of and willing to build the modern state, to promote the expansion of women's legal and political rights. These activists, from elite families, conducted their struggle in an "orderly manner" through legal and constitutional channels: they asked the government to expand education and health services (Efrati 2008, 2012). In order not to be perceived as "too radical," they insisted they did not want to "compete with men" in positions of power and leadership; rather, they wanted to "address the country's problems" (e.g., poverty, illiteracy), and they presented themselves as "mothers" demanding their right to participate in legislation for their sons and daughters, as a natural extension of their maternal duties – a position that did not threaten the family structure.

However, al-Shaikh Daʾud seems to have been influenced by al-Dulaimi on the condition of the peasant women – she, too, evokes in her book the "double servitude" that characterizes her life. This precise issue can be analyzed through the argument of the hybridization of the different nationalist narratives – pan-Arab and Iraqi – analyzed by Bashkin (2009, pp. 194–228). It means that at this time political activism was neither strictly nationalist (pan-Arab) nor Iraqist (focused on the Iraqi nation-state). This shows that despite their very different ideologies, agendas, and proposed solutions to change the political order of the time, nationalist and communist narratives also shared common imaginaries regarding the relationship between modernity and nationhood: both their ideological discourses situated modernity in the urban space, while rural space was perceived as the space of the non-modern.

In 1954, the government intensified its repression of the opposition, dismantling hundreds of societies and clubs and banning the existence of unions. The IWU had to be re-established as a single society rather than as a federation; it would be called the Women's Union Society (WUS, Jamʿīyat al-Ittiḥād al-Nisāʾī). After this campaign of repression, members of the WUS and the LDWR explicitly criticized the government's gender discourse, which constructed women as noncitizens: tribal law symbolized the absence of state intervention in matters of personal status and women's disenfranchisement. This evolution echoes the radicalization of the intelligentsia of the time, which was dominated by the radical anti-imperialist left rather than by the nationalists. It also prepared the ground for the institution of a legal framework regarding personal matters uniting rural and urban, Sunnis and Shiʿas, the Personal Status Code (PSC), also known as the Family Law.

The Iraqi Personal Status Code and the Postcolonial Question

In 1959, following the revolution of ʿAbd al-Karīm Qāsim, a pro-women PSC was adopted. It relied on both Sunni and Shiʿa jurisprudence. Women's rights activists, including Naziha

al-Dulaimi, participated in its drafting. It represented the political culture of the moment: a new state asserting its power over tribal and religious authorities and favoring a pro-women, cross-sectarian, nationalist approach to citizenship. The PSC or Family Law is the main legal framework governing family life. It is based on Muslim jurisprudence and was adopted by many Muslim-majority states at the time of their independence from European imperial powers. It gathered legislation regarding private matters (e.g., marriage, divorce, child custody, inheritance), effectively most of women's legal rights. Mounira Charrad (2001, 2011) points out that the PSC represents a field of struggle between different social and political groups – the state, the *ulemas*, tribal leaders, and social and political movements, including the women's movement. In Iraq, the adoption of an openly pro-women's rights PSC in 1959 (in the form of Law No. 188) was due not only to the political culture of the revolutionary elite that came to power through Abd al-Karīm Qāsim's (1914–1963) 1959 coup but also to the questioning of the dictates of the *ulemas* and tribal leaders over private matters. Crucially, the adoption of this code marked the beginning of women activists' inclusion in the process of negotiating for their rights.

The 1959 PSC put certain intestate inheritance rights for male and female heirs under the civil code. The civil code is a legal framework that treats men and women equally, thus granted, indirectly, gender equality in certain inheritance cases. Inheritance, one of the most sensitive and sacrosanct issues within both Sunni and Shiʿa *fiqh* (Muslim jurisprudence), along with the severe limitations placed on polygamy and the adoption of 18 as the minimum legal marriage age for both sexes, represented a strong political statement by the new Iraqi Republic, one that directly challenged the power of the *ulemas* in urban areas. As for rural areas, the abolition of tribal law constituted an essential part of the new state's modernization project. Law No. 188 was inspired by different schools of *fiqh* and operated within religious jurisprudence, thus eliminating the differential treatment of Sunnis and Shiʿas and allowing state-trained and appointed judges to rule on

personal matters without consulting the *ulemas*. Thus the new PSC, gathering both Sunni and Shiʿa jurisprudence, provided a legal framework applicable equally to all Muslim Iraqis. This makes Law No. 188 a symbol of the new nation's unity beyond sectarian lines. It also marks the inclusion of women's rights activists' demands through their participation in the legislative process itself – many feminist activists, including Naziha al-Dumaimi participated in the drafting of the PSC (Efrati 2005, 2012). This shows the strong relationship between issues of nationhood and gender in postcolonial Iraq: at a time when the political culture was marked by the anti-imperialist left, sectarian unity and pro-women's rights aspirations were linked. The revolutionary regime aspired to provide, and even more importantly to determine, the rights of its citizens through a gendered definition of nationhood.

In comparison with most Muslim-majority countries, it is crucial to understand the PSC as a field of struggle between newly independent states, political elites, and social and political movements. In the political context of contesting European imperialism, this struggle resulted in the discursive claim of authenticity and of resistance to Western models. During early independence the landed Iraqi nationalist elite attempted to build a strong state that would be the arbitrator of all civil law matters, undermining its direct competitors, tribal leaders, and the *ulemas*. However, in this postcolonial context, marked by the Western/indigenous modern debate in which women were deemed as "bearer of the nation" and through which issues of "cultural authenticity" were played, the field of family and women's legal rights remained the only field submitted to the so-called "authentic" authority of religious jurisprudence. Thus the PSC represented a progressive national symbol for the emerging Iraqi Republic, uniting Sunni and Shiʿa *fiqh* and favoring a balanced interpretation of religious jurisprudence. However, in submitting women's legal rights to *fiqh* rather than to civil law, it limited the possibility of more radical reform of women's legal status. The "authenticity" and "indigeneity" of the emerging "nation" relied on the compliance of women and family issues with "Islam." Women

activists, therefore, were forced to operate in the spaces between state- and nation-building projects. They were, and still are, caught between these separate but entwined projects, which together reinscribed or reproduced patriarchal structures and practices legitimized by a so-called Islam used as symbol of an "authentic" culture.

Women's Rights and Authoritarianism Under the Ba'thist Regime

The Baath coup of 1963 that ended the revolutionary regime of Abd al-Karīm Qāsim's was backed by the CIA (Farouk-Sluglett and Sluglett 1987). PSC reform – specifically the articles related to equal inheritance and polygamy – was one of the measures undertaken by the Ba'th regime after the first coup (Anderson 1963) (These articles of the PSC were reformed as soon as 18 March 1963, right after the fall of the Qasim regime in February 1963.). The inheritance article, which had relied on civil code, was replaced with an article that relied on *shari'a* and privileged Ja'fari jurisprudence. Thus, advancements in inheritance rights were abolished in Iraq in 1963, and no regime has ever reinstated it. The revised article on polygamy, while preserving its limitations, added a clause that allowed for polygamous marriages contracted outside the courts. Thus, the new article legitimized the illegal practice of polygamy. Reforming the PSC's most controversial and symbolic articles was clearly aimed at marking the end of the revolutionary atmosphere. Women activists, especially in the communist ranks, were violently repressed: some were jailed and tortured, and many others had no choice but to flee the country.

Suad Joseph's (1991) research has demonstrated that from the 1970s to the end of the 1980s, centralized Iraqi political power – unified around the authoritarian Ba'th Party and supported by oil revenues – came to impose state authority at every level of society, including at the community and family level. The regime was also the main and often unique provider of income for most of the population as it concentrated all the oil revenues of the rentier state. Until the mid-1980s, the Ba'thist regime subsidized the nuclear family in order to shift tribal, religious, and sectarian allegiances to the state (Joseph 1991; Ismael and Ismael 2000).

In the 1970s, women activists who mobilized for their legal rights, in the very limited political pluralism of the increasingly authoritarian Ba'thist regime, were able to push for reforms that were even more progressive. Their efforts were supported by full employment and the regime's ideological narrative promoting a pro-women secular socialism. Several authors (Farouk-Sluglett 1993; Al-Ali 2007; Ismael and Ismael 2007) indicate that the General Federation of Iraqi Women (GFIW, al-Ittiḥād al-'am li Nisā' al-'Irāq) was central to the implementation of the regime's developmentalist campaign, which placed women at the core of the country's progress. Throughout the 1970s, the party's ideological discourse on women was to "focus on equal rights" and "on rejecting the views that put women in a secondary position," associated to "feudal and tribalism views and mentality" (Sassoon 2012, p. 254). In the 1970s, the Ba'thist regime implemented a series of legislative measures aimed at encouraging women's participation in the labor force and in the general development of the country. The provision of free childcare, equal salaries, and paid maternity leave greatly enhanced women's working conditions. In 1978, the Ba'thist regime reformed the PSC at an unprecedented scale, reinforcing women's rights to divorce and child custody, imposing strict limitations on polygamy, and criminalizing forced and extralegal marriages. More importantly, the language of the PSC was modified and secularized: the religious term *zinā'* (adultery) was replaced with *khiyānazawjiyya* (marital betrayal). The GFIW's social work, reports, publications, and media campaigns, along with Saddam Hussein's numerous declarations of "women's liberation" at GFIW annual meetings, showed women's essential place in the Ba'thist modernization and development project.

However, by the mid-1980s, with the country at war with Iran with the support of its western allies, the women's movement was reduced to the GFIW, which became a mouthpiece of the Ba'th party even when it turned into a more conservative

discourse regarding family and gender issues. As the regime concentrated its budget on the war effort, weakening itself economically, it invited women to return to their houses and give birth to the "future soldiers of the nation" (Efrati 1999; Rohde 2010). Khoury (2013, p. 70) has shown the important steps taken by the GFIW in propagating the government's war narrative in its local branches, providing support to the soldiers' families, encouraging women to participate in the war effort, training nurses, and even collecting women's gold and jewelry "donations," as well as conducting surveillance and reporting dissent. The GFIW's local branches were the organ through which martyrs' families addressed their requests for compensation and their complaints. The GFIW played a crucial mediating role between the cultural, social, and security components of the Baʿth Party's local work. Its role transformed from serving a developmental and social agenda in the 1970s to one intimately bound up with managing the war's social and political repercussions. Its role in the following decade would prove no less central.

The Gulf War and the Invisible War

The US-led coalition's 6-week bombing campaign in January–February 1991 destroyed the functionality of the Iraqi economy and state. A UN special report from March 1991 indicated that after the bombing campaign, Iraq moved from a modern, highly urbanized, and mechanized economy to a pre-industrial one (Ahtissaari, M, "Report to the Secretary-General on Humanitarian Needs in Kuwait and Iraq in the Immediate Post-Crisis Environment", New York, UN Report no. S122366, March 1991). The US government launched what Joy Gordon called an "invisible war" (2010) in pressuring the UN to adopt harsh economic sanctions on the country. The UN's imposition of drastic economic sanctions perpetuated the war's destruction of state infrastructure. Hardest hit were the sectors on which women relied: the public services and social, education, and health systems. The regime in Baghdad responded by imposing austerity measures: it reduced the number of government employees, demobilized thousands of military and civilian personnel, and curbed women's work in the public sector. It pushed the population into a "survival economy" as people were forced to work several jobs, selling personal belongings and sewing their own clothes (Al-Jawaheri 2008). The dismantling of the education system, public sector, and state services impacted women's everyday lives. The effects were especially felt by female teachers and public employees, who saw their salaries plummet to such a degree that they could not even afford to pay for weekly transport (Al-Jawaheri 2008; Ali 2018). Women could not work alternative jobs; men, on the other hand, could work as engineers in the morning and as a taxi driver or shopkeepers in the afternoon. This limited women's financial contributions to the household and pushed many into domestic life. More generally, women bore the burden of household survival, as many men were involved in the military. Many women found alternative, informal ways to provide for their family's basic necessities, selling ready-made meals, personal objects, and homemade sweets, giving tutorials for teachers, nursing, or cleaning (Ismael and Ismael 2008).

In the context of extreme poverty, new forms of patriarchy emerged that were marked by conservatism and the idea that women "needed protection" (Al-Ali 2007; Al-Jawaheri 2008; Ali 2018). On the one hand, the regime's Faith Campaign espoused moral propriety of Iraqi women, and, on the other, women were forced to make degrading lifesaving choices. Female and child prostitution became rampant, and young women were forced into marriages with old wealthy men, all practices that the PSC had sought to eradicate. Proportionate to this deterioration, general poverty decimated the marriage rate. Informal unions, ʿurfi marriages, and temporary marriages, filled the gap (Ali 2018). More generally, the spread of corruption and communal and neighborhood relations degenerated into individualistic economic survival and mafia-type racketeering. This period restructured the social and cultural fabric of Iraq, fundamentally altering the values of sociability and morality (Al-Ali 2007; Al-Jawaheri 2008).

The GFIW was again charged with implementing the regime's new "tribo-Islamic" policies. Several of its leaders appeared on television wearing loose headscarfs and using religious references. Saddam Hussein's declarations and the GFIW's publications of this period show that gender rhetoric focused on denouncing the corruption of the Western world, as well as on applying shariʿa and "good Islam," to promote women's rights. Qurʾanic lessons were organized in Baʿth Party-affiliated organizations, and the GFIW trained women on Islam and the Qurʾan. Nevertheless, according to Rohde (2010), the GFIW kept a remarkably low profile during this period, which reflected the state's general loss of status. In contrast Khoury (2013) shows that despite being weakened by the war and sanctions, the GFIW was central in propagating the regime's propaganda and in managing the concrete impact of the bombings and sanctions, as well as in surveilling dissent and opposition.

Concerning the participation of the GFIW in the military conflicts themselves, Khoury evokes the dominance of women as witnesses and informants and the participation of what Baʿthists called the *mujāhidāt* in the 1991 uprising, who hit anti-regime prisoners with their shoes (2012, pp. 245–267). The role of women as informants, as fighters, as victims, and, most important, as barometers for the morality or immorality of the perpetrators (whether Baʿthists or rebels) became central to all the narratives of the events that emerged in the 1990s. Khoury shows the centrality of the Baʿth Party provincial and national leadership to the collection of information, the planning of responses, and the assessment of damages. The GFIW was involved in the regime's surveillance system – its local members were sent to participate in the celebration of Shiʿi religious rituals in Muharram, perceived by the regime as an expression of Shiʿa opposition and a place of politicization. GFIW spread the regime's "modernist" religious narrative by reminding women participating in these processions that the practices of extreme mourning of al-Hussain were potentially harmful to their and their children's health and that they should not wear the traditional ʿabaya (black robe) as this was a sign of "backwardness" (2013, p. 65).

The 2003 US-Led Invasion and Occupation

The invasion of Iraq by the US-led forces, coupled with the bombing and fighting that occurred between March and May 2003, led to approximately 150,000 civilian deaths. After the establishment of the occupation through the Coalition Provisional Authority (CPA) and the establishment of Iraqi governing councils based on communal quotas, Iraqis' daily lives began to be characterized by violence. The sectarian war and the generalization of violence in the country are the direct result of the invasion and politics undertaken by the occupation administration such as the de-Baʿthication campaign and the institutionalization of a political system based on ethnosectarian quotas. De-Baʿthication decommissioned 400,000 Iraqi soldiers and Baʿth Party members, undermining the state and politically marginalizing the Sunni population. The institutionalization of ethnosectarianism as the basis of the new regime exacerbated ethnic, religious, and sectarian conflicts and provoked political, social, and territorial fragmentation (Dodge 2005; Arato 2009; Ismael and Ismael 2015). The US army's repression of uprisings against the occupation – especially in Fallujah – and the rise of political and party-associated militias benefiting from the power vacuum all took a sectarian shape. The exacerbation of sectarian conflict reached its extreme during the 2006–2007 sectarian war. This civil war and all the associated events represented the second turning point after 1991 in Iraqi sectarian relations and reorganized society and territory according to sectarian lines (Haddad 2010, 2014). Such a fracturing is visible in the division of Baghdad into homogeneously Sunni and Shiʿa neighborhoods, each separated by checkpoints and concrete walls (Damluji 2010; Pieri 2014).

The sectarian dimension of the social retribalization that started under the Baʿthist regime in the 1990s was pushed even further in the chaos that followed the invasion. Several authors (Ismael and Ismael 2008; Al-Ali and Pratt 2009; Ali 2018) demonstrate that sectarian violence is gendered. Most women activists I interviewed, especially public and media figures, had received

W

death threats or been directly targeted by violence, including car bomb attacks in front of their offices or homes. Some had to flee the country, but the majority remains in Baghdad. Some moved into areas controlled by their sect as their neighborhoods were attacked by sectarian militias. Many neighborhoods were controlled by foreign soldiers, especially the US army until 2011, which constituted an important barrier for women who wanted to circulate freely, away from the harassing gaze of foreign armed men. In addition to the overall insecurity, which led to the deaths of many Iraqi women activists, most women interviewed noticed how the rise of conservative gender norms impacted their dress and ability to move freely in specific neighborhoods of Baghdad.

Today, many areas of the capital (and of the country) are controlled by militias and armed groups backed by conservative, sectarian Islamist political groups, and many women have witnessed or experienced incidents regarding clothes or behavior when crossing checkpoints. Incidents such as the closing of hair salons or car bomb attacks to forbid women from driving have been reported (Ali 2018). More generally, an overwhelming sense of tension has been created by the violence and the dominance of competing armed militias in the streets. It was expressed repeatedly: "Before we had one Saddam; today we have a Saddam at every street corner" (Ali 2018). Moreover, ethnographic research shows that the militarization of Iraqi public spaces has turned Baghdad into a "city of men": checkpoints, walls, and soldiers in the streets everywhere (Ali 2018). Many places are now inaccessible for women, and places such as cafés, once the pride of riverside Baghdad, are forbidden for women after 5 p.m., even in neighborhoods known for their openness. In 2007, over half the Iraqi population lived on less than 1 dollar a day. Acute malnutrition has more than doubled since 2003, affecting 43% of all children between the ages of 6 months and 5 years. Almost 50% of all households have been deprived of healthy sanitation facilities. There is a critical lack of medical drugs and equipment, and more than 15,000 doctors have been killed or kidnapped or have fled the

country. Even in Baghdad, the state provides a maximum of 5 h of electricity per day (Dawisha 2009). In addition, the lack of control and stability since 2003, as well as the privatization and liberalization of the economy, has provoked a drastic increase in the price of staple goods and basic necessities. As a result, the majority of Iraqis are poor even though they live in an oil-rich country. No major plans or policies have been undertaken by the new regime to deal with these issues. The new state's weakness and its inability to provide security and respond to basic needs (e.g., access to running water, electricity, housing, and employment), its mismanagement, and its corruption have pushed Iraqis to rely on alternative sources of protection and service. Women are the first target of the humanitarian and social crisis that started in the 1990s with the sanctions and has continued since 2003. Since the 1970s Iraqi women have been employed mainly in governmental jobs and in the public system and rely heavily on childcare, healthcare, and education support. Thus the destruction of functioning state services and institutions in 2003 impacted heavily on their everyday lives.

Fragmentation of Women's Legal Rights

The US-led invasion and occupation of Iraq in 2003 has exacerbated the social, economic, and political crisis in which the country has been plunged since 1991 and framed it in ethnosectarian lines. In this context marked by the institutionalization of communal – ethnosectarian and ethnoreligious – identities by the US-led administration and the extreme weakening of the state, the PSC has once again taken a central role in debates about issues of nationhood and statehood. The US-led administration put in power ethnosectarian political groups that were at the marge of power under the Ba'th regime, Shi'a Islamist parties, and Kurdish nationalists. In Arab Iraq, the US-led politics through the Coalition Provisional Authority (CPA) marked by the institutionalization of a communal-based political system, a marginalization of the Sunni population alongside with the destruction of the old state's

institutions, in addition to the contestation of the occupation itself by most Iraqis, plunged the country into a sectarian war. The post-2003 context is characterized by an extremely weak state, a largely contested political regime and the very fragmentation of Iraqi nationhood through the institutionalization of the separation of the Kurds and the Arabs, and the Sunni-Shi'a political divide.

While Kurdish nationalists dealt with the PSC on nationalist terms in the separate territory of Iraqi Kurdistan, Shi'a Islamists, driven by the defense of their politico-sectarian identity, pushed for a questioning of the unified PSC on sectarian grounds through different propositions that all introduce the possibility of a sectarian-based PSC: Decree 137 proposed in 2003, Article 41 of the new Iraqi Constitution adopted in 2005 and more recently in 2014 the Ja'fari Law proposition. The latter, based on the Ja'fari school – main Shi'a religious school in Iraq – could allow the marriage of girls since the age of 9 years considered by the Ja'afari school as *sin al-balagha* (the age of maturity) and allow precarious forms of marriages in which women and girls loose legal protection. Activists of the Iraqi Women Network (IWN), the main independent women's rights platform in Iraq since 2003 and the Organization of Women's Freedom in Iraq (OWFI), were firmly opposed to all these measures, defending the Law No. 188 for its inclusion of all Muslim Iraqis. According to IWN activists, Decree 137, Article 41, and the Ja'fari Law proposition brought the very notion of the comparatively progressive and unifying PSC into question on both religious and sectarian grounds. In turn, many civil society activists expressed fears over both the adoption of a system based on a regressive and conservative reading of Muslim jurisprudence and the sectarianization of women and family issues.

Significantly, Sunni Islamists also opposed these propositions, siding instead with the preservation of a unified code that facilitates intercommunal marriage. Conversely, many Shi'a Islamist activists supported the Ja'fari Law, considering it to be an affirmation of the freedom to practice Shi'a Islam after decades of repression under the Ba'th regime. According to a survey conducted by a women's organization in southern Iraq which confirmed my own research, even the majority of the Shi'a population (70%) considered Article 41 to threaten the unity of Iraq (Bint al-Rafidain/UNIFEM 2006). Most Shi'a clerics also opposed the Ja'fari Law, for example, Hussein al-Sadr – a prominent Shi'a cleric – stated that it was better for the state to adopt civil legislation in line with international conventions and leave issues of shari'a to the clerics: "We want Iraq to be a civilian [madani] and civilized [mutahadhar] state" (Al-hewar al-mutamaden, 2 March 2014). The fact that most of the Shi'a population and clerics also oppose the sectarianization of the PSC shows how much this issue does not divide Sunnis and Shi'as on strictly religious-sectarian lines but rather on political-sectarian lines. Shi'a Islamists who are in power push for a sectarianization of the PSC which is synonymous for them of more power, while Sunni Islamists who are on the marge of power defend a unified PSC.

Protest Movements

Alongside mobilizations around women's legal rights, women civil society activists were at the forefront of the struggle for welfare and social protection laws, against corruption, advocating freedom of expression, criticizing governmental salaries and "institutionalized corruption." Most of the independent women civil society activists I met participated in the Civil Initiative to Preserve the Constitution, which was launched in 2010 to apply pressure on the government, as well as mobilizations denouncing armed violence, sectarianism, and state incompetence in providing basic public services. The IWN took a strong stand with regard to Iraq's independence from foreign interference; it supported federalism and denounced human rights abuses in Iraq (Ali 2018). Activists also raised the issue of the disappeared and prisoners of the anti-terrorism campaign, who are still detained without judgment, as well as the police and security forces' use of violence (Ali 2018).

As pointed out by Zaid al-Ali (2014, pp. 125–60) and in line with my own observations (Ali 2016,

W

2017), under Nūrī al-Mālikī's first term (2006–2010), there was no mass protest in Iraq as the population was plunged into a sectarian war; opposition to the new political system was an armed opposition. During his second term (2010–2014), the wave of Arab uprisings reached Iraq and protests started; 25 February 2011 was called the Day of Rage. Thousands took to the streets despite the fact that Baghdad was declared a "no-drive zone." The security forces killed 20 demonstrators, but a hundred-day deadline was set due to the pressure of the Sadrists, one of the main Shiʿa Islamist political groups in the country, and the demonstrators. More recently, in the context of the invasion by the Islamic State Organization (IS) of Mosul in June 2014, ordinary citizens, civil society, and women's rights activists launched a strong grassroots movement on 31 July 2015 (Ali 2016, 2017). From Basra to Baghdad's Tahrir Square, this movement has expressed citizens' general exasperation at the corruption and mismanagement of the post-2003 government, corruption, and mismanagement epitomized by electricity cuts and a lack of public services. These protests quickly turned into a massive popular movement – supported by the prominent religious figure Ayatollah Sistani – vilifying Iraq's post-invasion regime and demanding radical reforms. Every Friday henceforth, demonstrators have gathered in the main public squares of Iraq's big cities, including Najaf, Nasiriya, and Basra, and echoed the slogans of the protestors in central Baghdad: "Bi-ism il-din baguna al-haramiyya" ("in the name of religion, we have been robbed by looters") and "Khubz, Huriyya, Dawla Medeniyya" ("Bread, Freedom, and a Civil State"). Demonstrators consider the new regime's corruption and sectarian politics as directly responsible for the formation and spread of IS.

The Shiʿa Islamist Sadrist movement joined the protest that started in the summer of 2015, if many civil society and women's rights activists such as OWFI's activists were critical of the involvement and hijacking of the popular movement by the Sadrists, others were far more nuanced. Hanaa Edwar, head of the Al-Amel organization and a prominent figure of the IWN, was very hopeful regarding the popular protests. She expressed positive views on the development of the protest

movement the day she visited the sit-ins with a delegation of IWN activists on 22 March 2016. Despite remaining critical of the Sadrists' populism and conservatism, especially regarding gender matters, Edwar expressed her support for the protesters and a positive view of the Sadrists' involvement. She believes that Moqtada al-Sadr's presence pushed the Sadrists' wide grassroots proletarian base onto the streets in a show of united nationhood and citizenship, especially at a stage when after weeks of mobilizations, some protesters, tired of being in the streets every Friday, were starting to go home. Many women's rights activists who participated actively in this movement of protest emphasized the importance of linking gender equality advocacy with the struggles for religious and class equality. The IWN activists insisted on the preservation of equal citizenship for Iraqis from all ethnic and religious backgrounds as a cornerstone for the preservation of women's legal rights. On 12 February 2017, pro-government thugs carrying sticks and knives attacked protesters during a demonstration organized by civil society groups that were gathered around Taḥāluf al-Iṣlāḥiyyūn (the Coalition of the Reformers). The attack resulted in the deaths of ten people, including one policeman, and hundreds of wounded. In addition to calling for the abolition of the ethnosectarian quota system and the denunciation of corruption, the demonstrators called for the Electoral Law to be reformed to include nonsectarian, small, and secular parties.

Conclusion

Past colonial legacies have met present ones: when the British invaded Iraq in the 1917, they put a conservative elite in power and put in place a system excluding the majority of the population, the US-led invasion and occupation of 2003 did the same which resulted in the questioning of the basis of women's legal rights on ethnosectarian lines. The US-led administration's destruction of the state as a unifying entity and social and economic provider has deeply impacted the social and economic lives of Iraqis. The new regime's

endemic corruption and use of violence to repress the opposition have exacerbated sectarian and political violence. As a result, women activists work in a context where the state is weak, dysfunctional, corrupt, and repressive. The state's structural ethnosectarian functioning and corruption have made it incapable of providing basic rights for its citizens – such as security and access to basic services (water, electricity, healthcare) – or of implementing a state of law. The overall climate of insecurity and political crisis, along with the competing powers of conservative militias on the streets and conservative parties in power, impact women's everyday lives and shape the limits and possibilities for women's rights advocacy.

Whether involved in women's groups or social and humanitarian organizations, women's initiatives and campaigns cover a wide range of activities that substitute the state's (lack of) welfare, educational, and social functions. However, the dysfunctional, ethnosectarian, and corrupt post-2003 state has forced women's political activists to rely on foreign funds. As a result, NGO and UN programs have shaped their agendas and discourse according to human rights notions of women's "empowerment" and "agency." Iraqi women are caught between, in Deniz Kandiyoti's words, "the hammer and the anvil": "They have to fight both for their formal *de jure* rights that are under constant threat from conservative social forces and for their substantive rights to security and human dignity that have become the casualties of endemic lawlessness and impunity in their societies" (2007).

Against all odds, independent women's groups and personalities have managed to develop their grassroots work and to participate in massive nonsectarian civil society mobilizations that have pressured the Iraqi government to implement welfare and social support and fight corruption. The work of independent women's groups and networks, in line with growing opposition to the new regime through the popular movement of protests, questions the ethnosectarian and corrupt post-2003 political system. This involvement of women activists in the movement of protest is noticeable in a context in which the Iraqi government is using the "war on terror" narrative to violently repress any kind of radical grassroots political activism.

Definition

Giovanni Arrighi (1937–2009) was one of the world's leading theorists of world capitalism, imperialism, and anti-systemic movements. With Immanuel Wallerstein and Terence Hopkins, he played a major role in the development of world-systems analysis, with its fecund synthesis of Marxism, Third- World radicalism, and critical social science, from *Annales* to the German historical school. World-systems analysis focused on the emergence of the capitalist world-economy structured into a tripartite zonal hierarchy divided into: rich and powerful core states; poor and weak peripheral states; and states of intermediate power and wealth in the semi-peripheral zone. From his early work on Southern Africa, to his iconoclastic *Geometry of Imperialism: The Limits of Hobson's Paradigm* (1983), to his trilogy on capitalism and world hegemony seen over the *longue durée*, Arrighi established himself as one of the most original and brilliant thinkers of the 20th and 21st centuries. This essay examines his life and work.

Giovanni Arrighi (1937–2009) was one of the world's leading theorists of world capitalism,

imperialism, and anti-systemic movements. With Immanuel Wallerstein and Terence Hopkins, he played a major role in the development of world-systems analysis, with its fecund synthesis of Marxism, Third-World radicalism, and critical social science, from Annales to the German historical school. World-systems analysis focused on the emergence of the capitalist world-economy structured into a tripartite zonal hierarchy divided into: rich and powerful core states; poor and weak peripheral states; and states of intermediate power and wealth in the semi-peripheral zone. From his early work on Southern Africa, to his iconoclastic *Geometry of Imperialism: The Limits of Hobson's Paradigm* (1983), to his trilogy on capitalism and world hegemony seen over the *longue durée,* including his magisterial *The Long Twentieth Century: Money, Power and the Origins of Our Times* (1994), *Chaos and Governance in the Modern World-System* (1999, with Beverly Silver) and *Adam Smith in Beijing: Lineages of a New Asian Age* (2007), and a series of pathbreaking essays (including 'Marxist Century, American Century: The Making and Remaking of the World Labour Movement' (1990), 'World Income Inequalities and the Future of Socialism' (1991), and a host of others), Arrighi established himself as one of the most original and brilliant thinkers of the 20th and 21st centuries.

Born in 1937 in Milan, Giovanni's political and scholarly interests were shaped by the common anti-fascist sentiments of his family, as during the Second World War northern Italy was occupied by the Nazis, followed by the development of the anti-fascist resistance and arrival of the Allies. Trained as a neo-classical economist and working at a host of different-sized business enterprises, Arrighi next took a teaching position in then Rhodesia. Here, in Africa, like many other world-system scholars, Arrighi developed his scholarly trajectory, mapping out the inequalities of the global system, following in the footsteps of Immanuel Wallerstein and Walter Rodney, both of whom he met in Africa, and their forerunners such as Oliver Cox, W.E.B. DuBois and C.L.R. James. During his time in Rhodesia, Arrighi met the African of Indian descent Bhasker Vashee, who

W

later served as long-time director of the Transnational Institute, an international fellowship of committed scholar-activists, headed earlier by the legendary anti-imperialist activist Eqbal Ahmad and Orlando Letelier, former adviser in Allende's socialist government in Chile and later murdered in a car bomb in Washington, D.C. by Pinochet's secret police. Arrighi and Vashee were in fact jailed together for their anti-colonial activities, with Giovanni deported after a week and Bhasker only released from solitary confinement after a year-long campaign. By 1966, Giovanni had gone on to Dar es Salaam, then home to many of Africa's national liberation movements, where he met Wallerstein, Rodney, John Saul and many others.

One of Arrighi's earliest essays, 'Labour Supplies in Historical Perspective: A Study of the Proletarianization of the African Peasantry in Rhodesia', included in his *Essays on the Political Economy of Africa* (1973, with John Saul), helped make his career. The essay was a brilliant analysis of the dispossession of the African peasantry in the age of imperialism. Here, along with the work of Saul, Martin Legassick and others, Arrighi helped develop a distinctive South Africa paradigm analysing the contradictions of this process for capitalist development in the region. Subsequently, Arrighi returned to Italy to teach, helping to found Gruppo Gramsci, before moving on to the centre of world-systems analysis in the US, SUNY Binghamton, and then later to Johns Hopkins, where he taught until his death in 2009.

One of Arrighi's most important but neglected works is his *Geometry of Imperialism.* Among the problems Arrighi identified here was that the term had come to be applied to everything and anything, thus weakening its conceptual usefulness. Indeed, Arrighi relates how, during an important seminar at Oxford on the subject in 1969–70 (a turning point in the debate on imperialism, according to Michael Barrat Brown), he presented a paper on the question, noting that its characteristics after the Second World War were radically different to those analysed by Hobson and Lenin.

> During the discussion, someone asked me whether I did not think that, by dint of filling 'old bottles' (the theory of imperialism) with 'new wine' (the

> novel content being lent to the theory) we would end up no longer knowing what was being discussed. (1983)

Lenin, in his work, noted that imperialism and colonialism were not synonymous with capitalism, going back as they did to Rome, and instead placed his emphasis on the central role of finance and/or monopoly capital. Moreover, Lenin specifically outlined the phenomenon of uneven development, which, he argued, following Hobson, was then leading to a global conflagration between imperialist states in the world capitalist system. This, argued Arrighi, was a quite accurate designation of the situation before the First and Second World Wars, but was largely irrelevant thereafter, as might have been expected from Lenin's own remarks on the subject. In applying the term 'imperialism' to quite different phenomena, it became what one analyst called 'A Tower of Babel'. In an analysis that was subsequently incorporated into his later work, Arrighi noted that Lenin tended to conflate two definitions of finance capital. The first was Hobson's, designating as it did a supranational entity with few if any links to productive activity; this resulted from class struggle, and led to income inequalities and the concomitant tendency towards underconsumption, his 'tap-root' of imperialism, as in England. The second definition was Hilferding's emphasis on the linkage between nations and their monopoly firms. These two designations more or less accurately captured the situation of England and Germany.

Hobson, first in his *The War in South Africa* (1900) and then later in *Imperialism* (1965), used the term to designate the process whereby nationalism, at least among the Great Powers, became subject to a general tendency by states to expand beyond their own borders. This was to be distinguished from colonialism of earlier periods, whereby population transfers became the basis for the effective expansion of a nationality, or new nations, as in the Americas or Australia. In the era of imperialism, the process tended to generate nationalisms of their own, replete with exclusivism and xenophobia, as with South Africa's white Afrikaners. Hobson contrasted this, too, with variants of internationalism, informal orders

of trade and investment based on peaceful exchange, which Arrighi refers to as 'Informal Empire' as opposed to formal territorial ones, based on economic inter-dependence in the former and replete with politico-military competition in the latter. Of course, as Arrighi outlined in his chapter on English imperialism, Britain combined both informal and formal territorial empires, with India the centre of the latter (hence the term 'Free Trade Imperialism') while the US tended towards Informal Empire based not on free trade but on free enterprise via the multinational corporation.

Clarified further here is Hobson's conception of finance capital, as speculative monetary flows going towards the great financial houses, or high finance, 'who use stocks and shares not so much as investments to yield them interest, but as material for speculation in the money market' (quoted in Arrighi 1983: 116). Hobson referred to these financial houses as the 'governor of the imperial engine', able to manipulate the life of nations. In Hobson's view, then, high finance presents two main characteristics. In the first place, it is:

> a *supranational* entity laying outside the place defined by the expansion of a nationstate. Secondly, while not belonging to this plane, it nevertheless influences it in a critical manner. *For in so far as it is a speculative intermediary* on *the monetary market,* high finance tends to transform the excess liquidity present on the market into demand for new investment opportunities, that is, principally for state loans and territorial expansion. (Arrighi 1983: 117)

This contrasts, too, of course, to a substantial extent, with Polanyi's conception of financial capital in his *The Great Transformation* (1957), as Arrighi points out. This goes back to a contradiction at the heart of high finance itself, needing the state for expansion and protection, but at times vulnerable to escalating inter-state competition, especially as this reversed the very tendency towards under-consumption to which it ostensibly owed its existence, presaging the triumph of commodity capital over money capital. Here, too, one can see the distinct types of supranational tendencies and variants of imperialism: the nation state and industrial and commodity capital, in Germany, contrasting sharply as it did with US hegemony and the supranational expansion of its

multinational corporations, especially after the Second World War. In his afterword, Arrighi arrived at an understanding that his work had become perhaps more useful, less as an analysis of imperialism than as a preface to a theory of world hegemony, with each expressing 'a different type of supra/transnationality of capital', with differing trajectories. To be sure, Hobson often referred to related aspects of imperialism, notably the public subsidy of private profit that went with its territorial ambitions, something that has been underscored in the context of US power by Noam Chomsky and others. Yet Arrighi, by focusing on the specific historical situation that Hobson and Lenin were analysing, tried to focus in on the analysis and specific object of the debates on imperialism overall during this period, in contrast to the conditions obtained after the Second World War. So while those related phenomena as Hobson and others underscored undoubtedly continue, including of course the use of violence to achieve politico-economic objectives abroad, Arrighi underscored the extent to which, despite US counter-revolutionary policies worldwide, US hegemony was associated with formal decolonisation of the vast majority of the globe.

Arrighi's most ambitious work, *The Long Twentieth Century* (1994; 2010), is widely considered by many the most compelling single volume account of capitalism over the *longue* durée. Drawing on Marx, Gramsci, Polanyi, and Braudel, he argues that capitalism has unfolded over a series of long centuries, within which hegemonic powers led systemic cycles of accumulation presiding over material and then financial expansions of the capitalist world-system. Here, Systemic cycles of accumulation brought together a hegemonic bloc of business and governmental organisations from the Italian city-states where capitalism emerged, wherein the capitalist city-state of Genoa allied with imperial Spain, the resulting transformation producing the successive three hegemonies of historical capitalism: the United Provinces, Britain, and the United States. What was distinctive here was the emergence of a capitalist logic of power, where the pursuit of money and profit was either more important than territory per se, or they cross-fertilised each other,

as in the example of imperial Britain. As opposed to the ideology of the competitive free market, the basis for the book is Braudel's conceptualisation of capitalism as the top level of world trade and finance, closely in league with violence and state power, where the law of the jungle operates and the great predators roam, guided by the principle of monopoly, where the great profits of capitalism have always been made.

This analysis is in line with Arrighi's emphasis on the centrality of Schumpeterian innovations and concomitant rents and monopolies in profits and related competitive pressures which, as part of recurrent bouts of inter-state and inter-enterprise competition, shaped and moulded the capitalist world-system as it evolved to global scale and scope, divided as it is between relational zones of unequal power and wealth, into the core rich states, the poor peripheral zones, and an intermediate semi-peripheral zone of medium level wealth. While all world-systems analysts agree on the reproduction of inequality in the capitalist world-economy, however, there is less agreement as to its causality. Here, Arrighi has underscored the centrality of unilateral transfers of capital and labour, both forced and voluntary, from the African slave trade to white-settler colonialism and related investment from Britain and elsewhere, in the great leap forward in wealth and power of that geopolitical designation today known as the West, underscoring of course, here, the entwined processes of race, ethnicity, and class formation in the global system. Furthermore, as conceptualised here, the capitalist world-economy is based on the reproduction of oligarchic wealth, presupposing the exploitation, exclusion, and ecological appropriation and despoliation of the great majority of humanity and their natural resources as outlined for example in Alfred Crosby's (2004) *Ecological Imperialism: The Biological Expansion of Europe, 900–1900.* While transformations in the structure are possible, as seen in the rise and fall of hegemonic and great powers, and rises or declines in wealth, underscored here is the structure of inequality. At the same time, as Arrighi argues, over time there have been substantial transformations in the social foundations of the three hegemonies of historical capitalism.

The publication of *Adam Smith in Beijing: Lineages of the Twenty-First Century* (2007) represented the culmination of what Arrighi called an unplanned trilogy on historical capitalism and the origins of our times, begun with *The Long Twentieth Century* (2010/1994) and continued with *Chaos and Governance in the Modern World System* (1999). The central idea behind the book was twofold: first, to analyse the shift in the epicentre of the capitalist world-economy from North America to East Asia in the context of Adam Smith's theory of economic growth and development; and second, to interpret Smith's masterpiece *The Wealth of Nations* (1776) in light of this very shift.

The book begins, like the *Long Twentieth Century* before it, with quotations from Smith on the discovery of the Americas and Smith's emphasis on the 'superiority of force' in determining the outcomes of market exchanges, not unlike similar observations by Fernand Braudel's comments on Europe as that monstrous shaper of world history. Part I, 'Adam Smith and the New Asian Age', analyses what Kenneth Pomeranz refers to as the 'Great Divergence' between East and West, with the rise of Western Europe and its settler offshoots in the Americans, notably North America, and the decline of Chinese-led East Asia. Drawing on Smith and Kaoru Sugihara, Arrighi contrasts what, on the one hand, he calls a Smithian, natural-path, Chinese-led East Asia path of both extensive and industrious development, with pronounced investments in labour-intensive, labour-absorbing, energy-saving production and based on market exchanges; with, on the other hand, the unnatural capital and energy-intensive path, based on labour-saving technology and replete with an industrial revolution and a correspondingly close relationship between state and capital. Of course, this conceptualisation of the rise of Chinese-led East Asia as a market-based social system, rather than capitalist, is a subject of fierce controversy and debate, with many arguing against Arrighi for the capitalism-based nature of Chinese development in the world-system today.

The resurgence of Chinese-led East Asia today is seen as a result of a fusion between these two paths, though with a clear understanding that

given the ecological limits inherent in Western processes of industrialisation, some more ecologically friendly form of development will be necessary if East Asia's continued rise is to open up a more sustainable path of development for the global system as a whole. What is particularly distinctive here in the Chinese-led East Asian model is not that there are no capitalists in these developments, but that they have no capacity to dictate to the state their own class interests as opposed to the general interest. In the Western capitalist path, in contrast, to varying degrees, as Marx and Engels noted, the power of the capitalist class turns the state into the executive committee for managing the common affairs of the bourgeoisie. Two critical aspects of the capitalist path of Western development were the inter-state competition for mobile capital that allowed capitalists to dictate to the states the conditions under which they would assist them to power, and the related arms race that created a virtuous circle for capitalist development in the West and a vicious circle for most of the non-Western victims of white-settler imperialism and colonialism across the globe.

Part II, 'Tracking Global Turbulence', examines Robert Brenner's varying accounts of the crisis of capitalist development beginning in the 1970s, but also compares the present downturn with that of the late nineteenth century, notably the Great Depression of 1873–96. Central to the analysis is the way in which the downturn of the late nineteenth century heralded the classic age of imperialism, as inter-enterprise competition turned into inter-state competition for overseas territories and markets, leading to the generalised conflagration that was the First and Second World Wars. As Brenner argues, in an analysis that was first laid out theoretically by Adam Smith, increased inter-capitalist competition played a central role in declining profits, in what Arrighi sees as a crisis of the overaccumulation of money or finance capital which cannot be profitably reinvested, going instead to varying degrees into state loans for overseas territorial expansion, or military spending.

A central difference, then, and one crucial to Arrighi's analysis of the contrast between late 19th- and early twentieth-century imperialism and similar phenomena today was the US reconstruction of the global capitalist market after the Second World War within the institutional framework of US global military alliances. In this formulation, the Cold War was about containing America's communist enemies and its capitalist allies, the latter as semi-sovereign states, as part of its informal empire. While appreciative of Brenner's analysis, Arrighi critiques it for underestimating the role of the US war in Indochina in the declining fortunes of US hegemony, being almost exclusively focused instead on US competition with Germany and Japan. This process of hegemonic decline continued with the new Cold War beginning in the late 1970s and 1980s, resulting in the collapse of the Soviet Union and the temporary efflorescence of US power in a unipolar one-superpower world. As in previous hegemonic cycles, the temporary reflation of the hegemonic power was simultaneous with a resurgence of its financial power in the global capital markets. This process was of course part and parcel of the financialisation of the US and global economy, with roots in the over-accumulation crisis and the move to floating exchange rates in the 1970s.

Here, the counter-revolution in monetary and development policy beginning with the rise of US interest rates in 1979 and the emergence of the Washington Consensus, ensured the reflation of world demand centred on the West, to the detriment of the Second and Third Worlds, which had borrowed money at variable interest rates for development in previous decades. This reversal also represented a massive abandonment of the New Deal tradition of subordinating private to public finance, showing too the ability of the capitalist class to dictate to all states the conditions under which it would assist to power, reflected here in the rise of the price of money, which facilitated an unprecedented wave of US indebtedness on the global capital markets. Simultaneous with the historic reversals in monetary policies were a host of inter-related bubbles and concomitant financial crises from Asia in 1997 to the global financial crisis and Great Recession of 2008.

Of course, it was also the Vietnam War and the related crisis of American capitalism and subsequent booms that allowed East Asia to move up the value-added hierarchy of the world-economy by simultaneous regional development and the selling of commodities in the West. Moreover, this process was part and parcel of what Arrighi called his systemic cycles of accumulation and related hegemonic cycles. Here, hegemonic powers preside over material expansions of the world-economy, with pronounced investments in material production and trade. When competition increases and profits concomitantly decline, the over-accumulation of capital and increased inter-state competition provides the supply and demand conditions for a financial expansion of the world-economy, the emergence of new regional centres or hegemonic contenders, and a related increase in systemic chaos. In these various autumns of hegemonic cycles and long waves of capitalist development, there are increasing polarisations of wealth, power, and income in the global economy and various national locales, as expressed for example in the *belle époque* of the European bourgeoisie in the late nineteenth century and the US's successive gilded ages, including that of today. This tendency has been recognised most recently in Thomas Piketty's (2014) *Capital in the twenty-first Century*, where he notes the tendency towards oligarchy globally and most especially in the US, which he sees as representing the most unequal society in world history in terms of the relationship between work, income, and wealth inequality. And in fact, though Arrighi's work in this regard is often misunderstood, class struggle and the polarisation of the capitalist world-economy into core and peripheral locales, along with related inter-state competition for mobile capital, in fact play critical roles in his conceptualisation of systemic cycles of accumulation, hegemonic cycles and recurrent phases of material and financial expansions of the capitalist world-system.

In Part III, 'Hegemony Unravelling', Arrighi begins by analysing the resurgence of the debate on empire and imperialism following the 11 September 2001 terrorist attacks and the ascendance of those promoters of the Project for the New American Century in the Bush Administration, which led to the Anglo-American invasion of Iraq in the Spring of 2003, whose disastrous legacy is still with us today with President Obama's announcement of a new endless war against ISIS. Underscored here, however, are the differences between what Arrighi sees as the US's bid for a truly world empire after 9/11 and previous instances of imperialism. Most significant, Arrighi argues, is the degree to which the US invasion of Iraq has backfired, merely adding to the rise of Chinese-led East Asia in the global economy. In this light, the superbubble of American hegemony, as George Soros once dubbed it, appears to have been ephemeral indeed, despite the still great residual power of the US in the increasingly chaotic global system.

Arrighi reviews the literature on the new imperialism, including David Harvey's (2003) book of that exact title. Arrighi (2007: 11) notes that both Hobson and Harvey were quick to point out the variety of contradictory phenomena to which the term 'imperialism' has historically been applied, underscoring that: 'Its most general meaning is an extension or imposition of the power, authority or influence of a state over other states, or stateless communities'. By this definition, Arrighi notes, the phenomenon has been around for quite some time, assuming a variety of forms. But Harvey focuses in particular, as did Hobson, on the relationship between capitalism and imperialism, while Arrighi in turn underscores the space of flows, or capitalism seen as a succession of systemic cycles of capital accumulation, and the fusion between capitalism and the state, where world capitalism can be seen as part and parcel of the rise and decline of hegemonic powers, as outlined in his three hegemonies of historical capitalism. What is particularly interesting here is the link Arrighi establishes between the over-accumulation of capital and the production of space, drawing on Harvey's theory of the spatio-temporal fix of capital addressed early in his classic but sadly neglected *The Limits to Capital* (2007). This fix is linked to what Marx referred to as 'the annihilation of space through time', part and parcel of processes of capitalist globalisation, as capital seeks to overcome barriers to its

reproduction by moving through time and space seeking to valorise.

The accumulation of capital, then, and related processes of imperialism, become linked to Schumpterian processes of creative destruction, including what Henri Lefebvre (1992) called *The Production of Space*. There are many analogies here with Edward Soja's Postmodern *Geographies: The Reassertion of Space in Critical Social Theory* (2009). Here, creative destruction, including that of built environments, is part and parcel of the changing historical geography of capital accumulation, as landscapes are made and destroyed to facilitate the capitalist accumulation of capital, including through war, if necessary. As Arrighi notes, Harvey's analysis was inspired by Hegel's *Philosophy of Right* (as was Marx's), where the contradictions of bourgeois civil society within unequal nation-states and their combination of wealth and poverty (what Marx called the absolute, general law of capital accumulation) necessitated the turn towards overseas expansion through imperialism and colonialism, which in turn ensured that the general law would be part of capital accumulation on a global scale, including the core–periphery divide. This spatio-temporal fix sought by bourgeois society was also analysed to varying extents by Hannah Arendt (1973) in her *Origins of Totalitarianism*.

One of the key processes is the ongoing primitive accumulation of capital, including the dispossession of original producers from their means of production, or what Harvey and others have called accumulation through dispossession. Here, Arrighi points out the convergence and divergence between his and Harvey's analysis, looking at the connections between dispossession and the expanding reproduction of capital in hegemonic powers, and his own and Marx's, who noted that the varied stating points of capitalist development (Venice, Holland, Britain, and the US) are simultaneously representative of the transfer of wealth and money capital, which restart capitalist development, in containers of ever larger scale and scope. At this point, Arrighi points to an anomaly within current processes of the expanded reproduction of capital on a global scale, namely that

instead of surplus capital going to the rising centre, China, it is the latter that is investing in the US.

This suggests a limit to the process, whereby, in Arrighi's reformulation of Marx's general formula of capital, M-C-M', also represents a recurrent pattern of global capitalism, in its alternation between phases of material expansions of the world-economy (M-C) and phases of financial expansions (C-M) (or Marx's abbreviated general formula (M-M'), representing what Arrighi calls systemic cycles of accumulation (M-C-M'). These cycles have propelled capitalist development and related processes of imperialism forward in space and time through recurrent spatial fixes aimed at the broadening and deepening the increasingly global division of labour during material expansions of the capitalist world-system. When these expansions reach their limits and there is an over-accumulation of capital relative to profitable outlets for investment, capital pulls out of trade and investment in material production and shifts towards investments in or betting on states, including through the buying-up of national debts until the system is remade under newer and broader social foundations under a rising hegemonic power. In previous cycles, then, overseas imperialism and related *belles* époques of the European bourgeoisie deepen the crises of capitalist development, including by the exacerbation of inter-state competition and inter-imperialist wars as part of struggles for world hegemony. Indeed, Arrighi (2007: 235) quotes approvingly Arendt's observation that imperialism ought to be thought of as 'the first stage in the political rule of the bourgeoisie rather than the last stage of capitalism'.

Arrighi moves on to chronicle Braudel's contention that the territorial size of the centre of accumulation in the global system necessitated growth to manage its ever-growing global spatial scale. Arrighi then takes the reader through a tour of capitalist imperialism from the Italian city-states, to the Dutch Republic, to the fusion of capitalism and imperialism in Britain, with a particular focus on the industrialisation of war. Thereafter, Arrighi, drawing on the work of Ludwig Dehio, shows how the rise of the US and the USSR transformed, to a larger extent,

the previous European balance of power with the emergence of superpowers on both sides of Continental Europe. As Arrighi chronicles the declining returns that the US is garnering from its militarised and extroverted path of capitalist development, part of the West European legacy, he sets the stage, finally, for Part IV, 'Lineages of the New Asian Age'.

Here, Arrighi traces China's astonishing resurgence at the centre of the material expansion of the East Asian region, underscoring the unique aspect of East Asia's 500 years peace, predating and relative to that of the West's militarised inter-state system, with its only 100-year peace on the European continent from 1815 to 1914. What was unique here, in what Fernand Braudel once called the super world-economy of the Far East, was its market-based economy, and China's related tribute trade system, here distinguished from capitalism, the top layer of high trade and finance closely linked with state power. While capitalists existed throughout this system, unlike in the West, they did not control the state. Of course, under the impact of the expanding Western inter-state system and capitalist world-economy, China and East Asia were eventually incorporated into the Western system as subordinate units.

Yet here, the achievements of the Chinese communist revolution, for all its violence and terror, made great gains, as Jean Dreze and Amartya Sen and others have shown, in the fields of health care, education, and eventually economic development. Along with the role of the overseas Chinese trading diaspora, not to mention China's almost unlimited supplies of labour, in sharp contrast to Africa, this enabled China to resume its former position at the head of the trade expansion in the region, not to mention its role as the world's industrial workshop. Underscored here are the market-based rather than capitalist aspects of this development, notably the process of accumulation without dispossession, including the role of township and village enterprises in the region, in sharp contrast to the processes of accumulation with dispossession that characterise the Africa of the labour reserves, especially in Southern Africa. In the latter region, drawing on the work of Gillian Hart and others, Arrighi notes that this legacy of white-settler colonialism and especially British imperialism impoverished the Southern African peasantry and working classes, eventually posing massive blockages to the continued accumulation of capital and contributing to the increasing peripheralisation of Africa in the global system.

While underscoring the social origins of China's ascent, Arrighi notes that unless China and the East Asian region are able to address the unsustainable aspects of capitalist development in the West and its impact on the global South, most especially ecological degradation, global impoverishment and global inequalities, then it is unlikely that a new path will be opened up for the remaking of the global system on new and enlarged social foundations, able to provide for greater democracy, equality and a new more sustainable relationship between humans, other species and nature and between human beings themselves. If, however, the positive traditions of the East Asian heritage can embrace new paths of development, more egalitarian and more sustainable, in conjunction with other forces in the global North and South looking for alternative socially just policies for a new global system, then Chinese-led East Asia's resurgence may be seen in hindsight as providing for a true commonwealth of civilisations based on mutual equality and respect that was Adam Smith's hoped-for long-term outcome of world-market formation and bring many of those phenomena associated with imperialism to an end.

Description

To better appreciate modern imperialism in Yemen, the following charts how relations with Eurasian powers like the Ottomans and Britain shifted from humble alliance making to outright (almost always failed) attempts at military conquest. As argued, it is crucial to reflect more closely on the manner Eurasian agents secured their initial foothold in the Western Indian Ocean world by way of such alliances. By the time Ottoman surrogates like Muhammad Ali and crews linked to venture capitalists in London established a presence in the Red Sea, the political orientations of a growing set of new political-spiritual movements were on the rise. The subsequent adaptations by Ottoman and British officers would directly impact how their respective empires evolved over the following nineteenth and twentieth centuries.

Introduction: Yemen and the World

For millennia, the inhabitants of South Arabia maintained a complex relationship with the larger world. Of primary importance had been the economic relations a multiplicity of distinctive (occasionally hostile) polities inhabiting regions today associated with Yemen maintained with others. Exchanging their valuable commodities like coffee and frankincense with Eurasian, Eastern Africa, and the Indian Ocean communities, Yemenis accumulated considerable wealth. With this wealth, extended families influenced both market affairs and interstate politics well beyond Arabia.

It was especially the families originating from the Eastern regions of Hadhramaut that thrived as overseas conglomerates; their virtual colonies in

SE Asia, India, and Eastern Africa empowered Yemeni businesses, aided in the spread of Islam, and eventually led to the establishment of Muslim dynasties that remained linked to Arabia. By the time the Ottoman Empire and their European merchant rivals arrived in the Indian Ocean world in the sixteenth century, these Yemeni diasporas were entrenched politically from Eastern Africa to the South China Sea. In the subsequent era of Eurasian imperialism in the larger Indian Ocean arena, these Yemeni communities played the role of local interlocutor, a relationship with the empire that endures until today (Clarence-Smith 2002).

The wealth accumulated in these regions through this process of exchange was so great that it had long been deemed imprudent for trading companies based out of Amsterdam or London to betray these Yemeni origin diasporas. The ultimate arbiters of power, Yemenis as such had a critical role in shaping the nature of modern imperialism in Eastern Africa, Southeast Asia, and Arabia itself. As political dynasties throughout the Indian Ocean and South China Sea regions wielded enough influence to make or break commercial enterprises from Europe, the evolution of modern imperialist policies necessarily required as much politics as violence. Indirect "rule" thus found its most obvious utility in the interactions imperial administrations sought with indigenous actors claiming some familial, business, political, or spiritual link to Yemen (Bang 2004).

By the seventeenth century, traders representing North Atlantic companies sought access to the terraced hills covered in addictive coffee beans, while Ottoman Janissaries laid counterclaims to the richest lands of all the Islamic realms. In these early modern iterations of the kind of negotiated imperialism that went global in subsequent centuries, Eurasian engagements with Southwest Arabia were more overtures of partnership than attempts at conquest. As such, exchanges between Dutch and British traders and their South Arabian interlocutors constituted the nuanced relationship of opportunity that brought Northwestern Europe first economically into a realm once reserved for the Portuguese pirates infesting the Indian Ocean and their Ottoman/Persian rivals (Casale 2010).

By solidifying mutually beneficial relations that quickly extended beyond just trade to also include military alliances in SE Asia and Eastern Africa, indigenous actors and their Eurasian allies established a working formula to assure the integration of modern imperialism throughout the larger Indian Ocean. The form of this integration took invariably contributed to the way the two primary imperialist projects in Yemen during the modern era took form. Indeed, both the Ottoman and British investments in expanding the empire in the region did reflect ambitions to thwart the other's bid at monopolizing access to the region. But such measures can only be understood by appreciating the impact mediated engagements with Yemenis had on how such strategies were developed. In other words, what transpired in South Arabia from the beginning of the nineteenth century constitutes both a unique story in the larger history of modern imperialism and a likely corrective to our understanding of how these respective empires transformed over the period.

Yemen as Source of Legitimacy

As the various imperialist projects that directly impacted life in Yemen constituted an amorphous, sometimes disorganized cluster of competing interests, it is impossible to ignore the already well-iterated corrective scholarship on the British Empire (Cooper 2005; Wilson 2016). The same nuanced reflection on Ottoman operations remains at its early form (Kuehn 2011; Blumi 2012; Minawi 2016). Of crucial importance here is the role of indigenous actors such as the Zaydi imams and Hadrami shaykhs as well as their rivals and fickle allies. It was these local entrepreneurs' political acumen and spiritual and/or economic influence, however modest on the global scale, which overwhelmed imperialist efforts to subdue them over the last 200 years. As such, the approaches to administrating the necessarily dynamic relations two often rival imperialist projects maintained with Yemenis require contextualizing in as much local as global terms.

As noted throughout, of primary importance were the initial commercial gains from securing

alliances with local Yemeni polities. Perhaps of equal importance, however, especially over the long term, was the larger ideological reward for securing these alliances. Yemen's symbolic value to would-be global actors, often operating exclusively within Muslim-majority contexts elsewhere in Asia or Africa, necessarily required close attention to a balance between control and partnership (Green 2011). After all, many of the primary interlocutors in South Arabia were part of networks responsible for the maintenance of the robust cultural productivity found in South Arabia's long visited centers of spiritual pilgrimage. Be it Zabid, Abha, Tarim, or Saʻadah, the corresponding political and religious order (or threat of disorder) Yemenis could offer would-be Eurasian administrators of far flung Asian and African Muslim communities, meant Yemen's spiritual leaders had some leverage over those claiming global power (Laffan 2003; Ho 2006).

Indeed, it is impossible to appreciate the larger political order for much of the modern era (from 1800 to the present) without its mutually affective relationship to the short-lived Eurasian struggle to integrate Yemen into their respective spheres of influence. A presence in Yemen brought some legitimacy in the larger Muslim world. At the same time, alliances with prominent Yemeni spiritual leaders could also help instigate instability for rival empires. This dual role of stabilizing ally and weaponized rival is most evident in the events of the early nineteenth century.

The well-known story of the momentary rise of Wahhabism and the Saud conquest of Mecca/Medina in 1805 animated the Ottoman sultanate to initiate a response that had long-term consequences for the spread of Eurasian imperialism into the region. Forced to rely in the end on an Ottoman-Albanian general governor of Egypt, Muhammad Ali Pasha, the 1811–1818 war over control of the Hijaz and the holy cities had a spillover effect that extended to Yemen. While less studied, the manner in which Muhammad Ali's forces subdued the Saud rebellion proves crucial to the long-term stability of the Yemen and larger Red Sea region, by the completion of the Suez Canal in 1869, of singular strategic importance to capitalist imperialism. As much a

loyalist as a rebel himself, Muhammad Ali returned not only the Hijaz region to Ottoman authority but extended the campaign to suppress equally dangerous rebellions with religious undertones throughout the Red Sea.

Long forgotten in the literature was the expansive role Muhammad Ali's forces played in introducing modern imperialism in Yemen. As his well-trained Egyptian and Balkan troops forged a formidable political unit that extended from Egypt, through Sudan, Ethiopia, and into the Great Lakes region, Muhammad Ali's expansive project, formally in the name of the Ottoman sultan, eventually extended to the eastern shores of the Red Sea (Blumi 2013: 21–42). At the time (1820s until 1838), indigenous, regional actors, and political leaders linked to merchant networks and often identified with rival religious organizations – Sufi orders and established Zaydi households – the entirety of what was politically and culturally Yemen was under the throes of destabilizing rebellions often induced by once loyal troops to Egypt's new ruling family (Fahmy 2012). Such conditions offered those with greater political ambitions (and a capacity to project violence across larger territories, especially Muhammad Ali and the British East India Company) an opportunity to service new alliances that proved the precursors to a longer imperialist project.

It is critical to highlight that these engagements were not the primary by-product of imperialist ambitions as long asserted in the literature. Indeed, revisiting the context in which this initial alliance was made – deemphasizing the violent subordination of all of Yemen, as often implied – puts front and center a local factor to account for especially British commercial interests gaining access to the region. Crucially missed in the larger context were the competitive origins of such alliances.

A Local Resource: Political Entrepreneurs and Indirect Rule

Local actors throughout the coastal areas of the Red Sea saw their potential marginalization as the

regional economy appeared to shift to reflect the new expansive – perhaps even imperialistic – ambitions of Muhammad Ali's surrogates. Be they entirely under his command or not, the violence they brought to the region threatened some locals to the extent that they made the perfectly logical overture to interested foreign parties for help (Miran 2009). In other words, local Yemenis, responding to indigenous conditions, opened the door to explore a new commercial (and soon political) arena for British capital.

That the exploitative dynamics of subsequent relations quickly translated into overtures to potential local allies – sanctioned and formalized by way of treaties with recognized "amirs" – necessarily entangles a larger set of actors in accounting for imperialism in Yemen. Crucially, it was the manner in which Ali's forces successfully engaged an ever-shifting menagerie of would-be religious leaders (or their followers) that offered the British merchants based in India their first opportunity to gain access to lucrative Yemeni trade. The region linking Mecca/Medina with Yemen by way of the 'Asir (until 1934, when Saudi Arabia annexed the territory from Yemeni polities) had become infested with religious-themed revolts, at times inspired by the ultra-orthodoxy advocated by the Wahhabi brotherhood or, as reactions, various Sufi-like Ismaili movements.

These multiple 'Asir rebellions over the 1818–1840 period may have found their origins in the actions of locals like Sharif Hammud of Abu 'Arish who established an alliance with the Wahhabis prior to the arrival of Muhammad Ali's forces in 1818. Another, more long-term threat to Ottoman/Egyptian plans to bring the Hijaz into the fold was Muhammad Agah. A mercenary with a large Albanian contingency of allies, by defecting from the service of the Ottoman sultan in the bloody period after the formal defeat of the Wahhabis in Mecca, Agah could seek an independent political path. From 1818 until his boarding a British ship for Bombay two decades later, Agah forged alliances with a variety of local communities in the search for political leverage and immediate economic gain. Allies like Ali bin Mukhtar, an early adherent to the Ismaili-orientated Idrisi

order just beginning to establish itself in the region, took advantage of such shifting power alliances to gain much sought-after overtures from Ottoman, British, Omani, or Dutch representatives.

It was in this context of seeking to reaffirm their investments in the larger Indian Ocean that Britain "discovered" a vibrant, fertile political arena into which merchants bearing English affiliation became willful allies with some of these Yemeni entrepreneurs. As reported by British officers surveying the Red Sea in 1838, the complex reactions initiated by Egyptian/Ottoman intrigues demanded a carefully considered response (TNA, FO 78/342, no. 15 Campbell to Palmerston, 27 March 1838, report from James McKenzie of the Bengal Lancers). The most important result of these debated overtures to local potential allies was an alliance with Muhsin bin Fadl of Lahj in 1838. Apparently under some threat of violence, British representative Captain Haines secured the port of Aden and environs from "the sultan of Aden" under the pretext of protecting trade from the larger instability caused by perpetual battles for power in areas north and west of Aden. Crucially, the precarious nature of this "alliance" meant the subsequent form of imperialist relations with South Arabian inhabitants required a multi-varied system of recruitment and coercion. This mediated, constantly renegotiated approach left much of the management of what authorities in Bombay formally identified as provisionally "British" to those living there (Dresch 2000).

The consequences of this "indirect rule" approach meant very little in terms of actual economic rewards but did start a process of integrating South Arabia into a strategic calculus that extended from the Red Sea to Singapore. Critically, the resulting emergence of an Aden base from which the British Empire protected access to its East Asian and African colonies empowered otherwise marginal indigenous actors. In time, more and more pliable local allies were integrated into a British sphere of influence. Despite their largely symbolic power, the leaders of the 25 separate polities signed treaties with the subsequent generations of British administrators, thus gaining some leverage over the operations of both

the British and Ottoman empires. This is proven by the periodic diplomatic crisis the two empires in Yemen faced as their respective local allies exploited the leverage they enjoyed to gain at the expense of rival Yemenis.

Capable of upsetting the precarious "stability" sought by both regimes, administrators based out of Bombay eventually formulated a plan to create a conglomerate of sultanates and emirates, calling it by the 1870s the "Western Protectorate" (WAP) to better define the political parameters of the empire's presence in Yemen. This cluster of vulnerable polities would serve as a bulwark to Ottoman and Zaydi imamate expansion toward Aden for the next 150 years. With the completion of the Suez Canal, Aden became more than just a coaling station, and the port became a veritable base of imperial operations.

Only in 1937, however, after much negotiation, would the formalities of British imperialism bring a South Arabian enterprise into the fold of the larger Indian Ocean context (Gavin 1975). In this year, Aden and its critical military and shipping role formally became an imperial colony and no longer a territory of India (Robbins 1939). At the same time an Eastern Protectorate was forged, consisting of a loose alliance of various Hadhrami polities with the sultanates of Kathri and Mahra. These modifications reflected once again a changing strategic value to British imperialism.

Here the foundations of modern imperialism in Yemen are laid. Necessarily predicated on alliances competing locals periodically sought, what were first only commercial enterprises like the British East India Company or a stopgap military expedition led by forces loyal to Muhammad Ali based in Egypt, by the end of the nineteenth century, became two very animated systems of political negotiation with little outstanding economic rewards. Rivalries between local claimants to authority offered, in other words, imperialism a point of entry but rarely a formula for reliable integration of Yemen into a truly exploitative imperialist project.

If imperialism itself is defined as a system in which one political, cultural, and/or economic order imposes itself on, in this case Yemen, the story of imperialism in Yemen is ambiguous. In this respect, Yemen since the 1830s has been going through violent political reorientations that induced direct imperialist investment into local and regional power struggles. Where foreign imperialism is most distinguishable from otherwise complicated local affairs is when the imperialist project attempts to impose the subordination of otherwise resilient indigenous actors. That every such project in Yemen recorded over this 200-year history has failed to implement such hegemony should be of importance to the reader, and a closer inspection of the forms of engagement between imperial administrators and locals is needed.

When a foreign power has tried to use direct violence in Yemen, it has been used in an attempt to tip the scales in favor of one of the local surrogates of empire rather than secure outright direct occupation. In the case of the Ottoman foray into local Yemeni politics, for example, from the 1830s to 1918, a variety of approaches were taken to recruit and then empower local allies to assist in administering Northern Yemen. Never was it a policy to occupy and colonize Yemen. Rather, Ottoman administrators long discovered that making headway in influencing Yemeni affairs to suit larger strategic concerns required indulging in taking sides in local disputes and helping tip the balance of local power. Indeed, throughout the period in question, in at least some part of what all maps from 1872 suggested was Ottoman Empire's sphere of influence in Northern Yemen, a local uprising was taking place. The fact violent exchanges took place does not, however, necessarily mean the objective of those fighting was the expulsion of a "foreign" force. As demonstrated in detailed research into the kinds of conflicts Ottoman officials had to manage while based in the highlands of North Yemen after 1872, invariably it was domestic conflicts between Yemenis that marked the violence and the Ottoman officials for the most part proved the necessary arbitrators (Blumi 2010, 2012, 2018).

As such, Ottoman administrative capacities in Southwest Arabia were largely steered to negotiating between rival parties, coopting when needed one strategically useful ally to subdue other

Y

parties but never aiming to exclusively rule over all Yemenis. The fact these configurations of ally and rival changed so often during the 1872–1918 period demands rephrasing the ways in which historians account for those events recorded in the records. A productive way to understand violence in Yemen, therefore, is to read struggles between locals as efforts to draw concessions from an imperial administration eager to maintain as much as possible stability. Crucially, it is never evident that Ottoman officials expected absolute calm; their primary objective for much of the 40 plus years entrenched in North Yemen was to assure roads and markets remained open. Conflict, in other words, often read in literal terms when consulting documents, could be understood alternatively as complex gestures by locals demanding a new level of engagement with their local adversaries and/or imperial interlocutors.

For the Ottoman administrators increasingly learning how their local interlocutors operated, the ideal result of a direct intervention into an otherwise local conflict was to secure a long-term alliance of mutual benefit. In return for a viable partnership over the maintenance of order and the collection of some taxes, the reasonable expectation from both imperial officials and local allies was a quiet, if not entirely stable, agreement to stay out of each other's way. In this regard, with some few exceptions, the Ottoman imperial state spent little resources in integrating Yemenis into the larger Ottoman world. Schools and garrisons used to train locals were selective, not comprehensive, as one may find in the Balkans or urban Syria at the time. Similarly, the maintenance of roads had as much a role as providing a concession to a local community as an imperial strategy to extend state power. As such, the need to apply violent coercion remained almost entirely up to how local politics, outside the purview of Ottoman influence, unfolded (Blumi 2012).

With the potential to upset the much sought-after stability, locals were regularly threatening violence against each other in order to secure political or economic rent from Ottoman (or British, Italian, French) operatives willing to pay for their compliance. To be sure, the Ottomans proved sophisticated administrators in such an arena, if not ultimately disdainful of how consistently manipulative Yemenis proved to be. Ottoman officials such as Ahmed Muhtar Pasha showed himself able to secure the necessary alliances to allow Ottoman troops by the thousands to make a rather stunning entry into the highlands of North Yemen in 1872. By no means an easy task, testimonials left behind in now well-studied documents and memoirs recount as much imperialist military bravado as appreciation for local politics (Pasha 1996).

All things considered, the successful arrival of a large number of Ottoman troops to help secure the political future of a number of would-be leaders scattered throughout the regions between the Red Sea coastal areas of Tihama and Sana'a' is impressive. No doubt the work of a political genius, the Ottoman policy of inducements, co-optation, and constant negotiation allowed relatively modest forces to eventually "fight" their way to Sana'a' (Farah 2002: 82–102).

In so reaching the heart of North Yemen, Ottoman officials extended the influence and thus power of their allies like the Zaydi imams, who at the time faced internecine fighting and external challengers. Overtime, even with so much political skill, maintaining these alliances proved a difficult and precarious task. The stabilization of the Mutawakkil dynasty for political expediency translated into a new era in which imamate power moved deep into middle Yemen, around Ta'iz, Ibb, and up to the boundaries of what would be for the next 130 years British "spheres of influence." As such, the entirety of the political project for the ultimate ascendant claimant to the imamate, by 1904 that would be Yahya bin Muhammad Hamid ad-Din (d.1948), began to recalculate the value of cooperation versus aggression toward other Yemenis. Crucially, the tactics used by the Ottoman imperial administration to keep this indigenous powerhouse in check, culminating in a treaty in 1911 that solidified Yahya's place in post-Ottoman Yemen, would resemble, if not outperform those strategies adopted, out of necessity, by their British rivals in the south.

Considering the abject failure of modern armies in 2015 onward to subdue peoples in precisely these areas, it is critical to consider further

just how uniquely successful Ottoman policies toward Yemen were at the time. Far from electing to simply use modern weapons against "savage" locals, the give-and-take that marked the Ottoman Empire's administration in Yemen would infrequently modify their otherwise sophisticated use of local knowledge and mutually beneficial alliances with powerful allies. Ironically, the increasingly studied cases in which imperialism was inspired by "modern state building ideologies," the generation of Ottomans loyal to the Committee of Union and Progress (the Young Turks) failed where their predecessors succeeded. The short time after the 1908 CUP "revolution" that brought – temporarily – modernist ideas to bear on policies in Yemen resulted in a vain attempt at circumscribing locals in a search for a more conventional, "rational" imperialist administration of Yemen. The upheavals caused by this inadvisable attempt to "modernize" Ottoman governance in Yemen proved more determinantal than positive and fortunately were reversed in time to negotiate a mutually beneficial treaty with Imam Yahya in 1911 (Blumi 2010: 68–85).

The lesson that Yemen can only be integrated so far by external forces would have to be learned again and again over the next century. These immediate investments in forging viable alliances with local communities, helping to arbitrate local disputes for the purpose of maintaining stability, rather than establishing a regime that would overtly exploit economically the region reflect the larger strategic concerns of both empires in the period.

By the end of the 1860s, with the global shift in trade patterns assured with the completion of the Suez Canal, an even greater array of interests linked to Europe entered the Red Sea theater. From Genovese companies making overtures to those with political ambitions on both sides of the Red Sea, to French, Swiss, and German companies paying equal homage to accepting local alliances in return for access to ports and land to serve as coaling stations, the Ottoman and British rivalry in the region grew exponentially more complicated. In this respect, it has been suggested elsewhere that the very presence of imperial rivals in the Red Sea and Arabian peninsula since the

1860s further assured local agents gained leverage over external powers (Blumi 2012). The possibility of mobilizing lucrative trading alliances with interests now able to link Mediterranean markets with the fringes of the Red Sea contributed to further complicating Yemeni domestic politics and opened new opportunities to new would-be rivals. In this regard, it would have been imprudent to attempt to subdue an entire population for economic exploitation. With so many possible resources available in the immediate region, the last thing the Ottomans or British needed was an insurgency with either side or third party (willing Italian or French) agents supplying locals weapons.

Of course, the very nature of these political engagements assured influence could be gained by the rival empire, a case in point being the Ottomans' attempt at stemming British expansion east of Yemen. As much as British agents have proven adept at instigating trouble for rivals by way of supporting local insurgencies to undermine rival states, events throughout the early 1870s, at a time when ascendency over the Red Sea constituted controlling all trade between Europe and Asia, prove the Ottomans were capable of exactly the same tactics. Ostensibly, Ottoman surrogates expanded influence throughout the Horn of Africa and constantly challenged allies to the British East India Company by providing logistical and financial support to religious firebrands calling for anti-European resistance. Perhaps the most useful example of this as it played out in South Arabia was the short-lived state in Dhofar, established in the eastern regions of Mahra province under the direction of a man named Sayyid Fadl Pasha (Alavi 2011). While claimed an area under British sphere of influence, the inhabitants of this agriculturally rich region, today located in the western regions of Oman, made open overtures for a native of the Indian Ocean in exile in the Ottoman territories to take over as an Istanbul-sponsored ruler. Fadl, a refugee from a Kerala homeland overrun by British imperialist forces earlier in the century, worked in union with indigenous communities to establish a state that pursued an overtly hostile relation to British allies. As such, the activities taking place

to upset local communications threatened the "Raj" government in Bombay's loosely administered territories in South Arabia. While eventually the threat would be eliminated, the local origins of this challenge highlight the precarious nature of British imperialism in the region (Blumi 2013: 130–133).

Imperialism in Yemen, in other words, constituted a constant shift in imperial state investment into local politics. The critical goal was assuring local allies survived the complicated rivalries that threatened their stability. The use of a larger empire's capacity to violently subordinate those who challenged local allies proved a modest investment of imperial resources; the regimes put in place certainly did not take on the contours of an occupation. Such policies allowed for local power circles to continue, grow, and invest in alliances that would outlive the empires themselves.

The legacy of the Ottoman enterprise, in particular, played a role in Yemen well beyond the actual 1918 date of departure. Many of the powerful actors in the twentieth-century North Yemen history can identify links of collaboration with this Ottoman operation, suggesting any successful transition for the twentieth-century leaders of North Yemen and their many southern counterparts, in part reflect the benefits gained from maintaining indirect political, economic, and sometimes cultural links in patronage of the British or Ottoman states provided. In this regard, while administratively it is impossible to confuse the two enterprises in South Arabia with imperialism in Eastern Anatolia or Bengal (in both cases policies led to millions of subjects dying), the superficial nature of the imperialist regime nevertheless had important roles to play in the post-imperial careers of polities that survived their respective departures.

World War I constituted one last major imperialist confrontation in Yemen. While Ottoman-Yemeni forces performed well in Southern Arabia, the larger context of an armistice left regional actors long allied with a now defunct Ottoman state scrambling in face of new contingencies. In time, the emergent local ruler – Imam Yahya – could transition from being the Ottoman's

unreliable ally to being the principle state builder of the period. Until his death in 1948 and indeed until the death of his son in 1962, the imamate navigated the pitfalls of northern Yemeni politics and proved a formidable rival to the remaining imperialist power in Southern Arabia (Blumi 2018: 29–56). Indeed, first from its Bombay administrative hub that maintained Aden as a territory until 1937, then in its struggle to maintain an "East of Suez" regime during the first half of the Cold War, British efforts to undermine North Yemen's uniquely independent state proved inept.

In the context of a largely hostile coexistence between North Yemen and British protectorates, imperialism in Yemen from the 1920s until the final departure of British forces in 1967 constituted a more violent story than the previous century. A fiercely independent and openly hostile rival to British imperialism, North Yemeni intrigues included the open investment in influencing the fragile day-to-day politics of largely autonomous WAP lands. Relying on a boundary reluctantly laid down between the Ottomans and British in 1905, the arbitrary line between now rival polities provided the never-ending instability British imperialism could not ever hope to survive. Indeed, the precarity of the imperialist project in the face of constant North Yemeni intrigues could only survive in the interim by offering a diverse group of increasingly mutually hostile political entrepreneurs to lucratively milk British stipends and weapons in return for relative calm.

With nothing more than a few "advisors" providing mountains of reports for the next century of exchange, British imperialism was not much more than a set of alliances with independent polities and a small "colony" in Aden that existed exclusively because of the business British India offered. Sustainable only as long as there remained a reasonable promise for profits (only assured with overt occupation of the Suez Canal in 1882), Yemenis tolerated their fumbling, otherwise illegitimate, and often poor European partners because their presence secured some balance of power. Otherwise likely overwhelmed by the explicit state building project of Imam Yahya in the interwar period, constantly flirting with

alliances with the Italians firmly entrenched in Eritrea, the WAP territories were the primary barrier and safety net for British imperialism.

With North Yemen's imamate funding and arming the periodic insurrection against British and allied local forces until at least 1960, what constituted British imperialist strategy proved both precarious and amorphous. By way of a hostile, proactive indigenous rival whose ideological orientation increasingly became anti-imperialist, the British imperial strategy developed entirely new approaches to its "indirect rule" policy East of Suez after World War II (Mawby 2006).

Here the complicated relationship between British (and by extension other Atlantic powers) investments in harnessing Islam to use against rival Muslims is evident (Massad 2015: 60–84). For the British Empire to survive the wave of anti-imperialism that infested its overseas ambitions – Pax Britannica misguides historians to overlook the massive potential for often united Muslim uprisings spreading across the entirety of London/Bombay's Asian and African territories) – administrators needed to find new tools. Apartheid regimes pitting racially divided societies and early forms of "ethno-national" difference only went so far. The resulting sectarianism often created the very instability that terrified advocates of "indirect" imperialism. Impossible to sustain under other conditions, the recognition that Muslim polities needed to learn to embrace British authority by way of surrogates with unequivocal loyalties proffered an investment in the survival and subsequent successful expansion of the Saud family. This policy shift in the 1920s had implications on Yemen with the direct occupation since 1934 of the 'Asir Province by Britain's most important ally in the region (Blumi 2018: 43–50). As had happened with the expulsion of the Hashemites from the Hijaz in the 1920s, the investment in Wahhabism as a tool to culturally insubordinate older Islamic traditions, including the prevailing order dominated by Zaydi/Shafi'i/Sufi traditions throughout South Arabia, British imperialism took on an increasingly violent form.

Coupled with this mutually beneficial investment in Wahhabi expansion, British authorities throughout the Indian Ocean capitalized on the availability of cheap labor and a growing cadre of Indian bureaucrats to partially colonize South Yemen with non-locals. In this demographic-induced shift, allied local families invested in sending surrogates throughout the larger British imperial realm, spreading in new ways a Yemeni presence in the larger world. Soon Yemeni diasporas were found equally in British-controlled ports, be it Port Said, Liverpool, or Hong Kong (Halliday 1992).

Ironically, the majority of the Yemeni merchants and sailing laborers who ended up in the port towns of England came from the North Yemeni provinces of Ta'iz and Ibb. The conflicted search for profits, the need to maintain law and order, and the growing influence the hostile North Yemeni imamate held over middle Yemeni migrants constituted another source of instability for the British Empire by the Cold War. In fact, it was these middle Yemeni migrants who would, by the 1950s, constitute the largest cadre of activists, be it in labor unions or often related, internationalist projects (Halliday 2001: 156–169).

This geographic spread deep into the imperialist homeland had consequences for the resistance to British Empire, with Yemenis from the North leading the way. Eventually forging alliances with pan-Arabist (especially Algerian and Palestinian) causes, labor activists linked to a variety of parties turned South Yemen into the epicenter of a global struggle against British imperialism. By 1967, the violent uprising against what remained of the British imperial administration in South Yemen pitted indigenous "Arab" Yemenis and the sizable South Asian colonialists whom London hoped would perform the role of useful surrogates upon the creation of a federated, loosely independent dependency after 1960. The violence thus projected at British troops, "traditional" local leaders, and South Asian colonists transformed the anti-imperialist insurgency into one bordering a veritable race war. As witnessed throughout Eastern Africa and Southeast Asia, old strategies to create tiers of allies among subjugated local populations using class, sect, and race had dire consequences for those empires left behind in Yemen.

Y

South Arabia Federation, Colony, and Imperial Albatross

Crucially, for many of the indigenous Arab-speaking communities along with the beneficiaries of commercial and political alliances with Britain, their fate in their homelands was also negatively impacted by the successful anti-imperialist insurgency of the 1960s. Initiated in the 1950s and taking its most reviled Federation of South Arabia in 1962, the British imperialist objective at the time was merely to secure Aden and its port facilities and air base in the most economical, politically austere manner. Instead, the clumsy efforts at leaving the transition to pliable, largely illegitimate emirs resulted in violence. When London attempted to coerce the far weaker emirates to accommodate the cosmopolitan inhabitants of what had until then been Aden Colony, the entire contours of the Cold War struggle between capitalist imperialism and the Global South manifested in open war. The eventual victory of the National Liberation Front initiated the exodus of what remained the old families long ago tied by treaty with the largely hands-off British imperialist enterprise in Southern Arabia.

Fatefully, the resulting exodus of many prominent South Yemeni families, either to North Yemen or dispersed in the larger world, had long-term consequences for those communities receiving them. In the case of the Trucial States (later Qatar, Bahrain, and the UAE), the arrival of South Yemeni refugees, many of grand families from the former Eastern Protectorate, allowed for intermarriage alliances with local elites in Ajman, Dubai, and Abu Dhabi. The alliances forged at that time have consequences today as war with neo-imperialist imprints once again visits Yemen. Today, former British-allied Arab families now seek to secure influence in Yemen with legitimate claims that they wish to return to their ancestral homes in Mahra, Kathri, or Qu'aiti states. This is a forgotten but important factor to account for UAE policies in the war initiated in 2015 by neo-imperialist interests (Blumi 2018: 131, 176–183).

Conclusion

Since March 2015, under the guise of an "international coalition" operating under various code names – "Operation Decisive Storm" and "Operation Restoring Hope" – Southern Arabia has been visited by a new generation of imperialist violence. In its present-day manifestation, the violence unleashed by allies of North Atlantic powers subjects the majority of people inhabiting Northern Yemen to very different tactics than used by imperialist officers of the past. What is lost on present-day ambitions on Yemen is the long history of Ottoman- and British-mediated interactions with indigenous actors. Today, the aim is outright economic, political, and cultural domination. From attacks of food and water supplies, the strategic infliction of civilian suffering as much as direct confrontation with a resilient indigenous opponent shapes a neo-imperialist investment in subduing a region of the world historically impervious to such methods. Ironically, the ambition to plunder much of Yemen's largely untapped wealth has been largely informed by previously collected information by imperial era geologists and anthropologists, whose regular forays into the Yemeni hinterland produced mountains of data long sequestered away as secret by oil conglomerates and economic managers.

As recently argued, the objectives of the most recent imperialist engagement with Yemen are historically incoherent unless this long-denied untouched wealth is also acknowledged (Blumi 2018). As in the past, North Atlantic interests seek to pry open Yemen's economy to service ambitions to monopolize the region's considerable wealth. While the commodities are different – coffee then, oil, minerals, and fish today – the challenge of securing Yemen continues to require considerable direct engagement, not overt violence. In the end, what narrating Yemen's relationship to imperialism requires is a constant reference to the fact Southern Arabia's modern history is intimately interconnected to the transformations of the modern, and postmodern, world. In this regard, Yemen's diverse peoples and the varied polities they have sustained are

not mere victims of global processes driven by Western imperialism but often the causal forces behind it.

Zionism's Imperial Roots

Lawrence Davidson
Department of History, West Chester University, Pennsylvania, PA, USA

Synonyms

Colonialism; Imperialism; Israel; Palestine; Peace; Settler colonialism

Definition

This essay argues that the roots of the Zionist movement in the imperial orientation of the European powers at the end of the nineteenth century and the first half of the twentieth century explain its subsequent behaviour and policies. The style of Israeli imperialism is the type of imperialism that is designed to eliminate the indigenous population and replace it with the population of the imperial conqueror. The relentless pursuit of this imperial aim explains the consistent Israeli policy of rejectionism when it comes to the supposed peace process ongoing since the 1970s. Israel is here understood as an imperialist state, both in its origins and its continuing practice and it is argued that this explains why there has been no solution to its conflict with the Palestinians. The essay concludes by suggesting that Israel will only cease be an imperialist state when the Israeli Jewish citizens will have to bear the social and economic costs of their government's imperialist efforts by themselves.

Imperialism

As commonly understood, imperialism is the domination of one people over another as a consequence of territorial expansion. At the root of this imperial process is physical conquest. What happens after conquest may vary. On the one hand, there might follow the most brutal form of imperialist aggression involving segregation and impoverishment of the indigenous population or even an attempt at their extermination. These extreme actions are usually taken to make way for the resettlement of the conquered land by elements of the conqueror's own population. Along with this would come a racist rationale explaining the primitiveness and inferiority of the conquered people, supporting the assertion that they must be removed to make way for the advance of civilisation. On the other hand, what might follow conquest is somewhat less

murderous political control and economic exploitation of the indigenous population. In this case there is no attempt at extermination (except of those who resist) and no large-scale displacement of population. There remains a rationale that pictures the 'natives' as primitive and inferior, but in this version of imperialism it is accompanied by a claim that conquest and economic exploitation will civilise and improve that population.

Just about all modern states outside of Europe have been shaped or influenced by past imperial conquest. This is particularly true of those states that are the product of the European expansion that took place from, roughly, the sixteenth through twentieth centuries. Interestingly, those that now appear most Western (the US, Canada, Australia and, as we will see, Israel) followed the first and most brutal path of imperial policy. Many of the states subjected to the second, allegedly more benign path, now languish in poverty and dependency. However, either path that was taken led to a modern political and economic picture built on the dead bodies of native peoples who were killed during a process of conquest, worked to death in its aftermath, or condemned to generations of second-class citizenship.

It is no surprise that most Western history textbooks do not dwell on the realities of this process, resulting in a situation where many otherwise educated Western citizens are barely aware of these facts. However, in other states, among the surviving native generations of peoples shaped by imperial victimhood, the memory of that process persists and still leads to tense and sometimes violent episodes between the Western and non-Western worlds. Indeed, in at least one case, that of Israel-Palestine, the process of imperial conquest goes on apace, and does so in that initial, more brutal way, described above.

Zionism

Modern Zionism is a movement seeking the establishment of a Jewish state. The idea took its present form in the work of the Austrian Jewish journalist Theodor Herzl who, reporting on the Dreyfus Affair in France (1894) and its

accompanying anti-Semitism for his paper, came to the conclusion that the Jews would never be able to successfully integrate into European society (Wikipedia, Dreyfus Affair). Therefore, in an era when nation states were the predominant form of political organisation, what the Jews needed was their own nation state. Herzl laid out his vision for a Jewish state in his book *Der Judenstaat* first published in 1896.

Important to the theme of imperialism is the fact that the motive for Zionism was the long trials and tribulations of Ashkenazi or European Jews. Herzl proceeded to found the World Zionist Organization (1897) but its members were almost exclusively Ashkenazi. An important question was where such a Jewish state could be located. Europe was out of the question, but Herzl was flexible when it came to the question of location. Over the years various territories in Africa and South America would be discussed. However, as the organisation grew it focused on the land of Palestine within the Ottoman Empire.

Herzl and his successors knew that wherever the Jewish state was realised it was going to be an imperialist undertaking, and particularly so if the target territory was Palestine. After all, the entire project, focused as it was on European Jewry, meant transferring large numbers of Europeans to a non-European land. Herzl and his fellow Zionists at the time did not think there was anything wrong with this because the nineteenth century was a time of European imperial expansion and thus constituted the foreign policy norm of the era. This being the case, the Zionist leaders who took over after Herzl's untimely death in 1904 (Chiam Weizmann and David Ben Gurion, etc.) concentrated their efforts on finding a Great Power ally that could facilitate the Zionist goal in the process of its own imperial expansion.

They eventually found this ally in the British Empire. It can be argued that the British were the most aggressive and successful imperialists of the age. By 1914 they were engaged in the First World War, which saw them also in need of allies. Thus, their alliance with the Zionists became possible against the backdrop of this war. We know why the Zionists sought this alliance, but why did the British react to the Zionist overtures favourably?

As late as 1917, the outcome of the First World War was in doubt. Indeed, the British and French were stymied on the Western Front and in the East they were in the process of losing their Russian ally because of the growing Bolshevik revolution. Under the circumstances, the British were casting about for assistance from just about anywhere they could find it. Because of the imagined worldwide influence of the Jews, men like the prime minister David Lloyd George and the foreign secretary Arthur James Balfour convinced themselves that the Zionists could help encourage the US to enter the war as an ally and discourage the Russians from leaving it despite growing communist power. After all, there was Wilson's friend, Supreme Court justice William Brandeis, head of the American Zionists, in a position of influence in Washington; and Leon Trotsky, who was Jewish, among the Bolshevik power circle in Russia. Trotsky was, of course, an opponent of Zionism, but the British leaders overlooked this fact. Many of the British leaders also were what we would today call Christian fundamentalists and so believed that the modern Jews were actually descendants of ancient Hebrews and therefore had a biblical destiny to return to Palestine. Finally, as the British considered their possible conquest of the Ottoman Empire (now a wartime ally of Germany), they envisioned securing the eastern flank of the Suez Canal by taking possession of Palestine and implanting there a co-operative 'client population'. Thus, the basis for a deal between Zionists and the British imperialist existed (see Davidson 2001). How then was the partnership formalised?

The Balfour Declaration

The partnership between the British government and the Zionists was made through the document known as the Balfour Declaration. It was issued on 2 November 1917 by Sir Arthur James Balfour, the British foreign secretary. He did so in the name of the wartime Cabinet of prime minister David Lloyd George. The Declaration read as follows:

> His Majesty's Government view with favour the establishment in Palestine of a national home for

the Jewish people, and will use their best endeavours to facilitate the achievement of this object, it being clearly understood that nothing shall be done which may prejudice the civil and religious rights of the existing non-Jewish communities in Palestine, or the rights and political status enjoyed by Jews in any other country.

In a 1923 memorandum to the British Cabinet, colonial secretary Lord Cavendish described the Balfour Declaration as a 'war measure' carried out at 'a time of extreme peril to the cause of the Allies'. Yet the whole episode reflected the imperialist mindset of the time. A European government (Great Britain) had undertaken to promise a private Western body (the World Zionist Organisation) open access to the territory of a non-European government (the Ottoman Empire). It was never actually demonstrated that the Zionists came through with their side of the Balfour Declaration bargain, and we can compare this to the pragmatic deal struck by the British around the same time with the Sherif of Mecca to support an independent Arab state throughout most of the Arab lands east of Suez in exchange for military assistance against the Turks. The Arabs certainly did keep their side of the bargain by launching repeated attacks on Ottoman forces throughout the war. Yet in the end the British abandoned the Arabs and restricted Arab independence to Arabia while converting the rest of the Arab lands into appendages of the British and French empires. On the other hand, the British never hesitated to fulfil their promise to the Zionists to facilitate their subsequent colonisation of Palestine. To do so allegedly facilitated their imperial goals.

Upon the Allied victory, the British and the French, following US president Woodrow Wilson's lead, established the League of Nations. Also, because of President Wilson's anti-imperialism articulated in his 14 points (which had promised self-determination the peoples of the German, Austrian, and Ottoman Empires), they masked the enlargement of empires with the mandate system. This was a system through which the Europeans would supposedly 'tutor' the non-Europeans in the art of self-government. The notion of Europeans, who had just initiated the most destructive war in world history, teaching non-Europeans how to act in politically

responsible ways, must have struck the Arab leaders as absurd.

At the conference held at San Remo, Italy, on 24–25 April 1920, the British and French divided up the post-war mandates among the Allied powers as a form of spoils of war. The British gave themselves the mandate for Palestine. Later, the League of Nations, essentially following the dictates of the French and British, would confirm these 'awards'. The British then arranged for the Balfour Declaration to be incorporated into the preamble of the Palestine Mandate. It was in this fashion that the Balfour Declaration, which was in truth a payment for wartime services allegedly rendered by the World Zionist Organisation, metamorphosed into what Colonel Ronald Storrs, Britain's governor in Jerusalem from 1917–26, called 'a high and noble task placed on our shoulders by the voice of nations' (Davidson 2001, p. 41).

From the British point of view at the time, this sort of talk translated into high-minded rationalisations for carrying forward their plan to implant the Jews as a client people in a conquered Arab territory. However, in the hands of the Zionist lawyers it would soon become the principal legal justification for the founding of the state of Israel. Thus, the Balfour Declaration is now often described as 'the official creation of the country [Jewish Palestine] …. The moment of birth of Jewish legal rights and title of sovereignty' and a 'binding act of international law …' (Grief 2004).

It is to be noted that the Balfour Declaration promised a Jewish national home (which Zionists claim was but a euphemism for a Jewish state) in Palestine. Many Zionists insist that this meant all of Palestine, including Transjordan. This assertion places the UN resolution of 29 November 1947, partitioning Palestine, at odds with the Balfour Declaration. For those who assert the Declaration as the basis of Jewish sovereignty in Palestine, the UN partition resolution is 'an illegal abrogation of the Jewish legal rights and title of sovereignty to the whole of Palestine' (ibid.). It is on this basis that these same Zionists insist on Israel's 'legal right to keep all the lands it liberated in the Six Day War', (Grief 2005), and take violent

exception to any 'compromises' with the Arabs. Some Zionists are even willing to assassinate Israeli heads of state (prime minister Yitzhak Rabin was killed in 1995) based on suspicion of such compromises.

The Balfour Declaration has obviously taken on a life of its own. The real intent of its authors, while still argued over, now stands second to the military power and political influence of those who would give the document a maximalist interpretation. The history of the document is testimony to the ability of those with power to shape the meaning of history as well as current events.

Other Zionist Arguments

It comes as no surprise that today's Zionists insist that Israel is not a product of imperialist power and expansion. They have come to reinterpret their own origins in part because of changing times and attitudes. In the nineteenth and early twentieth centuries, imperialism, at least from a Western perspective, was a legitimate pursuit. Indeed, Great Powers were 'great' in part because they were expansionist in this fashion. Therefore, the movement of European Jewish colonists into a non-Western land such as Palestine carried no stigma. However, by the end of the Second World War and the decolonisation process that followed, imperialism had acquired a quite negative image, and if the Zionists were going to claim legitimacy for their settlement project they would have to distance themselves from their imperialist roots and put in its place other claims to the territory they now occupied. Two arguments arose from the Zionists in their effort to escape their imperialist past.

Biblical Origins

To a certain extent the notion of Jewish biblical origins in Palestine had always been in the background of the Zionist movement. That is why, despite the fact that the great majority of early modern Zionists were secular and socialist, they nonetheless became fixated on Palestine as the

optimal site for colonisation. The ensuing argument claimed that Palestine was originally a Jewish place because of the existence of the short-lived ancient kingdoms of Israel and Judea. The inevitable differences between ancient Hebrews and modern Jews (so great that they might not recognise each other as 'Jewish' if they met) were ignored. Around this claim were laid all the religious trappings of Bible lore and storytelling despite the lack of evidence that any of these stories were real. Much of Israeli archaeology has been directly or indirectly devoted to establishing the legitimacy of these biblical claims with little in-depth success.

While the claim of Israeli legitimacy due to the prior existence of an ancient Hebrew presence has laid a mythic foundation for modern Israel, taking it seriously sets a very dangerous precedent. The assertion that past ancient residence is a legitimate basis upon which to claim present sovereignty is a formula for chaos. If the alleged successors of 2,000-year-old ancestors now laid claim to all ancestral land, the political stability of many countries would soon be turned upside down. There would be war in the Americas, Australia, New Zealand, Canada, etc. as there is now in Israel-Palestine.

Zionism as a National Liberation Movement

As mentioned above, the post-Second World War era was one of decolonisation. That meant that it was correspondingly a period of national liberation with the creation of a large number of new nation states in the place of the collapsing empires of Britain, France and other Western countries. The Zionists attempted (and still attempt) to transform their imperialist roots into the actions of a national liberation movement.

The Zionists would point out that it is they who forced the British out of Palestine. In this they ignore the Arab revolt. But this claim is of little importance. It is how the Zionists got to Palestine that matters and objective history tells us that, prior to the Second World War, the vast majority of them arrived as clients of the British Empire.

That, once there, they eventually turned against their original ally does not negate the fact of the original alliance. Nor does the fact that a small number of Jews resided in Palestine throughout the Ottoman period. These Jews, mostly religious devotees, never espoused any nationalist ambitions and, in fact, originally opposed Zionist claims to the land.

The Zionist claim to the status of a national liberation movement would be the equivalent of the apartheid white South Africans, or the white settlers of Algeria or Kenya, making the same claim. It certainly distorts the usual meaning of the term and can be regarded as basically a piece of self-justifying propaganda. Nor does the claim justify the State of Israel's essentially brutal imperialist style of behaviour once it was established.

The Zionist leadership's Imperial Plans

The attitude of the early Zionist leadership toward the indigenous Arab population of Palestine was typical of European settlers. Here is how the founder of modern Zionism, Theodor Herzl, put it in a diary entry on 12 June 1895: 'We must expropriate gently, the private property . . .. We shall try to spirit the penniless population across the border by procuring employment for it in the transit countries whilst denying it any employment in our own country' (Herzl 1960, p. 88). Herzl knew that expropriation was a generic behaviour for colonists during the era of European imperial dominance and he expected any Jewish colonial entity to follow suit and ethnically cleanse much of its territory of non-Jews. And, of course, to the extent that culture is rooted in geography, in one's traditional and ancestral place, such ethnic cleansing constitutes cultural genocide. Herzl was not a violent man and imagined that this ethnic cleansing could be engineered solely through the manipulation of the economy, but those who came after him would not be so delicate.

The European Jews who entered Palestine in the baggage train of the British army, which now served as a vehicle for the expansion of empire, did not seriously factor the native people into their plans. They went about creating an exclusively

Jewish economy which, when it employed Arabs at all, did so as cheap labour. The Zionists also required the eviction of all Palestinians from the land they purchased. This means that the Zionists never believed (and still do not) that the local population had any legitimate claims to Palestine. We happen to know what the Palestinian position was because it was documented by the ill-fated US King-Crane Commission. In 1919 that commission determined that the peoples of Greater Syria, of which Palestine was a part, wanted selfdetermination within an independent greater Arab state promised by the British to Sharif Hussein of Mecca in exchange for his willingness to rebel against the Ottoman Empire. That promise was never fulfilled.

Not surprisingly the British and the Zionists encountered evolving resistance to their imperial and colonial occupation. There were anti-colonial demonstrations as early as 1922, and in 1929 a large rebellion took place during which hundreds of lives were lost. What indigenous natural resistance to imperialism meant to the Zionist leaders such as Chaim Weizmann and David Ben Gurion was that the Palestinians could now be envisioned as enemies and anti-Semites, and their expulsion could therefore be rationalised as selfdefence. This is a position adopted even today by the State of Israel. A number of forceful population transfer proposals followed. Indeed, from the late 1920s onward, 'transfer' became the polite term for proposed ethnic cleansing and cultural genocide.

There was at this time a recent precedent for the application of the concept of transfer. In 1923, Greece and Turkey signed the 'Convention Concerning the Exchange of Greek and Turkish Populations' (Wikipedia, Convention). Eventually, some 2 million people were impacted by this agreement. It allowed for compulsory denial of citizenship of ethnic Greeks in Turkey and ethnic Turks in Greece, and the subsequent deportation of those who did not leave voluntarily.

Another immediate impetus to the notion of transfer was the British decision to sever Transjordan from Palestine proper. This was done in 1922 so as to provide a territory for Abdallah, the older son of Sharif Hussein of Mecca.

(Sharif Hussein was the leader who, during the First World War, had been promised an expansive Arab state in exchange for rebellion against the Ottoman Empire.) If the Arabs were not to get their large and independent Arab state, the British were willing to give Hussein's sons positions as rulers of small British client states. Thus, Hussein's son Feisal would become king of Iraq and Abdallah, the emir of Jordan. Dividing Transjordan from Palestine irked the Zionists (who were not allowed to settle there), some of whom, even today, feel that Jordan was 'stolen' from them. However, Weizmann seized on the separation to propose that the Palestinians living to the west of the Jordan river be transferred to Transjordan. 'Surely, if we cannot cross the Jordan the Arabs could', he wrote to the British colonial secretary Lord Passfield in 1930. At later moments, when the Zionists renewed their hope that Transjordan would become part of the future Jewish state, the concept of transfer of Palestinians was directed toward Iraq and Syria.

The Zionists subsequently applied pressure to the British government to consider a transfer plan, linking it to the success of the partition plan put forth by the 1937 Peel Commission. There is some evidence that the British were willing to go along with this idea and indeed at a meeting between Weizmann, Ben Gurion, and colonial secretary Ormsby-Gore on 28 June 1937 the latter agreed that 'the Arabs in the Jewish part [of Palestine] would have to be transferred' (Simons 2004, p. 42). As the probable outbreak of the Second World War became clearer to British leaders retreated from their advocacy of partition in order to keep the good will of the Arabs. But Weizmann never ceased to promote the possibility of transfer.

Weizmann was by no means alone in pressing for the ethnic cleansing of Palestinians. His fellow Zionist leader, and sometime rival, David Ben Gurion also promoted the transfer of Arabs. In a meeting on 9 July 1936 with Sir Arthur Wauchope, the British high commissioner in Palestine, Ben Gurion argued for the deportation of landless Palestinian peasants to Transjordan. He used almost the same words as would Weizmann. He told Wauchope that if Transjordan is

closed to the Jews, 'it surely cannot be closed to the Arabs'. A year later, in 1937, Ben Gurion was still pushing for transfer, now adding Syria to Transjordan as a possible area of relocation (25).

As Ben Gurion pursued this idea, it expanded in his mind. In July 1937 he wrote in his diary, 'it would be of tremendous advantage to us. ... for every transferred Arab, one could settle four Jews on the land'. Also, he was soon ready to see transfer forcefully imposed upon the Palestinian Arabs. In a 1941 memorandum he noted that 'complete transfer without compulsion – and ruthless compulsion at that – is hardly imaginable' (33). For Ben Gurion, compulsory transfer of as many Arabs as possible was now a necessary step toward achieving 'a truly Jewish state'. He doubted if the British had the 'courage' to take up such a project. However, he was determined that the Zionists would do so the moment they got the chance. 'Any wavering on our part as to the necessity of this transfer, any doubt on our part as to the possibility of its achievement, any hesitation on our part as to the justice of it, are likely to lose us a historic opportunity which will not reoccur' (29). Ben Gurion's hoped for moment would come late in 1947 and throughout 1948.

Both Weizmann and Ben Gurion, as well as most of the Zionist leadership in Palestine, were fixated on the needs of their group. That group was the Ashkenazic Jews of Europe, and those needs, the Zionists believed, could only be fulfilled in the Arab land of Palestine. That meant changing the very demographic nature of this non-European place. This was an imperialist formula if ever there was one.

Israel's 'War of Independence': The Concept of Transfer in Practice

In February 1947, the British government decided to give up its mandate and leave Palestine. The date for departure was set as 15 May 1948. Ben Gurion, sensing as early as 1946 that the British could not hold on for long, had been working on contingency plans for taking over Palestine once the British were gone. These efforts culminated in two plans known as Plan Gimel or Plan C and

Plan Dalet or Plan D. Gimel was a pre-planned series of responses to Palestinian resistance to the Zionist presence in Palestine, and included the murder of the Palestinian political and military leadership, financial supporters, and destruction of civilian infrastructure. Dalet was designed to realise the 'systematic and total expulsion' of Palestinians 'from their homeland' as a consequence of the upcoming military struggle with the Arabs (Pappe 2007, p. 28).

This was, of course, not the public position of the Zionist leadership. That position emphasised mass immigration of Jews into Palestine. But Ben Gurion, Weizmann, and the other Zionist leaders in Palestine knew that would not be enough to give the Jews a majority in the country. After all, in 1947 there were a million Palestinians in the territory the Zionists hoped to conquer. Against that number there were 600,000 Jews. For Ben Gurion, an acceptable, positive 'demographic balance' required at least an 80% Jewish majority (48). For that to be achieved, Jewish immigration had to be complemented by Arab emigration.

The steps taken in this process of ethnic cleansing have been laid out in detail by the Israeli historian Ilan Pappe. Putting his account together with other information, we get the following narrative: David Ben Gurion and the Zionist leadership saw the disintegration of British rule, together with the UN partition plan, as the 'unique historical opportunity' they had been hoping for since the 1930s. This was their moment to create an 'exclusively Jewish state' and, as Ben Gurion had written back in 1941, there must be no wavering or hesitation in doing what was necessary to rid the country of as many Arabs as possible. At this point 'the country' meant, for the Zionist leadership, all of Palestine west of the Jordan river. They gave up the ambition of conquering Transjordan because they were negotiating a deal with Emir Abdullah (whose army was the most formidable Arab military force in the region) that would ensure his staying out of the forthcoming war. So, even before the end of the mandate, the Zionists had decided to destroy the UN promised Palestinian state.

In December of 1947, Palestinian Arabs protested against the United Nations plan to partition

their country with a three-day general strike and demonstrations. The demonstrations spilled over into assaults on some Jewish shops and markets. Even though these actions were short-lived and there was soon a clear indication of a return to 'normalcy,' Ben Gurion used the incidents as an excuse to trigger Plan Gimel. Subsequent attacks on Palestinian villages and neighbourhoods were severe enough to cause some 75,000 Arab residents to run for their lives (40).

When in early January 1948 the first units of an all-volunteer Arab irregular force entered Palestine, the Zionist leadership initiated Plan Dalet (officially inaugurated in March but really acted upon earlier) and forced transfer or ethnic cleansing became a primary military objective. Ben Gurion told his followers that the Arabs were now a 'fifth column' and therefore they had to be arrested en masse or expelled. He concluded that 'it is better to expel them' (49). And how was one to expel them? Urban areas as well as villages were targeted for violent assaults, and massacres were apparently committed purposefully so as to spread panic among the Arabs of Palestine. Ben Gurion describes the tactics in a diary entry of 1 January 1948. Actions must be 'strong and brutal'. They must be carried out 'without mercy, women and children included'. And, finally, 'there is no need to distinguish between guilty and not guilty' (69). As part of this goal, the Zionist leadership was particularly anxious to destroy a longstanding tradition of Jewish and Arab worker co-operation in Haifa, and the unwritten truce between the Jewish city of Tel Aviv and the Arab town of Jaffa, or anywhere else where Jewish–Arab amity existed (58, 65). By the end of April, some 250,000 Arabs had fled. It is to be noted that this was before the entrance of regular Arab military forces into Palestine.

This was, of course, only the beginning. The Zionist 'war of independence' went on into early 1949 and a part of it continued to be waged against the unarmed civilian Arab population of Palestine. The Israeli historian Benny Morris has described the results: 'The principal cause of the mass flight [of Palestinians] ... was Jewish military attack. Almost every instance – the exodus – was the direct and immediate result of an attack on and

conquest of Arab neighborhoods and towns' (Morris 1999, p. 255). Some 419 Arab villages and towns were eventually destroyed and their populations killed or evicted. When it was all over Ben Gurion had achieved his 'positive demographic balance' and the vast majority of Palestine's Arabs were refugees. Only about 150,000 Arabs remained in what was now Israel. This is what the Arabs call the *Nakbah*, or 'Disaster'.

Post-independence Imperialism: Cultural Genocide

Having won 'independence', the Israelis embarked upon an ongoing process to 'Hebraise' the land they now called their own. Making the land 'Hebrew' automatically meant making it no longer Arab. As much as possible of the heritage of Arab culture, like the Arabs themselves, had to be evicted. This too can be seen as an imperialist process.

It began with a process of renaming things. It turned out that the Zionists had created a 'naming committee' back in the 1920s which had the job of 'Hebraising' the small areas of Palestine purchased by the Jewish National Fund (JNF). In 1949 this committee became a subdivision of the JNF and, with the help of archaeologists, geographers, and biblical scholars, began to systematically erase Palestine's Arab history and heritage from Israel's own official records, maps, histories, etc. This is a process that continues to this day. For instance, in July 2009, Israel's Transport Ministry announced that road signs (which now appear in Hebrew, Arabic, and English) would be replaced with signs in Hebrew only. This will happen despite the fact that 20% of the country are Arabic speakers and Arabic is supposedly one of Israel's 'official languages'. The transport minister, Yisrael Katz, asserted that he would not allow pre-1948 names on road signs. Doing so would threaten to turn 'Jewish Jerusalem into Palestinian Al-Quds' (BBC 2009).

Also in 1949, an Israeli meta-narrative was spun to the effect that when the Zionists arrived Palestine had comprised a small number of

hostile, backward, and nomadic residents but was otherwise largely empty. Thus, according to the history officially taught to all Israelis, and all Jewish children enrolled in Hebrew schools the world over, the only cultural heritage to exist in Israel, past and present, is the Jewish one. To make this alternative history plausible, the Israelis set about destroying many Palestinian archaeological sites and artefacts, ancient mosques, historic houses, and the like, to the extent that UNESCO's World Heritage office describes their actions as 'crimes against the cultural heritage of mankind' (Chamberlain 2014; see also Kletter 2005).

Through the 1950s, the Israeli government allowed both Christian and Muslim holy sites, museums, and archives to be looted by their own soldiers and then proceeded to destroy them. Those few Israeli archaeologists who objected were lied to about what was happening (they were told that the Arabs were doing the looting) and then, if they persisted in their opposition, forced to resign. David Ben Gurion, Moshe Dyan, and Golda Meir were all directly involved in this process of cultural destruction (Rapoport 2008). The process of preventing any public re-emergence of Palestinian culture goes on to the present day. For instance, in 2009 UNESCO chose East Jerusalem as the 2009 Arab Capital of Culture. The Israeli government immediately declared that no celebrations or demonstrations to this effect would be allowed. They banned all of the UNESCO-sponsored events not only in Jerusalem but also elsewhere such as in the city of Nazareth. Parallel Palestinian sports events, a literary festival, and a women's festival were also banned. Presently, Palestinians on the West Bank are under some 1,500 military regulations, many of which attack their ability to culturally and politically express themselves.

It should come as no surprise that Israeli textbooks mention none of this, but rather, according to Professor Daniel Bar-Tal of Tel Aviv University, 'present the view that Jews are involved in a justified, and even humanitarian, war against an Arab enemy that refuses to accept and acknowledge the existence and rights of Jews in Israel'. He found that from the beginning of the state of Israel

up to the present time, Israeli school books have defamed Arabs by labelling them as 'killers' and 'robbers.' Israeli Jews, on the other hand are consistently pictured as 'improving the country in ways they believe the Arabs are incapable of' (Meehan 1999, pp. 19–20).

Jamal Atamneh, coordinator of the Arab Education Committee in Support of Local Councils, a Haifa based NGO, notes that while the textbooks used by the Arab Israeli population are written in Arabic, they are not prepared by Palestinians who also have no advisory role in their preparation. 'For the past 15 years, not one new Palestinian academic has been placed in a high position in the [Education] Ministry. There are no Palestinians involved in preparing the Arabic-language curriculum [and] obviously, there is no such thing as affirmative action in Israel' (20). As As'ad Ghanem of Haifa University notes, Israeli Arab education budgets are considerably below those of the Israeli Jewish sector and this is a consequence of 'continuing discrimination in practically every sphere of life' (Ghanem 2001, p. 159). One consequence of these cumulative efforts has been to make 'Nakbah denial' easier for Israeli Jews and Zionists generally. As far as Palestinians are concerned, Nakbah denial is the Israeli version of Holocaust denial.

After 1948, some of the destroyed Arab villages were transformed into Israeli towns. In a rare moment of public truthfulness, the Israeli general and politician Moshe Dyan stated, 'Jewish villages were built in the place of Arab villages. You do not even know the names of these Arab villages, and I do not blame you because geography books [giving their them] no longer exist. ... There is not one single place built in this country that did not have a former Arab population' (Lis and Khoury 1969). As for Dyan's reference to missing Geography books, in January of 2010 the Al Jazeera news network reported on an interview conducted with an Israeli citizen doing a doctoral thesis at Ben Gurion University. The student's research shows that Israeli forces 'plundered and destroyed tens of thousands of Palestine books in the years after the State's establishment'. According to the researcher, this was done 'in the framework of its plan to Judaize the country and

cut off its Arab residents from their nation and culture'. It was a 'cultural massacre' concludes this researcher (Aletho News 2010). Over the intervening years there have been periodic attacks on Palestinian libraries and archives, not only in Israel and the Occupied Territories, but also in other countries such as Lebanon. These actions have not go unnoticed. In the summer of 2002 the American Library Association issued a resolution stating that the organisation (which has 450,000 members) 'deplores the destruction of library and cultural resources anywhere in the world, and therefore the destruction of these Palestinian library and cultural resources'. The resolution was considerably watered down under pressure. Its original version directly named the Israeli government as the perpetrator of the destruction (Heuer 1999).

Where the destroyed villages were not transformed into Israeli places, their ruins were bulldozed away and forests were planted in their place. Ilan Pappe tells us that this was part of what Israel calls 'making the desert bloom.' Referring to the web page of the Jewish National Fund, Pappe notes that many of the largest and most popular forest areas promoted by the site were not, as the JNF claims, built upon 'arid and desert-like areas' but on top of the ruins of once thriving Palestinian towns. Pappe refers to this as the 'deliberate airbrushing of history' (2007, pp. 229–234).

To these efforts one can add the destruction and desecration of Palestinian cemeteries, the purposeful uprooting or burning of the crops (particularly olive trees) of Palestinian farmers, the targeting of cultural centres, including the destruction of the Palestinian Ministry of Culture in 2002, and the special attention the Israeli government gave to undermining the Arabs of East Jerusalem following the 1967 war. For instance, the foundations of Jerusalem's Al Aqsa Mosque, one of the most sacred shrines of Islam and the religious and cultural symbol of Palestine, have been physically weakened by 25 adjacent Israeli archaeological excavations. The mosque itself has been the target of repeated acts of terrorism by Israelis including arson and vandalism. A fanatical sect within Zionism seeks the mosque's total destruction so as to pave the way

for the rebuilding of Solomon's temple. This effort is financially funded by fanatical Christian fundamentalists, most of whom are Americans (Chehata 2010).

Post-independence Imperialism: Treatment of Remaining 'Israeli-Arabs'

After 1948, in those areas where there were no more Arabs, it was relatively easy to perform cultural genocide. However, as mentioned, there was a small remnant of approximately 150,000 Arabs still left in what was now Israel. The Israelis often referred to them as 'present absentees' because, even though they had remained in Israel, they often ended up dispossessed of their land and homes. The historian Mark Tessler calls these people 'internal refugees'. Tessler tells us that the result was that they were 'divorced from their traditional social and economic institutional connections,' and 'cut off from their families and countrymen who resided in states with which Israel remained at war' (1994, p. 281). Both their physical and cultural presence in the Jewish state was seen as threat by the Zionist leadership who, following Ben Gurion's lead, continued to perceive this group as a 'fifth column'. And so, in October 1948, they were all placed under a system of martial law that lasted until 1966.

What martial law meant for the remaining Palestinians was a regime of restricted travel, curfews, administrative detentions, expulsions, confinement to certain geographical areas, limitation on the freedoms of expression and the press, assembly, and due process. The only legal right left to the Israeli-Arabs was the right to vote (they were given Israeli citizenship). Why give a feared and hated minority such a right? There are two possible reasons. First, it would be 'evidence' that Israel was the political democracy it claimed to be. Second, the Palestinians left in Israel were so small in number, so isolated and so controlled that voting was a meaningless act in terms of changing their condition, much less the essentially imperialist system that controlled Israel.

The military regime under which these people were placed facilitated their dispossession. A systematic transfer of the landed property

from the remaining Arabs to Jewish control now took place. This was done by the office of the Custodian of Absentee Property. According to the Custodian, any non-Jew who was 'absent' from his usual place of residence on or after 29 November 1947 could have his property confiscated. This was so even if you returned home on 30 November! It was deemed that the bulk of Israel's remaining Arabs were so absent.

The consequences of this process were economically devastating. For instance, the Palestinian Muslim societal structure, with its traditional hierarchy, its public and private endowments, social and economic support systems etc. all disappeared. The Palestine Christian community fared little better. Pauperised and isolated, the Palestinians of Israel quickly had the highest unemployment in the country. Mostly rural folk, many were forced to move to urban areas allotted to the Arab community where they became a classical cheap labour force. The Jewish state proceeded to deny them any personal benefits given to Israeli Jews, they were denied access to over 70% of the economy (through the ploy of not having served in the Israeli army), their education budgets were kept to a minimum, and any expression of Palestinian national feelings was made criminal (Pappe 2004, p. 160).

Ultimately, Zionist plans for the Palestinians under their control resembled the apartheid system then in place in South Africa. On a visit to Italy, ex-Israeli prime minister Ariel Sharon explained to then Italian prime minister Massimo D'Alema that South Africa's 'Bantustan model was the most appropriate solution to [Israel's] conflict [with the Palestinians in its territory]' (Eldar 2009).

Continuing Imperialism: The Occupied Territories

When Israel won the Six Day War in 1967, it found itself in control of territories that had traditionally been considered part of Eretz Israel (the Land of Israel) by the Zionist Movement. As early as 1918, when Chiam Weizmann presented the case for Zionist control of Palestine to the Paris Peace Conference, he presented a map that

included the territories taken in 1967. After the Six Day War, this expansionist point of view was not just held by the conservative Likud Party. Leaders of the Labour Party also were of this conviction. Thus the idea that the conquered territories of the West Bank, Gaza Strip, and East Jerusalem (as well as Syria's Golan Heights) were to be used as bargaining chips in negotiations that would trade land for peace has always been doubtful, and historically it is a tactic that has never been used.

Almost immediately after the end of the 1967 war, Israel's Labour Government began to establish colonies along the Jordan River. These were referred to as defensive military establishments but they soon had all of the characteristics of small civilian agricultural settlements. This made them illegal under international law. Within a year of the war's end, some 14 colonies had been set up throughout the conquered lands. In the early years of the colonisation programme, Israel's Labour Government tried to manipulate the process. This was done not to limit the numbers of settlers but rather to direct them to strategic points that would facilitate long-term control of the territories. With the election of more conservative Likud Party Governments in 1977 and afterwards, restraints on settlement loosened considerably. Both parties used special tax breaks and subsidised housing to attract colonists.

Two types of Israelis have been attracted to the colonies of the Occupied Territories. One group, making up about 60% of the current settler population, comprises citizens whose motivations are mainly economic. These people have been attracted by the government's tax breaks, cheap rents, and subsidised mortgages. Having grown up in a strictly segregated society that taught them to view the Palestinians as latter-day Nazis, they have no compunction about living on land confiscated from the local population. The other group, constituting of some 40% of the settler population, are religious fanatics who see the West Bank (an area they called Judea and Samaria) as well as Gaza as part of the God-given religious patrimony of the Jewish people. They believe that they have a divine mission to colonise the Occupied Territories. Their behaviour indicates that they are not only determined to settle the occupied lands, but

Z

that they hope to eventually drive out the non-Jewish population. They have also been willing to go to great lengths to sabotage any international effort that might result in a trade of land for peace.

A good example of this latter group is Gush Enumin (the Bloc of the Faithful). The group was established in 1968, significantly, in a hotel in occupied Hebron. By 1974, under the leadership of Rabbi Moishe Levinger, Gush Enumin was the most aggressive settlement organisation in Israel. This aggressiveness included booby-trapping the cars of several West Bank mayors, plotting to blow up Arab buses, and even planning an attack on the Muslim holy site of the Harem al-Sharif (Jerusalem's Dome of the Rock mosque). With the election of Menachim Begin and the Likud Party in 1977, Gush Enumin got a green light to settle anywhere in the territories. They did so as armed squatters with the co-operation and assistance of the Israeli government, particularly the man who was then agricultural minister, Ariel Sharon.

Once an alliance was solidified between fanatical religious colonists such as Gush Enumin and the right-wing Likud Governments of Israel, the position of the Palestinian population deteriorated rapidly. About 40% of the land on the West Bank was quickly taken and more is confiscated every year. Some 88% of the water drawn in the territories is diverted for the use of the colonists. Palestinian freedom of movement has been severely limited as the land they do live on is cut up into isolated cantons by checkpoints, Jewish-only roads, and 'security' walls. Violence by settlers towards Palestinians has become endemic. It must be understood that the status of the more fanatical and violent colonists is not that of rebels. It is that of a vigilante arm of the Israeli government. Taking the colonising movement as a whole, it represents an ongoing process of ethnic cleansing and cultural genocide against the indigenous Palestinian population.

Things have not always gone well for Israel's setters. For instance, the incessant resistance put up by the Palestinians of the Gaza Strip helped convince the Likud Government of Ariel Sharon, in August of 2005, to cut its losses and withdraw the settlements located in that area. There were only 8,000 settlers in the Gaza region living next to nearly 1.5 million hostile Palestinians. Such a move also made easier a subsequent neartotal blockade of Gaza which would rapidly impoverish its population. Nonetheless, the removal of the Gaza settlers so upset the Zionist religious settlement movement that they threatened civil war if they were called upon to leave the West Bank. There is no indication of present or future Israeli plans to do this. Indeed, settlement of the West Bank and East Jerusalem continue apace and Israel has now transferred over a 500,000 of its citizens into these areas.

All of Israel's settlements are illegal under international law. The law referred to here is the Fourth Geneva Convention to which Israel is a signatory. That convention forbids the forceful or voluntary transfer of a conquering country's civilian population into the conquered areas. The illegal status of the Israeli settlements has been confirmed by the International Court of Justice at the Hague, various international human rights organisations, various United Nations Resolutions, and even by the legal council for the Israeli Foreign Ministry. Legal Council Theodor Meron stated officially in 1967 that 'my conclusion is that civilian settlement in the administered territories [the Occupied Territories] contravenes the explicit provisions of the Fourth Geneva Convention' (Wikipedia, United Nations). Sometimes Israel will deny the illegality of the settlements using rather contorted misinterpretations of the law, but most of the time the government just ignores the issue. It has been allowed to do so because the governments of the US and Europe have seen fit to ignore Israeli behaviour and policies. Thus, while Israel is in violation of international law, there are no police to move against that nation and its settler agents.

The settlements are at the heart of post-1967 Israeli imperialism but they are also, almost necessarily, accompanied by the accoutrements of imperial force: the arrest or execution of all who resist, characterisation of resisting groups as 'terrorists', checkpoints, internal passports and the control of population movement, control of the indigenous economy for the benefit of the imperial conqueror, and in the case of Palestine, we can add water theft and home demolitions.

Conclusion

In the case of Israeli imperialism the present truly flows from the past. The fact that the Zionist movement has its roots in the imperial orientation of the European powers at the end of the nineteenth century and the first half of the twentieth century explains its subsequent behaviour and policies. The style of Israeli imperialism is the brutal kind explained at the beginning of this essay. It is the type of imperialism that is designed to eliminate the indigenous population and replace it with the population of the imperial conqueror.

The relentless pursuit of their imperial aim explains the consistent policy of rejectionism when it comes to the so-called peace process. The peace process, as described by William Quandt (2005) has been going on since the 1970s. Here are some examples of the process: the Rogers Plan (1970–72) sought a resolution to the 1967 War issues based on UN Resolution 242. The Israelis rejected this. In 1978, President Jimmy Carter arranged for the Camp David I Summit between Menachem Begin of Israel and Anwar Sadat of Egypt. This meeting was to create a 'framework for Peace' that included, among other things, autonomy for the Palestinians. As is it turned out, according to Carter, Begin lied about his intentions to grant that autonomy and so, in terms of the Palestinians, that part of the Camp David process failed (Carter 2008). In 1991–93 there was the Madrid Conference which sought resolution of the Arab-Israeli conflict as well as Palestinian-Israeli issues. This failed in good part due to Israeli intransigence. In 1993 came the Oslo Accords which saw the return to Palestine from exile in Tunisia of Yasser Arafat and the PLO. Israel allowed this under the assumption that Arafat would keep order among the Palestinians while the Israelis continued illegal expansion into the Occupied Territories. When the PLO refused to perform this role, the Oslo Accords began to break down. In 2000, the Camp David II Summit took place under the auspices of the Clinton Administration. At this meeting Israel allegedly offered Yasser Arafat most of the West Bank but configured in such a way that it

hardly came to more than a series of Bantustans. Arafat rejected the offer as not amounting to a functional state. In 2002, the Arab League offered up a plan for solving the Israeli-Palestinian conflict that promised Israel full recognition from the Arab states and open trade in exchange for Israeli agreement to the 1967 line as the border of a Palestinian state. Israel refused. Finally, George W. Bush initiated the 'Road Map' for peace. Under this same rubric, and pressured by the Obama Administration, direct talks between Israelis and Palestinians took place in 2010 and again in 2014. President Obama aimed at a viable two-state solution. But these talks soon bogged down as well, largely due to Israel's reluctance to compromise on issues that they felt they could simply resolve by main force and the introduction of a relatively new demand: the insistence that the Palestinian side explicitly accept not only Israel's right to exist (which the PLO had done as early as 1988) but that it accept Israel as an eternal 'Jewish state'. As the Palestinian Papers (leaked to the public in January 2011) detailing the 2010 negotiations made clear, the Palestinians agreed to the vast majority of Israeli demands (Swisher 2011). And yet the Israelis turned up their noses and walked away. Thanks to US support, they could have all they want by virtue of their military superiority. And what they want is the West Bank (Judea and Samaria): all of it.

There can be no doubt that Israel is a an imperialist state, both in its origins and its continuing practice. That is why there has been no solution to its conflict with the Palestinians. The end of the era of European imperialism came when the cost of maintaining the imperial system was economically greater than the citizens of the imperial states were willing to bear. That is probably what, in the end, will bring down Israel as an imperialist state: when its outside allies cease to subsidise its imperialist policies and much of the world will no longer have economic intercourse with it, the Israeli Jewish citizens will have to bear the cost of their government's imperialist efforts by themselves. If history is any guide, that is when the Israelis will begin to rethink their imperialist character.
