Definition

Imperialism has been going through different historical configurations of the relations between the dynamics of capital accumulation and the interstate system – which includes military power as a key component. Imperialism defines, on the one hand, a general feature of capitalism as a global political economy and, on the other

hand, a particular practice of individual states. The contemporary period is analyzed against this analytical background. The case of France is offered to confirm the relevance of imperialism's theories.

This essay addresses two main issues. One is the relevance of theories of imperialism to investigate the contemporary period and two to describe where France stands on the world space. Its goal is not to deliver an exegesis of what Marxist said about imperialism one century ago, neither the divergences between them, no more than to list the actual relevance of the main characteristics they deciphered at their time. The core of the argument deployed for the purpose of this essay, drawing on the common substance of Marxist theories of imperialism, is twofold. One, for over one century, imperialism has been going through different historical configurations of the relations between the dynamics of capital accumulation and the interstate system – which includes military power as a key component. Two, imperialism defines, on the one hand, a general feature of capitalism as a global political economy and, on the other hand, a particular practice of individual states. Put otherwise, general features of imperialism are crystallized in concrete forms in countries that can be thus labelled as imperialists. The case of France is offered to confirm the relevance of imperialism's theories.

This essay is sketched out as follows. Its first part proposes to draw on the methodological substance of classical theories of imperialism to decipher the main features of the contemporary era. This implies that the world space constitutes the conceptual starting point to understand countries' concrete practices, concrete being defined as "the concentration of many determinations, hence unity of the diverse" (Karl Marx (1857–1861), "Grundrisse" [Outlines of the Critique of Political Economy], "Introduction"). More precisely, the international positioning of a country in the world hierarchy depends on its economic and military power. Then, the paper argues that at the end of the last decade, dramatic changes took place shaping what can be characterized as the "2008 moment." On the economic side, the 2008

financial crisis morphed into a long recession, increasing economic competition between large transnational corporations and also between top powerful countries. On the geopolitical side, the US inability to manage the chaos in Iraq following the adventurist war launched by G.W. Bush combined with the consequences of the 2008 financial crisis closed what, in a controversial way, was called the "unipolar moment" created after the USSR falling apart. Also, time-epochal is the emerging of China as a major geoeconomic power and Russia's military assertiveness. A major feature of the "2008 moment" is that economic and military power became closer with each other at the world level.

Part II of the essay is centered on France. It underlines the double singularity of France: the centrality of state in social and economic relations and centrality of the military in state institutions (Serfati 2017). It then provides an overview characterizing France's positioning in the world space. The "rentier" features of France, already observed one century ago, did not disappear. Nor did the importance of Africa for France's geopolitical and economic interests. As a way to explore theoretical hypothesis laid out in the paper, the last section connects France's military surge since the end of the last decades with the transformations that took place at the world level. France is with the United States, the western country where economic and politico-military powers are the most interwoven in the shaping of their international position, even though France and the United States are obviously not competing in the same league. France attempted to leverage its military power as a "competitive advantage" on the world space, while it suffered a loss of "economic competitiveness." The surge was driven by external drivers, the opportunities and constraints resulting from the "2008 moment," and internal drivers, the deep embeddedness of military institutions and ecoon. The military leverage is wielded for complementary objectives at the world level and at the European level (Serfati 2019), while at the national level, providing arguments for increasing military and security budgets which consolidates the weight of military-related vested interest.

The Relevance of Imperialism Concept and the "2008 Moment"

The Basic Message of Marxist Theories of Imperialism

Following groundbreaking Hobson's *Imperialism* (1902), Marxists contributed to highlight the major transformations in capitalist dynamics. They differed in their analysis on several points, and as noted by A. Brewer in his critical survey of *Marxist Theories of Imperialism* "Different writers used the word differently," something that led him to make no attempt to present a definition of imperialism (Brewer 1980). In the early 2000s, calls for the return of imperialism came not only from conservative American thinkers but also in Europe from T. Blair's former adviser, Robert Cooper (Cf Boot 2001; Cooper 2002). On the Marxist side, "classical" theories were revisited. Theories of imperialism elaborated one century ago were criticized by influential scholars for both their obsolescence (Panitch and Gindin 2013; Wood 2003) and their fundamental inadequacies, even to analyze the reality of the early twentieth century (Harvey 2007), while their relevance argued by others (Callinicos 2009).

The purpose of this essay is not to survey the debate (For a survey, see Serfati 2018a) but, considering that the framework offered by Marxist theories of imperialism is relevant, to adapt it to the realities of the early twentieth-century capitalism. For that, it is useful to expose our reading of the concept of imperialism. From around the 1880s on, a new era emerged from the development of capitalism, a process already perceived by Marx and Engels in the *Manifesto* and theorized by Marx as follows: "The development of the product into a commodity is fundamental to capitalist production and this is intrinsically bound up with the expansion of the market, the creation of the world market, and therefore foreign trade" (Theories of Surplus Value, Marx 1861–3, Chapter XV, Ricardo's Theory of Surplus-Value, https://www.marxists.org/archive/marx/works/1863/theories-surplus-value/ch15.htm), and Marx adds: "The tendency to create the world market is directly given in the concept of capital itself" (Grundrisse: Notebook IV – The Chapter on Capital, https://www.marxists.org/archive/marx/works/1857/grundrisse/ch08.htm). Against this framework and decades after Marx's writings, Marxists theories of imperialism pointed to two major changes in capitalism that can be summarized in the definitions given by Lenin and Luxemburg. For Lenin, "Imperialism is capitalism at that stage of development at which the dominance of monopolies and finance capital is established" (Lenin 1916). For Luxembourg, "Imperialism is the political expression of the accumulation of capital" (Luxemburg 1913). These definitions deliver two messages. (1) Accumulation and reproduction of capital lead to the creation of a finance monopoly capital which controls the different types of capital: productive, merchant, interest-bearing money, land, real estate, etc. (2) In her definition, Luxemburg means by "political expression" the creation of a world space – a term better adapted to the new reality than world market – which is deeply influenced by states, what she calls the "system of states," which hold a core role in the international reach of finance monopoly capital. For Luxemburg, it is not a definition by passing, as different chapters in her *Opus magnum* are devoted to the multiple facets of state's involvement in imperialism (on the system of international loans, militarism, etc.).

These definitions shed light on the two drivers of transformations of capitalism into imperialism: the dynamics of capital and the international system of states. These underlying drivers transformed imperialism over time, with different configurations – rather than stages – taking place. To the era of "classical imperialism," which survived until World War II, succeeded the 1945–1991 period and then the 1990s and 2000s decades, with a turning point analyzed as the "2008 moment" (below). Each of these configurations was characterized with different combinations at the world level of the mix between economic and political-military power.

The World Space as Totality and Nations as "Concrete Hence Unity of Diversity"

This reading of Marxist theories helps us to propose that imperialism as a concept bears two meanings. Imperialism as an analytical

framework can apply both to the general configuration of capitalism existing since the end of the nineteenth century and to practice of individual states and national capitalist classes in the global political economy. Of course, as stressed by all Marxists analyzing imperialism, the distinctive characteristic of the latter is that "national economic organisms [became] parts of a much larger sphere, namely, world economy" (Bukharin 1915). That means that the "world economy" constitutes the starting point which allows to understand countries' concrete practices, concrete being defined as "the concentration of many determinations, hence unity of the diverse" (Karl Marx (1857–1861), "Grundrisse" [Outlines of the Critique of Political Economy], "Introduction"). Marx applied this method to connect the world market and a home market, when he wrote that "the world market [. . .] is not only the domestic market in relation to all the foreign markets existing outside it, but at the same time the domestic market of all foreign markets, as, in turn, components of the home market" (Karl Marx (1857–1861), "Grundrisse" [Outlines of the Critique of Political Economy], "Notebook II – The Chapter on Capital"). A similar method is also at the basis of the uneven and combined development hypothesis formulated by Trotsky when he refutes Communist International Stalin-inspired views: "It is false that world economy is simply a sum of national parts of one and the same type. [. . .] In reality, the national peculiarities represent an original combination of the basic features of the world process" (Trotsky 1931). It is with the capitalist expansion acceding to a global reach that in some particular – and exceptional – situations, a country "under the whip of external necessity" proceeds through a combined development "by which we mean a drawing together of the different stages of the journey, a combining of the separate steps, an amalgam of archaic with more contemporary forms" (*History*, chapter 1 "Peculiarities of Russia's Development").

This analysis, which gives further substance to the "materiality of nations" (On the relevance of uneven and combined development as an analytical framework to analyze contemporary capitalism, see Desai (2013). For an application to the

European Union, see Serfati (2015)), explains the role of the interstate system, in interaction with capital accumulation dynamics, in the transformations of the world space. Of course, an international state regime preexisted to nineteenth-century capitalism (Teschke 2003), but it did experience dramatic changes both in its content and its shape in relation with the development of capitalist relations. As early as 1875, in a letter to the United Workers' Party of Germany, Marx stressed that "the 'framework of the present-day national state', for instance, the German Empire, is itself, in its turn, economically 'within the framework' of the world market, politically 'within the framework' of the system of states" (Marx 1875).

The dynamics of capital accumulation put the international system of states at a very far cry of moving toward a transnational state as claimed by some (Robinson 2007). A major reason for that is that the "universalizing tendency of capital, which distinguishes it from all previous stages of production" (Marx, K. Grundrisse: notebook v – the chapter on capital) does not proceed on a levelling "playing field," as social relations – and capital is a quite specific type of social relations – are territorially bounded and politically organized in separate countries (Serfati 2013) which constitute the interstate regime. As said, the existence of the contemporary interstate system cannot be seen as a residual legacy, still less a "vestige" of nation-states constituted before the development of capitalism, even though the latter transformed the form and content of the interstate regimes. Capitalism does not – and cannot – abolish the national or the local, but makes for denser, overlapping socio-spatial networks increasingly dependent upon national states to help arbitrate between the different scales of the circulation of capital (Brenner 1997).

This is one reason why speaking of "global capitalism" could be misleading. This expression introduces a confusion between two processes: the cross-border circulation of interest-bearing money capital (called fictitious capital by Marx) circulating at an electricity speed all around the world thanks to three decades of deregulation of financial markets on the one hand and the material condition of value which are made possible only

through a labor process on the other. The latter is anything but "global" even when it is organized within the global value chains created by large transnational corporations (TNCs). Most TNCs go on depending on a regional and national base for a large share of their activities and in a number of industrial sectors the relations with their home government remain essential. "Global capitalism" constitutes what could be called an "empty abstraction."

Moreover, the role of states in developed countries is not limited to supporting "big business" (large TNCs). As autonomous entities being separated from the immediate process of value creation, they are in charge of maintaining the cohesion of capitalist-dominated social relations, which "reflect relations of production in their totality" (Marx 1847). Reproducing these social relations over time requires several factors which by definition go beyond the immediate process of production; they include the existence of a repressive apparatus and protecting property rights law enforcement. It should be added that governments have to take in charge a number of activities which capitalists are not prepared to assume because of their lack of profitability (education, transport infrastructure, etc.). In short, the state reflects the whole society, even though it rules for specific capitalist interest.

At the world level, the contemporary interstate system, based upon international organizations (IMF, World Bank, WTO, etc.), helps to reproduce capitalist social relations everywhere in the world, and in that way, it performs a role similar to the one played out by most powerful national governments within their territories. It still does so this within very limits. One, there is no "global state" able to claim the monopoly of legitimate coercion at the world level, as the latter remains a space for economic competition between "many capitals" and for political rivalries between states. Two, the cohesion of the international system of states is strongly dependent on capital dynamics which is plagued with contradictions culminating in economic crisis, and the way those contradictions and their explosion are mediated by the most powerful states further undermines this cohesion. This is because powerful governments resort to a variety of instruments to defend their ruling class and to preserve the reproduction of social relations within the territory on which they have the "monopoly of the legitimate coercion." To sum up, it can be said of the alliance of most powerful countries on which the interstate system is based what Marx said that from capitalists in their national economy: "Capitalists form a veritable freemason society vis-a-vis the whole working-class, while there is little love lost between them in competition among themselves" (Marx, Karl, *Capital* Vol. III Part II, chapter 10). It's a reminder that agents, including the most powerful states at the macro- (national) or international level, are submitted to chaotic laws of capitalist competition which operates at the world level.

Military Power as a Key Component of the World Space

In the context of a global space shaped by the intertwining of capital accumulation dynamics and the interstate system, this section addresses the building blocks of the status of any particular country in this world space. This status depends on its economic might – what in mainstream economics is called its "international competitiveness" (its economic performances on the world market), which is generally measured by the size of its gross domestic product (GDP), its share of world market exports, and the magnitude of foreign direct investments carried out by its large corporations (transnational corporations). Another criterion of "international competitiveness" of a country underestimated by mainstream economists is its ability to accumulate financial incomes from abroad, a core feature in the theories of "classical imperialism." Today, in finance-capital-dominated regime (Chesnais 2016), draining value created in other countries remains one of the main characteristics of asymmetrical power in international economic relations.

The military power constitutes, besides economic power, the other crucial dimension of the international status of a country. That economic and military power matters was obviously the case before 1914. As seen in Table 1, the more powerful economic countries were also the most militarized. The same hierarchical ranking in the share

France and Political Economy of Contemporary Imperialism, Table 1 Top military countries in 1913: share of world military expenditures and of world GDP (%)

	Share of world military expenditures (1)	Share of world GDP (2)
United States	8.4	18.9
Germany	15.9	8.7
Russia	15.0	8.5
United Kingdom	12.9	8.2
France	12.5	5.3
Italy	4.9	3.5
Japan	3.6	2.6

of world military expenditures and of world GDP confirms that the relation between economic and military power was strong. An outstanding exception was the United States, and it was only from the 1940s onward that this "anomaly" would be corrected by the status of world leader endorsed by this country. Over the 1870–1914 period, France was the country with the higher military expenditures-to-GDP ratio (4.8%), ahead of the United Kingdom (2.95%) and Germany (2.86%) (Offer 1993).

It is also worth to note that in 1913 France, Germany, Italy, and the United States accounted for almost 44.6% of world military expenditures, while in 2017 the same countries which form the top core of NATO accounted for about the same share of world military expenditures (46.3%, SIPRI data).

One century later, economic and military power remains firmly linked in the international positioning of country. Table 2 ranks the top 20 countries by their 2017 GDP and their military expenditures. A couple of observations can be made. One, most countries are included in both lists, with the exception of Mexico, Indonesia, the Netherlands, and Switzerland (Conversely, Israel, Iran, Pakistan, and Taiwan are in the top 20 countries by military expenditures but not by their

GDP. Their respective rankings (Milex and GDP) are for Israel (16 and 31), Iran (18 and 26), Pakistan (19 and 40), and Taiwan (20 and 22, the latter figure being estimated from domestic sources, as the country is not listed in World Bank indicators)). Two, for many of them, the ranking in both lists is similar or pretty close. Exceptions are Japan and Germany on the top end, Russia on the middle end, and Saudi Arabia on the lower end of GDP countries. Eleven countries rank in both lists with a (small) margin difference in their place being between 0 and 3. Three, these quantitative data, while showing the proximity of economic and military power, do not deliver on how those two components combine with each other in the international positioning of countries. Despite the relative proximity of the two indicators, there are substantial differences in the way countries are managing their material capabilities. Suffice to think of the differences between France and Germany (For a detailed comparison between the

international positionings of the two countries as far as military power is concerned, see Serfati 2019). To understand how the two components combined in leading countries, a theoretical background is needed.

On the side of mainstream scholarship, the responses to the issue of economic and military power interaction are a large source of debate from "hegemonic stability theories," as developed by Kindleberger, Gilpin, and others to Kennedy's thesis on the US "imperial overstretch," to Nye's emphasis on the role of "soft power" as an instrument indispensable to powerful countries' domination called "leadership." In J. Nye's widely known parlance, military and economy are the basis for "hard power," while culture boost countries' "soft power," which represents an "attractive power." As hard and soft power are often interpreted as being independent and concurrent sources of leadership – for example, by opposing US hard power and EU's soft power – Nye is eager to remind that "Markets and economic power rest upon political frameworks, which in turn depend not only upon norms, institutions, and relationships, but also upon the management of coercive power" (Nye 2011). This is an extension to international affairs of A. Smith's claim that the "invisible hand" of the market needs an "iron fist" to thrive in a country ("Civil government, so far as it is instituted for the security of property, is in reality instituted for the defence of the rich against the poor, or of those who have some property against those who have none at all" Smith Adam (1776), *An Inquiry into the Nature and Causes of the Wealth of Nations*, Book V, Chapter 1). The theoretical framework on the relations between economy and military underlying the international positioning of countries proposed in the next section is quite different from the mainstream approach as illustrated in the next section.

The "2008 Moment" and the Tightening Economic and Military Power

A new configuration of relations between economy and military took place at the world level at the end of the last decade with a new combination in the capital accumulation-interstate system nexus. The "2008 moment" closed the historical period opened in the early 1990 by the collapse of the USSR. The "2008 moment" was a conflation of economic and geopolitical seismic changes that had been simmering since the early 2000s. On the economic side, what began as a financial crisis morphed into a long recession (Carchedi and Roberts 2013). The overt or latent overproduction produced by the accumulation of manufacturing capabilities – not an exclusivity of China – is visible in a couple of sectors going beyond the steel one. In late 2017, a survey showed some or significant overcapacity in over half of sectors globally (Williams et al. 2017). And while the recovery is applauded in mainstream reports, between 2007 and 2018, the mass of debt fueled by a generous (for business) very low interest rates policy rose by 78% in constant dollar rate for the world nonfinancial corporations sectors (MCGI 2018). This ballooning of the private debt signals that the world economy is set again for a financial crisis of a wider scope and effects than in 2008.

On the geopolitical side, what, in a controversial way, was called the "unipolar moment" crumbled with the US inability to manage the chaos in Iraq following the adventurist war launched by G. W. Bush which combined with the consequences of the 2008 financial crisis at its epicenter. This US imperial disaster, which, "from a strategic point of view, is worse than Vietnam" (Thompson 2011), facilitated the return of Russia as a major geopolitical factor, as well as it opened the way to the ambitions for Iran to emerge as regional power in the Middle East. Also, the destabilizing effect of this war and other imperialist wars in the region was an accelerator for the "Arab Spring," whose deep roots were the protracted economic blockage that produced explosive social consequences. Finally, this profound change in the international status of the United States which characterizes the 2008 moment was also provoked by the full-speed development of the Chinese economy and the strengthening of its military and technological capabilities.

In this context, after having massively intervened in their national economy through rescue packages offered to banks and manufacturing industries (automotive) in the aftermath of the

crisis, governments of developed countries have continued to intervene, and they even widened the range of instruments to defend the economic interests of their country. Protectionist measures are on rise with, according to research, 73.5% of G20 exports facing some type of trade distortion in foreign markets, ten times the trade coverage of protectionism reported by the WTO (Jones 2017). Protectionist measures are in priority used by the top world economies: the world's top 60 economies have adopted more than 7000 protectionist trade measures on a net basis since the financial crisis and tariffs are now worth more than $400 billion (Evenett and Fritz 2017). They are now backed up with invocation of national security by governments. This acts as a covert form to promote a protectionist policy while governments go on speaking of "free trade." Despite the systematic recourse to national security, it is noticeable that "national security" is a loose notion ill-defined both in international and national regulation (Freshfields Bruckhaus Deringer 2018).

The increasing resort to the argument of national security by governments to erect protectionist barriers signals a clear reversal of trade and foreign investment policies carried out during post-World War II six decades ago. Architects of GATT – the General Agreement on Tariffs and Trade set in after World War II – and their successors at WTO were aware of the risks of including in the charter the "possibility by any Member of measures relating to a Member's security interests because that would permit anything under the sun" (Bhala 1998). GATT's Article 21 still provided states with a "security exception" with practically no chance for a country to challenge the decision before the dispute settlement body as nothing in the GATT prevents a WTO member from taking "any action which it considers necessary" to protect its "essential security interests," making each WTO member the sole judge of whether its trade-restrictive actions are justified (Murrill 2018). The strong growth of international trade in post-World War II decades limited the need for governments to resort to Article 21's protectionist clause. Then, the dangers of over-using national security concerns seemed lowered with the creation of WTO (World Trade Organization) in 1995 – at the heyday of the triumph of the "Washington Consensus" (deregulation, liberalization, privatization). One, WTO mechanisms were oriented toward legalizing dispute resolution and depoliticizing investment disputes through the widespread use of investor-state arbitration instead of diplomatic protection. Likewise, trade and investment treaties that multiplied until the 2008 financial crisis involved a relative separation between the economic and security realms (Roberts et al. 2018). Two, the continuation of the strong growth in international trade marginalized the rare cases of states invoking Article 21.

This period seems over since the end of the last decade. As the related WTO's Article 21 was hardly used during the heydays of 1990s and early 2000s trade expansion, it has now so frequently used as to become a core concern that "the GATT provisions [...] come closest to allowing a member to be a "cowboy" (Bhala 1997–1998). Arguing national security concerns to defend their national capital by large powerful countries against foreign competition reflects the deep unevenness of international relations, as a majority of countries must comply with what is decided by a small set of countries. Such rhetoric has also as a direct consequence to increase tensions between most powerful countries, as it transfers competition from the economic field to existential threats against the integrity of the country, something which reminds the pre-World War I's international relations. The US Administration is very active and this conduct began before Trump election. The number of mergers and acquisitions by foreign entities reviewed by the Committee on Foreign Investment in the United States (CFIUS), the government body in charge of determining the effect of the transaction on the national security of the country, doubled from 65 in 2009 to 143 in 2015 (CFIUS, Annual Report to Congress for CY 2015, 09/2017). Since that date, the Trump Administration repeatedly used the threats to national security rhetoric and mixed economic competition coming from China and Russia with the military challenges to US national security. In December 2017, the US National Security Strategy deemed China a "revisionist power" and a

"strategic competitor" that uses "predatory economics" to intimidate its neighbors and declared that "economic security is national security." The United States-China competition is thus a fresh reminder that economy and military power interact with each other in most powerful countries' agenda, with the United States setting the tune for the whole international relations and triggering in turn reactions from China. In a somewhat different vein, but still aggressively, D. Trump also linked economic and political leverage vis-à-vis the EU when he simultaneously declared that the "EU was formed, partially, to beat the United States on trade" and that NATO's European members aren't paying enough for defense, with the risk of United States withdrawing from the alliance (Johnston Jules, "Donald Trump says EU exists to compete with US presidential hopeful hits out at EU, WTO and NATO, Politico, 7/24/16).

Putting Economic Competition-War Relationships in Context: From Globalization of Wars to "Wars of Globalization"

For free trade believers, the current wave of protectionism risks to morph into trade war and fatefully to pave the way to war. Since the French philosopher Montesquieu declaring in his 1734 *Spirit of law* that "Peace is the natural effect of trade" to Norman Angell stating in 1912 that interdependence of nations and growth in trade relations would make war obsolete to the 1990s mainstream economics and political sciences based on the "Peace-Democracy-free markets" (PDF)-format globalization, the claim that free market and free trade capitalism consolidate peace and that protectionism is a prelude to war has a well-established tradition. Indeed, it's a too narrow framework to establish a direct correlation between free movements of goods and capital and peace. This correlation is based on the belief that interdependence means politico-military equality between nations and on the economic side, mutual gains between trading countries. On the contrary, on the world space, the reality is interdependence in unevenness, where rules of the game are set by the most powerful countries.

"Interdependence" in economic relations was at length underlined by students of "classical" imperialism, which entailed an extended practice of cooperation between rival countries as well as between their competing large firms. Cooperation went through the setting up of cartels in industries and bank syndicates to lend to dependent countries. Cooperation went so far to involve the top arms producers of Britain (Vickers), France (Schneider), and Germany (Krupp). Also, governments of rival countries massively traded with each other, including in the sector of arms. As late as 1912, the Russian government went on buying naval equipment from Germany. European governments also cooperated to conquer markets and distribute territories, with the well-known "scramble for Africa," jointly deploying violent and deadly means against indigenous populations. Still, interdependence also meant rising tensions, including through localized armed conflicts between large powerful countries between 1880 and 1904. In short, wars were not incompatible with increased economic and financial interdependence between most powerful countries.

After World War II, the relations between economic competition and inter-capitalist countries' wars dramatically changed mainly because of the economic and military US domination unchallenged by other western countries and the overarching presence of the Cold War, along with a massive popular condemnation of massive extermination ("never again"). Wars between developed countries ceased, and the breaking apart of USSR confirmed for many commentators the disconnection between economic competition and armed conflicts. In this context, wars at the time of "classical imperialism" were reinterpreted in mainstream literature as driven by "precapitalist forces," a thesis already defended in the aftermath of World War I by J. Schumpeter. On the Marxist side, E.M Wood notes that "For the first time [since 1945] in the history of the modern nation state, the world's major powers are not engaged in direct geopolitical and military rivalry." She goes on that "Capitalist imperialism has become almost entirely a matter of economic

domination" and concludes "it can be a very bloody business. But once subordinate powers are made vulnerable to those imperatives and the 'laws' of the market, direct rule by imperial states is no longer required to impose the will of capital" (Wood 2003, *op. cited*, p.153).

The view adopted in this essay is different. Wars did not disappear from the scene since the end of World War II, no more than the collapse of USSR, labelled as the "empire of evil" by R. Reagan, put an end to wars. True, they did not involve western countries fighting with each other, but several post-war military US interventions or "covert actions" to impose regime changes (Iran's Mossadegh, Guatemala, Chile, etc.) had as main goal not only to protect the interests of US companies against recalcitrant governments supported by rival countries (USSR/Russia, China). They had also a "demonstration effect" vis-à-vis European and Asian allies and otherwise economic competitors. Likewise, France in over hundred military operations launched since decolonization, mainly in Africa, aimed at preserving its geopolitical and economic interests – both are closely knitted with each other. French military operations – and still more US ones – have also a "demonstration effect" for allied countries: France cannot be rivalled by any country member of the "transatlantic bloc" (For an initial description of the "transatlantic bloc," see Serfati (2004), and for its updating in Serfati (2019), *op. cited*.) to cope with the chaos affecting large African territories, and this buttress its military expertise on the ground which is largely acknowledged, and even welcomed by the US military, more accustomed to fight from the air. As said by some experts, the French Barkhane military operation in Sahel has become the UN "life insurance" (Mena Analysis, "French Military Strategy in the Sahel" 16 January 2016, p.2). The conduct of the United States and France offers some similarities with what happened over one century before: controlling militarily areas of influence – through formal or informal colonization – was a way to resist economic competition from other countries. In short, "imperatives and the 'laws' of the market" have to be *permanently*

military monitored, even though today, there is no formal colonization any longer for several reasons, including the too much costly financial burden of "white man's that should be borne out to promote education, health, etc. in countries plagued with 'local wars'."

More broadly, militarism and war must be put in context. The era of "classical imperialism" was marked by globalization of war, a process foretold by Engels three decades before the outbreak of the world war when he wrote "And, finally, the only war left for Prussia-Germany to wage will be a world war, a world war, moreover, of an extent and violence hitherto unimagined. Eight to ten million soldiers will be at each other's throats and in the process, they will strip Europe barer than a swarm of locusts" (Engels 1988).

What has emerged from the 1990s onward are armed conflicts often called "new wars" but which could better be defined as "wars of globalization" substituting to 'globalization of wars' as observed in the twentieth-century. Most wars thriving in less developed countries are a *component* of "really existing globalization." Local wars are connected to the world economic (trade, finance, arms) and geopolitical setting through several channels (Aknin and Serfati 2008). This analysis contrasts with what researchers at the World Bank's calls "ethnic wars" which plagues dozens of countries and which they interpret as a *consequence* of their insufficient economic integration in "globalization" and of not adhering to "good governance." Not only those wars did not wind up since the early 1990s, but they have been on rise in last 10 years. The number of armed conflicts in the world in 2017 was 49, leading a think tank collecting data on them to observe that between 2008 and 2017, there has been an ongoing deterioration in global peacefulness (Institute for Economics and Peace 2018), with the human cost of conflict – death and forcibly displaced – rising to 68.5 million people in 2017 (roughly 1% of the world population) from 39.5 million in 2006 (UN Office for the Coordination of Humanitarian Affairs (OCHA), 2018 World Humanitarian Data and Trends report).

The Case of France

Two Singularities of France

A brief historical overview highlights two singularities of France (Serfati 2017, *op. cited*). One is the multisecular centrality of state institutions in social and economic relations. Sure, the power of the state with it "systematical combination, embracing the colonies, the national debt, the modern mode of taxation, and the protectionist system" was necessary everywhere in Europe to hasten the transformation of the feudal to capitalist mode of production (K. Marx, *Capital*, Vol. 1, chapter 31). Still, the way state institutions operated in each country depended upon class relations, and the configuration of class relations in France accounts for the centrality of state. In France, the violent conflict between the Monarchy and the nobility led the former to organize a highly centralized bureaucracy. Then, the absolute monarchy fought against bourgeoisie's claims through consolidation of the aristocracy and the church. The aristocracy was directly interested to accept the maintenance of the old system, as many of them acted as *fermiers généraux* (office holders) and collected of revenues flowing from seigneurial rights (Soboul 1956), further reinforcing the grip of state power on people. The momentum gained over centuries by state institutions consolidated during the 1789 revolution. The antagonism between the aristocracy, which had increasingly been integrated as key component of the absolute monarchy, and the bourgeoisie (This presentation is different from Teschke who argues that "In the run-up to Quatre-Vingt-Neuf, the class distinctions between the bourgeoisie and the aristocracy had become blurred," Benno Teschke Bourgeois Revolution, State Formation and the Absence of the International," p.12), drawing on the nascent proletariat (in Paris, the *sans culottes*), led the bourgeoisie to overthrow the monarchy and in turn to seize the state machinery to defend at home against royalists and abroad against the European coalition.

Alexis de Tocqueville and Karl Marx, in their comprehensive analysis of France, and despite their opposite political position, converged to underline how embedded was the strong sate centralization of the country (box).

> Toqueville wrote: "The reason why the principle of the centralization of power did not perish in the Revolution is that this very centralization was at once the Revolution's starting-off point and one of its guiding principles centralization fitted so well with the program of the new social order (after 1789, C.S.) (De Alexis De Tocqueville, "The Old Regime and the French Revolution," Knopf Doubleday Publishing Group, p.60) [. . .] "I assert that there is no country in Europe in which the public administration has not become, not only more centralized, but more inquisitive and more minute it everywhere interferes in private concerns more than it did; it regulates more undertakings, and undertakings of a lesser kind; and it gains a firmer footing every day about, above, and around all private persons, to assist, to advise, and to coerce them" (De Alexis De Tocqueville (183–1840), *Democracy in America*, vol. II, Part 4, chapter V).
>
> As for Marx, it was in the *18 Brumaire* that he analyzed the economic and social content of *Bonapartism* and concluded: "The executive power with its enormous bureaucratic and military organization, with its wide-ranging and ingenious state machinery, with a host of officials numbering half a million (besides an army of another half million) — this terrifying parasitic body which enmeshes the body of French society and chokes all its pores, sprang up in the time of the absolute monarchy" (Marx 1852).

All over the nineteenth century, the growth of state apparatus in France responded to a mix of drivers. One, all struggles between social classes generated by the development of capitalism – mainly between the working class and the bourgeoisie and to a lesser extent between peasants and large landowners – and also the struggle

within the ruling classes (finance, industrial, merchant) were arbitrated and settled by a further centralization of state apparatus and the strengthening of Paris vis-à-vis *province* (the countryside). Two, the hyperdevelopment of state institutions consolidated the bloc of financial interest over industry, as the public debt supported a mighty financial aristocracy and the growth of a strong banking system, while the industrial bourgeoisie conquered a more modest place than in England and later in Germany. The weakness of "entrepreneurial spirit" made the industrial bourgeoisie strongly dependent on industrial policy and more generally on state institutions. As Marx put it, "In England industry requires free trade; in France, protective tariffs, national monopoly alongside the other monopolies" (Marx 1848). The weakness of private entrepreneurship was somewhat compensated for by the development of a technical elite, trained in high school, a unique French system separated from universities and based on a strong selection of the top students, which carried out large technological projects in infrastructure (railways, water) and more recently in defense industry with weapon and nuclear systems. Moreover, this generated a permanent circulation of elites between large industrial groups and state institutions, reinforcing osmotic links between business and state. Three, in a country where class struggles have a long tradition, state institutions were inflated because of the need for the ruling class to codify social rights in state institutions (Note that institutionalization within state is not inevitable. The major social conquests won by the French working class at the end of World War II were institutionalized in the system of *Security Sociale* (SS) which was co-managed by labor and capital's representatives. The process of "étatisation" of SS accelerating after the 1973 crisis is an attempt to expel the labor of the direct control on the budget constituted by their contributions (seen in France as a "salaire différé," or deferred wage, that is as a part of their wage labor in case of illness, for retirement, etc. and not as a gift coming from a welfare state)). Four, the centrality of state in France was a consequence of the capacity of any state bureaucracy to reinforce its

power and trigger a self-growth process. Mechanisms of self-growing bureaucracy, explicitly analyzed in Marx's *18 Brumaire* (or by Trotsky in the case of bureaucratization of the Soviet regime),, are a cogent vaccine against Marxist analysis reducing the state to an "instrument" of capital.

Two, the centrality of the military institution in the making and the consolidation of the state constitutes another singularity of France. As documented by the historian C. Tilly, it has been a common feature in the consolidation of modern state (Cf chapter 3 "How War Made States, and Vice Versa," Tilly C. (1990), *Coercion, Capital, and European States*). The turn taken by political and social struggles in France however gave a prominent role to the armies, long after the wars – waged to extend the territories and populations on which taxes and rents could be collected – and Colbert's economic dirigisme were made inseparable under the long Sun King reign (1643–1715) (A statistical estimate, presented by their authors as *only illustrative* is that war expenditures accounted roughly 57% of total expenditure in 1683 and about 52% in 1714 (Eloranta and Land, 2011). According to some, the development of absolutism in France, based on a permanent reinvestment in the means of coercion by the ruling class, for internal rent extraction and external plunder, remained the normal strategy for expanded reproduction which entailed a "geopolitical accumulation" (Teschke 2006). This long tradition of "geopolitical accumulation" is rejuvenated, although in a quite different setting brought about by capitalism, in the "2008 moment" (below).

In a comparison with Prussia, it has been noted (Posen 1993) that the development of a mass army needed the spread of literacy, initially down to the level of the noncommissioned officer, to facilitate command, training, and political motivation. The first mass army depended ultimately upon a political revolution whose ideology, redolent of nationalism, stressed the equality and community of all Frenchmen. Even when conscription was abolished by the Bourbons in 1814, addressing education for soldiers remained an objective. A study of incoming conscripts in the late 1820s revealed that only about half could read.

Regimental schools were also instituted to teach the necessary skills.

Armies were deployed in the numerous wars with other European countries as well as to conquer colonies, but they also played a critical role at home to promote regime changes, generally provoked by popular working-class movements. A short chronology indicates the extent to which social insurrections interacted with regime changes. The 1815 Charles 10's Bourbon restauration came in the aftermath of Napoleonic regime crumbling and meant the return to an extreme reactionary monarchic regime. In 1830, a popular insurrection ended the French Bourbon monarch and ascent of his cousin Louis Philippe, Duke of Orléans, setting domination of the "finance aristocracy" (Marx) and provoking in reaction between 1831 and 1835 a number of uprising in France (*Canuts* at Lyon, barricades in Paris, etc.). Then in 1848 a proletarian demonstration with the rallying cry "République sociale" – first stage of the "People spring in Europe" – paved the way to a short-lived Second Republic and then, in 1852, to Louis-Napoléon Bonaparte's imperial regime. In 1870, the rout of Napoléon 3 to Prussia was followed by the *Commune de Paris* (April–May 1871). The latter was massively repressed by the armies with thousands of deaths during the *semaine sanglante* (bloody week).

After the Third Republic was proclaimed in 1870, following Bonapartism' meltdown, as archetypal of a parliamentary democracy, governments set in a new role for the army. Its democratic mission was encouraged with the introduction of universal *military* conscription. The conscription now extended to all males was accompanied by series of laws (1880–1882) that made education compulsory and free for children aged 6–13. The patriotic content of the curriculum aimed at reinforcing nationalism and it was instrumental for the preparation of the next war ("la revanche") with Germany and for colonial conquests to bring "barbarian" people the benefits of highest races' civilization (Jules Ferry, the architect of the deep reforms of the education system, said: *" les races supérieures ont un droit vis à vis des races inférieures [. . .] Elles ont un devoir de civiliser les races inférieures"* (Highest races have a right

upon lowest races [. . .]. They have the duty of civilising lowest races)., *Journal Officiel*, 28 July 1885). Mixing education at home and civilization mission abroad was also aimed at infusing in popular class' conscientiousness the benefits of colonization, the latter being on the side of "us" while colonized people being "them."

In this section, we focus on the role of army against the "enemy within," i.e., the "laborious classes" transformed into "dangerous classes." In 1902, at the interior minister, an emergency plan was elaborated to cope with a general strike at the national level (Cooper-Richet 1998). Coal mine workers were particularly targeted, with Eugène Schneider and other bosses "from the largest to the smaller company, calling for army during all the century, as soon as mine workers protest" (Id., p.64). But they are not the only workers in this case. Gendarmerie, which received from Napoleon 3 (1 March 1854 decree) the mission to "restore order in case of popular riots or rebellious demonstrations," was frequently mobilized, but has to be shouldered by army so frequently between 1871 and 1914 that two historians remark that "There was no decisive stage in the worker's movement in which the troops were not called to reinforce gendarmerie" (Mayeur and Rebérioux (1987). The army intervened in one out of five strikes between 1870 and 1890, but this rate increased in the early 1900s. Houte (2008)). Comparative studies show that the use of the army against workers were more frequent in France than in other European countries (For a comparison with Prussia, see Johansen 2001). Faced with the difficulty to use draftees – often sociologically close to workers demonstrating and prone to fraternization with workers – the French government created in 1921 a specific military force, *la gendarmerie mobile*, the role of which is to address social demonstrations, a proposal already made by the military staff in the early 1900s.

The connection between the "enemies within" and colonization was even physically established when Marechal Bugeaud, celebrated for his strategy of permanent warfare against Algerians struggling to resist French colonization, proposed to King Louis Philippe to crush the revolution at

home (the 1848 French revolution), stating that "he had never been lost a fight, either on battlefields or against insurrection" and was keen to "destroy the rabble" (Cited in Marx, K., who wrote with Engels' support an article on Bugeaud in *The New American Encyclopedia* (1858)).

Despite the central role held by the armies in France and in colonial conquests between 1871 and 1914, the Third Republic could never get a total loyalty to Republic's value from the officers. A number of them were anti-Republicans (Monarchists, Bonapartist, etc.). They often took side with the Catholic Church to challenge the Republic. The Dreyfus Affair (1894–1906) was a climax in antisemistism and antirepublicanism, with the minister of war leading the charge. A few decades later, when Maréchal Pétain was appointed as ambassador to Franco's Spain in 1939 by the Daladier government, he considered his mission as a way "to expiate the sins of the Popular Front" (Szaluta 1974), even though he was fully trusted by the former *Front populaire's* Prime Minister Léon Blum (1936–1938) at the time of his appointment in Spain. Back to 1932, he had overseen a report on the "enemies within" (*ennemis de l'intérieur*), mainly the Communist and other left-wing parties which he believed could take advantage of German aerial bombing to organize an insurrection (Général Voiriot 2001).

Pétain was obviously by no means an exception. During the interwar, a large share of the officer's cast was anti-Republican, and a number of them were active in extreme-right secret movement that attempts to topple elected governments. Another enduring feature is that many of them cultivated hatred of the extreme-left parties (Paxton 1966).

A "Usurary Capitalism"

The previous section gave some insights on the centrality of the state and the military in France's social relations. This section focusses on some peculiar characteristics of France on the world space. Marxists writing on imperialism were aware that the general features of imperialism, as a new historical era, found concrete determination in particular practices by leading countries in the

world economy (above). In their comparison between the few imperialist countries, they noted France's singularities. Lenin noted in his major opus that, "unlike British colonial imperialism, French imperialism might be termed usury imperialism" (Lenin (1916), *Imperialism…*, op. cited, chapter 4.); Trotsky wrote that "France is the classic land of finance capital" (The Struggle For State Power Democracy, Pacifism And Imperialism (30 June 1917)). Since Marxists saw the domination of finance capital as an outstanding feature of the new capitalist era, that France was archetypal in this way needs some clarification on the concept of finance capital. In short, it is needed to leave Hilferding's challengeable definition of finance capital as "capital controlled by banks and employed by industrialists" (For a critical reading of Hilferding's *Finance capital*, see Serfati 2018b) and for that to consider capital as a social relation based on exploitation of labor *simultaneously* incarnated into productive equipment and property rights. Our reading of Marx (Id.) is that financial revenues (dividends and interests) are endogenous to capital as an exploitative social relation and not only to loan capital. Then, as underlined by Lenin, "Imperialism, or the domination of finance capital, is that highest stage of capitalism in which this separation [between productive and property capital, C.S.] reaches vast proportions. The supremacy of finance capital over all other forms of capital means the predominance of the rentier and of the financial oligarchy" (Lenin 1916, *op. cited*, chapter 3). Sure, creation value only proceeds through a labor process. However, capitalism is not a mode of production but of social domination based on private ownership. Holding property rights (shares, bonds, loans, etc.) allows individuals and nations to claim a share of value created and by anticipation on future value. Put otherwise, for capitalism, producing goods is always a mean to produce value, never an end. In remarks anticipating what would become decades later the triumph of rentier capitalism, Marx notes that "All nations with a capitalist mode of production are therefore seized periodically by a feverish attempt to make money without the intervention of the process of production" (K. Marx, Capital Volume

II, Part I, Chapter 1, https://www.marxists.org/archive/marx/works/1885-c2/ch01.htm).

What is suggested in Lenin's and Trotsky's citation is that, while everywhere the capitalist dynamics became at their time dominated by finance capital, the "feverish attempt" for investments in property capital (in the sense of usurary capital) was more marked in France. This preference was due to several factors. One, the pregnancy of a mighty rentier class, whose birth dates back to the large sovereign debt of French public finances (due to wars and high military expenditures) well before the nineteenth century. Then, all over the nineteenth century, the thriving of a rentier class was facilitated by the presence of a large peasant population maintained thanks to the fragmentation of land ownership following the French revolution. The peasants, together with retail shoppers, were leveraged as a political counterweight to working-class movements by governments and in army to repress working class' strikes. Two, the successive regimes facilitated the consolidation of financial interests. It was the case during the Louis Philippe regime (1830). As said by Marx "It was not the French bourgeoisie that ruled under Louis Philippe, but one *faction* of it: bankers, stock-exchange kings, railway kings, owners of coal and iron mines and forests, a part of the landed proprietors associated with them – the so-called *financial aristocracy*" (Marx, K., *The Class Struggles in France, 1848 to 1850*, January–October 1850, https://www.marxists.org/archive/marx/works/1850/class-struggles-france/index.htm). Then, the Bonapartist regime (1852–1870) ran an industrial development based on large state-funded projects in infrastructures combined with a firm support to the banking system (the *Credit Mobilier*, a large French joint-stock bank founded in 1852 by Pereire brothers, represented a major experience of collecting savings to fund entrepreneurs).

The Third Republic (1871) was an era of prosperity for the rentiers. Their number considerably grew until World War I, reaching by 1910 eight million of depositors in French savings banks, and in 1913 their total assets were close to six billion francs – equivalent to around 18% of the French national debt (Ferguson 1994). A general improvement in revenues facilitated by strong macroeconomic growth increased considerably the wealth accumulated in France and made Paris "the quintessence of what one might indeed call a 'rentier society'" (Piketty et al. 2011).

Even after the defeat to Prussia, the French government was able to issue with a huge success two 5% government bond issues of 1871 and 1872 to finance war indemnities. Encouraged by a strong rentier social base, the French governments took measures to stimulate Paris as a major financial place with, as an evidence of state centrality, a tight control on the financial markets. In particular, it encouraged to invest in foreign securities with such a success that in 1911, foreign security purchases accounted for 38% of total French portfolio, from 25% in 1887 (Arbulu and Vaslin 2000). An appreciated measure was the passing of a law in the late 1880s exempting sovereign bonds from the introduced income tax and charging lower rates of stamp. Governmental initiatives facilitated the development by top French banks of a large network of foreign subsidiaries to promote foreign securities purchases.

This activism to issue foreign securities paid off for rentiers. On the 1880–1913 period, the return of foreign securities was much higher in France than in Britain: for the shares 12.84% vs 7.66% and for the bonds 6.88% vs 4.42% (Esteves 2011).

Three, the appetite for rent – and increasingly for foreign rents – could have been linked to a neglect for investing in domestic stocks. A research found that "French investors neglected French investments as the expected rate of return decreased, and turned to foreign assets when the anticipated rates of return on these investments increased" (Parent and Rault 2004). The authors conclude that it is a rational economic behavior based on diversification of portfolios in order to maximize the return-security couple. In any case, high, attractive returns on foreign securities were strongly linked to French government's involvement, something which made loaners more confident. The case of Russia is quite significant with an estimated 1,600,000 underwriters in France to the 14 loans negotiated with Russia until 1914 (Feis 1930). After 1880, Russia became the

leading recipient of French foreign investments, accounting for over 27% percent of them in 1914, from 7% in 1882. Russia was such a protected area for French finance capital, that in 1914, of the government owned debt 80% was held in France and only 14% in Great Britain. Nevertheless, the rate of growth of net overseas private long-term assets was considerably lower for France than for the United Kingdom (Fishlow, Albert, "Lessons from the Past: Capital Markets During the nineteenth Century and the Interwar Period," *International Organization*, Vol. 39, No. 3, Summer).

In the literature, the difference in respective orientation of foreign capital between France and the United Kingdom is often underlined. A majority of foreign securities was sold by French financial institutions to governments, an outstanding feature when compared to other developed countries. In several contracts negotiated with foreign governments, a clause required by the French government was that loan was conditional upon acquisition of French equipment by the borrowing country. Outstanding example is the Franco-Russian loan. They were associated with an active involvement of French companies, some of them through exporting from their home country, others by setting up local subsidiaries in metallurgy, mechanical equipment, oil, and mines.

Military orders were still key to the loans. To give an example, the French government used the occasion of the loan negotiations of 1909 to get orders for naval yards and equipment despite they were more expensive than their German rivals, as they could not have won the contract "in conditions of normal competition" (Spring 1988). Large French weapon producer Creusot took a direct part in the negotiation of loans proposed by French governments, and often the armament firms made advances, until the state of the market and disposition of the government should permit the issue of a public loan (Id., pp.127–128).

Other examples include the Bulgarian loan of 1896, when confronted to a contest between Krupp (Germany) and Schneider (France), the French government insisted on orders as a condition of placing the loan in Paris. A few months before the world war broke out, the bulk of a loan to Turkey was used for military preparation.

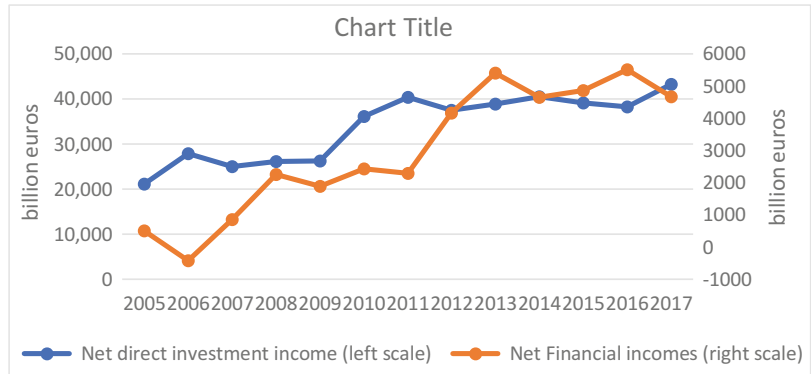
Turkey ordered in France six destroyers, two submarines to be built by Creusot, mountain guns, and seaplanes. Symptomatic of the conduct of governments and armaments firms, at the same time, a French mission was strengthening the Greek army and fortifications, and French firms received orders for weapons paid by the Greek government with the loan made by France (Feis, H, *op.* cited, p.329). Note that selling arms to two belligerent countries as were Greece and Turkey is a tradition French governments have kept on in the last decades (e.g., selling to India and Pakistan) .

All in all, Paris was a major financial power, ranking three behind London and New York in 1914, organizing complementary with London and benefiting from a very concentrated structure encouraged by the government.

France's Geopolitical and Economic Interests in Africa

France is one of five permanent members of the United Nations Security Council. In 2018, it ranked sixth in terms of world gross domestic product, seventh in terms of Portfolio Investment Assets (which are pure financial assets invested abroad), fifth in terms of Portfolio Investment liabilities (International Monetary Fund, Coordinated Portfolio Investment Survey (CPIS)), and eight in terms of both outward and inward foreign direct investment position (OECD, Foreign Direct Investment Statistics: Data, Analysis and Forecasts, http://www.oecd.org/corporate/mne/statistics.htm). The extraction of value produced in foreign countries by developed countries, a major feature of "classical imperialism," has not remained an exclusivity of the United States. As showed in Fig. 1, since 2009 net financial services (receipts less expenses) that accrue to French banks and other financial institutions (right scale) have continuously increased. Likewise, a few dozens of French transnational non-financial corporations have been accumulating a growing amount of revenues from their offshore activities (left scale) while repatriating at home a growing share of these revenues: the share of dividends in total revenues from their offshore activities has jumped to 79% in 2017 from 49%

France and Political Economy of Contemporary Imperialism,

Fig. 1 Revenues from foreign activities by large industrial and financial groups. (Source: Author from Balance of Payments data)


Source : Author from Balance of Payments data

in 2005). It is one reason for why France ranks also in the top of countries in terms of global gross financial assets of private households, sixth by the number of millionaires despite a limited total population compared to other industrialized countries (Crédit Suisse, *Global Wealth Report 2018*, October).

France is also a major military power. In 2017, according to SIPRI data, it ranked fifth in terms of military spending and sixth in terms of arms exports. France also stands as a major geopolitical power, thanks to the holding of a permanent seat at the Security Council. This position was awarded in 1945, when the countries having won the war gave themselves permanent membership, enjoying a privileged situation, with an exclusive veto power on world affairs. France's permanent seat is based on two pillars: the holding of nuclear weapons and the ambition to play a role in the world order through its strong regional presence in Africa and, to a lesser extent, in the Middle East. This explains that at the 1945 San Francisco conference and in the next decade, France, with the help of Britain and Belgium, waged an enduring action to prevent the UN to create a supervisory role for the UN in colonial territories (Pearson 2017).

The next sections focus on the role of Africa, which, by the interaction of economic and geopolitical factors, allowed France to remain a world power, while its economic influence on the world space has seriously declined in the last 10-plus years. It addresses the role of the region for French interest under "classical" imperialism and, then,

its enduring importance in contemporary era as evidenced by an acceleration of large military operations.

"Classical Imperialism": The Role of Colonies

On the eve of World War 1, France and Britain controlled most colonies in the world, and France possessed the largest Empire in African history.

There has been a long debate, backed on historical research to discuss the relationships between imperialism and colonialism. Both are sometimes considered as identical in the literature, a critic at times made to the Marxist approach to imperialism, as *real* colonization by European powers is said to have brought about limited economic benefits. Still, in the Marxist literature, imperialism is not equated with colonialism. There is a compelling evidence that Lenin did not confuse both processes (See his major opus, but also his notebook preparatory to the latter, "*finance capital (monopolies, banks, oligarchy, buying up,* etc.*) is not an accidental excrescence on capitalism, but its ineradicable continuation and product.... Not merely colonies, but also (a) export of capital; (b) monopolies; (c) a financial network of connections and dependencies; (d) omnipotence of the banks; (e) concessions and bribes.*" See also Stokes 1969) (who shows that the objective of Lenin's major opus was not to explain the formation of colonial empires but the driving forces leading to war). Instead, the deep interaction between economic, political, and cultural drivers is present in this literature.

As regards France, it is only by proceeding with economic reductionism and having a deep misunderstanding of the role of Africa in the history of French capitalism that it could be claimed that colonies are not a structural component – which go beyond the sole economic factors – of French imperialism. Extra-economic drivers include ideological factors, with the "moral issue" being the most outstanding feature of imperialism impulse (Brunschwig 1960) – e.g., bringing civilization to primitive people, a tradition long established and still alive in the "patrie de la déclaration des droits de l'homme" (One of the early designers of colonization, A. Sarraut, stated that: *La France qui colonise va organiser l'exploitation pour son avantage sans doute, mais aussi pour l'avantage général du monde* (colonization carried out by France is for her own interest, but also aims at improving the welfare of the world), Coquery-Vidrovitch (1979)). Political factors, both internal and external, played also a role. Among internal factors, after 1870, French military found in colonial conquest a response to the humiliation provoked by a sweeping military defeat, the annexation of Alsace and Lorraine to Germany, and the *Commune de Paris*, led to a significant migration of people from the Alsace and Lorraine to the Maghreb region. That colonization was at least partially a desire to quell social unrest has been also underlined in the British case (See Cain and Hopkins 1980). An external overarching political motive could have been that conquering colonies was the better way to prevent other developed countries to take possession of new territories and paved the way for further use when needed. It was the case for France after World War I. The closure of Russia as an important outlet for financial and trade exports led manufacturers and banks as well to increase their activities in direction of colonies (Girault 1993). Thus, a new appreciation of African colonies emerged during the interwar period. In the process, economic rent became a stated objective of trade with Africa, and the banking reform proposals of 1931–1932 (implemented by the *Front populaire* in 1936) aimed at "substituting a trade system integrated in capitalism to the existing economy of looting" (Coquery-

Vidrovitch, *op. cited*, p.59). According to historical research, it was during the interwar period that a modern conception of use of African colonies emerged in political and economic circles. Between 1913 and 1936, trade with African colonies massively increases. In proportion of total French trade, imports rose from 10% to 28.5% and exports from 14% to 33%. The apex in metropolitan-African colonies was reached in the 1950s, when a dramatic regime change took place in the post-war era: in 1958, 37.5% of French exports went to and 27.6% of imports came from the French zones. The growing importance of trade with African colonies, which reflected the loss of weakness of competitiveness on foreign markets and was mainly based on the exploitation of natural resources (e.g., cotton) and not on the development of industrial capabilities in colonies, was accompanied with harsher social conditions. Forced labor, a well-established practice on the continent, was massively used in the interwar period to build infrastructures (ports, railways, roads) and exploit natural resource dimension (Chafer 2016). Its extension was facilitated by the increase in taxation, a vivid example that "primitive accumulation" remained a permanent process. Economic rentability of business in Africa became a stated objective, and banking system reforms proposed in 1931–1932 (and also implemented by the *Front populaire* in 1936) aimed at "substituting a trade system integrated in capitalism to the existing economy of looting" (*la réforme bancaire devait permettre de substituer à l'économie de pillage antérieure un commerce integré au capitalisme*) (Coquery-Vidrovitch 1979, p.59).

Finally, military factors mattered in the possession of colonies. One, the armed forces were keen to have a training field to prepare more serious conflicts with developed countries which were simmering. Two, unlike Britain, French Africa sent 450,000 soldiers to Europe during the 1914–1918 War, with the largest contingents coming from Algeria (172,800), West Africa (90,000), Morocco (37,300), and Madagascar (34,400) for the defense of the metropole (Koller 2008). Africa also provided 135,000 wartime workers (most from the Maghreb) for French factories (Andrew and Kanya-Forstner 1978). After

the end of the war, the return to the traditional flow of imports (palm oil, palm kernel and peanuts) from France would destroy these nascent industries in North Africa (Koller 2008, *op.cited*, p.112) and destroy the nascent industrialization of the colonies brought about by the import of industrial goods by the Metropole during the conflict.

During World War II, the contribution of African troops was still more important accounting for 9% of total French troops against 3% during World War I.

Africa Remains Central for the International Status of France

The process of independence of colonies that occurred at the turn of the 1950s was accompanied by a comprehensive Gaullist strategy to maintain domination on these territories or, in De Gaulle's words, to move from "colonization to cooperation." Economic interests remained fundamental, with 138 conventions or cooperation agreements on economic issues were signed between France and its former colonies between July 1959 and July 1963 (Meimon 2007). Protection of economic interest was buttressed by a massive military presence was agreed on by most former colonies' governments and 13 formal defense and military cooperation accords were signed in the early 1960s. Thanks to these accords, France did not wage a war but responded to a formal call for assistance from a sovereign African government whose national security is under threat.

Over decades, the number of military troops deployed in Africa was seriously reduced, reflecting a variety of reasons, including budgetary constraints in France, a growing reluctance of African population, and changes in African government policy, keen to be rid of a total dependence on France. The flow of bilateral trade between France and its former colonies also declined in proportion of their global trade. Already in 1971, the trade of France with its former colonies in proportion of its total foreign trade was only 5.9% (exports) and 4% (imports). Those ratios went on declining in the last decade, but they were to some extent compensated for by the flows of trade with other African countries since in 2017 the whole Africa accounted for 13% of total exports and 11% of imports. Given France trade deficit reaching a disastrous 80 billion euros in 2017 (with the main deficit being with the EU), the 2.9 billion euros surplus registered with Africa the same year appears as a boon for France.

These macroeconomic data do not, however, expose the full scope of economic ties between France and Africa. For example, the French presence in Africa through foreign direct investment and flows of trade is focused on the critical and strategic sectors of most French blue chips, including Areva, Total, Vivendi, France Telecom, Bouygues, Suez, Veolia Environnement, and Bolloré, confirming Schumpeter's (1951) analysis of imperialism as a boon to sectional interests. The Sahel region, where most military operations are carried out, is a strategic region from a nuclear perspective. In 2017, France imported 98.7% and China 1.3% of African uranium exports (BCAO (2018), Rapport Sur Le Commerce Extérieur De l'UEMOA En 2017, Dakar, August). In France, where around 75% of electricity generation is nuclear produced and added to the role of nuclear deterrence, preserving the French nuclear power giant's Areva presence in Africa is vital. The group has remained strongly dependent on Niger's uranium, even though its share of its total production which accounted for more than 30% of its total production fell to 21% in 2016, as the French group has been prospecting for years in other countries (Canada and Kazakhstan). Africa is also vital to France's oil supply. Total, for instance, relied in 2017 on Africa (excluding North Africa) for 22% of its production and 25% of natural gas (2017 registration document). The French blue chip is the largest major based on the volume of hydrocarbon production and by the number of Group-branded service stations (over 4500) on the African continent. French interests are also highly present in public infrastructure such as telecommunications, roads, and water and in timber and plantation agriculture. In all of these ways, French capital has established deep and resilient claims in Africa and thus has been able to resist or fend off the dramatic changes in the continent over the past decade. From the standpoint of French capital in the former

colonies, this deep penetration serves as a platform for expansion across the continent as a whole. Other countries endowed with huge mineral reserves, including Gabon, Democratic Republic of the Congo, Mauritania, etc., are under strong influence of French large transnational corporations. Finally, although Africa accounts for only a modest share of French military exports, it remains an important ground for testing and using the weapons that France produces, as discussed below.

This centrality of the continent for French interest is confirmed by the fact that from 2000 to 2017, the rate of growth of French foreign direct investment (FDI) positions to the continent (+802%) (Computation from *Banque de France data* by the author) considerably overtook those realized in the world (+208%). FDI to the French Franc zone increased much more (+569%) than to OECD countries (+188%) reflecting an attempt for further embeddedness in the African "précarré."

In short, from a strictly economic perspective, Africa offers the following benefits: a large trade surplus that helps to compensate for France's global trade deficit; large financial incomes from direct and portfolio investments by French TNCs; and secure access to strategic and critical raw materials.

Another dimension of France's economic interest in Africa is the monetary zone, which was established in 1948 to create a preferential space for French capital and state interests. For decades, this monetary regime has allowed France to virtually control the monetary policies of its former colonies. Neither the devastating effects of structural adjustment policies, which resulted in a massive devaluation of the Franc CFA in January 1994, nor the creation of the euro, put an end to the French-controlled monetary zone in Africa. The French Ministry of Finance determines the rate of exchange for the Franc CFA, which is used by approximately 130 million Africans. A collateral advantage of the monetary zone in the context of financial deregulation is the large scale of capital outflows, which often escape the control of regulatory institutions. In fact, the level of capital flight from former French colonies is impressive, and the existence of a "zone Franc CFA" is a condition for this to occur. As the Franc CFA is convertible to euros and freely transferable to France, large French companies and other investors in Africa can exploit differences between the euro and the French CFA to repatriate capital to their own benefit and to that of other French financial institutions. What is clear is that capital flight from the countries of the former French empire, including Equatorial Guinea, Gabon, and the Republic of the Congo, could not occur without the economic connections to France and the persistence of dense "Franceafrique" networks. The Franc CFA is a tool of finance capital for imposing a neocolonial relationship on Africa (Ndongo Samba Sylla, "The CFA Franc: French Monetary Imperialism in Africa," http://roape.net/2017/05/18/cfa-franc-french-monetary-imperialism-africa/).

Acceleration of Large Military Operations and Foreign Projection

That the African former colonies are of critical economic and geopolitical importance is evidenced by the number of military interventions carried out by France during the last decades. Indeed, no official record exists, a significant reflection of the nature of political institutions (the Gaullist Fifth Republic) with large and uncontrolled power given to the president of the Republic and the absence of check and balance. Comparative research characterizes the French parliament as "one of the most impotent parliaments in foreign and defense policies" (Ostermann 2017). Another factor facilitating the military surge is the overcentralized decision-making process, buttressed on right-wing political consensus and compounded by an absence of significant anti-war movements, whose the capacity of mobilization fall behind a considerable margin from those acting in other European countries (e.g., in Germany, Italy, the United Kingdom, and Nordic countries).

Estimates on the number of military foreign operations range from 111 between 1991 and 2015 to 130 entre 1960 and 2011 (See Serfati, Claude, *op.cited*). In relation with the "2008 moment," France's use of force to protect

geopolitical and economic interests in its "backyard" (*précarré*), increased in number and intensity in recent years, with major operations engaged in Africa (Ivory Coast and Libya in 2011, Mali 2013, Central African Republic 2013), Sahel (2014), and in the Middle East (Syria and Iraq, 2014) . The concentration in time and the large scope of aforementioned operations marked a further amplification of French interventionist policy. In a speech which is a reminder of what was said a decade before by G. W. Bush when he decided to go to war in Iraq, President Hollande declared in the early days of military intervention in Mali that France "will stay with you [in Mali] as long as necessary" (Speech by François Hollande, Bamako, 2 February 2013), leading authoritative *Le Monde* to write 5 years after this claim that "Mali is our Afghanistan" (Christophe Ayad, "Le Mali est notre Afghanistan," *Le Monde*, 16 November 2017). In late 2018, Hollande's commitment was still confirmed by E. Macron, his successor (Cf *Le Figaro* "La France engagée au Sahel 'jusqu'à la victoire' contre les djihadistes, assure Emmanuel Macron" (France will stay in Sahel until "we win" against terrorists' confirms Emmanuel Macron), 17 December 2018).

In 2018, there were almost 20,000 soldiers deployed abroad, of which about 10% were involved in special operations, a significant increase in the number of such deployment. An international comparison in the ratio of force deployed in military operations abroad (overseas territories excluded)-to-total forces shows that in 2016 France ranked two with 8.90% behind the United States (14.9%), slightly ahead of United Kingdom (8.8%), Russia (6.7%), and Germany (1.7%) (Pwc (2017), *Global Defense Perspectives* 2017, November). A comparison between France and the United Kingdom when overseas territories are considered offers interesting insights on their geopolitical priorities. The quasi-totality of French presence abroad is split between (1) Africa and half of military there is concentrated in the Sahel region, reflecting the priority given to the protection of its geopolitical and economic interests in its "backyard," and (2) French overseas territories (over 54% of its military abroad). Both the Sahel region and overseas territories

(Caribbean, New Caledonia, French Polynesia (The United Nations includes Polynesia in its list of Non-Self-Governing Territories since 1986), Réunion/Mayotte, etc.) are the backbone of the international geopolitical presence of France and as such are listed as top priority in France's defense strategy. Thanks to this overseas territory, France boasts to have the second-largest exclusive economic zone worldwide after the United States. By contrast, the UK military abroad are overwhelmingly concentrated in Europe (73.8%), reflecting the full integration of UK forces in NATO, while North Africa and sub-Saharan region accounts together for over 20%.

There are a set of interacting drivers that account for the resurgence in France's military interventions in Africa. One is the need for France to preserve its geopolitical and economic interest in Africa. Military interventions are one vector for keeping France as a world power. It is not by chance that the country is particularly active at the Security Council on Africa issues, accounting for 70% of UN resolutions on matters regarding the continent, and acts as the "penholder" (The penholder system emerged around 2010. A council member may act as a penholder "when it is deemed to add value, taking into account as appropriate the expertise and/or contributions of Council members on the subjects" (presidential Note 507 updated in 2017)) for Burundi, Central African Republic, Democratic Republic of the Congo, Ivory Coast, and Mali.

Given the strategic importance of Africa for France, the decline in the last years of French economic position in the region is worrying. This is not only due to China's ambitions, but to European competition, with Germany becoming the first European exporting country in the African continent. In the context of a new "economic scramble" for Africa, for France the preservation of leading position in its former colonies is still more needed, and military operations to support local governments is part of this strategy.

Then, the role of military cannot be underestimated. At the top, there is the Chief of the Military Staff of the president of the Republic in charge of preparing foreign interventions well beyond contingency plans. Indeed, French

expertise in foreign engagements draws an emphatic assessment from US military. "The expeditionary culture that serves the French army" is confirmed by a French analyst, who describes "today's marine regiments' approach explicitly as 'colonial'" (Shurkin). Another driver to military interventions is the defense industry. The unique features of the defense industry have been long analyzed in the United States and often named "military-industrial complex" after 1961's President Eisenhower farewell address. Rather than this loose wording, and drawing on findings in industrial economics, the French industry has been analyzed as a meso-system, based on dense and interactive market and non-relations between its components. The French Armament meso-system (FAMS) is, because of the centrality of military in France, endowed with endogenous mechanisms of self-reproduction (Serfati 1995). Major agents in the FAMS are large defense contractor group with ten industrial groups accounting for over 80% of arms production and over 20% of total (civilian and military) French exports and also defense and nuclear related-technological agencies. Also central is the *Délégation Générale à l'armement* (DGA), the MoD's body in charge of procurement policy which acts as the backbone of the FAMS and is in permanent interaction with the armies to define operational needs. The FAMS draws a benefit from both increase of defense budget and military operations serving as a "combat-proven" label well appreciated by customers. As emphatically observed by the Ministry of defense, "'the combat-proven label of French weapons constitutes a major industrial advantage in sales'" (Ministère de la défense 2018).

The balance sheet of domination of French geopolitical and economic interests on its former colonies is pretty bleak. Focusing on the sub-Saharan region, when measured by the Human Development Index (HDI), the record is even appalling. Mauritania ranks 156, Mali 179, Burkina Faso 183, Chad 185, and Niger 188 that is the last in the UN list. One century and half ago, as colonization paid off for French ruling class and local elites, its costs for the colonizing power was a modest 0.29% of French annual budget. Of that sum, 83% went to military and central administration and only 17% to French West Africa's development (Huillery 2014). This imbalance in priorities funded one century ago is striking, but it is more revealing that a significant imbalance in favor of military is still visible in actual French policy. Figure 2 compares for the 2013–2016 period (2016, last available year for Official Development Assistance, ODA) the cost of foreign military operations in the Sahel area and the amount of ODA allocated to social infrastructure and services (education, water, sanitation) by France to the five countries making up the "G5 force" which French governments set up to "Africanise" war to terror. Public aid considerably trails behind military expenditures, with the

France and Political Economy of Contemporary Imperialism, Fig. 2 Military costs of interventions in Sahel region and France's Official Development Assistance (ODA) to this region (million euros). (Source: Author, based on French parliamentary reports and OECD data on Official Development Assistance (ODA). Conversion of euros in dollars based on OECD National Accounts Statistics)

ODA-to-OPEX ratio oscillating between 0.15 and 0.28. Clearly, the intensification of military interventions is given priority over developmental objectives.

Another dark picture is that the sub-Saharan region is also the lowest-scoring region on the corruption composite index established by the NGO *Transparency International*, which include corruption, democratic, and free media issues. "Bad governance," as said by the World Bank, is quite compatible with an intensive support given by the former colonial power in the region to authoritarian governments.

France's Military Surge and the "2008 Moment"

The increased military involvement in Africa is only an element of a more broader France's military surge observed since the end of the last decade. Three other trends are revealing on this military surge. One, on the 2007–2017 period, defense expenditures (Milex) and public order and safety (We follow here the COFOG classification) have increased at a higher rate than the total of general government expenditures (Table 3). Not only the increase of spending is significant by absolute numbers, but it the contrast with the evolution of key civilian budgets is also impressive. As education enjoyed a more limited growth than Milex and security, large cuts were made in environment, housing and community amenities, environmental protection, development recreational and sporting services, and housing development budgets.

France and Political Economy of Contemporary Imperialism, Table 3 General government expenditure by main functions governmental expenditures

2007–2017 growth	%
Total	23.6
Public order and safety	39.4
Defense	31.5
Education	16.1
Environmental protection	5.7
Cultural services	7.0
Recreational and sporting services	3.4
Housing development	-12.0

Source: Author from *National Accounts*

Moreover, in the pluriannual law on public expenditures (2018–2022), the rate of growth in military expenditures is much higher than other any civilian budget, including education and health.

Two, arms exports have increased by a margin in relation with the intensification of military operations. Ever since the earlies 1960s, weapon exports have been a major objective of the French meso-system of armaments, with a share of 30% of production exported being necessary to alleviate the defense budget's burden. According to SIPRI data, France delivered major arms to 81 countries in 2013–2017. Figure 3 gives the evolution of arms exports deliveries and orders between 2009 and 2017. As those figures have to be cautiously read, given the strong differences in data according different sources, they still indicate an increase in arms exports resulting of an active "military diplomacy" based on an unrelentless quest of customers, including when weapons could be used against civilian populations, as it is the case in Egypt and Yemen, triggering claims of a possible France's complicity in war crimes.

Three, as showed in Table 3, France has also been increasing its internal security apparatus, and the trend began much well before the terror attacks that hit Paris and the country in 2015. French governments have reacted to terror attacks by the implementation of a state of emergency in France, and the mobilization of 10,000 soldiers deployed in metropolitan France to protect the population against attacks is still active 5 years after.

Indeed, France could be, among western countries, an outstanding example of the tightening of defense (against foreign enemies) and security (at home) relations. The defense-security nexus, blurring the boundaries between external and internal threats, has a long historical record in France (above); it has strengthened after terror attacks, combining with a protracted targeting of "visible minorities" (For an analysis of the defense-security nexus, Claude Serfati, *Le militaire*, op.cited, chapter 5 "Vers l'état d'urgence permanent?"). France is the only country among democratic countries hit by terror attacks to have set for
France and Political Economy of Contemporary Imperialism, Fig. 3 French arms exports 2011–2018, million euros. Source: Authors, from Ministry of Defence, French customs, SIPRI database

18 months long a "state of emergency." This "addiction," as it is called by a number of NGOs (Benedicte Jeannerod, "France is addicted to the state of emergency. Put an end to it, Mr. President," 11 July 2017, https://www.hrw.org/news/2017/07/11/france-addicted-state-emergency-put-end-it-mr-president), stopped only to be replaced by a series of laws further criticized by NGOS as establishing a permanent state of emergency that could harm citizens' rights to liberty, security, freedom of assembly, and religion. The UN special rapporteur on human rights and counterterrorism expressed concerns about the 2017 counterterrorism law, which incorporates state of emergency powers into ordinary law and includes insufficient safeguards in the use of non-criminal measures against terrorism suspects. There is few doubt that the ease with which public and civil liberties can be further restricted in France is encouraged by overcentralized French political institutions, combined with a long established tradition in the country of the domination of the "executive power over the legislative power . . . [which] in contrast to the legislative one, expresses the heteronomy of a nation in contrast to its autonomy" (K. Marx, in his analysis of Bonapartism in France, *op. cited*, chapter 7).

Moreover, France's police, well known for a massive use of violence for decades, is the only one in Europe to deploy infamously called "nonlethal" weapons such as the Flash-Ball (or LBD), a gun that fires high-speed rubber bullets, which mutilated dozens of demonstrators during the 2019 "yellow vest" movement.

Conclusion: Analyzing French Military Surge in the Broader Context of the Global Political Economy of Imperialism

This essay is based on a hypothesis which allows to characterize the actual global political economy, defined as the "2008 moment," as a new configuration of imperialism. This framework is useful to analyze the French military surge.

The components making up the "2008 moment" had serious consequences on France's international status. On the economic side, the global deterioration of France's economic situation observed since the early 2000s is still more visible when compared to Germany. Both countries are leading the EU economy with over one-third GDP (respectively, 21.4% and 14.9%) in 2017. For over one decade, the divergence in economic performances on the world and EU markets between the two countries dramatically

increased. This growing asymmetry is not only a further source of instability for the EU, as the French-German "couple" has been the backbone of EU developments ever since 1958. It has also become a concern in French political establishment that their country becomes a junior partner in economy-related matters because of the growing role of Germany in the governance of the Union.

The "2008 moment" had also deep geopolitical effect on France. The turn in US Administration as regards its foreign military wars, which combined with the "Arab Spring" in countries with large French geoeconomic interests, compelled France to military intervene to defend its interests in Africa and in a lesser extent in the Middle East. It also opened a "window for opportunity" to the government to reassert its leading role among the very few group of countries able to complete and if needed replace the United States in its role of western leader in some regions of the world. Sarkozy's stubborn support to Tunisia's Ben Ali authoritarian regime until January 2011, after massive demonstrations demanding his removal which initiated the "Arab Spring" was replaced 2 months later by a war in Libya dressed in humanitarian clothes to defeat a dictator ((Gaddafi had been received in France with an incredible pump a few years before by Sarkozy, travelling with an entourage of 400 officials and erecting a Bedouin tent for his stay close to the *Palais de l'Elysée* (presidential house) . The two parties signed a cooperation accord including the sale by France of nuclear facilities and military equipment)), to which France successfully embarked its NATO allies (March 2011). The France-inspired regime change in Libya had deep destabilizing effects on the region, as two million working immigrants (mostly from sub-Saharan Africa) out of seven million residents were working in Libya and sent remittances to their families. The regional chaos, in turn, triggered a series of French military interventions in the Sahel region (notably in Mali in January 2013) and in the Middle East.

The general features of the world situation – more precisely that the tightening of economic and military links encapsulated in the "2008 moment" – are useful to understand this military surge. France is with the United States, the western country where economic and politico-military powers are the most interwoven in the shaping of their international position, even though France and the United States are obviously not competing in the same league. And, as the interaction between economy and geopolitics became closer since the end of the 2000s, this reflected in a French military surge that took diverse forms described above. In short, France attempted to leverage its military power as a "competitive advantage" on the world space, while it suffered a loss of "economic competitiveness." This military leverage is wielded for different objectives. At the world level, it aimed at protecting geopolitical and economic interests. At the European level, because of the growing imbalance between France and Germany in their economic performances weakening the role of France in EU governance, it supports France's activism to promote an EU defense agenda which would allow the country to remain a key factor in EU developments (Serfati, Claude, *The French military*, op. cited). At the national level, it provides some arguments for increasing military and security budgets. Here, the role of agency must be factored in. Given the historical centrality of military in France, powerful vested interests are at work. They include the executive power, totally dominated in France by the president who control the military establishment – active in favor of military interventions – through top officer seating as "special president's chief of state" (*chef d'état-major particulier du Président)*, who is the only one not to be hit by the "spoil system" after presidential election. It also includes the French Armaments Meso-System (FAMS). To sum up, the "structural" drivers at work at the world level impact the national level but they do so in a way which is peculiar to any country. As far as France is concerned, the historical centrality of the military in sociopolitical relations and the proximity of economic and geopolitical interests in the international positioning of the country are key éléments to understand France's military surge since the end of the last decade.

Definition/Description

Overview of the war, from its causes to the implementation of the peace agreement, from the viewpoint of international history. The connections of this war with the overall development of the Cold War, in Europe as well as in Asia, are a fundamental characteristic of this colonial conflict.

Introductory Paragraph

The peculiarity of the French Indochina war among conflicts of decolonization consists in the

intensity of its connections with the general dip-
lomatic history of the period. This is why the
history of the war has benefited invaluably from
the international history of the Cold War which
has developed since the early 1990s. Furthermore,
very recent openings of archives provide informa-
tion on the decision-making process of the French
and Vietnamese communist parties. The present
entry synthetizes these findings.

The war can be divided in two distinct periods.
Up to June, 1950, it was a colonial struggle of
regional significance and moderate intensity. The
Korean War transformed it in a major East-West
conflict.

French Indochina

The conquest of Indochina by France is a by-
product of the "opening" of China in the mid-
nineteenth century. It started in 1858 as a response
to the assassination of Catholic missionaries in
Vietnam, a tributary state of China, and was
extended northward as France looked for an
inland waterway to China. When French Indo-
china – named Indochinese Union in 1887 –
took its final form in 1900, Vietnam had been
divided in one colony (Cochinchina/Nam Bô in
the South) and two protectorates (Annam/Trung
Bô in the center, Tonkin/Bac Bô in the North). The
Union also included two non-Vietnamese protec-
torates, Cambodia and Laos. The legal distinction
between colony and protectorates meant little in
fact: the kings of Cambodia and Laos, and the
emperor of Vietnam who reigned in Annam,
were only nominal monarchs. French civil ser-
vants ruled in the five "countries," and the Union
as a whole was supervised since 1891 by the
Colonial Office. In addition, France was endowed
with a sphere of influence in southwestern China,
linked to Tonkin by the Yunnan railway.

There were few French residents in Indochina,
consisting mainly of civil servants, military per-
sonnel, and businessmen. Indochina was the eco-
nomic "jewel" of the French empire, thanks above
all to the large rubber plantations in Cochinchina
owned by companies such as Michelin and to rice
exports from the Red River delta in Tonkin. At the
local level, French administration relied on village

chiefs. Vietnamese personnel, deemed more
"enlightened" by the French, often served as
junior administrative personnel in Cambodia and
Laos. French citizenship was granted to some
assimilated Indochinese. These were a select
few, since higher education was limited. Vietnam-
ese Catholics, who had often served as interpreters
during the conquest and had been rewarded with
land, the landed elite of the Red River delta, and a
few important Chinese and Vietnamese tradesmen
could be counted either as supporters of French
rule or as members of a "loyal opposition" which,
at least before World War II, asked for a constitu-
tion but not for independence.

French rule had been accepted on the whole in
Cambodia and Laos, since it has prevented these
weak states from being partitioned between Siam
and Vietnam, but Vietnam was not officially pac-
ified before the end of the nineteenth century. At
this time, traditional civil servants (mandarins),
who previously had led the resistance to French
rule, were coopted as agents of a limited, conser-
vative modernization. This policy inspired, for
instance, the education provided to emperor Bao
Dai (1913–1997), who was to be acquainted with
French thought and civilization, but not enough to
cause political trouble, and the promotion of local
varieties of Buddhism in Cambodia and Laos to
contain Siamese influence.

A non-communist nationalist opposition existed
in Vietnam since the beginning of the twentieth
century, inspired by republican China and imperial
Japan. The main party of this persuasion was the
Vietnamese Nationalist Party (VNQDD), modeled
after the Chinese Guomindang. But after an aborted
insurrection in 1931 which was severely repressed,
the VNQDD survived only in exile. The Marxist left
prospered during the more politically lenient popu-
lar front governments of the late 1930s, but it was
deeply divided between Stalinists and Trotskyists,
and communist organizations of all stripes were
banned when France entered World War II.

World War II: Crucible of the Vietnamese Revolution

The Japanese occupation of Indochina provided
the setting which made possible the Vietnamese

revolution of 1945. The Japanese army occupied Tonkin in September 1940 and the whole Indochina in July 1941, both to deny use of the Yunnan railway to the Guomindang government, then located in Chongqing, and to base air forces that would strike further South. The 1940 armistice between Germany and the Vichy regime had left all French colonies intact, and Japan likewise acknowledged French sovereignty over Indochina. French authorities were left in place, but Indochinese material resources were diverted to the Japanese war effort. To divert the population from collaboration with Japan and Siam, Admiral Decoux, the governor general, took several measures to promote both national and Indochinese cultural identities (for instance, the creation of a cycling tour of Indochina). But unavoidable submission to Japanese demands undermined the legitimacy of French rule. For instance, during the mass starvation of 1944–1945, French authorities diverted rice from public granaries to feed the Japanese army.

The Indochinese Communist Party (ICP) seized the opportunity provided by the Japanese occupation of Tonkin to launch an insurrection in Cochinchina in November 1940. It was badly coordinated and severely repressed. This complete failure wiped out the ICP apparatus in the South, leaving the Trotskyists as the dominant force on the left in this part of the country. From then on, the rural Northwest of Vietnam, near the Chinese border, would be the stronghold of the ICP.

From his travels in China, Hô Chi Minh (1890–1969), the Annamese-born Komintern operative who had founded the ICP in 1930, had a firsthand knowledge of the "New Democracy" line adopted by the Chinese Communist Party (CCP) in 1937. Like the New Democracy, the Vietminh (Alliance for Independence of Vietnam, founded in clandestinity by the ICP on May 19, 1941) was a broad national front which prioritized national liberation over class struggle, but only as a temporary tactic, since according to party leaders, the anti-imperialist struggle itself, in the context of the world war, could hasten the socialist revolution. Just like the CCP, the ICP viewed itself as a part of the communist movement led by the Soviet Union, but had to adapt its methods to a country endowed with a large peasantry and a small proletariat, under conditions of foreign occupation. Vietminh fighters were able to seize several granaries and distribute the rice to peasants during the starvation of 1944–1945, thereby gaining their sympathy.

The Japanese coup of March 9, 1945, provided the Vietminh with an opportunity to plan a general uprising. After a raid of the US Navy on the coast of Vietnam, on January 12, 1945, the Japanese military jailed French officials to prevent them from assisting in an eventual Allied landing. The Japanese abolished French sovereignty over Indochina, reunified Vietnam, proclaimed independence of the three states, and forced the monarchs to nominate nationalist cabinets. Even before the coup, the Japanese had encouraged several nationalist entities such as the Cao Dai (urban) and Hòa Hào (rural) sects. They filled the new cabinets with genuine nationalists, but handed them very limited powers and did not cease requisitions. The popularity of their protégés declined accordingly. This political situation, and the fact that a sizeable part of the French repressive apparatus was now in jail, prompted the Vietminh to act. When Japan surrendered on August 10, 1945, the Vietminh launched a general uprising.

The Vietnamese Revolution

If the Japanese surrender made the Vietnamese revolution possible, the interallied conference at Potsdam (July 17–August 2, 1945) determined its characteristics. The conference assigned the disarmament of Japanese troops and the temporary occupation of Indochina to Chinese military authorities North of the 16th parallel and to British ones in the South. When Japan surrendered, neither the British nor the Chinese were present in Indochina. Since it was the Japanese that US President Harry Truman had invested with police tasks before the arrival of the allies, French authorities remained in jail. The Vietnamese revolutionaries took advantage of this power vacuum, and Japanese troops let them operate, defending only the buildings of the Indochinese central bank.

The resignation of the Trân Trong Kim cabinet on August 13 set off a series of peasant uprisings,

some spontaneous and others communist-inspired, which allowed the Vietminh to march South and take Hanoi on August 19. Emperor Bao Dai abdicated. A "Southern Committee" and a coalition cabinet were formed in Saigon and Hanoi, respectively, composed of a majority of communist members and a minority of non-communist nationalists. The Democratic Republic of Vietnam (DRV) was founded in Hanoi on September 2, 1945, with Hô as president. The power of the Vietminh was much more secure in the North than in the South, where it had to compete with the sects and the Trotskyists.

Of course, the independence of the three states was legally null and void, since it had been unilaterally proclaimed in wartime by the Japanese enemy. The Provisional Government of the French Republic (PGFR) never thought of granting them recognition, for if the Free French accepted to endow Indochina with some measures of social welfare and a limited dose of parliamentarism, they agreed with Vichy that the empire was the main claim of France to great power status. The PGRF did not even accept the reunification of Vietnam.

British military authorities in Saigon sympathized with GFR delegates. Both ignored the Southern Committee, which reacted by calling a general strike. In response, General Gracey proclaimed martial law and, on September 23, evicted the Committee from the Saigon town hall. The Committee and its troops fled to the countryside, where they were pursued by British soldiers and the French Expeditionary Corps to Indochina (FEC), which had now arrived in Cochinchina, using Japanese troops as auxiliaries. The FEC then proceeded to Cambodia, where the nationalist prime minister, Son Ngoc Thanh, was arrested on October 15. King Sihanouk signed in January 1946 an agreement with France which mentioned the internal autonomy of Cambodia, but within the limits set by the *Union Française* (French Union, the new name of the empire). These were unspecified at the time of the agreement, since they would be set by the new constitution that France would adopt in 1946. The agreement also provided that Cambodia would get a constitution with universal male suffrage.

North of the 16th parallel, the Chinese occupation was a blessing in disguise for the DRV. The Chinese military looted the country, and they exerted such political pressure in favor of minority VNQDD members of the cabinet that, to prevent a Chinese coup in their behalf, the ICP nominally dissolved itself in November 1945, thereby earning the suspicion of Stalin. (The party simply went underground.) But the occupation allowed the Vietminh to gain time, since China would not let the FEC reenter Tonkin prior to the relinquishment of French extraterritorial rights in China. The Sino-French treaty was signed on February 26, 1946.

China even saved the DRV from the military repression that the Southern Committee had suffered. General Leclerc, the commander of the FEC, wanted to land in Tonkin in March 1946, to gain time, if necessary, to repress a local uprising before the rainy season. Tide calendar made it imperative to land on March 6 at Haiphong, the port of Hanoi. On March 5, the Chinese government conditioned the landing to the prior conclusion of a political treaty between France and the DRV. Jiang Jieshi needed peace at his southern border to concentrate on the civil war against Maoists in northern China. It was also feared that , if Chinese military authorities had allowed the French to land without any agreement with the DRV, the Vietnamese might have exacted revenge against the Chinese community in Tonkin. Hence the agreement of March 6, 1946, between France and the DRV. This text recognized the DRV as a "free state" within the Indochinese Federation and the French Union. It provided for a referendum on the reunification of Vietnam and allowed the FEC to remain on DRV soil for no more than 5 years.

The FEC then proceeded to Laos, where the nationalist Lao Issara (Free Lao) cabinet was deposed on April 25. The three princes who headed the Lao Issara followed different paths: Phetsarath fled to Thailand, Souphanouvong (who had married a Vietnamese) became an ally of the DRV, and Souvanna Phouma played the political game within the French Union. Like Cambodia, Laos became a constitutional monarchy within the Union.

The Political Deadlock Between France and the DRV

Militarily, the March 6 agreement gave time to the DRV to smuggle arms from China and, should war start with the French, to plan the removal of its political and military apparatus to the countryside. Politically, it allowed it to negotiate the conditions of its "association" with France. But since the agreement had been extorted by China, the French were reluctant to negotiate with the DRV. Admiral Thierry d'Argenlieu, the new high commissioner in Indochina, a fervent Gaullist, was keen to implement the declaration on Indochina proclaimed by the PGFR on March 24, 1945. This text envisioned the creation of a new "Indochinese Federation" consisting of five "countries" – the reunification of Vietnam was not on the agenda. Civil liberties and equal access to public charges were granted, but only a limited kind of parliamentarism would be allowed: ministers would be responsible to the governor of Indochina, not to local parliaments. The governor would keep very large economic powers, for French planners wanted Indochina – which contained coal in Tonkin and hydroelectricity in Annam – to replace defeated Japan as the industrial powerhouse of East Asia. (The war would soon dry up the public funds that such a plan called for.) D'Argenlieu was certain that De Gaulle, who resigned from the presidency of the PGFR on January 19, 1946, would soon return to power, and he wanted the Gaullist vision for Indochina to be implemented. His unilateral decisions infuriated his superiors in Paris, but they were never countermanded, for Georges Bidault (1899–1983), who was prime minister during the negotiation with the DRV, belonged to a Christian Democratic party which professed to be "faithful" to De Gaulle; he was also very anti-communist and a hard-liner in colonial matters. Even Marius Moutet, the socialist minister of colonies, did not object to the initiatives of d'Argenlieu.

Moutet even inspired the measure that the DRV found the most provocative. Since the March 6 agreement provided for a referendum on the reunification of Vietnam, Moutet advised d'Argenlieu to launch a propaganda on the theme of "Cochinchina for the Cochinchinese." On June 1, d'Argenlieu created a provisional autonomous Republic of Cochinchina, presided by Dr. Nguyên Van Thinh. This initiative was unacceptable for the DRV, since it preempted the referendum and, should Vietnam remain divided, the DRV, locked in Tonkin, would not be able to develop the economic complementarity between the three parts of the country (rubber in Cochinchina, hydroelectricity in Annam, coal and rice in Tonkin).

Negotiation between France and the DRV began on July 6, not in Paris, but in the nearby town of Fontainebleau, to isolate the Vietnamese delegates. On July 22, d'Argenlieu unilaterally convened a conference with Cochinchina, Cambodia, and Laos, to define the details of the Indochinese Federation. For the DRV, which negotiated directly with the French government, the Federation was an option; for d'Argenlieu, it was a given. When the conference opened at the mountain resort of Dalat in Annam, on August 1, the Vietnamese delegation suspended the talks in protest.

The conference was supposed to resume in January 1947. On September 15, 1946, Moutet and Hô Chi Minh (who had traveled with the delegation to Fontainebleau) concluded a provisional agreement which stipulated a cease-fire, effective October 30, between the French and Vietminh armies South of the 16th parallel. Both sides duly implemented the cease-fire, but Vietminh terrorist units intensified their assassination campaign against pro-French leading citizens. In the meantime, the cause of autonomous Cochinchina did not prove very popular, to such extent that Léon Pignon, the political advisor to d'Argenlieu, began playing the traditionalist card by establishing contact with Bao Dai, who had fled to Hong Kong. Dr. Thinh committed suicide on November 19. In the North, the DRV had assassinated its main political opponents during the summer with the tacit agreement of the French army, since these non-communist nationalists were more vocally opposed to France than the DRV professed to be. The end result was that in autumn 1946, the DRV had established its firm political control in the North and was gaining ground in the South.

F

To counter this trend, d'Argenlieu planned a coup against the DRV government, to be carried in January 1947. But in November 1946, the Bidault cabinet denied the needed military reinforcements. The French government did not want to grant Vietnam an association between equals, such as between Britain and India, because France would lack the economic and military means to impose its will on Vietnam in such a setting. It did not want to create in Vietnam a precedent which would give arguments against French rule to the protectorates of Morocco and Tunisia. But in the context of the decolonization of British India, it did not want a coup which would be difficult to justify abroad.

The short-term aim of the French military was to stop the smuggling of arms from China to the DRV. Custom services in Haiphong were reinforced in October. The interception of a junk loaded with fuel caused the French Navy to bomb Haiphong on November 23, killing between 300 and 6000 people, including many civilians. During the bombing, Vietminh fighters discovered a copy of the coup operation planned by d'Argenlieu, which was carried by a French soldier. The DRV could not know that the French government had just shelved this option. From then on, the Vietminh prepared for a preventive war.

This war started on December 19, 1946. On December 18, the French high commissioner in Hanoi, Jean Sainteny, had ordered the removal of barricades from the streets of the European district. This decision led the Vietminh to believe that an assault was imminent. On December 19, at 8:00 PM, DRV authorities fled to the countryside and called for a general insurrection. Since the Vietminh had initiated the fight, France could now claim to wage a defensive war.

Soon afterward, the DRV issued several peace feelers. Sincere or not, they were deliberately ignored. On January 3, 1947, during the inspection trip of Moutet in Hanoi, Hô Chi Minh sent him a message calling for an immediate cease-fire and a meeting. The letter was intercepted by the French military and never delivered to the minister. On April 19, Hô again asked for an immediate cease-fire and peace talks. The answer came on

May 12, 8 days after the dismissal of communist ministers from the French government: the DRV would have to relinquish 50% of its armament; hand over to the FEC all hostages, prisoners, and defectors; and allow the FEC full liberty of action North of the 16th parallel. General Valluy, the new commander in Indochina, had drafted these conditions with the expectation that they would be turned down, since he did not want to compromise the large offensive that he was planning for autumn. Indeed, they were turned down, and the war started for real.

The causes of the war are clear. France and the DRV could not come to terms, since France refused to grant independence, whereas the DRV considered independence as a given and accepted only to negotiate the terms of a temporary association with France, on an equal basis. But the French government was wary of a full-blown war. The French military in Indochina and, through them, the Gaullists forced the hand of Paris.

A Colonial War

French intransigence was based on the assumption that the DRV was militarily weak and that war would be short. Indeed, in October 1947, the FEC almost captured Vietminh leaders. But they escaped and the war went on.

The early years of the war were very difficult for the Vietminh. Its troops, concentrated in the North, were thinly spread. Communications between North and South were very slow – hence, the importance of short-wave radio. The regular army – as opposed to guerilla irregulars – was entirely staffed by volunteers up to November 1949. Political commissars supervised officers and men, but communists were a minority among the military. So as not to alienate "bourgeois specialists," whose technical skills were needed, socialist measures were delayed: rents were reduced, but land was not redistributed. The cult of Hô Chi Minh was instituted to mobilize the masses, but "national salvation" associations devised to control the population remained understaffed. The Vietminh traded opium against

armament – as the French did – but arms procurements became scarce, especially once the French were able to seal the border between Tonkin and China in October 1947. The main provider was Thailand, whose armed forces gladly sold arms which would be used against the FEC, since Thailand had been forced to relinquish the provinces of Western Laos which it had acquired during World War II with Japanese backing. The Free Thai movement, which had opposed Japan, also sold arms, since it maintained good relations with the Vietnamese community in Eastern Thailand. But when Bangkok granted diplomatic recognition to the State of Vietnam in February 1950 to obtain American armament, supplies from Thailand quickly dried up.

The diplomatic position of the DRV was just as shaky. The Soviet Union prioritized Europe, and India went no further than barring the French Air Force from flying over its soil. Without the Maoist victory in China, the DRV would have risked isolation. DRV leaders were aware of the situation, and in the middle of 1949, they diverted soldiers to South China, to fight Guomindang troops there jointly with local communist forces, a gesture which was warmly appreciated by Mao Zedong and Liu Shaoqi.

France was in a much more comfortable position, but it too had problems. The FEC was dominant in the South and controlled cities and the main roads in the whole country. But terrorism was rampant in Hanoi and Saigon up to 1951, and the roads were frequently blocked. Due to the paucity of French citizens in Indochina, and to avoid sabotage by communist recruits, conscripts were not sent to Indochina, and the FEC was entirely staffed by professional soldiers, including colonial troops from Africa and North Africa. War expenditures were contained, from 4% of overall public spending in 1947 to 7% in 1950, but conversely worn-out armament was seldom replaced. American aid, which started in March 1950, was a real relief.

On the whole, French public opinion remained indifferent to the war. Communist ministers had been dismissed from the government after communist representatives had failed to approve the military budget in March 1947 (they abstained but

did not oppose it), but communist workers did not impede arm shipments to Indochina before November 1949. The Communist Party had started such actions at the request of the Cominform, which wanted it to engage in more offensive tactics. So, all in all, French governments could operate with a relatively free hand, and what is striking is that they did not offer more generous conditions to non-communist nationalists than to the Vietminh. The war was ostensibly waged as an anti-communist cause, but its real motive was the preservation of the French empire.

The official position was that France accepted to negotiate in good faith – but not with the "treacherous" Vietminh – within the limits set by the constitution of the Fourth Republic (October 27, 1946). This text invested the French government with full authority on the foreign and military affairs of the French Union, including Indochina, and it created a new status of "Associated States" whose relations with France would be negotiated on a bilateral basis. Although the constitution did not preclude the independence of these states, they could in fact be at most protectorates, endowed with full internal autonomy but having their foreign affairs managed by France. Bao Dai, to whom the VNQDD and similar parties had rallied, signed on December 6–7, 1947, an agreement on this basis, which mentioned the unity of Vietnam. But the treaty contained a secret protocol which conferred to the French high representative in Indochina all the powers of economic coordination previously mentioned in the Indochinese Federation project of 1945–1946. The protocol even added the creation of separate courts of law for French citizens, on the model of capitulations in the Ottoman Empire.

Bao Dai was unable to convince his followers to accept such conditions. Since new concessions were not forthcoming, he retired on the French Riviera. He could not rely on external support. The Truman administration was certain that French intransigence played in the hands of the Vietminh, but it remained passive, since the DRV was communist and France was the main power in continental Western Europe. So Bao Dai resigned himself to sign, on March 8, 1949, a new

agreement which created a united Vietnam as an associated state within the French Union. France had not offered new concessions. Bao Dai signed because, had he waited longer, France might have concluded a deal with General Nguyên Van Xuân, the head of the nominal Republic of Cochinchina.

Since war operations made it impossible to hold elections or a referendum, the State of Vietnam had no constitution. Cabinets were responsible only to the "chief of state," Bao Dai. When the "chief" returned to Vietnam, he was denied use of the palace of the French high commissioner in Saigon and retired to Dalat.

Cambodia and Laos were granted similar status. From then on, collaboration between France and the Associated States was conducted at the High Council and at the Assembly of the French Union, two bodies created by the 1946 Constitution. The High Council was an intergovernmental organization mandated to "assist" the French cabinet on the general policy of the Union (Constitution, Article 65). It met at irregular intervals, and its head was the French president. The Assembly, where metropolitan France was allotted 50% of the seats, was only a consultative body.

A War by Proxies Between China and the United States

The creation of the People's Republic of China (PRC) on October 1, 1949, provided relief to the Vietminh. Helping the DRV was a priority for Mao: it was an internationalist duty, and it might deter the United States from using Indochina to back Guomindang military operations in Southern China. But the PRC imposed nothing to the Vietminh. It was the DRV which asked for Chinese arms, money, and military advisers.

The PRC recognized the DRV on January 18, 1950, prompting the Soviet Union to do the same on January 30. This situation forced the US secretary of state, Dean Acheson, to recognize immediately the State of Vietnam (on February 7), although he would have preferred to make this recognition conditional on French assurances than the association agreement would be implemented in a liberal spirit. Non-communist

Asiatic states doubted that the Associated States were really independent: only Thailand recognized them.

Conversely, the creation of the PRC prompted the United States to start arming the FEC, provided that France expressly renounces to recognize Beijing. Since the start of the Malayan insurrection in 1948, Great Britain had urged Washington to assist France so that Indochina could resume its rice exports to Malaya. But it was China policy which prompted the United States to back France. The "China lobby" in the Republican party and at the Department of Defense kept asking for continued military payments to the Guomindang, which Acheson considered a failed state. Acheson much preferred military spending South of China, which would be both more effective and less provocative to Beijing. The first US shipments of war material were landed in Vietnam in March 1950. They were still of modest size, but the Korean War would soon quicken the deliveries.

Chinese reinforcements allowed General Vo Nguyên Giap (1911–2013), the Vietminh commander in chief, to attack in force at Cao Bang, in October 1950, the FEC troops which were retreating from the Chinese border. That was the military turning point of the war: from then on, the border between Tonkin and China would remain open, and Chinese material could flow freely to Vietnam. The DRV would now have the means to mobilize the whole population in its zones in Tonkin and Annam, at the price of a heavy regimentation. Military service had been made compulsory for men aged between 18 and 45 in November 1949, but many peasants did not want to leave their villages. To mobilize them, China and the Soviet Union urged the DRV, in 1951, to move from rent reduction to land redistribution. Chinese advisers taught the Vietminh propaganda devices such as the cult of working-class heroes. They convinced a reluctant Hô Chi Minh to mobilize women for portage (not for combat). Starting in September 1952, portage duty became compulsory for citizens of both sexes aged from 18 to 50. The counterpart was agrarian law, which was announced in January 1953, but implemented only after the war.

Chinese advisers did not dictate on the DRV. It was on his own volition that Giap engaged the FEC in pitched battles in the Red River delta as early as 1951, with disastrous results. (At Vinh, French planes poured napalm over enemy forces.) But this failure allowed Chinese advisers to prevail upon Giap and have the war zone extended westward, toward the mountains of Tonkin and Laos, to force the FEC to dilute its resources.

After the recognition of the DRV by China and the Soviet Union, there was no point for it to keep hiding its communist identity. The ICP was revived in May 1951, but was divided in three separate parties: Cambodian, Laotian, and Vietnamese. This reorganization was meant to enhance the "national" character and patriotic appeal of the Cambodian and Lao communists: the communist branch of the Khmer Issarak (Free Khmers) and the Pathet Lao (Lao state). The Vietnamese controlled the Cambodian and Lao parties. This made sense in the short term, since the two new parties were much weaker and Indochina had become a single, unified theater of war, but it was the seed of the bitter relations between the Cambodian and Vietnamese parties during and after the American war.

France, as well as the DRV, was on the verge of overstretch, in spite of American help. The United States paid for some 70% of war expenses in 1954, and these expenses decreased from 9% of French public expenditures in 1952 to 4% in 1954. But increased help to the FEC was only one aspect of American policy during the Korean War. The Truman administration also called, in autumn 1950, for an immediate and massive rearmament of NATO (North Atlantic Treaty Organization) countries and of West Germany. Accordingly, overall defense spending jumped to 30% of French public expenditures in 1951 and 1952. Such amounts dwarfed economic returns from Indochina: French capital had fled to other parts of the empire soon after the beginning of the war, plantations offered obvious targets for sabotage, and metropolitan exports to Indochina accounted only for an average 40% of French war expenditures.

The war, waged by professionals, depleted French units outside Indochina of officers and noncommissioned officers. The creation in 1951 of a Vietnamese National Army (VNA) by Bao Dai, at the urging of General De Lattre de Tassigny, then commander in chief, and of the United States, did not really change the situation, since this army needed many French instructors who would train it to interoperate with French units in the context of the French Union. Political rivalry between France and West Germany increased difficulties. To avoid the politically explosive creation of a German army so soon after World War II, France proposed at the end of 1950, and NATO accepted, the foundation of a European Defense Community (EDC). Germany would contribute 12 divisions to this entity. The project divided the French parliament so much that it was not called to vote before August 30, 1954. But one thing was certain: for the EDC to have a chance to pass, France had to contribute at least as many divisions as Germany; otherwise, Germany would have been the dominant power in the organization. Socialist representatives, whose vote was crucial to obtain a majority, insisted on this condition. And since, without the EDC, Germany had no army, NATO needed a vote as soon as possible. This made it necessary to end the Indochina war quickly, to bring the FEC back to Europe.

Relations between France and the Associated States were just as difficult. Cambodia and Laos, eager to save rice for their own citizens, refused to implement the customs union with Vietnam which was an essential part of the French economic program. The three states complained about the slow devolution of internal powers by French administrations. Grumbling against France became a resource for internal politics. King Sihanouk of Cambodia resented the Democratic Party which had won a large parliamentary majority at the 1946 election. This party asked for complete independence from France and a fully parliamentarian regime, whereas Sihanouk wanted to retain absolute power. In June 1952, with French backing, the king sacked the Democrat cabinet, had party leaders arrested, and nominated submissive ministers. Since independence from France was a popular theme, Sihanouk used it to consolidate his new powers. At the beginning

of 1953, he started asking for full independence. France refused to deal with him, the United States asked him to compromise, but since Vietminh troops had entered Laos and Northeast Cambodia in 1953, it was France which had to compromise.

This compromise was brought by the "scandal of piasters." The piaster was the currency of the Associated States. Its market value was inferior to its official value, set by France in 1945. By exchanging francs with piasters on the market, and then presenting these piasters to the central bank, which was bound by charter to buy and sell at official value, one realized a profit of more than 40%. The Vietminh, Bao Dai and his ministers, FEC soldiers, and all French political parties save the communists partook in the traffic.

The weekly *L'Observateur* exposed the affair on May 7, 1953. To cut the scandal short, Prime Minister René Mayer devalued the piaster on May 8, without prior consultation with the Associated States. This was a breach of sovereignty, since the independence association agreements made currency a joint responsibility of France and the three states. Bao Dai reacted immediately by joining Sihanouk in opposition to France. On May 20, Vietnam asked for a complete overhaul of institutional arrangements between the Associated States and France.

After the fall of Mayer (caused by the EDC), Paul Reynaud, minister for Associated States in the new Laniel cabinet (June 1953–June 1954), renegotiated the relations between France and the three states. According to Reynaud, a fiscal conservative, very favorable to the EDC, Indochina had become a burden for France. The talks transformed the French Union in a voluntary association of equals, comparable to the British Commonwealth. Although this was a flat contradiction of the 1946 Constitution, neither parliament nor the French people were consulted. Negotiations proceeded smoothly with Cambodia and especially Laos, but were much more difficult with Vietnam, to the point that when peace was concluded on July 21, 1954, the new independence and association treaty between France and Vietnam had only been initialed. It would never be signed. Angered by the slow proceedings, Bao Dai reacted by making Vietnamese participation

to the Geneva peace conference conditional on a prior French promise not to partition Vietnam, which Bidault, now foreign minister, had to give. This would have grave consequences for peace.

Peace on the Agenda

The demands of the Associated States against France were concomitant with the thaw in international relations after the death of Stalin, which made possible the Korean armistice of July 27, 1953. In this new context, the opinion that the conjunction of rearmament in Europe and continuation of the war in Indochina was beyond French means gained ground. The most eminent proponent of this thesis was Pierre Mendès France (1907–1982), a representative from the Radical (center-left) party. After the fall of Mayer, Mendès failed to be elected prime minister by only 13 votes. If one added the communists, a majority of French representatives were now in favor of peace.

The new prime minister, Joseph Laniel, elected on June 27, 1953, declared that his cabinet would negotiate "untiringly" to end the war. The difference with Mendès – which was left unsaid – was that foreign minister Bidault would not negotiate with the DRV. Bidault hoped that a relaxation of the Western commercial embargo against China – more severe than against the Soviet Union since the United Nations Organization (UNO) had declared the PRC an aggressor in the Korean War – and French assent to admission of the PRC at the UNO would induce Beijing to desist helping the DRV, thereby making possible a French military victory. The deal would be concluded at the political conference on Korea, planned for Spring 1954 in Geneva, for Article 60 of the Korean armistice allowed for the discussion at this conference of other topics than the conclusion of a peace treaty.

The program that Bidault set for himself contradicted the "wedge" policy of the US Eisenhower administration, which relied on a harsh treatment of the PRC to cause a rift between Beijing and Moscow. Bidault had to negotiate

very hard with the new, Republican secretary of state, John Foster Dulles (1888–1959), to have him issue the declaration of September 2, 1953, which stated that the Geneva conference could lead to peace in Indochina if China desisted from its aggression, but warned that an open Chinese intervention in Indochina would provoke a US military reaction which, if necessary, would be extended to China itself (Dulles had in mind operations on Hainan island).

The communists, too, aimed at military victories to maximize their bargaining power. After the Korean armistice, China warned the DRV that it would not send soldiers to Indochina. China had had to borrow two billion dollars to the Soviet Union to fund the Korean War. It could not afford a new war so soon. This caused DRV war plans, based once again on a large offensive in the Red River delta, to be rewritten at Chinese insistence. China asked for a consolidation of military positions in Northwest Vietnam and Laos. The main battle would have to take place at Diên Biên Phu, a large fortress in the mountains of Northwest Tonkin, which General Navarre, the new French commander in chief, had chosen to cover Laos and to start a counteroffensive. Such concentrations of fire power in remote locations had proved very effective in the past to bait and kill Vietminh soldiers, but their supplies had to be delivered by air, and at Diên Biên Phu, thanks to massive Chinese supplies of artillery, the Vietminh was able to neutralize the airstrip at the start of the battle on March 13, 1954. From then on, the Vietminh had the upper hand, and Diên Biên Phu would capitulate on May 7, the very day when negotiation on Indochina started in Geneva. Of course, Navarre had posted only a portion of the FEC at Diên Biên Phu, and operations continued in the rest of Vietnam.

The political objectives of the major communist powers were clearly defined. The Soviet Union wanted the EDC to be shelved, and it was ready to offer France a graceful exit from Indochina as a quid pro quo. There would be no formal linkage, but Moscow hoped that the end of the war would create a détente that would make French parliamentarians conclude that the EDC had become unnecessary. Moscow also wanted the

West to accept the PRC as a full member of the international community. China shared both of these goals, and to achieve them, it stood ready to give reassurance to foreign powers. It is during the Geneva conference that Beijing decoupled anti-imperialism from the exportation of revolution, a distinction embodied in the Sino-Indian treaty of peaceful coexistence (April 29, 1954).

This strategy might prove detrimental to the DRV, since if the independence of the whole Vietnam under Vietminh rule could not be gained in Geneva, both China and the Soviet Union accepted a temporary partition at the 16th parallel as a second best. The three communist powers coordinated their positions during a conference in Moscow in April 1954. The DRV and the PRC, both regional powers which were parties to the conflict, would table propositions, and the Soviet Union would act as an umpire and a broker with Western powers, as befitted the leader of the coalition. It is unclear if, in Moscow, the DRV formally accepted temporary partition as a fallback option. Partition, even temporary, was a sacrifice for the DRV, for during the whole war, it had maintained a foothold South of the 16th parallel, the Interzone 5, around the cities of Quang Ngai and Qui Nhon.

Among Western powers, it is very possible that, without the EDC in the balance, Dulles would have vetoed discussion of Indochina in Geneva. At the Berlin conference of the four occupying powers in Germany (January–February 1954), Bidault and his British colleague Anthony Eden (1897–1977) implored Dulles to accept this negotiation. According to the Churchill cabinet, a government that had ended war in Indochina would be in a good position to pass the EDC in parliament. Britain opposed a continuation of the war which might bring China in the conflict. Western allies knew that in such case, American war plans prioritized operations in China, with nuclear bombings if need be, and allotted few resources for the defense of Southeast Asia itself. It was not necessary for Britain to run such a risk, for the border between Malaya and Thailand was now secure, and, should the Sino-Soviet pact be activated, American air bases in England, where nuclear bombs were stocked, would have been a prime target for the

Soviet Air Force. For all these reasons, Eden accepted a definitive partition of Vietnam as a reasonable compromise. (He would agree to temporary partition only later, during the Geneva conference.) Dulles was not convinced, but he relented for fear that, should Indochina not be discussed in Geneva, the French parliament might definitely turn against the DRV.

Nevertheless Dulles tried to sabotage the conference. In late March 1954, the French and American chiefs of staff informally discussed the possibility of a massive American bombing around Diên Biên Phu (Operation "Vulture"). The Laniel cabinet secretly requested the bombing on April 4. What the Eisenhower administration offered instead was "United Action," a pursuit of the war until victory with massive American air and naval support. Congressional leaders asked that US allies provide the ground troops. That was not what Bidault needed, but Diên Biên Phu has received such attention that, after several weeks, he agreed to "United Action" if that was the price to obtain "Vulture." Eden killed the whole scheme by refusing British participation to "United Action" which, he understood, would have made negotiation in Geneva impossible.

Dulles issued new military threats during the conference itself. On May 8, he secretly offered France an American intervention in the war. The Laniel cabinet studied the proposition, but again American conditions did not fit French needs. France was asked to declare that it would maintain its forces in Indochina for the whole duration of operations, whatever turn they might take. Laniel, with his slim parliamentary majority of two votes, could not give such assurances after 8 years of war, and Dulles withdrew his offer on June 11. From then on, the Eisenhower administration was secretly resigned to the partition of Vietnam, even though it publicly condemned it.

Since major newspapers such as the *International Herald Tribune* mentioned in general terms these talks between France and the United States as early as May 15, American threats had a real influence on the conference. Vietminh armies were very tired after Diên Biên Phu and could not have sustained an extension of the war, not

to mention an American intervention. Dulles gave arguments to China and the Soviet Union to convince the DRV to settle for partition.

The Geneva Conference (April 26–July 21, 1954)

During the first weeks of the conference, the United States issued military threats but did not contribute propositions. Both the State of Vietnam and the DRV demanded the whole of Vietnam. Bidault refused to meet Pham Van Dông (1906–2000), the head of the Vietminh delegation. So, by default, it was left to Eden and his Chinese and Soviet colleagues, respectively, Zhou Enlai (1898–1976) and Viatcheslav Molotov (1890–1986), to conduct serious diplomatic business.

Since the United States refused that China chair the conference, a rotating chair was impossible, and the debates were co-chaired by Britain and the Soviet Union. From the outset, Zhou and Molotov tried to create an atmosphere favorable to negotiation. Zhou had Pham Van Dông agree to contact between French and Vietminh officers about the evacuation of the wounded at Diên Biên Phu. This technical commission would later be used as a sounding board to explore informally the possibility of partition. It is in this setting that the DRV would mention partition for the first time on June 10. Molotov accepted that negotiation of an armistice should be given priority over that of a political agreement and that this armistice be supervised by an international commission. Eden proposed that the conference convene in secret meetings as well as in official sessions. From then on, negotiation would progress mostly through private contacts.

Zhou made the first political opening on May 20, accepting that the wording of agreements could differ in each Associated State. It was an important concession, for even though the Pathet Lao and the Khmers Issarak depended on Vietminh assistance, they controlled one third of the Cambodian and Lao territories. But if China had backed them to the end, Cambodia and Laos might have called the United States to the rescue. Zhou took another important initiative on June 15,

when he forced the DRV to move its armed forces out of Cambodia and Laos and to renounce to have the Khmers Issarak and the Pathet Lao invited to the conference. Without these concessions, Western ministers, prodded by Dulles, might well have closed the conference without an agreement.

Mendès, who had been informed in general terms of "Vulture" and "United Action" by Edgar Faure, a fellow Radical and minister in the Laniel cabinet, revealed the affair in parliament, obtained a vote of no-confidence against Laniel, and was elected prime minister on June 17. He set himself 1 month to get an agreement in Geneva; otherwise, he would resign. It would be inaccurate to oppose Mendès the negotiator to Bidault the warrior. Mendès had talks with Pham Van Dông – whom Bidault had refused to meet – but he too issued military threats. On July 7, he declared that, should the conference fail, his last initiative as prime minister would consist in asking parliament to send conscripts to Indochina. Mendès, like Bidault, was an anti-communist. He accepted the partition of Vietnam at the 17th parallel only, not the 16th, so that Laos could be linked to the sea by a road running in non-communist territory. He insisted that the referendum on the reunification of Vietnam must take place 2 years after the peace agreement, not 6 months as Pham Van Dông would have liked, to give time to South Vietnam to put its house in order.

Mendès succeeded because Molotov and Zhou wanted an agreement. Zhou accepted a 2-year interval between peace and referendum; agreed that Pathet Lao forces would regroup in the Northeastern provinces of Phongsaly and Sam Neua, well to the North of the 17th parallel; and even threatened to cut all funds to the DRV if it did not give its assent to the 17th parallel. Molotov admitted that Cambodia and Laos, although they would be neutralized just like Vietnam, would be allowed to call foreign forces to their rescue if they deemed it necessary for their security. Molotov also agreed that, since the United States refused to sign any treaty with China, the political document of the conference – not the cease-fires – would be issued as an oral declaration. All these Chinese

and Soviet concessions made it possible to conclude peace on July 21, 1954.

Peace Terms

The Geneva agreement consists in three cease-fires (one for each Associated State) and a political declaration.

The three cease-fires are signed by the military commanders of the DRV and France. France and the DRV had chosen this arrangement to circumvent any objection from the State of Vietnam, since Bao Dai had delegated military powers to France for the duration of the war. In each state, the cease-fire is supervised by an international control commission comprising India (neutral, in the chair), Canada, and Poland. These commissions have very limited powers: they must report breaches of the armistice but cannot issue recommendations.

The cease-fires declare the three states neutral, neutrality terms being stringent in Vietnam only, where military reinforcements (both armament and military personnel), and the creation of foreign military bases, are strictly prohibited.

In Vietnam, Vietminh troops must regroup North of the 17th parallel and the VNA in the South. Vietnamese citizens are given 300 days after the cease-fire to regroup North or South of the 17th parallel, as they wish. This provision would allow the Catholics of Tonkin, who had fought against the Vietminh, to flee en masse to the South, where they would become the main political base of Ngô Dinh Diêm. The 17th parallel is only a provisional demarcation line, since Article 14a of the cease-fire mentions the future general election in all Vietnam (not its date). Therefore, it is illogical to separate the cease-fire from the political declaration, which mentions the interval of 2 years between the peace and the referendum.

The oral form of the declaration does not make it less binding, since oral agreements have the same legal value than written treaties. The declaration enjoins Vietnamese authorities North and South of the 17th parallel to get in touch on July 20, 1955, to organize general elections which will

take place in July 1956, under the supervision of members of the cease-fire commissions. Article 13 provides that the co-chairmen of the conference, Britain and the Soviet Union, will consult in the future, at the requirement of the control commissions, to "study" the measures necessary to enforce the three cease-fires. This wording is intentionally vague, but it allows for some form of cooperation between the two sides of the Cold War to maintain peace.

The United States and the State of Vietnam are not parties to the declaration. The United States only "took note" of it, excluding Article 13, since it did not want to cooperate with communist powers to preserve an agreement which it disapproved. The delegation of the State of Vietnam rejected both the cease-fire and the declaration. The move came from the new prime minister, Ngô Dinh Diêm (1901–1963), not from Bao Dai who had reluctantly assented to temporary partition as early as July 4. The chief of state had chosen Diêm to coopt the extreme nationalists who resented his cooperation with France. The nomination had taken place on June 16, at a moment when peace was still far from certain. If war continued, it would be with increased American participation, and Diem, with his well-known connections in the United States, was the man of the situation. He had officially applied for the position in May, the Saigon station of the Central Intelligence Agency (CIA) had started lobbying for him at the end of the month, and Bao Dai may have consulted with Dulles before choosing him. Laniel and Bidault, too, gave the green light to his nomination: it was their last contribution to the war effort.

The conference overlooked the protestation of the State of Vietnam because, in July 1954, this entity was not yet fully independent: the transfer of French powers was finalized only on December 31, 1954. But the day after, when South Vietnam became really independent, was it or not the successor state of France to the Geneva agreement? If it was, its protestation had no value. But it was not: according to the new treaty of association between France and Vietnam, initialed on June 4 1954, 17 days before the Geneva agreement, Vietnam would be the successor of France only for the treaties concluded *before* this convention itself.

And on both sides of the Cold War, nobody would take the risk to pressure South Vietnam to comply with the Geneva agreement.

The Consolidation of Partition

For all the talking about the unity of Vietnam, Dulles decided immediately after Geneva that reunification must never take place, since a communist success at the "general election" was likely. Diêm, who opposed any dealing with the DRV, was the ideal partner for such a policy. France and the two co-chairs did not object, and China was sidelined, since it was neither a co-chair of the conference nor a member of the control commission. The United States now took the initiative.

First, Cambodia, Laos, and South Vietnam were included under the umbrella of the Manila Pact, or Southeast Asia Treaty Organization (SEATO, September 6, 1954). Technically, the neutrality of Indochina was respected, since the three states were not parties to the treaty, but Zhou Enlai felt cheated. SEATO was an offshoot of "United Action," the coalition that Dulles had tried to create before Geneva. Eden had refused a coalition before the conference, which would have hampered the negotiation, but welcomed it after the peace. He shelved his project of "Asian Locarno," a cooperation between communist, neutral, and Western powers to guarantee peace in Indochina, which was unacceptable to Dulles. Now that war had been averted, Britain no longer interfered with American policy.

Moved by the same spirit of peaceful coexistence as Eden, Mendès would have liked the wording of the Manila Pact to insist as much on economic development as on defense, but he was in no position to insist nor to object to American initiatives in Asia in general. Mendès had brought the EDC to a vote on August 30, 1954, but had not asked for a vote of confidence over the project, and it had been defeated. From then on, until the French parliament definitely agreed to the admission of Germany into NATO (effective May 5, 1955), France ran the risk that the United States might rearm Germany on a bilateral basis, without any conditions.

For the same reason, Mendès did not extend recognition to Hanoi and Beijing after Geneva and accepted that the DRV be submitted to the same severe commercial embargo by Western powers than the PRC.

Neither could France pressure South Vietnam to implement the peace terms relative to reunification, since its contribution to the defense of the country was coming to an end. In Geneva, Mendès had promised that the FEC would leave South Vietnam if Saigon so requested. In September 1954, Diêm asked that this departure take place no later than March 1956. Anyway, the FEC was now needed in Algeria, and the Algerian war put Paris in the dependence of Washington. Technically, only the United States could provide the helicopters needed to trace the guerilla. Politically, since the Algerian independence movement was not communist, American support for this new war, crucial in the United Nations, was more difficult to obtain than in the case of Indochina. Possibly with these factors in mind, Mendès eased the transition toward defense of South Vietnam by American troops by secretly allowing, in January 1955, that all civilians within the US military mission in Saigon be replaced by military personnel.

The Soviet Union, too, renounced to interfere. Moscow convened three meetings of the co-chairmen: after Saigon failed to establish contact with Hanoi to prepare the general election in July 1955; after the rigged referendum of October 19, 1955, which established in South Vietnam a republican regime presided by Diêm; and in April 1956, when Diêm, prompted by the United States, reiterated his repudiation of the Geneva settlement, but promised unilaterally to respect the cease-fire. At each meeting, Britain defended South Vietnamese initiatives, and, more tellingly, the Soviet Union issued only mild and formal protests. Chinese and North Vietnamese calls for a new Geneva conference, in 1956, were ignored.

In fact, after Geneva, both the Soviet Union and China prioritized the consolidation of North Vietnam over reunification. Moscow refused to grant Hanoi a defense treaty, but, like China, offered generous economic aid. Both Molotov and Zhou Enlai advised a long-term strategy of national front in the South, so as not to provoke an increased American presence there. As long as Beijing and Moscow were in good terms, Hanoi had to bend to their will. The Sino-Soviet split of the 1960s and 1970s would provide the DRV with its historic chance; for now that Beijing and Moscow vied for primacy in the socialist camp, none of them could afford to let down the anti-imperialist cause of North Vietnam.

Conclusion

In retrospect, the Algerian war underlined the colonial character of the French Indochina conflict. The French defeat in Indochina encouraged the Algerian insurgents. The French military, who had become acquainted in Indochina with Maoist and Vietminh methods of indoctrination, were now keen to implement them in Algeria, in the most violent way. But the most distinctive feature of the French Indochina conflict remains its linkage with the general course of East-West relations in Europe as well as in Asia, since the EDC exerted a decisive influence on the course on the war and on the terms of the peace.

The same remark applies to the two other Indochina conflicts: the American war and the war between Cambodia, Vietnam, and China, which cannot be separated from the passage of Soviet-American relations from coexistence first to détente, then second Cold War, from the course of Sino-Soviet relations from rivalry to reconciliation, nor from the evolution of Sino-American relations from glacial Cold War first to unspoken alliance, and later to mutual indifference. The Indochina wars provide the classic example of the connection between local and global rivalries during the Cold War.

G

Gaddafi, Muammar (1942–2011)

Horace Campbell
Syracuse University, Syracuse, NY, USA

Introduction

Muammar Mohammed Abu Minyar Gaddafi (the name of the late President of Libya has been alternately spelled as "Moammar/Muammar Gadaffi/Gaddafi/Gathafi/Kadafi/Kaddafi/Khadafy/Qadhafi/Qathafi". For the purposes of this article, the name will be spelt as Gaddafi, except when quoting the name from other sources) was born in 1942 near Qasr Abu Hadi, a rural area outside the town of Sirte, in western Libya. He joined the ancestors on October 20, 2011, after being captured alive, sodomized, and killed in cold blood. Days after his brutal killing, NATO announced that it was its most successful military operation ever. The lessons of the life and death of Gaddafi open may avenues for an understanding of imperialism and anti-imperialism at the end of the twentieth century. Gaddafi's tenure as President of Libya after the 1969 coup d'etat can be compared to leaders such as Sukarno of Indonesia, Saddam Hussein of Iraq, and Gamal Nasser of Egypt who were anti-imperialists in their lifetime but were unable to marshal the social forces in their society who could genuinely give material reality to a policy of anti-imperialism. Gaddafi was an admirer of Nasser's Pan-Arabism and mobilized his society around the idea of the Great Socialist People's Libyan Arab Jamahiriya. As an exercise in socialism from above, this experimentation with radical anti-imperialism could be distinguished from the anti-imperialist project of the Vietnamese and the Cubans who built alternative institutions.

The Libyan government under Gaddafi organized annual anti-imperialist sessions called the Mathaba and gave material support to fighters for freedom against apartheid in Southern Africa. This endeared Gaddafi to citizens of those states who referred to him as "brother leader." At the end of apartheid, Nelson Mandela, the President of South Africa, personally intervened to end the international sanctions against Gaddafi and his family. Gaddafi gravitated toward radical Pan-Africanism and became a champion for the full unification of Africa. For this goal, he became a threat to those forces in Europe that exploited Africa. The convergence of these elements in Europe, exemplified by the French President along with the Wall Street firm of Goldman Sachs, precipitated the NATO intervention that destroyed Libya. No less a body than the British House of Parliament, Select Committee on Foreign Affairs noted that the intervention in Libya was based on lies. President Barack Obama noted that the support for the NATO intervention in Libya was the worst mistake of his presidency.

However, what Obama saw as a mistake arose from the logic of contemporary imperialism with the attendant forms of militarism and accumulation by dispossession.

Growing Up in the Era of Bandung

The Italians were decisively defeated at the Battle of Adwa (Ethiopia) in 1896. This defeat robbed Italy of its possible foothold in Africa after being excluded from the spoils that were shared by the imperialists at the infamous Berlin Conference of 1885. As the junior partner of European imperialism after the partitioning of Africa in Berlin in 1885, the Italians had occupied Libya after 1911. Without a developed industrial base, Italy populated Libya with settlers, and the economic crisis in Europe brought the fascists to power early in Italy. Fascist Italy unleashed untold terror on the peoples of Libya, and one of the outstanding characteristics of this Italian occupation was the sterling resistance of the Libyan peoples against external rule. Anti-imperialism and anti-colonialism were stamped into the political culture of Libya with Omar al Mukhtar being one of the most internationally known freedom fighters against Italian fascism. Nearly all households in Libya were affected by colonial rule, and the family of Muammar Gaddafi was no exception. Some of the biographers of Gaddafi assert that his father, Abu Meniar, was one of the resisters against Italian colonialism.

Libya became a battleground between differing imperialist forces in the Second World War, and Gaddafi was born in the midst of this inter-imperialist rivalry that had thrust the world into destruction and genocide. Major battles were actually fought on Libyan soil with one of the seminal turning points occurring with the defeat of General Rommel in Libya. At the end of this war, the British imperial forces were granted the authority over Libyan society, and the young Gaddafi grew up in the atmosphere of war and the handing over of the country to the British. Formal colonialism ended in Libya in 1951 when the United Nations created the United

Kingdom of Libya, a federal state under the leadership of a monarch, Idris. This king with no legitimacy within the traditions of resistance or within the political system sought to maintain power by banning fledgling political parties and centralized power in his monarchy.

This attempt at the centralization of power in the hands of the Libyan King occurred at the same historical moment as the Egyptian revolution, which deposed King Farouk in July 1952. This revolt had been led by the Free Officers Movement, a group of army officers led by Mohammed Naguib and Gamal Abdel Nasser. Three years later, Egypt played a crucial role in convening the Bandung Afro-Asian Conference in Indonesia to be a platform for anti-colonial and anti-imperialist forces. While western scholars pontificated about imperialism from the comfort of intellectual enclaves in Europe and North America, the anti-colonial forces placed new questions on the agenda. Thinkers such as Edward Said and Frantz Fanon theorized on the relationships between the culture of capital and imperial domination. Fanon made the unique contribution on the psychological and mental disorders emanating from imperial rule. In real life, the peoples of Vietnam, Cuba, South Africa, and Palestine produced some of the foremost thinkers on imperialism and anti-imperialism. The generation of Muamar Gaddafi matured at a period when the Algerian war of independence and the Egyptian revolt of Nasser stimulated young leaders from the Cape to Cairo.

After completing secondary school, Gaddafi was trained as an officer in the military. The biographers of Gadhafi reported that after he enrolled in the Royal Military Academy in Benghazi in 1963, he quickly sought to organize fellow recruits in an organization that had been patterned after the Free Officers Movement of Egypt. In 1964, Gaddafi founded the Central Committee of the Free Officers Movement of Libya. This formation organized clandestinely to replace the monarchy until they succeeded in 1969.

Military Coup d'etat 1969
Gaddafi had come to power as the leader of Libya after a coup d'etat removed King Idris on

September 2, 1969. As a group of military officers, there were few organic links with the other sectors of society such as the working peoples, students, teachers, civil servants, and the intelligentsia. The political underdevelopment of the political forces in the Libyan society meant that the dominant space for politics and organizing was in the military and in the mosque. It was in this political milieu where the 12 member of the central committee of the Free Officers proclaimed themselves the Revolutionary Command Council (RCC), the government of the new republic in 1969.

Lieutenant Gaddafi became the RCC Chairman, and therefore the de facto head of state, also appointing himself to the rank of colonel and becoming commander in chief of the armed forces. Gaddafi quickly asserted his authority and over the following years and emerged as the maximum leader. (For an elaboration of the career of Gaddafi, see the MA thesis of Musa Kusa, "The Political Leader and his social background" Muammar Qaddafi, the Libyan Leader, "Michigan State University, 1978. See also David Blundy and Andrew Lycett, Qaddafi and the Libyan Revolution, Little Brown, 1987 and Dirk Vandewalle, Libya since Independence: Oil and State Building, Cornell University Press, Ithaca. See especially chapter 4 "From Kingdom to Republic.") In the 42 years when Gaddafi was head of state, the politics of the society went through many twists and turns, but remained relatively stable. Ruth First, the South African revolutionary historian, after studying the Libyan experiment had termed the Libyan revolution, the elusive revolution (First 1974). This term was important in so far as it captured the reality of an anti-imperialist force that did not seek to ground its politics within the organized sectors of Libyan society. Like Sukarno of Indonesia and Saddam Hussein of Iraq, the political leadership in Libya attempted to orchestrate state-led anti-imperial politics without a full political and ideological mobilization of the people. Tragically, Gaddafi, like Sukarno and Saddam Hussein suffered from imperialist intervention, destruction, and demise.

Pan-Arabism and the Context of the Nonaligned Pressures of the 1970s

One year after the coup that brought Gaddafi to power, his hero, Gamal Abdel Nasser, died in November 1970. The new government in Libya had proclaimed itself to be aligned to the pan-Arab and Pan-African anti-imperial ideas of the Afro-Asian solidarity movement. By 1960, the question of the future of Congo had inserted itself inside the Bandung and Pan-African movements with grave consequences for the future of African self-rule. Leaders such as Kwame Nkrumah and Nasser had anticipated the holding of a Second Bandung Conference in Algeria in 1965, but the intense activities of imperial diplomats ensured that the Second Bandung Conference did not take place. Gaddafi had come of age in the midst of the killing of Sukarno and Patrice Lumumba and had anticipated that Egyptian technical experts would assist in the social transformation of Libya. The Libyan revolt of 1969 looked to Nasser and mimicked the "socialism from above" posture that had been characteristic of the Nasserite government. Libyan "revolutionaries had anticipated that technical experts from Egypt would support the Libyan 'revolution,' and they embraced the traditions of Nasser of supporting anti-imperialist projects while suppressing communists and progressive intelligentsia.

After Anwar Sadat succeeded Nasser in Egypt, the relations between Egypt and Libya deteriorated as the political leadership of Egypt grew closer to the United States and Israel. The ideological weaknesses of Nasserism without Nasser became very clear in North Africa with both Niemeri of the Sudan and Gaddafi of Libya seeking to project radical nationalism within the context of militarized states. Imperialism had taken the guise of promoting neoliberal economic projects to prop up global capital, and Egypt became a prime candidate for IMF interventions. After the 1973 war between Israel and Egypt, Gaddafi critiqued the capitulation of Sadat to the United States and fancied himself as the genuine supporter of the cause of the rights to self-determination for the Palestinian peoples. There were efforts to create a new state between Egypt, Libya, Syria,

and the Sudan, but these efforts foundered in the absence of proper planning, preparation, or real political work to transform the ideas of Pan-Arabism into practical reality. Flush with funds from the increased prices for petroleum products, Gaddafi sought to use money to buy political influence. This proved to be a flawed strategy that brought disaster after disaster with tragicomedy consequences.

Recovering the Independence of Libya and the Great Man-Made River

The first period of Gaddafi's tenure as the Head of State 1969–1977 was one where the society was supposed to be run by the Revolutionary Command Council. Radical initiatives occurred in this period such as the nationalization of oil companies and banks and the expulsion of the US military from the Wheelus military base in Libya. In September 1969, the government launched a "Green Revolution" to raise agricultural productivity so that Libya could rely less on imported food.

One of the most ambitious projects undertaken by the government of Gaddafi was the Great Man-Made River Project. The objective of the project was to bring water from the great underground aquifers of the Nubian Sandstone Aquifer System to the agricultural areas of Libya and to the urban areas. This project had been started in 1984 and was conceived to develop in five stages. On August 28, 1984, Muammar Gaddafi laid the foundation stone in Sarir area for the commencement of the construction of the Great Man-Made River Project. By August 28, 1986, Muammar Gaddafi inaugurated the Brega plant for the production of the prestressed concrete cylinder pipes, which are considered the largest pipes made with prestressed steel wire. The first phase had required 85 million m^3 of excavation and was inaugurated on August 28, 1991. The second phase (dubbed First Water to Tripoli) was inaugurated on September 1, 1996.

In order to provide the technical and industrial basis for this project, Gaddafi entered into agreements with Italian, Spanish, and Korean companies to undertake this project that was termed the eighth wonder of the world. By the time the project was well into its third phase, it consisted of the largest underground network of pipes (2,820 km (1,750 mi)) and aqueducts in the world. It consisted of more than 1,300 wells, most more than 500 m deep, and supplies 6,500,000 m^3 of fresh water per day to the cities of Tripoli, Benghazi, Sirte, and elsewhere. The total cost of the project was over US \$25 billion. In this project 1,000 million euros were invested for the installation of 50,000 artificial palm trees for water condensation. Characteristically, the imperial forces opposed this project just as they opposed the Transaqua Project to replenish Lake Chad.

What is significant in the study of imperialism and anti-imperialism in Libya is that the European imperialists felt threatened by this water transfer scheme, and during the NATO intervention in Libya, the factory in Brega that produced the pipes for the man-made river was bombed.

Political and Intellectual Limits of Gaddafi's Anti-imperialism

After Nasser passed away and the overthrow of Kwame Nkrumah in Ghana in 1966, imperialism intensified the efforts to dominate the political economy of Africa. Cuba had stood as an example of organized anti-imperialism, but the anti-communist stance of Gaddafi meant that his political organization did not seek to learn how Cuba survived US sanctions and blockade. Gaddafi and the Revolutionary Council in Libya had no real models to anchor their experiment in radical nationalism. Despite the lack of anchoring, the elementary claims at recovering national wealth were seen as threatening by the imperial forces. Libya had emerged within OPEC as a radical force, and by 1977, the US Department of Defense listed Libya as a potential enemy of the United States (for a chronology of the actions of the Libyan leadership in this period, see Libya since Independence: Oil and State Building). There was no doubt that Libya was no longer simply an outpost for western companies. However, the contradictory postures, alliances, and partnerships that were proposed left Libya isolated because of the personalized nature of diplomacy under Gaddafi. As one author summed up this period:

Pushing his policies of anti-Zionism, anti-communism, and anti-imperialism, Qadhafi became something of a champion of reawakened Arab pride, an exemplar to many young Arabs of commitment to Arab Unity and of sincere and dedicated endorsement of the Palestinian cause. …. Such widespread admiration was nevertheless relatively short-lived. It was not long before Qadhafi had begun to antagonize other Arabs with his disregard for diplomatic convention and his inflexible insistence on the absolute righteousness of his own policies and philosophies. (Harris 1986, p. 86)

After proposing a series of schemes to unite with Egypt, Morocco, Tunisia, and Syria, the Gaddafi regime became isolated. This was especially the case with the Palestinians where Gaddafi attempted to dictate in the internal matters among the Palestinians.

While representing himself as a revolutionary, Gaddafi exposed his lack of understanding of international politics and his own ideological limitations by the alliances that he attempted to forge. Although Libya had been placed firmly within the ranks of the nonaligned movement under Gaddafi, the political leadership did not have a profound understanding of the difference between rhetoric and reality when it came to many of the leaders in Africa. It was this ideological and intellectual limitation that influenced Gaddafi to develop strong relations with autocrats such as Omar Bongo of Gabon, Jean-Bédel Bokassa of the Central African Republic, and Idi Amin Dada of Uganda. In the specific case of Amin of Uganda, Gaddafi provided military and financial support to a leader who had killed hundreds of thousands and waged war against Tanzania, a society that was enduring the most of the battles against apartheid at that historical moment.

Throughout the first 20 years of the Gaddafi regime, the Libyan government was embroiled in the internal politics of Chad supporting differing factions and deepening the involvement of the Libyan military in a prolonged military scraps in the Aouzou dispute. The extended Libyan involvement in the military wrangles that has been journalistically termed the "Toyota War" diverted the attention of the African freedom struggle and gave legitimacy for the French military intervention in Central Africa. (Azevedo 1998. This war is also called the Toyota War by some western journalists.) Gaddafi's enamorment with self-styled "rebel" leaders and organizations meant that there was a steady traffic of individuals such as Charles Taylor who made pilgrimages to Libya. What Gaddafi did not know was that during his relationship with Charles Taylor, the latter was working as a US intelligence asset (2012). Through the organization named Al Mathaba, the Libyan leadership proclaimed itself to be at the forefront of anti-imperialism, but the Green Book, the theoretical basis for this revolutionary posture, was as contradictory as the policies of Gaddafi.

In 1977, there was the Declaration of the Establishment of the Peoples Authority, and from March 2, Libya was renamed the Socialist People's Arab Jamahiriya. One author traced the twists and turns of the forms of rule where Gaddafi took the title as a Guide. This author explored the periods 1969–1977, the period 1977–1988, the period of sanctions and isolation, the period of the 1990s, and the energetic period of what this author called Gaddafi's "conversion." This was the period after September 11, 2001, when Gaddafi and his sons worked hard to ingratiate himself with the United States and Britain and begged to be an ally in the Global War on Terror. Luis Martinez described these zigs and zags as the *Libyan Paradox* (Martinez 2007). Shukri Ghanem and Saif al-Islam Gaddafi were two central figures in the paradoxical relationship with the West.

Gaddafi and Libya in the Context of Western Militarism

In the period of neoliberal capitalism and imperial domination, the Libyan society managed to escape the worst prescriptions of the International Monetary Fund because of its large deposits of fossil fuels. Prior to the major discoveries of fossil fuel by US oil companies in the 1950s, Libya was a poor country whose principal export was scrap metal. Italian capitalism did not invest in the infrastructure of the society, and the social and technical backwardness was very evident in all regions of Libya. After the discovery of oil in the 1950s, the petroleum sector in Libya was dominated by British and US oil companies. By 1957, there were about a dozen companies operating in Libya on about 60 different concessions.

G

The companies operating there included the seven majors (called the Seven Sisters of oil and alternatively Big Oil) and the French para-statal Compagnie Française des Pétroles. There was also Oasis, a consortium of three companies new to international petroleum exploration, Amerada Hess, ConocoPhillips, and Marathon. (The Oasis Group (originally the Conorada Group) is a consortium composed of three US "independent" oil companies: Amerada (now Amerada Hess), Continental (now ConocoPhillips), and Marathon. Bidding independently, the companies won concessions throughout Libya during the first auction of oil rights in 1955. For details of the oil companies, see Martinez, Luis, *The Libyan Paradox*, and Vanderwalle, Dirk, *Libya Since Independence: Oil and State Building.*) Following the concession awards, the Oasis companies pooled their acquisitions. By 1965, when Libya opened a second round of concession bidding, Oasis was the number two producer of oil in Libya, bringing in more than 300,000 barrels per day. The energetic activities of these western companies expanded Libya's petroleum sector so that by 1970, at the time of the revolution, Libya was exporting 3.3 million barrels of oil per day (BPD).

Once the revolution took place in 1969, the Libyan government had started to tax the oil companies, but the intransigence of the oil companies speeded the processes of nationalization and control by the Libyans. After the 1973 war between Egypt and Israelis, the Libyan regime began to take an aggressive position in the Organization of Petroleum Exporting Countries (OPEC), and by 1979, the example of radical nationalization established by Libya had been followed by Iran, Saudi Arabia, and Kuwait. Over the 15-year period after the revolution in Libya, countries such as Iraq, Venezuela, Nigeria, Qatar, and the United Arab Emirates fully nationalized the holdings of the western oil companies (Juhasz 2009, p. 101). The leadership of Libya within institutions such as OPEC led to confrontations with the West culminating in the 1977 ranking of Libya as number 4 in the potential enemies list of the United States (the other enemies were the Soviet Union, China, North Korea, and Libya. Cuba was ranked fifth on this list. See Ronen, Yehudit. *Qaddafi's*

Libya in World Politics, p. 15). It followed from this ranking that the differences between the countries expanded to the point where the Reagan Administration bombed Libya in April 1986 in a clear effort to eliminate the leader of Libya (see op cit pp. 32–34).

The political leadership of Libya had used the increased resources from oil to develop a robust program of social and economic reforms. In March 1978, the government issued guidelines for housing redistribution, attempting to ensure the population that every adult Libyan owned his own home and that no one in Libya would be homeless. Following the social democratic traditions of Europe, the Libyan government bestowed greater access to health, education, housing, childcare, and support for newlyweds. These initiatives were called socialist, and in 1978, Gaddafi called for the People's Committees to eliminate the "bureaucracy of the public sector" and the "dictatorship of the private sector"; the People's Committees took control of several hundred companies, converting them into worker cooperatives run by elected representatives.

Despite the claim that the People's Committees were in control of the economy of Libya, the leadership encouraged sycophancy in the ranks of the bureaucracy while discouraging genuine working class leadership and organization. The underdevelopment of the political class in Libya meant that outside of the close-knit circle of sycophants and hangers on, the Libyan society had few resources to respond to the psychological and information warfare that had been launched against Libya. As Libya became enmeshed in the geopolitics for energy resources, the social science of empire was unleashed against Libyan society and its leaders.

Tribal Libya, rogue state, terrorist state, radical Islamist, and other prerogative social science categories obscured the achievements of this society and reproduced the divisions between Libya and Africa. This information war was actually supported by active measures by western intelligence services to foment divisions within Libya. Libya and Gaddafi became the basis for one of the most sustained efforts at psychological warfare and disinformation with Gaddafi being labeled

as a state sponsor of terror and terrorism. The National Security Directive Decision (NSDD) 205 of 1986 intensified the psychological war against Gaddafi to the point where historians will be hard pressed in the future to distinguish facts from fiction in relation to the many "terrorist" acts that were supposed to be orchestrated by Libya during the period of the Reagan Administration (Wehrey 2019). The US NSDD 295 had worked to incite internal dissent against Qadhafi with the objective of his removal from power. NSDD 224 of the Reagan Administration provided the justification of the bombing of Libya in 1986 on the grounds that Libya had been implicated in a number of terrorist attacks, especially the bombing of a night club in West Berlin on April 5, 1986.

After the bombing of Libya by the Reagan Administration in 1986, there were US military planners who argued that the bombing was an exercise in psychological operations (Goldstein 1997). Many books and scholarly articles drew from the disinformation campaign of the United States and the British in their covert wars against Gaddafi. One of the ironies of history was that while the Reagan Administration was accusing Gaddafi of sponsoring terror and terrorism, the Central Intelligence Agency had started to recruit Libyans, Algerians, and Egyptians to fight in Afghanistan with Osama Bin Laden (Coll 2004, see also Bergen 2001). It was this history of disinformation that renders very problematic the information on the bombing of the Pan Am Flight in 1988. Notwithstanding that the Libyan government under Gaddafi paid compensation to the families of those who perished, this episode exposed many of the contours of imperialism and anti-imperialism at the end of the cold war.

Gaddafi as a Beneficiary of Anti-imperialist Organization After the Cold War

Throughout the period of US imperial hegemony, the three forces that had been very successful in opposing US and imperial domination were the forces of the Cuban Revolution, the Vietnamese struggles, and the anti-apartheid struggles. In particular, the anti-apartheid struggles had mobilized the Pan-African forces globally to oppose white racism internationally. This opposition at the international level divided the world into those who saw the African National Congress and Nelson Mandela as terrorists. The military defeat of the apartheid forces along with their moral defeat had been a boon to the forces of peace after Nelson Mandela was released from detention in 1990. After the blundering of relations with Idi Amin and Bongo, Gaddafi drew closer to the freedom fighters in Southern Africa and provided material and financial support to African freedom fighters. Hence, when Gaddafi was demonized by the West, he was labeled as the "dear brother leader" by the ANC of South Africa.

The relationships between Gaddafi and the global Pan-African movement deepened after the seventh Pan-African Congress that was held in Kampala in 1994. The resolution of the Congress had stated that the next Pan-African Congress would be held in Libya. That resolution could not be enacted in 1994, because by that time, Libya and Gadhafi were under sanctions by the United Nations for the downing of the Pan Am Jet in 1988. In 1994, Nelson Mandela became the Head of State in South Africa, and for a short moment, the balance of the anti-imperialist forces tipped to the side of the oppressed.

Nelson Mandela had openly acknowledged the support of Cuba, Libya, the Palestinians, and other fighters for freedom who had supported the African National Congress. Nelson Mandela who had been declared a terrorist by the white racist minority regime and by western intelligence agencies undertook to successfully mediate between the government of Britain and the United States to have the sanctions against Libya lifted. Even in his advanced age, when he could not fly directly to Libya, Mandela undertook shuttle diplomacy to mediate between Gaddafi and the British. Mr. Mandela shuttled between Britain and Libya until he made a breakthrough where Libya agreed to the principal demand, that is, handing over Libyans who were accused of placing the bomb on the Pan Am Flight.

The UN sanctions were lifted in 1999 after the Libyan government agreed to hand over "suspects" to be tried in Europe.

One of the compromises that came out of these negotiations was that those accused of the 1988

Lockerbie bombing be tried outside Scotland. Hugh Roberts discussed at great length the sophisticated diplomatic maneuvers by Gaddafi and the Libyan government after these negotiations so that Libya could reenter the western fold without accepting responsibility for the Lockerbie disaster:

> It was only in 2003–4, after Tripoli had paid a massive sum in compensation to the bereaved families in 2002 (having already surrendered Abdelbaset Ali al-Megrahi and Al Amin Khalifa Fhima for trial in 1999), that sanctions were lifted, at which point a new reforming current headed by Gaddafi's son Saif al-Islam Gaddafi emerged within the regime. (Hugh Roberts, "Who Said Gaddafi had to go?" London Review of Books, November 2011)

Roberts is among the few scholars who penetrated the diplomatic push by the Gaddafi regime to end the sanctions without admitting anything in relation to the Lockerbie affair. It is worth quoting Roberts at great length:

> It is often claimed by British and American government personnel and the Western press that Libya admitted responsibility for Lockerbie in 2003–4. This is untrue. As part of the deal with Washington and London, which included Libya paying $2.7 billion to the 270 victims' families, the Libyan government in a letter to the president of the UN Security Council stated that Libya 'has facilitated the bringing to justice of the two suspects charged with the bombing of Pan Am 103, and accepts responsibility for the actions of its officials'. That this formula was agreed in negotiations between the Libyan and British (if not also American) governments was made clear when it was echoed word for word by Jack Straw in the House of Commons. The formula allowed the government to give the public the impression that Libya was indeed guilty, while also allowing Tripoli to say that it had admitted nothing of the kind. The statement does not even mention al-Megrahi by name, much less acknowledge his guilt or that of the Libyan government, and any self-respecting government would sign up to the general principle that it is responsible for the actions of its officials. Tripoli's position was spelled out by the prime minister, Shukri Ghanem, on 24 February 2004 on the Today programme: he made it clear that the payment of compensation did not imply an admission of guilt and explained that the Libyan government had 'bought peace'. (Hugh Roberts, "Who said Gaddafi had to go?")

From the moment of this tragic bombing of the Pan Am Flight over Lockerbie, Scotland, there had been conflicting reports from western intelligence agencies on who was responsible for this bombing. Shukri Ghanem, the quintessential insider of the regime and one of the "reformers," categorically denied that Libya had anything to do with the Lockerbie bombing.

The general line on Libya by western scholars and analysts was that the Gaddafi regime had undergone a "conversion," but Martinez in his book on the *Libyan Paradox* explained in great detail the fears of Gaddafi for his life. As a scholar working from French resources, Martinez would have been aware of the evidence produced by French journalists of the plans by British intelligence and the Islamic Fighting Group of Libya to assassinate Gaddafi in 1996. This was only one of the many assassination plots that Gaddafi had survived after coming to power in 1969. In November 2002, the British newspaper *The Guardian* reported that "British intelligence paid large sums of money to an al-Qaeda cell in Libya in a doomed attempt to assassinate Colonel Gadhafi in 1996 and thwarted early attempts to bring Osama bin Laden to justice" (Bright 2002). For further details of the relationships between western intelligence agencies and the Islamscists in Libya and Saudi Arabia (see Brisard and Dasquie 2002).

Imperialism and the Weaponization of Finance in the Age of Neoliberalism

Gaddafi had escaped the net of sanctions with the support of the Pan-African movement, but he became more ensnared into the web of international finance capital after the sanctions were lifted. There were a number of tracks of western penetration of Libya: trapping Libya in the web of the financialization of energy markets, demonizing Gaddafi, military penetration and support for known Islamists, supporting reformers inside the Libyan bureaucracy, and working to isolate Gaddafi in Africa.

With the assistance of South Africa and the new leaders that emerged in Africa after 1994, Gaddafi was rehabilitated within Africa with a steady stream of activists joining the pilgrimages to International Mathaba that was held in Tripoli every year. Gaddafi had created the International Mathaba as one component of the Libyan

Socialist Jamahiriya. The Mathaba's mission statement had been clear with the objectives, "to resist imperialism, racism, fascism, zionism, colonialism, and neo-colonialism." From 1982 forward, the Mathaba had international meetings where groups of freedom fighters from all over the world participated. While the bona fides of some of the organizations that attended the Mathaba meetings were questionable, the meetings had provided a space for governments such as that of Fidel Castro of Cuba, the Palestinian Liberation Organization (PLO), and Hugo Chavez of Venezuela to link up with African freedom fighters at the political and diplomatic levels outside of the UN forum. Western governments were incensed because Gaddafi gave visible support to African-American opponents of racism as well as to the American Indian Movement.

These genuine liberation movements could be distinguished from the others such as Blaise Compaore (the president of Burkina Faso and the person who played a significant role in the overthrow and assassination of Thomas Sankara in 1987) and Yahya Jammeh, the president of Gambia. The Al Mathaba confraternity brought together selected anti-imperialist activists from Africa, the Caribbean, and North America, but many of these activists never challenged the ideas of monarchical dreams which culminated in Gaddafi declaring himself, Kings of Kings (Anderson 2011).

There was opposition to Gaddafi from the leaders of the Gulf Cooperation Council. Leaders of Saudi Arabia, Qatar, and the United Arab Emirates were opposed to the radical ideas expressed by the Mathaba and Gadhafi. Western intelligence agencies such as the MI6 of Britain kept back channel links to those who opposed Gaddafi such as the Libya Islamic Fighting Group (LIFG). The evidence of the complicity between the Saudi and western intelligence agencies in supporting the Islamic Fighting Group revealed the reality that the plans for the military destabilization and removal of Gaddafi were not new, nor did they suddenly arise after the February 15, 2011, uprisings in Libya. The book *Forbidden Truth* had opened one window into the world of the relationship between groups such as the

Carlyle Group and the oil companies and Libya. Condoleezza Rice, as an executive of Chevron oil company, was enmeshed in the web of intelligence, finance, and international politics that transcended Libya. While she was Secretary of State, Condoleezza Rice visited Libya in September 2008 and articulated with clarity that the United States has no "permanent friends in Libya, only permanent interests."

Western scholars took time to study the investment of the Gaddafi family to end isolation, and particular interest was focused on Saif al-Islam Gaddafi who had earned a doctorate at the London School of Economics (the title of the dissertation is "The Role of Civil Society in the Democratisation of Global Governance Institutions."). Shukri Ghanem, Saif al-Islam Gaddafi, and Musa Kusa were three of the more influential sectors of the bureaucracy that promoted market reforms, and these were dubbed the "neo-liberal forces within the Libyan establishment. Organs such as the General People's Congress which was supposed to be the harbinger for the establishment of a 'regime of people's power' and 'direct popular democracy' at the grassroots never found a real base among workers, poor farmers, students and patriotic business persons. The inner circle of Gaddafi stifled genuine social engagement while the western educated bureaucrats worked to bring Libya into the fold of 'market reforms.'"

The connections and discussions between the Libyan leadership and western liberal scholars created an ambivalent relationship that exposed the hollow ideological basis regime of the intellectual apparatus of the leadership. Libyan universities did not produce rigorous scholarship because of the sycophancy that was promoted nationally and internationally around the Gaddafi family. When Libya signed a multibillion dollar exploration and production deal with British Petroleum in 2007, BP promised to spend US $50 million on education and training project. The ambivalence toward Europe that was expressed in political rhetoric was not matched inside the educational system. Those with resources in Libya sent their children to schools in North America and Western Europe. The Al

G

Mathaba was established as a vehicle for anti-imperialism, but this was hollow and depended on the whims and caprices of the "brother leader." In this situation, those who had been educated in elite western universities dominated the bureaucracy and promoted western-type "democracy" neoliberal "reforms" so that Libya could enjoy better relations with the United States and Britain. Various scholars had identified, Musa Kusa, Saif al-Islam Gaddafi (son of Gaddafi), Mahmoud Jibril, Shukri Ghanem, Aziz al Isawi, and Tarek Ben Halim as the neoliberal reformers inside the government of Libya (this line of reasoning has been developed by Martinez and Prashad (2012). These functionaries had been so schooled in western ideas about economics that despite the massive reserves of Libya, their mantra was that Libya needed to open up to the West in order to attract "foreign investment capital create free trade zones and enhance the fledgling stock market" (Martinez and Prashad 2012 pp. 136–138). Despite the dominance of the "reformers," the zigzags of Gaddafi in relation to the international policies frustrated British and US interests who wanted to have a dominant say in the future of the Libyan economy. During the period of sanctions, European firms from Italy, Germany, Spain, Austria, and Turkey had done brisk business in the oil sector, but the Gaddafi family wanted to be accepted by the United States and went all out to ingratiate itself to Washington and the associated intellectual networks of US capitalism.

Finance Capital and the Libyan Investment Authority

Five years after the NATO intervention in Libya and the killing of Gaddafi, there was the judgment in the High Court of London in October 2016 during the Libyan Investment Authority versus Goldman Sachs case. (Case Number HC-2014-000197. https://www.judiciary.gov.uk/judgments/libyan-investment-authority-v-goldman-sachs/. The details of the case which have been published online can be accessed from https://www.judiciary.gov.uk/wp-content/uploads/2016/10/lia-v-goldman.pdf. Some of the issues bordering the case are raised in the article "Goldman Sachs vindicated but bruised in court battle with Libyan fund" posted by Reuters

on October 16, 2016. See https://www.reuters.com/article/us-libya-swf-litigation/goldman-sachs-vindicated-but-bruised-in-court-battle-with-libyan-fund-idUSKBN12G0QE. Two days earlier, viz., October 14, 2016 there was an article posted by Reuters titled "Goldman Sachs wins $1.2billion with Libyan Sovereign Fund" This article is also available online at https://www.reuters.com/article/us-libya-swf-litigation/goldman-sachs-wins-1-2-billion-dispute-with-libyan-sovereign-fund-idUSKBN12E1GL. It can be understood from these articles by Claire Milhench that the $1.2billion dollars was part of LIA's $67billion sovereign wealth fund. It has revealed another $2.1billion battle between the LIA and the French Bank Societe General.) This was the outcome of a 2.5-year legal battle between Goldman Sachs and Libya's $67 billion sovereign fund over the use of the resources of Libya in the speculative activities of the financial oligarchy in the world. Gaddafi and the Libyan government had established the Libyan Investment Authority to manage the massive holdings that were held by the Libyan government in foreign financial institutions.

At the outset of the establishment of the LIA, the Libyans were concentrating on the country they knew, Italy. Gaddafi had made 11 visits to Italy where the Italians promised to pay reparations, and Gaddafi undertook to be the police for Europe in preventing would-be immigrants from crossing the Mediterranean. Soon after the establishment of the LIA, Libya took stakes of between 2% and 3% in Italian bank UniCredit and Italian aerospace and defense company Finmeccanica. It also took a 7.5% stake in the Italian soccer club Juventus. Other notable investments included a 0.7% stake in Belgian financial group Fortis, a 3% stake in British publisher Pearson, and a 1% stake in Russian aluminum company Rusal. By 2010, the Libyan Investment Authority had amassed over US$53 billion in assets and held these in different parts of the world. Later it was estimated that the Libyan government held approximately US $200 billion in investments throughout the world (Paul 2011).

The oligarchs of Wall Street ached to get their hands on the funds of the Libyan Investment Authority, and the tale of this "dalliance" remains

one of the lesser told aspects of the relationship between Gaddafi and the West. One can read from the *Wall Street Journal*, the principal financial newspaper in the United States, how the Libyan Investment Authority lost money and the acrimonious fallout of these losses:

> In early 2008, Libya's sovereign-wealth fund controlled by Col. Moammar Gadhafi gave $1.3 billion to Goldman Sachs Group to sink into a currency bet and other complicated trades. The investments lost 98% of their value, internal Goldman documents show. What happened next may be one of the most peculiar footnotes to the global financial crisis. In an effort to make up for the losses, Goldman offered Libya the chance to become one of its biggest shareholders, according to documents and people familiar with the matter. Negotiations between Goldman and the Libyan Investment Authority stretched on for months during the summer of 2009. Eventually, the talks fell apart, and nothing more was done about the lost money. Coker and Rappaport 2011

The case in the High Court in London in 2014–2016 brought out the inelegant measures that had been used by Goldman Sachs to get the Libyans to invest in questionable securities to the point where Libya lost US $5 billion.

When Gaddafi had sought to hold Goldman Sachs accountable, the company had dithered, but in the mood after the collapse of Lehman brothers in 2008, Goldman Sachs was trapped and had little room for maneuver, but the Libyans were the ones with the resources. With the full knowledge that the financialization project was orchestrated through the financial sector in Dubai, the Libyan Investment Fund moved to consolidate its position in the "dark markets" world of the emirates. Libya had entered into the opaque world of financing energy markets and because it was awash with funds could move internationally in ways beyond the control of Wall Street or London. After December 2010, the Central Bank of Libya took the controlling position in the Arab Banking Corporation based in Bahrain. The Arab Banking Corporation was owned by Kuwait Investment Authority, Central Bank of Libya, Abu Dhabi Investment Authority, and other shareholders with minor shares. Any move for making independent decisions in the Arab Banking Corporation threatened the web of

speculators in the derivatives industry that depended on the recycling of petrodollars from the oil-rich nations of Kuwait, Libya, and the Emirates. Libya had gone for the jugular by seeking to capture the base of the Intercontinental Exchange. After February 17, when the Libyans started to move to divest their funds from their overexposure with British and US financial institutions, there was the freezing of the assets of Libya prior to the façade of protecting Libyans by Britain, France, and NATO.

The destruction of Libya and the killing of Gaddafi meant that Goldman Sachs felt that they were in the clear, but even after the death of Gaddafi, the Libyan Investment Authority prosecuted Goldman Sachs in the courts in England. Understanding the time line of the external efforts at a transitional government and the outbreak of the war between the Dignity brigade and the Libya Dawn forces in 2014 may shed some light on the role of international financial organizations in Libya.

In the ruling of the British High Court on the Libyan Investment Authority (henceforth LIA) against Goldman Sachs, the learned judge, Judge Vivien Rose, found that Goldman Sachs did not have a case to answer for. This judgment exposed the subservience of the judiciary system of the United Kingdom in the same manner in which the factional fighting in Libya continues to relate to who will control the US $200 billion plus in reserves which is still frozen. In the world of finance capital, countries such as Libya had been able to avoid the chokehold of institutions such as the International Monetary Fund (IMF) and western banks because the financial sector of Libya was kept under strict control. More importantly, the leader of Libya made the case for using the vast reserves of the Libyan state to anchor the proposed African currency. This placed the leadership in Libya on a path of direct confrontation with the train of financialization that had overtaken most societies of the world.

Gaddafi and the African Union

After the intervention of Nelson Mandela to end the sanctions against Libya, Gaddafi had moved rapidly to engage with the global Pan-African

movement. With the encouragement of Tajudeen Abdul Raheem and Salim Ahmed Salim, Gaddafi convened an extraordinary meeting of the Organization of African Unity (OAU) in Sirte in 1999. The Sirte Declaration that came out of this meeting was the resolution adopted by the Organization of African Unity on September 9, 1999, at the fourth Extraordinary Session of the OAU Assembly of African Heads of State and Government held at Sirte, Libya. The Declaration announced the decision to establish the African Union and to speed up the implementation of the provisions of the Abuja Treaty, to create an African Economic Community, African Central Bank, African Monetary Union, African Court of Justice, and Pan-African Parliament, with the Parliament to be established by 2000.

With the energetic encouragement of Gaddafi, there was the preparation and ratification of the Constitutive Act of the African Union by December 31, 2000. When it was found out that a number of states could not sign on to the Constitutive Act because of outstanding dues to the OAU, Gaddafi paid the dues of these countries. There were summits at Lomé in 2000, when the Constitutive Act of the African Union was adopted, and at Lusaka in 2001, when the plan for the implementation of the African Union was adopted. The first session of the Assembly of the African Union was held in Durban on July 9, 2002. Thabo Mbeki of South Africa became the first Chair of the AU after the summit in Durban in 2002.

Western states were surprised by the speed of the adoption and ratification of the Constitutive Act of the African Union. The AU had differed from its predecessor the OAU in so far as the mandate of the Constitutive Act gave the AU the authority to intervene in serious circumstances such as war crimes, genocide, and crimes against humanity. By 2004, the Peace and Security Council of the AU became operational with the broad mandate to enhance peace and security in Africa.

At the third AU summit, held in Libya in July 2005, Gaddafi called for greater integration, promoting the long-standing call of the global Pan-African movement for a single AU passport, a common defense system, and a single currency, utilizing the slogan: "The United States of Africa

is the hope." At the 50th anniversary of Ghana's independence in 2007 at the AU summit in Ghana, Gaddafi again called for the rapid unification of Africa with a common currency. When he became the AU Chairperson in 2009, Gaddafi pledged to use the reserves of Libya to underwrite the African currency. This drive by Gaddafi to promote anti-imperialism in African Unity speeded his demise.

In March 2011 before the NATO intervention, Sarkozy who was then the President of France emailed the then US Secretary of State, Hilary Clinton, and set out clearly why the intervention took place. The information came out in 2016 during the elections in the United States. As content of the email revealed in March 2011, Sarkozy spelt out the following five reasons why there had to be intervention in Libya:

1. France wanted to gain a greater share of Libyan oil production.
2. The intervention was necessary to increase French influence in North Africa.
3. To improve the internal political situation in France. That the internal political situation in France is dependent on the instability of Africa.
4. To provide the French military with the opportunity to reassert its position in the world.
5. To address the concern of his advisers over Gaddafi's long-term plans to supplant France as the dominant power in Francophone Africa.

The role of France and its relationship with Libya and Africa became central to the NATO intervention that led to the fall of Gaddafi.

NATO, the Destruction of Libya and the Killing of Gaddafi

The NATO intervention in Libya started in March 2011. This intervention came in the period when there had been uprisings in Egypt and Tunisia deposing leaders Ben Ali and Hosni Mubarak. The first Libyan demonstrations against the Gaddafi regime occurred on February 15, 2011, but by February 21, 2011, there were reports that there was imminent danger that innocent civilians were about to be massacred by the army. These

reports on an imminent massacre were embellished by reports of the political leadership calling the rebellious forces "rats." The United States, Britain, and France took the lead to rush through a resolution in the Security Council of the United Nations, invoking the principle of the "responsibility to protect."

The UN Security Council Resolution 1973 of 2011 had been loosely worded with the formulation "all necessary measures" tacked on to ensure wide latitude for those societies and political leaders who orchestrated the NATO intervention in Libya. (Acting under Chapter VII of the UN Charter, UN Security Council Resolution 1973 established a no-fly zone over Libya, authorised the enforcement of an arms embargo, and authorised "all necessary measures" to protect civilians. UN Security Council Resolution 1973, U.N. Doc. S/Res/1973, 17 March 2011, para. 6. and para 13.) In the next 9 months, the implementation of this UN Resolution exposed the real objectives of the leaders of the United States, France, and Britain. With the western media fuelling a propaganda campaign in the traditions of "manufacturing consent," this UN Security Council authorization was stretched from a clear and limited civilian protection mandate into a military campaign for regime change and the execution of the President of Libya, Muammar Gaddafi.

The deployment of information warfare capabilities had defined the nature of the NATO engagement in Libya. The psychological warfare and disinformation from the era of the Reagan Administration were refined to justify the NATO bombing of Libya. Early in the campaign, the US Defense Secretary Robert Gates had outlined why it would not be necessary to have boots on the ground in Libya. Though it was the planning of the NATO commanders that electronic warfare and bombing would bring the regime to its knees, after 3 months of bombing, the regime of Gaddafi was still in place. A new arena was opened in relation to information warfare when in April 2011 the bombing had failed to dislodge the Gadaffi government. There was the buzz of referring Gaddafi to the International Criminal Court (ICC) for killing his own people. Together with the sanctions mandated by Resolution 1973,

international public opinion was mobilized to condemn the leadership of Libya. These maneuvers meant that it was necessary to dismiss and diminish the efforts of the African Union to mediate between the Libyan government and the opposition National Transitional Council (NTC). In fact, the NTC refused to meet the team of the AU. Despite the overwhelming bombing campaign, the NATO form of warfare required ground troops. These were provided by Chad, Qatar, and Sudan.

Imperial militarism experimented with a new mode of warfare in Libya. The first aspect of this warfare is to bomb by air. In 78 days the NATO forces (also called the coalition) flew more than 38,000 sorties. Despite the post-intervention stories of the success of the bombing campaign, the vaunted cooperation between the forces were hampered by the lack of interoperability between the computerized systems of the United States and the other "allies." There was no cooperation in relation to battlefield information collection and exploitation system (BICES). After the intervention there had been recriminations among analysts about the inability of NATO to advance information sharing. US forces utilized the SIPRNET (Secret Internet Protocol Router Network), and these capabilities were not shared. Electronic warfare accompanied the bombing so that the command and control capabilities of the Libyan leadership and Libya's telecommunication system were jammed. Secondly, NATO deployed Special Forces what the United States call Special Operations forces. Thirdly, NATO made use of local militias; and fourthly, they employ foreign forces that were aligned with them. This is how they went into Libya. Before this time, however, there had been enough information warfare on Africans and across the world to garner support for this warfare and its approach.

The vacuous nature of the political base of the Libyan leadership under Gaddafi was laid bare by the fighting for Tripoli after the NATO forces entered Tripoli with foreign troops from Sudan and Qatar. Before the entry of NATO in Tripoli in August 2011, the spokespersons for Gaddafi had boasted that Gaddafi had an army of over 65,000 military personnel to defend

Tripoli. The Libyan armed forces had been degraded under Gaddafi because the regime feared a coup d'etat. This fear was intensified after the rebellion broke out and officers such as General Younis defected. The western reports on the divisions in the army have outlined the depth of the infiltration of the Libyan establishment after years of seeking reconciliation with western states. Saif al-Islam Gaddafi had developed deep relations with the intellectual front persons for imperialism, and Muammar Gaddafi had enabled the imperial intervention by his close collaboration with their intelligence agencies.

During the initial stages of the integrated Qatar/special forces/private military contractor assault on Tripoli, the spokesperson for Gaddafi boasted that the regime had 65,000 armed personnel ready to defend Tripoli. Yet, when the Special Forces of NATO and Qatar showed up in Tripoli with Belhadj (of the LIFG) as the Head of the Tripoli Military Council, the 65,000 armed personnel who were supposed to defend Tripoli were nowhere to be seen. It devolved to citizens who opposed NATO to defend their communities.

The mythical 65,000 forces had been superseded by militias under the sons of Gaddafi. These "paramilitary" forces of Libya under Gaddafi were better at internal repression than in dealing with foreign threats. From the annual studies of the International Institute of Strategic Studies and from the Stockholm International Peace Research Institute, it was possible to obtain detailed information on the military expenditures under Gaddafi. According to these sources there were supposed to be over 120,000 persons under arms in Libya by January 2011: Army 45,000, paramilitary 40,000, Air force 8,000, Air Defense 15,000, and Navy 8,000 (Libya 2011). Undoubtedly, the Libyan armed forces were no match for the sophisticated weaponry of Britain, Canada, France, the United States, and other forces of NATO, but what the Vietnamese had shown was that political mobilization and organization of citizens to defend their society could neutralize superior weaponry. Gaddafi did not learn this elementary lesson.

Although the Libyan armed forces were composed of a number of paramilitary forces and

security services, these armed elements in Libya acted as a means of controlling the power of the regular military and providing Gaddafi and his family with security. The narrative of "tribal" loyalties ensured that the military units around Sirte, the birthplace of Gaddafi, were the best equipped and were supposed to be the most loyal. Libya had billions of dollars, but Gaddafi did not know how to buy weapons, maintain them, or spend the money to uplift the technical and intellectual level of the army. Saif al-Islam Gaddafi in dabbling with Islam and neoliberalism only served to confuse the soldiers as to where they should stand. Thus, when a real war emerged, Gaddafi who had been spending about a billion dollars per year on weapons was full of bluster but had no real army.

The execution of Gaddafi was a coordinated affair of British French and US imperialism. The gory details of the execution and sodomization have been documented by this author in the book *Global NATO and the Catastrophic Failures in Libya: Lessons for Africa in the forging of African Unity.*

NATO's Failure and the Place of Gaddafi in History

In April 2016, President Obama said what happened in Libya was the worst mistake in his presidency. Was it a mistake or that the US administration had been driven by the demands of finance capital and Wall Street? Obama, in saying that this was a mistake, sent a signal about differences within the US military and financial establishment over the future of imperial military interventions (Goldberg 2016). In his interview with Jeffrey Goldberg of the *Atlantic Magazine*, Obama blamed the British for what is called the Libyan "Shit Show." After Obama described what happened in Libya as a mistake, the British Parliamentary Committee admitted that what happened in Libya was based on lies. The British Government and the media said that the government claimed, without evidence, that Gaddafi was about to kill his citizens in Benghazi. Additionally, the British Parliamentary Committee said that NATO rushed into military intervention without pursuing other options (This observation had been made earlier by the

abstentions during the vote in the security council of UN to intervene in Libya).

The re-evaluation of the role of western governments in the killing and destruction in Libya is caught between the disinformation that had been propagated against Libya and the realities of the thousands of militias that have made life unbearable for Libyan citizens. Western intellectuals who had dubbed the NATO intervention a "civil war" had great difficulty in rationalizing the plans for reconstruction of Libya based on plans of "transitions to democracy."

In the United States and Britain, there is a re-evaluation of happenings in Libya consistent with the new mea culpa from Obama and House of Commons select committee. Such a re-evaluation is reinforced by the studies of German specialists who question the use of force for regime change in Libya. This notwithstanding, when academics and Western agencies inundate African institutions with grants to study terror, clearly, there is a studious avoidance of the implications of the intervention in Libya for the present instability in the Sahelian region of Africa.

Conclusion

The life of Muamar Gaddafi exposed the pitfalls of anti-imperialism without a clear ideological position. Gaddafi had been born into the era of anti-colonialism and the Bandung era of the struggles for bread, peace, and justice. Struggles against US imperialism had defined this period of anti-imperial history. In North Africa Gaddafi was caught between the pressures of Islamization and the need to provide a better standard of living for the people. Samir Amin had critiqued this form of leadership in the book *The Arab Nation: Nationalism and Class Struggle*. Gaddafi opposed the classic understanding of class struggles in Libya and designated his society a state of the people. While this designation was being propagated in theory, in practice, British, French, Italian, and US capitalists were working hard to train a class of Libyans who internalized the ideas of private property and the inviolability of the market. The bureaucrats who managed the apparatus of the state with Gaddafi internalized these ideas

with his own son emerging as one of the "reformers."

After the ending of sanctions with the intervention of the global Pan-African movement, there were intensified pressures by western finance capital to dominate Libyan society and its resources. Gaddafi was of the view that he was smart enough and equipped to navigate the entreaties of western suitors and western banks. When the uprisings in Tunisia and Egypt occurred, Gaddafi proved that he was very much out of touch with the realities of his own society and the societies around. His own hubris as to his popularity with his people ensured that he remained in Tripoli long after real support had disintegrated by the massive bombing campaign of NATO. The army of Gaddafi disintegrated, and Gaddafi was hunted down and killed.

In the world of imperialists and anti-imperialists, those from the imperial zone of disinformation and psychological warfare provided justifications for the killing with the mantra that he was about to kill his own people. Initially, US President justified the operations of NATO stating that that it meant that "the shadow of tyranny over Libya has been lifted." Three years later, Obama revised his opinion after the killing of the US Ambassador Christopher Stevens and the thousands of militias making life unbearable for the people.

Similarly in the United Kingdom, the Prime Minister David Cameron stated that he was "proud" of his country's role in overthrowing "this brutal dictator" until the select Committee of the House of Parliament reported that the Libyan operation had been based on lies.

The French were the only imperial force not to have any critical assessment of their involvement in Libya. Seven years later when France supported the Dignity battalion of General Haftar, there were open disputes between Italy and France over the role of France in Libya. The Deputy Prime Minister of Italy, Matteo Salvini, blamed France for supporting General Haftar in 2019 stating that "it would be very serious if France for economic or commercial reasons had blocked an EU initiative to bring peace to Libya and would support a party that is fighting. Some think that the [2011 Nato-led military intervention] in Libya promoted by [then-French

President Nicolas] Sarkozy was triggered more by economic and commercial interests than by humanitarian concerns."

> I hope we are not seeing the same film all over again.

The position of imperial states was very different from the states of the nonaligned world. Countries such as Cuba, Venezuela, and South Africa praised Gaddafi, while in most parts of Africa, there are those who call for exposure on the role of France in Libya.

After NATO declared victory, there were elaborate plans for the reform agenda in Libya. The supporters of Gaddafi were persecuted, and black Libyans were killed as mercenaries. The NTC orchestrated an elaborate process for parliamentary elections and a new government in 2012, but the case of the Libyan Investment Authority against Goldman Sachs thrust Libya again into war until the British High Court Judgment in 2016. Since then, the United Nations has attempted to create the basis for a government of National Unity, but the differing external forces that had come together to defeat Gaddafi could not agree. Libya is now caught in a war with Egypt, France, the United Arab Emirates, and Saudi Arabia supporting one faction led by general Haftar, while Italy, Qatar, Turkey, and other members of the EU supporting the UN back government in Tripoli. War and destabilization has plagued the peoples of Libya since 2011. The absence of real organization of the people by Gaddafi took a heavy toll on Libyan society.

Gandhi, Mohandas Karamchand (1869–1948)

Amrita Shodhan
SOAS, University of London, London, UK

Mohandas Karamchand Gandhi described as the man who shook the mighty British Empire with a pinch of salt, provokes political controversy, ambivalence, and opposing judgments. He is revered as a political saint and reviled as a mascot of the bourgeoisie, hailed as a critical anti-imperialist and rejected as a betrayer of the peasants, celebrated as an apostle of nonviolence and

castigated as creating the Hindu–Muslim divide. Gandhi led and was considered to be the chief architect of one of the most effective anti-imperialist movements in the world – the movement to gain independence for India from the British Empire. On 14 and 15 August 1947, British India was partitioned into two countries – Pakistan and India. While he was completely determined to overthrow the British Empire, he himself argued that the goal was to attain perfect self-control (*swaraj*) rather than national control (*swatantra*) over the government of India. Thus his anti-imperial ideas were based on a sense of individual duty to the common good and local welfare, rather than control over the nation state granting rights to citizens.

This essay will examine Gandhi's imperialism and anti-imperialism in the context of his life and examine the changes in his political thought and practice. Beginning with three educational years in London (1888–1891), going on to legal practice and adult life in South Africa (1893–1914) and on to middle age and political activism in India (1914–1948), we shall examine the evolution of his thought historically. The growth of his nationalist and universalist ideas will be examined simultaneously with his ideas of empire.

Early Life

Gandhi grew up in two small principalities (Porbandar and Rajkot), overseen by the British resident but ruled by native princes in the southwest corner of present-day Gujarat state. He was educated at a "modern" high school but was an indifferent student. As a young student, he admired British civilization, seeing its mastery over India as a sign of its greatness. He believed that its masculinity and strength were to be emulated and adopted. The purpose of adopting British ways of life, at the time was to overcome the humiliation of being of a subject race, at least according to his autobiography written from 1924–1925 (English translation published 1927–1929).

He was married at the age of 13 to Kasturbai, also 13, and their first child was born soon after

the death of his father, when he was 15. The child survived for only a few days. When Gandhi finished his schooling, he was advised and was himself taken with the idea of going to London to train as a barrister, so he could inherit his father's mantle of working in the Princely State of Porbandar. He was in London from 1888–1891 and was called to the bar at the Middle Temple before he returned to India. He said in an interview published at the time that he saw London as the center of civilization (Hunt 1993, p. 6).

From London he returned briefly to India to look for work as a barrister, but not being able to establish himself at the bar in Bombay and finding that he couldn't find employment in his father's former position as prime minister (*Diwan*) in Porbandar or Rajkot state, he took up the offer to work in South Africa for a Durban-based Indian firm. He went to South Africa intending to stay for a year (1893) but ended up making his career there for the next 21 years.

Critique of Government Policies in South Africa and Support of Empire

In London and South Africa, Gandhi engaged deeply with critics of Western life and culture such as the theosophists, vegetarians, naturopaths, and also Protestant Christian advocates. From them, he reoriented his youthful fascination with British culture and civilization to critique its basis and premises. Thus he began to question the basis of economic activity for being steeped in self-interest and rejected a model of citizenship that relied on unquestioning obedience to authority. Yet, he felt that he belonged to the local society of London and Durban as a member of the wider imperial world of Britain. It was also in this period that he had a growing conviction that Indian thought and spirituality were superior and Indian understanding of truth had a lot to contribute to this wider world. At this time, he was also in conversation with Raichand Mehta (later famous as Srimad Rajchandra), recognizing the importance of Jain *anekantvad* or *syadavada* – the recognition of multiple truths. He began developing his idea of duty and *dharma* (righteousness) as something more crucial in determining human

action than a sense of rights whose sole purveyor was the state.

During his time, in Durban, Natal, and Johannesburg, he looked on empire as a force for good. He said in his autobiography, referring to 1896, "Not that I was unaware of the defects in the British rule, but I thought that it was on the whole acceptable. In those days I believed that British rule was on the whole beneficial to the ruled ... colour prejudice ... I thought, quite contrary to British traditions, and I believed that it was only temporary and local" (Gandhi 1927, pp. 400–401).

From the first days of his entry into the legal profession in South Africa, Gandhi had faced color prejudice, and, with growing racial legislation in Transvaal, he – with the Natal Indian Congress and other organizations of colonial Indians there – actively began to petition the government to demand removal of disabilities being imposed by the newly independent Natal and Transvaal legislatures. Laws like the franchise to elect the legislature being framed to exclude Indians, the tax on laborers electing to remain in South Africa after indenture, and the restrictions on trading practices and locations of residence and movement were the issues the Natal Indian Congress engaged with in the period between 1893 and 1906. Gandhi was associated primarily with Indian merchant groups in South Africa – both Hindu and Muslim. It was for these groups that he demanded equality with the Whites. He distinguished Whites and Indians from both working-class Indians and the black African population. The methods of engagement were vigorous demonstrations, petitions, and marches.

Gandhi's demands for inclusion and equality in South Africa were based on an appeal to imperial fairness and justice. In this argument, empire was considered to retain a possibility of justice. The ideology of empire was seen as providing for an empress who was so far away from the population that this figure was equidistant from all the local factions and thus would not favor any particular group. The empress would treat all her subjects equally in accordance with their own traditions and thus be the epitome of justice. Gandhi read this notion of empire-as-

justice into Queen Victoria's often quoted 1858 Proclamation (Mukherjee 2010). According to him, writing in Indian Opinion on Empire Day celebrations, the Queen wrote to her prime minister that the Proclamation "... should breathe feelings of generosity, ... point out the privileges which the Indians will receive in being placed on an equality with the subjects of the British Crown ...." Gandhi goes on to suggest that "Expansion of trade and the acquisition of territory are not the only things true Imperialists aim at. There is a greater and a nobler ideal to work for: that of producing ... happy-hearted human creatures" (Gandhi, CWMG 1961, Vol. 5, p. 326).

Another basis for his claim that Indians were eligible for inclusion and should not be saddled with discriminating laws and regulations, was that they had inherited an "advanced" Aryan civilization from ancient Sanskrit/Vedic texts and culture. In the context of making political claims, he distinguished Indians from "native" Africans and did not form alliances with movements like the Bantu and Zulu rebellions fighting vicious land grab and exploitation.

Gandhi also argued for reforming traits that were ascribed to Indians and held responsible for holding them back. For example, in response to accusations of being dirty, he made cleanliness an important tenet of his movement. This remained so throughout his career in India as well. The radical idea of his cleanliness was that he made every upper caste member of his establishment responsible for cleaning the nightsoil and other "unclean" jobs traditionally performed by lower caste members.

Gandhi accepted that the groups of White, Indians, and Africans existed in a system of racial hierarchy, and he was not arguing for abolishing this. His demands were merely to remove specific disabilities for Indians in this system of racial hierarchy and color prejudice. After 1909, his politics does extend beyond the merchant class of Indians in South Africa to other Indian origin groups like the indentured labourers. However, the various different racial groups agitating for removal of specific restrictions facing their group continued their politics separately never reaching out to each other (Desai and Vahed 2015).

Critique of Modern Civilization

During this period, his critique of modern civilization, initiated to some extent in London, was going on apace. In 1904, after a blinding revelation on reading John Ruskin's *Unto This Last*, determined that he must alter his way of living, he set up a new establishment where all could live by their own labor. Thus came the establishment of Phoenix Ashram (a place of communal living) outside Durban in 1904. This became the place where his journal *Indian Opinion* was produced, as well as where his family was settled and they could live in a self-sufficient manner.

Gandhi extended the critique which is directed at modern society by Ruskin, Tolstoy, Thoreau, and others to demonstrate how the modern extractive civilization is based not only on alienation of labor from produce but also based on the availability of cheap resources and external markets made available by the exercise of political control over other territories by industrial countries. The extension of the market destroys the craft and economic base of the other countries held in colonial subjection as well as in the home country. Thus he extends the critique of modern civilization, making it also a critique of colonial economy. Indian nationalists like Dadabhai Naoroji, whose *Poverty and UnBritish Rule* (1901) and R.C. Dutt's *Economic History of India* (1905) were crucial in developing Gandhi's arguments regarding colonial economic extraction and the immiseration of Indian society under colonial economic relations.

As an imperial subject, he protested against those aspects of imperial rule that he saw as not living up to empire's ideals. Also, as an imperial subject, he felt compelled to perform the righteous duty of defending the empire to which he felt he belonged, by participating in imperial wars to the best of his ability – organizing an ambulance corps in the Boer War (1900) and a stretcher-bearer corps during the Zulu Rebellion (April 1906), and, later on, a medical mission in London (1914). Loyalism was the basis from which he critiqued empire. His participation in the imperial wars including later in the First World War and recruiting for the Indian army fighting in Europe,

has been seen as a betrayal of his principles of nonviolence as well as support for a government he was criticizing. Clearly, Gandhi was not a revolutionary and was not attempting to overthrow the establishment, his critique aimed to hold the establishment to its own professed promises of equality.

Changing Tactics – Development of *Satyagraha*

From after the Zulu Rebellion, which Gandhi claimed was not a war but a manhunt, one senses a greater disaffection with government. The failure of repeated petitions and letters, even delegations to the colonial secretary in 1906, to achieve any changes to government's discriminatory practices and policies led him to stronger actions, as in 1908's burning of the certificates of residence introduced to document and restrict future migration of Indians into Transvaal. It was in fighting these discriminatory laws against Indians by the local governments in Transvaal and Natal that he defined his politics of action as *satyagraha*. Initially called passive resistance following Thoreau and Tolstoy, Gandhi felt that the word suggested weakness (1927, p. 292). He therefore felt that a new name must be thought of for their specifically Indian practice. He announced a prize for coming up with a name for the movement in *Indian Opinion*. Maganlal, his nephew and manager of the paper, came up with the name *sadagraha*, and Gandhi reformed it to *satyagraha* (loosely translating as "insistence on truth").

The year 1909 was another turning point in his ideology with the writing of his foundational text Hind Swaraj (Gandhi 1997). With the failure of repeated petitions and letters from the *satyagraha* movement from 1906 onwards, as well as the ineffectiveness of a personal delegation he led in 1909 when the Union of South Africa was being negotiated in London, Gandhi's critique of imperial politics was becoming stronger. Already the *satyagraha* agitation was recognizing the higher law with which governments must also be held to account. In July 1909, in London, he also engaged with "revolutionary" Indians – Madanlal Dhingra,

G

Vinayak Savarkar, and others. He was as much aghast at their ideas as impressed by their patriotism and fervor to "do and die." In response to the rejection of the petitionary delegation of Indians he led to London, and the revolutionary will of the India House clique, he wrote in a furious 10 days his most foundational critique of modern life and politics: *Hind Swaraj*. In this text he demanded change which he called *Sudharo* (improvement) in Gujarati and *Civilization* in his English translation). Both the terms used in the text demonstrate that Gandhi presented his ideas not as revolution, but reform of the current practices. Menon has noted the sources of this text in the deep problems of industrialization in South Africa, a glorification of an imagined ancient, rural Indian ideal, and a disaffection and fear of the rising power of the working class in Europe. His criticism of contemporary industrial civilization was from a deeply conservative perspective that did not recognize the inherent hierarchies that were already being criticized by many of his compatriots and colleagues (Menon 2017).

Back in South Africa, the period from 1909 onwards was one of intensive protest against the growing racialist legislation there against Indians. His crowning achievement was the long march of striking mine workers and indentured labor from the coast to Johannesburg, achieving a coalition of middle-class Indian merchants with Indian indentured labor to argue for better rights of residence and travel between the provinces of the newly constituted South Africa, the repeal of a tax on laborers and their families living without indenture, and, the recognition of non-Christian marriages. This coalition was bringing together already politically active indentured workers, with the different Indian organizations under Gandhi's umbrella. Gandhi became the sole negotiator with Smuts, denying the further exposure of the violence of indenture in the mines and plantations to the Solomon Commission. Gandhi was apologetic about the violence undertaken by the indentured workers in their own defense, and their valiant sacrifices for the struggle were seen as mistakes in the correct practice of nonviolent resistance. Thus, he himself only valued the sacrifices of the satyagrahis – primarily middle class

Indians. Even in this major mobilization, he made no attempt to involve other black African labor. He thought the differences between the grievances of the Indian and African communities meant that it was not possible to speak of the two in the same breath (Desai and Vahed 2015, p. 302). Thus, if a struggle against apartheid is a struggle for equality for all the races of South Africa, then Gandhi cannot be seen as its first proponent. If, however, the anti-apartheid movement can see its beginnings in simple objections to particular racist legislation, then the Gandhian movement maybe considered to be one of their progenitors.

Gandhi in India (1914–1919)

Gandhi returned to India from South Africa in 1914. His reputation for fighting for the rights of Indians in South Africa had preceded him and he was welcomed as a hero by many in the Indian National Congress. Yet, his position as an outsider allowed him to take stock of the political situation in India by travelling around the country. He established his ashram in Ahmedabad, Gujarat, in western India (1915) and took up campaigns of local interest which helped him build his reputation as an activist who could mobilize popular support.

With Peasants His first campaigns with peasants were the Indigo farmer's campaign in Champaran district in the present state of Bihar (April 1917–March 1918), No-tax campaign in Kheda, Gujarat (March 1918). These campaigns were crucial in building up a reputation for Gandhi as a peasant leader. Though he earned relief for the peasants, not all the demands were met, nor did he establish Gandhian practices amongst these peasants. As analyzed by subaltern scholars, Gandhi's language and goals and renunciative persona struck a chord with the peasant groups and he was immediately and widely adopted as a redemptive leader by these groups. However, their interpretations of his message were their own and often beyond what he was preaching (Amin 1994).

With the Imperial War Effort In early 1918, Gandhi still argued for serving the imperial war

effort, advocating the recruitment of soldiers for the British Indian army to serve in the war. There is a sense here, as well as in his earlier support for imperial wars, that if Indians organized and did their duty by supporting the empire, the empire would fulfill its duty of providing for home rule and repealing unjust and exploitative aspects of its rule. As he said at his sedition trial in 1922, he had hoped that active support of the war would earn his compatriots equal rights in the Empire.

With Industrial Labor In early 1918, he jumped into the Ahmedabad textile mill workers' strike (February–March 1918). The strike lasted a few months in conditions of plague in the city, the workers were asking for a wage hike. He negotiated with the mill-owners, elaborating his ideas of trusteeship. He also established a worker's association called the *Majoor Mahajan*. The term Mahajan – the great men an anti-thesis to a union and parallel to the owner's traditional associations called Mahajan = great men. The tradition of labor-management cooperation set up by Gandhi is seen as a one of the reasons for the failure of the autonomous dalit and worker's movements in Gujarat, the western Indian state where he had his first establishment in India. His work with the textile mill labor is his most extensive work with industrial workers and demonstrates his anti-revolutionary activities most extensively.

Critique of Imperialism

At the end of the war, the government announced new legal acts enshrining repressive war-time provisions in law (The Rowlatt Act, 1919). In response to this draconian curtailing of civil liberties, Gandhi through the Indian National Congress made his first national call. He called for a general strike and this was taken up in different parts of the country with varying levels of enthusiasm. However, the biggest event of the Anti-Rowlatt Act demonstrations was the shooting of an unarmed gathering of hundreds of demonstrators at a walled garden in Amritsar – the Jallianwala Bag. This massacre and Gandhi's heading of the Congress inquiry into the events,

as well as the government's acquittal of General Dyer who had ordered the shooting, became a turning point in Gandhi's relationship with empire. In February 1922, he wrote the piece which occasioned his trial for sedition: "No empire intoxicated with the red wine of power and plunder of weaker races has yet lived long in this world, and this "British Empire", which is based upon the organized exploitation of physically weaker races of the earth and upon a continuous exhibition of brute force, cannot live if there is a just God ruling the universe"(Gandhi 1922a).

This statement came after 2 years of sustained agitation to demand the return of the Holy Lands to the Turkish Caliph (Khilafat agitation, 1920–1922) and a refusal to co-operate with the government of India. As part of that non-co-operation, Gandhi encouraged lawyers to give up legal practice, doctors to give up medical practice, and students to give up government education. He also advocated the use of locally manufactured items and bonfires of foreign produce, primarily cloth. In this period, he discovered the spinning wheel and adopted it as the symbol of his commitment to local self-reliance and disaffection with industry. It was also during non-co-operation that Gandhi developed a consistent vision of politics based on *panchayats* – a village-based system of government. He advocated panchayats for solving village problems, and they were used first in Champaran during the Indigo investigations.

This period of agitation after the war gave the basic outlines of Gandhi's anti-imperial position. It rested on his advocacy of local self-reliance and spiritual engagement. He advocated a bio-moral regimen to reorient individual commitment to politics. Thus he advocated bodily purity for the pure work of establishing just rule. The *swadeshi* (self-sufficiency) ideal was demonstrated through the collection and burning of foreign cloth, as well as the emphasis on the questions of rural development, spinning, and basic education. His economic program was now elaborated beyond the notion of commune and "bread labor" to a conception of village-based growth of self-sufficiency.

The sedition trial and subsequent period (1922–1929) was a period of constructive work and village development. Gandhi's constructive program and his idea of trusteeship (i.e., ownership of capital/ property in trust for its use for national good) remained the basis from which he critiqued both imperial government and the national bourgeoisie. The critique thus mounted, and his toleration of multiple layers of gradual transformation and his insistence on spiritual and voluntary change permitted in effect continuation of the modern economy, working in favor of the bourgeois nationalists. As Suniti Ghosh has shown, Gandhi's economic program was seen as compatible with imperial capital and Indian business (1989). Indian business, including large industrialists like G D Birla and Purushottam Thakurdas, were staunch supporters of Gandhi and the Indian National Congress. However, they were not averse to deals with the imperial rulers that benefitted them, to the betrayal of the non-cooperation movement. Thus, at the end of the salt *satyagraha* in 1931, they agreed that non-cooperation could be withdrawn, if certain types of government tariffs would be withdrawn. Thus, Ghosh has outlined how Birla was in touch with British authorities in London and chambers of Commerce to outline how Gandhi would be agreeable to various demands they might make, if there were concessions to local businesses. Gandhi's economic policies, in the wake of his compromises with Viceroy Irwin (March 1931) did not threaten the economic domination and power of the capitalists. Gandhi differed most from the socialists and communists in their belief in the necessity for class struggle. He considered class struggle as inculcating hatred and violence, and contrasted it with *satyagraha*. Thus, instead of compulsory divesting capitalists of their wealth, he believed the capitalists should be encouraged to voluntarily give up the wealth for personal use and devote themselves to being trustees of the wealth, using it for common good (Hardiman 2003, p. 83). Thus, it would seem that despite his rather revolutionary ideas about social worth and public duty, his policies and practical actions worked to benefit business interests, both national and global.

Constitutional Engagement

Despite the growing organized political movement by Indians, the British government announced a purely British group to constitute a commission (the Simon Commission) to review the Government of India Act coming up for this decennial exercise in 1929. The Simon Commission was boycotted and there was a split within the major political groups in India (the Indian National Congress and the Muslim League) which the government chose to reinforce but also amend by declaring a series of meetings in London for the principal parties chosen by the government. These round table discussions were first boycotted by the Congress, and they declared a renewed popular agitation to demand self-government.

This, the second major mass movement of the Gandhian agitation began with a declaration of the demand for full independence on 26 January 1930 followed by an announcement to disobey specific civil laws, primarily to break the salt law from March 1930. The program of civil disobedience captured the popular imagination, filling the colonial jails and showing up the imperial government as the draconian and oppressive force it was. The movement was suspended after a year in late February 1931 following a pact between Viceroy Lord Irwin and Gandhi. In this pact, Gandhi agreed to several reforms of the law which benefited local industry, and, he agreed to travel to London to negotiate the terms of the new Act for the Government of India which would lay the constitutional basis of government. His participation at the Round Table Conference proved futile and there was no agreement with the other disputants for power sharing in the government. The Congress opposed the demand for separate communal electorates for the minority religious groups and for the Dalit or Depressed Class communities. In spite of this, the Government announced the Communal Award (August 1932).

From prison, Gandhi then announced a fast unto death to oppose specifically the provisions of the award for the depressed classes. Bhimrao Ambedkar (1891–1956) was at the time the chief advocate for separate electorates for the

Depressed Classes. Gandhi ended his fast when there was an agreement with the various parties to have a system of joint electorates to elect selected Depressed Classes candidates to reserved seats for them in the provincial governments. These reserved seats were to guarantee political representation for Depressed caste groups; however, the candidates were voted for by all sections of the electorate, not only members of the Depressed Classes. This "agreement" provoked Ambedkar to write his most trenchant critique of the caste system, Gandhi, and the Congress.

Thus, in the 1930s Gandhi engaged with the terms of constitutional forms of centralized government. However, throughout this process, he remained dismayed by their structure and articulated this sense increasingly in the 1940s. Gandhi clearly accepted political engagement in discussing the formation of the post-colonial state, yet he remained unconvinced by it. In his political discussion, he based his democracy at the level of the village. His interpretation of *swaraj* – translated as Self Rule – was as much personal and individual as governmental.

He critiqued not only British power but also state power, and his critique was mounted from the perspective not of state but of self. His ultimate freedom was not control over government but control of the self. In order to achieve this perfect control over the self, one needed not an excess of identification with the state or society but an immersion of the self into the common good. Thus, not personal rights but collective duties were the watchwords of freedom and antiimperial action.

Subsequent to this political compromise, Gandhi's health was severely affected and he announced his retirement to Wardha, Seagaon (later called Sevagram), where he established a new refuge. However, even from this distant rural location, he participated actively in Congress affairs and was sought for advice regarding governmental policies as the Congress participated in elections in 1937 and formed nine provincial governments and ministries from 1937–1939.

With the start of the Second World War and the conflict within the Congress between Gandhi and Subhash Chandra Bose, the Congress ministries

resigned from power. The Peasant and Workers' Parties and the Congress Socialists were also active in this period, organizing and working with local peasants and workers. Nehru, set up the National Planning Committee of the Congress from 1938–1939, and it began to operate to discuss the planned growth of the national economy. Gandhi's economic policies of voluntary renunciation of property by industrialists and businessmen, or equalization of landholding by voluntary donations, were hardly followed by his industrialist supporters or Nehru's planning committee. The industrialists espoused his politics, as they found them more amenable to their own interests and policies than the radical autonomous peasant movements across the country that flourished in the umbrella of the broad nationalist front that the Congress developed.

Gandhi persuaded the Congress not to support the war effort, even though he recognized that the war against Fascism must be fought and he supported Britain in that effort. Yet he felt that India as a nation in bondage could not freely support the war effort. Thus he began the limited campaign of individual *satyagraha* whereby individual chosen candidates publicly declared their lack of support for the war effort and gave themselves up for arrest. Within 2 years, the Congress stepped up their opposition and declared self-government in 1942 with Gandhi calling for the British to Quit India. The movement was led by local Congress and non-Congress leaders as the Congress leaders were jailed within the very first days of the declaration on 8 August 1942. The *Quit India* movement was the last in the phase of Gandhian movements before independence.

Imperialism and Nonviolence

Gandhi emphasized that this self-control and control over the government could not be achieved by violence but by acting according to one's conviction of truth, One should always speak of it and convince the opponent not by opposition but by admitting that she/he too has an aspect of truth. Thus, no opponent was an enemy, but always the object of friendship. The power that Gandhi

sought was the power of brotherhood rather than that of brute force. This is what he called ahimsa or nonviolence.

Yet Gandhi was not afraid of violence and in fact welcomed the encounter with violence which could demonstrate the active insistence on nonviolence. He also felt that violence was better than compliance and cowardice. Thus, in 1944, he explained the violence of Congress members in the wake of the Quit India movement as the response to extreme oppression (Gandhi, CWMG, 1979, Vol. 77, p. 141, 150).

Gandhi's Universalism

Gandhi projected a universal appeal from a particularly "Indian" and anti-imperial political space. Yet there is no nativist genealogy to his anti-imperial traditions. His critique of modernity crucially drew on European and American thought. His colleagues were carefully drawn from multiple racial groups. The primary category by which he implemented his political praxis – both ideologically and in practice – was "Truth"; an absolute Truth that could be known in multiple dialogic ways through multiple conversations; an absolute Truth that could be known imperfectly by a single human being and therefore always ready for amending and rethinking. As a consequence of this view of Truth, Gandhi was always ready to amend his ideas and change his mind about actions already undertaken and underway. This has been criticized by many, even in his own times as being inconsistent or being opportunistic.

This position on Truth and its multiplicity did not deprive Gandhi of a means to action, as his Truth was not relative. He accepted that there were certain things that were wrong and these needed to change. Not only that, every seeker of Truth was required to work to change as the insistence on Truth could not be passive, could not be without action against Untruth.

In examining the way Gandhi proposed action, we have assessed here primarily aspects of his thought as they engaged with empire and generated an anti-imperial politics. He held, however, that all aspects of living and life could contribute to a considered anti-imperialism – the way the

children were brought up, educated, food was eaten, clothes worn; how sexual activity, marriage, and work were practiced.

Gandhi's leadership of this movement for political rights within and outside the empire reflected his imperialism and anti-imperialism. He was a maker of political praxis. He thought and he wrote and he acted; and while aspects of his thought and action were criticized as betrayals of the ideals he professed of truth, nonviolence, and justice, others have still found much in it that can apply to the contemporary situation, often finding it useful to continue to locate their critique in Gandhi. The postcolonial state is seen as inadequately overthrowing empire and continuing an exploitative/extractive relationship with its people. Yet a critique of Gandhi must recognize that the anti-imperialist position charted by him is not able to adequately address the concerns of various "fragments" of the nation such as women, Dalits, and Muslims. Thus to understand the anti-imperial subject position, internal divisions within the imagined community must be examined. Gandhi was conscious of these differences. He wrote extensively about the role and position of women, Dalits, and Muslims. He saw all of them as having to devise their own politics on the basis of their own inspirations. Thus, he asked women to be the authors of their own emancipation. Gandhian women have progressed their own politics to build on his arguments as well as diverge from him. Dalits and Muslims have not used Gandhi in similar emancipatory ways on a wider scale, arguing that not only did he not address their concerns but he actively opposed those who did. Ambedkar was Gandhi's strongest critic from the position of the Depressed Classes or Dalits.

What was it that Gandhi achieved as an anti-imperialist? How did he rock an empire? Was he a nationalist? There are multiple answers to these questions based on the various perspectives and on a selection of Gandhi's writings and the particular period in his life. Gandhi was a notoriously prolific writer and all his writing has been preserved with great care. Thus we have 99 volumes of his collected writings published by the Indian government. Gandhi was context-sensitive as well as constantly evolving and adjusting his points of

view; thus, many different views can find support in his writing. The critical trajectory of change in his thinking on imperialism was from a loyal imperialist seeking justice from empire in the best tradition of the Black Jacobins, to a universalist against empire, but not on the basis of an ethnic nationalism. He spoke from a particular place of Hindu thought but assumed that this personal space would be the same in truth value as other personal spaces, located in their own religious and cultural traditions.

Definition

Born on 17 August 1887 in Saint Ann's Bay, Jamaica, Marcus Mosiah Garvey is remembered as the leader of among the largest mass black political movement of the twentieth century.

Born on 17 August 1887 in Saint Ann's Bay, Jamaica, Marcus Mosiah Garvey is remembered as the leader of among the largest mass black political movement of the twentieth century. Garvey left school at 14, and in 1906 he moved to Kingston. Working as an apprentice under the guidance of his godfather, he read intensively, increased his skill in printing, organised youth meetings, published small newspapers, and took part in political debates and strike actions. Garvey left Jamaica in 1910 and travelled in various parts of Central America, founding newspapers in Costa Rica and Panama and criticising the imperialistic presence of the American United Fruit Company in the Caribbean. In the spring of 1912, after a brief return to Jamaica, he arrived in London in order to complete his informal education. He soon started writing for the *African Times and Orient Review*, a pioneering pan-African newspaper edited by the activist and actor Dusé Mohamed Ali (1866–1945). Criticising the global frame of colonialism and denouncing worldwide discrimination, Garvey's articles were published alongside texts by leaders like Booker T. Washington and W.E.B. DuBois (1868–1963) from the US and Joseph Ephraim Casely-Hayford from Gold Coast, whose *Ethiopia Unbound* (1911) was a classic work read by Garvey and most of the leaders of the black nationalist movement in the early twentieth century. During his years abroad, Garvey met various African seamen, traders, and activists, and he acquired a holistic view of the conditions of black and working-class peoples. Visiting mainland Europe on the eve of the First World War, he also gained a critical knowledge of European nationalism.

Reading Booker T. Washington's autobiography, *Up from Slavery*, Garvey was inspired by the idea of gaining self-confidence and autonomy through skilled and professional work and became interested in founding a Jamaican educational establishment modelled on Washington's Tuskegee College in Alabama. Back in Kingston in July 1914, he wrote a letter to Washington asking for an invitation to visit Tuskegee. However, Washington died in 1915 before Garvey could plan his trip. Garvey also started to think about the foundation of a global solidarity movement which would gather Africans from across the Western world on the basis of their race or colour. On 1 August 1914, Garvey and Amy Ashwood, who would become his first wife 5 years later, founded the Universal Negro Improvement Association and the African Communities League (UNIA-ACL). However, since Garvey left Jamaica in 1916, the first Jamaican branch of UNIA remained experimental.

The Early Years of the UNIA-ACL

In 1916, Garvey arrived anonymously in the US for the purposes of visiting Tuskegee College in Alabama and paying tribute to his mentor. After the visit, while preaching and travelling in the Southern segregationist states, he radicalised his views on racial issues. The years 1916 and 1917 saw rising numbers of racial riots and attacks in the US, and the safety and living conditions of African Americans worsened in most of the Southern states and the Northern urban centres. In 1918, hoping to re-form the UNIA, Garvey set up home in the black neighbourhood of Harlem, New York. Within a few months, the UNIA opened several chapters, working as a welfare and social organisation, and Garvey bought the Harlem Liberty Hall building on 135th Street and Lenox Avenue to establish his international headquarters. An outstanding speaker and debater, famous for his irony and emphatic tone, Garvey became the best-known black leader and the greatest polarising figure in Harlem and the black world.

A large number of Garvey's disciples opened branches of the UNIA in the US and the rest of the world, leading the movement to attract up to four million members in the early 1920s. With its militarily organised and disciplined African Legion and its Black Cross Nurses, the UNIA served as a response to the nationwide racial disturbances decades before the Black Panther Party for Self-Defense. Thanks to Garvey's commitment to the "Negro Race," the UNIA was also the first Afrocentric mass organisation calling for black economic empowerment and cultural independence, and promoting the return to Africa as a prerequisite for liberation and a better future. To set his projects in motion, Garvey founded a shipping line, the Black Star Line, to organise the resettlement of

blacks in Africa and to promote international trade between African American, Caribbean, and African businessmen; its first boat was named after Booker T. Washington. Moving to the poor urban black areas but developing an anti-communist rhetoric, Garvey also encouraged the establishment of black factories and corporations, and the rise of a black capitalism. Restaurants, shops, barbers' shops, clubs, and factories were funded by or affiliated with the UNIA headquarters.

In August 1920, Liberty Hall hosted the International Convention of the Negro Peoples of the World, which was attended by a crowd of 25,000 from more than 40 countries in the world. Some 2000 delegates drafted the "Declaration of the Rights of the Negro Peoples of the World." They hailed the red, black, and green of the UNIA flag as colours of African unity, and they appointed a government which was headed later by Garvey, the self-proclaimed Provisional President of the future Republic of Africa. The impressive and colourful street parade, the pompous ceremonies and concerts, and the enthusiasm of UNIA followers hailing Garvey as a "Negro Moses" provoked a range of criticism from Harlem radical militants who saw Garvey as a "Black Napoleon." His autocratic style of leadership caused defections in the ranks of the UNIA executive committee, including the departure of his wife Amy Ashwood in 1920. While Amy Ashwood kept her distance from Garvey and became involved in the global pan-African movement, Amy Jacques, Garvey's second wife, became his secretary and helped to secure the fame of the Jamaican leader. Amy Jacques later made a compilation of Garvey's letters, writings, and speeches which preceded Hill's edition of the UNIA papers (see Garvey 1980 and Hill 1983–2006).

Tactical and Ideological Confrontations: Garvey and the Globalisation of the UNIA-ACL

Wearing his classic plumed hat, Garvey developed his own iconography. His sense of pride in being African developed in a very fertile environment. Revisiting Negro cultural history in a positive way, the Harlem Renaissance bloomed in the presence of the UNIA. Large numbers of artists, scholars, intellectuals, and celebrities, including those who supported DuBois against Garvey, were definitively engaged in the Garveyist goal of the redemption of the Negro race (Martin 1991). Mastering the media propaganda, ready to make an alliance with the racist Ku Klux Klan to impose the repatriation of African Americans in the national agenda, and using populist expressions to raise the sense of black pride, Garvey clearly represented a new generation of black leaders. However, despite his growing popularity among the masses, he became more and more isolated and was criticised by the black establishment for his ambiguous and undiplomatic opinions. Above all, his Back-to-Africa campaign made him a target. Garvey's typical rallying cry "Africa for the Africans" was perceived as a threat to the Western colonial powers, which feared that his ideology of liberation was mobilising and uniting the black masses in Africa and the Americas.

The *Negro World*, the UNIA's weekly newspaper, was published in English, with some French and Spanish pages, from 1918 to 1933 and was widely disseminated across the globe by seamen, adventurers, and traders. Garvey's impact frightened the British colonial authorities. To oppose the Garveyist propaganda, they established the *British West Indian Review* and formally prevented the circulation of the *Negro World*, which was nevertheless sent from Sierra Leone to Kenya via southern Africa. Studying the circulation of the *Negro World* serves to highlight such subversive networks of communication; for instance, copies were sent from France to Dahomey by Kojo Tovalou Houenou, and were also circulating in the other French colonial territories.

In his tactics and ideology, Garvey had been deeply influenced by the Caribbean visionary thinker Edward W. Blyden (1832–1912), who spent most of his life working for the repatriation of blacks in West Africa, mainly Liberia (Akpan 1973). Garvey shared Blyden's evocation of the great African civilisations of the past as times of plenty and splendour to be restored. By praising cultural nationalism, and by re-creating a political

hierarchy with such titles as "Duke of Niger" and "Knight of the Nile" for his comrades in arms, Garvey captured the imagination of blacks as though they were a people and government in exile, waiting to return to their native land. This conquering position was problematic since Garvey had previously believed that Africans from the Western world should go back to Africa "to assist in civilizing the backward tribes of Africa" (Garvey 1980: 38). Like Blyden, Garvey developed a symbiotic relationship with Africa, although the UNIA leader never visited the land of his ancestors. Sent in 1920 and 1924 to organise the resettlement in Liberia, the UNIA missions were prevented from buying the land by lobbying by the US Firestone Company and by the hostility of President King of Liberia and the French and British authorities regarding the implantation of a subversive movement next to their respective colonial possessions, Ivory Coast and Sierra Leone. The UNIA's petitions to the League of Nations in 1922 and 1928, demanding that the German colonies in Africa be returned to native Africans as a sovereign black states, were also unsuccessful. As the Harlem-based UNIA organisation reached its highest phase in the early 1920s, thousand of branches followed individual trajectories worldwide, adapting the global themes of Garveyism to their own needs. The highly eclectic Garveyist movement interacted with several subversive African groups, and some UNIA emissaries and Garveyites played a role in anti-colonial politico-religious revolts in the Caribbean and in Africa; for example, strikes and social disturbances in the Huileries du Congo Belge corporation in Belgian Congo in 1921 were attributed to an alliance of African American Garveyist and communist tenants (see Lewis 1988). Some branches of the UNIA were opened in British West Africa, and Garveyism spread in the French-speaking colonies (Okonkwo 1980).

Indeed, in the US as in Africa, Garvey was opposed to DuBois, who served as the official US emissary in Liberia. The rivalry between the populist and grassroots UNIA movement and the black middle-class and integrationist groups represented by W.E.B. DuBois and the National Association for the Advancement of Colored People (NAACP) are well documented. Loaded with sarcasm and personal attacks, the rivalry between Garvey, the dark-skinned "Negro," and DuBois, the light-skinned "mulatto," saw harsh ideological confrontations over the concept of race and integration. While Garvey was calling for a black state in Africa or a separatist black state in the US, DuBois was advocating the end of segregation and racist legislation in order to assimilate blacks as full American citizens. However, some polemic and inadequate accounts may exaggerate the opposition between these two figures, who both promoted the improvement of living conditions for blacks. Colin Grant noted that "especially following his death, the story of Marcus Garvey was largely told from the perspective of his enemies" (2008: xii). Later, the Ghanaian leader Kwame Nkrumah put the UNIA colours and the Black Star on Ghana's flag out of respect for Garvey. Malcolm X, whose father met Garvey during a UNIA meeting in Canada, was also deeply influenced by him; Campbell (1987) and Erskine (2005) highlight the Garveyist heritage in culture and politics, focusing on figures like Bob Marley and Walter Rodney.

Deportation, Exile, and Death: Garvey, Fascism, and the Italo-Ethiopian War

Garvey's experience in the US was shortened by government harassment. In 1923, after reporting on UNIA activities for 4 years, the Federal Bureau of Investigation (FBI) under J. Edgar Hoover's control decided to open an official case against Garvey. The UNIA leader was convicted of attempted fiscal fraud in running the Black Star Line, and he was sent in 1925 to the Atlanta penitentiary to serve a 5-year prison sentence. Some UNIA militants petitioned on his behalf and, in November 1927 Garvey was released and immediately deported to Jamaica. Back in his native island, Garvey tried to re-form his movement at the 1929 UNIA Convention in Kingston; he also created *The Blackman*, an anti-colonial newspaper, which was regularly seized by the colonial authorities before publication was stopped 2 years later. Garvey tried in vain to enter the Jamaican political arena, but he was defeated at the 1930 elections for the legislative

council. While he was marginalised by the colonial system and the local elite, his political failure was counterbalanced by his exceptional influence on African cultural history in Jamaica. Before the French *Négritude* movement revised and took advantage of the stereotyped term "Negro" in the 1930s, and decades before "Black is Beautiful" became a self-emancipating ideal, Garvey issued repeated calls for the uplift of the Negro race, popularising the concept of mental emancipation from the psychological chains of racial inferiority (Cronon 1969). In the religious sphere, Garvey opposed the Christian Westernised representation of white as good and black as evil by asking black peoples to worship a black divinity and to enrol in the African Orthodox Church. His fervent Back-to-Africa statements were endorsed by the Rastafari movement. This socio-cultural and political movement was born in Jamaica in the early 1930s, as soon as the black masses heard that Ras Tafari had been crowned Emperor of Ethiopia under the name of Haile Selassie, in Addis Ababa in November 1930. From this moment onwards, Haile Selassie was deified and Marcus Garvey, the "Black Messiah," acquired the status of a prophet in Rastafarian theology. Although he advocated a black theology of liberation, Garvey neither embraced the Rastafarian cult nor praised Haile Selassie; see Campbell (1987) and Erskine (2005).

In 1935 Garvey settled in London. When Italy invaded Ethiopia in October 1935, Garvey got a unique opportunity to assume the leadership of the black resistance. Ethiopia, the only African country that was never colonised, had inspired the UNIA's "Universal Ethiopian Anthem" and was defined as the focal point of repatriation. Despite having branches all over the Americas and Africa, in England, and even in Australia, the UNIA and Garvey failed to play a unifying role on the front line. Breaking with the cohesive pro-Ethiopia spirit which invigorated the pan-African united front, Garvey publicly expressed strong criticisms regarding of Haile Selassie's exile and responsibility. Refusing to call for the liberation of Ethiopia on behalf of the UNIA, lacking the political understanding to analyse the global stakes of this war, and reporting with great awkwardness the similarities in propaganda between the UNIA and the fascist regimes of Hitler and Mussolini,

Garvey lost his audience and was discredited. Above all, some younger black Caribbean activists like C.L.R. James and George Padmore were taking stronger and more clearly articulated positions on the Italo-Ethiopian War, which was perceived as a crystallisation of racism, colonialism, and capitalism. Unable to embrace the black internationalist movement that had been born in solidarity with Ethiopia, Garvey became very unpopular and came to be seen as outdated. In 1937, Garvey made a tour of Canada for the eighth UNIA convention, and stopped off in Jamaica, where he made a last attempt to reform his movement, in vain. Finally, he went back to London, where he died in obscurity on 10 June 1940.

Garvey's Legacy

Garvey was declared Jamaica's first National Hero in 1964, and his remains were returned to Jamaica and buried in the Kingston National Park. Politically speaking, his pan-Negro ideology continues to impact African American and African nationalisms, and his transnational struggle calls into question the political and social boundaries in the history of the Caribbean. Although very few UNIA branches are still active today, the Garvey movement had a monumental influence on such groups as the Rastafarians, the Nation of Islam, the Ethiopian World Federation, and several African and Caribbean political parties. The Garveyist social environment was part of the background of many civil rights and Black Power activists (Sewell 1990). While his Back-to-Africa movement has lost ground despite the greater access to travel, his cultural legacy has kept growing. Some of the greatest reggae singers (Bob Marley, Peter Tosh, Burning Spear) have helped to popularise his life beyond the boundaries of the black communities, giving him the status of a folk hero. Academic meetings have regularly discussed the enduring weight of his words and actions and his relevance today in pan-African, black, and African studies. Finally, his unifying statements "One Aim, One God, One Destiny" and "Africa for the Africans at home and abroad" still echo in the minds of black peoples who celebrate his birthday each 17 August.

Colonialism; Internationalism; Middle East; Patriarchy; Race; Revolutionary feminism; Social relations; Solidarity; State violence; War

Definition

In understanding the relationship between gender, violence and imperialism the key question is: What social relations (re)produce, sustain, or at times adjust, violence against women? We may also ask: How should we make sense of the incomprehensible acts of killing, raping, harassing, or defacing girls and women in public or private spaces; or comprehend the burden of discrimination, inequality, displacement, dispossession, war, occupation, or militarisation on women? In addressing these questions, imperialism appears as the core co-ordinating force of a wide range of social, political, and economic relations. This analytical framework calls for a leap in our understanding of imperialism and its co-constituent relations with patriarchal and racialised capitalist structures of power. This analysis treats imperialism not as an abstract category, but rather as capitalist social relations which is profoundly classed, gendered racialised, and globalised, and understands it as a set of complex and contradictory social relations with *very* tangible impacts on women's lives locally and globally.

In this essay, the concept of imperialism is historicised as a feature of capitalism formed in the course of transition from its commercial, laissez-faire to the current monopoly stage based on finance capital, leading to enormous concentrations and expansions of power in economy, politics, culture, and ideology. Imperialism is thus not understood as a spatial/geographical *thing,* but as a set of complex social relations where local and global structures of power continuously influence and (re)shape each other. Violence, in this essay, includes both individual and structural forms, and is a *universal* form of gender power relations with the propensity to develop *particular* characteristics in different spaces and places based on norms, values, traditions, cultures, modes of social relations, and historical epoch. In this sense, imperialism subsumes elements of capitalist patriarchies *universally* but transforms them relatively, considering the *particularity* of each situation.

Another core argument in this essay is that capitalism has enormous power to organise and

institutionalise violence against women through mechanisms of consent and force. This dual characteristic of capitalism forces it to enter into a symbiotic relationship with other social forces (nationalist, religious, and racialised patriarchies) to create, sustain, and perpetuate violence against women. The specific imperialist forms of violence against women are largely entrenched in this collusion and are exercised at the levels of the state and civil society. Therefore, more than other social formations, violence against women in imperialism is structural and ideological with global reach. The scale and intensity of violence under imperialist capitalism has connected the struggle of women for justice and freedom globally. It has also reawakened feminist-anti-imperialist consciousness and the need for international solidarity to a level unprecedented in the history of capitalism. The two main sections of this essay will highlight women's global experience with violence in state and civil society, and will conclude with women's contemporary challenges in building a platform for global resistance against patriarchal imperialism.

Gender-based violence has exploded globally. Reports covering wide-ranging acts of violence against women have populated social media and policy debates. These reports, mostly prepared by women's groups, non-governmental organisations (NGOs), United Nations agencies, and supranational agencies such as the World Bank or human rights organisations, speak to the persistence and/or (re)emergence of interpersonal and structural forms of violence against women on a global scale. The public outrage and the efforts of courageous women globally to stop violence have had limited impact on its eradication. Paradoxically, the perseverance of gender-based violence is taking place in the context of the explosion of feminist knowledge and activism on this topic (see Lentin 1999; Steger and Lind 1999; Weldon 2002). It appears that the more we know about violence against women and the more inventive we are in our strategies to stop it, the more it (re)appears in all aspects of women's lives. Thus, the key question remains: What social relations (re)produce, sustain, or at times adjust, violence against women? We may also ask: How

should we make sense of the incomprehensible acts of killing, raping, harassing, or defacing girls and women in public or private spaces; or comprehend the burden of discrimination, inequality, displacement, dispossession, war, occupation, or militarisation on women? In addressing these questions, imperialism appears as the core co-ordinating force of a wide range of social, political, and economic relations. This analytical framework calls for a leap in our understanding of imperialism and its co-constituent relations with patriarchal and racialised capitalist structures of power. This analysis treats imperialism not as an abstract category, but rather as capitalist social relations which is profoundly classed, gendered racialised, and globalised, and understands it as a set of complex and contradictory social relations with *very* tangible impacts on women's lives locally and globally.

In this essay, the concept of imperialism is historicised as a feature of capitalism formed in the course of transition from its commercial, laissez-faire to the current monopoly stage based on finance capital, leading to enormous concentrations and expansions of power in economy, politics, culture, and ideology. Imperialism is thus not understood as a spatial/geographical *thing,* but as a set of complex social relations where local and global structures of power continuously influence and (re)shape each other. To put it differently, imperialism is an intricate system of capitalist accumulation, one that is neither the simple sum of its parts nor a purely geographic phenomenon, but rather constitutes a complex network of relations with its own systemic dynamics. However, imperialism should not be reduced to 'capitalism on a world scale' or 'globalisation'; nor is imperialism is the same thing as colonialism. Violence, in this essay, includes both individual and structural forms, and is a *universal* form of gender power relations with the propensity to develop *particular* characteristics in different spaces and places based on norms, values, traditions, cultures, modes of social relations, and historical epoch. In this sense, imperialism subsumes elements of capitalist patriarchies *universally* but transforms them relatively, considering the *particularity* of each situation.

Building on Zillah Eisenstein's groundbreaking anthology *Capitalist Patriarchy and the Case for Socialist Feminism* (1979) and Maria Mies's influential work on *Patriarchy and Capital Accumulation on a World Scale* (1986), there are two core arguments in this essay. First, there is global violence against women, to the extent that we can claim there is a 'war-on-women' (to evoke the imagery of 'war-on-terror' or 'war-on-drugs'). This is not a 'cultural' war, though cultural differences enact violence on women differentially. In other words, and to stress, culture per se is not the root cause of violence. Eisenstein proposed that to grasp the origin and the function of modern capitalist patriarchy, we should approach 'the mutual dependence of capitalism and patriarchy' dialectically. She wrote, 'Capitalist patriarchy, by definition, breaks through the dichotomies of class and sex, private and public spheres, domestic and wage labour, family and economy, personal and political, and ideology and material conditions' (Eisenstein 1979, p. 23). Mies, following Eisenstein almost a decade later, argued that the origin of contemporary violence against women is in capitalism; however, it manifests specific enough characteristics to set it apart from the violence women experienced under slavery or feudalism. She wrote (Mies 1986, p. 169):

> In the centers of the capitalist market economies, the expropriated *men* were turned into the new class of 'free' wage-earners, who own nothing but their labour power. But as *owners* of their labour power, they formally belong to the category of bourgeois 'free' citizens, who are defined as those who *own property,* and who can thus enter into contractual relationship with each other on the basis of the principle of exchange of values equivalent. Therefore, the proletarian *men* could be seen as historical subjects, as free persons...
>
> The women, however, have never been defined as free historical subjects in a bourgeois sense. They themselves, their whole person, their labour, their emotionality, their children, their body, their sexuality, were not their own but belonged to their husband. They *were* property; therefore, following the formal logic of capitalism, they could not be owners of property. (emphasis all in original)

The notion of 'property' in Mies's articulation is crucial for our understanding of the (re)production of violence against women in imperialist capitalism. In this sense 'property' means the *logic* of

capital to own women's labour power and women's bodies as the reproducer of one's own labour power and the human species (for an intensive theoretical discussion of capitalism, women, labour power, work and reproduction, see Barrett 1980; Dalla Costa and James 1973; Ebert 1996; Federici 2012; Fortunati 1989; James 2012; Weeks 2011). At the core of current imperialist forms of violence against women is the intensification of the scale of propertied women's bodies and sexuality that require further explication.

My second core argument is that capitalism has enormous power to organise and institutionalise violence against women through mechanisms of consent and force. This dual characteristic of capitalism forces it to enter into a symbiotic relationship with other social forces (nationalist, religious, and racialised patriarchies) to create, sustain, and perpetuate violence against women. The specific imperialist forms of violence against women are largely entrenched in this collusion and are exercised at the levels of the state and civil society. Therefore, more than other social formations, violence against women in imperialism is structural and ideological with global reach. In other words, imperialist forms of violence are *violence of scale* and *violence of intensification*.

The scale and intensity of violence under imperialist capitalism has connected the struggle of women for justice and freedom globally. It has also reawakened feminist-anti-imperialist consciousness and the need for international solidarity to a level unprecedented in the history of capitalism. The two main sections of this essay will highlight women's global experience with violence in state and civil society, and will conclude with women's contemporary challenges in building a platform for global resistance against patriarchal imperialism.

Imperialism and the 'War-on-Women'

I use 'war-on-women' as a metaphor to capture the extent of imperialist forms of violence against women. The imperialist 'war-on-women' is masculinised, militarised, and culturalised. It is happening in the state, the market, and civil

society; in short, it is structural and ideological. The discussion in this section is organised under two broad categories of 'state' and 'civil society' with the full understanding of interconnectedness of these two spheres of social relations where they reinforce and (re)produce racial, sexual, and class power relations. Therefore some level of repetition and overlapping of ideas is to be expected under these categories.

State Violence

The emergence of capitalism created major transformations in the division of labour worldwide. During the 'primitive accumulation' of the early stages of capitalism in Western Europe and its colonies, agrarian labour, usually under conditions of serfdom, was separated from the means of production and transformed into wage labour. This process replaced the rural subsistence economy based on production-for-use with the capitalist economy of production-for-value. This new mode of production appropriated and transformed the sexual division of labour, and thus thrived on the accumulation of value through slavery and women's labour and reproductive power. At the same time, the population of indigenous hunting-and-gathering societies found in Africa, the Americas, Oceania, and other territories was transformed into slave labour and appropriated directly, especially in the British and Spanish colonies of the Americas (Bhavnani 2001; Federici 2004; Linebaugh and Rediker 2000; Midgley 1998; Mies 1986; Smith 2005).

The international system in the imperialist era is full of contradictions between imperialist powers and colonised countries/peoples, between major imperialist powers and minor ones, even between continents, Europe and Africa, rich and poor countries. The organising of this international system is rooted in violence, including the two World Wars, which started in Europe. Women participated in these wars, but they were also raped and turned into 'comfort women,' for instance in Japan, to satisfy the demands of patriarchal nationalism and the sexual desire of patriarchal militarism (Enloe 2000; Soh 2009; Tanaka 2009).

Feminist theorists have argued that the capitalist state or nation states are patriarchal systems where the exercise of state power is also the exercise of masculine structural violence and coercion through which women are oppressed and exploited (Bannerji 1999; Jayawardena 1986; Jayawardena and De Alwis 1996; Joseph 2000; Moghadam 1994; Narayan and Harding 2000; Pettman 1999; Smith 2005; Walby 1992; Yuval-Davis and Anthias 1989; Yuval-Davis and Werbner 1999). The patriarchal capitalist state consists of institutions such as the military, police, prison, and law, which enable the state to institutionalise and organise forms of violence against women. Through the functioning of these institutions, the capitalist state gains the monopoly of violence (INCITE n.d.). Let us consider, as an example, the imprisonment of women in the US. Browne and Lichter show that in the early history of the US imperialism, women were imprisoned for failing to conform '... to cultural norms of the feminine ideal' (Browne and Lichter 2001, p. 613). They argue that most of these women were under the age of 25 and their crimes included '"moral offenses" such as stubbornness, idleness, disorderly conduct, serial premarital pregnancies, keeping bad company, adultery, and venereal disease. Women and girls also were punished for being sexually molested or raped' (ibid.). Reporting the result of a study that Browne and Miller conducted in the 1990s at New York State's Maximum Security Prison for women, they observe that (ibid., p. 618):

> ...the majority of incarcerated women in this setting had suffered severe violence, sexual attack, or sexual molestation prior to their incarceration. Women in the study were an average age of 32; about half were African American, one-quarter were Hispanic, and 13% were White non-Hispanic. Over two-thirds (70%) had been severely assaulted by at least one caretaker during childhood, over half (59%) had been sexually molested before reaching adulthood, and nearly three-quarters (37%) had been physically assaulted by an intimate partner. Three-quarters had been the victim of physical or sexual attacks by non-intimates as well. When all forms of violence were combined, only 6% of these women had not experienced physical or sexual assault over their lifetime. (emphasis in original)

Other studies have similar findings. The same pattern of a masculine patriarchal law-enforcing

mechanism is being experienced by Aboriginal women in Canada. They comprise 4% of the total population, but they comprise 34% of the prison population (Canadian Human Rights Commission 2003). This number increased by about 90% in one decade between 2002 and 2012. Women's incarceration is an instance of state structural violence, which is an integral part of capitalist sex, class, and race relations (Sudbury 2005).

Women's bodies are the source of instantaneous profit making on a global scale (Chin 2013; Jeffreys 2009; Kempadoo 2005; Kempadoo and Doezema 1998). Joni Seager shows topographically and statistically that the global sex trade is a multi-billion dollar industry (Seager 2003, p. 56). She argues '[T]he global sex trade is sustained by astounding levels of coercion, torture, rape and systematic violence' (ibid.). She also presents us with the astonishing statistics: 'An estimated 50,000 women are trafficked into the USA each year', 'Up to half a million women and children are thought to be trafficked into western Europe each year', and 'Prostitution and sex trafficking represents 2% of GPD in Indonesia and 14% in Thailand' (ibid., p. 57). Commoditisation of women's bodies is a privilege of power. It is exercised by males individually, such as by committing rape at home or on streets. It is also institutionalised, such as rape of women prisoners by prison guards and police or rape of women in refugee camps (Global Migration Group 2008). Massive displacement, forced migration, and sex trafficking of women as a result of military and economic aggression have created a catastrophic level of poverty where women are becoming new slaves (Elshtain 1987; Giles and Hyndman, 2004; Hynes 2004; Meintjes et al. 2001; Nikolic-Ristanovic 2000; Skjelsbæk 2001; Aafjes et al. 1998). Seager states that 'The poorest of the poor are women' and they 'not only bear the brunt of poverty, they bear the brunt of "managing" poverty: as providers or caretakers of their families, it is women's labour and women's personal austerity that typically compensate for diminished resources of the family or household' (Seager 2003, p. 86).

Poverty is also racialised: women of colour, migrant and refugee women, native women, black and Latino women, in particular in Asia, Africa, and Latin America, will constitute the majority of the estimated 1 billion people living in extreme poverty in 2015 (World Bank). To comprehend the racialisation and commoditisation of women's bodies, it is important to remind ourselves of the *inner* contradictory logic of patriarchal imperialism. It has the enormous power to absorb en masse women's labour power to onset global accumulation of wealth, but simultaneously disempower women, cheapen their labour power, enslave their bodies, and create a global condition of precariousness for them where their bodies are dispensable and disposable (Bales 1999; Butler 2004; Feldman et al. 2011).

Imperialist wars serve the purpose of reinforcing and realigning patriarchal, racialised, and colonised capitalist forces. A distinctive feature of imperialism is its dependence on war and militarisation as a mechanism to (re) produce itself and sustain its global hegemony. Imperialist wars in recent decades have penetrated all spheres of life from economy to schools, to borders, refugee camps, culture, and entertainment (Cole 2006; Eisenstein 2007; Moser and Clark 2001; Riley et al. 2008). Women and girl children have suffered greatly in the most complex and contradictory ways by wars. In the decade of the 1990s, the world also witnessed the genocide in Rwanda and the Democratic Republic of Congo, where rape, forced pregnancy of women, sex trafficking, and forced prostitution became part of the machinery of war. Feminist ethnographical studies show that women in war zones are regularly harassed and assaulted on their way to fetch water, get food from the market, or reach the headquarters of international humanitarian aid services where they are often forced to give their bodies to receive food (Moser and Clark 2001; Aafjes et al. 1998). The horrific atrocities committed against women under the conditions of war lead us to conclude that imperialist wars are symbolically and literally fought on and over women's bodies. Women signify land, nation, culture, ethnicity, religion, and community to be captured, controlled, covered, or securitised. They are the 'honour' of the nation and culture; they are the property. They either save or betray the

community through the conduct of their body and sexuality as ascribed by the patriarchal and racialised rule.

The Western imperialist powers involved in the former Yugoslavia's war in the 1990s, after intense legal wrangling, finally recognised the systemic use of rape as a 'weapon of war' against women in Bosnia Herzegovina (Giles and Hyndman 2004). As women in Bosnia Herzegovina, Africa, Palestine, and other war-ravaged regions were struggling with the aftermath of the war in refugee camps and more and more became the head of household or widowed, or were pulled into informal war economy, the imperialist powers were preparing for other wars. This time, though, women were used to justify war. To 'liberate' women in Afghanistan and Iraq and to install 'democracy' in the Middle East became the imperialist raison d'être to further plunder the region (Abu-Lughod 2002; Chishti 2010; Hirschkind and Mahmood 2005; Russo 2006; Stabile and Kumar 2005). The 1991 and 2003 US wars on Iraq and the 2001 attack on Afghanistan were, much like those of the colonial past, in pursuit of economic, military, and political interests of European and US imperialist powers (Klein 2007). Not surprisingly, imperialist wars helped the re-traditionalisation, re-tribalisation, and re-primordialisation of these societies (Mojab 2010). In other words, the imperialist wars and occupation created conditions in which the tamed feudal and religious patriarchal forces, which had been suppressed by the emerging capitalist, nationalist, secularist, and modernist states since the early twentieth century, were resurrected and (re)emerged with a vengeance. However, the presence of foreign occupying troops, lack of security, violation of human dignity, the rise in poverty, government corruption, in short the disappearance of the social in its totality, unleashed the force of patriarchy and legitimised the fierce controlling, disciplining, and punishing of women and girls by internal/native and external/foreign patriarchal forces (Al-Ali and Pratt 2009; Zangana 2007).

The purpose of citing prison, poverty, and war as forms of state violence is to make visible the scale and intensification with which capitalist patriarchy has gendered, racialised, and sexualised its imperialist domination. The hegemonic relations are established through the dual mechanism of consent and coercion. The capitalist patriarchal order utilises ideology, culture, and law to hold up the weight of its structural violence. For example, patriarchal capitalism has the capacity to execute legal reform to ameliorate gender, race, and class differences. In 'essence', though, the legal reform 'formalises' state violence through legitimising the dominance of the patriarchal, sexualised and racialised class in power. In other words, the ruling class has monopolised the state, in particular its instruments of political suppression and the legal system. This reality raises a serious consideration for the feminist anti-imperialist and anti-violence strategy: Is this colossal power reformable? If it is, would not legal reform inevitably lead us back into the very framework of the system which is fundamentally the cause of women's oppression and exploitation? To confront white-male hetero-normative dominance in the institutions of the state or in the military, some feminist activists and scholars have proposed 'feminisation' of these institutions. These debates undoubtedly have slightly improved gender, sexual, and racial discrimination, but one may argue that they have failed to eliminate violence but have added women, people of colour, and Lesbian, Gay, Bi-sexual, Transgender, and Queer (LGBTQ) persons to the hierarchy of these institutions. Cynthia Enloe's study of the militarisation of women's lives raises an important quandary: Do we make the military more equitable or do we militarise equality by legislating the rights of racial and sexual minorities to the military (Enloe 2000). To better grasp this dynamic (that is, the elasticity and proclivity of capitalist patriarchy to reform), let us think through its function within civil society.

Civil Society and Violence

Feminist theories have clearly shown that much gender violence is also committed outside the sphere of the state; that is, in civil society. Yet the state mediates and regulates patriarchal

violence against women (Fraser 1997; MacKinnon 1989). Civil society encompasses a wide array of social and ideological structures such as family, Church, media, and education. Contrary to the liberal notion of civil society as a 'third space' mediating between state and market, I understand it as an embodiment of racial, class, and gender power relations with strong ties to both the state and market. Therefore, civil society is not an autonomous space, free from the exercise of patriarchal capitalist forces. In the private sphere of home, Seager argues, 'Women suffer cruelties,' and 'For millions of women, the home is the most dangerous place they could be' (Seager 2003, p. 26). The Canadian Women's Foundation reports (Canadian Women's Foundation 2013, p. 2):

> On any given day in Canada, more than 3,300 women (along with their 3,000 children) are forced to sleep in an emergency shelter to escape domestic violence. Every night, about 200 women are turned away because the shelters are full. . . . As of 2010, there were 582 known cases of missing or murdered Aboriginal women in Canada. Both Amnesty International and the United Nations have called upon the Canadian government to take action on this issue, without success. . . . In a 2009 Canadian national survey, women reported 460,000 incidents of sexual assault in just one year.

A similar pattern emerges in other regions of the world to the extent that the United Nations' 2010 *The World's Women* reports on violence against women as a universal phenomenon which appears in the particular forms of physical violence committed by intimate partners, sexual molestation and assault, femicide, and female genital mutilation (United Nations 2010). The report, addressing the role of media, argues 'Images in the media of violence against women – especially those that depict rape, sexual slavery or the use of women and girls as sex objects, including pornography – are factors contributing to the continued prevalence of such violence, adversely influencing the community at large, in particular children and young people' (United Nations 2010, p. 127). Other studies also indicate a strong link between pornography and sexual abuse and marital rapes (Bergen 1998). Hearn suggests that '. . .virtual violences in intimacy through ICTs, such as forced use of pornography, use of pornography

with children, digi-bullying, cyberstalking, internet harassment, "happy slapping", threatening blogging . . . use of sex dolls, sex robots and teledildonics creates further possibilities for violence and abuse' (Hearn 2013). The point of reiterating, albeit briefly, the result of some of the statistical or analytical studies on forms of violence committed against women in the sphere of home, or on internet and media, is to show the boundless patriarchal capitalist attempt to enslave women's bodies and sexuality. The issue to consider is not only the matter of spatiality of violence (that is, private/public or state/market/civil society spheres), it is rather the scope and intensity of the imperialist 'war-on-women' globally.

Let us consider a different setting for the exercise of 'ideological' or 'cultural' violence against women. The imperialist wars in Iraq and Afghanistan were conducted primarily through high-tech military assault. However, the imperialist powers, led by the US, also undertook a cultural and ideological invasion through expansive 'post-war reconstruction' projects with 'democracy promotion' as its ideological core (Mojab 2009, 2011; Mojab and Carpenter 2011). The training of women to 'manage' and reassemble the society in ruins, and funding their activism in a variety of NGOs, replicated the historical process of co-opting social movements through funding mechanisms and reinventing racist, colonialist, orientalist, and imperialist feminist praxis (Amos and Parmar 2005; INCITE! Women of Color Against Violence 2007). Imperialist feminisms entered the scene of 'post-war reconstruction' with goals to 'liberate' and promote 'democracy' through 'women empowerment'. Their function is to legitimise militarised imperialist foreign policy based on the accumulation of wealth by dispossession. More significantly, they realign the foreign and domestic policy on controversial matters such as morality, family, sexuality, or women's reproductive rights. The renewed imperialist feminist tendencies in the last few decades have achieved three main goals. First, they have transnationalised religious-fundamentalist patriarchy. Second, they has relativised, localised, pragmatised women's struggle against patriarchal capitalism. Finally, they have discredited

feminism globally and thus made the building of a revolutionary and internationalist feminist anti-imperialist project an insurmountable task. Financial, political, and ideological dependency on imperialist feminism have contributed to a culture of spontaneity, corruption, class animosity and rivalry of masculine-capitalism among women's organisations and activists. More significantly, they has depoliticised, institutionalised, bureaucratised, and fragmented the women's movement to the extent that the struggle against feudal-religious-capitalist patriarchy, or women's resistance against militarisation and securitisation, has been limited to vacuous human rights discourse and reform of legal structure. This point will be further expanded below.

In this context, military experts in collaboration with some political scientists and anthropologists produced new literature arguing for a closer link between 'postwar reconstruction' projects, civil society, and humanitarian-aid efforts with the armed forces (Natsios 2005). The *U.S. Army/ Marine Corps Counterinsurgency Field Manual* (with a foreword by David H. Petraeus, James F. Amos, and John A. Nagl and with an introduction by Sarah Sewall) attracted huge interest when it was published in 2007. In 2008, it was downloaded 2 million times (see Biddle 2008, pp. 347–350). In the history of the academic publishing industry, it was the first time that a university-based publisher had published an army manual. The seeds of the idea of the collaboration of military and civil society were cultivated in the Bush Administration National Security Strategy (released in 2002), in which 'development' was one of the 'three strategic areas of emphasis (along with diplomacy and defense)...' (Natsios 2005, p. 4). The release of this document drew attention to the US Agency for International Development (USAID), the major player in the 'post-war reconstruction' projects in Afghanistan and Iraq. Based on the strategy of 'defence, diplomacy, and development', in the same year (2002) the Bush Administration announced an umbrella programme of reform called the Middle East Partnership Initiatives (MEPI), covering the area from Morocco to Pakistan. Zaki Salime argues that: 'MEPI followed a political rationality of "soft"

reforms through enhancement of citizen-entrepreneurship, women's empowerment, and capacity building of "civil society," as a means to uproot "terrorism" and spread "democracy"'. She contends that MEPI, 'has also mobilized funds to support NGOs and provide training for women, youth, entrepreneurs, and political players' (Salime 2010; 2011, pp. 215, 218). Thus, ideas of civil society, and NGOs, in particular women's NGOs, were promoted as venues for establishing capitalist democracy, in which the absolute rule of the patriarchal state would be realigned with the absolute rule of the patriarchal market/ privatisation and capitalist 'democracy' to strengthen the condition of oppression and exploitation for women (for a comprehensive critique of the NGO-isation of women's movement in Palestine post-Oslo peace process, see Abdo 2010; Hanafi and Tabar 2003).

The position of women is varied within and between different societies, and while there is certainly more that we need to learn about the extent of atrocities committed against women in each society, there are two arguments to be made. First, the state response to demands of women for a safe, equal, free, and just life are protracted over decades. Weldon, in her cross-national comparison study of democratic governments' response to violence against women writes, 'Although some national governments reformed rape laws or began funding shelters in the mid-1970s, many countries did not begin to address the problem of violence against women until the latter half of the 90s, and many more only in the first half of the 1990s' (Weldon 2002, p. 19). She emphasises that without a strong women's movement, this level of policy and legal reform would not have been achieved (2002, p. 61). In the 'Introduction' of the influential anthology *The Color of Violence* (Women of Color Against Violence 2006, p. 1), we read:

> However, as the antiviolence movement has gained greater prominence, domestic violence and rape crisis centers have also become increasingly professionalized, and as a result are often reluctant to address sexual and domestic violence within the larger context of institutionalized violence. In addition, rape crisis centres and shelters increasingly rely on state and federal sources for their funding.

Consequently, their approaches toward eradicating violence focus on working *with* the state rather than working *against* the state. (emphasis in original)

The allusion to 'professionalization' and 'working *with* the state' above are significant for this discussion. Critical feminist studies show that the co-opting of women's movements within the state and international institutions such as the World Bank, International Monetary Fund, and UN-based gender agencies, or other philanthropic foundations since the 1970s have depoliticised, institutionalised, bureaucratised, and fragmented women's movements worldwide. The imperialist agenda of import/export of patriarchal networks, networks that include corporations, NGOs and humanitarian agencies, religious institutions, military and security forces, and cultural organisations have transnationalised capitalist patriarchy in such a way that there is little escape for women.

Second, since the 11 September 2001 terrorist attack against the US, and the subsequent wars in the Middle East and North Africa, in some significant respects imperialist wars have interconnected and interrelated the oppression and exploitation of women in ways unparalleled in history. They have revived and realigned pre- and post-colonial tribal, religious, national, and sectarian grievances, disputes, and conflicts throughout most of Asia and Africa. Religions have taken a central stage in public lives, and thus secular space is shrinking globally (Amireh 2012; Moghissi 2013). Religious doctrines, from Islam to Christianity, Judaism, or Hinduism, are governing women's bodies, sexuality, and gender relations. Regimes of 'gender apartheid' are established in Saudi Arabia (since its inception in 1932), in Iran (1979), Afghanistan and Iraq (2003). Women's rights are continuously violated which include their right to property, inheritance, child custody, or free choice in marriage, reproductive rights, education, employment, travel, and a life free from sexual harassment at home, schools, workplaces or on the streets. The widespread rape, sexual harassment, domestic violence, 'honour killing', or humiliation and degradation are embedded in the social relations and the prevailing religious and cultural practices that women experience daily (Bennoune 2013;

Reed 2002). Religious groups have joined forces to stop, protract, and reverse the outcome of more than a century of women's resistance against patriarchal and colonial capitalist domination. The alliance of religious forces at the UN-sponsored global conferences on women since the 1970s (Mexico, 1974; Copenhagen, 1980; Nairobi, 1985; Beijing, 1995) has dragged down the demands of women to safe and free access to abortion, contraception, and the right to same-sex marriage. The notions of 'culture' and 'diversity' have been evoked in these settings by the state representatives to legitimise the rule of 'local', 'particular' patriarchy. The logic of 'cultural authenticity' and at times anti-Western or anti-imperialist rhetoric is being used by the state and civil-society sector to preserve the right of the particular nation state to misogynistic religious practices.

A characteristic of today's imperialism is the convergence of its domestic and international relations. For instance, 'War-on-Terror' is an instantiation of the overlap of domestic and international forms of co-dependency in surveillance, racialisation, incarceration, or policing. The cyclical crisis of capitalist economy since the 1980s has incorporated surveillance, security, and incarceration into public policy (Feldman et al. 2011). There is an emphasis on disciplining and punishing the public, in particular women, youth, aboriginal peoples, poor, and people of colour, through such mechanisms as 'War-on-Terror' or 'War-on-Drugs'. Angela Davis argues that the 'Prison Industrial Complex' is a new addition to the 'Military Industrial Complex' (1998). The disciplining apparatus of the state is extensively privatised, militarised, and has turned the securitisation and incarceration of people into profit. The migrant and refugee women, the sex trafficking of women, raising wired borders between the US and Mexico or building 'separation walls' in Israel and 'normalising' the right of the state to securitise citizens in border crossing or in schools are forms of racialised and genderised violence (Shalhoub-Kevorkian 2009). 'War-on-Terror' policy absorbs public resources and (re) forms the crisis of patriarchal capitalist economy through the process of privatisation. 'War-on-

Terror' is a violent model to inscribe law and order in 'lawless' capitalist-imperialist social order where, as Colin Dayan suggests, 'law is a white dog' (Dayan 2011). She traces the legacy of slavery in the contemporary US supermax prison facilities and shows the way the legal system on matters such as torture and punishment prepared the way for abuses committed by the US in Abu Ghraib and Guantánamo Bay prisons (ibid.). The policy has shifted attention from the state responsibility for human security to 'terrorism' and thus has targeted women, racialised, sexualised migrants and refugees mostly fleeing conflict zones.

Women are fiercely opposing and struggling against this complex network of patriarchies. Their resistance, courage, and resiliency are extraordinary. They have joined armed forces, and engaged in armed struggles, are combatants, suicide bombers, refugee camp social workers, community organisers, peace activists, refuseniks, humanitarian aid workers, leading protests and marches, and much more. The point is that they are not 'victims'; they participate, protest, dissent and resist in order to put an end to imperialism and its violence.

Anti-imperialism: A Revolutionary Feminist Rupture

Women and girls, day and night, go through the world frequently guarded against physical, sexual, emotional, cultural, religious, or economic assaults. They carry these burdens throughout their lives. Capitalism has produced a complex network of patriarchies to facilitate the accumulation of capital and to maintain social control. Capitalist patriarchy has conflictual and contradictory relations with women. Women are a social force to be managed and engaged with, but they are also to be controlled, punished, and disciplined. When analysed deeply, one can see remarkable homogeneity in the 'gender project' of patriarchal imperialist order, despite its apparent diversity. Imperialist patriarchy has fragmented women's movements globally and has forced them to become donor-driven; the

two forces of fundamentalism and imperialism are driving the global 'gender project', though opposing each other to divert attention away from the struggle around the oppression and exploitation of women. The two belligerent forces of imperialism and fundamentalisms are forcing women into a framework of patriarchal family roles, motherhood, morality and decency, nationalism, and cultural practices to reinforce gender violence. They have transnationalised the apparatuses of punishment and control of women's bodies and sexuality through instruments such as 'War-on-Terror', 'War-on- Drugs', torture, and surveillance.

Under these conditions, some theorists claim that imperialism is in the process of transforming into a new regime called 'Empire', characterised by eroding national borders and a dissolving nation-state system, which will leave the imperial(ist) order without leaders or centre (Hardt and Negri 2000). This is an optimistic, 'post-imperialist' scenario in which sovereignty is deterritorialised, leaving room for increasing mobility of labour, fluidity of capital, on-going migration, and organising on an international level. In this context of the 'withering away' of the nation state, human beings are said to be able to realise the dream of building a world that will turn its back on pillage and piracy and move towards equality and justice. However, developments in the first decade of this century point in a different direction. Although the world order is in a situation of flux, capitalist states today, as in the past, combine the need to cross national borders (for purposes of accumulation) with the urge to maintain spheres of influence (through war and occupation).

The global scene is messy and chaotic. We can conclude that the global explosion of violence against women coincides with the heightened finance capitalism in the past three decades, and remarkably resembles the globalised violence against the whole of humanity. At the core of current imperialist forms of violence is the intensification of the socialisation of production and the private appropriation of (re)production. At stake is building a global women's movement that can relinquish itself from the restraining

forces of reformism, relativism, essentialism, and pragmatism, and set a stage for a renewed revolutionary social transformation.

Definition

Under Article 2 of the 1948 United Nations Convention on the Prevention and Punishment of the Crime of Genocide, genocide is legally defined as "any of the following acts committed with intent to destroy, in whole or in part, a national, ethnical, racial or religious group, as such: killing members of the group; causing serious bodily or mental harm to members of the group; deliberately inflicting on the group conditions of life, calculated to bring about its physical destruction in whole or in part; imposing measures intended to

prevent births within the group; [and] forcibly transferring children of the group to another group."

The historical relationship between imperialism and genocide is vast and well-established. This relationship is generally understood to be rooted in acts of physical violence perpetrated by imperial powers in the processes of conquest and territorial expansion. What is less understood is the connection between imperialism and genocide found in indirect physical violence and other forms of violence carried out by settler-colonial regimes and the colonial powers. There is a reason for this. The imperial and colonial powers actively worked to ensure that the legal definition of genocide codified in the *Convention on the Prevention and Punishment of the Crime of Genocide* (1948; abbreviated to Genocide Convention from this point forward) did not contain elements that would implicate them in the commission of genocide.

There are numerous and important texts that provide summary overviews and in-depth analyses of historical cases of imperial genocides. Less so are the texts that question the legitimacy of the Genocide Convention itself based on it being an example of colonial law – law significantly shaped by the imperial and colonial powers in ways that served their interests by protecting them from the scope of its reach. This essay seeks to address this gap by illustrating the ways in which the original concept of genocide changed during its drafting process from one that incorporated elements that directly tied genocide to imperialism to one that has been applied almost exclusively to mass killings perpetrated by authoritarian states. It begins by summarizing the evolution of Lemkin's concept of genocide from its earliest stages to the one he included in the first formal draft of the Genocide Convention. Next, it provides an overview of the historical connections between imperialism and genocide, with mention of some of the significant texts in the field. This is followed by an analysis of the evolution of the legal meaning of genocide and the means by which Lemkin's concept of genocide and its relationship with imperialism were excluded from the

legal text. Bringing together the previous sections, the next part explains why the Genocide Convention is an example of colonial law. In the final section, suggestions are made regarding how to decolonize genocide.

Lemkin's Concept of Genocide

Lemkin's concept of genocide was "the culmination of a long tradition of European legal and political critique of imperialism and warfare against civilians. All of the instances about which he wrote for his projected world history of genocide occurred in imperial contexts," such as the destruction of Carthage, the Crusades, massacres of the Herero, and genocides under Ottoman rule, or involved deliberate attacks on civilian populations in warfare (Moses 2010: 25).

The term "genocide" was first used in print by Raphael Lemkin in his seminal work *Axis Rule in Occupied Europe: Laws of Occupation, Analysis of Government, Proposals for Redress*, published in 1944. Lemkin created the term "to denote an old practice in its modern development" (Lemkin 2005: 79) by combining the ancient Greek word *genos*, meaning race or tribe, and the Latin *cide*, meaning killing. Though Lemkin focused heavily on Nazi Germany and its transnational policies in his effort to illustrate his concept of genocide, it is clear in his larger body of writings on genocide, the evolution of his ideas and conceptualization of genocide, and his contributions to the first formal draft of what would become the Genocide Convention that Lemkin believed genocide was closely connected not only to German imperialism but the policies and associated impacts of imperialism more broadly.

Lemkin was particularly concerned with the cultural and physical destruction of national and social collectivities that occurred in conquest, territorial expansion, and colonization. In 1933, Lemkin presented his early ideas about genocide at the International Conference for Unification of Criminal Law. He proposed that "acts of barbarity" and "acts of vandalism" be considered "offenses against the law of nations." Lemkin

defined acts of barbarity as "attacks carried out against an individual as a member of a collectivity" with the goal being "not only to harm an individual, but, also to cause damage to the collectivity to which the latter belongs" (Lemkin 1933). Acts of vandalism were defined as "systematic and organized destruction of the art and cultural heritage in which the unique genius and achievement of a collectivity are revealed in fields of science, arts and literature" (ibid.). According to Lemkin, perpetrators of acts of barbarity and vandalism make evident their "asocial and destructive spirit" that is "the opposite of the culture and progress of humanity" (ibid.).

By 1944, Lemkin's acts of barbarity and vandalism grew to encompass what he referred to as eight techniques of genocide in various fields. The eight techniques include political, social, cultural, economic, biological, physical, religious, and moral (Lemkin 2005). They represent the primary activities by which a perpetrator commits genocide. In simplest terms, Lemkin defined genocide as "the destruction of a nation or of an ethnic group" (ibid.: 79). More specifically, Lemkin wrote, "Generally speaking, genocide does not necessarily mean the immediate destruction of a nation, except when accomplished by mass killings of all members of a nation. It is intended rather to signify a coordinated plan of different actions aiming at the destruction of essential foundations of the life of the national groups, with the aim of annihilating the groups themselves" (ibid.). The objectives of genocide are to disintegrate "the political and social institutions, of culture, language, national feelings, religion, and the economic existence of national groups, and the destruction of the personal security, liberty, health, dignity, and the lives of the individuals belonging to such groups" (ibid.).

As indicated in his reference to a "coordinated plan," Lemkin saw the eight techniques of genocide when implemented together as a "synchronized attack on different aspects of life" (see Butcher 2013). Each of the eight techniques shares some relationship with one or more of the other techniques. For example, the political technique involves the destruction of local institutions necessary for self-government, along with the

imposition of the occupier's system of institutions and administration. This is accompanied by the elimination of any reminder of the former national character. Local political parties are replaced by those of the occupier, and streets and buildings are renamed, with the new names corresponding with the language of the occupier (Lemkin 2005).

The political technique merges with the social technique, as dissolution of local institutions and administrative capabilities are accompanied by the abolition of local laws and courts. As Lemkin wrote, "The social structure of a nation being vital to its national development, the occupant also endeavors to bring about such changes as may weaken the national, spiritual resources. The focal point of this attack has been the intelligentsia, because this group largely provides the national leadership and organizes resistance against [the oppressor]" (Lemkin 2005: 83). The political and social techniques also interconnect with the cultural technique. The abolishment of the local language is not limited to the naming of streets and buildings. The cultural technique prohibits the local population from using their language in schools and the printed word. Measures are also implemented to stymie expression of the national spirit (ibid.). The occupied must not be able to make cultural contributions as members of their formal collectivity because doing so would contribute to the maintenance of the group's cultural vitality. Thus, "All persons engaged in painting, drawing, sculpture, music, literature, and the theater are required to obtain a license for the continuation of their activities" (ibid.: 84). Additionally, to deprive them of inspiration, the oppressor destroys national monuments, libraries, archives, museums, and galleries of art to be replaced by works produced by the occupier's group.

As the spirit of the occupied is being broken, so too is their ability to resist. Lemkin describes the economic technique as the "destruction of the foundation of the economic existence of a national group" (Lemkin 2005: 85). Destruction of the foundation requires crippling the group's development, even causing a developmental regression. According to Lemkin "The lowering of the standards of living creates difficulties in fulfilling

cultural-spiritual requirements. Furthermore, a daily fight literally for bread and for physical survival may handicap thinking in both general and national terms" (ibid.). A weakened and despondent population is easier to forcibly remove, assimilate, or even exterminate, depending on the totality of the occupier's objectives as well as the level of resistance mounted by the occupied peoples.

The biological and physical techniques intersect with the economic technique. Together, the biological and physical techniques represent two ways to eliminate the existence of the group by preventing future births and killing its members. The former can be achieved by imposing measures calculated to decrease the birthrate of the targeted group. Such measures include prohibiting marriages among members of the group, separating the group's men and women, and keeping parents malnourished, which can have the effect of lowering the birthrate and "lowering of the survival capacity of children born of underfed parents" (Lemkin 2005: 86). Meanwhile, the physical technique takes three primary forms: discrimination in feeding, undermining the health of members of the group, and mass killing. Malnourishment that results from discrimination in feeding has health impacts beyond the biological; it will lead to a decline in overall health and increase the death rate. Other means of endangering health include denying members of the group adequate clothing and shelter, withholding medicine and medical care, and generally imposing living conditions inimical to the long-term health and survival of group members. Finally, the existence of the targeted group can be eliminated by organized murder of its members. With the final two techniques – religious and moral – the perpetrator seeks to disrupt the national, religious, and moral influences of the people (Lemkin 2005).

Lemkin emphasized the importance of a group's "derived needs." According to Lemkin, "These needs find expression in social institutions or, to use an anthropological term, the cultural ethos. If the culture of a group is violently undermined, the group itself disintegrates and its members must either become absorbed in other cultures which is a wasteful and painful process or

succumb to personal disorganization and, perhaps, physical destruction" (quoted in Moses 2010: 25). Lemkin believed that national collectivities, even those without formal sovereignty, hold an inherent right to exist as such (Short 2010). It is in this regard that Lemkin opposed the forcible assimilation of weaker societies into stronger outsider ones.

As is indicated above, Lemkin was especially concerned with loss of culture. In 1946, he impassionedly wrote, "Our whole heritage is a product of the contributions of all nations. We can best understand this when we realize how impoverished our culture would be if the peoples doomed by Germany, such as the Jews, had not been permitted to create the Bible, or to give birth to an Einstein, a Spinoza; if the Poles had not had the opportunity to give to the world a Copernicus, a Chopin, a Curie; the Czechs, a Huss, a Dvorak; the Greeks, a Plato and a Socrates; the Russians, a Tolstoy and a Shostakovich" (Lemkin 1946: 228). Indeed, though Lemkin included a cultural technique of genocide, "culture" is not only what is produced by a national or social group but also the source of its production. Thus, Lemkin explicitly connected genocide and imperialism because of the resultant "specific losses to civilization in the form of the cultural contributions which can be made only by groups of people united through national, racial or cultural characteristics" (Lemkin 1947: 147).

Genocidal Imperialism

Lemkin's concept of genocide is illustrative of a preoccupation with *the occupation* of land and peoples by foreign powers. This overwhelming concern makes even more evident the connection between Lemkin's concept of genocide and imperialism. For Lemkin, the "destruction of a nation" was defined by two phases – destruction of the occupied group's national pattern and the imposition of a new pattern. According to Lemkin, "This imposition, in turn, may be made upon the oppressed population which is allowed to remain or upon the territory alone, after removal of the population and the colonization by the

oppressor's own nationals" (Lemkin 2005: 79). The process of genocide, then, involves a coordinated plan of different actions conducted by an outside group that aims to destroy a group by forcibly relocating its members, taking over their territory, and transforming it so that it reflects the occupier's institutions and values or by imposing the occupier's institutions and values on members of the group and the territory on which they reside.

Conquest, territorial expansion, and colonization employ a variety, if not all, of Lemkin's eight techniques of genocide and progress through the two phases referred to above. As Norman Naimark states in *Genocide: A World History*, "Genocide has been a part of human history from its very beginnings.… Extended families, clans, and tribes routinely engaged in genocidal actions against their rivals, just as ancient empires and modern nation-states enacted their murderous hatred for imagined or real enemies in mass killing" (Naimark 2017: 1). What some refer to as "modern genocide" finds its origin in the beginnings of the world order that continues today. This world order is largely dominated by western imperialist states, harking back to Spain's conquest of the "New World," Britain and France's conquest of North America, US expansionism, and European conquest of Africa, Australia, New Zealand, and parts of Asia.

There are significant works by some of the leading genocide experts who have chronicled the innumerable cases that exemplify the relationship between imperialism and genocide. In his massive work, *Blood and Soil: A World History of Genocide and Extermination from Sparta to Darfur*, like Naimark, Ben Kiernan notes the likelihood that genocide was a phenomenon present at the earliest stages of human history. With a primary focus on its modern manifestations, Kiernan records 600 years of genocide. Beginning with the 1400s, he discusses the genocidal nature of Spanish conquest, which "devastated the most populous islands and destroyed the most powerful kingdom of the New World, dispatched massive quantities of plunder back to the Old, opened up the Americas to other European powers and settlers, and established grim new precedents for

their murder of indigenous peoples" (Kiernan 2007: 72). Kiernan also documents cases of genocide and genocidal massacres during territorial expansion and ethnic conflict in East Asia to 1800, as well as genocidal massacres committed by Christians, Muslims, and Buddhists in Southeast Asia from the 1500s to 1800. Regarding these latter acts of genocide, Kiernan writes, "In all these cases, aggressive territorial expansion combined with cults of antiquity, and pastoral ideology of cult of agriculture to form an intellectual backdrop to mass killing" (Kiernan 2007: 133).

In addition to works like Kiernan's, there are others that take a predominantly theoretical approach to conceptualizing genocide, including its association with imperialism, such as Leo Kuper's *Genocide: Its Political Use in the Twentieth Century* (1982), Claudia Card's *Genocide and Social Death* (2003; see also Card 2010), and Martin Shaw's *What is Genocide?* (2007). Some focus on a particular region including, among others, Ward Churchill's *A Little Matter of Genocide: Holocaust and Denial in the Americas 1492 to the Present* (1997), Andrew Woolford's *This Benevolent Experiment: Indigenous Boarding Schools, Genocide, and Redress in Canada and the United States* (2015), Benjamin Madley's "Patterns of Frontier Genocide 1803–1910: The Aboriginal Tasmanians, the Yuki of California, and the Herero of Namibia (2007)," and Kelly Maddox's "Genocide in the Japanese Empire: Tracing the Genocidal Dynamics of Japanese Imperialism (2015)." Still others address the issue of cultural genocide and its connection to imperial and colonial history, such as Lindsay Kingston's "The Destruction of Identity: Cultural Genocide and Indigenous Peoples (2015)," Elisa Novic's *The Concept of Cultural Genocide: An International Law Perspective* (2016), and Lawrence Davidson's *Cultural Genocide* (2012).

In his aptly titled *Genocide: A Comprehensive Introduction*, Adam Jones addresses colonialism and neocolonialism (see also Kiernan 2007: 165–390). On colonialism, Jones writes, "The units that we know as states or nation-states were generally created by processes of imperial expansion.… The designated or desirable

boundaries of the state were first imposed on coveted lands through imperialism, then actualized, rationalized, made 'legible' and exploitable by the imposition of members of the dominant group or its surrogates upon adjacent or nearby territories and populations" (Jones 2017: 90). Where there was resistance or further desire to expand territorial control, the colonizer's actions "inevitably assumed a genocidal scale and character, and continues to do so" (ibid.: 91). What is implied in Jones' discussion of colonization is made explicit in Aimé Césaire's claim that "no one colonizes innocently" (Césaire 2000: 39). Furthermore, according to Césaire, a "nation which colonizes, that a civilization which justifies colonization – and therefore force – is already a sick civilization, a civilization which is morally diseased, which irresistibly, progressing from one consequence to another, one denial to another, calls for its Hitler, I mean its punishment" (ibid.).

This sickness, as Césaire refers to it, is especially evident in settler-colonial contexts, but can also be seen in the process of decolonization and the continued reach of former and new colonizers through neo-colonization. Regarding the former, writes Patrick Wolfe, "The question of genocide is never far from discussions of settler colonialism. Land is life – or, at least, land is necessary for life. Thus contests for land can be – indeed, often are – contests for life" (Wolfe 2006: 387). Similarly, writes Jürgen Zimmerer, "Space is a finite quantity for which people (by definition indefinite in their numbers) compete. The need for land can be real or imagined (it can include imaginative landscapes, for example, plans for settlements, economic or agricultural use, or fear of land shortage)" (Zimmerer 2014: 273). The sickness is not merely found in the move to expand and settle the land of others; it is in the placing of the settler's needs, often non-derived needs, ahead of the most basic of needs of the settled peoples. Put simply, "Settler colonialism destroys to replace" (Wolfe 2006: 388).

Decolonization was sometimes accompanied by periods of extreme destructive violence between those attempting to preserve the colonial restraints and those attempting to throw off the binds of colonization. France's resistance to Algerian self-determination exemplifies a genocidal response to a decolonial movement. As the suppression of cultural rights intensified, some members of the oppressed population began to organize and consider armed resistance. Rather than accept the demands of the colonized people, France resorted to force to maintain its control over Algeria. Describing France's use of force to suppress the legitimate rights of Algerians, Muhammad El-Farra wrote in 1956, "Entire villages are shelled, bombed, or burned; acts of genocide are committed against the inhabitants of towns and villages; an indiscriminate campaign of extermination is now taking place. . .These are acts of genocide committed against people whose only crime is their love for liberty and their desire to preserve their own culture" (El-Farra 1956: 7).

The period of decolonization has been followed by new forms of imperialism and with them new forms of physical and structural violence. A primary driver of colonial genocide was the pursuit of economic expansion by the colonial powers (Short 2016). Hence, resistance to decolonization and the advent of neocolonialism were rooted in, first, the maintenance of economic, as well as political and cultural, control and influence and, second, the development of new forms of control and influence. Indeed, Jones writes that under neocolonialism "formal political rule is abandoned, while colonial structures of economic, political, and cultural control remain. The resulting exploitation may have genocidal consequences" (Jones 2017: 91).

Despite the obvious connection between Lemkin's concept of genocide and its associated techniques to imperial and colonial genocide, the application of Lemkin's concept of genocide to the treatment of occupied and colonized peoples that does not involve mass killing has been deemed controversial or mistaken by some in the field of genocide studies. This is at least in part because significant elements of Lemkin's concept of genocide, including many of the elements that connected imperialism and genocide, were omitted from the adopted text of the Genocide Convention and are similarly omitted from some of the prevailing scholarship.

G

Imperializing Lemkin's Concept of Genocide

There are significant disagreements among scholars in the field of genocide studies regarding what constitutes the crime of genocide, leading Jones to conclude that genocide "will forever be an 'essentially contested concept'" (Jones 2013: 5–6). Perhaps the most significant source of this disagreement is the definition of genocide codified in the Genocide Convention. The concept of genocide Lemkin presented in 1944 in *Axis Rule in Occupied Europe* remained largely unchanged when he participated in the creation of the Secretariat Draft (1947) of the Genocide Convention in 1947. Though Lemkin was one of three experts tasked with developing the initial draft of the treaty, Lemkin's influence on the text is readily apparent (Novic 2016).

What was likely a pragmatic change for purposes of a legal document, Lemkin narrowed his eight techniques of genocide to three methods – physical, biological, and cultural. All three of the methods were included together in Article II of the Secretariat Draft (1947), illustrating their interconnectedness. Retaining various elements of Lemkin's eight techniques, physical genocide was defined as "causing the death of members of a group or injuring their health or physical integrity." Acts of physical genocide included the following:

(a) Group massacres or individual executions
(b) Subjection to conditions of life which, by lack of proper housing, clothing, food, hygiene and medical care, or excessive work or physical exertion, are likely to result in the debilitation or death of the individuals
(c) Mutilations and biological experiments imposed for other than curative purposes
(d) Deprivation of all means of livelihood, by confiscation of property, looting, curtailment of work, and denial of housing and of supplies otherwise available to the other inhabitants of the territory concerned

Biological genocide involved the restriction of births among members of a group by:

(a) Sterilization and/or compulsory abortion
(b) Segregation of the sexes
(c) Obstacles to marriage

Meanwhile, cultural genocide was defined as destruction of "the specific characteristics of the group." Acts of cultural genocide included:

(a) Forcible transfer of children to another human group
(b) Forced and systematic exile of individuals representing the culture of a group
(c) Prohibition of the use of the national language even in private intercourse
(d) Systematic destruction of books printed in the national language or of religious works or prohibition of new publications
(e) Systematic destruction of historical or religious monuments or their diversion to alien uses and destruction or dispersion of documents and objects of historical, artistic, or religious value and of objects used in religious worship

Seven of Lemkin's eight techniques of genocide – political, social, cultural, economic, biological, physical, and religious – those that draw a clear line from imperialism to genocide, were included in the Secretariat Draft (1947) definition of genocide. However, during the subsequent drafting process that involved states negotiating the terms of the treaty, meaning its provisions, prohibitions, and obligations, imperial and colonial powers chipped away at Lemkin's concept of genocide, leaving little of it and its connection to imperialism remaining in the legal definition included in the adopted text of the Genocide Convention.

Established in March 1948, the Ad Hoc Committee on Genocide comprised of seven states, including the United States, Soviet Union, France, China, Lebanon, Poland, and Venezuela, produced the second formal draft of the Genocide Convention. Using the Secretariat Draft (1947) as a foundation from which to work, the Ad Hoc Committee retained Lemkin's three methods of genocide, but isolated cultural genocide in Article III from physical and biological genocide, which

were included in Article II. This was done primarily at the behest of the United States, with France's support, in order to allow the United States to recognize the legitimacy of physical and biological genocide in Article II while also rejecting the concept of cultural genocide in Article III (Bachman 2018).

Perhaps because it was separated from the physical and biological methods, the Ad Hoc Committee Draft (1948) of the Genocide Convention retained much of Lemkin's concept of cultural genocide. However, the erosion of Lemkin's methods of physical and biological genocide in the text is evident. In the Ad Hoc Committee Draft, physical and biological genocide are limited to killing members of a group, impairing the physical integrity of members of the group, inflicting on members of the group measures or conditions of life aimed at causing their deaths, and imposing measures intended to prevent births within the group. The specifics of Lemkin's concept of genocide are imperative for our understanding of what the above acts entail. Gone from the Ad Hoc Committee Draft were the political, social, and economic techniques, as well as much of the physical and biological techniques.

This trend would continue when the Ad Hoc Committee Draft was opened for broader discussion and revision at the Sixth Committee of the General Assembly in late 1948. Just as Lemkin's political, social, and economic techniques of genocide were essentially eliminated from the Genocide Convention, and the physical and biological techniques were significantly abridged, cultural genocide was, for all intents and purposes, omitted altogether. All that remained of Lemkin's technique and method of cultural genocide when the Sixth Committee sent its draft to the General Assembly for adoption was the forcible transfer of children from one group to another. However, in the final text, the forcible transfer of children is not viewed as an element of cultural genocide but rather a means by which to commit biological genocide by impeding members of a group from producing new members of the group (Moses 2010).

As with negotiations at the Ad Hoc Committee, the United States was the most vocal opponent of the inclusion of cultural genocide. However, the United States was no longer satisfied with isolating cultural genocide from physical genocide. Instead, it insisted on cultural genocide's removal entirely. The United States even went so far as to threaten to undermine support for the Genocide Convention if cultural genocide were retained. Notably, at the time of the negotiations, the United States was engaged in many of the acts included in Lemkin's concept of cultural genocide (Bachman 2018). As Ward Churchill asserts, in successfully excluding cultural genocide from the Genocide Convention the United States accomplished "a maneuver serving to exempt a range of its own dirty linen from scrutiny" (Churchill 1997: 365).

With the omission of cultural genocide, which Lemkin referred to as "the most important part of the Convention" (quoted in Moses 2010: 37), the final blow to Lemkin's concept of genocide, and its direct connection to imperialism, had been landed. Lemkin was treated as if he did not understand genocide, "despite the fact that he invented the term and went to great trouble to explain its meaning" (ibid.: 21). Gone were the explicit connections to war, settler colonialism, colonization, neocolonialism, and structural violence. The imperial and colonial powers used their positions in the negotiations to ensure that their policies, whether those that were ongoing or those in their recent pasts, could not be used to implicate them in the commission of genocide. Even with their accomplishments in hand, they did not stop there.

At the 11th hour, the United Kingdom proposed the following text, which is included in the Genocide Convention under Article XII: "Any Contracting Party may at any time, by notification addressed to the Secretary-General of the United Nations, extend the application of the present Convention to all or any of the territories for the conduct of whose foreign relations that Contracting Party is responsible." In explaining its proposal, which the Soviet Union referred to as the "colonial clause" (Abtahi and Webb 2008: 1824), the United Kingdom claimed that it had been custom over the previous 20–30 years for multilateral treaties to contain such language. In addressing criticism of its proposal, the United

Kingdom argued that opposition was based purely on "political motives" in order to "create difficulties" for the colonial powers (ibid.: 1815). Seemingly without any recognition of the irony, the United Kingdom also claimed that it could not decide for its colonies whether they would accept and be bound by the Genocide Convention and, more importantly, whether they could be victims of genocide. Essentially, the United Kingdom argued that because colonial territories were not present to represent themselves at the negotiations, as only states could participate, colonial territories could not be obligated to abide by the terms of the Genocide Convention by the colonial powers without first obtaining their consent. The United States supported the United Kingdom's position, stating that it was "extremely reasonable" (ibid.: 1816).

With the inclusion of Article XII in the adopted text of the Genocide Convention, the imperial and colonial powers achieved the final success in severing the genocidal relationship between the occupier and the occupied. What remained of the imperial characteristics of Lemkin's concept of genocide was made essentially inapplicable. The imperial and colonial powers exploited the timing of the Genocide Convention negotiations just as they exploited the people, land, and resources under their direct and indirect control. Had the Genocide Convention originated years later, there might have been a very different outcome.

Colonial Law

Though the Soviet Union referred only to the United Kingdom-proposed and United States-backed Article XII as "colonial," the entire Genocide Convention is an example of colonial law. At the time of the negotiations that shaped the final text of the treaty in ways that greatly benefited the colonial powers, as well as those states that faced significant internal political opposition, colonization and threats to the existence of indigenous peoples as such remained a widespread reality, a threat that continues to this day.

When the United Nations was formed in 1945, there were 51 original members. At the time,

among these members, nine maintained trust and/or non-self-governing territories, including Australia, Belgium, Denmark, France, the Netherlands, New Zealand, South Africa, the United Kingdom, and the United States. These 9 states accounted for 93 of the 105 trusts and non-self-governing territories. The other 12 territories were administered by Italy, Portugal, and Spain, which themselves did not become UN members until December 1955. The 105 trusts and non-self-governing territories birthed 79 independent states over the next 54 years.

To put this into greater perspective, at the time the text of the Genocide Convention was negotiated and then voted on for approval at the General Assembly on December 9, 1948, only four African countries were eligible to participate – Egypt, Ethiopia, Liberia, and South Africa. These four countries accounted for only 7% of the total vote (LeBlanc 1988). Therefore, the most colonized continent in the world was unable to participate in a process that could have allowed the colonized to retain in the Genocide Convention the very practices they were subjected to by the colonial powers. Asia accounted for 22.5% of the votes, with 13 voting members (ibid.). Notably absent from the voting rolls was much of colonized Southeast Asia. Europe accounted for nearly 30% of the votes and the Americas encompassed 38% of the vote. The remaining 3.5% of the vote was represented by the Oceanic countries of Australia and New Zealand (ibid.).

Territories under colonial control that would later gain their independence were denied the right to participate in the drafting of the Genocide Convention, its negotiating process, and in voting to determine whether it would become open for ratification in the form it ultimately took. Furthermore, it is doubtful that it would have taken its final form had formerly colonized territories and representatives of indigenous groups been permitted to participate in the drafting and negotiating processes. Related to this latter point, Haiti – itself made up of people who had to utilize extreme violence to gain their independence – proposed at the Sixth Committee that members of groups affected by genocide have legal standing to call upon the United Nations for their own protection.

Haiti argued that if only states were able to report genocide, and not the members of victimized groups, the possibility remained that a state could be both the perpetrator of genocide and the only organ with the authority to initiate protective proceedings (Abtahi and Webb 2008). Haiti's proposal failed to elicit any debate. The chairman of the Sixth Committee noted that Haiti's amendment had been read at the 101st meeting. Unfortunately, the chairman noted, the Haitian delegation was not present at the time. None of the negotiating parties present at the meeting spoke in favor of the Haitian amendment, so it was presumed that minds were made up on the subject (Abtahi and Webb 2008). This raises some questions: Why wasn't Haiti present? Was the Haitian delegation aware that its amendment would be read at the 101st meeting? Why didn't any other negotiating parties speak in favor of the amendment? The answer to these questions, as well as to the question of why indigenous and colonized peoples were not included in the Genocide Convention's drafting and negotiating processes, is a simple one; most states had no interest in empowering their victims – past, present, and future.

Had the Genocide Convention been drafted and negotiated after wider decolonization, Leo Kuper argues that the "representatives of the colonial powers would have been somewhat on the defensive, sensitive to criticism of their policies in non-self-governing territories" (Kuper 1982: 31). Thus, colonial powers that were vested in protecting their interests were allowed to colonize the law just as they had colonized significant portions of the world, while the very groups impacted by colonization were unable to ensure that the relationship between imperialism, colonialism, and genocide was made explicit in the law that defined and prohibited the crime. This historical reality significantly shaped the resultant text of the Genocide Convention.

Decolonizing Genocide

Decolonizing genocide requires the reinstitution of a Lemkinian concept of genocide that explicitly reconnects genocide to imperialism in both its historic forms, including conquest, territorial expansion, settler colonialism, and colonization, and its more modern iterations, such as wars of aggression, including in some cases "humanitarian intervention," neocolonialism, economic and cultural imperialism, and structural violence.

Decolonizing genocide also requires the inclusion of the voices of victims and survivors – the voices of resistance – and not on the terms of the states that have committed genocide and colonized the Genocide Convention but rather on the terms of the affected peoples. Decolonization cannot take place when the colonizer dictates the terms. If we are to have a concept of genocide for the twenty-first century, one that reflects the realities of group-based violence – cultural, physical, and structural – that threaten the survival of peoples as such, it must incorporate the lived experiences of those who have been targeted with such violence. Anything less is an abdication of control over defining genocide to the very powers that have benefitted the most historically from the original drafting and negotiating processes and will gladly continue to reap the benefits in the future.

Finally, decolonizing genocide requires that past genocides not be left in the past, including those that preceded the adoption and entry into force of the Genocide Convention and those that do not fit neatly under the legal definition codified within. Perpetrators of genocide must not be permitted to ignore and whitewash their histories on founding myths, revolutionary ideologies, and claims of benevolence. There must be redress for past, as well as present and future, acts of genocide.

German Colonialism and Nazism as Anti-imperialism

Hans Goldenbaum
Max Planck Institute for Social Anthropology, Halle, Germany

Definition

Approaching Nazism as *anti*-imperialism places the focus on Nazi sources, their self-conception and self-projection, their ideology and propaganda. The perception of being the victim of long-lasting domination by foreign powers in a struggle for sovereignty is not to be underestimated as a main reason for the radicalism and totality of Nazi German foreign, settlement, war, and extermination policies.

A Change of Perspective

To approach Nazism as anti-imperialism might at first glance lead to some consternation. Extensive research has addressed the imperial or colonial nature of Nazi Germany. The German concept of *Lebensraum* or living space in the East, the war of extermination, and Auschwitz indicate the atrociousness of Nazism as an aggressively imperialist and colonising power. On the other hand, it may be argued that the anti-Semitic drive for total extermination defies the categories of colonialism

or imperialism. Approaching Nazism as *anti*-imperialism, however, places the focus on Nazi sources, their self-conception and self-projection, their ideology and propaganda. The perception of being the victim of long-lasting domination by foreign powers in a struggle for sovereignty is not to be underestimated as a main reason for the radicalism and totality of Nazi German foreign, settlement, war, and extermination policies. Nationalism and anti-imperialism, drawing on modern concepts of sovereignty and national self-determination, were intertwined with racist and imperialist notions of German superiority, and most importantly with the anti-Semitic idea of powerful and threatening Jewish aggression from both outside and within.

This essay sets out to situate Nazi anti-imperialism within the history of German imperialism and colonialism with and without colonies. After discussing imperialism and colonialism as phenomena of capitalist modernity, it will briefly sketch out the genesis of racism, anti-Semitism, and Darwinism. The question of whether and to what extent European colonialism, and especially German genocidal policies in Africa, contributed to creating the conditions in which Auschwitz somehow became 'thinkable and executable' (Zimmerer 2005, p. 211) will then be addressed. The First World War and the Weimar Republic will be dealt with as a caesura of utmost importance, as the Versailles experience melded perceptions of racist and imperialist superiority with ones of 'colonised' and powerless inferiority. The impact and importance of anti-imperialist elements in Nazi thought will be thematised by drawing upon Carl Schmitt, Goebbels, and others who construed and depicted as reactive and defensive the pursuit of an imperial sphere of influence. The idea of a 'natural' order along the lines of race or *Volkstum* contrasted with the purportedly aggressive and imperialist universalism of democracy. By addressing Germany's main enemies – Britain and later on the US – as 'plutocracies', Nazi thought and propaganda used a specific term encompassing all of the ideological ingredients of Nazi antiimperialism. Furthermore, Nazi propaganda outside of Europe, which at its core presented the Reich as an anti-imperialist and

anticolonialist power, has long been understudied. Thus, in the final portion of this essay, the main topics and themes of Nazi foreign propaganda will be outlined, taking the massive propaganda effort aimed at the Middle East and North Africa as an example.

Capitalist Modernity

German colonialism falls into the period of high imperialism between 1880 and the First World War. That said, the entangled history of imperialism and colonialism makes it necessary to delineate these concepts first. Imperialism *could* be defined as the (direct or indirect) policy of (economic and/or military) force to externally safeguard a nation state's interests, presupposing the modern nation state and the logic of capital accumulation, and incorporating, although not necessarily, colonialism. Reinhard (2008, p. 1) characterises colonialism as the territorial acquisition and domination of people based on the 'economical, political and ideological exploitation of the developmental differential' between two groups. Osterhammel (1997, pp. 16–17) supplements this account by suggesting that colonialism is a system of domination resulting from the process of territorial acquisition and is a hegemonic 'relationship between an indigenous (or forcibly imported) majority and a minority of foreign invaders'. According to him, the 'fundamental decisions affecting the lives of the colonized people are made and implemented by the colonial rulers in pursuit of interests that are often defined in a distant metropolis [on "imperial infrastructure" see van Laak 2004]. Rejecting cultural compromises with the colonized population, the colonizers are convinced of their own superiority and their ordained mandate to rule' (Osterhammel 1997, pp. 16–17). Osterhammel refers to a pursuit of *capitalist* interests. The acquisition by force of luxury goods and raw materials for the developing industry and market expansion were cause and effect of unfolding capitalism. Bourgeois society and Enlightenment thought were materially based on slave labour and colonial trade and commerce (Cheney 2010); it can be argued that 'the

economic practice of slavery – the systematic, highly sophisticated capitalist enslavement of non-Europeans as a labour force in the colonies – was increasing quantitatively and intensifying qualitatively to the point that by the mid-eighteenth century it came to underwrite the entire economic system of the West' (Buck-Morss 2009, p. 31).

Through slave labour and the overhaul and restructuring of local economies towards metropolitan needs during early globalisation of markets and production, indigenous and transferred populations were integrated into the evolving system of a global division of labour, under conditions of coercion and violence (Braudel 1981–84; Wallerstein 1989, 2011). This is also emphasised in Sebald's study on Togo under German rule: by preventing indigenous populations from accessing education, confining them to the lowest echelons of colonial administration, enforcing the cultivation of cotton for export, determining low purchase prices and employing forced or low-wage labour, the colonialists actually '*broadened* the socio-economic development differential between colony and metropole' (Sebald 1988, p. xxi).

This process was paralleled by ideological knowledge production: the mapping, classification, and hierarchisation of a world that was penetrated by European traders, missionaries, soldiers, and scientists. The fundamental difference between those who possessed at least the abstract commodity of their own manpower and those whose body was somebody else's property (and who were thus not producers of exchange value) was at the core of the modern racialisation of 'blacks' as opposed to 'whites' (Schmitt-Egner 1975). Racism was the 'ideological justification for the enduring hierarchization of the workforce and its highly unequal distributions of reward' (Wallerstein 1983, p. 78), as social inequality had to be reconciled with universalistic principles such as freedom and equality, even more so following abolition of slavery.

The central ideological process of modernity, it could be argued, can be identified as the colourisation, ethnicisation, or biologisation of the social. By the end of the nineteenth century,

the discourse on the *Other* had become fully biologised, reinforced by scientific discourses and Darwinist notions of evolution and selection that were transferred to the human sciences (Foucault 2003; Miles and Brown 2003). In the Indian or Arab colonies, the European colonists deemed the respective populations 'unfit' to rule due to the 'Orientals'' lower level of development. The colonists not only artificially preserved 'traditional' structures and elements of society, but also overhauled local economic structures, thus preventing local accumulation and creating arbitrary boundaries between or through territories and ethnicised groups (Al-Khafaji 2004; Beinin 2001, pp. 1–20; Gran 2009; Maddison 1971, pp. 35–70). In Europe, processes of state building paralleled by the advent of nationalism led to the formation of 'imagined communities' whose members conceived of themselves as the *same*, and different from the *Other*, on the basis of an ethnicised national identity 'regardless of the actual inequality and exploitation that may prevail in each' (Anderson 1991, p. 7; Hobsbawm 1991). Colonial projects or imperialist discourses stabilized and shaped these 'imagined communities' through the externalization of social tensions and nationalist homogenization (Wehler 1969). The idea of an ethnic nation (*Volk* in the German context) rooted in the soil gained ground, and nation and race became reality as 'discourses, institutions, architectural forms, regulatory decisions, laws, administrative measures, scientific statements, philosophical, moral and philanthropic propositions – in short, the said as much as the unsaid' (Foucault 1980/1977, p. 194). The *Other* outside (e.g. the indigenous colonial subject) was complemented by the *Other* within; modern anti-Semitism associated Jews, who had been 'imprisoned' in the Holy Roman Empire's sphere of economic circulation for hundreds of years, with the abstract, the incomprehensibility of modern capitalism and its circulation sphere (Adorno and Horkheimer 2002; Postone 1986). Inherent in this fatal association was the claim to explain 'a world which had rapidly become too complex and threatening for many people' (Postone 1986, p. 305). Modern and traditional, abstract and concrete, maritime and continental, 'a

conspiracy bent on world domination on the one hand, and a principle of upright openness on the other' – in its various expressions this 'dichotomy's initial pole is one of the opaque forms of society's principles of exchange: *Tauschen* that Carl Schmitt linked, in an etymologically suggestive manner, with a principle *of Täuschen* – of deception' (Diner 2000, p. 34).

German Colonialism

In 1940 George Orwell wrote that Nazi Germany was turning 'the subject peoples into a reserve of slave labour. It is quite practicable, so long as the myth of "inferior races" is believed in. [...] Hitler is only the ghost of our own past rising against us. He stands for the extension and perpetuation of our own methods' (Orwell 2001, p. 170). At the same time, Orwell criticised pacifists and others who opposed the war, stating that he 'would sooner side with the older imperialisms – decadent, as Hitler quite rightly calls them – than with the new ones which are completely sure of themselves and therefore completely merciless' (172). So what is imperialist and what is German in German imperialism?

As Conrad sums up in his concise colonial history:

> German colonialism was [. . .] linked to global economic competition and the hunt for raw materials and new markets for the industrializing countries, to global political conflicts between the European powers, and to the ideologies of evolutionism and Social Darwinism, which were increasingly linked to discourses of racial differences. (2012, p. 17)

The colonial project was preceded by discursive as well as political shifts in the wake of the founders' crash and crisis that led to more interventionist and protectionist policies of the Bismarckian state; for example, the 1879 introduction of protective tariffs. Moreover, colonialism was promoted by the trade and industrial associations, with their growing concentration of economic power and their protective and expansionist aims. In this shift, liberal economics were abandoned in favour of a straightforward nationalist perspective in discourses of *Weltpolitik*

(world politics) and *Lebensraum* (living space) (Smith 1986, pp. 52–111). While *Weltpolitik* focused on overseas colonies and maritime armament against the background of the competition between global powers, the theoreticians of *Lebensraum* focused on 'traditional' agriculture and, geographically, on Central and Eastern Europe. The latter's romantic and anti-modern discourse at times clashed, at times merged, with *Weltpolitik.* The Reich was seen as strong enough to steer the economy towards expansion and as entitled to do so (Schinzinger 1984, p. 163). Colonial fantasies were fuelled by:

> liberal models of a benign, protective father state that would naturally release its children from tutelage once they had grown up; by growing nationalist resistance against French military and cultural imperialism, accompanied by a drive for national unification; and, eventually, by the militantly competitive assertion of difference and strength vis-à-vis all of Germany's European neighbors. (Zantop 1997, p. 202)

German colonialism was started by private enterprises, as Bismarck focused on Europe and relations with Britain. Merchants bought land in what later became German South-West and East Africa. Later, Togoland was claimed by an 'Imperial Commissioner' to secure areas of interest for German trade companies and missionaries. All of the colonies were then enforced by the German military (i.e. the Navy), which established its own colony in Kiautschou, vis-à-vis local and European powers. The latter colony is also symbolic of the great powers' 'informal imperialism' in China, which at times relied upon brute force (Kuß and Martin 2002; Leutner and Mühlhahn 2007). Trade in and administration of these 'protected areas', or *Schutzgebiete,* was to be organised by private actors to reduce the Reich's burden, yet after a few years all colonies were placed under direct imperial administration. The history of German colonialism has been researched more thoroughly in recent years, whether concerning German South-West Africa (Kaulich 2003; Zimmerer 2001, 2003), German East Africa (Baer and Schröter 2001; Becker and Beez 2005), Togo (Knoll 1978; Sebald 1988, 2013) or Cameroon

(Schaper 2012; Schulte-Varendorff 2011), to name the best-known examples. The German colonial enterprise had direct and indirect economic and fiscal effects (Schinzinger 1984). While the share of colonial goods in German trade was marginal, the construction of railways reduced the costs of the transport of raw materials and goods and led to an increase in stock turnover in German colonial ports, to the benefit of shipping and trading companies. Moreover, railway projects and the massive expansion of the fleet as the main guarantor of the colonial enterprise brought an economic upswing for German industry, especially the iron, steel and mechanical engineering industries and shipyards. However, state expenditures significantly exceeded the revenues (Schinzinger 1984, p. 156, 160).

That said, it is not the economic history, but rather the history of colonial ideas and of colonial genocide that remains the focus of researchers. The German extermination campaign in South-West Africa killed at least 70,000 people and is generally seen as the first genocide of the twentieth century and the first German genocide (Schaller 2011; Zimmerer 2001, 2003, 2011). With a focus on 'law and administration of the racial state' and 'unfree labour, expulsion, and genocide as elements of population economics' (Zimmerer 2011, pp. 40–138), the controversial question of the connection between the philosophies of colonial rule and administration on one hand and the Nazis' later genocidal quest for *Lebensraum* in Eastern Europe on the other is raised (Baranowski 2010). Some scholars underline 'the decidedly colonial nature of the Nazi geopolitical project and the largely colonial dimensions of Nazi genocide' (Kakel 2013, p. 3), and explain 'the Nazi Holocaust as part of the emerging global histories of imperialism, colonialism and genocide (rather than a "unique" historical event)'. In this narrative, Auschwitz is described as 'colonial genocide' or 'exterminatory colonialism' (Kakel 2013, p. 4). This question of continuities or causalities is not new, as Orwell, cited above, was only one of the first to discuss it. Later, Hannah Arendt argued that the period of German imperialism was a 'preparatory stage for coming catastrophe', setting the stage

'for all possible horrors' (Arendt 1958, p. 123, 221). Arendt stressed the destructive and self-radicalising principles of expansion as 'a permanent and supreme aim of politics' and of power as an end in itself, hinting on parallels in the economic sphere. In so doing, she was building on Luxemburg's argument for a fundamental conflict between production capabilities, and consumption driving capital to market expansion. Capitalism is understood here as a mode of economy 'which tends to engulf the entire globe and to stamp out all other economies, tolerating no rival at its side', at the same time being in need of 'other economic systems as a medium and soil' (Luxemburg 1951, p. 467). Arendt pointed to the connection between exploitation and racism, as well as the 'totalitarian' consequences of the idea of 'natural laws' and man as the incarnation of the forces of history, not acting as an individual or on behalf of a group of individuals, but as the agent of a collective greater than the sum of its parts or of its will. This calls to mind Elie Kedourie's critical history of nationalism and the ideas of sovereignty and general will since the French Revolution: 'Consciousness of right bred a righteousness which excesses could never destroy, but only confirm' (Kedourie 1961, p. 18).

There is no question that there are many important connections between German colonialism and Nazi imperialism. The colonial project was driven by and reinforced scientific and popular discourse about the *Other* (Grosse 2000). Bolstered by Darwinist and other scientific theories in the second half of the nineteenth century, modern ethnologists and anthropologists were important actors in racist knowledge production. Laboratories, as well as the popular *Völkerschauen* ('human zoos'), were supplied with material appropriated by a host of German actors in the colonies (Baer and Schröter 2001). *Völkerkunde*, anthropology, eugenics, and connected scientific discourses influenced modern science and (bio-)politics in Europe and North America at least until 1945, delegitimised only by the sheer atrociousness of the German 'racial war'. The basic 'truth' shared by most scientists, journalists, and politicians of the time was that of a world divided into races, each race having

biological features that determined its intellect and behaviour as different from others. Society was understood and described in biological terms. Ethnic nations (*Völker*) were engaged in a 'fight for survival', a 'natural struggle for existence', necessarily expanding as a 'healthy' nation or declining to be exterminated (Schmitt-Egner 1975, p. 82).

In the colonies, natural or primitive peoples (*Naturvolk*) were differentiated from cultural nations (*Kulturvolk*), unproductive from productive labour. The indigenous populations were forced into wage labour; resistance was interpreted as stubbornness and laziness (Schmitt-Egner 1975, pp. 96–97). In concepts of the 'education of the negro', superior or differentialist racism and Christian missionary universalism at times formed forceful symbioses (for the German context, see Bade 1982). Legislation constructed and enforced colourised (i.e. 'visible') borders between *self* and *Other*, especially in the matter of mixed marriages, or *Mischehen*. Debates on public health and morals attacked the mixing of races as a threat to Volk and nation.

Finally, the colonial wars, especially the 1904–07 war against Herero and Nama, constituted a turning point regarding the administrative organisation and bureaucratisation of genocide. In a centrally planned and controlled 'war of pacification', physical extermination:

> was no unintended by-product of brutal warfare [...] but the aim almost from the beginning. Moreover, the war combined the genocidal massacre with ethnic cleansing and extermination through neglect in internment camps. This also reveals the extent of ideological firmness and political centralization that seems to be absent in other colonial contexts. (Zimmerer 2011, p. 22)

Colonialism Without Colonies

In the words of Enzo Traverso:

> the guillotine, the abattoir, the Fordist factory, and rational administration, along with racism, eugenics, the massacres of the colonial wars and those of World War I had already fashioned the social universe and the mental landscape in which the Final Solution would be conceived and set in motion. All

those elements combined to create the technological, ideological, and cultural premises for that Final Solution, by constructing an anthropological context in which Auschwitz became a possibility. (2003, p. 151)

It is obvious that there is a 'road from Windhuk to Auschwitz' (Zimmerer 2011), but only in the sense of *necessary conditions*. While Nazi policies imply racial discourse, colonial (even genocidal) practice and experience (collectively 'remembered' and institutionally retained), scientific and popular knowledge of the *Other*, and a modern bureaucratic state, they are not an inevitable result of the latter (see Traverso 2003, p. 152). In the words of Arendt, the latter are the origins, not the causes of the former (for the ongoing debate on the origins and causes of the Shoah, see Bauer 2001, pp. 1–118).

Moreover, for Nazi radicalisation and extermination policies to become reality, these origins had to coincide with modern anti-Semitism and a specific anti-imperialist self-perception and worldview under specific social and political conditions. The early enthusiasm for and subsequent brutality of the First World War remained a formative element for generations. At the same time, the deep penetration of enemy lands in the early days of the war had aroused colonial desires at unprecedented levels. Between 1914 and 1939, after the Great War had forced the end of the German colonial project, dozens of popular and research works on colonialism, different colonies, missionary enterprises, and the 'colonial question' in general were published. Against the backdrop of this 'colonialism without colonies' a German history of colonisation and conquest since the Early Middle Ages was imagined and constructed. It was based on an extensive corpus of colonial 'fantasies' that had accompanied and supported German colonial policies since the very beginning and were associated with 'positive identificatory figures such as Columbus, Humboldt, and "German" conquistadors' of the past (Zantop 1997, p. 202). It was stated that:

> We Germans are the best colonizers, but not the best colonial politicians. The former is based on the strength and talent of our nation [*Volk*], the latter has its basis in the agelong fragmentation of the state and powerlessness [*Ohnmacht*] of the German

nation. However, the latter is a result of the former, and thereupon our right to colonial possessions is based. It is impossible to exclude the best nation of colonizers from colonial policy forever after it is finally molded into a cohesive state unit. (Jacob 1939, pp. 8–9)

At the centre of the post-1918 discourses on *Weltpolitik* and *Lebensraum* stood the 'colonial guilt' of Germany's enemies, who had 'brought war to Africa', 'robbed the German colonies' and 'tarnished the reputation of the white race' (13). While attacking the 'lie of German colonial guilt' (e.g. allegations of bad treatment of the indigenous populations) in books, magazines, and *Völkerschauen*, Germans indulged in memories of a glorious colonial past, complaining about injustice and foreign arbitrariness. The loss of the colonies was integrated into the greater revisionist discourse on the Treaty of Versailles, which, according to the Social-Democrat Scheidemann, was intended 'to extort the declaration of its own unworthiness' and the 'consent to merciless fragmentation' from 'a great nation' and could be summarised with the words: 'Germany waives, waives, waives!' (Philipp Scheidemann's speech of 12 May 1919 to the National Assembly, cited in Heidegger 1956, p. 334; on German social democracy and colonialism, see 175–183) A German colonial project beyond the equator was on the German and especially the Nazi schedule at least until 1941 (Linne 2008; Ustorf 1995). While *Lebensraum* in the eastern provinces had already been a relevant topic for discussion and state policy since the nineteenth century, it became the focus of public attention with the formation of a Polish state and the loss of those provinces, which, in the words of the first foreign minister of the Weimar Republic, were the cause of 'severe damage' for 'the nutrition of our nation [*Volksernährung*]'. Internally, the government discussed Versailles, the 'diktat of shame', and its results for the 'German East', referring to the ethnic or racial composition of the provinces and the *völkisch* will of its population (e.g. Reichsminister 1919). At the time, the differentiation between ethnic nationalities (*völkische* or *Volksgruppen*), associated with the right of nations to self-determination in the

ambivalent tradition of the French Revolution, was common among all members of the League of Nations. Prior to the First World War, as nationalist discourse took up Darwinist and biologised concepts of nation and state, many had already been looking to ('dreamland') East or South-Eastern Europe for 'space' to be settled and 'cultivated' (Jureit 2012; Thum 2006). Romantic criticism of modernity propagated agriculture and the need for 'living space', associating modernity with the overwhelming process of industrialisation, with unemployment, rural exodus, and urbanisation, with isolation and alienation. Simultaneously, the modern nationalist conception of the natural and necessary identity of state, nation, and *Volk* made the question of national or *völkisch* space and its borders an urgent matter. In the nineteenth century, Friedrich Ratzel had already presented a theory of ethnospatial evolution in which he described spatial expansion as the final stage of a *Volk*'s process of taking root in the soil. It was in this tradition that geographers would state in the 1920s that 'German national soil' (*Volksboden*) is where the German nation settles (Jureit 2012, pp. 241–244). This sounds similar to what Hitler wrote in the same year: land and soil exist 'for the Volk that has the strength to take it and the diligence to cultivate it' (Hitler 1943, p. 147). The ideological processing of a claustrophobic panic prompted by perceived existential loss of space after Versailles (Jureit 2012, pp. 219–220; Smith 1986, pp. 196–230) is notably captured in Hans Grimm's successful and influential 1926 novel *Volk ohne Raum* (Nation without Space). The story of a farmer's son confronted with 'crowdedness' and 'density', coupled with the alienation of industrialisation and urbanisation that threaten his natural sphere of life, struck a chord with feelings of constriction and impotence experienced by a major section of German society in the Weimar years; a society in permanent crisis and contingency in the social, political, or familial spheres in times of general insecurity (Jureit 2012, p. 266; Peukert 1987). Grimm's 'nation without space' is situated in the area of tension between the German colonial project in Africa, the post-1919 colonialism without colonies which laments the victors'

'robbery of German lands' in Africa and 'Germany proper', and the discourse on 'living space' and the 'German East'. The novel connects with the nationalist, Darwinist, and anti-Semitic interpretive paradigms and thought patterns of the time and builds upon the dominant understanding of Versailles as a violation of the German nation and its natural rights: 'We demand the justice of space for all nations according to number and performance [*Leistung*]' (Grimm 1926, p. 1243). As a result of the distorted perception of the reparation regime after Versailles, nationalist and racist chauvinism fused with self-perception as the victim of aggression, colonisation and foreign domination; merging the struggle against Napoleon during the constitutive phase of German nationalism with the political critique of England and France in Versailles and the anti-Semitic conception of Jewish domination of the nation, foreign and domestic at the same time (Koller 2005).

Corresponding but not identical with *völkisch* nationalism was the 'conservatist' current ('Konservative Revolution') around Oswald Spengler, Carl Schmitt, Arthur Moeller van den Bruck, and others (see Weiß 2012); to take a comparative look at other European countries might be especially worthwhile in this context. In Italy, to give just one example, concurring proto-fascist and fascist intellectual currents like Enrico Corradini's nationalism and Paolo Orano's or Robert Michels's 'revolutionary syndicalism' theorised the 'proletarian nature' of the 'corporate' Italian nation since the beginning of the twentieth century, defending colonialism and war as preconditions for national redemption (Sternhell et al. 1994). As 'socialism empowered workers against the bourgeoisie', it was argued, nationalism or a 'national socialism' would 'empower Italians to transcend their decadent state and revive the nation, both morally and materially' (Marsella 2004, p. 208).

Nazi Anti-imperialism

Nazi anti-imperialism is not the analysis and critique of imperialism as defined above. An

ideological form of thought, it purports to explain complex economical and political conditions and relations through personalisation. It merges anti-Semitism and reactionary chauvinism with ethno-nationalist or *völkisch* geopolitics, political geography, and law. Taking up the formula of 'nation without space', its theoreticians wanted geopolitics to 'expand and recover' the 'constricted and mutilated Middle European living space' to solve the question of 'overpopulation' (Haushofer 1928, p. 49). Coining terms like *Volksdruck* (population pressure) and *Raumkörper* (space body), one of these theoreticians defined Germany as a major nation [*Großvolk*], the only one of seven 'world powers' that is 'oppressed, enchained and not free to arm and defend itself [*wehrfrei*]'. Apart from the assumption that one-third of its 'national comrades' or *Volksgenossen* were separated from its *Raumkörper*, 'the distress caused by a density that is the result of an unbearable overpopulation of living space' was perceived as forcing the state to push the frontier of this very *Raumkörper* (Haushofer 1934, p. 84). Resulting from this density and pressure, the natural right to expand arises for nations like Germany, Italy and Japan, 'an enormous ethical difference' in contrast to the plain material motivation or attraction to power behind the French and British colonial projects according to Haushofer (ibid.). Thus, Haushofer sets the just, natural, and defensive expansion of a *Volk* against an unjust, unnatural, and aggressive expansion, associated with imperialism, capitalism, and Britain, the 'nation of merchants'. German geopolitics could therefore be defined as 'an ideology legitimising international domination through putatively natural, hence timeless or unchanging principles' (Diner 2000, p. 27). While industrialisation, machinisation and urbanisation are associated with 'the Jewish', the category of *Raum* (space) signifies 'a positive existential form that, while connected to reigning circumstances, stands opposed to them'. As anti-Semitism thus is the internal or domestic manifestation of 'Haushofer's simultaneously rationalized and mystagogic rejection of and struggle against abstraction, seen as the product of Western capitalist social formation [...] Haushofer's anti-

British stance, apparent in his attack on the "plutocrats", represents its external dimension' (Diner 2000, p. 31). The same applies for Carl Schmitt, whose theory of a new ethno-national or *völkisch* 'order of greater spaces' in International Law – introduced shortly after the German occupation of Czechoslovakia – relates to Haushofer's works. Schmitt picks up the core principles of the US Monroe Doctrine, applying it to the European or 'Greater German' context, emphasising the 'prohibition on intervention by external powers', or rather powers 'alien to the space [*raumfremd*]'. Based on the idea of *völkisch* racial substance or belonging as the prior, natural category of order, Schmitt devises an 'order of greater spaces' that revolves around the principle of 'protection of the ethno-national character of every ethno-national group [*Volksgruppe*]' and the idea of dominant 'greater powers' to forcefully organise and structure the greater space following this criterion. According to Schmitt, who takes up earlier concepts of *Lebensraum,* 'greater' encompasses not only the merely quantitative, but also the qualitative meaning, implying a completely new conception of space (Schmitt 1941, pp. 75–76). The Reich, a 'concrete order', should replace the abstract state, led by the dominant *Volk* carrying the political idea of this new order. Thus, German hegemony would be natural and just – as opposed to the arbitrary and 'only political' concept of the US doctrine. Already, in 1932, Schmitt had criticised US 'economic imperialism' and the Monroe Doctrine, questioning its theoretical legal basis and its practical arbitrariness, but ignoring the economic context of European imperialism (Schmitt 1940a/1932). In this way, he wanted to highlight the dangers of imperialism 'for a nation on the defensive'. According to him, the Allies were still waging war against Germany – after Versailles by other, 'legal' means (Schmitt 1940b/1938, p. 247). Final defeat would only follow the acceptance of the alien vocabulary and concept of law, chiefly international law (Schmitt 1940a/1932). It is on the basis of this understanding that Schmitt elaborates his concept of an ethnopolitical new order of greater spaces, paying heed to the assessment that imperialist hegemony is founded in

international acceptance and thus legalisation of a major power's exclusive right to define, interpret, and apply a doctrine regarding its foreign affairs.

Moreover, Schmitt theorises the National Socialist attack on equality (*Gleichheit*) as abstract and artificial sameness opposed to racial homogeneity (*Gleichartigkeit*), associating the radical universalistic idea of equality with imperialist aggression against the concrete particular, and the universalistic world principle of the abstract state with the violation of concrete territory as a *völkisch* space (Diner 2000, pp. 60–63). With a complex ethnic mosaic in the East and South-East, where ethno-national or linguistic demarcations were impossible, the German Reich was the only entity capable of taking the lead. Schmitt thus legitimises German imperialist expansion based on and propagating an anti-imperialist anti-universalism or particularism implying hierarchisation. From this point of view it is exactly the radical racism of National Socialist law that renders it 'non-imperialistic and non-aggressive'; to protect blood as the 'fact' that organises mankind is totally defensive. The universalistic totality of states as tools of an indirect power or an 'international class' – associated in Nazi thought with 'plutocrats', 'democrats', 'capitalists', 'freemasons' or 'Jews' – would yield an 'international civil war'; only the idea of '*völkisch* totality' or the primacy of the Volk in the state would enable a stable international order (Schmitt 1940c/1938, p. 256; 1940d/1939, p. 286).

Goebbels and the Nazi propagandists used the term 'plutocracy', rule of the rich, to defame Great Britain and later also the US as aggressively capitalist states steered by rich and powerful elites, Jews, and freemasons (Goebbels 1997–2006). Through a homogenised concept of *Volksgemeinschaft* and the dichotomous distinction between 'creating' and 'money-grabbing' capital, the contradictions of modern capitalist conditions were projected outside (Britain and the US) and onto the *Other*. German industry was considered productive as opposed to the unproductive sphere of circulation that was associated with the Jews and 'plutocrats', whose aim was understood to be the colonisation and exploitation of Europe by any means. In this view, the

First World War and Versailles represented two sides of the same coin.

Nazi Anti-imperialism Abroad: The Case of the Middle East

Nazi propagandists went to great lengths to fight international 'plutocracy', even using a host of underground radio stations appealing to English workers and pacifists. Moreover, a massive propaganda effort focused on Middle Eastern and North African countries that had been a target for German economic penetration since the end of the nineteenth century and for military and propaganda activities during the German comradeship-in-arms with the Ottoman Empire in the First World War (Lüdke 2005; Schwanitz 2004).

Propaganda leaflets and broadcasts easily blended the Nazi's *völkisch* and anti-Semitic anti-imperialism with anti-colonialist attacks on the British (and French to a certain extent) and the Zionist project in Mandatory Palestine (Goldenbaum 2014; Herf 2009), reaching out to or communicating with the political public spheres of local elites and urban *effendiyya* who were struggling for their share in state power under secular or Islamised discourses on national sovereignty (Schulze 2002). The single most important vehicle for German foreign propaganda was short-wave radio, which was broadcast across Middle East and North Africa in Arabic, Persian, and Turkish. The broadcasts had been established to 'spread out the Empire's embarrassing issues' after the BBC had started German-language broadcasts in the wake of the occupation of Czechoslovakia. Recent research has found that the programmes consisted mainly of international and local news combined with daily political and weekly religious talks (Goldenbaum 2014). From the outset, the chief idea was to counter any critique of German imperialist aggression by attacking British imperialism and policies in the colonies, especially in Mandatory Palestine. In line with the Schmittian differentiation between German defensive *Raumpolitik* and English colonial despotism, the broadcasts presented world

affairs as an historical struggle between 'young nations' longing for sovereignty and independence from the British, French, and later also US yoke on one side, and their democratic (meaning plutocratic) oppressors fighting to preserve foreign domination on the other. In Germany, and since 1941 at the latest also in the foreign-language broadcasts, Russian 'Bolshevism' threatening Europe and the rest of the world joined the 'plutocrats' as an eternal enemy. As the latter were associated with an aggressive universalism of democracy, so the Soviet Union was associated with an aggressive universalism of communism, both being connected through the alleged Jewish conspiracy targeting nations and cultures. News on the nationalisation of Romanian oil companies hinted at foreigners and 'rich Jews' being forced out of the country, while news on the collapse of the French front contained reports of Jews fleeing the country carrying gold bars (ibid.).

The message was clear: in Europe and the region, the nations were engaged in a threefold struggle against colonisation; the direct colonisation of their countries by the imperialist democracies and the indirect economic colonisation of their countries by the Jewish plutocrats as well as the Zionist colonisation in Mandatory Palestine aiming 'to deport the Arabs from Palestine, Syria and Transjordan'. The radically anti-Semitic appeal – including the one to Islam and tradition – is to be situated between the diverse regional and transregional discourses of nationalism and self-determination on the receivers' side. The local conflict in Palestine that was taken up by nationalist elites in the region as a central rallying point, playing an important part in secular and Islamised debates in the Arab political public sphere, was skilfully associated in the German broadcasts with the anti-Semitic themes and imagery used to legitimise and describe racist and anti-Semitic aggression in the European theatre (ibid.).

It was stressed again and again that Germany as a young sovereign nation, led by its *Führer,* having just emerged from the Versaillian yoke of foreign domination, was attempting to establish a 'new order'. An emphasis on German military might and the homogeneity of the nation appealed

to powerless nationalist activists. Local social and political conflicts in the colonies were used to defame the colonialists' malicious chauvinism and the dysfunction of democracy. Nationalist collaborators would appear in the broadcasts to declare that 'the English turned out to be the bitterest enemies and the cruellest oppressors of the Arab countries'. They complained that Britain had 'sacrificed the blood of foreign nations and fobbed them off with phrases instead of truly granting them freedom, justice and sovereignty' (Das Archiv 1942, p. 102). While the German propaganda effort could build on the fact that the colonial situation and thus the 'economical, political and ideological exploitation of the developmental differential' (Reinhard 2008, p. 1) was a reality, and German radio was widely listened to, it is wrong to assume that the audiences in the region would automatically have adopted the contents of the propaganda or generally identified with National Socialist Germany. Speculations along these lines have been criticised with good reason in recent publications (see Nicosia 2015, pp. 1–17). Listeners followed different and competing broadcasts. A pro-German or pro-Allied stance during the Second World War cannot necessarily be derived from positive or negative attitudes towards the colonial powers or towards the political situation in general (see Gershoni 2014).

Starting from this observation, and regarding assumptions of 'ideology transfer' as too simplistic, a shift of focus might prove insightful: in comparing the historical context of modern anti-Semitism's genesis in Europe with the context of its reception as Nazi anti-imperialism in the Middle East during the 1930s and 1940s, the connection between the two becomes obvious. During the 'crisis of classical modernity' (Peukert), a form of thought gained ground:

> in which the rapid development of industrial capitalism with all of its social ramifications is personified and identified as the Jew. It is not that the Jews merely were considered to be the owners of money [...], but that they were held responsible for economic crises and identified with the range of social restructuring and dislocation [...]: explosive urbanization, the decline of traditional social classes and strata [...] etc. In other words, the abstract domination of capital, which [...] caught people up in a

web of dynamic forces they could not understand, became perceived as the domination of International Jewry. (Postone 1986, p. 306; cf. Claussen 2005, pp. 29–36)

The urban spaces in the Middle East and North Africa targeted by German propaganda were at the time in a similar situation of societal transformation. The main recipients of the broadcasts were urbanised elites and the precarious *effendiyya*, disconnected from their traditional and the urban colonialised context at the same time. Secular and Islamist groups like the Muslim Brotherhood, which at the time corresponded with and was the focus of German propaganda, participated in the secular nationalist discourse and struggle even though the *form* of the Islamist discourse was Islamic (Schulze 2002, pp. 9–11, 73). If Nazi anti-imperialism had a lasting impact on the region or rather on actual processes of the formation of ideologies, it was through the provision of anti-Semitic *semantics* to explain the dynamic forces that people could not understand; not just the economic forces in the process of integrating the region as a periphery into the evolving system of a global division of labour, but also the world historical and political forces that led to the creation of Israel and the 'Palestinian *nakba*'. It is anti-Zionism, often anti-Semitic, that at times was, and is, used by post-colonial regimes to mobilise and distract their populations. It is anti-Semitism that became one of the most influential forms of thought in the region in the second half of the twentieth century.

Nazi anti-Semitic anti-imperialism – as well as racial discourse and colonial (genocidal) practice and experience – was not only a necessary condition for the radicalisation of German policies in Eastern Europe that culminated in the war of extermination and the death camps, it also globalised its own anti-Semitic semantics that pretended to explain the upheavals of modernity. Furthermore, German propaganda played a role in the internationalisation and politicisation of the 'Israeli-Palestinian conflict' at a time when Jews were fleeing the Reich or were being exterminated in the East, and before Israel was even founded in the shadow of this 'caesura in civilization', Auschwitz.

German Imperialism and Social Imperialism, 1871–1933

Zak Cope
Belfast, UK

Synonyms

Colonialism; Germany; Imperialism; Social democracy; Social imperialism

Definition

This essay provides an overview of the development of the German working class in relation to the imperialist character of the German state and society. It focuses on the political aspect of embourgeoisement as entailing working-class incorporation within a state based on policies of conquest, plunder, and the exploitation of foreign labor. The essay relates the economic and political development of the German working class between the founding of the German Reich in 1871 and the voting into power of fascism in 1933 to the phenomenon of social imperialism (Sozialimperialismus). It argues that between 1871 and 1933, the better-off German workers, as represented politically by the Social Democratic Party of Germany (Sozialdemokratische Partei Deutschlands, SPD) and organized within the SPD-affiliated Free Trade Unions of Germany (Allgemeiner Deutscher Gewerkschaftsbund, ADGB), were prepared to compromise with imperialism insofar as it secured for them a rising standard of living and enhanced political representation.

German Imperialism and Social Imperialism, 1871–1933

This essay provides an overview of the development of the German working class in relation to the imperialist character of the German state and society. It focuses on the political aspect of embourgeoisement as entailing working-class incorporation within a state based on policies of conquest, plunder, and superexploitation. The essay relates the economic and political development of the German working class between the founding of the German Reich in 1871 and the voting into power of fascism in 1933 to the phenomenon of social imperialism (Sozialimperialismus). It argues that between 1871 and 1933, the better-off German workers, as represented politically by the Social Democratic Party of Germany (Sozialdemokratische Partei Deutschlands, SPD) and organized within the SPD-affiliated Free Trade Unions of Germany (Allgemeiner Deutscher Gewerkschaftsbund, ADGB), were prepared to compromise with imperialism insofar as it secured for them a rising standard of living and enhanced political representation.

Before proceeding, it is useful to clarify the terms "imperialism" and "social imperialism." Imperialism is the product of the concentration and centralization of capital on a world scale. The tendency to monopoly at home compels rival national capitals to acquire larger markets, secure control of key raw materials, and expand production so as to exploit relatively cheap foreign labor. In so doing, an increasing part of the imperialist country's wealth is created abroad and transferred home by a variety of means, including through taxation, debt servicing, profit repatriation, and unequal exchange. Modern imperialism is thus the military and political effort on the part of advanced capitalist countries to siphon and extort surplus (value) from other, typically underdeveloped, countries.

Social imperialism is the attempt by the imperialist bourgeoisie to assimilate the core nation working class into the capitalist polity by means of granting (sections of) it political, cultural, and material gains (Neumann 1943: 153–155). The benefits afforded this "labor aristocracy" can

take the form of extensive enfranchisement, increased leisure time, higher wages, legal pay arbitration, the right to organize, public welfare services, higher education, and relative cultural esteem. Within an imperialist country, there is a strong tendency for an inter-class national alliance to be formed, ideologically expressed through what Lenin called "social chauvinism," that is, support for the retention and/or extension of said benefits on the basis of the status quo ante.

Social Imperialism and the German Working Class (1871–1914)

As an area geographically marginal to the conquest of the New World and the subsequent slave trade, the bases upon which "primitive" capital accumulation was accomplished, by the mid-nineteenth-century Germany was in European terms a comparatively backward feudal economy. Rubinson (1978) describes how Germany moved from this semi-peripheral position to become a core country in the capitalist world system. For Rubinson (43), Germany could move toward core nation status only because the geographic expansion of capitalism that had taken place between 1800 and 1870 opened up enormous opportunities, within the British Empire especially, for investments in the construction of the world's railways and in cash-crop agriculture. The ascent of Germany to the semi-peripheral *core* of the world economy in the course of the nineteenth century thus related directly to the growth of capitalism in its colonialist and empire-building phase, that is, to the enlargement of the peripheral and exploited Third World. As Rubinson notes:

> The expansion of the size of the peripheral areas of the system allows for the expansion of the size of core areas for two basic reasons. First, increased peripher-alization means an increase in the amount of labor in the system, and this increase allows more areas to capture a larger share of the value produced by this increase of labor. Second, with such an increase, more areas can shift their position in the division of labor to specialise in core activities and benefit from the structure of unequal exchange between core and periphery. (44–5)

Germany's industrial revolution occurred between 1850 and 1873 (Wehler 1970). From 1862, under Prime Minister, later Chancellor, Otto von Bismarck, capitalist industry began to consolidate its institutional power within the state, having become allied to big agrarian interests (partly as a political move to halt the liberal-democratic tide). German capitalism had matured within the national market created by the customs union, or *Zollverein*, including all of the component states of Germany, established in 1818 and the subsequent unification of the country between 1862 and 1867. The German Empire (*Kaiserreich*) was founded in 1871 on the basis of Prussian dominance in the new military-state and the traditional "alliance of steel and rye" between landlords and industrialists. This alliance had first been established in the aftermath of the abortive 1848 revolution (the last gasp of German liberal democracy before 1919) and was later renewed in Prussia's National Liberal Party finance minister Johann von Miquel's consensus policy (*Sammlungspolitik*) of 1897–1898. *Sammlungspolitik* was subsequently cemented through the 1902 Bülow tariff and consolidated in 1913 through the support of petty bourgeois groups from the "old *Mittelstand*" (middle-class). As Fischer (1991: 40) notes, persisting as the hard core of reaction within German society, these groups played a decisive role in the rise to power of Nazism in 1933.

Monopoly Capitalism and the Origins of Social Imperialism in Germany

Imperialism and social imperialism were born of the Depression. The world economic crisis of 1873 was caused by overproduction precipitated by the increasing mechanization of industry and improved transportation networks. France and Germany especially saw demand for their agricultural output slump insofar as grain could be purchased and imported more cheaply from North America, Argentina, and the Ukraine (Halimi 2009). The ensuing period of depression up to 1896 in Germany saw the rapid growth of monopoly capitalism (Lenin 1970/1916). Syndicates and cartels were formed to limit production, divide territorial markets, and set prices, while the need to expand production demanded credit which only powerful banks could provide (ibid).

In response to German industrialization, British capitalism was compelled to expand its colonial empire (the foundation of its supposed "laissez-faire" economy) (Patnaik 2006) and introduce preferential tariffs (Krooth 1980: 19). The landed Junker aristocracy (Germany's former absolute rulers) shifted from a position of dependence upon free trade with Britain to demanding protection from foreign competition. At the same time, Germany's hitherto free-trading commercial bourgeoisie sought guaranteed foreign markets to absorb the enhanced productive capacity of industry. Both of these fractions of capital came to advocate naval armament and a militaristic colonial foreign policy. The Navy League (Flottenverein), formed in 1898 to garner mass support for Germany's naval program, was the largest and most successful interest group in Imperial Germany, larger in terms of membership than even the SPD. While some socialists opposed the subsidization of shipping lanes to the Far East and Australia as an "imperialist levy," a majority of the SPD supported it, arguing that it would help the working class by encouraging employment (Kitchen 1978: 183). Whereas, previously, German capitalism could afford to conduct its business outside of the state's direct intervention, after 1870 sections of German capital actively sought the help of the state to secure and protect colonial territories wherein they would enjoy supreme economic privilege (Geiss 1976: 46). East German scholars have explained the relative failure of German colonial ventures in the Bismarck era by emphasizing the unwillingness of bankers and industrialists, as opposed to shipping and trading concerns, to engage in colonialist activities. Germany's colonialism was launched before the nation had reached the stage of mature monopoly capitalism. Banking and industrial interests had at that time no urgent need for colonial supplies or investments (Dorpalen 1985: 255), though, as Dorpalen argues, the few profitable opportunities in the specific territories acquired by the Reich would certainly have discouraged any potential investors. Studies have borne out Lenin's thesis on the intimate connection between imperialism and capital exports in the German case:

> [It] was the abundance of British and French foreign investments and the lack of sufficient exportable capital on Germany's part that so greatly concerned German political and financial circles during the pre-1914 period and that played into the hands of the warmongering forces. (276)

Ardent colonialists established a number of interest groups that were to have a considerable impact, among which the German Colonial Association (Deutsche Kolonialverein) and the Society for German Colonization (Gesselschaft für Deutsche Kolonisation) were the most important. The former was established in 1882 on the initiative of Freiherr von Maltzahn, and its members included not only middle-sized businessmen, professionals, and merchants but also leading bankers, industrialists, aristocrats, and Reichstag members. These groups were to persuade the Bismarckian state, and its successor from 1890 under Kaiser Wilhelm II, that colonialism was an essential part of a wider anti-cyclical strategy to achieve economic stabilization. Moreover, men such as landowner and colonial propagandist Ernst von Weber argued that Empire alone would be able to overcome Germany's chronic crises of overproduction and overpopulation. Its absence, he averred, must ensure that the country would be faced with a bloody social revolution (Kitchen 1978: 180).

German Colonialism and Imperialism

By 1906, Germany had built up a colonial system consisting of bases, duly settled by its "white" citizens, in East Africa, South-West Africa, Cameroon, New Guinea, Togo, the Caroline, Pelua and Marianne Islands, the Marshall Islands, Samoa, and Kiauchau. On the eve of the First World War, the German Colonial Empire had a landmass of 1,140,200 square miles, an area roughly the size of India today (the world's seventh largest country at 1,147,949 square miles) (Henderson 1962: 131). Germany took a predominating influence over national economy in Italy, Russia, Switzerland, Belgium, Bulgaria, Romania, and, above all, Turkey (Krooth 1980: 35–36). Its hegemonic ambitions in Europe, however, were restricted by the intransigence of the ruling Osmanlis, Bulgars, Magyars, Poles, and Austrians. Moreover, even

with an economic union of the four Central Powers (Germany, Austria, Hungary, and Turkey), it would be a long time before the Bulgarian and Turkish peasants could apply the intensive land cultivation needed to feed Germany's growing working-class population. Moreover, Asia Minor could not furnish the copper, copra, India rubber, or palm oil required by German industry. Germany feared the Entente and feared above all that Britain would monopolize such tropical products from the colonies, products that Germany could not herself produce (38).

It was therefore imperative that German monopolies control sources of raw materials. On a world scale, the Caribbean, South America, Africa, Asia, and Oceania provided all rubber, about 73% of all colonial produce, some 54–60% of all oilseeds, almost 50% of all textiles, about 34–35% of all cereals and other foodstuffs, 24–28% of all fertilizers and chemicals, and 17% of all cereals alone. Indeed, only in fuels and wood pulp did the imperial nations produce more than half of the world's production of raw materials (Krooth 1980: 84, citing data from League of Nations 1926: 9–20). German imperialists foresaw that colonial raw material production could be increased over the longer term and German industrial dependence on foreign competitors thereby reduced in key fields.

Moreover, German banks contemplated the profits to be made from railway building and economic development. Indeed, profit rates were high in the colonies:

> The German East Africa company ([Deutsch-Ostafrikanische Gesellschaft] DOAG), which had a monopoly in the colony – it controlled the biggest trading network, the only land concessions, the big plantations and the two banks – paid a 5% dividend between 1906 and 1908, 6% in 1909, 8% in 1910 and 1911, and 9% in 1912. The South Cameroon Company also prospered after adapting to the [anti-settler] changes in colonial policy: it paid 8% in 1910 and 1911, and 5% in 1912. The biggest plantation in the German colonies, the West African Victoria Company, paid 15% in 1910 and 1911, 18% in 1912 and 20% in 1913, and its shares rose from 75% in 1907 to 450% in 1914. [Stoecker 1977: 202]

Yet such investments were a small fraction of total foreign investments, with only 2% of

German foreign investments going to the colonies in 1905 (Kitchen 1978: 198). As such, while individual companies made handsome profits from the colonies, the expense to the Reich was high.

Capital export was not the only way that the German *haute-bourgeoisie* was able to fleece the workers of underdeveloped countries with which Germany had economic relations (as noted below, non-equivalent exchange in trade was also important, especially in Eastern Europe and the Ottoman Empire). However, by 1914, Germany was the third largest exporter of capital in the world, after Britain and France. Germany exported RM23.5 billion in 1914, of which approximately RM13.8 billion was invested in underdeveloped countries, that is, in Russia, Turkey (Including Asiatic Turkey), European countries outside Austria-Hungary, France, Great Britain, Spain, and Portugal, Africa (including German colonies), Latin America, Asia (including German colonies), and other areas. This is a larger sum than the RM20 billion Germany was to pay as reparations to the victorious Allied powers in 1921 (Craig 1981: 437). Crucially, in the case of the non-capital-exporting countries, the transfer of value thus affected was entirely one-way. Not only did this process allow higher profits per se for the net value-importing country, but insofar as workers in the export dependencies were remunerated at levels below those prevailing in the imperialist country, it meant greater quantities of surplus value and, hence, higher *rates* of profit than would otherwise have prevailed. Nominal German wages in industry were around RM1,000 in 1914 (Broadberry and Burhop 2009). Even if only a quarter of German investment in underdeveloped countries was for the purposes of hiring labor power there, then, making the conservative assumption that workers in underdeveloped countries received the same wage rates as did German workers, we may safely estimate that the labor of 3.5 million foreign workers was transferred to Germany in 1914. At least half of this was certainly *surplus* value not paid for by German capital. There were approximately nine million German workers in 1914, so surplus value imported from underdeveloped countries would

thus have represented perhaps one-fifth of that created domestically. It is, therefore, not hard to see how the wage levels of the upper stratum of German labor were sustained.

Undoubtedly, German imperialism was much more than colonialism, and its main thrust was in Europe and the near East, rather than Africa and the Pacific. Yet colonies, obtained and kept by brutal military force (including the infamous massacre of around 60,000 Herero people residing in what is today Namibia between 1904 and 1906) (Curry 1999), not only enriched private treasuries and thereby sustained the profit rate in Germany but also improved the country's international status and fed her national chauvinism. Notably, overseas colonial expansion stimulated German capitalism's avaricious demand for rich raw materials and markets closer to home, from the heavy metals of eastern France to the granaries of the Slavic steppes (Krooth 1980: 26). Furthermore, the meager economic significance of its existing colonies makes it abundantly clear why Germany was bent on seizing or penetrating the colonies of other powers and, in particular, why it pursued the aim of a German Central Africa (Mittelafrika). The racial theories developed in German South-West Africa provided fuel to the fire of master race (*Herrenvolk*) thinking which, as Kuhl (1994) shows, was developed in its Nazi form with direct reference to its US eugenics pioneers. Indeed, as Schmitt-Egner (1975: 5i cf. Sarkisyanz 2002) writes, "all the decisive elements of the later fascist ideologies were perfected [in colonial ideology]." (Table 1)

Social Democracy and Imperialism before the First World War

Within the labor movement, the formal internationalism of the SPD, and opposition to the use made by capitalists of the imperial ideal, led to the more militaristic brand of social imperialism being greeted with hostility by workers (as during the state-orchestrated events of 1913 celebrating the centenary of Germany's liberation from Napoleonic rule). In practice, the social imperialist policy proclaimed by the Second Reich sat uneasily with the repression meted out to the labor movement. However, despite its ambiguity and internal

German Imperialism and Social Imperialism, 1871–1933, Table 1 Geographical distribution of German long-term foreign investment in 1914 (billions [US] of marks)

Source: Feis (1965: 23, 51, 74)

contradictions, the reality of social imperialism in Germany can be witnessed in the incorporation of leading and increasingly well-off sections of its working class into the structural mechanics of the monopoly capitalist state. Crucially, what Dahrendorf (1968: 15) has referred to as the survival of "authoritarian and anti-democratic structures in state and society' resulted less from workers" "blind prostration before the imperial myth than because [they] perceived good reasons for associating the chances of reform with the fortunes of empire" (Eley 1976: 287). This was particularly true of the best-off workers organized within the SPD and the ADGB.

Those sections of the German working class which were most strongly unionized and better paid tended to be employed in industries in which monopoly was most clearly present (export-oriented industries; the chemical, armament, and mechanical engineering industries; and certain steel works) and where employers could thus afford concessions to trade union demands. Unions were also strong in the expanding urban construction industries (where labor was in very high demand), the mechanical engineering industries (where labor was highly skilled), and in those industries where the labor form most closely resembled those artisanal trades which were strongly unionized earlier in the imperial period (leather workers, book

printers, typesetters, and woodworkers) (Tenfelde 1990: 252).

The SPD drew the bulk of its membership from this labor aristocracy. Thus, Wilhelm Liebknecht (co-founder of the SPD with August Bebel in 1869) frankly stated at the Party Congress of 1892: "The greatest portion of you who sit here are certainly to a considerable extent aristocrats among labor – I mean with respect to income." According to prominent Russian Bolshevik Grigory Zinoviev (1984: 488): "The predominant mass of the membership of the Social Democratic organization consists of the better-paid strata of labor – of those strata from which the greatest section of the labor aristocracy arises." Blank (1905: 520), meanwhile, estimated that non-proletarian supporters of the SPD approximated one-quarter of the total, equating to three-quarters of a million votes in 1903 (cf. Marks 1939: 345).

Statistics from 1886 to 1911 demonstrate that wages in Germany were rising more rapidly than the cost of living, although the intensity of labor may also have increased and the labor aristocracy undoubtedly "won a much greater increase in real wages than did the mass of the proletariat" (Marks 1939: 339, 342) (see Table 2).

On top of these unevenly distributed wage earnings must be counted the system of social insurance instituted by Bismarck, which considerably enhanced the material and legal position of the German working class. Germany's social insurance system, a forerunner of the welfare state as such, was built up in three stages: health insurance was introduced in 1883, followed by accident insurance in 1884, and old age and invalid insurance in 1889. Each new law covered

German Imperialism and Social Imperialism, 1871–1933, Table 2 Real wages in Germany (1887–1914)

Years	Mass of workers	Labor aristocracy
1887–1894	100.0	100.0
1894–1902	102.0	111.1
1903–1909	106.1	116.1
1909 to 1913–1914	105.1	113.2

Source: Kuczinski (1934: 25); Marks (1939: 341)

cumulatively larger sections of the working class. Over the same period, the Reich introduced pensions, national medical provision, and the right to education. State insurance for ill or disabled workers was coupled with stringent efforts to control and repress communist agitation (Berghahn 1994: 251–253). In 1907, economist Sartorius von Waltershausen wrote:

> The present age of social politics, which operates towards favouring the mass of the people and burdening the well-situated minority by means of direct taxes, contributions to workers' insurance, legal regulations, and administrative measures, is particularly suited to rear a middle-class out of the lower class. (von Waltershausen 1907: 429, cited in Marks 1939: 342)

As the wages of the German labor aristocracy rose with the expansion of big business, the SPD came to constitute a social-liberal opposition to capitalism, focusing on democratic reform and conservative trade unionism to the exclusion of all other political considerations actually or potentially facing the workers' movement (Rosenberg 1936: 1–68, passim). Through reformism, the expanding trade union movement, and the survival of petty bourgeois artisan traditions, the SPD quickly became assimilated to the existing social order in Germany. Thus, "revisionism" (avowed commitment to revolutionary socialism at the same time as advocating contrary ideals or practices) in Germany was based on the reality that socialist success at the parliamentary and municipal levels could translate into real gains for the working class and the trade union movement. As Fletcher (1984: 108) notes:

> [Conditions] appeared to be improving after [the curtailment of the anti-Socialist laws in] 1890, holding out some hope of a peaceful, piecemeal working class integration into the political nation. In any event, such developments as the gradual bureaucratization of the labor movement, the growth of a labor aristocracy and rising working class affluence made a revolutionary upheaval increasingly improbable.

In the decade before the First World War, the mainstream of the German labor movement had shifted decidedly to the right both in terms of its domestic strategy and regarding imperialist and militarist foreign policy, with the SPD's Reichstag deputies introducing resolutions to improve

premilitary youth training in the public schools and to procure for social-democratic cooperatives a share in supply contracts for the army (Schorske 1983: 245). The center of the SPD, represented above all by Karl Kautsky, envisioned the peaceful resolution of inter-imperialist conflict, tacitly identified with imperialism as such. Kautsky explicitly affirmed that with the military rivalries of the Western European countries set aside, czarist Russia would be contained by a "Western alliance for the mutual, rather than competitive, exploitation of the underdeveloped sectors of the globe" (ibid). Kautsky considered that the German middle classes would be supportive of this agenda, thus providing a convenient platform to consolidate a wider base for SPD electoralism.

Social-democratic views on imperialism before the First World War can be divided into four main tendencies. First, the avowed "social imperialists" in the SPD, among whom Ludwig Quessel was particularly influential, who considered that the workers' interest was in fully supporting the state in the imperialist struggle (263). Second, Eduard Bernstein was committed to the "ethical" mission of imperialism but baulked at supporting German militarism, particularly as directed against Britain. Third, the group represented by Kautsky, Hugo Haase, Theodor Liebknecht, and Georg Ledebour would go on to form the Independent Social Democratic Party as a non-revolutionary anti-war grouping. These placed various degrees of emphasis upon the need to work against war within the capitalist framework of promoting the development of international cartels (264). Finally, the "left radicals" in the party tended to focus on the negative aspects of imperialism for workers (higher tax burdens and costs of living and the increased difficulties of trade union struggles), ignoring the potentials of harnessing imperialism to a reform agenda (ibid). They urged the use of mass action against war. None of these sections of German socialism were able to mount an effective revolutionary opposition to imperialism or prevent the impending inter-imperialist war.

Republicanism, Imperialism, and the German Working Class (1918–1933)

The decline of the semifeudal Ottoman Empire brought rivalry between Great Britain, Austria-Hungary, Germany, and Russia as to who would gain control over its territories. Russia sought to dominate those southern Slav states, particularly Serbia, under weakening Turkish control. By doing so it would have control over the major trade routes through the Balkan straits of Bosporus and the Dardanelles. Great Britain, meanwhile, sought to safeguard its interests in the Turkish sphere of influence and Austria-Hungary to extend its sway in the Balkans. Austria-Hungary's imperial ambitions thus clashed with Russia's. When Archduke Ferdinand, the heir to the Habsburg throne, was assassinated by a Serbian nationalist, Austria-Hungary demanded burdensome concessions which Serbia refused. In support of Serbia, Russia mobilized its armies. Germany, allied to the Austro-Hungarian Empire, agreed to support its claims on Serbia and declared war on Russia and France. After Germany invaded Belgium, Britain declared war on Germany and Austria. All of Europe was then at war for the first time in a hundred years (Kennedy-Pipe 1998: 14–15).

The First World War was the product of imperialist nationalism on the part of the Great Powers of capitalist Europe (Bayly 2004: 472; Schevill 1951: 706). Germany's general aims in the First World War were twofold. First, it sought the elimination of France as a great military, economic, and financial power, thus creating a "*Mitteleuropa* economic system [embracing Austria-Hungary, a Poland severed from Russia, and possibly other neighbouring states, including Romania – ZC] dominated by German interests" (Fischer 1991: 57–58). Second, the "general aim of the war" was to drive Russia eastward, and to cripple her permanently by separating her "non-Russian vassal peoples" from her. As early as 6 August 1914, the German imperial chancellor, von Bethmann Hollweg, personally described the object of the war as "the liberation and military protection of the peoples (*Stamme*)

oppressed by Russia, the repulse of Russian despotism back to Moscow" (ibid).

During the First World War, German monopoly capital and businessmen like Krupp, Stinnes, Thyssen, Hugenberg, Roetger, as well as their representatives in the Reichstag and the Prussian diet (politicians such as Gustav Stresemann and Ernst Bassermann of the National Liberal Party) advocated the annexation of Longwy-Briey in France and the acquisition of the entire French market in Luxembourg, Belgium, Ukraine, the Transcaucasus, Romania, rump Russia, Turkey, and, not least, in France's colonial empire. To placate agriculture, industry advocated the concession of Eastern European land in Lithuania, Courland, Livonia, Estonia, and possibly Byelorussia either indirectly or through annexation. A trade treaty was to be imposed upon Russia as well as an "independent" Poland and Lithuania for the unrestricted admission of seasonal rural labor. Throughout this new German colonial and neocolonial empire, there was to be unlimited right of entry for German manufactures and unhindered export of raw materials for German industry and its workforce. The internal colonization considered a threat to the economic wherewithal of the large estates was to be diverted to the eastern Reich through the acquisition of land for an involuntary resettlement of small farmers and war veterans, thus also serving as a social and political counterweight to urbanization and the concomitant growth of the potentially revolutionary industrial workforce. Agricultural and demographic scientists were recruited to plan for "living space" (*Lebensraum*) in the northeast of the "New Germany" (Fischer 1991: 64–65).

Aside from the Bulgarian Workers' Social Democratic Party, the Serbian and Romanian Social Democratic parties and the Russian Social Democratic Labor Party (Bolshevik), all of the parties of the Second Workingmen's International, including the SPD, voted for war credits for their own government in the months preceding the First World War. In 1918, however, German imperialism was forced to admit defeat.

Social Democracy and the Reconstruction of Imperialism

In 1918–1919, the SPD augmented the capitalist *Sammlung* in Germany at the expense of the revolutionary Spartakusbund (the Spartacists, led by Rosa Luxemburg and Karl Liebknecht) and the Independent Social Democratic Party (Unabhängige Sozialdemokratische Partei Deutschlands, USPD), a loose-knit coalition of anti-war defectors from the SPD. SPD politician Philipp Scheideman proclaimed the Weimar Republic on 9 November 1918, to counter a declaration of the "Free Socialist Republic" made (under pressure from his radical supporters) by Spartacist leader Karl Liebknecht and became its first chancellor. After commander-in-chief Gustav Noske of the SPD (inaugurated as such by Colonel Reinhardt, Prussian minister of war), Colonel Maercker and other officers led six Free Corps (Freikorps) units under the command of General Luttwitz against the striking workers of Berlin in January 1919, another general strike called in protest was shot down during the week of 8–15 March. In this period, around 1,500 men, women, and children were executed under the orders of social-democrat ministers (Crook 1931: 503–504).

In the space of 2 months, the elite that had led Germany into the First World War were safely ensconced in their briefly tenuous positions of power. They had seen off the attempt by revolutionary communists, left-wing social democrats, and anarcho-syndicalists (who would in 1921 combine to form the Kommunistische Partei Deutschlands, KPD) to institute a socialist regime based upon the nationalization of heavy industry, the abolition and purging of the monarchy from governmental positions, and the breaking up of the large estates. The Republic's first president the SPD's Friedrich Ebert – of whom Field Marshal and later President Paul von Hindenburg of the Centre Party commented that he was "a loyal German who loved his fatherland above everything" (Carsten 1967: 94) and who declared in 1918 "I hate revolution like sin" – and its first defense minister, the SPD's Gustav Noske,

instead placed their faith in the newly formed Free Corps (Freikorps, illegal paramilitary formations of private volunteer armies raised to evade the military restrictions imposed on Germany by the Versailles Treaty) and the goodwill of the ruling class.

Subsequently, the Weimar Government employed martial and semi-martial law to repress revolutionary organizations of workers, notably, the Spartacist risings of 1919, the communist workers of the Ruhr in 1920 (Jones 1987), and the SPD-KPD Coalition Government of Saxony in 1923 (Price 1999: 155–157). On May Day 1929, communist demonstrations were shot at on the orders of Berlin's SPD police president Karl Zorgiebel, with many casualties ensuing. Later the same year, the KPD's Red Front Fighter's League (Rotfrontkämpferbund, RFB) and the League of Struggle against fascism (Kampfbund gegen den Faschismus, KgF) were banned by the SPD minister of the interior in Prussia, Carl Severing (Merson 1985: 316n).

Throughout the Weimar period, the SPD persistently rejected all KPD overtures to an anti-imperialist and anti-fascist United Front of the working-class parties (see Johnston 1999: 165; Olgin 1935: 115; Peukert 1976: 48; Schmidt and Burger 1995: 191–192). Instead, it preferred to pin its hopes on the "moderate" forces of German big business, including in its pre-fascist and semi-fascist forms of rule (Dutt 1978: 186).

Colonialism and Imperialism in the Weimar Era

Aggressive foreign policy was not far from the political surface in Weimar Germany. Hitler's aim of colonizing Eastern and Southeastern Europe was anticipated and partially realized by the Weimar Government's pursuit of informal economic hegemony in what was referred to in the 1914–1918 "war aims" debate as the *Österreich* (the eastern part of the greater "German Empire"). Indeed, the SPD was extremely anti-Soviet and, in matters of foreign policy, favored concerted Western opposition to the USSR even more than did Conservative German politicians. Kochan (1954) documents the course of German foreign policy toward the USSR and the SPD's part in its

formulation. The KPD consistently accused the SPD of an anti-Soviet and pro-imperialist bias in foreign policy. On 5 December 1926, for example, the SPD newspaper *Vorwärts* ran a story about an alleged Junkers arms factory operating in Russia. August Creutzberg, a KPD deputy in the Reichstag, accused the SPD of trying to curry favor with Britain: "Come what may you want to bring about a breach between Germany and Russia" (quoted in Kochan 1954: 121). Creutzberg pointed out that the SPD was not the enemy of the Reichswehr it claimed to be since it had recently and willingly employed its services against the working class. Ebert had previously declared himself "surprised and embittered" at the signing of the 1922 Rapallo Treaty (quoted in Kochan 1954: 58), which cemented German-Soviet diplomatic and economic ties. The SPD was undeniably a political opponent of the Rapallo Treaty and supporter of the Locarno Treaty of 1925 which consolidated the ties between Germany and Western European imperialism.

With the traditional German ruling class secured in its position by force of arms sanctioned by Social Democracy, "Wilhelmine concepts of Germany's Great Power status and her position as a 'world power' remained intact beyond 1918 to influence Weimar foreign policy in varying degrees" (Lee and Michalka 1987: 149–150). Indeed, there was real continuity in the foreign policy of the Second and Third Reich and the intervening Weimar Republic: "[Following] the Great [1929 Wall Street] Crash, Berlin concentrated both economic and foreign policies on Eastern and Southeastern Europe, so that Hitler had only to take up the threads of this policy" (151).

Politicians and senior diplomats in the Weimar period conceived of German trade policy as a means to impose economic and political hegemony upon the underdeveloped nations of the non-Soviet East. Weimar Germany thus attempted to set up a "penetrating system" of financial investment "in the weak and impressionable economies of the newly-liberated Eastern states" (91). The over-reliance of Polish capitalism, for instance, upon the products of German heavy industry (particularly iron wares, shovels, coal, machine oil, tipcarts and chloride explosives, salt, and leather) created a

situation of non-equivalent exchange whereby these were traded for Polish agricultural produce (potatoes, clover seeds, lupines, ores, pit props, meat, and eggs) (Spaulding 1997: 153). Germany strove to restrict the export of machinery and capital goods that would boost the industrial productivity of the Eastern European countries and imposed tariffs upon the products of those industries which might compete (particularly the non-cartelized coal, iron, and steel industries of Poland). The labor movement supported such tariffs in the name of protecting German jobs but pleaded for trade concessions to Polish agricultural producers in the name of cheaper food for German workers (158). Meanwhile, the dynamic export sector of German industry (which relied upon Polish markets for its goods) put up only half-hearted resistance within the Reich Association of German Industry (Reichsverband der Deutschen Industrie, RDI) to the protectionist demands of heavy industry. German politicians welcomed signs of Polish economic distress in the hope that the Polish state (whose leaders grossly overestimated its short-term capacity for capitalist self-reliance) might collapse and its frontiers be revised in Germany's favor. Throughout the period of Weimar *Osthandel* (Eastern European trade policy), Germany's political negotiators connected trade rights with border issues and the right of Germans to settle on Polish territory (the so-called right of domicile) (159).

A pseudonymous 1926 article by Politicus in Moscow's *Mezhdunarodnaya Zhizn* (International Affairs) argued that after its late start in the pre-1914 race for colonies and after having suffered from the loss of its fleet and its overseas possessions at Versailles, German imperialism was resurgent: "Objectively Germany is once again being pushed into an activization of her foreign policy with the aim of consolidating favourable conditions for the expansion in every way of her industrial exports and for the resumption of the export of capital" (quoted in Kochan 1954: 144). Hence, Germany signed trade treaties with and made large-scale investments in Romania, Bulgaria, Turkey, Persia, South America, Greece, Yugoslavia, China, and Siam. Politicus even spoke in Bismarckian terms of a *Drang Nach Osten*, a yearning for the East, only, of

course, in relatively "pacific" forms. These tendencies led in the 1930s to the threat, and then the actuality, of war over preferential trade agreements, tariff barriers, and trade routes, protected markets for investments and manufactures and sources of raw materials (Hehn 2002).

In the imperialist countries of the 1920s, as Krooth (1980: 76) writes, "the monopolists, the farmers and workers teamed up with the bankers" in a national alliance which could only lead to war. Indeed, in the inter-war period, the SPD was directly committed to the furtherance of specifically colonial ambitions in the Weimar era. The prominent SPD politician Eduard David wrote in the SPD journal *Vorwärts* in June 1918 that "we would have no objections ... if our colonial possessions were rounded off and enlarged by way of compensation and agreement" under the terms of a peace treaty (Ruger 1977: 298). The right wing of the SPD attempted to convince the German workers that the colonies would become the nationalized property of a social-democratic republic and would assure all German citizens of an "increase in production and wealth," full employment, and "human happiness." At the International Socialists' conference held in Berne in February 1919, the SPD openly protested the fact that the Versailles Treaty had divested Germany of its colonies and called for their restitution (300). In arguing for the "civilizing role" of imperialism in the colonies, Eduard Bernstein approvingly quoted Ferdinand Lassalle, founder of the General German Workers' Association in 1863, the SPD's precursor: "People who do not develop may be justifiably subjugated by people who have achieved civilisation." While there were differences in ideological emphasis between the openly colonialist right wing of the SPD (Gustav Noske, Ludwig Quessel, Max Cohen, Hermann Kranold, Max Schippel, Paul Lobe, Paul Kampffmeyer, and others around the leading revisionist journal the *Socialist Monthly* (*Sozialistische Monatshefte*), the "moderate" majority of the SPD preferred to call for mandates for German colonies to be awarded by the League of Nations (307). On 8 May 1925, the SPD involved itself in the formation of a colonialist lobby in the Reichstag with deputies from the Catholic Centre Party (Zentrum), the German

G

Democratic Party (Deutsche Demokratische Partei, DDP) and the DVP, whose leader, Foreign Minister von Stresemann, had recently resurrected First World War colonial official Hans Grimm's (the "German Kipling") slogan of "Volk ohne Raum" (people without space) to further popularize the colonial mission. In 1925, at the Second Congress of the Labor and Socialist International in Marseilles, SPD spokesman and finance minister Rudolf Hilferding again demanded colonies for Germany (Edwards 1978: 39).

The Political Economy of Imperialist Social Reformism

Imperialism in Weimar Germany combined pursuit of the trade interests (*Handelspolitik*) of monopoly industry with social policy (*Sozialpolitik*) aimed at securing the loyalty of the organized working class to the state (Abraham 1986). Social imperialism was seen as very much in the interests of capitalist development by the dynamic export fraction of German industry and their political and intellectual representatives:

> The re-establishment of Germany's economic potential and international stature required a national consensus, which would be based on reintegration of a chastened but still strong SPD. The antisocialist bloc gave way to a class-compromise bloc, a fragile compact for a period of limited growth and progress. It was possible for ascendant members of the dominant economic classes, in this case the dynamic-export fraction, to abandon the interests of other economically dominant fractions, wholly or in part, in favour of more thoroughgoing collaboration with parts of the organized working class. [125]

Both export and heavy German industry in the Weimar period were dominated by monopolies. However, only the export sector was truly dynamic and competitive on a world scale. Heavy industry required protection from imperialist rivals and could not afford the social policies which export industry supported. Heavy industry was not social-imperialist until the Nazi dictatorship began to provide it with the produce of colonized land and labor. In Britain, by comparison, the colonies allowed for social-imperialist platforms for both fractions of monopoly capital to pursue their divergent agendas (Cope 2012: 95–96).

The advance of Weimar *Sozialpolitik* can be witnessed in the following figures: employer contributions to health insurance rose 58% between 1925 and 1929 and then declined 31% by 1932; state expenditures on social insurance rose by 57% between 1925 and 1930 and then declined only 13% through 1932; state spending rose a full 25% from RM8 billion to RM10 billion in 3 short years from 1925 to 1928, declining only 2.4% in 1930; public spending for education (significantly easing pressure on the job market) was in 1925 already 45% above pre-war levels and in 1929 rested at 208% of 1913 levels. As rising unemployment threatened the contractual, social-partnership basis of *Sozialpolitik* after 1929, organized labor successfully obtained a transfer of RM2.4 billion from the General Treasury, a sum equivalent to 45% of the amount paid in by all employers and employees and a full 28% of the entire tax revenue of the Reich and Lander governments.

Given the general economic upturn occasioned by increased industrial productivity and the stagnation and subsequent decline of agricultural prices, for employed workers both nominal and real wages rose substantially after 1924. At the start of 1924, average wage rates were 10% below 1913 levels. Yet from 1924 to 1930, the cost of living rose modestly (by about 15%) while nominal wages rose substantially (over 60%). Hourly real rates rose by 40% from 1924 to 1929, more than 20% above 1913 levels. Real hourly and weekly earnings rose even further than the corresponding real rates: almost 55% and 60%, respectively. Real hourly earnings kept rising until 1931, at which time they were 30% above pre-war levels. As Abraham (1986: 238–242) notes: "If the gross annual earnings of fulltime employees in the fifteen largest industries is indexed (1913 = 100), then annual earnings in 1929 and 1930 exceeded 180 – a level not reattained until the late 1950s at the earliest."

In sum, Abraham suggests that organized labor made dramatic material (in terms of real wages and working hours), political (in terms of representation), and legislative (in terms of the extension of trade union rights, legally binding collective wage agreements, and a system of

compulsory arbitration) gains in the Weimar period. These were made possible by the high profits accumulated by dynamic export industries in the 1920s, which were able to tolerate welfare taxation and wage rises.

When the economic crisis of 1929–1933 came, however, the heavy industrial fraction of capital favoring policies of protection and the demolition of the welfare state, in renewed alliance with the agrarian lobby, saw the destruction of the so-called *Gewerkschaftsstaat* ("trade union state") as imperative. The Great Depression of 1929–1933 saw capitalist industry in Germany become politically united to overcome the gamut of economic and political policies of *Sozialpolitik*. Hitherto, the dynamic and export fractions of monopoly German industry had been opposed to the price fixing and quotas of the heavy industrial cartels in iron and steel which raised their own production costs considerably. Since these dynamic and export fractions of German capitalist monopoly made super profits through international trade in which they were highly competitive and had a high organic composition of capital, they could afford to ally politically and electorally with the ADGB and the SPD and deliver social reforms that improved the lives of most, if not all, German workers. This alliance pressured the heavy industry monopolies into mitigating their demands and ensuring that the protectionism which they craved was not fully implemented to the detriment of Germany's international trade.

Once the world market became moribund with the onset of world depression, however, the dynamic and export industries became more dependent upon the home market for their profits and thus more committed to reversing the social and wage gains of organized labor. The latter was prepared to see the German Republic collapse into oblivion rather than abandon *Sozialpolitik*. It thus refused to revive parliamentarianism whether of the left (allying with the burgeoning forces of the KPD) or of the right (allying with the DDP). By 1931, fissiparous German industry was seeking "a Bonapartist solution to the political crises and an imperialist solution to the economic crisis" (Abraham 1986: 157). Politically, by July 1932, the Nazi Party was the only force which might "provide a mass base while conceivably offering a program acceptable to both fractions of industry" (16).

Conclusion: Social Democracy and Social Fascism

The SPD sacrificed its liberal principles to enter into an alliance with the imperialist elite of the German Empire, ostensibly to prevent a drift toward extremism of the left or right. The predominant section of the German working class in the Weimar period, like its middle-class compatriots, refused to be proletarianized or pushed into an alliance with the KPD (whose sole base of support lay in the working class, including the unemployed). But the social forces to which its reformism was indissolubly wedded guaranteed that capitalist militarism and imperialism were to undermine the foundations of the alliance more or less rapidly.

Space prevents our discussing here the details of the Nazi seizure of power or the role of the SPD in facilitating it (Harsch 1993). Suffice to note, however, that despite its being almost an article of faith among historians of the Weimar Republic that the KPD line that Social Democracy paved the way for fascism in Germany was wrong and resulted in a disastrous political strategy, there is a good deal of evidence to suggest that the label of "social fascist" had a real frame of reference at the time of its coinage. The analysis of Social Democratic policy as social fascist was first put forward by Zinoviev in 1923 and was based on SPD support for the DVP's Stresemann rather than KPD politician Heinrich Brandler. It was then discarded only to return with redoubled force between 1928 and 1934, during which time the KPD gained many supporters. Ukrainian-born Dmitry Manuilsky, a member of the Comintern Executive Committee, defined social fascism thus:

> If in the epoch of the general crisis of monopoly capitalism, its general tendencies lead to fascization, i.e. to the abolition of the social and political gains of the working class, to an increased resorting to methods of political terror and the growth of reaction, a party which in practice repudiates the proletarian revolution, and therefore stands for capitalism, cannot help passing through the whole of capitalism's process of evolution, together with it. (1933: 28)

Social democracy's emphasis on fascism as being based on the negation of parliamentary democracy, while formally correct, does not address the precise class composition of fascist reaction. Instead of confronting capitalism and its major social pillars (the imperialist bourgeoisie and its beneficiaries), the social-democratic conception of fascism tended to obscure the difference between fascism and its revolutionary opposition. It posited an unbridgeable chasm between fascism and other forms of capitalist rule where, in reality, there are elements of class dictatorship in monarchies, constitutional monarchies, and bourgeois republics with narrow and broad franchises. Fascism is a change in the form much more than the composition of class rule (though it allows for sections of the hitherto politically marginal petty bourgeoisie to exercise power and accumulate wealth).

The German fascist state was an exceptional historical form of the bourgeois German state. German socialist Richard Löwenthal (1983/1933: 338–339) excellently summarized the conditions for fascist power:

> Fascism comes to power that much more easily in a country, the deeper its economic crisis and the smaller the reserves it has to alleviate it. It also comes to power that much more easily the fewer areas of imperialist influence, colonies, etc. the country has in relation to the needs of its capitalist class. It comes to power more easily in a country dependent on imported capital and with international debts, than in a capital exporting country which can live off its revenues. It comes to power more easily in a country with a large number of economic dead-weights which reduce its international competitiveness, than in a country enjoying rapidly increasing production and an expanding world market. It is therefore an essential characteristic of fascism that it has to make the most vigorous assertion of its imperialist claims, precisely because the basis for such claims is relatively weak. Fascism exemplifies the imperialism of those who have arrived late at the partition of the world. Behind this imperialism lies a huge need for expansionary opportunities, but none of the traditional weapons for realising them. It is a form of imperialism which cannot operate by means of loans, since it is so much in debt, nor on the basis of technical superiority, since it is uncompetitive in so many areas. It is something novel in history – an imperialism of paupers and bankrupts.

In 1933, there occurred what one historian has said amounted to a "quasi-guerrilla warfare" in Germany's poorest areas, with the superior force employed by the Brownshirts winning the battle of the streets and destroying the KPD's last bastion in society (Evans 2003: 243). As the battle raged, the German middle classes strongly sympathized with the Nazis, preferring the protection of their property to forestalling the drive toward one of history's most terrible bloodbaths. Along with 5–6 million European Jews (Hilberg 1986) and 5–6 million Poles, imperialist Germany's invasion of the USSR (1941–1945) cost that country between 25 and 30 million deaths. During the war, about 15% of Soviet women aged 20–49 died, while the mortality rate of men in the same age group reached the rate of 40% (Allen 2003: 115–116).

Global Finance Capital and Third World Debt

Ilias Alami

Synonyms

Debt; Dollar standard; Financial capital; Money capital; World money

Definition/Description

This essay provides a historical geographical political economy of the deep connection between global capitalist finance, global flows of capital in the form of money, and modern imperialism. It argues that the money-power of capital to

appropriate living labor and extra-human natures has expressed itself in particular violent ways in the spaces of the global capitalist economy successively referred to as the peripheries, the colonies, the Third World, and the Global South. The essay suggests that a crucial factor of explanation for the violence of the money-power of capital in those spaces is that they have retained a *subordinate positionality* in the network of space and power relations within which money-capital flows. This has been largely due to a multitude of imperialist policies and practices on the part of advanced capitalist economies and powerful agents and institutions located within them.

Introduction

The 1980s Third World debt crisis was a painful reminder of the tight link between the operations of capitalist finance, global flows of capital in the form of money, and modern imperialism. As is well known, the "resolution" of the crisis entailed the brutal disciplining of Third World states via the imperialist imposition of structural adjustment plans designed by the Bretton Woods Institutions (the International Monetary Fund and the World Bank), large private commercial banks, and advanced capitalist economies (the Paris Club of creditors), significantly contributing to the extension and deepening of capitalist property relations in the Third World. While often welcomed by local ruling elites, the policy prescriptions largely benefitted transnational capitalist firms, mining and extractive companies, global banks, and the interests of advanced capitalist countries. The consequences in terms of social and human costs, socio-ecological destruction, and globally organized dispossession across much of the Third World are well documented (e.g., Saad-Filho and Johnston 2005).

There is no doubt that much has changed in the global capitalist economy since this dramatic historical episode, including in terms of the organization and workings of capitalist finance, global patterns of financial capital flows to the Global South, and the political, institutional, and regulatory arrangements that underpin them. Developing

economies have received extremely large volumes of global financial flows since the early 2000s, reaching a high of USD12 trillion (an equivalent of over 20% of world GDP) in 2007 (IMF 2016a: 5). Financial markets in emerging capitalist economies have become increasingly open, deep, liquid, but also well-supervised and regulated. Financial centers such as São Paulo, Johannesburg, Shanghai, Mexico City, Istanbul, and Beijing have become deeply integrated in the global financial system and are now key sites of financial innovation, particularly at the regional level. Moreover, growing volumes of financial capital is now flowing into so-called "frontier" markets (countries in this group include Bangladesh, Bolivia, Cote d'Ivoire, Ghana, Kenya, Mongolia, Mozambique, Nigeria, Papua New Guinea, Senegal, Tanzania, Uganda, Vietnam, and Zambia (IMF 2016b: 24)). According to Bloomberg figures, stock market capitalization in frontier market, driven by global financial inflows, has reached more than USD700 billion in 2017. The global financial architecture has also experienced significant transformations (Grabel 2018). There has been a growing participation and assertiveness of emerging economies in multilateral financial governance (for instance, in the G20). Emerging economies have designed a variety of bilateral, subregional, and regional financial and monetary mechanisms, including currency swaps, reserve pooling arrangements, credit lines, bilateral aid, and development finance, often with the explicit aim to seek independence from the IMF (see Alami 2018a). They have also expanded the capacities of their national development banks, many of which now dwarf the volume of lending of the World Bank and regional multilateral development banks. As a whole, then, and though narratives about "the decline of the West" and "the rise of the rest" are often largely exaggerated and the recent hype around the BRICS (Brazil, Russia, India, China, South Africa) and other groupings of so-called "emerging" markets has gradually died down, it is clear that developing economies across the Global South play an increasingly important role in the reproduction of the financial world market (Marois 2012).

And yet, despite those remarkable geographical transformations, there is also still much in

common with the 1980s Third World debt crisis, both in terms of the specific conditions and modalities that led to its buildup and in terms of the power relations involved in its resolution. In June 2018, the IMF returned to Argentina, despite the fact that its policy "recommendations" in the early 2000s triggered one of the worst capitalist crises that the country experienced. Argentina is currently implementing austerity and structural reforms to restore the confidence of international investors. A couple of years earlier, a US court forced Argentina to pay billions of dollars to its creditors. This was because six hedge funds (based in tax heavens and world financial centers such as New York and London and representing only 7% of Argentina's creditors) had refused the proposed deal to restructure Argentinian sovereign debt and sued Argentina in New York federal courts. The Argentinian state agreed to pay billions in order to regain access to global financial markets. In 2018, the IMF also returned to a number of developing countries including Haiti, Guinea, and Egypt. In exchange for emergency lines of credit, it forced governments to lift energy subsidies – despite the fact that those are vital for the daily life of much of the population – and to privatize state-owned companies. The social unrest and spontaneous riots that ensued led to the death of dozens of people. The Congo republic is currently negotiating a deal with the IMF, which has insisted that its financial package will only be delivered "once *compliance with all relevant IMF policies* has been established" (quoted in Reuters 2018, emphasis added). Critical commentators have denounced a return to "classic forms of conditionalities" (CADTM 2018). In Puerto Rico, which declared bankruptcy in May 2018, a draconian austerity plan is being imposed by a non-elected US-appointed fiscal control board, to the benefits of the large US mutual and hedge funds that hold much of the debt and despite the fact that the territory was recently devastated by two hurricanes. Emerging economies have not been immune either: many have recently experienced severe financial issues associated with volatile global financial capital flows, often dramatically worsening domestic sociopolitical crises (for instance, in Brazil, South Africa, and Ukraine).

Due to large-scale and sustained capital flight from Turkey, the Turkish lira fell to a record low in August 2018. Turkey is in the midst of its worst financial crisis since the early 2000s. This poses risks of wider financial contagion to other emerging markets – bond markets in South Africa and Mexico have already been affected – but also to other developing economies. Indeed, developing economies across the income range have recently experienced a rapid buildup of external debt, partly due to economic difficulties associated with the end of the primary commodity supercycle (since 2013 or so), but also due to the strong international investors' demand for developing countries' debt: in a context of abundant international liquidity fueled by quantitative easing programs in advanced capitalist economies, international investors have been searching for high yields, and financial capital flows have poured in developing economies. There are concerns that mounting levels of external debt could lead to a generalized debt crisis across the developing world, with potential consequences for global systemic financial stability (IMF 2018).

This raises a series of questions: What makes developing and emerging economies particularly vulnerable to the movement of money-capital across the world market? What makes financial crises so recurrent and violent? What is it about the operations of capitalist finance that continues to reproduce deeply unequal power relations between national states across the world market, at the expense of developing and emerging economies? How and why is financial fragility and vulnerability exported to those spaces of the global capitalist economy? This essay suggests that the answer to those questions lies in what Patel and Moore have aptly called the deep entanglement of "the rhythms of world money and world power" (2017: 96). Put differently, this essay is concerned with the remarkable historical continuity of capitalist finance as a key vector of imperialism. It explores the mechanisms through which the fundamental relation between the operations of capitalist finance, the global flow of capital in the form of money, and modern imperialism has been historically entrenched and reproduced. In order to do so, the essay provides

a *historical geographical political economy* of the entanglement of world money and world power. *Historical*, in the sense that it takes a longue durée approach: it provides an overview of the various historical cycles of global financial capital flows to the spaces of the global capitalist economy successively called peripheries, the colonies, the Third World, and the Global South, since the early days of the world market in the sixteenth century to the contemporary period. It examines their changing drivers, patterns, composition, and crisis dynamics, with a focus on the spaces at the receiving end of those flows. The analysis if also *geographical*, inasmuch as it is concerned with how the spatial-territorial dynamics of expansion/contraction of capitalist finance, the geographical organization of the circuits of financial capital (the financial system), and the functional/spatial configuration of convertibility between different currencies (the global monetary system), has shaped changing geographical patterns of global financial capital flows to developing economies. The historical geographical political economy is grounded in the Marxian theory of money and the central role it plays in capitalist social relations of production. This is absolutely fundamental for the purpose of this essay, because at the most basic level, the global financial system is about "the assemblage and dispensation of money-power" (Harvey 2010: 52). As Marx was at pain to emphasize, the self-movement of capital in the form of money (thereafter, money-capital) represents "the common capital of a class"; it expresses the disciplinary power of "capital-in-general" (Marx 1894/1991; Clarke 1988). Indeed, it embodies the essential social relation of power and inequality between those who possess money and those forced to sell their labor power in order to get access to money and reproduce themselves. Money, or rather the lack thereof, endlessly coerces workers back into the act of market exchange and compels them to sell their alienated labor (Hampton 2003). Consequently, despite its appearance as a neutral object, money is the most preeminent, abstract, and "autonomous" social incarnation of class power (Clarke 1988; McNally 2014). When money is converted into capital, it stops being a "rational means to

satisfying social needs" and becomes a forceful and "irrational" general form of social regulation, subjecting social reproduction to the discipline and logic of capital, i.e., to *the money-power of capital to appropriate surplus labor time and extra-human natures* such as land, natural resources, and biodiversity (Clarke 2003; Arboleda 2017). Indeed, "inevitably, payments to banks [and other financial institutions] happen by exploiting workers and appropriating the rest of nature's work as much as possible" (Patel and Moore 2017: 98). Adopting such an approach, the essay shows, is crucial to understand the operations of capitalist finance, patterns of money-capital flows, and the global relations of power, value, exploitation, and dispossession that underpin them.

The central argument developed in the essay is the following: the money-power of capital to appropriate living labor and extra-human natures has expressed itself in particularly violent ways in the spaces of the global capitalist economy successively referred to as the peripheries, the colonies, the Third World, and the Global South. The essay suggests that a crucial factor of explanation – though it is certainly not the only one – for the *violence of the money-power of capital* in those spaces is that they have retained a *subordinate positionality* in the network of space and power relations within which money-capital flows or in what have been called the "relational geographies of money-power" (Alami 2018b). Importantly, spaces of the Global South have remained in a subordinate positionality in those geographies because of the weakness of capital accumulation (for instance, in terms of the heavy dependence of some developing economies on primary commodity exports to the world market), but also because of a *multitude of imperialist policies and practices* on the part of advanced capitalist economies and powerful agents and institutions located within them. The essay shows that there has been nothing natural about the concrete and distinct geographies of money-power, which have been socially constructed and enforced in a variety of ways that benefit core advanced capitalist economies. As a result, the subordinate positionality of developing economies has been a phenomenon of *remarkable*

historical continuity. Those arguments are substantiated throughout the essay by an examination of seven historical periods and cycles of money-capital flows to the developing world. The essay concludes by discussing questions of strategic-political organizing for emancipatory struggles.

From Sixteenth-Century Merchant Capital in the "Age of Discoveries" to 19th Industrial Capital

The early sixteenth century saw "the emergence of capitalism as a system of accumulation on a world scale" (Arrighi 1994/2010: 33). The process started with extremely vast and coerced transfers of wealth and resources across the globe. Expeditions led by European "explorers" and motivated by trade and treasure-seeking initiated the brutal conquest of the New Worlds by Portugal and Spain. This allowed the creation of gigantic territorial empires. In Asia and Oceania, sea trade monopoly by the Portuguese and then the Dutch was the main source of wealth extraction. In Latin America, wealth in the form of precious metals was savagely plundered and transferred to Europe, where they were used as commodity moneys. Imperial colonies also became a privileged outlet for Spanish and Portuguese exports (Dunn 2009). Those waves of money and capital flows during the early days of capital colonial expansion, notably on the part of commercial capital, set up important "path-dependence and locational lock-in" that importantly shaped subsequent cycles of money and capital flows (Martin 1999).

From the sixteenth to the eighteenth century, during what is often termed the mercantilist era, international capital exports were performed by state-sponsored merchant capital with the double objective of supporting trade activities (establishing outposts; setting up banking, insurance, and financial services; ship maintenance) and furthering strategic economic and political goals (Dunning and Lundan 2008). The main actors of these investments were colonial merchants from Holland, Britain, France, Spain, Portugal, and the American colonies. Famous examples of joint-stock companies created at the time by wealthy merchant

capitalists include the British East India Company, the Dutch East India Company, and the Royal African Company. These companies were granted foreign trade monopolies in particular regions of the world by royal charter. A significant part of these international investments was to develop overseas trade backed by naval power and to bolster colonization and land development – particularly in the Americas – with the development of plantations (Arrighi 1994/2010). The so-called transatlantic slave trade epitomized this period of large flows of capital, labor, and wealth, organized and controlled by merchant capitalists with the support of imperial powers. The vast accumulation of wealth associated with imperial dispossession (what Marx refers to as "primitive accumulation") contributed, though not systematically, to the development of capitalism in some of the metropolitan countries, particularly Britain. As Marx put it:

> The discovery of gold and silver in America, the extirpation, enslavement and entombment in mines of the aboriginal population, the beginning of the conquest and looting of the East Indies, the turning of Africa into a warren for the commercial hunting of black-skins, signalized the rosy dawn of the era of capitalist production. (1863/1981: 905)

The eighteenth to nineteenth centuries saw the forceful incorporation of vast new regions into the world market and its division of labor, such as the Russian empire, the Ottoman Empire, India, and West Africa. Meanwhile, declining profitability due to overaccumulated commercial capital triggered an increasing penetration of capital into the sphere of production (Clarke 1988). This paved the way for the industrial revolution and brought about changes in the motivations for capital exports, not least because industrial capitalists became important actors. Global capital flows became driven by the need to secure access to raw materials and conquer/protect foreign markets (Dunning and Lundan 2008). For instance, the development of textile manufacturing in Britain heavily relied on the colonial empire as both sources of raw materials (imported cotton from the American colonies and Egypt) and markets to export surplus commodity production (Dunn 2009). As such, global capital flows were strongly associated with the politics of empire building.

Britain, the leader of world trade, rapidly became the main capital exporter, as it recycled the large liquidities accumulated as a result of the industrial revolution (Dunning and Lundan 2008). Powerful merchant banks such as Rothschild, soon followed by joint-stock banks, were managing world trade and finance from London, which hosted international capital markets (Stallings 1987). Most money-capital flows from Britain consisted in portfolio investments (bonds and debt instruments) primarily in railway, shipping, and public utilities, predominantly in European countries and white settler colonies (Bloomfield 1968).

In the 1820s Latin America received large money-capital inflows, as newly independent states sought financing in international capital markets (Marichal 1989). State-issued bonds denominated in foreign "hard" currency (often sterling) on the London Royal Exchange. On the demand side, investors in London capital markets (particularly London banking houses) were highly tempted to invest in the gold and silver mines, recently freed from Spanish and Portuguese control. Latin American sovereign debts soared: "In this irrationally exuberant climate, Latin American states raised more than 20 million pounds during 1822–1825" (Reinhart and Rogoff 2009: 93). This ended up in these states almost all defaulting in 1826–1828, following a financial crisis in Britain and resulting in their exclusion from international capital markets until the 1850s (Marichal 1989). A second wave of money-capital flows happened in 1850–1870, with the return of Latin American states to international capital markets in the context of rapid world trade expansion. The stock of British investments in the region soared to 179 million pounds (Della Paolera and Taylor 2012). These developments further accelerated during 1870–1914, a period often dubbed the "first wave of financial globalization."

"High Imperialism" and the First Wave of Financial Globalization

The period 1870–1914 saw an unprecedented surge in world trade and international capital mobility. The stock of foreign assets grew from 7% to about 20% of world GDP (Obstfeld and Taylor 2004: 55). A series of innovations in the realms of transport (especially railway and steamship, triggering a sharp decline in both land and maritime transport costs) and communications (such as the invention of the telegraph) provided the technical backdrop for rapid growth in world trade and increasing global financial market integration. The growth of trade and money-capital flows was also facilitated by the almost complete absence of capital controls (Eichengreen 2008).

The continuous industrialization process in core capitalist countries demanded increasing amounts of raw materials, minerals, and agricultural products such as tea, cocoa, coffee, tobacco, rubber, tropical fruits, sugar, and meat (Dunning and Lundan 2008: 175). Capital was therefore invested in both the "direct" exploitation of these resources (in mining, plantations, farming) and the transport infrastructure (ports, railway, bridges, and other facilities) to enhance the flow of the exploited resources toward the world market (Bloomfield 1968). According to Dunning and Lundan, "about 55% of the global foreign direct investment stake in 1914 was directed to the primary product sector, 20% to railroads, 15% to manufacturing activities, and 10% to trade, distribution, public utilities and banking" (2008: 174). The new forms of capitalist organization that emerged to manage these foreign investments and operations were the forefathers of the modern transnational corporation such as "...Colt, Singer, Coca-Cola, Gillette, Heinz, Ford, United Fruit ...Siemens, Bayer, Bosch" (Dunn 2009: 120–121).

The direction of money-capital flows changed in the 1880s, in part due to a rise in tariff barriers and other protectionist measures in industrializing countries (European countries, the USA, and Japan) (Hobsbawm 1999; Dunn 2009). This surge in protectionism, coupled with a lack of economic dynamism in the core capitalist countries due to a major capitalist crisis (the first Great Depression 1876–1896) and to the growing power of the organized labor movement, pushed Britain to redirect part of its trade and capital exports to the peripheries and particularly to the regions under its political and economic control (both formal and informal empires). Money-capital

flows further expanded during the 15 years that followed (1897–1913) as Britain and other core capitalist countries embarked on a new phase of imperialism (mainly in the form of colonization), leading to the "division of the world among the great powers" (Lenin 1917). Major capital exporters in this period were Britain, the USA, France, and Germany, though the rise of Paris, Berlin, and New York as important financial centers in the early twentieth century did not threaten British financial hegemony. By 1913, "Britain owned perhaps £4,000 million worth abroad, as against less than £5,500 million owned by France, Germany, Belgium, Holland and the USA put together" (Hobsbawm 1999: 125).

While money-capital flows to the peripheries were highly geographically concentrated (according to Bloomfield (1968), as much as 75% of Britain's stock of foreign investments in 1913 was concentrated in the USA, Canada, Australia, New Zealand, India, South Africa, and Argentina), Latin America attracted growing volumes of flows in the 1880–1890s. Investment stocks reached unprecedented levels:

> British investments in the region were £426 million, more than double the 1880 total. Of this, £194 million sat in government bonds, now for the first time surpassed by a slightly higher amount, £231 million, in securities issued by private enterprises. (Della Paolera and Taylor 2012: 4)

Thirty-seven percent of total flows went to Argentina, 17% to Mexico, 14% to Brazil, 7% to Chile, and 5% to Uruguay (Taylor 2003). Much of those flows were driven by speculative operations, resulting in growing difficulties by national monetary authorities in debtor countries to maintain monetary stability and service their debt. Those countries were hit by severe financial crises, with consequences much worse than previous ones, as banking and financial systems in these countries had significantly grown since the 1880s, particularly in Argentina and Brazil. The crisis in Argentina in the 1890s was "arguably the world's first example of a modern 'emerging market' crisis, combining debt crisis, bank collapses, maturity and currency mismatches, and contagion" (Della Paolera and Taylor 2012: 5). Money-capital exports from France and Germany remained

largely directed to Europe, but flows to their colonies (especially in Africa) rapidly increased as well in the early 1900s. Overall, this early period of financial globalization was characterized by a remarkable integration of international capital markets: "Prior to World War One, a vibrant, free-wheeling [sic] capital market linked financial centers in Europe, the Western Hemisphere, Oceania, Africa, and the Far East. A nineteenth-century reader of *The Economist* newspaper could track investments in American railroads, South African goldmines, Egyptian government debt, Peruvian guano, and much more" (Obstfeld and Taylor 2004: 16).

Importantly, this process of global financial integration was facilitated by a particular functional/spatial configuration of convertibility between different currencies that deserves further elaboration. It was underpinned by the establishment of the first global monetary system, the classical gold standard, where currencies were convertible into predetermined quantities of gold. The system, which was first adopted in 1821 in Britain and some of its colonies (Ireland, Mauritius, New Zealand, and South Africa), was a "mechanism of class control" (Hampton 2006: 147). Indeed, by linking the quantity of money in circulation to the amount of gold hoarded in the coffers of the central bank (and then to the total global supply of gold when the gold standard became internationalized), the gold standard ensured that economic adjustment was guided by the rule of money in its most abstract form. Its purpose was to push the costs of adjustment onto labor, with wages, employment, and working-class consumption and living standards being the variables of adjustment (Kettell 2004; Hampton 2006).

The gold standard then internationalized. By the 1880s, most European capitalist economies and large chunks of their empires had adopted it. This led to the establishment of a global monetary system characterized by fixed exchange rates (currencies were pegged to the same metal standard) and high capital mobility: exchange rates were determined by international private flows of gold and credit (Hampton 2006). The internationalization of the gold standard was gradual and negotiated, but underpinned by the power of British

capital and the British state (Clarke 1988). This is because Britain was the leading power in both finance and international trade. London was the dominant international capital market, and it provided clearing facilities for sterling-denominated bills of exchange (mainly the Bill of London) that served as the main means of payment and purchase in international trade. Sterling became the main reserve currency: at the end of the nineteenth century, sterling accounted for 40% of foreign exchange reserves (Eichengreen 2008). In that context the British state and the Bank of England actively managed the internationalization of the gold standard, using a mix of cooperation with metropolitan capitalist economies and imperialism, with the double objective of enforcing the money-power of capital in the world market while maintaining sound money at home. Put differently, the whole international financial system was managed with the overall purpose of maintaining monetary stability and limiting value destruction in its core.

Consequently, the relative overall stability of the international financial system and its ability to weather crises over the period masked considerable geographical unevenness. While financial stability was relatively successfully maintained in the core, the costs of adjustment and capital devaluation were disproportionally borne by the peripheries. The export of financial fragility, a result of active policies by Britain and to a lesser extent France, Germany, and the USA, provided a "buffer" for core economies (Vasudevan 2009: 479). For instance, Britain imposed the "colonial sterling exchange standard" in its colonies and informal empire, in order to prevent the outflow of gold from Britain to the regions with which it carried trade deficits (Vasudevan 2009; Knafo 2013). Colonies had to fully back their currencies with reserves in pound sterling. In order to convert their currencies into gold, they were forced to first convert them into sterling. A portion of these sterling reserves had to be placed in London (Berlin and Paris for the other imperialist powers) under the form of British treasury bonds and bank deposits (De Cecco 1984; Eichengreen 2008). British financial institutions could then recycle these liquidities through money-capital

exports to countries on the peripheries, providing them liquidity to buy capital goods from British capitalists and generating considerable income from interests and dividends for Britain. Furthermore, during crises, and thanks to its privileged position of main global creditor and capital exporter, Britain could shift the brunt of devaluation costs to the peripheries by withdrawing British deposits and reducing loans and investments ("pulling capital away") (Gallarotti 1995: 38; Vasudevan 2009). The Bank of England was also able to direct international movements of gold and credit by manipulating its base interest rate (De Cecco 1984). Increasing the base rate could attract capital flows from the peripheries and trigger liquidity crises in countries that had otherwise balanced accounts and/or strong fiscal positions. These imperialist practices were relentlessly implemented, in part because of the shared view among core capitalist economies that "problems at the periphery would not threaten systemic stability" (Eichengreen 2008: 38).

In sum, while the international gold standard enforced the disciplinary money-power of capital over labor and extra-human nature in its most abstract form, the brutal adjustment mechanism was highly asymmetrical, and its costs were unevenly spatially distributed (Vernengo 2003). The very money-capital flows necessary to preserve stability in a few core capitalist countries and their financial centers (London, Paris, Berlin, and New York) were highly destabilizing to the peripheries (Gallarotti 1995). The following figures clearly illustrate this unevenness. During the period, core capitalist countries were hit by seven financial crises, while countries on the peripheries experienced 25 crises (Bordo and Eichengreen 2002). Britain maintained the gold standard for more than a century, other core capitalist economies for about 39 years on average, and countries on the peripheries about 14 years only (Vernengo 2003: 16). The financial history of poorer countries during the gold standard era was a history of volatile capital flows, financial instability, monetary crises, and repeated convertibility suspension. This was a key manifestation of the deep entanglement of capitalist finance and modern imperialism.

Hegemonic Decline, Capitalist Crisis, and the Fall of the Gold Standard

Global money-capital flows to the peripheries resumed in the early 1920s, led by the growing financial power of the USA and its booming capital markets (Eichengreen 2008: 67). After WWI, the USA emerged as the new global creditor, and Britain financial and commercial hegemony was increasingly eroded (Hobsbawm 1999). International banking gradually moved from London to New York (Marichal 1989). The international status of sterling was seriously challenged by the US dollar, which became the main reserve currency in the 1920s. US capital exports expanded first in nearby regions such as Central America and the Caribbean and then further south. US banks gained influence in the region at the expense of British banks (Stallings 1987). The period marked the beginning of US imperialism in Latin America and the so-called dollar diplomacy, whereby banks' activities became closely linked to US imperialist policy. More systematically than British imperialism in its informal empire, the central objective of US imperialism was to "[establish] the political conditions for capital accumulation in what was now defined as the American sphere of influence" (Panitch and Gindin 2012: 39). Increasing volumes of US capital were invested in railroads, plantations, mining, and oil extraction (Stallings 1987).

The monetary system that underpinned this expansion was the result of a joint endeavor of the USA and Britain to establish a new international gold standard, to make sure that states were submitted to the discipline of gold, in a context of growing popular unrest, labor militancy, and trade unionism, and the rise of parliamentary social democratic parties in core capitalist countries' domestic politics (Panitch and Gindin 2012; Eichengreen 2008). The system established in the 1920s was a gold-*exchange* standard, as countries held their reserves in gold and in foreign exchange (mainly dollar and sterling), reflecting the previously mentioned reconfigurations in the hierarchy of the world market. The system performed poorly during its short existence, as gold and money-capital flows ended up worsening macroeconomic global imbalances instead of adjusting them (Eichengreen 2008). The global capitalist crisis of overaccumulation of 1929 sounded its death knell. The monetary regime was first suspended in the (more financially vulnerable) peripheries in 1929. Countries in the peripheries were severely hit by deflationary crises when capital inflows suddenly stopped and the revenues from primary commodity exports fell due to the collapse of world trade. Several states (Argentina, Brazil, Chile, Paraguay, Peru, Venezuela, Uruguay, Australia, Canada, and New Zealand) suspended the gold standard in order to service their debt and tame severe deflationary crises. Other countries soon followed, resulting in the complete disintegration of the gold standard at the peripheries, which in turn "further undermined its stability at the center" (Eichengreen 2008: 70). In core capitalist countries, the gold standard also proved particularly unfit for crisis management, aggravating deflationary spirals. Investors lost confidence in states' capacity to maintain the value of their moneys and sought refuge in gold (ibid). Britain abandoned the gold standard in late 1931, effectively marking the collapse of the international monetary regime (Panitch and Gindin 2012).

This meant a return to manage floating exchange rates, with the widespread deployment of exchange and capital controls and a collapse in global capital flows: the stock of foreign assets fell from about 20% of world GDP in 1914 to about 8% in 1930, 11% in 1938, and 5% in 1945 (Obstfeld and Taylor 2004: 55). This had far-reaching implications in terms of the geographical distribution of financial risk and adjustment costs. Indeed, Vasudevan (2008) interestingly remarks that during this period (1919–1939) of "hegemonic decline, war, and economic instability in the center, the incidence of crisis in countries in the periphery was less than that in the core . . .[as] the imperial countries lost much of their control over their possessions, the absence of the safety valve that the countries of the periphery provided led to the concentration of financial crises in the countries of the capitalist core itself."

Postwar State-Led Development and the Bretton Woods System

The postwar period saw the establishment of a system that aimed at facilitating world trade and international investment, which were deemed essential to restore accumulation on a world scale after a devastating world war. The Bretton Woods agreement, signed in 1944, was a coordinated attempt (though largely under the hegemonic leadership of the USA) to establish a framework for the regulation of money and cross-border money-capital flows that allowed significant scope for domestic economic policy-making. More precisely, it established a gold-dollar exchange standard: a fixed but adjustable exchange rate regime, whereby currencies were convertible into US dollar at a specific parity and the dollar was in turn convertible into gold at the defined rate of 35 dollars per ounce of gold. As such, the USA could create money that would flow into the world market, facilitating trade and rapid capital accumulation, while huge gold reserves allowed maintaining it "as good as gold" in value terms. The framework was complemented by the creation of international financial institutions to manage international monetary affairs: the IMF was created in order to correct imbalances by providing short-term liquidity during balance-of-payment crises and overseeing exchange rate adjustments. The World Bank was set up to fund longer-term development projects, first in the context of Europe reconstruction and then in what became the Third World.

This particular functional/spatial arrangement of convertibility between different currencies was associated with a change in the geographical pattern and composition of global capital flows. Two important trends can be identified. Firstly, within the framework of the Marshall Plan, a significant component of these flows were US government loans (recycled trade surpluses, denominated in dollar) to Western Europe and Japan and then increasingly to Third World countries (Soederberg 2005). Contrarily to previous waves of loans to the peripheries, the power of imposing sanctions and incentives was mediated by the IMF and the World Bank (ibid). Secondly, private capital flows mainly consisted in foreign direct investment. As Swyngedouw puts it, "the spatial expansion of commodity production became the preferred 'spatial fix' in which financial capital was intimately link with the need to transnationalize commodity production and exchange" (1992: 44). Indeed, by insuring relatively stable foreign exchange markets, the global monetary regime deterred "speculative geographical currency arbitraging," reduced risks and uncertainties associated with currency fluctuation, and "stimulated location strategies based on considerations of cost and of spatial differences in workers' resistance and working-class power" (Swyngedouw 1992: 46). Foreign investment from US firms was first chiefly directed to Western Europe and Japan. From the mid-1950s, foreign investment also flowed to Latin America and Southeast Asia, as US, European, and Japanese capital sought to invest in these regions in order to re-export the finished product, profiting from a low-wage workforce heavily repressed by collaborative and authoritarian regimes (ibid). On the receiving end of the flows, the state and local bourgeoisies actively encouraged (and, in some cases, managed) these flows. This was facilitated by the Bretton Woods system, under which various forms of capital and exchange controls played an important role in allowing states to nationally process class relations in relative isolation from the speculative movement of money-capital (Holloway 1995). In the Third World, the system (temporarily) allowed enough autonomy for the consolidation of the modernist developmental project and for the construction of "centralized capitalist states, to counter possible revolutions from below and to preside over the formation of exploitable laboring classes" (Selwyn 2015: 529). Many countries across the Third World also opted for a variety of development strategies of industrialization by import substitution, which included a combination of subsidies and tariffs and a mix of capital controls which allowed for a multiple exchange rate system promoting devalued currencies for exporters and appreciated currencies for importers.

From the mid-1960s, changing power relations between capital and labor precipitated a mounting global capitalist crisis. An international cycle of

working-class struggles, both in the realms of production and reproduction, ruptured global capitalist accumulation and broke the Keynesian class compromise (Cleaver 1989; Holloway 1995). In advanced capitalist countries, struggles in the workplace were complemented by various emancipatory political struggles, such as civil rights and anti-war movements and student protests. Struggles also raged in the socialist bloc and in the Third World, including insurgencies and late anti-colonial struggles (ibid). Industrialization by import substitution strategies and developmentalism were reaching their limits as well. Their reliance on acute forms of exploitation and heavy labor suppression, while failing to provide public infrastructures; the exclusion of the majority of the population from development gains; and increasing inequalities were generating more and more resistance. The crisis soon manifested itself as declining profit rates, generalized inflation, slowdown in productivity gains and investment, balance of payment deficits, and a crisis of the welfare state in advanced capitalist countries (Clarke 1988). As a result, the global demand for and the supply of credit grew enormously. This importantly transformed the geographical pattern and composition of capital flows to the Third World (as discussed in the next section) and increasingly undermined the geographical foundations of the Bretton Woods system.

Indeed, transnational corporations, global banks, and other financial institutions became growingly involved in "speculative geographical currency arbitraging" and in the use of Euromarkets in order to escape national regulation and find profitable opportunities (Swyngedouw 1992). Euromarkets are offshore financial markets for currencies, loans, bonds, and other financial instruments. They originated in the dollar-denominated bank deposit liabilities held in foreign banks or in foreign branches of US banks. US banks set up branches in London, which first emerged as a "hub," but offshore markets then developed in other countries, including Singapore, Hong Kong, Switzerland, and the Bahamas (Roberts 1994). Consequently, the space of circulation of the US dollar became

increasingly distinct from its space of regulation (Corbridge and Thrift 1994; Martin 1994). Increasing international capital mobility further aggravated the outflow of dollars from the USA. Moreover, there were growing pressures on the US balance of payment pressures as a result of growing competition from countries such as Japan and West Germany. US gold reserves melted away, which meant that the gap between the quantity of dollars in circulation and the quantity of gold hoarded by the USA was growing (Dunn 2009). As a result, the USA had growing difficulties maintaining the dollar-gold parity, and a generalized speculative run was more and more threatening (Vasudevan 2008). Printing more dollars became increasingly inflationary, especially in the context of spiraling military expenditures associated with the Cold War. Eventually the Bretton Woods system collapsed, after Nixon's unilateral decision to suspend the dollar convertibility in 1971.

The collapse of Bretton Woods and a series of political economic transformations had far-reaching consequences for the geographical patterns and composition of capital flows to the Third World over the period. The global geographical reorganization of production, accompanied by the unfolding of a new international division of labor, led to growing imbalances in international payments which were financed by massive expansion of international credit (Charnock and Starosta 2016). International credit creation was compounded by mounting global conditions of capital overaccumulation and by the collapse of the Bretton Woods system of fixed exchange rates (which removed the "metal limit" on credit creation), resulting in speculative movements of liquidity across the world market. In that context, growing volumes of overaccumulated capital and "petrodollars" flowed into the Third World under the form of syndicated bank loans – mostly from large American and European banks – and public bond issues on Euromarkets (Vasudevan 2008). As state-led development strategies of industrialization by import substitution were increasingly reaching their limits (including a slowdown of economic growth, balance-of-payment problems, inflation, intense social unrest), states across the

Third World increasingly tapped into abundant and cheap international liquidity and resorted to large money-capital inflows in order to sustain productive capital accumulation and finance the brutal repression of working-class struggles (Clarke 1988; Cleaver 1989). This "bout of uncontrolled lending in the 1970s and early 1980s' catastrophically ended up with the Third World debt crisis, after the huge hikes in interest rates triggered by the 'Volcker shock' in 1979–1982" (Corbridge and Thrift 1994: 13). Sovereign debt levels doubled from 8% of GDP at the beginning of the 1970s to about 22% in 1982 (Vasudevan 2008). Mexico defaulted on its sovereign debt in August 1982. This provoked a generalized loss of confidence in international financial markets, a sudden stop of commercial lending and capital flight from the Third World to the USA. The crisis soon spread to more than 40 countries, prompting the international financial community to elaborate a plan to prevent a general financial collapse.

Neoliberal Restructuring and the Basis for Subordinate Financialization in the 1990s

A series of plans were therefore implemented in order to organize the devaluation of capital, but also to ensure that debtor states remained within the bounds of the international financial system (Soederberg 2005). As discussed in the introduction, the imperialist imposition of structural adjustment plans designed by the Bretton Woods Institutions and advanced capitalist countries was a crucial aspect of crisis resolution, at heavy social and environmental costs. Importantly, a number of neoliberal policy prescriptions – including full convertibility of the current account and a unified exchange rate system, the lifting of capital controls on both inflows and outflows and non-discrimination between local and foreign investors, the opening of banking systems to foreign banks, and domestic financial liberalization – deepened the financial integration of Third World countries and further subordinated them to the money-power of capital.

Other aspects of the crisis resolution also had momentous consequences for the relationship between capitalist finance, global patterns of capital flows, and the particular form of subordination of the Third World to the money-power of capital. The first one is the 1989 Brady plan, which consisted in securitizing debt claims by turning them into Brady bonds that could then be traded in secondary markets (Vasudevan 2008). While this allowed international investors to diversify sovereign risk, this also established developing countries' dependence on international financial markets and encouraged short-term foreign borrowing in order to finance fiscal deficits (Painceira 2012; Kaltenbrunner and Karacimen 2016). As a result, the imperative of maintaining "creditworthiness" became an absolute priority in policymaking, at the expense of working-class interests, especially in areas of fiscal and monetary policies, exchange rates, but also labor and environmental standards and political stability (leading to the violent repression of social movements and forms of state authoritarianism) (Soederberg 2005). Rolling over state debts also meant that developing states had to ensure the generation of high financial returns to international investors. Secondly, the development of capital markets in Third World countries, promoted by international financial institutions, and their growing integration into global markets, created new opportunities and needs for local capitalists in order to fund their operations, access foreign exchange, and hedge financial risks, increasing the dependence of nonfinancial firms upon international financial markets (Kaltenbrunner and Karacimen 2016). Those forms of financial dependence have shaped the particular form of "subordinate" financialization that has unfolded across developing states since then (Powel 2013; Kaltenbrunner and Painceira 2015, 2017).

These processes deeply transformed the geographical pattern and composition of money-capital flows to the developing world, which recovered in the early 1990s. Firstly, capital inflows became driven by portfolio investment (often dubbed "hot money" due to their volatility) and foreign direct investment rather than official and bilateral loans. Portfolio flows have been

largely driven by interest rate spreads between advanced capitalist economies and developing economies, providing an incentive for speculative carry trade and geographical currency arbitrage. Indeed, the deregulation of interest rates in developing economies has resulted in the tendency for high interest rates in order to attract money-capital flows. The composition of debt flows also changed from a dominance of sovereign debt to private debt (banks and corporations). Foreign direct investment flows have been motivated by the ongoing process of geographical reorganization of capitalist production on a planetary scale, but also by the opportunities provided by the large-scale privatization of state-owned enterprises and opening of public sectors in developing economies.

Throughout the 1990s, money-capital flows to the developing world proved to be extremely volatile. They followed a highly destabilizing boom-and-bust pattern and catalyzed a number of macroeconomic dynamics, including the formation of asset price bubbles in real estate and capital markets, as well as credit-fueled consumption. They provided incentives for short-term borrowing denominated in foreign currencies, with high foreign exchange risk due to maturity and currency mismatches. They also contributed to the tendency for exchange rate overvaluation, often deteriorating external competitiveness, worsening trade deficits, and aggravating dependence on short-term money-capital inflows. Periods of boom inevitably ended in busts (i.e., a sudden stop and/or capital flight), triggering rapid currency depreciation and difficulties servicing external debts. In many cases, this resulted in a generalized financial crisis spreading to other developing economies, forcing the deployment of violent state-enforced bouts of austerity in order to restore creditworthiness and regain the confidence of international investors, largely at the expense of workers, peasants, the poor, and environmental protection. As Corbridge and Thrift put it, "the victims of sound money policies [were] rarely the same as the progenitors of the earlier round of easy money" (1994: 4). According to IMF figures, "in Mexico the 1994–1995 crisis cost 20% of GDP, Brazil's 1994 crisis

cost 13%, Thailand's 1997 crisis cost 44%, Russia's 1998 crisis 6%, Argentina's 2001 crisis 10% and Turkey's 2001 crisis 30%" (Marois 2015: 30). International financial institutions and advanced capitalist economies blamed those costly and recurrent financial crises on developing countries' alleged high corruption levels, poor monetary and fiscal management, and lack of political stability and robust institutions for the protection of property rights. Moreover, the very same international financial institutions and advanced capitalist economies used those crises as political opportunities to push for further domestic and international financial liberalization across the Global South. In order to boost credibility and enhance investor confidence, developing economies were also "strongly encouraged" to let exchange rates freely float, build high primary budget surpluses to signal fiscal responsibility, adopt inflation-targeting frameworks to maintain price stability, and accumulate vast amounts of foreign exchange reserves to self-insure against sudden capital flight.

Commodity Super-Cycle, Money-Capital Flow Bonanza, and the Post-2008 "Brave New World"

Money-capital flows to developing countries increased considerably in the 2000s, driven by large volumes of liquidity on international financial markets and by the primary commodity boom. They skyrocketed from an average of 487 billion USD in 2003–2005 to more than USD12 trillion in 2007. Over the same period, many developing economies across Asia, Latin America, and Africa streamlined and consolidated their domestic financial and banking systems to mitigate the risks associated with volatile cross-border money-capital flows. This is what Thomas Marois calls the institutional development of more "muscular" state financial apparatuses (2012, 2015). This has included a variety of the "self-insurance" policies such as large reserve accumulation, but also the empowerment of central banks and treasury departments and other state institutions involved in the management of financial and

monetary affairs; the design of policies and institutions to socialize financial risks and the costs of financial crises, such as funds earmarked for bank bailouts and the recapitalization of foreign banks, credit, and deposit guarantees; and active state intervention to rationalize and strengthen failed domestic financial and banking systems, their upgrading to international norms such as Basel I and Basel II. As mentioned in the introduction, this also involved the design of a variety of bilateral, subregional, and regional financial and monetary mechanisms, including currency swaps, reserve pooling arrangements, credit lines, bilateral aid, and development finance, often with the explicit aim to seek independence from the Bretton Woods Institutions and to avoid the type of external crises that had plagued their development in the 1990s early 2000s.

The 2008 global financial crisis sparked a brief but brutal episode of capital flight, with money-capital flows to developing economies contracting to less than 500 billion USD in 2009. In a context of drying up of liquidity, international investors sought refuge in what are deemed "safe" and "high-quality" assets, mostly in the USA and other core advanced capitalist countries, which triggered sharp currency depreciations in developing and emerging economies. Global money-capital flows to the Global South rapidly recovered between 2009 and 2013, amidst much enthusiasm within the international financial community: developing and emerging economies had weathered the 2008 global financial crisis relatively well, the postcrisis economic recovery had been swift, growth prospects looked much better than in advanced capitalist countries (the so-called "two-speed" recovery), and primary commodities and asset prices were booming. There was also much talk of geographical rebalancing of power in the global capitalist economy and of emerging economies becoming the new engine of global growth. Developing and emerging economies' sovereign credit ratings and funding conditions improved. In addition, vast interest rate differentials between developing countries and advanced capitalist economies provided a highly lucrative opportunity for speculative carry trade and geographical currency arbitrage operations (interest

rates in the latter group of countries being close to zero or negative in the context of quantitative easing programs). Put differently, cheap money borrowed in the core was invested in spaces across the Global South that provided both opportunities for short-term capital gains and better prospects of exploitation of living labor and extra-human natures. Large volumes of money-capital flows poured in.

A combination of factors, including the end of the commodity boom, the worsening of the Euro crisis, the US Fed "taper tantrum," and a looming crisis in China, led to a deterioration in global economic conditions and rapidly changing global risk aversion from 2013 onward. Developing and emerging economies were badly hit, and money-capital inflows sharply slowed down or reversed, in a context of sovereign credit downgrades, falling currencies, and financial distress. State authorities implemented violent bouts of austerity, in desperate attempts to restore international investor confidence, often dramatically worsening domestic sociopolitical crises (for instance, in Brazil, Turkey, South Africa, Ukraine). As discussed in the introduction, many countries have called the IMF again to the rescue. In order to understand the mechanisms at play in this particular historical sequence, it is necessary to examine the contemporary geographical organization of the circuits of money-capital and the functional/spatial configuration of convertibility between different currencies and how they have shaped postcrisis geographical patterns of global money-capital flows to the Global South.

The Global South in the Contemporary Geographies of Money-Power

Since the collapse of the Bretton Woods system in the 1970s, the deregulation of exchange rates, and the widespread liberalization of the capital account, the functional/spatial configuration of convertibility between different currencies is defined by "the right to switch currencies at will" (Hampton 2003: 5). This means that the relative value of currencies (the exchange rate) is, in principle, determined by supply and demand

on foreign exchange and currency markets. The structure of the current global monetary system, though, is ridden with power relations and is underpinned by the international hierarchy of national states and imperial power. As such, it is best described as a pyramid of currencies. Those currencies have different "liquidity premiums" which depend on their "degree of convertibility" (Andrade and Prates 2013). This degree relates to currencies' ability to perform internationally the functions of money, such as unit of account, means of payment, and store of value. The currencies of core capitalist states are at the top of the hierarchy, with the US dollar in leading (though contested) position, given that it "serves as a universal unit of account, while the monetary liabilities of the U.S. state function as a universal means of purchase, means of payment and a key reserve asset" (Ivanova 2013: 63). The currencies of developing and emerging economies lie at the bottom of the pyramid, due to their extremely poor ability to perform the functions previously mentioned. There is therefore a built-in structural and spatial asymmetry in the contemporary global monetary system. This asymmetry translates into the unequal capability of states to attract global money-capital flows, systematically penalizing developing economies. This is most blatant in crisis contexts. As the geographical unfolding of the global financial crisis has shown, "drying up" of liquidity during crises amounts to capital flight from developing countries (and currency collapse) and a rush to "safe" assets denominated in advanced capitalist countries' currencies. It is worth highlighting that this "flight to safety" to assets in advanced capitalist countries reinforces the "safe haven" character of the latter's currencies. Put differently, during crises, currency instability in developing countries contributes to maintaining currency stability in advanced capitalist countries, as well as the value of the assets in which they are denominated. This is a key manifestation of contemporary imperialism, and it entails a highly uneven spatial distribution of financial vulnerability and deflationary adjustment. Consequently, the crisis-driven bouts of state-enforced austerity and labor disciplining in

order to maintain/restore creditworthiness and confidence in the national money have been harsher in developing countries, crucially shaping their trajectory of capitalist development and incurring high social costs disproportionately borne by the working class.

This asymmetry in the functional/spatial arrangement of the global monetary system is compounded by a second set of geographies that concern the spatiality of the global financial system. The multiple markets and institutions of the financial system are integrated into "distinctive geographical and institutional hierarchies from the local to the global level" (Clark 2005: 99). World financial centers such as London, New York, Frankfurt, and Tokyo dominate this hierarchy, centralize and concentrate the money-power of capital, and exert control functions over the global financial system as a whole (Martin 1999). While financial centers in emerging economies such as São Paulo, Johannesburg, Shanghai, Mexico City, and Istanbul have become important regional sites of financial innovation, this has not challenged the dominance of the aforementioned world financial centers, which remain disproportionately located in advanced capitalist countries and largely control the global orchestration of money-capital flows (Bassens 2012; Clark 2015).

There are at least two ways through which world financial centers exercise huge power on the wider geographies of the global financial system, with important implications for developing and emerging economies. Firstly, powerful actors of the global financial system, such as global investment banks, organize their scale of operations and diversification into other geographical markets, *from* those world financial centers. This has a considerable impact on patterns of global money-capital flows, particularly in case of financial distress, during which those actors tend to consolidate their activities in advanced economies at the expense of operations elsewhere, shaping the uneven geographical unfolding of crises and often penalizing developing countries. Secondly, world financial centers exercise huge power on the wider geographies of the global financial system because they are the leading sites of

production of financial instruments and knowl-edges. Credit rating agencies and other special-ized firms produce financial knowledge that "categorize" the uneven geographies of global finance, shaping the global circuits of money-cap-ital (Lee 2011). The production of this knowledge is permeated by a set of power-laden imaginaries and representations, such as Western- and capital-centric views of history and modernity, stagist/linear conceptions of development, imperial/neo-colonial imaginaries, racism, and specific norms of masculinity (see Alami 2018b for a fuller expo-sition of those arguments). This is reflected in processes of risk valuation, resulting in the repre-sentation of developing and emerging economies as a cluster of asset classes with relatively high risk/reward ratios. This, in turn, has four very concrete material consequences which are partic-ularly important for understanding patterns of money-capital flows to developing economies and their shifting financial reputation.

Firstly, money-capital flows to developing economies are extremely pro-cyclical, often wors-ening periods of financial distress (Lee 2011). Secondly, the clustering together of ECE assets has implications for crisis transmission and con-tagion between developing countries categorized as "emerging" or "frontier" markets (as the mul-tiple crises during the 1990s and 2010s showed). Thirdly, in order to attract money-capital in a context of international competition between developing economies, states have to deploy eco-nomic policies that provide high rewards to the application of capital in its money form, such as extremely high interest rates. Fourthly, this leads to the buildup of particular forms of external vul-nerability characterized by the large presence of nonresident investors in short-term financial assets (including bonds, shares, foreign exchange derivatives, etc.), making developing economies highly exposed to capital account reversals (Kaltenbrunner and Painceira 2015, 2017). All four aspects result in developing economies being significantly penalized by the way the global financial system structures and orchestrates the global flow of money-capital. This is essential for understanding the recent global financial

crisis, its uneven geographical and temporal unfolding, and associated patterns of global money-capital flows. This is also a key factor of explanation of the violence of money-power, expressed through the operations of global capi-talist finance in the global South.

Before concluding, it is worth insisting that those geographies of money-power have been enforced and maintained through various imperi-alist policies. The collection of essays in Panitch and Konings (2009), for instance, shows how the institutional framework of American finance shaped the global finance system and how "the institutional linkages between the American state and the structural power embedded in the system of global finance have functioned to enhance the power of the US state" (2009: 8). Similarly, Norfield (2016) explores the imperialist policies implemented by the UK to retain control of the global financial system through the City of Lon-don since the 1980s.

Conclusion

The essay has provided a historical geographical political economy of the entanglement of world money and world power. As such, it has gestured toward a theoretically informed explanation of the violence of the money-power of capital in the peripheries. The key argument, substantiated throughout the essay by adopting a longue durée view, is that while the global flow of money-capital must be understood in terms of the money-power of capital to appropriate living labor and extra-human natures, the latter has also been mediated by relations of imperialism since the birth of the world market. The essay has shed light on a particularly crucial aspect and manifes-tation of that process, which is the production of specific *spatial relations*. Indeed, money-capital does not flow in a void. Its flow is organized and structured by what has been referred to as geog-raphies of money-power, which are constituted by the geographical organization of the global finan-cial system and by the functional/spatial arrange-ment of the global monetary system. The concrete

and distinct geographies of money-power, while experiencing radical transformations throughout the history of global capitalism, have been consistently underpinned and enforced by imperial power, at the expense of the spaces of the world market successively referred to as the peripheries, the formal and informal colonial territories, the Third World, and the global South. In fact, the subordinate positionality of those spaces in the geographies of money-power, and the associated violence of expression of the money-power of capital, has been a phenomenon of remarkable historical continuity. Importantly, the essay has shown that this has in turn contributed to reproducing imperial-hierarchical relations between spaces across the world market.

This analysis of the entanglement of world money and world power is important for three reasons: firstly, for understanding how financial fragility and vulnerability, as well as the costs of adjustment during crisis, are unevenly distributed across the world market, largely at the expense of workers, peasants, the poor, and non-human natures in the Global South; secondly, for making sense of the global relations of power, value, exploitation, and dispossession that underpin the operations of capitalist finance and global patterns of money-capital flows and how those contribute to the reproduction of pervasive inequalities on a planetary scale; and finally, it has also implications for questions of strategic-political organizing and emancipatory struggles. Indeed, the analysis suggests that anti-capitalist struggles against capital's drive to reduce human life and lifeworlds to economic resources and money abstractions (through privatization, commodification, marketization, and financialization practices) must, by necessity, also be *anti-imperialist*. These must involve struggles for the reconfiguration of the relational geographies of money-power and against the imperialist practices that underpin them. This points to the need for transnational forms of solidarity that can bridge those geographies, involving workers in both countries that receive large amount of money-capital flows and in those that are the source of those flows.

Global Free Trade, Imperialism, and International Trade Law

Donatella Alessandrini
Kent Law School, University of Kent, Canterbury, UK

Introduction

In their 1953 *Economic History Review* article "The Imperialism of Free Trade," historians John Gallagher and Ronald Robinson made two points that are still relevant for thinking about the relationship between global trade, imperialism, and international trade law. First, they emphasized the informal mechanisms that, alongside formal rule, ensured British expansion throughout the nineteenth century and, by doing so, they questioned the orthodox view that divided the century in periods of imperialism and anti-imperialism, emphasizing continuities instead. Secondly, they articulated a critique of the link between free trade and anti-imperialism that was thought to characterize this period, thereby challenging the conventional view according to which "free" trade could dispense with Empire. Taking the cue from this seminal article, the first section of this entry engages with the Empire of Free Trade, highlighting the role international law mechanisms and free trade ideology played in ensuring commercial expansion; the second analyzes this role in the context of the post-war multilateral trading system, focusing on the mismatch between free trade rhetoric and actual trade practice; and the third brings the preceding analysis to bear on current international trade relations.

The Empire of Free Trade

The "Imperialism of Free Trade" was an influential intervention in the debate about nineteenth-century theories of imperialism. Despite the focus on Britain, it has since generated broader discussions about the relationship between capitalism, imperialism, and free trade. In it, Gallagher and Robinson took issue with the view that, unlike the early and late parts of the nineteenth century – seen as the apex of British imperialism – the mid-Victorian period had been "indifferent" toward Empire. Between 1841 and 1851 alone, they pointed out Britain had directly occupied or annexed "New Zealand, the Gold Coast, Labuan, Natal, the Punjab, Sind and Hong Kong." In the 20 years that followed, it asserted control over "Berar, Oudh, Lower Burma and Kowloon, over Lagos and the neighbourhood of Sierra Leone, over Basutoland, Griqualand and the Transvaal; and new colonies were established in Queensland and British Columbia" (1953, pp. 2–3). The myth of "indifference" surrounding this period becomes more difficult to sustain if the analysis of imperialism goes beyond these examples of direct rule (i.e., annexation or occupation) to include techniques of political and commercial control, for instance, those exercised through paramountcies (in Malaya centered on Singapore) and suzerainties (in West Africa) and, importantly, through so-called free trade and friendship treaties. The latter in particular were widely used to achieve commercial expansion: between 1836 and 1861, treaties were signed with Persia, Turkey, and Japan, among other states, enabling Britain to conduct trade with these regions (1953, p. 3). Often referred to as "unequal treaties" because of the asymmetry in power relations, these agreements contained unequal obligations for the parties involved. For instance, the Treaty of Nanking signed as a result of the Opium War required China to cede Hong Kong to Britain and open five Chinese ports for trade, while also establishing a favorable tariff regime for British goods (Anghie 1999, pp. 36–37). Gallagher and Robinson's point was, therefore, that throughout the nineteenth century, the British government had ensured the protection or acquisition of commercial interests, by

"informal means if possible, or by formal means if necessary" (1953, p. 13).

This combination of formal and informal mechanisms was however not new, nor did it pertain exclusively to nineteenth-century British imperialism. It was inextricably linked to processes of capital accumulation, which in turn relied on the construction of powerful racial hierarchies enabled by, among other means, international law. As critical legal scholars have pointed out, international treaties and doctrines have been powerful techniques of commercial expansion and racialization since at least the sixteenth century (Knox 2016). Francisco de Vitoria, the famous Spanish theologian and jurist, asserted the "natural law" right to freely trade, forcefully in the event this right was denied by another country. As gold was "discovered" in America in the fifteenth century, and the feudal law of the time applied only to members and enemies of the *Respublica Christiana*, a different legal regime was needed to discipline relations with the native populations. According to Vitoria, the natives possessed "reason" but were also governed by a law of nations (*jus gentium*) which included the right to trade and the right to evangelize; and denying such rights, which were premised on the superiority of Christian civilization, could give rise to "just war." The regime of early colonialism led by the Spanish was to give way in the seventeenth century to the mercantilist system led by the Dutch and the British (Chimni 1993). This system was centered around trade monopolies exercised not by means of formal control but through trading companies. The role played by legal doctrines to legitimate this regime was, again, crucial. Thus, writing in the seventeenth century, Hugo Grotius developed the theory according to which the sea was open to the trade of all nations. The doctrine of *Mare Liberum* was his response to a request by the then Dutch United East India company for a legal opinion that would grant them the right to trade in the East Indies against Portuguese claims of exclusive rights (Esmeir 2017, p. 83).

Mare Liberum therefore points to the role that trading companies have played in the development of imperial regimes as well as to their

influence over the evolution of international law. Companies were granted the right to trade, make peace and war, as well as the power to exercise sovereign rights over non-European peoples, which included profiting from the slave trade and the sale of slave-produced goods (Knox 2016, p. 14); but whereas in the sixteenth and seventeenth centuries they were mainly concerned with making profits, in the eighteenth and nineteenth centuries they became increasingly involved in acquiring and governing territories (Anghie 1999, pp. 32–33). This shift reflected, at least in part, the changing circumstances of capital accumulation: as the British industrial revolution revealed the need for colonies to absorb the "flood of products pouring out of the new factories" (Chimni 1993, p. 228), direct control became the preferred means for transforming their societies into markets for manufactured goods. Positivist international lawyers enabled this enterprise by crafting the standard of "civilization" which, relying on ideas of racial inferiority, granted some non-European territories legal personality (particularly in order to sign treaties) depending on whether or not they were deemed to meet European social norms, including those which guaranteed the rights of property and the freedom of commerce (Koskenniemi 2002; Anghie 2005). Therefore, the relationship between formal and informal control as well as that between state and corporate interests is complex and has shifted over time, but it is not something limited to nineteenth-century British imperialism.

Having called into question the idea that the middle part of the nineteenth century was a period of anti-imperialism in British history, the second point Gallagher and Robinson made was about the mismatch between governments' declarations in relation to free trade and actual policies, a point which enabled them to challenge the conventional view according to which free trade beliefs could dispense with imperialist attitudes. They noted that it was during the Gladstone government – the liberal government of anti-imperialist reason – that Britain "annexed Basutoland in 1868 and Griqualand West in 1871" (1953, p. 3). But their target was not only policy-makers and the Manchester School who had sought to make free trade

principles the basis of government policy. It was also those who had seen imperialism as the highest stage of capitalism, applying historically to the period after 1880. They were referring to the exponents of the classic theories of imperialism and in particular to Hobson and Lenin who, they claimed, had seen late-Victorian imperialism as a significant shift in the nature of British expansion and a "sharp deviation" from the static liberalism of the middle of the century (1953, p. 2). Gallagher and Robinson's argument was that, despite their differences with the Manchester School, the critics of imperialism shared the view "that mid-Victorian 'indifference' and late-Victorian 'enthusiasm' for empire were directly related to the rise and decline in free-trade beliefs" (ibid.). The views of classic theorists of imperialism (e.g., Hilferding, Luxemburg, Bukharin, Lenin) were much more varied than Gallagher and Robinson acknowledged. However, the important point they made is that, instead of a correspondence between free trade beliefs and anti-imperialism, a mismatch between free trade thinking and actual trade practice had characterized government policy in this period. Indeed the appropriate slogan for Free Trade Empire should not be "trade not rule" but rather "trade with informal control if possible; trade with rule when necessary" (1953, p. 13). In other words, free trade theory could not explain government policy; instead, commercial expansion was at issue when free trade was invoked as the basis of government action.

Now, the classic theory of "free trade" appears only in the eighteenth century when French physiocrats and British classical political economists reject the economic assumptions of the mercantilist system that had dominated over the past two centuries, posing instead the universal applicability and desirability of what were to become the twin pillars of free trade: international specialization (Smith 1776) and comparative advantage (Ricardo 1817). According to these principles, provided each country specializes in the production of the goods it can produce more efficiently (i.e., at a lower cost), and exchanges them for those it cannot produce efficiently at home, all countries benefit from trading with one another.

In other words, international specialization guided by the "law" of comparative advantage promises to deliver world prosperity. There are however two observations scholars have made with regard to the global dimension and universal assumptions of the theory.

The first is that historically British trade policies followed free trade prescriptions at a particular point in time and only to a very limited extent. The system of protection practiced since Henry VIII was certainly a crucial factor in English industrialization (Chang 2007) as were the vast territories on which Britain exercised formal and informal control to extract raw materials. By the beginning of the nineteenth century, however, the protective legislation of other countries became an obstacle to further expansion of British trade: protection at home was unnecessary given the competitiveness achieved by English manufacturers, although it continued to benefit the landed aristocracy. However, protection of agricultural goods desired by the latter meant the price of labor in the manufacturing sector had to be kept at a certain level to allow workers to reproduce; so the repeal of English import duties on food and grains provided an opportunity to lower its cost through cheaper imports and consequently to further increase the competitiveness of manufacturing.

The unilateral repeal of the Corn Laws (i.e., tariffs on food and grains) in 1846, often portrayed as the foundational act of faith in free trade by a European government, can be seen in a different light: it came at the end of a struggle between the landed aristocracy and the industrial capitalists, with the latter prevailing. The intellectual superiority of free trade that was invoked at this point in time was also to affect a particular international division of labor, one favorable to British manufacturing interests. As Engels put it (1888, p. 2): "To convert all other countries to the gospel of Free Trade, and thus to create a world in which England was the great manufacturing centre, with all other countries for its independent agricultural districts, that was the next task before the English manufacturers and their mouthpieces, the political economists." Such division of labor concerned the relationship with other European nations as well as that with the colonies. The Cobden-Chevalier treaty signed by Britain and France in 1860 to reduce tariffs between the two countries is one example of the bilateral treaties signed between European states, supposedly under the influence of free trade theory. These treaties however applied selectively to specific goods rather than across the board. Free trade theory was also invoked to persuade former colonies to continue specializing in the production and export of agricultural goods; but, as Chang (2007) points out, it was Hamilton's rejection of free trade "wisdom" that paved the way to US industrialization. This possibility however was not open to other colonies, particularly those racialized as "uncivilized" and in need of assistance by European states (article 6 Berlin Conference, 1885). There is therefore very little evidence in the nineteenth century of free trade theory being "applied" uniformly, with all countries benefiting from trading with one another.

The second observation regards the conceptual apparatus of free trade and can be derived from Marx's critique of classical political economy. Marx challenged both Say's law, which excluded the possibility of excesses in the market as it assumed supply generated its own demand – thereby obliterating the role that colonial markets performed in absorbing such surpluses; and the principle of comparative advantage, which naturalized an unequal division of labor between countries. Both postulates can be found in Ricardo's writings. Marx (1848, p. 1) focuses on the conditions that await the working class "under the reign of perfect Free Trade" and asks:

What is the natural normal price of the labor of, economically speaking, a working man? Ricardo replies, "Wages reduced to their minimum – their lowest level." Labor is [therefore] a commodity as well as any other commodity . . . [With free trade] "that labour being equally a commodity, will equally sell at a cheaper price" – that you will have it for very little money indeed, just as you will have pepper and salt.

"Freedom" in "free trade" is therefore for Marx freedom of capital but his is not a defense of protectionism, which he describes as the "artificial means of manufacturing manufacturers" (1867,

p. 921); it is only because of his assumption that free trade could lead to international labor solidarity that he declares himself in favor of free trade (1848). The broader point deriving from his analysis is that the pitting of free trade against protectionism is misleading: what is at stake is selective and strategic liberalization, with different capitals articulating different interests and exercising different pressures on governments. The power to enact strategic liberalization, however, clearly depended on the country at issue. As shown by the Berlin Conference convened in 1884–1885 to settle European rivalries over the so-called scramble for Africa, free trade and liberalization "meant nothing other than the naked exploitation of raw materials from the colonies" (Dembour and Stammers 2018, p. 174; see also Rodney 1972). And while the need for the colonies to keep their markets open to the trade of all nations was enshrined in the early legal instruments contemplating their future self-determination (articles 22 and 23, League of Nations, 1920), the imperial powers continued to protect their domestic markets.

The mismatch between free trade theory and government practice was to provide one important continuity between the Empire of Free Trade of the nineteenth century and the international trade relations of the twentieth century, although the old imperial regime was to give way to a new multilateral trade system.

Free Trade and the Post-war Multilateral Trading System

The assumptions about the universal beneficial effects of trade liberalization were refined at the beginning of the twentieth century when Ohlin (1933) introduced the neo-classical reformulation of free trade theory. For them, international trade arises not because of the differences in labor productivity alone (as Ricardo had thought) but because countries are "endowed" with different supplies of the factors of production, and different supplies entail different prices. The policy prescription of the "factor-endowment model" is that countries that are endowed with large supply

of labor should specialize in the production of labor-intensive products, while countries rich in capital and/or technology should specialize in the production of capital and/or technology-intensive goods. The post-war international division of labor is said to be based on these "universal" principles, which are then supposed to have been translated into multilateral law with the entry into force of the General Agreement on Tariffs and Trade (GATT) in 1947. The GATT, which applied to trade in goods, did not eliminate tariffs and other forms of government intervention overnight but contained legally binding obligations for contracting parties to progressively reduce these measures. This commitment to liberalization was deemed necessary to enable "market prices" to reflect "real prices" as closely as possible, thereby facilitating the operations of comparative advantage on the world market.

The problem with this view of the post-war international trade system is that it cannot explain why sectors of major export interest to the soon-to-be independent countries – taking the logic of the factor endowment model at face value – were excluded from liberalization. Agriculture and, in the 1960s, textiles were not subject to the same liberalization rules that applied to manufacturing and remained largely protected in industrialized countries through tariffs, non-tariff measures, and subsidies. In other words, the free trade principles were said to inform that legal system could not, once again, explain trade practice. This differential treatment was enshrined in the law of the GATT despite the concerns articulated by the seven so-called "less developed" countries which denounced the double standards embodied by multilateral trade rules (Brown 1950). Expressed in part through arguments about the past of colonial exploitation that had shaped the state of their economies, these concerns were dismissed because the conference, it was claimed, dealt with purely "economic" matters, while "political" claims in relation to colonialism and "development" were best dealt with within the United Nations. Former colonies, however, gradually acquired independence (except Latin American countries which had become independent in the nineteenth century) and by the 1960s could

count on their numerical superiority to articulate their discontent with the international trade system. "Developing" countries saw the GATT as "structurally" disadvantaging their trade for at least three reasons. First, GATT law treated industrial products differently from primary products, enabling protection of the latter and therefore curtailing the earnings newly independent countries were expected to make according to free trade theory. Secondly, as more and more independent countries came to specialize on raw materials and primary commodities (the other sector of export relevance to their economies), their prices started to plummet because of the "rigid" demand from industrialized countries, again compromising their export earnings. And finally, as GATT law did not allow developing countries to support their "infant" industries, their manufactures were unable to compete with goods from industrialized countries.

These concerns were articulated in terms of dependency, core-periphery, and world systems theories (e.g., Prebisch 1959; Frank 1969; Cardoso 1973; Amin 1976; Wallerstein 1979). Despite their differences, these schools placed their emphasis on the structural inequalities generated by the international economic system, of which the trading regime was an integral part. Their insight was that past colonial and capitalist relations had generated an international system in which those countries which were the centers of capital accumulation still relied on the economies of other countries to export goods and capital and extract cheap materials to sustain underconsumption or overproduction at home. This system in turn generated unequal relations concerning technological development and terms of trade (Fischer 2015). Raul Prebisch, one of the major exponents of the dependency school, became the first Secretary-General of the United Nations Conference on Trade and Development (UNCTAD), around which many countries coalesced in the 1960s to demand structural change of the international system as a whole. UN resolutions such as the one on Permanent Sovereignty over Natural Resources, the Charter of Economic Rights and Duties of States, and the one launching the New International Economic Order extended beyond trade and contained proposals for reforming international economic relations, including those concerning foreign investment. Trade and investment law and policy were indeed seen as closely connected as they concerned the regulation of the movement of goods and capital. Originally, when the rules of the post-war international economic system were designed, the International Trade Organization (ITO) was meant to administer both trade and investment rules. It never came into force due to the refusal of the US Congress to ratify the Charter, and what was instead adopted was its chapter on trade, which then became the GATT.

The attempt to obtain multilateral rules favorable to foreign investors was however never abandoned. As Sornarajah has pointed out, the emerging international law on foreign investment, a creature of the post-colonial period, represented an attempt by capital exporting countries to argue for the existence of international norms and standards that allowed for the protection of foreign investors beyond the level provided by the domestic laws and courts of the newly independent states (Sornarajah 1994). These efforts were successful to an extent, particularly as bilateral investment treaties signed between capital importing and capital exporting countries contained high standards of protection, including the obligation to not discriminate between foreign and domestic investors. But they did not succeed at multilateral level as capital importing countries resisted both the call to adopt a Multilateral Agreement on Investment (MAI) that would have provided uniform high standards of treatment (Picciotto 1998); and also attempts made through arbitration to universalize these standards by deeming them to have acquired the status of customary international law (Sornarajah 1994).

Reforms were however achieved within the multilateral trade system. Developing countries' engagement with the structural inequalities of the GATT resulted in their right to not reciprocate when industrialized countries made tariff concessions (GATT, Part IV). This exception to the reciprocity principle of the GATT prepared the ground for so-called Import Substitution Industrialization (ISI). While for some scholars non-

G

reciprocity – together with the refusal to extend national treatment to foreign investors at the multilateral level – resulted in considerable levels of industrialization in the 1950s and 1960s (Rodrik 1997), others point to the fact these countries would have achieved better results had full liberalization been rolled out (Lal 1983). And the second argument seems to have prevailed in the 1990s when the neo-liberal revolution of the multilateral trade regime took place (Lang 2011).

There were however important material factors that played a role in such a transformation, including the end of Cold War with the respective spheres of geo-political influence (Faundez 2017); the debt crisis that many countries in the Global South which had borrowed from the United States experienced as a result of its decision to increase interest rates; the structural adjustment policies that were imposed to reschedule their debt requiring countries to liberalize their tariff regimes (Gowan 1999; Tan 2014); and, importantly, the loss of competitiveness that the old industrial centers (United States, Europe, and Japan) witnessed as newly industrialized countries took the lead in manufacturing. Indeed, if in 1972 North Western European countries and the United States were still responsible for over a half of world exports, the situation had changed greatly in the 1990s as Asia had increased its share "from about a sixth to a third, at the expense of all other continents" (Federico and Tena-Junguito 2018). The search for new comparative advantage in the three industrial centers was therefore on and it accelerated at the end of the 1980s: the loss of competitiveness in manufacturing, it was thought, could be compensated by the gains to be made through the liberalization of services and capital, on the one hand, and the protection of intellectual property rights (IPRs), particularly those on technological innovations, on the other (Preeg 1995).

The post-war multilateral trading system could not "liberate" the new comparative advantage because it only dealt with trade in goods – and mainly industrial goods given the fact that agriculture continued to be protected. The World Trade Organization (WTO) established in 1995 accomplished such an objective: it extended free trade universal assumptions to areas not covered by the GATT, including services, investment, and intellectual property rights. But there was also a qualitative change in the way the multilateral trade system was to approach the regulatory powers of members states. Whereas the GATT had embodied a system of negative regulation in that it prevented states from discriminating against foreign (industrial) goods for protectionist purposes, the WTO enacted a system of positive regulation (Ostry 1990) detailing what states had to do to comply with WTO norms and mandated standards such as those relating to sanitary and phytosanitary measures and so-called technical barriers to trade. As Lang (2011) has pointed out, "ideas," particularly those articulated by trade lawyers, played a role in this transformation. Chief among these was the adoption and elevation of the world market as a "free" market, a space unencumbered by obstacles, particularly those posed by government regulation, that may disturb the conditions of "perfect" competition. The key move, he has argued, was "to define a barrier to trade primarily in terms of its economic effects, rather than its form or intention. In this approach, a governmental action constituted a barrier to trade if – and to the extent that – it 'distorted' the conditions of competition . . . as compared to the conditions of competition which would exist in an imagined 'free' market. . ." (2011, pp. 226–227).

The imagined "freedom" involved in this global market was, as Marx noticed with respect to "free" trade, that of capital: when the rules on the uniform protection of IPRs and the liberalization of services and investment are considered together with those requiring countries to adopt standards and regulations which had been set in the three industrial centers – the WTO emerges as a powerful legal structure, supported by an effective dispute settlement system, that provides ample support for foreign investors and their capital (Alessandrini 2010). And while the WTO agreement on services also provides for the liberalization of "natural persons," the movement of labor, particularly unskilled labor, continues to be impeded, and agricultural goods continue to be highly protected in the Global North (Hunter 2003; Orford 2015).

The mismatch between free trade theory and practice is therefore a characteristic of the post-war multilateral trade system. This discrepancy is made possible, at least in part, because the economic and legal regimes of "developing" states continue to be regarded as "inadequate" or "deficient." Within the GATT, developing countries' economic policies, especially those relying on import substitution, were seen as failing to deliver higher volumes of trade, comparable to those of industrialized nations, and improved standards of living. With the WTO, the "lack" of appropriate institutional arrangements is considered responsible for the ineffective working of the markets so that in addition to the new standards (Intellectual Property standards, sanitary and phytosanitary standards, technical standards, and regulations) developing countries have to implement mechanisms such as the Trade Policy Review Mechanism (which monitors countries' compliance with WTO norms) and the Integrated Framework (which provides assistance to those least developing countries that integrate trade in their growth plans) have been put in place to ensure that countries' legal regimes are kept in check.

Global Free Trade and Imperial (Dis) continuities

What does this very limited excursus into the evolution of the post-war multilateral trade system say about imperialism and the ideology of free trade with which Gallagher and Robinson were concerned? By considering the complementarity between formal and informal rule, together with the mismatch between free trade theory and actual practice, they came to the conclusion that imperialism was "a sufficient political function of th[e] process of integrating new regions into the expanding economy; its character [being] largely decided by the various and changing relationships between the political and economic elements of expansion in any particular region and time" (1953, p. 5). There have been more recent attempts to engage with their work. Desai, for example, has called for an understanding of these complex and changing relationships in terms of "uneven and combined development" where past dominance by single powers, whether actual or attempted, is being replaced with a multipolar system in which powerful countries attempt to "maintain unevenness and resolve the contradictions of their capitalisms at the expense of weaker ones – but are less likely to have their way in the face of more numerous and stronger contenders and larger populations capable of aspiring to more than bare survival" (Desai 2013, p. 17).

The evolution of the post-war international trade system points to ceaseless attempts by leading trading powers to maintain economic dominance through a discourse about "free" trade and its universal validity and desirability which finds correspondence neither in the international trade law that is supposed to translate it nor in the practice of the multilateral trade system that is supposed to give it effect. In this sense there is continuity in the way "free" trade rhetoric is invoked as universally beneficial while selective trade interests are being pursued instead. From this angle "free" trade and international trade law can be seen as informal mechanisms of control and capitalist expansion which remain important areas of analysis for studies of imperialism (Gracott and Grady 2014) together with the way in which "development" discourses continue to order societies and prescribe courses of action in the name of a superior economic rationality (Anghie 2000). However, there are also arguments about discontinuities that merit attention.

It is, for instance, argued that the non-reciprocity developing countries obtained through their denunciation of the structural imbalances created by the GATT left them relatively free to not comply with its obligation to reduce tariffs on manufactured goods, even as industrialized countries reduced theirs. The claim is that GATT rules allowed for policy space, and scholars make a similar point with regard to the flexibilities built in the WTO system (Santos 2012). It is however important to acknowledge that this freedom was relative for, while developing countries were allowed to support their industries under the GATT, their exports continued to be hindered and the associated earnings continued to be compromised. Also, as soon as the conditions of competitiveness

changed against "old" industrialized countries, charges of "unfair" trade practices were levied against newly industrialized countries, anti-dumping duties were imposed on their products to protect domestic markets, and non-reciprocity was eventually withdrawn in favor of an "equal" playing field that required all countries to reciprocate (Gibbs 1998, p. 3). This freedom was relative also because, while it became possible to talk about exceptions from the norm the multilateral trade system embodied (i.e., trade as a means to accumulate capital in order to "develop"), the norm itself was never open to challenge: countries could opt for more or less liberalization but they had to industrialize, grow, and "develop." Indeed, "development" has played a crucial role alongside the myth of free trade in the transformation of entire societies in the wake of decolonization (see Escobar 1995; Pahuja 2013). And, finally, the policy space of individual states continues to be relative because regulatory autonomy is always affected by (trans)national arrangements that shape the global economy, not only trade and investment arrangements but also those concerning global finance, whether states are formally part of them or not (Linarelli et al. 2018).

Another argument concerns the shift in the global balance of power that is associated with the rise of China and other emerging economies, which are increasingly seen as leading sites of capital accumulation capable to resist the demands of powerful trading nations. For instance, during the first and only round of WTO negotiations, the Doha Round, developing countries have formed coalitions to block attempts by the United States and the European Union in particular to negotiate multilateral rules providing further protection to foreign investors (Faundez 2017). The inability to pursue this agenda at WTO level is seen by some as having contributed to the surge of mega-treaties like the suspended Transatlantic Trade and Investment Partnership (TTIP) – with which the United States and EU would have agreed to enhanced liberalization of trade and protection of foreign capital; and the now defunct Trans Pacific Partnership (TPP), with which the United States has attempted to get countries relying on access to its market to

agree to higher standards of protection of foreign capital, thereby also trying to curb the rising influence of China (O'Donoghue and Tzouvala 2016). The US administration has abandoned such efforts in favor of direct trade action against China, allegedly because of her "unfair" trade practices, in a move that is reminiscent of US actions against newly independent countries in the 1980s (Gibbs 1998, p. 3). China has indeed become a permanent concern for leading agencies of capital accumulation. This seems to be confirmed by recent trade data which shows that: "Until the early 1990s, the fall in the share of 'old rich', from 56% to about 40% of world exports, was compensated by the relative increase of exports from the 'other OECD' countries – most notably Japan. [However] In the last 15 years, exports from the advanced countries decreased further to slightly over a third, the other OECD countries returned to a sixth, their level for the 1970s, and the 'rest of Asia' (mostly China) jumped to a quarter of the world market" (Federico and Tena-Junguito 2016, pp. 1–2).

The dominant position that former imperial states enjoyed within the multilateral trade system in the post-war period is thus no longer taken for granted; however, whether changes in trade imbalances conclusively point to a shift in the global balance of power is an open question. Scholars have, for instance, pointed out that, although capitalism has always been transnational, since the 1970s production has become increasingly more fragmented, taking place through global chains and networks, which makes it difficult to ascertain the value produced by each firm operating along these chains as well as that captured by states where these firms are supposed to reside (Hamilton and Gereffi 2009). From this standpoint conventional trade data, particularly that concerning trade balances, says very little about global power relations. One particular issue, as Fischer has argued, is that the current system of international accounts is still based on an outdated conception of the post-war world where capital flows were restricted and international trade consisted of national economies exchanging final goods and services with one another. As he points out: "The difficulties such

a system faces in accounting for activities between a transnational parent company and its foreign affiliates, for instance, help to explain the dissonance between the deterioration of recorded US trade balances and the increased profitability of US companies operating in the global market" (2015, p. 721). These difficulties call into question the argument according to which shifts in geopolitical power are reflected neatly into trade imbalances; at the same time, they point to the need for more thorough investigations into the ways in which economic value is produced and distributed along these chains to understand how commercial expansion and capital accumulation take place in the global economy.

The pitting of "free" trade against protectionism, which can be traced back to the nineteenth century and the debates Gallagher and Robinson examined, does little to address these complexities so to explore those "changing relationships between the political and economic elements of expansion" that give imperialist processes their character (1953, p. 5). The multilateral trade system appears today more complex and fragmented than it was in the post-war period. Taking a longer historic look at these changing relationships, however, reveals that "imperial formations" are constantly shifting and have never been "steady states" in the sense of being securely bounded, regular or well regulated within stable geographical boundaries (Stoler 2006, pp. 135–136). For its part, international trade law has provided and continues to provide a powerful mechanism through which these formations are articulated; it does not simply translate free trade theory into, acting as conduit for, international trade practice.

Global Health and US Imperialism

Jacob Levich
Administration, Stony Brook University, Stony Brook, NY, USA

Interventions in the field of public health are a significant form of "soft power" by which imperialism extracts profits from the world's poorest billions. US involvement in the health field is intended, inter alia, to help ensure efficient use of low-cost labor in transnational production chains; to support and rationalize military interventions; to create and exploit worldwide markets for health-care products, especially pharmaceuticals; and broadly to consolidate control over the lives and bodies of Global South people. Crucial to the enterprise is a complex network of charitable foundations, US government initiatives,

international institutions, national health ministries, and NGOs, all steered by the interests of Western capital. By far the most influential force within this network is the Bill & Melinda Gates Foundation (BMGF), the world's largest private charity.

"Global health imperialism" has been characterized as an informal system with the following features:

- Global health crises are held to *originate from* poor countries and constitute a *threat to* wealthy countries. Response to such crises is regarded as a security concern.
- Westphalian national sovereignty is considered an impediment to effective management of transnational health issues.
- Overarching health-care planning, policies, and programs for the people of poor countries are determined by the experts and financiers of wealthy countries. Foundation funding is used as leverage to ensure that national health systems cannot function independently.
- Existing national and local health-care management is subordinated to, and must be cooperative with, the goals of Big Philanthropy and Western capitalism.
- Militarization of health-care delivery and disaster management is deemed appropriate and necessary. Military forces involved are drawn from the United States, NATO, and allied countries.
- Health philanthropy is modeled on the philosophy and practices of private corporations. Health-care funding is conceived as an investment activity; quantifiable return on investment is the guiding principle for grant-making.
- Big philanthropy underwrites vertical initiatives potentially profitable to Western-based transnational corporations – for example, vaccines and other pharmaceuticals – instead of supporting primary care and strengthening national health systems. Drugs and other health-care commodities produced by Western TNCs are financed by the taxes of the poor.
- Existing systems of international health-care governance are being superseded by new forms of supranational governance comprising

the formal institutions of global capitalism – the World Bank, the G7 – as well as health-related TNCs, the major US- based foundations, and associated networks of NGOs. The scope for democratic participation by the people in their own health care is radically narrowed (Levich 2015: 732).

Health philanthropy is nevertheless widely seen as a creditable endeavor. Like the *mission civilisatrice*, it allows the global ruling class to conceal its operations behind humanitarian postures.

History

Systematic public health regimes originated as military programs during the era of colonial expansion. Florence Nightingale's advocacy in the wake of the Crimean War inspired the establishment of the Royal Commission on the Health of the Army, which instituted sanitation measures in order to slow the death rate among British troops occupying India. Modern epidemiology can be traced back to the efforts of US Army physician Walter Reed, who studied yellow fever in order to facilitate the construction of the Panama Canal.

Private charities entered the field as colonial conquests were consolidated, and the West became concerned with maximizing the exploitation of imperialized labor. The first schools of tropical medicine were established in Britain and the United States in the late nineteenth century with the explicit aim of increasing the productivity of colonized laborers while safeguarding the health of their white overseers. As a journalist wrote in 1907:

> Disease still decimates native populations and sends men home from the tropics prematurely old and broken down. Until the white man has the key to the problem, this blot must remain. To bring large tracts of the globe under the white man's rule has a grandiloquent ring; but unless we have the means of improving the conditions of the inhabitants, it is scarcely more than an empty boast. (quoted in Brown 1976: 897)

Hence the formation of the Rockefeller Foundation, incorporated in 1913 with the initial goal of eradicating hookworm, malaria, and yellow

fever. In the colonized world, public health measures encouraged by Rockefeller's International Health Commission yielded increases in profit extraction, as each worker could now be paid less per unit of work, "but with increased strength was able to work harder and longer and received more money in his pay envelope" (Brown 1976: 900). As well as enhanced labor efficiency – which was not necessarily a critical challenge to capital in regions where vast pools of underemployed labor were available for exploitation – Rockefeller's research programs promised greater scope for future US military adventures in the Global South, where occupying armies had often been hamstrung by tropical diseases.

As Rockefeller expanded its international health programs, typically in close collaboration with US government agencies, additional advantages to the imperial core were realized. Modern medicine promoted the benefits of capitalism to "backward" people, undermining their resistance to domination by imperialist powers while helping to create a native professional class increasingly receptive to neocolonialism and dependent on foreign largesse. Rockefeller's president observed in 1916: "[F]or purposes of placating primitive and suspicious peoples medicines have some advantages over machine guns" (Brown 1976: 900).

After World War II, public health philanthropy became closely aligned with US foreign policy as neocolonialism thrust "development" on Third World nations. The major foundations collaborated with USAID and allied agencies in support of interventions aimed at increasing production of raw materials while creating new markets for Western manufactured goods. A section of the US ruling class, represented most prominently by Secretary of State George Marshall, argued that increases in the productivity of tropical labor would require greater investments in social infrastructure including public health. In a 1948 address to the Fourth International Congress of Tropical Diseases and Malaria, Marshall, a leading architect of US policy during the early years of the Cold War, outlined a grandiose vision of health care under "enlightened" capitalism:

Little imagination is required to visualize the great increase in the production of food and raw materials, the stimulus to world trade, and above all the improvement in living conditions, with consequent cultural and social advantages, that would result from the conquest of tropical diseases. (quoted in Packard 1997: 97)

Paul Hoffman, president of the Ford Foundation during the 1950s, regarded public health programs as defensive weapons in the Cold War: "[T]he Communist victory in the Chinese Civil War taught the 'lesson' that Communism thrived on social and economic disorder" (Hess 2003: 319); the mission of postwar philanthropy was therefore to encourage development schemes that might pacify Third World peoples. The seminal Gaither Report, commissioned in 1949 by Ford, explicitly charged the foundations with advancing "human welfare" in order to resist the "tide of Communism . . . in Asia and Europe" (Gaither 1949: 26).

Prestige in the field of public health became especially important to the United States as Third World governments and peoples learned of the tremendous achievements of socialist health programs. Inspired by the "barefoot doctor" program that revolutionized public health in the People's Republic of China, the 1978 International Conference on Primary Health Care promulgated the Alma Ata Declaration, reframing public health as a collaborative effort among sovereign nations and embracing the goal of "health for all." Alma Ata proposed a philosophy of primary care in which the people were held to have "a right and duty to participate individually and collectively in the planning and implementation of their health care" (Declaration of Alma Ata 1978). Wealthy states and philanthropists were encouraged to assist the developing world but only on condition of respecting local concerns and national sovereignty.

In response to Alma Ata, US foundations and ministries sought to strike a delicate balance, operating so as to placate Third World peoples without unduly encouraging real reform or de facto independence. In rare cases, the foundations relinquished control of infrastructure and trained personnel to national health ministries, but in no case were the health systems of imperialized countries permitted to become self-sustaining, and actual investment in Third World health care was meager

in comparison with the extravagant promises of Cold War rhetoric. Nevertheless, manufacturing a semblance of collaboration with Third World governments was deemed necessary in the context of the postwar struggle for "hearts and minds." With the end of socialism in Russia and China, however, both the theory and practice of international health assistance underwent a drastic change.

Global Health Governance

The concept of "global health governance" (GHG) arose in the West in the early 1990s, reflecting Washington's confidence that the fall of the Soviet Union would usher in a unipolar world dominated by US interests. President Bush's announcement of a "new world order" found its way into scholarship as "global governance," describing a loosely defined transnational regime effectively led by the United States and consisting of both public institutions and some combination of private actors, including TNCs, private foundations, and NGOs. This was a vision of diffuse, omnipresent power to be exercised collaboratively by the institutions of global capitalism and guaranteed, in the last resort, by the US military. Such a regime would function most effectively without the traditional impediments of democratic accountability and Westphalian sovereignty (see Levich 2015).

In the field of public health, "nonstate actors" – meaning primarily foundations, NGOs, and public-private partnerships (PPPs) – were recognized as having significant scope and authority to function in an area once reserved to national governments. The Alma Ata principles became moot as structural adjustment programs demanded disinvestment in public health throughout the developing world. In their place arose a profusion of foundation- and state-sponsored NGOs, based primarily in the West and funded more or less directly by multibillionaires. As national health systems were hollowed out, health spending by donor countries and private foundations rose dramatically. Far from providing support for national health-care operations, the new global philanthropic regime systematically bypassed or compromised national health ministries via "public-private partnerships" and similar schemes. Western governments and foundations saw an opportunity to affect a "shift to a post-Westphalian framework" (Ricci 2009: 1).

The attenuation of national sovereignty is only rarely discussed as a conscious aim of GHG. Instead, global health governance is proposed as a necessary defense against disastrous transnational epidemics. The world, advocates say, now stands at a critical, unprecedented juncture – one at which the acceleration of cross-border travel, urbanization, and trade has made "emerging infections" inevitable and potentially catastrophic. The menace is framed in terms reflecting colonialist assumptions and summoning racial fears: communicable diseases are invariably discussed as phenomena *emerging from* poor countries and *threatening to* the Western world.

Hence, GHG was easily folded into the larger discourse of "security" that arose in the wake of the 9/11. Worldwide alarm about bioterrorism provided an opportunity to "link together two previously separate fields: health and national/international security" (Rushton and Youde 2015: 18). This linkage was envisioned as reciprocal: not only would health-care workers "open up a medical front in the War on Terror" (Elbe 2010: 82), but also military forces would routinely be mobilized as a response to health disasters. For example, global health security was a major pretext for the US response to the 2010 earthquake in Haiti, which entailed military invasion, occupation, and ruthless commandeering of national resources and governmental operations. Imperial interventions in the health field began to be justified in the same terms as recent "humanitarian" military interventions: "[N]ational interests now mandate that countries engage internationally as a *responsibility to protect* against imported health threats or to help stabilize conflicts abroad so that they do not disrupt global security or commerce" (Novotny et al. 2008: 41; emphasis added).

Some analysts denounced the militarization of public health as worryingly authoritarian and strategically counterproductive, but to Bill Gates, the world's second richest man, it was a welcome development:

> One of the things I am saying that is pretty radical – and people may disagree – I'm saying the military should be cross-trained not just for military action but for natural disasters and epidemics. … If you pair them with this so-called medical corps, you get something pretty dramatic without spending. (Fried 2015)

Gates' endorsement was especially significant because his foundation had become the leading exemplar of philanthropy in the era of global health governance.

The Gates Foundation

Established in 1999 and initially endowed with a portion of Bill Gates' Microsoft riches, the Bill & Melinda Gates Foundation (BMGF) is now by far the world's largest private foundation; with more than $50 billion in assets, it dwarfs once-dominant players such as the Ford Foundation, the Rockefeller Foundation, and the Carnegie Corporation (BMGF 2017). Within the United States, BMGF invests in "education reform" (i. e., school privatization), but the bulk of its activities are directed at the people of the imperialized world, where its ostensible mission involves providing birth control and combatting infectious diseases.

BMGF exercises power not only by means of its own spending but also through steering an elaborate network of "partner organizations" including nonprofits, government agencies, and private corporations. As the third largest donor to the UN's World Health Organization (WHO), it is a dominant player in the formation of global health policy. It orchestrates elaborate public-private partnerships – charitable salmagundis that tend to blur distinctions between states, which are at least theoretically accountable to citizens, and profit-seeking businesses that are accountable only to their shareholders. BMGF is the chief funder and prime mover behind prominent "multi-stakeholder initiatives" such as the Global Fund to Fight AIDS, Tuberculosis and Malaria, and Gavi, the Vaccine Alliance (formerly GAVI), a public-private partnership between the World Health Organization and the vaccine industry. Such arrangements permit BMGF to leverage its stake in allied enterprises, much as private

businesses enhance power and profits through strategic investment schemes.

The Foundation funds NGOs that lobby governments to increase spending on the very initiatives that it sponsors. The powerful NGO known as PATH (Program for Appropriate Technology in Health), which supports the development and distribution of vaccines, is funded by BMGF and is so closely linked to the Foundation that it functions effectively as a subsidiary. From time to time, BMGF also intervenes directly in the agendas and activities of national governments. Although Foundation publicity frequently bemoans the sorry state of public health care in the imperialized world, BMGF declines to spend its funds on rehabilitating the national health apparatus of poor countries. Instead, it invests almost exclusively in health-care "verticals" – initiatives targeting specific diseases and other health conditions that can be managed from top to bottom by the Foundation and allied organizations. The effect is to outflank and further disable health ministries already crippled by neoliberal disinvestment.

BMGF has been compared to "a massive, vertically integrated multinational corporation (MNC), controlling every step in a supply chain that reaches from its Seattle-based boardroom, through various stages of procurement, production, and distribution, to millions of nameless, impoverished 'end-users' in the villages of Africa and South Asia" (Levich 2014). It is a functional monopoly in the field of public health. In the words of one NGO official: "You can't cough, scratch your head or sneeze in health without coming to the Gates Foundation" (Global Health Watch 2008: 251). The Foundation's global influence is now so great that former CEO Jeff Raikes was obliged to declare: "We are not replacing the UN. But some people would say we're a new form of multilateral organization" (Pickard 2010).

BMGF, Big Pharma, and the Vaccine Business

The chief beneficiary of BMGF's activities is not the people of the Global South but the Western

pharmaceutical industry. The Gates Foundation's ties with the pharmaceutical industry are intimate, complex, and long-standing. Soon after its founding, BMGF invested $205 million to purchase stakes in major pharmaceutical companies, including Merck & Co., Pfizer Inc., Johnson & Johnson, and GlaxoSmithKline (Bank and Buckman 2002). The relationship has grown in subsequent years, creating a revolving door that now routinely shuttles executives between BMGF, Gates-controlled NGOs, and Pharma's Big Five.

This symbiosis between BMGF and Big Pharma arises from the particular requirements of pharmaceutical capital. Despite annual revenues approaching $1 trillion, the industry has been unable to reverse a declining rate of profit and finds itself in a perpetual state of crisis. Pharmaceutical innovation is trending downward, and the search for exploitable new molecules is becoming increasingly frantic and expensive. As drugs become more expensive and less efficacious, profit margins are increasingly undercut by necessarily massive marketing operations. Therefore, Big Pharma seeks to supplement declining sales and rising costs in wealthy Western countries by exploiting largely untapped "pharmerging markets." Since 70% of the world's population lives in countries so designated, profits are potentially enormous. Thus, BMGF's interventions, designed to create lucrative markets for surplus pharmaceutical products, are crucial to the industry.

BMGF's collaboration with Big Pharma is strikingly evident in the area of vaccines, Bill Gates's particular obsession and historically the central business of his foundation. BMGF entered the field in 1999 with a $50 million contribution establishing the Malaria Vaccine Initiative. Here, Bill Gates saw an opportunity for his fledging foundation to dominate, instantly and decisively, an entire field of charitable endeavor: "With one grant . . . we became the biggest private funder of malaria research. It just sort of blows the mind" (Strouse 2000). Since then, BMGF's involvement in vaccine development and delivery has been transformative, integrating private corporations and investment capital into a field where, until

quite recently, the profit motive had played a relatively minor role.

State-sponsored immunization programs spread widely during the twentieth century and doubtless saved millions of lives, especially in countries that were able to integrate immunization into robust public health programs. The most widely distributed vaccines were not patented. Although Big Pharma spokesmen were happy to take credit for immunization successes, vaccines were in fact a neglected corner of the drugs business; in the capitalist world, industry involvement was a matter of manufacturing doses and selling them in a buyer's market shaped by government procurement programs that tended to depress prices. Margins were so slim that by the mid-2000s, many firms contemplated exiting the business altogether ("A Smarter Jab" 2010).

BMGF's response has been to fund R&D aimed at creating new and reformulated vaccines that are patentable while eschewing involvement in the proven vaccines traditionally deemed necessary for robust immunization programs – those for diphtheria, mumps, pertussis, tetanus, etc. BMGF has consistently focused on promoting precisely the new and expensive "blockbuster vaccines" that pad Big Pharma's profit margins. The bulk of its early investments were geared toward immunization against pneumococcal disease (with a vaccine developed by Pfizer), hepatitis B (GlaxoSmithKline and Merck), and the flu-like bacterial infection Hib (Merck and Sanofi); over time, numerous branded drugs have been added to its roster. As of 2017, four of the five projected top-selling vaccine products worldwide – Pfizer's Prevnar-13, Merck's Gardasil, Sanofi's Pentacel, and GSK's Bexsero – had been heavily subsidized and promoted by the Gates Foundation (EvaluatePharma 2017: 22).

An additional advantage of vaccines to pharmaceutical capital is the sheer size of the market. Whereas the profit potential of most drugs is limited by their addressable population, i.e., sick people, vaccines address the universe of healthy people and are therefore exponentially more lucrative. Revisions to national immunization calendars in Global South countries can expand the addressable population by hundreds of millions;

G

therefore, BMGF employs a variety of strategies to pressure health ministries into adopting branded vaccine products. For Big Pharma, this creates a predictable annual return and obviates the need to spend hundreds of millions on marketing.

Because poor countries are often reluctant to commit huge tranches of their meager health budgets to vaccine purchases, BMGF has developed a variety of financing mechanisms designed to assimilate national health systems into the global market. In 2009, Gavi pioneered the use of a new type of development financing, the Advance Market Commitment (AMC), as a means of subsidizing the sale of Pfizer's new pneumococcal vaccine, Prevnar, to low-income countries (Gavi 2009). Through Gavi, BMGF and five wealthy countries – Italy, the United Kingdom, Canada, Norway, and Russia – offered a contract guaranteeing a viable market for the drug, committing to buy new vaccines at a negotiated high price purporting to cover development costs. The pilot country was impoverished Rwanda, which was converted overnight into a market for 1.6 million doses of the patented vaccine (Misbah and Ngoboka 2009). As a condition of the vaccine program, Rwanda agreed to add Prevnar to its routine national immunization program, though it was unclear how the country might hope to finance its commitment to future purchases once Gavi subsidies lapsed Sheikh & Ngoboka (2009). Soon thereafter, Benin, Central African Republic, and Cameroon were also enlisted, expanding the market by further millions. AMC financing proved so effective that Prevnar became the world's leading vaccine product, with projected 2022 sales of $6 billion (Evaluate Pharma 2017: 32). Gavi, meanwhile, had demonstrated "proof of concept" of an elaborate neoliberal scheme that transferred public funds to private coffers.

A more recent addition to Gavi's array of services is "innovative development financing," a debt-based mechanism that taps capital markets to subsidize vaccine buyers and manufacturers. Through an intermediary, the International Finance Facility for Immunisation (IFFIm), Gavi floats bonds on the Japanese uridashi market. The bonds are secured by the promise of government donors to buy millions of doses of vaccines at a set price over periods as long as 20 years. The system is hailed in development circles as a neoliberal "win-win": although capitalists take a cut at every stage of the value chain, poor countries are said to benefit from access to vaccines that might not otherwise be affordable. Bondholders receive a tax-free guaranteed return on investment, suited to an era of ultra-low interest rates. For Gavi, this "organizational form without country presence" offers a powerful means of steering peripheral vaccine markets from the core while outflanking the political inconveniences of traditional development aid. Hence, IFFIm now annually supplies as much as 39% of Gavi's cash (Atun et al. 2012).

Pharmaceutical firms, meanwhile, are able to peddle expensive vaccines at subsidized prices in a cash-poor but vast and risk-free market:

> By creating a predictable demand pull, IFFIm addresses a major constraint to immunisation scale-up: the scarcity of stable, predictable, and coordinated cash flows for an extended period. (Atun et al. 2012).

Although Gavi's involvement in vaccine pricing is typically praised as though the organization is dedicated to setting price ceilings, in fact it acts invariably to raise the floor.

Recent BMGF/Gavi activities in Sri Lanka offer a virtual case study in what has been called "pharmaceutical colonialism." Gavi targeted the country in 2002, offering to subsidize a high-priced vaccine supplied by Crucell, a subsidiary of Johnson & Johnson. The vaccine, known as pentavalent Hib, was a cocktail adding *Haemophilus influenzae* type b immunity to the traditional DTwP shot; it was this new formula that made the drug patentable and thus profitable. In exchange for Gavi's support, the country agreed to add the vaccine to its national immunization schedule. (The agreement was reached; it should be noted, against the backdrop of a genocidal civil war that left Sri Lanka's health ministry in desperate need of funds.)

Within 3 months of the vaccine's introduction, 24 adverse reactions including 4 deaths were reported, leading Sri Lanka to suspend use of the vaccine. Subsequently, 21 infants died from adverse reactions in India. Critics pointed out

that Hib is a minor public health issue in South Asia and that adverse reactions could be projected to cause the deaths of 3125 children for every 350 lives saved by the vaccine (Kalyanam 2013). Thus the customary argument in favor of new vaccines – that the significance of a few drug-related deaths is far outweighed by the number of lives saved – was flipped on its head. Nevertheless, WHO, a Gavi partner, promptly stepped in to declare the vaccine safe, whereupon Sri Lanka reversed the suspension. Presumably pressures were brought to bear both on WHO and the Sri Lankan government.

Once pentavalent vaccine was firmly ensconced in Sri Lanka's national immunization program, Gavi began to phase out its financial support. Sri Lanka continued to buy the Gates-prescribed vaccines, presumably diverting money from other areas of the public health budget. In effect, Gavi secured Sri Lanka's legal commitment to buy patented vaccines on an ongoing basis, using subsidized prices as a loss leader, and then left the country on the hook with a perpetual obligation to buy. Gavi calls this process "graduation." In a write-up appearing on Gavi's promotional website, Sri Lankan health minister Ananda Amarasinghe purported to reveal "the secrets behind the country's immunisation success story." Collaboration with the consortium has been effective, Dr. Anand suggests, because "our *colonial masters* established a good foundation" (Endean 2015; emphasis added).

Should financial schemes fail to create the markets required by pharmaceutical capital, imperialism may resort to more forceful methods. Actual or threatened military aggression is a reliable strategy. The de facto US/UN military occupation of Haiti following the 2010 earthquake provided an opportunity to thrust new healthcare schemes on the country, including a massive immunization program entailing purchases of an experimental rotavirus vaccine as well as patented pentavalent vaccines for diphtheria, tetanus, *Haemophilus influenzae* type B, and hepatitis B. (Evans 2013). Another typical form of pressure is the shakedown: the World Bank has proposed making development aid and debt relief conditional on the achievement of vaccine targets

(World Bank 2010: 33). The array of tactics available to the imperialists means that poor countries are all but powerless to resist. As public health journalist Srinivasan (2011) has written of PATH, "the agenda is to look for ways to introduce the vaccine into the national immunisation programme. The question is not 'whether' but 'when' and 'how.'"

Medical Experimentation

The US medical industry routinely uses imperialized nations as laboratories for new and often dangerous treatments and drugs. The practice is rooted in domestic medical experiments in which slaves, and later poor African-Americans, Native Americans, and Puerto Ricans, were used as guinea pigs for surgical procedures, radiation tests, and risky pharmaceutical trials. The "Tuskegee experiment" is only the most notorious of countless similar operations (see generally Washington 2006). After the civil rights struggle curtailed such practices within the United States, offshoring of medical experimentation became common.

Today, BMGF assists the pharmaceutical industry in relocating clinical trials to emerging markets, where drug safety testing is seen as relatively cheap, speedy, and lax. GlaxoSmithKline CEO Jean-Pierre Garnier has frankly characterized this process as "massive arbitrage" facilitated by globalization: "arbitrage in labour cost, in financial cost, but also in pools of skilled employees and in regulatory and administrative hurdles" (Petryna 2009: 82). According to anthropologist Adriana Petryna:

> The geography of clinical testing is changing dramatically. In 2005, 40 percent of all trials were carried out in emerging markets, up from 10 percent in 1991. . . . GlaxoSmithKline ran 29 percent of its trials outside the United States and Western Europe in 2004; by 2007, that figure grew to 50 percent. Wyeth Pharmaceuticals conducted half of its trials outside the United States in 2004; that figure rose to 70 percent in 2007. (Petryna 2009: 12)

The consequences of this strategy were briefly publicized in 2010, when seven adolescent tribal girls in Gujarat and Andhra Pradesh died after

receiving injections of HPV (human papillomavirus) vaccines as part of a large-scale "demonstrational study" funded by the Gates Foundation and administered by PATH. The vaccines, developed by GSK and Merck, were given to approximately 23,000 girls between 10 and 14 years of age, ostensibly to guard against cervical cancers they might develop in old age.

Extrapolating from trial data, Indian physicians later estimated that at least 1200 girls experienced severe side effects or developed autoimmune disorders as a result of the injections (Mehta et al. 2013). No follow-up examinations or medical care were offered to the victims. Further investigations revealed pervasive violations of ethical norms: vulnerable village girls were virtually press-ganged into the trials; their parents bullied into signing consent forms they could not read by PATH representatives who made false claims about the safety and efficacy of the drugs. In many cases, signatures were simply forged.

An Indian Parliamentary Committee determined that the Gates-funded vaccine campaign was in fact a large-scale clinical trial conducted on behalf of the pharmaceutical firms and disguised as an "observational study" in order to outflank statutory requirements. The Committee found that PATH had "violated all laws and regulations laid down for clinical trials by the government" in a "clear-cut violation of human rights and a case of child abuse" (Parliament of India 2013). Once the flurry of newspaper coverage died down, BMGF and Big Pharma resumed and expanded offshore trials. In India in 2011, more than 150,000 people were involved in at least 1600 clinical trials, conducted on behalf of British, American, and European firms (Buncombe and Lakhani 2011). R&D offshoring is now so widespread in the Global South that clinical trials are considered a normal part of health-care delivery. As a South African newspaper declared: "We are guinea pigs for the drugmakers" (Child 2013).

Contraception and Population Control

The ideology of birth control embraces two very different traditions. Whereas feminists generally have supported contraception and abortion as a way of enhancing the health and freedom of women, capitalist elites have sought to leverage birth control in order to manage population trends, especially in the Global South. Marxist feminists warned that by the 1970s

> the influx of professionals into the cause [had] changed the goals of the birth control movement, from a campaign to increase the area of self-determination for women and all working-class people to a campaign infused with elitist values and operated in an elitist manner. These professionals were mainly of two groups: doctors and eugenists. (Gordon 1977: 10)

This transformation was enthusiastically sponsored by Western foundations and governments. The Rockefeller Foundation invested in eugenics research beginning in the 1920s and helped found the German eugenics program that undergirded Nazi racial theories (Black 2003). After a brief period during which widespread horror at Nazi atrocities forced eugenic theory underground – as neoconservative jurist Richard Posner lamented, Hitler had given eugenics "a bad name" (Posner 1992: 430) – a number of powerful white men, notably John D. Rockefeller III, became obsessed with "differential fertility." Taking note of the higher birth rate in poor countries, some imagined a future world overrun by hungry, unruly brown masses – people who would inevitably demand food and justice, enforcing their will through the sheer weight of numbers. Rockefeller organized the Population Council in 1953, predicting a "Malthusian crisis" in the developing world and financing extensive experiments in population control. These interventions were embraced by US government policymakers, who agreed that "the demographic problems of the developing countries, especially in areas of non-Western culture, make these nations more vulnerable to Communism" (Critchlow 1995: 85).

In India, traditionally the laboratory of choice for Western demographic experimentation, the Ford Foundation worked with USAID to tie development aid to "contraceptive acceptor targets," i.e., numerical quotas. Ford Foundation money, coupled with pressure from the Population Council and USAID, culminated in an era of

unbridled aggression in the area of government-sponsored "family planning" and incentivized a brutal sterilization campaign that forcibly vasectomized 6.2 million men and killed at least 1774 during the 1970s (Biswas 2014). Thereafter India redirected its efforts toward women, using a "target-driven" approach that resulted in further thousands of deaths and countless coercive procedures, often conducted in camps designed for mass sterilizations.

Widespread horror at these policies inspired the 1994 International Conference on Population and Development (ICPD), which issued a Programme of Action that became known as the "Cairo Consensus." The ICPD condemned coercion and repudiated sterilization quotas; however, much of the ICPD Programme reflected the values and imperatives of market capitalism, emphasizing above all "individual rights" that would permit "individual choice and responsible decision-making." At the same time, the ICPD's criticism of state actors meshed conveniently with a key part of the imperialist agenda: increased intervention by Western nongovernmental actors, not excluding private enterprise. The Population Reference Bureau declared with satisfaction that "NGOs, religious and community leaders, and the private sector (what the UN calls 'civil society') are now active partners with governments in deliberations on new policies and programs" (Population Reference Bureau 2004).

Thus Cairo set the stage for the 2012 London Family Planning Summit, at which representatives of more than 70 governments, NGOs, and private firms announced their financial commitments to a stunningly ambitious program of population control. Unlike the ICPD, which had made some gestures toward inclusion of Global South feminists, this was a top-down, ruling-class affair, organized and orchestrated by the Gates Foundation. Melinda Gates, who emerged as the world's most visible spokesperson for access to contraception, revealed that BMGF intended to donate $1 billion toward supplying birth control to 120 million women and prevent 110 million unwanted pregnancies by 2020 (Goldberg 2012); an additional $3.6 billion was pledged by organizations ranging from Planned Parenthood to the

foundations endowed by Michael Bloomberg and Hewlett-Packard. With one flamboyant stroke, commentators agreed, BMGF had moved contraception to the top of the global public health agenda.

The putative urgency of the project was puzzling to say the least. In fact the global rate of population growth had been in steep decline for more than four decades. From its peak of 2.1% in 1971, the rate had fallen to 1.17%, a postwar low, in the year of the London Summit (World Bank 2017). In order to marshal support for a crash contraceptive program targeting Third World women, BMGF and its allies had needed to manufacture a sense of crisis. This was done in part through a canny reframing of the issue of "differential fertility" that had so troubled an earlier generation of family planning advocates. The world's poorest countries, mostly in Africa, still reported alarmingly high fertility rates (the highest of these include Niger, with an average of 6.76 children born per woman; Burundi, 6.09; and Mali, 6.06 (CIA 2015). These numbers were repeatedly deployed by BMGF and friendly journalists in what appeared to be a coordinated effort to rekindle overpopulation hysteria. In the post-Cairo world, however, it was advisable to avoid any taint of racism and eugenics. Thus publicity surrounding the Summit blithely revived long-discredited arguments that overpopulation is the cause, rather than the result, of poverty, climate change, and all manner of social ills. According to Melinda Gates: "When women and their partners have access to contraceptives, everyone benefits. Maternal mortality rates drop, children are healthier and better educated, and incomes rise" (Gates 2015).

In fact, human fertility rates reflect prevailing social conditions and vary greatly across class, time, and region (Rao 2004: Chapter 3). Following the Industrial Revolution, Western countries underwent a "demographic transition" from large to small family sizes; this transition was linked to an improved standard of living and had very little to do with the availability of contraception. This rise in living standards was attributable largely to massive transfers of wealth from the periphery to the core; but while the West prospered, the

G

imposition of imperialist forms of production on the periphery had profound social and economic consequences for poor countries. Imperialism "brought down death rates through modern technology but ... could not bring down birth rates because [it] increased social inequality and undermined the economic security and self-sufficiency of the masses" (Bandarage 1994: 43). Ironically, then, the West was able to complete demographic transition only through a system of exploitation that relied on the prevention of a similar transition in the South. Mahmood Mamdani's research demonstrated that Third World agricultural laborers and middle peasants required large families because family labor was essential to their survival and prosperity: children were needed both to work the land and to provide support for their parents in old age (Mamdani 1972). At the risk of oversimplifying, it is not "overpopulation" that causes poverty but vice versa.

Yet the contraception industry and its supporters persist in touting population control initiatives as the key to alleviating poverty, a myth is further cloaked in quasi-feminist rhetoric about "reproductive health" and "women's empowerment." According to Melinda Gates, such empowerment is to be achieved via the widespread distribution of long-acting, reversible contraceptives (LARCs) – primarily injectables like the notoriously dangerous Depo-Provera and subcutaneous implants such as Norplant. In a 2012 Newsweek profile, Melinda Gates described visiting remote clinics in sub-Saharan Africa where, she claims, women literally begged her for Depo-Provera injections – supposedly their only means of hiding contraceptive use from "unsupportive husbands" (Goldberg 2012). Injectables are ideally suited to Third World countries, she opined elsewhere, because they enable women to "receive a shot behind [their] husband's back" (quoted in Posel 2015). In the high style of imperial feminism, her putative support for poor women was yoked to disdain for poor men.

Publicly BMGF promotes LARCs in the name of freeing women to make responsible choices; however, there is reason to believe that Western family planners prefer these methods precisely because they afford Global South women *the least choice possible* short of actual sterilization. LARCs leave far more control in the hands of providers, and less in the hands of women, than condoms, oral contraceptives, or traditional methods. Some methods, like Norplant, can render women infertile for as long as 5 years.

Recent events in India suggest that LARCs are being promoted as a soft form of sterilization. The country's mass sterilization programs, which persisted even after Cairo, became politically inconvenient after 15 women died as a result of botched "cattle camp" tubal ligations in 2014. After a highly publicized meeting between Modi and Mr. and Mrs. Gates, the prime minister felt empowered to introduce injectable contraceptives in the national family planning program as a next best substitute for sterilization (Barry and Dugger 2016). Seventy prominent Indian feminists, scholars, and health workers signed a statement in vehement protest of the decision, to no avail (Nigam 2015).

Additional support for this view can be found in BMGF's close relationship with EngenderHealth, Inc., which is listed on the Foundation's website as a family planning "partner." Founded in 1937 as the Sterilization League for Human Betterment, the organization was frankly devoted to the eugenic project of "fostering all reliable and scientific means for improving the biological stock of the human race." Later, with funding from Hugh Moore, it was rechristened Birthright and during the 1970s played a lead role in USAID's sweeping sterilization campaigns in India and elsewhere in the Third World (Dowbiggin 2006). In the wake of Cairo, the organization rebranded yet again, downplayed promotion of sterilization as such, and shifted its focus to "long-acting and permanent methods" of contraception (LAPMs): intrauterine devices (IUDs), injections, and implants, as well as tubal ligations and vasectomies. To this end, EngenderHealth has received more than $36 million in BMGF funding. This close partnership between BMGF and an organization primarily devoted to the sterilization of Global South women makes little sense if "reproductive choice"

is indeed the goal. Rather, in a post-Cairo ideological climate that makes open advocacy of sterilization indecorous, BMGF and its partners apparently see long-lasting, provider-authorized contraception – effectively a form of temporary sterilization – as a politically acceptable means of top-down fertility control.

Pushing LARCs in India and other imperialized countries appears to be a means of quietly advancing the traditional population control agenda under the bright new banner of reproductive choice while not incidentally creating vast new markets for the pharmaceutical industry. The reasons underlying imperialism's ongoing commitment to population control are multifold and can be summarized as follows:

Ideology: The myth of overpopulation supplies reliable cover for the ruling class as it expropriates ever greater shares of the people's labor and the planet's wealth. Recently, for example, imperial ideologists have discovered the advantages of blaming climate change on population growth on the Global South. As stated in *Aspects of India's Economy*, "Malthus's heirs continue to wish us to believe that people are responsible for their own misery; that there is simply not enough to go around; and to ameliorate that state of wretchedness we must not attempt to alter the ownership of social wealth and redistribute the social product, but instead focus on reducing the number of people" (Chakrabarti 2014).

Global "security": The Western ruling class appears to share Dean Acheson's view – famously ridiculed by Mao Zedong – that population growth engenders revolutions by "creating unbearable pressure on the land" (Mao 1949). During the Cold War, and especially in the wake of the Chinese Revolution, it was commonly thought by US planners that too many Third World "mouths to feed" would inevitably create conditions hospitable to Communism. The fall of the USSR failed to alleviate such fears but instead transferred them to a new set of adversaries: popular resistance groups primarily located in the Middle East and typically designated with the catch-all term "terrorists." Thus the 1986 report of the US Vice President's Task Force on Combatting Terrorism warned that "population pressures create a volatile mixture of youthful aspirations that when coupled with economic and political frustrations help form a large pool of potential terrorists" (Public Report 1986: 1).

The Reserve Army: Population control can be seen as a way of optimizing the size and distribution of the global reserve army, thereby assisting the West in striking the balance necessary to maintain sufficient leverage over workers while controlling emergent resistance. Ruling class management of surplus labor does not necessarily require reducing the size of the world's population *tout court*; rather, the interventions contemplated are targeted toward specific regions and classes in a system of global "demographic arbitrage" recently proposed by European think tanks (European University Institute 2008).

Hegemony: Population control is, in a broader sense, one of the instruments of social control. It extends ruling-class jurisdiction more directly to the personal sphere, aiming at "full-spectrum dominance" of the developing world. Like laws regulating marriage and sexual behavior, such interventions in the reproduction of labor power are not essential to capitalists but remain desirable as a means of exercising ruling class hegemony over every aspect of the lives of the working people. Population control as such directly targets the bodies and dignity of poor people, conditioning them to believe that life's most intimate decisions are outside of their competence and control.

As ever, the relationship between bourgeois ideology and imperialist practice is dynamic and mutually supportive. As David Harvey has observed: "Whenever a theory of overpopulation seizes hold in a society dominated by an elite, then the non-elite invariably experience some form of political, economic, and social repression" (Harvey 2012: 63).

Outlook

In 2017, the World Health Organization granted BMGF "official relations" status, solemnizing its leading role in the international public health system. Later that year, when Tedros Adhanom Ghebreyesus was named WHO Director General, Bill Gates was widely understood to have been the kingmaker (Huet and Paun 2017). As a public health official in Ethiopia, Tedros had been deeply involved in BMGF initiatives, supportive of public-private partnerships, and given to bestowing lavish praise on the billionaire. Meanwhile, the militarization of health care proceeded apace: in 2018, amid escalating attempts to destabilize the Maduro government, the United States dispatched a 900-foot navy vessel to the coast of Venezuela, purportedly to provide medical care in aid of a "humanitarian crisis" (Daniels 2018). Current trends promise further expansion and consolidation of global health imperialism.

Yet resistance is growing. In 2016, after Filipino parents realized that a mass dengue vaccination program was making their children sick, protests and widespread vaccine refusal forced Sanofi to concede that its product, Dangvaxia, posed significant health risks. Subsequently, the Philippine government suspended the program, which unsurprisingly had been pushed and subsidized by BMGF (Editorial Board 2018). The Fourth Annual People's Health Assembly, held in Savar, Bangladesh, in 2018, brought together some 1200 grassroots health activists in protest of the neoliberal NGO-ization of health care. They called for a revival of the Alma Ata principles and denounced the health impacts of corporate power (Baum 2018). Further people's struggles for health justice can be expected. How much can be achieved in the absence of socialist revolution remains to be seen.

'Global Labour Arbitrage' and the New Imperialism

John Smith
Kingston University, London, UK

Synonyms

Capitalism; Exploitation; Global labour arbitrage; Marxism; Neoliberalism; Superexploitation; Value transfer; Wage differentials

Definition

This essay argues that the most significant transformation wrought by the past three decades of neo-liberal globalisation is the tremendous expansion of the southern proletariat, whose living labour contributes most of the value that is unequally shared between 'lead firms' headquartered in North America, Europe, Japan, and outsourced producers in the low-wage economies of Africa, Asia, and Latin America. This is the principal form taken by the 'global labour arbitrage'-driven globalisation of production, in which cheap and flexible workers in low-wage countries replace relatively expensive workers in the imperialist countries. It signifies a new, qualitative stage in the globalisation of the capital–labour relation, a principal result of which is the greatly enhanced dependency of northern capitalists on the super-exploitation of southern living labour. This reality is obscured by supposedly objective statistical data which records value generated by low-wage workers in countries from China to Bangladesh to Mexico as 'value-added' by firms – multinational corporations (MNCs) and their numerous service- providers – in the countries where there products are consumed. This new, qualitative stage in capitalism's evolution possesses a very specific quality: the globalisation of the capital–labour relation, in the context of and on the foundation of a pre-existing division of the world into oppressed and oppressor nations, entails the internalisation of this division. Neo-liberal globalisation is, therefore, the unfolding of the imperialist form of the capital relation.

> We have yet to see a systematic theory of imperialism designed for a world in which all international relations are internal to capitalism and governed by capitalist imperatives. That, at least in part, is because a world of more or less universal capitalism . . . is a very recent development. (Wood 2005/2003: 127)

Introduction

The most significant transformation wrought by the past three decades of neo-liberal globalisation is the tremendous expansion of the southern

proletariat, whose living labour contributes most of the value that is unequally shared between 'lead firms' headquartered in North America, Europe, Japan, and outsourced producers in the low-wage economies of Africa, Asia, and Latin America. This is the principal form taken by the 'global labour arbitrage'-driven globalisation of production, in which cheap and flexible workers in low-wage countries replace relatively expensive workers in the imperialist countries. It signifies a new, qualitative stage in the globalisation of the capital–labour relation, a principal result of which is the greatly enhanced dependency of northern capitalists on the super-exploitation of southern living labour. This reality is obscured by supposedly objective statistical data which records value generated by low-wage workers in countries from China to Bangladesh to Mexico as 'value-added' by firms – multinational corporations (MNCs) and their numerous service-providers – in the countries where there products are consumed. Another result is the transformation of the global working class: three decades ago, half of the world's industrial workers lived in low-wage countries, now 80% do. Neo-liberal globalisation has hurled the workers of the dominant nations and the workers of the global South together, in competition with each other and yet bound together in mutual interdependence, connected by globalised production processes, their labour power exploited by the same banks and MNCs. But this new, qualitative stage in capitalism's evolution possesses a very specific quality: the globalisation of the capital–labour relation, in the context of and on the foundation of a pre-existing division of the world into oppressed and oppressor nations, entails the internalisation of this division. Neo-liberal globalisation is, therefore, the unfolding of the imperialist form of the capital relation. The division of the world into oppressed and oppressor nations, which Lenin emphasised was the essence of imperialism, lives on in the form of the racial and national hierarchy that makes up the so-called 'global labour market'. To put this another way, the globalisation and global shift of production signifies that the oppression of nations is now internal to the capital–labour relation, giving rise to a mutant,

imperialist form of the law of value. This transformation of the essence of capitalism, of the capital–labour relation itself, was first proposed by Andy Higginbottom:

> The wage labour relation is not only between capital and labour, but between northern capital and southern labour. In this sense, class exploitation and racial or national oppression are fused …. The working class of the oppressed nations/Third World/global South is systematically paid below the value of labour power of the working class of the oppressor nations/First World/global North. This is not because the southern working class produces less value, but because it is more oppressed and more exploited. (Higginbottom 2011: 284)

As a result, this latest stage of capitalist development has been leading not to convergence with the 'advanced' countries and the waning of the North–South divide but to global apartheid, in which the southern nations have become labour reserves for super-exploitation by northern capitalists. The suppression of the free international movement of labour is the linchpin of a vast system of racism, national oppression, cultural humiliation, militarism, and state violence that imperialism has imposed on the proletarianised peoples of the world. It is a weapon of class warfare, wielded in order to enforce the highest possible overall rate of economic exploitation and to wage political counter-revolution – to divide and rule, to impede the emergence of the international working class as an independent political force fighting to establish its own supremacy.

This is imperialism on an entirely capitalist basis, in an advanced stage of its development, in which capitalism and its law of value has fully sublated the old colonial division of the world; in other words, it has discarded all that is inimical to it, and preserved and made its own all that is useful to its continued dominion. Just as Karl Marx could not have written *Capital* before its mature, fully evolved form had come into existence (with the rise of industrial capitalism in England), so it is unreasonable to expect to find, in the writings of Lenin and others writing at the time of its birth, a ready-made theory of imperialism capable of explaining its fully evolved modern form. This accords with a basic axiom

of materialist dialectics: there cannot be a concrete theoretical concept of a system of interaction which is not itself fully concrete and developed. An urgent task is still before us: to understand the evolution of the capital–labour relation in the era of what Jyoti Ghosh calls 'imperialist globalisation', in which the relation between capital and labour has increasingly become a relation between imperialist capital and low-wage southern labour. In other words, the task is to develop a theory of the imperialist form of the law of value.

Central to this task is the development of a concrete concept of 'super-exploitation'. For present purposes, exploitation and super-exploitation can be simply defined. If the working day comprises two parts – necessary labour-time (the time a worker takes to create value equal to what he/she consumes) and surplus labour-time (the time spent producing surplus value for the capitalist) – the rate of exploitation is the ratio between them. Super-exploitation signifies a higher rate of exploitation than the prevailing average domestic rate of exploitation within the imperialist economies. It is argued here that international wage differentials provide a distorted reflection of international differences in the rate of exploitation; and that northern capitalists, in ways to be explored, can increase their profits by relocating production to nations where the rate of exploitation is higher than average; that is, where living labour can be super-exploited.

Imperialism and super-exploitation are brought together in the increased dependence of northern capitalists on the proceeds of super-exploitation of low-wage workers in the global South, as captured in the term 'global labour arbitrage', which denotes the substitution of relatively highly paid domestic labour by low-wage southern labour. This can take the form of shifting production processes to low-wage countries or importing migrant labour from low-wage countries and super-exploiting them at home. The former, in the words of the International Monetary Fund (IMF), is 'the more important and faster-expanding channel, in large part because immigration remains very restricted in many countries' (IMF 2007: 180).

Global Labour Arbitrage: 'An Increasingly Urgent Survival Tactic'

By uprooting hundreds of millions of workers and farmers in southern nations from their ties to the land or their jobs in protected national industries, neo-liberal capitalism has greatly stimulated the expansion of a vast pool of super-exploitable labour. Suppression of the free mobility of labour has interacted with this hugely increased supply to produce a dramatic widening of international wage differentials between 'industrialised' and 'developing' nations, vastly exceeding price differences in all other global markets. This steep wage gradient provides two different ways for northern capitalists to increase profits: through the emigration of production to low-wage countries, or the immigration of low-wage migrant workers. The IMF's *World Economic Outlook 2007* (IMF 2007), which included a special study of 'labour and globalisation', made the connection between outsourcing and migration quite precisely: 'The global pool of labour can be accessed by advanced economies through imports and immigration', significantly observing that '[t]rade is the more important and faster-expanding channel, in large part because immigration remains very restricted in many countries' (180). But not precisely enough: by the 'global pool of labour' they mean the global pool of low-wage labour.

What the IMF calls 'accessing the global labour pool' others have defined as 'global labour arbitrage' (sometimes 'global wage arbitrage'), whose essential feature, according to Stephen Roach, the economist most associated with this term, is the substitution of 'high-wage workers here with like-quality, low-wage workers abroad' (Roach 2004). Roach argues that '[a] unique and powerful confluence of three mega-trends is driving the global arbitrage'. These are 'the maturation of offshore outsourcing platforms . . . e-based connectivity. . . [and] the new imperatives of cost control' (Roach 2003: 6). Of these, 'cost control' is the most important, 'the catalyst that brings the global labour arbitrage to life'. The first two mega-trends, in other words, merely provide the necessary conditions for the third – reducing the

cost of labour – to express itself. Expanding on this, Roach explains that:

> In an era of excess supply, companies lack pricing leverage as never before. As such, businesses must be unrelenting in their search for new efficiencies. Not surprisingly, the primary focus of such efforts is labour, representing the bulk of production costs in the developed world; in the US, for example, worker compensation still makes up nearly 80% of total domestic corporate income. And that's the point: Wage rates in China and India range from 10% to 25% of those for comparable-quality workers in the US and the rest of the developed world. Consequently, *off-shore outsourcing that extracts product from relatively low-wage workers in the developing world has become an increasingly urgent survival tactic for companies in the developed economies*. (ibid., my emphasis)

This is a much sharper and richer description of neo-liberal globalisation's driving force than the one offered by the IMF's technocrats – or indeed than is to be found anywhere in the radical, 'value chain' or Marxist literature. We might ask, though, why Roach says 'extracts product' instead of 'extracts value' – capitalists, after all, are not interested in the product of labour but in the value contained in it. We suspect that to say 'extracts value' would imply that these workers create more wealth than they receive in the form of wages – in other words that they are exploited, challenging the very foundations of modern economic theory, which categorically denies that capitalism is a system of exploitation, and opening the door to its Marxist critique, which calls the difference between the value generated by workers and what is paid to them *surplus value,* the source and substance of profit in all its forms. It is notable that, in order to give the most concrete possible definition of this most important phenomenon, Roach felt obliged to dispense with the empty abstractions of mainstream economics and invoke Marxist concepts and, almost, Marxist terminology.

Despite being jargon, which can act as a code, giving access to those with the key while mystifying everyone else, there are two reasons why 'global labour arbitrage' is much more useful than any of the core concepts so far developed by value-chain analysts, proponents of global production networks, or neo-Marxist theorists of

'new imperialism' and 'transnational capitalism'. First, 'global labour arbitrage' foregrounds the labour–capital relation, spotlights the enormous international differences in the price of labour, and encompasses the two ways in which northern capitalists can profit from wage differentials: outsourcing and migration. Second, it focuses attention on the fragmented and hierarchically organised global labour market which gives rise to these arbitrage opportunities. 'Arbitrage', in the economists' lexicon, means profiting from imperfections in markets that are reflected in different prices for the same product. By communicating prices across segmented markets, arbitrage causes existing price differences to narrow, thereby improving the efficiency of markets and promoting their unification (in contrast, speculators bet on the future movement of prices, typically amplifying price swings) unless some artificial factor (in this case, immigration controls) intervenes to prevent price differences from being arbitraged away, in which case arbitrage becomes an opportunity for open-ended profiteering. In general, the bigger the market imperfections, the bigger are the price differences and the bigger the potential profits; and there's no market more imperfect than the global labour market. (For a useful discussion of the difference between arbitrage and speculation in modern financial theory, see Miyazaki 2007.)

That capitalist firms seek to boost profits by cutting wages is hardly a startling revelation. Their employees don't need Stephen Roach to tell them this. Indeed, Roach's advice is not intended to alert workers to the challenges they face but to advise capitalists what they need to do more of. Stephen Roach is not alone in according primacy to capitalists' voracious appetite for low-wage labour. Others include Charles Whalen, a prominent labour economist, who has argued that '[t]he prime motivation behind offshoring is the desire to reduce labour costs … a U.S.-based factory worker hired for $21 an hour can be replaced by a Chinese factory worker who is paid 64 cents an hour' (Whalen 2005: 13–40, 35). David Levy is another international business scholar who explicitly recognises that what he calls the 'new wave' of offshoring … is a much

more direct form of arbitrage in international labour markets, whereby firms are able to shift work to wherever wages are lower (Levy 2005: 685–693, 689). According to Levy, two things have unleashed this 'new wave': 'low-cost and instantaneous transmission of data that embed engineering, medical, legal, and accounting services' combined with 'the increasing organizational and technological capacity of companies, particularly multinational corporations, to separate and coordinate a network of contractors performing an intricate set of activities'. However, Levy considers 'increasing organizational and technological capacity' to be the 'core driver of the latest form of offshore sourcing', confusing the driving force (desire for cheap labour) with the means of harnessing this force.

Roach's views deserve the attention given to them here because when he expressed them he was not an academic viewing the world from an ivory tower but chief economist for Morgan Stanley, the leading investment bank, with particular responsibility for its very active Asian operations; and because he has gone further than most in analysing how and why wage arbitrage is the essence of outsourcing. Roach's emphasis on the 'extraction of product' from 'like quality' low-wage workers in India, China etc. by MNCs headquartered in 'developed economies' – and his plain speaking – contrasts with the general rule in academic and business literature, which is to obfuscate this most important point and treat labour as just one factor of production among others, making glancing, desultory references to wage differentials as one of a number of possible motives influencing outsourcing decisions. IBM CEO Samuel J. Palmisano gave a classic example of this in an article in *Foreign Affairs*:

> Until recently, companies generally chose to produce goods close to where they sold them …. Today… companies are investing more to change the way they supply the entire global market …. These decisions are not simply a matter of offloading noncore activities, nor are they mere labour arbitrage. They are about actively managing different operations, expertise, and capabilities so as to open the enterprise up in multiple ways, allowing it to connect more intimately with partners, suppliers, and customers. (Palmisano 2006: 127–136, 129–131)

Anwar Shaikh points out that 'cheap labour is not the only source of attraction for foreign investment. Other things being equal, cheap raw materials, a good climate, and a good location … are also important … But these factors are specific to certain branches only; cheap wage-labour, on the other hand, is a general social characteristic of underdeveloped capitalist countries, one whose implications extend to all areas of production, even those yet to be created' (Shaikh 1980: 204–235, 228).

Global Labour Arbitrage and the Theory of 'Comparative Advantage'

A survey of outsourcing literature published by the World Trade Organization (WTO) and the Hong Kong-based Fung Global Institute (FGI) asks two questions which serve well as a starting point for this discussion: 'Why did firms in advanced economies find it profitable to increasingly offshore tasks or parts of the production process to developing economies? And does international trade theory need a new framework to study this phenomenon of global supply chains?' (Park et al. 2013: 29). Their answer to the first question – 'Vast absolute differences in unskilled labour wages between developed and developing economies, driven by differences in factor endowments, made cross-border production sharing profitable' – accords well with Stephen Roach's concept of global labour arbitrage, and – if we strike out 'driven by differences in factor endowments' – shares its qualities of clarity and directness. 'Differences in factor endowments' is a euphemistic reference to the vast unemployed and underemployed reserve army of labour, dehumanised and converted by the bourgeois mind into a 'factor of production', and the purpose of its inclusion is to justify the authors' affirmative answer to their second question, which is that no, 'international trade theory' does not need a new framework. Production outsourcing to low-wage countries, the WTO-FGI researchers argue, 'stays true to the concept of comparative advantage, as defined by the Heckscher-Ohlin model of trade' in which each country 'use[s] its relatively abundant factor of production relatively intensively' (30).

Fleshing out their 'concept of comparative advantage', the WTO-FGI researchers predict that 'a relatively unskilled, labour abundant developing economy would complete and export the relatively unskilled labour intensive tasks …. Similarly, a relatively capital or skilled labour intensive country would export intermediate products, such as capital goods and design and research and development services' (29–30). This boils down to a banal assertion that each country will try to use its resources to its own benefit. The Heckscher-Ohlin [H-O, sometimes rendered as H-O-S-S with the addition of Wolfgang Stolper and Paul Samuelson] model turns this simplistic truism into a theoretical model by making three false and far-fetched assumptions. The first is that products for final sale cross borders but 'factors of production' do not – there is no place in the H-O model for foreign direct investment or indeed any international capital flows, and this also rules out structural trade imbalances, since the resulting accumulation by one country of claims on the wealth of another is tantamount to foreign investment. As for the immobility of labour, this is treated as a fact of nature that needs no explanation. The second assumption is that all 'factors of production' are fully utilised, a necessary condition for 'equilibrium'; that is, for supply and demand to be balanced and for the 'factors of production' to be rewarded to the full extent of their contribution to their firm's output. It assumes, in other words, the validity of 'Say's law', after the classical economist Jean-Baptiste Say, who more than 200 years ago argued that supply creates its own demand. Heterodox economists question whether the ideal state resulting from these two assumptions has any practical relevance. Marxists argue that this ideal state is itself absurd, pointing to the third and most important of the fallacious assumptions upon which 'modern trade theory' and indeed the entire edifice of economic theory is based: the conflation of value and price, or the presumption that the value generated in the production of a commodity is identical to the price received for it. This conflation is achieved by making the production process invisible; the value of commodities is not only discovered but, in the world of marginalist economics, is determined by the confrontation in the marketplace between sovereign and equal individual buyers and sellers. As Marx said, the value of commodities 'seem[s] not just to be realised only in circulation but actually to arise from it' (Marx 1991/1894: 966). Modern trade theory, in essence, is constituted by substituting individual nations for individual property owners.

The WTO-FGI researchers contrast the H-O model of comparative advantage with what they call the 'Ricardian model': 'The Heckscher-Ohlin model of trade argues that technology is freely available across countries and hence comparative advantage is determined by relative factor endowments. In contrast, the Ricardian model of trade stresses differences in technology as the basis of international trade – countries tend to specialise in activities about which their inhabitants are especially knowledgeable' (Park et al. 2013: 30). The 'Ricardian model' is given its moniker because 'differences in technology' imply differences in the productivity of labour, and David Ricardo's original theory hinged on the difference in the productivity of weavers and winemakers in Portugal and England. Yet on closer inspection, this theory has much more in common with the H-O approach than with Ricardo's original theory. Ricardo, along with Karl Marx and Adam Smith, espoused the labour theory of value, according to which only one 'factor of production' – living labour – is value-producing; materials and machinery merely impart to the new commodities already-created value used up in the process of production (Bhagwati 1964: 1–84). Eli Heckscher and Bertil Ohlin replaced Ricardo's labour theory of value with a two-factor (labour and capital) model in which the relative abundance of each determines where the supply and demand curves intersect, which in turn determines the value of commodities and thus the productivity of the labour that produces them. The so-called Ricardian model does essentially the same thing with its two-factor production function; both are founded on a tautological identification of value and price and on the circular reasoning which springs from this. The difference between them is where in the circle they choose as their starting point.

Outsourcing and Migration: Two Forms of Global Labour Arbitrage

The wildfire spread of outsourcing during the past three decades is the continuation of capital's eternal quest for new sources of cheaper, readily exploitable labour power. Nearly 150 years ago, Karl Marx gave prominent place, in his 1867 address to the Lausanne Congress of the International Workingmen's Association, to a prescient warning that 'in order to oppose their workers, the employers either bring in workers from abroad or else transfer manufacture to countries where there is a cheap labour force' (Marx 1867a). Intense rivalry between competing imperialist powers inhibited the development of this trend within Europe, but not so in North America, where, as Gary Gereffi's recounts, 'In the early 20th century in the United States, many industries . . . began to move to the US south in search of abundant natural resources and cheaper labour, frequently in 'right to work' states that made it difficult to establish labour unions. The same forces behind the impetus to shift production to low-cost regions within the United States eventually led US manufacturers across national borders' (Gereffi 2005: 4). What began as a trickle in mid-nineteenth-century Europe had become a steady stream in North America in the early twentieth century, and by the end of that century and the beginning of the next was an enormous floodtide, 'a systematic pattern of firm restructuring that is moving jobs from union to non-union facilities within the country, as well as to non-union facilities in other countries' (Bronfenbrenner and Luce 2004: 37–38).

The three quotations cited in the above paragraph have a common theme: a central motive of capitalists' outsourcing impulse is, in Marx's words, 'to oppose their workers', to negate efforts by workers to organise themselves into unions and counter employers attempts to force workers into competition with each other. Unfortunately, trade unions in the imperialist countries did not heed Marx's warning and nor did they act upon the advice which immediately followed it: '[g]iven this state of affairs, if the working class wishes to continue its struggle with some chance of success, the national organisations must become international'.

Aviva Chomsky, in *Linked Labour Histories*, a multi-layered study of the coevolution of the labour movements in New England and Colombia since the late 1900s, recounts how New England textile mills relocated first to North Carolina in the first decades of the twentieth century, then, in the 1930s, to Puerto Rico, thereby becoming the true pioneers of international production outsourcing in the Americas, before moving to Colombia and beyond in the post-war period. Chomsky points out that 'most accounts place this phenomenon in the second half of the 20th century. I argue that the events of the late 20th century continue a pattern begun by the earliest industry in the country, the textile industry, a century earlier' (Chomsky 2008: 294). She calls this phenomenon 'employers' 'capital flight' away from strong trade unions and towards cheap labour', and makes an essential observation: 'most accounts treat immigration and capital flight separately. My approach insists that they are most fruitfully studied together, as aspects of the same phenomenon of economic restructuring'. She also persuasively argues that '[c]apital flight [i.e. outsourcing] was one of the main reasons the textile industry remained one of the least organised in the early to mid-20th-century, and it was one of the main reasons for the decline of unions in all industries at the end of the century'. Chomsky draws attention to another specific quality that immigration and outsourcing have in common: 'immigration and capital flight . . . relieve employers of paying for the reproduction of their workforce' (3) by giving employers access to a ready-made workforce in southern nations, who are sustained in part by remittances from migrant workers in the imperialist economies, by foreign aid and public debt, and not least by unpaid labour performed in the family or informal economy. William Robinson (2008: 204) similarly argues: 'the use of immigrant labour allows employers in receiving countries to separate reproduction and maintenance of labour, and therefore to "externalise" the cost of social reproduction'.

Bangladesh provides a particularly vivid example of how, during the neo-liberal era,

outsourcing and migration have become two aspects of the same wage-differential-driven transformation of global production. Speaking of 1980s and 1990s Bangladesh, Tasneem Siddiqui reported that 'the continuous outflow of people of working-age . . . has played a major role in keeping the unemployment rate stable' (Siddiqui 2003: 2). According to the International Organisation for Migration, 5.4 million Bangladeshis work overseas, more than half in India, with the rest spread between Western Europe, North America, Australasia and the Middle East, especially Saudi Arabia. Some $14 billion of remittances flowed into households in Bangladesh in 2012, equivalent to 11% of Bangladesh's GDP. In the same year, Bangladesh received $19 billion for its garment exports (80% of Bangladesh's total exports), but this includes the cost of imported cotton and other fabrics, typically 25% of the production cost. In other words, net earnings from garment exports in 2012 approximately equalled total remittances from Bangladeshis working abroad. And while only a small fraction of export earnings are paid out in wages, all of the latter flows directly into poor households.

The World Bank reports that in 2013, each of Britain's 210,000 Bangladeshi migrant workers, the largest concentration of all imperialist countries, sent home an average of $4,058, close to the average for other imperialist countries. In comparison, average wages following the 2013 increase in Bangladesh's textile industry were $115 per month, or $1,380 per year. Thus, each Bangladeshi working in Britain remits in 1 year what it would take his (most Bangladeshi migrant workers are male) wife, sister or daughter 3 years to earn working in a garment factory.

Neo-Marxists and the 'Global Labour Arbitrage'

Most of the scholars and analysts cited so far in our survey of 'global labour arbitrage' have been from mainstream or heterodox schools. This is because Marxist academics have, by and large, neglected this subject. This is epitomised by an anthology of essays published in 2005 by Marxist scholars entitled *Neo-liberalism: A Critical Reader* (Saad-Filho and Johnston 2005). Its front cover is a photograph of women working on a production line somewhere in Asia, yet – despite the many insightful articles it contains – not one of them discusses the super-exploitation of southern labour, male or female, or asks how capitalist firms in imperialist countries reap super profits from them, or recognises that this might be not just relevant to 'neoliberalism' but its very essence.

What is so special about 'global labour arbitrage', apart from its great force, is that it takes place entirely within the orbit of the capital–labour relation. 'Global labour arbitrage', or the globalisation of capitalist production processes driven by the superexploitation of low-wage southern labour by northern capital, is capitalist imperialism *par excellence.* Here, capitalism has evolved ways of extracting surplus value from the so-called 'emerging nations' which are proper to it, which are effected not by political-military coercion but by 'market forces' – what Ellen Wood in *Empire of Capital* calls the 'internationalization of capitalist imperatives' (2005/2003: 118).

As Wood recognises, the exercise of military power by states continues to play a central and very active role in constituting the imperialist world order, policing it and violently removing obstacles in its way, whether these be forests and forest dwellers, insubordinate despots, rebellious social movements or radical governments. But, in common with other neo-Marxist theorists of 'new imperialism' and 'global capitalism', her theoretical framework gives no place to the most important, most direct, most pernicious and most quotidian exercise of coercive violence by the state in the global political economy: the suppression of the international mobility of labour. Apart, that is, from one cursory mention, a brief and passing acknowledgement that '[n]ot the least important function of the nation state in globalisation is to . . . manage the movements of labour by means of strict border controls and stringent immigration policies, in the interests of capital' (137). Yet she gives neither this nor the massive relocation of production processes to the global

South any further attention, despite their obvious relevance to her stated aim of defining 'the essence of capitalist imperialism' (7).

International Differences in the Rate of Exploitation

Critics of dependency theory used to argue that, if there were differences in the rate of exploitation between imperialist and semicolonial countries, the much higher productivity of labour in the former means that workers in imperialist nations may even be subject to a higher rate of exploitation than in the Third World, despite their much higher levels of consumption. Thus, in their 1979 exchange with Samir Amin, John Weeks and Elizabeth Dore argued that '[s]ince it is in the developed capitalist countries that labour productivity is higher, it is not obvious that a high standard of living of workers in such countries implies that the exchange value of the commodities making up that standard of living is also higher' (Weeks and Dore 1979: 62–87, 71). Nigel Harris put forward essentially the same argument: 'other things being equal, the higher the productivity of labour, the higher the income paid to the worker (since his or her reproduction costs are higher) and the more exploited he or she is – that is, the greater the proportion of the workers output [that] is appropriated by the employer.' (Harris 1986: 119–120).

The globalisation of production processes has fatally undermined this argument: the consumption goods consumed by workers in the North are no longer produced solely or mainly in the North. To an ever greater extent, they are produced by low-wage labour in the global South; what matters is *their* productivity, *their* wages. Nevertheless, these arguments continue to be advanced to the present day – Alex Callinicos argues that '[f]rom the perspective of Marx's value theory, the critical error [of 'theorists of unequal exchange such as of Arghiri Emmanuel and Samir Amin'] is not to take into account the significance of high levels of labour productivity in the advanced economies' (Callinicos 2009: 179–180); while Joseph Choonara believes that 'it is a misconception that workers in countries such as India or China

are more exploited than those in countries such as the US or Britain. This is not necessarily the case. They probably [!] have worse pay and conditions, and face greater repression and degradation than workers in the most developed industrial countries. But it is also possible that workers in the US or Britain generate more surplus value for every pound that they are paid in wages' (Choonara 2009: 34).

Ernest Mandel uncomfortably straddled the dependency thesis and its 'Marxist' antithesis without achieving anything in the way of synthesis. This equivocation is evident in his major economic work *Late Capitalism* (1975/1972). In the chapter entitled, he admits that 'the existence of a much lower price for labour-power in the dependent, semicolonial countries than in the imperialist countries undoubtedly allows a higher world average rate of profit' (Choonara 2009: 68), implying that its value is also lower, that it endures a higher rate of exploitation. Later, in the chapter on unequal exchange, he appears to reiterate this, referring to 'vast international differences in the value and the price of the commodity labour-power' (Mandel 1975/1972: 353), but on the next page he argues the opposite, that there 'exists in underdeveloped countries . . . a lower rate of surplus value', spending several pages developing a numerical example in which the oppressed-nation workers endure a *lower* rate of exploitation than in the imperialist countries – with no explanation or justification. Either way, neither the vast differences in the value nor the price of labour-power make it into the ten features defining 'the structure of the world market' that concludes his analysis.

Wages, Productivity . . .

It is argued here that global wage differentials have driven and shaped the global shift of production. It is therefore important to remind ourselves just how wide these differentials are. Data on average wages, in both rich and poor countries but especially in the latter, are notoriously unreliable. Masking growing wage inequality, they include the wages of skilled workers and

managers, they typically count only those in formal employment, and they take no account of widespread underpayment and of illegally low wages. Bearing this in mind, the US government's Bureau of Labour Statistics reports that, despite decades of wage stagnation in the US and years of above-inflation wage rises in China, average hourly 'labour compensation' (wages + benefits) of US manufacturing workers in 2010 was 20 times greater than in China ($34.74/hr vs. $1.71/hr), or 14 times greater when Chinese wages are measured in PPP$. This obscenely high ratio underestimates the global picture, since labour compensation in countries like Canada, Germany and Denmark is higher than in the US, while Indian, Sri Lankan, Indonesian and Vietnamese workers are even cheaper than Chinese workers. Bangladeshi wages are lowest of all: there, the minimum wage in the garment industry is just 31¢ per hour – and this after a 77% increase wrested by hard-fought strikes in 2013. Wages elsewhere in Bangladesh's economy are even lower. Dhaka's *The Daily Star* reported in May 2013 that tea-pickers are paid 55 taka ($0.71) for a day's work ('Tea worker's daily wage only Tk 55', in *The Daily Star*, 25 May 2013).

Clearly, wages are profoundly affected by conditions in labour markets – like repression of unions, massive unemployment and underemployment – none of which have any direct bearing on the productivity of workers when at work. This is one reason to question the widespread belief of mainstream economists that differences in wages reflect differences in productivity and that low wages in 'emerging economies' merely reflect the low productivity of their workers. That Western firms are so keen to outsource production to the other side of the world is proof in itself that the low wages they find so attractive are not cancelled by low productivity. As Larudee and Koechlin found (2008: 228–236, 232), in the case of FDI into low-wage countries, multinational firms carry a considerable share of their productivity with them. Why is this important? Because, to the considerable extent that international wage differentials do not reflect differences in productivity, they must reflect international differences in the rate of exploitation. And a higher rate of

exploitation implies that more of the wealth created by these workers is captured by capitalists and turned into profit. There is nothing more important in political economy than understanding how this happens, and how it is rendered invisible in standard interpretations of economic data.

A theoretical concept of 'productivity' is essential if we are to understand anything about global political economy. But productivity is especially complex because it can be measured in two mutually exclusive ways: by the quantity of useful objects created in a particular amount of time, or by the quantity of money that these useful objects can be sold for. The 'use value' and 'exchange value' definitions of productivity produce very different results. For example, if Bangladeshi garment workers increase production from ten shirts per hour to 20 shirts per hour, they are, according to the first measure, twice as productive as before; but if the multinational firm they are supplying imposes proportionate cuts in the price of each shirt, the 'exchange value' measure of their productivity will remain unchanged. These two definitions of productivity are contradictory, mutually exclusive, incompatible. To formal logicians and vulgar economists, they cannot both be true. But to dialecticians, these contradictory definitions reflect a really existing contradiction inherent in commodities and therefore in the labour that produces commodities. While the mainstream concept of productivity attempts to solve this puzzle by abolishing the use-value definition, obliterating it; for Marxist political economy, 'productivity' is a contradictory unity, embodying what Marx counted among the greatest of his discoveries: 'the two-fold character of labour, according to whether it is expressed in use value or exchange value' (Marx 1867b: 407–408).

To mainstream economics and in the brain of the capitalist, 'productivity' always refers to the monetary value of the goods and services generated in a given period of time; in other words, value-added per worker. But this gives rise to a series of paradoxes, anomalies and absurdities; for example, those in Europe and North America who stack shelves with imported goods appear to add

much more value (i.e. to be many times more productive) than those who produce these goods. Another example is that the outsourcing of labour-intensive production tasks boosts the productivity of the workers whose jobs are not outsourced – even if nothing about this work or the payment received for it changes in any way. Thus, Gene Grossman and Esteban Rossi-Hansberg contend that 'improvements in the feasibility of offshoring are economically equivalent to labour-augmenting technological progress' (Grossman and Rossi-Hansberg 2006: 15). A further example is provided by per capita GDP, which, leaving aside relatively minor variations in the proportion of a nation's population who are economically active, is synonymous with average productivity. On this measure, six of the eight most 'productive' nations on earth are tax havens, which by definition produce nothing of use; meanwhile, Bangladesh languishes in 192nd place out of 229 nations. Its garment workers produce large quantities of use values – but insufficient exchange value to allow their employers to run safe factories or pay a living wage.

. . . and the GDP Illusion

Statistics on GDP, trade, and productivity suffer from much more severe defects than those afflicting wages. Here, the problems are conceptual, not technical. Bangladesh's garment-exporting industry – in the global spotlight since the death of 1,127 garment workers in the collapsed Rana Plaza building in April 2013 – provides a glaring illustration of this. Few, apart from mainstream economists, would deny that Primark, Wal-Mart, H&M and other high-street retailers profit from the exploitation of Bangladeshi garment workers. A moment's thought reveals other beneficiaries: the commercial capitalists who own the buildings leased by these retailers, the myriad of companies providing advertising, security, and other services to them; and also governments, which tax their profits and their employees' wages and collect 20% VAT from every sale. Yet, according to trade and financial data, not one penny of the profits reaped by US and

European retail giants derives from the labour of the workers who made their goods. The huge mark-up on the costs of production, typically 60–80% and often more, instead appears as 'value-added' in the UK and other consuming countries, expanding their GDP by far more than that of the country where these goods are actually produced.

However, by redefining 'value-added' as value captured, our perception of the global economy is transformed. It allows us to see that the lion's share of the value produced by low-wage workers in China, Bangladesh, and elsewhere is captured by corporations and governments in the imperialist countries. A closer look at this key mainstream concept makes clear why such a redefinition is necessary. Value-added, the fundamental constituent of both GDP and productivity, is the difference between the prices paid by a firm for all inputs and the prices received for all outputs. According to mainstream economic theory, this amount is automatically and exactly equal to the value generated in the firm's own production process, and cannot leak to other firms or be captured from them. The process of production is thus not only a black box, where all we know is the price paid for inputs and the price received for the outputs; it is also hermetically sealed from all other black boxes, in that no value can be transferred or redistributed between them. Marxist political economy rejects this absurdity and advances a radically different conception: 'value-added' is really value captured. It measures the share of total economy-wide value-added that is captured by a firm, and there is no direct correspondence between this amount and the value created by the living labour (or, if you prefer 'factors of production') employed within that firm. Indeed, many firms supposedly generating value-added are engaged in non-production activities like finance and administration that produce no value at all.

If, within a national economy, value produced by one firm (i.e. in one production process) can condense in the prices paid for commodities produced in other firms, then it is irrefutable that, especially in the era of globalised production, this also occurs between firms in different countries. To the extent that it does, GDP departs ever

further from being an objective, more-or-less accurate approximation of a nation's product, becoming instead a veil that conceals the increasingly exploitative relation between northern capitals and southern living labour; in other words, the imperialist character of the global capitalist economy.

Three important conclusions flow from this.

It is impossible to analyse the global economy without using data on GDP and trade, yet every time we uncritically cite this data we open the door to the core fallacies of neoclassical economics which these data project. To analyse the global economy we must decontaminate this data, or rather the concepts we use to interpret them.

Redefining 'value-added' as value captured reveals that the globalisation of production is driven not just by international wage differentials but by international differences in the rate of exploitation.

Redefining 'value-added' as value captured also reveals the heightened dependence of capitalists and capitalism in the imperialist countries on the proceeds of the higher rates of exploitation of living labour in the global South. The imperialist division of the world that was a precondition for capitalism is now internal to it. Far from marking a transition to a post-imperial world, neo-liberalism therefore signifies the emergence of the fully evolved imperialist form of capitalism.

Conclusion

Armed with the concepts developed in this essay, the door is open to understanding how surplus value extracted from workers assembling Dell computers and Apple iPods in Foxconn's Chinese factories, and those producing clothing and footwear in Bangladesh and the Dominican Republic for Wal-Mart, H&M and so forth, massively contribute to these firms' profits even though there is no trace of this in GDP, trade, or financial flow data. It allows us to see that a major part of the revenues and profits from the sale of the products

of global value chains accruing to firms based in imperialist countries, their distributors, and their employees (and therefore appearing in the GDP of the consuming countries), and the very large cut which is taken by governments and used to pay for foreign wars, the social wage and so on, represents the unpaid labour of super-exploited Chinese and other low-wage workers. It allows us to understand why, according to standard interpretations of GDP and trade data, these massive transfers of wealth are invisible but no less real. And, finally, it allows us to see that profits, prosperity, and social peace in Europe, North America, and Japan are, more than at any time in capitalism's history, dependent upon the super-exploitation of low-wage labour in Africa, Asia, and Latin America. Acknowledging this reality is to acknowledge that neo-liberal globalisation marks not the supersession of imperialism but the culmination of capitalism's imperialist trajectory.

Boosting profits through increasing relative surplus value is generally held by Marxists to be the pre-eminent driver of advanced capitalism. A modification of this view has long been required; comprehension of the global outsourcing phenomenon now demands it. In the era of neo-liberal globalisation, the rate of profit in the imperialist countries is sustained by not one but three ways to increase surplus value: increasing relative surplus value through the application of new technology in the classic manner intensively studied by Marx in *Capital;* increasing absolute surplus value by extending the working day, a major feature of capitalist exploitation in today's global South; and 'global labour arbitrage', the expanded super-exploitation of southern labour power made possible by the depression of its value to a small fraction of that obtaining in the imperialist countries. The trajectory of capitalist accumulation and crisis is determined by the complex interaction of all three elements. Of these three, 'global labour arbitrage' stands out as really new and specific to neo-liberal globalisation.

It is understandable why members and aspiring members of privileged social layers in imperialist countries might find it convenient to take statistics on GDP and labour productivity at their face value – by doing so they can avoid confronting

the disturbing and complacency-shattering consequences of recognising the relations of exploitation, imperialism, and parasitism that are intrinsic and fundamental to the contemporary capitalist world order and to their social position within it. On the other hand, for workers in the other imperialist nations, the globalisation of production means that nationalist-reformist attempts to protect workers' living standards and access to social services behind protectionist barriers, including border controls on the free movement of labour, are not only reactionary, they are also futile. If US and European workers do not wish to compete with their sisters and brothers in Mexico, China, and elsewhere, they must join with them in the struggle to abolish the racial hierarchy of nations and the tremendous disparities associated with it, and to achieve an authentic globalisation – a world without borders – in which no one has any more right to a job, an education, or a life than anyone else. The path to socialism goes through, not around, the eradication of the gigantic differences in living standards and life chances that violate the principle of equality between proletarians. As Malcolm X said, 'Freedom for everybody, or freedom for nobody'.

Global Value Transfers and Imperialism

Donald A. Clelland
Department of Sociology, University of Tennessee, Knoxville, TN, USA

Definition

Imperialism is the unequal transfer of economic value across space, a form of super-exploitation by powerful states or firms in one location visited upon weaker states/peoples/firms in another place. *Global value* transfer, surplus *drain*, and surplus transfer are employed as synonyms here.

> Whether you can observe a thing or not depends on the theory which you use. It is the theory which decides what can be observed. (Albert Einstein 1926)

Imperialism is the unequal transfer of economic value across space, a form of super-exploitation by powerful states or firms in one location visited upon weaker states/peoples/firms in another place. I employ *global value* transfer, surplus *drain,* and surplus transfer as synonyms. Similar

terms that appear in the literature include 'geo-graphical transfer of value', 'economic drain', 'surplus extraction', 'capital drain' or 'transfer and unequal exchange' (Amin 1974; Emmanuel 1972; Kohler and Tausch 2002; Raffer 1987).

Because capitalism is characterised by commodification of everything, everywhere (Wallerstein 1983), the basic form of surplus extraction derives from the production and sale of commodities. Capitalists are compelled toward imperialism because the system is based on mini-mising costs of production in order to maximise profits. A distinguishing feature of surplus drain lies in the need for capitalists to widen the reach of the system in order to ensure the capture of lower costs. The cheapest costs are rarely near at hand, so commodified production stimulates an expanding territorial search. Consequently, global value transfer is a driving force that causes accu-mulation of wealth and power at the core and stagnation of the periphery (Amin 1974; Baran 1957; Frank 1969; Wallerstein 1974, 1983).

Without global surplus transfers, there can be no worldwide capitalism. The capitalist world-system is a 'hierarchy of core-periphery *complexes,* in which surplus is being transferred' (Frank 1969: 98). It is important to realise that 'peripheral does not mean marginal in the sense of dispensable: without peripheries, no core [and] no capitalist development' (Hopkins 1982: 13). Indeed, core and periphery are not geographical or national categories but relationships of imperi-alistic global surplus transfer. 'Such a relationship is that of coreness–peripherality . . .. The losing zone [is] a *periphery* and the gaining zone a core.' All commodities culminate from production chains that generate its components. Often located in a peripheral territory, subordinate producers generate value that is embedded in the traded commodity, and that value is far beyond the costs of production plus profit for which they are paid. These lower costs of production, particularly to the disadvantage of labour, generate high levels of value transfer to distant buyers and often super-profits for capitalists. Marx (1993: vol. 3) briefly explored superprofits (extra surplus value) as above-average profits derived from monopolistic control over resources or technologies, leading

to land rents, mining rents, or technological rents. Lenin (1964: vol. 23, 105–120) explored the notion more fully. For recent discussions, see Amin (2010), Smith (2011), and Higginbottom (2013). Through global transfers, core citizens 'liv[e] off the surplus value produced by others' while peripheral residents are 'not retaining all of the surplus value they are producing'. As a result, a majority of the world's surplus capital accumulates at the core, 'making available dispro-portionate funds' that capitalists utilise 'to gain additional competitive advantages' (Wallerstein 1983: 31–32).

This essay will examine four conceptual themes that pinpoint the ways in which imperial-ism is structurally embedded in capitalism.

1. Expropriation of surpluses across space is an historical and increasing source of polarised wealth accumulation in the world. Such global transfers take many forms, their economic centrality varying over time. Probably the most basic of these forms is differential costs of labour.
2. The relentless pursuit of lower costs is a driv-ing force of global imperialism, so capitalists seek to maximise profits by constructing long-term *degrees of monopsony* that disadvantage both labourers and capitalist competitors.
3. Imperialism structures hidden drains of sur-pluses not only from underpaid labour but also from unpaid labour and the externalisation of costs to ecosystems, communities, and households. I conceptualise this process as the expropriation of *dark value transfers*.
4. Core citizens benefit greatly from the con-sumer surpluses that derive from peripheral dark value drains, so they are not likely to support anti-imperialistic movements against this system of global value transfer.

Global Value Transfers Through Differential Labour Costs

Karl Marx insisted that all history is the history of class conflict in which the subordinate class resists the seizure by elites of the surpluses they produce

(Marx and Engels 1848). In accord with Einstein's opening quotation, we will not be able to see global surplus transfers unless we widen Marx's theoretical lens. In this vein, we need to recognise that capitalism has exhibited a history of territorial conflict in which subordinate groups resist the seizure of their surpluses by external elites; that is surplus expropriation across space. In addition to the historic forms of plunder and tribute, global value transfer takes many forms; for example, production monopsonies, sales monopolies, politically manipulated trade, tariffs, loans, and exchange rates. The form that is examined here is that based on differential production costs.

Theoretical Foundations

Even though global value transfer is an extension of Marx's analysis, it is a fundamental problematic that he barely broached in the work he published. Moreover, surplus drain is an idea that has either been rejected or ignored by most Marxists and most other economic theorists (Amin 2012). While classic Marxist theorists of imperialism focused on monopoly capitalism as the driving force behind the new form of imperialism of their day, they largely ignored explicit analysis of surplus drain. Hobson (1902), Luxemburg (1951), Lenin (1964: vol. 1), Bukharin (1972), and Hilferding (1981) did not focus on cheap labour or the problem of integrating a theory of monopoly capitalism with Marx's labour theory of value. Instead, they grounded their arguments in analysis of superprofits that derive from capital and commodity exports to the periphery.

Starting in the 1950s, some neo-Marxist theorists shifted the analytic focus from core exports of capital and commodities (Lenin 1964: vol. 1) to core foreign direct investment and commodity imports from the (semi) periphery. Extrapolating from Marx's (1993: vol. 1, parts 3, 4, 5) theory of surplus value, Paul Baran (1957) introduced the concept of *economic surplus* (as distinct from surplus value) as key to economic growth, and he contended that loss of economic surplus blocks peripheral development. Frank (1969) expanded

this by arguing that colonialism structured *development of underdevelopment* to ensure surplus transfers to the imperial core. However, Baran (1957) and Frank (1979) paid little attention to the linkages between cheap labour and surplus drain, choosing instead to prioritise surplus transfers from international trade, taxation, and repatriation of investments. In making this conceptual choice, they moved away from the orthodox Marxist emphasis on the linkage between labour exploitation and surplus creation. It was not until Emmanuel's (1972) theory of *unequal exchange* that international wage differentials were recognised as major sources of surplus drain. Subsequently, Amin (1974) incorporated this notion into his analysis of 'accumulation on a world scale'. Concurrently, Wallerstein (1974) introduced world-systems analysis, a perspective in which a multi-state capitalist system is driven by surplus drain, particularly the value extracted from underpaid labour throughout the system. Recent extensions of global value transfer theory include Cope (2012) and Higginbottom (2013).

The New International Division of Labour

The classical theories of imperialism (e.g. Lenin 1964: vol. 1) were responses to a restructuring of the world-economy as a result of declining profit rates. That restructuring included the massive export of capital, as loans, to the Third World. In the 1970s, a new imperialist structure of accumulation emerged, again in reaction to declining profit rates. Scholars analysed this continuing worldwide transformation as a *new international division of labour* (Frobel et al. 1980) to acknowledge the relocation of core manufacturing to semiperipheries. Analysis of this epochal change gave rise to a proliferation of concepts previously unknown, such as deindustrialisation, newly industrialising countries, export-led development, fragmentation of production, outsourcing, transnational corporations, commodity chains, global value chains, supply chains, global production networks (Dicken 2011). This phase of restructuring reflected an historical shift

from the core export-oriented imperialism (capital and products) to import-oriented imperialism (peripheral commodities).

Frobel et al. (1980: 41) pointed to the most imperialistic aspect of this restructuring: 'the *worldwide* organized allocation of the elements of the production process to the cheapest labour force that could be found'. More broadly, the shift indicated an intensification of capital's normal search for unpaid costs, always a basic element of the global value transfer, and it resulted in dramatic change in the world class system. The fuller capitalist incorporation of China, India, and Russia doubled the size of the world working class (Freeman 2008: 687). The newly integrated workers were cheap labour and disproportionately female (Pyle and Ward 2003), with a majority trapped in the informal sector (International Labour Office 2007). Concurrently, the size of the transnational capitalist class expanded, and the role of the *comprador bourgeoisie* (Amin 1974) and its associated professional/managerial cadres shifted from that of traders to overseers of production (Robinson 2004). Since this restructuring of the world economy followed the logic of unequal exchange, it integrated vast numbers of workers and subordinate capitalists as new exploited classes to supply cheap labour and services.

Unequal Exchange and the Imperialism of Free Trade

Unequal exchange is a concept grounded in the logic of semi-permanent differential costs of production and the logic of trade between competitive capital and monopoly capital (for an overview of unequal exchange theories, see Raffer [1987]). It is reasonable that the theories should focus on the price of labour and international trade since these are areas in which spatial cost differentials are highest. Unequal exchange theorists contend that the primary mechanism of global value transfer is the *imperialism of free trade* rather than monopoly profits based on control of economic systems through military imperialism. Gallagher and Robinson (1954) coined the phrase

'imperialism of free trade,' arguing that 'the main work of imperialism' was the geographical expansion to new areas and the deepening of free trade mechanisms in areas that were already controlled. Basically, unequal exchange theories are attempts to place spatial value transfer from cheap labour at the heart of Marxist theory. In doing so, they emphasise the reality that free trade entails the exchange of cheap, low-profit peripheral exports for high-priced, high-profit core imports. These global value transfer chains accumulate surpluses disproportionately at the core through mechanisms of unequal exchange (Clelland 2013, 2014).

The imperialism of free trade is structured through global commodity chains in which the various components, starting with raw materials, are produced and combined. Such transnational chains were among the basic features of historical capitalism (Hopkins and Wallerstein 1986). In recent decades, many core 'lead firms' have offshored a majority of their production to the (semi)periphery. Typically, the lead firm designs the product, establishes patent rights over its innovations, develops quality standards for component parts, organises and governs the supply chain, and controls the distribution and sales of the finished import (Gereffi et al. 2005).

A commodity chain is the most important mechanism for the extraction of surplus across space, and unequal exchanges are embedded in each of its transfer points. The relationship that exists between nodes in the commodity chain has the same basic form as the core/periphery relationship, and, in turn, the same form as the relations of production within each node of the chain. This abstract model assumes that all of these relationships are not usually between equals (as in the abstract model of neo-classical economics), but between unequals. At all levels, then, the relationship is one of surplus extraction (Clelland 2012).

Imperialistic Impacts of Wage Differentials

How has the new international division of labour exacerbated global wage differentials? Greater

trade liberalisation increased the importance of the relative wages of the unskilled labourers who comprise a majority of the new industrial labour force in the Global South. On the one hand, there has been a 'race to the bottom' in wages, as labour's share of the GDP continues to decline in most Southern countries (International Labour Organization 2010). On the other hand, transfer of industry has been accompanied by greater wage inequality between North and South, as well as greater wage inequality within peripheral and semiperipheral countries.

What, then, is the size of global value transfers that are derived from these wage differentials? Applying mean core–periphery manufacturing wage differentials to the adjusted total value of core imports from the periphery, Cope (2012) concluded that the global value transfer is approximately US$2.8 trillion annually, or nearly one-third beyond what was paid for the imports. (For estimates of the global value transfer through differential production wages, see Amin [1974, 2010], Emmanuel [1972], Kohler and Tausch [2002].) This transfer equates to about 6% of the core GDP. Clelland (2013, 2014) offers an alternative method by comparing the consumer price consequences of different wage levels. For instance, the total payment to peripheral workers for the production of a pound of coffee is only 16% of the price. If the cost of similarly skilled US workers at minimum wage levels were substituted for average US farm worker wages, the labour cost would nearly double the price to consumers. Similarly, the peripheral labour cost for the production of an Apple iPad is only 9% of the consumer price. If the costs of similarly skilled US minimum-waged workers were substituted for the widely variant costs of lower-paid Asian labour in the production chain, the price of the iPad would nearly double.

Global surplus transfers that result from differential wages are a much larger proportion of the economy of the periphery than of the core. Indeed, the worst impact of these 'imperialistic rents' is that they remove about half of the potential profits of the Global South (Amin 2012: 4). Moreover, those transfers exceed the capital that is annually invested in expanded reproduction of those societies (Kohler and Tausch 2002). The impacts of these surplus transfers are not just measured in short-term livelihood disadvantages. The long-term loss to the (semi) periphery of this global transfer is significant, for the basis for investment in expanded economic and social development is reduced (Baran 1957; Frank 1969).

Imperialism Through Degrees of Monopoly

A fundamental assumption of classical Marxist and neo-classical economics is that capitalism is based on nearly pure competition over the long term, thus providing the laws or tendencies that drive the system. (Marx [1993: vols. 1, 3] assumed nearly pure competition in his labour theory of value and his conceptualisation of the falling rate of profits.) In this view, neither price differentials nor monopoly persists in the long run. In sharp contrast to this scholarly assumption, Kalecki (1939: 252) contends that monopoly is 'deeply rooted in the nature of the capitalist system' and is 'the normal state of capitalist economics.' Similarly, Braudel (1981: vol. 2, 412–422) drew a sharp distinction between the competitive market facing most firms and the 'anti-market' sphere of 'real capitalism,' the realm of the monopolists who shape and dominate the capitalist world-system. In short, the capitalist struggle for monopoly is an historical driving force of capitalism. To emphasise the gradational nature of monopoly, Kalecki (1954) coined the concept *degree of monopoly:* the relative ability to set prices in the distribution process, as opposed to the determination of prices by the competitive market. (Kalecki [1954] also uses the synonymous terms *degree* of *market imperfection* and *degree of oligopoly.* Marx [1993: vol. 3, part 6], Amin [2012] and other Marxist theorists [e.g. Sau 1982] use the terms *monopoly rents*, *imperialist rents*, and *superprofits* in ways that are parallel to my applications of Kalecki's *degree of monopoly.*)

Many discussions of monopoly point to: (a) collusion among potential competitors in setting high prices in order to collect high profits; and/or (b) state protection of selected capitalists.

In contrast, the logic of imperialism that is built into capitalism is the search for lower costs to attain a more monopolistic position. In addition, degree of monopoly is commonly based on economies of scale, increased productivity through technology, barriers to entry, patent rights, advertising and marketing, as well as invention of a unique product or productive system. But the greatest of these is *barriers to imitation* through international policing of intellectual property rights. In other words, a capitalist constructs a degree of monopoly through the ability to lower costs or raise prices beyond what would be possible in a purely competitive economy.

Dominance Over Subordinate Capitalists Through Degrees of Monopsony

Any national core economy may be described as a form of monopoly capitalism (Baran and Sweezy 1966; Hilferding 1981). However, the larger capitalist world-economy is a *degree of monopsony* system in which a few buyers dominate a context in which there are many sellers (Robinson 1993). Current imperialism is based less on obtaining superprofits through export of core finance and goods than on securing imperial rents by controlling the prices of peripheral imports (Amin 2012). The most powerful monopsonists are the firms that have established a high degree of monopoly by employing the mechanisms indicated above. Because of their large size and small number, these firms enjoy the privilege of unequal power in the negotiations with smaller, very numerous suppliers. Indeed, this is the unequal trade at the heart of unequal exchange. Kalecki (1954) defined degree of monopoly as the ability to control the mark-up, the difference between total costs and revenue. In contrast, contemporary imperialism is largely the ability to control 'mark-downs'; that is, the power to force down the cost of production in the periphery. From the origins of capitalism, agricultural trade from the periphery took the form of production by a multitude of peasants who sold to a small number of traders, who in turn exported to a small number of core buyers (commission merchants), the original

transnational capitalist class (Wallerstein 1974). Those core buyers used the competition among sellers to force down the costs of production, prices, and profit rates. Both small producers and compradors worked informally for monopsonistic core traders/wholesalers who obtained the bulk of profits. Setting aside the many boom periods of initial production, these profits are often termed *imperial rents* (Amin 2012), in recognition of the limited energy expended in trade as contrasted with the amount of labour required in the production process. These rents, sometimes termed *monopoly rents*, were largely *monopsony rents*. The heart of the current form of imperialism is an expanded, more organised, more rationalised version of the original system. It is a monopsonistic system of 'free trade' designed to expand global value transfer.

The new compradors are the peripheral capitalists who do the real work of providing or raising investment funds, constructing factories, purchasing supplies and equipment, hiring labour, and organising production. Having a low degree of monopoly, the peripheral capitalist struggles to cut costs but obtains little increased profit. In order to remain a competitive seller to the monopsonistic buyer, that subordinate capitalist must turn those lower costs into lower prices. This is an imperialistic system in which the monopsonistic final buyer becomes a rentier who obtains imperial rents by outsourcing production to subordinate competitive capitalists who must accept lower profits. Quite often, such firms are double rentiers since their high monopoly profit rates were already based on technology rent or design rent insured by legal barriers to imitation. Today, such capitalists hold a position similar to the hated landlords of Ricardo's (1817) time. They obtain their share of the economic surplus from claims of property rights, leaving actual production to others.

Degrees of Monopoly Through Cheap Labour Exploitation

Of all the differential costs of production upon which the system of imperial monopsony is

built, the most important are the highly divergent costs of labour. In the classic Marxist model, the capitalist who hires workers and organises the labour process obtains profit from the extraction of surplus value from those workers. How do contemporary subordinate peripheral capitalists extract surplus value from workers in order to drive down costs? Analysis of a core corporation that has outsourced production to Asia provides a good overview of the kinds of tactics that subordinate capitalists employ to slash labour costs. In 2010 and 2011, the vast majority of Apple's Chinese subcontractors engaged in a mix of the following practices: (a) below minimum wages that violated national and local laws; (b) excessive overtime hours at wage rates that did not meet legal requirements; (c) wage deductions to discipline workers; (d) gender discrimination in wage rates; (e) employment of lower-paid underage and foreign bonded labourers; (f) failure to implement safety measures; (g) structuring unpaid work time into the daily routine; and (h) deducting fees from wages for equipment and uniforms (Fair Labour Association 2012). All these strategies are efforts to increase absolute and relative surplus value, much of which is captured by the lead firm. To maximise cost-cutting strategies, peripheral subordinate capitalists employ cheap indigenous professional and managerial cadres. These 'hired-hand' capitalists are proficient at: (a) recruiting cheap waged workers; (b) effecting organisational efficiency and time management; (c) speeding up worker productivity; and (d) expropriating hidden unpaid labours from workers. Managerial personnel drive waged workers through Taylorist speed-ups, shift quotas and longer work weeks than are legally tolerated in the core. Like the workers they exploit, these overseers of production are the servants of monopoly capitalists.

The value transfer from subordinate to more monopolistic capitalists is clear in empirical analyses of surplus extraction. In the iPad commodity chain (Clelland 2014), the subordinate capitalists who organise the production and supply chains are primarily transnational corporations headquartered in South Korea and Taiwan, but nearly all the production occurs in China. While these semiperipheral capitalists retain about 15% of the total profits from iPad sales, 76% is captured by Apple. The operating profit margin (OPM) for this core corporation is about 25% of its revenues, but the OPM for the subordinate semiperipheral capitalists is quite narrow (only 7%). Reflecting that there may be several tiers of subordinate capitalists in a production chain, the tightest OPM in the iPad chain occurs for those smaller Asian capitalists to whom the semiperipheral corporations subcontract parts of the supply chain. While most of the responsibility for cutting labour and other production costs is most heavily externalised to lower tiers of subordinate subcontractors, they capture very little of the surplus value and attain a slim operating margin that drives them to slash labour costs even more deeply.

A similar pattern of global value transfer occurs in the coffee commodity chain (Clelland 2013). The ability to capture surplus does not lie in the hands of those organising and supervising labour power, but in the hands of the transnational corporations that hold high degrees of monopoly. In the case of coffee, the total profits are about 17% of the retail price, but only about 2% of the price is retained by peripheral capitalists. While peripheral capitalists organise and control 86% of the productive labour, they have little control over the capture of the surpluses that are generated by their efforts to keep costs of production low. The degree of monopsony possessed by a small number of wholesale coffee roasters and distributors allows them to usurp most of the surplus value generated by the large number of peripheral subordinate capitalists.

Imperialism Through Global Transfers of Dark Value

The global transfer of value occurs through two types of surplus drain. The first is *bright value transfer*; that is, the movement to the core of profits from sales in the periphery. These are monetarised and measured with transparent accounting techniques (Clelland 2012: 199–200). In contrast to these visible global surplus transfers, there is a second type of surplus

drain that I term *dark value tranfer*; that is, the movement to the core of peripheral products containing large amounts of differential costs. For Marx (1993: vol. 1) the value of a commodity is based on the labour time involved in its production. However, there are important components of value that are more deeply hidden, for capitalism is 'an economy of unpaid costs' (Wallerstein 1999: Chap. 5). The savings from under-compensated peripheral labour and inputs are such unpaid costs or dark value. Capitalists attempt to transform dark value into bright value (profits) simply by maintaining prices despite low costs. This transformation of nothing (non-payment) into something (monetarised bright value) is a form of value capture for accumulation (expanded reinvestment). Alternatively, the dark value costs may be used to cut output prices. In this case, the dark value is embedded in the product and captured as extra value for the buyer.

How, then, is this dark value produced and captured? The sources of dark value may be found in any of the factors of production (capital, labour, land, resources, energy, environment, knowledge) when a capitalist obtains a component of production at less than the average world-market price. The following sections examine how dark value is embodied in: (a) under-compensated waged labour; (b) under-compensated informal sector labour; (c) unpaid inputs from households; and (d) ecological externalities.

Dark Value from Under-Compensated Waged and Salaried Workers

Much of the material basis for global value transfer lies in the exploitation of cheap export production workers in the (semi) periphery. Dark value is transferred from these workers because capitalists pay them at levels well below core averages. The dark value added (value for which no payment is made to labour) in periphery to core exports is worth 30–100% beyond the market prices (Clelland 2013, 2014). If the unpaid differential costs of core versus periphery salary payments to

cheap engineers and managers were taken into account, another 35% would be added to the dark value of high-tech peripheral imports (Clelland 2014) and another 13% for low-tech peripheral imports (Clelland 2013). In the case of the Apple iPad, the total dark value hidden in the services of low-paid Asian engineers and managers is worth more than five times the bright value that appears in the accounts of its key suppliers (Clelland 2014).

Dark Value from Under-Compensated Informal Sector Workers

The new international division of labour not only captures the cheapest waged workers possible but also devises deeper exploitation of forms of labour outside the formal sector. Dark value is drained from informal sector workers in two ways: (a) subcontracting with capitalists for production in export chains; and (b) support of under-paid waged labourers in these chains. Increasingly, transnational capitalists subcontract with subordinate peripheral capitalists who outsource at cheaper-than-wage rates to several forms of informal sector workers (Dedeoglu 2013), including industrial and agricultural subcontracting with households (United Nations 2011). For this reason, a majority of the world's new jobs are being created in the informal sector (International Labour Office 2007).

Rather than eliminate those informal forms, subordinate capitalists routinely integrate them into their production systems, as mechanisms to lower labour costs. The capitalist who lowers production costs most deeply through such strategies attains a greater degree of monopoly than a competitor who is unable to capture the same level of cheap informal labour. Through subcontracting of home-based production to women in their households, for instance, capitalists super-exploit labour by: (a) paying below subsistence remuneration for produced items; (b) integrating unpaid child labour into the production process and (c) by externalising costs of production, such as electricity and equipment, from capitalists to households (Pyle and Ward 2003).

In addition, informal sector workers subsidise the low incomes of formal sector waged labourers. Beyond each under-paid waged worker is a large support staff of food producers and informal service providers who contribute to the reproductive capacity of this worker. By supplying low-cost survival needs to the waged worker, these poorly remunerated labourers subsidise low capitalist wages. Because they help make cheap export production wages possible, they are part of the extended chain of global value transfer. The daily life of the under-compensated peripheral waged worker entails the unequal exchange of her labour time for more hours of labour time from informal producers. For example, she may drain dark value from a lower-paid child care-giver who makes it possible for her to work for wages outside her household. This flow of dark value cheapens the reproduction costs of peripheral labour and, thus, the wage level that capitalists pay. If paid at the core minimum wage and rendered visible in costs of production, the informal-sector labour embodied in each iPad would add almost 30% to its retail price. Even though most scholars would consider them to be outside the commodity chain, the savings from the underpaid services of the Chinese underclass contribute dark value that is nearly equivalent to Apple's gross profit margin for each iPad (Clelland 2014).

Dark Value from Unpaid Reproductive and Household Labour

The wages of paid labour are included in the commodity price, but what about the price of the basic commodity, the cost of reproducing labour? Like other components of any commodity, labour has a chain of suppliers, but they are unpaid. The vast dark energy used up in this production is excluded from the formal accounting of production costs and from prices. Though mainstream economists and most Marxists do not view such unpaid labour as producing surplus value, this household work is a crucial source of surplus value because it provides the capitalist with the basic component of production. While Marx (1993: vol. 1, 176) claimed 'the secret of profit

making' lay in exploitation of waged labour that occurred in the hidden abode of the factory, we really need to enter the hidden abode of labour reproduction, the household, to find that secret. While many other costs of production are bought for prices that cover replacement, labour is provided without inclusion of its reproduction costs, so it is simply 'rented.'

Global outsourcing to capture dark value from cheap waged labour also captures dark value from household labour. Not only workers directly employed in export production, but also most of the peripheral population contributes a portion of their household and/or informal labour power to global transfer of value. Peripheral households and women absorb the costs of reproducing, maintaining, educating, and socialising the labour force (Dunaway 2012). Capitalists are able to drain hidden surpluses from households because a majority of the world's workers earn only a portion of their livelihoods from waged labour. Indeed, these *semi-proletarianised households* pool the greater proportion of their resources from non-waged activities, inadvertently encouraging capitalists to pay 'the lowest possible wage' (Wallerstein 1983: 91). Concealed in profits and cheap consumer prices is the unpaid reproductive labour of millions of peripheral households. In addition, unpaid family members provide much of the support labour for male-dominated, household-based enterprises (Dedeoglu 2013; United Nations 2011). The dark value of uncosted household hours is embedded, not only in finished products, but also at every level of the production and distribution chains, until it reaches the core consumer at a price that does not reflect the value of all the embodied labour (Clelland 2013, 2014). How economically significant is unpaid household labour? If paid at the core minimum wage and rendered visible in costs of production, the unpaid reproductive labour embodied in each iPad would add almost 25% to its retail price (Clelland 2014).

Dark Value from Ecological Externalities

A large share of the world's peripheral resources are either owned by core multinational

corporations or are contracted out by states at low prices (Magdoff 2013). Had ownership been retained in peripheries, the continuing cost of resources would be much higher than it is today, in order to provide 'resource rents' to the owners. These flows are not just an unpleasant result of past imperialism, but follow on today as 'continuing dispossession' (Harvey 2003). In addition to the visible, documented drains of ecological surplus, there is the hidden problem of uncosted and plundered resources. The consequences of such drains have been studied in the flourishing research about 'ecological unequal exchange' (Jorgensen and Rice 2012).

In the case of natural resources, surplus is not just that which is available after the reproduction costs of the ecosystem have been met, for surplus is enhanced by the destruction of the system itself. Natural capital is withdrawn from the ecological world bank, without replacement. Consequently, realistic cost allocation would entail either a decline in capitalist accumulation or price increases. On the one hand, every commodity has an environmental footprint; that is, the total ecological base needed for its production and distribution (Wackernagel et al. 2002). To the extent that the footprint is not fully costed, the capitalist absorbs dark value. On the other hand, commodity production leaves a large footprint in the form of threats to the survival of local communities and households. Peripheral areas absorb the side effects of the capitalist's unpaid ecological damage, reflected in public taxes for clean-up, health risks to residents, and loss of access to ecological resources that once supported local food security. Moreover, damage to world ecosystems (especially global climate change) is disproportionately borne by peripheral areas, reflecting another deeply hidden form of dark value drain. If ecological recovery were costed at core levels and rendered visible, the dark value savings to Apple from outsourcing some ecological externalities would add 38% to the retail price of the iPad. Moreover, this ecological unequal exchange is nearly double Apple's operating profit margin (Clelland 2014).

How Do Capitalists Utilise Dark Value?

In a purely competitive system, all captures of dark value would quickly be matched by competitors, but this does not happen in real capitalism (Braudel 1981: vol. 2, 413–422). Thus, capitalists who capture significant levels of dark value can utilise it in three ways. First, the capitalist might monetarise some portion of the dark value in order to expand accumulation through reinvestment. Second, the capitalist can employ the dark value to attain protection from competitors through degrees of monopoly. Third, they can apply the hidden value to roll back prices in order to attract a greater volume of consumers than their competitors.

Consumer Surplus as Deterrent to Anti-imperialism

The commodity chain is the imperialistic globalised structure that is devised to ensure capital accumulation in the core. However, it is also a surplus extraction chain that is grounded in unequal transfers from lower-to higher-wage sectors. Thus, capitalism is not only imperialistic because it accumulates most of world surplus at the core, but also because it delivers cheap goods to a majority of core citizens by means of the expropriation of dark value from peripheral workers. Expanded consumption in the core provides the opportunity for increased drain of value based on unequal production prices between core and periphery. Since core lead firms have a high degree of monopsony over peripheral capital and labour markets, these capitalists can extract massive savings through the dark value embodied in cheaper labour. Unlike core unionised workers, peripheral waged workers have been unable to drive the price of labour very much above the subsistence level. As a result, workers who do the same tasks with similar skills and equipment earn hourly wages that differ by as much as a ratio of 15:1 across regions of the world (for analysis of average wages by country, see Bureau of Labour Statistics [2013]).

It can be generalised from Clelland (2014) that the total value transfer approximates one-third of the core GDP. When dark value arrives in the core, it can be distributed three ways: as profits, as wage payments, or as consumer surplus. For example, core capitalists distribute the embedded dark value from a pound of coffee three ways. It can be estimated from (Clelland 2013: 84) that about one-fifth of dark value is transformed into profits while another 15% is allocated to wages (about half to salaried workers). However, most of the embedded dark value is captured by customers because it is worth nearly 50% more than the market value of the coffee (Clelland [2013: Table 4.1; 2014: Tables 1.5]). As we see in this example, most dark value collected by core firms is not transformed into profit but into lower consumer prices than would result from core production. The difference between the price of the commodity if it were produced in the core and the actual price that benefits from capture of peripheral labour is *consumer surplus*. This argument is a radical variant of the neo-classical economic concept of consumer surplus. My use of the concept differs from that by most other scholars, who focus on subjective utility, the difference between real price and what an individual would be willing to pay (see http://www.businessdictionary.com/definition/consumer-surplus.html). This methodology points toward the objective reality of the hidden value of unpaid costs to consumers.

At a minimum, the value transfer is worth about $4,000 annually to the average core household. Surprisingly, the imperial project invented and administered by the core transnational capitalist class benefits the core population more than the capitalists. The undercosted peripheral hours remain embedded in the purchased product. If dark value were fully costed, profits would be diminished and/or the prices of commodities would be increased. The vast majority of core citizens, including most of the working class, depend upon imperialism to acquire much of their affluence through the structural transmission of value from the periphery.

Global Value Transfer and the Aristocracy of Labour

This is the story of the hidden surplus that capitalist imperialism drains from its peripheries to benefit its core capitalists and consumers. Since the beginning of capitalism, the essence of imperialism has been the capture of value and its transfer across space. Both logic and evidence point to the benefits of lower costs that are transmitted from the point of origin to the place of their realisation. This capture of surplus is grounded in transfers derived from the extraordinary differences in labour costs between periphery and core, and the transferred value is significant.

Most of this transfer would not occur in a world economy that was purely competitive. In such a system, the capitalist who captured the lower price of production would also capture the benefit in the form of higher profit. In reality, core buyers of peripheral products receive the captured value of cheap labour. This transfer of value is based on the monopsonistic power of a few core firms to push down the prices, wages and profits that can be attained by the many peripheral firms in a highly competitive context. In this monopsonistic relationship, those peripheral capitalists act as underpaid subordinates who slash export production costs, especially labour.

The core–periphery structure of global value transfer is the essence of imperialism. The differential wage component of global value transfer is based on the idea that two classes of labourers, working under similar conditions, produce commodities of equal market value. The difference in surplus value produced by the cheaper labour class may be considered as dark value derived from underpayment. Concealed in periphery to core exports, this dark value approximates the bright value of trade prices. Since dark value is extra surplus expropriated through underpayment of labour costs, much of it is readily transformed into bright value of imperial rent.

However, cheap labour could not be as cheap without that deeper level of dark value expropriated from even cheaper workers who reproduce labour power through unpaid or ultra-cheap inputs

from households and the informal sector. This hidden labour is embedded in the production of all surplus, and it is concealed in all commodities. When we take its value in labour time into account, the size of the global value transfer from periphery to core roughly doubles. Surprisingly, capitalists do not capture all the dark value obtained from the various forms of cheap peripheral labour involved in periphery to core exports. Most of the dark value is captured by core consumers because capitalists utilise it to reduce prices. This consumer surplus is value beyond price and it is part of the imperial rent. Its value is greater than that captured by core capitalists.

World capitalism is a system that delivers the goods to its core population at the expense of the world majority. Since capitalists transfer part of their dark value surpluses to them, most of the core working class becomes a consumerist *aristocracy of labour* (Brown 2013; Communist Working Group 1986). (This viewpoint is an expansion of the 'aristocracy of labour' thesis of Lenin [1964: vol. 23, 105–120] that is found in Amin [1974]. For overviews of the aristocracy of labour debates, see Post [2010] and Cope [2013].) Cheap goods consumerism is now the driving force of the world economy. In the core, what was once Lenin's (1964: vol. 23, 105–120) small 'bribed' section of the working class has been transformed into a broad aristocracy of labour comprised of ordinary citizens who have little reason to oppose the imperialistic system from which they obtain rewards. Objectively, the majority of the Global South population should resist surplus drains. However, most (semi)peripheral elites, state leaders, emerging professional/managerial classes and middle classes benefit from the expropriation and export of dark value embedded in the imperialistic value transfer system. The workers who most need to unite are those of the (semi)periphery. They have nothing to lose but their commodity chains of global value transfer.

Definition/Description

This chapter on Global War and Afghanistan demonstrates that violence is used as a vital element in the Empire of Capital as it seeks to supress any competing system which seeks to advance collective welfare and reciprocity that are embeddedin precapitalist systems. The chapter argues that violence is a necessary component in suppressing popular resistance in the imperialist system dominated by the capitalist states (Empire of Capital), represented by the United States and its allies. The US is capable of defeating Afghanistan and other states through the overwhelming control over military violence.

Throughout the endless occupation of Afghanistan, many people in the West have continued to believe the myth that this country is a remote, worthless land populated by backward, hostile people. The influential author Andrew Bacevich (2009) wrote: 'NO SERIOUS [sic] person thinks that Afghanistan – remote, impoverished, barely qualifying as a nation-state – seriously matters to the United States.' Given the general level of ignorance about Afghanistan perpetuated by intellectual elites, political and military leaders, and mainstream media it is not surprising so few of the taxpayers footing the bill and the families sacrificing their loved ones for the ongoing military expedition question the story of why a small coalition of states, led by the US, invaded Afghanistan and continue an occupation with no end in sight. The accepted story is that the invasion was a necessary act of retaliation that would eliminate the terrorists responsible for the 9/11 attacks, which in the process would somehow liberate Afghan women and girls, give democracy to Afghans, and generally make the world a safer place. The passion for war has ebbed as the toll in blood and resources mounted and the combat mission has been transformed into a mission to train Afghan forces. Still, the myths used to justify the invasion and ongoing occupation of Afghanistan prevail.

It is beyond the scope of this essay to counter the myth that Afghans are backward and hostile. It suffices to repeat what some Afghans told me during my visits: 'If you come to Afghanistan as a guest we will treat you with the greatest hospitality, but if you come as an imperialist – as a thief to steal from us – we will kill you.' I would reply: 'If you invite me to your home, I will come in friendship to enjoy your hospitality; I will not search through your cupboards looking for whatever I can steal.' I can attest to the fact that when one visits on these terms, Afghans are extremely hospitable. Moreover, many Afghans – even many considered illiterate by Western standards – are acutely aware of their place in the historical progression of global political economy. Many Afghans maintain that they defeated the British and Soviet imperialists of the nineteenth and twentieth centuries and contend that they will ultimately defeat the US-led forces whom they also perceive as imperialists. This is not to suggest that most Afghans seek isolation from the West: many would welcome engagement and trade on fair terms; however, many fear they are sacrificial pawns in this latest rapacious mode of militarised capitalist expansion. Depictions of Afghanistan that suggest the ongoing warfare is rooted entirely in tribal, ethnic, and religious conflicts, or a supposed global clash of civilisations, obfuscate the many material rationales rooted in an expanding global political economy that Afghans identify for the successive foreign occupations of their land since the beginning of the nineteenth century (Skinner 2013). The tribal, ethnic, and religious conflicts that stretch beyond the borders of Afghanistan throughout the region of greater Central Asia are certainly important factors in understanding warfare in Afghanistan, but these are issues beyond the scope of this essay. These are not causal issues; they are symptomatic. None of these issues – even if they did indeed threaten world peace and the very foundations of global civilisation, unlikely as that widely propagated explanation seems – explains the real strategic and economic interests the most powerful and wealthiest nation states have had in Afghanistan, since the beginning of the nineteenth century and to the present day.

This essay does counter the myth that Afghanistan is a remote and worthless land by examining the geostrategic value of Afghanistan in the context of the historical expansion and evolution of capitalism and the emergence of an 'Empire

of Capital' (Wood 2003). Afghanistan is a land of immense natural resource wealth; Afghan mineral resources are estimated to be worth one trillion US dollars (Najafizada and Rupert 2010; Risen 2010), and the total value of all extractive resources, including oil and gas reserves, may be as much as three trillion US dollars (Najafizada 2011). Afghan resources are of significant value, but their greater value lies in catalysing the development of a trans-Eurasian network of transport, energy transmission, and communications infrastructure with Afghanistan as a central node – Afghanistan lies at the geopolitical centre of the struggle to expand an emerging Empire of Capital throughout Eurasia. Barely more than two centuries after Elizabeth I granted the East India Company its royal charter in 1600, the paramilitary forces of the East India Company pushed northwards through India to make their first forays into Afghanistan. The expansion of capitalism was, however, stalled at the borders of Afghanistan for almost another 200 years until the US-led forces 'liberated' Afghanistan with the invasion of 7 October 2001. Feel-good propaganda stories aside, few Afghans and especially few Afghan women and girls were liberated by the invasion. International investors, however, were truly liberated – investors are now free to profit not only by extracting Afghanistan's wealth, but even more so by developing the infrastructure to make use of its strategic position at the centre of expanding capital across Eurasia. Afghanistan is a geopolitical and economic keystone poised to become a central node of transport, energy transmission, and communications networks spanning Central Asia that will ultimately connect the disparate regions of the Eurasian supercontinent. The US Government and the Asian Development Bank (ADB) call this initiative the 'New Silk Road' (Clinton 2011).

Building physical infrastructure, however, is only part of developing the New Silk Road. Hillary Clinton's (2011) comments when announcing the New Silk Road demonstrate that creating the political-legal-economic infrastructure, which she described as 'new rules for the 21st century', are equally important. The strategic and economic importance of global trade in various resources wax and wane with changes in technology or consumers' whims, but a remaining constant is the growth of the physical transport, energy transmission, and communications networks, as well as the less tangible but no less real political-legal-economic infrastructure of empire. Building this superstructure of dominance lies at the heart of building empire. The Bush and Obama administrations' expanding regime of new rules, which is enforced by military dominance at least as much as political influence, strengthens the concept of New World Order originally conceived by Woodrow Wilson. This New World Order, nearing its centenary, relies on the hegemonic leadership of the US in partnership with other powerful wealthy capitalist states – partnerships tied together by a growing matrix of state, sub-state, and supra-state governance and military organisations; non-governmental organisations (NGOs); and corporations. The theorist Ellen Meiksins Wood (2003) describes this complex matrix of domination as an 'Empire of Capital'.

In this essay, I first examine the vast resource wealth of Afghanistan. Second, I examine the development of the New Silk Road as a means not only to exploit this wealth but more importantly to expand US and allied dominance in Central Asia and throughout Eurasia. Third, I argue that the invasion of Afghanistan was not necessary in the legal sense defined by international law; however, the invasion and continuing occupation are necessary, from the perspective of geostrategists, to expand capital and maintain US dominance in the global political economy. I conclude that the invasion and occupation of Afghanistan constitute one battle of many in an endless global war for the expansion of capital that demonstrates the emergence of an Empire of Capital. The US continues to compete for global dominance, but the empire that the US leads is becoming increasingly multinational in composition as the most powerful and wealthiest capitalist states ever more closely align their interests towards global and not exclusively national capital expansion. The invasion of Afghanistan failed to liberate most Afghan women, but it successfully liberated capital, by destroying Afghan normative systems of collective ownership.

The Wealth of Afghanistan

On 31 January 2010, Hamid Karzai, then president of Afghanistan, announced that an 'almost-finished' report by the United States Geological Survey (USGS) indicated that Afghanistan's non-fuel mineral resources are worth a trillion US dollars (Najafizada and Rupert 2010). More recent surveys show that Afghan oil and gas reserves may be worth as much as an additional two trillion US dollars (Najafizada 2011; USGS 2011). The story of Afghan resource wealth had been reported for decades in the business pages and extractive industries journals in North America and Europe; however, it was never front-page news until 13 June 2010, when the *New York Times* published a headline proclaiming, 'U.S. Identifies Vast Mineral Riches in Afghanistan' (Risen 2010). The *New York Times* journalist James Risen wrote that US geologists had 'stumbled across an intriguing series of old charts and data at the library of the Afghan Geological Survey in Kabul that hinted at major mineral deposits in the country'. News of the occupation forces accidentally stumbling upon hints of vast Afghan mineral wealth may have surprised many in the West; however, Afghans, no doubt, found the idea that their unexploited riches were only recently 'discovered' preposterous.

For at least five millennia, the various peoples who populated the territories that would later make up Afghanistan mined their vast resource wealth and traded their products throughout Eurasia and North Africa via the ancient Silk Road. The immense copper resource of Mes Aynak is one of many resource sites that have been mined for centuries and in many cases millennia and which demonstrate the historical wealth of Afghanistan. The archaeological site at Mes Aynak shows evidence of five thousand years of copper mining. Located 40 km (25 miles) southeast of Kabul, Mes Aynak covers an area of 450 square km (280 square miles). A five-thousand-year-old Bronze Age mining town lies below a Buddhist city that reached its height of prosperity in the fifth to seventh centuries (Afghanistan MOMP 2014). Today, the Aynak copper deposit is recognised as the second largest in the world, containing as much as 20 million

metric tons of exploitable copper (Huntzinger 2008, p. 24). In 2007 – in a deal that will be analysed more thoroughly later in this essay – the government of Afghanistan awarded the concession to extract the copper at Aynak to a joint venture consortium of two Chinese state enterprises, with China Metallurgical Construction Corporation (CMCC) as 75% owner and Jiangxi Copper Company (JCC) as 25% owner. It was widely reported that the consortium paid $3 billion for the concession, but documentation shows a payment of $4.39 billion (Hong Kong Stock Exchange 2008). Yearly copper extraction at Aynak could be as high as 200,000 metric tonnes, which is 1.3% of current annual world production. Afghanistan could become among the top 15 copper producers in the world on the strength of only this one of several rich copper deposits in the country. Gross revenues from Aynak are expected to reach $1.404 billion per year, with annual profits after tax of $304 million. A 15% royalty will net an annual state income of $390 million (Huntzinger 2008, pp. 24–29). The entire mining sector was forecast to generate annual revenues for the government of Afghanistan of between $500 million and $1.5 billion by 2016 and more than $3 billion by 2026 (Global Witness 2012, p. 7). Recent events demonstrate that the forecasts for development time were overly optimistic, but the fact remains that investors will ultimately exploit Afghanistan's vast resource wealth. The immense multi-billion-dollar mining project in Aynak and an iron mining project currently being developed by an Indian–Canadian consortium in Hajigak are the first of numerous projects of similar scale, with many smaller projects also in early production stages (Skinner 2008, 2013).

As early as 1808, surveyors embedded within the paramilitary units of the British East India Company scrambled through Afghanistan attempting to exploit its riches ahead of their Russian competitors (Elphinstone 1815, p. 306; Shroder 1981). A primary objective of the first commercial expedition to Kabul, led by Captain Alexander Burns in 1836–37, was to find coal to power the East India Company's Indus River fleet (Grout 1995, p. 192). Unfortunately, Burns's

expedition had greater success in propelling the East India Company into the First Anglo-Afghan War of 1839–42. Another captain of the East India Company, Henry Drummond (1841), documented one of the first modern geological surveys of Afghanistan, which he conducted during the war. In his report, Drummond refers to an earlier 'voluminous Geological Report' prepared by Captain Herbert, which attracted the attention of 'practical men and capitalists in London' (Drummond 1841, p. 76). Drummond reported that, in addition to the many mineral deposits he surveyed, the extent of existing excavations as well as quantities of slag at various Afghan mine sites bode well for the profitability of mining investments. Drummond observed excavations at the Aynak copper mines 'so large, that they have more the appearance of caverns than mining galleries' (1841, p. 79), indicating the massive amounts of copper that had been mined during five millennia of artisanal mining.

In a rationalisation of imperialism prescient of the arguments that political and military leaders would make again in the twenty-first century, Captain Drummond claimed the 1839 British invasion of Afghanistan would not be perceived as an 'act of aggression', because the reorganisation of the existing system of Afghan mine management and improvements in the working conditions of Afghan miners would lead to an 'era of peace, of prosperity, and of permanent tranquility in Afghanistan' (quoted in Grout 1995, pp. 193–194). The British envoy to Kabul, Sir W.H. Macnaughten, wrote in 1841 that developing Afghanistan's resources would employ the 'wild inhabitants . . . reclaim them from a life of lawless violence' and increase the wealth of the Afghans as it increased the wealth of the East Asia Company (quoted in Grout 1995, p. 193). However, the British never did secure enough of a foothold in Afghanistan to establish commercially viable mines. Nonetheless, they maintained 'a comprehensive interest' in Afghanistan's resources throughout the nineteenth and twentieth centuries until the British army and air force finally retreated from Afghanistan in 1919 to end the Third Anglo-Afghan War (Ali and Shroder 2011, p. 5).

After the last British retreat, in 1919, a new Afghan government – a democratic parliamentary monarchy based on the British system – encouraged exploration and development. In 1927, a Soviet surveyor, Vladimir Obruchev, published a report titled 'Fossil Riches of Afghanistan' and detailing his oil and gas discoveries (Ali and Shroder 2011, p. 5). The Obruchev depression in the natural-gas-rich Amu Darya Basin still bears his name (Klett et al. 2006a). In the early 1930s, the Afghan Government granted the American Inland Oil Company a 25-year exclusive concession to oil and mineral exploration rights. However, the company withdrew from the deal, upsetting the Afghans in 'their first real experience with voluntary foreign penetration' (Shroder 1981, p. 44). After the Second World War, the Afghan Government initiated large-scale geological exploration. It sought technical and financial assistance from American, Western European, Czech, and Soviet sources, often pitting First-World and Second-World surveyors against one another on overlapping but secretive exploration projects. By the 1970s, more than 700 geological reports indicated that a wealth of resources awaited exploitation (Shroder 1981; Tucker et al. 2011). The Afghanistan Ministry of Mines and Resources and the United Nations (UN) in Kabul concealed numerous reports containing 'information on resources perceived to be world-strategic and therefore a threat to Afghan independence should too much notice be attracted' (Shroder 1981, p. 45).

A USGS website claims: 'During the 1980s and 1990s, the USGS conducted broad regional oil and gas resource assessments in northwestern Afghanistan' (USGS n.d.). Considering that north-west Afghanistan was occupied by Soviet troops during the 1980s, this claim seems contentious. It may indicate that USGS surveyors worked with the American-backed mujahedin during the 1980s. During the 1990s, in view of the close relations between the US and the mujahedin military commanders, the USGS may have conducted assessments on the ground. 'Mujahedin' – the plural of 'mujahedi' – translates as strugglers, or the fighters of jihad. In the Afghan context, seven rival mujahedin

G

organisations, based on political, regional, tribal, ethnic, and religious differences, gained power in different parts of Afghanistan during the anti-Soviet jihad of the 1980s. All of the mujahedin organisations maintained bases in Pakistan and all received financial and logistical support and arms supplies, from the US as well as from Pakistan and Saudi Arabia, during the Soviet occupation. US support continued after the Soviet withdrawal in 1989 until one of the mujahedin factions – Jamaat-i-Islami, led by Burhanuddin Rabbani – succeeded in invading Kabul to overthrow the socialist government in 1992 (Coll 2004; Rashid 2000, 2008). A number of mujahedin factions financed their anti-Soviet insurgency not only with US support, but also via mining (DuPée 2012). One particularly successful mujahedin commander, Ahmad Shah Massoud, financed his military campaign with his profitable gem-mining industry in Panshir. When Jamaat-i-Islami seized power from the nominally socialist government to establish the first Islamic Republic of Afghanistan in 1992, Massoud, became defence minister and nationalised his gem mines. With assistance from the Polish company Intercommerce, the Panshir mines generated US$ 200 million of revenue per year during the rule of the short-lived Islamic republic (DuPée 2012, p. 12). Following the Taliban takeover in 1996, the deposed Jamaat-i-Islami and two other rival mujahedin factions coalesced as the United Islamic and National Front for the Salvation of Afghanistan (UINFSA), better known in the West as the Northern Alliance. The UINFSA commanders operated nearly 100 emerald mines prior to the US-led invasion in 2001 (DuPée 2012, p. 13).

Despite Afghanistan's holding some of the world's largest known deposits of fuel resources and minerals, only limited development of oil, gas, salt, coal, building materials, emeralds, lapis lazuli, and various other gemstones began after the Second World War. The American authors of an influential book published during the Soviet occupation, titled *Afghanistan: The Great Game Revisited*, argued that the Soviet invasion was a resource grab for Afghan minerals, oil, and gas, as well as a strategic gambit to gain access to the Persian Gulf oil fields (Klass 1987). However,

during the Soviet occupation, industrial-scale development was limited to the few areas the Soviets could secure, such as the northern gas fields. Nevertheless, from the early 1970s to the early 1990s, Afghans derived much of their foreign exchange from natural gas sales to the USSR (Noorzoy 1990, 2006). The Soviets also briefly mined uranium at two locations during the 1980s (McCready 2006, p. 8). During the civil war of 1992–96, development all but halted. After the Taliban takeover of Kabul in 1996, the US initiated negotiations, which ultimately failed, to develop various projects, including the Turkmenistan–Afghanistan–Pakistan (TAP) gas pipeline, with both the Taliban, which controlled most of Afghanistan, and the UINFSA, which controlled some territory in the north (Foster 2008; Gilman 1997).

On 20 March 2002, the USGS published its first post-invasion report, listing more than 1000 deposits, mines, and occurrences in Afghanistan on the basis of a compilation of existing data and literature (Orris and Bliss 2002). Subsequent reports have been informed by increasingly detailed ground and aerial surveys, including imaging spectrometer data collection conducted over most of Afghanistan in 2007 (Tucker et al. 2011). A partial list of the abundant minerals of Afghanistan includes copper, iron, gold, mercury, cobalt, lead, and uranium; rare metals including chromium, cesium, lithium, niobium, and tantalum; and rare earth elements. In 2002, the USGS also identified oil and gas reserves that far surpassed Soviet estimates (Klett et al. 2006b; *Oil & Gas Journal* 2006; Shroder 2007). Each subsequent assessment has shown larger deposits of oil and gas. In 2006, the USGS assessment of potential Afghan oil and gas listed 1.6 billion barrels of crude oil, 16 trillion cubic feet of natural gas, and 500 million barrels of natural gas liquids (Klett et al. 2006a: vii). In 2011, the assessment was increased to 1.908 billion barrels of crude oil, 59 trillion cubic feet of natural gas, and 667 million barrels of natural gas liquids (USGS 2011). In 2012, Chinese state enterprises began oil and gas production in Afghanistan (Hall 2013; Shalizi 2012) and construction of a $700 million oil refinery (Baraki 2012). A joint venture between an

American company, FMC, and an Afghan company is building another oil refinery which is projected to generate annual revenues of $400 million per year (Wadsam 2012).

In view of the extensive history of resource exploration and extraction in Afghanistan, Risen's (2010) claim that American geologists were ignorant of Afghanistan's vast resource wealth until 2004 when they fortuitously 'stumbled' upon some old Soviet-era documents is ludicrous. The numerous post- 2001 joint studies conducted by the USGS, the British Geological Survey, the Afghanistan Geological Survey, and the Canadian Forces Mapping and Charting Establishment (USGS 2008) confirmed the facts known in the West, since the nineteenth century, that Afghan mineral and petroleum resources were of vast quantity and of significant economic and geostrategic importance. The only news in Risen's frontpage article of 2010 was that Afghanistan's natural resource wealth, previously estimated to be worth billions of US dollars (Skinner 2008), could instead net trillions. Clearly, throughout the twentieth century, American and allied strategic planners were either knowledgeable of Afghanistan's vast resource wealth or incredibly negligent in their duties.

Despite its economic and geostrategic significance – or arguably, precisely because of this significance – exploitation of Afghanistan's resource wealth was constrained throughout the twentieth century. A key obstacle throughout the century was the lack of transport, energy transmission, and communications infrastructure. Political instability since the early 1970s and the Soviet invasion on 25 December 1979 created even greater obstacles. Foreign investors might have hoped that the withdrawal of Soviet troops in 1989, and the US-backed mujahedin victory over the nominally socialist government in 1992, would have opened Afghanistan to foreign investment. However, the internecine civil war that immediately erupted between rival mujahedin factions precluded hopes for development. In 1996, the Taliban seized control of Kabul, fracturing Afghanistan into two quasi-states, with the US-supported UINFSA entrenched in the north. Yet, despite these many physical and political obstacles blocking Afghan resource development, the greatest obstacle dissuading foreign investors throughout the twentieth century was a fear of nationalisation, because 'minerals were traditionally considered state property' (Shroder 1981, p. 49). Even the mujahedin warlord Massoud nationalised his profitable gem mines when he became defence minister of the first US-backed Islamic republic in 1992.

If the US-led 'Operation Enduring Freedom' invasion of 2001 accomplished nothing else, it secured the freedom for foreign investors to profit from Afghanistan's resource wealth by destroying the last vestiges of its poorly developed and badly broken state enterprise system. The US Department of State (2010) reports that Afghanistan 'has taken significant steps toward fostering a business-friendly environment for both foreign and domestic investment'. Afghanistan's new investment law allows 100% foreign ownership and provides generous tax allowances to foreign investors, but does not provide protection for Afghan workers or the environment (Noorzoy 2006). A few analysts have employed crude analyses to argue that the US-led coalition invaded Afghanistan simply to secure possession of its resource wealth, but the potential of reaping a few trillion dollars' worth of natural resources is not an adequate rationale for launching a military expedition that cost at least as much or more. Resource extraction in Afghanistan, nonetheless, plays an increasingly large strategic role in catalysing development of a New Silk Road, which is an integral factor in expanding capital in Central Asia to ensure dominance of the US-led Empire of Capital throughout Eurasia (Skinner 2008, 2013).

The New Silk Road

Clearly, Afghanistan is of significant value as a source of economically and strategically significant natural resources, but is it as remote as popular mythology would have us believe? On the contrary, Afghanistan is poised to become an important node in a trans-Eurasian network of transport, energy transmission, and communications infrastructure. For millennia, the land now

known as Afghanistan was a strategic land bridge at the centre of a trans-continental trade network known as the Silk Road. The various peoples who populated this land not only exported the gems and minerals they mined, as well as the once bountiful agricultural products they produced; they also profited by maintaining the trans-Eurasian trade routes and providing logistics and security to facilitate transporting trade goods through their territories. However, with the advent of cheaper, faster, and more reliable sea travel from the fifteenth century, caravels and eventually supertankers and container ships superseded the camels, donkeys, and horses that travelled the ancient Silk Road.

Although Afghanistan lost its central place in global trade from the fifteenth century onwards, it resumed geopolitical significance in the nineteenth century, for a different reason: the leaders of the British, Russian, and Persian empires used Afghanistan's rugged terrain as a *barrier* to separate their empires (Rubin 1995). The East India Company's initial forays into Afghanistan as early as 1808 ultimately resulted in the ignominious defeat of the British in three Anglo-Afghan wars fought between 1839 and 1919. Unable to effectively exploit its riches, the British had to be content with using Afghanistan as a strategic barrier to protect the Indian jewel of the British Empire to the south from the Russian Empire to the north. After forcing the British military forces out of Afghanistan to end the Third Anglo-Afghan War in 1919, Afghans enjoyed a brief period of freedom from military interventions, and they had hopes of opening the country to trade and commerce on their own terms. However, during the Cold War, the US and USSR resumed using Afghanistan as an inter-imperial barrier (Rubin 1995). Consequently, the development of modern transport, energy transmission, and communications infrastructure that took place elsewhere in the region throughout the nineteenth and twentieth centuries bypassed Afghanistan. With the collapse of the USSR, the strategic need to use Afghanistan as a *barrier* separating rival empires also collapsed; instead, Afghanistan can now be used as a *bridgehead* to expand capital.

The transition of Afghanistan from a barrier separating rival empires to a bridgehead from which to further expand the reach of capitalism is a key to strengthening the US-led Empire of Capital. As the former national security advisor to the Carter Administration, Zbigniew Brzezinski, argued, 'the distribution of power on the Eurasian landmass will be of decisive importance to America's global primacy' (1997, p. 51). The nation state or empire that can dominate trade on the supercontinent will dominate the globe; dominance over the process of reconnecting Eurasia via Afghanistan and the Greater Central Asia region is an integral component of this strategic quest for power. The shortest routes between China and Europe, as well as between India and Russia, are via Afghanistan. Railways, highways, oil and gas pipelines, electrical transmission lines, and fibre-optic cables will eventually criss-cross Afghanistan to connect Eurasia. As in previous imperial ages, the empire that achieves primacy is the one that, among other aspects of power, establishes itself as builder, protector, and arbiter of trade routes. Development of Afghanistan is inevitable, but the US and its closest allies have no economic advantage to dominate development in this region; their only clear advantage is military power. The 9/11 terrorist attacks provided a convenient pretext to exercise this power. This is not to argue that the 9/11 attacks and subsequent invasion of Afghanistan and Global War on Terror are necessarily part of some vast conspiracy: opportunistic strategists seized the opportunity provided by the terrorists. The wealth and strategic importance of Afghanistan may not be well known in the West, and were no doubt purposely obfuscated by effective propaganda, but they were not a state secret.

Hillary Clinton announced the US Government's New Silk Road strategy in Chennai, India, on 20 July 2011. In her address, Clinton called on Indian leaders to help build a New Silk Road as an 'international web and network of economic and transit connections'. 'That means', Clinton said, 'building more rail lines, highways, energy infrastructure … upgrading the facilities at border crossings … and removing the bureaucratic barriers to the free flow of goods

and people.' Clinton also stated: 'It means casting aside the outdated trade policies that we are living with and adopting new rules for the 21st century' (Clinton 2011). Clinton's remarks indicate that creating the political-legal-economic regime is as critical as building the physical infrastructure. Throughout the centuries of expansion and evolution of capitalism, the strategic and economic importance of global trade in various resources waxes and wanes with changes in technology or consumers' whims. A constant that remains is the growth of the physical transport, energy transmission, and communications networks as well as the less tangible but no less real political-legal-economic infrastructure of empire. Building this entire infrastructure of dominance lies at the heart of building empire – a process evident in the battle for Afghanistan.

The idea of building a new Silk Road was formulated long before the invasion of Afghanistan. The Silk Road Strategy Act of 1997 (Gilman 1997) and Silk Road Strategy Act of 1999 (Bereuter 1999) did not pass into law; nonetheless, documentation of their debate demonstrates the strategic thinking of US decision makers in the 1990s. The initiator of the first failed act, Benjamin Gilman (1997), aimed 'to focus American diplomatic and commercial attention, as well as American foreign assistance, on the important regions of the Caucasus and Central Asia' in order to rebuild 'links to Europe and Asia'. While Gilman's bill focused on facilitating oil and gas exports to the West, it also aimed more broadly to establish 'economic interdependence' and to develop 'open market economies and open democratic systems' in the region. Gilman designed the bill to 'help promote market-oriented principles and practices', 'assist in the development of the infrastructure necessary for communications, transportation, and energy and trade', and 'support United States business interests and investments in the region' (1997, pp. 2–3). According to Doug Bereuter, who chaired the subcommittee meetings on the 1997 bill and sponsored the attempt to resurrect it in 1999, 'the collapse of the Soviet Union has unleashed a new great game, where the interests of the East India Trading Company have been replaced by

those of Unocal and Total, and many other organizations and firms' (US Congress 1998, p. 6). As Gilman (1997) indicated in the bill, the US objective is to secure investors and liberate capital in general, of which the oil and gas sectors are vital commercial interests but by no means the only ones; mining is also of great concern. However, US legislators failed to pass either Silk Road Strategy Act into law, as US negotiators simultaneously were unable to finalise agreements with the rival governments of a divided Afghanistan. The Taliban ruled most of Afghanistan while the UINFSA ruled a rump state in the north. The invasion of 2001 eliminated the difficulty of having to negotiate with these rival Afghan governments. In their place the US-led invasion force installed an interim government headed by Hamid Karzai, composed primarily of warlords from the UINFSA (Skinner 2013).

Within days of the invasion, the editors of the *Christian Science Monitor* expressed concern that the US might be perceived to have invaded Afghanistan for control of its resources. The editors wrote:

> As late as 1998, two years after the Taliban took over, the US company Unocal was negotiating with that radical Islamic regime about a pipeline that would run through Afghanistan and down to Karachi in Pakistan. Some Taliban officials even visited the US to discuss the matter. Also in that year, then-oil-industry executive and now Vice President Dick Cheney was captivated by the Caspian's potential. 'I can't think of a time when we've had a region emerge as suddenly to become as strategically significant as the Caspian,' he told a large group of oil-industry executives in Washington. (*Christian Science Monitor* 2001)

These editors were concerned that 'the conspiracy-minded in the Middle East and elsewhere will see the hand of Big Oil at work in creating a puppet government in Kabul'. However, by definition, conspiracy denotes secrecy – the Silk Road strategy was not secret. Nor was Dick Cheney's proposal 'to preclude any hostile power from dominating a region critical to our interests' secret (1993, p. 4). Indeed, the institutions of the US state publicly identify US interests and objectives, even if these tend to be couched in euphemistic language.

The US National Security Strategy of 2002 outlines a two-track strategy. The first track is to *engage* currently compliant but potential challengers of US dominance in the globalising capitalist system – particularly China, but also Russia – in mutually profitable economic activities. The second track is to be prepared to militarily *contain* any rival state should it demonstrate non-compliance (Bush 2002). The forward presence of US and allied forces in Afghanistan facilitates achieving both objectives. Not surprisingly, according to a RAND publication, 'China feels very vulnerable where its sea lines of communication are concerned'; consequently, 'there is great interest in building pipelines' and other 'strategic passageways' to Central Asia, Russia, and Pakistan (Beckley et al. 2014, p. 25). American strategists seek to *engage* China along with all other states in the region in these industrial endeavours within the rubric of the US-led global economic system, while setting the rules to maintain dominance of American corporate and state interests. However, should any state not co-operate, the *full-spectrum dominance* and *forward presence* of the US military with the support of its closest allies will militarily *contain* any hostile power. The US-led combat mission in Afghanistan has been transformed into a training mission. Nonetheless, a sizeable foreign military training force will probably remain in Afghanistan indefinitely to maintain a forward presence to contain China or Russia if necessary and to continue the ongoing containment of Iran. This objective looms large among the other strategic objectives supporting resource extraction, development of the New Silk Road, and the general expansion and security of capital.

The Afghanistan Investment Support Agency advertises that 'Afghanistan is ideally situated to again function as a strategic gateway', offering 'a point of access to an extended regional market of more than 2 billion people' (AISA 2010). Afghanistan is a new frontier for capital development: building and operating the necessary infrastructure to exploit this potential will be a capital-intensive but highly profitable and power-enhancing venture. A key agency in co-ordinating development of the New Silk Road, since 1996, is the Central Asian Regional Economic Coordination Program (CAREC) of the Asian Development Bank (ADB). Between 2001 and 2011, CAREC invested more than $17 billion in 'regional infrastructure and initiatives to promote connectivity and trade' and open 'previously unexploited resources' throughout Central Asia (CAREC 2012, p. 1). Afghanistan remains the missing link in the system. Only 7% of roads in Afghanistan are paved, four provincial capitals are not connected to the regional network, and 70% of inter-provincial and inter-district roads are in 'poor' condition (ADB 2014, p. 2). In the late 1970s, the French rail company SOFRERAIL proposed building a railway linking Afghanistan with Pakistan and Iran to develop Afghanistan's then fledgling mining industry; however, the proposal collapsed because of disagreements between Afghanistan and Iran and the eventual political turmoil in Iran and Afghanistan (Shroder 1981, p. 47). The only railways existing in Afghanistan are 75 km of recently renovated railway from Uzbekistan, initially built to supply Soviet forces based near Mazar-e-Sharif, and the preliminary sections of an Iranian railway under construction from Iran that will terminate in Herat (Skinner 2013).

There is a symbiotic relationship between mines and railways, but co-ordinating investment in these correlated industries is difficult. The inherent conundrum is that investors will not invest to develop a large-scale mine not serviced by a railway, but investors will not invest in a railway unless there are reasonable prospects of profiting from existing developments. The fix for this conundrum in Afghanistan was to utilise state enterprises to aggregate these mutual interests. When the government of Afghanistan granted the development concession for the massive Aynak copper deposit to the consortium of CMCC and JCC, commentators such as Robert Kaplan (2009) and Michael Wines (2009) were incensed. Why, they asked, should the Afghans award the Chinese a treasure liberated by the sacrifices of US and allied soldiers and why should these soldiers protect the investments of Chinese state enterprises? But awarding the Aynak mine to the CMCC–JCC consortium may

have been a shrewd calculation on the part of US and allied strategists in co-operation with China and Afghanistan. The Chinese consortium will construct a 400-megawatt power plant to feed the mine and its smelters, develop a nearby coalmine to feed the power plant, and construct a railway that will stretch from west China through Tajikistan to the Aynak mine and on to Pakistan. This railway will also eventually link to the Herat terminus of the Iranian–Afghan railway. Excess electrical power will supply nearby Kabul, and the railway will service the equally massive Hajigak iron mine that an Indian–Canadian consortium is currently developing as well as many other future developments. On 22 September 2010, the Afghanistan Ministry of Mines and Petroleum (MOMP) announced an agreement with the CMCC–JCC consortium to build a railway to service Kabul and the Aynak copper mine that will 'connect Afghanistan to the railways of Pakistan, India, and South East Asia and to the extensive rail system of China, Europe, and Central Asia'. The railway will be designed 'to carry the heaviest of loads . . . and commercial goods for transit, agricultural products, passengers and normal freight', according to the MOMP (Afghanistan MOMP 2010). The railway will be built on the 'BOOT' principle – Build, Own, Operate, and Transfer. The Chinese consortium will own and operate the railway until it recovers its capital cost, at which time it will train Afghan staff prior to transferring ownership to the government of Afghanistan. Capital costs for the railway are estimated at between US $4 billion and US $5 billion (Afghanistan MOMP 2010). This is in addition to the US $4.39 billion that CMCC–JCC paid for the mining concession, plus the unpublicised costs it will incur to build the mine. A Canadian mining company, Hunter-Dickinson, was initially expected to win the Aynak concession, but it was unlikely that any private company could have undertaken such a large project in view of the high capital cost for not only mine development but also the necessary railway and power-generation infrastructure, compounded by the political risks of investing in Afghanistan and the commercial risk of investing in a resource with high market volatility. The

American, Canadian, and British governments operate state-financed insurance schemes to protect investors from political risk in foreign investments, but they will not insure investments of this scale. The CMCC–JCC consortium clearly had an advantage of scale as a state enterprise that few if any private corporations could match. Moreover, China's growing economy needs a growing supply of copper regardless of its market price. Most importantly, by engaging China economically, the US and its allies align China's interests with the interests of the Empire of Capital (Skinner 2008, 2011, 2013).

Among other elements of the New Silk Road currently in development are the CASA-1000 and TAPI energy transmission projects. The CASA-1000 is a 1222-km network of high-voltage electricity transmission lines that will export high-voltage electricity from Kyrgyzstan and Tajikistan to Pakistan and Afghanistan (CASA-1000 2015). This project is under the direction of the Central Asia–South Asia Regional Electricity Market (CASAREM) project with funding from the Asian Development Bank, European Bank for Reconstruction and Development, International Finance Corporation, Islamic Development Bank, and World Bank. The TAPI (Turkmenistan–Afghanistan–Pakistan–India) pipeline will transport natural gas from Turkmenistan across Afghanistan to markets in Pakistan and India (Hormats 2011). This project, which has facilitated cooperation between India and Pakistan as well as engaging both China and Russia as investors (Muzalevsky 2011), surpasses the ideas of the architects of the initial TAP pipeline and the Silk Road Strategy Acts of 1997 and 1999. Plans are now under way for an equally ambitious gas pipeline from Turkmenistan via Tajikistan and Afghanistan to China (Samimi 2012).

Clearly, the economic and strategic value of Afghanistan will be exponentially multiplied if the New Silk Road can indeed be realised. The geostrategic power of the US-led Empire of Capital will be strengthened by ensuring its hegemonic position in every aspect of development in Afghanistan and Central Asia, which is key to power across Eurasia. However, as during every

G

historical epoch of rapid development and capital expansion, there will be vast differences between the winners and the losers. The leadership and investors in the Empire of Capital are manoeuvring to be the biggest winners. The losers will be Afghans who are dispossessed of their traditional lands and livelihoods to make way for development. Although the post-invasion Afghan government instituted a legal regime purportedly to protect Afghans, it is inadequate and skewed to disproportionally protect investors' property rights. Consequently, continuing conflict is inevitable, and the foreign occupation to secure capital expansion in Afghanistan is unlikely to end in the foreseeable future.

The Battle for Afghanistan: Just War or Just One Battle of Endless Global War?

The invasion of Afghanistan is often portrayed as the necessary war – the just war – in contrast to the unnecessary invasion of Iraq. The myth persists that, having been provoked and given no other option but war by the terrorists who attacked New York and Washington on 11 September 2001, the US and its closest allies fought a just war in Afghanistan. The 9/11 terrorist attacks are frequently compared to the Japanese attack on Pearl Harbor. However, a more accurate historical comparison is with the terrorist attack that provided the pretext for Austria-Hungary to invade Serbia, which triggered the First World War. In that case, the allied victors – the US, the UK, and France – found Austria-Hungary and its ally Germany guilty of the international war crime of aggression. The act of terrorism that was the *precipitating cause* of the current global war, like the terrorist attack that precipitated the First World War, did not make war necessary; in both cases, the criminal terrorists could have been dealt with by numerous diplomatic, police, and military actions short of launching a global war. Instead, the US and its closest allies used the 9/11 terrorist attacks as a pretext to remove the recalcitrant Islamist Taliban regime from power; the assassination of Franz Ferdinand in Sarajevo provided a pretext to remove the recalcitrant Serbian

nationalist regime from power. In both cases, the *precipitating cause* of war was a criminal act perpetrated by a non-governmental terrorist organisation. In both cases, the *immediate cause* of war was the desire of the invaders to remove a recalcitrant regime that acted in ways contrary to the interests of the invaders. In both cases, the *deep cause* of the war was a complex of factors rooted in the tensions of expanding empires manoeuvring for geopolitical advantage. Opportunistic leaders of wealthy powerful states, in both cases, seized the opportunity provided by a terrorist attack to launch retaliatory military actions with aggressive geostrategic objectives that reached far beyond merely eliminating or punishing the terrorists.

A notable proponent of the Global War on Terror, Michael Ignatieff, quipped: 'There might be reason, even though the awakening has been brutal, to be thankful to the barbarians. After all, they are, as the poet Celan said, a kind of solution. They have offered the empire a new *raison d'être* and a long-term strategic objective: the eradication of terror' (2003, p. 6). However, as Ignatieff also observes, the American public and its political leaders are uncomfortable with recognising they are citizens of an empire. Americans, according to Ignatieff, are 'a people who remember their country secured its independence by revolt against an empire, and who have often thought of their country as the friend of antiimperial struggles everywhere. It is an empire in other words, without consciousness of itself as such. But that does not make it any less of an empire, that is, an attempt to permanently order the world of states and markets according to its national interests' (2003, p. 2). Consequently, the leaders of empire must continuously invent popular rationales for war as a façade for aggressive military actions.

When George Bush declared the Global War on Terror on 20 September 2001, he stated that the military operations to come would be retaliatory in intent, but would achieve 'far more than instant retaliation' (G.W. Bush 2001a). In fact, since the invasion began on 7 October 2001, retaliation has disproportionately affected millions of Afghans who bore no responsibility for the 9/11 terrorist attacks. An astounding 96% of Afghans have been

personally affected by death, injury, disability, and the destruction of their homes, assets, and livelihoods (UN 2010, pp. 2–8). Retaliation as a reason for war may have satisfied a critical mass of Bush's constituency. Retaliation was also politically useful for demonstrating that the US and its closest allies possess both the political will and the military capacity to punish any challengers, regardless of the human, material, and political costs. Retaliation, however, is an illegal rationale for war according to international law: only *self-defence* and last resort meet the legal criteria for war (Duffy 2005; Mandel 2004). Special Operations Forces from the US, the UK, Canada, Australia, and New Zealand, with additional air support from Germany and France, unilaterally invaded Afghanistan, avoiding debate in the UN Security Council regarding the legality of this aggressive force. Proponents of the invasion argue that UN Security Council Resolution 1368 (UNSC 2001) sanctioned and legalised this use of aggressive force. The resolution is certainly a strongly worded condemnation of the 9/11 terrorist attacks, which urges states to seek out and bring the perpetrators to justice, but it does not in any terms sanction the invasion of Afghanistan. In fact, no mention of Afghanistan exists in the document.

What did occur was that the US, with the support of a small but powerful military coalition, instituted new de facto international law by overtly violating the laws of war. The leaders of most other powerful states tacitly acquiesced. Unable to legitimise the invasion of Afghanistan on the criteria of extant law, President Bush attempted to justify launching a global war using broad philosophical rationales. Bush stated (2001a): 'This is civilization's fight. This is the fight of all who believe in progress and pluralism, tolerance and freedom . . . Freedom and fear are at war. The advance of human freedom, the great achievement of our time and the great hope of every time, now depends on us'. Laura Bush (2001b) added that the 'fight against terrorism is also a fight for the rights and dignity of women' and because 'in Afghanistan we see the world the terrorists would like to impose on the rest of us'. A self-claimed right to illegal retaliation and abstract concepts of securing freedom and the

rights of women and girls were the initial stated objectives of the Global War on Terror and its first battle – the invasion of Afghanistan, codenamed 'Operation Enduring Freedom'.

The Bush Administration later defined what it really meant by 'freedom' in *The National Security Strategy of the United States of America* (G.W. Bush 2002), popularly referred to as the Bush Doctrine. In a chapter titled 'Ignite a New Era of Global Economic Growth through Free Markets and Free Trade', the Bush Doctrine defines 'real freedom' as free trade (17–20). Pre-emptive warfare, which most analysts identify as the radical innovation of the Bush Doctrine, is a means to liberate capital; however, neither pre-emptive warfare nor wars fought to expand free trade are departures from the historical practice of the US state. The truly radical action of the Bush Administration was to so clearly articulate the objective of free trade and to rationalise the use of aggressive pre-emptive warfare in its pursuit. Few state leaders objected to the Bush Administration's claim to these new de facto legal rights, nor did the Obama Administration repudiate the de facto international law that the Bush Doctrine invented. Instead, the Obama Administration tried to rebrand the global war as 'Overseas Contingency Operations' (Burkeman 2009; Wilson and Kamen 2009), but nevertheless expanded global warfare. We should take George W. Bush at his word when he declared a global war on 20 September 2001 – this is truly a war of global scale without end. Afghanistan was the first of many battlefronts in this global war with far-flung overt and covert operations in Pakistan, Iraq, and the Horn of Africa, as well as in the Philippines, South Asia, Latin America, and the Caribbean (G.W. Bush 2007; US Congressional Research Service 2009). The Obama Administration, instead of ending the war, has expanded it into Libya and Syria and has re-invaded Iraq. President Bush's declaration of global war and the subsequent Bush Doctrine overtly declared the mode of violence necessary to expand capitalism.

In the case of Afghanistan, the long-delayed exploitation of resources and transformation of the ancient Silk Road trade network into a modern

transport, energy transmission, and communications infrastructure would eventually occur with or without Western investors. However, to maintain global hegemony, it is necessary that the US-led Empire of Capital manoeuvre not to only grab the eventual lion's share of profit from these processes, but, more importantly, to maintain its dominant position to rule over these processes. But the US and its closest allies have few political or economic advantages in Central Asia; military power is their only clear advantage in this region. The 9/11 terrorist attacks provided an opportunity to rationalise employing the military in *creative destruction* to lead to *stabilisation and reconstruction:* this is warfare and state-building with imperial intent. The US and its allies may establish advantages in financing, designing, constructing, and servicing the trans-Eurasian transport, energy transmission, and communications infrastructure and developing resource extraction to expand capital. More importantly, the US and its allies will determine the political-legal-economic regime to rule this trans-Eurasian network. Moreover, they will profit economically and politically from the military and security complex needed to protect this system, essentially as a regional affiliate of a global protection racket. The best-case scenario, from the perspective of imperial strategists, is to further *engage* China, Russia, India, and the less powerful states of the region in expanding capitalism in Afghanistan and Central Asia. Nonetheless, the US and allied militaries will remain in situ to *contain* any potentially hostile state from intervening in Central Asia outside the rules set by the Empire of Capital. Whatever the outcome in Afghanistan and Central Asia – even the worst-case scenario of a further collapse into total chaos and warfare in the region – investors in the military-industrial complex and its sibling, the development-industrial complex, profit from war (Skinner 2013).

The Empire of Capital: Expanding and Evolving Capitalism

In this latest stage of capitalism, the Bush and Obama administrations' expanding regime of new rules – enforced by military dominance at least as much as political influence – strengthens the concept of New World Order originally conceived by Woodrow Wilson. This New World Order, nearing its centenary, relies on the hegemonic leadership of the US increasingly in partnership with other powerful wealthy capitalist states – partnerships tied together by a growing matrix of state, sub-state, and supra-state governance and military organisations; NGOs; and corporations. An 'Empire of Capital', as Ellen Wood (2003) describes it, is emerging – this is a US-led empire that can no longer be described merely as an American empire. The *dominant* US state requires the support of closely allied *subdominant* states that not only act in concert with the *dominant* state, but can also substitute as the dominant state. For example, the US and the UK, playing its subdominant role, jointly declared their intentions to invade Afghanistan and later Iraq. When the US and the UK became preoccupied with invading Iraq, Canada fulfilled its *subdominant* role to temporarily command the occupation of Afghanistan. This *subdominant* role of imperial partnership contrasts with Canada's historical *subordinate* role within the British Empire. The subdominant states of the Empire of Capital remain as independent nation states and competing national capitals, but act in concert within a unified empire when their interests are aligned and it is mutually beneficial to do so. One the most important roles of the *dominant* US state in this empire is to aggregate the interests of competing nation states and their national capital.

This conception of an Empire of Capital contrasts with William Robinson's (2004) idea of transnational capital. While this emerging empire does demonstrate a distinct tendency towards transnational capital it, nevertheless, remains rooted, at present, within the existing multinational framework of competing nation states. Moreover, there are indications that an Anglocentric hierarchy persists to further mitigate movement towards truly transnational capital. For example the so-called 'Five Eyes' – the security-military apparatuses of the five Anglophone powers, the US, the UK, Canada, Australia, and New Zealand – remain more closely linked to

each other than to their counterparts in other allied states. The fact that the invasion of Afghanistan was led on the ground exclusively by the Special Operations Forces of this Anglophone quintet indicates not only the depth of security-military interoperability, but also the depth of interoperability at every level of state apparatuses. Nonetheless, this also demonstrates the exclusion of other allied states from this exclusive Anglophone club. It is not evident that state, military, and corporate leaders of the most powerful and wealthiest capitalist states have yet transcended xenophobic nationalism to move toward truly transnational capital. The brief renaming of French fries as 'freedom fries' across America was laughable, but also indicative of the fractures existing in this imperial system. The US-led Empire of Capital does, nevertheless, demonstrate an increasing degree of multinational co-operation and interdependence among the most powerful and wealthiest capitalist states.

There are significant fractures in the empire. For example, many analysts mistakenly refer to the invasion of Afghanistan as a joint action by the US and the North Atlantic Treaty Organization (NATO). However, the US, the UK, Canada, and briefly Germany were the only NATO states to engage in combat prior to 2003, after which NATO assumed command of the UN-sanctioned International Security and Assistance Force (ISAF). Moreover, the US-led Operation Enduring Freedom forces that unilaterally invaded Afghanistan remained separate from the less aggressive ISAF until the Obama Administration unified these separate forces under one command in 2008. The reticence of the European members of NATO to participate in the aggressive military actions of Operation Enduring Freedom may have come about because state leaders feared the limits of their own military capacities or the costs associated with aggressive combat. They must have recognised the fact that international law and the UN Charter, which show that the invasion of Afghanistan is a war crime of aggression, supersede NATO treaty obligations. Perhaps most importantly, European leaders certainly knew that popular opinion was against joining the invasion on the basis of the massive protests in their countries and around the world in September and October 2001, which demonstrated opposition to the invasion (Skinner 2013).

The social relationships of domination and subordination inherent in the capitalist system are extremely conflictual at all of the system's interstitial fault lines; thus the global expansion and intensification of capitalism require increasing securitisation and militarisation. To maintain their dominance to ensure the pursuit of their mutual interests, the wealthiest and most powerful capitalist states must co-ordinate a full spectrum of power to suppress any possible threats not only from non-compliant states, but also from any organisation or popular movement that demonstrates resistance to capital expansion. Throughout the twentieth century, the US increasingly assumed the role of hegemonic co-ordinator to aggregate the interests of capitalist states. George W. Bush's declaration on 20 September 2001 of the Global War on Terror – a global war that is still expanding without either end or boundaries – is a conjuncture in the history of global political economy. Nonetheless, this latest global war demonstrates as much continuity as exception in the centuries-long history of the violent expansion and evolution of capitalism. Moreover, Bush's conception of New World Order is not a radical departure from the New World Order that Woodrow Wilson conceived at the end of the First World War. The Obama Administration rebranded its global military expeditions as Overseas Contingency Operations in an attempt to differentiate its foreign policy, but, despite superficial differences, successive US administrations continue to build the regional infrastructures and overall superstructure of dominance of an expanding Empire of Capital to aggregate the mutual interests of the wealthiest and most powerful capitalist states. The inseparable structures of militarism and capitalism have expanded and evolved throughout the centuries of the emergence of capitalism. During the 100 years since the First World War, the most powerful and wealthiest capitalist states under the leadership of the US have increasingly co-ordinated these inseparable structures to the point where it is no longer possible to identify an American empire

G

that is distinct from the emerging Empire of Capital. The battle for Afghanistan is one of many battlefronts in the global war of imperial expansion that illustrate the emergence of this multinational empire.

Violence is a necessary component of the Empire of Capital, because the remaining foundations of pre-capitalist systems, particularly any competing normative systems of collective welfare and reciprocity, must be destroyed if capitalism is to continue its expansion. Violence is needed to contain or destroy any state that fails to conform to the imperial standards dictated by the empire. Furthermore, violence is needed to suppress the popular resistance that flares up within the interstices of the imperial system in reaction to the destruction of traditional norms and livelihoods. Violence is also needed to suppress any popular resistance within the centres of empire. Finally, violence is needed to crush any possible alternative to the globalising Empire of Capital. In many respects, this latest violent mode of imperialism is not new, but merely a more overt iteration of past imperial practice. Nonetheless, this imperial system requires a radical reorganisation of the pre-existing international system and an increasing capacity for overwhelming military dominance by the US and its allies. What is truly unique at this historic conjuncture is the unrivalled position of power of the US and its closest allies in every facet of social relations and the relative weakness of any potential state-based challenger. Nonetheless, as Brzezinski (2009, p. 10) recognises, US global leadership is threatened not only because the 'global center of political and economic gravity is shifting away from the North Atlantic toward Asia and the Pacific', but also because of 'intensifying popular unrest'. The Global War on Terror forcefully contains both of these perceived threats by strengthening the powers of state and private security forces throughout the empire to suppress popular resistance while aggressively thrusting a US-led military coalition deep into Central Asia in an endless occupation of Afghanistan. It is impossible to argue that the invasion of Afghanistan was a necessary response to the 9/11 terrorist attacks. Moreover, the supposed objectives of promoting

democracy and liberating women and girls were not achieved. Nevertheless, from the perspective of imperial geostrategists, the necessity of this act of military aggression is clear: the invasion of Afghanistan did liberate capital.

'Great Games' in the Literature of Imperialism

Vipan Pal Singh
Department of English, School of Languages, Literature and Culture Central University of Punjab, Bathinda, Punjab, India

Definition

The term 'Great Game' was coined in the nineteenth century to describe the rivalry between Russia and Britain. The game motif is useful to describe the broader rivalry between nations and economic systems with the rise of imperialism and the pursuit of world power.

The term 'Great Game' was coined in the nineteenth century to describe the rivalry between Russia and Britain. Britain sent spies disguised as surveyors and traders to Afghanistan and Turkestan and, several times, armies to keep the Russians at bay. The Anglo-Afghan war of 1839–42 was precipitated by fears that the Russians were encroaching on British interests in India after Russia had established a diplomatic and trade presence in Afghanistan. By the nineteenth century, there was already no such thing as neutral territory. The entire world was now a gigantic playing field for the major industrial powers, and Eurasia was the centre of this playing field.

The game motif is useful to describe the broader rivalry between nations and economic systems with the rise of imperialism and the pursuit of world power. This game goes beyond British rivalry with Russia over Afghanistan, for the heart of Eurasia really encompasses both Central Asia and the Middle East, what was once Turkestan, the Persian Empire and the Ottoman Caliphate, comprising the Persian, Turkic, and Arab worlds, peoples which are mostly Muslim.

To clarify the complexity of imperialist strategies from the twentieth century onwards, I defined

three 'games' in *Postmodern Imperialism: Geopolitics and the Great Games* (Walberg 2011). During the nineteenth-century imperial game (which I call Great Game I [GGI]), Britain kept Afghanistan, Iran, and the Ottoman Caliphate as nominally independent political formations, though in compliance with British interests. The former were carefully monitored by Britain, while in the latter, the weakened Ottoman rule had turned the Caliphate into a useful neutral actor allowing the various imperial powers to pursue trade in the region without resorting to war.

This situation changed radically with the First World War. This was a disaster for all the European imperial powers, and the Russian Revolution in 1917 was a declaration of war against the imperialist system itself. This marked the beginning of what is called here Great Game II (GGII): the Cold War between imperialism and communism, where the US united its former imperial rivals Britain, Germany, France, et al. to fight the antiempire forces, though this game did not take centre stage till the end of the Second World War. The period from 1917 to the Second World War can be called the endgame of GGI.

In the Middle East, cynical British plans to carve up the Ottoman Caliphate after the First World War were exposed when the Russian communists immediately published British diplomatic correspondence with Tsar Nicholas II, much as WikiLeaks exposed diplomatic mendacity in 2010. Britain went ahead anyway in 1918, carving up the Caliphate as a political compromise in the region with the rival interests of France, Germany, and imperial Russia was no longer necessary. Apart from the Turkish Anatolian heartland, the Caliphate was divided into quasi-colonies ('mandates') with a radical plan to create a Jewish state in the Palestinian heartland.

Turkestan was now part of the new communist politico-economic formation. Until the end of GGII, with the collapse of the Soviet Union, it remained out of bounds to imperialism, a backwater, an integral part of a kind of secular caliphate, where borders meant little and people were united around a stern communist faith rather than nationalism or religion. In the 1920s, the USSR divided it up roughly according to ethnicity

into *pro forma* administrative divisions Uzbekistan, Kazakhstan, Tajikistan, Kyrgyzstan, and Turkmenistan (in order of population), the 'stans', plus Azerbaijan. These were developed in accordance with Soviet central plans, achieving a high standard of living compared to non-socialist neighbours Afghanistan, Iran, and colonial Pakistan, but at the expense of Islam, which was largely repressed. (Stalin had approved an Islamic Directorate for Central Asia and Kazakhstan during the Second World War to mobilise Central Asian Muslims against the Nazi invasion and from the 1960s madrasahs in Tashkent and Bukhara were allowed to function, but observing the faith was severely restricted.)

As the Soviet Union was not viewed then as an imperial threat to British India, Afghanistan, a weak monarchy, lost its geopolitical importance as a Russian gateway to India during the GGI endgame. Iran, which straddles the Middle East and Central Asia, was also a weak monarchy, but by the late nineteenth century was becoming far more important than Afghanistan, as vast oil reserves had been discovered there, and coal was being replaced by the much more practical oil as the fuel to run the growing empires. Iran was occupied by Britain and imperial Russia during the First World War, and again by Britain and the Soviet Union in the Second World War, during the GGI endgame, to keep it from siding with Germany and to ensure access to its oil. It became vital to the support of the empire in GGII but took on a radically different role as GGIII got underway.

The Great Game II Endgame

The embrace of Islamists by Reagan and the collapse of the Soviet Union were a pageturner. Truth is indeed stranger than fiction.

With the collapse of the Soviet Union and the socialist bloc in 1989–91, and the beginning of what is called here Great Game III (GGIII), the Middle East and Central Asia once again came together as a new Silk Road, stretching as it did a millennium earlier from Italy to China. It is once again accessible to all comers and takes in at least 17 new political entities: the former Yugoslav

republics of Bosnia, Croatia, Macedonia, Montenegro, Serbia, Slovenia, and Kosovo in the Balkans; Armenia, Azerbaijan. and Georgia in the South Caucasus; Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan and Uzbekistan in Central Asia; with Moldova and Ukraine in eastern Europe.

But instead of being united under Islam or the Mongols, today it is largely under the sway of the US and its multilateral military arm the North Atlantic Treaty Organisation (NATO). The way stations on NATO's twenty-first-century caravan route from the Atlantic Ocean to the Chinese frontier reveal the nature of the current game. All the above new countries have official ties with NATO, and two former Yugoslav republics (Slovenia and Croatia) are now full members. Most have provided troops for US wars in Afghanistan and Iraq. The US has military bases in Kosovo, Kyrgyzstan, and Tajikistan, is directly arming and training Georgia's military forces, occupies Iraq, and is waging war in Afghanistan from Pakistan.

The region, from the Balkans to the borders of China, has been one of intrigue and war for a century, more so now than ever. US-NATO interest in this vital crossroads is keen. The region is important in geopolitical-strategic terms: US control there means containing Russia, China, and Iran, the dream of British strategists in GGI and of American strategists in GGII and III. It is also the location of most of the world's petrochemical resources, from Saudi Arabia and the Persian Gulf in the south to Kazakhstan in the north and Iran in the east. This, of course, might explain why the US is so keen to take and keep control of it and has gambled its all in pursuit of this goal over the past decade. The three major wars conducted by the US in the past decade – Yugoslavia (1999), Afghanistan (2001) and Iraq (2003) – all lay on this legendary Silk Road.

Pre-modern, Modern and Post-modern States

An important GGIII institutional innovation has been the shaping of a new type of state out of the traditional GGI and GII nation states and the remains of the socialist bloc. The collapse of the Soviet Union and Yugoslavia resulted in the creation of 22 new states (15 ex-Soviet, 7 ex-Yugoslav), all of which were eager to carry favour in Washington, up to and including permission to establish bases via Status of Forces agreements. These states have been dubbed post-modern as opposed to pre-modern (or failed) and modern (the traditional post-Second World War nation state). 'The postmodern system in which we Europeans live does not rely on balance; nor does it emphasize sovereignty or the separation of domestic and foreign affairs. The European Union has become a highly developed system for mutual interference in each other's domestic affairs, right down to beer and sausages' (Cooper 2002).

The political elites of the new states of the socialist bloc and ex-Soviet Union were eager to renounce whatever sovereignty necessary to join the European institutions, and welcomed NATO commissions which proceeded to restructure them militarily and politically in accordance with US-NATO requirements. Even Iraq's new army and security forces are supposedly being structured and trained in accordance with US-NATO requirements. EU president Herman Van Rompuy confirmed this when he said that 'the time of the homogenous nation state is over' (quoted in Johnson 2010); hence, the notion of post-modern imperialism.

Review of New Great Game Literature

With the collapse of the Soviet Union, there came a rush of 'new Great Game' literature dealing with the obvious political manoeuvrings of the US in Central Asia in search of the Mackinder/ Brzezinski Holy Grail, almost exclusively focused on oil. Apart from Dugin (1997), the collapse of the Soviet Union is seen as merely an opportunity for 'brash new, Wild West-style entrepreneurs' and securing long-term US energy needs. Most, like Baer (2004), Engdahl (2004), and Johnson (2007), argue that the US-British strategy is dominated now by oil security.

The classic work in this field is *The Grand Chessboard* by Brzezinski (1997), which inspires his protégé Obama's 'geostrategy' in Eurasia.

> The defeat and collapse of the Soviet Union was the final step in the rapid ascendance of a Western Hemisphere power, the United States, as the sole and, indeed, the first truly global power.... For America, the chief geopolitical prize is Eurasia. (Brzezinski 1997, p. xiii)

Brzezinski marvels that throughout history, world affairs have been dominated by Eurasian power but that 'for the first time ever, a non-Eurasian power [the US] has emerged not only as the key arbiter of Eurasian power relations but also as the world's paramount power' (31). Fortunately for America, Eurasia is too big to be politically unitary. For Brzezinski, history began in the fifteenth century; however, he rightly identifies 'the Eurasian chessboard' as 'the setting for "the game"' (31, 35).

His vision of the future is of a world in thrall to US cultural imperialism with post-Soviet Russia a post-modern state much like his native Poland, a willing handmaiden of a US world order, with only China to be cajoled into acquiescence. The era of direct invasions ended with the Soviet occupation of Afghanistan. The much more sophisticated US would be able to co-opt local elites and feed them on Hollywood blockbusters to establish the necessary control over Eurasia.

He condemns the neo-con wars, but his hubris blinds him to his own vital role in preparing the stage for precisely today's nightmare. He remains unapologetic about his policy of supporting Islamists against the Soviet Union (thereby facilitating the antiimperialist Islamic awakening), ignores Israel completely in his analysis and policy prescriptions, and desists from calling the US an empire, referring to a 'common global community': a 'trilateral relationship among the world's richest and democratic states of Europe, America, and East Asia (notably Japan)' (Brzezinski 1993, pp. 221–222). Even without the neo-con nightmare, he is pessimistic about the future of this 'community' unless the US discards its consumerism and overcomes its 'spiritual emptiness', apparently oblivious to his own argument that US mass culture is an essential tool in the imperial project.

The term 'new Great Game' has become prevalent throughout the literature about the region, appearing in book titles, academic journals, news articles, and government reports. The mainstream literature simply compares the British–Russian nineteenth-century stand-off with the twenty-first-century situation, granting that the playing field is complicated by transnational energy corporations with their own agendas and the brash new entrepreneurs who have taken control after the collapse of the Soviet Union.

Kleveman argues, 'Regional powers such as China, Iran, Turkey, and Pakistan have entered the arena, and transnational corporations (whose budgets far exceed those of many Central Asian countries) are also pursuing their own interests and strategies' (Kleveman 2004, p. 3).

Mullerson, a 'liberal' imperialist, argues that the pre-First World War Great Game and the current one have 'as their components respective *missions civilatrices*' (Mullerson 2007, p. 98). There are many games now and players change teams depending on what game is being played. China and Russia are watching how the West and the Muslim world exhaust each other in the war over terrorism (78), yet Washington co-operates with China and Russia on 'terrorism' and drug trafficking. The games are not always zero-sum competitions. Russia and China too are competitors in Central Asia for markets, resources, and political influence, but on a world level are allies, counterposed to US hegemony. Europe is a faithful member of the US team and plays no independent role in either Central Asia or the Middle East.

Mullerson dismisses religion as a legitimising factor in general and in Central Asia in particular. He argues that Islamic parties there such as the Islamic Renaissance Party (Tajik), which was part of United Tajik Opposition that fought Tajik authorities in a 5-year civil war, the Islamic Movement of Uzbekistan (renamed the Islamic Party of Turkestan), and Huzb ut-Tahrir are really political parties advocating 'religious totalitarianism' and using terrorism. He cites Thomas Friedman and Bernard Lewis (112), approving their view that

these ideologies must be wiped out to end terrorism. The West must carry on with its *mission civilatrice.* 'The road to democracy, as the Western experience amply demonstrates, is long and hard, full of pitfalls and obstacles' (112).

A Johns Hopkins University paper 'The Key to Success in Afghanistan: A Modern Silk Road Strategy' tries 'to visualize the kind of Afghanistan that might come into existence after US troops begin pulling out in 2011. The basic idea is that instead of being a lawless frontier, post-war Afghanistan should turn into a transit route for Eurasia, providing trade corridors north and south, east and west', requiring more roads, railways, and pipelines, making 'Afghanistan a hub rather than a barrier' (Starr et al. 2010).

Critique

The new Great Game literature is weak on important counts. Even where imperialism is alluded to, there is no acknowledgement that the politics of Central Asia is part of a larger game which centres on the wars in Iraq and Afghanistan, with Israel a major player. The Johns Hopkins study makes no criticism of the invasion and the right of the US to decide on how Afghanistan should be developed, and ignores the geopolitical aim to bypass Russia, Iran, and China. It draws inspiration not from the ancient silk route but from the conquest and subjugation of America itself which culminated in building the transcontinental railroad in 1869 to promote capitalism regardless of the wishes of the natives.

Only in relation to Russia is the overt imperial nature of US moves in Eurasia discussed openly and opposed in mainstream and popular writings. The Eurasian geopolitical theorist Alexander Dugin has provided a radical reinterpretation of the nineteenth to twentieth-century geopolitics of Mackinder and Haushofer in the context of post-Soviet collapse Russia, aimed at opposing US imperialism. In *The Foundations of Geopolitics: The Geopolitical Future of Russia* (1997), he declares that (and here I paraphrase) the battle for the world rule of Russians continues, and Russia remains the central actor in a new anti-

bourgeois, anti-US revolution. Dugin predicts that a Eurasian Empire will be constructed on the understanding of a common enemy: refusal to accede to Atlantism and US hegemony, both political and cultural, not necessarily leading to military conflict. Russia's natural resources and its strategic position at the heart of Eurasia should be used to oppose US plans and to promote a new Russian-European alliance without US hegemony, based on a Russo-German axis, excluding Britain since it is part of the Anglo-American axis. He advocates rapprochement with Japan and encouraging China to assert its hegemony in South-East Asia rather than Siberia. His focus is Russian resurgence and he does not incorporate Israel into his analysis, though he promotes the idea of a 'continental Russian-Islamic alliance', based on a Russia-Iran understanding, dismissing al-Qaeda and 'international terrorism' as instruments of the West. US sponsorship of new postmodern players is a move in itself in the new Great Game, which is not acknowledged in the mainstream literature. The new states were created by undermining the Soviet Union, instigating the subsequent colour revolutions and invading Afghanistan and Iraq; all important moves by the imperial hegemon to reshape the entire Eurasian region to create a new playing field and a new game.

In GGI and GGII, too, British colonies and protectorates were shaped consciously by the colonial office to play quasi-independent roles in some future informal empire (depending on the type of colony, i.e. a privileged settler one like Canada or one like India). Over time, these players developed in ways sometimes unforeseen, such as Afghanistan, Iran, and Iraq.

The Moscow-based Institute of Oriental Studies analyst Knyazev argues that the US strategy is to create its own secular 'postmodern caliphate' to encompass the Middle East and 'Greater Central Asia [which] calls for the dilution of borders between the five post-Soviet states and their merger with Afghanistan and Pakistan' which he dubs a 'geopolitical marasmus' (Radyuhin 2011). However, such an ambitious project of adjusting borders and state-creation is hardly within the scope of current US geopolitical

capabilities, nor is Israel any help in bringing together Muslim nations throughout the region into a subservient commonwealth.

The qualitative difference between GGI, GGII and GGIII is not clearly seen in the literature. Edwards (2003) sees in the original Great Game (my GGI) the 'forerunner of the Cold War struggle' and in the current game 'the last remnant of the struggle between USA and Russia', conflating my GGII and GGIII. Mullerson (2007) refers to a Great Game II, which picks up where Kipling lay off, ignoring imperialism as the underlying system, the subsequent Cold War, and the role of Israel.

Mullerson downplays historical parallels as 'more interesting than useful and more superficial than profound' (38) reflecting his lack of appreciation of the underlying continuity of these imperial games. He acknowledges that Washington is expanding its influence in region but denies it has any long-term interests in staying, and he condemns Dugin's Russian Orthodoxy-inspired messianism (not unlike US manifest destiny) preordained to clash with the West, as a reversion to Genghis Khan, Tamerlane, and Czarism.

Mullerson notes the interesting irony that, as sole superpower, the US has now lost its Cold War legitimacy as the leader of the anticommunist bloc, suffering the burden of providing world order and security (he is an Estonian immigrant to Britain). Therefore, today it 'needs more military power than would have been necessary … since today it would be necessary to carry out the hegemonic burden on a global scale' (111). But he could just as easily argue that after collapse of the enemy the victor should need less military force. He thereby implicitly acknowledges that the current new world order the US is enforcing is not a voluntary association of free nations, that security and peace are defined by the US (i.e. by accepting US hegemony, you have freedom from subversion by the US). While he dismisses the Russian geopoliticians and their pursuit of Russian empire, is there really much difference between the peace and security of Genghis Khan and that of the US today?

His support of secularism and respect for Friedman and Bernard Lewis shows his ignorance

of the long history of imperial use and promotion of Islamist 'totalitarian ideologies', and the fact that the US engineered the collapse of the Soviet Union using Islamists, allowing the Wahhabis to penetrate Central Asia and the Middle East, while supporting oppressive secular regimes. His proposal to snuff out these movements just adds fuel to a fire that the US has been stoking irrationally for decades.

An interesting description of post-Soviet Central Asia is provided by Rob Johnson, who sees it experiencing 'the recreation of a pre-communist Khanate' (Johnson 2007, pp. 33–34), with increasing unrest as a result of the break-up of the Soviet Union: the 1988 Armenian/Azeri war and riots in Ashgabat, conflict between Uzbeks and Meskhetian Turks in Ferghana in 1989, between Uzbeks and Kyrgyz in Osh and between Tajiks and Armenians in Dushanbe in 1990, the Chechnya separatist uprising of 1991–2000, the Abkhaz and South Ossetian separatists in Georgia from 1990 on, civil war in Tajikistan 1992–97, the Uzbek uprising in 2005, and the riots in Kyrgyzstan in 2010. US interference in the form of 'democracy support' and pursuit of its geopolitical strategies is merely adding oil to the flames.

Ex-CIA agent Baer, while excoriating the US for the invasion of Iraq, would also like to nudge Central Asia (the whole Muslim world for that matter) towards a secular modernity, but at least he emphasises that we can't force this on tribal societies that will change only slowly (Baer 2004). The closest in the mainstream media to an accurate understanding of the source of terrorism and the need for the US and Israel to pull in their claws are so-called 'paleoconservatives', who have long criticised US imperial adventures. Voices crying in the right-wing wilderness include Ron Paul and Eric Margolis (2009), who, while agreeing that it's all about oil, call for the complete US withdrawal from Iraq and Afghanistan, and for Israel to make a just peace by granting the Palestinians a state.

None of them recognises the distinction between Muslim Brothers and what I call neo-Wahhabis, the former genuine followers of Islamic civilisational traditions, the latter adopting

anarchist strategies of mass terror deriving from GGI and GGII; that is, from the imperialists themselves. The best analysts of the Great Game strategies, the GGIII wars, and the role of Israel include M.K. Bhadrakumar, Pepe Escobar, Israel Shamir, and others cited in the main body of Walberg (2011).

Definition

Anti-imperialism as ideology and strategy is embedded in left parties' political identity, especially in a country with the semi-peripheral position of Greece, at least until the 1980s. Throughout Greek history the quest for "national independence" took the form of frequent anti-imperialist struggles, which during the post-war period were mainly anti-US based on a diffuse anti-American sentiment in large parts of Greek society. Anti-imperialism as a political strategy was implemented mainly by the Communist Party of Greece (KKE), the Panhellenic Socialist Movement (PASOK) and Andreas Papandreou in the 1970s-1980s and the Coalition of Radical Left (Syriza) and Alexis Tsipras during the 2010s.

Introduction

Anti-imperialism was a crucial factor for the development of Greek left party strategies during

the democratic era (1974-today) and it has been a distinctive feature of the left's political identity throughout Greek history and a successful tool for the expansion of its political influence in the post-war period. Three features of Greek anti-imperialism can be defined: (a) in principle connected with a notion of "national independence" which always gave anti-imperialism a supra-class appeal, thus making it an effective party strategy; (b) predominantly a left case and especially a communist case; (c) in its various forms (anti-fascism, anti-Americanism, anti-Germanyism), primarily constituted as a public sentiment from below, mobilised through a political strategy from above. Greek left, throughout its historical development, was closely connected with communist ideas and practices, something that affected the content of anti-imperialist strategies. The Greek context is characterized by the absence of a traditional social-democratic party; the first labour party in Greece, the *Σοσιαλιστικό Εργατικό Κόμμα Ελλάδος* (Socialist Labour Party of Greece – SEKE), founded in 1919, aligned itself from its early beginnings with the Communist International and was quickly transformed into *Κομμουνιστικό Κόμμα Ελλάδας* (Communist Party of Greece – KKE). Consequently, anti-imperialist strategies were inspired by Marxism-Leninism, thus incorporating the norms of official Soviet ideology on this issue. Nevertheless, the Greek left's adherence to Soviet norms was not one-sided but tended to include the real socio-political conditions in the country, something that made anti-imperialist discourse appealing also to non-communist political forces.

Development of Greek Anti-imperialism (1930–1974)

Greek anti-imperialism is rooted in the interwar years. In 1934, KKE described Greece's "dependence on foreign capital" as the main reason for the "feeble development of industry and productive forces." Moreover, it pointed out that "the dependence of Greece upon foreign capital, especially English and French capital, is expressed, first of all, by the existence of huge external debt" (KKE 2008a/1934, p. 70; all translations from Greek sources in the present essay are by

the author). In that sense, "socialist revolution" would be preceded by a "bourgeois-democratic" stage of revolution that would achieve "the liberation of the country from the yoke of foreign capital," as a prerequisite for socialism (23–24). This theoretical framework was reconceptualized during the Axis invasion in Greece in 1940–1941 as "patriotic"; as put by KKE's general secretary "today all Greeks, we are fighting for our freedom, honor and national independence" (Zachariades, 2011/1940). Under Axis Occupation of Greece, anti-imperialist struggle developed "anti-fascist" features. KKE created the *Εθνικό Απελευθερωτικό Μέτωπο* (National Liberation Front – EAM) as its resistance organization, and the *Εθνικός Λαϊκός Απελευθερωτικός Στρατός* (National Liberation People's Army – ELAS) as its armed branch. In EAM's most publicized pamphlet, it is pointed out that its struggle is a "national liberation struggle and only if it is understood and organized like that can it bring the desirable result" (Glenos, 1944/1942, p. 39). EAM helped KKE acquire an extremely massive popular base after the end of Occupation – 500,000 members in mid-1940s from 18,000 in mid-1930s – and praise as the most respected champion of "national resistance" and "social liberation" in Greek politics.

After liberation (1944), KKE, responding to Greek right's growing aggressiveness, reiterated its inter-war anti-imperialist strategy by confronting British and (especially) American "imperialism." In December 1944, ELAS forces engaged in large-scale battles with British and right-wing forces in Athens; and from 1946 to 1949, its successor *Δημοκρατικός Στρατός Ελλάδας* (Democratic Army of Greece [DSE]), fought against the governmental army which was strongly backed and supplied by the US. In this context, anti-imperialism was primarily conceived as anti-Americanism, following the outbreak of Cold War in the late 1940s. The defeat of DSE in 1949 was accompanied by the advance of a semi-democratic political system, which was grounded on the political exclusion of communists. Apart from the malfunctioning institutions of post-war Greek polity (parliament, elections, King and Army), the US Embassy played a

particularly intrusive role in the domestic political arena in order to ensure the pro-US and anti-communist direction of Greek political life. Its interventions, sometimes aggressive and tactless, cultivated a rising anti-US popular sentiment which enabled the semi-legitimate Greek left to re-articulate its anti-imperialist appeals.

After 1951, the banned KKE formed, along with other left-wing groupings, the *Ενιαία Δημοκρατική Αριστερά* (United Democratic Left [EDA]) as its legal political front to run in parliamentary elections. EDA tried to take advantage of the growing social unrest against the semi-democratic regime by stressing the impact of the US interventions on the quality of democracy in Greece. Moreover, the management by the US and Britain of the Cyprus issue (which in the eyes of many Greeks at the time was seen as "pro-Turkish" and "anti-Greek") enabled EDA to display its anti-imperialist appeals as "anti-NATO." In that sense and after the shift that Khrushchev initiated after the 20th CPSU Congress, KKE, through EDA, employed the strategy of the *"*National Democratic Change" which highlighted anti-imperialism as the basic means for democratization. This strategy strongly influenced the political forces of the liberal "Centre" (the *Ένωσις Κέντρου* [Centre Union] led by Georgios Papandreou) which gradually tended to endorse EDA's slogans and pursue coalitions with the latter at local government and civil society organizations.

The victories of the Centre Union at the 1963 and 1964 elections, after an 11-year period of conservative rule, was considered as a major step for the country's democratization; nevertheless the clash between Prime Minister Georgios Papandreou and King Constantinos in July 1965 resulted in the fall of the former's government and the outbreak of massive and violent public demonstrations of an anti-royal and ultimately anti-American character which radicalized a large part of the Centre Union's party cadres and electorate. The formation of an informal centre-left within the Centre Union, under the Prime Minister's son Andreas Papandreou, paved the way for an approach to EDA. Andreas Papandreou, a US citizen and former Professor of Economics at University of California, Berkeley, supported the view that Greece should pursue its independent path to economic development without being bound by US interests.

The military coup d'état on 21 April 1967 and the establishment of a military dictatorship (1967–1974) halted this path of convergence but made the questions of democratisation and national independence for the anti-dictatorship political forces more urgent than ever. The Colonels' regime triggered a polymorphous resistance movement, not very massive at first, which resulted, in November 1973, in the Athens Polytechnic School uprising which was the most striking sign of the regime's lack of legitimacy (Kotsonopoulos 2009). In the eyes of many Greeks, the coup d'état was orchestrated by the US, which resulted in the deepening of the anti-US sentiment in parts of Greek society (Lialiouti 2015, pp. 44–46) and pushed the resistance organizations to mere anti-imperialist discourse. It is characteristic that the main slogan written on the gate of the Polytechnic School during the 1973 uprising was "US Out! NATO Out!" revealing a diffused anti-American sentiment in parts of Greek society.

For his part, Andreas Papandreou chose to form a resistance organization, the *Πανελλήνιο Απελευθερωτικό Μέτωπο* (Panhellenic Liberation Front [PAK]), inspired by liberation movements in the Third World, and he radicalised his theoretical perspectives by adhering to the "Dependency School" and especially the group of theorists behind the *Monthly Review* journal (Tassis 2009). Papandreou developed his own theory of "paternalistic capitalism" (Papandreou 1972) through which he connected U.S. aggressiveness and expansionism with the domination of managerial elites and national security managers on economy planning that enhanced the paternalistic tendencies of the system. Imperialism in that sense (though he didn't use this term) was the inevitable consequence of the paternalistic character of US capitalism. In the case of Greece, "all kinds of [US] corporations [...] invaded Greece" and imposed a longstanding "procedure of economic colonization" (Tassis 2009, p. 128) which called for

national independence as a basis for a socialist and popular economic program. In February 1968, the KKE experienced an internal split which created the Eurocommunist *KKE Εσωτερικού* (KKE of the Interior [KKE (int)]). The latter challenged, unsuccessfully in the end, the primacy of the pro-Soviet KKE in the left political space and extended its anti-imperialist rhetoric by downplaying the realignment of the country to the East instead of the West. In any case, anti-imperialism and anti-Americanism was defining the resistance initiatives of both parties.

Anti-imperialism in Democratic Greece: The 1970s and 1980s

The transition to democracy was accomplished by the conservative government led by Constantinos Karamanlis in 1974–1975. One of the first moves of the new Prime Minister was to withdraw Greece from the military section of NATO, clearly a choice that corresponded with the ascending anti-US sentiment in the country. This choice by a political leader, known for his pro-US positions prior to the dictatorship, proved the readiness of the Greek public to embrace an anti-imperialist discourse. On these grounds, the parties that represented the Greek left during the 1970s attempted to combine the goal of democratisation with "national independence" and anti-imperialist struggle (Karpozilos 2019).

On 3 September 1974, Andreas Papandreou founded the *Πανελλήνιο Σοσιαλιστικό Κίνημα* (Panhellenic Socialist Movement [PASOK]) as a new socialist party that aspired to dominate the centre-left political space. In its founding document, PASOK claimed to be a "political movement" that struggles for four political aims: "national independence," "popular sovereignty," "social liberation," "democratic procedure" (Spourdalakis 1988, p. 291). Moreover, it declared that "the seven dark years which passed under the gloomy military dictatorship and the tragedy in Cyprus are nothing but a particularly crude expression of Greece's dependence upon the imperialist establishment of the USA and NATO" (289). In that sense, for PASOK, "real democratisation" passed through the total disengagement of the country from its relations with the

US and its commitments to NATO. PASOK's anti-imperialist discourse appeared mainly through anti-right appeals, against the New Democracy party, with the latter being considered as the cardinal proponent of the imperialist interests in Greece. Papandreou invested in this rhetorical construction to polarise party competition and enhance his own party's electoral fortunes. There is a single slogan that PASOK has elaborated until its ascent to power in 1981: "Greece belongs to Greeks." This contradicted Karamanlis's long-time motto "Greece belongs to the West"; meaning that, in PASOK's eyes, the Western world was not a source of well-being for the country but the root of its misery. For Papandreou, Greece was not an exclusively Western country but also Balkan and Mediterranean one, and in this sense was more of a developing than a developed economy.

Therefore, PASOK's anti-imperialist strategy meant specific positions on foreign policy issues. For example, PASOK supported the cautious reorientation towards the Soviet Union; it rejected Karamanlis's moves for rapprochement with Turkey after the 1974 invasion as actions imposed to him by NATO; it established friendly bonds with several Third-World liberation movements and socialist regimes such as the Syrian Baath Party, Gaddafi's Socialist Jamahiriya, Palestine Liberation Organisation, North Korea etc.; it initiated the common action of South European socialist parties – (Spanish PSOE and the French and Portuguese PS) in opposition to traditional European social democracy; it disagreed with the country's accession to European Economic Community (EEC), dismissing the latter as just another "imperialist machinery" with the extremely popular slogan "EEC and NATO are the same syndicate"; it asked intensively for the removal of the NATO military bases in Greece – "Bases of death out!." This string of positions increased Western misgivings on a potential PASOK Government but at the same time created in the domestic political arena the image of a "popular movement" that fought "boldly" for the country's "national independence." In this context, PASOK's victory at the 1981 elections was considered as a major step for a "change" in the course of Greek politics and the consolidation of

the young democracy, with a non-interrupted transition to power from a right-wing government to a non-right-wing.

PASOK, while in government (1981–1989), maintained its rhetorical stress on anti-imperialism, but at the same time favored a more pragmatic approach to the actual issues of foreign policy. For example, while PASOK recognized PLO as soon as it undertook governmental responsibilities and Andreas Papandreou welcomed Yasser Arafat in Athens in 1982, on the other hand, in 1983, it came into a controversial agreement with the US that NATO military bases in Greece would be removed only after a period of five years; without however ensuring that this removal would actually take place following the deadline. Papandreou chose to hold a rigid stance on issues not affecting directly the Greek state and a more compromising stance on major foreign policy issues such as the NATO bases or the country's accession to the EEC, which were nevertheless the peaks of PASOK's electoral appeals. Especially on the EEC issue, PASOK shifted from a non-negotiable anti-Europeanism to soft euro-scepticism in the mid-1980s and critical pro-Europeanism in the early 1990s. In that sense, PASOK managed to retain the symbolic value of its anti-imperialist appeals, without actually fulfilling its pre-election pledges, implementing a version of "rhetorical anti-imperialism." This shift, of course, was the result of PASOK's expansionary and distributive economic policies in the same period which were supported by EEC funds. In any case, this highlighted the retreat from anti-imperialism as an election-winning strategy to Europeanism as a counter-measure to the country's decreasing dependency upon the US. The continuous presence of PASOK in government gradually altered its political scope from a popular movement with a clearly anti-imperialist orientation to a government party with a growing pro-Western allegiance.

On the other hand, the communist and Euro-communist left seemed to become minor partners of PASOK's rapid march to power, preoccupied with their own internal competition. Their emphasis on anti-imperialism was unequivocal, just as was their common assessment of an imminent crisis in the imperialist system (KKE 2008b/1973; KKE (int) 1974). However, they had different approaches to what international allegiances Greece should pursue. KKE, following Soviet Union's foreign policy directives, demanded the country's immediate "release" from its "imperialist affiliations" and favored the development of "cordial relations" with the countries of the "socialist world." KKE was the main proponent of the anti-US spirit, and in some ways was "idolised" in democratic Greece due to its long-time struggle against imperialism and its domestic "defenders." Its staunch pro-Sovietism became a distinctive feature of the political identity it attempted to carve, and probably resulted in it abandoning its aspirations for a more decisive role in Greek politics, something that reveals also the limits of anti-imperialist strategy, especially as re-orientation towards the "socialist camp."

This was a crucial point of KKE (int)'s differentiation from its "orthodox" counterpart. Greek Eurocommunists found in the developing EEC project a new international political space that could disengage Greece from the bonds of "US imperialism." KKE (int) declared that it tried to foresee the various and multifaceted contradictions in the prevailing and resurgent international alliances, in order to locate Greece's position in a changing international system. Of course, this version of "reformed communism" that KKE (int) was promoting, apart from a call for "national unity" against the "polarization" that PASOK and KKE were betting on, was defined by an arduous attempt to create a political identity that could outdo some of the determinants of left politics in post-war Greece (anti-imperialism, anti-Europeanism, pro-Sovietism).

PASOK's victory in 1981 was apprehended by the two communist parties as a partial "restoration" of the injustices Greek leftists experienced in the previous years. Papandreou's "rhetorical anti-imperialism" was convenient for KKE's policy aims, nevertheless the former's back-and-forth tactics created animosity between the two parties, resulting in a clash in the late 1980s. KKE came to regard PASOK's anti-imperialism as a cover for the latter's intentions to loot the former's

electoral base. At the same time KKE (int) grad-
ually discarded its communist symbols, being
rebranded as *Ελληνική Αριστερά* (Greek Left
[EAR]) in 1987, and dismissed anti-imperialism
as nationalism in the making. Both parties co-
existed in a short-lived, abrasive political coali-
tion. This was called the *Συνασπισμός της
Αριστεράς και της Προόδου* (Coalition of Left
and Progress [SYN]) and positioned itself
strictly on an anti-PASOK basis. It eventually
led to KKE's second internal split in 1991. Anti--
imperialism seemed to be a secondary issue when
it became apparent to all leftists that "real social-
ism" was facing its historical decline.

Anti-imperialism in Democratic Greece: The 1990s and 2000s

The collapse of communism pushed the Greek left
into a spiral of constant identity crisis and
brought to Greece's doorstep a Balkan region
shattered by ethnic strife and economic recession.
Moreover, the country's accession to the Euro-
pean Union (EU) in 1992 made the process of
"Europeanisation" a national goal for the
country's power elite while the social
legitimisation of the Europeanisation project
signalled the marginalisation of "national inde-
pendence" as a collective goal and "anti-imperial-
ism" as party strategy. These developments
affected the strategies of the Greek left parties.

PASOK endorsed a "Third Way" kind of polit-
ical programme under the term "modernisation,"
coined by Costas Simitis, Andreas Papandreou's
successor as leader of PASOK. Simitis dismissed
Papandreou's "rhetorical anti-imperialism" as
"populism" and emphasised the need for Greek
society's "convergence" with its European coun-
terparts. Simitis's Governments (1996–2004)
have been linked with several foreign policy
choices that have provoked public outcry: the
management of the Imia/Kardak crisis (1996);
the capture of Kurdish leader Abdullah Öcalan
in Kenya (1999); the participation of Greece in
the Kosovo War (1999); the neutral stance it held
during the Afghanistan and Iraq Wars (2001 and
2003). The fact that the abovementioned events
were met with mass demonstrations in Greece
with a clear anti-US orientation shows that anti-

imperialism was still rooted in Greek political
culture even when the political actors themselves
did not employ corresponding strategies. Thus,
the modernizing and pro-EU PASOK still inclined
to the necessity of bringing back the "rhetorical
anti-imperialism" by inviting Yasser Arafat to its
1999 Congress or letting its youth organization
participate in the mass anti-war rallies.

KKE, on the other hand, which, after the 1991
split, remained a hard-line Communist Party, still
insisted on a traditional "anti-imperialist" strategy
consisting of the denial of Western (military)
intervention in the Balkans and rejection of the
EU as "another imperialist formation." KKE calls
for "international solidarity" for "movements and
parties" that were fighting for their "national inde-
pendence" against imperialism; the party searched
out in this version of "anti-imperialism" a state of
normality in the diverse and anarchical post-com-
munist international system. Also it quickly diag-
nosed that anti-Americanism as a cultural frame of
reference for anti-imperialism retained its strong-
hold in the Greek public sphere. KKE played a
pivotal role in the demonstrations against
Öcalan's capture and especially against the
Kosovo War in the late 1990s, something that
helped it ensure its electoral survival in a highly
hostile socio-political environment.

SYN became a single party in 1992 by includ-
ing the expellees of the 1991 KKE split and the
former Eurocommunists of EAR. The distinctive
feature of its political identity in the 1990s was its
pro-EU stance, which distanced it from traditional
anti-imperialist strategies. SYN held a pacifist
anti-war stance during the Kosovo War, while
certain elements inside the party kept up an old-
fashioned left discourse though with no explicit
communist appeals. In the early 2000s the party
pursued a "left unity" strategy with several radical
left parties and groupings that resulted in the for-
mation of the *Συνασπισμός της Ριζοσπαστικής
Αριστεράς* (Coalition of Radical Left [Syriza]) in
2004 as an electoral coalition at first and a political
coalition later. Syriza aligned itself with the grow-
ing anti-globalization movement, co-organized
with the Greek Socialist Workers Party (SEK)
the 4th European Social Forum held in Athens
in 2006, and embraced a notion of "anti-

imperialism" not grounded in Greek left political tradition, but in international debates concerning global justice, alter-globalization, neo-liberalism and grassroots movements. In this context, Syriza attempted to present itself as the main proponent of a different kind of anti-imperialism which was de-connected from the traditional notions of "national independence" and "imperialism," and for this reason was highly criticized by the KKE.

Anti-imperialism During the Economic Crisis (2009–2019)

The arrival of the economic crisis is connected to the revival of a popular old style anti-imperialist sentiment of a predominantly anti-German character. The management of the crisis by the European elites with the imposition of a "Memorandum" between Greece and the so-called Troika (European Commission, International Monetary Fund, European Central Bank), that included severe austerity measures, resulted in the loss of national sovereignty since Troika's representatives functioned as commissioners over the Greek government's agencies (Eleftheriou and Papadopoulos 2018). This state of affairs, which could be defined as a "colony of debt" (Kotzias 2013), triggered a wave of anti-Germanyism that was presented with explicit references to the 1940s and Axis Occupation of Greece (Lialiouti and Bithymitris, 2013), something that made it also plausible to right-wing pundits and audiences. PASOK, being blamed as the government that brought the IMF in Greece, eventually lost most of its electoral influence on its party base, as well as its political integrity. The radical left faced in an ambiguous manner this public sentiment: Syriza developed an anti-Troika discourse with references to "national independence" from the Troika rule that resembled to the "rhetorical anti-imperialism" of PASOK in the 1980s, personified in the leadership of Alexis Tsipras; the KKE tried to re-state "anti-imperialism" as "anti-capitalism" by not embracing the anti-German tendencies in public discourse.

Syriza managed to exploit the electoral losses of PASOK and become the main opposition party after the June 2012 elections. From 2012 to 2015 it attempted to prepare itself for governmental duties, meaning that it should present itself as credible actor to be tolerated by the country's debtors. In its discourse, it preserved the "rhetorical anti-imperialism" of the anti-Troika appeals while it moderated its policy proposals, mainly by accepting the necessity of negotiating with Troika a new bailout agreement, rather than abolishing the previous one (that was the position of Syriza's majority faction). The minority faction of Syriza opted for a "Grexit" strategy, believing that the solution in the country's crisis was to be found outside the Eurozone framework. This strategy was framed by formulations of "national independence" that echoed a traditional left anti-imperialist discourse. During its first governmental spell (January 2015-August 2015). Syriza utilized its quasi anti-imperialist discourse during the negotiations with Troika, in order to preserve a coherent domestic base of support; these tactics reached their peak at the 5th of July referendum. After its defeat and acceptance of a new bailout programme and the departure of the minority faction that formed *Λαϊκή Ενότητα* [Popular Unity], Syriza gradually shifted from this quasi anti-imperialist discourse, by negotiating in a less conflictual manner with Troika and partially embracing US foreign policy goals in the Balkans. In any case, the reinvention of Greek anti-imperialism during the crisis demonstrates the persistence of a public sentiment converted into a political strategy, considered to be a relic from the past and a remnant of the nation-state, in the context of a rapidly changing global environment. Nevertheless, it seems that for the left political forces (even for KKE) anti-imperialism tends to become less desirable, mainly due to the fact that an anti-imperialist power strategy is conceived to be non-feasible in the EU context.

1983 invasion; Grenada; Marxism-Leninism; Maurice Bishop; New Jewel Movement; US imperialism

Definition

This essay describes the struggle for socialism and independence in Grenada. It focuses on US efforts to subordinate the country to its own economic interests, culminating in the 1983 US invasion. It describes the legacy of revolutionary socialist Maurice Bishop and his New Jewel Movement in struggling against US imperialism.

Grenada is a group of three small islands in the southern Lesser Antilles Archipelago in the southeastern Caribbean Sea in the western Atlantic Ocean, covering a land area of 344 square kilometres. In 2013, more than 80% of Grenada's population of 105,900 were of Afro-Caribbean origin, 10–13% of European and mixed racial origin, and 5% of South Asian origin. About 2% of Grenada's population are of Arawak, Carib, or Amerindian indigenous origin (World Bank 2015). In the 1970s, the vast majority of Grenadians were descendants of former slaves transported from Africa to the Caribbean by European slave traders from the 16th to the nineteenth century. They lived as peasants in small towns and villages in rural areas. In the twentieth century, the Grenadian class structure was dominated by privileged Europeans and mulatto landholders who subordinated descendants of African peasants lacking access to higher education (Henry 1990, pp. 51–82).

Maurice Bishop and the New Jewel Movement

Born in Aruba on 29 May 1944 to the son of a Grenadian nationalist and populist leader, Maurice Rupert Bishop was a revolutionary leader and prime minister of the island nation of Grenada. Growing up in Grenada in abject poverty, he was drawn to political life in the context of British colonial control and its disregard for the island's Afro-Caribbean majority working-class and peasant population. Like many other Third-World anti-imperialists, Bishop was drawn as a young adult to antiracism, Marxism, and then Leninism. After earning his law degree in the UK, he returned to Grenada in the early 1970s to join forces with the growing number of

anti-imperialist nationalists seeking to both end British colonial rule and to establish an egalitarian, antiracist society through building a peasant and workers movement among the Afro-Caribbean majority. To achieve these goals, Bishop was a founder of the New Jewel Movement (NJM) in 1973, a socialist anti-colonial party organised by Grenada's Afro-Caribbean activists devoted to independence and socialism.

The NJM (New Joint Endeavour for Welfare, Education, and Liberation) was a popular organisation for Grenadian independence and national revolution that mobilised the peasant majority for socialism and equality from its formation in 1973 to 1983, when it was overthrown by a US military invasion. In 1979, the NJM achieved national power through the popular insurrection and armed rebellion which overthrew the Government of prime minister Eric Geary, viewed as corrupt and subservient to British colonial rule. According to Henry (60), 'The emergence of peripheral capitalism in Grenada was accompanied by particular patterns of class exclusion, class inclusion, and distributions of authority . . . The transition from colony to nation was . . . a period marked by changes in the existing patterns of class relations, thus also demanding the generation of new symbols' which contributed to demands for both national independence and socialist re-distribution 'to resolve the illegitimate foundations of the colonial state'. The nationalists who obtained power in the 1960s were primarily beneficiaries of the entrenched system of class domination that was rooted in the control of the Grenadian state by European and mulatto landholders (60–62).

In the 1970s, the NJM transformed into a political party with a platform of nationalising the island's major infrastructure, redistributing land to peasants, and recovering a greater share of revenues derived from the tourism industry, which was providing a growing share of the national gross domestic product. The NJM struggled to break the dominance of the pro-British Government of Eric Geary, who served as Grenada's premier as the island archipelago transitioned to independence. The NJM gained a popular base among the majority of Grenada's

peasant inhabitants, who were seeking to gain equality along with independence. In 1973, the NJM formed a military wing, the National Liberation Army (NLA), modelled after Third-World armed revolutionary fronts. It comprised an activist base of committed revolutionaries who were devoted to armed struggle to achieve independence and socialism. According to Joseph Ewart Layne, an NLA activist, 'members of the NLA could be called on at any moment to give their lives to the struggle' (Ewart Layne 2014, p. 2). From 1973–74, the NLA mobilised popular opposition to remove Geary from leadership.

First elected premier with British support in 1967, Geary assumed the post of prime minister when Grenada gained independence on 7 February 1974. A trade union leader in the colonial era, he was widely viewed as corrupt and beholden to British and foreign interests. Independence was viewed by many Grenadians as a formal procedure which would continue British suzerainty and cement imperial domination over the island chain (1–6). Bishop played a decisive role in the NJM's growth through advancing a Marxist democratic political programme to nationalise the island's sparse economic resources and form an egalitarian society.

Bishop and the NJM tapped into the popular sentiment that independence from the UK also required redistribution and greater equality. Upon taking power, with popular support the NJM established a People's Revolutionary Government (PRG) modelled after the Cuban system of socialism in the 1970s. During its 4 years in power, the PRG /NJM enacted popular reforms including universal popular education (which allowed the peasant majority to attend school), social insurance, and health care. The revolutionary PRG mainly enacted reforms to expand social and class rights but did not depose the landholding class from its position of privilege. While the PRG outlawed competing political parties, a pluralist opposition remained through the Church, a dominant bourgeois press which was highly critical of the PRG, and the active organisations of the upper class, which was able to activate dissent against the state with the support of the US State Department and Central

Intelligence Agency (CIA) operatives. Meanwhile, the fledgling PRG did not have the resources for political education, and thus turned to Cuba for assistance in defending the revolution. As Henry (1990, p. 74) notes, 'the PRG had to engage in more extensive programs for political education than the nationalist leaders. They had to go beyond established styles of political education within Grenadian parties'.

Using this Cuban socialist model, the PRG vastly expanded the participation of women and youth to expand their rights in state and public affairs through the National Women's Organization, National Youth Organization, Young Pioneers Movement, and the Centre for Popular Education, which was responsible for increasing literacy among the masses. The bourgeois press and media and the Grenadian Church leadership fiercely condemned the PRG's founding and nurturing of these popular organisations. They opened the door to foreign imperialist intervention on behalf of the upper classes (Henry 1990, pp. 51–82). While the PRG admirably developed mass organisations which included thousands of members, including a People's Militia, it was unable to consolidate power in the 4 years it was in power before it was deposed in the US foreign invasion and coup d'état of October 1984.

US Military Intervention in Grenada

The PRG and NJM were able to withstand the internal opposition but did not have the military strength to withstand an armed US invasion backed up by a political operation choreographed by the Central Intelligence Agency (CIA) and the Pentagon. Opposition to the PRG intensified with a greater level of covert support following the election of Ronald Reagan as US president. The popular backing and resilience of the PRG is demonstrated by the inability of the US government to dislodge its leadership from 1981–83 without direct military intervention. Behind the scenes, US military intelligence fomented dissent among PRG leaders which led to Bernard Coard, the deputy prime minister, seizing power on 13 October 1983.

Bishop was placed under house arrest and the Grenadian army took control of the major military and communication installations. However, popular support for Bishop broke into mass demonstrations which overwhelmed the military government. On 16 October, protesters overtook the beleaguered military guard, setting Bishop free. In the ensuing days the Grenadian army fired rounds of ammunition into large crowds shielding Bishop at Market Square and the Fort Rupert military installation in St George's, Grenada's capital. On 19 October, Bishop and five other Cabinet ministers in the NJM (Fitzroy Bain, Norris Bain, Jacqueline Craft, Vincent Noel, and Unison Whiteman) were executed without trial immediately after the military overpowered the masses protecting them at Fort Rupert. Nonetheless, since the majority of the population continued to support Bishop and the NJM, the military government stood on shaky ground. In the immediate aftermath of the US invasion, foreign critics charged that internal divisions in the NJM leadership contributed to the loss of popular support for the government (Marable 1987). But these assessments did not account for the genuine support which the NJM had built among the peasant population or the significance of US covert operations which fomented division in the PRA and supported the coup d'état which installed Coard as leader of a military government.

While Bishop advocated unwavering opposition to US imperialism, his faith that the US working class was an ally in the struggle against imperialism proved highly overstated and mistaken: 'We certainly place a great deal of importance on the activity and the potential, and the possibilities of the American working-class movement . . . in terms of the potential for doing mortal damage to the international capitalist and imperialist system from within the belly of the main imperialist power on earth' (Bishop et al. 1983, p. 10).

What Bishop failed to recognise was that US imperialism is supported by most workers, and certainly organised labour in the US, which has historically conspired with the State Department and CIA to counter authentic workers' movements and help install unions supportive of US imperialism. Moreover, as US imperialism relies on control over critical economic resources, the US working class benefits from foreign interventions which cheapen the labour costs and the price of raw materials produced by Third-World workers. Indeed, an ABC-Washington Post survey conducted shortly after the invasion showed that 71% of the US public favoured it, while 22% opposed it (Beck 1993, p. 2).

The US military invasion of Grenada, called 'Operation Urgent Fury', was a prototype of American imperialism in the Caribbean, utilising an admixture of covert operations and deceptive propaganda to establish the basis for overthrowing democratically elected governments with popular support in the region. The US Grenadian intervention also consisted of a spurious claim that US citizens were endangered by the NJM Government, which the US destabilised through arming and supporting opponents to Bishop. On 25 October 1983, 2 days after the bombing of the US government's military installation in Beirut, Lebanon, US president Reagan ordered an invasion of Grenada on the grounds that growing popular unrest and the presence of Cuban forces posed a threat to US medical students (who were, in fact, known to be out of harm's way). This was the first overt use of direct armed intervention by US forces since the Vietnam War and indicated that the US was willing and eager to use military power to protect its economic interests worldwide.

In 1983, the Reagan Administration invaded Grenada with the US Rapid Deployment Force joined by a small delegation of troops from Barbados, Dominica, Jamaica, St Lucia, and St Vincent. They routed all opposition, imprisoned activists, and killed leading officials in the NJM. Subsequently, the Grenadian government arrested 16 leaders of the military that had overthrown and killed Bishop and sentenced them to life imprisonment (Crandall 2006, pp. 105–169). However, more than 20 years after the coup d'état, popular support remains among Grenada's working class and peasants for the legacy of Bishop, who sought to bring economic

G

justice to the island where poverty is rampant and inequality continues to grow.

Shaping Public Opinion Through Media as Organs of Propaganda

In retrospect, the US military invasion of Grenada can be seen as a decisive victory against a small and ragtag opposition. The US government used the intervention to build popular US support for a wider use of force in the Americas and throughout the world to secure economic and political supremacy over regional powers as the Cold War with the Soviet Union was coming to an end. The intervention occurred at the dawn of the Information Revolution, as cable television news broadcast services permitted 24-h coverage of current events and instantaneous commentary and assessment of significant events.

US Armed Services and the CIA mobilised public opinion through directly feeding propaganda to news outlets, claiming that US medical student's lives were under threat. In addition, the military released a report noting that the intervention and defeat of the NJM were supported by a popular majority in Grenada. To this end they sponsored what they called 'the first scientifically-structured public opinion survey conducted in Grenada' in December–January 1983 and 1984 to exhibit public support for the invasion which removed the NJM (United States Congress 1984). The report to Congress about a pleased Grenadian population does not reveal the deliberate distortion of events and indiscriminate attacks on civilians by the US military following the invasion. It includes mostly fictitious claims about US fire-fights with Cuban advisors defending Fort Richmond, a prison where Bishop had been taken and then assassinated. In addition, the US military conducted Psychological Operations (psy-ops) to calculatingly provide misinformation to the press and public and create the impression that its forces had already quelled all popular opposition and controlled key installations such as the harbour in St George's. Investigative reporters who managed to reach Grenada found these reports to be untrue. Bernard Diederich, a correspondent for

Time, reported that he obtained more accurate information from the Grenadian People's Revolutionary Army than the US military:

> The PRA soldiers who careened down to the 'Carenage' (waterfront) from Fort Frederick in their little jeeps had, as it later turned out, more accurate information. They informed us that the old folks home behind the town near Fort Frederick had been bombed and thirty people killed. Actually it was the mental hospital that had taken 250-pound bombs, resulting in the death of eighteen bedridden inmates. (Diederich 1984)

The US military shaped a general view of a population pleased with US intervention. However, most Grenadians viewed the troops as an occupying force of reckless marauders who had brazenly killed innocent civilians and endangered the general welfare of the population.

In fact, the Western media was prevented by force from entering Grenada during the invasion. According to Jacqueline Sharkey of The Center for Public Integrity, a liberal think tank:

> The 1983 invasion of Grenada gave the Pentagon its first opportunity to try . . . news-management techniques. Pentagon personnel, with the knowledge and approval of the White House, barred journalists during the first days of fighting. Reporters who tried to reach the island by boat were detained by US forces and held *in communicado.* Journalists who tried to fly in were 'buzzed' by a Navy jet and turned back for fear of being shot down. Nearly all the news that the American people received during the first two days was from US government sources. White House and Pentagon personnel reported that the conflict had been enormously successful and, in the words of Defense Secretary Caspar Weinberger, 'extremely skillfully done'. (Sharkey 1991, p. 5)

While the international press was prevented from accessing Grenada to report on US military operations, in the days leading to the invasion, for all intents and purposes, leading foreign-news reporters for major newspapers like the *New York Times* and the *Washington Post* served as the mouthpiece for the Pentagon and White House. Both papers reported that the White House spokesman said the redeployment of naval ships to the south-eastern Caribbean was precautionary and possibly to protect foreign students studying in Grenada. Only after the US invasion did the two papers unsuccessfully

attempt to cover the invasion, but their earlier general silence reflected a long-standing policy of non-interference in US foreign policy by major press outlets which continued into the early twenty-first century. Given that Grenada was the first large-scale, direct, military operation by the US since the war in Indochina, the debacle which ensued between the White House and press corps was quickly put to rest and a new policy of co-operation between the major media and US foreign policy was established to support US invasions in the Western Hemisphere and throughout the world (69–76). Since the 1983 invasion of Grenada, reporters for major newspapers which report on foreign policy are frequently reliable former operatives of the US military, with ties to the CIA and secret services.

The main purpose of a public opinion poll among Grenadian civilians held in the aftermath of the US armed intervention was to create the aura of support for the overthrow of the NJM. However, the main purpose of the military report was to pursuade popular opinion to support US armed intervention. Grenada was the model for all future invasions. In subsequent examples, the military and State Department have falsified evidence to show heroic armies welcomed by the general populace, and have provided disinformation when reports have criticised their operations.

Late-Cold War Anti-imperialism and US Militarism

The Grenadian Revolution was quintessentially a late twentieth-century anti-imperialist struggle against centuries of colonial domination and capitalist exploitation of the island's peasant population for the extraction of cloves and spices. According to Brian Meeks, the Grenadian Revolution bears striking similarities to comparable anti-imperialist movements of the late 1970s. Mainly, these revolutions were triggered by an aversion to post-colonial domination over economic resources and the failure to shift away from subjugation for the economic extraction of natural resources by the peasantry.

While Grenada was far smaller and less significant economically to the imperial ecumene than Iran or Nicaragua, it served as a crucial first object lesson of the potential consequences for Third-World revolutionaries in defying the system of US economic domination. In the aftermath of the Vietnam Wars from 1954–74, the US and UK were indifferent to the notion of formal democracy and sought to prop up corrupt and dictatorial governments that were of strategic economic importance to Western capitalism (Meeks 2001). The revolutions in Iran, Nicaragua, and Grenada were generated by growing peasant and working-class opposition to the pretence of the appearance of free markets and formal democracy in post-colonial states under the tight military and economic command of the Americans and British. Meeks suggests that the US defeat in Indochina in 1975 created an opportunity for popular movements to liberate themselves from de facto imperial domination. Correspondingly, in the late 1970s, popular movements for national liberation also broke out and won independence for their respective countries in the Portuguese African colonies of Angola, Guinea-Bissau, and Mozambique. In each case, as in Grenada, the US and UK used proxies to undermine and overthrow popular governments, and funded mercenaries and rogue armies to foment inter-ethnic rivalries and civil disorder. Meeks notes that the 'international window of possibility' of antiimperialist revolt of the late 1970s was shortlived and unsustainable for weak states like Grenada and Nicaragua (ibid.).

As a founder of the NJM, Maurice Bishop was a charismatic leader and dynamic orator who rallied the masses to support land reform and generate economic resources in the island-nation, which was dependent on the export of cloves as a cash crop. In 1974, following 300 years of colonisation, Grenada had gained independence from Britain at the same time as the NJM was gaining wider support among the working class and peasants through Bishop's comprehensive plan to transform the country. However, Sir Eric Matthew Gairy, Grenada's first prime minister, engaged in political repression and violence against his radical opponents to undermine growing labour and peasant unrest on the islands.

G

He formed an infamous internal security force known as the Mongoose Gang to kill workers and political opponents of the government. Bishop's own father, Rupert, was among those murdered by the paramilitary organisation. In the country's formative years of independence, the Gairy Government was charged with massive electoral fraud to prevent the NJM from taking power.

In March 1979, tens of thousands of the island's small population of about 100,000 were mobilising against Gairy, demanding an improvement in living conditions. To counteract the protests, Gairy mobilised the Mongoose Gang to kill the NJM leaders. The NJM discovered the plot, timed to take place during Gairy's visit to the United Nations in New York. To prevent bloodshed, the NJM seized power with the support of the majority of the country's population. Upon taking leadership, Bishop reaffirmed the party's commitment to democracy and egalitarianism. He promised protection of political and religious freedoms, elections without fraud, and that the people's revolution was 'for work, for food, for decent housing, and health services' for all Grenadian people (Crandall 2006, p. 126).

The NJM leaders sought to create a democratic society with greater equality through land reform and redistribution of wealth. As the Cold War was coming to an end, and neoliberal policies expanded in the US, United Kingdom, China, and a growing number of other countries, popular support for socialism in Grenada propelled Bishop and the NJM to power. Once in office, the NJM sought to align with ostensibly socialist countries such as Cuba, which provided vital technological and economic assistance, and the Soviet Union. In the 1980s, Bishop's political support expanded dramatically among the island's working class and poor population as economic reforms were implemented by him and the NJM Government.

With a poor economy enjoying few natural resources, and isolated by the US, Bishop turned to Cuba to provide medical assistance and help in advancing the nation's economy through promoting tourism and trade. Immediately following the Revolution of 1957–59, the Cuban government

had not overtly embraced a socialist transformation, but had primarily been motivated by opposition to US imperialism. It had gradually nationalised its economy, especially its sugar industry. The Cuban revolutionary government had been committed to removing the worst features of comprador capitalism manifested under the dictatorship of Fulgencio Batista from 1952–59. This had been tied to powerful criminal organisations (mostly US-linked) and had turned Havana into a major centre for gambling, prostitution, and illicit drug trading. The revolutionary government had striven to improve the quality of life for the majority of workers and peasants in Cuba, and opposed US domination over Cuba's economy and society. In the ensuing years, the Cuban government provided military support to anti-colonial and antiimperialist movements in Africa, notably Angola and Ethiopia. The NJM primarily sought out Cuban military support as a means to prevent US foreign intervention, and posed no military threat to the region.

Cuba began assisting in building an airport capable of accommodating large commercial aircraft for foreign travel and tourism, while providing foreign funding through trade. While the airport included an airstrip that could accommodate military aircraft, as is the case in virtually any modern airport, Grenada did not possess military aircraft that could have been used for aggression against any regional state, and surely did not pose a threat to US interests in the region. Some worried that Cuban military aircraft could have used Grenada as a regional base. But Bishop and the NJM Government denied that the airport would be used for military purposes.

Grenada never posed a military threat to US hegemony in the Caribbean, but the NJM was considered a thorn in its side, especially as the country drew closer to Cuba for medical, educational, and military assistance. In 1981, in the wake of Reagan's election as president, steadfast critics committed to overthrowing Bishop and the NJM were appointed to key posts in the US State Department. Indeed, historians have found documentary evidence that the CIA orchestrated a political crisis in Grenada in 1982 and 1983, staging a coup d'état against Bishop by arming

military supporters of his former law partner Bernard Coard, who was also a former deputy prime minister. Coard seized power on 13 October 1983, and 6 days later mass demonstrations against the military putsch fomented a national crisis. To many observers at the time, it appeared that the US military was more intent on suppressing popular dissent than fighting against a dangerous foreign power. According to a study by Robin Andersen for Fairness and Accuracy in Media, 'When reporters were finally allowed onto the island, the warehouses they found were half empty. Some contained cases of sardines, and most of the weapons were antiquated' (Andersen 2006, p. 120). The report further documented that the weapons found were appropriate for small defensive operations in Caribbean island nations and that figures on the number of Cubans on the island 'were greatly inflated'. The report quotes Stuart Taylor of *the New York Times*: 'Over three days the Pentagon estimate of the number of Cuban fighters who had met the invading force seems to have plunged from more than 1,000 to fewer than 200, including the estimated 30 to 70 Cubans who were killed' (ibid.; Taylor 1983).

Conclusion: Legacy of Grenadian Radical Anti-imperialism

The legacy of the Grenadian revolution and the overthrow of Bishop during a US-sponsored military intervention and coup d'état demonstrates the subservience of countries in the Caribbean Basin to US imperialist domination, especially if they seek an independent path. Even Cuba could not defend the NJM Government from US military intervention. While the US government dominates the island chain, popular majorities in Grenada are proud of the legacy of Bishop and the NJM. In 2015, more than 35 years since the Revolution, Grenadian citizens continue to honour the tangible inheritance of Maurice Bishop's revolutionary anti-imperialism in both popular lore and benefit from the concrete improvements that were enacted during his short tenure in government leadership. Historian Shalini Puri finds:

... even as leftist leaders across the region renounced the strategy of armed seizure of state power, armed uprising as a political solution remains an active popular discourse. Like the stubborn rumors of arms caches hidden throughout the countryside, it persists. It is no coincidence that the 2008 and 2003 elections were replete with references to the Revolution [and] to Bishop as an iconic figure. (Puri 2014, p. 260)

Under the NJM Government, Grenada instituted major health and education programmes, including the National Insurance Scheme, maternity leave law, and free primary school education. Puri notes: 'It is doubtless such policies that lead to even some of those who were imprisoned by the NJM to cite the People's Revolutionary Government as the government that had most helped the country' (260).

This admiration for the revolutionary legacy is supported by Joseph Ewart Layne, a leading activist in the NJM Government who was imprisoned for more than two decades after the US-sponsored coup in 1983. He aptly writes that the NJM was 'the first successful revolution ever to take place in the English-speaking Caribbean' (2014, p. xii), and was only defeated by a four-and-a-half year campaign of external destabilisation. To defeat the Grenadian revolution, the Reagan Administration orchestrated a coup and assassination of Bishop and dispatched more than 6,000 US marines and two aircraft carrier groups, and yet 'it still took six days of fighting before the US Goliath could silence the Caribbean David' (ibid.). Given the array of imperial military forces lined up against the small island nation, which sought to chart an independent course, the NJM can be viewed as exemplary in demonstrating that a sparsely populated small nation with few natural resources can resist the dominant world imperialist power.

What seemed correct and certain in the aftermath of the US invasion of Grenada in 1983 has been proven to represent disinformation in the three decades since. Grenada never posed a threat to US regional hegemony and its invasion demonstrated that the White House and Pentagon would use manipulation and force to overthrow governments in the Third World.

Guerilla Warfare

Guerrilla Warfare

Guerrilla Warfare and Imperialism

Yannis Skalidakis
University of Crete, Rethymnon, Greece

Synonyms

Cold war; Colonialism; De-colonialism; Guerrilla warfare; Partisan war; Social revolution

Definition/Description

This chapter examines the historical definition and practice of guerrilla war that has a long legacy and tactics that can be found in all historical epochs since antiquity. The modern form of guerrilla war hars its origins in the Spanish resistance to the Napoleonic forces and has extended into the contemporary era in major anti-imperialist struggles.

Guerrilla Warfare and Imperialism

Like all historical phenomena, guerrilla warfare has its roots in the past. Elements, mostly in tactics, that constitute this form of war can be more or less found in every historical period since antiquity. But the guerrilla as we know it, however surprising, is a modern form of war. Most writers agree to place its origins in the Spanish resistance to Napoleonic forces (the term *'guerrilla',* meaning a small war, was transferred into the English

language from this conflict) during the Peninsular War from 1808–14. The most important war theoretician of that time, Carl von Clausewitz, devoted a chapter to 'The People in Arms' in his monumental 'On War'. This form of fighting was adopted during the 19th and early twentieth century by conquered and oppressed nations and ethnicities, as European imperialism was progressively conquering the entire globe. Episodes like the Philippine resistance to US occupation, the Boer War (often described as the greatest nineteenth-century partisan war), the wars in the periphery of the Ottoman Empire (as in Libya and Morocco) and at its heart (in Turkey after the First World War) spread guerrilla warfare worldwide. During the inter-war period, guerrilla warfare intertwined with the communist movement in the Chinese resistance against Japanese aggression, and found its more important modern expert in the person of Mao Zedong. The Second World War marked the return of guerrilla warfare to the European continent, then heavily occupied and exploited by Nazi Germany, in the form of 'partisan war'. This successful reappearance initiated its renewed practice in the other continents as the high hopes of an end to colonialism were frustrated by the realities of the Cold War and the aggressiveness of old and new imperialisms. The Cuban Revolution became a symbol of the victorious guerrilla strategy and a paradigm for other insurrections. Forms of guerrilla warfare, usually combined with other tactics, persist to this day, although their identification is becoming more difficult as they are blurred with 'terrorism' and their political goals are sometimes indistinct.

People and Nations under Arms

> 'Like smoldering embers, it consumes the basic foundations of the enemy forces.' (Carl von Clausewitz)

Guerrilla warfare is fought by small groups of volunteers, armed civilians defending their land from foreign intervention. The two elements – small groups (militias) and civilian character – were piecemeal intertwined in eighteenth-century Europe and during the American Revolution. Small detachments, auxiliary to the tactical forces, were used by the middle of the eighteenth century

in Europe, for example by the French against the British. These fighters were often mercenaries and foreigners, despised by army officers but nevertheless employed. Across the Atlantic, groups of civilians started riots against the British administration in America and later fought as 'irregulars' against British troops, gradually building a local identity and forming a regular army from and besides the initial militias (Polk 2008, pp. 4–18).

The idea of civilians bearing arms to defend their homeland originated in the modern era from the French Revolution and the rise of the democratic citizen instead of the royal subject. Until then (and well after that in many territories), a non-military bearing arms was simply an illegal fighter, an outlaw, and his punishment was usually death without trial. Armed resistance against any kind of oppression was sometimes associated (and almost always treated as such) with banditry. Banditti, haiduks, kléphtes, 'primitive rebels' (Hobsbawm 1981) were the ancestors of the modern revolutionaries and guerrilla fighters. The introduction of the general military conscription transformed the way of waging war by setting new laws. But the guerrilla fighters, engaged in an illegal practice, were still excluded from any protection, even if operating in co-operation with tactical forces.

The massive participation (*levée en masse*) by conscription to the Revolutionary Wars marked the turn from the professional armies of the monarchs to the modern massive armies of the nation states. War was thus 'democratised' and from then on the use of arms and military training became common knowledge, at least in Europe. Ironically enough, the first conflicts characterised as guerrilla fighting were in fact a reaction to this procedure and its outcomes. This was the case of the revolt in the Vendée, the uprising by locals against military conscription in 1793, caused also by the local reaction to the revolutionary state's measures against the Roman Catholic Church. Similarly religious features can be found in the original *guerrilla* of the Spanish people against the French, and 'atheist', occupation of their country during the Napoleonic wars (1808–14). There, the basic elements of the guerrilla, as we shall know it, were crystallised: armed civilians in small groups fighting a superior foreign army to

liberate their homeland. As no tactical army existed there to assist it, the guerrilla became the main form of war. But a crucial parameter was the aid given to the Spanish rebels by the British navy; from then on, external aid was considered a basic element for guerrilla warfare.

Foreign authorities or institutions loyal to them were overthrown, popular support was obtained and new authorities (the *juntas* in the Spanish case) were organised in liberated areas. It was a people's war with no military end, while the society continued to resist the invaders. This idea of continuing the resistance in the name of the society or the nation, while the state had capitulated, would have radical repercussions in the twentieth century. The Spanish throne, wisely enough, dismantled all guerrillas and juntas after the French withdrawal.

As the phenomenon of armed popular resistance was growing, military theory acknowledged it, beyond legal considerations; after the Napoleonic Wars, Carl von Clausewitz treated this matter in his famous Chapter 26 entitled 'The People in Arms'. Having studied, and actively participated in the Napoleonic Wars of his time, he formulated a general war theory based on his experiences. Concerning the popular uprising, he promoted its combination with regular army operations and pointed out successfully some main characteristics, such as the national character of this kind of war and its success in rather mountainous or otherwise inaccessible lands. Despite its early theorisation and limited documentation, Clausewitz's chapter on people's war was unique for a long period. Therefore it was used by supporters of the guerrilla tactics and even thoroughly studied by partisan leaders until the Second World War, as in the case of the Central Committee of the Greek People's Liberation Army (*ΕΛΑΣ*). But times had changed, and with them guerrilla fighting had gone a long way before returning to the Old Continent.

Resisting Colonialist Expansion

> 'I never saw a Boer all day till the battle was over and it was our men that were the victims.' (General Sir Neville Lyttelton)

During the second half of the nineteenth century and until the outbreak of the First World War,

Europe remained peaceful. It was the imperialistic era and the Europeans were off to conquer the world. A kind of total war was therefore fought against the natives; the efforts to establish rules in the wars between 'civilised' nations in Europe had no place in the rest of the world. No distinction was made between fighters and civilian population and the extermination of the latter was a gloomy forerunner of the horrors of the Second World War. The inequality between the opposing sides was growing with the use of modern weapons and other fruits of the industrial revolution (Traverso 2003, pp. 63–68).

In the colonies, national sentiment was growing and with that the ideas of independence and the overthrow of the foreign yoke. A series of national parties and leagues were founded between 1881 and 1914; amongst them, the Indian National Congress and the Panindian Muslim League, the Chinese Tongmenghui, the Indonesian Budi Utomo and Sarekat Islam, the Young Arab Society and the Filipino Katipunan. From the latter emerged the Filipino guerrilla army of Emilio Aguinaldo against US occupation. Against the massive and brutal American colonial war against the population (waged by 150,000 US troops in 1900, as in Iraq in 2007), a guerrilla campaign was deployed which, despite its official defeat, continued to fight the Americans, then the Japanese and then again the Americans, in the form of the Hukbalahap and more recently, the New People's Army.

But the most notorious guerrilla war of this period was fought between Europeans in the south of the African continent: the Boer War. As British imperialism was reaching the edges of the world in search of rich resources, it came to confront previous Europeans settlers of Dutch origin in South Africa. These settlers, known as Boers, fought back, trying to preserve their control of the land and force out the new invaders. They deployed guerrilla tactics, setting ambushes and inflicting serious damages on British tactical forces. The British, in order to crush Boer resistance, deployed measures until then imposed only on, 'inferior races'. The civilian population was imprisoned in concentration camps, behind barbed wire, where they died in their thousands. To defeat the Boer guerrillas the British Empire

had to wage its largest land campaign of the century, larger even than its effort against Napoleon (Joes 1996, p. 42). The Boer War ended at the beginning of the twentieth century. Sixty years later, another armed struggle would appear there, that of MK (Umkhonto we Sizwe), the armed branch of the African National Congress (ANC) under the leadership of Nelson Mandela against South African apartheid (Seddon 2005, p. 323).

People's War

> 'The strategy of guerrilla war is to pit one man against ten, but the tactic is to pit ten men against one.' (Mao Zedong)

Despite the spread of guerrilla tactics, these had proved quite unsuccessful by the end of the nineteenth century. The use of modern weapons, like machine guns and chemical weapons, radically transformed warfare into an industrialised operation. The concept of total war was also developing during the First World War, as parts of populations were seen as targets. Amid this mass carnage in battlefields between trenches, there was no room for guerrilla tactics.

In this transitory period, the ascent of the communist movement would change the nature and status of guerrilla warfare. While not used in the Great War, the October Revolution or the subsequent Civil War in Russia, the importance of guerrilla warfare was acknowledged by Lenin in an early article ([1906] 1998), in his conception that no method of struggle should be excluded on grounds of principles.

But it was in China, where peasant revolts periodically broke out, that the Communists deployed an epic guerrilla campaign, under the name of the 'People's Protracted War', from 1927 until the seizure of power in 1949. That was a guerrilla war with an essential difference from all previous ones; it was organised and led by a Communist Party and thus was not waged to defend a prior state of affairs but to combine national independence with radical social revolution. The areas controlled by the guerrillas would abolish the old laws and became the nucleus of a new authority, legitimised by the struggle against the foreign aggressor and reforms in favour of the local peasant population.

The Chinese peasantry was for a long period on the brink of insurrection against a central government whose cohesion and power were fragile. The provinces were exploited by local warlords and bandits, while revolts erupted sporadically. Most probably, it was the Japanese conquest and occupation policies that gave the spark that started the 'prairie fire' of the first successful communist-led guerrilla war (Moore 1966, pp. 201–223). In 1934 the Red Army began its Long March to its base in Yan'an, and soon Mao Zedong became the leader of both the Party and the Army.

In 1938, the Japanese had occupied the biggest part of northern and central China, the main harbours and all the industrial centres. But, as the Nationalist forces of Chiang Kaishek retreated inland, the Communists under Mao Zedong gained support in the occupied countryside, established their power in liberated areas and from there unleashed guerrilla warfare against their enemies. This year, in Yan'an, Mao would give a series of lectures, later published under the title 'On Protracted War'; he supported the secondary but absolutely essential role of guerrilla warfare in combination with what he called 'mobile warfare' of tactical forces (point 95). American journalist Edgar Snow wrote that the Chinese communists had created 'the largest guerrilla organization in the world'. In the final stage of the war against Japan, in December 1941, while partisan fighting was dynamically reappearing in Europe, the Communist Party decided upon dispersing its Eight Army and concentrating on guerrilla warfare. By the time of Japan's defeat in 1945, at least one million fighters were under communist command (Rice 1990, p. 85). After a four-year civil war, the revolution had won in this immense country.

Partisan Warfare

> 'In the occupied regions conditions must be made unbearable for the enemy and all his accomplices. They must be hounded and annihilated at every step, and all their measures frustrated.' (Stalin)

The reappearance of guerrilla war in Europe during the Second World War was a successful one. This success led to the spread of such methods in the post-war world, from the anti-colonialist

struggles to the recent wars in Iraq and Afghanistan. Political as well as military-technical factors allowed this successful re-emergence of guerrilla tactics in Axis-occupied Europe. At first, the density of the Axis forces was not equal in the vast occupied areas of Europe, including the Balkans and parts of the Soviet Union from spring-summer 1941 onwards. Especially in the Balkans, the mountainous landscape multiplied the strength of forces necessary to control it, just at the time that all resources and manpower were required for Operation Barbarossa against the Soviet Union. In the critical period of autumn 1941, partisan warfare broke out in Yugoslavia, inaugurating a successful resistance against Axis occupation in the Balkans. Moreover, the military needs of the German attack plans created two different levels within the German army: the first-quality troops were used in the military operations and the second-quality troops were assigned to controlling and policing the occupied territories. The latter were an easier adversary for the partisan fighters.

Soon the Second World War took the form of a total war; the orientation of all social functions to the service of massive military mechanisms turned all aspects of social life into 'targets'. With more than the two-thirds of the 60 million victims being civilians, the word 'civilian' lost its meaning. Under these circumstances, the choice to resist behind enemy lines became more popular (Margaritis 2014).

The Soviet leadership openly called for resistance behind the enemy's lines and the population of the country, facing extermination by Nazi racial policies to 'germanise' their land, organised a strong partisan movement, backed by the remains of the state and the Communist Party.

The British, once more facing a Continental blockade, decided to unleash an 'ungentlemanly warfare' using a special unit, the Special Operations Executive (SOE) to 'set Europe ablaze', in Churchill's phrase. This unit, trained in sabotage and information gathering, deployed guerrilla tactics and systematically co-operated and supplied partisan armies in occupied Europe. Nearly 150 years after the Peninsular War in Spain, the British found again in these modern *guerrilleros* an ally against the greatest Continental power.

Leaving aside Soviet and British goals, armed resistance in Europe emerged as a new phenomenon; it resulted from the quick collapse of the European states' sovereignty and the reaction against Axis policies aiming to enslave populations or even annihilate some of them. In several cases, resistance took the form of secession from the body of Hitler's 'New Europe', with movements facing the challenge of administering liberated territories long before the actual end of the war. The political forces of the resistance movement – characteristically the Communist Parties – were grossly designing a political programme for the post-war period. No intention for return to the *status quo* ante bellum existed in this case. On the contrary, belief was strong in the coming of a new era which would bring radical social changes, deep-rooted reforms or even revolution. These aspirations were based not only in political programmes but also in the reality of the liberated areas, where partisan movements – as in Yugoslavia, Albania and Greece – established their own governments in the form of Committees of National Liberation (Skalidakis 2014).

Post-war Europe was no place for guerrillas. In some cases, conflicts originating from the war or even before it endured for years before fading away, as in Spain against the Franco regime (1944–50) or in the Baltic countries, Ukraine and Poland against the Soviet Union. Perhaps the only guerrilla conflict worthy of the term was the Greek Civil War (1946–49). As the massive leftist movement of the country, originating from the resistance against Nazi occupation and its collaborators, was suppressed by the old establishment, under British tutelage, a civil war began, mainly in the mountainous countryside. The fighters of the Republican Army of Greece (Dēmokratikos Stratos Ellados – DSE) applied guerrilla tactics successfully until 1948, but it failed to secure a necessary liberated base and the National Army prevailed in 1949. Meanwhile, the US had replaced Great Britain as the protector of the country, the Truman Doctrine for aid in Greece being the forerunner of the Marshall Plan and eventually the Cold War. The country became

a laboratory for applying counter-insurgency methods while American military experts pored over the various Wehrmacht reports about partisan war in the Balkans. On the other hand, the glory of the victorious anti-fascist Resistance fostered the expansion of guerrilla warfare around the rest of the world.

Decolonisation

> 'Strike to win, strike only when success is certain. If it is not, then don't strike.' (General Vo Nguyen Giap)

After the Second World War, the Cold War era emerged but the so-called 'First' and 'Second' worlds remained relatively peaceful. It was the Third World that would from then on be the scene of endless wars. Between 1945 and 1983, more than 20 million people died 'in major wars and military actions and conflicts' in this part of the globe; and during this period guerrilla warfare seemed to be the primary form of fighting (Hobsbawm 1995, pp. 434–437). It was adopted by the various movements of national liberation in Asia, Africa and Latin and Central America in their struggle to gain national independence from colonial powers and to defend this independence from neo-colonialism and mainly imperialistic US intervention. As the colonial powers or the local settlers resisted the path to decolonisation, theatres of guerrilla warfare opened up in Indochina, Malaya, Philippines, and Indonesia in South-East Asia; Angola, Guinea-Bisau, Mozambique, Kenya, Rhodesia, and Congo in Africa. The strategy of the colonial powers facing this new situation differed. The French chose to wage full-scale war against their rebellious colonies while Great Britain took a more political stance, trying to suppress the dangerous, that is mainly communist, elements of the various movements and to negotiate with the rest for a controlled disengagement.

After the Second World War, the British Empire was in decline. During the war, the British made several concessions in order to maintain it, but the dynamic of decolonisation was stronger than the Empire's resistance. British governments after 1945 thus promoted a process of reforms aiming towards a 'Commonwealth of Nations'.

Nevertheless, the British fought against a guerrilla campaign in Malaya while bitter fighting burst out also in British Africa, notably in Rhodesia and Kenya, where the white settlers were against the Empire's disengagement strategy.

On the other hand, post-war France didn't opt for a federal-type Commonwealth but for a centralised 'Union Française' (1946). What that meant was foreshadowed by the symbolic events in Algeria on 8 May 1945. The same day that Europe was celebrating the end of the war and the defeat of Nazism, the French police opened fire on a demonstration of natives in Sétif supporting independence. Over the following days, French repression left thousands of victims.

The national insurrection in Algeria finally began in 1954, but until then the French had confronted another guerrilla army and fought and lost another colonial war far away from the Mediterranean in Indochina. This vast area was lost to the French during the war but after that, they meant to take it back. That was not acceptable to the Viet Minh independence movement and its leader Ho Chi Minh who had fought the Japanese, and another war began in 1946. The Vietnamese applied guerrilla tactics in the country's jungles and benefited from the Chinese Revolution after 1950. Guerrilla warfare spread to Laos and Cambodia, while China and the Soviet Union officially recognised the Democratic Republic of Vietnam. Finally the Viet Minh forces, under the leadership of Vo Nguyen Giap, crushed the French in their base at Dien Bien Phu in 1954. It was the first time that a colonial European power had been defeated by 'natives' in the twentieth century – the only previous such incident being the Italian defeat in Ethiopia in 1896 (Margaritis 2014).

This debacle didn't seem to dishearten France, which prepared its next colonial war in insurgent Algeria that same year, 1954. The Algerian Front de Libération Nationale (FLN) was established on 1 November and the revolution began. In a greatly inferior position, the Algerian insurgents gradually gained support, men and weapons as French repression of the population grew. Guerrilla tactics were then applied in the countryside, in the form of *wilayah* (district) war. Small groups of

locals would ambush isolated French detachments, seizing their weapons and other supplies. In the area of Kabylie, a counter-government was established providing political status to the movement (Polk 2008, pp. 138–142). But, in this case, it was the events in the capital during the Battle of Algiers, and their political repercussions, that finally forced the French, after years of brutal repression and use of torture, to withdraw from Algeria in 1962.

While the Algerian revolution broke out, the baton was decisively passed from the French to the Americans in Vietnam, as the first military mission arrived in November 1954. The Ngo Dinh Diem Regime, backed by the US, used repression against South Vietnam's peasantry, creating thus an even more favourable environment for the Viet Minh. Relocation of hundred of thousands, incarceration in concentration camps and exploitation paved the way for another guerrilla war waged by the experienced Vietnamese movement. The pattern of a successful insurgency was once more applied; the insurgents gained popular support, abolished previous structures of authority, and imposed their rule in liberated areas before finally accomplishing a military victory (Polk 2008, pp. 173–174).

Another example of guerrilla warfare against colonial rule took place in Portugal's African colonies. The Popular Liberation Movement of Angola (MPLA), the Partido Africano da Independencia do Guine e Cabo Verde (PAIGC) of Amilcar Cabral in Cape Verde and Guinea-Bisau, FRELIMO (Front for the Liberation of Mozambique) shook the Portuguese 'New State' during the 1960s. These movements led to large military expenses and subsequent decline of the Portuguese economy, causing social unrest and accelerating the fall of the country's dictatorship (Galván 2009, p. 2731). The murder of Patrice Lumumba in Congo in 1961 consolidated the viewpoint that no political compromise was possible with imperialism. We hear this realisation in the words of Amilcar Cabral in his address delivered to the first Tricontinental Conference of the Peoples of Asia, Africa and Latin America held in Havana in January 1966:

The past and present experiences of various peoples, the present situation of national liberation struggles in the world (especially in Vietnam, the Congo and Zimbabwe) as well as the situation of permanent violence, or at least of contradictions and upheavals, in certain countries which have gained their independence by the so-called peaceful way, show us not only that compromises with imperialism do not work, but also that the normal way of national liberation, imposed on peoples by imperialist repression, is armed struggle. (Cabral 2008, p. 138)

Social Revolution

'It is not necessary to wait until all conditions for making revolution exist; the insurrection can create them.' (Che Guevara)

At the peak of the Cold War, the unexpected triumph of the Cuban Revolution and the ascent to power of Fidel Castro, who had started the campaign with a handful of supporters, gave am almost mythical (and mystical) dimension to guerrilla warfare. After Vietnam and Cuba, guerrilla warfare became an irresistible method for revolutionaries worldwide. A theory was even created preaching that guerrilla warfare could succeed even if political or social conditions were unfavourable; the guerrilla as a focus would concentrate the necessary means so that the revolution could triumph. This was 'focalism' or 'foco', supported by Che Guevara and formulated by the French journalist Régis Debray as the predominance of military (guerrilla) tactics over political strategy: 'the principal stress must be laid on the development of guerrilla warfare and not on the strengthening of existing parties or the creation of new parties' (Debray 1967, p. 115). These estimations would in fact sadly fail the same year, along with Guevara's execution and Debray's arrest in Bolivia, after an unsuccessful attempt to expand the revolution.

This omen wasn't enough to restrain the spread of guerrilla wars in Latin America and Africa, as movements of national independence continued their struggle and a new spirit of social revolution was growing all over the world in 1968. The symbol of Che and his cry for 'two, three, many Vietnams' was calling to action thousands of militants and conquered the hearts and minds of

youths in universities all over the globe. World revolution was envisaged as guerrilla wars broke out throughout the Third World, leading to the dispersal and defeat of the US military and the growth of support by Soviet Union, China or Cuba, as a contemporary writer formulated it (Vega 1969).

Indeed, guerrillas emerged in almost all Latin American countries – Venezuela, Argentina, Colombia, Bolivia, Brazil, Paraguay, Peru – with some of them surviving in various forms down to the present day. One of the most well-known surviving guerrilla armies in Latin America is the Revolutionary Armed Forces of Colombia (FARC). In a country with longstanding political violence, guerrilla resistance emerged in the 1960s in the countryside, under the influence of the Cuban Revolution, and in 1966 the FARC was founded. In the 1980s it participated in political negotiations with the government and since then has formed several political fronts. In the 1990s FARC's military strength continued to increase while counter-guerrilla operations were held by paramilitary groups in a 'dirty war'. Since 2002, the Colombian government has received counter-terrorism funding from the US as part of the latter's 'war on terror' (Leech 2011). The fighting in Colombia continues today as a proof of guerrilla warfare's enduring presence in the twenty-first century.

Several other guerrilla campaigns have similarly continued from the 1970s to the 1990s, gradually transforming into political parties and even taking governmental power. The most notable cases are the Farabundo Martí National Liberation Front (FMNLF) in power now in San Salvador, the Sandinista National Liberation Front (FSLN) in power in Nicaragua in the 1980s with its leader Daniel Ortega being president today. José Mujica, current president of Uruguay, was a member of the Tupamaros National Liberation Movement (MLN-T), a former urban guerrilla group there. Other more radical guerrillas didn't adjust to the political system after the revolutionary tide, and still continue their armed struggle. The most notorious among them is the 'Sentero Luminoso' (Shining Path) in Peru. This guerrilla was organised by the Maoist Communist Party of Peru, a splinter-group from the initial Peruvian Communist Party with its roots in the university campuses and its leader a former university professor, Abimael Guzmán (Gonzalo) now in prison. It started its armed struggle in 1980 following the classic Maoist methods of guerrilla warfare; that is, abolishing state institutions in the remote countryside and creating counter-state organs. At the beginning of the 1990s, Shining Path's control of the countryside had expanded significantly when in 1992 its leader Guzmán was arrested and the downfall began. Nevertheless, its activity has not ceased entirely even today.

The radicalisation of social and national struggles in the 1960s with the rise of guerrilla warfare affected also pre-existing conflicts in Europe. Characteristically, the Basque movement for national self-determination shifted to the left, adopting social demands. A significant part of it, Euzkadi ta Askatasuna (ETA), embraced armed struggle. A former faction of the youth of the Basque nationalist party PNV, ETA became an independent organisation in 1959 and rapidly radicalised in the 1960s. National oppression by the Franco dictatorship was combined with an intensified social conflict as the Basque Country became the epicentre of labour protest and political opposition to the dictatorship. From the late 1960s until the late 1970s, half of all labour protest throughout Spain was Basque in origin. In the context of world-wide armed struggles against imperialism and aspirations for social revolution, ETA considered the Basque Country as a land colonised by Spain and opted for revolutionary, that is guerrilla, warfare. This strategy was fully applied from the 1970s onwards and continued unchanged after the fall of the dictatorship. Violence escalated at the end of the decade as military factions of ETA chose terrorist methods to respond to the growing state repression. There were dozens of victims. Another tactic was to take the war to 'the enemy', choosing targets in Spain, outside the Basque Country. In recent decades, a series of peace negotiations and ceasefires have paved a way for a politicisation of the conflict (Dowling 2009).

After the Cold War

'Marcos is all the exploited, marginalised, oppressed minorities resisting and saying "Enough". He is every minority who is now beginning to speak and every majority that must shut up and listen.' (Subcomandante Marcos)

As the revolutionary tide began to ebb in the 1970s and 1980s, many guerrilla movements faded away while others degenerated in internal clashes for regional power. The end of the Cold War had multiple consequences, such as the withdrawal of external aid for and against armed movements challenging state power in Africa. But, as the post-Cold War period didn't prove to be one of sustainable peace and growth, as had been declared by its 'winners', guerrilla warfare continued to be a means of challenging political, national and economic realities. In Africa, guerrilla war was in essence related with movements of national independence and not of socialist aspiration. The 'failure' of the existing states to handle the post-colonial inheritance fuelled numerous contemporary guerrilla campaigns as a 'manifestation of rage against the patrimonial "machinery" of [these] dysfunctional states' (Bøås and Dunn 2007: 36–37). Often seen as remnants of the past, these 'non-classical' guerrillas are nonetheless expressions of political reaction against the reality of many African states, in the context of the current form of imperialistic international relations, that is globalisation.

The emblematic guerrilla of the globalisation era has undoubtedly been the Zapatistas movement (EZLN) since its insurrection in the Mexican state of Chiapas in 1994. Its strategy of creating autonomous institutions while not aiming to seize state power has been very influential in political theory and philosophy and has inspired many forms and actions of the anti-globalisation movement. Nonetheless, some more 'classical' guerrillas continue to exist or have emerged during this period. In Nepal, a guerrilla war was launched by the (Maoist) Communist Party in 1996 with remarkable results, as the centuries-old monarchy was finally abolished 10 years afterwards and a federal democratic republic established. The wars in Afghanistan, lasting from the resistance to the British and the Soviets to the contemporary form

of religious war against US intervention, and the expansion of the guerrilla war by the various Sunnite groups as a form of jihad in Iraq, Syria, and elsewhere, must also be mentioned.

As our world becomes more obscure, with a threatening global economic crisis triggering international disputes, the long-celebrated globalisation reveals its essential nature; imperialism is still a valuable term to describe the current phase of the capitalistic system. While history didn't finally end, nor did politics. To return to Clausewitz and his famous quotation 'War is merely the continuation of policy by other means', we must expect to see variations of guerrilla fighting in the future.

Definition

This essay explores the life and work of Argentine Marxist revolutionary, physician, author, guerrilla leader, military theorist, and diplomat, Ernesto 'Che' Guevara (1928–1967).

We all appreciate heroes whose actions and historical stature help enable us to recognise our potential as human beings and who give us the impetus to be better than we are – more courageous, more selfless, more committed to making the world a better place. This is especially true today when our world is on the verge of planetary catastrophe at the hands of a transnational capitalist class and its corporate clientele and a US-led imperialist order seemingly willing to forsake millions of lives in favour of protecting its corporate interests through a shameful complicity with the brutality and aggressiveness required as the 'leader' of the 'free world' (Robinson 2008). Today, as we witness the world's only superpower using its divinely ordained pre-emptive power to 'democratise' rogue countries through the savagery of war, symbolically delousing its new immigrant populations from the south by highlighting their supposed cultural inferiority, and deploying surveillance and cyber capabilities to steal industry secrets and sabotage financial systems in order to advantage its domestic industry and spy on its own citizens and those from countries around the world, we can safely say that while democracy clearly has no historical present in the US, it could possibly have a future should a socialist alternative to capitalism be one day realised. Yet, this seems unlikely in today's historical juncture, in a world harrowed by war, famine, racism, and ecological destruction.

Any vestiges of social responsibility are trampled into dust by a world corporate media system that deploys its own 'heroes' – i.e., Bill Gates, Warren Buffet, Mark Zuckerberg, the Walton family – to ensure that the capitalist marketplace is venerated as the motor force of democracy. Humanity appears weak and puny in the face of the entrenched dominance of the capitalist mode of production and its billionaire heroes, and alerts us to the seemingly insuperable task of emerging victorious against any and all forces aligned with

the interests of capital accumulation. As Peter McLaren (2010) notes:

> In a world torn between the oppressed on the one side, and those who esuriently exploit them, on the other, there seems little hope today of a grand alternative for the wretched of the earth. They seem forever caught between the jaws of those scrupulously respectable people who offer them the slavery of wage labour and a lifetime of alienation in exchange for their labour power, and those who loathsomely criminalize their very existence, or feel justified to leave them to suffer whatever cruel fate the market has in store for them. (102–103)

The unmitigated lie that we are destined to be passive participants in history and unable to act in a world of necessity becomes evident when we come to know and recognise the valiant self-fashioning of those who – despite being locked within the prison house of capitalism with its dislocation and disaggregation of person identity – create spaces of protagonistic agency that enable them to act with integrity, valour, and commitment toward a 'collective struggle' (Darder 2011). What we need is to learn of and from the heroes who stand among real men and women and who have made profound contributions in our lifetime precisely because of their humanity – because somehow conditions in and around their lives forced them to demand of themselves more than most of us dare to do. The real heroes of our world are those whose disquieting commitment to resisting the brutalisation of everyday life convinces us that we too can be revolutionaries – that in the substantive and aggregative nexus of our historical experiences, we all have the capacity for courage, for honouring others, and for revolutionary love.

Ernesto 'Che' Guevara was a man from whose storied legacy we can glimpse the possibilities of an authentic humanity, recognising at the same time that he was also one of the most important socialist revolutionaries of the twentieth century and beyond. His accomplishments as an intellectual and a military commander continue to be felt in the hearts of those who knew him and among new generations who continue to discover him anew (Löwy 2007). His gift to his own generation and future generations was his refusal to give succour to despair, his diligent focus on the

world-historical antagonisms of his day, the clarity he achieved in redressing social injustices of his time and his pedagogy of revolution that was based on a critical engagement of Marxist-Leninist theory and the philosophy of praxis he developed from the basis of such an engagement (Harris 1998). Through the words with which he agitated, incited, and persuaded men and women to fight for a socialist alternative, we witness the honesty, self-reflection, and integrity that he argued were necessary characteristics of the 'new [wo] man' and socialist revolutionary (Löwy 2007). His Guevarian pedagogy and socialist imaginary were not the product of some privileged access to his own internal reflection but came through a commitment to truth, a struggle for solidarity, a belief in the political efficacy of guerrilla warfare, and a search for a coherence between theory and practice, a coherence that has informed various revolutions since and provides great insights into how we, as critical educators, can begin to attain proletarian hegemony through a pedagogy of love, revolution, and social justice.

A Legacy of and for Revolution

Che is revered as an epic symbol of revolutionary heroism among disenfranchised communities across the globe and especially in his native América Latina. His extraordinary willingness to make the ultimate sacrifice of his life to liberate humanity, his unwavering commitment to his Guevarian (Marxist) pedagogy, and his courageous and unflinching affront to capitalism and US imperialism support the image of a knight from Arthurian legend, a secular Christ, or an avenging angel wielding a fiery sword promulgated and instructed by divine ordinance to slay the hydra-headed beast of US imperialism. For many of us on the left, he inspires and energises us to continue to fight for what we know is right and just, and instils a sense of solidarity and love that reminds us of our purpose.

Hundreds of books and articles have been written about Che, the man who, alongside Fidel Castro, spearheaded a socialist revolution that brought down the dictatorship of Fulgencio

Batista in Cuba in 1959 and played a key role in various aspects of Cuba's transformation into communism. In 1965, he moved on to develop and support other socialist revolutions in Congo-Kinshasa and in Bolivia, where he was eventually captured and assassinated by the Bolivian army with CIA assistance. He was and continues to be a controversial figure, idolised by poor, indigenous, and otherwise brutalised communities worldwide and intensely hated not only by the transnational functionaries of the capitalist superstructure and the restrictive circle of the ruling class but also by those of the working class whose enduring embourgeoisement positions Che as a determinate threat to their upward mobility (McLaren 2000).

A man who grew up in the so called middle class with privilege and opportunity and became a physician, Che renounced what could have been a lucrative medical profession to bring an end to the unnecessary suffering of people caused by what he recognised not only as the unconscionable and gluttonous greed of the capitalist class but more importantly as the very system of capitalism itself in which it was impossible to function humanely since it was powered by overaccumulation and the expropriation of surplus value from the poor in order to serve the interests of the rich. Those who have deeply studied his life, including his writings, whether divinising him as a revolutionary hierophant or misguided romantic adventurer, consistently point to a man who held a deep love for humanity and an abiding belief that human beings could and would change through the development of a socialist-humanist consciousness in both immanent and productive ways. He grasped keenly the full extent to which capital expands and encroaches upon every aspect of social life, including our social and political values and the ways in which we engage with each other and our world. He denounced capitalism and imperialism on the basis of the devastation and unfreedom it creates for the masses of exploited peoples and the inhumanity that it engenders in individuals and society. He argued that capitalism necessarily spawns inequality and creates human beings who are motivated by a stygian individualism that results in the negation of the essential qualities of humanity – love of and for our fellow

human beings, responsibility for the wellbeing of all, honesty, creativity, voluntary labour, solidarity and a sense of community (Löwy 2007).

The obsessive focus on the self that characterises much of how we engage in the world, including our explanations for success and failure, is part and parcel of the totalising effect of capitalism that breeds a deep-seated survival of the fittest attitude that normalises poverty and other forms of human suffering. This individualism runs throughout all institutions under capitalism, including education, where the opportunity to learn is determined through competition for grades and scores as if these were not related to a host of other social factors and in particular poverty and the availability of material resources. It is considered a superior human quality to strive to be the best of the best and to leave others trailing behind. Given this capture of education by individualism, it is not surprising that people learn early on to see themselves not as part of a social group working collaboratively to achieve goals with the benefit of mutual support but in an antagonistic relationship to each other. Capitalism pits human beings against each other such that 'man' becomes 'man's' worst enemy. A central aspect of Che's revolutionary goals was the transformation of (wo)man into human beings who, through the alchemy of critical consciousness, could transmute historical experiences of exploitation into a praxis of liberation by embodying the values of revolutionary socialism – values that could only be fully achieved outside of capital's value form. In other words, the problem was not only to rid the world of capitalists, but capital as a social relation. McLaren (2010) writes:

> The fact that all Washington administrations are populated by a particularly venal cabal of career opportunists, theocratic sociopaths, anti-Enlightenment activists, pathological liars and vulpine opponents of democracy should in no way confound us into thinking that the problem of capitalism is rooted in acts of political malfeasance by clever but corrupted politicians. Such acts may be torturously accommodating to capital, and lead to impoverishment, bloodshed, repression, misery, and eventually to genocide and even to the obliteration of entire nations, but they are not the source of the problem. The problem itself can be traced to Marx's world-historical discovery: the alienated

character of the very act of labouring and the exploitation that is a fundamental part of selling one's labour-power for a wage. (105)

Historical conditions set the stage for what came to be for Che a life of tremendous self discipline, theoretical clarity, and revolutionary vision invoked through a profound love for humanity and a conviction that a society that callously exploited, bestowed cruelty, and created or accepted barbaric living conditions for any of its citizens needed to be radically transformed. Che suffered throughout his life from terrifying asthma attacks that may have sensitised him to people's suffering. Indeed, he worked in his youth with leper communities and was deeply affected by the way in which they were treated with disdain. He was an avid reader of the classics and many revolutionary texts from his early youth onwards. He was raised in a politicised household with parents who actively took part in dissident political activity. At the age of 23, he embarked on a journey with a close friend that took him through South America, where he witnessed for himself the abject poverty, hunger, disease, drug addiction, and indignities impoverished peasants and workers experienced at the hands of those who seemed unable or unwilling to see or feel their suffering. His journaling throughout this time suggests that these experiences were deeply troubling to him and offered the opportunity for reflection that spawned both the desire and commitment to do something meaningful in his life. As Guevara (2004) wrote in his now famed *Motorcycle Diaries*:

> The person who wrote these notes passed away the moment his feet touched Argentine soil again. The person who reorganizes and polishes them, me, is no longer, at least I am not the person I once was. All this wandering around 'our America with a capital A' has changed me more than I thought. (25–26)

The concerns and questions evidenced in these diaries ultimately developed into a revolutionary consciousness that involved a deep capacity for honest self-reflection and a Guevarian pedagogy that brought triumph to the Cuban Revolution and a strong belief that the only way to defeat US imperialism was with a united América Latina.

This latter antiimperialist and, particularly, anti-US position was solidified as he evidenced the overthrow of Guatemala's President Jacobo Arbenz with the assistance of the CIA in service to the interests of the United Fruit Company. It is believed that his vision of a united América Latina, was beginning to see fruition as he moved to support Bolivia's revolution and planned to follow thereafter with insurgencies into his native Argentina. Alas, as the US recognised that his enormous courage, his charm and gift of persuasion, and his brilliant socialist pedagogy were a daunting if not indomitable force to be reckoned with, the CIA hunted him down and put an end to his socialist internationalist agenda. He was captured in Bolivia in 1967 and summarily executed on the orders of the CIA (McLaren 2000).

A key moment in revolutionary history was the fateful meeting of Che Guevara and Fidel Castro in Mexico City when Fidel and his men were exiled from Cuba after serving 2 years in prison as a result of being captured during their first attack against the dictatorship of Batista in 1951 (Fidel's 26 July Movement in Cuba had only a narrow base composed largely of middle-class intellectuals). After training in Mexico City, Che, Fidel, and other Cuban exiles boarded the *Granma* that took them to Cuba and so began the Cuban Revolution that toppled the Batista Government with a final victorious battle led by Che and peasant guerrilla forces at Santa Clara in 1959. This historic achievement and the years that followed serve as testament to Che's extraordinary bravery and commitment, and to the significance of a Guevarian pedagogy – a testament that lives on today despite an overwhelming campaign to domesticate Che into yet another superhuman hero of the market in an attempt to mystify his extraordinary but very real and human revolutionary accomplishments.

The commodification of Che's name and face – which are now plastered on coffee mugs and T-shirts and sold to consumers across the world, but especially in the US – is a strategic attempt to diminish Che's image as a revolutionary and attenuate the potential of his dialectical thinking in helping today's youth

achieve critical consciousness. The iconisation of Che extracts his humanity and with it the socialist ideals that he embodied and that gave millions the hope for a socialist alternative. It serves to turn Che against himself as he becomes the commodified form that he rejected and against which he courageously fought. We recognise the marketisation of our heroes as strategies of hegemonic control but also note the contested spaces within which Che is made and iconised. As McLaren (2000) states elsewhere:

> Even though there appears to be more of a willingness by rank-and-file North American commentators to de-reify Che as saint or sinner and to place him somewhere in between, we must remember that every encounter with that irrepressible force known as Che occurs in an occupied space. It is a space of reception dense with public signs and personal memories, a space de-limited by the discourses and 'ways of telling' that are most available to society, most overdetermined within society, and carrying the most currency within today's economy of ideas – especially in the public media. (7)

Yet people are not always duped by the anesthetising impact of shopping mall politics. Che stands, among other human heroes in history, to remind us that even within the totalising system of capital that aims to eclipse the virtues inherent in our existence, there are essential aspects to our humanity that remain, perhaps buried deep within the interstices of our self-and-social transformation, that can be nurtured, recovered, and brought forward to create new revolutionary heroes among us and in future generations until we can finally find ourselves in the moment of true victory, when humanity is vindicated from the treacherous workings of capital and its attendant antagonisms and we can move into the light of our secular salvation.

Indeed the extraordinary – some would say miraculous – reappearance of Che's body on 28 June 1997, near the airstrip where it had been discarded thirty years earlier, seems a prophetic reminder and admonition to the world that a martyr was made of Che to liberate humanity, such that we may find the fortitude to rise toward this most fearsome of goals, lest his execution be in vain (McLaren 2010).

A Guevarian Pedagogy

Che was a man devoted to the revolution, fully willing to make the ultimate sacrifice in order to free humanity from its enslavement to the chillingly individualistic and devouring monsters of capital. His readings of Marx, Lenin, and other revolutionary theorists began early in his youth but later became sources of study – to be analysed, critiqued, and built upon. A brilliant Marxist, Che believed wholeheartedly that revolution was the ultimate course in which the world was headed, that capitalism would suffocate humanity until the threat became too much to be endured at which time the people would rise up against it. However, he did not believe in uncritical idolatry or teleological accounts of historical victory over capitalism but rather argued that a revolutionary philosophy of praxis must be adapted to specific socio-historical contexts (McLaren 2000). As such, he recognised and denounced the enormous and growing power of US imperialism and its inextricable link to capital interests.

Che, however, was also a brilliant guerrilla warfare strategist who was not content to merely wait for conditions to be ripe for revolution. He argued that conditions for revolution could and should be accelerated to liberate the millions of people that at the time faced poverty and other inhumanities. His Guevarian pedagogy involved the idea that revolution required a short period of preparation, to ensure sufficient support among the people, and then a hard strike against those who would support the state apparatus, specifically against the state military.

Although he believed that armed struggle was and should always be a last resort, he was convinced that a socialist revolution was synonymous with armed conflict, and that it must be thus since the capitalist class and the imperialist powers would never give up their presumed right to exploit under a mantra of false ideologies that serve their interests. According to Löwy (2007, p. 79), 'the principle of the inevitability of armed struggle was [for Che] derived precisely from the sociology of the revolution: because the revolution is socialist it can be victorious only through revolutionary war' (79).

For Che, a socialist revolution could only survive under conditions of profound love – a love that was deeper than the romantic version used to commodify feelings and to turn people into possessions under capitalism. In Che's now famous words:

> Let me say, with the risk of appearing ridiculous, that the true revolutionary is guided by strong feelings of love. It is impossible to think of an authentic revolutionary without this quality. This is perhaps one of the greatest dramas of a leader; he must combine an impassioned spirit with a cold mind and make painful decisions without flinching one muscle. Our vanguard revolutionaries must idealize their love for the people, for the most sacred of causes, and make it one and indivisible. They cannot descend, with small doses of daily affection, to the places where ordinary men put their love into practice. (Anderson 1997, pp. 636–637)

Che was a man of love and his love for humanity reached the ultimate crescendo as he transcended the presumed natural state of self-preservation engendered through capitalism and embraced a socialist consciousness that included a vision for something far greater than one individual's needs – the struggle for humanity's liberation. Thus, within this socialist framing, we can recognise his now famous words uttered proudly and unflinchingly moments before his execution to reflect this revolutionary vision: 'Shoot, coward, you are only going to kill a man' (cited in Kunzle 1997).

And although these courageous words impel an image of an heroic being beyond what any mere mortal can presume to emulate, we learn that this was not an instinct held deep within him but something that was fostered during his youth when he was said to be a risk-taker – something that allowed him to push himself to the limits of what a young man could endure as he played rugby despite his life-threatening asthmatic condition. We see his vigilance of character enacted through self-reflection as he wrote during a battle in Cuba's Altos de Merino:

> Upon arriving I found that the guards were already advancing. A little combat broke out in which we retreated very quickly. The position was bad and they were encircling us, but we put up little resistance. Personally, I noted something that I had never felt before: the need to live. That had better be corrected in the next opportunity. (cited in Anderson 1997, p. 327)

With this profound love and respect for humanity, Che was clear that a true revolutionary must necessarily harbour a deep hatred toward any who would destroy the opportunity to liberate humanity.

> Hatred is an element of struggle; relentless hatred of the enemy that impels us over and beyond the natural limitations of man and transforms us into effective, violent, selective, and cold killing machines. Our soldiers must be thus; a people without hatred cannot vanquish a brutal enemy. (Guevara 1999)

And yet he showed profound empathy for his captured enemies and afforded them the dignity he perceived the right of every human being. Rooted firmly within the Latin American humanist tradition, for Che, the 'standard of dignity' to which all revolutionaries should adhere is reflected in the words of José Martí: 'A real man should feel on his own cheek the blow inflected on any other man's' (cited in Löwy 2007, p. 24).

Those who wish to discredit his name and destroy his legacy of bravery that was built upon his love take a righteous moralising position that his statements and actions regarding armed struggle reflect a dark and murderous side. These capitalist moralists who direct massacres without bloodying their own hands suggest that love and hate as claimed by Che are contradictory. Löwy (2007) argues otherwise:

> To hold life in profound respect and to be ready to take up arms and, if need be, to kill, is contradictory only in the eyes of Christian or pacifist humanism. For revolutionary humanism, for Che, the people's war is the necessary answer, the only possible answer, of the exploited and oppressed to the crimes and the institutionalized violence of the oppressors …. (24)

Zizek (2008) talks about the ultimate cause of violence as the fear of the neighbour. But he also describes what he calls 'divine violence'. He sees divine violence as an infusion of justice beyond the law. It is extra-moral but not immoral. It is not a divine licence to kill. It is divine only in a subjective sense, in the eye of the beholder, or in the mind of the person enacting such violence. It is Walter Benjamin's Angel of History looking forward as he/she moves backwards, slaying the masters of progress, restoring the balance to the history of the world. It is a violence that refuses a

deeper meaning; it is the logic of rage, a refusal to normalise crimes against humanity, either by reconciliation or revenge; it is, in other words, a refusal to compromise with injustice. Zizek describes divine violence as pure power over all of life for the sake of the living, it is a type of sign that the world is unjust. It is not the return of the repressed, or the underside of the authoritarian legal order. Nor is it the intervention of some omnipotent God. Rather, it is the sign of the impotency of God. There is no objective criterion with which to judge divine violence. Zizek claims that Che's comments are united in Che's motto: *Hay que endurecerse sin perder jamas la ternura.* (One must endure [become hard, toughen oneself] without losing tenderness).

The legal monopoly of violence in capitalist society is embodied in the institutions of the state, or political society, and clearly the social forces that constitute state formations are not static but historically contingent. While it is clear that the state is both an instrument of coercion as well as the production of consent, it is a matter of debate whether contemporary developments in civil society can result in an augmentation of state violence. Suffice it to say that, given his analyses of state formations, international relations and the political economy of his day, Che was committed to the inevitability of armed conflict in the struggle for socialism.

Che argued that fundamental to revolution was the making of the 'new (wo)man'. Not only was the development of characteristics and values among the people that would support the revolution essential to its success but it was also at the heart of the goals of a socialist revolution. Liberating humanity was not merely about redistribution of resources but about changing the ways in which human beings related to each other and to their world. This required a pedagogy of revolution – the critical understanding of what the revolution was ultimately about, beyond the initial desire for bringing justice and greater resources to the suffering masses.

Che was known to always carry books with him and to spend time reading them to the men who fought alongside him, often in addition to providing literacy instruction since many of the men who fought the Cuban Revolution were poor peasants who had never had the opportunity for schooling. In Che's words we hear a vision that can readily map into the ideas set forth a decade later by Paulo Freire (1970) in *Pedagogy of the Oppressed* and which spawned the Critical Pedagogy movement. Specifically, Che recognised that a revolutionary praxis would bring a socialist consciousness and would engender the unequivocal demand for justice and restore the necessary sense of agency to lead their struggle.

> The first step to educate the people is to introduce them to the revolution. Never pretend you can help them conquer their rights by education alone, while they must endure a despotic government. First and foremost, teach them to conquer their rights and, as they gain representation in the government, they will learn whatever they are taught and much more: with no great effort they shall soon become the teachers, towering above the rest. (cited in Löwy 2007)

Through his words, we recognise, as McLaren (2000) notes, that he was not only 'a teacher of the revolution but a revolutionary teacher' who saw the emancipatory nature of teaching and rejected traditional teaching pedagogy that is characterised by oppressive teacher/student relations in which the teacher holds all the knowledge and doles it out at will while simultaneously discrediting the knowledge of the oppressed. We can see how this traditional teaching approach sustains the status quo as the oppressed are led to feel grateful for the opportunity to learn without the opportunity to question and transform the existing social relations that oppressed them in the first place. Che's revolutionary pedagogy was an affirmation to the ontologies and epistemologies of the workers and peasants to which only the oppressed are privy by virtue of their social and historical positioning. As Che indicated, in the tradition of Marx before him and Freire after him, a revolution must be a people's revolution, even though it may be initiated by a vanguard which fights not for them but whose actions ultimately should reflect the people's decisions.

The new (wo)man would be a product of a new society within which education would play a vital role. Socialism, Che believed, would engender individuals that were responsive to the needs of the whole group and who held a deep commitment to the development of humanity and the

G

revolutionary cause. Socialism requires a different set of values, the value for social justice, for communal efforts, for sacrifice, for equally supporting others, for labour as a creative endeavour, and shared responsibility for those tasks that a society deems necessary but that no one really wants to do, a responsibility that helps individuals develop in community (Martí 1999).

His actions and personal testimonies about him reveal a man who did not stand above the rest but lived to the best of his ability through the values that he professed. He was said to hold enormously high expectations of others and to be even more demanding of himself. He lived, to the best of his ability, his Guevarian politics but he was quick to point out his own deficits as a socialist revolutionary, recognising the imprint of capital's seemingly intransigent stranglehold on every aspect of our lives. In Cuba, where an 82- foot statue of Che stands, marking his mausoleum in Santa Clara (often called 'the City of Che'), children are encouraged to be like el Che – to develop the characteristics that he espoused and exemplified as a revolutionary (Martí 1999).

Che in the Context of World Capitalism

Our current transnational capitalist world has reached a level of destruction unprecedented in the history of humanity. Famine, war, racism, sexism, hatred are all implicated to various degrees in the incessant necessity for capital accumulation underwritten by an imperialist creed that legitimises US exceptionalism and the quest for power beyond what the imagination can condone. William Robinson (2008) makes a clarion call for action as he relates the disastrous fate capital has procured:

> The system of global capitalism that now engulfs the entire planet is in crisis. There is consensus among scientists that we are on the precipice of ecological holocaust, including the mass extinction of species; the impending collapse of agriculture in major producing areas; the meltdown of polar ice caps; the phenomena of global warming, and the contamination of the oceans, food stock, water supply, and air. Social inequalities have spiraled out of control, and the gap between the global rich and the

global poor has never been as acute as it is in the early twenty-first century. Driven by the imperatives of over accumulation and transnational global control, global elites have increasingly turned to authoritarianism, militarisation, and war to sustain the system. Many political economists concur that a global economic collapse is possible, even probable. (vii–viii)

Indeed this is Marx's prophetic critique of capital restated in the context of today's crisis of capitalism; yet it is still uncertain if capitalism will bring about its own demise as a result of workers rising up in response to their destitute conditions.

The ideological marriage of democracy to capitalism that sustains the image of the US as a benevolent protector of the 'developing world' serves to conceal its treacherous dealings against any socialist alternative, even when this is the popular will of the people, in service to transnational capital. Evidence of US-sponsored massacres can be found across the globe, but particularly in América Latina, which has served for centuries as a killing field for US profit and power. Indeed, the massacres of greed and hatred can be traced to the infamously historic year of 1492, when a colonial power matrix was instituted that placed wealth and power in the hands of white, able-bodied, Christian men through a murderous war waged materially and ideologically against indigenous communities. According to decolonial theorists Ramon Grosfoguel, Enrique Dussel, Anibal Quijano, and others, the continual violence enacted upon the peoples of the global South is a founding aspect of Cartesian Western epistemology, instituted as the universal truth on the basis of the *ego cogito* (I think, therefore I am) that rises out of the historic and epistemic conditions of possibility developed through the *ego conquiro* (I conquer, therefore I am) and the link between the two is the *ego exterminus* (I exterminate you, therefore I am) (Grosfoguel 2013). The genocide perpetuated by Western imperialists on the indigenous populations of the New World and African slave populations of the Middle Passage was followed by epistemicide – the demonisation and disappearance of indigenous knowledges that accompanied the expansion

of the US settler-colonial state. Today we search for the wisdom of the autochthonous societies of our lost ancestros – the Arawaks, the Caribes, the Chibchas of the Antillean coastline, the Tapuyas, the Arucanos, the Incas, the Patagones, and countless other tribes massacred, tortured and enslaved by the European invaders.

Che was far ahead of his time in his understandings of the social conditions in América Latina. His conviction that only a united Latin America could emerge victorious against US imperialism seems prophetic in our age of financialisation, monetarism, hedge-fund hucksterism and fictitious capital. From his socio-historical and political location in the global South, Che's epistemology challenged and extended Marxist thought. For Che, imperialism was not an extension of capitalism as Marx would have it but intricately imbricated in its conditions of possibility. As Robinson (2008) explains, colonisation was the first of multiple stages in the development of capitalism that has continually expanded in subsequent waves to reach today's totalising formation. Che's revolutionary ontology was forged out of the converging and worsening crises of capitalism, society, and civilisation, the dictatorship of ownership, first-hand experience of the coloniality of power (*patron de poder colonial*), the brute force US capitalists were able to wield through the military-industrial complex, and the privileged geopolitical positioning of the US and its proximity to Latin America that had correspondingly undermined the dignity and livelihood of countless populations throughout Las Américas. As he witnessed Cuba's professional class flee the country in droves after the victory of the revolution, he came to recognise that the bourgeoisie would rather sell their soul to the highest bidder, side with the imperialist ambitions of the US, and take refuge in the certainties of the past than give up their perceived right to lands in favour of agrarian reform.

Yet, at the time, the guerrilla warfare deployed by Fidel and Che and the promise of a future free from the jackboots of imperialism helped secure a socialist alternative for Cuba, and thus it was

believed that the same victory could be realised by other national liberation movements. In today's transnational capitalism, the accumulation of wealth by the largest transnational corporations is based on the hyper-exploitation of the peoples of the 'developing' world, particularly exacerbated through the North American Free Trade Agreement. The concentration of the transnational capitalist class's wealth and power enables it to wield tremendous influence in national and international policy. Not surprisingly, it is fiercely opposed to large-scale socialist developments (such as Venezuela's Bolivarian Revolution) that may upset the 'democratic' stability of the nations that procure their profits. A massive military industrial complex and a narco-terror war that has militarised the US-Mexican border serves to bolster US surveillance and intimidation of all Latin America in the service of transnational corporate interests (Monzó et al. 2014).

Yet even under this hyper-capitalist world order, Che's heroic legacy continues to inspire and hold promise for the marginalised communities of América Latina and to spur and inform new socialist movements. Revolutionary struggles that have come to bear Che's foundational signature include the Cuban Revolution, the Sandinista Revolution, the Zapatistas indigenous movement in Chiapas, Mexico, which is explicitly inspired by Che's teachings, and the Bolivarian Revolution led by Hugo Chavez that began in 2007. However, these are small-scale movements in comparison to the large-scale socialist alternative that Che envisioned.

A Guevarian-Informed Critical Pedagogy

Although Che recognised, as Marx did, the totalising and self-reproducing aspects of capital, and although his vision of socialism transcended nationalised boundaries of identity (although not gender ones), he did not come to see the extent to which capitalism would persevere nor the magnitude of destruction and human suffering it would engender. Today's globalised world and the unyielding and supreme power of the US

make localised guerrilla warfare politically unserviceable. While we support social movements in which the oppressed masses extol their collective power to fight for justice, emancipation, and freedom from oppression and exploitation in Latin America and across the world, we believe that a different type of war must be simultaneously waged within the imperialist powers themselves; an ideological war or, in Gramscian terms, a 'war of position'. This is a concerted epistemological challenge to US cultural hegemony, the ideological underpinnings that hold the capitalist system together. According to Gramsci, a war of position is a necessary precursor to a 'war of manoeuvre' in which social movements collectively attempt through a united front to topple the state apparatus. Che recognised this ideological war must be waged through education and the creation of the revolutionary consciousness in the new (wo) man. There is no blueprint available today for the road to socialism, only those with the courage to remake history using the insights gleaned from a very unreliable attempts to control the social production of labour power by the workers. As McLaren (2010) remarks:

> The stages of liberation that were to follow lockstep from the contradiction between the forces and the relations of production – the accumulation of evolution powered by a law of dialectical development that would inevitably lead from the economic contradictions of capitalism to the establishment of a classless society under 'the dictatorship of the proletariat' – did not follow in the wake of the quixotic predictions of the dogmatists (a condition into which a great many fundamentalist Marxisms fall), ensuring the final victory of socialism over the cut-throat capitalists, the end of alienated labour and the flourishing of human culture. What young radicals such as Che had discovered in the interim was that it was not history that should drive the revolution but the other way around – the peasants and the workers should direct their own fate, making economic decisions and deciding which share of production is to be assigned to accumulation and which share to consumption . . .. But today, nearly forty years after Che's death, when the contradictions at the heart of the market economy are more exacerbated than they were in Che's day (even in the industrialized capitalism of Marx's day!), there

are no completed socialist revolutions to serve as a living model for the world, only those that have been ceaselessly and violently interrupted, or those that, following in the intrepid footsteps of Simon Bolivar, are being tested in the barrios of Caracas or los alto-planos of Venezuela. (103)

A revolutionary critical pedagogy is a philosophy of praxis that interrogates the ideological conditions and contradictions that sustain societal structures as if such were natural or the best possible democratic options available. A host of institutionalised structures are in place in the US that serve to keep the masses of workers anesthetised to the suffering of others and duped into believing that our capitalist system is the best of all possible worlds, including the corporate media and our increasingly privatised school system. Normalised ideologies about human 'nature', including individualism and competition are so culturally embedded in the way society functions that people find it difficult to conceive within the lineaments of their technocratic rationality that individuals could thrive within a set of values that emphasise overcoming necessity for every person through collectivist cooperation. Closely associated with individualism are ideologies that serve to create and sustain discourses necessary for identity construction, such as those associated with race, class, gender, and sexuality. However, as important as identity construction has became in today's culture of racism, homophobia, patriarchy and ableism, the formation of these identities is often used by the transnational capitalist class to divide workers against each other by administering a specific image of what it means to be 'American', and in doing so masking the role of capital as an 'equal opportunity' exploiter and effectively circumventing class struggle and the construction of protagonistic political agency.

A Guevarian informed revolutionary critical pedagogy re-inserts the values of freedom from necessity, provides spaces for self-and-social critique, encourages self-reflection and sacrifice for the good of humanity, promotes anti-racist, anti-

sexist, and anti-homophobic curricula and pedagogical practices, and encourages an informed public to learn from and with those whose epistemologies are rooted in the histories and struggles of the global South. Within a Guevarian informed revolutionary pedagogy, education is not only freely available to all but carries with it a responsibility for each person to meet the needs of society's most aggrieved populations. Within such a framing, teachers are viewed as committed intellectuals who create the conditions of possibility for the development of a socialist consciousness so that they may actualise their own power and recognise this as an inherent human capacity, leading to a renewed sense of agency and the will to act toward the creation of a new sociality.

For the youth of our nations, Che offers an alternative to the individualistic and greed-based consumer logic to which they are socialised, and offers opportunities for students to create a protagonistic political agency. The feeling that we are powerless to change the world's suffering is not an accident – it is a strategic aspect of class relations. Hope is the first step that must be taken to enable us to act towards something bigger and better than the world we have constructed. In Joel Kovel's (1997) words:

> Therefore capital must go if we are to survive as a civilization and, indeed, a species; and all partial measures and reforms should be taken in the spirit of bringing about capital's downfall. Nothing could seem more daunting than this, indeed in the current balance of forces, it seems inconceivable. Therefore the first job must be to conceive it as a possibility, and not to succumb passively to the given situation. Capital expresses no law of nature; it has been the result of choice, and there is no essential reason to assume it cannot be un-chosen. Conceiving things this way is scarcely sufficient. But it is necessary, in both a moral and a practical sense. (14)

Far from being an ambivalent space that defies categorisation, love is a foundational element in a Guevarian informed revolutionary pedagogy. The media exalts a capitalist-based love in which people become the possession of others in the name of love. A revolutionary love is one that does not encounter state boundaries or colour lines and one that encourages freedom of spirit and a commitment to the well-being of others. It is a feeling that honours the dignity of human beings above all else. It is a love willing to sacrifice for humanity and its freedoms. It is a love that will spawn new revolutionary heroes in our lifetime and generations to come until we finally achieve the most fearsome of victories – a socialist alternative in which all of humanity can live and love freely.

Anti-imperialism: National Versus Communitarian

By the turn of the twentieth century, the global composition and relative proportion of Karl Marx's industrial proletariat was confined to a marginal Western minority. Outside the West, there was no comparable industrial development or concentration of the working class. The vast majority of production forces remained rural and agricultural, while the relation of production appeared to have preserved most aspects of feudalism. Marx has originally predicted that socialist revolution to take place in the most advanced industrial nations where the proletariat is most concentrated. But Marx's prediction has never been materialized, while Russia, and despite its

small working class, was the first to experience the triumph of a socialist revolution.

Vladimir Lenin needed to stir a great deal of agitation to place Marxism in the context of an international revolution. In an effort to justify revolutions in Russia and in undeveloped countries, he sought to transform Marxist interpretations of socialist revolution beyond the strict dialectic of industrial relations.

After all, capitalism was hardly a comprehensive global phenomenon. Uneven capitalist development placed the Western proletariat in and at the center of global wealth. Leninism synthetically advanced the proposition that world capitalism is characterized by fundamental contradictions that pit advanced Western industrialism (imperialism or monopoly capitalism) against mostly resource-based, dependent nations (Third World or underdeveloped countries). National liberation or a democratic revolution is, thus, established as an essential prerequisite for socialism (Lenin 1916; Stalin 1913). The alliance between workers and peasants as well as those of the oppressed nations in the Third World was considered fundamental to the defeat of world capitalism (Lenin 1905), through a permanent (Trotsky 1906–1930) or staged (Stalin 1929) international revolution. Imperialism was set as the highest stage of capitalism whose demise depended on an ingrained cyclical economic crises as well as on the Third World's national liberation and, consequently, international revolution (Lenin 1917).

However, anti-imperialist national liberation and democratic revolutions in the Third World failed to follow a deterministic or historic inevitability. Throughout the twentieth century, theoretical and strategic differences resulted in opposing perspectives among leftist movements. Disagreements oriented various responses to central questions such as the following: How could the national struggle be linked to the international? What types of alliances were needed to be forged between classes? Which national classes could be considered anti-imperialist? Who should lead the alliances? Which political programs were to be pursued? (Conversi 2017).

Relative consensus, however, remained in attributing Westphalian traits to the nation state. The nation or the national group is thought to be comprised of a population, confined to a geographic territory, and linked by a shared identity. It was a prerequisite for a democratic revolution to be centered around the transformation of state power from bourgeois to socialist. Lenin's view did not dwell on details in efforts to unravel the determinants of a nation but created space for discussion of the attributes of a national group brought together in a political union against dependency and exploitation. Consequently, the Westphalian state became the target for revolutionary transformation.

A century after Lenin, the national question has yet to pave the way for a democratic or a successful national liberation synthesis. Firstly, it became evident that postindependence nations were territorially constructed and imposed by colonial design rather than through an indigenous awakening. This is exemplified in the 1916 Sykes-Picot secret Agreement that divided the Ottoman Middle East into different spheres of colonial direct and indirect influences. Secondly, and as a consequence of such actions, the affiliation of communitarian groups within national territories was widely disputed by primordial and cross-national affiliations that refused detachments, such as the case of the Kurds or sectarian groups in the Arab region. Some states such as Lebanon, Syria, and Palestine were granted independence through a gerrymandering of national territories to reflect particular sectarian compositions suitable to the preservation of colonial interests. Thirdly, nation states, including those formed following the anti-imperialist liberation movements (and in order to force the unity and assimilation of different groups) soon degenerated to repressive autocratic regimes (Egypt, Algeria, Iraq, Syria, Southern Yemen, etc.), inciting anti-nationalist communitarian grievances. Assimilation projects in Iraq under the Arab Socialist Ba'ath party, for example, witnessed a demographic engineering aimed to undermine ethnic Kurdish and Shiite Arabs conglomerate powers. Lastly, post-Soviet globalization trends seem to have deterritorialized

geopolitics, revoking requisites that traditionally served as the essence of nation states' sovereignty and independence (Salamey 2017). Economic liberalization and collective security, for example, increased states' dependencies on global market and governance.

Thus, the original challenge in establishing an anti-imperialist alliance formed around a national platform consistently proved problematic. Communitarian affiliations (ethnic, religious, racial, tribal, linguistic) that were rooted in primordial cultural solidarity emerged resilient to modernizations or states' territorializations. Communitarianism stood robust against the assimilation of the oppressed within a national liberation project. The Jewish question, for instance, presented an early dilemma where leftist disagreements revolved around whether recognizing Jewish communal, national assimilation, or national secession would contribute to the strength or weaknesses of the working class and those of oppressed "nations" (Marx 1843; Lenin 1905–1918; Trotsky 1934).

Thus, when Jewish nationalism sought an independent state in Palestine and assembled behind the Zionist movement, leftist responses split on the issue of whether Jewish separatism served or opposed imperialism (Rodinson 1973; Ben-Zvi 1957). Division was further deepened by the communitarian and religious nature of this nationalist brand. Quarrels centered around whether Zionism enhances or undermines the development of a working-class consciousness. Marxists have traditionally opposed religious indoctrination and mobilization on the ground of having to contribute to dogmatism and false consciousness.

The question emerged equally divisive following the 1979 Iranian Islamic Revolution, which was founded on religious communitarian rather than nationalist principles. The revolution overthrew the monarchy, stood in direct confrontation with the United States and Western imperialism, and promised the redistribution of wealth and welfare. Despite its wide crackdown on left opposition, Tudeh, the Iranian communist-leaning party, stood in support of the Islamic theocracy. This support proved to be in vain as loyalty to the Ayatollahs did not spare the party from political prosecution. In 1983, the party was disbanded, and its members imprisoned or executed. Thus, religious communitarianism in Iran presented a two-edged "liberation" scenario in the struggle against imperialism: while being largely inspired by the philosophical tenants of Husseinism that rejected global injustice and stood against Western imperialism, it had no tolerance for class politics that stood against perceived unity of the community (Ummah). Twelvers Shiism's Husseinism served well the revolutionary fervor while metaphorically reverting to the lessons extracted from perceived injustice committed against the Prophet Muhammed's grandson and his ultimate martyrdom for righteousness.

Still, the Islamic Revolution held another intriguing peculiarity that echoed international revolutions and drove another wedge in the anti-imperialism debate. Its communitarianism recognized no national boundaries and promised liberation of the dispossessed from colonialism and enslavement everywhere. Naturally, the deprived and dispersed Shiite communities within the predominantly Sunni-majority nation states were most susceptible, sparking a region-wide Shiite communitarian awakening to demand emancipation and an Islamic State. Substantial-sized Shiite communities in Iraq, Bahrain, Kuwait, Saudi Arabia, Afghanistan, Pakistan, and Lebanon were among the most inspired by the Iranian Husseinist fervor, enthusiastically responding to communitarian appeal while moving away from left and national secularism. In Lebanon, for example, and throughout the 1980s, the Lebanese Communist Party and The Communist Workers Organization witnessed an exodus of their majority Shiite members, switching rank in favor of own communitarian parties: Amal and Hezbollah. The latter waged an assassination campaign against leftist intellectuals in the early 1980s.

Communitarian Shiite parties, such as Hezbollah in Lebanon and Hezbolda'awa in Iraq, aimed to reinvent Khomeinism in their own countries, echoing traditional communist parties' efforts to reincarnate Leninism in national experiences. Their international was thus replicated by a

Velayat-e Faqih or the Guardian of Islamic Jurist, providing a forum for leadership guidance and coordination across countries (Salamey and Othman 2011). The evolution of militant Shiite groups in MENA states demonstrated a changing regional environment that favored a communitarian political discourse. To what extend has this shift challenge the political economy of world capitalism and those of imperialism? This paper aims to provide a preliminary response.

It analyzes the experience of Hezbollah in Lebanon as a communitarian political party. It also assesses the extent to which such a communitarianism has provided an antithetical discourse to imperialism. The assessment is formulated within an analytical framework that utilizes globalization's Double Movement theory, which lays the foundations for a dialectical interpretation of rising communitarianism and the demise of nationalism (Salamey 2017). Conclusions are accordingly formulated to support this analysis.

Hezbollah and Shia Communitarianism

The Lebanese confessional composition gave primary impetus to Hezbollah. The country had initially recognized 18 sectarian groups divided between Muslims, Christians, and Jews. The 1943 political pact formed among sectarian elites vested power in the hands of a Christian Maronite President and to a lesser extend a Sunni Prime Minister. The Shia Parliament Speaker and the Shia community, in general, fared the worst in the distribution of power. The Shia had been historically marginalized in Lebanon and in the wider region. Successive rule by Sunni dynasties has subjugated non-Sunnis to discriminatory treatment. French colonial mandate over Lebanon injected secular liberalism and modernization that helped reverse more than 500 years of historic discrimination practiced against Christians; however, it failed to do the same for the Shiites.

Thus, throughout French rule and post-independence periods, relative deprivation among the Shia community incited radical appeals. Its population was predominantly made of poor peasants, agricultural laborers, and a newly formed proletariat brought to urban centers in Lebanon, Syria, and Palestine. The community was denied fair access to jobs, public services, and public offices and, hence, excluded from the process of liberalization, while its bourgeoisie had difficulties developing along Lebanese national lines. Shia youth were highly recruited by revolutionary secular Arab nationalist, Palestinian, socialist, and communist parties.

The 1975 Lebanese Civil War witnessed the mobilization of Shiite youth by left-wing parties assembled under the Lebanese National Liberation Movement, demanding reform and access to the Maronite-dominated nation state. The defeat of the left by the Syrian and Israeli military incursions and the triumph of the Iranian Revolution brought the Shiite closer to recognizing their strength through the community. Initially, the Shiite Amal movement gained grounds by forcing the communist party out from Shiite strongholds before cleansing the Palestinians. Later, Hezbollah presented a radical and transnational communitarian alternative. It distinguished itself from Amal by rejecting the entire Lebanese national arrangement, calling for its replacement by an Islamic State. Its aims were first articulated in its 1985s "Open Letter to the Oppressed" (Hezbollah 1985). Both groups clashed for a short period of time, and Hezbollah gained significance following from those who had lost faith in the "national project." Many of its new recruits had fought in the past alongside leftist and Palestinian organizations for democratic state reforms. It was Hezbollah's well-orchestrated armed campaign against Israeli occupation in Southern Lebanon and radical challenge to the state apparatus that captured popularity among the community (Salamey 2019; Salamey and Tabar 2012).

Practically, the rise of Hezbollah in the 1980s and its expansion throughout the 1990s signified a turning point in Lebanese and regional politics. Not only did this phenomenon coincide with the collapse of the Soviet Union and the end of left-opposition discourse in the region but also signaled the beginning of an overarching transnational communitarian paradigm challenging Arab and Lebanese nationalism.

The Double Movement and Hezbollah's Communitarianism

Two major coinciding and interdependent historic developments can explain modern communitarianism. The first is an intensification of globalization that featured the integration of post-Soviet states with the rest of the democratic world through ultra-capitalist expansionism. Liberal views describe the phenomenon as a third wave of democracy (Huntington 1991). It features a movement of many states toward capitalism while global economy being revolutionized by modern communication technology with production, investment, and commerce flooding Third World markets. Second, and consequently, a phenomenal decline of nation states undermined states' relevancy in the protection of their own productive forces: bourgeois and labor alike. Liberal literature characterizes this development as a decline in state's sovereignty and independence (Axtmann 2004). Evidently, international laws regulating the world economy and trade removed essential states' barriers and undermined the ability of underdeveloped nations to stand against global capital, particularly those centered in industrial nations. The national bourgeoisies, long considered protectionists, were turning into cronies (such as the case of Egypt, Tunisia, Syria, and Yemen).

However, globalization's interconnectedness of countries and its exposure of Third World national economies to a vicious and predatory ultra-imperialism incited transnational communitarian resistance and region-wide protectionism. By the turn of the twenty-first century, national debts brought many world's nation states to the verge of bankruptcies. By 2018, Lebanon's public debt reached 152% of the country's GDP. Thus, a Double Movement was unleashed where globalization paved the way for market integration and deterritorialization, on the one hand, and communitarianism mobilized groups across countries for protectionism, on the other (Salamey 2017). Most communitarian movements in the Middle East, including Hezbollah, manifest these Double Movement dialectics.

Communitarianism, inspired by the Iranian and Afghani models, claimed protectionism within local and across regional politics. On the state (Israel, Turkey, Iran, Saudi Arabia) as well as non-state level (Hezbollah, ISIS, Qaeda, Nusra, Houthies, Kurdish parties, etc.) politics turned bluntly communitarian and often transnational. The post-Arab Spring politics witnessed a spectacular rise of communitarian movements throughout the Arab region, demanding rights and empowerment (Salamey 2018).

Evidently, under intensive globalization, Hezbollah's communitarianism had many advantages to offer compared to leftist and national bourgeois parties. In contrast to nationalism, its communitarianism has been rooted in primordial cultural bonds rather than disputed modern territorial, and largely colonial, national constructs. Such affiliation has moved beyond class emancipation that was promised by leftist ideologies. The common destiny that binds the community together is extracted from centuries old of unbroken history, compared to a highly contested modern national or class consciousness. In Hezbollah's narrative, it began throughout Shia plight for justice against universal subjugation and inspired by Imam Hussein's martyrdom (680 AC). The oppression against the community that was carried out by successive "false Islamic" rules, mostly Sunni, has been extended to contemporary times through colonial and imperialist Western-backed regimes. The community has been entrenched in an existential struggle, threatening its entirety with collective prosecution and extermination. Thus, Hezbollah's community is expanded beyond the confinement of national boundaries or class economy to express a holistic inclusion of all its productive forces being attached by a common destiny everywhere (Hezbollah 1985). An irredentist ideology evokes historic rights to restore justice through a "cultural-identitarian" political movement (Elsenhans et al. 2015).

Therefore, Hezbollah established itself as a protectionist for Lebanese Shiites, not only in confronting external threats and global dominance but also in containing domestic rivalry presented by competing communitarian groups, Sunnis and Maronites alike. Communitarian struggle in the

Lebanese context is projected as existentialist, and the stakes in the confessional politics are heightened on the account of national or class consciousness. Despite the limited and short-lived experiences of secular and cross-confessional worker unions and syndicate organizations during the 1960s and 1970s, intra-class competition has consolidated the fragmentation of the working and middle classes along confessional loyalties. This rapture has been interlocked by competition for jobs and services. Hezbollah along the Amal Movement have, thus, provided the Shiite community with means to assert own interests in the confessional bargain and, ultimately, to be charged with an unprecedented level of empowerment (Salamey and Tabar 2012).

Distinct from most nationalist and socialist political practices, the party awaited neither reform nor the capture of the state's institutions to act on its promises. Since inception, it enforced its program within the practices of own community and among followers, thus acting as a state within the state in proximity to a dual power arrangement (Sharara 2008). It ran a voluntary communitarian economic networks that relied on local Islamic informal Shiite system of taxation (Al-Zakat and Al-Khums) that collects approximately one-fifth of individual income. Charitable and religious services constituted additional sources of income. Activities, tied to the formal economy, established and managed by the party, were expanded to include construction, community services, education, medical, security, investment, commerce, banking, telecommunication, and housing sectors. Illicit economic operations incurred important revenue directly benefiting the community while being protected and facilitated by the party. In addition to the harvesting and exporting of hashish, these activities included cross-border transactions such as the smuggling of weapons, oil, drugs, food, and merchandize as well as money laundering. A comprehensive communitarian governance system complements economic activities to include a political, judicial, and enforcement institutions (Salamey and Pearson 2007).

In short, a communitarian economy, or what can be labeled as "economunitarianism," captures the modes of activities immersed within the community. Religiously rooted traditions of taxation, as well as funds gathered through donations and nongovernmental organizations, financial institutions, semiformal as well as nonformal and illicit economic activities, cross-border transnational networks, and conglomerated sectarian trading zones, are among the variety of functions consolidating the foundations of a welfare-based communitarian economy, thriving on rentierism (Salamey 2017).

Globalization further enhanced the party's ability to maneuver national boundaries and expand the strategic relevance of the community across countries. It provided the party with unprecedented access to technology, communication networks, and financial markets. Technological advancements expedited its capacity to utilize sea, air, and land transportation systems. The liberalization of global markets, despite US sanctions, undermined restrictions and loosened scrutiny against its financial operations – including cash transfer.

Regional interconnectedness elevated its security relevance in the contestation of power. In addition to liberating Lebanon from occupation, the party's historic armed resistance against Israel has served multiple strategic purposes. It placed the party among the favorable proxies to both Syria and Iran. Backed by local Shiite community and relying on a low military budget, it demonstrated effectiveness in asymmetric warfare against Israel, the region's most advanced and equipped army. Following Hezbollah's well-orchestrated and organized military operations, in 2000, Israel was forced to end a 25-year occupation of the predominantly Shia Southern Lebanese territory. The victory strengthened Shiite's domestic advantages, restored Syrian influence, and invited Iran to play a prominent role in the country's balance of power.

Yet, in 2006, Hezbollah demonstrated another strategic depth during a renewed conflict with Israel. It bombarded Israel's northern borders with short- and medium-range missiles, forcing hundreds of thousands of Israelis to flee. The confrontation elevated the potential of the party to prove relevant in any regional showdown, particularly in a hypothetical Israeli-Iranian conflict.

Since then, Iranian financial and military support to the party has intensified to include advanced precision and long-range missile systems (Kenner 2018).

Hezbollah's regional depth continued to deepen while playing a central role in strengthening Shiite alliance across the region. In 2012, it was called for the rescue of Syrian President Bashar Al-Assad who was threatened by an armed Sunni Islamist insurgency. Hezbollah responded by sending waves of fighters across the borders to help defeat the armed opposition and restore the well-being of the largely Alawi regime (The Alawi is a subsect of Shiism and controls major military and power posts in Syria, including the Presidency.). In coordination with the Iranian, Syrian, and Russian military forces, Hezbollah's fighters demonstrated a stunning success that awarded them strategic role and increasing Iranian support. The party is also believed to have extended logistic and training assistance to Shia fighting groups in Iraq and Yemen.

Whether Hezbollah's Communitarianism Is Anti-imperialist

Leninist conceptualization of anti-imperialism deviates from those offered by Hezbollah's Communitarianism. Important traits assert the party's anti-imperialism in the age of globalization. To begin, it has successfully staged a liberation movement against foreign Israeli occupation and as part of a region-wide resistance rejecting foreign imposition. It promoted itself as the party of the oppressed fighting the US-Israeli alliance, accused of attempting to dominate and subjugate the region against the interests of the local inhabitants. It vowed to continue the struggle until achieving the full liberation of Palestine from Zionist occupation. Its social welfare network, financed by local and diaspora contributions as well as Iranian foreign backing, provided a safety net for the poor amid degenerated state services (Hezbollah runs a pseudo rentier economy, where its areas of control are "deregulated" and turned informal while receiving social services in return for support). In this sense, it laid the foundations

of a dual power, where the community appeared relatively independent from state's apparatus and jurisdictions (Salamey and Pearson 2007). Also, the party's clerical and populist orientation helped establish and complement a socioeconomic solidarity or "economunitarianism" that diffused the rigidity of strict class stratification, typical of most industrial societies. A mutuality of class interests provided through a protectionism role offered to both local bourgeois and labor within the framework of communitarianism. Thus, while the party helped improve the Shiite bourgeois position in the confessional share of national market and state power, it offered the working class and the poor a protective umbrella against state and global capitalist incursions deemed harmful to lower classes. This duality was demonstrated in its activities throughout post-2005 Syrian pullout from Lebanon where it played a pivotal role in restructuring the Lebanese confessional balance of power in favor of Shiite's elite. At the same time, it rejected the state's privatization and regulations that aimed to strengthen capitalist economy, often imposed by the World Bank and conditioned by local and international lending institutions (Salamey and Pearson 2007).

For these reasons, Hezbollah shares important attributes with "progressive" nationalist movements in the Middle East that were characterized as anti-imperialists (Nasserism and Baathism). Its communitarian solidarity for self-preservation echoes national unification and self-determination. Nonetheless, distinctions differentiate its communitarianism from those that called for the defense of the fatherland. Its irredentism defies territoriality and evokes a wider regional and global movement opposing imperialism.

Limitations to the party's anti-imperialism echo those of "progressive" nationalists. The party, after all, is not an anti-capitalist party nor does it aim to end the monopoly of global capitalism. It is rather a Shiite Jihadi party committed to the doctrine of Velayat-e Faqih and Islamic justice. It tolerates no otherworld religious views, including what could be its own Shia deviations. Despite tactical alliances formed with non-Shiites, it ultimately seeks the primacy of its own sect. Hence, Hezbollah's Shiism is like nationalism,

confined to a community of adherents with evi-
dent chauvinism. Such a characteristic contributes
to the consolidation of communitarian false class
consciousness and undermines the unity of the
poor across divides. Thus, when the Arab Spring
against autocratic rules culminated in a Sunni
Islamists' empowerment across the different Arab
countries, Hezbollah stood critical and dispatched
its own fighters against Syrian Islamist opposition
groups. The party even praised Russian military
intervention and joined the Iraqi-Syrian-Iranian-
Russian defense alliance to crush Syrian Sunni
Islamists.

But major deviation from nationalism lies in
Hezbollah's social indoctrination. From a leftist or
a liberal perspective, it stands for ultraconservatism.
Not only in its gender outlooks but in its entire
religious indoctrination that submits to supernat-
ural forces and cultist collectivism while rejecting
liberal individualism and social egalitarianism.
Having abandoned the immediate demand for an
Islamic State, it has continued to oppose state
secularism and flex its maximum tolerance to co-
opting with Lebanese multi-confessional state
(Hezbollah 2009).

Beyond its conservative ideological complex,
the regional political economy deconstructs the
party's anti-imperialism. Hezbollah is tied to the
Iranian Revolutionary Guard and commanded by
the Supreme Leader Ayatollah Khamenei through
a Velayat-e Faqih regime. Though it projects Shi-
ite empowerment on regional level, the Guards'
fundamental role is to protect the Islamic Revolu-
tion of Iran. As previously discussed, Hezbollah's
communitarianism has presented a mutuality
between Lebanese and Iranian Shiism on a strate-
gic as well as political levels. But the expansion of
Iranian power in the region has been essentially
linked to its efforts to secure an important share of
the world oil market. Its rivalry for regional dom-
inance with oil-rich Saudi Arabia has been a major
driver of conflict, thus further awaking and deep-
ening Shia-Sunni feuds. Hezbollah has joined this
struggle in confronting and undermining Saudi
influence mostly in Lebanon and Syria. From
this perspective, the Iranian plight for the share
of the oil market, to supply advanced capitalist

industrial states, detaches Hezbollah from a fun-
damental anti-imperialism discourse.

Prospects of Communitarian Anti-imperialism in the Age of Globalization

In summation, globalization's Double Movement
has simultaneously unleashed two political forces
with each aiming to reconstruct post-Soviet global
order: one that seeks the integration of economic
markets and political systems (mostly global
financial and capitalist institutions centered in
the North) and another that sets in motion a trans-
national communitarian power contestation
(mostly regional powers along associated non-
state militant groups in the South). The first
searches for the deconstruction of market barriers
and the universalization of global regulations, and
the second mobilizes associations and alliances
across borders to assert respective power rele-
vance and protect own resources. As globalization
advances, the world appears as a union of com-
munitarian associations brought together by mul-
tiple constructs that encompass interests beyond
territoriality. While the EU represents an early
manifestation of an economic conglomeration in
the North, various communitarian associations
have been brought together by primordialism
across Southern nations. In the MENA region,
communitarianism expresses transnational pri-
mordial affiliations while being polarized along
sectarian Sunni-Shia camps and led by regional
powers (Saudi Arabia, Iran, and Turkey) but also
along ethnic, provisional, and tribal lines
(Salamey 2018). Major regional states, such as
Iran, Turkey, and Saudi Arabia, have attempted
to improve their respective global relevance by
expanding their power along transnational com-
munitarian trajectories.

Following the collapse of the Soviet Union,
sectarian-communitarianists in the Third World,
such as Hezbollah, have come to dominate the
political arena, some posing as viable alterna-
tives to communists and nationalists in rejecting
imperialism. The rise of Hezbollah, formed on
the eve of collapsing Soviet Union, represented a

direct challenge to Lebanese nationalism, the Left movement, and the Israeli occupation and captured the complexity of new communitarianism. Despite distinctiveness and multiple military successes in resisting foreign occupation and in opposing the dictation of world financial institutions, Hezbollah's experience attests to the fact that it has aimed to improve communitarian power position on the national and regional levels.

Like nationalism, Middle Eastern communitarianism invites divergent assessments over its transitional and anti-imperialist orientations. Evidently, by altering and restructuring the MENA regional spheres of influence, it presents a revisionist movement against the twentieth century's postcolonial order. By mobilizing the community against historic subjugation, it displays anti-imperialism and liberation tendencies. Yet, its political economy seems to synchronize with rather than to antagonize global capitalism. Regional resource-supplying states (Saudi Arabia and Iran) aim, through regional communitarian mobilizations, to improve their respective bargain in the demand-side market. Oil- supplying states thrive on the well-being of industrial capitalism. Undoubtedly, industrial states help infuriate contradictions and competition among suppliers to maintain open access to resources and control of prices. There are also aspects of compradorialism where communitarianism provides intermediary states with strategic role relevant to global powers (Turkey and Israel). Thus, while communitarianism rises to provide stronger protectionism compared to those offered by territorial nationalism, its primary purpose is to improve own stands in the global capitalist economy.

This analysis suggests that Middle Eastern communitarianism, particularly its revisionist type (Shiite), reduces class contradictions in the context of a rent-based welfare economy. However, at no point does it help formulate a class consciousness or spark an anti-imperialist transitional revolution of the Leninist type. Under communitarianism, the ability of the proletariat to establish an independent anti-imperialist movement is significantly curtailed.

History, Transnational Connections, and Anti-imperial Intentions: The League Against Imperialism and for National Independence (1927–1937)

Fredrik Petersson
History, Åbo Akademi University, Turku, Finland

Definition

The text summarizes the scope and scale of the League against Imperialism's (LAI, 1927–1937) transnational and global ambitions of becoming a stern petitioner against colonialism and imperialism. Established in 1927 at the "First International Congress against Colonialism and Imperialism" in Brussels (10–14 February), the LAI immediately earned an international reputation; however, the trajectory and development of the organization was one that faced several internal and external organizational and ideological turns throughout its existence. This article aims at discussing these dimensions of the LAI.

The League Against Imperialism and for National Independence (LAI) was established at the "First International Congress Against Imperialism and Colonialism" in Brussels on 10–14 February 1927. This essay about it is based on my doctoral dissertation and book (Petersson 2013). The Congress was attended by 174 delegates from 34 countries, representing 134 organizations, associations, or political parties.

On 13 February, the German communist and member of the German Reichstag Willi Münzenberg (1889–1940), the prime mover and

organizational force behind the Brussels Congress, stated that "[O]ur congress requires no director [...] All parties and organizations, through the participation of their delegations and representatives, have unanimously agreed upon the establishment of a World League against Imperialism" (Munzenberg 1928, pp. 4–10). This corresponded with Münzenberg's vision of gathering "prominent" left-wing trade union and social-democratic leaders, bourgeois radicals, pacifists, and intellectuals, to stand side by side with "liberal radical elements in the imperialist countries" and colonial delegates.

Participating at the congress were several characters who later assumed leading positions in the decolonization process in the colonies after the Second World War: Jawaharlal Nehru as delegate of the Indian National Congress, the Indonesian Mohammad Hatta of Perhimpunan Indonesia, and Reginald Bridgeman, British socialist and devoted advocate of anti-colonial and pacifist ideals. Other well-known characters in Brussels were trade unionist Edo Fimmen from the Netherlands, Josiah T. Gumede from South Africa, and delegate of the African National Congress and the Senegalese delegate of the French-based Committee in Defence of the Negro Race Lamine Senghor. While Albert Einstein supported the foundation of the LAI and was appointed a member of its Honorary Presidium in Brussels, Mahatma K. Gandhi politely declined to get involved, informing the Hungarian communist Laszlo Dobos, Münzenberg's right-hand-man in preparing the congress, that this anti-colonial movement brings "a certain fright".

The Communist International, Anti-imperialism, and the Road to Brussels

The original plan for the congress had been set in motion by Münzenberg in 1925 during the proletarian solidarity campaign Hands Off China in Germany. The process leading to establishment of the LAI and the euphoric anti-imperialist demonstration in Brussels 1927 was complex, involving the moral consent and material support of the principal provider: the Communist International (Comintern, Third International, 1919–1943) in Moscow. The relationship between the LAI and the Comintern determined the decisions and activities of the organization throughout its existence from 1927–1937. The LAI was the result of the Comintern's aspirations to find a path to the colonies. After the Bolsheviks seized power in Russia in October 1917, and once the Comintern had been established in the shape of a "world party" in Petrograd (3–7 March 1919), the colonial question represented an enigma that haunted the international communist movement. Regardless of the colonial disorder that had erupted on a global scale in connection with the peace negotiations at Versailles in 1919 (concerning Egypt, India, China, and Korea, for example), the symbolism of US president Woodrow Wilson's message of national self-determination and independence was not enough to curb the desire of anti-colonial activists residing in or visiting Europe. The prospect looked promising for the Comintern to assume authority over the colonial question, however, and despite several attempts to address it (e.g., the Lenin–Roy debate at the Second International Comintern Congress in Moscow, 19 July–7 August 1920), the "First Congress of the Peoples of the East" in Baku (September 1920), the Sino-Soviet collaboration between Sun Yet-sen's Kuomintang and Chinese communists in China, frequent obstructions or difficulties contributed to keeping the Bolsheviks and the West European communist movement out of touch with anti-colonial activists living in the colonial and semicolonial countries. Linked to this dilemma was the meticulous surveillance by national security services in monitoring communist activity in the colonies. The Comintern realized that Europe was the key for developing contacts between the communist and anti-colonial movement, especially in colonial power centers such as London, Paris, Amsterdam, and Brussels.

In 1924, Dmitri Manuilski (1883–1959), the Ukrainian communist veteran and leading

secretary in the Comintern apparatus in Moscow, conceded that the Comintern had "to win the revolutionary movements of liberation"; however, he was not capable of introducing any method to do so. Attempting to answer Manuilski's wish, the Executive Committee of the Comintern (ECCI) authorized the Indian communist Manabendra Nath Roy, by then considered the colonial expert in the Comintern, to lead the International Colonial Bureau in Paris, which aimed its activities at finding contacts with anti-colonial movements and prominent characters in France and Great Britain (Haikal 1993). The bureau turned into a futile undertaking, shaken by internal conflict and lack of resources, and when the French Sûreté deported Roy from France in January 1925, the initiative seemed to be lost.

Münzenberg is key to understanding the history of the LAI (Gross 1967; Petersson 2013). The attempts described above were failures for the Comintern to manifest the colonial question in the international communist movement, or proved its incapacity to find reliable contacts within the anti-colonial movements in Europe. Münzenberg, acting as general secretary of the communist mass organization the Internationale Arbeiterhilfe (Workers' International Relief, IAH, 1921–1935), began to address the colonial question in various public campaigns in 1925. However, in comparison to the imperialist nations in Europe (Great Britain, France, the Netherlands, and Belgium), Germany had no colonies as a consequence of the Versailles Peace Treaty in 1919. The colonial question thus filled a political field in a Germany which felt humiliated by that treaty. From 1925–1927, Münzenberg and the IAH conceived the anti-colonial project together with the decisionmakers at Comintern headquarters. In February 1927, this culminated in the Brussels Congress.

Paving the way for the congress involved staging and coordinating a number of public campaigns (relying upon the active involvement of European intellectuals) such as: Hands Off China (1925; in support of the Shanghai textile workers' striking in protest against the violence of the British mandate forces); Against the Cruelties

in Syria Committee (1925–1926; supporting the Syrian nationalist movement against the French military's bloody response); and protests against the "draconian measures of oppression" by the Dutch mandate forces in Java and Sumatra in January 1927. Münzenberg succeeded in getting prominent intellectuals across Europe (known for their engagement in pacifist, leftist, or humanitarian questions) to sign petitions and resolutions, for example: the French author Henri Barbusse, Georges Pioch, Emilie Chauvelon, Léon Werth, Albert Fournier, Helen Crawfurd, Frances Countess of Warridge, Arthur James Cook, the British socialist George Lansbury, Arthur Holitscher, Alfons Paquet, Helene Stöcker, Otto Lehmann-Russbüldt of the League for Human Rights in Germany, the German authors Ernst Toller and Eduard Fuchs, the artist John Heartfield, the manager of the left-wing theatre Weltbühne in Berlin Erwin Piscator, and the well-known communist figurehead Clara Zetkin. However, Münzenberg realized in January 1927 that the frequent use of these names made them "no longer that effective."

The central fact to explain the birth of the LAI in 1927 was Münzenberg's idea of forming the League against Colonial Oppression (Liga gegen koloniale Unterdrückung [LACO]) in Berlin at the "Rathauskeller" conference on 10 February 1926, an event which gathered 43 delegates representing anti-colonial movements in Berlin and Europe. The primary purpose of the LACO was to coordinate and prepare the Brussels Congress, something Münzenberg had been anticipating since the success of the Hands Off China campaign in Germany in 1925. The establishment of the LACO also signified Münzenberg's dependence on receiving support from the Comintern to sponsor the preparations for an international congress against imperialism and colonialism. This entailed giving the Comintern authority over the political direction of the congress and, later, the LAI. This was a task laid upon Roy in Moscow. After examining the results from the LACO conference in Berlin, Roy introduced his conclusions to the ECCI secretariat in Moscow (and later sent them to Münzenberg), stating that "the object of the League [LAI]" should be "to act as a neutral

intermediary between the Communist International and nationalist movements in the colonies" (RGASPI 542/1/3, 10–11).

Transnational Anti-imperialism and the League Against Imperialism

The Brussels Congress was Münzenberg's finale, arising from which he expected a massive demonstration against imperialism and colonialism, and recruits for communism. However, Münzenberg and the Comintern had not anticipated that the Brussels Congress would turn into such a huge political success, stirring up euphoric emotions among the participants and prompting widespread international attention in the press. The "Organisation Resolution," adopted at the Brussels Congress, had stipulated the urgency with which the LAI should develop activity on a national basis; that is, establish national sections across the world. Yet, while trying to capitalize on the heady feeling of collective joy in the LAI and the anti-imperialist movement, the principal organizers and governance behind the LAI – Münzenberg's IAH and the Comintern – were initially at a loss about what to do next. For the nerve center of the LAI, the International Secretariat in Berlin, and the individuals working there (Gibarti, the Indian nationalist revolutionary Virendranath Chattophadyaya [Chatto], and the Chinese communist Hansin Liau of the Chinese National Agency), this caused confusion due to poor communications with Comintern headquarters. With questions about the LAI's organizational structure and relation to the Comintern leaving finances and budget unresolved after the Brussels Congress, the LAI's International Secretariat nevertheless advanced the project to establish sections in Europe (Germany, Great Britain, France, the Netherlands, and Belgium), the US and Latin America, and Japan. However, it soon became evident that it was difficult to organize sections in Asia, India, and Africa. The expansive phase of the LAI came to a halt after 1927, but aside from external factors such as the Kuomintang putsch against the communists in China in April 1927, increased antagonism from the Labour and Socialist International, and scrutiny of the LAI by European national security services in 1927, the major damage was caused by the Comintern. By responding slowly and with suspicion to the magnitude of the LAI, both politically and organizationally, the Comintern's indecisive behavior in settling the organization's future direction after the Brussels Congress proved to be a serious setback.

The geographical setting of the LAI was global in scope and intent, aiming to question and criticize the system of colonialism and imperialism. Posing as an international petitioner against these systems, it was limited by the possibilities of political spaces and physical places to enact its activism. The center for the LAI was Berlin, which housed about 5,000 colonial residents and resembled a "global village" for the Comintern and communism during the inter-war years before the Nazi Party (NSDAP) assumed power in 1933. Other anti-imperialist centers of similar magnitude were few and far between. The LAI section and its secretary Reginald Bridgeman in London were under strict surveillance by MI5 and Scotland Yard and received almost no support from the Communist Party of Great Britain; the French section experienced an even more desolate situation, isolated by the Partei Communiste Francais and circumscribed by the Sûreté. The Dutch section had a promising position with Fimmen assuming a leading position, supported by Hatta's Perhimpunan Indonesia. However, the sectarian behavior and methods of the Communist Party of Holland more or less broke up the section in 1928. The US section experienced a downward spiral despite receiving support from author Upton Sinclair, Professor William Pickens of the National Association for the Advancement of Colored People (NAACP), and Roger Baldwin of the American Civil Liberties Union. Despite using New York as the center for its operations to connect with Latin America, Earl Browder, leader in the Communist Party of the USA, stated later in 1930 that the section had turned into a political space for "fascist agents." In conclusion, the British Home Office and the Colonial Office in India

managed to thwart any anti-imperialist tendencies emerging in the country after the Brussels Congress, as highlighted especially by the infamous Meerut Conspiracy Trial (1929–33).

Anti-imperial Intentions and Transformation of the League Against Imperialism

Berlin continued to function as the operative center for the LAI. The Comintern had nonetheless expressed a wish to move the LAI's International Secretariat to Paris in 1927, the "colonial metropolis" in Europe. This question developed into a dispute between Münzenberg and the Comintern, only reaching a conclusion once the Comintern acknowledged that the mooted relocation was impossible. From Berlin, the LAI developed anti-imperialist propaganda by issuing leaflets, pamphlets, and newsletters (*Pressedienst; Informationsbulletin der Liga gegen Imperialismus; The Anti-Imperialist Review; Der koloniale Freiheitskampf* to mention but a few), material intended for global circulation and perusal by the anti-imperialist movement. The LAI could not, however, avoid being caught in the ideological maelstrom of the international communist movement. This related especially to the Comintern's continuous policy shifts, reflecting the ongoing upheavals in the Soviet Union's societal and political scenery. While the LAI was established in the period known as the "united front" (the second period was termed "from above"), with the Sixth International Comintern Congress in Moscow in August 1928 the "new line" was introduced: no collaborations outside of the communist movement, a political position characterized instead by the infamous epitome "class against class." The Tenth ECCI Plenum in Moscow (3–19 July 1929) corroborated this new policy as correct, which as Comintern secretary and Finnish communist Otto W. Kuusinen explained at one of the sessions: "The united front strategy, which we used to carry out from below, we have since then no longer pursued from below, but from above. We

have through our tactic a stable position among the broad working masses, [and] in the mass movements of the proletariat" (RGASPI 495/168/120, 1–25). In 1930, Bohumíl Smeral, Czechoslovakian communist, emissary of the Comintern, and secretary at the LAI's International Secretariat in Berlin concluded that it was "unfortunate" for the LAI since it was established in the "second period." These policy shifts in the Comintern had the effect of "epileptic zigzags" on the international communist movement, stated the Catalonian communist Andreu Nín in 1928.

Smeral's pessimism was grounded in the political results and consequences of the LAI's "Second International Congress against Imperialism and Colonialism" in Frankfurt am Main (21–27 July 1929). In comparison to the Brussels Congress, the Frankfurt Congress turned into a vitriolic scene of disputes and polarization between the communist sector and noncommunist delegates. The congress was, in size, a larger event than the Brussels one, attended by 263 delegates from 31 countries and regions representing 99 organizations, and preceded by an anti-imperialist youth conference on 20 July. The sources tell of a carefully planned plot by the communists, carried out to perfection for the sole purpose of showing who was in control over both the LAI and the antiimperialist movement. The political *leitmotif* at the congress was twofold: to highlight the pending war threat against the fatherland of socialist construction (the Soviet Union); and to declare support for the Soviet Union. The effect of this scheme worked in reverse, exposing the communist nature of the LAI and leaving the organization at a loss over how to act, plunging the anti-imperialist movement into a year of confusion. After the congress, the majority of noncommunist members in the LAI Executive Committee left voluntarily (Fimmen, Nehru, Pickens, Hatta, and Baldwin). Albert Einstein (the honorary president) severed his ties after considering the LAI's attitude on the Arabic question to be anti-Semitic; whereas James Maxton, chairman of the LAI and leader of the British Independent Labour Party, was expelled by the British LAI section in September 1929. The ensuing

crisis and organizational turmoil forced the decisionmakers at Comintern headquarters to reassess the very purpose of the LAI, a process that paved the way for turning it into a hub of the anti-imperialist movement in Europe. This latter undertaking was left in the hands of the LAI's international secretary Virendranath Chattophadyaya, with a focus on finding anti-colonial activists in Berlin, London, Amsterdam, Marseilles, and Hamburg to act as vital links in the global spread of anti-imperialism.

Fields of Activity: Propaganda, Recruitment, and Education

The LAI succeeded in three particular fields: the creation of public campaigns to raise awareness of global political events; the recruitment of anti-colonial activists in Europe; and the establishment in Berlin of an educational ethos at its center for anticolonial activists who lived in Europe from 1927–1933 (Petersson 2013, 2014). First, the Meerut Conspiracy Trial was the central question for Bridgeman and the British LAI section, an operation sanctioned by Kuusinen and supervised by Münzenberg. Other campaigns involved: the political disorder in Latin America and against American imperialism; protests against the Manchurian crisis in 1931; attracting support in Europe for the defendants in the Scottsboro Trial in 1931; and developing the anti-war campaign in Germany in 1932. The latter idea resulted in the Amsterdam Anti-War Congress in August that year, and later evolved into the Amsterdam-Pleyel Movement in 1933, one of the first bodies of opposition to the Nazi regime and Hitler's rule over Germany.

The non-public side of the LAI was harder to define, but it was intended to function as a hub. This objective had been part and parcel of the Comintern's original idea in establishing an organization "to act as an intermediary" to the colonies. Chatto was the mastermind behind such activity, having at his side the active assistance of the Indian nationalist and journalist A.C.-N. Nambiar and the "Indian Bureau" in Berlin.

The latter was a subsection of the International Secretariat, established with money from Nehru's Indian National Congress (INC) in February 1929. The bureau aimed, wrote Chatto, to function as "a centre for recruiting students, for finding out the best and most reliable among them, to take up the question of sending literature and also for obtaining journals, books and other literature on India, which are not directly available without payment by the League" (RGASPI 495/19/312, 38–42). The bureau connected with other individuals of the anti-colonial community dispersed across Europe, originating from China, Japan, India, West Africa, and North Africa. Chatto advocated the use of curricular activities and academic courses on imperialism and socialism to test the "candidates"; that is, by educating anti-colonial activists in the Marxist-Leninist conception of imperialism, the LAI International Secretariat examined if these candidates were useful, reliable, or suitable to undergo further education in one of the educational units of the Comintern in Moscow (e.g., the International Lenin School, or the Kommunisticheskii universitet trudiashchikhsia Vostoka [Communist University for Eastern Workers, KUTV]).

The above constituted an essential role for the Soviet Union and its foreign policy, in which the LAI was part of a larger network, engaged in accumulating intelligence on political and social events across the world. The organizational structure of the LAI facilitated this process. Hierarchical relations determined this method, working from top to bottom, and vice versa, having the International Secretariat answer to the decisionmakers at Comintern headquarters in Moscow (the Eastern Secretariat), while the national sections were obliged to gather and send information to the International Secretariat which then passed on the documents to the Comintern in Moscow for evaluation. Chatto's work to perfect the LAI as a hub fitted this scheme perfectly, as it created a network of trusted individuals in various parts of the world. However, while national security services feared the extent of this network, in reality it was a limited and fragile structure, sensitive to external or internal disruptions.

League Against Imperialism: Dissolution and Heritage

Mustafa Haikal's study on the LAI in 1992 (the first study to use documents from the formerly secretive Comintern Archive in Moscow after its opening-up; see more below) concluded that the LAI began its "disintegrative process" at the LAI General Council in Brussels (9–11 December 1927) (Haikal 1992). First, the LAI General Council met only once; and second, the sessions focused on solving "organizational questions rather than discussing political issues," according to Münzenberg (Münzenberg 1928). The statement illustrates the LAI's inherent problems, characterized by the radical "turn to the left" at the Frankfurt Congress in 1929 which was symptomatic of how Stalinization transpired and manifested itself within the international communist movement and its "Solar System" (the national parties, the mass and sympathizing organizations). The LAI's charisma definitely vanished when the communists adopted a harsher attitude towards noncommunist members as seen publicly at the Frankfurt Congress for the first time.

However, other factors are equally relevant for explaining the LAI's downfall: its International Secretariat in Berlin was gradually isolated because of the political milieu in Weimar Germany at the start of the 1930s, and with the national sections barely able to function due to lack of resources and repression from security services, the anti-imperialist network disintegrated. Further, Chatto was summoned to Moscow in 1931, accused of having committed "political dishonesty," a case built on the charge that his Europäische Zentralkomitee der Indischen Nationalisten (an anti-British committee active in Europe, run by Chatto and Mahapragya Acharya in Berlin and Stockholm, also known as the "Berlin Committee") had cooperated with, and received money from, the German government during the First World War. The accusation deprived Chatto of his position as international secretary, and in September 1937 he was executed in Moscow.

Chatto's departure from Berlin in 1931 confirmed the sectarian tendencies that had emerged

in the LAI at the Frankfurt Congress in 1929. From this point on until the Nazi's assumed power in Germany on 30 January 1933, the LAI had to combat daily political struggles and humiliating police raids in Berlin, while the national sections barely existed on paper, aside from the British one, which focused its activities on the Meerut Trial.

With Hitler and the NSDAP gaining power after the General Election on 30 January 1933, this foreboded the end of German communism and socialism. On the night of 27 February, the end arrived with the Reichstag Fire in Berlin. However, the LAI's International Secretariat (which held its last meeting on 30 January) had prepared for the possibility of being forced to escape to Paris. In February, the German LAI functionary Allo Bayer dismantled the international secretariat and sent most of the bureau's material to Paris, but the greater part of these documents seems never to have made it across the German-French border.

By relocating the LAI's International Secretariat to Paris in March 1933, the ambition was to revive and reconstruct the anti-imperialist network. But for those involved, especially for Münzenberg (who escaped from Germany by car in the first days of March), it was no longer possible to resurrect the LAI. He requested the decisionmakers at Comintern headquarters in Moscow to remove him from the position of general secretary, and to transfer the International Secretariat to London. Osip Piatnitsky, the Russian communist and administrative key figure in the Comintern apparatus, approved Münzenberg's request in August 1933, authorizing Bridgeman to assume responsibility for the LAI International Secretariat in London. The organization Bridgeman was handed was not comparable to that of its former glories. He concluded that "it was necessary to reconstitute the work of the LAI from the beginning" (RGASPI 542/1/61, 1–43). Despite Bridgeman's socialist ethos, the LAI was still controlled by British communists (Harry Pollitt, Percy Glading, Shapurji Saklatvala) and drifted into an abyss of inactivity, managing to create a minor protest campaign on the Abyssinian crisis in 1935, and produce a

pamphlet in defense of the Chinese nationalist struggle in 1936. From 1933–1937, the LAI had London as its base; however, Bridgeman resolved to replace it with the Colonial Information Bureau (CIB) in 1937, a socialist association which publicly renounced the former communist ties of the anti-imperialist movement. Bridgeman nonetheless acknowledged the historic heritage left by the LAI:

> Since its foundation in 1927 the League against Imperialism has done consistent work in connection with the different aspects of the colonial struggle; but it is essential that we should advance from the position of a small group of people interested in the colonial struggle, seriously restricted in their activities because of their association with a 'banned organization', and activate the working class organizations and peace societies. (Saville 1984)

A similar argument was given by the president of Indonesia, Achmed Sukarno, in his introductory speech at the Afro-Asian Conference in Bandung, Indonesia (17–24 April 1955). He reminisced in nostalgic terms of how:

> Only a few decades ago it was frequently necessary to travel to other countries and even other continents before the spokesmen of our peoples could confer. I recall in this connection the Conference of the 'League Against Imperialism and Colonialism' which was held in Brussels almost thirty years ago. At that Conference, many distinguished delegates who are present here today met each other and found new strength in their fight for independence. [. . .] It was not assembled there by choice, but by necessity. (McTurnan Kahin 1956, p. 40)

The history of the LAI exposes how difficult the actors found it to create an anti-imperialist utopia, a dilemma which confirms the utopianism of communism; that is, the LAI was an expression of communism and belonged to the complex ideological and administrative system of international communism at that time. The LAI was unified by two factors: first, the ambition to create a public platform against the system of colonialism and imperialism; second, its inescapable part in a movement wanting to spread communism on a global scale. Stripped of its communist ties, the LAI resembled a business enterprise or a religious clique, unable to act due to a weak financial structure, and riven by contesting ambitions for power within its hierarchy. Its legacy was as a nostalgic

reference for the decolonization movements which emerged after the Second World War.

LAI Archives and Collections

LAI documents are located in a number of archives. The primary resource is the Comintern Archive, part of the Russian State Archive for Social and Political History (RGASPI) in Moscow. The LAI has a special *fond* (collection) in the archive containing approximately 100 files (resolutions, reports, correspondence, drafts, budgets and calculations, lists of members and attendance at conferences, congresses, meetings). Since the Comintern was itself an organization (with links to other mass and sympathizing organizations of the communist movement, comprising numerous governing and institutional bodies), documents on the LAI are located in both vertical and horizontal horizons in the Comintern Archive. The Stiftung Archiv der Parteien und Massenorganisationen der DDR im Bundesarchiv (SAPMO BA-ZPA) in Lichterfelde, Berlin, contains a number of sources on the LAI, principally documents of the Kommunistische Partei Deutschland (KPD), reports of police surveillance on Berlin's communist habitat, press clippings, and memoirs. The National Archive in Kew Gardens, London, illustrates how the British security service monitored the activities of the LAI in Great Britain and the British colonies. This involved an exchange of intelligence between national security services (Germany, the Netherlands, and France), as well as building up a vast quantity of personal dossiers on individuals tied to the LAI (Münzenberg, Gibarti, David Petrovsky, Chatto, to mention but a few). The Internationaal Instituut voor Sociale Geschiedenis (IISG) in Amsterdam has an LAI collection, consisting primarily of the LAI's publications and congress material, material which gives a good insight into LAI's public side. Some documents on the LAI are located in the Stockholm City Archive, material which adds depth to the organization's political campaigns. The published documents (resolutions, congress manifesto, speeches, and greetings) from the Brussels Congress, gathered

H

together as Das *Flammenzeichen vom Palais Egmont. Offizielles Protokoll des Kongresses gegen koloniale Unterdrückung und Imperialismus Brüssel* and issued under Gibarti's editorship, and distributed by Münzenberg's publishing company Neuer Deutscher Verlag in June 1927, still stands out as an exceptional eyewitness account that captures the conviction and euphoria among the individuals attending the congress.

Definition/Description

Ho Chi Minh was the leader in the Vietnamese struggle for national liberation from the French and U.S. forces and was instrumental in the country's independence and efforts to transition to socialism. As a Third Internationalist, Ho Chi Minh gained support from the Soviet Union in Vietnam's liberation struggle from the French in 1954 and then the American imperialists. While he did not live to see the Vietnam's independence from the Americans, Ho is viewed as the primary leader in the country's national liberation.

Overview

Ho Chi Minh – also known as Nguyen Sinh Cung, Nguyen Tat Thanh, and Nguyen Ai Quoc – was the central figure in the Vietnamese struggle for national liberation in the twentieth century. He was born in Nghe An province in central Vietnam on 19 May 1890. His father, who passed the Mandarin exams after three attempts but passed up the opportunity to be a royal bureaucrat, taught him the Chinese script. Forced to stop his formal schooling when he was accused of participating in a peasant strike, Ho signed on as a mess boy on a French ship and left Vietnam in 1911. As a mess boy, cook, and crew member on various vessels, he visited, among other places, New York, London, Paris, Algeria, Tunisia, and Senegal over the next few years. His first significant political act was presenting the 'Petition of the Annamese Nation' to the Versailles Peace Conference in Paris in 1919. But by his own account, the transformative event in his life took place in 1920, when he came across Lenin's 'Theses on the National and Colonial Questions'. This touched off a remarkable career in the international communist movement. He was one of the founders of the French Communist Party, and he went on to serve in several countries, particularly in China, as an operative of the Third International that was set up to assist revolutionary struggles globally.

In 1930, he chaired the conference that unified the different Vietnamese communist organisations in Hong Kong. There followed a number of years where he was side-lined and assigned to Moscow, probably owing to differences with the then prevailing line of 'Third Period Line' of the International, which placed equal emphasis on opposing imperialism and carrying out the domestic class struggle. This line, Ho apparently felt, undermined the creation of the broad nationalist front that was needed to break French colonial rule.

With fascism on the rise in Europe, the Communist International abandoned the Third Period line in favour of a strategy of forming broad 'Popular Fronts'. This paved the way for Ho's return to Asia in 1939 and, in 1941, to Vietnam, where he chaired the Eighth Congress of the Indochinese Communist Party, which sought to create the broadest national united front against imperialism and fascism. From thereon his leadership of the revolution was undisputed.

In August 1945, the Communist Party launched a general insurrection to seize power, and on 2 September he read the country's Declaration of Independence from French colonial rule in Hanoi's Ba Dinh Square. Ho tried to negotiate France's peaceful withdrawal from Vietnam, but when this failed, he led a nine-year struggle that culminated in the cataclysmic French defeat at Dien Bien Phu in 1954. At the Geneva Conference in 1954, Vietnam was temporarily partitioned into two zones that would be united after national elections 2 years later, which Ho was expected to win handily.

When the US went back on the agreement and set up the government of South Vietnam, 20 more years of warfare ensued, which ended with Washington's total defeat in 1975. Ho did not, however, live to see final victory and the country's reunification, passing away on 2 September 1969. But he never wavered in his confidence that Vietnam would be unified. This defiant mood was captured in the statement he issued as the US stepped up its bombing and prepared to send more troops to Vietnam in 1966: 'The US imperialists can send to this country 500,000 troops or more ... The war can go on for five years, ten years, twenty years or more. Hanoi, Haiphong,

H

and a number of towns and enterprises can be destroyed. But the Vietnamese people are in no way frightened! Nothing is more precious than independence and freedom. When the day of victory comes, we will rebuild our country and make it more beautiful and more magnificent' (quoted in Vo Nguyen Giap 2011, p. 42).

Legend

Ho Chi Minh was a legend in his time, and like all legends, he manifested a variety of personae to people who worked with him, met him, or studied him. To the Soviet premier Nikita Khrushchev, Ho was a living 'saint of communism':

> I have met many people in the course of my political career, but none has made such a particular impression on me. Believers often talk of the Apostles. Well, through his way of living and his influence over his peers, Ho Chi Minh was exactly comparable to these 'holy apostles'. An apostle of the Revolution. I will never forget that gleam of purity and sincerity in his eyes. His sincerity was that of an incorruptible communist and his purity that of a man totally devoted to his cause, in his principles and in his actions. (quoted in Brocheux 2007, p. 144)

In contrast, for Sophie Quinn-Judge (author of the best study of Ho's activities from 1919–41), although Ho was motivated 'by sincere patriotism and a deep resentment of French imperialism':

> He was not some sort of communist holy man. He lived with women at various times, made compromises and infiltrated other nationalist parties. He was not always straightforward – in many situations he would have regarded it foolhardy to be honest about his political beliefs. The depth of his attachment to communism is difficult to gauge – the one thing one can say is that he had little interest in dogma. The path he followed was often chosen from a range of options narrowed by events outside his control. (Quinn-Judge 2002, p. 256)

Ruth Fischer, a contemporary and colleague in the Communist International, offers yet another view, more nuanced than those of Khrushchev and Quinn-Judge:

> Amid these seasoned revolutionaries and rigid intellectuals, he struck a delightful note of goodness and simplicity. He seemed to stand for mere common

decency – though he was cleverer than he let on – and it was his well-earned good name which saved him from being caught up in internal conflicts. Also, he was temperamentally far more inclined strongly toward action than toward doctrinal debates. He was always an empiricist within the movement. But none of this detracted from his colleagues' regard for him, and his prestige was considerable. (quoted in Lacouture 1968, p. 44)

The Man of Action as Writer

The man of action *par excellence*, Ho nevertheless did a lot of writing and thinking. He was, for instance, quite a skilled propagandist. His short piece on lynching, which he subtitled 'A Little Known Aspect of American Civilisation', written in 1924, has lost none of its immediacy and power over 80 years later, and a great part of the reason is his command of irony and sarcasm:

> Imagine a furious horde. Fists clenched, eyes bloodshot, mouths foaming, yells, insults, curses . . . . This horde is transported with the wild delight of a crime to be committed without risk. They are armed with sticks, torches, revolvers, ropes, knives, scissors, vitriol, daggers, in a word with all that can be used to kill or wound.
>
> Imagine in this human sea a flotsam of black flesh pushed about, beaten, trampled underfoot, torn, slashed, insulted, tossed hither and thither, bloodstained, dead . . ..
>
> In a wave of hatred and bestiality, the lynchers drag the Black to a wood or to a public place. They tie him to a tree, pour kerosene over him, cover him with inflammable material. While waiting for the fire to be kindled, they smash his teeth, one by one. Then they gouge out his eyes. Little tufts of crinkly hair are torn from his head, carrying away with them bits of skin, baring a bloody skull . . ..
>
> 'Popular justice' as they say over there, has been done. Calmed down, the crowds congratulate the organizers, then stream away slowly and cheerfully, as if after a feast, making appointments with one another for the next time.
>
> While on the ground, stinking of fat and smoke, a black head, mutilated roasted, deformed, grins horribly and seems to ask the setting sun, 'Is this civilization?' (Ho 1969 [1929], pp. 20–21)

Though Ho wrote a lot, theoretical innovation was not his forte. This was something he readily admitted. In fact, Ho is rumoured to have said not without sarcasm, that he did not need to

write since Mao Zedong had written all that needed to be written (Masina 1960, p. 18).[1]

So why read Ho? Well, not so much to encounter theoretical originality but to experience how a committed revolutionary with an agile mind sought to translate the concepts and ideas he was coming across as an international activist in Marxist-Leninist circles into the strategy, tactics, and organisation that would successfully liberate a colonised country in the first half of the twentieth century, defeating in the process two empires: France and the United States. As we read him, we witness a creative collision of Marxism with colonial realities, resulting in the innovative modification of a paradigm of class and class conflict originating in Europe as it migrated to Asia.

The Young Ho

Ho came to political maturity in the turbulent era unleashed by the First World War. For almost a decade after 1911, the year he left Vietnam, he was mostly at sea as a ship's cook or mess boy, visiting different parts of the world, including New York and London, before finally settling in Paris for a few years beginning in 1919. An activist for Vietnam's freedom from the very beginning, he first drew attention while lobbying foreign delegations for Vietnam's freedom during the Versailles Conference of 1919. Like many other representatives of colonised nations, he was drawn to the gathering by President Woodrow Wilson's promise of self-determination for subjugated nationalities.

The young Ho or Nguyen Ai Quoc, as he was known then, was not shy about expressing the primacy of the struggle against colonialism as a criterion in determining whom he would work with. At the historic Tours Congress where the French Socialist Party voted to join the triumphant Russian Bolsheviks' Third International, Ho intervened on the floor, saying, 'The Socialist Party must act effectively in favour of the oppressed natives . . .. We shall see in the Socialist Party's joining the Third International the promise that from now on it will attach to the colonial questions the importance they deserve'.

What distinguished Ho from other nationalists and colonial revolutionaries, according to the noted French war correspondent Bernard Fall, was that while he was passionately committed to Vietnamese independence, he understood that Vietnam's status as a colonial country was 'typical of the whole colonial system' (quoted in Fall 1967: vi). He felt a strong affinity with other peoples caught in the same web of systemic oppression and all his life he held the conviction that liberation had to be not only national but universal. His 'Report on the National and Colonial Questions at the Fifth Congress of the Communist International' (Text 13) was not only a comprehensive description of the system of French colonialism but an angry statement of solidarity with Arabs, Africans, and Pacific peoples who were under French rule. For Ho, the national question was intimately tied to the class question.

Ho's worldview was shaped not only by his youthful experience as the son of an impoverished teacher who chose not to serve as a bureaucrat in France's client kingdom, but also by his class status as a coloured person eking out a living for almost a decade as a messboy on ships plying international routes. There are few workplaces more international in their labour force than ocean-going vessels, and this experience of common hardship with co-workers of all colours could not have failed to be a factor in his embrace of Marxism.

The Encounter with Lenin

The key link to Ho's socialist future was Lenin. Here it is worth quoting Ho's road-to-Damascus experience that he recounted in an essay entitled 'The Path which Led to Leninism' (Text 42):

> What I wanted most to know – and what was not debated in the meetings – was: which International sided with the peoples of the colonial countries?
>
> I raised this question – the most important for me – at a meeting. Some comrades answered: it was the Third, not the Second International. One gave me to read Lenin's 'Theses on the National and Colonial Questions' printed in *L'Humanité*.

> In those Theses, there were political terms that were difficult to understand. But by reading them again and again finally I was able to grasp the essential part. What emotion, enthusiasm, enlightenment, and confidence they communicated to me! I wept for joy. Sitting by myself in my room, I would shout as if I were addressing large crowds: 'Dear martyr compatriots! This is what we need, this is our path to liberation!'

Lenin's 'Theses' was probably the most significant document produced by the Third International. It was there that the Russian revolutionary leader made three key points that were to be central in the formulation of the strategies of the Vietnamese and other Asian communist parties later on. First, the 'cornerstone of the Communist International's national and colonial policy must be the uniting of the proletarian and working masses of all nations and countries in a joint revolutionary struggle for the overthrow of the landowners and the bourgeoisie. Only such a union can guarantee the victory over capitalism without which it is impossible to suppress national inequality and oppression' (Lenin 1974, p. 279).

Second was the 'necessity of supporting the peasant movement in backward countries against the landowners, against the possession of large estates, against all customs and remnants of feudalism, and of striving to give the peasant movement a revolutionary nature, bringing about a closer union between the West European Communist proletariat and the revolutionary movement of the peasants in the east, the colonies, and in the backward countries in general . . .' (ibid.).

Third, the immediate task with respect to the colonies and oppressed countries was to support the bourgeois democratic national movements in the colonies and backward countries – though this should be 'only on the condition that the elements of the future proletarian parties. should be grouped and educated in the knowledge of their special tasks – those of a struggle against the bourgeois democratic movement within their nation' (1974, p. 282). The socialist revolution would come later.

These theses, which might seem non-controversial today, were of momentous significance when they were first articulated.

The first point addressed head-on the neglect of the colonial question which was, in fact, prevalent among European progressives in the inter-war period. During the Fifth Congress of the Comintern in 1925, a frustrated Ho carried Lenin's argument one step further, affirming that, without decisively dealing with the colonial question, socialists could not expect successful revolution in the West.

> You must excuse my frankness, but I cannot help but observe that the speeches by comrades from the mother countries give me the impression that they wish to kill a snake by stepping on its tail. You all know today the poison and life energy of the capitalist snake is concentrated more in the colonies than in the mother countries. ... Yet in our discussion of the revolution, you neglect to talk about the colonies. ... Why do you neglect the colonies, while capitalism uses them to support itself, defend itself, and fight you? (Nguyen Ai Quoc 1974, p. 309)

The second point, on the revolutionary potential of the peasantry in the colonies, was also something that tended to be slighted. This was not simply because of the socialists' preoccupation with the leading role of the European working class in the world revolution – which was still expected to be ignited in the developed capitalist countries. It was also because of classical Marxism's disdain for the peasantry, as expressed in Marx's comment about the 'idiocy of rural life' and his comparing peasants to a 'sack of potatoes' in terms of their capacity for political organisation.

The third proposition was what most attracted Ho. It was also the idea that would elicit the most controversy in the history of the Communist International. This thesis eventually came to be known as the 'two-stage' theory of revolution. It was, from one perspective, simply an effort to formalise the Russian revolutionary experience in 1917 – which began with the February democratic revolution and was followed by the October socialist revolution – to serve as a strategy for progressives in the 'backward societies', with one key modification being that the first stage would not only be a struggle for democratic rights but for national independence.

Theoretical and Political Tensions

Lenin's two-stage formulation became the foundation of Ho's strategy for liberating Vietnam. Looking back at the development of the strategy almost 30 years after the founding of the Indochinese Communist Party, Ho recounted in his 1959 'Report on the Draft Amended Constitution' (Text 40):

> In Vietnam following World War I, the national bourgeoisie and the petty bourgeoisie were unable to lead the movement for national liberation to success. The Vietnamese working class, in the light of the October Revolution, charted the course of the Vietnamese revolution. In 1930, the Indochinese Communist Party, the political party of the working class, was founded and showed that the Vietnamese revolution should go through two stages: the national democratic revolution and the socialist revolution.

The reality was, however, more complex. The two-stage theory, in fact, bedevilled the Third International and Communists in the East with several tactical controversies. One was how the revolutionary party would relate to its non-Communists allies, especially the 'national bourgeoisie' and pro-independence elements of the landlord class, during the struggle for independence. Another was what would be the main demands of the 'national democratic' stage, especially in regards to the land issue.

These were theoretical questions with great practical import, the resolution to which, Ho realised, would have a great bearing on the outcome of the revolution in the colonies. In his 'Reports on Tonkin, Annam, and Cochin China' to the Executive Committee of the Communist International, Ho – writing then under the name of Nguyen Ai Quoc – asserted that in Vietnam, 'the class struggle does not occur in the same manner as in the West (cited in Song Thanh 2012, p. 103). 'During the period when the Nghe-An Soviets were being organized, Ho's attitude was somewhat ambiguous. While he most certainly did not approve of the action taken he took no steps to stop it. During a Thought Reform course in 1953, it was disclosed that Ho had voted against the solution calling for a peasant rising,

but he was in a minority of one and submitted to the will of the majority. Whatever the truth there is no doubt that this was the first occasion on which Ho lost control of the movement under his charge' (McAlister 1969, p. 94). 'Nationalism', he asserted, 'was the great motivating force' (ibid.). In another piece based on his lectures to Vietnamese cadres in Guangzhou, he wrote, 'The workers and peasants are the masters of the revolution . . . are its root . . . while the students, the small traders and landowners, who are also heavily oppressed by the capitalists, even though not as heavily as the workers and peasants, are the revolutionary friends of the latter' (cited in Song Thanh, 2012, p. 109). According to later interpreters such as Song Thanh, these comments indicated that Ho had early on placed the emphasis on a united front of classes against imperialism in the 'bourgeois democratic revolution', in contrast to the position that the domestic class struggle must be given equal priority: 'Starting from the reality of a colonial country, he does not consider that these tasks must be necessarily carried out at the same time, in the same manner, but gives priority to the anti-imperialist task, for national liberation whereas the anti-feudal task, to distribute land to the tillers, will be realized gradually' (2012, p. 113).

It was the Chinese cockpit that provided the grist for the mill for the different sides in the debate on strategy and tactics for the colonial and semi-colonial world. In China, application of the two-stage approach under the direction of the Comintern translated into the Chinese Communist Party's support for the Nationalists or Kuomintang. This was not just a case of forming an alliance with the Kuomintang, but of helping to build the latter organisationally and militarily. The policy ended in a debacle in 1927, when Chiang Kai- Shek turned on the Communists and massacred large numbers of them.

Ho was working for the Comintern in Canton from 1924–27, so he was familiar with the fatal dynamics of the Nationalist- Communist 'United Front'. By the time he was sent by the Comintern to Hong Kong to unify the Vietnamese Communist movement in 1930, the Third International had entered its notorious 'Third Period', where

Communists directed the 'main blow' against the Social Democrats – labelled 'Social Fascists' – in the capitalist countries and abandoned united fronts with bourgeois and petty bourgeois nationalists in favour of 'worker-peasant-soldier' governments in the colonies.

Ho was able to impose a fragile unity among the competing Vietnamese communist factions and establish the Indochinese Communist Party. But unification was based on an interpretation of the two-stage theory according to the radical Third Period line, which was in the ascendant during that period. Ho's 'Appeal Made on the Occasion of the Founding of the Indochinese Communist Party' (Text 15), dated February 18, 1930, also known as the 'Abridged Platform', called on the Vietnamese 'workers, peasants, soldiers, youth, school students' to: 'overthrow French imperialism and Vietnamese feudalism and reactionary bourgeoisie': 'make Indochina completely independent'; 'establish a worker-peasant-soldier government'; 'confiscate the banks and other enterprises belonging to the imperialists and put them under the control of the worker-peasant-soldier government'; and 'confiscate all the plantations and property belonging to the imperialists and Vietnamese reactionary bourgeoisie and distribute them to the poor peasants'.

Was this Ho speaking or was it the Comintern? Or had Ho temporarily been won over to the Third Period line? It seems that Ho was articulating the Comintern line while having serious reservations. Giap, for instance, pointed out that the 'Abridged Platform did not advocate the motto "land reforms and land to the tiller," which is the key task of the anti-feudal revolution' (Vo Nguyen Giap 2011, p. 7). Moreover, this passage advocating broad union appeared:

> The Party must have frequent contact with the petty bourgeoisie, the intellectuals, the middle-peasants, the youths, members of the Tan Viet Party, etc. As for the rich farmers, small and middle-sized landowners and Vietnamese bourgeoisie who have not yet expressed anti-revolutionary inclinations, we should try to neutralize and win them over, and take advantage of their position. (119)

These moderating elements, however, did not go unnoticed, and in October 1930, on orders from the Communist International, which passed a resolution nullifying the February programme of action authored by Ho and returning strictly to the simultaneous anti-imperialist, anti-feudal, and anti-capitalist line of the International. For Ho, this repudiation began almost 8 years of marginalisation from the leadership of the Vietnamese Communist Party, most of which were spent in Moscow.

Nonetheless, Ho tried his best to prevent the Third Period line from completely wrecking the broad anti-imperialist front that he still saw as necessary (119–120). He opposed the peasant uprisings that the newly unified party instigated in the provinces of Nghe An and Ha Tinh in north-central Vietnam in 1931, and which saw the establishment of village soviets. Ho probably had a premonition that the Third Period line would lead to a disastrous policy in terms of political alliances. And it did. As John McAlister, Jr. (1969, p. 99) notes:

> Perhaps the most fundamental mistake was that the Communist terrorism was almost exclusively directed at lower-echelon Vietnamese officials who were exercising authority for the French administration, rather than at the French themselves. ... The Communists attributed this misstep to the shortcomings of the Theses on the Bourgeois Democratic Revolution in Vietnam, adopted by the Indochinese Communist Party in October 1930. ... As one Vietnamese Communist critic has seen it, this program 'committed the error of advocating the overthrow of the national bourgeoisie at the same time as the French colonialists and indigenous feudalists. ... [For] this bourgeoisie had interests which were in conflict with the imperialists . . . [and] they ought to have been drawn into the ranks of the bourgeois democratic republic and not systematically separated.'

Influenced by Lenin's careful – some would say opportunistic – policies on political alliances, Ho had a strong bias against excluding anyone solely on the basis of class origins, and this would not be the last time he would vote against and criticise an exclusionist policy. Asked who were the Communists' allies and who were their enemies, Ho would probably have said, along with Lenin: That depends on conditions, time, and place.

Creating a Broad Front

The Comintern shifted to 'Popular Front' politics in 1935 following Hitler's coming to power in Germany. With its championing of broad anti-fascist alliances, the new approach appealed more to Ho's instincts about the kind of tactics that would advance the independence struggle. His period of marginalisation ended and he returned to Asia and Vietnam, where he oversaw the articulation of the new party strategy for Vietnam. The key points of the new approach, contained in a report titled 'The Party's Line in the Period of the Democratic Front (1936–1939)' (Text 16), were:

1. For the time being the Party should not put forward too exacting demands (national independence, parliament, etc.). To do so is to play into the Japanese fascists' hands.

   It should only claim democratic rights, freedom of organization, freedom of assembly, freedom of the press and freedom of speech, general amnesty for all political detainees, and freedom for the Party to engage in legal activity.
2. To reach this goal, the Party must strive to organize a broad Democratic National Front. This Front should embrace not only Indochinese but also progressive French people residing in Indochina, not only the toiling people but also the national bourgeoisie.
3. The Party must assume a tactful, flexible attitude towards the national bourgeoisie, strive to draw them into the Front and keep them there, urge them into action if possible, isolate them politically if necessary. At any rate, we should not leave them outside the Front, lest they fall into the hands of the reaction and strengthen it.

By the time the Second World War broke out, the conditions were in place for the Communists to lead Vietnam's independence struggle. Not only had their tough organising enabled them to survive fierce French repression in the aftermath of the Nghe An and Ha Tinh soviets, but their only competition – the Vietnam Nationalist Party (VNQDD) – had been destroyed by the French.

As in China, they now had an extraordinarily supple tactic – the Democratic National Front – to unite the nation against both the Japanese and the French colonial government that had submitted to Japanese control. Yet even as he invoked the patriotic feelings of all Vietnamese, Ho made it a point in his 'Letter from Abroad' (Text 17), to link the struggle for independence with the class revolution in the country and with the world revolution:

> The hour has struck! Raise aloft the banner of insurrection and lead the people throughout the country to overthrow the Japanese and the French! The sacred call of the Fatherland is resounding in our ears; the ardent blood of our heroic predecessors is seething in our hearts! The fighting spirit of the people is mounting before our eyes! Let us unite and unify our action to overthrow the Japanese and the French.
>   The Vietnamese revolution will certainly triumph!
>   The world revolution will certainly triumph!

He was not a communist for nothing.

The Leninist in Action

Jean Lacouture, one of Ho's biographers, points to the strong influence on Ho of two Leninist ideas: the notion of the 'favourable moment' and the concept of the 'main adversary' (Lacouture 1968). Nowhere was his mastery of these two principles more in evidence than when he declared Vietnam's independence in 1945. The 'favourable moment' is akin to Louis Althusser's concept of an 'over determined contradiction', a particular confluence of forces and circumstances that, if taken advantage of, rewards bold political action. Analysing the Russian Revolution as an 'over-determined contradiction', Althusser writes: 'Russia was overdue with its bourgeois revolution on the eve of its proletarian revolution; pregnant with two revolutions, it could not withhold the second even by delaying the first. This exceptional situation was "insoluble" (for the ruling classes) and Lenin was correct to see in it the objective conditions of a Russian revolution, and to forge its subjective conditions, the means of a decisive assault on this weak link in the

imperialist chain, in a Communist Party that was a chain without weak links' (Althusser 1969, pp. 87–128). Such was Lenin's decision to seize power in October 1917. And such was Ho's decision to launch a general insurrection and declare independence in August and September 1945, taking advantage of a conjuncture where the French had been disarmed by the Japanese, the Japanese themselves had just capitulated to the Allies, and the French had as yet no means of reclaiming the colony (Lacouture 1968, pp. 100–101). It was, like Russia in 1917, a situation virtually inviting the Communists to step in. August and September 1945 saw an insurrectionary takeover, but a relatively bloodless one, with the Communists utilising to the maximum the legitimacy that they had gained from their leading role in the five-year anti-fascist struggle against the French colonial regime and its Japanese supervisors.

The crafting of the 'Declaration of Independence of the Democratic Republic of Vietnam' (Text 20) showed Ho's command of the united front tactic – the main purpose of which was to isolate the 'main adversary' – not only at the national but at the global level. The key problem in 1945 was to prevent the Western imperial powers that had vanquished the Japanese from ganging up on the Vietnamese. Ho was very well aware that the US was an imperial power. But he was also conscious that Americans themselves had an anti-colonial tradition, and that this was a fly in the ointment in US post-war policy in Asia – one that made Washington very uncomfortable at being seen as supporting the restoration of French rule in Indochina, though the Free French Government in exile had been a wartime ally of the US.

The good relations established between the Communists and operatives of the US Office of Strategic Services (OSS) during the anti-Japanese campaign provided a base for Ho's strategy. His invocation of the first lines of the US Declaration of Independence – 'All men are created equal. They are endowed by their Creator with certain inalienable Rights; among these are Life, Liberty and the Pursuit of Happiness' – at the very beginning of Vietnam's declaration of independence was a master stroke designed to deepen the rift between the mightiest global power and a colonial power that had been severely weakened by the war.

The years from 1946–54 saw Ho at his peak as a leader. He negotiated an agreement with the French high commissioner Jean Sainteny that recognized Vietnam as a 'Free State at the heart of the French Union'. It was a controversial deal, and to gain popular acceptance, Ho shared the complex rationale of his moves with a hostile audience at the municipal theatre in Hanoi:

> We have actually been independent since August 1945 but so far no power has recognized our independence. The agreement with France opens the way to international recognition. It will lead us to an increasingly more solid international position, which is a great political achievement. There will only be fifteen thousand French troops and they will stay for five years. ... It is a show of political intelligence to negotiate rather than to fight. Why should we sacrifice fifty or one hundred thousand men when we can attain independence through negotiation, maybe within five years? . ... I, Ho Chi Minh, have always led you on the path to freedom. You know that I would rather die than sell out my country. I swear to you that I did not sell you out. (quoted in Brocheux 2007, p. 116)

The speech turned the crowd around. It also, incidentally, revealed what Lacouture describes as Ho's penchant for debate as a method for resolving issues: '[O]ne thing about Ho [that] is beyond dispute is his passionate desire to persuade people, his thoroughly democratic urge to win acceptance for measures by argument rather than compulsion (Lacouture 1968, p. 219).

Future events would show that Ho's linking of the deal with Sainteny was a wise tactic, one which put the French on the defensive and cast a pall of illegitimacy over their breaking the deal and their subsequent war of reconquest. It was also an audacious military move that gave the Vietnamese, according to Ho in his 'Political Report at the Second National Congress of the Viet Nam Workers' Party (Text 30), 'nearly one year of temporary peace [that gave] us time to build up our basic forces'.

Ho and the People's War

War is the pursuit of politics by other means. With no-one was this Clausewitzean dictum truer than with Ho, who oscillated masterfully between negotiations and war, always keeping his eye on the ball, which was an independent Vietnam. By December 1946, with the collapse of negotiations with the French, it was back to war.

While General Vo Nguyen Giap is often credited as a military genius owing to the strategic and tactical brilliance with which he conducted the Battle of Dien Bien Phu, Ho's writings also reveal a comprehensive grasp of the principles of people's war. In his 'Appeal Issued after Six Months of Resistance' (Text 23), issued on 14 June 1947, Ho presciently outlined the course of the next 7 years:

> The enemy wants to win a quick victory. If the war drags on, he will suffer increasing losses and will be defeated.
>
> That is why we use the strategy of a protracted war of resistance in order to develop our forces and gather more experience. We use guerrilla tactics to wear down the enemy forces until a general offensive wipes them out.
>
> The enemy is like fire and we like water. Water will certainly get the better of fire.
>
> Moreover, in the long war of resistance, each citizen is a combatant, each village a fortress. The twenty million Vietnamese are bound to cut to pieces the few scores of thousands of reactionary colonialists.

Discussions of warfare comprise much of Ho's writings after 1947. In them he continually reiterates the essentials of what he called the 'protracted war of resistance':

- The party must guide military strategy;
- Cling to the people because they are the source of strength of the army;
- The aim of guerrilla warfare is 'not to wage large-scale battles but to nibble at the enemy, harass him in such a way that he neither eat nor sleep in peace, to give him no respite, to wear him out physically and mentally, and finally to annihilate him' ('Instructions Given at a Conference on Guerrilla Warfare', Text 33)

- Guerrilla war is a necessary phase, but inevitably as the balance of forces shifts towards the people's side, the war passes from the defensive to the phase of active contention to the 'general counteroffensive'. While it is possible to determine the major stages on the basis of the general situations ... it is not possible to separate one stage completely from the other, like slicing a cake. The length of each stage depends on the situation at home and in the world, and on the changes in the enemy's forces and in ours. ('Political Report at the Second National Congress of the Vietnam Workers' Party', Text 30)

The similarity of these prescriptions to Mao's theory of people's war is striking, but it is questionable whether Ho, or Giap for that matter, simply lifted them from Mao. The principles appear to have emerged largely from a process of experimentation and learning from mistakes in the monumental process of trial and error that was the Vietnamese Revolution.

This is not to say that some cross-fertilisation between the two roughly simultaneous people's wars did not take place, given Ho and other Vietnamese Communists' close contacts with the Chinese and, in Ho's case, direct participation in the Chinese Revolution at certain points in his revolutionary career.

The Crucible of Land Reform

Even as the military struggle went on, the problems encountered in managing the different classes involved in a national independence struggle were not easily resolved, and, in a people's war, resolution of these issues had an impact on the military equation. Here, Ho's writings evince a tension between satisfying the demands of the peasantry, who constituted 90% of the population, and neutralising the upper classes, particularly the landed class.

During the Japanese occupation and the first years against the French recolonisation, Ho and the party's policy was to postpone land reform and promote rent reduction, along with confiscation of

land belonging to the French and pro-French Vietnamese (Text 30).

Rent reduction meant forcing landlords and rich peasants to reduce their rent to 20% from 50%, the operative principle being 'limiting the feudal landlords' exploitation of the peasants while at the same time proceeding with changes in the property system so long as this measure does not impede the United National anti-Colonialist Front' (government directive cited in Brocheux 2007, p. 153).

With the final victory over the French at hand in 1953, the party decided to finally implement radical land redistribution. Brocheux suggests that it was a challenge from Stalin and the newly triumphant Chinese that prompted Ho to push land reform (145). This is unlikely given the centrality that he and his comrades had placed on agrarian reform as the 'main content' of the bourgeois democratic stage of the revolution. What is true though is that Ho felt that reform should be carefully planned and implemented owing to the complexity of the rural social structure. Indeed, early in his career as a Communist, he underscored the differences between the European countryside and Asian rural society:

> [The] social conditions of small landlords with ten to one hundred *mau* are complex and unpredictable. With that amount of land, a peasant could end up being exploited, an exploiter, or neutral. ... [T]he class struggle does not take shape the way it does in the West. The workers lack consciousness, they are resigned and disorganized. ... In this way, if the peasants have next to nothing, the landlord does not have a great fortune either ... The one is resigned to his fate, the other moderate in his appetite. So the clash between their interests is softened. That is undeniable. (158–60)

While he was not directly involved in implementing it, it was Ho who laid out the strategic direction of the land reform programme in 1953 ('Report to the Third Session of the National Assembly', Text 34):

> [T]he key problem remains unsolved: the peasant masses have no land or lack land. This affects the forces of the resistance and the production work of the peasants.
>   Only by carrying out land reform, giving land to the tillers, liberating the productive forces in the

countryside from the yoke of the feudal landlord class can we do away with the poverty and backwardness and strongly mobilize the huge forces of the peasants in order to develop production and push the war of resistance forward to complete victory.

But even as he laid out the strategy of radical land reform, Ho cautioned that the wiping out of feudalism must proceed 'step by step and with discrimination'. Specifically, this meant that 'in the course of land reform, we must apply different kinds of treatment to the landlords according to their individual political attitudes. This means that depending on individual cases we shall order confiscation or requisition with or without compensation, but not wholesale confiscation or wholesale requisition without compensation'.

These cautionary notes were, however, forgotten in the whirlwind that was visited on the countryside where land reform became, in many places, an organized *jacquerie*. Many abuses were committed and many people were killed – according to Bui Tin, more than 10,000 people were eliminated, 'most of them Party members or patriots who had supported the Revolution but were reasonably well off (Ruane 2000, p. 67). Ho then personally intervened to 'rectify' the campaign, which involved dismissing Truong Chinh – who was close to the Chinese, who had closely involved themselves in the process – from his post as secretary general. Ho led the process of party self-criticism, but left it to General Giap, a trusted favourite, to voice his opinions and issue the party's public criticism of itself at the 10th Congress of the Party Central Committee:

(a) While carrying out their anti-feudal task, our cadres have under-estimated or, worse still, have denied all antiimperialist achievements, and have separated the Land Reform and the Revolution. Worst of all, in some areas they have made the two mutually exclusive.

(b) We have failed to realize the necessity of uniting with the middle-level peasants, and we should have concluded some form of alliance with the rich peasants, whom we have treated in the same manner as landlords.

(c) We have attacked the land owning families indiscriminately, according no consideration to those who have served the Revolution and to those families with sons in the army. We showed no indulgence towards landlords who participated in the resistance, treating their children in the same way as we treated the children of other landlords.

(d) We made too many deviations and executed too many honest people. We attacked on too large a front and, seeing enemies everywhere, resorted to terror which became far too widespread.

(e) Whilst carrying out our Land Reform programme we failed to respect the principles of freedom of faith and worship in many areas.

(f) In regions inhabited by minority tribes we have attacked tribal chiefs too strongly, thus injuring, instead of respecting, local customs and manners.

(g) When reorganizing the Party, we paid too much importance to the notion of social class instead of adhering firmly to the political qualifications alone. Instead of reorganizing education to be the first essential, we resorted exclusively to organizational measures such as disciplinary punishments, expulsion from the Party, executions, dissolution of Party branches and cells. Worse still, torture came to be regarded as a normal practice during Party reorganizations. (quoted in O'Neil 1969, pp. 166–167)

Though he did not directly guide the land reform and thus could not be held directly accountable for the abuses that were committed, Ho was reproached for not intervening even when he was warned of grave cases of abuse, and for limiting himself to expressing concern (Bui Tin 1999, p. 28). Yet there is no doubt that the Chinese-style land reform contradicted Ho's previous emphasis on uniting rather than dividing, negotiation ahead of battle, education instead of bureaucratic or organizational measures, and rectifying people instead of turning them into pariahs.

The Marxist as Humanist

Like Mao, Ho had a moralistic streak. But, in his exhortatory essays, Ho adopted a very un-Maoist approach to revolutionary morality, refraining from characterising people he disagreed with in the party as class enemies or 'capitalist roaders', always urging unity above momentary differences, always holding up the possibility of redemption and urging cadres to assist people who had fallen by the wayside. For instance, in 'To Practice Thrift and Oppose Embezzlement, Waste and Bureaucracy' (Text 32), Ho says:

> There are people who are enthusiastic and faithful in struggle; they fear neither dangers, hardships, nor the enemy, thus they have served the revolution well; but as soon as they hold some authority, they grow arrogant and luxurious, indulge in embezzlement, waste, and unconscious bureaucracy, thus becoming guilty in the eyes of the revolution. We must save them, help them recover their revolutionary virtues. Others while pretending to serve the Fatherland and the people, indulge in embezzlement and waste and harm the Fatherland and the people. We must educate them, and lead them to the revolutionary path.

One of the most impressive things about Ho was his projection of a solid ethical core, the quality that, as noted earlier, led Khrushchev to characterise him as a 'communist saint' and Ruth Fischer, a colleague in the Third International, to say he stood out 'amid seasoned revolutionaries and rigid intellectuals' because he struck a 'delightful note of goodness and simplicity'. Ho's ethics derived from multiple sources, Marxism being only one, though the most important, of them. Confucianism was one important source. As Giap noted, 'The amount of Chinese culture which he absorbed in his childhood was so substantial and so deeply imprinted in his mind that he could compose poems in Chinese characters, as was the case of his famous poetry. Therefore, it's not surprising that in his speeches and writings, he did use Chinese concepts and quoted Confucian dictums to express more clearly his thoughts' (Vo Nguyen Giap 2011, p. 53).

> When it came to ethics, there was a refreshing lack of dogmatism that marked his politics. One cannot,

for instance, imagine the same expression of humanism coming from Mao:

> The good side of Confucianism is selfimprovement in personal ethics. The good point of Catholicism is benevolence. The good point of Marxism its dialectical method. The good point of Sun Yat Sen doctrine is that it fits in with the conditions of Vietnam. Confucius, Christ, Marx, Sun Yat Sen shared common points, isn't that so? They are all in pursuit of happiness for mankind and welfare for the society. If they are still alive today and sit together, I believe they would live together in perfect harmony as close friends. I'm trying to be their humble student. (52)

There was an ascetic quality to Ho. This was manifested not only in his disciplined lifestyle, which included hard work and regular morning exercises, but most obviously in his celibacy. Ho, says Sophie Quinn-Judge, had relations with women, but no long-term ones. When asked about it, his explanation was very much like the Vatican's rationale for celibacy among priests, with the difference that he did not impose it on others:

> When I was young and acted as an activist overseas, I was not too ugly to be loved by girls. Wherever I went, there was at least two or three girls attracted to me. Some even expressed wishes to become my companion . . .. However . . . to realize my dream, I always had to work in secret. I thought that wedlock would restrict my work because if I had a wife and children, I could hardly hide myself. During the time I was staying in France, lots of French Communists advised me to get married. The same thing happened when I came back to China and met Zhou En-lai, Zhou De, and so on. I explained my reasons to them, and they understood. (quoted in Khanh Hong 2010, p. 91)

A sketch of Ho's personality would be incomplete without calling attention to a chivalrous quality that not only embraced women and friends but extended to enemies. Among the latter was General Raoul Salan, who accompanied Ho on his visit to France in 1946 in his unsuccessful bid to secure French recognition of Vietnamese independence. With war having resumed between the French and the Vietnamese, Ho learned that Salan had been appointed commander-in-chief of the French forces in Indochina and wrote him a letter which contained the following passage: 'We were good friends. Now circumstances beyond our control have transformed us into adversaries and I think that regrettable. On my part, the sacred duty of a patriotic citizen obliges me to struggle for my homeland and my fellow-countrymen. On your part, your responsibility as a combatant also obliges you to do what your heart does not wish to . . .. Because we are obliged to fight each other, I hope you will prove to be a chivalrous combatant and gentlemanly adversary, waiting [for] the moment when we again become friends' (quoted in Song Thanh 2012, pp. 528–529).

This affirmation of friendship that transcended national and ideological barriers even as Ho planned to fight to the death was rare, prompting a Vietnamese commentator to call the Ho–Salan relationship 'a struggle between genuine knights' (529).

From Fond Uncle to Stern Father

What is interesting is that Ho's humanism and courtly behaviour coexisted with a steely determination to get what he wanted. There were times when he resorted to extreme measures, especially when he felt dialogue had become impossible with the Communists' competitors for the loyalties of the Vietnamese. As Lacouture (1968, p. 210) notes:

> The fond uncle is quite capable of playing the heavy father when he wishes. In the North his firm hand was felt by the anticommunist nationalists (VNQDD). . . . and the Catholics between September 1945 and July 1946. And in the South he dealt sternly with the Trotskyites and the Hoa Hao recalcitrant.

The standard story that is brought up to illustrate Ho's tough side is that he caused the arrest of the venerable Vietnamese nationalist Phan Boi Chau in order to rid himself of an attractive rival among Vietnamese political exiles in Canton in 1925. It must be pointed out, though, that some scholars, like Sophie Quinn-Judge (2002, pp. 74–76), dispute Ho's role in Phan's arrest.

With the Trotskyites, he was vituperative in his language and was eager to show his loyalty to Stalin: 'With regard to the Trotskyites there can

be no compromise, no concession. We must do everything possible to unmask them as agents of fascism and annihilate them politically' (Text 16). That such a strong statement could lead not just to political but to physical elimination by Viet Minh partisans is not surprising. It is reported that the Viet Minh eliminated the Trotskyists by tying several of them together and throwing them into a river to drown. It is also said that in 1946, the Viet Minh 'apprehended Nguyen Ta Thu Than, the most gifted Trotskyite leader and writer, at the train station in Quang Ngai, then took him to a sandy beach and put a bullet through his head' (Moyar 2006, p. 18). Ho may not have been personally responsible for these deeds, but he cannot escape accountability for a harsh political line that encouraged such abuses.

From National Democracy to Socialism

During his lifetime, Ho was dogged by the question of whether he was principally a nationalist or a communist. For his rivals in the nationalist movements in Vietnam, as well as for his enemies in Paris and Washington, he was the agent of world revolution, the man of the Communist International *par excellence*. For the Trotskyists, and for some of his rivals in the Indochinese Communist Party, he was either a petty bourgeois nationalist or was guilty of 'nationalist deviation'. Stalin is said to have suspected him of unhealthy nationalist tendencies and dared him to enact the radical land reform to smoke him out (Brocheux 2007, p. 145).

The situation after the defeat of the French in 1954, however, showed Ho to be a faithful Leninist. Faithful, that is, to Lenin's 'Theses on the National and Colonial Question', which contained the theory of a bourgeois democratic revolution followed by a socialist revolution that had had such a big impact on Ho in the early 1920s. With Vietnam divided into the sovereign North and the US-controlled South, Ho adapted the theory to the particular circumstances of the country:

> [T]wo tasks confront the Vietnamese revolution at present: first, the construction of socialism in the North, and second, the completion of the national democratic revolution in the South. These tasks have a common aim: to strengthen peace and pave the way to reunification on the basis of independence and democracy. (Text 40)

The demands of socialist revolution and national independence were, in Leninist fashion, creatively reformulated to meet the particular historical conjuncture, but there was no doubt that socialism in an independent nation was the strategic aim. Ho had been dead nearly 6 years by the time the country was rid of the Americans and reunified in March 1975. But, faithful to his Leninist vision, his followers immediately moved to declare the national bourgeois democratic revolution completed in the South and christened the whole country the Socialist Republic of Vietnam. For Ho, genuine nationalism meant working to bring about socialism to a nation state that would be part of an international order of independent socialist nation states.

A Marxist Pragmatist

Ho left no significant theoretical innovations, much less an integrated body of theory. This has of course not prevented some in the Vietnamese Communist Party from claiming that he left behind 'Ho Chi Minh Thought', which was described as a new development in Marxist-Leninist theory. Not surprisingly, this elicited a certain amount of scepticism since Vietnamese knew that Ho did not leave behind any body of theoretical writing (Quinn-Judge 2002, p. 256).

Where Ho did excel was in his ability to adapt abstract Leninist ideas to Vietnamese realities, developing a strategy and tactics of national revolution based on these, and creating an organisation, the Communist Party, to put this into effect. Perhaps his analytical approach was best articulated in the speech he gave inaugurating the first theoretical course of the Nguyen Ai Quoc School on 7 September 1957:

> Reality is problems to be solved and contradictions lying within things. We are revolutionary cadres,

our reality is problems to be solved that the revolution puts to us. Real life is immense. It covers the experience drawn from the work and thought of an individual, the Party's policies and line, its historical experiences and issues at home and in the world. In the course of our study these are realities to be kept in touch with.

He continued:

Thanks to its ability in combining Marxism-Leninism with the actual situation of our country, our Party has scored many successes in its work. However, the combination of Marxist-Leninist truth with the practice of the Vietnamese revolution was not complete and brought about many mistakes namely those committed in the land reform, readjustment of organization and economic construction. At present, in building socialism, although we have the rich experiences of brother countries, we cannot apply them mechanically because our country has its own peculiarities. Disregard for the peculiarities of one's nation while learning from the experiences of the brother countries is a serious mistake, is dogmatism. But underemphasis on the role of national peculiarities and negation of the universal value of the great, basic experiences of the brother countries will lead to grave revisionist mistakes. (quoted in Woddis, pp. 111–112)

Ideas do matter in history. And it was Ho's ability to translate revolutionary ideas into a pragmatic but inspiring programme, with a tough organisation to carry it out successfully, that made him exceptional.

Ho and Socialist Construction

How useful Ho's ideas, especially those that have to do with 'constructing socialism', are today – as Vietnam seeks to break out of underdevelopment, and classical socialism has been discredited – is an interesting question.

During both the period of revolution and socialist construction in North Vietnam, Ho was always extremely sensitive to the state of agrarian class relations. One of the reasons for this was his vision of making agriculture the key sector of the economy, at least in the early stages of national development. 'If we want to develop industry and the economy generally speaking, we must take agriculture as the foundation. If we don't develop agriculture, we will have no basis for developing industry because agriculture supplies raw materials and food to industry and uses commodities made by industry' (quoted in Song Thanh 2012, p. 359). At another time, arguing against a colleague who advocated focusing resources on heavy industry to achieve rapid industrialisation, he is reported to have said, 'It is a subjective decision if we want to industrialize in great haste. Therefore, in economic planning, we must promote agriculture first, then come handicrafts and light industry, and only afterwards comes heavy industry' (358).

Ho displayed the same sensitivity to class relations in the city, and for reasons that had to do not only with keeping the middle classes and entrepreneurs on the side of the revolution but national reconstruction. Had Ho been alive in the late 1970s, one can certainly see him having put a stop to the expropriation of shops and small factories belonging to the Sino-Vietnamese that triggered the flight of the 'boat people'. One can imagine him calling a retreat after the programme of accelerated socialist construction created tremendous dislocations in both the countryside and the cities in the late 1970s and early 1980s. But would he have gone so far as to support market reforms, the revival of the private sector, and the courting of foreign investors that have marked Vietnam's political economy in the last two decades? Given the strong streaks of pragmatism and humanism that he mixed with Marxism, one suspects that he would have, though he would probably not have endorsed one commentator's assertion that '[o]wing to the law of development, in society, there will be a part of the population that gets richer first, and other parts after, but the people's standard of living is higher and raised step by step' (354).

Vietnam has, in broad strokes, followed Deng's path of stimulating rapid capitalist development through integration into the global economy to achieve the prosperity that Ho felt was an essential pillar of socialism. It has achieved some success, becoming one of the world's top exporters of rice and coffee. Unfortunately, its post-1978 model of development has also reproduced the Chinese pattern of sharply rising income inequality. Though the country's Gini coefficient (the best measure of inequality) is

low compared to other South-East Asian countries, it is rising. In 2013, the number of extremely wealthy people in Vietnam grew by 14.7%, the second fastest rate in South East Asia after Thailand, leading the Communist Party chief Nguyen Phu Trong to warn: 'The rich–poor divide ... shows signs of getting worse'. Trong added that the gap existed even inside the Party. 'Some Party members have gotten richer so quickly, leading a lavish life that is miles away from that of the workers' (Thanh Nien News 2013).

How would Ho have reacted to this situation were he alive? It is hard to imagine such a development not worrying him, or his not taking steps to reverse it. But much like the country's current leaders, he would have been hard put to contain a process where the very mechanism chosen as the route to prosperity – rapid capitalist development – spawns the conditions which create the sharp inequalities pushing the country farther and farther away from its avowed goal of achieving socialism.

Hobson's Research on Imperialism and Its Legacy

Simon Chilvers
Economic Geography, University of the Fraser Valley, Abbotsford, BC, Canada

Definition

John Atkinson Hobson (1858–1940), who signed his name as J.A. Hobson, can be considered a major theorist of imperialism. His book *Imperialism: A Study* (1902) is arguably *the* single most-influential work for this study field.

John Atkinson Hobson (1858–1940), who signed his name as J.A. Hobson, can be considered a major theorist of imperialism. His book *Imperialism: A Study* (1902) is arguably *the* single most-influential work for this study field. Although it claims to isolate the 'taproot of imperialism' and inspired mass struggle leaders, its significance lies also in its thematic heterogeneity and possible contradictory interpretations. Some exegeses are thus vital when presenting this text and Hobson's wider *oeuvre,* for he wove original ideas together with the essential strands of British Liberalism.

On Thrift, Poverty, and Monopoly Capital

Hobson was born in Derby, England, to a regional newspaper proprietor, attending grammar school before attending Oxford University and then working as an extension course lecturer. *The Physiology of Industry* (1889), which he wrote with A.F. Mummery, a celebrity businessman, attacked the thrift ideal of economics, that saving increased wealth and spending decreased it. To be effective, the authors held that capital gains needed commensurate rises in consumption: 'real saving' helped to do so, unlike 'nominal saving'. Employment and wages would be higher if the wealthy did not periodically withhold capital from industry and cause 'over-supply', where goods became unaffordable for many people. Competition informed over-production, since capital-holders saved, hopeful of larger future profits. It was not that saving never reduced aggregate consumption, varying who consumed: limits existed as to how much anyone could ever consume.

The Physiology of Industry related unemployment and bankruptcies after 1873, when the Long Depression began, to how the Franco-Prussian War (1870–71) informed heightened consumption and subsequently an abrupt return to normal conditions. Manufacturers initially enjoyed windfalls, but then, after the conflict, greater profits were made by retailers, whose fortunes declined as failed producers entered

their field. Against views that recession was due to scarce gold, commerce informed monetary value, rather than *vice versa*.

Mummery and Hobson ruffled academic feathers: the latter never obtained a permanent lectureship. Extension work, however, informed his first single-author book, *Problems of Poverty* (1891), a response to public concerns about an 'outcast' class following the 1889 London dock-workers' strike. It argued that price changes meant that a 'labour aristocracy' purchased more goods with £1 than before, owing to new manufacturing techniques, yet the poorest were unable to afford even basic items. Residential and commercial rents appeared to be another salient issue, having risen by 150% in five decades. Employers 'sweated' homeworkers to avoid labour laws and the costs of premises, with women who were isolated from trade unions, the most affected, still performing domestic chores and having below-subsistence wages. This was made possible since their needs were met partly by spousal or parental earnings, informing masculine discourses on the contradictory 'freedoms' of employability and 'protecting the fairer sex'.

Problems of Poverty also linked over-saving and under-consumption to competition and capital concentration, the issue of 'big survivors' producing without regard for current demand. If business 'combinations' proved infeasible when many firms were in existence, monopolistic conditions facilitated pacts to 'sheathe the price-cutting weapon': as a self-preservation policy, fights used 'blunted lances'. The pioneering of 'trusts' – 'the highest reach of capitalistic evolution' – went further, where a trustee board governed nominally independent companies that pooled capital for dividends. Mimicking these trends, Hobson perceived 'labour combines' as forming, which regularised, and thereby diminished, the aggregate friction between labour and capital.

The Evolution of Modern Capitalism (1894) affirmed Hobson's motif of over-production and under-consumption, linking mechanisation and an enhanced division of labour to its heightened modern state. Credit made such developments possible, besides aiding

consumption (an 'expansion of the time-market'). Nevertheless, the book's greater novelty was its relating of such issues to monopoly. Loose agreements to *lessen* competition culminated in formalised 'trusts' – entities that increased the might available *for* competition. If railways extorted isolated farmers and Standard Oil set prices for suppliers and consumers, like cases represented not 'unfair competition' but 'an application of those same forces always operating in the evolution of modern capital'.

'Trusts' did not *ipso facto* mean lower or higher prices: adjustments related to the degree of (perceived) competitive threats. With monopoly prices determined by different considerations from competitive ones, inferior plant that might yield marginal profits would be idle in a 'trust', since producing more or fewer items meant suboptimal profits. Investment was concentrated in ideal sites, raising efficiency, output, and startup costs. Demand figured thus even less in business calculations. 'Trusts' also informed growing net unemployment, a proliferation of distributing classes (made possible owing to monopoly production profits), and political divisions between unionised workers in large industries and other labourers. With minimal competition, 'trusts' practically owned their employees.

The Problem of the Unemployed (1896) reiterated earlier themes, arguing that monopolies wasted labour power in ways analogous to unemployment *per se,* with 'clerks, advertisers, shop-assistants, *etc*.' doing 'excessive and useless' work as viewed from a 'social standpoint'. The 'central fact' of unemployment studies was over-capitalisation, a matter arising from 'unearned income', where an individual's revenues did not correspond to their 'outgoing effort'. As some people saved far beyond any possible personal use, they lent via banks to expanding businesses; investor confidence hinged on whether goods were sold. If over-production occurred, lending ceased. The remedy was not abolishing what Karl Marx claimed to be 'unearned income', since Hobson deemed property vital for encouraging anyone to work at all. Instead of challenging the social organisation of production,

consumption standards needed to be raised, if necessary by taxing 'unearned income'.

On Imperialism and War

As tensions between the British Empire and the Boers grew during 1899, *The Manchester Guardian* commissioned Hobson to visit the Transvaal. His article 'Capitalism and Imperialism in South Africa' (1900) argued that the eventual war (1899–1902) benefited only monopoly and financier interests. Mining giants, chiefly Cecil Rhodes, backed by investment banks, were cosmopolitan cohorts formerly against Crown rule and championing Boer independence because it did not risk plans for a chartered company. Such ilk turned into British 'patriots' after failing to get their way with Boer officials through 'stealthy means'. It was vital to overturn a state shunning policies aiding large capital.

Transvaal stakes grew as new gold fields were located in 1886, drawing an influx of British miners and petty traders. Hobson observed that these classes would never benefit from Rhodes and others running the territory: ending Boer rule meant losing out to cartels using 'compounds' (unfree native labour and company stores). An attempted coup in 1896 implicating Rhodes – the 'Jameson Raid' – did not inspire Transvaal Britishers. Although disenfranchised, they had few major grievances, since the underdeveloped mining sector paid handsomely. Monopolists and financiers subsequently changed tack, appealing to a wider audience. Although from diverse nations, they pressured the British state: its subjects faced 'repression'. 'Activists' demanded democracy (*sans* citizenship obligations) for white male temporary residents. Cape Colony newspapers, bought by large capital, sent libels around the empire, fuelling a 'race-lust frenzy'.

To Hobson's mind, though the financiers of monopolies appeared as 'the most-powerful guiding force in aggressive Imperialism', they succeeded only by 'cooperating with and moulding for their purpose weaker forces having purer

and less definite aims'. Other major beneficiaries – the armed and civil services, weapons manufacturers, public contractors, and so on – seemed antithetical by nature to liberal values seldom supported elsewhere. *The War in South Africa* (1900) expanded on the causes and effects of hostilities unsought by Boers and Transvaal Britishers. The state's claim of the latter as its subjects had been 'treacherous': it claimed 'suzerainty', refused negotiating in good faith, censored conciliatory Boer statements, and precipitated conflict by marshalling border troops. Hobson foresaw disaster for all except monopolists and financiers, since massive 'compound' mining profits would result from a British Army victory. Ending certain Boer taxes was alone believed to raise dividends by £2.5 million p.a.

An aspect of the war appealing to people sceptical that Boers were striving for 'racial supremacy' over Britishers concerned black exploitation. While some Boers kept slaves, humanitarianism obscured *the* issue. In principle, the farmer with one or two slaves differed little from a 'compound'. Yet the quantitative difference implied great changes: 'put concisely, war is being waged to secure for the mines a cheap supply of labour'. Black workers appeared inexpensive as they were 'abundant' in number, with livelihood means other than wages – demanding suppression of tribal occupations, paying chiefs 'premiums' to remit men, and building low-fare railways, besides implementing 'hut' and 'labour' taxes, the latter payable annually by males lacking 4 months' waged employment.

Controlling Transvaal politics hence facilitated super-profits. However, the *type* of capital entering South Africa seemed unable to sustain any manufacturing or 'progressive agriculture' potentially informing an expanded white settler civilisation. Imperialism here looked *different*, with its lopsided form of development. One sector utilised capital and labour in disproportionate quantities compared with all others, injuring their growth. 'Serf-society' existed, deploying 'forcible methods' on behalf of a 'race-based aristocracy'.

The Psychology of Jingoism (1901) discussed British cultural conditions that 'inverted patriotism' and made it 'the hatred of another nation', hiding class stakes behind policies. Multiple 'instruments of instruction' overtly or insidiously propagated an imperialistic mindset: music halls and churches represented 'screens' for strategic financier interests. 'Lie factories' (the press) spent fortunes prating about their impartiality, while police connived in assaulting peace campaigners. Other nations derived mirth from imperialists angry at foes never 'standing on the sideline waiting to be shot'. When jingoism faltered, another 'screen' rolled out: 'protecting savages'.

Every theme Hobson elaborated before 1902 can be discerned in *Imperialism*. Colonialism equated to a community's expansion, colonies becoming autonomous partners; after 1884 there were subordination and competing empires, causing extreme nationalism. Areas under this 'new Imperialism' were Crown Colonies (*sans* representative or responsible rule) with sparse white settlement. Although they were 'irrational from a national standpoint', their costs benefited *some* classes. Public funds repaid loans (plus interest) for military and expedition supplies (aiding certain manufacturers) and increased armed and civil service positions. Annexations fluctuated currencies (aiding speculators), secured foreign markets or investments, and gave engineers, missionaries, prospectors, ranchers, and others employment.

Hobson judged that one correlation best evinced his 'vested interests' thesis. For 18 years, although foreign trade with imperial rivals grew, its total value declined in relation to internal transactions. Simultaneously, investment incomes from abroad doubled, dwarfing external trade profits by 5:1. Fully 15% of British wealth was invested overseas, half as foreign and colonial state borrowings and the rest held in railways, banks, telegraphs, municipal services, or 'industries directly-dependent on land values'. Foreign policy appeared to be 'primarily a struggle for profitable investment markets' as classes living on interest did so ever more from holdings abroad, with an incentive to extend their portfolios and safeguard existing revenues.

Imperialism distinguished two investor types. A 'rank and file' were cat's-paws, commercially and politically, for 'general dealers' who, rather

than use stock to earn dividends, speculated with it in currency markets. Imperialist forays also benefited underwriting public debt and company flotations; any policy affecting asset values needed their sanction. While 'imputing so much power to financiers seems a too narrowly economic view of history', Hobson wrote, 'finance is rather the Imperial engine governor' (1902: 66). This body ran on 'patriotic fuel', empowering 'adventurism, military enterprise, political ambition, and philanthropy'. Enthusiasm for expansion – 'strong and genuine, yet irregular and blind' – was regulated by lenders to states. They made the 'final determination' on the basis of their interests, with newspapers 'putting into minds beliefs influencing policy, thus affecting money markets' (66–67).

Hobson linked his finance judgements to how 'trusts' informed ever greater amassed capital sums. 'Automatic saving on an unprecedented scale' resulted because the hyper-rich did not consume adequately, with their profit-seeking investments creating a 'stricter economy of existing capital'. As lucrative opportunities in 'trusted' industries diminished, 'investment markets beyond the home area were forced' (1902: 80). Such territories often required annexation (it being implicit that an apt capital protector was necessary). Over-production and under-consumption thus linked to foreign policy. 'If the British raised their consumption and kept pace with rising productive powers, neither excess goods nor capital could clamour for Imperialism' (86). Since distribution did not directly relate to need (a matter governed by 'other conditions'), Hobson argued against imperialism as 'industrial progress demanding new markets and investment fields'. Modern capitalism's inequities informed *over-saving* – from rents, monopoly profits, and 'other unearned income' – which was *the* reason for recent world developments.

Hobson considered that taxes funding empire management never fell unduly on the classes constituting imperialism's 'taproot'. While Britain had millions living in poverty, steady indirect taxes paid debt financiers and landowners 'dole money'. Fluctuating direct taxes were 'paraded' to fool people that all paid their way. Many taxes

appeared to be protectionism renamed, raising prices and portending Great Power tensions over key resources. Liberalism seemed dead, with debates inside the British state taking place only between rival imperialist camps.

Imperialism also assessed an expanding empire's corrupting effects in its heartland. Southern England was packed with 'autocracy-trained' men returning from life overseas, running for office and, hostile to liberty, 'bringing despotism home'. They defended 'Western parasitism': elites drawing vast tribute from abroad, who supported 'tame masses of retainers' performing 'minor industrial' or personal services. Various discourses buttressed imperialism for such 'cultured' classes and *hoi polloi*. 'Social efficiency' appeals (also known as 'scientific racism') – wrapped in 'thin convenient theories' from biology and sociology – indoctrinated the former with 'moral grandeur'. For the latter, there was 'hero-worship, glory, and sporting spirit: history falsified in coarse flaring colours' (1902: 234).

Although few world regions were unclaimed by imperialists, Hobson contended that land rights meant little without labourers. Imperialism depended on 'forced labour' as different from 'unfree contracts' of the waged *partout*. Acquisition methods included seizing community resources, issuing travel passes (impeding mobility), promulgating militia levies to actually supply businesses with workers, and stoking unrest that justified martial law. Taxes were designed, as was 'forced labour', less for revenue than for compelling labourers to seek wages. Indenture particularly injured remitting communities, since the able-bodied vanished entirely from a locale.

On Internationalism

Hobson's works after *Imperialism* asserted that Liberal principles informed prosperity, peace, and equality. *International Trade* (1904) argued how tariffs spurred internationalism and were a sectarian policy. Protection helped some industries, reflecting their political weight, yet harmed commerce overall by skewing capital distribution and consumption. As in the case of imperialism,

tariffs inflamed national antagonisms, with beneficial exchanges misrepresented as rivalry for limited markets, stymieing demands for wealth redistribution. Privileged classes increased rents and profits at the community's expense, consolidating capitalist structures to repress competition better. Cartels injured trade, since 'the real question' amid non-competing groups was monopoly's worth, and exchanges did not involve like production costs.

Measures to lessen inequality were proposed in *The Crisis of Liberalism* (1909): public ownership of land, popular control over credit and insurance, plus free transport networks and industrial power. Any monopoly would be tackled. This 'practicable Socialism' disavowed 'abolishing the competitive system and socialising instruments of production, distribution, exchange', and so on, instead offering workers 'economic conditions requisite to the employment of their personal powers for private advantage and enjoyment' (172–173).

An Economic Interpretation of Investment (1911) revealed that only 10% of British investment was in the country; foreign revenues had risen by 90% over 20 years, mostly from state bonds, municipal stock, railway securities, or construction, manufacturing being incidental. No European country now figured in the top ten destinations: the Americas or colonies were preferred. Writing for a business press, Hobson claimed that imperialism was changing: 'nationalist aspects weakening and giving way to an economic internationalism exercised with little political control, the minimum affording asset security' (117). Finance seemed 'the aptest peace instrument'. Wars started because of 'reckless insults' – even weapons manufacturers 'lost out'.

Hobson rejected his recent conclusions in *Towards International Government* (1915). With a progressive publisher, he argued that the 1914 war served the interests of arms dealers, who bid states against one another, knowing their secrets. It complimented how politicians backed 'their' investors and traders, with quarrels arising over tariffs or markets where special interests were claimed. War was 'mainly a product of these antagonisms', specifically financier competition

over concessions in undeveloped countries. *Pace* his 1911 work, 'political weapons' made all the difference: free capital movements were 'normally a pacific force', binding creditor and debtor by 'mutual advantages' (1915: 139).

Democracy after the War (1917) proposed that European upper classes deemed their interests and survival to involve hostilities, not peace. While investment struggles in the Balkans, Turkish Empire, and Morocco underpinned the ongoing war, other reasons existed. Capitalists earned vast profits from conflict financing and contracts, aiming also to 'settle industrial unrest threatening revolution' as 'impossible by constitutional methods' (41). German landlords urged war for staving off property taxes and an ending of agrarian customs. Britain was similar, albeit with its aristocracy 'fused more completely with the industrial plutocracy' (42). Akin to what *Imperialism* noted abroad, conscripts now laboured in factories under military law.

Taxation in the New State (1919) observed how war-debt interest was a colossal £350 million p.a. for lenders, with conflict also massively expanding the capital of many manufacturers, farmers, brewers, and mine-owners. Public funds paid cash for destroyed assets and shortages helped profiteers. Banks earned from enlarged credits and deposits that doubled in 5 years. By writing down securities, which 'safely' recovered value later, businesses kept profits 'out of income'. Capital applied to plant enlargement, rather than dividends, escaped taxes, *gratis* bonus shares then being issued. Assets that the state bought at inflated prices were sold back to former owners below market rate. Elites netted 'several thousand million pounds' in such ways.

The Morals of Economic Internationalism (1920) proposed that the US must help reconstruct Europe. If some nations could not pay, those with surpluses had to provide credit too. It was not 'charity' but 'an intelligent sense of self-interest'. Allowing Central and Eastern Europe to starve risked dangerous reactions, with any protectionism threatening insular nationalisms. 'In Britain', Hobson wrote, the latter policy meant 'heaping fuel onto the class war fire'; America needed to 'learn lessons from Russia and Hungary' (54–55).

Problems of a New World (1921) reiterated how the Bolshevik revolution changed global affairs. A different imperialism appeared as a ruling class strategy for avoiding social unrest, one where self-preservation 'trusts' substantially replaced competition. Concerted action through the League of Nations (which needed to include Germany) might inform international and industrial peace by 'substituting a race cleavage for that of class'. Undeveloped countries with 'cheap labour' would export produce 'to well-paid, short-houred and contented Western workers, employees of combines, who transform it by scientific manufacture'. Capitalists aimed to 'make them partners in a sweating-system involving foreign exploitation', and 'favoured proletariats' becoming 'little shareholders'.

Hobson noted that the imports essential for satisfying home populations 'cannot be bought by their full equivalent in exports'. Under free exchange, raw materials and food-stuffs would long 'remain on a higher level than manufactured exports', owing to different efficiencies. Syndicates were induced to organise production abroad 'cheaply': 'forced or sweated labour and using Governmental aids to obtain land or business opportunities at minimal cost' (1921: 185). Most overseas produce would thus 'arrive' as monopoly rents or super-profits on native labour, a portion of this surplus gain becoming available for supporting Western workers in relative comfort: higher real wages, low import prices, shorter hours, and so on. States taxing the wealth that imperialist exploitation made possible, or leasing 'Crown lands' for revenue, might then offer their citizens enhanced social security. The moral temptation was 'a limited international, under which an oligarchy of great nations shall live on the resources and subject peoples of undeveloped countries'.

Legacy

Hobson lived long enough to observe, analyse, and predict several profound world developments. His ideas became known internationally through their adoption by major figures in twentieth-century history. Two contrasting men are especially significant. On the one hand, John Maynard Keynes, who did more than any economist of the period to save capitalism, borrowed heavily from Hobson's work. On the other hand, Vladimir Ulyanov, also known as Lenin, cited *Imperialism* extensively and favourably in a pamphlet of the same title (1933). Hobson's relation to these personalities informs – indeed overshadows – many divergent readings of his bibliography.

Economists discussing Hobson and Keynes usually uphold the latter's views, with the former styled as a lesser (albeit inspiring) thinker. Keynes notably proposed that underinvestment relative to profit rates appeared to be of greater significance in determining crises than boom-period under-consumption. This perspective focused attention on interest rates and the minted money supply. For Hobson, of course, these matters were palliatives: *the* issue was equalising property distribution, not temporarily ending abstention. Thus conservative critics of Keynes, highlighting his 'Hobsonian' debts (more than he did), attack the foundation of the production–consumption disequilibrium, proposing that effective demand can rise. Omitted are Hobson's points about how the wealthiest literally fail to unproductively consume more (hence the larger productive investments, possibly informing capital exports, until confidence disappears), enduring class divisions, and imbalances that are potentially reproducible at ever grander scales.

The renown of a 'Hobson–Lenin thesis' rests on the former's ideas and the latter's deeds. Lenin added little to any imperialism 'theory' *per se*, self-admittedly clarifying mainly how Hobson's logic (and that of other monopoly capitalism students) necessitated civil war. No radically independent 'Leninist' view exists. The proletarian state leader's endorsement consequently informs more heat than light as to a Liberal's work, something compounded by the fact that both *Imperialism* texts are generally assessed in isolation from their political contexts and their authors' other concepts.

Supporters and detractors of 'Marxism' (or Lenin in particular) traverse two paths: they appeal to empirical data, that is, if it 'matches' what either *Imperialism* claimed, and they compare select propositions against universal principles, that is, whether an author proved 'consistent'. Notably, Lenin's favour drew attention only after Hobson's death. While Western historians during the 1920s and 1930s affirmed the latter's negative 'national' cost-benefit analysis for 'new Imperialism' colonies, they ignored his capital export theory and how prominent socialists, who also included Rudolf Hilferding, Rosa Luxemburg, and Nikolai Bukharin, utilised it. A decade on, many writers presumed to be 'Marxists' lacked *any* explanation for empire growth. After 1945, however, the translation of Soviet Union materials citing Lenin became commonplace, with Hobson's *Imperialism* a key text for partisans contending whether capitalism inevitably meant colonies and competing empires.

Notwithstanding that the Soviet Union exported capital much like its capitalist rivals, Hobson's insights and modern relevance were subsumed by Cold War polemics. Divorcing his text from debates about decolonisation or neo-colonisation, most Western academics claimed that nothing 'economic' informed *de jure* (not *de facto*) territorial control. Both *Imperialism* texts needed rejecting, commonly via an article by Joseph Schumpeter, 'The Sociology of Imperialisms' of 1919 (1951b). Although this perceived 'new Imperialism' as greed-driven, it was deemed possible only in autocratic contexts, that is, 'unlike' many North Atlantic societies after 1918. Atavistic behaviour was not simply 'irrational' (the view of some Liberals against Hobson), but represented 'feudal' elements struggling for power; it diminished as industrial capitalism developed.

Scholars making claims about what kind of imperialism the British Empire epitomised overlaid 'economic *vs*. cultural' discussions after about 1960 with nineteenth-century case studies. Aiming to refute 'Marxism', historians proposed Hobson's *Imperialism* as reductionist, introducing

a non-existent 'new imperialism' break, and with inadequate primary data. Alternative contributions included discussions of how Hobson/Lenin 'really' explained world war, not annexations, and arguments that 'informal' free trade zones or defence of sea routes defined 'new imperialism'. Analysts during the 1970 and 1980s stressed events abroad, neither 'economic' nor 'metropolitan', as informing empire growth. An important 1990s view, which alleged that Hobson failed to explain pre-Industrial Revolution imperialism and saw manufacturers as driving policy, nevertheless highlighted undemocratic financier ties.

International disputes concerning reformers or revolutionaries, and exchanges that *Imperialism* generated years after its publication, often mean that Hobson's longterm Liberal Party allegiance is overlooked. Historians of the period are divided between those observing a 'consistent' *laissez-faire* disciple or state-interventionist and others who perceive an 'inconsistent' mixer of these creeds. A more recent argument has been that Hobson purposefully transcended genres, seeking political propaganda effects from this technique, his only steady ideals being free trade and equality of subjects. It remains to be seen whether social movements against monopolies and socialism today, advocating small-scale property, will make anything else of Hobson's career.

Afterword

Hobson once jested about his origins: 'the middle stratum of the middle class of a middle-sized industrial town' (1938: 15). Before the 1920s were out, this cohort's political vehicle, the Liberal Party, was broken, with reactionary and socialist forces defining a new economic and ideological era. For Hobson, the agendas of such polarities endangered not just his class but property *in toto*. Over 40 years, he countered the discourses that rival theorists offered, developing their aspects that were compatible with liberal beliefs and contesting those that were inadmissible. Struggles in imperialist societies for 'the

middle class' and its political weight, regularly observed by him, perhaps also help explain the possible class-contradictory readings of his works.

Synonyms

Ifeoma Okoye; Nigeria; Nigerian marxism; Socialist-feminism; West African radicalism

Definition/Description

Ifeoma Okoye is Nigeria's preeminent socialist-feminist novelist. Neo-colonialist Nigeria under "flag independence" has been a theater of conflict where women's rights have been suppressed as part of an imperialist ideological crusade. Okoye's

oeuvre presents us with examples of how individual women, as well as radical collectives, can find agency even as exploitative structures tighten their grip on the country.

Introductory Paragraph

Ifeoma Okoye, Nigeria's preeminent Marxist, socialist-feminist novelist is 82 years old this year (2019). Three years ago she published a grammar compendium aimed at ESL learners. In 2013, she came out with her masterpiece, *The Fourth World*, a novel that dealt with Enugu's eponymous shanty and the avenues for reclaiming human agency there. Her long literary career started in the 1970s and has continued up to this day, with children's books, young readers' tomes, novels, and short stories all aimed at the liberation of the private sphere in neo-colonial Nigeria. In this article, her novel *Behind the Clouds*, written as an intervention against the mistreatment of childless women, is examined in detail.

Imperialism and the Private Life of the "Native"

From the times of the Spanish Reconquista and the subsequent Iberian assault on the life-worlds of "natives" on three continents (Grosfoguel 2011), Euro-colonials saw themselves as harbingers of proper conduct. The British Empire positioned itself as the civilizing force that

outlawed the sati in India and the killing of twins in Nigeria's South-East, Igboland (Imbua 2013). The rising bourgeoisie of the UK, despite advances in science, found it elevating to "bring Christianity to the heathens," and most especially to end the practice of cannibalism that it saw as diametrically opposed to every Christian value. It would have shocked Edwardian gentlemen that non-Christian commentators had long deciphered the Christian Eucharist as *will-to-cannibalism* (from the point of view of Jewish Ultra-Orthodoxy, an uncompromising view is put forward regarding this by Rabbi Tovia Singer today) (Singer 2018) but also that in the case of a radical Nigerian practitioner of the Western visual medium of oil painting, a masterful statement in the early 1960s also brought forward the same proposition from the point of view of the self-decolonizing radical African artist: Erhabor Emokpae in his The Last Supper (Okeke-Agulu 2015, pp. 248–252). "Christendom" may have had a fixation with cannibalism precisely because of the cannibalistic impulses of its most sacred ritual.

In truth, British colonizers had brutally altered the private lives of "native" populations under their rule, tore the texture of the societies that they held captive, and in the case of Nigeria's South, they created newly mint, disruptive patriarchies in a region that had hitherto been either governed by matriarchies (Amadiume 1987a) or by a delicately balanced two-track parallel structure whereby men and women had separate political authority structures (women governed the marketplace, had their own leadership, deities, and market shrines) (Matera et al. 2013). *Flag independence* (copyright Bade Onimode) and neo-colonialism arguably made things worse in this department. In Nigeria where forms of gender fluidity had existed (Amadiume 1987b) before and under the British, today we see the worst aspects of heteronormative machismo, complete with a legal ban on homosexuality and the wide spread financialization of sexual relationships.

Ifeoma Okoye's Marxist-Feminist Anti-Imperialism

In Nigeria, socialist-feminist voices were among the most vocal against imperialism since at least the year 1946, when Olufunmilayo Ransome-Kuti transformed the Abeokuta Ladies' Club to the Abeokuta Women's Union by also admitting market women beyond the socialites who had used it primarily as a venue for high tea. The new women's union battled traditional rulers and the colonial authorities, and catapulted its leader to international fame. Funmilayo Ransome-Kuti, who was also the musician Fela's mother and who would later die as a result of her defenestration by Obasanjo's soldiers from his son's Kalakuta Republic compound, was so radical that in 1953, she became one of the vice presidents of the Women's International Democratic Federation, a Soviet sponsored umbrella organization headquartered in East Berlin; and in 1970, she received the Lenin Peace Prize. FRK started an avalanche in Nigerian radical feminism. Gambo Sawaba, Bene Madunagu, Molara Ogundipe-Leslie, and Amina Mama all followed in her wake, each representing new sensibilities that enriched Nigeria's socialist feminisms (Sawaba came from the Muslim North, Madunagu participated in a commune and is a Trotskyite, Ogundipe-Leslie's poetry and theoretical work are of global renown, and Amina Mama fights US securitization in Africa under AFRICOM today) (Mayer 2016a). Nigeria's trade union conglomerate, the Nigeria Labour Congress, adheres to a very progressive women's policy since the early 2000s and a 30% quota system (Nigeria Labour Congress 2003). It helps Nigerian radical feminists considerably that in the country, patriarchal oppression in the "traditional" form does not hark back to precolonial times (except in urban Kano and similar Northern bastions of Islam), or to premodern times, or the fog of prehistory. On the contrary, *the "traditional status quo" is obviously a product of the early twentieth century when Britain (tried to) put an end to women's political power*. The assertive qualities one finds among women in Nigeria, is factually and

historically rooted in the real socio-political traditions of the country, as opposed to the imagined community and invented traditions of colonial sanction. The brutality of neo-colonial arrangements is partly due to the strength of those traditions that obviously negate the imperialists' ideological ballast by their very survival. In the cultural sphere, this manifests in the suppression of everything to do with pre-Christian traditions as "idolatry" in the Southern regions of the country, from traditional art to other components of *habitus*. The unrelenting onslaught of televangelism and charismatic fundamentalist Christianity on Nigeria's South is among other things the cultural expression of this violent, neo-colonial form of collective imaginary that erases the region's authentic past from the collective consciousness.

In this article, I focus on the Igbo socialist-feminist writer Ifeoma Okoye, the foremost radical woman novelist of Nigeria, by way of examining her take on the plight of childless women under Nigeria's pervasive neocolonial social and political system. It would be tempting to see the plight of childless women as a problem that was uniformly rooted in inadequate knowledge structures and insufficient health care before and during colonialism (although in the latter case, the responsibility of the ruling Euro-colonials would of course already be proven). As Ifeoma Okoye shows us, there is much more to this problem than first meets the eye. It is indeed the traditional lack of awareness as to the biology of conceiving a child that had once formed an important part of the oppressive weight of societal expectations on women of child bearing age and quite often child bearing "responsibility" in Igbo contexts. On the other hand, the colonial destruction of the politico-economic power in the hands of women and with it all the creative solutions that women had found in such situations before the arrival of the European norms of the nuclear family, actually also provided the sociopolitical background to the survival of those selfsame, inadequate knowledge structures as they manifest in the early neo-colonialist era that Okoye describes in her novel.

In the 1970s as well as today, these social and epistemological ills together form the most suffocating status quo in Nigeria, complete with hair raising double standards for women and for men in many communities. The confluence of inadequate schooling/insufficient health care and social "conservatism" (in fact: *neophyte neo-colonial patriarchy that conserves nothing authentic of its context, history and provenance*) make sure that women are abused and bear the worst consequences of the patriarchal/neo-colonial system, the Southern Nigerian subsystem of imperialism.

Chimamanda Adichie's mainstream liberal Igbo (Nigerian) feminism is world famous today. According to the critic Oyekan Owomoyela, Enugu's own Ifeoma Okoye is, however, "the most important female novelist from Nigeria after Flora Nwapa and Buchi Emecheta," (Owomoyela 2008, p. 142) signaling how Igbo feminist women have continued to shape and define Nigerian women's writing since the early 1960s, and also Ifeoma Okoye's special status among radical feminist authors in the country.

There are around 12 peer reviewed journal articles that deal with Ifeoma Okoye's *oeuvre* that appeared in the last decade. Beyond Owomoyela's sympathetic exposition, Onyemachi looks at gender issues especially in Ifeoma Okoye's 2013 magnum opus, *The Fourth World* (2013) (the novel according to her "oscillates between ecofeminism and environmental psychology") (Onyemachi 2016, p. 348). For Onyemachi, "*The Forth World* represents the maternal bond shared between the female gender and nature, which are two great sources of reproduction" (Onyemachi 2016, p. 348). Onyemachi, as well as, no doubt, Okoye, link environmental decay and poor governance with Nigerian versions of patriarchy. Ifeyinwa J. Ogbazi offers a sensitive structuralist reading of Okoye, especially *Behind the Clouds* (Ogbazi 2011). Chikwenye Ogonjo Ogunyemi, a refugee academic who fled Nigeria because of Abacha's dictatorship, is a masterful African feminist voice that still influences how we think about African women writers. Ogunyemi's analysis (in true 1990s fashion) still euphemistically refers to

Ifeoma Okoye's political views as "pan-African-ist": this is true in itself but it does not do justice to Okoye's *unified socialist-feminist theory* as I shall demonstrate here.

Femi Osofisan was another important critic in terms of categorizing Okoye. He did this through an act of self-conscious group-self-denial, wherein he demonstratively included Okoye in what he called a cohort of "warriors of a failed utopia" (along with himself), in the mid-1990s (Osofisan 1996). What he meant was that she was a socialist and socialism was of course done for, with the then alleged end of history... Nonetheless, Osofisan's placing Okoye in this (for him, misguided) crème of Nigerian literature is in itself telling.

Finally, Mayer in 2018, after uncovering the history of Nigerian Marxisms in his *Naija Marxisms* (2016a), wrote a celebratory essay where Okoye's role in that movement and the role of Marxism in her oeuvre were finally addressed in an adequate way (Mayer 2018). Naturally, as relevant as Marxism has been for Okoye as a writer, there have been less politically radical, and perhaps even somewhat ethno-centric, frameworks employed in unlocking Okoye's message. The feminist critic Chikwenye Okonjo Ogunyemi calls Okoye "*Omunwa*" (Igbo for "the mother without," the "daughter of the soil") (Ogunyemi 1996, pp. 45; 303), the mother in the public domain (Ogunyemi 1996, p. 45). *Omunwa*s for Ogunyemi represent the nurturing side of Nigerian womanhood under incredible duress. Traditionally in Igbo areas, the marketplace had been a public place under the power of the women of the given community. It had had its own rules and its own shrine and deity, until the warrant chiefs of the British unsettled and later *ended* this parallel system (Matera et al. 2013; Amadiume 1987a) along with all vestiges of outright matriarchy (Ogunyemi 1996, p. 49). Women of stature had had a very important role in Igboland before colonization, so much so that the famed Women's War/*Ogu Umunwaanyi*/Aba Riots gave concrete political expression to their dissatisfaction with the shifting grounds and the loss of agency under colonial rule (Matera, Bastian and Kent 2013). Of course, it is also possible for us to understand Ogunyemi's insight in terms of

historical materialism and posit that when intellectuals such as Ifeoma Okoye stand up for the vulnerable (from young children generally to the adolescents of shanties and women of all walks of life) in their works, they perform a function that is not "natural" in the biological sense but that is rooted in specifically Nigerian forms of social resistance and historical social formations that had been matriarchal.

The Okoyes: Radical Lives

Ifeoma Okoye was born on December 21, 1937, in Anambra State, in the then Eastern Region, in Igboland. She studied in Ogbunike, in Anambra's Oyi local government area, where she received a teaching certificate in 1959. She worked at an international school in Enugu for 4 years in the late 60s. In 1974, she started university at the University of Nigeria Nsukka. She gained her BA in English in 1977 there. In 1986–1987, she studied at Aston University in Birmingham. She earned a post graduate degree (MSc in Teaching English for Specific Purposes). She went on to lecture first at Institute of Management and Technology, Enugu (1978–1992) and then at Nnamdi Azikiwe University at Awka, Anambra State (1992–2000). They had four daughters and a son with her husband Mokwugo Okoye, the revolutionary independence hero of Nigeria that the British had jailed for sedition in 1950, and who subsequently became the best-known Nigerian Marxist essayist, belletrist, and public intellectual from the 1950s to almost the turn of the millennium (died 1998). Mokwugo Okoye did not define Ifeoma Okoye: their relationship, however, resulted in the mutual cross-pollination of ideas, foci, and commitment. Although Mokwugo Okoye's political career ended early, when future president Nnamdi Azikiwe broke with incarcerated radicals to please his British patrons (Zik's *volte face* stretched from 1949 to 1954). Okoye embarrassed a number of Nigerian administrations, military, and "democratic" with his Promethean bravado that baffled Nigeria's comprador class. Mokwugo Okoye was as incorruptible as Robespierre, and he chose to drive a dilapidated Peugeot 403 even in the 1990s (Mayer 2016a, p. 126), and even as he sat on the Board of the Nigerian Broadcasting Corporation. The shocking

fact about the Okoyes always was that they lived on their legitimate income and nothing else. Mokwugo was a prolific writer, an autodidact and a light hearted, open-minded essayist in the vein of Lin Yutang, the Chinese belletrist he admired. Mokwugo's Marxism was open, non-sectarian, and critical of the USSR, where he was treated as guest of honor during his visits. His numerous volumes include A Letter to Dr Nnamdi Azikiwe, African Responses: A Revaluation of History and Culture (a panoramic work in the vein of Basil Davidson's African Genius), The Beard of Prometheus, Points of Discord, and another about 15 volumes (See more: Mayer 2016a, pp. 126–133). Ifeoma Okoye, although she touched on matters of political economy and party politics in works such as *Man Without Ears* (sic) and *The Fourth World*, examines *the political of the personal* in her other works.

Ifeoma Okoye is a household name across Africa for her young readers' series. She also writes highly successful and award winning adult books and short stories: *Behind the Clouds* (novel, 1982; received Spectrum Books Award); *Men Without Ears* (1984; Best Novelist of the Year Award by Association of Nigerian Authors; translated also into Russian), *Chimere* (novel, 1992); *Nowhere to Hide* (novel, 2000); *The Fourth World* (novel, 2013/2016, shortlisted for NLNG Literature Prize); "The Pay Packet in Touch Stone" (short story, 1993); "The Power of a Plate of Rice" (short story, 1999), "Waiting for a Son" (short story, 1999, 2000); The Trial and Other Stories (a collection of powerful short stories, 2005). "Waiting for a Son" won the Commonwealth Short Story Competition (in the African Region) for the year 1999.

Behind the Clouds: The Childless Woman as Outcast and as Rebel

After a series of extremely successful children's books and young reader's books where Ifeoma Okoye taught her target audience the virtues of community, sharing, play, thrift, and the love of learning, she decided to start writing adult literature, inspired by the example of countless contemporary African writers, especially within Longman's Drumbeat Series that gave a venue to the new generation of writers who started

publishing after independence (Ifeoma Okoye's personal communication). Behind the Clouds also appeared in Longman's Drumbeat series in 1982. The novel's plotline is not complicated: Ije Apia, the protagonist, a representative of the comfortably well-off professional class (the lower rungs of the bourgeoisie, really) cannot conceive of a child. Her shy, kind, and decent architect husband Dozie Apia, whom she had helped to graduate in the UK, years prior to the novel's timeframe, is now subject to grueling pressure from his mother and the wider family to take another wife, in order to secure that an heir is born to the clan. Virginia, Dozie's one-time paramour (and turned such only under the influence of alcohol, we are assured) suddenly shows up, claiming to carry Dozie's child, and is allowed to stay in the family's house as a "second wife," until Dozie finds out that the child is in fact not his. At that juncture, he decides to finally consider the possibility that it is him who is the real cause of the Apias' childlessness. A small operation ensues in the UK, after which Ije (who had, in the meanwhile, taken up residence elsewhere and found an office job) forgives him and the Apia family reunites in happiness. All this is told in a matter-of-fact tone, with an economy of language that revels not in flourish. I claim that this novel is an example of realism in the Lukacsian sense, including the notion that it presents a typical situation (Lukacs 1980). A number of twists in the plot make the plotline sound unrealistic or even contrived to an average Western reader. When the "second wife" shows up to claim that she has a child from the "man of the house," she is allowed to stay on, given a car and a driver, and is in fact eulogized by the man's mother, while the "first wife" suffers emotional trauma in sunken disbelief – while the husband actually loves her (!). Subplots of the novel are similarly reflective of West African social realities: "herbalists" (*juju* men) are employed by the educated and Westernized protagonist; a women's social club forces its members to participate in every ceremony it throws and charges fines in cases of skipping (as well as applies subtle pressure to ensure that members wear a new dress for each occasion); a Pentecostal faith healer (Apostle Joseph) "cures" infertility by sleeping with the affected women

of his congregation (and fathers a number of children even in the case of the protagonist's friend Beatrice); the husband finances the construction of an entire village church; the "second wife" maltreats domestics to such an extent that they run away; Ije is accused of sprinkling poison on her husband's food by the "second wife." Is it possible to treat such scientific ignorance, social carelessness, and vile attitude to life as "regular," and is it reasonable to call this a realist novel? If one considers the testimony of Marxian analyses of how Nigeria, its political economy, and its knowledge economy functions (from Mokwugo Okoye to Bade Onimode, from Bene Madunagu to Claude Ake, notably including radical feminist thinkers), and if we consider the history of cultural movements in the country from the Pentecostal revolution to Nollywood home videos and their most important themes, including the testimony of daily papers, then we must answer this question in the affirmative, with a resounding "yes": indeed, Ifeoma Okoye's novel is a prime example of realism in literature despite *or even because of* the outlandish injustices that occur throughout their narratives. It is also useful that we rid ourselves of comforting platitudes on "traditional culture" and the exotic pull of *juju*, if we aim at understanding the writer. Ifeoma Okoye makes us realize that these phenomena today serve obscurantist, socially retrograde purposes in the country. The "law of the land," feudal customary law, is a source of law along with common law and *sharia* in Nigeria; and juju has legal sanction in the case of the country's federal land law. Okoye does not allow us to imagine that the (mostly) invented traditions of the primeval forest would solve today's problems in Nigeria or elsewhere. Solidarity, genuine affection, and human emotion are the real living forces in Africa's emotional life for Okoye, while the conservatism and ignorance of the mother-in-law is in fact a useless ballast that impedes the light, while the unnecessary luxuries of Nigeria's neo-colonialist consumer culture (from bleaching creams to lace materials and related ostentation) only result in further loss of direction. The most important message of the novel, however, is a positive one: Ije gives generously (to her husband in London) but can withdraw her generosity (she leaves the house at a certain point); and she has real agency as a woman: she can take up employment, she can rent an apartment on her own, she is not defined by her husband. Dozie, her husband, is not a strong man but neither is he evil: Okoye treats his infidelity with quite a bit of understanding and allows him to reunite with his wife who gently manages his life for the sake of both of them. As Behind the Clouds appeared in the early 1980s, the landlord in the novel only asks for 6 months' rent in advance (today an entire year's rent is charged as caution money by landlords in the country). The novel's main aim is, of course, to draw readers' attention to the plight of childless women in Nigeria but also to present the social forces that provide the causal explanation for such plight. Finally, it also offers solutions as to how a woman may reclaim agency even as those social forces are at play.

Conclusion

Ifeoma Okoye belongs to the generation of Nigerian writers who would scoff at ideas of *English as lingua franca*. In fact, Okoye believes in standard English to such an extent that she published a grammar book for EFL learners just 3 years ago and where British grammar is *de rigeur* (Okoye 2016). The same goes for her attitude towards science and education in general. Okoye believes in the redemptive qualities of science, study, personal effort, and rigor. She despises escapism and especially the kind that focuses on the primeval forest and *juju*, forces that had lost their socially progressive characteristics and that had long degenerated and became useful for reactionary forces in the country. She equally detests crooked Christian pastors who destroy extant traditions. She wants to keep every useful facet that international exposure has brought to Nigeria: from English (in what she views as its correct form) to standards in public education. In this her attitude differs sharply from the similarly Marxist Kenyan novelist Ngugi wa Thiong'o who maintains that local vernaculars should be used for writing progressive literature and who criticizes English for "'colonizing the mind." Despite this difference in opinion over the redemptive possibilities that

vernaculars offer, Ifeoma Okoye still fights against the forces that underpin the economic, social, and political alliance of Nigeria to imperialist powers. In *Men Without Ears*, she points to Tanzania as an example (this was in 1983), in *The Fourth World*, she explicitly highlights the role of radical organizers in keeping alive her protagonist, and she makes ample references to her Marxist commitment (Okoye 2013). In *Behind the Clouds*, the consequences of the new "status quo" are laid bare as they really define family life in a neo-colonial country: with inadequate public health structures, on the one hand, and repressive, "double standard" spousal relations, on the other (only the woman is blamed for infertility, the traditional method of co-wives in separate houses in the same compound is not even *discussed* as an option, help from co-wives and shared labor is unthinkable, individualistic considerations seep in to dominate, there is no adjudication by women's groups as would have happened prior to the arrival of British sanctioned warrant chiefs, etc.). Thus have neo-colonial family units become *loci* of treachery, and extramarital affairs avenues for con women, says Okoye. Thus did alienation from one's own emotional labor appear in Igboland. In Ifeoma Okoye's novel, the protagonist solves these contradictions through immense personal effort while she grows and finds true agency. In her subsequent novels and short stories, though the personal effort remains, agency will be found with the help of the new, socialist collective. Does this make *Beyond the Clouds* less of a radical novel than subsequent ones? It does not: *Beyond the Clouds* is a radical novel already. In it Okoye shows us how a radical woman in a private setting may tackle the forces that are sustained by neo-colonialism and imperialism *all by herself*, and this is at least as important as any other sociopolitical fight in the Nigerian arena.

Definition

This chapter discusses the contemporary role of migration within imperialist capitalism, with particular attention to how migration is structured by borders.

Introduction

While migration has always been a feature of human societies, it has taken specific characteristics within imperialist capitalism. Although migration is often presented as an anomaly or disruption to the "normal" functioning of capitalist societies, it can be more accurately understood as "an integral element of the evolving process of production restructuring and working-class reconfiguration" (Pradella and Cillo 2015: 47; also Hanieh 2018). Borders structure imperialism, enabling multiple regimes of accumulation, differentiated geographically and socially.

Migration has taken various forms throughout the development of imperialism; this chapter focuses predominantly on the contemporary context, since the global financial crisis of 2007–2008. Following an introductory discussion, the chapter outlines the role of immigration controls enforcing international divisions of labor; the production of migrants as a reserve army of labor; immigration controls' creation of differential conditions for exploitation within the same country; and the role of racism. The consequences for class structures and class struggle are further explored through a case study of Britain.

Many scholars have noted the role of borders in sorting and filtering labor under capitalism (e.g., Anderson 2010a; Mezzadra and Neilson 2013; Hanieh 2018). Bloch and McKay (2016) note the "uneven opportunities to migrate, with border controls aimed at excluding some groups while the global elite can move freely; the growth of forced migration as a consequence of North/South relations and the need of capitalism for low-paid and often precarious workers" (5). In recent decades, a hardening of borders has been accompanied by increased "cooperation as neighbouring states work together against shared threats to their sovereign control over their territories" (Jones 2016: 68–9). Border controls have proliferated, both internally, within states' national territory, and externally, through imperialist states' control over workers' movements beyond their borders, both directly, for example, European Union and NATO deployments of warships against migrant boats in the Mediterranean, and through paid proxies, such as the EU's deal with Turkey since 2016 and the US "Southern Border Plan" involving Mexico.

Just as imperialism develops as a direct consequence of the internal contradictions of

capitalism (Lenin 1916/1975; Yaffe 2006), racism and immigration controls are driven by the imperialist division of labor (Williams et al. 1979; Cross 2013). Migration of labor and export of capital are part of the same process: countries' relation to capital shapes conditions for migration by its citizens, and where labor-intensive processes are required close to the point of consumption, it is difficult to export production, and so instead labor is often imported to imperialist countries. Social care, catering and hospitality, construction, and some parts of food processing, logistics, and agriculture are all typical of this tendency. For example, in the USA, three quarters of agricultural workers were born in Mexico, and over half of these lack immigration papers and are therefore more susceptible to exploitation (Delgado Wise and Márquez Covarrubias 2013: 127). Immigration controls regulate mobility according to the needs of capital and create differential terms for inclusion. Racism reflects these differentiated conditions and encourages their acceptance as "natural."

Lenin (1916/1975) defines imperialism as a stage of capitalism characterized by the domination of the economy and society by monopoly finance capital, resulting from intrinsic capitalist tendencies toward expansion and concentration (for more recent applications, see Yaffe 2006; Petras and Veltmeyer 2013). Finance capital represents the fusion of banking and manufacturing capital into massive multinational companies, whose operations are international but whose ownership and management are concentrated in a handful of countries. "Imperialist" and "oppressed" are used in this chapter as shorthand for countries' relationship to this system. There are significant differences of degree and quality within each category, including whether an oppressed country has political independence, which leads Lenin (1916/1975) to sometimes use "dependent" to refer to "countries which, politically, are formally independent, but in fact, are enmeshed in the net of financial and diplomatic dependence." Countries' relationship to imperialism is understood here as fundamentally rooted in their material relation to global capital, mediated by such other factors.

Maintaining Imperialist Divisions of Labor

Foster et al. (2011) point to the dependence of imperialist super-exploitation on the immobility of labor, highlighting the role of borders in containment and differentiation as well as exclusion. Production and reproduction operate across the uneven space of international capitalism, with caring relations shaped by the demands of differentially constituted labor regimes and restrictions on movement and rights of migrating workers' "dependents" (Strauss 2015). Since the 1970s, a new international division of labor has developed "to separate labor-intensive industrial production operations from information-rich capital intensive operations, and to relocate the former closer to new overseas strategic sources of cheaper labor" (Delgado Wise and Márquez Covarrubias 2013: 118). As these authors demonstrate using the case of Mexico, structural adjustment policies during this period created new arrangements to open oppressed countries to foreign capital, leading to production for export and the dismantling of many countries' forces of production, both agricultural and industrial, contributing to a huge surplus population and increasing pressure to migrate. Over the same period, immigration controls tightened in many imperialist countries, containing the vast majority of this surplus population within oppressed and underdeveloped countries.

This is part of a longer history. Feldman (2012) points to the similarities between contemporary restrictions on migration from poorer to richer countries and previous policies of "containment" against the Soviet Union, which aimed at undermining the potential for socialist countries to inspire revolution in Europe and elsewhere. He quotes the American diplomat George Kennan, credited with designing the Cold War containment strategy, who wrote in 1948:

> We [the USA] have 50% of the world's wealth but only 6.3% of its population. In this situation, our real job in the coming period ... is to maintain this position of disparity. To do so, we have to dispense with all sentimentality ... we should cease thinking about human rights, the raising of living standards and democratisation. (cited in Feldman 2012: 78)

This parallel, between the containment of socialism and the containment of the poor, is not coincidental. The relative privileges of large sections of the population of imperialist countries depend on both maintaining the incorporation of oppressed countries within capitalism and preventing their populations from escaping exploitative conditions through migration. To put this another way, autonomy of mobility for some workers is enabled through restrictions on geographical mobility for other workers, which enforce profitable mobility within the capitalist labor process.

Migrants as a Reserve Army of Labor

Marx (1890/1967) argues that capital accumulation necessarily produces a relative surplus population or reserve army of labor (RAL). Marx (1890/1967) assigns the RAL the importance of "a condition of existence of the capitalist mode of production" (592), disciplining the active labor army (ALA) through competition, forcing workers "to submit to overwork and to subjugation under the dictates of capital" (595), and determining overall wage levels, to the extent that "the general movements of wages are exclusively regulated ... by the varying proportions in which the working-class is divided into active and reserve army" (596). The RAL-ALA composition is thus central to the labor-capital relation.

In an earlier period of capitalism, emigration from Europe to the Americas and Australasia provided an outlet for surplus workers, totalling around 70 million people between 1850 and 1920, equivalent to 17% of Europe's population in 1900, limiting the expansion of the RAL and consequent impoverishment within some of the major imperialist countries (Smith 2015: 108–109). In the more recent period, migrants from oppressed countries have often been described as an RAL for imperialist countries, who can be called on during periods of increased labor demand and sent home when demand falls (Castles and Kosack 1973; Wills et al. 2010). Pradella and Cillo (2015: 48) argue that today's global RAL "is accessed by Western European capital

through outsourcing/offshoring, trade and immigration." Smith (2015: 110) outlines the important role of migrant labor from oppressed nations in imperialist countries over recent decades, including the USA, EU, and Japan, and argues that in the USA the "much larger inflow of super-exploitable Southern labor [during the 1990s] partly explains the United States' relative economic dynamism vis-à-vis Europe." But as Miles (1986) points out, many of those who migrate were in work prior to migration, contradicting their characterization as an RAL en masse. While the RAL today is overwhelmingly concentrated in oppressed countries (Foster et al. 2011), attempts to move are met with systematic violence, and the numbers who move are negligible in shifting the international distribution of the RAL.

An empirically grounded and nuanced application of the concept of the RAL to migration might be achieved by considering the impact of borders in creating class fractions with differing RAL-ALA distributions (Vickers 2019). Restrictions on migrants' rights in many imperialist countries force them disproportionately into the RAL – whether through precarious and/or low-waged employment that makes migrants constantly on the lookout for the next job or an additional job or through outright unemployment, both representing available labor from employers' perspective. Within segmented labor markets, the higher RAL-ALA ratio of migrant populations contributes to lower wages and consequently higher profit margins. State immigration controls play a central role in producing migrants as special forms of cheap labor.

Migration and Immigration Controls

Migration allows for fluctuations in demand for labor and provides skilled labor without the normal costs of training. Internationally, trends are converging toward temporary and seasonal labor migration under a discourse of "managed migration." In the USA, despite a trend toward more Mexican migrants settling for the long term, they "are often subject to labor precarization and social exclusion," including substandard housing,

discrimination in public schools, low wages, and limited access to health care (54.1% lacking health insurance) (Delgado Wise and Márquez Covarrubias 2013: 129). The operation of borders has shifted, in ways that Hanieh (2018) summarizes as the securitization of borders, the growing involvement of private capital and nongovernmental organizations in migration management and the externalization and extra-territorialization of borders. These developments have increased the discipline exercised by states over the working class, incorporated increasingly wide layers of the population within the physical and ideological operation of racialized border controls, and sharpened lines of differentiation.

The percentage of the world's population who are resident outside their country of origin has not changed substantially in recent decades, although a growing global population has led to an increase in absolute numbers (Crawley et al. 2018: 14). Migration occurs on a significant scale between imperialist countries and between oppressed countries, with the latter increasing in significance in recent years, "often clustering in special economic zones located on borders, and producing goods within regional production chains . . . partly indicative of the regionalization of capitalist production circuits, and the emergence of new poles of accumulation in places such as East Asia" (Hanieh 2018). Imperialism also creates structural tendencies for migration from oppressed to imperialist countries, on terms that leave little agency for migrants, and politicizes these movements as a "problem" requiring management. This results in class fractioning within imperialist countries, mirroring the international division of labor.

Some of the main drivers of contemporary migration include conditions of poverty and inequality that lead families to sponsor some of their members to move for work and send back remittances; authoritarian state practices in many oppressed countries, driven by the need to enforce exploitative conditions; wars, resulting from imperialist countries' pursuit of profits against their rivals or as the intervention of last resort against governments that refuse to cooperate with imperialist exploitation; and environmental destruction, resulting from the unplanned and

inherently expansionary nature of capitalist production. "Development" under imperialism does not reduce out-migration; indeed, within sub-Saharan Africa, wealthier countries tend to have higher rates of out-migration than poorer ones (Bakewell 2011: 132–3). As Cross (2013) shows in detail regarding West African migration to the EU, movements of people have been shaped in part by systematic dispossession of households from their means of production and subsistence affected by capitalist development, alongside the development of sites of transit and recruitment that create opportunities for the sale of labor power.

Remittances provide an important source of foreign currency for oppressed countries to buy imports, benefiting multinational companies, and enable the reproduction of labor power in oppressed countries despite a lack of waged employment and state welfare. For example, Smith (2016) reports: "in 2013 each of Britain's 210,000 Bangladeshi migrant workers remitted an average of $4,058, three times the annual wages of his (most Bangladeshi migrant workers are male) wife, sister, or daughter working in a garment factory back home" (44). The World Bank (2018) estimates remittances to low- and middle-income countries totalled $466bn in 2017 and the real figure is likely to be higher because many informal transfers are unrecorded. One in seven of the world's population, more than a billion people, is involved in remittances as senders or recipients. Consequently, Hanieh (2018) argues that "migration (and its associated remittance flows) is a major route through which much of the world's population is integrated into global capitalism," and attacks on migrants have ramifications for their dependents back home. Recipients' reliance on remittances encourages migrants to tolerate poor conditions. A survey of low-paid migrant workers in London found 71% sent money home, on average remitting 20–30% of their income, mostly as contributions to daily subsistence. Those with the highest levels of remittances were also those working the longest hours (Datta et al. 2007b: 51–9). In some cases, such as the EU following the 2007–2008 financial crisis, economic downturns have not led to a

decline in migration and remittances, because of migrants' willingness "to endure considerable hardships to support their families back home" (Schierup and Castles 2011: 17). In a survey of 402 migrants in North East England during 2014–2015, out of those who said they lacked sufficient money for necessities for themselves, 31% said they still remitted money (Vickers 2019). In other cases, such as Saudi Arabia following the fall in oil prices in 2014, mass deportation campaigns spatially displaced the effects of economic downturns onto migrants' countries of origin (Hanieh 2018). Remittances thus do not combat inequalities within imperialism but rather sustain them in multiple ways.

Migrants' experiences are becoming increasingly polarized, in terms of "access to labour markets but also modes of entry into nation states" (Bloch and McKay 2016: 16). Yet, compared to an earlier period following World War II, today "not only less skilled but also skilled migrants are now subject to temporary-migration schemes" (Piper 2011: 70–71). This conditional mobility of labor combines with highly mobile capital to result in a situation in which "workers everywhere no longer have a quasi-monopoly of jobs but must now compete with an apparently 'inexhaustible pool of potential labour' in the global economy, creating for capital a supply of labour of comparable efficiency but at different prices" (Lewis et al. 2015: 581). Exports of capital and imports of labor operating under differentiated regimes are thus part of the same process, and internal differentiation has been intensified by reductions in state welfare in many imperialist countries that have accentuated "the differentiation of the conditions of exploitation and reproduction of labour-power of heterogeneous complexities through the superimposition of the formal mediation of citizenship (and/or through the reassertion of the formal mediations of race, ethnicity, and gender)" (Starosta 2016: 83).

Smith (2015: 112) points to the contrast, between surplus labor trapped by immigration controls in oppressed countries and the large numbers of skilled workers who migrate. For example, estimates suggest that more than half of the doctors and a quarter of the nurses trained in Ghana

emigrate (Bakewell 2011: 136–7) and from 1995 to 2004, Tanzania lost 78.3% of its doctors this way (Smith 2015: 112). This "brain drain," echoed in many other oppressed countries, represents another form of national exploitation, enabling imperialist countries to benefit from training paid for by oppressed countries and creating pressure for oppressed countries to raise wages for professionals, driving within-country wage inequality (Smith 2015: 112).

"Replacement migration" chains have developed based on countries' relative positions within imperialism, involving, for example, the migration of British nurses to the USA or Canada, replaced by South African nurses, in turn replaced by Zimbabwean nurses, all seeking better conditions, or similarly Polish nurses migrating to Sweden, replaced by Moldovan nurses, in patterns that are sector-specific and gendered (Piper 2011: 64). Farris (2015) points to the connection between the precariousness of migrant women's work and their concentration in the so-called reproductive sector, with 42% of migrant women across the EU-15 countries working in "the care-domestic sector in private households, the care sector in hospitals, residential care and home care and cleaning activities," not including undocumented migrants performing private domestic work in households in the "shadow economy" (6–7). In many major destination countries, an increase in female participation in the labor market has created demand for low-paid care-related services, fulfilled for the most part by migrant women (Piper 2011: 65–6; also Farris 2015). Gendered migration has thus enabled an increase in non-migrant women's availability for waged labor, offering the illusion of progress toward gender equality.

International inequalities in wages, conditions, state support, and overall standard of living lead some people to accept wages and conditions that are poor by the standards of their country of residence, but compare favorably to their country of origin (Anderson 2010a; Wills et al. 2010: 7). For example, in Mexico the average wage for manufacturing jobs is US$2.57 per hour. In the USA, an undocumented Mexican migrant can expect to earn US$5 per hour for similar work,

considerably more than if they remained in Mexico even though it is far below the formal US employment rate of US$16.45 (Delgado Wise and Márquez Covarrubias 2013: 128). These wage differentials are further supported by circuits for the reproduction of labor power that extend across borders, for example, through circular migration and transnational family structures, which partially extend the lower costs for the reproduction of labor power in oppressed countries to migrants from these countries within imperialist countries (Hanieh 2018). This contributes to qualitative differences in workers' relationship to capital, combining with differential rights connected to immigration status.

Beyond borders' role as a filter for labor according to capital's spatially differentiated needs, they also help to shape the character of labor. As Anderson (2010a) argues:

> Immigration controls function both as a tap regulating the flow of labour, but also ... as a mould shaping certain forms of labour. Through the creation of categories of entrant, the imposition of employment relations and the construction of institutionalised uncertainty, immigration controls work to form types of labour with particular relations to employers and to labour markets. (301)

Mezzadra and Neilson (2013: 101–102) argue that immigration controls do not only "mold" those who cross international borders but also wider class structures. Categories produced through borders have material, legal, and ideological dimensions, combining to harness the creative capacity of living human beings to generate surplus value for the capitalist class.

All migration has implications for labor, not only that which takes place under formal economic migration categories. Complementing this, Anderson (2010b) points out the complexity of the factors that lead to segmented labor markets, including employers' racialized stereotypes about "types" of migrants and the requirements of jobs, from formal skills to "soft skills" and preparedness to work in certain conditions (109–11). Social networks can also play an important role in structuring migrants' position within the workforce, helping migrants find work but sometimes sustaining disadvantaged positions and carrying

obligations that can deepen migrants' oppression (Bloch and McKay 2016: 12).

Paine (1977) argues that the general population do not directly benefit from migration but instead see the consequences of "ghetto housing, overcrowded schools and hospitals, sexually frustrated young men, etc., all of which generates social tension which gets blamed on the migrants themselves" (207). The more that the ruling classes benefit from the super-exploitation of migrants, by keeping down social provision in the areas where they are concentrated, the more they appear in everyday experience to be a burden. In the absence of strong political movements capable of offering a systematic analysis of the causes of people's problems, this fuels the growth of racism.

The Role of Racism

Often, academic literature focuses either on migration *or* race. For example, Datta et al. (2007a: 404) note the predominant framing in much of the British industrial relations literature of workers according to ethnicity regardless of migration background. Racism has a long history, predating capitalism, but in its current form, it is shaped by the divisions produced through imperialism, with borders playing a central role in structuring racialization (Hanieh 2018). As Smith (2016) points out, racialization is shaped not only by identities or differential conditions within Britain but also international competition and consumerism:

> The increasingly global character of the social relations of production and the increasing interdependence between workers in different countries and continents objectively strengthens the international working class and hastens its emergence as a class 'for itself' as well as 'in itself', struggling to establish its supremacy, yet, to counter this, capitalists increasingly lean on and utilize imperialist divisions to practice divide and rule, to force workers in imperialist countries into increasingly direct competition with workers in low-wage countries, while using the cheap imports produced by super-exploited Southern labor to encourage selfishness and consumerism and to undermine solidarity. (46)

Migration forms a particularly intense and contested component within this wider system of divisions, leading to the racialization of British immigration controls (Sivanandan 1991). By dividing the working class, racism and nationalism increase "the precarity of labour relations and intensif[ies] the exploitation of virtually all workers" (Pradella and Cillo 2015: 47).

National oppression forms the basis of racism toward migrants from oppressed countries (Williams et al. 1979), their descendants, and anybody else associated with these countries through skin color, religion, accent, dress, or other markers. As Cope (2015: 62) says:

> The development of capitalism on a world scale produced deep-seated economic, political and cultural inequalities which, in the minds of its defenders (also its beneficiaries), have congealed *ideologically* around the ascription of supposedly natural characteristics – those which fit them for domination or subjection – to peoples and nations.

This explains the targeting of people that may be diverse in many ways, but have in common association with an oppressed country. Hierarchical racialized categories shift over time, for example, Karakayali and Rigo (2010: 127–31) trace the dominant "figures of migration" in Europe since World War II, moving through the "guest worker" to the "refugee" to the "illegal migrant." Connections can be traced from these figures to the changing needs and conditions of European capitalism, as the labor needs of postwar expansion gave way to falling labor demand and the strategic use of asylum for Cold War "dissidents" to demonstrate the supposed moral superiority of capitalist democracies (Schuster 2003), and on to the deepening capitalist crisis and consequent drive to create super-exploitable workers without rights through "illegalization" (Oliveri 2012).

Today, racialized systems of governance reconcile systematic violence and deprivation of liberty with liberal values and obscure borders' political role:

> One of the most shocking features of this new racism is its capacity to develop reasonable discourses, apparently based on matters of fact, race-neutral principles and politically correct postures, through which discriminations become de facto and de jure acceptable for a large share of the population, still believing in democratic and egalitarian values.... Besides the crucial criminalizing frame, there are many other discursive strategies that essentialize, racialize and orientalize migrants while depicting them as a threat and as a resource in relation to the main interests of the receiving societies – security, well-being and identity. The representation of migrants as victims completes the picture: it contributes, at the same time, to patronize and de-politicize them and to offer a positive self-presentation of Western societies as 'doing good things for migrants' such as rescuing them from oppressive regimes, miserable living conditions and backward cultures. (Oliveri 2012: 800–801)

Furthermore, Mishra (2018) describes the connections between racialization and imperialist foreign policy: "launching military campaigns, often without bothering to secure the consent of a frightened people, and while supporting despotic leaders they talk endlessly of their superior "values" – a rhetoric that has now blended into a white-supremacist hatred . . . of immigrants, refugees and Muslims" (6). People categorized as "ethnic minorities," who might be more accurately described as racialized minorities to reflect the active process of racialization (Oliveri 2018), are thereby placed in an oppressed position susceptible to super-exploitation. This helps shape class relations, in ways that are particularly acute in imperialist countries, illustrated below through a case study of Britain.

Case Study: Migration to Imperialist Britain

Applying Lenin's definition, Britain has pronounced imperialist characteristics. In recent decades Britain's economy has been increasingly reliant on surplus value drawn in from overseas investments and the financial sector in myriad ways, including returns on loans and export of financial services (Norfield 2016). In 2014 Britain's external assets (foreign investments) totalled £10,171.7bn (ONS 2015), more than 5.5 times gross domestic product (GDP). Rates of return from foreign direct investment, which accounts for around 10% of Britain's total overseas assets, were 9% for investments in Africa and 13% in Asia in 2014, compared to 5% returns on

investments in Britain and the north of Ireland (ONS 2015). This represents imperialist super-exploitation.

A large part of Britain's investments abroad takes the form of loans, an example of what Lenin (1916/1975) calls a "gigantic usury capital" that is typical of imperialism. Britain is highly dependent on the import of goods, with a net deficit of £123.7bn in 2014, and finances this to a great extent through the export of services, with a net surplus of £89.1bn (ONS 2015). Twenty-nine percent of Britain's service exports are accounted for by financial services, the highest for any of the G7 group of wealthy countries. Financial and insurance services employed more than a million people in 2013 and accounted for 6.8% of GDP, again the highest proportion for any G7 country (Banks et al. 2014). Financial services do not produce anything but simply redistribute surplus value produced elsewhere in the global economy into the hands of British finance capitalists. This reliance on the financial sector places the City of London at the heart of British capitalism, making it vital that the city's global position is sustained.

New Migration to Britain

Low-skilled, strongly gendered, and often temporary migration to the EU from outside has grown rapidly in recent decades, alongside highly skilled migration from outside and various forms of movement within the EU, with increasing polarization. Schierup and Castles (2011: 23) identify tendencies across Europe toward inclusion of migrants in formal rights alongside ongoing "real economic and social exclusion," enforcing acceptance of low-paid, insecure work. Migration to Britain continued despite the economic crisis, and protecting continued mobility for "highly skilled" workers has been a major concern within discussions about Britain's departure from the EU (*Financial Times*, 19 October 2016). In total, around 8.3 million residents of Britain and the north of Ireland were born abroad, around 12.5% of the total population (Alberti 2017).

In 2008, the labor government introduced a points-based system for migration from outside the EU, representing a new stage in the fine-tuning of immigration to the needs of British capital. This system allocates points according to attributes including qualifications, skills, English language competence, age, and income, with a top tier in which "high-skilled" migrants, generally from more middle-class backgrounds and speaking excellent English, are granted greater rights, followed by workers with more limited rights, often tied to specific employers. The bottom tier, for "low-skilled migrants," was indefinitely suspended as soon as the system was launched, given the availability of labor from other parts of the EU. Differences in migrants' class position within Britain correspond closely to the position of their countries of origin within imperialism. As Datta et al. (2007a) note:

> ...those coming to Britain from high-income countries have been crucial in helping meet a still growing demand for high-skilled workers, with around a third (36%) of those coming from Japan and a little under a quarter (23.1%) of migrants from Germany who are now living in London finding employment in managerial positions. (412)

A policy advisor from a business membership organization reported that the ability to quickly meet skill needs in response to changing customer demands was a significant motivation for British companies to recruit internationally (Vickers 2019). They indicated migration chains in some sectors, where graduates in digital and IT industries were leaving North East England for London, increasing the need to bring in migrant labor or outsource to workers resident in another country. At the other end of the workforce in terms of status and pay, key sectors of the British economy are reliant on low-skilled migrant labor.

In 2004, eight formerly socialist countries in Eastern Europe joined the EU, followed by Bulgaria and Romania in 2007. They entered the EU in a position subordinate to the interests of the big European imperialist powers; this offered British capital access to a substantial new source of labor, and their subordinate status was reflected in the treatment of migrants from these countries. Poland was the largest single source of EU migrant labor during this period. Prior to joining the EU, Poland had experienced the fastest growth and fastest privatization of all the former socialist

countries in Eastern Europe, the highest unemployment rate of any EU Member State, and lower per capita GDP than many other Eastern European countries. It shared other typical features of the formerly socialist countries, wherein:

> Job security has been replaced by insecurity, through casual contracts.... [The] unemployed rely on low-value state benefits and on informal legal and illegal income-generating activities.... employers resort to the use of self-employment contracts, enabling avoidance of health and safety responsibilities, regular pay increases and payment of social contributions, and to shed staff more easily.... In some workplaces employers have been quick to dismiss workers who try to join or organize unions. (Hardy 2008: 6)

This offered a ready supply of unorganized labor under pressure to migrate.

Migrant workers from Eastern Europe have faced systematic discrimination within Britain, based on attributes such as accent and language (Ashe and Nazroo 2016; Vickers et al. 2016), and have been disproportionately concentrated in poorer sections of the working class. In 2014–2015, 83.7% of Polish adults in Britain were classified as economically active, compared to 59.4% of the general population. This reflects the conditional nature of their presence within Britain, dependent on the sale of their labor power. This conditionality has been enforced by special restrictions on access to out-of-work benefits and some other forms of state support, beyond those affecting British citizens and backed by the deportation of those without means to support themselves. State-enforced compulsion to work reduces the possibility of turning down work because of low pay or poor conditions. In 2014–2015, 31.4% of Polish migrants in work were employed in "elementary occupations," more than three times the percentage for the general population, and Polish workers' median hourly pay was £7.94, compared to £10.81 for the general population. The reliance on EU migrant labor in some sectors reached around 40% for "packers, bottlers, canners, and fillers" and "food, drink, and tobacco process operatives" (Morris 2017: 24–5). Dustmann and Frattini (2014) show that EU migrants who arrived during 2001–2011 made a net contribution of £20bn to Britain's public finances, representing a massive transfer of wealth to Britain. Although demographics and sectorial compositions differ across Britain, the prevalence of differential inclusion is consistent. Labor segmentation has coincided with social exclusion, including divisions between migrants from different countries, undermining potential for class-based solidarity against exploitative working practices (Datta et al. 2007a: 422–3). Since 2008, growing numbers of people have also moved to Britain from Southern Europe, fleeing the even more intense impacts of economic crisis and austerity in those countries (Alberti 2017).

Meardi et al. (2012) argue that the benefits of EU10 migrants for British employers have resulted as much from their mobility, as from their readiness to accept low wages:

> It would be simplistic to see intra-EU mobility as just a strategy, by governments and employers, to lower labour costs and weaken trade unions.... In fact, wages seem to have been affected only marginally in the EU15 . . . real wages had already been stagnant in Western Europe for a while, and unions declining, so there was no urgent need for EU employers to import foreign labour to stop wage or union growth.... more than low costs, the specific attractive feature of the new labour supply relies exactly on their 'mobility', which offers a corrective to the longblamed 'sclerosis' of European labour markets. (8)

Sporton (2013: 445) connects the deregulation of labor markets since the 1990s and the shift to "managed migration" since 2002, as part of a neoliberal drive to create a workforce within Britain that is "flexible" from the perspective of employers but "precarious" from the perspective of workers themselves. As part of this shift, they point to the explosion of agency employment, from 775,000 to 1.37 million between 1997 and 2007. In a survey of over 1000 employers, all of those who employed a disproportionately large number of EU migrants had recruited them via an agency (CIPD 2013: 16). This has led to invisibility for many migrant workers at the bottom of supply chains, because their employment via agencies means their employment is recorded in the category of "administration, business, and management" – the largest sector of employment for Eastern European workers by far according to

the Border and Immigration Agency in 2008 (Hardy 2008: 10).

The tailoring of immigration controls to the needs of British capital has been further reinforced by restrictions on migration on grounds other than employment or investment, for example, to study, for family reunification or for asylum (Vickers 2012, 2019). This reflects compliance with waged labor or private ownership of capital to invest as the dominant forms of conditionality for migration to imperialist countries. Alongside the intensifying capitalist crisis, Britain's border controls have extended internally, intensifying conditions for super-exploitation.

Internalizing Immigration Controls: The "Hostile Environment"

In 2013, the Home Office created the Interventions and Sanctions Directorate (ISD), with the explicit aim of building partnerships to push undocumented migrants out of Britain:

> The unit has overall responsibility for removing incentives for people to stay illegally and encourage those who are in the country unlawfully to regularise their stay or leave the UK.… The unit works closely with government departments and a range of other partners across the public and private sectors to identify those migrants accessing such services and benefits to which they are not entitled. (ICIBI 2016)

In 2014 the government passed an Immigration Act that extended border controls into many areas of everyday life (Wemyss 2015), including health care, private-rented housing, employment, banking, and driving private vehicles. This built on pre-existing arrangements for data sharing to enable immigration enforcement, for example, a relationship between the Home Office and the Driver and Vehicle Licensing Agency (DVLA), established in 2005 and extended in 2008 (ICIBI 2016), and restrictions on benefits and health care. A further Immigration Act in 2016 continued down the same road, increasing sanctions for non-compliance.

Businesses, local authorities, charities, and Members of Parliament (MPs) have also been involved in the hostile environment. For example, Bales (2017) discusses the "arrest by appointment" of 35 workers in July 2016, after their employer, Byron Burgers, told them to attend meetings deliberately timed to coincide with immigration raids. Protests opposing this collusion followed outside several Byron outlets across Britain. As with many other elements of the hostile environment, this represented an intensification and systemization of longer-term trends, with precedents including alleged collaboration between the University of London School of African and Oriental Studies (SOAS) and the Home Office to deport cleaners fighting for a living wage in 2009 (*The Guardian*, 27 June 2009). In another example, Corporate Watch (2018) documents collaboration between at least 12 London borough councils, the Greater London Authority, homelessness charities, and the Home Office to deport homeless migrants, with similar practices reported in Bristol, Brighton, and other cities with large numbers of rough sleepers. A high court ruling in December 2017 found the deportation of EU citizens on grounds of street homelessness to be unlawful, but campaigners allege their involvement continued. During 2012–2018, MPs reported more than 700 people for suspected "immigration abuse," presumably mostly constituents approaching them for help (*The Independent*, 23 June 2018).

Migration and the Labor Aristocracy

Phizacklea and Miles (1980: 6) use the concept of "class fractions" to describe "objective position[s] within a class boundary which [are], in turn, determined by both economic and politico-ideological relations," whose composition and relationships must be empirically established. This offers a way of understanding class divisions arising from imperialist borders and immigration controls, including polarization within long-established racialized minority sections of the working class, differentiation among recent migrants, and forms of relative privilege enabled by imperialist super-profits, giving rise to a "labor aristocracy." The remainder of this chapter focuses on the latter, in relation to migration. The term "opportunism" (Lenin 1915/2005) expresses political tendencies toward the defense of narrow, short-term interests of particular class fractions rather than the long-term interests of the entire working class. Within

Britain, this has taken the form of chauvinist trends within the working class, who align their interests with imperialism and follow the lead of the British ruling classes against workers from other countries. These divisions are unstable, and while processes of fractioning are always underway, distinct fractions often become visible only in moments of intense struggle, when underlying processes burst to the surface in mass collective action.

Within Britain, trade unions have often failed to represent the interests of the whole working class and have instead tended to consolidate the position of a labor aristocracy whose privileges rely on the maintenance of imperialism and consequently complicity with racism (Clough 2014; Carbonella and Kasmir 2018: 14). This gives the labor aristocracy an interest in the fragmentation and subjugation of the working-class majority and provides a material basis for chauvinism and racism among the working class, beyond the purely ideological dimensions discussed by Virdee (2014). This material basis suggests that such divisions are intrinsic to imperialism.

While a minority of racialized minority workers has been drawn into the labor aristocracy, particularly since the 1980s, and their example has been used to encourage aspirational individualism, the majority remains in a super-exploited position that has much in common with new migrants. The enduring insecurity of racialized minority sections of the working class was vividly illustrated by the attacks on the so-called Windrush generation, which made headline news in 2018. The Windrush generation refers to people who moved from the Caribbean to Britain in the decades after World War II as commonwealth citizens, symbolically represented by the docking of the MV Empire Windrush on 22 June 1948. They were granted British citizenship as part of the 1971 Immigration Act, alongside restrictions on further migration. In 2016 reports began to appear about people within this group being refused access to state services because they had no documents to prove their citizenship. For example, Albert Thompson, who arrived from Jamaica as a teenager 44 years before, found

himself denied cancer treatment by the NHS (*The Independent*, 25 April 2018). Hundreds more are thought to have been deported (*The Guardian*, 5 June 2018). Home Secretary Amber Rudd responded to the ensuing public outcry by saying this was all a mistake and subsequently resigned, and Prime Minister Theresa May promised compensation. Yet, these apologies are undermined by the existence of a Home Office pamphlet, first issued in 2010, titled *Coming Home to Jamaica*, which offers guidance to those deported after decades living in Britain. This demonstrates the extent to which lines of entitlement are shifting in the current British context, and borders are expanding their operation to ensnare growing numbers of people. As Schierup and Castles (2011: 24) argue, established members of racialized minority groups have weaker claims to social citizenship than white citizens and, in the context of the capitalist crisis, are moving closer to the situation of temporary migrants and refugees.

Britain's labor aristocracy has taken various forms, from industrial sectors directly connected to colonialism in the late nineteenth century, to higher-paid public sector workers in the second half of the twentieth century, and workers in the financial sector today. Trade unions in Britain today largely fail to organize among, let alone represent, the most oppressed sections of the working class. Membership has fallen, in absolute terms and as a proportion of the workforce, and has become more middle class (BIS 2017). In 2016, union membership among people earning over £1000/week was proportionally higher than among those earning less than £250/week (BIS 2017: 29). Higher-paid trade unionists outnumbered those in lower-paid roles by 4:1 in 2016, increasing from 2014 when it was 3:1. This was at a time when there were 5.1 million low-paid workers. The concentration of highly paid workers within Britain's unions cannot be accounted for by gains won through struggle. Indeed, the "trade union premium," wage differentials associated with union membership, actually fell between 1995 and 2016 from 15.3% to 7.6% for the private sector and from 30.4% to 14.5% for the public sector (BIS 2017: 41).

Following a series of mergers, Britain's trade union movement has become dominated by massive monopolies, with the biggest three unions, Unite, Unison, and GMB, together accounting for over half of Trade Union Congress (TUC) membership. This has included the merger of unions whose members are employed at very different levels of seniority, meaning that low-paid workers may be forced to be in the same branch as their managers. In addition, these mega-unions have a significant stake in the system, including huge investments in properties and shares. In 2009 the big three unions received a total income of £386.5 million and paid out only £3 million in strike pay (Clough 2010). These characteristics of union membership, structures, and financial membership help to explain the historical tendency for British trade unions to be reluctant to support migrant workers or to be outright hostile (Richmond 2002). Trade union membership in 2016 was 16.2% among workers born outside Britain, compared to 25% among workers born in Britain (BIS 2017: 5).

Yet despite these tendencies to divide the working class, disunity and antagonism is not a foregone conclusion. The labor aristocracy is not a mechanical consequence of relative privilege, but also political, and therein lies the possibility for opportunism to be challenged and alliances to be formed. Britain's engineering construction worker strikes of 2009–2010 provide an example of both the pressures toward opportunism and the possibility for more internationalist positions to win through.

These strikes began on 28 January 2009, when workers at Lindsey Oil Refinery in North Lincolnshire were told that IREM, an Italian company that was due to take over a third of the contract, on behalf of the French multinational Total, was refusing to employ British labor. Another subcontractor, Shaw's, had issued 90-day redundancy notices in mid-November 2008, meaning that workers already facing redundancy in mid-February would not be allowed to apply for the IREM jobs. They were also told that the Italian and Portuguese workers IREM was planning to employ would be housed on floating barges for the duration of the job and would be bussed back to the barges for lunch – interpreted as an attempt to keep them separate from British workers and trade unions. The entire workforce across all subcontractors voted for strike action, and the following day over 1000 workers from Lindsey, Conoco, and Easington sites picketed Lindsey. The strike called for international equality and unionization, driven by grassroots unofficial action, as Gall (2009) describes:

> …when the assembled workers voted to walk out, the entire stewards' committee (on advice from Unite EUOs) resigned in order to distance the union from 'unlawful action'. An unofficial strike committee was then elected which formulated the strikers' demands following approval at a mass meeting on the strike's third day. These were: no victimisation for taking solidarity action; all ECI [Engineering Construction Industry] workers in Britain to be covered by the NAECI [National Joint Council for the Engineering Construction Industry] agreement; union controlled registering of unemployed and locally skilled union members, with nominating rights as work becomes available; government and employer investment in proper training/apprenticeships for a new generation of ECI workers; all migrant labour to be unionised; union assistance for immigrant workers – including interpreters – and access to union advice to promote active integrated union members; and building links with construction unions on the continent. (418)

Following this, the unofficial strike spread to over 20 sites across Britain.

Neither local strike leaderships nor their unions ever officially endorsed the slogan "British jobs for British workers," which some workers used on placards in the early days of the strike, quoting Labor Prime Minister Gordon Brown. Attempts by the far-right British National Party (BNP) to intervene in the strikes and recruit to their "solidarity" union front were firmly rebuffed, and BNP members were reportedly chased out of the car park outside a mass meeting at the Lindsey plant. Yet "British Jobs for British Workers" was used to characterize the strikes in much of the capitalist media, ignoring the context in which it had been raised:

> Following the government's spending billions of pounds of public money in bailing out banks and indemnifying them against their losses, the strikers sought to make the point that they too demanded government protection.… The first strike at

Lindsey concerned IREM's practice of exclusively using Italian and Portuguese workers specifically brought into Britain for this work and excluding local labor, whether British or non-British. So this was not a strike against the use of overseas workers per se, and the strikers did not call for the expulsion, repatriation, or sacking of "foreign" workers.... After the strike committee asserted itself, the slogans on the placards changed to "fair access for local labor" where "local" meant already domiciled worker and was not a cipher for "British" or white "British" workers. The two unions then repeatedly made statements like, "Our fight is with the employers who want to tear up our [NAECI] agreement and undermine our hard-won conditions at Staythorpe and wherever else. Not with the workers they seek to exploit" (Gall 2009: 422).

The strike was settled with an agreement that included an end to the segregation of foreign workers.

Following these successful strikes, in June the same year, 51 workers employed by Shaw's at Lindsey were made redundant without consultation, or the industry norm of the opportunity to transfer to another of the site's contractors, and with only a week's pay in lieu of notice. Simultaneously another subcontractor at the site took on 60 new workers to perform similar work. According to a GMB union press release, a senior manager at the site blamed the refusal of a transfer option on "an unruly workforce who had taken part in unofficial disputes and who won't work weekends." Workers responded by calling for unofficial solidarity actions across the industry. Three days later contractors, with the backing of Total, announced the sacking of a further 647 workers for participating in unofficial strikes. Total initially agreed to talks with unions and the Advisory, Conciliation and Arbitration Service (ACAS), but failed to turn up. The 647 workers were given the option to reapply for their jobs, seemingly an attempt to weed out leading trade unionists. Workers responded by publicly burning their dismissal notices; solidarity strikes spread to more than 20 sites, including Polish workers at Drax in North Yorkshire, with 900 contract workers at the Sellafield plant in Cumbria stopping work for 3 days. Faced with such unity, Total made a statement expressing hope that its subcontractors at Lindsey would soon reach an agreement allowing work to resume. As 2000 workers rallied outside Lindsey, the Unite and GMB unions announced their official endorsement of the strikes, with GMB pledging a £100,000 hardship fund. The strike ended with an agreement between Unite, GMB, and the managing contractor Jacobs, including the full reinstatement of all sacked workers for at least 4 weeks, following which national terms would be followed for any further redundancies.

These strikes demonstrated that despite material divides within the working class, and attempts by the capitalist media and politicians to encourage chauvinism, a more internationalist approach can win out. Faced with determined and independent action by workers, the unions had little choice but to give official support, if only to end the dispute. The strike committee at Lindsey played a crucial role in maintaining a degree of independence from the union leadership to drive the action forward. However, it is important not to overstate these victories: even after the 2009 strikes, employers continued to employ migrant workers below industry rates (Gall 2009: 426–7). Similarly, the danger of a chauvinist direction to trade unionism in the industry did not disappear and required constant political struggle. Other examples suggest continuing failures by Britain's major trade unions to integrate migrants, leading to splits in recent years from Unite and Unison to form new workers' organizations including the IWGB and United Voices of the World (Alberti and Peró 2018).

Conclusion

While immigration controls produce tendencies toward class fractioning, to the detriment of the working class, migration itself offers opportunities for international alliances and solidarity. Although some have suggested that the presence of immigrants weakens worker solidarity and radicalism, Strikwerda and Guerin-Gonzales (1998) argue that the evidence for this comes "almost exclusively from the pre-World War I United States or contemporary Western Europe – both periods of apparent 'failure' or 'conservatism' of

the labor movement as a whole" (24–5). The authors cite other examples where unions have included and in some cases been led by migrants. Virdee (2014) gives other examples of migrants who have been part of working-class leaderships in Britain, and Alberti and Però (2018) discuss more recent examples (also Oliveri 2012, 2018; Vickers 2014). Writing about the exploitation of Russian migrant workers in Europe in an earlier period of imperialist crisis, Lenin (1913/1977) points to mutual learning and class development through international migration, both taking workers "out of their semi-feudal conditions and . . . putting them in the ranks of the advanced, international army of the proletariat" and introducing new methods, for example, "Workers who had participated in various strikes in Russia introduced into America the bolder and more aggressive spirit of the mass strike" (454–7). This reflects the potential for special kinds of exploitation to produce special forms of resistance and for international migration to strengthen the working class.

Imperial Tastes and Imperial Rule in Nineteenth-Century India

Kawal Deep Kour
Institute for Narcotics Studies and Analysis (INSA), New Delhi, India

Definition

This essay attempts an analysis of how imperial expansion was intertwined with the dynamics of trade and networks of production, consumption, and exchange of psychoactive substances. The intake of psychoactive substances has encoded meanings with cultural, social, spiritual, meta-physical, and transmutative effects. Exploring this vital dimension of the impact of addictive commodities in shaping patterns of dominance (in this context, sugar, tea and opium), this essay explores the economics of opium, the politics of the Empire and its role in effecting a metamorphosis of landscapes and livelihoods in the Indian subcontinent.

It was through the networks of distribution that the stories of sugar, tea, and opium were set to intersect and entwine the colonial British Empire in Asia. What linked the commodities were the shifting patterns of dietetics that sugar and tea fostered first in England and later Britain. The adding of milk to tea was reported in France around 1680 but that practice was not originally connected with adding sugar. The physician and philanthropist John Coakley Lettsom (1744–1815), in an essay of 1772 titled "Natural History of the Tea-Tree" (about the various benefits gained from drinking tea), recommended it as an alternative to "vegetable infusions" on the grounds of superiority in "taste and effects."

Soon, tea drinking began to be associated with wide-ranging discourses from culture of health to culture of respectability, to becoming a symbol of patriotic zeal. In 1783, the annual consumption of tea in England was about 5,000,000 lb. and the tea duty was 27%. In 1784, Pitt, lowered this duty to 12%, thus, extending the use of tea among the

poorer classes of society. Tea and sugar consumption were considered to be patriotic as they supported the British Empire. There exists sufficient evidence to document the enormous increase in sugar trade in consequence of the increased consumption of tea. Medical articles of the early nineteenth century hailed sugar as a most valuable article of diet, as a "restorative" and capable not merely of supporting but strengthening life. Superintendent of agriculture Charles Alfred Barber, a botanist and taxonomist (in his essay titled, "Sugar Cane and Health," *Knowledge* [1892]) reported that 72 lb. of sugar per head was consumed annually by the inhabitants of Great Britain and Ireland, 52 lb. in the US, 25 lb. in France, and only 17 lb. in Germany.

The "Psychoactive Revolution," which Courtwright (2005: 1) mentions is what triggered the mass consumption market, was followed first by massive mercantile pursuits and later by an advocacy of imperial dominion in Asia and Africa. Consumption mannerisms have been significant indices of power relations, a view echoed in Sidney Mintz's classic study of sugar where he has explored the impact of commodities in shaping patterns of economic dominance and also as "platforms" in challenging and, in many instances, reverting the prevailing order. Mintz claimed that sugar in nineteenth-century Britain pioneered the principle of mass consumption. The growth of sugar plantations in the Caribbean islands acted as a catalyst in propelling the demand for tea. Interestingly, in the period 1600–1800, to quote Robert William Fogel (Fogel and Engerman 1974), "slave produced sugar was the single most important internationally traded commodity, dwarfing in value the trade in grains, meat fish, tobacco, spices, cloth or metals." Tea was introduced in the second half of the seventeenth century, and its general employment was not adopted without bitter opposition. The Portuguese were the first Europeans to gain the right to trade with China, and the first to drink tea. Around 1514, they reached the South China coast and were the first to introduce tea to Europe. In 1643, an attempt had been made in the

English parliament to forbid its use. Over time, however, it came to characterise British ideas of gentility and respectability in the 18th and the nineteenth centuries; a historical incident attended by wide-ranging ramifications. The therapeutic properties of tea were being widely recognised in France and England where it was believed to be a preventive against cholera.

Tea came to be regarded as "necessary for life," the enhanced consumption of which was upheld in great measure by custom and was essentially dependent on the use of sugar for enhancing its flavour. By the early years of the nineteenth century, tea drinking was no longer a luxury. It was eulogised as a "national drink," the consequence of which, as Sidney Mintz observed, was that "the production of tea was developed energetically in a single vast colony and served there as a means not only of profit but also of the power to rule." Consumption triggered production and trade. Incidental to the increased demand for tea was an upsurge in the demand for exotic Chinese ceramics for the tea and sugar ritual. Its widespread adoption in Britain and Europe led in large part to an upsurge in the demand for both the products (tea and sugar) fuelling the need for economic expansion in Asia and the Indies.

While the Orient was exotic (early European explorations and maritime contacts creating a spectacle of material indulgence and economic prosperity with the discovery of spices, silk, Chinese wares, cotton, and tea), the Occidental goods did not appeal to the Chinese. This lack of interest in European goods was to continue through the nineteenth century and its effects profoundly shaped the contours of the East India Company's trade. This lure of the "riches of the East" was to lead to a severe drain on resources, a reverse flow of precious metals, particularly silver from Europe to Asia, in particular China, from whom the British imports included silk, ceramics and tea.

The East India Company used capital raised from sales of Indian cotton in Canton. A system of credit was developed whereby the Company sold bills (redeemed in London) and used this silver to buy Chinese tea. Expenses on tea from China

were annually draining England of its precious metals, including silver, from the Spanish colonies. By 1813, Britain was buying about 32 m lb. (14.5 m kg) of tea. China accumulated vast amounts of silver, which became the standard global trading currency of the period. During the first decade of the nineteenth century, China gained about $26 m in her world balance of payments. An effective solution to the drain of metals from Europe was revealed in the export of two Indian commodities: raw cotton and opium. Opium sales to China rocketed year after year to serve, after Carl Trocki, as "incubators of capitalism." Opium proved an amazing commodity. In Montgomery Martin's work entitled *Colonies of Great Britain* (Martin 1834) it appears that the East India Company alone sold the following quantity of opium: in the year ending 1800: 4054 chests for 3,142,591 Sicca Rupees (hereafter s); in 1810: 4561 chests for 8,070,955 s; in 1820: 4006 chests for 8,255,403 s; in 1830: 8778 chests for 11,255,767 s and in 1837: 16,916 chests for 25,395,300 (Martin 1834).

The pattern of economic growth and capital accumulation in the East and the West was reversed towards the end of the eighteenth century with opium making a significant contribution towards reshaping the trade balance. In fact, drugs and the trade in intoxicants like coca, tobacco, and opium have acted as facilitators in the formation of the British Empire and in the creation of a global capitalistic economy. However, the conjunction of "relentless commodification" of drugs, their redefinition and appropriation as powerful symbols of exploitation, and domination provides an interesting insight into the basis of intentional intoxication, where the "Addiction" of one leads to "Corruption" of the other. Herein, lay the crux of the economics of opium: politics of the Empire and its role in effecting a metamorphosis of landscapes and livelihoods.

In his pioneering study *Phantastica: Narcotic and Stimulating Drugs*, published in 1924 during the Prohibition Movement, the renowned German toxicologist Louis Lewin divided drugs into five categories. His work was the first effort ever at studying drugs by their effect. The categories are euphoriants, excitants, hypnotics, inebriants, and phantasticants. As per his classification, tea and caffeinated products (of which sugar was an important constituent) were grouped as "Excitantia," and opiates, including cocaine were "Euphorica." Nevertheless, they were all psychoactive substances, consumption of which was capable of inducing significant physiological and psychological changes in mind and body over a period. Moreover, the three linked commodities (sugar, tea, and opium) share a similar trajectory of attraction and repulsion (Lewin 1924: 23–27). They began their careers as exotic, but with significant therapeutic properties. Contemporary medical journals such as the *British Medical Journal* carried articles which hailed sugar as a "muscular food," a nerve restorative, a most valuable article of diet". Tea was regarded as a preventive against cholera; its simulative properties being upheld all over Europe. The protagonists of the Temperance Societies in England even urged people to replace drinking gin and whisky with tea. Opium also went from being a medicine to mass drug food.

It was their "downward filtration" as articles of mass consumption which led to their being denounced as potent agents of physical degeneration, social turmoil, and moral failing. It is recorded that sugar was the first luxury indulged in "next to the actual necessaries of life"; its use being limited by the price. The "use/abuse dichotomy," the demarcation between "pleasure and aesthetic qualities" and "medicinal side" and "euphoric side" were all located within the eighteenth-century European discourse of science and medicine, assigning to the commodities meanings within the prevailing discourse.

The consumption process from elite to mass is suggestive of geographic and cultural fluidity, with symbolic connotations attending each mutation. Although trade was a prime carrier in the "Europeanisation" of commodities, the tentacles of the Enlightenment era's prosperity and the notion of progress which it spawned provided a

thrust to the desire for control, over both distribution and production of commodities to ensure their constant availability. The medical/botanical debate, motivated by the necessity to control production, further spurred the demand for exotic commodities. Along with the movement of plants, which followed the growth of botanical sciences, it was peasant agriculture and tropical plantations that were patronised to ensure an increasing supply of crops for the world market.

Europe was enriched by a range of products (tobacco, maize, potato, cocoa, and beans) from the New World. Tea took them towards Asia, where China was the home of the brew whose lure proved more enchanting than either spices or textiles. The English East India Company outmanoeuvred the Dutch to monopolise the entire tea trade with China, which was to inaugurate a long phase of confrontation between the two countries. The English had after a slight skirmish managed to establish a small base at Canton in 1637, and continued there for 150 years till 1664. This was in stark contrast to their spirit of commercial enterprise. Attempts to establish free and direct access to the tea trade via diplomatic relations were met with stiff resistance from the Chinese, who viewed all foreigners suspiciously and likewise the expansionist policies of Europe in Tibet, the East Indies, Philippines, Burma, and Nepal.

As British mercantile interest in China swelled, in opium, the British finally found something that the Chinese would buy in large quantities. Prior to 1796, opium was admitted into China on payment of a duty when a few hundred chests were imported. Yet clandestine sales, of 20,000 chests imported towards the latter half of the nineteenth century, heavily drained the Chinese exchequer. Opium turned the balance, establishing itself as a powerful commodity financing British economic and political expansion. This was done by structurally linking the economies of China, India, and Britain in a trade triangle. By 1773, the establishment of an opium monopoly in India ensured and regulated supply, with profits from opium trade being ploughed into buying exports of tea from China.

"Opium Made the World Go Round"

The Portuguese traders first realised and capitalised on the sale of opium, establishing a trade in the early sixteenth century. The Portuguese initially sold tobacco from their Brazilian colony in exchange for China's silk. Like other European nations, Portugal quickly discovered that opium provided a much better tool for trade. Dutch merchants were quick to enter the increasingly lucrative opium trade. Like the Portuguese, they focused their efforts on controlling the Chinese market. Hence, the British did not *introduce* the Chinese to opium but were *more efficient in supplying* it than previous importers.

In 1773, following the conquest of Bengal, Warren Hastings, the East India Company's governor there, redesigned the system of ensuring monopoly rights in opium. Nobody was allowed to cultivate the poppy except with a licence from the government, and every cultivator was bound by law to sell the opium produced from his crop to the government. It was to be administered by the Bengal government, although the operations extended into the North West Provinces, Oudh, and Punjab of British India and also into the native states in central India and Rajputana. Initially, the East India Company tried to prevent British importation of opium into China since the illegal business interfered with its legitimate trade. Based in Canton, representatives of the Company asked Warren Hastings to halt exports from India to China. As a result of financial and political realities, Hastings allowed the export of 3450 chests of the contraband in two ships. In 1773, opium earned the Company £39,000. Twenty years later, the annual revenue from opium sold in China alone had ballooned to £250,000. The popular drug was incrementally beginning to reverse the imbalance of trade between Britain and China. Between 1806 and 1809, China paid out seven million Spanish dollars (*peso de ocho*) for opium. The East India Company kept the price artificially high, which meant that only the upper classes could afford it. It was not just profit motive that made opium expensive and beyond the budget of Chinese; the drug was officially illegal, and the East India

Company did not want to antagonise the Chinese government.

- A technological innovation upset the equilibrium. This was the invention of the steam engine and the mechanised production of cotton by factories in the North of England. The surplus found a ready market in India, whose merchants paid for the product in cash. However, to pay for the ever increasing amount of cotton, the Indians needed to cultivate and sell more opium. As a result, opium flooded into China. Opium began as an answer to a crisis, but by the end of the nineteenth century it had itself developed into a major crisis. The Indian opium entering China in 1839 was enough to supply 10 million addicts. By 1900, there were an estimated 40 million addicts in China. The following statement exhibits the consumption of opium spanning a period of 20 years. In the year ending 1800: 4054 chests for 3,142,591 *Sicca Rupees* (hereafter s)
- In 1810: 4561 chests for 8,070,955 s.
- In 1820: 4006 chests for 8,255,403 s.
- In 1830: 8778 chests for 11,255,767 s
- In 1837: 16,916 chests for 25,395,300 s (Martin 1834).

Opium wrought havoc. Opium purchased from the cultivators was sent to the two factories at Ghazipur and Patna (in Bihar), to be manufactured into articles of commerce, the "Excise (Abkaree) opium" and the "Provision opium." Excise opium was the manufactured opium retained for consumption in India through vendors, and Provision opium was sold monthly by auction in Calcutta to merchants who exported it. The government issued advances to the peasants.

It was claimed that Indian opium maintained a high reputation in the Chinese market as the drug was admitted to be far superior to the drug produced in China. After 1833, when the monopoly of trading by the East India Company ceased, this operation had become too profitable to be shut down. Thereafter, opium traffic was run as a British government enterprise, and this included raising and harvesting the crop, preparing the opium, licensing the smuggling operations, and laying

out necessary bribes in China. Thus was forged a structural trade link between the economies of India, China, and Britain which was to set on course a massive worldwide deliberation on the politics, economics, and significantly the ethics of Britain's Indian opium trade with China.

What did British India stand to gain? From 1870–1914, India ran an annual surplus of about £20 m with China. In 1870, opium accounted for at least £13 m: two-thirds of India's surplus with China. Europeans of this period preferred the "informal empire" because it seemed to protect all interests that were really vital or profitable without the considerable cost of ruling over an alien society. John Fairbank has observed in his *Trade and Diplomacy on the China Coast*, has hinted on the centrality of the opium trade to the British commercial interests rather than tea (Fairbank 1953). In addition, opium was no "cotton or molasses." It was endowed with a power to create dependencies, destabilise societies, and sustain empires. The gigantic dimensions assumed by the opium trade led to the Chinese rebellion, the utter exhaustion of the imperial exchequer, and ultimately to the growth of tea plantations in the Indian colony.

Definition/Description

What is the relationship between imperialism and the global environment? This entry examines this question through the gaze of Global Ecological Political Economy (GEPE) and argues that imperialism must be understood as an *ecological* phenomenon, in the sense that the expression of power, dominance, and oppression inevitably (re)produces systemic environmental consequences. Conversely, this entry adds to this formulation an important corollary: global environmental change and responses to it are in turn enmeshed with the forces of imperialism and often exacerbate unjust social relations and power imbalances across and between societies and states.

Introduction

In his masterpiece work, *The Open Veins of Latin America* (1973), Eduardo Galeano recounts five centuries of European imperialism in the Southern continent. His historical narrative weaves through the plunder of Latin America's natural resources – from gold and silver, cacao and cotton, rubber and coffee, fruit, hides and wool, petroleum, iron, nickel, manganese, copper, aluminum ore, nitrates, and tin, and so on. The account draws connections between the material exploitation of these resources and the lasting legacy of social domination and impoverishment faced by the

people of Latin America following centuries of what at its core amounts to "theft" of its natural capital. As many scholars have argued, a similar trend of material and subjective exploitation continues in the twenty-first century, albeit in new forms and featuring new flows, as the global structure of neoliberal globalization locks the "Global South" into patterns of "unequal exchange" (Emmanuel 1972), economic coercion, military dominance, and overbearing cultural influence (Duménil and Lévy 2004; Harvey 2003; Kiely 2006; Petras and Veltmeyer 2001).

Scholars have, however, only more recently begun to consider the *ecological* consequences of these imperial forces. This entry asks "what is the relationship between imperialism and the global environment?" and examines this question through the lenses of Global Ecological Political Economy (or GEPE) – a theoretical approach which "consider[s] the structural political-economic dynamics involved in human-environment interaction and advocate[s] historically contingent change to underlying productive and social relations with the normative aim of confronting socio-ecological injustices, broadly defined" (Katz-Rosene and Paterson 2018, p. 8). It argues that imperialism must be understood as an *ecological* phenomenon, and conversely global environmental change should be interpreted not as some socially neutral phenomenon, but rather an anthropogenically influenced force which has the effect of reproducing, echoing, and in some cases prompting new imperialist responses. That is, the expression of power, dominance, and oppression tends strongly to reproduce systemic environmental consequences, and in turn global environmental changes often exacerbate unjust social relations across and between societies and states.

Ecological Imperialism

At its most fundamental level, the European conquest of distant continents (and in particular the Americas) completely transformed the world in ecological terms – not only through the infrastructural and commercial developments which facilitated the exploitation, processing and transport of

minerals and other commodities which eventually made their way from hinterland to imperial core, but also through the introduction of new species of flora, fauna, and various pathogens – many of which had an invasive impact on indigenous flora, fauna, and regional ecology both in colonized regions and in the European colonizing countries. One of the first works to popularize this notion was Alfred Crosby's *The Columbian Exchange* (1972), which recounted the massive transfer of lifeforms between Europe and the Americas as successive waves of colonists brought "old world" crops, plants, animals, seeds, bacteria, and viruses (both knowingly and unwittingly) along with them on their ships, and similarly brought "new world" species back to European colonial centers. As hinted above, the impacts of this "ecological exchange" were wide-reaching and world-altering, not only in terms of their impact on various cultural practices (the widespread adoption of tomatoes in Italian cuisine, chocolate in Swiss confectionary, or chilies in Indian food, for instance, was only possible due to this exchange) – but more importantly via the "invasive" character of many of these species which had no natural competitors or prey in their new environments. The smallpox virus, for instance, was responsible (along with other communicable diseases never before found in the Americas) for the deaths of many millions of indigenous peoples (by some estimates killing upward of 90% of the original inhabitants of the continent, see Diamond 1998). In another example, common earthworm species – now ubiquitous throughout North America – did not exist prior to the European conquest of the continent (Eisenhauer et al. 2007). The wide-ranging ecological exchange which occurred as a by-product of European imperialism completely rewrote the world's ecology and generally facilitated the imperial expansion of European kingdoms around the world (with a notable exception being Central Africa, where pathogens unfamiliar to Europeans helped *delay* their conquest, see Crosby 1986; Diamond 1998; Mann 2005, 2011).

Thus from its very origins in European empires, modern imperialism has been by definition an *ecological* phenomenon. Another early observer of this dynamic was Karl Marx (Clark and Foster 2009). In his writings about the nineteenth-century guano trade (wherein European powers fought for control over nitrate-rich islands off the coast of South America), Marx identified what would come to be known as the "metabolic rift" – at its core an ecological imbalance between various spaces and places engendered by capitalist exploitation. For Marx, this was made visible in the transfer of soil nutrients from countryside (where it was usable and required) to urban areas (where it was not), occurring as industrialization gave rise to rapid urbanization, requiring more intensive fertilization of agricultural lands in the countryside to satiate the rising demand for food from wage laborers. This in turn created the impetus for nitrate-rich guano and the commodification (and requisite market competition, and interstate rivalries it engendered) for various fertilizers as commodities. In short, for Marx the imperial rivalries in the Pacific were clearly tied to the forces of industrialization, capital accumulation, and – more to the point – this was causing the vast ecological transformation of the European countryside (though he would not have expressed it in these terms). Building on Marx's concept of metabolic rift, Clark and Foster identify how today a global metabolic rift is the legacy of historical and contemporary forms of imperialism which are endemic to capitalism: "The social metabolic order of capitalism is inseparable from such ecological imperialism, which is as basic to the system as the search for profits itself" (Clark and Foster 2009, p. 311).

The drive to accumulate capital – a requirement in capitalist societies – leads to a range of ecological transformations and imbalances of this sort. These include the build-up of pollution around export-processing zones in the Global South as multinational corporations seek production sites with lax environmental laws (Frey 2003); the growing specter of plastic pollution in the world's oceans as disposable single-use plastics are prioritized for cost reasons over reusable or regenerative materials (Parker 2018); or even the accumulation of climate-changing greenhouse gases in the atmosphere as the world's largest oil companies (both private and state-owned)

prioritize profit over the known traumas that will ensue from global warming (Riley 2017). These are just some examples of the global-scale metabolic (ecological) rifts engendered by the neoliberal stage of imperialism.

Managing the Anthropocene

It is clear then that we live in a global capitalist system which is structured by the past and ongoing present of imperialism, and that this system has a range of ecological manifestations. At the same time, however, the modern efforts to "manage" the known environmental consequences of capitalism themselves have imperial origins. That is, the origins of dominant forms of Western environmentalist thought – with its focus on "environmental management" – can themselves be linked to early European imperialism. Two sorts of discursive transformation occurred alongside early imperialism in Western thought which contributed to this early form of environmental knowledge (Katz-Rosene and Paterson 2018). The first was a shift from seeing the world holistically toward seeing it as an inert set of specific species, organic chemicals, natural resources, and so on – a shift which occurred alongside the scientific revolution of the seventeenth century as early innovators like Galileo and Newton made their respective scientific discoveries (see, for instance, Merchant 1990; Plumwood 2002; Thomas 1996). The second involved the manifestation of powerful forms of "othering," notably xenophobia and Orientalism, which occurred as Europeans traveled the world and encountered peoples whom they failed to interpret as human (Saïd 1978). That is, they constructed the peoples they encountered in their minds as part of nature, not part of humanity (Todorov 1984), a logic which gave rise to the exploitation and oppression of indigenous peoples alongside the exploitation of nature itself. Both of these discursive transformations, of course, contributed to an ethos of colonial management and control of both the natural world and any peoples who were not of European ancestry. Perhaps the best example of this dual transformation is the manifestation of the plantation economy in the Americas, made possible only thanks to the combined domination of land (via deforestation and monocropping of select commodity crops or mining of select precious metals) and people (in this case African slaves and indigenous peoples of the Americas) (Obeyesekere 1992; Studnicki-Gizbert and Schecter 2010).

This imperialist framing of ecology notably served to justify the expropriation of wide swaths of land and territory in the global British Empire. It was expressed most significantly by John Locke, whose Second Treatise on Government served to justify British colonialism by explicitly arguing that the indigenous peoples of North America should be understood within the category "nature" rather than "humanity," and doing so precisely by reference to how they used the land. Since, claimed Locke, the indigenous inhabitants of North America did not appear to enclose land or issue private rights to property, they could not be said to be "improving" it in the way contemporary land title was understood in Europe, and thus – he reasoned – so gave up their rights to it (Locke 1966; Wood 2005). Of course, the rolling out of enclosure and private property rights which was facilitated by this dual philosophy has a range of legacies today: on the one hand, the social *and spatial* stratification along the lines of gender, race, and class stemming from the policies of forced displacement, land-grabbing, expropriation, and unjust laws which saw only white, wealthy, men own land; and on the other hand, a system wherein natural resources are predominately controlled, if not owned, by private capital (or at least strongly *influenced* by private capital in those cases when it is owned by the state).

As early as the mid-eighteenth century, some concerns about what is now termed "environmental degradation" emerged, yet they were initially noticed in colonial contexts and framed within the logics outlined above. In other words, early concerns about (local) environmental change were often stimulated by observations made by colonial managers worried about how such changes might impact imperial modes of production and accumulation. For instance, Grove (1995) shows in great detail how this occurred on many small islands in the Atlantic and Indian Oceans which

served as supply posts for British (and to a lesser extent French) colonial ships: Many of these islands were rapidly deforested to make space for plantations to supply ships with food, and yet after being deforested, rainfall patterns shifted, significant amounts of soil erosion occurred, and flooding and other related problems ensued – problems which were in essence *ecological* but also experienced by colonists as being of a *commercial* nature. Unfortunately, constrained by colonial norms, such observations about ecological damage tended to (with some notable exceptions) result in conservationist efforts which in practice exacerbated the displacement of colonized people through efforts such as "forest conservation" systems (initiated in India in the mid-nineteenth century, then imported back to Britain through the Forestry Commission created in 1919), or which further marginalized impoverished communities. The latter occurred as the notion of "resource scarcity" became enmeshed with colonial-era advancements in the study of human demography and population growth. Thomas Malthus' population thesis – which articulated a concern about whether food production would be able to keep pace with an exponentially growing human populace (Malthus 1959) – was rank with contempt for poor peoples, and failed to recognize how human development and more equitable forms of wealth distribution could potentially address population growth rates while improving quality of life. While Western environmentalism has many roots and variations, this version has become integral to hegemonic forms of environmental management today, represented for example by the "neo-Malthusian" arguments of Paul Ehrlich, Garrett Hardin, and the original *Limits to Growth* report (Ehrlich 1968; Hardin 1968; Meadows et al. 1972).

Neo-imperialism and the Reproduction of Global Ecology

While the empires of Europe were slowly eroded and eventually disbanded with the end of formal colonialism in the late twentieth century, the socio-environmental legacy of imperialism would continue to manifest in neo-imperial and neo-colonial forces. Despite the emergence of an embedded form of liberalism in the post-war Bretton Woods global order (Ruggie 1982), and a doubling down of laissez-faire neo-classical economics in the 1980s (Harvey 2005), the founding ethos of "freedom" underpinning modern globalization was certainly not enjoyed by all. Namely, the "rolling back" of the state and "rolling out" of business-friendly regulations which accompanied neoliberalism (Peck and Tickell 2007) have facilitated the continued domination of capital over nature (Castree 2008), and rich over poor (Piketty 2014). Drawing from Hornborg's theories of "ecologically unequal exchange" (Hornborg 1998) and Moore's theory of the "Capitalocene" (Moore 2017), this section demonstrates how contemporary neo-imperial relations within the global political economy – as embedded in the existing structures of global finance and investment, international trade, and official development assistance (ODA) – have an essential *ecological* quality.

As Bunker identified long ago (Bunker 1984, 1985), contemporary international trading relations include the same character of "embedded" energy, water, and other materials that travel alongside traded commodities. For instance, the exportation of an orange from South Africa to Europe is as much the exportation of *the water* contained in the fruit and the energy embodied in it – now transferred to a different continent. At the scale of a single commodity, this may seem inconsequential, but viewed at the macro-scale, it raises serious social and ecological questions about the "virtual trade" of water and energy from countries which lack access to clean water and affordable clean energy to countries where it is readily available. Hoekstra (2002) notes that 13% of all water used for agricultural production is in fact exported in this virtual format – through agricultural commodities. Picking up on this dynamic, authors like Hornborg and Rice (Hornborg 1998; Rice 2007) have drawn upon Emmanuel's notion of "unequal exchange" (Emmanuel 1972) to emphasize the latter's *ecological* character. That is, the notion of "ecologically unequal exchange" identifies the deep imbalances which exist in contemporary

trade relationships, not solely in terms of economic injustices between richer and poorer nations, but also in the character of material environmental consequences stemming from this trade.

As a result of a number of forces relating to neoliberal globalization, much of the production of goods consumed in the Global North has increasingly been displaced to areas in the Global South. These forces include the rise of the multinational corporation as a powerful entity *vis-à-vis* the state (Schmidt 1995); the "flexibilization" of labor and weakening of collective bargaining laws (Stone 2005); and the "financialization" and corresponding rise of service-based economies in industrialized nations (Epstein 2005). That shift is thus simultaneously a shift in the distribution of environmental risks – workers now engaged in many of the world's dirtiest industries are located in the Global South. Shipbreaking and electronics manufacturing and recycling are perhaps the iconic industries representing this shift (Demaria 2010). This transnationalization of production is usually understood as arising out of two specific dynamics – "industrial flight" and "pollution havens." In the former, MNCs react to stricter environmental regulations and seek when possible to move production to jurisdictions with weaker standards; in the latter, the impetus comes from developing nations compelled (often via conditional loan stipulations mandated by the World Bank or International Monetary Fund) to lower the regulatory burden for multinational producers in a bid to bring in foreign investment (Levinson and Taylor 2002).

This dynamic is mirrored also within the Global North: That ecologically damaging production which *has* remained within the Global North (or North-North exchanges of hazardous waste for that matter) produces a similar pattern of spatial injustice – wherein ecologically damaging production processes, as well as the dumping of hazardous industrial wastes, tend to be predominantly located in poor communities, and the social costs are unfairly borne by lower income or marginalized communities (Chavis 1993; Cole and Foster 2001; O'Neill 2000).

The Injustice of (and Resistance to) Imperial Ecology

As global responses to environmental problems have progressed since their colonial articulation in the mid-eighteenth century (and modern iterations in the early 1970s), they have been shaped by imperial dynamics in important ways. At the initial UN Conference on the Human Environment in Stockholm in 1972, Indira Gandhi famously contested the imperial neo-Malthusian framing of the global environmental crisis as one pertaining largely to the growing masses of (undifferentiated) humans threatening a finite set of increasingly scarce resources. Gandhi took issue with the articulation at the time that *all* must make sacrifices to save the planet; this was, after all, only very shortly after a range of newly independent countries had shaken off colonial shackles and were beginning to pursue accelerated economic and social development – the rhetoric of crisis struck her as a strategy by the rich of "pulling up the ladder behind them," so to speak. In fact, there is some fairly direct evidence that this was a strategic proposal by some in the Global North; notably, Hardin's infamous "lifeboat ethics" article (1974) explicitly argued that within the context of a global environmental crisis, rich countries ought to abandon the developing world to save themselves.

Over time, this imperial dynamic in "global ecology" (Sachs 1993) shifted to being less about controlling and limiting development in the Global South, and more about instrumentally seeking accumulation opportunities in responses to environmental change. By the time of the UN Conference on Environment and Development (UNCED) in Rio in 1992, hegemonic environmental discourse had become framed in the context of the shift to neoliberal globalization (Bernstein 2001; Paterson 1996) and thus responses to the issues of the day – biodiversity, climate change, and deforestation, in particular, and "sustainable development" more broadly – were understood through the promotion of novel markets, the protection of intellectual property rights, and the expansion of the global reach of transnational corporations (TNCs). In Hildyard's

(1993) terms, it entailed putting "foxes in charge of the chickens."

The global biodiversity crisis was thus framed as one of protecting genetic diversity (Shiva 1993). Countries from the Global North, pursuing the interests of their burgeoning biotech sectors, argued successfully that the UN Convention on Biological Diversity, one of UNCED's two treaties, should make no distinction between "in situ" and "ex situ" conservation of biodiversity (Kothari 1992). Biodiversity was to be protected not only by conserving and enhancing forests and wetlands, but further by enabling TNCs to identify and extract the specific genetic properties of organisms. A gene bank where the genetic diversity of a huge range of species is "conserved" would have the same status in the treaty as a highly diverse standing forest or wetland. Of course, Big Biotech was advocating this discursive shift because its largest firms in the medical/pharmaceutical and agricultural sector were immersed in a rapid race for novel genetic modifications of organisms for commercial purposes (McAfee 1999).

This strategy was closely mirrored in the strategy within the trade regime. The same companies (with allies in this case in the entertainment sector, see Tyfield 2008) were lobbying aggressively for the inclusion of patent protection in the negotiations for what became the World Trade Organization in 1994. This resulted in the Agreement on Trade-Related Intellectual Property Rights (TRIPS) as a key part of the WTO treaty. To maximize accumulation from investment in biotechnology, companies needed to globalize Western patent protection rules, which TRIPS sought to enforce (Purdue 1996). This is where its imperial dimensions become particularly clear. The "development" of new genetic strains by Western biotechnologies mostly arose out of the identification of particular genes in plants and animals (including humans, with genetic material taken at times without consent from indigenous peoples in various parts of the Global South), on which patents were then claimed. In many cases, the specific properties of the varieties of plants or animals were already known among its communities of users, so the companies were in effect engaging

in a form of "primitive accumulation" – appropriating things or knowledge previously held in common and then seeking to enforce their private property rights to those things or knowledge. Vandana Shiva (Shiva 1999) termed this "biopiracy." There were various egregious examples of this, such as a California company taking out a patent on basmati rice, grown for centuries in South Asia (Woods 2002).

Neo-imperialism and Climate Governance

In the case of climate change, the regime under the UN Framework Convention on Climate Change (UNFCCC) became similarly organized around transnational corporate interests. In this case, intellectual property rights were less central, but instead the global climate governance regime became organized around the creation of novel markets – markets in rights to emit greenhouse gases (GHGs) or in promises *not to emit* them (Betsill and Hoffmann 2011). The Kyoto Protocol (KP) to the UNFCCC, signed in 1997, created three such "carbon markets" (Newell and Paterson 2010). Kyoto's successor, the Paris Agreement of 2015, created the possibility of others, albeit in a different institutional context (Carbon Brief 2018). Carbon markets have thus become central to climate policy and governance in many countries, such as the EU, China, South Korea, and in subnational jurisdictions in the USA and Canada (see the World Bank's "Carbon Pricing Dashboard" for a survey of such policies; The World Bank 2018).

Carbon markets have an explicitly neoliberal ideological agenda. Their intellectual origins trace back to Ronald Coase, a Chicago economist and friend of Milton Friedman. He argued that environmental problems were problems of inadequately specified property rights (Coase 1960). Rather than state-led interventions such as regulation or taxation, Coase advocated decentralized solutions via litigation or establishing clearer property rights (Lane 2012; Solomon and Gorman 2002). This eventually became the logic for establishing new property rights in GHG (or

"carbon") emissions, which could then be traded as commodities.

As a neoliberal solution, carbon trading was then pushed heavily not only by governments ideologically attached to such "market-based mechanisms," but also by many companies that saw distinct economic opportunities in these markets. Coalitions of TNCs started to push for such markets from the mid-1990s onward (Meckling 2011; Newell and Paterson 2010; Paterson 2012). Some of these were financial companies who would engage in the actual trading, but most were companies that would be regulated by carbon markets. They saw that if regulation of GHGs was coming, then carbon trading was considerably preferable to carbon taxes but especially to direct regulation (governments forcing the adoption of particular technologies, for example). It gave them flexibility in how they met their obligations – whether to invest in emissions reductions or seek to purchase additional allowances within the market, in particular. But it also gave them an asset at the same time as an obligation: emissions allowances have a market value and thus can be turned into financial strategies by companies as part of their overall commercial strategy.

But in the context of global negotiations, this solution was neo-imperialist in at least two ways (see especially Bachram 2004; Lohmann 2005, 2006). First, while it had already been the case (following precedent in almost all other environmental agreements) that countries' obligations to reduce emission were expressed in the UNFCCC in terms of departure from their current emissions levels (as opposed to for example on some abstract principle like equal per capita emissions across countries), the emergence of carbon markets turned this into a property right. For example, if (say) Canada had agreed to reduce its emissions by 6% under Kyoto, then this became a right to emit 94% of its 1990 emissions in the 2008–2012 in the so-called Kyoto commitment period, and thus each tonne of the 433 Mt of carbon emissions that make this amount up was turned into a tradable allowance – an "Assigned Amount Unit." Yet at the same time the world knew that there was a finite "carbon budget" that all countries could collectively emit over time without incurring dangerous or even catastrophic climate change (although disagreement existed and persists about how big that budget is). In other words, high emitting countries (like Canada) were appropriating the "atmospheric space" and in effect depriving low emitting countries access to that space.

Second, carbon markets are imperialist in that alongside "cap and trade" markets (where allowances are allocated to countries or companies which can then trade them) there are additionally "carbon offset" markets (where a company or country can invest elsewhere to reduce emissions, thus "offsetting" their own emissions). In this process, a company seeks to develop a project, say a windfarm, in the Global South. It applies to have it registered with the Kyoto Protocol's Clean Development Mechanism (CDM), or one of the NGO certification organizations that have emerged in the last two decades, and has to go through a process by which it seeks to demonstrate that the project reduces GHG emissions compared to what would have been the case without the project. If it succeeds, then emissions credits are issued for the projects which are then sold to actors in the Global North seeking to offset their own emissions. These markets thus not only enable actors in the North to continue high levels of emissions (a particular twist on the logic of ecologically unequal exchange), but they also can generate more actively imperial dynamics (for instance, cases of displacement of people and other human rights abuses have been exposed in numerous carbon offset projects (see Corbera and Brown 2010; Wittman and Caron 2009). With forestry projects in particular, the problem of imperial control arises heavily since it requires the project developers to ensure that the forest is not cut down or otherwise damaged by local communities, so that credits can keep flowing for the lifetime of the project.

Correspondingly, a good deal of social movement resistance in relation to global environmental governance can be understood as anti-imperialist mobilizing. In the climate regime, an early reaction to hegemonic framings of climate change, by Indian environmentalists Anil

Agarwal and Sunita Narain (Agarwal and Narain 1991), explicitly argued that such framings were a case of "environmental colonialism." They showed that the World Resources Institute's 1990 report (1991), the first to include GHG emissions, produced a ranking of countries by GHG emissions based on the simple measure of absolute emissions. China and India both appeared in the top five emitters on that measure. This reflected the underlying imperialist framing of environmental degradation as produced by an undifferentiated humanity, as we saw in the 1970s and late eighteenth century. Ignored entirely, Agarwal and Narain showed, were questions of either per capita emissions (i.e., how much the typical Indian emitted compared to the typical American), or of the social purpose of those emissions, which they argued should be separated into "luxury" and "survival" or "subsistence" emissions. For instance, why should the emissions of those flying round the world for leisure or business be counted the same as those of a subsistence rice farmer?

This argument has formed the basis of recurrent opposition to global environmental governance. Since the mid-2000s, it has mostly been articulated through "climate justice" movements, focused mostly on opposition to carbon markets (on the basis of the above critical arguments), but also on the inadequate pace of measures in the Global North to transform economies away from fossil fuels, with the consequent production of disasters and insecurity for many in the Global South. These movements have often invoked a notion of "ecological debt" (Roberts and Parks 2009), deployed to show that, given the finite character of the global "carbon budget" over time, and given how the Global North has already used more than its fair share of that budget, by any defensible measure of distributive justice, the North in practice owes debts to the South to redress the imperial dynamics in climate change itself (for a quantitative assessment of the historical value of climate debts among nations, see Matthews 2016). These notions of climate justice and ecological debt have become the basis of a widespread upsurge in environmental protest around climate change focused variously on UNFCCC conferences (Hadden 2015), other UN events (Giacomini and Turner 2015), oil pipelines (Barry 2013; Gunster and Neubauer 2018), and divestment from fossil fuels (Mangat et al. 2017), among other mobilizations and campaigns for social and ecological justice.

Conclusion

In conclusion, this entry has examined the relationship between imperialism and environment through the lenses of GEPE. It has shown how the forces of imperialism and environmental change have a long-standing dialectical relationship which continues at present in a variety of ways. Whether it is the various "metabolic rifts" created through the neoliberal governance of global trade, finance, and development regimes; the "neo-Malthusian logics" inherent in rich countries' efforts to "manage" global environmental challenges; the various dimensions of injustice witnessed in the lived-experience of environmental damage; or efforts to commodify and profit from the practice of climate change mitigation (or even critical social responses to such commodification), the legacy of imperialism and new iterations of neo-imperialism are clearly intertwined with the manifestation of ecological change, and vice versa. This is to say that the imperial expression of power, domination, and oppression often generates ecological impacts, and conversely, environmental changes have had the effect of prompting or exacerbating neo-imperialist responses. As the world approaches various climatic and biodiversity thresholds and "tipping points" in the twenty-first century (Intergovernmental Panel on Climate Change 2018; United Nations Environment Programme 2012), the imperialism-environment dialectic is one to which those concerned about global inequities and social justice ought to pay close attention.

Imperialism and Settler Colonialism: Xenophobia and Racism in North America

Stacy Warner Maddern

Definition

This essay examines the historical trajectory of the colonization of North America by imperial European forces spanning from the 15th to 18th centuries. The primary focus concentrates on the treatment and removal of indigenous peoples with particular attention paid to the development of settler colonialism by the English Crown and the xenophobic foundations of Americana.

The expansive ramblings of settler colonialism, particularly its goal of eliminating indigenous culture carried out primarily by strategies of disavowal, have been identified by Ostler (2015) as "a convergence between settler colonial ideology and the project of continental empire-building" (p. 42). Native American opposition to colonial empire (and the United States) has rarely been framed as anti-imperialism in historical context. Perhaps doing so would challenge the doctrine of American exceptionalism for which the empire is embedded. The very notion of American culture (and its European origins) relies heavily on dispelling the origins of an indigenous people. Wilson (1998) observes the significance of the oral tradition to Native American culture in which there is little distinction between "story" and "history." Accordingly, there is an excess of "anecdotes and legends" used by each tribe or

nation to explain "the creation of the world and its own origins and experience." These "histories" have largely been dismissed by most Western scholars, regarded simply as "myths" from which nothing can be ascertained concerning the past or the origins of the indigenous peoples in North America (pp. 4–5).

The subjugation of autonomous Native American nations by European empires occurred by military and pseudo-legal means. Settler colonial discourse relied heavily on historical narratives to conceal the existence of these nations. Such perspectives attempt to separate American colonialism with previous types dependent on the elimination of pre-existing inhabitants and fail to recognize anti-colonial forces seeking to retain substantial political and economic autonomy (Ostler 2015).

There are 554 legally recognized "Indian tribes" currently in the United States, representing a combined population of nearly two million. The end of the nineteenth century witnessed a drastic decline of indigenous population making much of their current number a product of the last century. Wilson reports that nearly "twenty-five million or more United States citizens are known to have some Native American ancestry." He also suggests that the "lack of recognition in America of indigenous peoples leaves many feeling unseen, a people without a past" (p. xxiv). Much of this can be interpreted as the result of the European invasion of America four centuries ago.

The total amount of land that remains under tribal control is estimated at some 55 million acres. This is a massive decrease from the pattern of people and cultures that existed in 1492. Since then the entire nations have been uprooted and deposited thousands of miles from their homelands. Tribal isolation is no longer an exotic existence, but rather a suburban nightmare strewn across an abandoned landscape. Native America currently represents a forgotten, invisible culture buried in the American past confined to reservation communities where struggles with obesity, alcoholism, and other various addictions are the norm.

Native Americans were victims of repeated assaults on their "social, psychological and spiritual world." Wilson contextualizes this "breathtakingly ambitious experiment in social engineering" as the cause of a devastating "historical trauma" for Native Americans infected by Eurocentric ideals (Wilson, p. xxv). After condemning their cultural and spiritual practices, Anglo-Saxon superiors further subjugated Native Americans by forcing them to assimilate. Such practices included removing children from their tribal existence and sending them to boarding schools where they were forbidden from speaking their native languages. These attempts to transform Indians into Americans sought to supplant their history and sense of identity. This would eventually be referred to as the American "melting pot" (p. xxvi).

The "Savage" Conquest

Much of the colonial mission in the Americas was predicated on the use of propaganda that presented indigenous people as uncivilized "savages." Wilson (1998) offers such descriptions as "simple and rude in manners, and destitute of the knowledge," used for determining that Native Americans were "most apt to receive the Christian Religion, and to subject themselves to some good government." This was partially an assurance made to ease colonists and investors coming to the New World in the hope of developing a "paternalistic relationship with grateful natives" (Wilson, p. 64).

England's conquest of Ireland in the 1560s and 1570s were instrumental in determining policies toward the "savage people." Canny (2001) suggests that Ireland, in particular, was an apprenticeship for the colonization of the New World. Excessive measures of brutality against the Irish were justified because they were considered "savage heathen" following the teachings of Catholicism which the English considered a form of "paganism" objected to by all Protestant Europe. The Irish, like Native Americans, were cast as nomads because they practiced "transhumance" which entailed moving herds of animals from one area to another during the course of the year to graze. Such was barbaric behavior, and, as

such, they should be "treated like wild beasts" (Wilson, p. 64).

The use of Biblical accounts has long served as the greatest means for reinforcing our basic perception of reality. Wilson describes the Bible as a confirming history as "a linear process whose meaning comes from change." It is a perspective that emphasizes movement as progress, particularly as we move further away from our own beginnings, in this way conquering our own ignorance and irrationality. In the wake, Wilson claims, "we leave behind other, less 'developed' peoples" (p. 13). Barbarous tribes and non-European peoples were believed to hold a particular position in history. Functionally, they were intended to represent that which had escaped history itself. The founder of modern anthropology, Edward Tylor (1871), identified the "savage state" as representing the early condition of mankind, "out of which the higher culture has gradually been developed or evolved" (Wilson, p. 14).

European colonization grew out of late feudal era changes that resulted in new trading networks and militaristic nation-states. These forces accelerated a century-old drive to conquer nature along the medieval borderlands – the moors, coastal and river marshes, forests, and floodplains that, in the mind, stood for darkness and waste – and were sharpened by a heightened religious fanaticism generated during the Crusades. Europe's culture of colonization was framed by dispossession of indigenous peoples in Moorish Iberia and Celtic Ireland, by looting of the Inca and Aztec empires, by piracy along the Spanish Main, by racist convictions applied to Africa, and by an almost insatiable appetite for territorial conquest (Wilson 1998; Judd 2014).

The anti-Muslim Crusades were designed to control Muslin trade routes to the Far East, while "domestic crusades against heretics and commoners were carried out to terrorize poor people" (p. 32). Peter Linebaugh (2008) describes such Crusades as "a murderous device to resolve a contradiction by bringing baron and commoner together in the cauldron of religious war" (pp. 26–27). As a precursor to later patterns of colonial capitalism, the impact of the Crusades was somewhat paradoxical insofar as while they

encouraged sectarian intolerance of Islam in Europe, they also helped shape European perceptions of other cultures. The results of the conflict helped fuel an intense paranoia that drove efforts to expand European influence (Wilson 1998).

The colonization of the Americas was initialized by Europeans, "heirs to rich and ancient cultures, social relations and customs in their lands of origin, whether Spain, France, Holland or England" (Dunbar-Ortiz 2014, p. 32). As they made passage into the Americas and were introduced to indigenous inhabitants, Europeans abandoned their known social relations, entering into a culture of conquest. Here they engaged in violence, expropriation, destruction, and dehumanization. This was nothing new, yet a continuation of what European institutions had formed several centuries before during the Crusades to conquer North Africa and the Middle East, which lead to unprecedented wealth in the hands of a few. European merchants and settlers were largely responsible for establishing profit-based religion in the Americas. Roxanne Dunbar-Ortiz (2014) identifies this "deadly element" utilized for seeking personal wealth. Reflecting on the use of the Christian zeal as a justification for colonialism she writes:

> Coupled with a militaristic tradition, also developed in western Europe during the Crusades, allowed for a mercenary status against the "pagan" peoples of the world. Urban II began the call for such ventures by granting soldiers the right sack and loot Muslim towns and cities, which promised wealth and prestige back at home. (Dunbar-Ortiz, p. 32)

The perception of Native Americans as having an underdeveloped culture has justified European attitudes since the time of Columbus. The dominant settler ideology was a doctrine of superiority, one that tied Eurocentrism to God as the guide of superior force. Europeans were self-proclaimed as the chosen people, predestined to stake claim over the New World. This "vision" promised a return to grace and identified a providence that demanded subduing the wilderness and supplanting the Indian. In large part, the conquest of Native Americans was driven by an understanding that coexistence was not an option as the notion of equality was objectionable to the European "reality"

(Wilson, p. 15; Deloria 1975, 1988). Such reality was built on an image of the indigenous peoples as relics of the human past.

The rise of the modern state in Western Europe was based on the accumulation of wealth by means of exploiting human labor and displacing millions of subsistence producers from their lands. The armies that did this work benefited from technological innovations that allowed the development of more effective weapons of death and destruction. When these states expanded overseas to obtain even more resources, land, and labor, they were not starting anew. The peoples of West Africa, the Caribbean, Mesoamerica, and the Andes were the first overseas victims. South Africa, North America, and the rest of South America followed.

The "discovery" of America seemingly increased the differences between Native Americans and Europeans, rather than reduce them. The European attitude toward people who did not look or act like them was served as a foundation for their future relations with indigenous tribes. Trade was essentially a key aspect in forming the relationship between them, one that would prosper and stabilize in the century that followed Columbus. Trade was largely responsible for shaping the expectations that each side had of the other. This was, however, not to last as the balance in trade would eventually tip in Europe's favor. The New World would increasingly be drained of its wealth becoming part of the European colonial empire. The fate of Native Americans would be nothing short of "catastrophic collapse by means of conquest and disease" (Wilson, p. 57).

Jamestown, 1607

The colonial enterprise has been characterized as "a mixture of bullish arrogance, ruthless pragmatism and unrealistic expectations" (Wilson, p. 64). For its part, England began its colonial mission in America with Raleigh's Roanoke colony on an island off the North Carolina coast. The expedition was driven by the pursuit of nonexistent gold mines, and no time was invested in growing crops or other forms of sustenance. The settlers became extremely dependent on indigenous peoples for food, which they either took or engaged in skirmishes to obtain. Within a year the settlement perished only to resurface again in 1607 with the Jamestown Colony, what is now the Virginia coast.

Halfway through the first summer most of the original colonists in Jamestown perished either from starvation or disease. The survival of the colony was made possible only by assistance offered by Native Americans. In 1705, the colony's historian, Robert Beverly coined the years 1609 to 1610 as "the starving time." As with the Roanoke settlers before, the willingness of Native Americans to provide, "Bread, Corne, Fish, and Flesh in great plentie," would save these "feeble men" who otherwise would have perished. The "relationship" was extremely one-sided as the settlers were dependent on their native hosts. Both practical and psychological issues would create vast inconsistencies in English attitudes toward the natives. The supremacy of Christian civilization was at stake. It could hardly be used as the central justification for colonial expansion if the conquers were reliant on the yet to be conquered.

For the settler who longed for comfort, Native American communities offered a refuge where ample diet and relative freedom were available. The threat of severe punishment for deserting their posts did not stop many from fleeing. Any "appreciation" of native culture, however, did not live long. Scorn and resentment would eventually surface leading to aspersions concerning the Natives' real motivation. There were suggestions of malicious intent accusing the natives of seeking to undermine and "threaten English security and self-esteem." Captain John Smith was soon convinced there could be only one explanation, "their chief God they worship is the Devil" he announced, "they ... serve him more of fear than love" (Wilson, p. 67).

Smith's leadership was a rallying cry that galvanized an awareness that the settlers' dependence on the Natives was leading them astray. Their ceaseless need for food became a point of tension in their relations with them. Under Smith, the English developed a system of compulsory

purchase: if the Indians refused to sell corn, they took it by force, leaving a few trinkets as token payment. In times of desperate hunger, they simply stole what they wanted, threatening or killing anyone who tried to stop them. As a result, the Native Americans frequently went hungry or did not have enough seed to plant for the following year.

In an effort to ease the tension that had formed with the English settlers, Native Americans sought to teach them how to grow corn and construct more efficient means of fishing. These were mostly rejected by the settlers who were more interested in producing tobacco for export back to England. Knowing that they could bully food out of the Native Americans appeared an easier means for sustenance that having to actually do it for themselves. The Indians would become increasingly frustrated with the brutal asymmetry created by English settlement. Any hope for achieving balance with the settlers failed regardless of symbolic exchange or display of strength and status. It was no long before the natives became acutely aware that, irrespective of their intent, the balance of power was rolling away from them.

New England, 1617

The colonization and conquest of what was to become known as "New England" brought about drastic changes for existing indigenous cultures. Deadly epidemic pathogens were introduced altering the composition and number of indigenous populations. The transformation of the ecological system caused numerous imperial conflicts. In the wake of such disruption, the decline of indigenous groups increased, while European populations grew expeditiously.

In 1617, while exploring the northern coast for a company of venture merchants, John Smith landed on an area he would later coin as "New England." Smith was taken with the landscape of southern New England, which had been transformed by a tribal custom of removing trees and burning undergrowth to create vast open spaces. Smith, the self-appointed "Admiral of New England," had been educated by the colonial experience in Jamestown. He rejected the search for gold in favor of fishing as a source of wealth. He recognized the significance of natural resources in abundance and envisioned a commercial empire in New England. He was also aware of the need for laborers needed to transform the region.

Smith's conquest of the region was largely supported by Sir Ferdinando Gorges, a military man who commanded the harbor fort of Plymouth, England, and an ardent proponent of American colonization. Gorges and Smith had a complex relationship, one mired in debt and patronage. Woodward (2008) describes Gorges as a "leading figure in the North Virginia Company," who had previously been given "authority to settle North American land roughly between the Potomac River and present-day Bangor, Maine" (p. 105). In 1615, Gorges financed Smith's in a second voyage to New England. The venture failed, as Smith was captured by a French privateer in the Azores.

Six years prior to Smith's original visit, a series of epidemics, perhaps smallpox or chickenpox, had swept through the coastal tribes, killing nearly 90% of the population. The desultory trade relationship that was force upon Native Americans through their contact with Europeans was not the most pressing danger or problem. Rather, it was the ominous presence of unfamiliar pathogens for which the Europeans were armed. Because they lacked Native exposure to the infections that their new neighbors had weathered, a result of be subjected to crowded urban conditions and the company of livestock, they were ill-equipped to defend themselves from fast-spreading diseases that had been transported to the New World. These diseases were rampant and indiscriminant as they ravaged the New England coast beginning in 1616 with an outbreak of smallpox or bubonic or pneumonic plague. These epidemics occurred in cycles and traditional native remedies – sweat lodges, fasting, and emetic herbals – only worsened the effects of these virulent fevers. Estimates suggest that between 75% and 90% of coastal inhabitants died, and deaths among starving and abandoned survivors, or from secondary

infections, added to the toll. Not only was the mortality rate high, but the suffering was terrible.

In tragedy, Gorges recognized opportunity to develop a new, more elaborate plan for large-scale colonization which led to the sealing of the Mayflower Charter on November 3, 1620. Smith had attempted to tie himself to the negotiations after becoming aware that a congregation of Separatists were considering New England as their new attempt to settle outside of England. Having previously fled England for Amsterdam and Leiden, they had now secured investors from the Virginia Company of London to settle a plantation along the Hudson River, immediately south of New England.

Smith had a strong dislike of religious radicals, but it did not stop his attempt to lobby for a position as their military commander. As Woodward (2008) explains, these negotiations failed as the "Separatists, whose late start and faulty navigation would lead them to found a New England plantation at Plymouth instead of on the Hudson" would ultimately rejected Smith's services. Smith later reported that a Separatist leader had said "my books and maps were much better cheape to teach them, than my selfe" (pp. 111–112).

The Mayflower Charter landed on Cape Cod in November 1620 with approximately 100 prospective colonists. The members of the Mayflower Charter, having recently left behind a rigidly authoritarian and legalistic society in England, were immediately troubled by the fluidity and dynamism of Native American culture. They would much have preferred to avoid all contact and maintained what were essentially "foraging expeditions" as their primary food supply. Much of this consisted of finding leftover food that the tribes had discarded. This was acceptable because it meant they were able to avoid the actual natives. By 1621, such methods of gathering food proved inadequate. As there first winter settled in, they became more desperate, and by the spring, their number had decreased by half as many died from disease and starvation.

It was clear that these new colonists were in need of help. They were ill-prepared to survive in New England. The neighboring Wampanoag, seeking to establish a balance of power in their relation with Europeans, would eventually come to their rescue. Massasoit, the Wampanoag leader, viewed an alliance as a means of restoring equilibrium. Massasoit sent a delegation with an offering of food to the members of the Mayflower Charter. This resulted in a formal treaty and became the first official agreement between the colonists and natives in the colonization of America.

The historical representation of this agreement depicts a "fair and even-handed" arrangement one that demonstrated "good faith on both sides" (Wilson, p. 79). More accurately, the "treaty" sowed the seeds from which further misunderstanding and conflict would flourish. Several clauses "clearly favored the English" including one which required that any Indian guilty of an offense against the English should be handed over to the colony for trial. But, there was no reciprocity for English offenses against the Wampanoag. Fundamentally, this was an agreement that eliminated Wampanoag sovereignty. It was legal manipulation used to undercut tribal influence.

On the surface "King James would esteem of him [Massasoit] as his friend and ally," but this had different meanings across cultures. The Wampanoag were convinced that they were entering into an equal partnership. As far as England was concerned, Massasoit "acknowledged himself content to become the Subject of the Sovereign lord the King." Salisbury (1984) comments that "the English regarded the treaty as one not of alliance and friendship between equals but of submission by one party to the domination of the other." From the Native American perspective, the significance of the treaty lay not in the document itself but in the exchange of gifts and speeches accompanying it, which ritually ended the enmity between the two peoples and redrew the boundaries separating them. The new relationship was not merely a political alliance but a spiritual realignment that brought the two peoples into a shared social network where they were bound together by mutual obligation.

Building a "City on the Hill"

Rationalized origin stories are located at the center of most modern nation-states. This is nationalist propaganda, the kind that fosters patriotism and loyalty to the state. Dunbar-Ortiz (2014) identifies the English founders of the first North American colonies, leading to the United States, as making the most of "providential opportunity." There can be no mistake that the teachings of the French religious reformer John Calvin "coincided with the advent of invasion and colonization of the Americans." Calvinism was a Protestant Christian movement with a strong separatist political component. Central to it was the doctrine of predestination for which "Calvin taught that human free will did not exist" (p. 47).

In the founding of the Massachusetts Bay Colony, the Pilgrims, as they became known for their strict puritanical beliefs, drew upon the Calvinist ideology. Generally viewed as the spiritual founders of America, the Pilgrims settled had come to the New World hoping to find a permanent home where they could practice their religion undeterred. They would soon become a heartening symbol for generations of immigrants seeking a fresh start in America. Originating from a small Protestant sect that was critical of the Church of England, accusing it of corruption, the Pilgrims sought to obey the injunction in the Second Book of Corinthians: "come out from among them and ye be separate, saith the Lord."

Prior to their voyage to the Americas, the Pilgrims tried to establish a new way of life in the more tolerant atmosphere of the Netherlands, but both their distinct identity – and their Englishness – was a perceived threat. After a brief return to England, they found passage to the New World via the Mayflower Charter. In keeping with the strict separatist doctrine, they avoid other communities, particularly Native Americans, whom they tried to completely avoid.

Between 1624 and 1629, other religious dissidents settled in the region, specifically Cape Ann and Salem. The Massachusetts Bay Colony was formally established in 1630 when John Winthrop and a thousand settlers arrived. Grouping their huts and dugouts into nine or ten villages around Boston Harbor, these "Puritans" prepared the way for the "Great Migration," the arrival of 20,000 colonists from southern England during the next decade.

As the primary architect of the new colony and its first governor in 1630, John Winthrop was a trained lawyer who devoted considerable thought and ingenuity to establishing a legal basis for colonization. In doing so, he advocated for the widely accepted theory of *vacuum domicilium*, which deemed "unsubdued" (European-style cultivation) land as that which could be legitimately possessed and "improved." This was the "legal" basis by which land was acquired since most of the territory used by the Native Americans was, by this definition, "unsubdued." In addition, because they were identified as "savages," the indigenous had no "civil government" for which to exercise its own sovereignty. As such it followed that they neither had a "natural" nor a "civil" right to the land (Wilson, p. 83). This was significant because it would render tribal independence within the colony's boundaries as nonexistent. The transfer of land and authority was to benefit only one party – the settlers, colonialists, English, or Europeans.

The Massachusetts Bay Company recognized that, in practice, Indians might "pretend right of inheritance" to those lands in which they were living. In such cases, colonists were instructed to make "reasonable composition" (Wilson, p. 84). Such laid the groundwork for what eventually become known as *eminent domain* and the *takings clause* of the US Constitution. Reference or understanding of "composition" in the Native American political system was, at best, an alliance between two distinct groups, one that might signify appointment of new leadership or a change in order. While new rights and tributes may have been a factor, there is no such understanding that would ever require a tribe to be completely evicted from an area or risk losing their autonomy or ethnic identity.

I

Biological Warfare

The wholesale transfer of land from indigenous to Euro-American hands from 1492 onward has less to do with European invasion, variable technology, or material possession. Instead, it was the bacteria that they unwittingly brought with them that led to the massive depopulation of Native Americans. Nearly 100 epidemics and pandemics of European diseases were unleashed on Native Americas between first contact and the beginning of the twentieth century. There can be little doubt that the decline of the Native American population "was an increased death rate due to diseases introduced from the Eastern Hemisphere" (Thornton 1987, n.p.).

Both Eurocentric desire and Christian doctrine were used to justify both physical and natural disasters that befell these populations. For example, in 1633 a prolonged drought brought havoc on both Natives and settlers which ended only when – as both sides seemed to have agreed – the English God responded to the Puritans' prayers by sending rain. This had significant meaning for both sides when it came to empowerment and defeat. For the Puritans it meant superiority of a winning God, while Native American tradition of ritual and ceremony were left to be questioned and doubted. After a devastating outbreak of smallpox swept through New England, leaving the colonists virtually untouched but killing a large number of Narragansetts and their neighbor the Pequot, colonists reacted by claiming that these tribes had clearly been targeted by the English God for daring to challenge the colony. The interpretation that the epidemics were proof of the Europeans' greater spiritual power was widespread. Religious potency – held by those who were barely affected by the epidemics – led to a number of deathbed conversions to Christianity. The Pilgrims themselves looked for a religious meaning in the epidemics. Such discoveries were certainly self-serving with claims of God favoring the European beginning in the New World by "sweeping away great multitudes of the natives … a little before we went thither, that he might make room for us there." Governor Winthrop drew a similar conclusion when he wrote, "God hath hereby cleared our title to this place" (Wilson, p. 86).

For those Native Americans who survived the epidemics, there were other problems to consider such as the loss of crucial phases in the annual subsistence cycle – planting, harvesting, and hunting. Such circumstances brought many to the edge of starvation. The tribal structure suffered with the elimination of entire lineages of sachems and other high-ranking individuals. This had significant consequences as it disrupted the complex web of kinship and authority that held communities together. The greatest impact undermined Native Americans' confidence in themselves and their view of the world. As Francis Jennings (1976) writes, "The American land was more a widow than a virgin." Challenging the perceived history of desolation, Jennings places the Europeans in a wilderness of their own making in describing Jamestown, Plymouth, Salem Boston, Providence, New Amsterdam, and Philadelphia as "sites previously occupied by Indian communities." He concludes by casting the "so-called settlement of America" as nothing more than a "resettlement of a land made waste by the diseases and demoralization introduced by the newcomers" (Wilson, p. 77).

Dismissive historical perspectives on the loss of Native American life often conjure theories that portend to blame the victim for their own demise. This instance is no exception. In 1863, Francis Parkman directly accused the New England tribes as being their own worst enemies by suggesting that the indigenous just "melted away, not because civilization destroyed them." Instead, Parkman claimed it to be "their own ferocity and intractable indolence" that made it impossible for continued existence. Such iteration was furthered by the US Secretary of State, Lewis Cass, who believed that some "strong exciting" racial characteristic impelled native people to "their own ceaseless hostilities [which] have, more than any other cause, led to their melancholy depopulation." Popular European perceptions were tainted by this chaos theory which allowed for Native Americans to be dismissed as "savages." Chaos, in this regard, suggested animalism and a lack of self-control. In reality, this was just an illusion. While

the tribal communities in North America may have "managed their relationship with the land and with each other in a profoundly different way, their world was at least as orderly as contemporary Europe's" (Wilson, p. 47).

The Pequot War

The Pequot War is considered a major turning point in colonial history. In the 1630s, the Pequot were a dominant and plentiful tribe that controlled what is now eastern Connecticut. The Pequot established a commercial monopoly with the Dutch in the 1620s, controlling the fur trade and accumulating a considerable fortune of the highly prized *wampum*. In adopting an European economic system, the wampum was a Native artifact that was used more and more as a kind of currency throughout New England. In the early 1600s, it was formally recognized as legal tender by the Massachusetts Bay Colony.

When the Pilgrims settled the Massachusetts Bay Colony in the 1620s, the Pequot maintained 15 villages along the Mystic River in Connecticut. The Pilgrims, who were aware of Spanish colonizers' barbarous abuse of native peoples in the Caribbean and Central America, were determined to establish more humane Euro-Indian relations. Yet, as Judd (2014) explains, "despite these promising beginnings, the lower Connecticut Valley quickly became a contested region, with Pequot, Mohegan, Narragansett, Niantic, Dutch, Pilgrim, and Puritan jousting for land and furs" (p. 52).

In the years that followed, several confrontations and reprisals resulted in numerous casualties, but none so damaging as the death of the Englishman John Stone. The Pequot, who at the time were seeking an English alliance in fighting off Dutch traders, were accused of the murder. The Puritans called for action against Stone's killers. Historically, such retribution has been described as leverage in pursuit of their own ambitions in the valley, suggesting "subjugation more than alliance" (Judd, p. 52). In 1633, the Pequot were inflicted with numerous disasters that incited a period of internal crisis. The Dutch responded by dealing with other tribes in the region. After a new smallpox outbreak devastated the coastal tribes, the Pequot grip on their tributary tribes started to wane. This coincided with a large-scale English settlement that was beginning to wreak havoc on a finely tuned system of tribal relationships (Wilson, pp. 87–88).

In 1636, the Massachusetts Bay colony ordered Captain John Endecott to sail to Block Island and kill every Indian male he found there. Ninety Indians were murdered, most of them Narragansett, unconnected to the Pequot. Endecott then attacked the Pequot, burning two of the villages that resulted in the death of one man. The actions of Endecott, while appearing senseless, left the Connecticut River settlers, particularly Plymouth, as targets for a Pequot counterattack. On April 23, 1637, warriors, believed to be Pequot, attacked the colonists. This set the stage for what was to be a full-scale war.

Within a month of the attack, a Puritan militia, along with its Mohegan allies, stormed the Pequot village on the Mystic River and torched it. 300–600 inhabitants were shot and burned; most of them were women, children, and older men. The motives behind the massacre have since been the subject of great debate, the consensus of which suggests fear of the Pequot as the primary motive. The colonists, who were camped only five miles away, believed the tribe was a threat to their civilization. The slaughter itself was unlike any tactic or result ever witnessed by Native Americans whose warfare typically "prescribed low-casualty conflicts, hit-and-run tactics, and the taking of live captives" (Judd, p. 53). It is generally considered an act of genocide. As Judd explains, "Pequot survivors were parceled out as slaves among the victors, and for all practical purposes the tribe was exterminated" (p. 53). Central to the outcome of the war was the realization that there was very little possibility for the two peoples to live together in peace. The Pequot War nearly exterminated one of the most powerful indigenous groups in New England. It also created a foundation of conflict that would lead to other disputes, as witnessed in a second conflict, known as King Philip's War, in 1675.

Colonial Expansion

Throughout the sixteenth century, the colonial map across North America dramatically increased. In 1664, England seized New Netherland from the Dutch and renamed it New York. Edmund Andros was later appointed by King James II to be the new colony's Governor. The New York Colony did not envision itself a "city on the hill" like the founders of New England. Rather, Andros was a pragmatic royalist who sought merely to build a powerful foundation for an English empire. In doing so, he viewed Native Americans not as a threat but instead as a potential asset in intensifying the struggle between France, Spain, and England for mastery of North America. His approach was radically different in dealing with the Native Americans, and it would set the tone for much of Britain's relations with them for the next century.

Andros came to office almost as King Philip's War erupted in New England which represented a major effort by the natives to drive the English colonists out of New England. King Philip, also known by his Wampanoag name of Metacom, was the son of the tribal leader Massasoit. Fearful that the conflict might develop into a general uprising against the English, Andros proactively incited the Mohawks to launch the fatal attack that would eventually break the rebellion and allowed "refugees" to flood into New York prohibiting any other Colony from pursuing them. Andros also refused to return the seven principle Indians responsible for instigating the war. In 1677, he called for a conference at Albany, at which the Mohawks undertook not to carry out raids in New England, and the Puritans agreed, in return, that New York should treat directly with the Iroquois. New York was a royal possession and therefore could not be challenged or ignored with impunity.

The contrast in tribal-colonial relations in New England and New York was vast. In what is now upstate New York all the way west to the Great Lakes region, the six Iroquois peoples – Mohawk, Onondaga, Seneca, Oneida, Cayuga, and Tuscarora – never surrendered the right to define themselves or their conviction to run their own lives. Certainly, their culture has been altered by means of forced assimilation, but their commitment to sovereignty continues even today. Such endurance can only be attributed to their unique spiritual and political confederation, known as the League of Five (later Six) Nations. Such was the vehicle by which they have been able to maintain a separate identity and destiny from that of their European counterparts. Wilson cites the League as that which enabled them "to play a crucial role in the history of colonial America which still has repercussions today" (p. 98).

In making the Iroquois the cornerstone of his Native American policy, Andros entered into a treaty with the Five Nations acknowledging their preeminent position and allowed them to pull other tribes – their children – into an alliance with the English. Andros referred to this as the "Chain of Covenant," which seemingly had different meanings for both sides. The Iroquois saw it as an extension of the same principles they already shared among the Five Nations. This was an association of essentially autonomous peoples who combined for mutual defense. The English, however, chose to view the "Chain" as a kind of pyramid, with New York at the top, the Iroquois (and, to some extent, the New England colonies) in the middle, and the various dependent indigenous nations at the bottom. Authority over all these peoples and their lands flowed down the hierarchy from its ultimate source in the English Crown.

Structurally, the "chain" replicated the feudal intent of the seventeenth- and early-eighteenth-century Europe by creating a defensive apparatus for England's settlement and sovereignty over any group that sought protection from the League. Given the centralization of their power, England thus encouraged the Iroquois to extend their influence far beyond the existing colonies into the interior. This would allow the English to acquire "title" to vast tracts of North America. As Jennings reflects, the British had created a reasonable alternative in donating "an empire to the Iroquois in order to claim it for themselves."

After 1677, the Covenant Chain was expanded to include several English colonies, most notably Massachusetts and Maryland, along with those colonies' subject Indians. The upshot of these

arrangements was that the Iroquois cooperated with their colonial partners in subduing and removing subject Indians who impeded settler expansion. Still, Andros was fully aware of England's precarious position being far too reliant on the Iroquois' protection and goodwill. In the eighteenth century, European competition for American colonies became even more intense as French traders moved far into the interior and along the Mississippi River. In 1701, France appointed its first Governor, asserting colonial territory and in 1718 founded New Orleans as the capital of its new province. Concurrently, the Spanish were moving north and east into the Plains region setting their sights on the Alamo.

As the English pushed south and west, establishing their colonial dominance along the eastern coast, their trading agreements with the Cherokees, Chickasaws, Choctaws, Creeks, and neighboring tribes, brought them closer to both French Louisiana and Spanish Florida. The constant movement and settlement led to numerous conflicts between opposing European forces. For 38 of the 74 years between 1689 and 1763 England (and, after the Act of Union in 1707, Britain) was at war with one or both of her colonial rivals in North America, who also spent much of the time fighting between themselves. In almost every one of these conflicts, Native Americans played a crucial part, often contributing the bulk of the troops for colonial war parties – which sometimes contained no more than a handful of Europeans – and almost invariably suffering the heaviest losses.

The diverse native societies encountered by Europeans throughout the seventeenth century were not static isolates lying outside the ebb and flow of human history. Rather, they were products of a complex set of historical forces, both local and wide ranging, both deeply rooted and of recent origin. Although their lives and worldviews were shaped by long-standing traditions of reciprocity and spiritual power, the people in these communities were also accustomed to economic and political flux which allowed them to absorb new peoples (both allies and antagonists), objects, and ideas, including those originating in Europe. Such combinations of tradition and innovation

continued to shape Indians' relations with Europeans, even as the latter's visits became permanent.

Native American Anti-Imperialism

The most appropriate conception of Native American resistance can initially be summed up as a group of single tribes and alliances that took up arms to defend their lands and ways of life. Such defenses were largely grounded in critical view of European Americans and against those who were willing to enter into alliances with them. Militant tribes, seeking to protect their own way of life, often targeted factions within their own nations seeking compromise with Americans. Identifying targets of an anti-imperialist movement does not always recognize imperial power alone but also those in collaboration with it (Ostler 2015).

In seeking an alternative means for survival, Native Americans rejected dependence on Empire. These anti-colonial interpretations have been derived from the actions of educated tribal leaders who boldly articulated a rejection of nationalist aspirations in favor of conditions that would make sovereignty possible within space controlled by the United States. Such rejections included adherence to the moral authority of Christianity and US political traditions. In doing so, Native Americans appealed to Euro-Americans on their own terms, having educated themselves on secular institutions which had published anti-colonial critiques and proposed reforms. Understanding their predicament, they sought not an end of colonialism, but rather conditions by which they could continue living in the same manner than once had in a preserved space allowable under colonial rule.

The wave of settler aggressions in the late 1760s and 1770s led many Indians to regard Americans as their most serious threat. The fate befallen scores of Native Americans in New England and Virginia was a strong indication of what awaiting the rest. Such recognition prompted the Shawnee Tecumseh, to ask: "Where today are the Pequots? Where the Narragansetts, the Mohawks, the Pocanets and many other once

powerful tribes of our people? They have vanished before the avarice and oppression of the white man" (Wilson, p. 148).

Consequently, many Indians believed that the disaster and chaos at the hands of whites had been something of their own doing. In embracing certain aspects of European culture, they had neglected the spiritual roots of their own power. Many sought a return to their own rituals and ceremonies, but doing so would require rejecting alcohol, Christianity, and other impurities introduced by the whites. This was the only way in which Native Americans found the strength needed to overcome what was by that point was identified as their enemy. The revival of "traditional values" was created a new phase in the evolution of Native Americans. What they had lost at the hands of their colonizers was far more internal than external. Since they had never been a material culture, they were to look at the material ways which they had adopted. Spiritual strength that had once held all of their traditions together had become infected with disease. The source of the illness, like many recent epidemics, had been delivered from European shores.

Building a new diplomatic network among Native Americans signified many changes to the former aboriginal system of ad hoc alliances. The very notion of tribal sovereignty, once held as a cornerstone of the indigenous way of life, need to be reconceived as one far more durable and extensive if they, as a people, were to defend themselves against the whites. As a people, their origins were clear. It began with the Five Nations stretching outward from the Great Lakes to the Gulf of Mexico, draw together a network that included scores of peoples, some of them once enemies, now bounded for a common cause. Ostler (2015) cites an unnamed Shaman who described how the anti-American alliance would later indict the colonists for having taken "away all their lands and cruelly and treacherously treated some of their people" (p. 43). The Native Americans charged the Europeans with delivering an unjust war upon their nation, one that destroyed many of their tribes.

While the building of the US continental empire can clearly be categorized as a case of imperialism, the suggestion that the colonization of North America was a product of imperialism is not the norm. Certainly, the effort to eliminate Native Americans merges the settler colonial ideology with continental empire-building (Veracini 2010). As always, the justification for this brutality was the supposed "savagery" of the Indians. Before the Revolutionary War began, they had already begun to charge the British with damaged by making them dependent on alcohol and other trade goods, destroying game, and encroaching on their lands. In 1763, Indians launched a series of attacks against British posts, igniting Pontiac's War. Warriors from numerous tribes joined the uprising in an effort to drive British soldiers and settlers out of the region. The war is named after the Odawa leader Pontiac, the most prominent of many native leaders in the conflict.

Native Americans sensed opportunity with the outbreak of the American Revolution. In early 1776, the Cherokees were invited to join a party of Mohawks, Shawnees, and Delawares in forming a pan-Indian alliance against the colonists (Wilson, p. 150). The opposition gave outsiders and other observers insight into indigenous thought. The one British Mohawk leader, Joseph Brant, who called on Iroquois warriors to fight the Americans, was later credited as the one who "began this Rebellion to be sole Masters of this Continent" (Ostler, p. 43).

In the decades following independence, economic problems, rampant speculation, and disputes over title drove more and more settlers west in search of their own land, keeping the United States in almost permanent conflict with Native Americans. Indians objected to the "highly offensive" treaties imposed on them after the war. They challenged the way in which US officials spoke to them as people who "must . . . submit to the dictates of a proud conqueror." In the late 1780s, the western tribes formed a confederacy that included Shawnees, Delawares, Mingoes, Wyandots, Miamis, Ottawas, Ojibwes, Potawatomies, Creeks, and Cherokees to defend against further advances by the United States. Dowd (1992) describes the unification of several distinct communities for political purposes, as

"creative argumentation, intricate diplomacy between tribal communities, management of internal dissent, and strategic planning" (p. 99). As a result, religious practices, including the Green Corn Ceremony, were renewed. Powerful emetics were consumed as a means of purifying the soul from the ill effects inflicted by the European ways of life. Prophecy was of central importance of the movement in casting the Europeans as demonic beings, "pale faces" with "great white wings." The "insatiable avarice," of Europeans was cited as being driven by its "encroachments on the red men." Such visions were targeted by specific actions that would "not be satisfied until they had crowded the Indians to the extreme ... pushing those who should escape ... all would at length be exterminated" (Dowd, pp. 101–109; Ostler, p. 44).

In 1787, the passage of the Northwest Ordinance intended to encourage American settlement and development of the region. It was poorly received by Native Americans who saw it as an immediate threat. The Ordinance would eventually lead to the dispossession and conquest of Native American lands clearly stated that it (land and property) "shall never be taken from them without their consent" and that they "shall never be invaded or disturbed, unless in just and lawful wars authorized by Congress." By 1790, hundreds of aggrieved warriors were up in arms. Two expeditions sent by President Washington to "pacify" any rebellion were destroyed by a coalition of Shawnee, Potawatomis, Ottawas, Ojibways, and Delawares led by the Miami chief Little Turtle. The coalition would eventually fall in the Battle of Fallen Timbers in 1794 (Wilson, p. 154; Ostler, p. 72).

In 1795, following the Battle of Fallen Timbers, terms for peace and concessions were agreed upon, and a treaty was signed at Fort Greenville, Ohio. The treaty was supposed to bring an end to the conflict in the Northwest, and, in particular, the Ohio country. New territorial lines were drawn relegating Native Americans to northwestern Ohio. It also introduced the practice of annual payments following land concessions. The treaty became synonymous with the end of the frontier in the Northwest Territory.

The response to the Fort Greenville Treaty, in the first years of the nineteenth century, was a refocused effort by Indians in building a new anti-imperial movement. Among the Shawnee many Indians sought a spiritual path that leads them to abstain from alcohol and to reject European trade goods and technology. They returned to their pre-European modes of dress and consumption. Central to this "new way" was a strict adherence to renewed religious rituals. The movement drew spread to include large numbers of Delawares, Kickapoos, Potawatomies, Ottawas, Ojibwes, Menominees, Ho-Chunks, Sacs, Foxes, and Iowas. Those who joined the new movement were critical of any Indian leaders who cooperated with the United States. Chiefs who signed the Fort Greenville Treaty were charged with witchcraft and crimes against their people. As Ostler states: "In this instance, then, the immediate target of an anti-imperialist movement was not the imperial power; it was those perceived to be collaborating with it" (p. 45).

The critique of US imperialism would become a rallying cry for the indigenous tribes in North America. Following the Fort Wayne Treat in 1809, which led to more cession of land through the use of bribery and violence, Tecumseh noted further "the treachery of the British" toward Indians. In the transition from British to what was now a Euro-American phenomenon, Tecumseh claimed that their "new fathers the Americans ... told us they would treat us well." He concluded that the "Americans" were no different as they too would murder "men, women, and children." Tecumseh took charge of such momentum by seeking support from the British in Canada and by traveling to several other tribal nations throughout what was the United States and beyond its western borders. All diplomatic efforts with US emissaries were designed to re-acquire all Indian lands east of the Mississippi River.

The outbreak of war in 1812, between Britain and the United States, was again viewed as an opportunity for Native Americans to come together in rebellion against what were now the "Americans." Tecumseh called for his people to seize the moment, "to form ourselves into one great combination." The British were keen on

the prospects of Tecumseh's ability to deliver Natives in supporting them in the conflict, appointed him a brigadier general. While he was effective in scoring a string of spectacular victories in the Great Lakes area, the strength of the American military proved to be too much. In October of 1813, during the battle of the Thames, US troops routed British and Indian forces, killing Tecumseh as he tried to rally his men. Six months later, to the south, Andrew Jackson led troops against the Creek Red Sticks, killing over 800 at Horseshoe Bend.

The battles of the Thames and Horseshoe Bend can be seen as marking the defeat of a string of interrelated anti-imperial movements that had waxed and waned for over 50 years. At their strongest moments, these movements had adherents in scores of Indian communities from the Gulf of Mexico to the Great Lakes and posed a serious threat to US imperial ambitions. During this time, they succeeded in created new forms of political organization and identity, positing a "polygenetic theory of human origins, a separate creation and correspondingly different ways of life for 'red' and 'white' people." Though placing "red" people in a superior moral position, the Confederationists' theory of racial division was pluralistic, as it held that the Creator had given each people specific technologies and separate lands, rather than hierarchical, as in European and US racial theory, which regarded "civilization" as inherently superior to "savagery." The Confederationists also articulated a systemic critique of European and US imperialism. Prophets not only received visions and preached moral regeneration and the revival of ritual; they developed a historically and empirically informed analysis of imperial interests and strategies and used this analysis to mobilize supporters, assess current conditions, and forecast future possibilities. Although the anti-imperialist Confederationists developed the most robust oppositional ideology of any Indians in the early nineteenth century, critiques emerged from communities that had already been colonized. Until the 1830s, however, oppressive conditions generally worked against openly anti-colonial articulations.

Racial Attitudes and the Birth of "Redness"

The initial impact of the differences between Europeans and Native Americans designated superior and subordinate groups, respectively. Central for to the conflict was a new racial consciousness, one in which indigenous people no longer identified as members of specific tribes but as part of a more unified "red race" poised in opposition to the invading "race." The belief that the Native American and "white" worlds were essentially irreconcilable clearly reflects a long history of broken promises. As Wilson observes, "repeated removals profoundly shaped nativist beliefs." He also includes the story of an unnamed Shawnee shaman who died and traveled to the "sky world," where he had been given a "dire warning" about following the white man's beliefs. "Beware of the religion of the white man," the Shaman was told, ". . . every Indian who embraces it is obliged to take the road to the white man's heaven; and yet no red man is permitted to enter there, but will have to wander about forever without a resting place" (Wilson, p. 150).

The Europeans, and certainly the English, had long held that "savage" and "civilized" societies were incapable of coexisting. This view deemed indigenous people as untamed, like the wild animals with which they share the wilderness. It seemed impossible, to Europeans, that they were capable of more advanced and virile civilization. Instead, the dominant view was that they would disappear. The only hope for Native Americans was to break their tribal allegiance and become "civilized."

In 1826, Elias Boudinot published *An Address to the Whites*. Boudinot was Cherokee with about one-sixteenth of "white" blood. At age 16 he adopted a European name, dressed like a southern gentleman, and spoke in flawless English. Having been educated at a mission school, he had been "properly" assimilated into the Euro-American way of life. His *Address* rejected the necessity to "darken these walls with deeds at which humanity must shudder." Instead, he sought to detail Cherokee progress toward civilization. He sought appeasement and "mercy" to allow Cherokees to

avoid the common fate of "the poor aborigines [to] melt away before the white population." Denson (2004) contends that Cherokee histories offered portrayals of white Americans as "treating them with kindness" and then follow with how recent "U.S. actions had betrayed a long-standing friendship" (pp. 40–41).

The continual representation of Native peoples as savages is what made "temporal interest and eternal welfare" that much more difficult. Konkle (2004) adds that "a Native person has to endure being responded to as a savage Indian, no matter how 'civilized' his appearance" and characterizes Boudinot's writings as "emerging oppositional critique" (p. 51). In doing so, Boudinot addresses the discrepancy between white knowledge about indigenous peoples and the Native American reality. While he admits that Natives may be "ignorant," "heathen," and mad "savage," he stresses that they (Natives) are "no more than all others have been under similar circumstances. Eighteen centuries ago what were the inhabitants of Great Britain?" (p. 69).

The American Indian

Native Americans remain a tiny minority, representing less than 1% of the US population. Scattered throughout the country with heavy concentrations in the west and southwest, more than half of all Indians live in Oklahoma, California, Arizona, New Mexico, Alaska, and Washington State. These populations tend to be dispersed among other groups, rather than to congregate in "Indian areas" where might be easily identifiable. There are high concentrations in urban areas. Most of the remaining tribal lands – which many urban Indians still regard as home – are relatively isolated, so travelers and visitors to major centers are unlikely to see them without going out of their way (Wilson, p. xxiv).

The traditional Indian is no more. Some, as the result of intermarriage with non-Indians, do not even look racially particularly distinct. For someone whose only image of the "Indian" is still some furred, feathered and beaded figure staring inscrutably out of a nineteenth-century photograph, they

seem unsettlingly inauthentic and unclassifiable. In fact, it is profoundly unrealistic to suppose that any people, especially Native Americans, will look the same as they did a hundred years ago. All cultures evolve. American Indians, in addition, have faced pressures and enforced changes that are almost unimaginable to most other peoples.

Dunbar-Ortiz (2014), in a somewhat prophetic reminder, recalls the original settlers of the Massachusetts Bay Colony adopting "an official seal designed in England before their journey." It depicts a "near-naked native holding a harmless, flimsy-looking bow and arrow and inscribed with a plea, 'Come over and help us.'" Some 300 years later, US military veterans of the Spanish American War revealed a similar seal showing "a naked woman kneeling before an armed US soldier and a sailor with a US battleship in the background." This "altruistic theme" she suggests can be traced "into the early twenty-first century, when the United States still invades countries under the guise of rescue" (pp. 49–50).

The genocidal conquest of indigenous lands in the settler colonies of North America is the basis for agriculture, railway building, urban development, and mineral extraction in those countries. Today, whereas more than 400 native peoples remain within the 48 contiguous states of the United States and over 200 within Canada, these currently reside in reservations or "replacement lands" comprising a mere 3% of the continental United States and a lesser portion of Canada. Despite this, having never ceded it by treaty or other formal means, native North Americans retain legal title to around one third of the US land mass and even more of Canada's. The reservations into which they have been forced were effectively "dumping grounds" for Native Americans, whom they were not in any way intended to benefit. Aside from a layer of smaller Native entrepreneurs, ranchers, and bureaucrats, the principal beneficiaries of the reservation system have been large mineral and energy monopolies; these are vital to the health of the US economy:

> It is one of history's supreme ironies that this same 'worthless' acreage turned out to be extraordinarily rich in minerals, endowed with an estimated two-

I

thirds of what the U.S. now claims as its own uranium assets, as much as a quarter of the readily accessible low-sulfur coal, 15–20 percent of the oil and natural gas, and appreciable deposits of copper, bauxite, zeolite and other strategically/commercially crucial ores. These minerals, plainly belonging to the indigenous nations within whose reservation boundaries they lie, constitute what federal economic planners now like to call 'U.-S. domestic reserves.' Without these resources, America's contemporary business as usual could never have been created, and would presently come to a halt in a hot minute. (Churchill 1998, p. xii)

Yet not only would the proceeds from the natural resources found on reservation land make Native Americans the largest per capita landholders of any group in the United States, and the richest, they are by far the most impoverished.

Introduction

Antarctica has no indigenous population, and so there has been no domination and resistance of peoples as is usually associated with colonialism and imperialism. It is nevertheless possible to understand Antarctic territory as having been the object of imperial endeavors. Proposals for

how to govern the continent as well as what is perceived the relevant international law to be applied to Antarctica have also reflected an imperial outlook. The history of interstate relations concerning the governance of Antarctica can be understood in terms of three waves of Antarctic imperialism: the first led by Spain, the second by Britain, and the third by the United States. Each was part of a broader imperial project. Viewing the history of Antarctica in imperial terms helps us recognize the relationships of power that have infused the geopolitics of Antarctica and relates it to the broader international political context in which Antarctic politics has necessarily been embedded.

The First Wave of Antarctic Imperialism

The territory that was to become the states of Argentina and Chile came into contact with the European states system during a wave of European expansion that took place between about 1400 and 1715. The outcome of a series of papal bulls and the 1494 Treaty of Tordesillas between Spain and Portugal was that Spain considered itself to have authority to commission its explorers to claim territory not already discovered west of a line drawn from the Arctic pole to the Antarctic pole 370 leagues west of the Cape Verde Islands. Spain proceeded to acquire the land that became Chile and Argentina with the belief that its rights extended all the way to the South Pole. It should be remembered that until the early nineteenth century, Antarctica remained a purely hypothetical continent (Howkins 2010).

The Captaincy-General of Chile within the Viceroyalty acquired its independence in 1810 as the modern state of Chile and the Viceroyalty of the Rio de la Plata emerged in 1816 as the independent state of Argentina. Both successor states considered themselves to have inherited the entire land that had been granted to Spain. The Chilean-Argentine frontier was generally uninhabited and unmapped at independence (Véliz 1968, p. 405). The successor states in South America were highly centralized, with cities at their core and

vast distances between the urban areas and the peripheries. In many cases the boundaries between the states were quite vague.

Argentina and Chile spent much of the century after independence negotiating portions of their mutual boundary. The starting point in these negotiations was the South American legal doctrine of *uti possidetis, ita possideatis*, literally "as you possess, you may continue to possess." In other words, the status quo was to remain. A limitation of reliance on this principle was that in many cases there had been no settled boundary between the colonial administrative units. Where there had been an official demarcation, this often differed from the boundary in practice. One thing that was agreed, however, was that no *terra nullius* remained and that no future colonization or foreign intervention would be tolerated (Duran-Bachler 1972, p. 61).

During the nineteenth century, Chile and Argentina worked to settle their mutual boundary in the Magellan Straits, Patagonia, and Puna de Atacama. Where negotiations on their own were inadequate, they proceeded to arbitration. In the early twentieth century, they turned their attention to their boundary in Antarctica. The principle of *uti possidetis, ita possideatis* was particularly inadequate here because there had been no Antarctic boundary. Negotiations held in 1907–1908 were inconclusive (Scott 2004, p. 67).

Further efforts were made in the 1940s, but bilateral diplomacy was to prove unsuccessful. According to their general treaty of arbitration, the next step would be arbitration, which was in the first instance to be requested from His Britannic Majesty's Government. This was not a viable option in this scenario since Britain did not recognize the rights of either state to Antarctic territory.

As we have seen, Spain was the imperial power during the first period of Antarctic imperialism. To be precise, the object of this imperial project was not Antarctica itself but the land and resources of South America. There has been very little recognition of what has been described as the first wave of Antarctic imperialism within the English language literature on Antarctica. It

tends to be amalgamated with the second for reasons that will be explored below.

The Second Wave of Antarctic Imperialism

The first sighting of the Antarctic continent by Europeans was probably as early as 1820 (Headland 1989, p. 26), but the second wave of Antarctic colonialism was a twentieth-century phenomenon; it is best understood as having emerged in the first decade of the twentieth century and having undergone most of its development between the world wars. Britain was the dominant colonial power during this second wave; France, Norway, Australia, and New Zealand were involved in this colonial project, although the latter two primarily as the recipients of British policy.

In contrast to what was described above as the first wave of Antarctic imperialism, this consciously imperial project had Antarctica as its object. It followed on from the "new imperialism" of about 1870–1910 during which European states gained extensive territory on the African continent. European states believed that they had a right to make claims to any "non-civilized" territory. France acquired an area 20 times the size of France itself (Barraclough 1964, p. 62).

The legal regime within which the European colonizing states divided up the territory in Africa was confirmed in the General Act of the Berlin Conference signed on 26 February 1885. A claim was not to be valid until and unless followed by annexation and effective occupation, and the colonizing power would be expected to notify other states. The applicability to Antarctic colonialism of the requirement of effective occupation was debated given the difficulty of long-term occupation in Antarctica but was in general terms accepted, certainly by Britain.

The British Antarctic claim is based on Royal Letters Patent of 1908 and 1917 and by the end of 1919 Britain appears to have developed a policy of Antarctic imperialism (Beck 1983, p. 457); British policy-makers deemed it desirable to incorporate the whole continent into the British Empire (Beck 1983). This did not come to pass, however, most basically because France and Norway also began to demonstrate interest in Antarctica, and there was an understanding shared by colonial powers that they should not deny another "civilized" state the right to make a territorial claim nor be overly critical regarding the claims of other states.

Britain went on to negotiate boundaries between its claimed Antarctic territory and that of France and Norway. France formally declared sovereignty over Terre Adélie in 1924, and Norway's claim to Dronning Maud Land is dated from 1939. A British Order in Council in 1923 provided for the government of the Ross Dependency by the Governor of New Zealand and an Order in Council of 7 February 1933 established the Australian Antarctic Territory.

By the outbreak of World War II, the United Kingdom, New Zealand, Australia, France, and Norway had divided up the whole continent other than the territory between 80° and 150° West of Greenwich. There was some speculation as to whether the United States might claim this portion of Antarctica. Some privately financed expeditions by US nationals such as those by Byrd in 1929–1931 and 1933–1935 advanced claims on behalf of the United States. The United States nevertheless reserved its rights in respect to questions of territorial sovereignty in Antarctica (Myhre 1986), and several US scholars (e.g., Reeves 1934) rejected the idea that Antarctic territory might be acquired by effective occupation, suggesting that Antarctica might be *res communis* as opposed to *terra nullius*. US Antarctic policy was from the 1920s to the 1950s undergirded by what became known as the Hughes doctrine, which meant:

(i) That the United States made no claims to territory in Antarctica because no "actual settlement" could be made even though first discovery could be proved.
(ii) The United States would not recognize claims by other countries because this condition of "actual settlement" was not fulfilled (Hall 1989, p. 137).

Efforts to Resolve the Conflicting Outcomes of the First Two Waves of Antarctic Imperialism

The portion of Antarctica claimed by the United Kingdom overlapped the South American Antarctic, the most accessible and strategically important part of the continent, bringing the outcomes of these two waves of Antarctic imperialism into direct conflict. Meanwhile, actions by Chile and Argentina could be interpreted not only as furthering their efforts at boundary delimitation but as belated attempts to participate in colonial claim-making as per Britain, France, Norway, Australia, and New Zealand. A standard account of the evolution of Antarctic geopolitics such as that in Joyner (1998, p. 17) therefore proceeds along the following lines:

> The earliest claims to Antarctica were made by European powers. The onset of World War II, however, broadened interest in the Antarctic, and two non-European states soon joined the ranks of territorial claimants to the frozen continent.

Chile is viewed as having been the first to move. A Chilean Decree of 6 November 1940 defined the "Chilean Antarctic Territory" as consisting of "[a]ll lands, islands, islets, reefs of rocks, glaciers (pack-ice), already known, or to be discovered, and their respective territorial waters, in the sector between longitudes 53 and 90W" (Bush 1982b, pp. 310–312). Argentina is in most standard accounts deemed to have followed with a claim made in 1943 (Hall 1989, p. 138) amended in several Argentine maps published in 1946 (Joyner 1998, p. 18).

A dual reading of these actions is facilitated by the fact that "occupation" has meaning within both regimes: it was relevant to the placement of a boundary in South America, but "effective occupation" was also a means of acquiring territory in the new imperialism of the late nineteenth and early twentieth century. When their positions were viewed in terms of the dominant legal regime of new imperialism, the position of both Argentina and Chile appeared weaker than that of the United Kingdom because as we have seen, key actions they took to demonstrate effective occupation over territory that overlapped that claimed by the United Kingdom also succeeded those of the United Kingdom.

The United Kingdom proposed several times between 1947 and 1954 that a case be submitted to the International Court of Justice (Scott 2004, p. 75). In Notes to Argentina and Chile of 21 December 1954, the United Kingdom suggested as an alternative course of action, an arbitral tribunal to decide on their respective rights "under international law to the territory designated by the Letters Patent of 1908 and 1917 as Dependencies of the Falkland Islands" (Bush 1982b, p. 5). The United Kingdom went so far as to make two unilateral applications to the Court the following year, but in 1956 the Court issued orders removing both cases from the list because both Chile and Argentina denied the Court jurisdiction.

The South American states were no doubt concerned that if the case were to reach the Court, the now dominant law of new imperialism would be the relevant law applied, so leaving them in a weaker position. Both saw themselves as anti-colonial states. At the San Francisco conference in 1946, for example, Argentina recorded a reservation to Article 77 of the Charter of the United Nations that dealt with colonial possessions (Bush 1982a, p. 615). Argentina and Chile perceived their interests in Antarctica as nationalist and anti-imperial, developing the idea of a "South American Antarctica" to further their anti-imperialism (Howkins 2010, p. 41).

There were several other attempts during the 1940s and 1950s to initiate processes aimed at resolving the conflicting outcomes of what has been described here as two periods of Antarctic imperialism. In 1940, for example, Argentina proposed an international conference to determine the juridico-political status of Antarctica, an invitation that was repeated on several occasions (Scott 2004, p. 74).

The United States proposed the internationalization of Antarctica. In 1948 the United States distributed a draft agreement by which Antarctica would become a United Nations trusteeship. The preamble to the agreement referred to Article

I

75 of the UN Charter as having provided for the establishment of an international trusteeship system. Article 3 stated that Argentina, Australia, Chile, France, Norway, New Zealand, Great Britain, and the United States would be designated as the "administering authority of the trust territory." The administering authority would "carry out in the trust territory the basic objectives of the system as set out in Article 76 of the Charter, so far as they may be applicable in the trust territory." The United States was thereby associating itself with the European wave of Antarctic imperialism and effectively asking the South American states to have their positions interpreted in terms of twentieth-century European colonialism as now inclusive of the United States and to then merge those rights with others.

This proposal was not well received, and the United States went on to make another proposal to internationalize Antarctica; this time the United States proposed a condominium (US Department of State 1948). By Article 2, parties were to

> Merge and join their claims to, and interests in, specific portions of the area covered by this agreement and vest such individual claims and interests in the special regime hereby established, each agreeing not to seek a division of the territory in the area, but to join with the others for the purposes embodied in this agreement.

This proposal was not much better received by states believing that they enjoyed territorial rights in Antarctica; nor did they welcome the suggestion by India in 1956 that the "Antarctic question" be discussed at the General Assembly, India hinting at the possibility of a trusteeship. The Unite States and Soviet Union showed some sympathy for the proposal (Howkins 2008).

Interestingly, a key component of discussion regarding internationalization options was the universal or planetary importance of knowledge being gained through scientific research in Antarctica. Science was to become the dominant theme in rhetoric regarding international cooperation that ultimately resulted in the 1959 Antarctic Treaty. The preamble to the Antarctic Treaty acknowledged the "substantial contributions to scientific knowledge resulting from international cooperation in scientific investigation in

Antarctica" and to the benefits of establishing a "firm foundation for the continuation and development of such cooperation on the basis of freedom of scientific investigation."

There were 12 original signatories of the treaty: Argentina, Australia, Belgium, Chile, France, Japan, Norway, South Africa, the Union of Soviet Socialist Republics, the United Kingdom, and the United States of America. Article 4 accommodated the differing positions as regards territorial rights. Article 4 provides:

1. Nothing contained in the present treaty shall be interpreted as:
   (a) A renunciation by any Contracting Party of previously asserted rights of or claims to territorial sovereignty in Antarctica
   (b) A renunciation or diminution by any Contracting Party of any basis of claim to territorial sovereignty in Antarctica which it may have whether as a result of its activities or those of its nationals in Antarctica
   (c) Prejudicing the position of any Contracting Party as regards its recognition or non-recognition of any other states right of or claim or basis of claim to territorial sovereignty in Antarctica
2. No acts or activities taking place while the present treaty is in force shall constitute a basis for asserting, supporting, or denying a claim to territorial sovereignty in Antarctica or create any rights of sovereignty in Antarctica. No new claim, or enlargement of an existing claim, to territorial sovereignty in Antarctica shall be asserted while the present treaty is in force.

Article 4 is generally regarded as the cornerstone of the treaty.

The Dominant Postcolonial Perspective on the Antarctic Treaty

Since entry into force of the Antarctic Treaty in 1961, Antarctica has been governed by the Antarctic Treaty System (ATS). By Article 1(e) of the Environmental Protocol to the treaty, the ATS is

defined as "the Antarctic Treaty, the measures in effect under that Treaty, its associated separate international instruments in force and the measures in effect under those instruments." What could be referred to as the dominant postcolonial interpretation of the treaty is of its Article 4 as having "frozen" the territorial status quo, thereby rewarding pre-treaty colonialism and prolonging its significance (Dodds 2006).

The number of Parties to the Antarctic Treaty increased gradually, but when the ATS commenced negotiations for a convention by which to regulate mining, Malaysia under Prime Minister Mahathir took the lead among Third World countries, critiquing the ATS as being non-transparent and perpetuating the privilege of a few. Mahathir presented his position as anti-colonial (Hamzah 2013, p. 97), asserting that Antarctica did not belong to the claimant states any more than colonial territories belonged to colonial powers.

The "Question of Antarctica" remained on the agenda of the United Nations General Assembly from 1982 to 2005, during which period regular debates were held regarding governance arrangements for the continent and whether it should be brought within the United Nations. Although key players in the ATS defended the System over the period, the "neocolonial" challenge by developing countries to the legitimacy of the system did serve to shape subsequent developments in the ATS (Haward and Mason 2011). It was one factor influencing the rejection by the ATS of a convention providing for mineral exploitation in Antarctica and its effective replacement by an Environmental Protocol, Article 7 of which prohibits activities relating to mineral resources other than scientific research. Malaysia acceded to the Antarctic Treaty in 2011, which is sometimes interpreted as an example of a broader tendency of the ATS to co-opt its postcolonial critics (Chaturvedi 2013).

The Third Wave of Antarctic Imperialism

The Antarctic Treaty can also be read as not only freezing colonialism but as itself a product of colonialism. Howkins (2010, pp. 47–48) interprets the treaty as a "reformulation" of the practices of settler colonialism. "Contemporary scientific claims to legitimacy in Antarctica rest on the idea of doing some good, making use of the landscape in a particular way."

If we are to discern a product of imperialism, we need also to identify an imperial power. The United States can be viewed as having served as the hegemon during a third wave of Antarctic imperialism. During its rise as a world power, US rhetoric made much of its being anti-colonial, and the United States is often assumed to be an anti-imperial power. But there is also a literature (e.g., Ferguson 2004; Odom and Dujarric 2004) that accepts the United States as having constituted an imperial power, even if its version of imperialism was "surreptitious" (Immerwahr 2019).

During its years as a world power, the United States has very rarely acquired formal colonies. The United States has, rather, permitted other states to acquire or retain their own independence and to conduct their foreign policy as sovereign entities. But the United States has then used multilateral treaties and institutions to disseminate its policy preferences, and although other states may have participated in the negotiation of those instruments, the broad policy direction was in most cases steered by the United States. The net effect of the United States protecting its own legal system from external interference but disseminating its policy preferences via international law has been an increase in US influence over the policy choices of other countries (Scott 2012).

Viewed from this perspective, the Antarctic Treaty did not only freeze the colonial claims of others but constituted an act of imperialism on the part of the United States. Despite having made no territorial claim of its own, the United States would, by Article 4, be able to go anywhere on the continent and to use the continent for all but non-peaceful activities.

> In formalistic, black letter law terms, the territorial rights of the claimant states have been preserved and nothing that takes place during the life of the ATS can detract from the status of those asserted rights. On the other hand, and bearing in mind the

distinction between formal and effective sovereignty, the fact that the Antarctic Treaty did not include provisions that in practice respected the asserted sovereign rights of the claimants meant that the effective sovereignty of those states would likely be diminished over time by state practice and by developments both internal and external to the Antarctic Treaty System. (Scott 2011, p. 58)

It is in this sense that Article 4 functioned to disguise US hegemony in the name of science.

Recent Scholarship on Antarctic Settler Colonialism and Imperialism

Dodds (2006) noted that polar scholars have not embraced postcolonialism as much as might be expected, with Indian scholar Sanjay Chaturvedi being one of several notable exceptions (others include Collis 1999 and Hains 2002). There has, however, been considerable literature emerge in the last two decades, emanating from several disciplines.

Recent scholarship on Antarctic settler colonialism includes, for example, that by Howkins (2010) who, in distinction from the historiographical approach presented here, views South American expansionism as a relatively understudied example of settler colonialism. Leane and Nielsen (2017) have provided an account of the role played by dairy cows in facilitating Byrd's Second Antarctic Expedition in 1935; through this account they provide insights into the symbolic promotion of US colonial interests in Antarctica.

An imperial lens is also being applied to contemporary activities. Dutton (2009), for example, has examined contemporary French and British Antarctic travel writing, to find that the imaginary of the ice continues to be shaped by colonialism. Collis and Stevens (2007) investigated McMurdo and Mawson Stations and the anatomy of their spaces as examples of contemporary colonialism.

There is, of course, a politics to the scholarship on postcolonial Antarctica. In response to the postcolonial critique of the ATS as exclusively benefiting its participants, it could be pointed out, for example, that the original parties to the treaty have not only been members of a privileged "club" but have at the same time assumed responsibilities toward the continent that non-parties do not have. Treaties are not automatically binding on third parties, but states wanting to demonstrate continuing commitment to their asserted territorial rights have needed to actively reinforce their position. Indeed, it may be construed as valid for countries geographically proximate to the continent, including Argentina, Chile, Australia, and New Zealand to influence to a disproportionate extent Antarctic governance.

While in no way asserting any direct correlation between the two, and noting that postcolonial literature has emanated from scholars in claimant states, it might also be noted that US scholars including Joyner (1998) have perceived Antarctica as a global commons, those such as Chaturvedi (2013) from non-claimant countries have criticized the colonialism embedded in the treaty, and those from claimant states such as Kaye and Rothwell (1995) have made particularly notable contributions to analyzing the detail of legal claims in Antarctica.

Conclusion

Despite its lack of an indigenous population, Antarctica has not been removed from imperialism. There is increasing scholarly interest in analyzing that imperialism. This contribution has identified three waves of Antarctic imperialism, each of which has essentially subsumed the previous wave within its own framework of political understandings and international law. Antarctica was not the direct object of the first wave, which resulted in Spanish colonization in South America, but was very much the object of the second wave in which the United Kingdom, France, Norway, Australia, and New Zealand claimed portions of the continent.

Since the emergence of twentieth-century Antarctic imperialism, the actions of the South American states have been interpreted within the "new imperialism" framework of justifying claims via effective occupation. The majority of English language accounts portray both the states involved in European Antarctic imperialism and in South

American boundary delimitation as having been engaged in the same process of colonial "claim-making." The historiographical interpretation presented above has distinguished between these two waves of Antarctic imperialism. Viewing them all as having been involved in an equivalent process of "claim-making" tends to favor the position of the United Kingdom over that of Argentina and Chile.

What has been described as a third wave of Antarctic imperialism did not require any of the claimant states to renounce their claims but superimposed a governance system justified by the universal and non-political nature of science. The fact that the United States led the negotiation of the treaty and that it benefited disproportionately from that treaty insofar as it had made no territorial claim of its own but would now have access to the whole continent supports the assertion that this was an example of US informal empire. Viewing the history of Antarctic geopolitics in terms of successive waves of imperialism does not only elucidate the place of Antarctica within shifting global relationships of power but also points to the possibility that there may be additional imperial moves or proposals for the governance of Antarctica and its resources as global relationships of power continue to evolve (Scott 2017).

Imperialism, Uneven Development, and Revolution: The Example of Amilcar Cabral

E. San Juan
Washington, DC, USA

Synonyms

Amilcar Cabral; Colonialism; Guinea-Bissau; Imperialism; Portuguese imperialism; Post-colonialism; Revolution; Uneven development

Definition/Description

This chapter examines the concept of post-colonialism through the lens of the theory and practice of Amilcar Cabral, who was a leading figure in the struggle for Guinea-Bissau's independence from Portugal. Cabral endeavoured to forge a country that was rooted in anti-imperialist struggle through unifying diverse ethnic groups in a common struggle for national liberation and independence and through building a common national consciousness rooted in the mobilization of the peasants, dispossessed and multiple class forces unified in the struggle to create a socialist government of national unity, forming the basis for a post-colonial society.

> It is important for us to identify the new victims and the new victimizers in the neocolonial era – for we do not live in a postcolonial era as the postmodernists claim. We must struggle together both locally and globally. The local struggle must be combined with global or international struggle and solidarity. We must fight on all fronts . . .. We must carry on a continuous resistance, a continuous dissidence, which will forge the way to a better future for the peoples of the world. (Nawal El Saadawi 1997) The masses are the torch-bearers of culture; they are the source of culture and, at the same time, the one entity truly capable of preserving and creating it – of making history. (Amilcar Cabral 1973)

The paralysis and inconsequentiality of post-colonial theory and criticism concerning globalised capitalism are so patently clear as not to warrant rehearsing again the objections of Aijaz Ahmad (1995), Arif Dirlik (1997), Neil Lazarus (1999), and others (see Schulze-Engler 1998; Stummer 1998). The charges range from the discipline's fetishism of textuality and its corollary metaphysics, its sly if civil evasion of 'contemporary imperialist practices' (Davies 1998, p. 23), to what Benita Parry calls the 'elective disaffiliation' of post-colonial critics 'from the variable articulations of an emancipatory politics' (1998, p. 48). This is not just because this genre is devoted to specialised studies on widowburning or British colonisation of the Indian subcontinent, Australia, Canada, and South Africa (Ashcroft et al. 1989). The explanation is more than theoretical or discursive. Robert Young, the editor of the new magazine *Interventions: The International Journal of Postcolonial Studies* put his finger on its symptomatology: 'The rise of post-colonial studies coincided with the end of Marxism as the defining political, cultural and economic objective of much of the third world' (1998, pp. 8–9). This diagnosis is more wishful thinking than a factual statement. To be sure, the 'Third World' as a homogenised entity never claimed to elevate Marxism as its all-

encompassing objective; no one does this, anyway. Another agenda lurks in the background.

Post-colonialism seems to require a post-Marxism as 'supplement', a prophylactic clearing of the ground (Loomba 1998; Moore-Gilbert 1997). What is meant by post-Marxism or the 'end of Marxism' is really the reconfiguration of the international class struggle between the imperial metropoles and the revolting masses of the periphery. It signifies the end of the bourgeois national project initiated by the Bandung Conference led by Nehru, Nasser, and Sukarno (Ahmad 1995) and its project of plural national-liberation trajectories (Denis 1982). This project of post-colonial states modernising on the basis of anti-communism and pragmatic philosophy, reliance on Soviet military support and cynical playing of the 'American card', collapsed with the bankruptcy of most neo-colonial regimes that succumbed to World Bank/IMF 'structural adjustment programs' and conditionalities.

Post-colonial normativity inheres in its claim to discover complexity and difference hitherto submerged by totalising axioms. The principle of uneven and combined development, as adumbrated by Marx and Engels, Lenin, Trotsky, and others in the socialist tradition, renders all the rhetoric of ambivalence, syncretism, and hybridity redundant. But this principle has been ignored or neglected because a linear teleological narrative of social evolution has been ascribed to classical Marxism, conflating it with ideas of unidirectional progress and developmentalism from Jean Bodin to W.W. Rostow and the gurus of modernisation theory (Patterson 1997). I want to elaborate on this distortion of Marx's position because it functions as the crucial basis for arguing the alternative rationality of unpredictable social change offered by post-colonial theory. The metaphysical idealism underlying post-colonial dogma, its hostility to historical materialism (the dialectical theory of comprehensive social transformation), and its complicity with the 'New World Order' managed by transnational capital can be made transparent by juxtaposing it with Marx's thesis of an uneven and unsynchronised process of development in specific social formations.

In essence, the most blatant flaw of post-colonial orthodoxy (I use the rubric to designate the practice of Establishment post-colonialism employing a post-structuralist organon) lies in its refusal to grasp the category of capitalist modernities in all its global ramifications, both the regulated and the disarticulated aspects. A mechanistic formula is substituted for a dialectical analytic of historical motion. Consequently, in the process of a wide-ranging critique of the Enlightenment ideals by post-colonial critics, the antithesis of capitalism – proletarian revolution and the socialist principles first expounded by Marx and Engels – is dissolved in the logic of the global system of capital without further discrimination. The obsession to do away with totality, foundations, universals, and systemic analysis leads to a mechanical reification of ideas and terminology, as well as the bracketing of the experiences they refer to, culminating in a general relativism, scepticism, and nominalism – even nihilism – that undercuts the post-colonial claim to truth, plausibility, or moral high ground (see Callinicos 1989; Dews 1995; Habermas 1987).

A typical exercise in repudiating a historical materialist approach can be seen in Dipesh Chakrabarty's objection to the institutional history in which Europe operates as 'the sovereign theoretical subject'. Modernity – 'the meta-narrative of the nation state' – is understood as European imperialism in collusion with 'Third-World' nationalisms. What is at stake is the question of a history of India written from the subaltern (peasantry) point of view. Chakrabarty calls for 'radical critique and transcendence of liberalism (i.e., of the bureaucratic construction of citizenship, modern state, and bourgeois privacy that classical political philosophy has produced)', a call that he believes finds resonance in Marx, post-structuralism, and feminist philosophy (1995, p. 386). While he seeks to provincialise Europe by demonstrating the limits of Enlightenment rationalism (its coercive violence suppressed the heterogeneity of other cultures and civilisations), he also rejects cultural relativism and nativist histories.

Chakrabarty's obsession is to unmask, demystify, or deconstruct the themes of citizenship

and the modern state as though they were permanent, transhistorical, and ubiquitous. In the end, Chakrabarty negotiates for a compromise which he labels a 'politics of despair': 'I ask for a history that deliberately makes visible, within the very structure of its narrative forms, its own repressive strategies and practices, the part it plays in collusion with the narratives of citizenships in assimilating to the projects of the modern state all other possibilities of human solidarity'. His intent is to unfold a radically heterogeneous world 'where collectivities are defined neither by the rituals of citizenship nor by the nightmare of "tradition" that "modernity" creates' (388). Not to worry. The dreams of repressed subalternity in India and elsewhere await a Foucauldean genealogical excavation that the group of elite academics like Ranajit Guha, Partha Chatterjee, Gyan Prakash, and Gayatri Spivak have already begun. On the other hand, the status quo of existing property relations and asymmetries of actual power relations (articulating class, gender, locality, religion) in India remain untouched.

Remembrance as Prophecy

Central to the post-colonial malaise is the belief that history or historical narratives of colonised peoples by Europeans have been permanently damaged, hence they are useless for recovering native or indigenous originality. Eurocentric knowledge (whether expressed by Cecil Rhodes or Joseph Conrad, by Black Elk or Fray Bartolome de las Casas) can never disclose the truth about the colonised. Following Lyotard, only local narratives can have validity from now on. Unless postcolonial historians naively believe they can return to a past where local narratives of tribal groups ran parallel and never intersected, the notions of locality and place are unintelligible outside of a wider global space from which they can be identified. What is missing in the critique of Eurocentric history is a dialectical comprehension of such relations – the relation between Europe and its Others – that precisely constitute the problem of one-sidedness, falsity, distortion, and all the evils that post-colonials discern in

modernity (including Marxism as a peculiarly European invention). Parallel or coeval modernities need to be theorised within a differentiated, not centralised, ontology of determinate and concrete social formations if we don't want to relapse into essentialising metaphysics.

In 1878, Marx wrote a letter to a Russian journal that complained of a certain tendency that mistakenly elevated his hypothesis about capitalist development in Western Europe to a 'suprahistorical theory'. He wanted to correct the misapplication to Russia of his notion of the transition from feudalism to capitalism given in *Capital:* the emergence of capitalism premised on the expropriation of the agricultural producers can occur only when empirical preconditions exist. Russia will tend to become capitalist only if it has transformed the bulk of the peasantry into proletarians. Marx explains that this did not happen in Roman times when the means of production of the plebeians or free peasants were expropriated; they became 'not wage workers but an idle mob more abject than those who were called "poor whites" in the southern United States'; after this, there appeared not a capitalist but a slave mode of production. Marx objects to his critic's attempt to generalise the hypothetical conclusion of his empirical inquiry:

> [My critic] absolutely insists on transforming my historical sketch of the genesis of capitalism in Western Europe into a historico-philosophical theory of the general course fatally imposed on all peoples, whatever the historical circumstances in which they find themselves placed, in order to arrive ultimately at this economic formation that ensures, together with the greatest expansion of the productive powers of social labor, the most complete development of man. But I beg his pardon. (It does me both too much honor and too much discredit.) [Here follows the instance of the Roman plebeians.] Thus events that are strikingly analogous, but taking place in different historical milieux, lead to totally disparate results. By studying each of these developments separately, and then comparing them, one can easily discover the key to this phenomenon, but one will never arrive there with the master key of a historico-philosophical theory whose supreme virtue consists in being suprahistorical. (Marx 1982, pp. 109–110)

Now, it is clear that events cannot be judged in themselves apart from the historical milieu, and

that there is no 'master key' to unlocking all phenomena – which is not to say that one doesn't need some schematic framework or methodological guidelines for gathering data, testing and evaluating them through some principle of falsifiability or verification, and finally formulating general albeit tentative observations. I think Marx was not disclaiming the validity of the notion of primitive accumulation he outlined, nor the scheme of historical development enunciated in the 'Preface' to A Contribution to the Critique of Political Economy (1859). The fundamental insight on the contradiction between the forces of production and the relations of production, manifest in class struggles and in the global phenomenon of uneven development, has served as a fertile *problematique* or framework of inquiry – paradigm, if you like – in which to raise questions and clarify problems of social change and historical trajectories.

There are at least two examples in Marx's theoretical practice that evince a sensitivity to the heterogeneous and disparate motions of diverse collectivities. The first deals with the subject of the Asiatic mode of production, which departs from the teleological assumptions of Marx's theory of transition from the ancient and feudal to the capitalist mode of production. No necessary succession is implied in the unfolding of the transition sequence. Because the socio-economic specificity of Asiatic society has led to a notion of despotic, stagnant, and arbitrary societies quite inferior to the dynamic Western counterparts, the notion has become problematic and controversial. Karl Wittfogel's book *Oriental Despotism* (1957), which examined the hydraulic economy of China and diverse societies under a centralised 'patrimonial' bureaucracy (inspired by Max Weber's studies), however, became a weapon in the Cold War against Stalinism.

Marx and Engels first became interested in investigating non-European societies when they engaged in journalistic criticisms of British foreign policy in 1853. They noted that despotism and stagnation characterised certain societies where the state management of public works (irrigation) predominated together with the self-sufficient isolated village community, as in ancient China. Later on, in Grundrisse, Marx emphasised the fact of the communal ownership of land by autarchic communities, the stable basis for the social unity embodied by the state. In *Capital,* Marx presented the Asiatic mode as one way in which the social product is communally appropriated; this system is founded on the social relations of the self-sufficient village anchored to the unity of handicrafts and agriculture. The 'secret of the unchangingness of Asiatic society' rested on the absence of private property (which precluded the rise of social classes as agents of change) and the simplicity of production methods. It is of course questionable how autonomous self-sufficient villages could coexist with the powerful interventions by centralised absolutist states whose origin also needs to be elucidated.

From a Weberian perspective, the stationary Asiatic mode displayed a lack of civil society and the dominance of a centralised state apparatus. Some scholars have claimed that Marx and Engels justified the 'progressive' role of British imperialism in creating private property in land and thus destroying the stationary Asiatic mode. This modernising effect, carried out through the railway system, free press, modern army, and means of communication (all technological determinants incorporated into social relations) has been used to apologise for if not legitimise imperial expansion as the only way of exploding an otherwise immutable and backward social formation. Here is Marx's own 'apologia' for British rule in India written for the New York *Tribune* (25 June 1853) in Marx's original English:

> England, it is true, in causing a social revolution in Hindustan, was actuated only by the vilest interests, and was stupid in her manner of enforcing them. But that is not the question. The question is: Can mankind fulfill its destiny without a fundamental revolution in the social state of Asia? If not, whatever may have been the crimes of England, she was the unconscious tool of history in bringing about that revolution. (Marx and Engels 1959, pp. 480–481)

Faced by the 'cunning of Reason' (to use the Hegelian phrase), Marx counsels us to put aside 'whatever bitterness the spectacle of the crumbling of an ancient world may have for our personal feelings' because we, tutored in

Enlightenment wisdom, are also aware of the advances made possible by imperial cruelty: the destruction of barbarian egoism, the Oriental despotism which 'restrained the human mind within the smallest possible compass, making it the unresisting tool of superstition, enslaving it beneath traditional rules, depriving it of all grandeur and historical energies' (1959: 480). Postcolonial sceptics condemn this narrative schema as reductive and positivistic. To my mind, however, it is the most graphic triangulation of opposites, a cognitive mapping of ruptures and contradictions that epitomises the genuinely dialectical vicissitudes of history apprehended by Marx in his survey of historically specific milieus and concrete conjunctures.

The other example catalysed by the discovery of the Asiatic mode of production is the possibility of a non-capitalist road to communism exemplified by Russia in the nineteenth century. In the midst of revolutionary struggles in Russia, Marx revised his early conception of Russia as 'semi-Asiatic' and examined the nature of the Russian *mir* or commune. Could it provide the foundation for socialism or arrest its advent? Marx and Engels held that it could, provided that capitalist relations of production do not strangle the whole countryside and that working-class revolutions in Europe would coincide with any vast social change in Russia. Plekhanov disagreed with this, but it only proved that there is no deterministic and unilinear paradigm, or an evolutionary mechanistic formula that would dictate how stages of development would unfold. It was Stalin who decreed in 1931 that Asian societies were subsumed under the categories of slavery or feudalism, thus pursuing the path of Western European development from primitive communism and then sequentially to slave, feudal, capitalist, and socialist stages. But, of course, that is not the end of the story.

It was the return of a serious concern with non-European routes to modernity in the 1960s (such as the Asiatic mode and the Russian commune) that spurred discussions over dependency, uneven development, and underdevelopment, world systems theory, the specificity and complexity of 'Third- World' societies, and African

socialism. The theoretical liabilities of Orientalism incurred by the Asiatic mode have been spelled out by Bryan Turner: 'its theoretical function was not to analyse Asiatic society but to explain the rise of capitalism in Europe within a comparative framework. Hence Asiatic society was defined as a series of gaps – the missing middle class, the absent city, the absence of private property, the lack of bourgeois institutions – which thereby accounted for the dynamism of Europe' (1983, p. 36). Nonetheless, the notion functioned as a heuristic tool that Marx deployed to eliminate any teleological determinism or evolutionary monism in his speculative instruments of historical investigation.

On the pivotal significance of these socioeconomic formations, Eric Hobsbawm calls attention to its implicit thesis of human individualisation through the historical process, via exchange conceived in terms of reciprocal interactions. It is in the course of demarcating the precapitalist *Formen* – before full-fledged commodity production set in – that Marx revealed his commitment to an emancipatory if utopian vision. Whether in ancient Greek and Roman, Asiatic, or Germanic versions, these tribal communities contrasted favourably with the bourgeois epoch because 'man always appears ... as the aim of production, not production as the human goal ...'. Marx continues: 'In fact, however, when the narrow bourgeois form has been peeled away, what is wealth if not the universality of needs, capacities, enjoyments, productive powers, etc. of individuals, produced in universal exchange?' In effect, the totality of human development, 'the absolute elaboration of his creative dispositions' and human powers signifies a 'situation where man does not reproduce himself in any determined form, but produces his totality' (1965, pp. 84–85). Informed by this synthesising impulse in which dealienation of labour becomes the aim of revolutionary praxis, Marx's method of historical specification does not degenerate into the disintegrating, anomic reflex that vitiates post-colonial discourse. Marx's empathetic understanding and interpretation of the past in their uniqueness, which post-colonial hermeneutics inflates into an axiom of incommensurability, does not preclude a synoptic,

all-encompassing apprehension; in fact, it presupposes that stagnant and paralysing continuum that, as Walter Benjamin (1969) puts it, must be blasted apart to release the forces of change.

It is in this context that Marx seized the moment of 'the break-up of the old village communes' in India by British imperialism as a disastrous event pregnant with its contrary. It is progressive in the sense that it releases or unfolds human potential. On the other hand, Marx believed (in a letter to Vera Zasulich in 1881) that if the Russian village commune (mir) were left free to pursue its 'spontaneous development', then it could be the point of departure for 'social regeneration in Russia'. This shows that Marx, far from being a unilinear determinist, posited the dialectical-materialist view that the peasantry can acquire a communist consciousness, depending on which aspects (the collectivist or privative) of the *mir* would be enhanced by a changing historical environment (Levine 1978, p. 175). This anticipates what Mao, Cabral, and others have recognised in appraising the conjuncture of forces in any contested situation, namely, 'the sovereignty of the human factor in revolutionary warfare' (Ahmad 1971, p. 147).

George Lichtheim reflects that Marx's ideas on the various forms of social metabolism which are crystallised in different stages of society illustrates the modes in which humans individualise themselves through the historical process of 'evolving various forms of communal and private property; that is, various ways of organising his social intercourse with nature and the – natural or artificial – preconditions of work .... The forcible disruption of the Indian or Chinese village community by European capital completes the process by rendering it truly global' (1967, p. 85). In any case, a revolutionary Marxist position does not prescribe a causal monism or a freewheeling causal pluralism. Gregor McLennan has summed up succinctly the dialectical imperative of the Marxist approach: 'Structural principles must be complemented by, or even include, notions of individual action, natural causes, and "accidental circumstances"…. Nevertheless, material and social relations can be long-term, effective real structures that set firm limits to the nature and degree of practical effect

that accident and even agency have' (1981, p. 234). In other words, Marxism views the world not as a closed totality but as an 'open, structured whole, with irreducible differences' (Haug 1984, p. 16) comprehended dialectically, mindful of the play of contradictions.

I have dwelt at length on this topic because of the post-colonial critic's insistence that the method of historical materialism is fatally compromised by its Enlightenment provenance. If Marx is a Eurocentric apologist for the 'civilising mission' of imperialism, then we should have nothing to do with his indictment of capitalism and advocacy of socialist revolution. It might be instructive to note that the charge of Eurocentrism levelled against Marx does not permit a nuanced and rigorous appraisal of his critique of bourgeois philosophy; the polemic of Eurocentrism does not distinguish the nature of capitalist modernity as a specific epochal form, one which is constituted by the complex, uneven relation between coloniser and colonised. Capitalism disappears when all of modernity, both positive and negative elements, becomes ascribed to a geopolitical region (the metropole vis-à-vis the periphery) that cannot be divorced from the world-system of which it is an integral part.

Samir Amin has perspicaciously described the historical genealogy of Eurocentrism in the drive of capital to subordinate everything to exchange value, to accumulation, hence the need for standardisation. But this drive to uniformity also precipitates its opposite, unequal accumulation or impoverishment of the masses. For Amin, the most explosive contradiction generated by transnational capital inheres in the centres/peripheries polarisation and its corollary, the 'imperialist dimension of capitalist expansion' (1989, p. 141). Post-colonial affirmation of cultural difference, or the interstitial and syncretic by-products of the centre/periphery dynamic, evades a critique of economism and reproduces itself as an inverted Eurocentrism that cannot resolve the crisis of inequality. A genuine universalism cannot emerge from incommensurable and provincialised cultures, no matter how valorised as singular or cosmopolitan; the impasse can be broken only by a national popular-democratic

breakthrough instanced by national liberation struggles.

Sublimating Contradictions into Heterogeneity

It is not exorbitant to state that today all social relations and practices, as well as the process of social transformation, labour under the imperatives of accumulation, competition, commodification, and profit-maximisation. Post-colonial paradigms of hybridity and ambivalence are unable to offer frames of intelligibility that can analyse and critique the internal contradictions embedded in the neo-liberal reality and ideology of the 'free market.' Driven by a pragmatic empiricism, post-colonialism cannot offer a frame of intelligibility for a 'cognitive mapping' of all those historical trends that marked the breakdown of developmentalism, modernisation theory, and other theoretical solutions to the crisis of monopoly capital from the Bolshevik Revolution of 1917 up to the scrapping of the Breton Woods agreement and a unitary monetary system. As many have noted, postcolonialism, its logic and rhetoric, coincides suspiciously with the anarchic 'free market' and the vicissitudes of finance capital on a global scale. Bound by its problematic, the post-colonial critic cannot even entertain the crucial question that Amin poses: 'how can we develop the productive forces without letting commodity relations gain ground?' (1977, p. 101).

There have been many explanations for this inadequacy and limitation. Amin (1998) locates it in post-colonialism's rejection of modernity, the Enlightenment narrative of emancipation and convivial democracy. The excesses of instrumental reason are ascribed to the teleology of progress instead of the logic of capitalism and its presuppositions (private property, entrepreneurship, wage labour, technological improvement, laws of the market). The conflation of the ideals of Enlightenment with the telos of utilitarian capitalism and its encapsulation in the historiographic fortunes of modernity has led to a sceptical, nominalist conception of subjectivity and agency. Disavowing modernity and the principle of collective human agency (humans make their own history under determinate historical conditions), post-colonialism submits to the neo-liberal bourgeois cosmos of fragmentation, individualist warfare, free-playing decentred monads, and a regime of indeterminacy and contingency. This ironic turn damages post-colonialism's claim to liberate humans from determinisms and essentialisms of all kinds.

I think the fundamental error may be traced to two sources whose historical matrix I have alluded to earlier. We have, first, the inability to conceptualise mediation or connections in a dialectical manner, substituting instead a seriality of differences whose equivalence or solidarity remains unpredictable; and second, entailed by the first premise, the incapacity to conceive of the conjunctural moment of society as inscribed in the uneven or unequal development of the world-system. Uneven development involves the inescapable polarisation of the world into peripheral and central economies, tied with the intrinsic contradiction between labour and capital and the international division of labour whose boundaries were laid by the history of European colonialism and later by finance or monopoly capital. Why theorise mediation and uneven development in a precise historicised fashion? Because our intent is to 'master' and so escape the 'nightmare of history and to win a measure of control over the supposedly blind and natural "laws" of socioeconomic fatality' (Alavi 1982). As Fredric Jameson suggests, historical reconstruction, 'the positing of global characterisations and hypotheses, the abstraction from the "blooming, buzzing" confusion of immediacy, was always a radical intervention in the here-and-now and the promise of resistance to its blind fatalities' (Jameson 1998, p. 35).

From a historical-materialist perspective, the dynamic process of social reality cannot be grasped without comprehending the connections and the concrete internal relations that constitute the totality of its objective determinations. Several levels of abstraction have to be clarified, among them the relation between the knowing subject and the surrounding world (both nature and the built environment), knowledge of which is

desired. Truth in this tradition comes from human practice, the intermediary between consciousness and its object; and it is human labour (knowing and making as a theorised synthesis) that unites theory and practice. As Lenin puts it, everything is mediated and connected by transitions that unite opposites, 'transitions of every determination, quality, feature, side, property, into every other' so that 'the individual exists only in the connection that leads to the universal' (1963, p. 132). The reciprocal interaction of various levels of formal abstractions has been elaborated by Bertell Ollman (1993) under the categories of 'metamorphosis' and contradictions. These levels of abstract mediation, however, need to be transcoded into their concrete manifestation without necessarily succumbing to the one-sided immediacy of empiricism or pragmatism. Otherwise, what Fabian (1983) calls the allochronic orientation of Eurocentric thought with its taxonomic, non-coeval representation of Others would continue to prevail.

What is required next is to confront the second-order mediations which are historically specific and transcendable; namely, the market, money, private property, the transformation and subordination of use-value to exchange value. These are, in short, the sources of alienation and perversion of what Meszaros calls 'productive self-mediation' of individuals in social life. Alienation on the level of national struggle can only be resolved in the colonised people's conquest of full sovereignty, 'the socialisation of the principal means of production' (1983, p. 13) and reproduction in a socialist transformation. Indeed, it is these historical phenomena of alienation and reification that post-structuralist thought hypostatises into the nihilism of modernity, converting mediation (transition) into serial negation and occluding its prefigurative, transformative phase or aspect (Lukacs 2000). Contradiction, sublation, and over-determination do not figure as meaningful concepts in postcolonial theorising.

Without a concept of totality, however, the notion of mediation remains vacuous and useless. All determination is mediation, Roy Bhaskar reminds us in his magisterial study *Dialectic*

(1993). Totality in its historical concreteness becomes accessible to us in the concept of uneven development, and its corollary ideas of overdetermination (or, in Samir Amin's thought, 'underdetermination'), combined development in the coexistence of various modes of production in a specific social formation, or in another framework: Wallerstein's world-system mapping of periphery and core societies. We have come to accept as a commonplace the differential rhythm of development of societies, the uneven pace due to presence or absence of cumulative growth in the use of production techniques, labour organisation, and so on, as reflected in Marx's inquiry into Russia and Asia as mentioned earlier. It is indeed difficult to explain how the old imperial polities of Britain and France were superseded by Germany and the US, and how West Germany and Japan have occupied dominance today.

Uneven development results from the peculiar combination of many factors which have marked societies as peripheral or central (Lowy 1981; Novack 1966). In many societies shaped by colonial conquest and imperial domination, uneven and combined development is discernible in the co-presence of a modern sector (usually foreign-dominated or managed by the state) and a traditional sector characterised by precapitalist modes of production and ruled by merchant-capitalist and feudal/tributary ruling classes. In these peripheral formations, we find a lack of cumulative growth, backward agriculture limited by the lack of an internal market, with the accumulated money capital diverted from whatever industrial enterprises there are into speculative activities in real estate, usury, and hoarding (Mandel 1983). This unsynchronised and asymmetrical formation, with variations throughout the post-colonial geography of post-Second World War excolonised countries, serves as the ideal habitat for 'magic realism' and wild absurdist fantasies (Borges, Cortazar), as well as all those cultural expressions and practices described as hybrid, creolised, syncretic, ambivalent, multiplicitous, and so on, which postcolonial theory and criticism have laboured so hard to fetishise and reify as permanent, everrecurring, and ineluctable qualities (San Juan 1998).

In my view, this historical conjuncture of uneven and combined development can only be grasped by a dialectical assessment of imperialism such as those propounded by Gramsci, C.L.R. James, Walter Rodney, Amilcar Cabral, and others in the Marxist-Leninist tradition. It was Lenin who remedied the classical limitation of the Second International and the social-democratic parties by integrating in his idea of world revolution the revolt of the industrial working class in Europe with the mass uprisings of colonised nations, as well as peasant revolts against landowners. Lenin's post-1914 writings – the Hegel Notebooks, the article 'The Socialist Revolution and the Right of Nations to Self-determination', etc. – theorised how the 'particular' of national liberation movements can, under certain conditions, become the road to the universal of socialism. In this discourse, mediation assumes the form of contradiction between oppressed peoples in the colonies and oppressor nations. As Kevin Anderson argues, 'Lenin's theory of imperialism has become dialectical in the sense of pointing not only to the economic side of imperialism but also to a new revolutionary subject arising from within global imperialism: national liberation movements' (1995, p. 142). Unless we can improve on Lenin's theory of national liberation with its processual or dialectical materialist method, we will only be indulging in postcolonial verbal magic and vertiginous tropology that seems to be infinitely reproduced by a delirious 'otherness machine' (Appiah 1991, p. 356).

Portuguese Imperialism Begets its Antithesis

As for the concrete translation of the Leninist tradition into situated historical praxis, I can only allude to the brilliant and enduring example of Amilcar Cabral and his achievement. In what way does Cabral supersede the mechanical version of decolonisation as a valorisation of interstitiality, syncretism, and transculturation?

A few key features of Cabral's thought need to be underscored. Cabral's theory of national revolution is a creative application of Marxism as a dialectical theory of action in which history generates the unforeseen within the parameters of what objectively exists. Cabral understood the Marxist insight that 'the process of history seeks itself and proves itself in praxis' (Lefebvre 1969, p. 162). He theorised national liberation in his concrete milieu (the Portuguese colonies of Guinea Bissau and the Cape Verde islands) through the paradigm of interacting modes of production in history. Cabral insisted on the centrality of the level of productive forces as the 'true and permanent driving power of history' (1973, p. 42). Imperialist rule deprived the colonised peoples of agency, the vocation of shaping their own history. Since imperialist domination negated 'the historical process of the dominated people by means of violently usurping the free operation of the process of development of the productive forces, the goal of decolonisation is 'the liberation of the process of development of national productive forces' (43). The struggle for national liberation is not simply a cultural fact, but also a cultural factor generating new forms and content in the process (1979, p. 211).

For Cabral, culture is the salient or key constituent of the productive forces. Culture becomes the decisive element in grasping the dialectic of subjective and objective forces, the level of productive forces and the production relations, as well as the uneven terrain of class struggles: 'Culture is simultaneously the fruit of a people's history and a determinant of history, by the positive or negative influence which it exerts on the evolution of relationships between man and his environment, among men or groups of men within a society, as well as among different societies' (41). But Cabral urges a concrete differentiation of tendencies and possibilities: 'Nor must we forget that culture, both as a cause and an effect of history, includes essential and secondary elements, strengths and weaknesses, merits and defects, positive and negative aspects, factors both for progress and stagnation or regression, contradictions, conflicts . . . . Culture develops unevenly at the level of a continent, a "race," even a community' (210, 212). If liberation is an act of culture, it is also a struggle to shape a richer culture that is simultaneously 'popular, national, scientific and universal' (212).

Framed within the problematic of a nonlinear narrative, Cabral conceives of national liberation as a wide-ranging transformation of the combined political, economic, and cultural institutions and practices of the colonised society. It is not narrowly culturalist or merely superstructural because culture refers to the 'dynamic synthesis of the material and spiritual historical reality of a society'. In a broad sense, it is the recovery of specific African forms of subjectivity, a 'regaining of the historical personality of the people, its return to history through the destruction of imperialist domination'. This recovery is staged as a popular cultural renaissance with the party as the chief pedagogical agency wielding the 'weapon of theory', the organised political expression of a mass, national-popular culture in the making. This renaissance occurred in the praxis of the liberated zones controlled by the PAIGC (African Party for the Independence of Guinea and Cape Verde) where the culture-changing processes of criticism and self-criticism, democratic discussion, teaching and learning from the participants, and so on were encouraged and institutionalised. This will recall Marx's dialectical thesis of an alternative to unilinear evolutionism of the Russian village commune: if the subjective force of the peasantry acquires consciousness and organised identity, the objective situation can be transformed in a liberatory direction (Marx 1971/1850–52). In the context of the African Gold Coast, C.L.R. James formulated this Marxian thesis as the objective process of the 'movement of a people finding themselves and creating a new social order', the basis of unity being the actual conditions in which the people live (1992, p. 351).

Cabral was called by his people *Fundador da Nacionalidade:* Founder of the Nationality, not Founder of the Nation. According to Basil Davidson, this is because 'the nation was and is a collectivity and necessarily founds itself, but [Cabral was the] founder of the process whereby this collectivity could (and does) identify itself and continue to build its post-colonial culture' (1986, p. 39). Cabral also believed that 'the dialectical nature of identity lies in the fact that it both identifies and distinguishes' (1979, p. 208). Seizing

the strategic initiative, Cabral exhorted his comrades and fighters to engage in a double and totalising task cognisant of the uneven cultural and ideological strata of the geopolitical terrain:

> Every responsible worker and every militant of our Party, every element of the population in our land in Guinea and Cape Verde, should be aware that our struggle is not only waged on the political level and on the military level. Our struggle – our resistance – must be waged on all levels of the life of our people. We must destroy everything the enemy can use to continue their domination over our people, but at the same time we must be able to construct everything that is needed to create a new life in our land. (quoted in Cohen 1998, p. 44)

Cabral combined national and social elements into an insurrectionary movement in which the partisan unit, no longer a local entity but a 'body of permanent and mobile cadres around whom the local force is formed' (Hobsbawm 1973, p. 166), became the germ of the 'new life', the embryonic nationality becoming the nation.

Developing certain themes in Fanon, Cabral's Marxism is unique in concentrating on the potential nation as 'a form of revolutionary collective subjectivity' mediating actual classes, sectors, and groups into a 'nation-for-itself' that can reclaim the 'inalienable right of every people to have their own history' based on its right to control 'the process of development of national productive forces'. Cabral located the roots of this subjectivity in the cultural resistance of the masses which was 'protracted and multiple . . . only possible because by preserving their culture and their identity the masses retain consciousness of their individual and collective dignity despite the vexations, humiliations and cruelties they are exposed to' (1979, p. 209). It is that notion of integral 'dignity' that lies at the centre of Cabral's 'weapon of theory'. As Timothy Luke acutely remarked, Cabral valued the 'emancipatory forms of collective subjectivity' in the colonised subjects and so promoted 'the politically organised and scientifically rationalised reconstitution of the traditional African peoples' history-making and culture-building capacities' (1990, p. 191). Cabral urged his activists: 'I am asking you to accomplish things on your own initiative because everybody must participate in the struggle' (quoted in Chaliand 1969, p. 68). Cabral's originality thus

lies in his recognising that the nation-in-itself immanent in the daily lives of the African peoples can be transformed into a nation-for-itself, this latter concept denoting the peoples' exercise of their historical right of self-determination through the mediation of the national liberation movement, with the PAIGC as an educational organising force that seeks to articulate the national-popular will.

Contrary to post-colonial speculation, Cabral's project is the making of a nation in the course of the anti-imperialist struggle. Comprised of numerous ethnic groups living apart, highly fragmented with over a dozen languages, Guinea-Bissau and Cape Verde did not fulfil the orthodox qualifications of a nation laid down by Stalin: 'a stable community of people formed on the basis of a common language, territory, economic life and psychological make-up manifested in the common culture' (1970, p. 68). Cabral's exceptional contribution consists in articulating the nation-in-process (of transition from potentiality to actuality) in the struggle against Portuguese colonialism. The project of the party he founded, the PAIGC, aimed to generate national awareness by mass mobilisation of the peasants in conjunction with the petty bourgeoisie, the embryonic proletariat, and the declassed youth. Through skilful organisation and painstaking ideological education, the PAIGC converted the cultural resistance of the tribal villages into a dynamic and formidable force capable of defeating a technologically sophisticated enemy.

Cabral began from the paradoxical phenomenon of the indigenous petty bourgeoisie beginning to acquire a consciousness of the totality by comparison of the various parts of colonised society. He exhorted the petty bourgeoisie to commit class suicide in order to coalesce with the peasantry (the workers constituted a tiny minority; a national bourgeoisie did not exist); but Cabral had no illusions that such alliances would spontaneously firm up in a post-colonial environment. He stated shortly before his assassination on 20 January 1973: 'You know who is capable of taking control of the state apparatus after independence . . .. The African petty bourgeoisie has to be the inheritor of state power, although I wish I could be wrong. The moment national liberation comes and the

petty bourgeoisie takes power we enter, or rather return, to history and the internal contradictions break out again' (quoted in Davidson 1969, p. 134). Cabral's insight warns us of the dangers of reifying post-colonial culture as an interstitial, ambiguous space of contestation devoid of any outside from which critique can be formulated. Contradictions persist even in transitory class alliances (the famous unity of opposites in Lenin's discourse), hence the need to calculate the stages of the struggle which demand strategic mutations and tactical alterations, while keeping in mind a constant theme: 'the masses keep intact the sense of their individual and collective dignity' (Cabral 1973, p. 69). The axiom of uneven and combined development rules out such post-colonial assumptions of contingent heterogeneity and incommensurable disparities of individuals that ignore mass native cultural resistance. Cabral upheld the anti-post-colonial belief of the 'supremacy of social life over individual life', of 'society as a higher form of life' (1979, p. 208), which in effect contradicts the neo-Kantian attribution of moral and rational agency to bourgeois individuals, a criterion that 'postpositivist realists' (Mohanty 1995) and assorted eclectic deconstructionists espouse.

Notwithstanding the resurgence of armed anti-imperialist insurgency in 'Third-World' neocolonies like Colombia, the Philippines, and Mexico (Chiapas), the moment of Cabral might be deemed irretrievably remote now from our present disputes. However, the formerly subjugated peoples of colour grudgingly acknowledged by Western humanism (following Kant's axiom of rational autonomy and Adam Smith's notion of the 'free market') cannot be simply pacified by reforming capitalism's international division of labour. The post-colonial cult of the Leibnizian conceit (Harvey 1996), in which alterity and marginality automatically acquire subversive entitlement, has carried out the containment of Marxist ideas and ideals of national liberation by an aestheticising manoeuvre analogous to what Neil Larsen discerned in cultural studies: 'a subtle transfer of emancipatory aims from the process of objective social transformation to the properly "cultural" task of intervention in the "subject"-forming play of discourse(s)' (1995, p. 201). But as long

as capitalism produces uneven and polarising trends in all social formations, there will always exist residual and emergent agencies challenging the reign of 'the law of value' and post-modern barbarism (Amin 1998).

We cannot of course return wholesale to the classic period of national liberation struggles indexed by the names of Nkrumah, Cabral, Ho Chi Minh, Che Guevarra, Fanon, and others. My purpose in bringing up Cabral is simply to refute the argument that historical materialist thinking is useless in grasping the complexity of colonialism and its aftermath. Would shifting our emphasis, then, onto studying the subaltern mind remedy the inadequacies and limitations of post-colonial theory? I might interpolate here the view of two Australian scholars – Jon Stratton and Ien Ang – who believe that the limits of the post-colonial/diasporic trajectory can be made up by the voices of the indigenous and the subaltern within the context of the 'relativisation of all discursive self/other positionings within the Anglophone cultural studies community' (1996, p. 386). This intervention in the site of textual-discursive representation is salutary, but the problem of articulating a counter-hegemonic strategy focusing on the 'weak links' (where the IMF/World Bank's 'structural conditionalities' continue to wreak havoc) remains on the agenda. For it cannot be denied that within the hybridising, syncretic, borderless milieu of the post-colonial episteme one encounters, without much uncanny afterthought, 'the still globally culturally hegemonic realm of the USA' (King 1995, p. 117).

Finally, I want to situate post-colonialism as a symptomatic recuperation of finance capital, at best the imaginary resolution of contradictions between exploited South and exploiting North, within the altered geopolitical alignments of the world-system (Wallerstein 1995).

The 'Third World' was a viable conceptualisation of the nationalist bourgeois struggles that led to the independence of India, Ghana, the Philippines, Egypt, Indonesia, and other nation states after the Second World War (Hudis 1983). The classic post-colonial states created the Bandung coalition of non-aligned states which gave a semblance of unity to the 'Third World'. However, US hegemony during the Cold War continued until the challenge in Vietnam,

Cuba, and elsewhere. The last expression of 'Third-World' solidarity, the demand for a 'New International Economic Order' staged in the United Nations, came in the wake of the Oil Crisis of 1973; but the OPEC nations, with their political liabilities, could not lead the 'Third World' of poor, dependent nations against US hegemony. Notwithstanding the debacle in Vietnam and the series of armed interventions in the Caribbean and elsewhere, US world supremacy was maintained throughout the late 1970s and 1980s by economic force. This mode of winning consent from the 'Third World' used monetarist policies that caused lower export earnings and high interest rates, reducing these polities to dependencies of the IMF/WB and foreign financial consortia. The defeat of the 'Third World' bloc in 1982 allowed the US-led Western bloc to exploit 'international civil society' into a campaign against global Keynesianism. From 1984 to the 1990s, however, global Reaganomics, the instability of the financial markets, the fall of the dollar, worsening US deficit, etc. posed serious problems to the US maintenance of hegemony over the Western bloc. Despite the success, and somewhat precipitous collapse, of the Asian Newly-Industrialising Countries, the 'Third World' as an independent actor, with its own singular interests and aspirations, has virtually disappeared from the world scene. What compensates for this disappearance is post-colonial theory and criticism whose provenance owes much more to finance capital than has heretofore been acknowledged or understood, a disappearance masked by the carnivalesque regime of simulacra and simulations that, despite its current hegemony, fails to repress, I dare say, the labour of the 'old mole' burrowing underground. Wherever neocolonialism (Woddis 1972) prevails, the ideal and practice of national liberation will continue to thrive.

Introduction

Lenin had written his famous book *Imperialism: The Highest Stage of Capitalism* at a time when the World War I was looming large, the entire third world was divided into areas of domination by the nation-state backed finance capital of the colonizers. The colonialism imposed on countries like India resulted in a situation where the

potentialities of capitalist development in these countries were severely retarded, primarily because the economic surplus of these countries was siphoned off to the colonizing power. Since this happened across the third world, a division of the word into two clear segments, with the advanced capitalist countries oppressing the third world colonized ones, was clearly visible. Theories of imperialism starting from Rosa Luxemburg to Lenin have emphasized on imperialism as being a structure whereby the advanced capitalist countries oppress the poorer third world countries.

It can be argued that this entire process of subjugation of the third world countries by the advanced capitalist countries seems to be irrelevant in the present conjuncture due to two sets of reasons (for a fuller discussion on these issues, see Chowdhury (2018)). First, the erstwhile colonies are now independent nations with the process of decolonization. Today's developing countries or the erstwhile colonies are politically independent. Lenin was talking about a time when the capitalist countries in aid of their respective nation-state based monopoly capital were marking out territories for exploitation. This entire architecture, at least at the political level, does not exist anymore. This marks an important departure from the world conjuncture in Lenin's time. Second, it has been generally argued within the literature that imperialism retards capitalist development in the colonies or the developing countries. However, contrary to this analysis, the world is witnessing significant capitalist development in the developing countries like China, India, etc. China currently is the second largest economy in the world having the highest share in world exports. India has witnessed significant increase in its growth rates since the early 2000s. According to the billionaire list brought out by *Forbes,* China has 373 dollar billionaires in 2018 (increase of 54 since 2017), with a net worth of $1123 billion. In 2018, India had 115 dollar billionaires, increase of 18 since 2017 (*Forbes,* available at https://www.forbes.com/billionaires/#156677ce251c). Just two decades back, hardly any Indian businessman found an entry into this list of the richest people on earth. But now India ranks third in the number of dollar billionaires in the world.

But what has been the reason behind this increase in the capitalist accumulation in India? What are the processes that are driving the accumulation? Has this increase in growth and capital accumulation resulted in a betterment of lives for the people at large? What has happened to the issue of inequality in the country? These issues will be discussed in the remaining part of the paper primarily focusing on the post-reform period in India and linking up the developments in India with global capitalism and imperialism.

Genesis of the Liberal Economic Development Path in India

India was a British colony for two centuries. The loot and plunder of the economy orchestrated by the British resulted in a situation where massive deindustrialization, pauperization of the peasantry, mass poverty, hunger, and unemployment became the defining features of the country. The Indian freedom struggle therefore not only argued to overthrow British rule but also articulated demands for the amelioration of the conditions of the people. It was felt by the policy makers that colonialism was imposed and implemented in India under the slogan of "free trade" with the British virtually making India an open field for global capital to exploit. Moreover, as a result of colonialism, the Indian capitalist class, on the eve of independence was lacking both in terms of resources as well as establishing its political hegemony over the state structure in the country. Two consequences immediately followed from this – First, the state envisaged a planned development trajectory for solving the problems of underdevelopment; second, the bourgeoisie had to strike a compromise with the landlords and big farmers in the rural areas to tighten its hold over the country, which was predominantly rural in nature.

The planning process therefore suffered from a number of contradictions. On the one hand it had to maintain a high rate of investment in the heavy industries sector. Simultaneously, it had to ensure that there was adequate surplus food output available at a reasonable price from the agriculture sector to feed the workers in the industrial sector.

Two problems immediately arose. First was the problem of employment. Since the focus of the initial planning strategy was to invest in heavy industries, it could not generate adequate employment for the people because of it being more capital-intensive. It was envisaged that the small scale sector, which was labor-intensive, would take care of the employment problem.

Second was the problem of ensuring an adequate and growing surplus of food from the agriculture sector to feed the non-agriculture workers. The production condition in Indian agriculture did not permit such increase in production and surplus due to a multiplicity of reasons. First, the prevalence of landlordism in the countryside sucked out resources through the imposition of absolute ground rent, which left the farmers with very little to improve investment and production. Second, the prevalence of money-lenders and usurious rates of interest further eroded the income of the farmers. Third, as a result of the compromise that the Indian bourgeoisie stuck with the landlords and peasants, the terms of trade tilted in favor of agriculture, relative to manufacturing products (Mitra 2004). This was achieved through the policy of increasing the Minimum Support Price for the farmers. Since the production of crops was dominated by large farmers, the increase in the minimum support price greatly benefited them. But the increased income that they received was not spent on mass consumption goods belonging to the small-scale industry. Rather, they spent it on luxury and imported items which had very little impact on employment in the country.

The tilting of the terms of trade against manufacturing and in favor of industries had other serious consequences. Manufacturing uses agricultural products as raw materials. If the prices of agricultural products increase relatively more than manufacturing products then the real price of raw materials will increase which will escalate the cost of production in the manufacturing sector. This increase in the cost of production in the manufacturing sector can be passed on to the final consumers by increasing the price of the manufacturing products. But because of an increase in terms of trade in favor of agriculture, the price of food witnessed a steep increase. Now, at a given money wage, this implies that less money would be available for the workers to buy industrial commodities, assuming that the workers maintain a stable food intake. Therefore, the demand for industrial products from the general masses will decline. On the other hand, faced with an all-round inflationary situation, if the working class organizes to demand higher wages, industrial disputes, strikes, and intensification of conflict between labor and capital will rise. This is precisely what happened in India during the 1960s–1970s, where huge inflation of essential items were accompanied by industrial stagnation, food shortage, and rising working class action against these conditions.

It became a very volatile situation. Contrary to the promises of the development planning policy, growth rate stagnated, unemployment increased, and the economy witnessed very high rates of inflation. Politically, the rising working class movement, the unrest within the middle class and sections of the peasantry, compelled the state to take some drastic measure. As a result, Emergency was imposed on the country in 1975. Democratic rights were withdrawn, the opposition was put behind bars and the freedom of press was severely curtailed.

The Emergency marked a break from the earlier policy of development planning. After recovering from the electoral losses immediately after imposing Emergency, Indira Gandhi came back to power in 1980. After her come back, the government's policy moved away from statist policy of planning towards a more pro-business policy approach (Kohli 2007). There were essentially three components of this new model of development – first, the state prioritized economic growth as its goal, second, to achieve this goal, big business was supported, and third, this shift towards big business also necessitated a taming of labor (Kohli 2007). With the coming to power of the Rajiv Gandhi government, in 1984, the policy towards supporting big business was followed more intensely. Most of the controls imposed on private corporate business, like licenses, were abolished; Indian economy was opened up towards the world economy.

The planners, contrary to the above-mentioned analysis, construed the Indian state to be a supra-class entity. In order to maintain the policy of

development, adequate public investment had to be undertaken. The only way to mobilize resources for such high public expenditure was to impose taxes on the rich. The planners assumed that the state would be able to extract the resources from the capitalists. But for this to happen, the capitalist class had to be disciplined and compelled to make the necessary tax payments. However, this did not happen since the capitalists found various means to evade taxation (Patnaik and Chandrasekhar 2010). Even during the 1980s, when the public expenditure-GDP ratio increased, resources were primarily mobilized through indirect taxes, with capitalists and rich being given tax concessions (Kohli 2007). Thus, the state was continually moving towards a fiscal crisis with its commitment towards public expenditure to maintain the development plan being not met by adequate taxes. Second, the demand for mass consumption goods did not improve, because the size of the home market was limited due to absence of land reforms in the rural areas. Third, in spite of import restrictions, with the capitalists trying to emulate the lifestyles of the rich in the advanced capitalist countries, there was always a latent demand for commodities produced in the developed countries (Patnaik and Chandrasekhar 2010). This led to import leakages (through smuggling) hurting India's balance of payments position. When the rich and the capitalists gained significant economic and political power, they demanded liberalization of trade to avail these commodities. This continued pressures led to the policies of reforms being adopted since 1991 in India.

The discussion above shows that crisis was looming large in the Indian economy on many counts. First, the fiscal position of the state was getting worsened because of its inability to collect taxes. Second, employment did not improve, nor did production in mass consumption industries. Third, the current account deficit had a tendency of moving towards a crisis. All this culminated in the balance of payments crisis of 1991, following which the Indian government opted for a policy of (neo) liberal economic development trajectory, practically abandoning the policies of development planning.

Characteristics of Liberal Economic Development in India

Our analysis of the transition of the Indian economy from development planning to liberal economic model showed that this change was a result of changes in the economic parameters as well as the class nature of the economic processes. The Indian capitalists, as it were, shred two constraints from the initial days of planning to the current period of reforms – first, there was dissociation from the rural rich and landlords, who were there prime allies immediately after independence. This was done not through an overthrow of landlordism or a redistribution of land. Rather, Indian capitalism accommodated the rural landlords and big farmers politically but curtailed their economic strengths considerably. Demographic factors, changes in the nature of capitalist penetration in the rural areas, and other developments played their parts in this process. Basu and Das (2013) point towards a decline of landed property as the prime source of political, economic, or social power in today's India. Mitra (2004) argued that the MSP was used as a weapon by the landlords and big farmers to tilt the terms of trade towards agriculture. But in today's India, we are witnessing huge farmer rallies demanding a rise in MSP, which is supported by all major political parties including the communists. The persistence of an acute agrarian crisis has led to this situation.

Second, with time the Indian capitalists gained in economic and political strength and did not want the state to dictate terms to them. As a result, the policies of licenses and other kinds of restrictions were abolished. "State intervention" was argued to be the root cause of most of the problems afflicting the economy. It was suggested that the state or the government should not be involved in business. Therefore, privatization of public sector units and public utilities became a very important part of the liberal economic policy framework.

This so-called "withdrawal of the state" was not merely limited to privatization. The policy framework also entailed a cut back on the fiscal space of the state. This entailed both a cutback on public expenditure as well as the fiscal deficit. The false theory of public investment crowding out

private investment was argued within the policy establishment to cut back on fiscal deficit, a theory which was proved to be wrong by Keynes way back in 1936 (Patnaik 2017). This cut back on public expenditure or the fiscal deficit had got nothing to do with crowding out private investment. This policy of curtailing public expenditure pointed towards another very crucial political–economic change in India, viz., the embrace of global finance capital.

One of the crucial aspects of the pre-reform period economic policy making was that it was relatively autonomous to global capital. The experience of the colonial period was one of exploitation by global capital which pauperized India. Therefore, economic policy making immediately after independence was envisaged as being relatively autonomous to global capital and imperialism. That is why the planners put controls on the movement of capital and commodities and modeled India as a closed economy. This policy was helped by the global situation where India remained non-aligned to both the socialist camp led by the USSR as well as the imperialist camp led by the USA. In doing so, India could bargain with both and gained technology and capital, while maintaining relative autonomy from both. But with the weakening of the East European and Soviet socialist countries and their final demise, the world situation completely changed in favor of the USA and global capital. The domestic class dynamics within India as well as the crucial change in the world conjuncture pushed the country towards embracing policies of liberal economic reforms and opening up to global finance capital.

The global finance capital also underwent significant changes as compared with the period when Lenin was theorizing imperialism. The character of the current finance capital is different from that of Lenin's conception in three fundamental ways. First, while Lenin had emphasized on finance capital as capital "controlled by banks and employed in industry," the new finance capital is not necessarily tied to industry in any special sense. Rather, it moves around the world in the quest for quick, speculative gains. Secondly, finance capital in Lenin's time had its base within a particular nation, and its international operations

were linked to the expansion of national "economic territory." But the finance capital of today, though of course it has its origins in particular nations, is not necessarily tied to any national interests. The distinctions between national finance capitals have become meaningless today and we can talk of an international finance capital. This international finance capital is detached from any particular national interests and has the world as its arena of operations. Thirdly, in order to ensure such uninhibited global operation, the world should not be split up into separate blocs or into economic territories that are the preserves of particular nations and out of bounds for others.

A number of conclusions follow from the above. Firstly, since finance capital has turned into international finance capital which is highly mobile, the autonomy of the nation-state in policy-making has been reduced. If it is profitable for international finance capital to move freely from one place to another without hindrance then the role of any nation-state in controlling this flow of capital is curtailed. Precisely, this has been sought to be achieved with the introduction of the policies of neoliberal globalization across the globe which essentially is nothing but a policy of allowing free movement of finance capital. Finance capital opposes government intervention which is not beneficial for itself. As a result, states across the globe have cut back on their expenditures, particularly earmarked for development. Secondly, since finance capital needs the entire globe for its operations and does not want the world to be split up into separate blocs, intra-imperialist rivalry remains muted. Thirdly, speculative activities take the center stage of global economy rather than industrial activities because the role of the international finance capital is essentially to reap rapid speculative profits from one part of the world to another (Chowdhury 2018).

India, once being brought into the vortex of global finance capital, has to play by its dynamics, as enumerated above. The privatization of public sector assets, the reduction in fiscal deficit, and government expenditure were first implemented in India in accordance with the Structural Adjustment Program advocated by the IMF and then it became state policy. Secondly, the government

has to continuously ensure that it remains attractive to international finance capital. Since international finance capital is globally mobile, any policy which is not appreciated by them will result in a massive outflow of capital from the country causing severe problems in the external sector. Therefore, countries like India have to appease global finance capital. Since finance capital does not like fiscal deficits, it should be curbed, and since labor militancy is abhorred by finance, labor needs to be tamed, so on and so forth. Thus, India from a position of maintaining relative autonomy vis-a-vis global capital was sucked into the vortex of international global capital with the implementation of liberal economic policy model.

This change in the relationship of domestic capital with international capital also meant a change in the nature of the Indian bourgeoisie. As has been already argued, earlier it was believed that imperialism thwarts the capitalist development in the third world countries. But the current conjuncture has witnessed that the big bourgeoisie of countries like India and China have become major players in the international market. As has been already noted, within the richest bourgeoisie in the world, China and India have a very high number. These companies have global ambitions and are operating across the globe both in the financial as well as the industrial sector. For example, a company like the Tata Motors from India has bought off the Jaguar Company, one of the leading automobile companies in the world, located in the UK. (TATA buys Jaguar in 1.15 billion pounds deal, *BBC News*, 26th March, 2008, http://news.bbc.co.uk/2/hi/business/7313380.stm (Accessed on 8th July, 2016)) The Indian company Reliance has a worldwide reach and is engaged in oil and gas exploration all across the globe. There are even reports that Indian companies are buying huge tracts of land in African countries like Ethiopia for business purposes. (Anuradha Mittal, "Indian land grabs in Ethiopia show dark side of South-South co-operation," *The Guardian*, 25th February, 2013, http://www.theguardian.com/global-development/poverty-matters/2013/feb/25/indian-land-grabs-ethiopia (Accessed on 8th July 2016)).

Thus the adoption of the policies of liberal economic development marked the ascendancy of the Indian capitalist class both in the domestic as well as the international economy. It also marks a decline in the fiscal space of the government in the economy. But that does not necessarily mean a withdrawal of the state from the economy. Rather, as we will see presently, it marks a change in the nature of state intervention, where the state favors capital at the expense of the working people. How have these developments impacted on inequality in India? We now turn to answer this question.

Inequality in India

As is well known, the household surveys in India, conducted by the National Sample Survey Organization, collect data on household consumption rather than income. As a result, researchers have generally used the consumption data to arrive at some notion of inequality in India (Pal and Ghosh (2007), Sen and Himanshu (2004), Mazumdar et al. (2017)). However, with the publication of tax data by Indian authorities, it has become possible to estimate income inequality in India. Banerjee and Piketty (2005) first estimated income shares of top 1% and top 10% of the population in India, up to the year 2000. Subsequently, Chancel and Piketty (2017) updated this data and came out with some striking numbers (see Fig. 1).

At least three empirical observations are immediately evident from Fig. 1. Firstly, as per Chancel and Piketty's (2017) estimate, the income share of the top 1% in India is currently higher than it was during the British rule; it is in fact highest ever, within the period considered by the authors. In 1922–1923, the top 1% income share was 13%, which increased to 20.7% in 1939–1940, declined to 6.2% in 1982–1983 and then subsequently increased to 21.7% in 2013–2014. Secondly, during the period of planning in India, the inequality remained stable and declined to a historic low in 1982–1983. Thirdly, the period of rapid increase in inequality, as captured by the top 1% income share, coincides with the period of economic reforms and globalization in India. Post 2000, this increase in inequality also coincides with the period when India witnessed highest rates of growth in its history. While Chancel and Piketty

India: Liberal Economic Development, Inequality, and Imperialism, Fig. 1 Top 1% income share in India: 1922–2014. (Source: Reproduced from Chancel and Piketty (2017))
(2017) do not put forward any theory or hypothesis to account for the changes in the top 1% income share, the congruence of these changes with various growth phases of the Indian economy is not coincidental. Rather, one can account for these changes within the changing political economy of India.

In Fig. 1, it is clear that the share of income in India going to the top 1% has reached historic levels, even higher than the level witnessed during British rule. Thus over time, inequality in India has increased steadily. It is also the case that this inequality is increasing at a much faster rate, as compared with many other economies in the world, as seen in Fig. 2.

From Fig. 2, it is seen that there has been an increase in the income share going to the top 10% in all the selected countries. However, what is striking is that rate of increase of this share in the case of India is the highest and currently the income share of the top 10% is highest in India, among the selected countries.

It is not only the case that income share of the top income earners have drastically increased in India, it is also the case that there has been significant increase in wealth inequality in the country, as has been shown by Anand and Thampi (2016) based on All India Debt and Investment Survey data collected by the NSSO. The top 10% owned around 51% of the total wealth in the economy in

1991, which has subsequently increased to 63% in 2012. Similarly, the share of the top 1% in terms of wealth has increased from around 16% to 31% during the same period (Table 1).

Even in terms of consumption expenditure, Mazumdar et al. (2017) show that there has been a significant increase in the real consumption expenditure of the top quintile classes as compared with the lower ones, particularly in the post-reform period in India. They identify two patterns of growth of real consumption expenditure in the post-reform period. Initially, between 1993–1994 and 2004–2005, only the top quintile experienced above than average growth rate in real consumption expenditure. But the growth of the lowest quintile was higher than the middle ones during this period. However, in the subsequent period, 2004–2005 to 2011–2012, while the topmost quintile witnessed higher than average growth in real consumption, all descending quintiles had a lower growth than the preceding quintile. It must be remembered that this was the period when India witnessed the highest rate of growth of GDP, but still the lower quintile could not increase their real consumption expenditure.

The preceding discussion showed that there has been a significant increase in inequality in India, particularly during the post-reform period. The increase in inequality has happened in terms of income, wealth, as well as consumption. In other

words, while there can be debates about the exact methodology on the basis of which various authors have arrived at their numbers, the basic trend of rising inequality in India is indisputable.

Explaining Rising Inequality: A Debate

More than the data what lies at the center of the debate is how to interpret the Chancel and Piketty (2017) and other results showing a rise in inequality. Ghatak (2017) believes that the entire evolution of the inequality, as represented by Chancel and Piketty (2017), can be explained by the Kuznets curve. He writes,

> In the early stages of development, those who are richer are better poised to take advantage of the new opportunities while an excess of supply of unskilled labour keeps average wages down.

Therefore, in the initial years, the per-capita income in India was low, hence inequality was low. But with liberalization as "new opportunities" started coming in with an excess supply of unskilled labor, inequality has risen. But with capital accumulation taking place at a rapid pace, demand for labor will increase, which in turn will increase the real wage rate and result in decline in the inequality. Thus, Ghatak (2017) argues "growth is not the enemy," rather focus should be on providing education and health to the masses to help them gain skill and catch up with the structural transformation in the economy.

Kuznets curve was first proposed by Simon Kuznets in a seminal paper (Kuznets 1955). The essential argument basically posits an inverted U-shaped curve with respect to income inequality and growth. Thus it implies that in the initial periods of growth, income inequality will increase and then as growth progresses, it will decline. Ghatak (2017) argues that instead of negating Kuznets curve, Chancel and Piketty's (2017) findings actually support it, since at lower levels of growth, inequality was low and then it increased with increase inequality.

Which is a lower or higher level of growth depends on the starting and end time point. It must be remembered that Chancel and Piketty (2017) provides data since the British period, when the growth rate of income was close to zero (Habib 2017). With independence, the growth rate increased substantially. In fact, estimates suggest that after independence in 1947, the

per capita growth rate in India increased five times. But the Chancel and Piketty's (2017) study, as seen in Fig. 1, suggests that in spite of such a huge increase in growth, inequality in India did not witness any secular increase, immediately after independence. Those who defend the Kuznets curve (like Ghatak (2017)) would argue that per-capita income was too low for any increase in inequality. However, what is important from the point of view of Kuznets is to look at the growth rates of per-capita income and inequality, not the level. Secondly, India was not an egalitarian paradise even in 1950s. It was marked by huge inequalities in land and wealth. Still, an increase in growth did not materialize into an excessive increase in inequality, maybe because of the fact that planning ensured that capital is kept under some kind of control. Moreover, public investment was increased; the economy was oriented towards a growth trajectory which was predominantly state led. In such an economy, rising inequality would have jeopardized the legitimacy of a state-led growth path. Hence, it was kept under control.

This is not to argue that the dirigisme regime in India was an ideal egalitarian system. Neither is this to argue for going back towards license raj-like system. However, the point is that a simple relationship that Ghatak (2017) expects between income inequality and growth does not hold. Rather, a complex set of factors determine the exact relationship. For example, planning in India was not disbanded and liberalization ushered in due to the fact that inequality was low, or that growth rate did not increase. In fact Chakravarty (1987) shows that the growth rate of GDP was much higher during 1980–1981 to 1983–1984 as compared to 1950–1951 to 1959–1960. Planning was disbanded as a result of the internationalization of finance capital and the incapacity of the Indian state to reign in the capitalists and maintain a fiscal balance aimed at higher public investment, as has been already mentioned above.

With the opening up of the economy and a more business-oriented policy making, inequality in India has increased quite dramatically. An analysis of the organized manufacturing sector in

India sheds further light on the issue of increasing inequality in the country. Basu and Das (2018) show that there has been an increase in the rate of profit, which has been mostly driven by a rise in the profit share or a redistribution of income from the workers to the capitalists. During the period of study (1982–1983 to 2012–2013), the capacity utilization (or demand factors) did not change much. There was increase in labor productivity but not real wage. In other words, the increase in productivity was mainly appropriated by capital. Basu and Das (2018) conclude that "regressive income redistribution and not technological progress has kept profitability rising over the long run in India's manufacturing sector." Now, most of the arguments explaining rising inequality have been based on the assumption of technological progress, which to begin with favors those who have higher education and capital. But Basu and Das (2018) showed that technology had very little role to play in increasing the profit rate in India. In fact, the output-capital ratio actually declined. Rather there has been an increase in labor productivity (propelled by a rise in capital-labor ratio) but real wages has declined or at best remained stagnant.

Now, the share of labor in income can be expressed as w/x, where w=real wage rate and x = labor productivity. The trend of the share of labor in organized manufacturing sector is shown in Fig. 3.

This fall in the wage share is obviously the mirror opposite of a very significant increase in the profit share in India, which the Basu and Das (2018) paper allude to. The question is what explains the fall in the wage share in India? While a detailed answer to this question is beyond the scope of this entry, certain important points can be made with the help of some preliminary empirical observations.

Firstly, there has been a huge increase in the proportion of contractual workers in the organized sector in India (see Fig. 4). The wage rates of the contractual workers are less than those of the permanent workers. Therefore, with the increase in proportion of contractual workers, the average real wage in the organized industry have come down. The reason for the increase in
India: Liberal Economic Development, Inequality, and Imperialism, Fig. 3 Share of labor in net value added in organized manufacturing. (Source: Annual Survey of Industries, various issues)
India: Liberal Economic Development, Inequality, and Imperialism, Fig. 4 Share of contractual workers in organized manufacturing sector. (Source: Same as Fig. 3)

the contractual workers, however, is a question that needs to be answered. With the opening up of the economy, Indian manufacturers are facing competition both in the international as well as domestic market. Cost cutting, therefore, is imperative in the competition to survive. Particularly, Indian exports have increased

significantly during this period, which is again regarded by many as the stimulus through which growth rate in the economy has increased. Moreover, changing nature of technology and capital has brought in flexible technologies which promote casualization and contractualization of labor. Lastly, with vast masses of informal and

underemployed labor in the country, workers' bargaining power has declined, which has retarded their capacity to increase the real wage or resist contractualization. As a result, the share of contract workers in India has increased, even with high growth and thereby reducing the wage share in Net Value Added.

The secular decline in the wage share points towards two important issues. First, it shows that the Ghatak (2017) argument is wrong. With increase in growth rate, as compared to the pre-reform period, real wages should have increased, according to this argument. But that has not happened. Second, this shows another crucial manifestation of the rising inequality in terms of the growing gap between profit earners or capitalists and the wage earners or the workers. The earlier discussion of rising inequality mainly pertained to an inter-personal comparison of inequality. But the falling wage share points towards the growing inequality between the two classes.

Indian Growth Process and Inequality

As has been already pointed out, the policies of reform in India increased the growth rate of GDP, as compared with the pre-reform period, particularly since 2003. This increase in growth rate of output has not resulted in an increase in growth rate of employment. Rather, with an increase in growth rate of output, there has been a decline in the growth rate of employment and an increase in the growth rate of labor productivity. While the growth rate of output increased from 4.7% during 1981–1982 to 1991–1992 to 6.2% during 1992–1993 to 2015–2016, the growth rate of employment actually declined during this period from 2% to 1.3% (Table 2). Thus, the post-reform growth experience of the Indian economy can be characterized by three stylized facts – (1) increase in growth rate, (2) increase in inequality, and (3) reduction in the growth rate of employment. Chowdhury (2014) argues that these three stylized facts are not disjoint. Rather, they constitute a totality of the growth process that India has witnessed. In other words, these three features are linked.

India: Liberal Economic Development, Inequality, and Imperialism, Table 2 Average growth rate of employment, output (value added), and labor productivity

	1981–1982 to 1991–1992	1992–1993 to 2015–2016
Growth rate ef Employment	2.0	1.3
Growth rate of value added	4.7	6.2
Growth rate of labor productivity	3.1	5.7

Source: KLEM Database, Reserve Bank of India

Essentially, the growth rate of employment is the difference between the growth rate of output and the growth rate of labor productivity. Table 2 shows that there has been an increase in labor productivity in the post-reform period as compared with the pre-reform period. This has resulted in a decrease in the growth rate of employment. The question is what has caused the growth rate of labor productivity to increase.

Chowdhury (2014) argues that the increase in the growth rate of productivity is a result of the growth process that India has witnessed. The main stimulus of growth for the Indian economy during this phase has come from exports and an increase in consumption of the rich. In order to export in the international market, there has to be technological progress to compete with other players. As a result, an economy transiting towards an export-led path must have significant increase in technological progress and labor productivity. Moreover, as already argued before, cost cutting through increased employment of contractual workers are also resorted to. This results in a stagnant real wage and employment in the economy. But the growth process also results in huge capital accumulation and profits for the corporate sector. These two contrasting phenomenon of stagnant real wage and increasing profit immediately gives rise to inequality. Therefore, it can be argued that the phenomenon of rising inequality is embedded within the growth process itself. However, even if the economic processes in the country can tend to increase inequality, the state can try and reduce the income inequality by taking redistributive policies. In other words, there exists a relation between the

state policy and inequality in the economy. We now turn to a discussion of these issues.

State and Inequality in India

In the paper by Chancel and Piketty (2017), there is a striking observation that the authors make. According to them,

> The wealth of the richest Indians reported in Forbes' India Rich List, amounted to less than 2% of National income in the 1990s, but increased substantially throughout the 2000s, reaching 10% in 2015 and with a peak of 27% before the 2008–9 financial crisis.

This huge increase in the wealth of the dollar billionaires in India is concomitant with the increase in the share of the top 1% in income. Now, an argument can be made that this huge increase in income and wealth of the rich is not something to worry about. Rather, it can be argued that they have talent to innovate, and the income/wealth that they have accumulated is a return to that innovativeness. This is the basic argument of capitalism for high inequality.

In the case of India, however, this argument is false. In a paper looking at the wealth of dollar billionaires in India, Gandhi and Walton (2012) report that only 15% of the total wealth accumulated by the billionaires are self-made, rest of the wealth can be categorized as inherited and growing. Now, even within capitalist logic, if we grant that the amassing of this huge wealth is a result of innovativeness, their progenies should not get the wealth in inheritance (since they too must earn their wealth), but prove their talent. This, however, is not happening in India. In the absence of a wealth tax, wealth flows to the next generation automatically and perpetuates wealth and income inequality. The nonexistence of the wealth tax is not due to capitalist logic. Rather, it exists because the power structure in the country is such that the rich families can protect their wealth not only for themselves but also for their progenies.

The second important observation of the Gandhi and Walton (2012) paper is that around 60% of the wealth of the billionaires are coming from the "rent thick" sectors. These are not the sectors which are undertaking innovations in the economy. But these sectors are essentially resource-based sectors like real estate, petrochemicals, spectrums, etc., which are directly dependent on the government for getting licenses to run their companies. In each of these sectors, there are cases of corruption where government land, or spectrum, or oil fields have been given to private corporate companies for a song. This granting of public wealth or natural resources to the capitalists constitutes a case of primitive accumulation of capital, where the capitalists gain the resource or wealth gratis from the state. This has hugely increased the wealth of the capitalists in India. In other words, the balance was tilted in favor of the capitalists not because of any inherent logic of the growth process. Rather it was tilted through government policy, exogenous to the growth process. This point is most evident if we look at the issue of tax concessions provided to the corporate sector in India. It has been estimated that the total amount of tax revenue forgone as a result of giving tax concessions to the corporate sector, between 2005–2006 and 2014–2015, was more than Rs 6 trillion. In the recent period, the share of corporate tax concessions to GDP has increased from 1.7% in 2013–2014 to 2.8% in 2017–2018 (calculated from Government of India budget figures).

The aforementioned discussion needs to be read jointly with the issue of falling labor income share in India. In spite of the fact that contractualization has increased at a rapid pace in the country, the constant clamor for labor market flexibility shows that trade union activities, rights of workers are under serious threat. The proportion of workers who report to be members of trade unions in India is declining as per NSSO data. The falling number of strikes in India show that the capacity of the working class to put up a fight has declined. The contractualization of workers and overt and covert impediments towards trade union activities are tilting the balance in favor of capital.

Till now, we have mainly looked at capital-labor relationship and discussed the issue of income shares of classes based on a model capitalist economy. But Patnaik (2015) points out that the capitalist sector does not operate in isolation

but is surrounded by precapitalist settings. With the tendencies of primitive accumulation of capital infringing on the precapitalist sector, petty producers in the latter gets dispossessed. But not all can be accommodated into the capitalist sector as wage earners. Thus, the average income of the petty producers declines with primitive accumulation. This gives rise to inequality in the system, taking the capitalist and the precapitalist sectors together. The primitive accumulation of capital enlarges the labor reserves, which in turn has a downward pressure on wages in the capitalist sector. Thus, with primitive accumulation of capital, the tendency of inequality in the system goes up. Bhaduri (2018) shows how, in India, a more favorable climate for private investment was created through various policies including massive transfer of land and related natural resources to capitalists at highly subsidized prices. Those who were displaced from such land grab could not be accommodated within the corporate sector because of its high labor productivity. This in turn has fueled the informal sector, which puts downward pressure on wages, even in the formal sector. Such change in the policy environment and state's incentives towards capitalists are difficult to sustain in an electoral democracy. But policy convergence within the parties is a major bulwark of sustaining such a policy regime. This in turn is a result of correlation of class forces favoring the rich within a matrix of power in India dominated by the nexus of corporates, politicians, and the bureaucracy.

Within this milieu of domination by capital across the economic and political spectrum, the promise of capital to the poor working people is the promise of equality of opportunity. The promise is that anybody with talent can move out of poverty or underdevelopment in India, irrespective of hierarchies. This is, however, not happening in India. Iversen et al. (2017) show that occupational mobility in India, particularly for lower-end occupations, is very low. They find that the odds ratio of a laborer's son remaining a laborer rather than becoming a professional (as compared to a professional's son becoming a laborer rather than remaining a professional) was 55. What is even more worrying is that there exist much higher risks

of downward mobility among different sections of the population. For example, while only 4.3% of sons of forward caste professionals became manual laborers, compared to 9.4% of OBC professionals' sons, for SC and ST the numbers are 21.9% and 24.2%, respectively. In short, caste still plays a significant role in India in deterring occupational mobility and is therefore an important marker of inequality.

This discussion points towards an important aspect of Indian political economy. The capitalism that we have in India has resulted in inequality in the system. This inequality, however, has two dimensions to it. On the surface, researchers have tried to explain this inequality based on the workings of the economy itself. In other words, they have tried to endogenize the distribution parameters. It is indeed the case that the working of the market economy generates certain inequalizing trends endogenously. However, the overall outlook of the state determines to a great extent the evolving dynamics of inequality, as is evident from the above discussion. Since, state policy to a large extent determines the locus within which the distribution parameters vary within an abstract market economy, inequality trends become a matter of politics. Class struggle and politics therefore can change the distribution parameter in favor of the workers.

Conclusion

The transition of India from a planned economic development model towards neoliberalism is a result of developments both within the boundaries of India and outside. Within India, the contradictions of planning, the rising to dominance of the bourgeoisie, and the downward influence of the landed elites, not through land reforms but through an accommodation within the capitalist growth process, ushered in the policies of neoliberal capitalism. On the external front, the rise of international finance capital and policies of globalization meant that the Indian ruling class felt that its interests lay in allying with metropolitan capital rather than opposing it. This had its benefits for the capitalists and the rich, their wealth reached

unprecedented proportion. But this was at the cost of the workers and the poor. On the one hand, the share of wages in Net Value Added declined, and on the other hand, the share of income going to the top 1% of the population increased phenomenally.

This increase in inequality, we have argued, is tied with the economic processes unleashed in India. However, this provided an incomplete picture of the dynamics of inequality in India. The state, even though it propagates the policy of "withdrawal" has played a decisive role in shifting the income distribution towards the rich. What we are witnessing, therefore, in India is a very high degree of inequality, which the state is not recognizing. Rather, there is an implicit promotion of this inequality through various concessions that are provided to the corporates and the rich.

The state has evolved a twofold policy in this regard. First, domestically, there is no discussion about redistributive policies, apart from certain schemes which provide some basic relief to the poor. Second, at the international level, with the rise of the Indian bourgeoisie; they are demanding a seat in the high table of power. As a result, in some cases the interests of the Indian bourgeoisie comes into conflict with that of metropolitan capital. Nonetheless, this conflict is not oriented towards devising a policy autonomous to imperialism or metropolitan capital. Rather, this conflict only signifies the growing aspiration of the Indian bourgeoisie for a slice of world power. In the meantime, the condition of the poor remains abysmal with massive unemployment and underemployment and a huge increase in inequality. The struggle for an egalitarian India therefore should be primarily aimed at the Indian bourgeoisie and the state. While this struggle will be long drawn, the growing inequality and its various manifestations are becoming increasingly evident. One can only hope that the Indian masses would be able to follow an alternative path of development, whereby such glaring inequality can be reduced.

Definition

This essay examines the Indian Rebellion, or 'Sepoy Mutiny' of 1857, a major uprising in India in 1857–58 against the rule of the British East India Company in the country. Rather than viewing the Indian National Rebellion of 1857 as a momentary outburst, and so limiting its significance within a short historical time frame, the essay locates the ways in which the rebellion was preceded by and influenced other anti-colonial protest movements. It is suggested that in order to have a 'holistic' reading of the Rebellion, it is necessary to explore the period from the 1830s to the 1870s, one which witnessed colonialist expansion and also the challenges posed to British rule by a number of peasant and tribal movements in the context of exploitative and oppressive British land settlement policy. The 1857 Mutiny carried different meanings for different social classes and communities. In fact, it represented many mutinies, and any one homogeneous characterisation is grossly inadequate in capturing its multiple meanings. The essay anticipates that future historians will unearth other hidden meanings of the Mutiny by exploring new archival materials and asking different sets of questions.

Michel Foucault's journey in *Discipline and Punish* started with a vivid description of a spectacular case of torture near the Church of Paris in 1757. Among so many legal changes in Europe and the US, Foucault noted 'the disappearance of torture as a public spectacle' by the end of the 18th and the beginning of the nineteenth century (Foucault 1995: 3–8). However, British colonial rule in India signified a different trajectory of power. It enjoyed a 'monopoly of violence'. In fact, 'the infliction of pain as a mode of punishment was an insignia of power for the British in India'. In the context of the aforesaid modalities of British power in India, one eminent historian of the 1857 Mutiny, Rudrangshu Mukherjee, noted in his discourse multiple instances of unprecedented insurgent violence and counter-insurgency violence during and after the rebellion. The Mutiny witnessed looting, killing, and destruction by the insurgents. The targets included the British, their property, and government buildings. The punishment for the rebellion was 'exemplary' and 'spectacular' (see Mukherjee 2007: xvi, xx, 23, 36, 39). The revolt was ruthlessly suppressed as the British army moved into the rebel territories. Sepoys (native Indian soldiers) were blown off from canons, even on the mere suspicion of being

involved in the Mutiny. The counterinsurgency measures included public execution of the rebels and indiscriminate burning of native villages (Bandyopadhyay 2004: 169; Metcalf 1998: 43).

It is pertinent to prepare a broad chronological catalogue of the course and extent of the rebellion before analysing its character. As the sepoys of a regiment at Meerut refused to load the new Enfield rifle in the early summer of 1857, they were sentenced to imprisonment and sent off to jail in fetters. The sight of their compatriots' humiliation led the XI Native Cavalry, based in Meerut, to mutiny on the night of 10–11 May 1857. The mutineers then marched to Delhi where the reluctant and ageing Mughal emperor, Bahadur Shah Zafar, was installed as the symbolic head of the revolt. The revolt soon spread to the areas north and west of Delhi (Bose and Jalal 1998: 90–92). By the end of May, the rebellion had spread to Ferozepur, Muzaffarnagar, Aligarh, Naushera, Etawah, Mainpuri, Roorkee, Etah, Nasirabad, Mathura, Lucknow, Bareilly and Shahjahanpur. Between 1 and 13 June, Moradabad, Badaun, Azamgarh, Sitapur, Neemuch, Banaras, Kanpur, Jhansi, Dariabad, Fatehpur, Nowgong, Gwalior, and Fatehgarh had witnessed uprisings. There were uprisings in Hathras and Indore on 1 July (Joshi 1957: 379–380).

The spectacular subversive events connected with the 1857 Mutiny include: the rebels' taking possession of Kanpur under the leadership of Nana Saheb; capture of Jhansi Fort, restoring power to Rani Lakshmi Bai; the rebels' siege of the Lucknow Residency, the citadel of British power; Tatya Tope dislodging the British from Kanpur and recapturing it; Kunwar Singh capturing Arrah and Azamgarh. The tragic events in the Mutiny include: Bahadur Shah Zafar's surrender to the British, the deaths of Kunwar Singh and Lakshmi Bai; and the hanging of Tatya Tope (Joshi 1957: 379–382).

In the aftermath of the Mutiny, the British colonial rulers gave it specific meanings through their technologies of power such as photography, memorials, and history writing. The most authoritative 'prose of counterinsurgency' that appeared after the revolt was the massive three-volume

History of the Sepoy War in India by Sir John William Kaye. 'Kaye's history was not so much about the Black Man's rising as about the White Man's suppression of that rising' (Amin 2007).

The Mutiny of 1857 had many dimensions. It started with the sepoys of the Bengal Army rising in revolt against the British Raj in northern India from 10 May 1857 onwards. Diverse social classes (landlords and peasants, princes and merchants) and religious communities (Hindus and Muslims) participated in the revolt, each for their own reasons. Large areas of the region remained out of British control for a year and more (Metcalf 1998: 43).

The land settlement policy introduced by the British in northern India immediately before the Mutiny adversely affected both the peasants and the landlords. British annexation of Awadh in 1856 had antagonised the sepoys of the Bengal Army, of whom several thousand recruits originated there. The revolt was preceded by around 14,000 petitions from the sepoys about the declining conditions of the peasantry and the hardships faced by them due to the summary settlements in 1856 which followed the annexation of Awadh. The landlords (*taluqdars*) also were adversely affected by the settlements, which led to the dispossession of a number of powerful *taluqdars* (Bandyopadhyay 2004: 171–173).

The Mutiny had religious dimensions. Rumours were circulated in the summer of 1857 about the cartridges of the new Enfield rifle being coated with the fat of cows and pigs, about forced conversions to Christianity, and about British intentions to disarm the sepoys. These rumours spread from village to village, from bazaar to bazaar, and from one sepoy line to another (Mukherjee 2007: 46). This testifies to the deep-rooted suspicions that prevailed between the Hindu and Muslim communities about the intentions of the British. It should be mentioned in this connection that in the post-Mutiny period the British administrators felt the urgent need to understand the minds of their native subjects. This is evident in the statement of W.W. Hunter, an eminent member of the Indian Civil Service: 'The chronic peril which environs the British

power in India is the gap between the Rulers and the Ruled' (Hunter 2002/1871: Dedication).

The discursive field of the 1857 Mutiny is highly contested. Karl Marx, on the basis of observations made by Disraeli, characterised the Mutiny as a 'national revolt' (Marx and Engels 1978: 142). The nationalist historians of India have tried to appropriate it as an organic part of India's nationalist movement. However, in the centenary year of the Mutiny, P.C. Joshi, the general secretary (1935–48) of the undivided Communist Party of India, noted large-scale peasant participation in the major sites of rebellion around Meerut and Delhi in northern India (Joshi 1957: 295). It may be mentioned in this connection that the posthumously published book of Eric Stokes, the eminent British historian of colonial India, was titled: *The Peasant Armed: The Indian Rebellion of 1857* (Stokes 1986).

The question of the Mutiny's leadership has been much debated by historians. Stokes coined the phrase 'peasants in uniform' to characterise the sepoys (Joshi n.d.). He argued that coming from the small land-owning families of Awadh, the allegiance of the sepoys was to the land. Consequently, the distinction between the sepoys and the peasants got blurred. Stokes identified 'elites' or 'magnates' such as *taluqdars/zaminders* (landlords), who had been marginalised and squeezed by the British, as leaders of the rebellion. Rudrangshu Mukherjee did not accept this interpretation. Stoke's emphasis on magnates suggests that peasants were subordinate to or manipulated by the elites. On the contrary, Mukherjee argued, 'peasants and clansmen could and often did act outside magnates' initiative' (for the debate, see Priti Joshi n.d.).

Nationalist leaders of diverse shades supported the 1857 rebellion. V.D. Savarkar, 'intellectual guide to Hindu chauvinistic politics', wrote the first full-length Indian version of the story of 1857 in his book *The Indian War of Independence of 1857*. He found to his 'great surprise the brilliance of a War of Independence shining' in the Mutiny (Savarkar 1909: vii). The great Indian revolutionary, Bhagat Singh and his comrades also regarded 1857 as a war for independence. The prominent leader of the nationalist movement and the first prime minister of independent India, Jawaharlal Nehru, wrote about the place of the rebellion in the history of British rule in India, while in Ahmednagar Fort jail (1944). He did not subscribe to the path taken by the Mutiny, but he did not deny that it 'assumed the character of a popular rebellion and a war of independence'. It may be mentioned in this connection that the government of India led by Nehru commissioned Dr. Surendranath Sen to write a definitive history of the Mutiny on the occasion of its centenary (for diverse nationalist assessments of the rebellion, see Singh 2007: 44–66). All of this goes to show that the 1857 rebellion created an anti-imperialist spirit which touched the minds of the proponents of Hindu nationalism, liberal nationalism, as well as the revolutionary tradition of nationalism in British India.

On the occasion of the 1857 Mutiny's 150th anniversary, historians have opened up fresh dimensions by exploring further archival materials, asking new questions and doing ethnographic research. The special issue of the *Economic and Political Weekly* (EPW) bears testimony to this work. In his theoretical intervention, Dipesh Chakrabarty has enlightened us about two different kinds of recall of 1857: as incitement for popular politics, and as a festive time on the national calendar. In this context, he mentioned the fact that the Forum for Democratic Initiatives in Delhi held a conference at the Gandhi Peace Foundation on 20 March 2007 on '1857 and the Legacy of Peasant Resistance' with the subtitle, 'Tebhaga, Telangana, Naxalbari and Now, Singur'. Chakrabarty argued that this is an instance of looking on 1857 as the precursor of many other rebellions to come (Chakrabarty 2007: 1695). Recent ethnographic research shows that the memory of the 1857 Mutiny has been carried in the oral folk-tale and folklore traditions of the Dalit (lower castes) in northern India. Other than establishing their own heroes and heroines, such narratives have contested the monopoly of the elite icons of the Mutiny such as Kunwar Singh, Tatya Tope, and Nana Saheb. Rani (queen) of Jhansi is the dominant woman icon in the elite discourse of the Mutiny. Ethnographic research has located stories about brave women

I

martyrs of 1857 in the Dalit narratives, such as Jhalkaribai, Avantibai, Udadevi, and Mahaviridevi. The martyrs of Dalit communities have often been deified and are found to be worshipped by the villagers in different regions of northern India. Moreover, many Dalit icons have been incorporated in contemporary Dalit political discourses to glorify their traditions (see Tiwari 2007: 1734–1738).

William Dalrymple, in his presentation in December 2006, argued that earlier generations 'have, perhaps, underplayed the power of faith and religion' as a motive force behind the 1857 Mutiny. He drew our attention to 'the huge weight of emphasis on this factor given in the rebels' own documents' (Dalrymple 2007: 37–38).

The historians of the Mutiny mostly concentrated their attentions on regions situated in the 'Gangetic heartland' of northern India. On the occasion of the Mutiny's 150th anniversary, some researchers (L.N. Rana, Sanjukta Das Gupta, and Shashank Sinha) have drawn our attention to the participation of Jharkhand tribal communities in eastern India (Bhattacharya 2007: 69–142).

Rather than viewing the Indian National Rebellion of 1857 as a momentary outburst, and so limiting its significance within a short historical time frame, one should locate the ways in which the rebellion was preceded by and influenced other anti-colonial protest movements. It is suggested that in order to have a 'holistic' reading of the Rebellion, one needs to explore the period from the 1830s to the 1870s, the period which witnessed imperialist expansion and also challenges posed to the British rule by a host of peasant and tribal movements (Pati 2010: 4).

The rebellion in 1857 created a crisis of authority in the British Empire. Within weeks of its outbreak, the government of India sent a dispatch to the Cape Colony requesting an urgent transfer of troops. In addition to providing military support, the governor of the Cape Colony, Sir George Grey, assisted officials by providing financial assistance for those in India affected by the violence. In fact, the rebellion provided an opportunity for Britons throughout the world to show their loyalty to the Empire. In the wake of the uprising, colonial officials throughout the Empire expressed fears of native rebellion and justified the greater use of force to maintain British control and hegemony (Bender 2013, pp. 1–23).

The 1857 Mutiny carried different meanings for different social classes and communities. In fact, it represented many mutinies, and any one homogeneous characterisation is grossly inadequate in capturing its multiple meanings (for diverse interpretations and the historiography, see Ray and Chaudhuri (n.d.)). It is expected that future historians will unearth other hidden meanings of the Mutiny by exploring new archival materials and asking different sets of questions.

Definition

This entry describes the historical expansion of imperialism as inseparable from the colonial subjugation of indigenous peoples on a planetary basis. It argues that without the subjugation of indigenous (or "aboriginal") peoples, imperialism in any of its modern forms would have been not only impossible but inconceivable. The entry describes the colonialist appropriation of knowledge, natural resources, labor, and wealth from

indigenous societies, and the genocidal logic that propelled it. Mainstream conceptions of the origins of scientific, cultural, and historical "progress" are demonstrated to be thoroughly imbued with Eurocentric colonial prejudice.

"Imperialism" has been defined in a number of ways. Irrespective of the definition employed, however, the phenomenon described is inseparable from the colonial subjugation of indigenous peoples on what has long since become a planetary basis. Indeed, without the subjugation of indigenous (or "aboriginal") peoples, imperialism in *any* of its modern forms would have been not only impossible but inconceivable (Nietschmann 1994). As Shuswap resistance leader George Manuel observed more than 40 years ago, the Earth's several thousand First Nations comprise a Fourth World, and its near-total subjugation has been the veritable bedrock upon which all three of the other "worlds" delineated at the 1955 Bandung Conference were constructed (Manuel and Poslins 1974).

In the Bandung formulation, the First World consisted of the industrially advanced capitalist/ imperialist powers situated primarily in Western Europe, North America, and Japan; the Second World comprised the Eurasian socialist bloc countries, which were construed as being anti-capitalist and therefore inherently anti-imperialist; and the Third World was composed of the First's Afro-Asian colonies and former colonies; Latin America was grafted onto the basic schema at the 1966 Tricontinental Conference, held in Havana (Prashad 2007, pp. 31–50, 105–115). The formulation is noticeably different from that embodied in the "three worlds theory" later propounded by Mao Zedong, wherein the USA and the Soviet Union comprised the capitalist/imperialist First World; Western Europe and Commonwealth countries, as well as Japan, all of them imbued with a "dual character," comprise the Second; and the Third World is made up of the remaining countries (states), each of which is construed as being fundamentally anti-imperialist (on the Maoist formulation, see Melkote and Merriam 1998, p. 10). It follows that perfecting the contemporary imperial edifice of globalization is contingent upon continuation and intensification of Fourth-World subjugation.

Invariably, the effects of the subjugating process have been genocidal, both in terms of the coerced and often compulsory cultural emulsification of aboriginal societies and, not infrequently, the outright physical liquidation of indigenous populations (either through direct killing, imposition of what Raphaël Lemkin termed "slow death measures" [1944], or a combination of the two). As Davis and Zannis (1973, pp. 19–20) observe, "slow death measures" are delineated in the so-called Secretariat's Draft of the 1948 Convention on Prevention and Punishment of the Crime of Genocide, largely prepared by Lemkin, as systematic deprivation of adequate nutrition, clothing, housing, sanitation, and medical care, especially in combination with forced labor or other debilitating physical exertion. Imposition of such measures typically arises in the context of the perpetrators' expropriation of the victimized population's land-base, natural resources, and attendant economy. Hence, the dissolution and ultimate disappearance of Fourth World peoples, at least in the sense that they've traditionally understood themselves to *be* such, and often in terms of their biological existence as well, must be seen as integral and inherent to colonialism, thence imperialism, a reality entirely consistent with Lemkin's original conception of genocide:

> By 'genocide' we mean the destruction of a nation or of an ethnic group . . . . Generally speaking, genocide does not necessarily mean the immediate destruction of a nation, except when accomplished by mass killings . . . . It is intended rather to signify a coordinated plan of different actions aiming at the destruction of essential foundations of the life of national groups, with the aim of [eradicating] the groups themselves. The objectives of such a plan would be disintegration of the political and social institutions, of culture, language, national feelings, religion, and the economic existence of national groups, and the destruction of the personal security, liberty, health, dignity, and even the lives of the individuals belonging to such groups. Genocide is directed against the national group as an entity, and the actions are directed against individuals, not in their individual capacity, but as members of the national group . . . . Genocide has two phases: one, destruction of the national pattern of the oppressed group; the other, the imposition of the national pattern of the oppressor . . . . Denationalization was the word used in the past to describe the destruction of a national pattern. (Lemkin 1944, pp. 79–80)

Lemkin goes on to explain that he believes the word "denationalization" to be "inadequate [to describe the phenomenon he is discussing] because: (1) it does not connote destruction of the biological structure; (2) in connoting the destruction of one national pattern, it does not connote the imposition of the national pattern of the oppressor; and (3) denationalization is used by some authors to mean only deprivation of citizenship" (p. 80). Following Lemkin's definition (having literally coined the term, one suspects that he above all others knew its meaning), it is impossible to contest Sartre's "controversial" conclusion that colonialism is *inherently* genocidal (Sartre 1968).

In this respect, it matters little whether a particular imperial system or project is associated more with the "civilizing mission" ascribed by Lewis Feuer to imperialism's "progressive" variant, or with what he refers to as the "regressive" objectives of conquest, unadorned material exploitation, and/or repopulation ("settlement") of forcibly acquired territories with racially preferred "breeding stock." Feuer offers "the Alexandrian, Roman, British, French, and Dutch" empires as examples of "progressive imperialism" which supposedly "elevates living standards and cultural life ... brings education and the arts to its more backward areas [and] establishes a universal rule of law and security of person." As examples of "regressive imperialism," he points to "the Nazi variety and, in several respects, the Mongolian and Spanish" (Feuer 1986, p. 4). Nor does the political ideology of the system have much bearing. Insofar as the impacts upon Fourth World nations have been virtually indistinguishable over the long term, such distinctions are ultimately cosmetic or, perhaps more accurately, deliberately obfuscatory. Invoking Sartre once again, "there are neither good nor bad colonists: there are colonists" (Sartre 2001 [1957], p. 51).

It may be this inconvenient truth, more than anything else, that explains why the significance of Fourth World subjugation, despite its clearly foundational location within the architecture of colonialism/imperialism, has been consistently neglected in currently predominating theorizations and analyses of the imperial phenomenon as well as attendant anti-imperialist discourse.

Decolonization of Fourth World nations and concomitant resumption of their genuinely self-determining existence(s) find no place within any "reasonable" paradigm of liberation. Correspondingly, consideration of such questions has been largely relegated to the realms of historical interest or delineations of "minority rights" whenever it not been avoided altogether.

Hardt and Negri's *Empire* (2000) is instructive. In the entirety of its 400-page text (there are also 78 pages of notes and index), "Native [North] Americans" are the only indigenous peoples characterized as such, and, apart from a passing reference on p. 177 to "genocidal wars" having been waged against them by the USA, are discussed only in a 4-page span (pp. 169–172). Here they are depicted only as a transient barrier to US territorial expansion "from sea to shining sea" during the first century of the country's existence. Presumably, the authors believe that this barrier was ultimately overcome through total extermination, leaving Native North Americans no less extinct than the carrier pigeon, since they offer no hint in their discussion of the subsequent evolution of US imperialism that it might be in any sense contingent upon the ongoing subjugation of indigenous peoples and expropriation of their resources within what the USA claims as its domestic territoriality. The misimpression thus conveyed is strongly reinforced, moreover, by their unequivocal (and erroneous) assertion that indigenous peoples were from the outset, and by implication remain, "outside the Constitution as its negative foundation: in other words, their exclusion and elimination were [and are] essential conditions for the functioning of the Constitution itself" (p. 170).

In *The Sorrows of Empire* (2004), to offer another prominent example, Chalmers Johnson acknowledges that the "real" beginning of US imperialism can be dated from 1898 (as Hardt, Negri, and many others have contended) only if "one [is] willing to regard the lands of Native Americans and Méxicans as essentially uninhabited" (p. 190), but the insight is otherwise unremarked. Moreover, in a later book, *Dismantling the Empire* (2010), Johnson effectively nullifies the insight itself by making no mention whatsoever of Native Americans, thereby leaving

a distinct impression that the continuing subjugation of Fourth World nations within the USA is to be viewed as something other than an integral part of its imperial construction. So, too, Andrew Bracevich's *American Empire* (2002), while in Niall Ferguson's *Empire* (2003), expansion of the USA to continental proportions merely "implied colonization" of Native North America (p. xii). Scores of comparable examples (a few of them deployed hereinafter) might as readily be cited.

While such deficiencies have prompted the emergence of a parallel literature devoted to explicating the facts and implications of Fourth-World colonization, the mainstream of anti-imperialist thinking, notwithstanding the undeniably high degree of sophistication it often displays in other respects, has thus remained distinctly ungrounded, an elaborate castle not so much built on sand as suspended in mid-air. This literature has burgeoned over the past 40 years, and now includes such mature and expansive works as Lauren Benton's *A Search for Sovereignty* (2010), Anthony J. Hall's *American Empire and the Fourth World* (2004), Anthony Pagden's *Lords of All the World* (1995), and Robert A. Williams's *The American in Western Legal Thought* (1990), to name but a handful. At one level, the result has been a considerable amount of self-contradiction within anti-imperialism's theoretical/analytical corpus; at another, we have seen the widespread embrace of prescriptions for "liberation" which, whatever else might be said of them, would in their fulfillment embody consummation of Fourth World genocide on a planetary basis.

The State

Although, globally, it assumes a vast array of forms, the sociopolitical organization of indigenous societies is unified by the absence of the sort of centralization of authority and concomitant concentration of power characteristic of the state (Nietschmann 1987, pp. 1–3). Fourth World nations are "stateless," not because they have never attained the capacity to enter into statist trajectories, but rather, as Pierre Clastres concluded, because they have consciously set themselves "against the state," typically

developing complex sets of relations actively precluding consolidation of socioeconomic and political hierarchies and attendant structures of juridico-bureaucratic rationalization and coercive enforcement.

Clastres worked closely with the Aché (whom he unaccountably refers as "Guayaki," a colonial term meaning "rabid rats") of present-day Paraguay, and they figure centrally in his book *Society Against the State* (1974). For that reason, his work has been misconstrued/misrepresented as focusing exclusively on "hunter-gatherer societies." In actuality, as he explained at length (1974, pp. 62–82), the term itself is essentially a misnomer, accurately applicable to only a very narrow range of peoples, with the great majority of those thus labeled either deriving some often substantial portion of their subsistence from agriculture, or having demonstrably done so in the past. As he observes, even the Achés, "who are [now] pure hunters and nomads of the forest, gave up cultivating corn towards the end of the sixteenth century" (p. 69).

That this abrupt abandonment of agriculture/ retreat to the forest was precipitated by Spain's establishment of Asunción in 1537, and the steady spread of settlers and Jesuit missions throughout Aché territory, seems rather obvious. It should be noted that, as was detailed by Mark Münzell (1974), Norman Lewis (1976), and others around the time Clastres's book was published, Paraguay commenced an "informal" campaign to exterminate what remained of the Achés, often using machetes rather than guns as a means to avoid incurring the expense of ammunition. Survivors, mostly children, were sold into the country's still-thriving slave market (Arens 1979a).

In many instances, the decision to do so arose from direct experience, an unknown but substantial number of First Nations having experimented with statism to varying extents and found its anticipated benefits sufficiently outweighed by its costs that they elected to dismantle whatever state apparatus had been created. A prime example is that of the sprawling Mississippian ("Mound Builder") culture which began to emerge somewhere around 1000 CE and within two centuries encompassed most of the eastern

half of what is now the USA. By the latter point, Cahokia, its "capital city," located near present-day St. Louis, Missouri, had reached a population of perhaps 40,000 (larger than either London's or Rome's at the time), a matter reflecting an extraordinarily high degree of agricultural attainment (Martinez et al. 2016, p. 4). The increasing concentration of political authority and resultant socioeconomic stratification attending the process were apparently deemed unacceptable to the bulk of the populace, however, and by roughly 1350, the residents of Cahokia had dispersed, resuming the "tribal" identities and decentralized lifestyles they had led prior to its rise. The pattern of dismantlement thereafter spread throughout the remainder of the culture and was still ongoing in some areas at the time of the initial European invasions, c.1550–1650.

In contrast, although statism and imperialism may often function symbiotically in terms of consolidation and refinement, the formation of empire *requires* a state. This has been true since establishment of the earliest known imperium (that of Assyria, c.2500 BCE) and includes the "empires" attributed to the Maya, Inca, México (Aztec), and other First Nations, albeit in many such cases the term may well be misapplied. Mayan civilization, which originated at least as early as 2000 BCE and existed in its "classic" form from approximately 250–900 CE, attained an astonishingly high level of cultural sophistication, including not only flourishing agricultural and trading economies, but, among other things, written language and a system of mathematics incorporating the concept of zero and enabling them to apprehend extremely complex numbers without the aid of computers, to measure time more accurately than was possible in Europe until the later nineteenth century, and thus to achieve a remarkably precise understanding of astronomy (Foster 2002, pp. 248–262; Slater and Traxler 1983, pp. 101–110).

Although the civilization was both sustained and expansive, eventually incorporating virtually all of the distinct peoples indigenous to the Yucatan and contiguous areas of what is now Mexico, as well as present-day Belize, Guatemala, and western Honduras in their entireties, it never exhibited the "center" ("metropole")

indicative of imperial order. Rather, it seems to have consisted of a number of "mini-empires," somewhat resembling city-states, bound together mainly by the development of cultural affinities, and a broader range of trade relations. Even that arrangement appears to have ultimately proven to be too sociopolitically/economically stratifying, as dismantlement of its statist structures commenced at some point in the tenth century CE and was largely completed by the Mayapan revolt of 1441 (well before the Spanish invasion) (Coe 1999).

The Tenochtitlan-centered Aztec Empire (Tenocha) of present-day Mexico comes much closer, although it was never a true territorial empire. Its power extended as much by trade as by military force, and was maintained as much by intermarriage and diplomacy as by coercion. It was, moreover, relatively short-lived, having been established through the "triple alliance" of 1427 and destroyed by the Spanish invasion of 1519 (Carrasco 1999). Whether its statist structure would have eventually been dismantled by the Méxicas themselves will thus remain unknown. The Incas perhaps came closest to establishing a genuine imperialist system, although the inception of their empire, centered in what is now Peru, dates from 1437 and, like Tenocha, was effectively destroyed by the Spanish less than a century later. We are thus left with the same unanswerable question regarding the Incan state (McEwan 2008). While the effects of statism/imperialism on the Fourth World have been negative from the outset, however, their inherently genocidal dimension did not become fully apparent until the advent of the modern state through a process initiated by the coronation of Charlemagne as "Holy Roman Emperor" in 800 CE.

While, to quote Voltaire, the resultant territorial/governmental "agglomeration" was "neither holy, nor Roman, nor an empire" (quoted in Renna 2015, p. 60), its establishment triggered the invention of Europe, otherwise known as "The West," both geographically and culturally. Notwithstanding the title conferred upon Charlemagne by Pope Leo III, the term "Holy Roman Empire" originated in 1254 and was applied to his domain only retrospectively. From its capital,

situated not in Rome but in the small Frankish city of Aachen, the Carolingian dynasty Charlemagne founded forcibly expanded its dominion outward in all directions so that by 814 CE, it encompassed everything south of present-day Denmark to a point about halfway down the Italian peninsula, and from the present French/Spanish border in the West through Carinthia in the East. The western half of the area was for the most part encompassed within the prefiguring Frankish kingdoms of Neustria, Burgundy, and Austrasia, which Charlemagne essentially inherited upon receiving the imperial crown. Aachen was situated in Austrasia, its location central to the empire after its initial phase of eastward expansion (Riché 1993).

It should be noted that a rather similar, but always separate, prefigurative process had commenced in Britain as a result of Anglo-Saxon invasions during the fifth and sixth centuries. It would not be until the Norman conquest of 1066 that a dynamic comparable to that unleashed by Charlemagne made its appearance, however. By 870 CE, the empire's eastward thrust had reached the far side of Moravia, a push that was relentlessly pursued by the Carolingians' successors over the next several centuries, prompting the conceit that those presiding over the European subcontinent were "entitled" to anoint their realm not merely "a continent in its own right" but, ultimately, "*the* Continent" upon which the world was centered (Barbero 2004).

As Kenneth C. Davis observes, "This may come as a severe shock to Conservatives in Great Britain's Parliament and to other European traditionalists who have strong views on Europe's cultural superiority. But, sorry folks . . . Europe, including the British Isles, is simply a large western peninsula of Asia" (1992, p. 129). Indeed, although Europeans had by then been describing their land-base as such for centuries, Lewis and Wigen point out that Europe's supposed (and entirely arbitrary) geographic demarcation from Asia was not identified as the Ural Mountains until 1730 (1997, pp. 27–28). Suffice it to say that, geographically speaking, the existence of a "European continent" is purely invented.

Politically, the Carolingian Empire consisted of several relatively autonomous states (the number changed over time, and always included a welter of duchies, city-states, and other subdivisions), the heads of which were invariably confirmed through professions of fealty to both the emperor and the papacy. This in itself was unremarkable. The Carolingians were unprecedented, however, in the emphasis they placed on attacking the core spiritual beliefs from whence the plethora of "tribal" peoples whose territories were incorporated into the various states, and thus the empire, derived their distinct cultural identities. They imposed instead the unitary doctrines of Western ("Roman," "Latin," "Catholic," or "Occidental") Christendom (McKitterick 2008).

This was in stark contrast to earlier/other empires, which were by and large content to extract various forms of tribute from those they conquered or otherwise colonized without stripping them of their cultural identities or imposing their own. There was no effort on the part of the Mongols to "convert" non-Mongols into Mongols, for example, or of the Méxicas to absorb tributary peoples into their own culture. Quite the opposite, in fact. The late Roman Empire was perhaps an exception in that, having adopted Christianity as its official religion, it set about imposing it upon the very peoples targeted by the Carolingians. The result, of course, was that the infuriated "barbarians" promptly sacked Rome, forcing the imperial center eastward to Constantinople (Mohawk 2000, pp. 62–71; Burns 1994). Each state was thus distinctly imperial in its internal construction as well as its external allegiances and ambitions.

For two centuries, beginning in 1096, the culturally genocidal synthetization of European identity set in motion by the "Carolingian Renaissance" was reinforced and advanced at a steadily accelerating rate by the organization of a series of nine papally ordained "Crusades" pitting Western Christendom against both its Eastern counterpart (Byzantium) and their mutual theological rival, the "Eastern" religion of Islam, which predominated in Christianity's Levantine "Holy Land." In 1147, a series of "Northern Crusades" was also launched against the eastern Baltic Slavs (from the Latin word *sclavus*, meaning "slave"), while yet another, known as the Reconquista, was undertaken on the

Iberian peninsula to wrest it from Islamic control (Christiansen 1980; O'Callaghan 2003).

The First Crusade was authorized by the Council of Claremont in 1095 and the last was undertaken in 1291. The last of the Northern Crusades ended in 1290, and, by 1294, the Islamic dominion in Iberia, which had once extended to roughly the present French/Spanish border, had been reduced to the area around Grenada (Grenada itself was not "reconquered" until 1492). It will be noted that, while the Reconquista has always been framed as a contest between "The East" (signified by Islam) and "The West" (signified by Western Christendom), the Iberian peninsula is in fact the most westerly portion of the European landmass. Even in the figurative sense of theological distinctions, the contrivance of an east/west dichotomy was from the outset nonsensical, given that both religions, based as they are on the same preexisting Hebraic text (the "Old Testament"), originated in exactly the same place. The nuances of scriptural interpretation by which Western Christendom distinguished itself from Eastern (Byzantine) Orthodoxy were, moreover, in no small part derivative from Islamic interpretations (Rodinson 1987, pp. 15–17; Djaït 1985).

The heads of each state and substate were responsible for mustering and leading the forces necessary to mount these protracted campaigns, a matter which, while solidifying the authority vested in statist rulers, served to inculcate an increasing sense of commonality among troops drawn from the multiplicity of tribal cultures/societies encapsulated within each state's boundaries. Amplified by the harsh realities of combat once battle was joined, this preliminary outlook rapidly cohered into a genuinely collective sense of "us," a term whose meaning yields itself only in contradistinction to "them." Self-evidently, "us" consisted exclusively of those "on our side." while "them" was not only "other" but by definition "the enemy." From there, it was but a short step to the perception that while "we" (of The West or "Occident") were fully human, "they" (the "Others" of "The East," also referred to as the "Orient") were less so, perhaps of another species altogether (Churchill 2011, p. 19).

The sheer virulence manifest in this seminal "crusader mentality" would seem to have arisen from a deep-set and abiding sense of cultural inferiority among the subcontinent's élites; the very name "Europe," after all, derives from the Phoenician word *"erub,"* meaning "darkness" or, some would say, "ignorance." This, in turn, triggered a compulsive and sustained drive by the West to compensate by asserting its "rightful" ownership not only of such material "property" as might be possessed by others, but, as will be discussed below, of their intellectual attainments as well. Most Semitic languages contain variations; the Akkadian *erebu*, Arabic *maghreb*, and Hebrew *ma'ariv* as examples. For obvious reasons, neo-Aryanist scholars prefer to believe that it originated in a combination of the Greek words εὐρύς and ὤψ/ὠπ−/ὀπτ-, ostensibly meaning "wide-gazing" (Bernal 1987, pp. 367–399). Since, as Martin Bernal demonstrated in the third volume of his magisterial *Black Athena* (2006), Greek terminology was substantially based on Phoenician prototypes, however, the Aryanist argument is vacuous at best. It was amidst this snarl of pathologies that, as Lumbee legal scholar Robert A. Williams Jr. has shown, the conceptual template upon which the West would thereafter define its relations with all Others, indigenous peoples in particular, was forged. Williams dates this to the mid-thirteenth century commentaries of Pope Innocent IV on Innocent III's *Quod super his*, completed in 1209 (1990, pp. 13–15).

That the mentality involved has lost none of its original substance or lethal intensity over the near-millennium that has elapsed since the medieval Crusades is abundantly apparent in Hitler's framing of the German bid to establish an eastern empire during the 1940s, as well as the cogency with which Aimé Césaire, among others, subsequently linked the Hitlerian framing to Western colonialism/imperialism as a whole. He aptly observed that Hitler was belatedly reviled by Europeans, not for "crimes against humanity," per se, but instead for "the fact that he applied to Europe colonialist procedures which until then had been reserved exclusively for the Arabs of Algeria, the coolies of India [and] the blacks of Africa" (Césaire 1972 [1955], p. 14). Insofar as

I

they were then struggling mightily to maintain their overseas empires, or at least substantial portions of them, he continued, countries like Britain, France, Portugal, and the Netherlands (all loudly condemning of the "Nazi horror") were themselves busily "chewing on Hitler's vomit" (ibid., p. 63).

Through it all, The West's peculiar version of the state, formed, maintained, and continuously refined on the basis of internal colonialism, has been instrumental, indispensable to the evolution of European imperialism in each of its phases and typologies. By the late twentieth century, only a handful of Europe's multitudinous indigenous peoples (notably, the Basques [Euskaldinak] and Sámis [pejoratively known as "Lapps"]) remained sufficiently in touch with their autochthonous traditions to struggle for resumption of a self-determining existence on that basis (Watson 2007; Mörkenstam 2005). As American Indian Movement (AIM) leader Russell Means once put it when arguing that indigenous peoples, no less than others, are entitled to exercise the right of self-determination:

> For Europe to colonize the whole planet, it first had to colonize *itself*. At this point, Europeans have been colonized for so long, and so thoroughly, that they've actually forgotten the fact of their own colonization. Since it's hard to imagine being more colonized than *that*, it seems to me that Europeans are the ones most desperately in need of decolonizing.

Imperial Reach: Phase 1

From at least as early as the First Crusade, the West harnessed itself to the task of fabricating what was purportedly "its own" civilization, self-anointedly superior to all others, through a peculiar mode of cultural imperialism against Others. This initially devolved upon a form of what might be best characterized as intellectual cannibalism wherein the Western intelligentsia systematically credited itself with the achievements of Eastern (primarily Islamic) philosophers, mathematicians, and scientists, while denying that those whose knowledge was thus appropriated

had either produced it or were culturally capable of having done so.

With respect to mathematics, for instance, although the word itself derives from the Arabic term "*al-jabar*," Western scholars have historically (and routinely) attributed invention of the algebra to the Greek Diophantus, during the third century CE. In fact, the algebraic method was conceived in its modern form by the Persian polymath Ibn Mūsā al-Khwārizmī around 820 CE (Boyer 1991: pp. 228–229, 234). In the same vein, many of the "brilliant innovations" credited to Europe's later mathematicians were outright plagiaries of much earlier discoveries by their Islamic counterparts. The theorem attributed by the West to Nicholas Copernicus in 1543, for example, is virtually identical to "Tūsī's Double," a theorem set forth by a Persian, Nasīr al-Dīn al-Tūsī, in 1247 (Saliba 2007, pp. 197–200). Copernicus also plagiarized the work of a fourteenth century Syrian predecessor, Abu'l-Hasan ibn al-Shātir, to such an extent that al-Shātir is sometimes referred to as "the Pre-Copernican Copernican" (Roberts 1957, pp. 428–32).

Similarly, "Viète's Laws" of numerical analysis, supposedly discovered by the Frenchman François Viète during the sixteenth century, were lifted from al-Tūsī; so, too, the "Ruffini-Horner method" of computing the derivative of polynomials, supposedly devised by a pair of Europeans during the late eighteenth century (Berggren 1990, pp. 304–309; Ypima 1995, pp. 531–551). "Wilson's Theorem," credited to the Englishman John Wilson in 1770, was already employed by the Arab mathematician Ibn al-Haytham ("Alhacen") by 1000 CE. Such illustrations of the West's claiming Islam's mathematical knowledge as the product of its own "intellectual tradition" are seemingly endless, extending not just to algebra but to such rarefied domains as calculus, trigonometry, non-Euclidian geometry, and number theory. Even the numerals, together with the attendant concepts of zero and decimal fractionation, essential to Europe's eventual mathematical sophistication, were swallowed whole from "Eastern" Others (Sesiano 2000, pp. 137–166).

One result (particularly as regards the plagiarism of Ibn Sīnā ["Avicenna"], Ibn Rushd

["Averroës"], and others among Islam's Aristotelian philosophers) has been the West's conjuring of a proud "history" which it falsely claims originated in the culture of ancient Greece. In actuality, as John Mohawk observes:

> The West had no direct intellectual connection whatsoever to the thinkers of classical Greece: important works of the ancient Greeks had largely disappeared from the [Western] world by the second century. Aristotle's writings were already rare by the first century . . .. Pope Gregory the Great ordered the library of Palatine Apollo burned and forbade laymen to read even the Bible. Jerome, an early father of the Church, boasted that the classical authors were being ignored; in 398 [C.E.] the Fourth Council at Carthage forbade [even] Church leaders to read them. Young monks bragged of their ignorance of classical writings, and books and libraries were systematically destroyed. John Chrysostom, a father of the Greek [or Eastern Orthodox] Church, declared his satisfaction that all trace of the writings and philosophy of antiquity had disappeared under the early hegemony of the Christian Church. (Mohawk 2000, pp. 67, 70)

Much the same procedure was/is evident in such less rarefied fields as architecture, engineering, agriculture, and medicine, with concepts, crop types, and technologies developed in the Islamic East ingested wholesale under the guise of being "invented" by the West. Kirkpatrick Sale, for example, has argued that a "new rationality" signified by the appearance of such technological marvels as the public clock, eyeglasses, paned glass windows, paper, the printing press, and (most of all) guns and gunpowder during Europe's "High Renaissance" enabled its unparalleled outward thrust, beginning in the mid-fifteenth century (Sale 1990, pp. 41–42). In reality, such rationality was "new" only to the West; every one of Sale's examples, and many others besides, had appeared much earlier in The East.

Public clocks were in use in Baghdad by 750 CE, and in 797 Hārūn al-Rashīd, the city's calīf, is known to have presented an especially elaborate one to Charlemagne (Turner 1997, p. 184). Eyeglasses, the invention of which is credited to the Florentine Salvino D'Amarto in 1284, were already being worn in China by 1260 (Durant 1950, pp. 995–996). High-purity, clear, colorless glass was first produced by Abās ibn Fīrnā, an Andalusian Berber, c.850 (he developed both quartz-based and silica-based methods of making it), while Islamic artisans had perfected the techniques of making stained glass and assembling paned windows at least a century earlier still (ibid., p. 342). Paper was invented in China around 105 CE, where it was developed to near perfection before the techniques of making it, together with ink, were passed along to the Persians during the eighth century, and thence to the West during the thirteenth century. The printing press (or, more accurately, moveable type) was developed by China's Pi Sheng in 1041, about four centuries before Gutenberg (Durant 1935, pp. 727–730).

Although there were efforts during the thirteenth century to credit Roger Bacon with inventing gunpowder, it had by then been known in China for some five centuries and was "discovered" by the West only by way of Islam. It may be that Europeans discovered the process of "corning" gunpowder during the 1420s, thereby making it more reliable and easily transportable, but without Islamic chemists having perfected techniques of purifying saltpeter c.1240, there would have been no weapons-grade powder to corn. As was recorded by the Bishop of Léon, cannons were already in use by Muslim forces during the Battle of Seville in 1248, while the first known use of such weapons by Europeans came nearly a century later during the 1346 Battle of Crécy (Kelly 2004, pp. 19–37; Morgan 2007, pp. 174–175).

Even Islamic institutions were copied, universities and hospitals being but two salient examples. The world's first university, al-Qarawiyyan ("Karaouine"), was established in present-day Morocco in 859 CE. The second was Egypt's al-Azhar, founded in 972 CE, followed by Persia's seven-campus Nizamiyya system, centered in Baghdad, which was developed during the eleventh century (Durant 1950, pp. 287–288; Crist 2017, p. 232). The West finally got in the act with establishment of the University of Bologna in 1088, and the Universities of Oxford and Paris in 1096 and 1150, respectively. Revealingly, the mandate of the Bolognese undertaking was from the outset to glean knowledge from "the more advanced countries" (i.e., those of The East).

Even such standard scholarly practices as peer review were simply lifted from Islamic prototypes (Spier 2002, pp. 357–358).

Similarly, the world's first hospital (*bimaristan*) was established in Baghdad in 805 CE, thereafter proliferating rapidly throughout the Islamic world. Europe's first was founded by the French king Louis IX shortly after his return from the Seventh Crusade in 1254 (he'd inspected Muslim medical facilities during his stint in the East). European medical practices and technologies remained reliant upon those long-since developed in Islam for the next several hundred years, with Ibn Sīnā's 14-volume *Canon of Medicine* (*Al-Qanun fi al-Tibb*), completed in 1025, still in use as an instructional text for training medical aspirants at the University of Paris until the mid-eighteenth century or later (Cesk 1980, pp. 17–23; Weisser 2017, p. 109).

Nonetheless, by the early 1400s, it had become obvious that Europe lacked the capacity to penetrate the "Near Eastern" barrier presented by Islam, thereby securing either ports on the Red Sea or overland access to the broad range of much coveted goods (most famously, silk, tea, and spices) produced in the "Far East" (i.e., Cathay [China] and India [Hindustan]). The goods were for centuries moved over the 4,000-mile Silk Road, originating in eastern China, traversing the "Middle Eastern" domain of Persia, and terminating in Anatolia, the Levant, and Egypt. Goods produced in India were transported north along routes intersecting the Silk Road at various points (Wolf 1982, p. 28). Trade was conducted all along the way, with the result that, even after sea routes were opened across the Indian Ocean, only a relatively small portion of the initial loads were still available for acquisition by European traders (through Muslim brokers) by the time they arrived in the eastern Mediterranean (Abu-Lughod 1991, p. 202, 239–241; Hobson 2004).

Cutting out the Islamic middlemen obviously stood to substantially increase both the profit margins of Venetian and other European commercial enterprises and the quantity of goods available in the West. Hence, in 1434, the Portuguese set out to find a water route to the Far East by circumnavigating Africa. The expedition failed to accomplish its mission (the Cape of Good Hope was not rounded until 1488) but it did succeed in establishing the first European toehold on sub-Saharan Africa's Atlantic Coast. Quite unexpectedly, this opened up a very different source of wealth with which to build the West's then embryonic economies (Wolf 1982, p. 129).

Over the next four centuries, the lucrative trade in black chattel slaves inaugurated by the Portuguese, and subsequently participated in by the Spanish, English (later British), French, Dutch, Danes, and various of their settler colonies/states, precipitated the forced, permanent removal of perhaps 20 million Africans from their homelands, with untold millions more killed while resisting enslavement or by the rigors attending the forced marches by which they were moved from inland locations to coastal "port factories." There is considerable and ongoing dispute over the numbers. Hence, contrary to the assertions of many European/Euro-American scholars, there is no "scholarly consensus." I've taken the widely accepted figure of 15.5 million slaves having arrived in the "New World" (of whom roughly one-third did not survive initial stints in "seasoning camps" in the Caribbean), added a further 2.5 million who did not survive the Middle Passage across the Atlantic, and yet another million who perished while being held at European-owned/-garrisoned "port factories" along the African coast while awaiting shipment (Elmina, Bonny, and Benguela in particular) and simply rounded off the sum to arrive at 20 million (Inakori 1982; Rodney 1982, pp. 96–97).

By some estimates, a roughly equal number of people died while resisting capture in the interior or during forced marches to the port factories. This would make the total impact of the Atlantic slave trade upon west Africa's indigenous societies about 40 million. Even if the actual number was somewhat less, the sheer scale of the losses incurred by indigenous African societies from Senegambia in the north through present-day Angola in the south during the Maafa (as the Atlantic slave trade is known in Kiswahili, meaning "great disaster") left them forever devastated, unable in the aftermath to regain either their original cohesion or the levels of material security

their economies had provided (Inikori and Engerman 1992).

It should be noted that the impact of the West's transatlantic trade in black slaves was to an extent exacerbated by a complicated Islamic trade in the same "commodity" lasting from roughly 650–1950 CE. While the volume of the latter is sparsely documented, the closest studies to date suggest that it was conducted in a far less intensive fashion and on a noticeably smaller scale than was its European counterpart; i.e., somewhere between 3.5 and 10 million sub-Saharan Africans were enslaved by Muslims over a period of more than thirteen centuries. Raymond Mauvy has argued for a higher total of 14 million, while Basil Davidson holds that even the 3.5 million estimate may be too high (Segal 2001, pp. 56–57). The sources of black slaves for the Islamic trade, moreover, were primarily the eastern Sudan and Africa's east coast. Its effects thus exhibit little overlap with those attending the transatlantic trade.

That said, it is worth mentioning that one reason the scale of Islamic commerce in black flesh was much smaller than that of European Christians (at least until the nineteenth century) was that there was less demand. Muslims were as inclined to enslave Slavs and the "white" peoples of the Transcaucasus (especially Georgians and Circassians), as well as Western Christians, as blacks. There are at present no reliable estimates of the numbers at issue apart from Robert Davis's recent study, in which he concludes that perhaps 1.25 million slaves taken from the West were traded/held along North Africa's Barbary Coast alone between 1530 and 1780 (2003, p. 23). Based upon that limited sample, it seems reasonable to suggest that, overall, the Islamic market may have been satiated through the enslavement of rather more whites than blacks.

This outcome was effectively ensured through a more insidious process wherein African leaders were selectively co-opted through formal, albeit duplicitous, recognition by the participating Western powers as "legitimate heads of state" in their own right. Invariably, the quid pro quo demanded was that in exchange for European support vis-à-vis regional rivals (as well as steady supplies of guns, munitions, liquor, woolens, and other manufactured

goods), the African participants would facilitate the trade by providing copious numbers of captives taken from other peoples. Thus were the prototypes of what would become Westernized state structures implanted on "the Dark Continent," a circumstance in itself foreclosing upon the prospect of restoring preexisting modes of sociopolitical and economic organization when "the shameful trade" finally ended during the mid-nineteenth century. Meanwhile, as has been documented by Walter Rodney, among others, the profits accrued by the British alone were sufficient to underwrite England's late-eighteenth century "Industrial Revolution" in its entirety (1982, pp. 82–90; Galeano 1973, pp. 91–96).

Imperial Reach: Phase 2

Since millions of black slave laborers were neither needed nor desired in Europe itself, the vast influx of developmental capital attending the Occidental trade in their flesh was contingent upon a second factor. Word of Vasco de Gama's arrival in Calcutta by way of the Cape having not reached Europe until 1499, Spain had commissioned Christóbal Colón (the surname literally translates as "colonizer") to seek an alternative route to the Far East by sailing due west (i.e., to circumnavigate the globe itself). The result, of course, was that in October 1492, the "Great Navigator" made landfall on a large island half-a-world away from where he thought he was and promptly pronounced himself successful. While Colón was never aware of it, he had stumbled upon the outer reaches of an entire hemisphere, much of it well-populated and sustaining a multiplicity of thriving cultures, the existence of which had previously been unknown to the West. The "West" is used here strictly in the sense of its contrivance.

Certainly, the Norse (resident then and now to the western edge of the Asian landmass) had established settlements in present-day Labrador and Newfoundland roughly five centuries before Colón's celebrated "Voyage of Discovery," and, having subsequently explored both southward and inland, cannot be characterized as having been "unaware" of North America's existence

(Ingstad and Ingstad 2000[1991]). Nor could the Basques, who are known to have been fishing off the coast of Newfoundland for at least a century before Colón set sail (Kurlansky 1998, pp. 27–29; Kurlansky 1999, pp. 58–59). There is also strong evidence of a West African presence in Mexico long before its "discovery" by the Spanish, as well as a distinct possibility that the indigenous Guanches of the Canary Islands, exterminated by the Portuguese during the fifteenth century, had originated in the Americas and traversed the Atlantic from west to east (Forbes 1988, pp. 6–21).

Having secured the title of governor, Colón returned in 1493 to the island he'd christened Española (present-day Haiti and the Dominican Republic), situated in a body of water he depicted as "the Caribbean Sea" (the word "Carib" translates as "cannibal"). In his journals, Colón habitually insisted that indigenous peoples with whom he'd had no contact were "Caribs" (a label with which all non-Arawakan native cultures of the Caribbean basin remain afflicted to this day) (Sale 1990, pp. 129–132). Here, he was simply employing an already common Euro-supremacist trope whereby the "savagery" of Others was signified by allegations of their supposed cannibalism. In actuality, as was demonstrated by William Arens in *The Man-Eating Myth*, there has never been tangible evidence that anthropophagy was/is an integral feature of *any* culture. Nonetheless, there remains a strain of scholarship (referred to as "cannibology") obsessed with proving the opposite (Churchill 2000).

In any case, as governor of Española Colón established the prototype of the plantation economies that would predominate throughout not only Spain's but all European colonies in the Caribbean and appreciable portions of both North and South America until the late nineteenth century, in many areas until much later (in some, it lingers still). This entailed the wholesale and intensive use of slave labor to clear previously uncleared land and cultivate certain crops highly valued in the European "mother countries" (primarily sugar, cotton, tobacco, coffee, and cocoa, but others as well) in increasingly massive quantities, milling and refining them as needed. Much of the land

was of course already in cultivation before the European invasion(s) and was simply reallocated to the growing of commercial crops rather than foodstuffs. The policy quite predictably induced mass starvation among the indigenous peoples whose fields were thus expropriated even as they were harnessed to such heavy labor as cutting cane and clearing additional acreage (Galeano 1973, pp. 71–120).

Initially, indigenous peoples were enslaved en masse for such purposes, forced to perform heavy labor under conditions so harsh that entire populations died in astonishingly short periods. Of Española's indigenous Taínos, who by the contemporaneous estimate of Bartolomé de Las Casas had numbered perhaps 3 million in 1493, fewer than 100,000 remained alive by 1500, when Colón was recalled to Spain, and by 1550, they were "extinct." It should be noted that during the 1960s, Sherburne Cook, Woodrow Borah, and other scholars of the "Berkeley School" concluded that Las Casas's estimate was, if anything, far too low, i.e.: that the Taíno population of Española may have numbered as many as 8 million when Colón first arrived (Keen and Haynes 2012, p. 12).

The same pattern was everywhere evident as the Spanish rapidly expanded their dominion on the continental landmass of this "New World" to include everything from Péru in the south to what they called California in the north. In Péru, for example, as historian David Stannard recounts:

> [B]etween a third and a half of the annual quota of coca workers died as a result of their five month service in the fields and those who did survive, and the fewer still who lived out the remainder of the year, had only the next round of work to face in the coming season . . .. Within a century following their first encounter with the Spanish [in 1528], 94 to 96 percent of [the indigenous Andean peoples'] once-enormous population had been exterminated; along their 2000 miles of coastline, where once 6,500,000 people had lived, everyone was dead. (1992, pp. 89, 91)

Stannard acknowledges that a large proportion of these deaths were caused by "measles, mumps, typhus, influenza, diphtheria, scarlet fever, and haemorrhagic smallpox" (ibid., p. 91), European-

imported diseases to which America's indigenous peoples had no prior exposure and a correspondingly low level of acquired immunity. To his great credit, however, he refuses to follow the now fashionable practice of invoking Alfred Crosby's (1986) "virgin soil" hypothesis as a basis upon which to dismiss the staggering toll as "unintended and inadvertent," thereby exculpating both the particular colonizers involved and the West more generally. Instead, he observes that in view of the grotesquely debilitating conditions imposed upon enslaved indigenous populations in the Americas, their resistance to disease would have been reduced to the point that they would have died by the millions no matter *how* many generations of acquired immunity they had inherited (Stannard 1992, pp. xii, 138–139). Certainly, as evidenced by the catastrophic rate of disease mortality suffered by Slavic slave laborers under the Nazis, this was the case with twentieth century Europeans (Mazower 2008, pp. 309–312).

As such "extermination through work" depleted what had begun as substantial indigenous populations in region after region, a spiraling demand for replacements spawned a significant, and far too little remarked, trade in American Indian slaves captured in the hinterlands, which was sustained until the mid-eighteenth century (in some areas until much later). Rather perversely, under the circumstances, a seldom remarked factor contributing to indigenous population decline was the export of native people for sale in European slave markets. While data in this connection is sketchy, Renápe/Lenápe historian Jack Forbes (1992) points to the sale of some 4,000 in Seville alone between 1493 and "the early 1500s," and estimates that as many as 30,000 were owned in Spain by 1700 (some portion were likely sent to the Canary Islands, a Spanish colony). The Portuguese owned thousands more, not only in the mother country but also in the Azores, while the market in Antwerp, supplied mainly by Dutch slavers until 1650, attracted purchasers of still other thousands from as far eastwards as the Hapsburg (Austro-Hungarian) Empire (Forbes 1988, pp. 26–42). All told, an overall estimate of 50,000 or more seems quite reasonable.

Beginning in the mid-sixteenth century, however, the preferred method of replenishing the ranks of slave laborers in the Americas increasingly became importation of black chattel from Africa's Atlantic coast, a process justified on the basis of scriptural interpretation (i.e., a reading of the biblical story of Ham which led to the conclusion that blacks "lacked souls," were therefore nonhuman, and should thus be deemed "natural slaves" [in an Aristotelian sense]) and, correspondingly, there arose the preliminary formulations of what would become known as "race law" and an arc of "racial science" culminating in eugenics during the twentieth century (Haynes 2002; Gould 1996). Ironically, the best-known "Aristotelian" depiction of black subhumanity was/is probably that of the Dominican friar Bartolomé de Las Casas, while successfully arguing (during his celebrated debate with Juan Ginés de Sepulveda at Valladolid in 1550) to the opposite effect with regard to the peoples indigenous to America (Hanke 1959).

This, in turn, unleashed what Patricia Williams (1991) has aptly described as an "alchemy of race and rights" throughout the West. So too, the pursuit of "scientific" (biological) explanations for supposedly innate differences between "races" which ultimately crystallized in eugenics, an "empirical" doctrine founded in England during the 1880s, virtually hegemonic within the US intelligentsia from 1910 to 1930, and most thoroughly applied by the Nazis between 1932 and 1945 (Kuhl 1994). Following the Second World War, eugenics research has been continued under such rubrics as "social biology," and governmental policies have been influenced accordingly (Black 2003, pp. 411–444).

The growth of the transatlantic slave trade paralleled the steep decline of the native population throughout Iberian dominions in the Americas, peaking during the eighteenth century. Although the first African slaves arrived on Española in 1502, less than 5 per cent of the trade's total volume is estimated to have occurred by 1600, during which period indigenous peoples were still available in sufficient numbers to satisfy demand. As the effects of indigenous population

decline became increasingly pronounced during the seventeenth century, the trade expanded accordingly, with a further 16 per cent of its total volume dating to the period 1601–1700. During the eighteenth century, with the hemispheric indigenous population having been reduced by upwards of 90 per cent, the trade surged dramatically, with more than half of total volume having been carried out between 1701 and 1800. A further 28 per cent of total volume dates from the nineteenth century, despite the British and US bans on the international trade in 1808 (Brazil continued to maintain black chattel until the late 1880s, as did the Spanish colony of Cuba) (Curtin 1969, pp. 265–268; Stannard 1992, p. 171).

The US ban was rather cynical, since, as Henry Wiencek has recently shown, "America's favorite slaveholding philosopher of freedom" Thomas Jefferson had already realized that by outlawing importation while retaining the domestic system of slavery the value of each slave already in the country (and all who could be "bred" from them) would be driven sharply upwards, thereby greatly increasing the real and potential wealth of owners such as himself. Jefferson also pioneered the monetization of slaves, thereby allowing their conversion into capital (Wiencek 2012, pp. 8–9, 85–100). This had the effect not only of hollowing out the societies indigenous to much of the western and central sub-Sahara, but of greatly confusing the newly contrived racial nomenclature assigned by the colonizers to the remnants of indigenous peoples surviving in the New World.

As Forbes (1988) has shown, the inclusion of both indigenous Americans and black Africans within the slave-labor forces maintained on most plantations over spans of several generations produced what might be properly termed "red-black peoples" in many regions. Since persons of "mixed-race" were automatically denominated as being other than "Indio," the physical eradication of the New World's indigenous peoples was augmented by the residue's being thereby "defined out of existence." It has been argued that the Spanish term "Indio" derives not from Christóbal Colón's belief that he had reached the "Indies" (now Indonesia, although he was actually looking for Cipango [Japan]) but from his original

description of the Taínos as being "una gente en Dios" ("a people in God") (quoted in Matthiessen 1984, p. 3).

Be that as it may, under the legal codes effected throughout Spain's New World colonies and Portuguese Brazil, it was applicable *only* to "full-blood" Indians while all others were defined as being something else, depending on their specific "racial admixture." Nicolás Sánchez-Albornoz lists two-dozen terms formally assigned to different combinations and "degrees" of "red-black-white" descent (1974, pp. 129–130). Although the biolegal construction of "Indianness" was rather simpler in the Anglophone colonies of North America, and subsequently the USA (all those born of "red-black admixture" were defined as black, those whose pedigree included white lineage as well were cast as "colored"), there were/are roughly 30 colloquial terms employed to classify different biracial and triracial combinations. Examples of the latter include "Croatan," "Melungeon," "redbone," "buckhead," and "brass ankle" (Berry 1963, pp. 32–36).

The drive to extinguish indigenous cultural identity was further reinforced by a process of what the Osage scholar George Tinker has termed "missionary conquest" (1993), wherein priests and others dispatched by the papacy for such purposes offered "salvation" to people severely traumatized by the devastating of their societies, but only on condition of their abandoning their own spiritual beliefs in favor of Catholicism's "one true God," pledging fealty to an Iberian Crown, and seeking to emulate their colonizers' ways of life. For a full half-century, beginning with the promulgation of Juan López de Palacios Rubios's *Requerimiento* in 1513, such comprehensive Westernization was in fact compulsory throughout the Spanish New World dominions, on pain of death or enslavement. The law, derived from Pope Alexander VI's 1493 Bull *Inter caetera* extending Church authority over the whole of the New World, was typically read to indigenous people by a priest in untranslated Spanish. It specifically required them to:

> acknowledge the Church as the Ruler and Superior of the whole world, and the high priest called Pope, and in his name the King and Queen . . . our lords, in his place, as superiors and lords and kings of these

islands and this [land] . . . and that you consent and give place that these religious fathers should declare and preach to you'. It then informed them that, 'if you do not do this . . . we shall powerfully enter into your country, and shall make war against you in all ways and manners that we can, and shall subject you to the yoke and obedience of the Church and of their Highnesses; we shall take you and your wives and your children, and shall make slaves of them, and as such shall sell and dispose of them as their Highnesses may command; and we shall take away your goods, and shall do you all the mischief and damage that we can'. It thereupon concluded with a pronouncement of self-absolution, asserting that any 'deaths and losses which shall accrue from this are your fault, and not that of their Highnesses, or ours, nor of these cavaliers who come with us. (quoted in Williams 1990, pp. 91–93)

As secular law, the *Requerimiento* was a bald attempt at post hoc justification, given that mass enslavement of "Indios" had already been underway for 20 years on Española, and there had been no shortage of attendant slaughter. Although it was officially repealed in 1556, the law had by then largely accomplished its purpose and would in any event continue to be invoked for another 50 years. While nothing so straightforwardly draconian appeared in Portuguese colonial law, missionary practice in Brazil was essentially the same (Schmink and Wood 1992, pp. 35–54).

In any case, the insatiable demand for slaves, whether indigenous to America or to Africa, was fuelled by more than the plantation system alone. There was to be sure an infrastructure to be built; fortifications, cities and towns, roads, mills, refineries, and port facilities, all of which required the investiture of heavy labor in massive quantities, and all of which proliferated with remarkable rapidity throughout the Spanish New World colonies in particular. And then there were the mines. From 1503 to 1660, Spain took some 185,000 kilos of gold and 16 million kilos of silver from its New World possessions (a quantity three times greater than the precious metals possessed by the West *as a whole* in 1500); while, during the eighteenth century, the quantity of gold arriving in Lisbon from Brazil "exceeded the total volume . . . Spain had taken from its colonies in the preceding two centuries" (Galeano 1973, pp. 33, 64).

In terms of sheer magnitude, this sudden influx of wealth to Iberia, and thence the West more broadly, was utterly unprecedented. Initially, it accrued all but entirely from the Spanish plunder of the superbly crafted gold and silver jewelry and ornamentation ubiquitous throughout both the México and the Inca domains, but, as these sources were quickly exhausted, the labor-intensive turn to mining of the metals began almost immediately. While rich veins of ore were found in hundreds of locations, that unearthed from the Cerro Rico site at Potosí, in present-day Bolivia, was by far the most spectacular. Between 1556 and 1783, in addition to tens of thousands of indigenous people (mitayos), some 30,000 black slaves were "expended" in the course of bringing 41,000 metric tons of silver up from the depths of that one mine, reputedly "enough . . . to make a bridge from the tip of the Cerro to the door of the [Spanish] royal palace across the ocean" (ibid., p. 33).

All told, as Eduardo Galeano has noted, the quantities of gold and silver at issue were in themselves more than sufficient to have underwritten the West's vaunted industrial revolution, not only in England, but *in its entirety*. Such industrialization did not occur in Iberia, however. Galeano sketches the process through which the vast quantities of gold and silver simply washed through or past Spain, expended by the Crown on the acquisition of arms and manufactured goods produced by "lesser" peoples to the north (mainly those of the Low Countries and westerly Germanic states), thereby financing development of *their* industrial base. While lavish expenditures on luxury goods temporarily allowed the "Spanish nobility [to enjoy] living in a contra-historical Middle Age," such imperial "delirium . . . simultaneously sealed the ruin of Spain" (ibid., p. 29), a matter signified by a drastic *decline* in Iberia's domestic productive capacity during the first century of its vast New World empire (e.g., of an estimated 14,000 looms operating in 1550, roughly 400 remained operational 50 years later) (ibid., pp. 33–42).

Nor was this all. At the time of Colón's 1492 "discovery," roughly two-thirds of all vegetable foodstuffs now commonly consumed by humanity were under cultivation in the Americas and nowhere else. Many of these (corn, beans, and

potatoes as examples) do not exist in nature and had come into being only as the result of extensive hybridization by the broad array of native peoples whose economies centered on farming them (Lowes 1986, pp. 62–71; Weatherford 1988, pp. 59–78). Acquisition of these three crops, especially the potato, rapidly transformed European agriculture, allowing the West to attain an otherwise inconceivable level of nutritional stability even as the cultures that had created and thrived on them were systematically pushed beyond the bare margins of subsistence and otherwise annihilated (Stannard 1992, pp. 56–57).

Potatoes became a staple of the Western diet (albeit, only a handful of the 3,000-odd varieties developed in Peru prior to the Spanish invasion were cultivated in Europe), an eventuality resulting not least from the plant's general hardiness and the fact that its average yield of about 50,000 pounds per acre was considerably greater than most Old World crop types (Nunn and Qian 2011, pp. 594, 599–605, 643–644). Beans, the yield of which varies by type but is nonetheless substantial, added an important protein component lacking in potatoes (Kaplan and Kaplan 1992). The effect of corn ("maize") was somewhat more indirect in that it was grown mainly to feed livestock. Nonetheless, since it is a richer grain with a per acre yield about three times greater than that of wheat and other Old World alternatives (Galinat 1992; Warman 2003, p. 117), its cultivation underpinned a substantial increase in meat proteins and animal fats available for consumption by average Europeans.

The dazzling cornucopia of additional items introduced to the Western diet by way of invading the New World, ranging as they did from "chilies to chocolate," afforded it not only an inestimably greater nutritive balance but also a diversity now enshrined as Spanish, Italian, French, and other distinctive "national cuisines." To get the idea, one need only try and imagine what Italian cuisine would be like without tomatoes, peppers, beans (apart from garbanzos and favas), squash (especially zucchini), chocolate, and vanilla, none of which was known to the West until its invasion of the Americas (Foster and Cordell 1992; Weatherford 1988, pp. 99–116). The idea of noodles (pasta) was, of course, lifted from China, while coffee (espresso) was introduced by Islam.

Other products of indigenous American knowledge cannibalized by their Western colonizers were no less valuable. These included such pharmacological marvels as quinine, ipecac, coca, arnica, witch hazel, and petroleum jelly, to name but a handful of the more important, as well other medicinal knowledge, including cures for scurvy, intestinal worms, goiter, headaches, and constipation. Quinine is used both to treat and as a prophylactic against malaria. Ipecac cures amoebic dysentery, and, in a milder dosage, is still prescribed as an emetic. Coca is mainly known as a stimulant (especially as the base from which cocaine is made) but is also highly effective in treating altitude sickness. Arnica remains a popular remedy for pain and swelling attending sprains, while witch hazel is widely used to relieve the ache of strained muscles. Petroleum jelly is perhaps the most commonly used skin ointment in the world today (Weatherford 1988, pp. 175–200). All but quinine were used by America's native peoples for the purposes indicated prior to the arrival of Europeans, and they discovered its utility in treating malaria shortly after the invaders introduced the disease to the New World.

Although it is seldom acknowledged, the West still very much relies upon the level of medicinal knowledge native Americans had attained long before the European invasions. Kelp, for example, was used by the Incas to cure goiter and remains the essential ingredient in drugs prescribed for the condition. Similarly, the indigenous headache remedy contained a close relative of today's aspirin (i.e., acetylsalicylic acid). The bark of a shrub used by California's indigenous peoples to cure constipation contains properties "modern science" has been unable to synthesize or improve upon; the bark itself remains the active ingredient in all laxatives common in the West. As with quinine, the cure for scurvy (acute deficiency of vitamin C) offers an especially clear example of Europe's cannibalization of indigenous knowledge (Vogel 1970, pp. 267–414).

To these must be added a range of medical/surgical techniques and technologies such as rubber tubing and syringes (indeed, rubber itself), completely unknown to the Old World. The Méxicas had by the early sixteenth century developed especially advanced surgical techniques, documented by the Spanish as including a method of repairing broken bones closely resembling what is now termed "medullary fixation" (i.e., inserting a rod to reinforce the repair) unequalled by Western surgeons until the twentieth century. Méxica surgeons were also adept at removing tumors, are known to have successfully performed cranial surgery, and employed scalpels allowing greater precision than anything available in the West until lasers came into use. Their practice, moreover, was based on one of the more accurate apprehensions of human anatomy in the world. The broader Méxica practice of medicine (which included dentistry) was divided into specializations, prefiguring the adoption of a similar arrangement in the West by about three centuries (Schendel 1968, pp. 45–61).

Probably the most significant medical insight the Méxica and other indigenous physicians imparted to their Western counterparts (albeit the notion was fiercely resisted by the West until the early nineteenth century) was the importance of sanitation and personal hygiene in preventing disease. (Europeans at the time the New World invasion began, and for a considerable period thereafter, routinely dumped raw sewage into the street and actually believed that bathing *caused* certain illnesses, often living their lives without once cleansing their bodies.) (Vogel 1970, pp. 253–261; Lowes 1986, pp. 51–52; Weatherford 1988, pp. 189–190).

The intellectual cannibalism apparent in the West's earlier-remarked attribution to itself of Islamic knowledge has in some ways been even more pronounced with regard to that obtained from America's indigenous peoples. The antimalarial properties of "cinchonine," as quinine was known in the West until 1820, was, for instance, "discovered" by the Countess of Chinchona only by virtue of her having been the first European treated with quina-quina (bark of barks), the

traditional Incan remedy for fevers, in 1638 (Hobhouse 1986, pp. 3–18). Similarly, the cure for scurvy was not "found" by the British naval officer James Lind during the 1780s; the cure, as he contemporaneously recorded, was shown to the French explorer Jacques Cartier by the Wyandots in 1535. Nor was ipecac "discovered in Brazil during the 1600s" or its use in curing "the flux" (amoebic dysentery) first revealed by the Dutch physician Helveticus in 1688. Rather, it had long been employed for that purpose, and in mild doses as an emetic, by peoples indigenous to the Amazon Basin from whom the Portuguese learned its uses, c. 1550 (Weatherford 1988, pp. 181–183).

In the same vein, the Venetian polymath Fausto Veranzio was not, as Wikipedia would have it, "the first" to design a suspension bridge in his *Machina Novae* (1616). Spanish conquistadors began reporting the existence of such bridges, and not infrequently attaching sketches, shortly after their 1532 arrival in Peru, where native engineers had designed and constructed more than 200 of them in the course of completing the Incas' 25,000-mile road system (von Hagen 1976). Veranzio's design was of a structure not only bearing a remarkable resemblance to those already conceived and built by the Incas, but specifying use of the very same materials.

Actually, Veranzio offered two variations of the design in *Machina Novae*. The first was of a rope and wood construction virtually identical, both in form and materials, to that of the Incas. The second was of a type developed in China as early as 300 BCE, utilizing exactly the same engineering principles, but substituting iron chains for the primary ropes (Kirby 1990, p. 139; Lay 1992, pp. 336–337). The Incan and Chinese variations were apparently developed independently of one another (at least there was no known interaction between the two civilizations). In any case, Veranzio credited neither. Any number of additional illustrations might be offered, and a few will be mentioned below, but it should for the moment be sufficient to observe that "Irish" potatoes were never Irish (albeit, it will in fairness be noted, that it was the English colonizers, not the colonized Irish, who coined the term).

Imperial Reach: Phase 3

Establishment of Iberia's New World empires during the early sixteenth century, and shortly thereafter those of the French, English, Danes, Swedes, and Dutch (even the tiny Duchy of Courland sought to join the parade) made possible the realization of the West's imperial ambitions on a planetary scale. The Iberian New World dominions derived from Pope Alexander VI's Bull *Inter caetera* of 1493, which purported to divide it between them. Hence, Portugal's empire in the Americas was lodged in Brazil, while that of the Spanish encompassed the rest of South America, all of Central America and present-day Mexico, more or less all of the present-day continental USA west of the Mississippi River and as far north as Oregon, plus Florida and most of the Caribbean islands (Williams 1990, pp. 80–81).

Brazil declared itself an independent empire in 1822, and Portugal, after an unsuccessful effort to contest the matter militarily, conceded the point in 1824 (Fieldhouse 1967; pp. 122–125). (Brazil, from which Uruguay separated in 1828, remained officially an empire until a coup d'état led to its becoming "a dictator-led republic" in 1889.) In the meantime, a series of wars of independence in Mexico, including the northern half seized by the USA in 1848, and Spanish holdings in South and Central America, waged from 1810 to 1822, led to Spain's formal relinquishment in 1836 of its continental New World empire as a whole, and recognition of the newly formed states of Gran Columbia (from which Venezuela separated in 1830, and Panama in 1903), Ecuador, Chile, Peru, Bolivia, Paraguay, the United Republics of Rio de la Plata (later Argentina), Mexico, and the Central American Republic (the provinces of which later separated, becoming Guatemala, Honduras, Nicaragua, El Salvador, and Costa Rica) (ibid., pp. 112–120). Thereafter, all that remained of Spain's empire in the Americas were the colonies of Cuba and Puerto Rico, both of which were seized by the USA in 1898. Puerto Rico remains a US colony at present (Rivera Ramos 2007).

The dominion of "New France" was proclaimed in 1534 with respect to an area initially encompassing the present-day Canadian province of Québec as well as the area then referred to as Acadia, which included present-day Nova Scotia and Newfoundland. By the early seventeenth century, however, French territorial claims had dramatically expanded its "Upper Country," extending northward to surround the southern half of Hudson's Bay and westward to a point beyond Lake Winnipeg (in present-day Manitoba), while the two compartments of "Louisiana" extended southward from the Great Lakes to encompass the entire Mississippi River basin (broadly defined). Nova Scotia and "Prince Rupert's Land," the area around Hudson's Bay, were ceded to England in the 1713 Treaty of Utrecht, and the balance in the Treaty of Paris a half-century later (Steele 1994, pp. 159, 222–225).

The only French colony in South America, Guiana, was established in 1602 and remains an "overseas department" of France at present. In the Caribbean, France established the colony of St. Domingue (now Haiti) on the western third of Española in 1664, but lost it to Toussaint Louverture's successful slave revolution (1800–1803). Meanwhile, it had also taken control of the Lesser Antilles in their virtual entirety, retaining three of the islands (Martinique, Guadeloupe, and Marie-Galante) as overseas departments even now (another island, St. Barthélemy, is currently designated as being part of the French "overseas collectivity") (Fieldhouse 1967, pp. 120–122; Steele 1994, pp. 34–49, 59–79; James 1963).

England's first move towards forging an empire in the Americas came in 1583, with its chartering of the colony of Newfoundland (headquartered at the trading port at St John's, established in 1520). This was followed in 1586 by the launching of a failed effort to establish a colony, to be known as Virginia, at Roanoke (in present-day North Carolina). The "Lost Colony," as Roanoke is known, was redeemed in 1607, when the Virginia Colony was successfully established at Jamestown. In 1620, the Plymouth Plantation was founded to the north (i.e., at a point roughly equidistant between Virginia and Newfoundland) and merged with the subsequently established Massachusetts Colony in 1691. An area around Plymouth still known as "New England" had also been filled in by establishment

of the Province of Maine in 1622, the New Hampshire Colony in 1623, the Connecticut Colony in 1633, the Rhode Island and Providence Plantations (present-day Rhode Island) in 1636. South of New England, the "Maryland Province" was founded in 1634, New York and New Jersey Provinces were ceded to England by the Dutch in 1664, and Pennsylvania Province was established in 1684 (with Delaware Colony splitting off in 1704). South of Virginia, the Province of Georgia was founded in 1670, the colonies of North and South Carolina in 1710 (Steele 1994, pp. 37–57, 80–109).

At that point, English colonies encumbered the entire Atlantic coast of the present-day USA north of Spain's colony of La Florida (established c.1559–65), as well as a small portion of that in what is now Canada. All of "New France" was then ceded to England under the 1763 Treaty of Paris, thus expanding its purported dominion to encompass virtually all of North America east of the Mississippi River (ibid., pp. 207–225). In turn, the British were compelled to relinquish all claims to territorial sovereignty south of Canada in the 1783 Treaty of Paris, by which it recognized US independence, while Canada remains part of the British Commonwealth.

England's other New World holdings were relatively small, consisting primarily of the Caribbean islands of Barbados (1625), Nevis (1628), Monserrat (1623), the Bahamas (1648), Anguilla (1650), Antigua and Barbuda (1666), Jamaica and the Caymans (1670), and sometimes St. Kitts and St. Lucia (beginning in 1623). Anguilla, Monserrat, and the Caymans remain British "overseas territories" at present. A small enclave on Nicaragua's Mosquito Coast, declared an English protectorate in 1655, was maintained for over a century, but Britain's only actual colony in Central America, "British Honduras," was not established until 1862. It gained independence as Belize in 1973 but remains part of the British Commonwealth (as do Antigua, Barbuda, Nevis, St Kitts, Jamaica, the Bahamas, and several other Caribbean islands) (Fieldhouse 1967, pp. 57–83).

Apart from Greenland, which it claimed in 1721, the Danish New World empire consisted only of the Caribbean island colonies of

St. Thomas (established in 1671), St. Jan (now St. John, established in 1718), and St. Croix (purchased from France in 1733). The "Danish West Indies," as they were known, were sold to the USA in 1917 and are now referred to as the "US Virgin Islands." Dutch imperial adventure in the Americas began with construction of Fort Nassau (present-day Albany, New York) in 1614, followed by the more ambitious trading center of New Amsterdam (present-day New York City) in 1625. In 1655, "New Netherland," as the colony was called, expanded by absorbing the colony of New Sweden to the south, but was ceded to the British in 1667 under the Treaty of Breda. In exchange, Britain ceded to the Dutch its settlements in Surinam (now Suriname) which, together with the Caribbean islands of St. Maarten, Curaçao, Aruba, and Bonaire, became the Netherlands' longest-held New World possessions (Fieldhouse 1967, pp. 50–51, 343; Steele 1994, pp. 110–130).

Even the Courinans tentatively established the colony of "New Courland" on Tobago in 1654 but were shoved aside by the Dutch 5 years later. They regained control of the island in 1660 but abandoned it in 1666. Unsuccessful attempts were made in 1668 and 1683 to renew planting operations before the Duchy finally gave up altogether, selling its interests to the Netherlands in 1689 (Jekabson-Lemanis 2000). Without the abrupt and massive infusion of wealth in the form of precious metals, to say nothing of profits accruing from the trades in African slaves and plantation-produced commodities, Europe would have lacked anything near the wherewithal necessary to rapidly refine certain of the technologies it had acquired from Islam, armaments in particular, thereby gaining an ever increasing advantage in its drive to dominate Others. These "tools of empire," as Daniel Headrick termed them (1981), would prove decisive, affording the West a capacity to dictate terms to the world that remains unrelinquished.

Of similar importance were the crops acquired in the Americas. Regularization and exponential expansion of the transatlantic trade as well as that with India and China, exploration of the vast reaches of the Pacific, meeting the burgeoning

requirements attending maintenance of a seaborne military presence across far-flung regions, all were heavily contingent upon the West's ability to provision ever larger numbers of ships with such nonperishable staples as dried "navy" (haricot) beans. Still more significantly, the tremendous improvement in Western agricultural productivity following the introduction of New World crops enabled an unrivalled population growth in Europe. Estimated as having been about 73 million in 1492, the number of Europeans nearly tripled over the next three centuries, reaching roughly 200 million by 1800, while Africa's remained constant at about 100 million and that of America's indigenous peoples essentially collapsed, plummeting from 100–125 million to around 6 million (Rodney 1982, p. 97; Dobyns 1966; Lord 1997, p. 25).

By 1850, the population of Europe had reached 250 million, and thereafter it *really* began to grow, mushrooming to 468 million by the second decade of the twentieth century. From 1850 to 1900, an average of 400,000 people per year were exported from Europe to an array of settler colonies/states. By 1914, the number had reached a million per year, and a third of the planetary population was of European descent. The extent of the West's increasingly gross overpopulation made the exporting of "surplus" people something of a priority from the beginning of the nineteenth century onward, allowing it to undertake a process of "replenishing the earth" through the establishment of settler colonies/states in which indigenous peoples were/are literally replaced on what had been their lands, having either been exterminated entirely or their numbers reduced to the point that the remnants were soon buried beneath an overburden of Europeans (Belich 2009, pp. 79–87). This, it should be noted, was precisely the model adapted by the Nazis for application in Eastern Europe under their notorious Generalplan Ost in 1941. Therein, a third of the resident Slavic population was to be rapidly exterminated, a third driven from the vast area intended for repopulation by Germans, and the remaining third reduced to serving as slave laborers (Mazower 2008, pp. 204–211, 281–286).

In the US portion of North America alone, there were more than 4 million white settlers and 1 million black slaves by 1800, figures that rose to approximately 67 million and 9 million, respectively, during the nineteenth century. After 1865, blacks in the USA were, at least in a formal sense, no longer slaves. Although it is a common misconception that the huge mass of settlers arriving in the USA during the nineteenth century were mainly English and (Scotch-)Irish, the largest number were German (Luebke 1990, pp. 161–163, 173–174). The indigenous population of the Canadian portion of North America has been estimated to have been as high as 3.5 million when European colonization commenced. According to a comprehensive government tally undertaken in 1875, there were fewer than 160,000 surviving, and by 1900, the number had dropped to 101,000. The settler population, on the other hand, had reached about 5 million in 1800 (Dobyns 1966, p. 414; Price 1950, p. 197).

British colonization of Zimbabwe began in 1890, with the construction of Fort Salisbury (present-day Harare), and white settlers began to arrive shortly thereafter. By 1927, a point at which the number of settlers had yet to reach 44,000 in the still new colony (named "Rhodesia," after Cecil Rhodes, the British imperialist who had chartered its establishment) and despite there being upwards of 3 million indigenous Africans within its boundaries, the implementation of a white supremacist order was complete. In 1965, the settler minority (by then 308,000, as opposed to nearly 8 million blacks) unilaterally declared independence from Britain, thereby, after constitutionalizing white rule in 1968, converting Rhodesia into a fully fledged settler-state. The indigenous population, which still numbered perhaps 1 million at the beginning of the century, had been reduced to less than a quarter of that by 1890 (Townsend 1941, pp. 73, 79–81; Martin and Johnson 1981, pp. 35–72).

Much the same pattern prevailed in other Anglophone dominions, notably Canada, Australia, New Zealand, and Hawaii, as well as Ibero-American settler-states such as Argentina, Uruguay, and Brazil. Variations on the theme,

wherein settler rule was meant to be permanent despite the white population remaining much smaller than that of the subjugated, were also evident in French colonial Algeria, the Dutch/British Cape Colony (South Africa), and British Rhodesia (now Zimbabwe), and elsewhere. The first British (penal) colony in Australia, New South Wales, was established in 1788, at which time the indigenous population was about 750,000. By 1900, the "aborigines" had been reduced to 93,000 (with one native people, the Palawas ["Tasmanians"], having been completely exterminated) while the population of mostly British settlers had grown from fewer than 6,000 to over six million (Rowley 1970, p. 385; Price 1950, p. 197; Elder 1998). The Maori population of Aotearoa (New Zealand) numbered some 200,000 in 1800, at which time there were 50 Europeans in the islands (which were proclaimed a British colony in 1840). By 1900, there were fewer than 40,000 surviving Maoris, while the settler population had reached nearly 1 million (Price 1950, p. 197; Price 1963, p. 95).

The Kanaka Maoli (indigenous Hawaiian) population is estimated to have been as large as 800,000 when the British first visited the islands in 1778. By 1898, the year it was annexed as a US "territory" (i.e., colony), the number of indigenous people had been reduced to fewer than 40,000, while the population of non-Kanaka Maoli had risen to over 150,000. The latter figure is somewhat deceptive; however, as the "settlers" were predominantly Japanese and Chinese imported during the nineteenth century by a small group of white missionaries cum planters, mostly to provide cheap labor on their sugar plantations. In 1893, the planters, backed by the US military, overthrew Hawai'i's constitutional monarchy and established the Republic of Hawaii, with themselves in charge. Following annexation, the white population surged to more than 100,000 by 1940, while that of the Kanaka Maoli, including those of mixed ancestry, rebounded to about 64,000 (Stannard 1989; Kent 1983, pp. 39–40, 60).

Argentina holds the dubious distinction of being second only to the USA in terms of the number of European settlers (6.6 million) imported during the nineteenth century. Concomitantly, its indigenous population, conservatively estimated at 300,000 at the onset of Western colonization, had been reduced by something in the neighborhood of 90 per cent by 1900 (data in this regard is quite sketchy) (Trinchero 2006; IWGIA 2011). Uruguay is unique in that it is the only country on the continental landmass(es) of the Americas to claim that, apart from a small number of *mestizos* (mixed-bloods), its indigenous population had been completely eradicated by 1800. It is thus populated *entirely* by European settlers (Albarenga 2017).

By 1800, the nonindigenous population of Brazil consisted of about 1.5 million mostly Portuguese European settlers and a slightly greater number of black slaves. By mid-century, a further 2 million or more slaves had been imported from the sub-Sahara, while the white settler population had grown to roughly 3 million. As the slave trade became increasingly problematic thereafter, the emphasis shifted and more than 2 million additional European settlers, predominantly Italian, were imported during the last quarter of the century (a further 2 million had been imported by 1930). The remarkably diverse indigenous population, reflecting at least 188 distinct languages, had been reduced by an estimated 95 per cent (i.e., from 6 million or more at the beginning of Portuguese colonization to roughly 250,000 in 1900). In the process, three-quarters of the societies known to have existed in the sixteenth century, including major agricultural complexes along the coast, had been rendered extinct (Stannard 1992, pp. 91–94; Davis 1977).

France colonized Algeria in 1830. Nearly a million Pieds-Noirs had "permanently" settled in Algeria by 1960, about 800,000 of whom returned to France after the colony's hard-won independence 2 years later. While they never outnumbered the Muslim population (about 85 per cent of which was/is Arab and the rest indigenous Berbers ("Moors"), which numbered nearly 23 million in 1960, the settlers' subjugation of the "natives" was sufficiently harsh and degrading as to be characterized as genocidal by

Sartre (1968). Algeria's official estimate is that some 1.5 million Algerians were killed by French troops and Pieds-Noir militias during the colony's war of national liberation (1956–1962), while millions more had perished due to French-imposed deprivations during the preceding 125 years of colonial rule (Naylor 2000, p. 274).

What became South Africa began as the Dutch Cape Colony in 1652. The colony was ceded to Britain in 1814, and the Boers (Dutch settlers) promptly moved northward to form both the Orange Free State and the Republic of Transvaal (known as the Boer Republics). Following the second Boer War (1899–1902), Britain merged the three entities as the Union of South Africa in 1910 and granted its independence in 1931. The Republic of South Africa, as it was renamed in 1961, was from the outset specifically constituted as a settler state. While whites (Dutch and English combined) never exceeded 13 per cent of the country's population, they maintained absolute control over its power, property, and wealth under the legally codified system of racial hierarchy known as apartheid. The indigenous (black) population, which comprised three-quarters of South Africa's 40.6 million people in 1990, was excluded from government, consigned to 13 per cent of the land (divided into "Bantustans," or "Black Homelands," as they were also called), and generally subjected to conditions of abject poverty until 1994, at which point a sustained and mounting black insurgency led to the end of de jure white rule (Fredrickson 1981).

The Spoils of Empire

Without quinine, of course, the prevalence of malaria throughout the tropics would have precluded the full flowering of European overseas colonialism in its "classic" form, not only in much of Latin America but also South and South-East Asia, and sub-Saharan African. Indeed, demand for the drug, obtainable only from the bark of the Andean cinchona tree, led to the literal theft of seeds and cuttings from Peru and Bolivia during the early-to-mid-nineteenth century and establishment of what would become well over a hundred cinchona plantations on Java and other islands in the "Dutch East Indies" (now Indonesia), and scores of others in the British colonies of Ceylon (now Sri Lanka) and India. The Dutch naturalist Justus Hasskarl smuggled cinchona seeds out of Péru in 1852, sprouted them, and established the first plantation on Java 2 years later. Plantations there were by far the most successful, and by the end of the nineteenth century, Java accounted for 90 per cent of the international trade in cinchona bark, while the quinine factory at Bandung was the world's largest producer of the drug itself (Hobhouse 1986, pp. 16–33; Headrick 1981, pp. 71–73; Headrick 1988, pp. 234–235).

The British continued limited production in northern India, but most planters in Ceylon had converted to growing tea by 1900. The French also attempted to establish cinchona plantations in several locales, and to some extent succeeded in Indochina (as they called the area encompassing what are now Vietnam, Laos, and Cambodia), but never managed to produce enough quinine to meet the needs of their personnel in the colony itself. Not only did the wholesale conversion of substantial areas to the cultivation of cinchona seriously undermine the traditional economies of peoples indigenous to such areas (especially Java's Baweans and Baduis) but the increasing availability of quinine made possible a considerable acceleration in the establishment of plantations devoted to raising other cash crops, thereby obliterating such economies altogether (Cavanagh 1983).

European colonization of the African interior, with all its devastating impact on the proliferation of societies indigenous to the region, already badly damaged as many of them were by the ravages of the slave trade, was never viable until quinine became widely available during the late 1860s (Headrick 1981, pp. 62–64, 73). This set off the "Scramble for Africa," culminating in the Berlin Conference of 1884–1885 (also known as the "Congo Conference"), during which Europe's imperial powers essentially divided the continent among themselves, partitioning its entire land-mass into colonial compartments (the "Belgian Congo," "French Equatorial Africa," "British

Kenya," "Spanish Morocco," "Portuguese Angola," "German South-West Africa," and so on) with consequences that continue to plague Africa's Fourth-World nations to this day (Pakenham 1991).

Following Charles Goodyear's supposed discovery of "vulcanization" in 1839 (actually, the Quechuas of Brazil and Peru were already employing the process long before the Spanish invasion), and especially after John Dunlop unveiled the pneumatic tire in 1888, rubber became another major factor. Although variants can be found in landofia vine native to equatorial Africa, as well as the Assam (Ficus) tree in South-East Asia, the term "rubber" refers to the sap of the Hevea tree, found only in Amazonia prior to 1550 (less preferred cousins, the Manihot and the Castilloa, are native to Central America and southern Mexico). "Vulcanization" is simply the mixing of sulfur into heated rubber to increase its elasticity and durability while eliminating its natural surface stickiness and substantially reducing its odor. Having thus processed the material, which they called *caoutchouc*, the Quechuas (as was recorded by the Spanish during the 1530s) used it not only in making the earlier mentioned medical devices, but rain-proof ponchos, shoe soles, balls and other children's toys, tie-down ropes akin to what are now called bungee cords, and a number of other items (Wolf 1982, pp. 325–326; Weatherford 1988, pp. 47–48; Headrick 1988, pp. 243–244).

As the rise in demand shifted from dramatic to explosive with the advent of motorized vehicles during the final decade of the nineteenth century, little overstatement is embodied in the observation that Belgium's King Leopold transformed his vast "Congo Free State" into a gigantic rubber plantation. Prior to 1890, rubber production was an exclusively Brazilian enterprise, entirely dependent upon the tapping of wild trees. Total output at the time of Goodyear's "invention" was less than 30 tons per year. By 1900, Brazil's output of "wild rubber" had reached 26,000 tons, and would peak at 35,000 tons in 1920, but demand vastly outstripped its capacity. In the latter year, world production totaled slightly over 310,000 tons, nine-tenths of it accruing from newly established rubber plantations in Central Africa and South-East Asia (Wolf 1982, pp. 329–330; Headrick 1988, pp. 244–248).

It is often contended (incorrectly) that rubber production in the Congo accrued from the native landofia vine rather than the Brazilian Hevea tree. While output was initially dependent upon landofia (both wild and cultivated), that was so only until much higher yielding, but newly planted, Heveas reached the age at which they could be tapped (typically 6–7 years). By 1906, more than 600,000 acres had been converted into Hevea plantations and the proportion of total rubber product attributable to landofia was both greatly diminished and rapidly declining. It is also worth mentioning that by the same year some 250,000 cocoa plants were under cultivation, in expectation of establishing cocoa plantations in the near future. Other cash crops originating in the New World which were also being grown in appreciable quantities, again with an eye toward expansion, included vanilla trees, cinchona trees, and coca. Entire peoples in the colony's interior were conscripted as forced laborers under conditions rivaling those imposed by the Spanish and Portuguese upon indigenous Americans more than three centuries earlier, and with entirely comparable results: by 1903, the colony's black population, which had numbered over 20 million in 1885, had fallen to barely 8.5 million (a near two-thirds reduction in less than 20 years) (Hochschild 1998, pp. 226–233, 278).

In Malaya (now Malaysia), while the effects were far less lethal, the indigenous Malays and Senois were completely dislocated and in a sense lost beneath an avalanche of laborers imported from China and India (they comprised nearly 70 per cent of the colony's population by 1910) as the British converted two-thirds of the peninsula's cultivated land into rubber plantations. By 1920, Malaya's output totaled half of world rubber production, a proportion diminished over the next several years by the rapidly expanding share claimed by the Dutch East Indies, where some 875,000 acres (mostly on Java and the east coast of Sumatra) had been used to establish even larger-scale plantations (Townsend 1941, pp. 455, 524–525; Fieldhouse 1967,

pp. 331–354; Headrick 1988, pp. 245–246). The French, too, cashed in on the boom, although somewhat belatedly, converting upwards of 500,000 acres into rubber plantations in the colony it called Indochina during the 1920s. More specifically, the plantations were/are concentrated in southern Annam and Cochinchina, the most southerly portion of Vietnam. Output reached 60,000 tons in 1939, but by then this came to only 5 per cent of global production (Headrick 1988, pp. 247–248).

Other New World crops placed in cultivation, plantation style, in the West's African and Asian colonies included tobacco and vanilla. Although the vanilla tree is native to Central America, and is still grown there for commercial purposes, the former French colony of Madagascar now provides 80 per cent of the world's supply. Between vanilla plantations and logging operations, the island's biologically unique habitat has been in large part devastated, with predictable effects on the indigenous Malagasy peoples (Allen 2019, pp. 32–49, 171–201; Steavenson 2019). By 1550, commercial production had begun earnest, both in Brazil and on a number of Caribbean islands. While neither was indispensable to Europe's expansion in the manner of cinchona, or to the evolution of its technology in the manner of Brazilian rubber trees, both were/are quite profitable and thus figure not insignificantly in the ever-increasing concentration of global wealth in Western hands.

More important, however, was the proliferation of the plantation mode of agriculture itself, pioneered with sugarcane in the Caribbean and Brazil during the sixteenth century, adapted to other crops in various American locales during the seventeenth century, and thereafter imposed by the colonizers in every quarter of the world. While the first sugar plantation was established by the Portuguese on Madeira, in 1452, and in 1484 Spain had established a second in the Canaries, the idea did not really take hold until the first harvest on Española in 1501. The Portuguese began planting it along the coast of Brazil in 1516, by 1530, the Spanish had opened at least a dozen sugar plantations on Cuba and the other Caribbean islands, and a century later, the English

had commenced the process of felling all the timber on Barbados en route to converting the entire island into a sprawling cane-growing/slave-importing/sugar refining enterprise which, by 1790, served as the hub of what had become "easily the most important trading activity of the British nation" (Ponting 2000, pp. 481–482; Hobhouse 1986, pp. 51–52, 59–60, 70).

Roughly half of the indigenous Africans imported to the New World were consumed on Brazilian and Caribbean sugar plantations at the rate of 1 black life for every 2 tons of sugar produced, while the rapidly rising demand for iron gears to equip the hundreds of cane-milling operations springing up in both areas was among the more significant stimulators of the Industrial Revolution in its early phase (Hobhouse 1986, p. 62; Benitez-Rojo 1996, p. 93). By the early nineteenth century, moreover, the immense and steadily growing popularity of sugar among Europeans and their settler diasporas generated a commerce so lucrative that had prompted a global proliferation of cane plantations, most notably those of the Dutch on Java, the Spanish in the Philippines, and Anglo-American settlers in Louisiana and Hawai'i (Knight 2007, pp. 32–42; Quirino 1974, pp. 21–34; Follett 2005, pp. 19–25; Kent 1993, pp. 35–41).

Overall, the profitability of plantation agriculture was such that it was adapted to the cultivation of a range of crops other than sugar and, as mentioned earlier, cinchona, Hevea, and vanilla for consumption by European/Euro-settler markets. These included tobacco, indigo, hemp, jute, copra, sisal, oil palm, coconuts cacao, coffee, opium poppies, and, of course, the British East India Company's "prize commodity," tea (Hartemink 2005, pp. 11–12; Robins 2006, p. 3; Rappaport 2017). Cotton grown on slave plantations was by far the most important commodity produced in the USA during the first half of the nineteenth century, dominating its niche in the global trade, the profits accounting for the country's greatest concentrations of wealth and providing the motor force behind its economic/industrial development (Bruchey 1967; Baptist 2014, pp. 245–246, 317–323, 350). Before the end of the century, US corporations like United

Fruit (now Chiquita Brands) were establishing vast banana plantations in Central America, while, in Hawai'i, "king sugar" was on the verge being rivaled by corporate pineapple plantations (Chapman 2007; Kent 1983, pp. 78–90).

There was certainly land available to accommodate such undertakings since, by 1914, Europe's imperial powers, together with their settler state offshoots, enjoyed colonial dominion over fully 80 per cent of the earth's landmass. From the colonies, both external and internal, came not only the array of agricultural products necessary to maintain the privileged "quality of life" attributed to the superiority of "Western civilization," but the minerals crucial to the military/technological advantages accruing from its burgeoning industrial order. Along appreciable quantities of cobalt and uranium, nearly 10 per cent of the world's copper was extracted from Katanga, in the Belgian Congo, for instance, while the British garnered over a third of the tin from Malaya (Townsend 1941, pp. 15–23; Ansprenger 1989, p. 305; Headrick 1988, pp. 265–276).

It was truly, as Samir Amin has put it, "accumulation on a world scale," the material culmination of "Eurocentrism" in its most crystalline form (Amin 1974, 1989). The colonizers' "modern world system" was functioning with ever-mounting efficiency to accomplish certain of its intended purposes, i.e., enlistment of comprador élites to assist in stripping the colonized populace of their resources, rendering them so destitute that they would "voluntarily" submit to a de facto mode of slavery, laboring under unspeakably grueling conditions in the mines and fields in return for little more than bare subsistence. Those denied or who refused such "employment" were left to try and eke out an existence from whatever tiny plots might be left to them, become social criminals of various types, or starve (Wallerstein 2011; Sartre 2001 [1956]; Rodney 1982, pp. 147–173; Galeano 1973, pp. 225, 258–273; Stolnitz 1965).

The situation was most acute for the myriad peoples indigenous to the "shatter zones" created by the slave trade in Africa and the Americas (Wolf 1982, p. 231; White 1991, p. 14; Ethridge 2006, p. 208). Having been not only decimated but subjected to the most extreme forms sociocultural disruption over a period of centuries, their traditional economies obliterated, they were especially vulnerable to "proletarianization" or, in the alternative, being merged into a "detribalized" mass of "peasantry" (Arrighi 1970; Littlefield and Knack 1996). When they were not being actively disparaged as retrograde "tribalists," the relative few still able to reject colonization en toto, retaining their traditional identities and ways of life, were targeted for "assistance" in "overcoming" the "plight" of "primitivism" or simply ignored (Anghie 2005, pp. 163–178).

This was in fact a matter of law. While the right of self-determination was taken up by the League of Nations in 1918, affirmed in the 1941 Atlantic Charter, and enshrined as bedrock principle of international law in the 1945 UN Charter, First Nations were omitted at every step (Fisch 2015, pp. 192–197). It was not until 1957 that they were first mentioned in an international instrument, the International Labor Organization's Indigenous and Tribal Populations Convention (No. 107). Therein, rather than self-determination, they were accorded a "right" to be absorbed into the "broader societies" of whichever states or colonial entities had usurped their territories (Anaya 2004 [1996], pp. 54–56). In effect, they were entitled only to accept the process of "dark vanishings" to which they were existentially opposed (Brantlinger 2003).

"Decolonization"

While a half-millennium had been required to construct Western Europe's global order, its dismantlement took only three decades. In 1945, the European powers emerged from the cataclysm of World War II so weakened that none of them was able to forestall the rapid dissolution of its colonial empire. Sometimes by negotiation, often through bitterly fought wars of national liberation, all but a handful of The Continent's overseas "possessions" had attained formal independence by 1975 (Smith 1975; Ansprenger 1989, pp. 208–289).

Concomitantly, the end of hostilities consummated a shift in "the nomos of the earth" from the

Old World to the New that had been underway for some time, with North America's predominating settler state, the USA, assuming the imperial mantle of defining the rules by which the system of imperial exploitation would be reorganized (Schmitt 2003 [1950], pp. 227–232, 290–292). Here, the key ingredients were the US-initiated formation of the United Nations in October 1945, in large part to effect "the progressive codification of international law," and the 1944 Bretton Woods Agreement, also engineered by the USA, creating both the International Monetary Fund (IMF) and the entity soon to be known as the World Bank (Bennis 1996, pp. 1–13; Anghie 2005, pp. 191–195, 263–268).

Through these mechanisms, Western Europe's overseas colonialism was rapidly supplanted by what Ghana's Kwame Nkrumah (1965) termed "neo-colonialism," which he described as "the last stage of imperialism." At issue was the reality that where decolonization was negotiated, the newly "independent" colonies were legally bound either to honor concessions granted by their former colonizers to private corporations or "pay compensation according to internationally determined standards" (Anghie 2005, p. 214). Honoring the concessions left First World transnational corporations in control of Third World economies and extracting more wealth than ever, while "postcolonial" governments opting to buy them out and thus burdened with the resulting "debts," were in desperate need of financing to underwrite their own enterprises (Barnet and Müller 1974, pp. 123–147; Escobar 1995, pp. 21–54).

Both the IMF and World Bank were ready and willing to arrange loans from First World lenders, always inadequate but carrying onerous terms and always contingent upon recipients' effectuation of policies and expenditure of funds in ways ensuring an "investment climate" appealing to First World transnationals: "favorable" royalty and tax rates, low wages and barriers to the unionization of workers, establishment of an effective state security apparatus, "austerity" with respect to health care and social welfare programs, building of infrastructure desired by foreign corporations rather than local populations, and so on (Chaliand 1976, pp. 24–32; Prashad 2007, pp. 69–71, 225–238; Budhoo 1994).

The upshot has been the routine accrual of "super profits" to First World banks and corporations, perpetual impoverishment of Third World populations, and a mushrooming mountain of debt incurred by the "postcolonies" (Barnet and Müller 1974, pp. 152–162; Bello 1994; Mbembe 2001).

> In 1970…the sixty [Third World countries] classified as 'low income' by the World Bank owed commercial lenders and international agencies $25 billion. Three decades later, [their] debt…had ballooned to $523 billion…. These are not 'poor' countries. Over the course of these three decades, the sixty states paid $550 billion in principle and interest on loans worth $540 billion. Yet they still owe $523 billion. The alchemy of international usury binds the darker nations. (Prashad 2007, p. 276)

To be sure, a number of postcolonies sought to reject the neocolonial script. They were, however, invariably subjected to a continuum of coercive tactics ranging from pointed denials of access to both credit and markets to internal subversion culminating in "regime change" (Olson 1979; Ray et al. 1979, pp. 1–46; Prados 1986, pp. 91–107). Noncompliant leaders like Patrice Lumumba were assassinated, and in some cases, most prominently that of Indonesia in 1965, the repression suffered by those opposing First World agendas assumed the form of mass murder on a genocidal scale (De Witte 2001; Bevins 2020, pp. 137–158).

While the preferred posture of most postcolonial governments was initially that of "nonalignment" (neutrality) in the Cold War contest between the First and Second World countries, the treatment accorded them by the former prompted many to seek assistance from and in some instances openly side with the latter (Prashad 2007, pp. 46–50; Rakove 2014). The inclination was strongly reinforced by the necessity of liberating the French colonies of Indochina and Algeria as well as Portugal's African colonies through armed struggle, and, following the success of the Cuban revolution in 1959, the rapid proliferation of unabashedly Marxist guerrilla formations throughout the neocolonies of Latin America. For a while, it was argued that the 1966 Tricontinental Conference marked "the coming of a

New International" capable of eradicating imperialism once and for all (Windrow 1998; Horne 1977; McQueen 1999; Abbott and Rodrigues 1998; Gross 1995; Prashad 2007, pp. 105–115; Gerassi 1971, pp. 74–76).

The reef upon which this hopeful scenario soon foundered was the extent to which it hinged upon the willingness and ability of the Soviet Union and China, the principle Second World powers, to provide sustained and substantial material support to Third World countries. The 1961 "Sino-Soviet split" had left them deeply at odds, however, the Soviets pursuing a policy of "peaceful co-existence" with the First World, China counterposing what it framed as an uncompromisingly confrontational stance (Lüthi 2008; Zhai 2000, p. 21). Accordingly, rather than working in concert to facilitate and bolster "revolution in the Third World," each sought to strengthen its position vis-à-vis the other by bringing post-colonial countries into its own politico-economic orbit (Chaliand 1976, pp. 161–165).

To that end, the USSR and China each proffered military, technical, and economic assistance, albeit always conditionally and, with very few exceptions, never in amounts sufficient to meet the needs of recipients (Goldman 1967; Larkin 1973; Friedman 2010, pp. 257–263). Certainly, having scuppered the hallowed principle of "socialist unity," neither was able on its own to muster the wherewithal to seriously challenge the economic clout wielded by the US-centered "Free World" (as the First World preferred to style itself). The Soviet interest, moreover, seems to have been largely confluent with that of the USA in preventing any serious disturbance of the geopolitical status quo by insurgent Third Worlders (Wallerstein 2017 [1995], pp. 47–49).

China's hopes of selectively dispensing its far more limited resources to destabilize the prevailing order were dashed by the US-backed Indonesian bloodbath in 1965 (Garver 2016, pp. 218–224; Bevins 2020, pp. 124–128, 165–167). Nonetheless, the USA having decided for a variety of reasons to use Vietnam as a showcase for its presumed ability to militarily crush not only guerrilla insurgencies in colonial/neocolonial settings but the "people's armies" of even

the strongest Third World countries as well, China had little alternative during the second half of the 1960s but to incur the tremendous expense of supplying the Vietnamese with weaponry, munitions, and other war materials (Giap 1961; Jian 1995, p. 379; Zhai 2000, p. 135).

Agriculture; Indigenous peoples; Latin America; Mining and minerals; Natural resources; Neo-extractivism

Definition/Description

This chapter examines the hundreds of years of dispossession of indigenous peoples by the imperialist powers of the West. The system of imperial plunder has continued into the present era as foreign imperialist powers and multinational corporations extract agricultural commodities and natural resources with the support of comprador classes. This examination of Bolivia under Evo Morales reveals a modest effort to in part reverse the pillage of the first populations in Latin America.

One year after the conclusion of US president George W. Bush's second term in office, James Cameron's 2009 film *Avatar* struck a chord with viewers from both the developing and developed worlds. From the first indigenous president of Bolivia (Aymara coca-grower and labour organiser Evo Morales) to Western scholars of social

science and environmental studies (Hage 2011; Taylor 2010), the story of the confrontation between the indigenous Na'vi on the richly vegetated planet of Pandora and their imperialist invaders in search of mineral resources proved widely resonant. However, as Ecuadorian human rights activist Luis Saavedra has recently explained, rarely has this confrontation between indigenous and non-indigenous people ended as heroically as depicted in *Avatar* (Saavedra 2013). The romanticised encounter between the technologically advanced but militaristic 'West' and the materially impoverished but spiritually attuned 'Rest' is a fiction long lamented by indigenous communities (DeLoria 1998) and brutally belied by the recent intensification of violent conflict over natural resource extraction in Latin America that has led to growing accusations of imperialism on the part of primarily Canadian, Chinese, and American transnationals (Bebbington 2012; Gordon and Webber 2008; Sassen 2010).

According to the Observatory of Mining Conflicts in Latin America (OMCAL), worldwide mineral exploration expenditures have increased tenfold since the 1990s. During the period from 1990–2001, four of the top ten destinations for mining investment in the world were in Latin America, and in the 2000s alone mineral investments quadrupled (Bebbington 2012; Bridge 2004;). Vast swathes of national land in countries such as Peru, Chile, Colombia, and Guatemala have been opened to transnational mining companies through lenient tax codes and promises of windfall profits and maximum royalties, leaving some countries with more than 50% of their land in the hands of foreign mining companies (Veltmeyer 2013, p. 89). One of the many downsides of this opening-up is that there are more than 195 mining conflicts currently active in Latin America. Driven in part by a surge in global demand for electronics, and having already depleted many of the world's most profitable reserves of good quality ore, major industry players such as BHP Billiton, Rio Tinto, Goldcorp, Barrick Gold, and Newmont are moving into ever more remote locations where reserves are harder to extract, less concentrated, closer to drainage basins, at significantly greater geological depths, and surrounded by more fragile ecological systems (Canel et al. 2010).

A disproportionate number of these territories are also home to indigenous communities, particularly in places like Peru and Chile which, in 2012 alone, registered 34 and 33 such conflicts respectively. One of the most brutal of these conflicts took place on 5 June 2009 in the Amazonian town of Bagua in Peru, when a coalition of indigenous and non-indigenous activists blockaded a highway to register their anger over not being consulted about an oil concession in their territory, a situation that is increasingly common following the Garcia Government's decision to privatise much of the countryside in 2008 (Bebbington 2009). By the end of the day, ten local protestors and 23 policemen were dead and scores of others were injured. While not all such conflicts have ended as tragically as that in Bagua, indigenous, human rights, and environmental activists have faced growing criminalisation and other forms of state and corporate-sponsored violence over the past few years everywhere from Guatemala's goldfields to Chile's copper mines. According to the Foro de los Pueblos Indigenas Mineria, Cambio Climatico, y Buen Vivir (Forum of Indigenous Mining Communities, Climate Change, and 'Good Living'), convened in Lima in 2010, the exploitation of mineral resources in Latin America has reached unprecedented levels. Similarly, the London-based human rights group Minority Rights Group International issued a 2012 report warning of the intensification of the resource scramble which is affecting nearly all the world's 370 million indigenous people. Nowhere is this happening more than in Latin America, home to 40 million indigenous peoples (Walker 2012). Borrowing from Karl Marx's description of the late 17th- and early eighteenth-century processes of 'primitive accumulation' that transformed English subsistence farmers into wageworkers, growing numbers of scholars have followed David Harvey in conceptualising this latest round of corporate 'land grabbing' as a form of 'accumulation by dispossession' (Harvey 2005; Gordon and Webber 2007; White et al. 2012). Unlike the 'accumulation by exploitation' that provided the impetus for much of the

mid-twentieth-century labour organisation and subsequent nationalisation of the mining industry in countries such as Bolivia and Argentina, 'accumulation by dispossession' refers to the wave of water and land privatisations begun in the 1990s that has forced growing numbers of indigenous communities from their ancestral territories. It is in large part as a result of these 'land grabs' that many scholars have returned to the category of imperialism which, just two decades ago, had begun to seem outmoded.

For the first time in more than two decades, in the early 2000s, imperialism made a dramatic comeback across the social sciences as political liberals (Ferguson 2008) and neo-Marxists (Hardt and Negri 2000; Harvey 2005) alike penned tracts about the re-emergence of US-led empire. While the former approved of this ostensibly benign successor to the British Empire, recognising a new role for the US as a 'global moral leader', the latter remained sharply critical, worrying about the increasingly de-territorialised conglomeration of multinational companies that seemed poised to extract additional value, labour, and primary commodities from peripheral territories in the service of what Leslie Sklair has called 'the transnational capitalist class' (Sklair 2002). Following the 1990s when the ecumenical buzzword 'globalization' had largely eclipsed the class-based terminology of imperialism that had characterised the work of critical scholars of development in the post-Second World War period, the precise meanings, dynamics, agents, and social processes of twenty-first-century imperialism came to be widely debated in Latin America and beyond (Grandin 2006; Robinson 2006).

The concept of imperialism has a long and varied history in Latin America, waxing and waning in relation to cycles of anti-colonial struggle and subsequent military and economic 're-colonisation'. Following the term's regular invocation by the nineteenth-century independence fighters in their struggle against both Spanish and US colonialism (from Simón Bolívar in the 1820s to José Martí in the 1890s), imperialism began to be used systematically by scholars to analyse the region's uneven integration into the

global economy in the first decades of the twentieth century. On the heels of the 1898 Spanish-American War, which inaugurated the only period in American history when the US obtained overseas territories, this was a period of intense monopoly power on the part of US corporations and a period when 'imperialism' was on the lips of both supporters and opponents alike. While supporters such as Theodore Roosevelt enthusiastically celebrated the fact that 'expansion has been the law of our national growth', less sanguine observers sought to expose how the colonial extensions of the former European empires had laid the groundwork for the continued subjugation of the now formally independent countries of Latin America (Johnson 2004, p. 29). No longer subject to Spanish rule, these countries found themselves 'protected' by the paternalistic Monroe Doctrine (1823) which prohibited further European involvement in the region. At the same time, however, they also found themselves subject to increasingly direct economic and military intervention on the part of the US. Primarily because this was a period characterised by a substantial expansion of US corporate involvement in export-led development in Latin America on the part of firms such as Standard Oil, historians have dubbed the period between 1850 and 1930 the 'second conquest' of Latin America (Grandin 2006; Topik and Wells 1998). As private corporations in the extractive sectors moved more and more aggressively into Latin America, it was small-scale agriculturalists, itinerant miners, and indigenous communities who bore the brunt of this expansionism. Despite high levels of foreign investment and company promises to deal with the 'social question' by 'modernising' living facilities, inculcating North American work ethics, and providing relatively high salaries, the extractive enclaves overseen by US companies often left the countries of the region either economically stagnant or considerably worse off. This was particularly evident in increased alcohol abuse, domestic violence, and other forms of familial dislocation occasioned by the development of extractive enclaves (Klubock 1998). Between 1822 and 1964, US troops were sent to the region

36 times to quell nationalist uprisings, many of them in opposition to the expropriations of US companies (Banerjee 2009, p. 7).

The beginning of the Cold War ushered in what promised to be a significantly less imperialistic era in US–Latin American relations. As President Harry Truman famously announced in his 1949 inaugural address:

> Guarantees to the investor must be balanced by guarantees in the interest of the people whose resources and whose labour go into these developments. The old imperialism – exploitation for foreign profit – has no place in our plans. What we envisage is a program of development based on the concepts of democratic fair-dealing. (quoted in Grandin 2006, p. 161)

Despite these promising words (echoes of which we find repeated in contemporary discourses of 'corporate social responsibility' in the mining sector), by the 1950s, scholars of Latin America were already beginning to identify the new forms of US-led imperialism they saw unfolding around them. In the two decades between 1950 and 1970, as decolonisation struggles swept across Africa and Asia and nationalist leaders of the Non-Aligned Movement rose to power on explicitly anti-imperialist platforms, development economists opposed to the modernisation paradigm began to write about 'informal imperialism' or 'the imperialism of free trade' (Gallagher and Robinson 1953). Inspired by Rosa Luxemburg's argument that imperialism was the 'direct result of the expansion of the capitalist mode of production into precapitalist modes of production', and that periodic crises of capitalist accumulation structurally necessitated the ongoing colonisation of precapitalist spaces and modes of life, dependency theorists such as Andre Gunder Frank (1967) and world-systems theorists like Immanuel Wallerstein (Wallerstein 1974) argued that the 'core' industrialised capitalist countries had systematically under developed the countries of the 'periphery' (Topik and Wells 1998, p. 23). In perpetual search of cheaper raw materials, lower labour costs, and better terms of trade, North American companies not only failed to bring the promised 'modernisation' to the countries in which they operated (these theorists argue), but they were, in fact, responsible for their deepening poverty and instability. As well as facilitating a net loss of profits to the northern economies, they sharply exacerbated tensions between the city and the countryside, rural and urban, indigenous and non-indigenous. Despite the fact that most of the countries with sizeable indigenous populations (including Guatemala, Mexico, Ecuador, Bolivia, and Peru) were able to maintain some rights to communal landholding throughout this period (largely owing to variously aggressive efforts at agrarian land reform), indigenous labourers remained subject to ethnic stereotypes that resulted in their double exploitation at the hands of both foreigners and national elites. Frequently construed by export-oriented *criollo* elites as subhuman, insufficiently modern, the bearers of 'traditional values', or otherwise culturally backward, they were repeatedly condemned for holding the region back from a fully fledged capitalist take-off.

And many of these dynamics began to worsen in the 1980s. This was a period described by development economists as the 'Lost Decade' and characterised by two central and overlapping processes of what could justifiably be called US imperialism: the first economic and the second military. First, as a more or less direct result of the structural adjustment programmes (SAPS) instituted by the major global lending organisations headquartered in Washington, DC (the International Monetary Fund [IMF] and the World Bank), economic growth slowed and even declined across the region. Between 1980 and 2000, GDP rose 6% per person (in comparison to 75% per person during the period 1960–80; Johnson 2004). The international financial institutions (IFIs) lent millions of dollars to countries throughout the region on the condition that they 'adjust' their macro-economic policies to facilitate reduced or eliminated trade barriers, diminished capital controls, the privatisation of national industries, and the reduction of state subsidies for agriculture and health. With the controversial and still-debated exception of Chile, the effects of these policies were largely disastrous for

indigenous communities, which saw their livelihoods decimated as local markets became flooded with heavily subsidised agricultural imports and extractive companies, lured by the promise of near 100% repatriation of profits, moved in to rapidly take control of formerly nationalised industries (Gill 2000; Gledhill 2004. The second and equally lethal process was the intensification of long-standing US-backed wars against 'communist insurgents' in which hundreds of thousands of indigenous peoples lost their lives in places like Guatemala and El Salvador. Committed to stemming the red tide of communism and protecting the freedom of free trade throughout the hemisphere, the US actively funded military regimes such as the right-wing Contras in Nicaragua and the Ríos Montt dictatorship in Guatemala, often more or less explicitly in the service of the interests of big business such as United Fruit (Nelson 1999). By the early years of the 1990s, 75,000 people had lost their lives in El Salvador and more than 200,000 people, mostly Mayan, were dead as a result of the 'scorched earth' campaigns in Guatemala.

Despite the fact that indigenous communities have long mobilised in opposition to the demands of both colonial capitalism and US imperialism, it was not until the 1990s that indigenous people organising for political, economic, and cultural rights gained significant ground throughout the region (Yashar 1998). The beginning of the 1990s witnessed an unprecedented mobilisation of indigenous peoples in opposition to both the structural adjustment programmes of the IMF and free-trade agreements such as the 'Free Trade Agreement of the Americas' that aimed to both further liberalise their economies and abolish critical protections for communal landholding (such as Article 27 of the Mexican constitution). The immediate symbolic impetus for this mobilisation was the 1992 quincentenary of the arrival of the Spanish colonisers. During that year, indigenous peoples rose up in the streets in country after country demanding an end not only to the macroeconomic policies of the World Bank and the IMF since the 1980s, but to what they called the 500 years of 'genocidal subjugation' since the arrival of Christopher Columbus. From the

Spaniards to the Americans to their own national elites at whose hands they had long suffered the racism, classism, and cultural discrimination of 'internal colonialism', their dispossession, they argued, had been one of unbroken imperialist expropriation. As Eduardo Galeano and others have shown, it was the original incapacity of the Spaniards to understand the use-value of gold (rather than simply its exchange-value) that led to the first pillage of the continent, with enough metal extracted by the end of the seventeenth century to build a bridge across the Atlantic (Galeano 1971). From the infamous sixteenth-century Bolivian mines at Potosí to the privatisations of the mining sector in the 1990s, 'extractive imperialism' has been at the centre of nearly every stage of this expropriation (Veltmeyer 2013). While in the early part of the twentieth century it was primarily surplus labour that was extracted from mine workers (both indigenous and non-indigenous), by the late 1990s it was the natural resources themselves that were of greatest interest as mining jobs became increasingly reserved for highly skilled foreign labourers (Petras and Veltmeyer 2014). As Saskia Sassen has observed: 'One brutal way of putting [this] is to say that the natural resources of . . . good parts of Latin America count more than the people on those lands count as consumers and as workers' (Sassen 2010, p. 26). In response to this increasingly direct invasion of their territories, and emboldened by the passage of key international legislative frameworks such as ILO Convention 169, the United Nations Declaration on the Rights of Indigenous Peoples, and the Inter-American Declaration of the Rights of Indigenous Peoples, indigenous federations in places such as Ecuador and Bolivia began to powerfully rise up throughout the 1990s, successfully ousting a number of the national administrations that had most egregiously permitted the foreign expropriation of their 'national patrimony' (Becker 2011; Sawyer 2004).

The result of much of this mobilisation throughout the region has been the extension of cultural, educational, and linguistic rights to indigenous minorities or what Charles Hale has called, 'neoliberal multiculturalism' (Hale 2002).

However, this extension of cultural rights has frequently been accompanied by an active undermining of substantive political and economic rights. In particular, governments have refused to acknowledge the rights of indigenous self-determination, including the right not only to 'free, prior, and informed *consultation*' (FPIC) about mining activities in their territories, but 'free, prior, and informed *consent*' over whether those activities go forward in the first place. In most countries, despite some constitutional recognition of 'pluri-nationality' or 'pluri-culturality', governments have been reluctant to surrender their rights to decision making about critical national resources, often maintaining direct control over sub-soil resources. Private companies in the mining sector are increasingly involved in corporate social responsibility (CSR) efforts that they hope will offset the more environmentally damaging of their practices (and indeed, a small consulting industry has cropped up around CSR in the mining industry). At the same time, however, many of these same companies have also been actively involved in the writing of highly investor-friendly country mining codes that undermine indigenous rights (most vividly in countries such as Colombia) and advocating free-trade agreements that both break up communal landholdings and mitigate against indigenous decision making about extraction (Canel et al. 2010; Hogenboom 2012; Li 2011).

It was at least in large part as a result of these contradictions that the mid-2000s saw a substantial shift in power across the region toward what many scholars call 'post-neoliberal governance' (MacDonald and Ruckert 2009), as radical-populist regimes rose to power in Ecuador, Bolivia, and Venezuela on explicitly anti-imperialist platforms, and more moderate governments like Brazil and Argentina nationalised key industries that had formerly been privatised. As states took control of their natural resources (nationalising the oil industry in Venezuela, assuming ownership over natural gas in Bolivia, and insisting on significant windfall taxes and royalties from mining companies in Ecuador), the prices of primary commodities soared and with them the capacity of these 'twenty-first-century socialist' administrations to invest in social and material infrastructure, robust programmes of redistribution, and an expanded public sector. In addition, in both Bolivia and Ecuador, constitutions were approved that explicitly rejected the models of limitless capitalist growth assumed by most neoliberal economists and that advocated instead indigenously inspired conceptions of living more harmoniously with a more diverse set of human and non-human others. Despite these gestures toward more economically just and ecocentric post-neo-liberal polities, however, the governments of the region have continued to be accused of what Eduardo Gudynas calls, 'a new extractivism' (Gudynas 2010).

From Morales's radical-left MAS (Movement For Socialism) party in Bolivia to the more centrist administration of Ollanta Humala in Peru, national governments that have enacted some of the most far-reaching post-neo-liberal policy transformations are at the same time engaging even more aggressively than their neo-liberal predecessors in extractive projects over which indigenous communities have little control. The result has been sharply intensifying confrontations between indigenous communities and the nation states of which they form a part. Indigenous federations like the Confederation of Indigenous Nationalities of Ecuador (CONAIE) in Ecuador and the National Council of Ayllus and Markas of Qullasuyu (CONAMAQ) in Bolivia have turned against their own governments which, in response, have moved to criminalise their protest. Historically, most of the movements against mining have been movements against 'accumulation by exploitation' led by ethnically mixed trade unions which have agitated for higher wages, better working conditions, and an increased voice for workers in decision making (Bebbington et al. 2007). While such mobilisations continue around mines like La Escondida in Chile, the battlefields have increasingly shifted to the more remote territories of indigenous nationalities, a move that has been accompanied by a marked resurgence in cultural and racial discrimination. As former president of Peru, Alan García argued in 2009: 'Enough is enough. These peoples are not monarchy, they

are not first-class citizens. Who are 400,000 natives to tell 28 million Peruvians that you have no right to come here? This is a grave error, and whoever thinks this way wants to lead us to irrationality and a retrograde primitivism!' (Bebbington 2009, p. 13). In the years since, indigenous peoples have increasingly been turned against by both the leftist administrations they helped to elect and by large numbers of the nonindigenous poor who have been the main beneficiaries of the new redistributive programmes. They increasingly find themselves in a paradoxical position: symbolically exalted in national constitutions for their alternative development models while at the same time constructed as 'infantile environmentalists', enemies of national sovereignty, or allies of foreign NGOs when they try to actually put those models into practice. To the 'socialists of the 21st century' who are in power in Venezuela, Bolivia, and Ecuador, these alliances testify to a new kind of imperialism in which indigenous communities are deeply implicated: not the imperialism of free trade, but the imperialism of NGO-led conservationist environmentalism.

Despite, then, considerable continuities in the dynamics, methods, and agents of 'extractivist imperialism' over the preceding centuries, there are also considerable changes that will inevitably demand more nuanced theorisation in the years to come. At least four of these changes are worth mentioning by way of a conclusion. First, with the decline of US global hegemony, the dominant players in the mining industry in Latin America are no longer overwhelmingly from the US, but increasingly Chinese, Canadian, and, though to a significantly lesser degree, Australian. After more than a century of US-orchestrated economic and military imperialism throughout the region, the beginning of what many are already calling 'the Asian Century' is heralding a shift toward significantly less binary models of extractive influence that are just as frequently South–South as they are North–South. Second, as Robinson has similarly pointed out in his critique of models of imperialism that remain too closely tied to outdated twentieth-century models of a nation-state-based global geopolitical order, not only are these regional blocs shifting, but the nature of the

relationships between state, capital, and non-state (NGO) groups is undergoing dramatic change. New alliances between state-owned extractive industries, foreign investors, and both conservationist and business-oriented NGOs make it increasingly difficult to talk about unified or coherent sets of political actors. Third, with the shift to the left that began in the early 2000s, discourses of imperialism are being wielded by Marxist-inspired presidents in ways that depart significantly from the strongly class-based and US-focused anti-imperialist projects characteristic of the Latin American left throughout most of the twentieth century. As part of these shifts, in many South American countries, environmentalist strands of indigenous thought and practice have been reenvisioned as the products of imperialist intervention on the part of foreign NGOs, the result of which has been a deepening of splits within indigenous movements between those who support and those who oppose extractivist development. And finally, the iconic image of anti-imperialist opposition to foreign control over extraction is arguably no longer the mestizo male mineworker or trade unionist of the mid-twentieth century, but the indigenous woman. Although women have historically played central roles in Latin American social mobilisations throughout the twentieth century (e.g. the Mothers of the Plaza de Mayo in Argentina), over the past decade indigenous women like the Defensoras de la Pachamama in Ecuador have played increasingly visible roles as opponents of mining projects, often paying the price in death threats from extractive companies or time spent in jail. After more than 500 years of foreign-dominated extractivism (colonial, republican, nationalist, neo-liberal, and now post-neo-liberal), it is these women who have emerged as the central voices of resistance to twenty-first-century 'accumulation by dispossession'. While the sanitised encounters depicted in *Avatar* may little resemble the actual confrontations ongoing throughout the hemisphere, it is clear that the struggles over natural resource extraction in Latin America will only intensify in the years to come, and that the imperialism to which they bear witness urgently demands more nuanced theorisation.

Definition

There are many cases where imperialism has hindered industrialisation in peripheral countries while directing their development toward benefiting core countries. This has been seen across the world, even though imperial power has been exercised to varying degrees and under a wide range of circumstances.

There are many cases where imperialism has hindered industrialisation in peripheral countries while directing their development toward benefiting core countries. This has been seen across the world, even though imperial power has been exercised to varying degrees and under a wide range of circumstances. India, for example, was formally a part of the British Empire, while other countries, such as Egypt, were subjected to more indirect forms of imperial influence. Industrialisation, or the lack thereof, under imperial rule has been examined by recent research employing empirical evidence, quantitative analyses, and theoretical advances. Bringing this work together allows for a more complete analysis of the complex interactions between industrialisation and imperialism. Imperial influences have often stunted local industrialisation in the periphery, while promoting industry only to the extent that it benefited the base of imperial power. These trends are seen across countries, whether they were subjected to direct or indirect imperial rule.

Marxist scholars have identified three main phases through which the relationship between the countries at the centre and the periphery of the global economy has passed (Sutcliffe 1972). These phases are: (1) when wealth was extracted from peripheral countries while manufactured goods were exported there from the centre; (2) when monopoly capitalism developed and the contradictions of capitalism compelled capital to flow from the centre to the periphery; and (3) the post-colonial phase when the growth of peripheral countries was repressed in order to secure the lead of the advanced capitalist countries (172). Much of the dependency theory and world-systems research in the 1970s focused on this third category (e.g. see Amin 1977; Wallerstein 1979). Yet in order to appreciate the developments that took place in recent history, it is useful to have an understanding of the ways that imperialism and industrialisation were connected in the more distant past. Recent research has tended to move

away from the broader scope of older theories of imperialism. Instead, more narrowly focused empirical studies highlight the complexity of the history of industrialisation and the relationship of this process to the influences of imperial power.

Recent research on long-run economic growth is also relevant for an analysis of the connections between industrialisation and imperialism. Much of this literature stems from the work of Acemoglu et al. (2001), who focus on how institutions shape economic growth. These researchers find that the institutions established by colonial-era European settlers overseas shaped countries' long-run economic growth trajectories. These authors also note, however, that institutions can be improved to promote economic growth, as in 1960s South Korea or the Meiji Restoration in Japan.

In a subsequent paper, Acemoglu et al. (2002) take urbanisation in 1500 as a proxy measure of economic prosperity, and find a negative correlation between economic prosperity in 1500 and 1995. Again, institutions are the main focus of their analysis. They argue that strong private property laws promote investment and economic growth. Other researchers, such as Ferguson (2003), make similar arguments about the importance of the protection of private property for shaping a country's development. Part of the analysis in Acemoglu et al. (2002) looks at the connections between industrialisation and economic growth. It finds that institutions that were conducive to industrialisation (e.g. through securing property rights) 'played a central role in the long-run development of the former colonies' (p. 1236). This vein of the literature offers examples of how theories connecting institutions to industrialisation, and to economic growth more broadly, can be studied empirically. Yet this empirical economics research suffers from the lack of a more nuanced historical analysis of how imperialism affected industrialisation. To this end, it is useful to look beyond the economics literature and to incorporate the insights of other disciplines into a broad-based analysis of industrialisation and imperialism.

Brenner (2006) asks 'What is, and what is not, imperialism?' For the purpose of exploring the connections between industrialisation and imperialism, a starting point is his identification of 'the classical capitalist imperialism of the years 1884–1945, which witnessed states' construction of ever larger imperial units that aimed to restrict the economic advantages made possible by formal and informal empires to their own national capitals' (87). The history of industrialisation, however, antedates Brenner's timeframe, and a comprehensive analysis of imperialism and industrialisation would extend at least as far back as the late eighteenth century, when Britain's industrial revolution began. Also, industrialisation (and de-industrialisation) remains an important issue in the post-colonial era. Still, the focus of this analysis is the late eighteenth century through the early twentieth century, when the major developments in the industrialisation of peripheral countries were shaped by the influence of imperial powers.

The distinction between direct and indirect imperial rule offers an analytical framework through which to view the development, or lack thereof, of industries in peripheral countries. Austin (2003) highlights how different terms have been used in the literature to describe the various degrees of an imperial power's involvement in peripheral countries. Gallagher and Robinson (1953) use the terms 'formal' and 'informal' imperialism, while dependency theorists make the distinction between 'colonial' and 'neo-colonial' influences. Austin offers a general definition of imperialism as 'foreign control of assets and decisions, including where such control exists in fact but not in law' (2003: 145). Robinson (1972), while employing a similar definition of imperialism, develops it further to account for local agency and the non-European foundations of European imperialism. It is with this range of degrees of imperial influence in mind that the terms 'direct' and 'indirect' imperialism are employed herein to discuss a range of cases in which imperial power was imposed in varying levels of directness. However, this analysis demonstrates that it is not essential to make these distinctions when analysing industrialisation under imperial influence. Whether under direct or indirect imperial rule, peripheral countries had their industrial development shaped by imperial power.

I

Previous researchers, such as Gallagher and Robinson, have made the distinction between various degrees of directness of imperial rule in order to highlight the observation that imperial power was exercised in areas beyond the formal confines of a given empire. In the case of the British Empire, '[f]or purposes of economic analysis it would clearly be unreal to define imperial history exclusively as the history of those colonies coloured red on the map' (Gallagher and Robinson 1953: 1). This is an important insight, and it is useful to adopt this broader conception of imperialism when analysing how industrialisation did or did not develop in countries under a range of types of imperial influence. It is significant to note that imperialism had similar effects on industrialisation in peripheral countries even as the directness with which imperial power was imposed varied by country. Thus, the distinctions that appear throughout the literature on imperialism between direct and indirect power are useful in this analysis insofar as they allow the framework to extend beyond countries that were formally under imperial rule. Yet the distinction between levels of directness of imperial rule does not lead to a conclusion that industrialisation was impacted differently depending on the degree of imperial power that was exercised. On the contrary, industrialisation was shaped by imperial power, whether that power was imposed directly or indirectly.

While distinguishing between direct and indirect imperial rule, it is useful to examine the causal mechanisms through which imperialism affected industrialisation in peripheral countries. Channels of influence through which core countries impacted the industrialisation of peripheral countries include the drain of surplus from the periphery, trade policy imposed on the periphery, and support for agriculture at the expense of industry in the periphery. India and Egypt serve as case studies of how these processes hindered the industrialisation of peripheral countries under imperial rule.

India offers an example of industrialisation in a peripheral country under direct imperial rule. British economic interests and imperial ambitions in India can be dated from 1600, when the East India Company was given a Royal Charter (Riddick 2006). The Company moved from having more narrow economic goals to actively administering large regions of India after Robert Clive's victory at Plassey in 1757 (Riddick 2006). How the British presence in India affected industrialisation has been a subject of much debate. One vein of the literature argues that it resulted in de-industrialisation as local manufacturing was undermined by the new division of labour (e.g. see Bagchi 1976; Harnetty 1991; Perlin 1983). Similarly, others argue that India's industrialisation was undercut by a general de-skilling of local labour under imperial influence (Headrick 1988). But recent research calls aspects of these claims into question. Roy (2009), for example, finds that for the Indian iron industry, nineteenth-century knowledge transfers were adopted successfully by technically skilled Indian blacksmiths, while other aspects of the iron production process, such as iron-smelting, were laden with high-cost activities that hampered the benefits that knowledge transfers potentially offered in India. Similarly, Roy (2000) argues that traditional Indian industry was not completely destroyed by British imperialism, but rather that it adapted and some sectors were able to compete with modern industry. Specifically, Roy argues that 'other than textiles, there are almost no examples of significant competition [from imported goods] and technological obsolescence' (1444). Roy is thus critical of nationalist adherents of the de-industrialisation school of thought who, he argues, extrapolate from the example of the textile industry to the economy at large in their attempt to make imperial rule appear to have been a universal disaster for the Indian economy.

Still, the textile industry makes for an instructive study of how imperialism negatively impacted Indian industry. Patnaik identifies this process as taking place mainly during the 'second phase' of the colonial destruction of the pre-capitalist Indian economy (1972: 212). The first wave of this destruction was a 'drain of wealth' process led by the East India Company, but after the Napoleonic wars the destruction occurred as imported textiles out-competed urban handloom production and rural weaving industries. In the

face of such widespread economic disruption, Patnaik argues that '[i]t is hardly surprising in these conditions that Indian industrial capital did not grow' (213). He goes on to build a case for attributing the lack of industrial development in India to the power that the British had in that country. This is tied to the directness of British rule in India, which was powerful enough to hamper industrialisation through 'discriminatory interventionism' in favour of British capital, along with British control of the banks. This made for significant constraints binding the growth of Indian industrial capital (213). Despite these factors restricting India's industrialisation, it is important to emphasise that British rule in India did not result in the total obliteration of Indian industry. Roy's studies suggest a more nuanced interpretation of the effect that imperialism had on Indian industry. While some Indian industries, namely textiles, were indeed ruined by imperial trade policies, this should be interpreted as part of the broader 'commercialisation' of India's economy (Roy 2000).

There is no way to answer with certainty the question of how India would have industrialised had the British not had so much control over India's politics and economy. Eventually the British did act to encourage the development of Indian industry (as seen in the 1920s when protectionist policies were enacted in favour of infant industries) but these policies were implemented only because of pressure imposed by Indian nationalists (Austin 2003). However, the overall outcome of Britain's direct imperial control in India is associated with the underdevelopment of Indian industry. Pomeranz suggests that '[t]he British probably did not frustrate an industrial breakthrough [in India] that was otherwise highly likely … but nineteenth-century changes may have made such a breakthrough even more difficult than it would have been otherwise' (2000: 295). Still, Pomeranz blames British policies in India for the 'development of [Indian] underdevelopment' (ibid.). This process was influenced, at least in part, by the fact that 'each act of [industrial] investment became an isolated episode, no more than a shift of some processes in the manufacturing chain from

England to India' (Patnaik 1972: 213). The key aspect of this argument is based on British political control and the restriction of Indian capital. Patnaik (1972) argues that this deprived India of benefiting from the positive linkage effects that evolve in environments where capital is able to be invested freely. And since 'British firms in India were outposts of Britain' and there was no desire to invest in high levels of training for Indian workers, British-promoted industries in India did not yield the full potential of positive externalities for the Indian economy (Mukerjee 1972: 209). Taking a long-term view, up through the present day, leads to a characterisation of this process as being 'the transformation of traditional economies into modern underdeveloped ones' (Headrick 1988: 4).

India, as the 'Jewel in the Crown' of the British Empire, is a prominent example of how direct imperial rule shaped the path of industrialisation in a peripheral country. Areas subject to indirect imperial rule during the last quarter of the past millennium also had their industrialisation impacted by imperial powers. Egypt, for example, was occupied by the British, who proceeded to shape industrial policy there. China offers another example of a country where imperial powers influenced political and economic developments even less directly. Several European countries, including the British in Hong Kong and the Portuguese in Macau, had coastal outposts in China, but only directly exercised their power inland during active military campaigns. Imperialism in these cases influenced the development trajectory that local industries followed, even though the imperial influence was less direct and lasted for a shorter period of time than in the Indian case.

The British presence in India lasted for nearly three-and-a-half centuries, but the British only entered Egypt in the late nineteenth century. This is not to say that there was no British presence in Egypt before then; European capital was so heavily invested in Egypt that when the Egyptian state became bankrupt and unstable in the early 1880s, the British felt compelled to invade it in order to secure their interests there (Davis 1983; Moon 1972). To safeguard their interests in Egypt,

the British invaded in 1882 and began four decades of formal occupation. They soon found themselves in a position where they had to stay in Egypt to stabilise the country through managing its debts, and to prevent the Ottomans and French from regaining more influence there (Cain and Hopkins 2002; Davis 1983). To work toward paying down Egypt's debt, the British promoted the widespread cultivation of cotton for export. A contemporary observer noted that British occupation 'transformed the entire Nile Basin into a gigantic cotton plantation' (Salama Musa, quoted in Davis 1983: 45). This led to far-reaching changes in Egypt, which influenced the direction of its industrial development.

While the British occupation of Egypt was directed toward getting Egypt to pay down its debt, it also made Egypt a more attractive destination for foreign investment (Davis 1983). Most of this foreign investment went into agriculture (Beinin and Lockman 1987). This happened either directly or indirectly. 'Foreigners directly invested their capital in land companies, established mortgage and credit companies and banks, and gained control of the import and export trade. European banking houses also lent vast sums of money to the Egyptian state, which used most of it to develop the country's infrastructure – irrigation, railroads, port facilities – in order to facilitate the cultivation and export of cotton' (Beinin and Lockman 1987: 8–9). While these developments directed the course of early industrial development in Egypt, they did not result in widespread industrialisation, as they were narrowly focused on the particular goal of promoting the cultivation of cotton for export. As in India, however, there is more to this story than a simple case of the complete hindering of industrialisation in Egypt. As Beinin and Lockman note, '[d]espite the contention of some proponents of dependency theory . . . the subordination of Egypt's economy to the dictates of metropolitan capital did not permanently preclude industrial development' in Egypt (1987: 10). Egypt eventually developed a broader industrial base in the post-First World War era (Beinin and Lockman 1987; Radwan 1974).

The initial phase of industrial development in late nineteenth-century Egypt was based on cotton production. As the Egyptian countryside was positioned toward large-scale cotton cultivation for export, industrial development in Egypt also began to be shaped by these same forces. The development of large estates for producing cotton as a cash crop led to the increased mechanisation of agriculture and the promotion of industries related to preparing cotton for export (Alleaume 1999). Some of this development took the form of improved transportation and communications infrastructure (Davis 1983). Irrigation projects were another significant outcome of the increased cotton production, as pumping stations and irrigation and drainage networks had to be built to supply water for the cotton plantations. The Egyptian government and large landowners relied on British capital for these investments. By directing foreign capital toward developing the infrastructure needed for large-scale cotton production, these forces resulted in the Egyptian economy being centred on primary commodity production rather than manufacturing. Under the British occupation of Egypt it was argued that 'it was to the benefit of both Britain and Egypt that the former should engage in manufacturing while the latter confined itself to the production of agricultural raw materials' (Barbour 1972: 54). The development of this centre–periphery relationship suggests the stymying of Egyptian industrialisation under imperial rule. But, as mentioned above, this relationship does not describe the entire history of Egyptian industry, as local institutions such as Bank Misr promoted the broader industrialisation of Egypt after the First World War (Beinin and Lockman 1987; Davis 1983). Nonetheless, imperial power initially promoted industry in Egypt to serve British interests, and this shaped the structure of industry in Egypt.

Egypt offers an example of how industrialisation was directed along a path to underdevelopment under less-than-direct imperial rule. Egypt was free from direct European rule for the first three-quarters of the nineteenth century, and then was under British occupation (without formally being part of the British Empire) from 1882 through the end of the First World War. Initially,

industry failed to develop in Egypt, unless it was for the processing of cotton for export. Limited industrial development did occur in Egypt, then, along with the state bureaucracy that was needed to co-ordinate irrigation projects and improved means of communication to facilitate the expansion of cotton production. These changes to the Egyptian economy and state laid the foundation for the industrialisation that did eventually take place in Egypt (Davis 1983). Davis, following this line of reasoning, argues that 'foreign capital [in Egypt] established the prerequisite for native industrialization by providing capital accumulation for the large landowners, facilitating national integration among sectors of the upper class, creating a stratum of skilled managerial personnel and familiarizing certain landowning families with the techniques of capitalist enterprise' (1983: 195). In Egypt, as in India, imperialism directed industrialisation along a certain path; one that served the interests of the imperial power overseeing the running of these economies. Yet imperial rule also led to the development of state bureaucracies and capitalistic local elites, which proved to be important for later industrialisation in these peripheral countries.

Whether a country was directly or indirectly subjected to imperial rule, industrial development was still shaped to suit imperial interests. British manufacturing and financial interests in India and Egypt offer examples of these processes. In his broader study of economic imperialism, Austin reaches the same general conclusion: 'At an imperial level, colonies were expected to specialize in the production of primary commodities, and their administrations rarely did much to promote manufacturing' (2003: 151). Yet there were cases where industrial development did occur under imperial rule, and not just in the settler colonies (for an analysis of the role that British capital played in the development of the US, Australian, and Canadian economies during the 'age of high imperialism', see Edelstein 1982).

To bring these exceptions from the trend of under-industrialisation into this analysis requires the study of other, non-British, imperial powers. North Vietnam, beginning in 1894, and the Dutch East Indies, starting in the 1930s, each saw limited industrialisation led by textile production. Protectionist policies were an important part of these developments, and it is also important to note that these industries were owned by outside powers: French in the Vietnamese case, and various European, Chinese, and US owners in the Dutch East Indies (Austin 2003). Industrialisation in Korea was also shaped by an imperial power, as Korea developed heavy industry while under Japanese rule (Kohli 1994). This process was shaped by the colonial institutions put in place by the Japanese in Korea, as well as by Japan's goal to develop Korea in order to support the military strength of the Japanese Empire. So industrialisation was not impossible to achieve for peripheral countries under imperial rule, but it only occurred in isolated cases and when it suited the interests of the imperial powers; whether to support imperial business owners in Vietnam and the Dutch East Indies, or to strengthen the military power of imperial Japan.

Imperialism affected industrialisation through myriad and complex channels. The main outcome of this relationship was the shaping of the industrialisation processes by imperial power. Whether in India, where the British presence influenced policies for centuries, or in Egypt, where the formal British occupation lasted for only four decades, industries were developed to serve the imperialists' interests. As under-developed countries today continue to suffer lower levels of economic performance than the former imperial powers, the impact of imperialism on industrialisation remains an important historical factor for understanding contemporary global inequality.

Investor-State Dispute Settlement Mechanisms and Imperialism

Shawn Nichols
Department of Politics, UC Santa Cruz, Santa Cruz, CA, USA

Synonyms

Neoliberalism; Trade; Imperialism; Transnational capitalist class (TCC)

Definition

The investor-state dispute settlement (ISDS) mechanism included in free trade agreements extends into domestic policy spaces and disciplines governments into maintaining the most favorable conditions for capitalist accumulation. Serving as a form of continuity between past imperial relations and present articulations of subjugation and control, ISDS is both linked to, and dependent upon, imperial domination in earlier epochs. The uneven development of capitalism that resulted from imperialism has provided the incentives for the geographic dispersal of both production processes and financial flows in the neoliberal era. ISDS thus serves to protect the processes associated with the transnationalization of capital through internalized, universalized interventions.

Introduction

Bilateral and multilateral free-trade agreements have proliferated in recent decades, becoming increasingly qualitatively encompassing in terms

of the issues over which they preside and challenging the sovereignty of governments at all levels. The investor-state dispute settlement (ISDS) mechanism included in such agreements, in particular, extends into domestic policy spaces and disciplines governments into maintaining the most favorable conditions for capitalist accumulation. Specifically, ISDS authorizes investors to bring disputes directly against governments for adopting new regulations with the potential to negatively impact future profitability or market share, including those designed to protect the environment and human health. Designating such measures as acts of indirect, or creeping, expropriation, investors are authorized to seek compensation for the deprivation of earnings that might have been realized in the absence of the measure. Circumventing national-based judicial system, disputes are arbitrated by private, ad hoc tribunals under the auspices of the World Bank's International Centre for Settlement of Investment Disputes (ICSID) or the United Nations Commission on International Trade Law (UNCITRAL), drawing on principles of international commercial arbitration (see Van Harten 2005; Nichols 2018). In spite of significant public opposition around the world, efforts are currently underway to establish a permanent multilateral investment court, indicating that there is a sustained commitment to the maintenance, and even expansion, of the ISDS regime (European Commission 2015).

Included for the first time in a multilateral free-trade agreement in the North American Free Trade Agreement (NAFTA) and subsequently duplicated in numerous other bilateral and multilateral agreements, ISDS was rhetorically cloaked as an effort to protect against judicial impropriety. In reality, however, it has been advanced to universalize capitalist discipline on a global scale by locking in the most favorable conditions for capital wherever it might flow (Nichols 2016). ISDS is the culmination of a series of highly organized efforts by business lobby groups to redefine the boundaries of property rights by selectively advancing the most expansive definitions of property in the US juridical context, legal principles that remain unsettled in both domestic and international law (for a discussion of these efforts, see

Nichols 2016). Indeed, the development of the regime has depended on both national and transnational fractions of capital, as well as other social groups, seeing their interests as "tied to the mast of a neoliberal market-based system of global economic governance" (Gill 1997: 21–22).

Crucially, ISDS serves as a form of continuity between past imperial relations and present articulations of subjugation and control. It is both linked to, and dependent upon, imperial domination in earlier epochs since the uneven development of capitalism that resulted has provided the incentives for the geographic dispersal of both production processes and financial flows in the current era. As noted by David Harvey, "new rounds of primitive accumulation attack and erode social relations of production achieved through preceding rounds" (Harvey 2006b: 437). The current accumulation strategies have driven the demand for the ISDS regime for its ability to lock in state commitments in the face of popular contestation. While linked to past forms of imperialism, however, the argument proposed here is that current processes of subordination associated with ISDS correspond to a qualitatively different world order, whereby a dominant transnational capitalist class (TCC) seeks to articulate its interests through both national and supranational apparatuses, namely, those related to universalizing the conditions for capitalist accumulation, globally.

Accumulation strategies linked to control over peripheral regions have been a consistent feature in the history of capitalist development. Indeed, the territorial expansion of political rule and, ultimately, the extension of capitalist relations to areas previously outside of the logic of the market have been essential to the system's required growth and expansion. While many varieties of empire have existed historically (for a discussion, see Harvey 2006b: 436–445; Maier 2006), the territorial extension of the British Empire represented the "first empire to be driven by capitalist logic," the accumulation strategy of which was to create value through competitive production and export capitalist relations to its colonial holdings (Wood 2003). In addition to territorially expanding its empire, however, Britain used its power to extend the conditions for capitalist

I

accumulation through informal forms of control, including sponsoring unequal trade and investment treaties that would ultimately replace direct colonialism by the late twentieth century (Panitch and Gindin 2005: 105). The use of these practices to extend control over peripheral areas would find continuity in the economic strategies advanced by the United States when it took on the role of reconstructing the system of global capitalism in the post-World War II era that saw the end of direct colonial rule. The strategies advanced by the United States would evolve in the economic restructuring undertaken as the capitalist system was again threatened by crisis in the 1970s. Moreover, these developments would usher in a new epoch in the history of capitalist development that would require new forms of control that, while sharing certain features in common with imperial domination, respond to the imperatives of a different world order in which a transnational, rather than a nationally based, capitalist class is dominant.

Informal Empire Under Pax Americana

Emerging from World War II as the preeminent political power in the capitalist sphere, the United States began reconstructing a new world order. Among other things, this included leading the creation of a variety of supranational institutions for the purpose of establishing the conditions conducive to spreading and securing capitalist relations. Processes of informal imperialism were undertaken during this period, taking shape in the military, economic, and cultural dominance of the United States vis-à-vis the rest of the world. These processes differed in substantive ways from imperialisms of the past, however, in that the United States, rather than seeking to secure national control over other territories for the purpose of excluding capital from other states, instead forged a strategy to expand capitalist relations for the general benefit of global capitalism.

The post-World War II period of decolonization produced dozens of newly independent nations with formal sovereignty. The power

relationships underpinning the imperial system, however, did not disappear with the formal end of colonialism. The economic development strategies advanced by leaders in the United States and other Western countries, in collaboration with elites in postcolonial states, locked these new states into a pattern of dependency, prioritizing large-scale infrastructure projects and Western technologies over local self-sufficiency and autonomy (McMichael 2008). The relationships forged during this period reflected a form of empire, characterized by Maier as a "particular form of state organization in which elites of differing ethnic or national units defer to and acquiesce in the political leadership of the dominant power" (Maier 2006: 33). Crucially, it involved institution building, the dissemination of cultural values, and was backed by the material political and economic power of the United States.

The most consequential institutional building during this period culminated in the 1944 establishment of the Bretton Woods system, which included the International Monetary Fund (IMF), World Bank, and the General Agreement on Tariffs and Trade (GATT). Providing the institutional foundation on which the economic development of postcolonial countries would be linked to the priorities of elites in the core capitalist countries, a primary goal of these efforts was to maintain access to resources and markets in the developing world. The overarching strategy guiding the institution building was to improve economic conditions to prevent the spread of communism and to stimulate the demand for goods and services originating in the First World. More specifically, the strategy involved supporting economic growth in postcolonial nations by providing loans and technical expertise to enable them to expand their primary exports and earn the foreign currency necessary for importing First World infrastructural technologies and commodities. Based on Keynesian macroeconomic principles that had become dominant following the Great Depression, the Bretton Woods Institutions moved funds to countries that needed purchasing power, thus "lubricating the world economy" (McMichael 2008: 59).

This model of development would begin to reverse the colonial division of labor created by the Europeans whereby colonies provided mostly primary goods to the metropole, with manufacturing moving to lower cost sites of production in the Global South. The urban bias of the project, which required importing highly subsidized food products from the First World to feed urban workers, destroyed agricultural self-sufficiency, as large agribusiness corporations drove farmers into bankruptcy. These processes would further tie the fate of newly sovereign postcolonial nations to that of the United States and former imperial powers, creating new economic dependencies. Crucially, these developments would also establish the foundation on which the next stage of (neoliberal) economic restructuring would build.

The development strategy led by the United States in this period corresponded to a world system and structure of accumulation characterized by a particular dominant mode of social relations of production, which placed historically specific requirements on the nation state (see Cox 1987: 397–398). Concretely, the liberal state of the previous epoch was transformed into a welfare state and called upon to resolve the contradictions that threatened the viability of capitalism by promoting nationally oriented economic growth through Keynesian economic principles, providing a basic social safety net for the working class and poor in order to quell social unrest. Internationally, the strategy involved incorporating newly sovereign states into a system that prioritized national development and, reflecting Keynesian ideals, stimulating demand for Western goods and services through policies designed to generate purchasing power in states and regions lacking it. Oftentimes, these policies sacrificed the autonomy and self-sufficiency of the "beneficiaries," leading to contradictions and, ultimately, crisis, which would surface as the postwar economic boom began to come to an end.

As the postwar economic boom began to wind down in the late 1960s and early 1970s, crisis once again threatened the stability of the capitalist system, and the gains made by labor following the Great Depression were interpreted as barriers for accumulation (Harvey 2006a). At this point, the United States again led efforts to resolve the crisis and reconstitute the conditions for accumulation, this time through neoliberal restructuring. Specifically, the restructuring included dismantling the barriers to flows of both financial and productive capital. Following the removal of such barriers, capitalists positioned to take advantage of the cost savings associated with reconfiguring supply chains across multiple jurisdictions began engaging in wage, regulatory, and fiscal arbitrage, an opportunity that existed because of the uneven development of capitalism generated by the earlier period of imperialism and the associated processes of primitive accumulation. The jurisdictional exit option introduced by liberalization enhanced the structural power of mobile capital as governments considering adopting new regulations or taxes faced the threat of capital flight. Reinforcing the shifting power dynamics of the social forces, working-class solidarity was eroded, as the geographical dispersal of the production process fragmented the working class in national contexts and exacerbated cleavages between workers in different jurisdictions.

In addition to extending production processes across jurisdictions, the 1971 abandonment of the dollar-gold standard, established as part of the Bretton Woods system, and its replacement with a system of floating currencies, provided the impetus for the creation of a variety of new lucrative financial products. Initially designed to enable firms to hedge against the risk of currency fluctuations and lock in rates through the purchase of derivatives, a growing market for speculative financial products provided another outlet for accumulation. As global financial institutions imposed requirements on countries forcing them to remove capital controls, as well as other regulations designed to stabilize currency and financial markets, opportunities were introduced to speculate against fluctuations in the value of currencies and other commodities (Stiglitz 2002). These developments similarly reflect vestiges of imperialism, as the processes that emerged from decolonization and Western-

led development created the conditions in which global financial institutions gained access to domestic policymaking in postcolonial countries, enabling dominance to be exercised while formal sovereignty was maintained.

The liberalization of finance also increased the structural power of capital, providing the backdrop against which large capitalist entities diversified their holdings. The integration of financial and industrial capital rendered largely obsolete the cleavages that historically existed between these two fractions of capital. The combination of the erosion of working-class solidarity and the increase in the structural power of transnational capital provided the conditions under which capitalist accumulation was reestablished, albeit in a qualitatively different world order than that which previously existed. Specifically, the shift from a capitalist system based on flows of capital and the trade of goods between discrete nation states to one characterized by a system of globalized financial flows and the transnationalization of production and supply chains redefined the relationship between capital and territoriality.

The transition to a new regime of accumulation, however, is dependent on the outcome of class struggle (Jessop 1990: 308–9). With the cleavages between traditional fractions of capital having become less salient given firms' diversification of activities across both sectors and states, transnational class alliances were constructed, disrupting the existing national-based class structures (Robinson 2004: 49–54). Given that the capitalist state is tasked with reproducing the conditions of production (Robinson 2004: 87), these developments transformed the state to correspond to the imperatives of the dominant social forces. The state thus ceased to serve as a national container for mediating class compromise in the ways that it did in the previous epoch. Instead, it came to function to advance the interests of an increasingly dominant transnational capitalist class (TCC), namely, universalizing the most advantageous conditions for global circuits of capital. ISDS would become one significant component of this global strategy.

The Transnational Capitalist Class and ISDS: Continuity Between Imperial Past and Present

Vigorous debates are waged over both the composition and even the existence of the TCC (see Robinson 2004). It is proposed here that the TCC consists of a class-conscious group of transnational elites, including leaders of transnational firms, as well as sympathetic political actors, scholars, and media executives, who share an interest in global, rather than national, circuits of capital. Advancing its interests through a network of national and supranational institutions that function as a "collective authority for a global ruling class," and institutionalize class relations between capital and labor, globally (Robinson 2004: 88; 2014), the TCC articulates power differently than the nationally rooted capitalist classes of earlier periods. Moreover, while imperialist states of the past exercised direct control over peripheral populations based on accumulation strategies corresponding to the interests of national-based capitalists locked into competition with rival capitalists in other jurisdictions, the leaders of capitalist states exercise new forms of political control that are driven by a logic that is not rooted in territorial-based competition. While the United States, for example, is heavily implicated in establishing the conditions for capitalist accumulation, globally, these processes should not simply be understood as a project driven by the state on behalf of capital rooted exclusively in its territory.

Indeed, the state is constituted by the existing social forces and mediates the interests and demands of the various groups, with policies reflecting the balance of power among them (Poulantzas 1976; Cox 1987; Jessop 1990). The neoliberal state thus reflects the increasing dominance of transnationally oriented capitalists relative to other social groups, including capitalists whose operations are limited to the domestic market. In this way, while the United States, having emerged politically dominant from the two World Wars, has served as the "point of condensation for pressures from dominant groups to resolve problems of global capitalism" (Robinson 2004: 138),

this exercise of power neither relies directly on traditional forms of domination, nor does it imply that such efforts are driven by a competitive interest in maximizing the state's power vis-à-vis other states.

Indeed, the logic of the accumulation strategy that has emerged is transnationally oriented and thus relies on the development of supranational institutions and practices to secure the conditions of its reproduction. With barriers to capital flows eroded, transnationally oriented capitalists sought to construct hegemony, as understood by Antonio Gramsci, during this period by articulating their specific interest as in the general interest (Gramsci 1971), namely, the notion that economic growth is sacrosanct and that foreign investment is necessary for achieving it. Moreover, as capitalism reached the limits of its geographical expansion, having been spread to nearly all corners of the globe, the maintenance of accumulation came to increasingly depend on subjecting spheres to the logic of the market that was not previously commodified in a process of intensive capitalist enlargement (Robinson 2004; Harvey 2006a; Panitch and Gindin 2005). From health care and education to the environment, living organisms, and even investment risk, the increasing commodification of social relations has, in a dialectical process, amounted to what David Harvey identified as accumulation by dispossession (Harvey 2006a). Specifically, as a new range of social and political goods are subjected to the market, groups lacking sufficient economic resources are dispossessed of their access to them. These processes have, unsurprisingly, generated popular opposition sufficient, in some cases, to force the reversal of such policies. It is in light of this reality that the demand for a supranational legal and regulatory structure to instill neoliberal discipline, globally, began to be articulated by the increasingly dominant TCC.

While these processes of intensive capitalist enlargement are not rooted in territory in the same way as those associated with extensive, or geographic, enlargement, there is indeed a nexus between the two sets of processes. Previously, capitalist states, driven by competition and compelled to promote their industrial growth, undertook expansive strategies to procure raw materials and secure markets for surplus capital. The associated processes of political control, subjugation, and extraction established a particular colonial division of labor that would eventually be restructured into a decentered system of domination universalized to secure the most beneficial conditions for accumulation in the epoch to follow. The intensive enlargement of capitalist relations has thus relied upon the uneven development generated by the imperial practices of outward expansion and control of earlier periods. In this way, rather the North-South divisions of the global class structure disappearing, they still function as sites of opportunity for capitalist accumulation, albeit through different, and decentered, modes of domination.

In much the same way that the era of formal colonialism produced elites in local contexts that benefited from their relationship, however, subordinate, to the imperial power, well-positioned transnational elites in the Global South share a common interest in global circuits of capital, along with other transnationally oriented elites in other jurisdictions. Thus, to the extent that the conditions generated through the uneven development of capitalism in their "home" jurisdiction provide a basis for accumulation, their allegiance is to the shared agenda in its promotion.

As Russell, Noronha, and D'Cruz note in their study of the emergence of a TCC in the information technology sector in India, a distinction should be made between the current era and that of previous forms of imperialism. Noting that Indian capital is developing "not so much in competition with other national capitals but in conjunction with their evolution" (Russell et al. 2016: 115), such a view is in contrast to the classical theories of imperialism advanced by Lenin and Hobson, which conceived of rival national capitals, as well those associated with world-systems analyses (Wallerstein 1974; Chase-Dunn 1998). Instead, the conditions created by neoliberal restructuring should be understood as a historical rupture that witnessed the ascendance of the TCC, which emerged from historically specific processes of economic exploitation culminating in

the transnationalization of production and finance (Cox 1987: 355).

It is in this context that ISDS should be understood. While the effects of imperialist practices of past eras are imprinted in the modes of domination articulated in the current epoch, the regime serves the historically specific disciplinary requirements advanced by the TCC, namely, those associated with the dominant social relations of production characterized by the decentering of production and finance. As one component in a diverse, decentered network of institutional apparatuses, ISDS thus represents the establishment of a supranational legal regime that both sanctions and articulates the social relations of production at the global level (Hall 1978; Nichols 2018: 246). In this way, it exists as a coercive form of political authority, the strategy of which is to manage and protect the processes associated with the transnationalization of capital through internalized, universalized interventions (Robinson 2004: 139; Panitch and Gindin 2005: 104). Functioning similarly to modes of discipline that established and protected the dominant social relations of production in earlier epochs, it serves to institutionalize neoliberal ideology, globally, and insulate such policies from social contestation and political reversal. In this way, ISDS should not be understood as an extension, or deepening, of empire but rather as a coercive disciplining mechanism for an "imperial machine defined by a whole series of new characteristics, such as the unbounded terrain of its activities" (Hardt and Negri 2000).

Expanding Property Rights Under ISDS: Accumulation by Dispossession

In the wake of hundreds of disputes brought under ISDS challenging environmental and other regulations (see Public Citizen 2018) since the adoption of NAFTA and other agreements that include such provisions, debates have been reinvigorated over the appropriate distribution of costs between the public and the private associated with governmental measures. Efforts to shift the costs away from private actors at significant expense to the public have taken shape in concerted political maneuvers to expand the boundaries of property rights beyond the standards previously established by US domestic courts, which have served as the juridical foundation for the arbitration of ISDS disputes at the international level (Nichols 2018). Conservative legal theories advanced, first, by Wesley Hohfeld (1919) at the early part of the twentieth century and later by Joseph Sax (1964, 1971), Frank Michelman (1967), and Richard Epstein (1985) have provided the conceptual framework used to justify the broadening of property rights and ultimately investor rights, under ISDS. Viewing the government as in competition with owners of private property over public use, these legal scholars sought to replace the patchwork of juridical tests with a single test that would standardize and marketize the private-public allocation of costs generated by regulatory measures (Coase 1960; Michelman 1967).

These ideas have been used to legitimize the notion that property need not be of a physical nature but rather should be conceptualized as a set of rights corresponding to an abstract form of economic value, represented as a bundle of sticks, the diminution of which amounts to an act of expropriation if a given act impacts the value beyond some theoretical threshold (Nichols 2018). Business groups advocating for ISDS have echoed these legal principles and selectively cited US domestic court rulings that reflect the most expansive conceptualization of property rights and, ultimately, expropriation. The jurisprudence remains far from settled, however, and protracted political struggles have been unfolding around the definition of property rights as it pertains to findings of expropriation under ISDS.

Lying at the heart of the ongoing struggles around property rights in the context of ISDS is the interpretation of a few key provisions. First, ISDS provisions, such as those that exist in the NAFTA, provide a highly ambiguous definition of the term *investment*, the defining of which is necessary for determining what exactly is being protected under the regime – and what is not. For example, Article 1139 of the NAFTA seems to

conflate the term *investment* with *property*, thus providing an opening for arbitrators to find a violation of property rights in any case of state interference with the anticipated benefits associated with a broadly defined investment, including those of both a tangible and intangible nature. It must only be demonstrated that an investor has put assets at risk and that they are somehow bound up with the fortunes of another country for something to be categorized as a protected property right, or investment, under ISDS (Posner, Interview 2011). Included in this category would be anything from registering a patent to making a series of decisions with the expectation that a given set of risks would be rewarded, opening up the door to disputes beyond those associated with control over physical property to intangible, and even speculative, assets, such as portfolio investment, future earnings, and market share. Regulations are inherently adopted in response to new information or conditions and generally generate some cost to private property. For this reason, the authority to adopt such measures has historically been protected under the state's police powers. Enclosing the regulatory environment and treating any interference with it as a violation of property rights that requires public money be used to compensate private investors thus represent the socialization of the normal business risks required of investing.

Second, the interpretation of the term *expropriation* itself lies at the center of the debate over ISDS. Article 1110 of the NAFTA states:

> No party may directly or indirectly nationalize or expropriate an investment of an investor of another Part in its territory or take a measure tantamount to nationalization or expropriation of an investment ('expropriation') except: a) for a public purpose; b) on a non-discriminatory basis; c) in accordance with due process of law and Article 1105(1); and d) on payment of compensation in accordance with paragraphs 2 through 6. (North American Free Trade Agreement, Chapter 11, Article 1114)

The legal ambiguity of the term "expropriation" and "measures tantamount to nationalization or expropriation," combined with the fact that they remain mostly undefined in the treaty text, means their definitions have been evolving "in the absence of a doctrinal basis" (Holbein and Ranieri

2008: 25). The stakes over the interpretation of this controversial legal concept are high, as the question of when a measure should be categorized as a non-compensable government regulation, protected under the state's police powers, hinges on such a determination. In particular, the notion of an act being "tantamount to expropriation" remains one of the most controversial and ill-defined aspects of ISDS provisions, with debates unfolding over whether it implies a higher standard of treatment for investors that requires compensation for any act of the state that generates private costs beyond some point.

A third set of issues is related to the invocation of three related ISDS obligations alongside Article 1110 on expropriation, the combination of which has the effect of expanding investors' rights. Under NAFTA, for example, Articles 1102, 1103, and 1105 on National Treatment, Most Favored Nation, and Minimum Standard of Treatment, respectively, were adopted to prevent discrimination based on nationality and to ensure that some ambiguously defined minimum standard of treatment be afforded to foreign investors (NAFTA 1993). Significant debate has unfolded, however, over the question of whether governments are required under customary international law to provide a standard of protection that is higher than that which is guaranteed to domestic-based companies and investors (OECD Working Papers on International Investment 2004). Adding to these debates, more recent ISDS provisions have included a "fair and equitable treatment" (FET) standard, which has been interpreted by some to require an even higher level of protection than that which exists under customary international law, as it authorizes disputes to be brought if investors find that their "legitimate expectations" have been violated with respect to the future use of their investment (Brown 2013). A frequent litigation strategy has emerged to use the FET standard in conjunction with the expropriation provisions in order to challenge what investors view as overly intrusive government acts. These provisions thus serve as a locus of struggle around the expansion of property rights and, ultimately, investors' rights in host countries.

Finally, the circuitous logic of the ISDS provisions complicates the general exceptions included to ostensibly empower governments to regulate for the public good. For example, while NAFTA Article 1114(1) holds that provisions must not be construed in such a way that parties would be prevented from taking actions required to ensure investments are undertaken in an environmentally sensitive manner, it goes on to state that measures must otherwise be consistent with the chapter's requirements (North American Free Trade Agreement, 32 I.L.M. 1993). The uncertainty over whether regulatory measures are protected under the state's police powers means that any measure has the potential to trigger the compensation requirement if other provisions are violated, including those related to investors' expectations, the degree of economic impact, and other such considerations.

Given the juridical ambiguity of ISDS requirements, the assessment of the appropriate balance between the private and public costs associated with regulatory measures has fallen to tribunal arbitrators, who are tasked with evaluating the merits of a given dispute in light of the evolving, and generally inconsistent, jurisprudence. Specifically, they are tasked with adjudicating the threshold between a legally permissible regulatory measure that merely represents a diminution of value and does not give rise to expropriation and an act that constitutes a property rights violation and, therefore, expropriation. In arbitrating such disputes, tribunals apply one of two legal litmus tests, or a combination of the two, to determine whether the state named in the dispute must provide compensation to the affected investors for the costs associated with the measure. One test focuses on the purpose of the law or regulatory measure, implicitly acknowledging the right of policymakers to regulate for the public good, as long as the measure is nondiscriminatory and not of a protectionist nature. A second test focuses exclusively on the economic effects of the measure on the dispute-bringing investor. To the extent that arbitrators strictly apply the second test, eschewing the first test's evaluation of the measure's purpose, the government named in the dispute will be required to compensate in nearly all cases if the investor is impacted beyond some theoretical threshold.

As Marx identified, property relations represent the legal expression of production relations (Marx 1894). Given that states use law to direct and sanction the relations of production and exploitation through the construction of rights around private property (Poulantzas 1978: 322, 324), juridical ideology lies at the heart of class struggle (Edelmann 1973: 22–23). The struggles around ISDS should thus be understood as class based, with the regime functioning to extend capitalist relations into new realms, subjecting social, environmental, and economic protections to the logic of the market, and dispossessing social groups of the ability to translate popular demands into public policy. Codifying and articulating the social relations of production at the supranational level, the regime thus locks in market discipline and establishes a "worldwide institutional grid that offers transnational capital multiple exit options within putatively suboptimal regulatory environments (Brenner et al. 2014: 129).

The pattern established by arbitrators in their choice of litmus tests is thus highly revealing for what it signals about the nature of the class struggle playing out around property rights in the context of the ISDS regime. An analysis of the NAFTA disputes arbitrated thus far (for a survey of disputes, see Nichols 2018) suggests that tribunal arbitrators have selectively drawn from a diverse range of opinions issued from US courts, overwhelmingly applying a litmus test that interprets expropriation as broadly as possible, thus eroding the distinction between non-compensable regulations and state acts defined as expropriation. Consequently, any governmental act adversely impacting private assets beyond some threshold is likely to be categorized as expropriation in the face of an ISDS dispute. Crucially, the evidence also suggests that, by conflating the terms *property* and *investment*, they are establishing new categories of intangible property that include highly speculative assets and market share.

These developments provide an example of the establishment of a "commodity fiction" (Polanyi 1957), a narrative that has been used to advance a

myth of the existence of a new set of property rights where none formerly existed. By treating the maintenance of a business-friendly regulatory environment as a legal obligation, ISDS confirms marketization as the sole means for apportioning the costs generated by a given measure between the public and the private. Moreover, it establishes a new set of property rights where they had not previously existed, delinking political, social, and economic resources from their "real historical existence or processes of production" (May 2000: 22–23).

Conclusion: ISDS and Contemporary Global Capitalism

The direction in which ISDS jurisprudence has been developing has dramatic consequences for what it reveals about the dominant accumulation strategy in the neoliberal era of global capitalism and the form of domination that has emerged to secure the conditions for its reproduction. As Stuart Hall noted, the particular articulation of the social relations of production depends on the current stage of capitalist accumulation (Hall 1978: 186–194). ISDS was developed in a historically specific context characterized by the culmination of neoliberal restructuring that had been pursued in response to the capitalist crisis of the 1970s and had led to the rapid decentralization and, ultimately, transnationalization of production and finance. It is in this context that the regime came to sanction and articulate the social relations of production at the supranational level in order to secure the most beneficial conditions for capital wherever it may flow. Universalizing neoliberal policies and insulating them from popular debate and decision-making, ISDS serves as the "political-juridical counterpart to disciplinary neoliberalism" (Gill and Cutler 2014: 5). It does so, specifically, by intensifying the scope of market discipline, subjecting the costs associated with the regulatory environment to the market and socializing them to the public.

Given the relationship between the juridical-political and economic spheres, these developments have strong implications for what they

signal about the relationship between the global and the national, particularly as it pertains to the commodification of social relations underpinning the expansion of capitalism (Gill 1998; Robinson 2004; Nichols 2018). Given the exhaustion of the geographic expansion of capitalism as an accumulation strategy following the incorporation of nearly every corner of the globe into the logic of capitalism, ISDS should be understood as a mechanism to secure and safeguard the conditions for intensive enlargement as the commodification of social life is deepened. Rather than intervene directly in formally sovereign jurisdictions as imperial powers did in the past, an increasingly dominant TCC has developed a coercive tool by way of ISDS that serves to universalize neoliberal ideology and redistribute power from other social groups, transnationally. As noted by Robinson, global capitalism "requires an apparatus of direct coercion to open up zones that may fall under renegade control, to impose order, and to repress rebellion when it threatens the stability of the system" (Robinson 2004: 137).

As barriers to the flow of capital were largely abolished in the latter part of the twentieth century, the uneven development of capitalism resulting from centuries of imperialism has provided the conditions under which new strategies of accumulation were developed. New dominant social modes of production emerged with the deterritorialization of production and finance, creating the impetus for alternative forms of domination and control that would universalize neoliberal discipline and secure the conditions for accumulation in the face of opposition that might emerge in response. ISDS has therefore provided one such tool, enabling coercion to be exercised by the TCC, while formal sovereignty is maintained, one of many such qualitative differences between the current epoch of global capitalism and earlier periods of imperialism.

Introduction

Iraq has had a unique, extraordinary, and contradictory historical relationship with international law and world order. From its inception as a modern and sovereign state in 1932, it was considered the pride of the new postwar order – a triumph of the "peaceful" workings of the international institution of the Mandate system of the League of Nations. By the first Gulf War in 1991 and later the 2003 invasion, it was labeled a "rogue" and "outlaw" state that needed to be put in its place by the "civilized" world through the instruments of war, economic sanctions, and unilateral invasion. This chapter will explore this contradictory relationship and its dynamics in history. The manner in which imperialism operated in Iraq could not be understood without a closer look at its relationship with international law and its institutions from 1921 to the 2003 Iraq War, as well as the geopolitics of political economy. My argument is that Iraq's continuous centrality to core questions of world order, whether during the Mandate period, the first Gulf War, or ultimately the 2003 invasion, were no coincidence but rather illustrates Iraq's (and the region's) geopolitical and economic importance to imperialism and the interests of empire.

This chapter will show how certain questions of international law, including claims of "newness" of world order (in particular during the Mandate period, the 1991 Gulf War, and the post-9/11 "War on Terror"), could be understood in relation to the history of imperialism in Iraq. The tracing of how international law and its concepts continued to further imperialism puts emphasis on the continuities rather than discontinuities of the imperialist project in relation to the modern history of Iraq. The shifting patterns of the international legal order and the various interpretations of "world order" during the past century will be explored in the context of Iraqi history. This chapter will show how the case of Iraq reveals the manner in which questions of international law were principally linked to the economic control and exploitation of the natural resources of the region and in turn to the global political economy. Iraq's geographical location explains its centrality to imperial rivalries during both world wars and the Cold War as it lay at the "crossroads between Europe and the Mediterranean to the west and inner Asia to the east," as well as being a "connecting route" to the Indian Ocean and bordering countries to the southeast (Penrose

and Penrose 1978). It was not only Iraq's unique geographical location but its geopolitical importance in relation to its rich natural resources that would turn it into a theater for war and ultimately a target of the neoliberal transformation of its economy.

This retelling of Iraqi history will rely on Third World Approaches to International Law (TWAIL). TWAIL scholarship and methodology has consistently revealed how colonialism and imperialism are in fact constitutive of international law and its discipline (Gathii 2011; Anghie 2004). In other words, international law could only be grasped by studying the historical processes of imperialism that were central to its development and expansion. TWAIL reveals that imperialism and the expansion of capitalism in the Third World were historically juridified through international law and its processes. As Makau Mutua wrote, "[t]he construction and universalization of international law were essential to the imperial expansion that subordinated non-European peoples and societies to European conquest and domination" (Mutua 2000). TWAIL scholars assert that international law was born out of this "colonial encounter" and that in turn European imperial expansion had enduring consequences on modern international law (Okafor 2008).

There are two ways that TWAIL will be used in this chapter. The first is with regard to history and its interpretation. TWAIL scholarship has used a historical method to explore the relevance of the history of imperialism to modern international law and to expose how deeply imbricated international law is with imperialism. This "turn to history" traces certain continuities to help us understand international law today. TWAIL scholars consider the historical method as vital to contextualize certain contemporary legal practices and concepts, tracing their (inter) connections with the past. Anghie, one of the most notable TWAIL scholars, has traced today's modern international law and the doctrines of Francisco de Vitoria, which were used to justify the Spanish conquest of the indians of the Americas in the sixteenth century (Anghie 2004). By connecting and contextualizing a series of historical events and eras starting with

fifteenth-century Scholasticism, the 1884-85 Berlin Conference, the Mandate system of the League of Nations, the Bretton Woods institutions, and all the way to the invasion of Iraq, Anghie emphasizes that what might appear as new in international law and world governance is in fact fairly old. Furthermore, he illustrates how questions of "governance," "sovereignty," and "the rule of law" have historically and intrinsically been linked to capitalist pursuits of commerce and trade. This chapter will undertake a similar analysis of Iraqi history by showing how capitalist exploitation of Iraq and control over the region was the driving force of imperial powers, and this in turn would be translated into questions of world order and international law.

The second way in which this chapter will use the TWAIL perspective is by deconstructing the claim of "newness" of world order that was used to justify the necessity of reforming the fundamental norms of international law and its order. Obifor Okafor has revealed how claims of "newness" were in fact a political maneuver used by Great Powers, more recently the United States, to reassert imperialism and justify the 'war on terror' and the invasion of Iraq – responses that would otherwise be untenable under international law. A close look at the workings of the imperialism of international law in Iraq reveal how these claims of "newness" were made to mystify reality. In 1932, Iraq's advancement through the Mandate process into a "civilized" sovereign state, becoming a member of the society of nations, was heralded as a prime example of the coming of a "new" world order whereby the peaceful settlement of the colonial question led to the formation of new states. The reality of course was quite different as Iraq's sovereignty was a legal fiction. Iraq remained under a disguised form of imperialist control sanctioned by international law. A similar claim of newness occurred in 1991 when after the fall of the Soviet Union, the US decided to wage a war on Iraq to "liberate" Kuwait. This event was claimed to be the assertion of a "New World Order," where the rule of international law would be imposed by force, while the UN Security Council was to finally become effective in advancing "world peace and security." The fact

was that it merely intersected with the consolidation of US imperial power and interests in the region. By 2003, the US invasion of Iraq under the (illegal) doctrine of "preemptive war" or the so-called Bush doctrine was considered to have ushered yet another shift in (some called it a crisis of) world order, whereby imperialism would redefine itself in relation to international law.

A broad sweep and synthesis of the modern history of Iraq during some of its most crucial periods from the Mandate until the invasion will therefore reveal how these various claims of "newness" of world order by imperial powers were not new after all. Iraq and its people were always victims of colonialism and imperialism, especially through the mechanisms of international law and its institutions, from its establishment as an independent modern and "civilized" state in 1932 up until its classification as a "rogue" state deserving of economic sanctions and finally its complete and utter destruction after the 2003 invasion and occupation with the aim of reintegrating it into the global capitalist economy.

Iraqi "Independence" Through the Mandate System of the Interwar Order

The first significant event in the history of modern Iraq in relation to world order was the establishment of a sovereign state of Iraq in 1932 through the protracted process of the Mandate system of the emerging postwar international order following the Treaty of Versailles, the 1919 Paris Peace Conference, and the formation of the League of Nations. The Mandates system was consequently established after the end of World War I with the intention of creating a lasting peace in the former territories of the German colonies in Africa, Asia and the Pacific Ocean, including the Arab provinces of the Ottoman Empire. This system was based on Article 22 of the Covenant of the League of Nations and provided for a "sacred trust of civilization" to promote the well-being of the natives of these colonies, which were said to have been "inhabited by peoples not yet able to stand by themselves under the strenuous conditions of the modern

world" (Pederson 2015 Mazower (2009)). The idea of this "civilizational" process of the Mandate system reflected the idealism of the League in attempting to organize a peaceful order and to prevent war. The mandatory power was meant to govern and advise the administration of the mandated territory until its people were able to stand on their own. It was also meant to protect the native populations from pillage, exploitation, and annexation that would have been acceptable in the former Westphalian order. Iraq was designated as an "A" Mandate, as opposed to a "B" or "C" Mandate of Africa and the Asian Pacific. The "A" Mandates were recognized as being developed and "semi-civilized" enough to gain "provisional" independence sooner than the other designations, following tutelage by the mandatory power, which had a supposedly limited role of giving administrative and technical advice.

Britain, which had already occupied Iraq during the war, was chosen as Iraq's mandatory power at the San Remo Conference in April 1920. The native population of Iraq however was so vehemently opposed to any form of control, "mandatory," or otherwise, that a popular revolution broke in 1920. It was only after this revolution was ruthlessly crushed that Britain accepted the idea of a national self-government as being necessary to the fulfillment of its mandatory obligations. The Hejazi, Emir Faisal was eventually handpicked and installed by the British government to be the future King of Iraq at the 1921 Cairo Conference. The mandatory relationship was expressed in the form of the first Anglo-Iraq Treaty signed in 1922. This treaty incorporated the provisions of the Mandate, although it expressed Britain's mandatory relationship vis-à-vis the League, but not vis-à-vis Iraq (Quincy 1930). The instrument of the treaty was used to distance Iraq from any reference to the much-hated Mandate, while it maintained an institutional structure that gave the British significant control over the Iraqi state. The Treaty required that the Iraqi government appoint British advisors to shadow every ministerial post, creating a parallel advisory system, which ensured British influence over the Iraqi state and its institutions. Furthermore, the 1925 Constitution or Organic Law guaranteed that the provisions of the Treaty

would be upheld as it allowed wide executive powers to the king and cabinet. It limited the state's constitutional structures and gave the king the power to veto legislation and override parliament. The 1922 Anglo-Iraq Treaty, which was an instrument of international law, therefore gave the British wide room to influence and control the Iraqi state (Sluglett 2007).

On September 1929, the British government agreed to support Iraq's entry to the League of Nations and in turn its formal independence by 1932 (Pederson 2015). A new treaty was ratified in 1930. The 1930 Anglo-Iraq Treaty maintained a "close" alliance between the two states. The provisions of the Treaty limited Iraq's sovereignty, especially with regard to Britain's right to move troops on Iraqi soil, as well as the employment of British advisors. The economic dimensions of the Treaty were couched in military terms, while the administration of the strategic sites of the Port of Basra and the Iraq Railways were left under British semi-autonomous control. In Geneva, the Permanent Mandates Commission (PMC), the main body of the League responsible for supervising the Mandates, determining whether Iraq had reached the "degree of maturity" acceptable for independence, began its deliberations. The British High Commissioner, Henry Dobbs, submitted a report to the PMC, which concluded that Iraq had "all the working machinery of a civilized government" and could "stand alone" administratively, even if it cannot do so militarily or economically, and that was sufficient (Pederson 2015). The British government claimed that it had appropriately fulfilled its obligations as a mandatory power.

Although the PMC were skeptical throughout its deliberations, it unanimously agreed to admit Iraq into the Society of N ations after requiring a declaration confirming Britain's continuing "moral responsibility" to the implications of Iraq's independence. In October 1932, Iraq became the first mandated state to gain formal independence through the processes of the Mandate system. The reasoning that the members of the PMC, who as lawyers and jurists were well aware that they were making international law, reveals an attempt to construct a unique doctrine of sovereignty that ensured the geopolitical and economic dominance of Iraq and the region as a whole, especially when it came to access to oil (Hammoudi 2016).

Hence, although Iraq not only appeared independent, but also was independent under international law, in reality it remained (economically, militarily, politically, and geopolitically) under imperial British dominance and control. Iraq's sovereignty was swiftly given by the Great Powers through the League of Nations with the main purpose of ensuring Western access to oil through a legal mechanism that was enshrined under international law and in line with the principles of the world order of the time (Hammoudi 2016). In fact, Iraq's sovereignty was meant to be a model for the entire Middle East, a region with a unique geopolitical significance for imperialism, especially given the importance of its oil deposits for the capitalist world economy.

The 1930 Anglo-Iraq Treaty and its corresponding doctrine of (limited) sovereignty in international law had severe consequences on the people of Iraq, especially the working class and the poor peasants. The curtailment of Iraq's sovereignty and Britain's ability to influence and intervene in nearly all the affairs of the Iraqi state allowed a small clique of *Sherifian* ex-Ottoman officers, to run the government, maintaining their political power and in turn British imperial interests. The Treaty (along with the oil concessionary agreements) was the legal mechanism(s) by which oil was to be extracted and transported westward across the desert to the shores of the Mediterranean, while Iraqi labor was superintended to ensure the smooth operations of the infrastructure of economic dominance.

The most advanced sectors of the working class were concentrated in the colossal industrial enterprises and privately owned and administered enclaves of the oil fields in Kirkuk and the semi-autonomous Port of Basra and railway system. Despite the fact that these wage earners were in better conditions than their counterparts elsewhere (not to mention the serf-like conditions of the peasants), they embodied the contradictions of the capitalist system in the colonies, living under wretched conditions, low wages, and racism (Batatu 2004; Hammoudi 2016).

The oil workers, for instance, lived in miserable conditions within company camps that were segregated from the larger gated villas where British staff resided. This colonial-type segregation was even more evident in the 12 mini-company towns that were built across the desert in parallel to the (Kirkuk-Haifa-Tripoli) oil pipelines (Mitchell 2011; Bet-Shlimon 2019). The wage gap between Iraqi laborers and British staff was enormous. Moreover, Iraqi workers were frequently discharged without notice and had no protections despite the 1936 Labor Law, a basic law that was passed but never applied by the government or the company. Such a system of extreme class exploitation was a direct result of the legal arrangements described above. Similar semi-colonial legal structures governed the railway system and the Port of Basra, both managed by semi-autonomous administrations headed by British administrators and experts. The Treaty ensured that these strategic sites would remain under British control after Iraq's formal independence. Like their counterparts in the oil fields, the railway and port workers received inadequately low wages, while they lived in wretched conditions, some in tiny mud huts in the outskirts of the cities. The processes of the international institution of the Mandate and the Anglo-Iraq Treaty would therefore continue to affect common Iraqis in their everyday lives even after so-called independence.

It was not surprising then that the Iraqi working class would begin to organize themselves under the guidance of anti-imperial groups such as the illegal Iraqi Communist Party (ICP) and trade unions to fight for better conditions, simultaneously waging an overall struggle against the imperialism embedded in the international legal structures of the Treaty. Beginning with the railway workers, concentrated in the *Schalchiyyah* workshops in Baghdad, who organized the first major postwar labor strike in 1945, demanded higher wages and the right to form their own unions. Similarly, the port workers drafted a petition, specifically calling for the consistent application of the labor law to all grades of port workers, especially the most vulnerable cargo workers who were governed by a piecemeal system of employment (Batatu 2004). The port

workers organized their first experiment in strike action in May 1947, which was swiftly suppressed by police. The oil workers' union waged some of the most militant strike actions against the Iraq Petroluem Company (IPC). Most famously, during the Gawurbaghi strike of 1946, when municipal police coordinated with the British Embassy and the IPC to violently repress the strike, leading to the death of at least 18 workers (Bet-Shlimon 2019). Although all these strikes were violently suppressed, these experiences were formative for the Iraqi labor movement and would be of utmost value for the wider nationalist and anti-imperialist struggle that erupted in 1948.

The Wathba of 1948: The Spark of Revolutionary Anti-colonial Struggle in Iraq

After Iraq gained its independence in 1932, the state was still quite unstable as various military factions struggled to gain power from those who were seen as too compliant with British imperial interests. In 1936, a military coup led by General Baqr al-Sidqi led to the formation of a short-lived government alliance with the progressive social democrats. In April 1941 another coup led by the Arab nationalist Rashid al-Gaylani overthrew the pro-British monarchy until it was reinstalled by a second British invasion and occupation a month later.

The Iraqi people persisted in their struggle against the 1930 Anglo-Iraq Treaty, the juridical manifestation of imperialism in their country. The *Wathba* uprising of 1948, which was described by Hanna Batatu as the "the most formidable mass insurrection in the history of the monarchy," was the moment when the people's anti-colonial and anti-imperial struggle against the social and legal order sparked the processes that would lead up to the 1958 July Revolution, which would overthrow the British sponsored monarchy a decade later (Batatu 2004). Led by an alliance of workers and students, massive demonstrations were sparked on the streets of Baghdad by news of the signing of the Portsmouth Treaty, which was meant to revise the 1930 Anglo-Iraq Treaty to make it more consistent with the UN Charter. However, the reality was that this Treaty maintained the British connection under a new

guise, as it gave British "experts" a say in Iraq's military planning and maintained British military bases on Iraqi soil. The Portsmouth Treaty turned out to be a mere extension of the 1930 Treaty with "new-fashioned terminology," which reestablished the continuation of British intervention in Iraqi affairs under the new liberal international legal order (Batatu 2004).

The *Wathba* was one of the largest mass demonstrations in the history of the Iraqi monarchy. It was a culmination of all the previous struggles by the workers and students that seemed to be confined to the workplaces and universities. The anger spilled onto the streets. The well-organized movement, which was led and guided by a couple of people's steering committees compromised a heterogeneous group of Iraqis and united the working class, the underclasses and the middle class (whether communists, social democrats, or Arab nationalists). Iraqis from all walks of life – students, lawyers, workers, and squatters – marched together to oppose imperialism and its preservation by the ruling class. The movement called for the annulment of the new Treaty and the resignation of the cabinet. The massive *Wathba* strikes and demonstrations spread with fire-like intensity to other parts of the country. Fearing all-out revolution, the regent decided to renounce the Treaty in a public statement. This splintered the movement as right-wing nationalists were satisfied, while the left saw it as a mere tactic, calling for more than the mere cancellation of the new treaty but the end of imperialism in the country and the cancellation of the still operative 1930 Anglo-Iraq Treaty. Moreover, workers and the poor called for economic justice and "bread" considered as essential for any "political freedoms" (Haj 1997). By January 27, police were directed to shoot into a crowd of protestors on the Ma'mun Bridge, killing at least 300 unarmed Iraqis. This bloody event would eventually lead to the resignation of the government. Although the cancellation of the Portsmouth Treaty was achieved, the "caretaker" government eventually imposed martial law, while suppressive police tactics were used in other parts of the country to break labor strikes and suppress all forms of dissent, which continued for several months thereafter.

The *Wathba* had a significant impact on the decolonization of international law (Hammoudi 2016). It struck a thunderous chord against imperialism in the region and the Third World more broadly. It showed how the common people of Iraq struggled for a vision of a new social and legal order in their country that was based on an equitable and just international legal order. As they waged their struggles on the streets and in their workplaces, they were attempting to affirm their human dignity as reflected in the emergent principles of the UN Charter. They rejected the continuation of the imperialism that was imposed upon them through the Mandate system and called for a truly independent Iraq that would be a part of a Third World that was free of colonial subordination and imperial influence. In other words, with their very actions, they sought a free Iraq that would break away from the web of imperialism and its manifestation in yet another juridical guise.

The *Wathba* awoke a spirit of determination of anti-colonial struggle that persevered throughout the coming turbulent decade until the monarchy was overthrown by the 1958 July Revolution, sparked by the actions of the Free Officers under the leadership of Brigadier ʿAbdul Karīm Qāsim (Romero 2011). The *Wathba* inspired the grassroots organized protest actions to come, opening the way for the Revolution. During the riots of the 1952 *Intifada*, there were calls for the "renewal" of the revolutionary *Wathba*, while the 1956 Uprising of Najaf and Hayy was launched in response to the British-French-Israeli attack on Egypt following Nasser's nationalization of the Suez Canal (Batatu 2004; Bashkin 2009). Labor strikes intensified throughout this period, most notably with the massive dockworkers strike of Basra in 1953, which completely shut down the entire port city. The government continuously imposed martial law to crush these upheavals. In the end, it was because any demands for social reform from the people were consistently and violently suppressed by the regime that the Free Officers decided to take things into their own hands by planning a military coup that would initiate the revolutionary process of the liberation of Iraq and its people from the British imperial yoke.

The July Revolution of 1958 and Iraq's Break from the Orbit of Imperialism

The July Revolution of 1958 should be analyzed not only in the context of the *Wathba* and the *Intifada* of November 1952 but other significant events in the region, such as the Palestinian *Nakba*, the Egyptian Revolution of 1952, as well as the signing of the Baghdad Pact in February 1955. The Baghdad Pact was considered by the Iraqi public as yet another attempt to reimpose imperialism in Iraq and the region after the demise of the Portsmouth Treaty in 1948 (Romero 2011). The Free Officers, who were clearly influenced by Nasser's revolutionary clandestine methods, organized a military coup in anticipation of a people's revolution, with aim of shattering the *ancien régime* of the pro-British Hashemite monarchy and its oppressive social order. Proclamation No 1 read out on Baghdad Radio announced the establishment of a people's republic, promised the participation of the Iraqi people in shaping their future, and ended Iraq's close alliance with the West by declaring a neutralist foreign policy in line with the principles of the 1955 Bandung Conference. The Proclamation was clear that its revolutionary claims were in line with the principles of international law of the time and the UN Charter, as well as the non-alignment of the Third World that were asserted in Bandung:

> ...[W]e have undertaken to liberate the beloved homeland from the corrupt crew that imperialism installed...Rest assured that we will continue to work on your behalf. Power shall be entrusted to a government emanating from you and inspired by you. This can only be realized by the creation of a people's republic, which will uphold complete Iraqi unity, tie itself in bonds of fraternity with the Arab and Moslem states, act in keeping with the principles of the United Nations and the resolutions of the Bandung Conference...Accordingly, the (new) national government shall henceforth be called the Republic of Iraq... (Quoted in Batatu 2004).

The Revolution uprooted the legal structures that maintained the old social order starting with the elimination of the 1930 Anglo-Iraq Treaty and with it the imperialism of its international legal structures, which was maintained for nearly three decades after the emergence of a novel liberal international order with the signing of the UN Charter in 1945. Decolonization was just beginning to sweep the Third World, and in Iraq the anti-colonial struggles finally materialized with the initial actions of the revolutionary officers. Within 2 weeks, a Provisional Constitution was drafted that frustrated the constitutional structures of the 1925 Organic Law, which constricted the people's popular sovereignty. Furthermore, a new Agrarian Reform Law was passed, which finally ended the "semifeudal" system, a remnant of British imperial policy, bringing the tribes and rural areas into the purview of state law (Marr 1985).

Iraq's emergence as a republic ruled by a nationalist military regime ensured that it would be a contested zone of rivalry during the Cold War, especially between Arab nationalists and communists. A coup led by Ba'athists trained by the CIA brought down the revolutionary Qasim regime in 1963, before it too was overthrown 8 months later by another military coup led by Nasserites (Mathews 2011). The US returned the Ba'ath to power in a coup in 1968, opening up the path for Saddam Hussein's ascent to power, which would materialize in 1979 with the purging of his rivals. Iraq under Saddam would become a totalitarian regime for over two decades, ruling over the party apparatus, the military, and Iraqi society with an iron fist. A year after gaining power, Saddam plunged Iraq into military adventurism going to war with Iran (1980–1988) following the fall of the Shah, with the support of the US, which supplied both sides with weapons.

The First Gulf War (1991): The Punishment of a "Rogue State" During the New World Order

Following a devastating and pointless 8-year war with Iran, Iraq's economy was in tatters. Kuwait exceeded its OPEC quota, further depressing Iraqi oil prices and in turn it's economy. In addition, Kuwait was allegedly drilling into Iraqi territory at the border and extracting oil from the Rumailah oil field. After receiving a seemingly indifferent response in relation to Iraq's oil dispute with Kuwait from the US ambassador (widely regarded as a "green light"), Saddam Hussein, a longtime

ally of the US (considered Kuwait's actions as tantamount to military aggression), ultimately decided to invade Kuwait in August 1990. To his surprise, his resort to invasion, annexation, and occupation would ignite "one of the most significant international crises of the post-1945 epoch" (Halliday 1994).

The US swiftly began to assemble a coalition of states to counter Iraq's action with the initial aim of recovering the sovereignty of a UN member state. President George H.W. Bush not only turned to international law and its mechanisms but also evoked the concept of a "New World Order" to justify a US-led war against Iraq. After all, the UN Security Council was now free from the bipolar constraints of the Cold War and able to operate collectively against aggression for the maintenance of peace – the very basis of the system of collective security and self-defense embedded in Chapter VII of the UN Charter.

President Bush immediately deployed a US military force to Saudi Arabia. The US administration began employing pressure on member states to pass a series of UN resolutions, the first of which was Resolution 660, which condemned the invasion and demanded immediate and unconditional withdrawal of Iraqi troops. Economic sanctions and a trade embargo were swiftly imposed through Resolution 661, completely isolating Iraq from the outside world. Member states were called upon to prevent the transfer of any funds to Iraq or Kuwait for trading purposes, the supply of all goods, with the exception of "foodstuffs intended for humanitarian purposes." Iraq's annexation of Kuwait was declared null and void under international law (S.C. Res 664, UN SCOR, 45th Sess. 2937th mtg., UN Doc. S/Res/664).

In November 1990, President Bush approached the Security Council for a resolution sanctioning military force against Iraq. The Council adopted Resolution 678, which did not expressly mention military force, but authorized "Member States... to use all necessary means to uphold and implement resolution 660... and to restore international peace and security in that region." On January 16, 1991, President Bush, blocking all diplomatic efforts, launched military action against Iraq, resting the legality of his action on Resolution 678 (Quigley 1992). Despite the fact that this war was presented with a cloak of legality, it was in fact illegal for various reasons, but especially the fact that Resolution 678 was constructed in such an ambiguous way that it was described by one observer as "a masterpiece of obfuscation" (Springborg 1994). It was worded in a way to invoke the authority of Article 51 ("the inherent right of individual or collective self-defense") and Article 42 (that limits the right of self-defense "until the Security Council has taken measures necessary to maintain international peace and security," which in this case was already taken through economic sanctions) of the UN Charter without any explicit reference to them (Springborg 1994). In other words, the resolution's appropriation of the phrase to "restore international peace and security in the area" from Article 42 was merely meant to convey a vener of legality to the blatantly unlawful use of force.

The effects of the war that began in January 1991 were devastating to a scale never seen before in the history of warfare at the time (Simons 1996). American missiles and aircraft were the main source of mass destruction – around 88,500 tons of bombs were dropped, including napalm, cluster bombs, and "daisy cutter" bombs in contravention of the laws of war. The fact that these bombs were dropped in heavily populated urban areas meant that colossal civilian death was virtually certain. Coalition air sorties, which covered over most of Iraq, for nearly a month before the ground offensive began, bombed at will, while "carpet" bombing by B-52 deliveries had nuclear-like destructive effects on towns and villages. A UN report later described the effects of the bombing as "near apocalyptic" and argued that it reduced life in Iraq to a "pre-industrial age" (*Excerpts from UN Report on Need for Humanitarian Assistance in Iraq*). US military planners completely destroyed Iraq's civilian infrastructure, following a deliberate policy, which in the words of Secretary of State James Baker was intended to turn Iraq into a "backward and weak state" (Simons 1996). Sewage and water treatment facilities, electrical generators, hospitals, and clinics were all targeted and

destroyed. As Iraqi soldiers were complying with UN demands by withdrawing from Kuwait, US aircraft mercilessly attacked those fleeing at the Jahra-Basra road with cluster bombs and uranium creating a bloody wreckage of metal, corpses, and limbs. This incident was to become one of the most horrific massacres of the war. The US war on Iraq was therefore a clear and calculated attempt to destroy the very social fabric of Iraqi society and its economy.

The manner in which the US administration operated the levers of international law and its mechanisms to justify its military action on Iraq has been argued to be the development of a form of "hegemonic international law," whereby the hegemon not only appropriates and navigates the existing international legal mechanisms but, in breaching certain aspects of it, is confident that it was simultaneously creating new rules for its own advantage (Alvarez 2003). Prominent international lawyers, such as Richard Falk and John Quigley, have detailed how and why the US were in violation of the UN Charter despite their uses of international mechanisms. Quigley argued that the high level of force took US action outside the parameters of the Resolution 678 standard of "necessary" means (Quigley 1992). This was not to mention the fact that the resolution itself violated the UN Charter, which clearly stipulates that military force must be a measure of last resort. "The presence of aggression does not always enable the Council to use military force to oppose it," wrote Quigley, "[t]o the contrary, the Council may use military force only if other [less drastic] means will not succeed" (Quigley 1992). Similarly, Falk emphasized that once the shift was made from sanctions to war, "the UN's role was fundamentally flawed from the view point of international law... [as] [t]he Security Council violated its own constitutional framework to the extent that it allowed the coalition to operate independently..." without any oversight and without exhausting all nonmilitary options (Falk 1994). In this way, the UN was not only manipulated by the US administration to justify its waging of unrestricted warfare against Iraq, but it was also entirely complicit in the war, especially in the brutal sanctions regime established thereafter.

The reference to the coming of a "New World Order" dedicated to "peace, security and the rule of law" in countering the aggression of a "new Hitler" was certainly meant as a powerful rhetorical device. President Bush ceaselessly insisted that this crisis was "between Iraq and the entire world" (NYT, August 23, 1990) and framed Iraq's actions solely in terms of being a threat to world order, arguing that the US was merely stepping in to reestablish the rule of law and order in the region. The underlying contextual reality, however, was that Saddam Hussein was not just any aggressor and Kuwait was not just any state. It should not be forgotten that Hussein was not only considered an important US ally in the region, but also that the US administration provided him with stockpiles of weapons during the Iraq-Iran war. At this conjuncture, economic interests and important concerns of geopolitics within the context of the maintenance of US imperial power in the region were at stake. Simply put, the US could not allow a Third World leader, who controlled such vast energy resources, to dictate the price of oil. This certainly explains its overwhelming use of force to get its point across.

The first Gulf War was therefore not a "test" case for the principle of collective security and the mechanisms of the UN as often treated, but rather it was the manifestation of an overdue US policy pronounced by President Carter in 1980, which at the time was a warning to Soviet expansion. "The Carter Doctrine" considered any attempt by an outside force to control the Persian Gulf region as an "assault on the vital interests of the United States of America," and that such an assault would be repelled "by any means necessary, including military force" (da Vinha 2017). President Bush fashioned a corollary from this doctrine emphasizing that Persian Gulf oil was untouchable. As Daniel Yergin, an American strategist and oil expert, wrote, "No single nation had dominated the Persian Gulf region since oil was discovered there; were one to do so, the global balance of power would be changed" (Yergin 1991). Oil therefore was (and remains) a major determining factor of US foreign policy in the region.

The International Regime of Economic Sanctions and Its Violent Effects

Economic sanctions, which were initially put into place as a non-violent means of putting pressure on Iraq to withdraw from Kuwait, remained in place, to ensure compliance with Resolution 667 – a resolution that was drafted in Washington and London and set the terms and conditions of Iraq's surrender. According to one UN diplomat, Resolution 667 contained "precedent-setting" provisions that were "highly intrusive" and impinged on Iraqi sovereignty "by design" (Malone 2006). The resolution affirmed all previous resolutions and established the most comprehensive international regime of economic sanctions in UN history. The terms and requirements for lifting the sanctions included UN demarcation of the Iraq-Kuwait border; the unconditional destruction of Iraq's weapons of mass destruction under international supervision, including all chemical and biological weapons; Iraq's acceptance of liability for damages arising from its invasion of Kuwait with a fund to be created to meet claims from Iraqi oil revenues; and a UN Compensation Commission to administer it based in Geneva. In addition, a UN Special Commission (UNSCOM) was created to oversee the destruction of Iraq's biological and chemical weapons.

Resolution 687 effectively criminalized the Iraqi regime as a part of a "punitive peace" that was very similar to what was done to Germany with the Treaty of Versailles (Simpson 2004). It stigmatized Iraq as a "rogue state" under international law. As Gerry Simpson has shown, international law and the structures of world order have historically functioned in this manner – treating some states as "sovereign equals," while others are singled out as "rogue states" with the aim of maintaining the geopolitical interests of the Great Powers (Simpson 2004).

The economic sanctions imposed on Iraq, which would go on for the next 12 years until the 2003 invasion, were the cruelest in the history of international governance and international law (Gordon 2010). It reduced a population whose general standard of living was that of the most developed and industrialized countries of the Middle East into one of the most impoverished – a society notable for its scientists, engineers, and doctors would become dominated with Mafioso-type criminals, thieves, beggars, and corrupt profiteers (Gordon 2010). It was impossible for Iraq to restore any of its destroyed vital infrastructure – electricity, telecommunications, transport, sewage treatment, and water – and meet its urgent humanitarian needs, as long as these extremely restrictive sanctions were in place. The sanctions eliminated Iraq's ability to sell its oil on the international market, which was catastrophic for a country that was dependent on oil sales for its gross domestic product. Moreover, Iraq's high dependence on imports (nearly 70% on food) meant that the effects of sanctions were immediate and cataclysmic for ordinary Iraqis (AlNasrawi 2001).

Sanctions would directly lead to a dramatic increase in child mortality, malnutrition, and waterborne diseases. Numerous studies and UN reports strongly suggest that at least 500,000 children under the age of 5 died directly as a result of the sanctions (Gordon 2010). When asked about this shocking level of child mortality, US Ambassador to the UN, Madeline Albright, famously said, "We think the price is worth it" (CBS news, 60 Minutes, May 12, 1996). The US administration was in fact unwilling to consider the lifting of sanctions as long as Saddam Hussein remained in power. Robert Gates, the head of the CIA at the time, made it clear that only when there is a new government could any easing of sanctions be considered. Iraqi compliance with any UN resolutions was consequently of no relevance (Simons 1996).

The sanctions regime involved a very complex bureaucratic and institutional framework of international governance made up of various UN bodies tasked with its administration – the most important of which was the "Iraq Sanctions Committee" (Von Sponeck 2006). This committee initially tasked with reviewing the Secretary-General's reports and, to compile information regarding the implementation of Resolution 661, began to take broader responsibilities, especially with regard to the determination of which goods were allowed into the country as humanitarian exemptions.

The US administration, however, had enormous influence over every aspect of the application and administration of the sanctions as it unilaterally interfered with the committee's tasks, ensuring that the majority of requests – of even the most basic humanitarian goods – were denied, usually on the basis of potential military use or "dual use." Chlorine, necessary for sanitization in hospitals, for instance, was consistently prevented from being imported on the basis that it could be used to manufacture chemical weapons (Abdullah 2006). Although an "Oil-for-Food program" was finally adopted by the Security Council and accepted by the Iraqi government in 1996, it did little to significantly alleviate the impact of the sanctions especially on the most vulnerable sectors of society.

The sanctions led to such a high level of death and suffering that it was argued to be a policy aimed at the destruction of the Iraqi people – a form of "genocide" perpetrated by the UN Security Council (Halliday 2000). Veteran UN officials, most famously, the coordinator of humanitarian relief to Iraq, Denis J. Haliday, and later his successor Hans von Sponeck, would ultimately submit their resignations in protest of what they considered a deeply immoral policy (Von Sponeck 2006). It was no wonder that the UN was held with deep resentment by the people of Iraq.

The international regime of sanctions that was imposed on Iraq is a perfect example of how violence is inherent within the existing international legal order itself. It also reveals the pliancy of international law and institutions to imperialist interests. The assertion of a "new" world order where waging war and starving an entire population was presented as the imposition of "the rule of law" over aggression was more than just a necessary façade, but as Falk emphasizes was the same civilizational discourse that characterized "the settler conquests of indigenous peoples in the 'age of discovery' and of colonial warfare ever since" (Falk 1991). The war and the imposition of a medieval policy of sanctions on a defenseless population were not any different from the actions of imperialism throughout history. What has become more sophisticated is the

legal reasoning and mechanisms used to justify these brutal policies. The invasion of Iraq in 2003 would be a continuation of the imperialism of US foreign policy and international law.

The 2003 Invasion and Occupation of Iraq: The (Re)integration of an "Outlaw State" into the "Civilized World"

A decade of sanctions made it clear that US policy of "regime change" through containment was a failure, and as international outcry over the sanctions grew, the US could not allow for a post-sanctions Iraq to emerge with an unhindered regime after all that happened. A group of "neo-conservative" ideologues in Washington, associated with the think tank called a "Project for the New American Century" (PNAC), and which included Paul Wolfowitz, Richard Perle, Zalmay Khalilzad, and the Secretary of Defense, Donald Rumsfeld, were of the view of the necessity of waging a war on Iraq. In September 2000, the PNAC published a white paper that made the argument for a significant shift in American foreign policy, including a militaristic expansion of US power by taking advantage of the "unipolar moment," with the aim of preserving its geopolitical supremacy and precluding the emergence of a Great Power rival. The report advocated for the waging of strategic "theater wars" around the world, emphasizing the importance of controlling Middle Eastern oil as a matter of US national security (PNAC 2000). What was needed however was a spark – "some catastrophic and catalyzing event...a new Pearl Harbor" (PNAC 2000). This event came in September 11, 2001, when al-Qaida attacked New York and Washington.

The newly elected administration of George W. Bush's US National Security Strategy followed a similar logic to the PNAC report. It articulated the doctrine of "preemptive war," which was used to justify the invasion of Iraq. Bush claimed that the US was in an endless "global war" against terrorism and their supporters, which included Saddam Hussein's Iraq. On September 12, 2002, Bush declared to the UN General Assembly that Iraq

was one of the "outlaw . . . regimes that accept no law of morality and have no limit to their violent ambitions" (Wall Street Journal, September 12, 2002). Although no credible link was ever found between al-Qaida and the Iraqi regime, the Bush administration fabricated a dubious connection, making its case at the UN that Iraq still possessed weapons of mass destruction (WMDs) even after the International Atomic Energy Agency and subsequently the newly formed UN Monitoring, Verification, and Inspection Commission (UNMOVIC) had confirmed through its inspectors that there was no evidence of any nuclear programs in Iraq.

As it would became clear during the war that WMDs were nowhere to be found, the Bush administration shifted its justification for war to the notion that the Iraqi people were being liberated from a dictatorial regime, evoking the cause of democracy and human rights. Bush declared in his speech to the UN General Assembly that, "liberty for the Iraqi people is a great moral cause, and a great strategic goal. . .Free societies do not intimidate through cruelty and conquest, and open societies do not threaten the world with mass murder" (President's address to the UN in New York, 38 Weekly Comp. Press. Doc 1529, 1530–1532, Sep. 12, 2002). Regime change was after all the official US policy ever since the passing of the Iraq Liberation Act of 1998 in Congress, which avowed the ultimate goal of removing Saddam Hussein's regime to establish a "democratic" government in Iraq. In this way, the very nature of Iraq's regime was presented as being a threat to world security and peace, guaranteeing that Iraqi compliance with UN resolutions would not be enough to halt US war plans. Iraq had become the focal point for the "war on terrorism."

The Legal Justifications for the Invasion, the Myth of Newness, and the Doctrine of Preemption in International Law

The US administration endeavored to construct a legal argument to justify its plans to wage a war on Iraq. It deployed the notion of self-defense as a preventive measure, insisting that it did not need UN authorization to go to war to protect the "civilized" world from the potential threat of terrorists.

The entire basis of the UN system was premised on the notion of collective self-defense through the workings of its mechanisms and only authorized the use of force in the very narrow circumstances of an "imminent" threat. These established principles of world order emerged out of the Nuremberg trials, where aggression was affirmed to be the "supreme international crime." The Charter itself explicitly favors resolving disputes using peaceful means and through multilateralism. This was a system therefore that was instituted for the very purpose of preventing war. The Charter's preamble clearly emphasizes the need to "save succeeding generation from the scourge of war." It was consequently more of a stretch to justify the notion of unilateral use of force on the basis of preemption in international law as "legal vigilantism" is not permitted by the Charter (Simpson 2005). It was no wonder that the majority (at least 80%) of international lawyers around the world considered US actions as a dangerous legal precedent – an amendment to the principles of the international legal order. For them, the Iraq War was clearly illegal (Paulus 2004).

The US's endeavors to transform the structures of world order in its favor by invading Iraq would have wide-ranging detrimental effects on what was accepted under international law – instituting what one legal scholar referred to as a "Texan international law. . .that emphasizes the threat from outlaws, the need for self-help, the unreliability of institutions and the frontier spirit" (Simpson 2005). Furthermore, the Bush administration's reasoning that the existing institutional structures of world order needed to be altered to correspond to a "change of circumstances" of post-9/11 was merely the deployment of what Okafor has called, a "technology of imperialism" where a "myth of newness" is propagated to justify its imperial actions (Okafor 2005).

The US Invasion, the Destruction of the Iraqi State, the Slaughter of the Iraqi People, and the Cleansing of Its Cultural Heritage

Although the US failed to secure a resolution from the UN Security Council (France, Russia, Germany, and China were all in firm opposition), it

decided that it would go ahead with its war plans. Consequently, against the will of the international community and in defiance of the unprecedented anti-war protests of millions of people around the world, the US-led collation, which included Britain, launched its war offensive in an operation, codenamed "Iraqi Freedom" on March 20, 2003. It began with a massive campaign of aerial bombardment in the form of a tactical "Shock and Awe" that aimed on inflicting maximum destruction and overwhelming psychological harm on the people of Iraq. By the time American tanks entered the city, Iraqi soldiers had abandoned their posts, avoiding confrontation and returning to their homes. Saddam Hussein's regime had collapsed with astounding ease, its leadership having fled into hiding. Although the Iraqi people and army did not rise up to defend this brutal regime, American troops were not welcomed with "flowers and candy" as was propagated by the media and Iraqi exiles. By May 1, all combat operations had come to an end.

US plans to stabilize postwar Iraq were a complete fiasco. What would ensue post-invasion was not merely chaotic but reflects the collapse of the Iraqi state. It would amount to nothing less than the intentional "cultural cleansing" of Iraq and its heritage (Baker et al. 2010). Iraq's already crumbling infrastructure was entirely demolished, while state institutions were subject to organized looting, pillage, and obliteration. Looters broke into government buildings (including, ministries, hospitals, libraries, and universities). US troops were ordered to safeguard only the oil fields, the Ministry of Oil, and the Ministry of Interior. As they stood by, mobs of looters, some led by criminal gangs and others driven by poverty, grabbed anything and everything they could get their hands on. Ministries, hospitals, libraries, and universities were ransacked.

The epitome of this devastating turn of events would be the tragic looting of Iraq's National Museum and the burning of the National Library and Archives. Tens of thousands of artifacts, many dating back to antiquity, were looted, while entire archival records and irreplacebale manuscripts were burned to ashes. Although the Office of Reconstruction and Humanitarian Assistance (ORHA) headed by retired Lt. General Jay Garner (who was initially appointed to run postwar Iraq in January 2003) had drawn up a list of the most important cultural sites in the country that needed protection, it was ignored. This was clearly a deliberate move calculated to "cleanse" not only all vestiges of the former Iraqi state but the unique history and cultural heritage of a proud people, so as to follow destruction with the reconstruction of a capitalist neoliberal, free-market order, and the imposition of the most extreme economic "shock therapy" on the region (Klein 2008).

The New World Order of Economic Plunder, the Bremer Orders, and the Transformative Occupation of Iraq

The Coalition Provisional Authority (CPA) was established to replace the ORHA in May 2003, thwarting Garner's plan to hold national elections in 90 days. The CPA's mission was "to restore conditions of security and stability, to create conditions in which the Iraqi people can freely determine their own political future... and ... [to facilitate]... economic recovery, sustainable reconstruction and development" (Halchin 2006). The CPA would become the official governing body of the occupation, having full executive, legislative, and judicial control over Iraq, until "sovereignty" was officially handed over 14 months later. Bush appointed Paul Bremer III, a longtime foreign service official and at the time a private consultant, to head the CPA. Bremer's very wide discretionary governing powers – he was able to create laws with the stroke of his pen – earned him the title of "American Viceroy of Occupied Iraq" in the press (Bremer 2006).

The UN Security Council Resolution 1483 passed in May 2003 recognized and formalized the CPA as the occupying power in Iraq. The resolution affirmed the CPA's responsibility to govern the country under the law of occupation under the principles of international law, which prevent the occupying power from undertaking any significant transformative changes to the structures of the occupied state or its economy. The resolution emphasized, "the right of the Iraqi people to determine their own political future and

I

control of their natural resources"(UNSC Resolution 1483, 22 May 2003, S/RES/1483). The CPA, however, would practice an extremely intrusive form of occupation that was in clear violation of the basic principles of international law as it embarked on far-reaching legal reform to entrench a deep transformation of Iraq's economy (Rittich 2018). Moreover, as the UN Security Council finally lifted sanctions, it established a Development Fund for Iraq, which would be controlled by the CPA. In other words, the UN not only legitimized the occupation but also granted control of Iraq's economy and reconstruction (including its oil revenues) to the US and in turn to the representatives of the IMF and the World Bank – "the pillars of neoliberalism and the Washington Consensus" (Doran 2012).

Upon his arrival to Baghdad, Bremer, who lacked expert knowledge of the country and did not speak Arabic, had one primary mission, and that was to radically reorganize Iraq's economy, promote free-market policies, and privatize state-owned industries, opening up the economy to foreign investment, including Iraq's oil wealth. In other words, his job was to restructure the plundering of the Iraqi state and its economy. The tearing down of the semi-socialist economic structures of the Ba'athist regime was to be, in Bremer's own words, "a very wrenching, painful process, as it was in Eastern Europe after the fall of the Berlin Wall" (Chandrasekaran 2009). Although it is true that the US clearly failed to adequately plan for a postwar Iraq, this was not the case with the economy, which was always a priority for US designs.

As the officially recognized occupying authority, the CPA swiftly introduced a wide range of regulatory and legal reforms covering everything from banking, public employment, labor law, public ownership, and foreign investment. As Bremer emphasized this point when he said, "We're going to create the first real free market economy in the Arab World" (Chandrasekaran 2009). The process to impose this economic model was to be cataclysmic as it subjected Iraq's closed and state-centered economy to the mercy of global capitalist forces through the passing of 100 executive orders (passed with Bremer's

signature and referred to as "the Bremer Orders"). These orders would lay the foundations for the new neoliberal Iraqi state, permanently altering the social and economic structures of Iraqi society in a profound way. In effect the result was the abolition of the entirety of any social safety net in place, plunging ordinary Iraqis into unprecedented levels of poverty and unemployment (Rittich 2018).

Order no. I was issued on May 16, 2003, and inaugurated the process with the "De-Ba'athification of Iraqi Society." It removed all members of the Ba'ath party from their positions in state institutions, including ministries, universities, hospitals, and schools. During Saddam's reign, nearly every public servant, especially those in middle to high-level positions, had no choice but to be a member of the party. Therefore, Order no. I amounted to the sacking of 500,000 Iraqi state administrators and civil servants from their jobs overnight (Juhasz 2006). The order also prevented former members of the party from being employed by the new state, leading to massive unemployment. The key positions were later filled largely by US-sponsored Iraqi exiles. Order no. 2, "Dissolution of Entities" further exacerbated the situation by dissolving the Iraqi armed forces and essentially putting a large number of armed and military-trained Iraqis into unemployment and desperate economic circumstances. The order worsened the security situation and would eventually bring about the rise of sectarian militias during the civil war a few years later.

Order no. 39, "Foreign Investment," opened up the Iraqi economy to foreign investment to the detriment of local investors as it prevented preferential treatment of Iraqis. Considering the fact that large parts of Iraq's economy were publically held, this order had a profoundly transformative effect on the structure of the Iraqi economy. Although natural resources and oil were excluded, the order basically ensured massive privatization of nearly all major state industries by lowering eliminating taxes and eliminating custom duties on foreign companies. Order no. 37, for instance, replaced the progressive tax structure with a flat tax rate for both individuals and corporations.

Rather than encourage investments, these reforms increased capital flight and unemployment, as local industries were unable to compete. The "market fundamentalists" of the CPA did not factor in the fact that the already devastated Iraqi economy was in dire need of protections to get off to a good start (Abdullah 2006). Order no. 87 dealt with "Public Contracts" and established open competition in the process of awarding contracts, without protecting local contractors. In other words, it made sure that the contract work in relation to the reconstruction of post-invasion Iraq would be handed to foreign companies (especially US companies like Halliburton, Bechtel, and Fluor) rather than allowing Iraqis to rebuild their own country. Finally, Order no. 100, "Transition of Laws, Regulations, Orders, and Directives Issued by the Coalition Provisional Authority," ensured that these CPA laws would continue to be in force until they were amended by the transitional government or its successors. However, this was a difficult task for any future government, as any changes to these arrangements might compel a government to provide payment of compensation for lost profits under international foreign investment rules, exposing it to liability under international trade law. Order no. 100, therefore, further entrenched these structural changes, locking future Iraqi governments and constraining its capacity for policy-making.

The Bremer Orders were in clear violation of international law, namely, the 1907 Hague Convention, which precludes an occupying power from transforming a society to its likeness. Nevertheless, the US occupation of Iraq as described above could be considered to have brought about a new form of "transformative" occupation under international law. As legal scholar Andrea Carcano has shown, "the occupation of Iraq stands out because it . . . [was] 'transformative'. Not since the aftermath of World War II and the post surrender occupations of Germany and Japan had the world witnessed as occupation undertaken to install a new political and economic regime in lieu of an exiting one on a grand scale" (Carcano 2015). One could go further to argue that through the CPA and its orders, the US administration

"legalized" the economic plunder of the Iraqi state (Mattei and Nader 2008).

US plans in relation to Iraq's oil were more elusive until leaks of secret talks emerged on the drafting of a new hydrocarbon oil law, whereby production sharing agreements (or the like) would be used to allow foreign oil companies complete access to oil, notwithstanding Iraqi legal ownership (Muttitt 2011). This cosmetic arrangement was developed due to the high sensitivity of the question of oil in Iraq and to avoid any mass outcry. The new oil law would have significantly altered the balance of power between the Iraqi government and the foreign oil companies that was altered after the 1961 Law No. 80, which resisted the exploitative terms of the foreign-owned Iraq Petroleum Company and which initiated the nationalization of Iraq's oil wealth – a process that was completed in 1972, when every Iraqi oil field was nationalized. The US and foreign oil companies were looking to reverse this long process of nationalization. In the end, the plans to fully privatize Iraq's oil were abandoned due to the exploding of mass resistance of Iraqi civil society and trade unions, especially the Iraqi Federation of Oil Unions (Muttitt 2011). Through incessant protests and strikes, Iraqi workers and civil society were able to shift the national conversation, successfully preventing (for the time being) the passing of this colonial oil law, which would have led to the complete foreign control and the privatization of Iraqi oil under the legitimacy of a democratically elected Iraqi government.

Conclusion

The CPA transferred "sovereignty" to an Iraqi Interim Government led by an American picked, Ayad Allawi, on June 28, 2004. This was followed with the Iraqi Transitional Government in May 2005, and national elections on May 20, 2006, which elected the first Iraqi government of Nouri al-Maliki. The new 'democratic' Iraqi institutions that emerged from the occupation were sectarian by structure and design – something that never existed in the past. With no plans for actual

reconciliation, sectarianism would be reflected in every aspect of the emerging political process, whether it was in the elections for the National Assembly or the drafting and adoption of a new constitution at the end of 2005 (Al-Ali 2014).

What emerged after the invasion and occupation of Iraq was an extremely weak state with a political system divided across ethno-sectarian rather than nationalist lines. For these reasons, it was easily swayed by regional powers, not to mention terrorists groups, such as ISIS. Iran, for instance, gained a major foothold through its influence of the Shia'a political parties in power. The constitution, which was so hastily drafted and passed by an unelected group of conservative individuals, did not turn into a document for national unity and reconciliation but rather sowed division and distrust among Iraqis, particularly the Sunni community, who felt they were excluded from the constitutional process. Moreover, it ensured that the powers of the federal (as opposed to provincial) government were so limited that Iraq would become one of the weakest states in the world (Al-Ali 2014). The constitution therefore "set in motion a destructive cycle that has wrought havoc since the day it was entered into force" (Al-Ali 2014). This would erupt in a bloody civil war, which would tear apart the country for years to come.

This chapter has reconsidered some of the most important events of the modern history of Iraq, focusing on its relationship to imperialism, international law, and world order. I have shown how in every "world order" since World War I, Iraq had a central place in strategies of imperial powers, and this was principally due to its geopolitical significance, especially its vast oil resources. The "sovereign" Iraq that emerged after the Mandate system was constructed to ensure Great Power access to Iraqi oil, while the first Gulf War and the 2003 invasion were planned to ensure US supremacy over the region, for whoever controls the "global oil spigot" that is the Persian Gulf controls the global economy (Harvey 2003).

International law was an important part of the workings of US imperialist schemes and strategies to wage war, impose sanctions, and invade, occupy, and transform Iraq. There is no doubt

therefore that one could not adequately understand Iraq's past or present without grasping how imperialism, international law, and the global political economy are intimately connected and how they always diverged there. Finally, the notion of a New World Order was evoked on every turn, and this clearly illustrates a truism highlighted by Noam Chomsky: "The New World Order is "new" only in that it adapts traditional policies of domination and exploitation to somewhat changed contingencies; it is much admired by the West because it is recognized to be a device to keep "the countries and people of the world" in their proper place. *The bottles may be new; the wine, however, is of ancient vintage*" (Chomsky 1994). A close examination of the modern history of Iraq certainly affirms this persistence to be a characteristic of imperialism in the Third World.

Irish History and Imperialism

Maurice Coakley
Griffith College, Dublin, Ireland

John Stuart Mill wrote in 1868: "Englishmen who know India are the men who can best understand the social ideas and economic relations of Ireland." A few years earlier, Karl Marx also made a comparison between the two: India was "from a social point of view…the Ireland of the East." The reversed order here is significant because it was at least partially through their study of Ireland and its history that Marx and Engels came to question their earlier optimistic assumptions about the global spread of capitalist production. English involvement in Ireland preceded capitalist industrialization by over half a millennium. The fact that prolonged English rule in Ireland seemed to have created not an advanced economy but a social catastrophe did not bode well for later colonies of the British Empire (Marx and Engels 1978; Mill 1868).

The first "imperial" invasion of Ireland in the twelfth century was part of a wider process of feudal expansion across Europe. By the mid-thirteenth century, the feudal knights – owing allegiance to the English monarchy – had taken control of most of the country and established a network of towns especially along the south and east coasts. The English rulers introduced a feudal system of government and social organization similar to that being established across most of Europe. At the core of this social order was a manorial economy worked, in the main, by servile labor. The sale of the agricultural surplus encouraged the growth of towns (Anderson 1974; Down 1987).

The Anglo-Norman conquest involved not merely a replacement of rulers, but the imposition of a very different social order. Cattle-rearing was at the heart of the Gaelic economy. Land was owned by the kin group and was allocated by one's position within the clan, but cattle were individually owned. Cattle were also the main form of exchange and tribute. This form of social organization imposed significant obstacles to surplus extraction. There was very little opportunity for labor intensification, and herders could flee from the territory with their cattle if they faced excessive exactions from chiefs. Aside from this, cattle tended to be dispersed to minimize disease, which helped promote strong kinship bonds. This social context limited the authority of the Gaelic chiefs and discouraged the concentration of social power, contrasting sharply with the structures of feudal society.

One significant difference between the Norman feudal conquest of England and Ireland was that while the former was a mainly aristocratic affair – knights and clerics – the conquest of Ireland included a significant plebeian element. This difference was in part a consequence of the demographic expansion that occurred in England in the preceding century and in part a consequence of the difficulties the conquerors encountered in bringing to heel the indigenous population. At the margins of feudal Ireland, in upland areas and in the west and north, a distinctive clannic-pastoralist social order endured. Its persistence had long-term consequences for Ireland's historical development.

In the conquered areas, the new rulers established a manorial economy based upon an extensive arable agriculture, involving a significant shift from pastoral husbandry. The divide between settler and native became an important aspect of the structure of power in medieval Ireland. The rural population was divided into two layers: a small stratum of free English-speaking peasants and the unfree *betagh* – serfs – the original Irish population. The manorial economy produced a sufficient surplus to maintain a vibrant commercial order and to help finance England's wars against France and Scotland. The towns were exclusively English.

Toward the end of the thirteenth century, the European feudal order experienced a generalized crisis which strongly impacted on Ireland. Demographic expansion had reached its environmental limits; climate change – a mini ice age – tipped the feudal order over the brink. Over the course of the fourteenth century, there was a significant decline in production and trade which was magnified by

the arrival of the Black Death from the 1340s. Population fell by up to two fifths. The feudal aristocracy responded to the crisis by increased warfare and pillage and by attempting to increase the level of exactions on the peasantry.

In Ireland, the outcome of the feudal crisis was shaped by the distinctive features of an ethnically divided peasantry and by the survival of a clannic-pastoralist social order at the margins. The formerly free English-speaking peasants found themselves increasingly squeezed by lordly exactions, while the Gaelic-speaking peasants were in a better position to flee to marginal zones. Attempts were made in England and across Europe to reimpose conditions of servility. In Ireland, this was combined with efforts to maintain English law, customs, and language.

The feudal crisis in Ireland led to the breakdown of most of the manorial economy. The English-speaking stratum largely disappeared, serfdom collapsed, and the urban centers experienced significant decline. Gaelic clans regained control over large areas of the country, reestablishing their distinctive social order in which pastoral production predominated. Even in the lowland areas of the south and east where the colony was strongest, the feudal lords had to make significant concessions to the indigenous population and a hybrid social order emerged that combined Gaelic and feudal elements. By 1500, English rule in Ireland had shrunk to a small area around Dublin, known as the Pale (Coakley 2012; Down 1987; Nicholls 1972).

Across Europe, the systemic crisis of feudalism led to the emergence of centralized states which sought to establish uniform systems of law. Feudal lords struggled to maintain their control over their own regions and were amenable to accepting the power of a strong monarchy. In England, the centralization of monarchical power, especially in the legal sphere, was closely linked to the development of vernacular literacy. This process coincided with the religious reformation, which led to prolonged conflict ending with Europe divided – roughly speaking – between a Protestant north and a Catholic south (Anderson 1974).

The Tudor program for the (re-)incorporation of Ireland was different from the original Anglo-Norman conquest in a number of ways. It sought to incorporate the Gaelic chiefs into the English state system and to anglicize the Gaelic regions. It also involved reformation of the Irish church.

A combination of coercion and conciliation secured the formal acquiescence of the leading Gaelic chiefs and Anglo-Norman lords alike. This formal compliance enabled the English government to introduce a program of structural reorganization, focused around a scheme of "surrender and re-grant." The chiefs and lords formally surrendered their lands to the monarch who regranted them under conditions of English law. This was intended as a precursor for a more general imposition of English law on Ireland. In effect, collective ownership of land, structured through kinship, was to be replaced by individual ownership. In practice, the English state for most of the sixteenth century lacked the power to carry through a thorough reorganization of Irish society. The attempts by the chiefs and by the Anglo-Norman lords to increase their local power and their level of surplus extraction resulted in widespread resistance and deepening social conflict. This social unrest was compounded by the Tudor monarchy's attempt to impose the Protestant reformation on Ireland.

A feature of the reformation across Europe was the widespread use of vernacular languages for religious services and scripture as part of a general project of making religion more accessible to the lay population. In Wales it seems that the translation of the Bible and other sacred texts into Welsh played a crucial role in promoting a Welsh reformation and incorporating Wales into the English political system. In Ireland, the reformation was disseminated through English, a language spoken by very few people. Over the course of the sixteenth century, opposition to the English state's secular policies of social engineering fused with hostility to their project of religious transformation.

Ireland had been Christianized a half millennium before the Anglo-Norman conquest when following the collapse of the Western Roman Empire the Christian church was at its weakest. The early Christian missionaries adapted to the Gaelic social order developing a decentralized

church organization and establishing a Gaelic literate tradition.

England's battle to incorporate Ireland coincided with intensified interstate competition, sharpened by the rise of European naval powers. With the beginnings of the colonization of the Americas and the rise of an Atlantic economy, Ireland came to acquire a new geopolitical importance, especially in the context of English rivalry with Spain and France. For the English rulers, pacifying Ireland had come to involve much more than land acquisition; it had come to impact on the security of their kingdom.

The Gaelic chiefs who had initially accepted the English reformation found themselves in a precarious situation. They had never possessed a monopoly of power in their own territories, and while their new alliances with the English authorities may have strengthened them at a material level, it also reduced their level of popular consent. Trapped between a disgruntled population and an overbearing government, they threw their lot in with Counter-Reformation Spain. Religious conflict, contrasting modes of social organization, and geopolitical rivalries combined to ensure that the incorporation of Ireland took the form of a full-scale deeply destructive conquest, involving a huge loss of life (Canny 2001; Coakley 2012; Lennon 1994).

The Elizabethan rulers had hoped to encourage a mass English settlement in Ireland, but while significant numbers did migrate, they were much too few to overwhelm the native population demographically. Only in Ulster, where Gaelic resistance had been strongest, did a sufficiently dense settlement occur, and even there most of the settlers were Scottish, though there was a significant minority of settlers of English descent.

The defeat of the Gaelic revolt had coincided with the end of the Tudor dynasty in England and the merger of the English and Scottish polities under the Stuart monarchy. While the new king was of Scottish origins, the center of gravity of the unified kingdom was very much in the South of England. The political unification of England and Scotland did create some religious tensions, which had ramifications in Ireland. The Scottish Protestants were Calvinist (Presbyterians), while the Church of England (Anglican) was first and foremost a national church, with its own hierarchy.

A popular revolt in Ireland in 1641 sparked a civil war throughout the islands as parliament and monarchy in England vied for control of the newly established standing army that was being raised to crush it. The Cromwellian conquest of Ireland that followed was devastating. William Petty, a Cromwellian official, conservatively estimated that over a third of the Irish population died in the course of the conquest. The officers of the Cromwellian army were compensated for their services with large grants of Irish land (Smyth 2006).

In Ireland, religious adherence rather than skin color or place of birth came to guard the borders of power. In 1600, 80% of land in Ireland was owned by Catholics; a century later that figure had fallen to 14%. Catholics were excluded from the legal system, from the parliament, from the military, and from the state employment. Landownership, education, and most of commerce were dominated by Protestants. Despite all this, there were significant limitations to the power of the Irish Protestant landed elite. They still had to make a profit from the land, and outside of the northeast region, settler numbers were too few to work the land themselves. More than that, the high death tolls from the conquests meant that labor was a scarce commodity in the seventeenth and early eighteenth centuries. The peasants possessed a demographic advantage in this period, and the landowners had little choice but to rent out the land to a layer of middlemen who came to accommodate the customary practices of the peasantry. Social peace was established by permitting the peasantry to maintain, to a considerable degree, a traditional way of life (Beames 1983; Coakley 2012).

The Far Side of Industrialization

The industrial revolution in England had a huge knock-on effect on Ireland, as it did on Scotland, but with very different outcomes. Urbanization within England created a huge market for food,

and the Irish landowners began a serious effort to reorganize agrarian society in order to profit from the new opportunities. From the 1780s, the Irish population began to rise rapidly to about eight million in 1840, not least as a consequence of the ubiquity of potato farming. The demographic balance turned in favor of the landlords. However, the attempts to restructure landholdings came up against fierce resistance from clandestine peasant movements who had a deep commitment to maintaining the right of access to land. The effective exclusion of Catholics from the legal system worked against the formation of a stable alliance between a more prosperous stratum of peasantry and the landlords. More than that: the Irish parliament had passed legislation that ensured that any improvements made by tenants which increased the value of the landholdings could be confiscated by the landlords, while tenants enjoyed minimal legal protection. The combination of factors ensured that the Irish peasantry had no material interest in any form of agricultural improvement (Ó Tuathaigh 1990).

The contrast with (lowland) Scotland is striking. There, a layer of capitalist "yeoman" farmers emerged who, in alliance with the landowners, exercised considerable power over the increasingly landless laborers. From the second half of the eighteenth century, lowland Scotland came to develop a three class agrarian social order of landlords, capitalist farmers, and landless laborers, similar to England. This layer of capitalist farmers helped to create a mass market for consumer goods in the countryside, which in turn fostered industrial production in the Scottish cities (Coakley 2012).

There were significant social changes and economic advances in Ireland in the late eighteenth and early nineteenth centuries. Agriculture became more commercialized and markets more widespread especially in the eastern regions. Literacy spread and the confessional-based social order in Ireland came under increasing strain. The success of the American drive for independence encouraged the (mainly Protestant) Irish middle classes to challenge English mercantilism and to seek parliamentary reform and greater autonomy from Westminster. In the 1780s many

of the discriminatory laws against Catholics were abolished, though they were still prevented from becoming members of Parliament.

The success of the French Revolution radicalized the reform movement. The fact that the revolution occurred in a Catholic country undermined the confessional stereotypes and raised the prospects of an Irish political and social revolution that transcended religious boundaries. Support for the United Irish movement – as the local Jacobin supporters were called – was particularly strong among the Presbyterians of east Ulster, many of whom had links with the American rebellion. By the late 1790s, the United Irish movement had acquired mass support across the east coast (Whelan 1996; Smyth 1992).

Almost as many people died in 1 year in the course of the suppression of the United Irish revolt – 30–40,000 – as were sent to the guillotine throughout the whole of the French Revolution. One political consequence of the defeat of the United Irish rebellion was a change of government structure. The Westminster government concluded that the settler ruling class in Ireland could not be trusted to govern the country. With the passing of the Act of Union in 1801, Ireland became, formally, an integral part of British state, the United Kingdom. What would become known as the "Anglo-Irish" ruling class was integrated into the British political order, where they were elected as members of parliament and appointed to the House of Lords. While the British government in Westminster governed Ireland directly, they also maintained a distinct governmental apparatus within Ireland. Westminster appointed a Lord Lieutenant – effectively a colonial governor – who controlled an increasingly centralized executive apparatus to rule Ireland. This enabled them to introduce measures like the creation of the national policing force or a primary educational system distinct from the rest of the United Kingdom and which could act as test cases for administrative changes closer to home. The Lord Lieutenant's office also commanded a substantial military force and later an armed constabulary (Kenny 2004).

The exclusion of Catholics from Parliament was challenged by the election of Daniel

O'Connell, a Catholic lawyer, to the House of Commons in 1829. Westminster responded by removing the prohibition against Catholics while simultaneously reducing the size of the Irish electorate from 100,000 to 10,000 (Ó Tuathaigh 1990).

In the first decades following the industrial revolution in England, there was a significant expansion of domestic textile manufacturing across Ireland, primarily spinning and weaving, but this largely collapsed with the rise of factory production in England, accentuating Ireland's socioeconomic problems. As England industrialized, Ireland became a major exporter of agricultural products to English markets. By the 1840s Ireland had become England's granary. These changes in agricultural production were not accompanied by a transformation in agrarian social relations. On the contrary, the "middleman" structure of land tenancy intensified. Each layer of middlemen extracted substantial rent, crushing those at the bottom. The commercialization of Irish agriculture came up against customary practice. Despite the popular resistance to landlord-directed agrarian transformation, the process of parcellization of the land in Ireland continued with more and more peasants driven to the most marginal lands. The process was facilitated by the widespread adoption of the potato as the premier subsistence crop. Increasingly a huge section of the population became dependent upon a single crop for their survival. The potato crop was grown on only one twentieth of Irish farmland, but it fed most of the population. By the 1840s, this disproportion had reached a perilous state. A potato blight in 1845 pushed Ireland over the edge into a full-scale famine (Ó Tuathaigh 1990).

Throughout the famine years (1845–1849), large quantities of grain and other food products continued to be exported to England. Famine relief was grossly inadequate, and many landowners took advantage of the famine to clear their property of uneconomic tenancies.

In *Late Victorian Holocausts*, Mike Davis described the internment camps established by the British in India to manage famine conditions in the 1870s. The workhouses performed a similar function in Ireland in the 1840s, separating parents from children and husbands from wives. Many were ill, but all were forced to work because of the widely held belief among the English and Anglo-Irish elite that the primary cause of Ireland's social problems was the indolence and backwardness of the native population. Over a million people died of starvation or related diseases. In the years following 1845, another two million people emigrated.

In 1848, the London *Times* which had opposed expenditure on famine relief expressed the view that the Irish people "have always been listless, improvident and wretched, under whatever rulers...They have not participated in the great progress of mankind...We do pity them, because they have yet to be civilised." Political economists like Malthus had argued that Ireland was overpopulated and needed radical reconstruction if a modern capitalist form of agriculture was to be established. Much of the English and Anglo-Irish ruling class welcomed the famine as an opportunity for clearing the land. A further factor facilitating the high death toll in the famine was the belief in ruling circles that assisting the starving peasantry with government relief would interfere with the workings of free trade. The Great Famine coincided closely with the rise of free trade as the global gospel of the British Empire. Nassau Senior, a leading economist and adviser to Queen Victoria, remarked that the famine "would not kill more than one million people, and that would scarcely be enough to do any good" (Davis 2001; Eagleton 1995; Kinealy 2002; McDonough 2005).

In the wake of the famine, there was a sharp reduction in the practice of the subdivision of landholdings. Without access to land, the peasantry increasingly opted for emigration as a survival mechanism. Alongside spiralling emigration was a process of the centralization of landholdings and the emergence of a more prosperous peasant stratum. Despite this, the Irish countryside never became dominated by large labor-employing farms. Small farms remained the norm; the great majority had less than 30 acres. Only 5% of tenants held plots of over a hundred acres; another 10% rented plots of over 50 acres. The landlord class showed little inclination to develop a long-

term alliance with them. Westminster passed an act in 1860 giving landlords complete power over their estates and blocking any customary rights to tenants. The more prosperous peasants could not afford to put too great a distance between themselves and the mass of the peasantry.

One legacy of the famine was the radicalization of a younger generation who concluded that it was necessary to destroy landlordism and achieve complete independence from Britain. The Irish Republican Brotherhood (IRB) founded by exiles in Paris built up a clandestine organization determined to politicize the population and plan for insurrection. The insurrection of 1867 was easily enough suppressed, but the Fenians (as the IRB became known) helped politicize the popular social classes. In particular, Fenians played a crucial role in instigating the Land War in the 1870s and 1880s (Coakley 2012)

Competition from the new settler economies in North America, Argentina, and Australia led to a collapse in agricultural prices. The spectre of famine returned. Attempts by landowners to use the crisis to push through land clearances provoked a wave of popular resistance led by Fenians (or ex-Fenians) and the formation of the Land League in 1879.

The "Land War" began in the poorest western regions of Ireland but quickly spread throughout the country. Fears of another famine combined with a new level of political awareness (and the arrival of mass literacy) encouraged the formation of a mass movement that paralyzed the state and exposed the structural weakness of the Anglo-Irish landlord class. Within a year of its formation, the Land League had over a thousand branches and 200,000 members. William Forster a leading government official wrote: "the Land League is supreme...I am forced to acknowledge that to a great extent the ordinary law is powerless." To broaden its base, the Land League developed an alliance with the constitutional nationalists and their leader, Charles Stuart Parnell. The "New Departure" as it became known called for peasant proprietorship, full self-government, and complete independence from Westminster. It also opposed imperial expansion (Bew 1978).

The scale of the popular resistance in Ireland and the political threat posed by the alliance between republican radicals and the constitutional nationalists created a major challenge to the British state. Coercion was attempted but with limited effect. Gladstone, Prime Minister and Liberal leader, was forced not only to adopt a conciliatory approach to the agrarian protest movement but also to accept the need for radical political change in Ireland: the ending of landlord power and the institution of limited self-government.
