Preface

The Palgrave Encyclopedia of Imperialism and Anti-Imperialism presents prominent themes, epochal events, theoretical explanations, and historical accounts of imperialism from the beginnings of modernity and the capitalist world system in the sixteenth century to the present day. Important scientific and scholarly interpretations of imperialism have in the last 20 years reshaped the way intellectuals analyze and map human history. The present work takes these innovations a step further, offering a body of comparative research that both challenges and enhances our understanding of the world we live in.

Starting from a shared commitment to internationalism and social justice, we have taken care to include entries that elucidate the historical and contemporary centrality of imperialism to all aspects of society. In doing so, we have attempted to present imperialism from a range of perspectives. As such, we do not agree with all of the interpretations or conclusions reached by all of the authors whose work appears herein. Indeed, we differ profoundly with some of the assertions made, the most questionable of which tend to reflect typical ideological prejudices of imperialist society. Nonetheless, we believe that a glaring inattention to the transfiguring effects of imperialism on the political structures, economic institutions, cultures, and psychologies of both imperialist and oppressed nations can be found across the political spectrum. We consider this oversight a major obstacle to the understanding and progressive transformation of society and hope that this encyclopedia contributes to its overcoming.

While post-colonial studies have from the 1970s onward described the perseverance of forms of cultural domination, clearly an important marker of imperialist influence, critical geopolitical and economic analysis is absent in much of the research. At the same time, whereas formal imperialism has largely been abandoned (though not completely, as the examples of Afghanistan, Iraq, and Palestine show), free-market globalization has stimulated a new era of neo-colonial imperialism, reinforcing divisions in wealth within nations and across borders. Given a renewed popular and academic interest in the subject, attendant to its increasingly obvious real-world import, a comprehensive collection on imperialism is an invaluable resource to scholars and students of the humanities and the social sciences. Yet, whereas imperialism is an indispensable element of contemporary political analysis and scholarly investigation, a primary academic reference work on the subject has up to now been sorely lacking. As well as its academic relevance, imperialism is of profound concern to anyone interested in international history, politics,

sociology, and economics. The *Encyclopedia of Imperialism and Anti-Imperialism* was conceived and designed to fill this gap for scholars and students across academic disciplines and beyond the confines of the university.

In its broadest definition, imperialism is the military, political, legal, and/or economic control of one people's territory by another so that the subject territory is made to relinquish resources, labor, and produce for little or no compensation. Almost all societies have been subject to various forms of imperialism at one time or another, transforming their established political order and socioeconomic activities, prohibiting old customs and imposing new ones, dislocating inhabitants from their communities, and, in some instances, settling and occupying territories afresh. In the process, imperialism has imposed national, racial, ethnic, and class domination on disparate populations. This work examines how imperialism has impacted societies in the Third World, (i.e., the former colonies of Asia, Africa, Latin America, and the Caribbean) as well as how it has shaped social relations and popular perceptions in the First-World countries of Europe, North America, and Japan. It describes imperialism's shifting mechanisms of international wealth transfer and reveals how super-profits derived from superexploitation, accumulation by dispossession, and debt usury (none of which can treated in isolation from the others) have come to form the very taproot of the global profit system.

"Imperialism" is a term that is politically charged. For some, it signifies the glory of empire, the march of progress, and the triumph of civilization. In recent years, there has been a dramatic surge in pro-imperial discourse, epitomized in Britain by the work of scholars and commentators such as Niall Ferguson, Robert Kaplan, Andrew Roberts, William Dalrymple, Daniel Kruger, Keith Windschuttle, and Dennis Prager. In the 1990s, US political scientist Samuel Huntington famously decried the inherent barbarism of all non-Western cultures in his *The Clash of Civilizations* and found an eager mainstream audience in the context of the so-called War on Terror and the discourse of "humanitarian interventionism." Meanwhile, the state and corporate media monopolies dominating public discourse around the world present phenomena associated with ongoing imperialist machinations and processes in a consistently and universally benign light, except where a rival might be held culpable.

This volume does not attempt any exhaustive account of the human toll of imperialism, which would require dozens of thick volumes to cover the spectrum in any detail. It is important to state, however, that the development and maintenance of industrial capitalism was made possible, inter alia, by the plunder of Indian gold and silver from the Americas; by the wholesale theft of Indian land by force of arms and the resultant 50–100 million deaths from war, overwork, overcrowding, economic ruin, starvation, malnourishment, and related diseases; by the slave trade (1500–1869), which resulted in the deaths of perhaps 20 million Africans; by the loss of up to 100 million Africans from their homeland and hundreds of years of agonizing toil, wanton mistreatment, and early death for them; by the Cromwellian conquest of Ireland between 1649 and 1650 that resulted in approximately 618,000 deaths as well as the colonial exploitation that led to the Great Famine of 1845–52 resulting in

1 million deaths and 1 million emigrants; by Britain's plunder of India that resulted in about 29 million deaths from famine between 1877 and 1902; by Belgium's colonization of the Congo, which, between 1880 and 1920, resulted in at least 10 million deaths through starvation and slaughter; by Japan's colonial wars leading to perhaps 30 million deaths; by the killing of half-a-million Iraqi children under 5 years of age who died between 1991 and 1998 from sanctions imposed by the USA and UK; and by investors' ongoing dispossession of the land of the world's poorest peoples, which results in needless hunger, preventable disease, and curable disease leading to the unnecessary deaths of 100 million children every decade.

Added to these figures must be those deaths occurred during the First World War (37 million) and Second World War (at least 50 million), wars instigated by imperialist rivals as a means of each securing preferential trade agreements, tariff barriers, trade routes, protected markets for investments and manufactures, and sources of raw materials. Leaving aside excess deaths caused by economic dependence on foreign monopolies, we may also consider imperialism as responsible for the deaths of tens of millions of people in interventions by the major imperialist powers (the USA, especially) all over the Third World since 1945.

In light of the above, we believe that it is impossible to properly understand imperialism without reference to the struggle against it. Anti-imperialism took shape in the West with mass opposition and national liberation struggle leading to the dissolution of the Austro-Hungarian, German, Ottoman, and Russian Empires following the First World War. Its appeal grew considerably with the impact of the Russian and Chinese revolutions and the subsequent erosion of the British and French empires in the aftermath of the Second World War. In the English-speaking metropoles, the struggles of Black Americans and Irish, as well as the struggles of the Palestinians in the 1960s and 1970s, popularized anti-imperialist resistance still further. With the disintegration of the Soviet Bloc and the imposition of neoliberal regimes everywhere, the struggle between East and West has shifted primarily to that between North and South, exposing the abject divisions of income and opportunity within the world system. We present here a range of biographies and movement studies that exemplify the rich and ongoing tradition of national liberation theories and practices.

By highlighting the centrality of imperialism to present and historical social realities, this encyclopedia provides a multifaceted corrective to the myopic (inter)nationalism espoused in the global North by both the political right and its ostensible foes on the left. Undoubtedly, the class interests of the labor aristocracy have been reflected in the analyses and propaganda of the European and North American left for which imperialism is too often understood either as a historical or cultural throwback or as benefiting only (some) capitalists or a narrow upper stratum of workers in specific sectors of the economy. Under capitalism, however, the privileges of the metropolitan workforce relative to the proletariat proper (exploited, value-creating wage-earners) are afforded only by imperialism and can, therefore, only be maintained or extended by the same means. Ultimately, this ensures that the pursuit of short-term economic advancement by what is thus constituted as a mass labor

aristocracy must entail open or tacit compromise with capital. Those within the upper echelons of the global working class who aim to determine their destiny free of capitalist diktat must advocate the abolition of global wage scaling, the sine qua non of imperialism, even in the certain knowledge that this will mean a lengthy and considerable reduction in their compatriots' purchasing power.

The Palgrave Encyclopedia of Imperialism and Anti-Imperialism provides a comprehensive examination and overview of its subject, covering many of the most significant social, cultural, political, and economic aspects of the imperialist project. Entries chronicle the ways in which imperialist domination has unfolded, tracing its roots, goals, tactics, influence, and outcomes over time and space. We have not, unfortunately, been able to include all of the biographies that we would have liked to (e.g., of such anti-imperialists as Jose Maria Sison, Bhagat Singh, George Habash, Hassan Nasrallah, Gerry Adams, Michael Collins, Sitting Bull, Robert Mugabe, Daniel Ortega, Muammar Gadaffi, Rajani Palme Dutt, Lin Biao, Enver Hoxha, Abimael Guzmán, Charu Majumdar, and Subhas Chandra Bose, among others), or entries on all subjects relating to imperialism. We encourage readers to use this resource as a spur for further investigation. Nonetheless, we are confident that *The Palgrave Encyclopedia of Imperialism and Anti-Imperialism* is the most comprehensive scholarly examination of the subject to date.

We hope you enjoy reading it as much as we enjoyed editing it.

About the Editors

Immanuel Ness is Professor of Political Science at the City University of New York. He is the author of *Organizing Insurgency: Workers in the Global South* and *Southern Insurgency: The Coming of the Global Working Class,* among other forthcoming works, and editor of *Journal of Labor and Society.*

Zak Cope is an author and researcher. He is currently a visiting researcher at Queen's University Belfast, where he received his Ph.D. He is co-editor of *The Palgrave Encyclopedia of Imperialism and Anti-Imperialism*. His published works include *The Wealth of (Some) Nations*, *Dimensions of Prejudice*, and *Divided World Divided Class*.

Abd al-Karim al-Chattabi

Abd-el-Krim al-Khattabi (1882–1963)

Mevliyar Er
Mevliyar Er is a Freelance Researcher, Birmingham, UK

Synonyms

Abd al-Karim al-Chattabi; Abdu l-Karīm al-Ḫaṭṭābī; Mohammed Abd al-Karim; Moulay Muḥend; Muhammad Ibn 'Abd al-Karim al-Khattabi

Introduction

Mohammed Abd-el-Krim Al-Khattabi became an icon throughout the world for initiating extensively organized resistance initially against the Spanish and then the French imperial powers in the Rif region of northern Morocco during the years 1921–1926, the first country founded after a successful war of decolonization. Unlike most uprisings, achieving independence was not the trigger for his struggle: Abd-el-Krim did not turn resistance fighter against imperialism defined as a means of achieving greater economic progress but rather against exploitation and injustice. Abd-el-Krim was a Rifi, an ethnic group within the region's larger Berber community, with Tamazight being the native language of the Rifis. Until then, neither of the two powers had ever encountered a firmly united opponent that was astonishingly well organized both politically and militarily. His ability to manage to unify numerous independent tribal leaders or a fragmented society, marked by adherence to different paths (*tareeqah*) of Sufism (Islamic spiritual sciences) if not blood feuds, for the purpose of setting up a sizeable army, is what makes Abd-el-Krim so unique and the ensuing success of the Rifis unprecedented. His leadership skills, family background, him being a charismatic speaker and

judge on Islamic jurisprudence, and farsighted dedication for economic progress were certainly determining factors to attain allegiance. Another factor that makes Abd-el-Krim unparalleled is his successful implementation of socioeconomic reforms based upon *Sharia*, the Islamic law, and its execution through increased numbers of judges and courts (El-Asrouti 2007, p. 103). He forbade the traditional self-administered justice by appointing a Muslim judge (*qadi*) – accompanied by two legal officials (*'udul*) – for each clan. Until then, the Rifis adhered to common law (*urf*), which in most instances was contradicting – in particular concerning the rights of women – the Quranic law (El-Asrouti 2007, p. 99). In line with his policy to improve the role of women, his wife endeavored to open a girls' school (Pennell 1987, p. 113). In an interview with a journalist of the *Chicago Tribune*, Abd-el-Krim called upon experts ao to help in establishing a school system in the Rif (Sasse 2006, p. 311). He had also plans to establish a university combining traditional and modern sciences (Pennell 1986, p. 149).

Abd-el-Krim surprised most of European and American visitors who met him: Contrary to expectations he was relatively small, slightly plump, and calm. He was always dressed in traditional clothes and wore a turban, and his office was in a rather small clay building. He is described as being down-to-earth, intelligent, energetic, and a man of practical thinking. Western journalists interviewing him invariably express their amazement about his sharp mind and his knowledge about the international political affairs. As a devout Muslim, Abd-el-Krim was driven by the fundamental tenet of Islam. He publicly protested against claims of the French media that he intends to conquer Fes and become sultan of Morocco or become a khalif. He assured that his aim was to defend independency of the Rif and to achieve its recognition by other nations (Bode 1926, p. 18). Abd-el-Krim also emphasized repeatedly that the Riffian tribesmen, who supported him against the Spanish, were driven by fear of losing tribal independence and religious custom and not by nationalism (Abd-el-Krim 1927, p. 11). Thus, when he raised the issue of

freedom, most tribes were on his side (Abd-el-Krim 1927, p. 11).

Abd-el-Krim was driven by an unshakeable will to fight for a cause: Despite the overwhelming imbalance of power stages against him, there is no question that Abd-el-Krim had any doubts of winning the war against the united armies of Spanish and French colonial powers equipped with the latest war technology. Despite the dead-end situation of his army vis-à-vis a powerful European army, he still believed strongly that he would have triumphed had his policies been carried out and the *Sharia* been imposed correctly (Pennell 1986, p. 231). In a propaganda speech given, he said "…if you join us, we will be as one. We will defeat the Christians with your help or without it…" (Pennell 1986, p. 83). Abd-el-Krim's life and his military achievements are briefly summarized in the following.

Abd-el-Krim's Biography

Abd-el-Krim grew up in Spanish Morocco, a situation that had been long endorsed by the Sultan Moulay Abdelaziz and the members of his family whose lifestyle, let alone their political or financial leadership skills, left much to be desired. It was a relatively war-torn environment, the causes of which ranged from claims to the throne in Morocco to blood feuds between families or tribes. For this reason, Abd-el-Krim mentions in his memoirs that he was used to war and to the smell of gun powder since early childhood (Abd-el-Krim 1927, p. 41). Abd-el-Krim's family, briefly referred to as Khattabis here, was from the clan *Ait Hattab* in the Rif, with the most numerous and powerful tribe *Ait Waryiġel* under its auspices. Research to date failed to link the line of ancestry of Khattabis to *Ait Waryiġel*, but there seems to be unanimity among researchers that the Khattabis settled and ruled in the region of the *Ait Waryiġel* clan, for more than, as put by Abd-el-Krim (1927, p. 39) a 1000 years. Abd-el-Krim claims in his memoires that his ancestry originated from the Arabian peninsula and that they had a *sharifian* lineage, i.e., descendants of the Prophet Muhammad.

Abd-el-Krim's father was a *qadi* and governor, as was his grandfather and his mother was the daughter of a *qadi* (Bode 1926, p. 18). Thus his family enjoyed a good reputation and was influential throughout the region (Abd-el-Krim 1927, pp. 10–11). Abd-el-Krim and his brother, Si M'hammed (1893–1967) – who would later play a significant role in Abd-el-Krim's successes – pursued Islamic studies from a very young age, their first teachers being their father and their uncle (Abd-el-Krim 1927, p. 39). At the very beginnings of the twentieth century, at the age of 20, Abd-el-Krim moved to Fes and studied for 2 years at the *madrasas* Al-Attarin and Saffarin in order to fulfill the entry requirements for the renowned University of al-Qarawiyin in Fes, which includes – apart from Arabic language and grammar – memorization of the Quran in full as well as few other texts on Islamic jurisprudence. At the University of al-Qarawiyyin, Abd-el-Krim (then aged 22) begun to advance his Quranic studies. Si M'hammed, in turn, became a qualified mining engineer in Spain (Abd-el-Krim 1927, p. 10).

Between 1906/1907 and 1913, Abd-el-Krim taught at a school set up by the Spanish while simultaneously writing columns for the Arabic supplement of the Spanish daily newspaper *Telegrama del Rif* up until 1915. In 1909 and still during the process of his postgraduate studies of Islamic and Spanish law to become an Islamic judge – which he accomplished with an excellent qualification in 1912 at the age of 30 – Abd-el-Krim worked as a Spanish translator and advisor for the *Oficina de Asuntos Indigenas*, Department of Native Affairs, which was set up for greater citizen oversight and, as Abd-el-Krim would later discover, to submit the population. He translated for diverse mining companies, which inevitably informed him about economic exploitation plans of the colonizers. In 1910 Abd-el-Krim was appointed by the same department as *qadi* for the Melilla region and in 1914 as supreme judge. As a judge, Abd-el-Krim's work had mainly to do with the organization of the protectorate, such as the legal aspects of rights and title deeds to the iron deposits of Beni Tuzin, which bordered on his own tribal area.

Initially, thus both father and son were loyal to the Spanish. For this loyalty the Khattabis are taunted by researchers in the field: Fleming (1991), e.g., notes that "Abd-el-Krim and his father also helped organize a Spanish faction in their home kabyle. For this act, the elder Abd-el-Krim was awarded the Cross of Military Merit and an annual pension of fifty pesetas, while the younger was named qadi al qudat, or chief Islamic judge of the Melillan region" (p. 61). Abd-el-Krim justified this loyalty with the belief that the Spanish would bring economic progress and that without any foreign involvement this would not be possible. In fact, among several other economic deficiencies in the region, a major hindrance to development was poor infrastructure. Due to its geographical location and surrounding mountain ranges, the region was relatively isolated from the rest of the country. Hence, the Rif was relatively poor vis-à-vis the rest of the country, a phenomenon known as "Mezzogiorno effect." Terhorst (1925), a German diplomat and eyewitness of those times, describes the Rif region as follows: "2,000 meter high, gloomy, coarse and steep mountain chain extends along the North African Mediterranean coast between Melilla and Ceuta. The veil of the unexplored stretches mysteriously over this stage-like mountain world. The Rif is still a mystery, has still something dark, unknown to the European. Two Englishmen tried to move deeper into the mountains; but no one ever heard anything from them. Apparently a Frenchmen has managed to cross the Rif in 1600" (p. 154). Yet another reason for their loyalty to the Spanish was the idea of using the Spanish as a shield against the French colonial powers. The Khattabis were ardent opponents of any French involvement in the region. The sultan had signed the Act of the Conference of Algeciras on 7 April 1906, which had entitled also the French to establish a protectorate over Morocco. Since 1912 France maintained a troop of around 75,000 men in Morocco. These were divided into two groups, one into east and the other into west, and each was under the command of a division general. Two-thirds of the regular army consisted of African nationals including Moroccan (Bode 1926, p. 19). Later during the resistance, a

significant number of indigenous legionnaires both from the Spanish and French protectorate armies would change sides: In July 1921, for instance, nearly 5,000 were recorded to have deserted (Sasse 2006, p. 100).

The loyalty of the Khattabis changed in 1914 when the Spanish gradually began to advance into *Beni Urriaguel*. Abd-el-Krim and his family began to experience unfair practices inflicted on the locals directly. The French, who had gained control over the heartland of Morocco, were equally not in an amicable relationship with the local population. The Spanish authorities began to cut the incomes of the tribal leaders, including the father of Abd-el-Krim, and instead were paying bribes to tribesmen whom they expected to help in their efforts to expand into the Central Rif more readily. Abd-el-Krim started taking action by criticizing such corrupt practices as well as colonialism as a driver for economic progress, first through his job as journalist (Ayache 1981, p. 182). In 1915, when questioned by his employer, Abd-el-Krim told that both he and his father were supporters of the Young Turks and were working for the revolt of Islam against the Allies, particularly the French. Moreover, he candidly stated that any Spanish interference in these schemes would prove to be a fatal error (Abd-el-Krim 1927, p. 44; Ayache 1981, p. 217). For saying this, Abd-el-Krim was imprisoned on 6 September 1915, by the Spanish for almost 1 year. On 23 December 1915, Abd-el-Krim attempted to escape with a rope far too short at the other end but failed after breaking his leg, which would leave him slightly limping for the rest of his life. He was eventually released in return for his father's support for the landing of the Spanish at the Bay of Al Hoceima (Abd-el-Krim 1927, p. 46).

The uneasy relationship finally came to an end in 1918 when the Spanish continued to subjugate more tribes. Dissent among the population was exacerbated by a bad harvest, which was further complicating the already prevalent poor economic conditions (Pennell 1986, p. 65). Abd-el-Krim's father began to initiate an organized resistance (Abd-el-Krim 1927, p. 41 and 55). In order to strengthen unity among the tribes and to put an end to blood feuds, monetary fines charged for murder (*haqq*) – which had been abolished by the Spanish – were reintroduced and extended to apply to collaborators as well. The Rifis felt the reward of unity when they foiled a major attack led by General Manuel Fernández Silvestre (1871 Cuba – 1921 Annual, Rif) from the sea. Nevertheless, the general still managed to enter by using a different route later on. Confronted by the imminent threat of Spanish invasion, Abd-el-Krim's father started a campaign but died unexpectedly in August 1919. There were speculations that his father's death was due to a poison administered by the Spanish (Abd-el-Krim 1927, p. 57). With his death, the troop (*harakah*) disintegrated so that the Spanish could proceed with their plans for invasion without any resistance up until the beginning of 1921. Along these developments Abd-el-Krim, together with his brother, continued the campaign to form an inter-tribal alliance. Abd-el-Krim realized that Islamic concept of unity was the main peacemaking element which could help the Riffians find supratribal consciousness and identity (Pennell 1986, p. 238). He maintained a tolerant disposition toward tribal leaders with different ideologies and would endorse the legitimacy of their statuses among their respective tribes as long as they agreed to accept him as a leader. Soon, the brothers' endeavors bore fruit. Abd-el-Krim, being a charismatic leader and an impressive preacher, recorded more success than his father or any other Berber rebel leaders ever managed to achieve: In April 1921, at the age of 39, Abd-el-Krim was elected by 50 *Sheikhs* as their military leader. Political as well as religious decisions equally fell within the scope of Abd-el-Krim's duty. An oath of allegiance, consisting of one page, was designed according to a traditional homage document. It expressed that the signatories are committed to him with their hearts and tongues, that they compliantly obey him with their heads and rush to him with their feet, and that they will not be disobedient to him, and that they will not stray from the joint path of the community. The document ends with the sentence: "We pay

homage to you, we recognize you as the Head, and entrust you to guide us with justice, kindness and truthfulness and to judge between us justly" (El-Asrouti 2007, p. 79). In the oath Abd-el-Krim is addressed as khalif although Abd-el-Krim repeatedly denied that he aspired the status of the khalif.

Soon after his election, Abd-el-Krim managed to unite the various independent and quarrelsome tribes in the Rif to the point where he could field an army of some 65,000 men (Abd-el-Krim 1927, p. 94; Hart 1976, p. 388). Abd-el-Krim's efforts of unification also involved cooperation with other rebel leaders. One of the most troublesome for the imperialist powers was El Raisuli (1871–1925). Immediately before Abd-el-Krim's revolt, Raisuli had for some years led an ardent resistance against the colonial powers in the Jibala region (western zone of the Rif occupied by Spain). Raisuli's war tactics entailed piracy, in particular maritime. Raisuli refused Abd- el-Krim's invitation to join him. He was captured in 1925 and imprisoned (Furneaux 1967, p. 133). Eventually he died in captivity as a prisoner of Abd-el-Krim in 1925.

Despite the lack of support from other rebel leaders, Abd-el-Krim recorded two victories on a single day and proved that the oath was well-deserved: In a surprise attack on 2 June 1921 launched on Dhar Ubarran, about 600 Spanish soldiers were killed. Similarly, General Silvestre's troops ended with a defeat in Sidi Idris (Pennell 1986, p. 81). These victories encouraged more and more men to join Abd-el-Krim's troops. The success of the Rifis in the ensuing Battle of Annual on July 17, which lasted for 5 days, was unprecedented in the history of any battle of this kind. One of the participating soldiers, Chaaib Si-Mohand N'aali, reports in a documentary: "Abd-el-Krim was our leader. We encircled the Spanish troops. They resisted. But they were afraid and exhausted. We wiped them out." There are significant discrepancies in the literature concerning the number of troops on both sides: The estimated numbers for the Spanish troops range between 25,000 and 30,000 (Hart 1976, p. 374) and for the Rifis 3000 (El-Asrouti 2007; p. 61, 92, 95). Woolman (1968, p. 149) considers

in addition to the regular also the local army and estimates the total number of the Rifi Army to have been around 80,000. The Spanish death toll is estimated to have been between 8,000 and 10,000 (Sasse 2006, p. 40; El-Asrouti 2007, p. 61). Other historians set the death toll higher, at up to between 13,000 and 19,000 fatalities including captives (Hart 1976, p. 374). Out of panic and fear, not least induced by General Silvestre's decision to retreat the very next day, many Spanish soldiers fled the battlefield. The general eventually lost his life in this battle. Large amounts of war booty had fallen into the hands of Rifis. About 700 Spanish solders were captured, which were kept for a ransom. Abd-el-Krim warned from the start to impose death sentences upon those who abused or tortured prisoners of war or mutilated dead bodies (Pennell 1986, p. 81). In his memoires Abd-el-Krim states that the death toll of his enemies would have reached hardly conceivable dimensions had he not done this (Abd-el-Krim 1927, p. 72). For the Rifis the defeat of their opponents was an "absolute miracle" – as Krim's brother had called it: Abd-el-Krim ordered that *Quranic* verses be recited and prayers of thanks performed for the attained and the upcoming victory over the Spanish (Pennell 1986, p. 168). The colonial forces, in turn, dubbed the clash as "the Disaster of Annual." The reconquest of the areas lost in the past continued, and the Rif Republic was proclaimed on 1 February 1923. The humiliating failure of the Spanish military contributed to the instability of the Spanish government, and on 13 September 1923, Miguel Primo de Rivera (1870–1930) assumed absolute powers as a dictator following a coup d'état.

Bode, a German author, summarizes his impressions in his book on Abd-el-Krim published in 1926 on how the Muslim world felt about the Rif resistance, namely, that not Mustafa Kemal Paşa but Abd-el-Krim became the champion of Islam (Bode 1926, p. 55). Abd-el-Krim received innumerable financial supporters and collaborators – including Turks and Germans – for his cause. Large amounts of monies were collected in Madras, Delhi, Kalkutta, Syria, and

Lebanon to help "Muslims in Morocco" (Bode 1926, p. 24, p. 55). Abd-el-Krim sent letters – through journalists or envoys – to heads of states across the world asking for acceptance of his newly founded country. Abd-el-Krim also had plans to abandon the Spanish currency and introduce own currency, namely, "Riffan," for the Rif instead. Through one of his European collaborateurs, namely, Captain Charles A. P. Gardiner, an English arms smuggler and speculator, the notes were printed in England on the 10 October 1923, but these were disposed off into the sea after Abd-el-Krim refused to pay the excessive price Gardiner was asking (Sasse 2006, p. 178 and 304).

In July 1924, the Spanish experienced another crushing defeat in Chaouen. As in 1921, this was also a surprise attack where the Spanish had to give up one post after another. Concerning the death toll on both sides during this clash, there are significant disparities in the literature, too. The Spanish, according to one source, lost about 10,000 soldiers (Pennell 1986, p. 176).

But the tide began to turn. Since the beginning of 1924, the Rifis were observing problems initiated now by the French colonial powers: The Ouergha Valley, one of the most fertile regions of the Rif, was an important source of supply for agricultural produce to Rifis, and it began to be of interest to the French, too. Under the excuse of rearrangement of plot boundaries, the French began to build blockhouses and military posts around the valley. Food was already short due to embargos, and Abd-el-Krim forbade food exports and threatened any infringement with hard penalties. There was another reason for food shortage, notably contaminated soil: the Spanish had resorted to using the acutely poisonous chemical warfare agent S-Lost (Yperite) or mustard gas by aerochemical method for the first time in history starting in 1921 and on a large scale in 1924 in the Rif (Kunz and Müller 1990, p. 175). The poison was sourced from Germany and produced in Spain under the supervision of the German chemist Hugo G. A. Stoltzenberg (1883–1974). No one was spared from this atrocity: Not only were the guerilla fighters their target but also villages and water resources. The Ouergha Valley was largely spared from this contamination.

Under pressure from his people to take action, Abd-el-Krim decided to attack the French. With this decision, as he later admitted, he made the greatest strategic mistake since he took up the leadership of the resistance: He had not foreseen that the two competing imperial powers would eventually unite their manpower and resources against the Rifi resistance. Initially the French, as the Spanish had earlier, were recording significant losses. Out of desperation and the fear of losing even Fes, the French General Lyautey (1854–1934) saw no other solution than a joint operation with the Spanish to defeat the Rifis. Now the Spanish with 200,000 and the French with 160,000 men supported with the latest war technology were confronting the Rifi troops, consisting of about 60,000–80,000 men (Sasse 2006, p. 51). Pröbster (1925) makes the following statement concerning the number of troops on each side: "On the 9th July 1925 the French decided to increase the number of their troops to 150,000. The Spanish army consisted of about 100,000 Soldiers. In contrast, the number of the Rifis were at most 40,000–50,000. The aim of the Franco-Spanish army consisting of a quarter million men was to destroy the Rif republic founded by Abd-el-Krim" (p. 154). With regard to the number of Rifi troops, Pröbster (1925) adds: "Marshal Pétain estimates this figure to be between 30,000 and 40,000" (p. 158). The number of dead and missing French soldiers between April 1925 and May 1926 was 2,162 (Sasse 2006, p. 56). The territories lost were gradually reconquered, and on 26 May 1926, *Mulay Muhend*, the lion of the Rif, as Abd-el-Krim is remembered by the Rifis, was forced to surrender to the French forces. After being imprisoned for 2 months in Fes, Abd-el-Krim was exiled on the 28 August 1926 together with his two wives and children, his brother, his uncle, and their families – altogether 30 people (Malbert 2016) – to the French island La Réunion, located in the east of

Madagascar. The family lived at several accommodations including Chateau Morange – an impressive colonial castle – and then Castel Fleuri. The Réunionese felt proud having Emir Abd-el-Krim's arrival, and soon the Riffians made friendship – despite initial reservations of the authorities – with some members of the Indo-Muslim community of about 1,500 Gujaratis from India (Malbert 2016). Abd-el-Krim remained discrete, would meet only few families, and had good relationship with the governor. The authorities would appoint Ismail Dindar, a tailor, to cater for the families' traditional clothing and *halal* food requirements (Malbert 2016). Dindar eventually became Abd-el-Krim's best friend. One year before leaving Réunion (in 1946), Abd-el-Krim befriended Raymond Vergès, the leader of the Réunion Communist Party (Malbert 2016). He used to spend his time teaching Arabic and Quran, which he knew by heart, to the children in the family and the children of Dindar, and from 1937 onward – as by then surveillance of the family was reduced – also discovering the island and hunting. The family would grow sugar cane, mango, litchi, and guava in their garden and geranium on a large plot of land they had acquired. The family was granted a pension and would complement their income by selling geranium oil in their shop in Saint-Denis (Malbert 2016). In an interview conducted in 2013 Abd-el-Krim's daughter Meryem el-Khattabi (1939–2017) noted that her father used to say to his children that the island was a kind of "Kindergarten managed by the French."

In 1947 a decision was made to relocate Abd-el-Krim and his family of about 41 (some sources state 52) people to Southern France. The Greek ship "SS Katoomba" was hired for this purpose. However, during the transfer, Abd-el-Krim and his family managed to escape in Egypt. Abd-el-Krim's escape was planned and orchestrated by his admirers: On 23 May 1947, Mohamed Ali Eltaher, the president of the Palestinian Committee in Egypt, received a telegram from Abdo Hussein Eladhal, briefly informing that the ship with Abd-el-Krim on board had left the harbor of Aden

on the 23 May. On 27 May, Eltaher informed King Farouk (1920–1965) of Egypt, via a telegram, about Abd-el-Krim's arrival at the Suez Canal and asked for his support in freeing him, as the ship once in Egyptian waters would lose authority from France. On 30 May at Suez harbor, Abd-el-Krim was visited in the night by Eltaher accompanied by few other men from the Arab Maghreb Bureau and the king's representatives to discuss the escape plan and the king's proposal of an asylum in Egypt. Abd-el-Krim showed no reservations but said that he would also consult the matter with his family and come up with a final decision once in Port Said after the ship had passed the Suez Canal. In Port Said, Abd-el-Krim endorsed his acceptance and left the ship with his family pretending to visit the city.

Abd-el-Krim lived henceforth in Cairo. In January, 1948, he announced the formation of the National Liberation Committee of North Africans – supporting the liberation of Morocco, Algeria, and Tunisia – and presided over it until his death in 1963. His daughter Meryem el-Khattabi stated in an interview in 2013 that Abd-el-Krim would send fighters on a mission (*Fidayins*) for the armed struggle. As during his struggle in the Rif, he was counting on support from Germany to arm Algerian rebels. Abd-el-Krim's influence seems to have gone beyond the Maghreb countries, as there are claims that, for instance, Ho Chi Minh and Abd-el-Krim had cooperated during the war in Vietnam against the imperial powers: Minh asked Abd-el-Krim for support upon which the latter persuaded the Maghreb soldiers fighting in Indochina on the side of the French to change fronts (Sneevliet 1942, footnote 2). Similarly, when consulted as to which course of action to take upon the imminent creation of Israel, Abd-el-Krim replied: "Don't worry, do nothing. We cannot win that war for two reasons: We will either be defeated by the little Jewish state, and we will become a laughing-stock across the world; or we will win, and we will have the whole world against us. So what to do? Let the Jews colonize the Palestinians. We will be dealing with a classic colonial

situation, and the Palestinians will liberate themselves, as Moroccans, Tunisians and Algerians will one day liberate themselves" (Barrada and Sitbon 2004, p. 98). There is also evidence that Che had met Abd-el-Krim twice in 1959 in the Moroccan embassy in Cairo (Er 2015). In 1958, 2 years after Morocco became independent, the King of Morocco, Mohammed V, declared Abd-el-Krim as a national hero, ordered the release of all his confiscated properties in Ajdir, and invited him during a personal visit in Cairo in 1960 to return to the Rif. Abd-el-Krim refused this invitation, stating that the country had not become fully independent (Woolman 1968, pp. 227–229).

Publications on Abd-el-Krim and His Struggle

Abd-el-Krim's resistance made headlines throughout the world right from the beginning. The continual media coverage on the Rif War is certainly associated with the impact of the amazement with which the world had followed the relative success of the Rifis against the technologically far better equipped imperial powers. It should therefore come as no surprise that his failure and capture was covered in newspapers under praiseworthy and eulogistic headings such as "Like Prometheus Chained to a Rock," (San Francisco Chronicle, 24 October 1926). Abd-el-Krim's biography – based upon a relatively short interview – was published very soon after his capture. A French journalist had a rare chance to conduct an interview with him as soon as he was captured and published it in the form of a biography in 1927. The interview was conducted in French, and as Abd-el-Krim could not speak French, his brother acted as translator. Given the worldwide reputation of Abd-el-Krim, the rather short book was circulated widely. Its German translation came out in the very same year. The Chinese communist leader Mao Zedong is said to have held a copy of it and that he expressed his admiration for Abd-el-Krim's leadership by telling a Palestinian delegation of Fatah in 1971 the following: "You have come to me to hear me speaking about a people's liberations war, but in your

own recent history you have Abd-el-Krim. He is of one the most important inspiration sources, of which I have learned what the people's liberations war exactly is" (Sneevliet 1942, footnote 2). However, given the continuous media coverage of the Rif War and interviews conducted by the American journalist Mowrer (in October 1924) – published in *Chicago Daily News* from November 1924 to early January 1925 – and Vincent Sheean (in 1925) with his 1926 book *An American Among the Riffi*, the biography did not contain much more information.

Books of history tend to avoid mentioning wars that went against their interests: Although Abd-el-Krim and the Rif War made continuous headlines during the 1920s, it is largely ignored in the historical literature. Abd-el- Krim's resistance had led to the loss of thousands of lives, and his ideology was based upon Islamic ideals. Headings of more recent scholarly literature on the Rif War involve phrases such as "a forgotten war" or referring to Abd-el-Krim "the unknown or forgotten leader." His struggle and his motives were also falsified in his home country until recently: Moroccan schoolbooks briefly mention about Abd-el-Krim by underlining that he had fought against the colonizers for the Moroccan throne.

In contrast to scholarly literature, it is an unprecedented phenomenon that Krim's resistance continues to be used generation after generation as a setting for novels and films across nations (Er and Rich 2015). Initiated in Hollywood, since its beginning, the Rif War is continuously being portrayed across nations in the fiction genre, where it is generally used as danger setting for adventurers. Now as then, these publications do not purport to provide a realistic recount or enact realistic scenes on the Rif War but to associate it with extreme brutality and promiscuous behavior purportedly justified by Islamic teachings, a system of explanation much rooted in orientalism (Er and Rich 2015). These novels and films present their own thematic settings while giving a false image of Abe-el-Krim, namely, as a lover of Western women. No evidence exists that Abd-el-Krim was promiscuous or had any relationship with Western women. According to the norms and traditions of the time, Abd-el-Krim had two wives called

Thaimunt and Fatima; both women were sisters of his close confidants and ministers Si Mohammed Boujibar and Si Mohammed Mohammedine Hitmi (Woolman 1968, p. 207; Sasse 2006, p. 44). From these marriages Abd-el-Krim had 11 children, 6 of which were born in Réunion. With regard to brutality with which the Rifis allegedly had conducted the revolt, there is sufficient evidence by the imperial powers on propaganda to perpetrate massacre on the Rifis (Er and Rich 2015), if the use of mustard gas for the first time in the history of mankind is not sufficient proof thereof.

The Military Techniques

The military techniques and tactics applied by the Rifis during the clashes earned the greatest admiration of not only the opponent soldiers but also the high-rank officers. In the context of the El Mers campaign on 24 June 1923 in which the French forces had 200 casualties, Windrow (2010), for instance, remarks: "Prince Aage [a French captain of royal descent] saw them coming in from his left front; he took professional pleasure in the skill with which they alternated between mounted movements and skirmishing on foot with carbines" (p. 482). In order to get thorough understandings of the diaries of the operations, remnants of the battles including ruins of buildings such as forts, trenches, or hills never ceased to be subject to scrutiny by military experts and historians since the end of the Rif War (Windrow 2010, p. 525). Scholarly studies on Abd-el-Krim and the Rif War frequently characterize Abd-el-Krim as co-inventor of modern guerilla tactics. Abd-el-Krim adhered to Islamic teachings on self-glorification and megalomania, when he was asked to comment on his successes: To the question of Paul Scott Mowrer (1887–1971), a foreign correspondent for the *Chicago Daily News*, in 1924, as to who actually planned the Annual victory Abd-el-Krim responded "God planned it but I was present."

Worldwide research on the Rif War is unanimous that the war tactics of the Rifis were emulated during other rebellions such as the Druze War of Syria with France (1925–1927), the

Algerian War of Independence with France (1954–1962), and the Vietnam War with the United States (1946–1954) (Sasse 2006, p. 96). Twentieth-century anti-colonial revolutionary leaders – such as the Vietnamese leaders Hô Chi Minh (1890–1969) and Võ Nguyên Giáp (1911–2013) and the Yugoslav leader Tito (1892–1980) – are specifically mentioned as being influenced by the military tactics of Abd-el-Krim (Seymour 2008, p. 62; Sneevliet 1942, footnote 2). There is evidence that in particular Che Guevara (1928–1967) – who is considered as the most successful anti-imperialist guerilla leader to date – employed the tactics and methods, which were devised by the Rifis (Er 2015). The link between Abd-el-Krim and Che comes through, the Spanish Republican veteran of the Moroccan colonial campaign, Alberto Bayo (born in 1892 in Cuba – died in 1967 in Cuba), the much respected guerilla trainer of Che. Bayo had joined the Spanish army in 1916 and had become a pilot in the Air Force. His first assignments in Morocco are recorded to have started in 1919. Eventually, Bayo joined the elite corps *Legion Española* (the Spanish Foreign Legion), which was specifically founded to combat the rebels in Morocco. As a pilot Bayo had also dropped chemical war agents into the Rif. It was also during one of his missions in the Rif sometime between September 1924 and 1925, when he was seriously wounded and even lost one eye (Dosal 2010, p. 49). Bayo, already 64, had fought for 11 years against the Rifi rebels – the only guerrilla war he fought against – and had participated in the subsequent Spanish Civil War (1936–1939), when he was approached by Castro in 1956 for the purpose of training his soldiers in Mexico for the Granma expedition against the Batista regime (Dosal 2010, p. 49). The Castro brothers as well as Che Guevara took part in the training sessions. Generally, most of the successes of the rebels against the Batista forces are claimed to have been due to Bayo's tactical teachings.

With regard to the source of Bayo's expertise on guerilla tactics, Abel and Fisch (2011) comment that through North African guerillas Bayo had discovered methods of fighting that occupied him for the rest of his life, and as a theoretician of these, he had attained popularity all over the

world. The extent of Bayo's admiration for the tactics of the Rifis is put by Hansen (1960) as follows: "Castro succeeded in persuading Colonel Alberto Bayo to give a select group of cadres theoretical and practical training in guerrilla warfare. Bayo was well-known in Latin America as an expert in this field, having served in the Spanish forces that fought Abd El Krim in Morocco. The colonel became an admirer of the Moroccan guerrilla fighters and made a study of their tactics, which he sought, unsuccessfully, to place at the disposal of the Republican government of Spain in the civil war against Franco."

Similarly, Fidel Castro (1926–2016), yet another role model for Che, mentions in his biography (Castro and Ramonet 2008, p. 162, 168; Balfour 2002) that *he read about the Battle of Annual, one of the most successful attacks against the Spanish initiated by Abd-el-Krim in 1921.* Castro and Ramonet (2008) further says: "Later, in the twenties, Franco took part in a colonial war, in Morocco, in which the army had massive casualties. There was one battle, at Annual, in which Spain lost over 3,000 men. I've read the whole history of that war" (p. 496). Castro makes a few statements regarding the teachings of Bayo with reference to the Rif War. In his autobiography Castro comments that, "Bayo taught us how to set up a guerilla to break a defence the way Moroccans of Abd-el-krim faced with the Spanish." Castro and Ramonet (2008) further says: "Bayo never went beyond teaching what a guerrilla fighter should do to break through a perimeter when he's surrounded, on the basis of his experience of the times Abd el-Krim's Moroccans, in the war in the Rif, broke through the Spanish lines that encircled them" (p. 174). Research demonstrates in fact that there are a number of tactical similarities between the tactical teachings of Bayo as well as the operational methods used by Che during his battles in Cuba and the methods applied by the Rifis under Abd-el-Krim's leadership (Er 2015).

Abd-el-Krim's Strategic Innovations

There was no shortage of trained men in the Rif. A description of the Riffians' personality and

prowess is provided in Terhorst: "They are big and tough people, who can easily overcome any pains and labour. They are good riders and shooters, as it is the pride of any Rifi to own a gun. In order to possess a gun a Rifi works hard from a very young age and saves up to acquire one. The death of an enemy makes little difference if it is for getting a gun for it" (Terhorst, p. 173). Researchers on the Rif War unanimously agree that the contentious spirit of the Rifis – not least triggered by the idea of *jihad* and martyrdom – was one of the main determinants of their success. Another factor that gave the Rifis a competitive edge was their ability to cope with the demands of the guerrilla life in a challenging environment. The Rifi warriors were used to the difficulties associated with living in the Atlas Mountains, had a good knowledge of the topology of the Rif, and were extraordinarily acclimatized to both the excessive heat and the cold rainy seasons (Pechkoff 1926, p. 141, 211, 228). For this reason, Abd-el-Krim himself once made the supercilious statement that one Rifi would beat any ten Frenchmen (Woolman 1968, p. 184). Abd-el-Krim also appointed a general for each region (Sasse 2006, p. 96). Being vital for the success of their resistance, Krim's best warriors never fought jointly against the enemy. Each used to take leadership responsibilities for subgroups of warriors during a military operation and was under direct control of Abd-el-Krim (Abd-el-Krim 1927, p. 94; Hart 1976, p. 388).

During the battles and ambush attacks, the Rifis are also known to have used mountains, cliffs, and bushes in an astonishing way, for their own advantage. Some of the war tactics and methods that were specific for the Rifis include the following: caves dug in the slopes (Windrow 2010, pp. 523–524); extensive use of granite ramparts, rocks, and boulder-strewn summits in the hills as concealment/cover from which to target the enemy; the use of smokeless-powder rifles that made it impossible to locate its user; and hiding cannons in caves and using these exclusively at night, which made their discovery impossible (Woolman 1968, p. 108; Windrow 2010, p. 555). Most operations were conducted in the night. Apart from these, few other guerilla

tactics are still mentioned in the literature as having been typical for the Rifis. These fall into three different categories of defense techniques, namely, siege war, attack on armored cars, and bayonet-versus-knife fighting.

The siege war techniques used by the Rifi soldiers are the most enthusiastically and vividly described methods that can be found in the literature on the Rif War. Woolman (1968) refers to one such siege tactics as follows: "Mhamed Abd el Krim's strategy and tactics were simple but effective. The Rifians were to surround each small enemy outpost and attempt to take it by sneak attack. If this failed, they were to wait for the garrison to run short of water or bullets, then kill the besieged men as they made a break for freedom. These tactics worked to perfection in eastern Spanish Morocco during the Annual rout" (p. 156). Abd-el-Krim himself sees as the reason for the success in Dhar Ubarran and Sidi Idris on 2 June 1921 the division of the Spanish troops into blockhouses which were encircled by the Rifi armies in a surprise attack (Abd-el-Krim 1927, p. 67).

Another innovative siege warfare technique applied by the Rifis was the so-called double ring of trenches dug around posts or camps, which they used to beat back resupply attempts or to prevent access by rescue parties (Windrow 2010, p. 532). Only a few incidents are known where foreign legionnaires succeeded to get through the camps (Windrow 2010, p. 533). In the rare case where legionnaires managed to break through the first one, they would be held back by the second ring. On 3 May 1925, General Colombat was unable to break through the Berber trenches encircling Bibane, despite 6 h of fighting (Windrow 2010, p. 511).

Kunz and Müller (1990) mention the Rifi tactics of attacking armored vehicles, which they claim was also successfully practiced later on by other infantrymen from across the world. By referring to Woolman (1968), the authors describe the method: "While some men controlled the tank's crew through rifle shots into the vision slits, the others used to creep up onto the vehicle to throw grenades (produced by local craftsmen) into the hatch"(p. 58). Woolman's (1968) version

is as follows: "The Spanish opened fire as soon as the enemy appeared, but although the guns brought down some of the Rifian attackers, others dropped to the ground and waited until the cars lumbered closer. Jumping up, the Rifians surrounded each car, fired their rifles through the ports, and set fire to the gasoline tanks, thus completely destroying the armored car" (p. 104). Windrow (2010, p. 498) states that the Rifis would lay flat to avoid being seen by the crew. The first of such attacks known to have taken place was on 18 March 1922 against the Spanish tank company equipped with 12 French Renault FT-17s. In a joint operation with the legion infantry, their task was to drive the tribe Beni Said from the towns of Tugunz and Ambar (Scurr 1985). The legion suffered 86 casualties during this counter-attack by the rebels.

A further tactical approach that was identified as being unique to the Rifis relates to the use of bayonet-versus-knife fighting. Windrow (2010) describes this method as follows: "it was whichever side showed the most aggression that had the essential advantage. On the receiving end of a determined bayonet-charge the Berbers, like any other fighting men, would themselves 'float', and this tactic – if exactly timed, and carried out with real resolve – was successfully employed often enough for veteran officers to regard it as a panacea against any threat within 100 yards" (p. 471).

In additions to these, further guerilla tactics and methods are mentioned in the literature, which had caught the attention of witnesses of the clashes. One frequently described tactics relate to demoralization of the enemy by repeating the *strike and run tactic* until the enemy is demoralized and takes a static and defensive posture. Windrow (2010) describes the battle of the highly organized French company III/3rd REI on 6 May 1922 with the Rifis: "Any halt other than to deliver a rapid fusillade encouraged the Berbers to concentrate their own fire, pinning the platoon down and creating a static target towards which the tribesmen were instinctively drawn" (p. 470). During this clash, the French had 99 casualties (40% of their strength which included 17 killed, 64 wounded, and 18 missing). Rifis managed to apply this tactic even at a larger scale. During the

winter of 1923–1924, for instance, more than a quarter of the foreign army was tied down in static positions without any plans to regain the initiative (Windrow 2010, p. 498). Woolman (1968) cites the description of a Spanish legionnaire on how the Rifis used to defend themselves: "Abd el Krim's characteristic fighting tactics are to withdraw or retreat while the enemy advances, but at the first halt of the latter, to start sniping, at which the Moroccans are experts. And it is very difficult to shoot them down as they never collect in large groups, but in isolated bevies which are continually on the move; whereas the French and Spanish troops, moving in concentrated masses, are easy targets" (p. 184).

Yet another method relates to the method of preventing relief columns from joining one another (Woolman 1968, p. 90, 104, 136). At the end of July 1924, to mention one example, the Oued Laou outpost line near Tetouan was isolated by Krim's forces, and any relief attempt was fiercely attacked (Windrow 2010, p. 498). "It took 8th Company no less than three hours to get within 50 yards of the base of the rocks by alternate fire and rushes, but they were then pinned down, and two messengers sent back to appeal for artillery support were both shot as they ran" (Windrow 2010, p. 541).

The Rifis also used the presence of two imperial powers in their fighting arena to their advantage: After an operation into the French protectorate, Abd-el-Krim could always switch to his base in the Spanish territory. French were not authorized to follow him there as they wanted to avoid clashes with the Spaniards. At times Abd-el-Krim's success against the French was also due to misleading information he was disseminating: As opposed to his true intention, he would announce that his main target would be the north, i.e., the Spaniards.

The tactic of systematically targeting the vanguard during an ambush was yet another prime tactic of the Rifis. Windrow (2010) writes: "The Berbers did not give junior leaders the luxury of much time to think, and the man with the coloured képi and Sam Browne belt was a priority target" (p. 470). Referring to the clashes during July 1925, Windrow (2010) writes: "The bereaved II/1st Foreign, south of Ouezzane, had been led by Captain Derain, doubling up in command of the battalion and his own 5th Company due to the heavy officer casualties" (p. 543).

Windrow (2010) gives description in the context of clashes on the hills: "The moment of first occupying a summit was among the most dangerous, since the Berbers often counter-attacked immediately before the soldiers could organize a perimeter or set up machine guns. . . . As the first platoons reached a crest . . . tribesmen who had dropped a little way down the reverse slope might fire into their faces and launch an uphill rush at extraordinary speed" (p. 483). Windrow further notes, "A few tribesmen noted for their ambush skills had been watching and remembering every detail for several days; the best shots with the best rifles occupied a height from which they could see far along the back-trail or even the fort gates, while those with old muskets hid themselves among the rocks and trees a few yards from the track. However antique their weapons, the first blast at point-blank range could always drop one or two légionnaires in their tracks" (p. 491). The diaries of former legionnaires often mention fear of going outside an outpost or fort, let alone being sent to the front line. For this reason, the front line was also used as a punitive measure for those who broke the rules or committed offenses in the army. Given the great danger looming outside outposts and forts, foreign legionnaires would only go out if it was an absolute necessity, such as in case of water shortage after the area was checked and guarded by spahis, as described by Windrow (2010): "If there were any Spahis with the main garrison they rode out first and occupied high points, but in all cases the machine guns in the watchtowers were cocked, riflemen manned the walls, and look-outs scanned the surrounding terrain with binoculars while the water parties led the mules to the river or well. Such corvées were preceded by an advance guard which went beyond the watering point to picket any overlooking crest" (p. 491). However: "The routes and timetables of both corvées and supply parties inevitably became predictable, and by the tenth time an NCO [Non-Commissioned Officer] had carried out this duty without incident it was equally inevitable that he tended to relax his vigilance . . .. This

was the moment at which the Berbers would strike" (Windrow 2010, p. 491). Routs triggered by fear were frequently observed during the Rif War. Windrow (2010) gives a description: "On 3 September, near Souk de Ait Bazza, a series of fierce attacks on a Moroccan Skirmisher battalion 'produit un léger flottement'; this elegantly phrased panic ('a light floating . . . ') was quelled by charges that cost two companies of I/2nd REI another 33 men killed" (p. 484). Referring to the incident of Annual, Windrow (2010) notes: "The withdrawal on 22 June [1921] soon degenerated into a rout, and many men were ambushed and cut down. Silvestre and his staff all died; the body of the native affairs officer Colonel Morales was handed back later" (p. 464). Concerning the persistency with which the Rifis defended their posts using aforementioned tactics, Woolman (1968) says: "The forces at Melilla now numbered 36,000; led by Generals Sanjurjo and Calvalcanti, the Spanish slowly pushed their way to Nador, which they retook on August 13. Under intermittent attack from snipers, the Spanish struggled slowly onward; it took them almost two months to advance the few miles between Nador and Zeluan" (p. 103).

Conduct of Operations

Abd-el-Krim's aim was to create the nucleus of an army modeled to some degree on Western standards. Abd-el-Krim's regular troops (about 10,000 men) consisting of infantry and artillery wore military uniforms (Bode 1926, p. 22; Furneaux 1967, p. 117). The traditional tribal dress was retained in most cases, but the soldiers wore different colors of turbans to denote their rank (Windrow 2010, p. 497).

Despite their tactical innovations and fighting expertise, the Rifis were heavily reliant upon weapons from the Western world. Krim was actually very keen to get whatever modern technology he could and even planned to start a small air force in the Rif (Abd-el-Krim 1927, p. 103). An agreement for the purchase of four military planes was made with a French company, but only one could be smuggled into the Rif from Algeria in December 1923 (Sasse 2006, p. 196). By the end

of the war, Spanish troops confiscated 53 boxes containing a dismantled machine made in France (Sasse 2006, p. 203). Between 1926 and 1930, no fewer than 124,269 rifles, 232 machine guns, 128 artillery pieces with 4549 grenades, and 7 mortars were collected from the Riffians by the Spanish (Woolman 1968, p. 213; Sasse 2006, p. 203). Abd-el-Krim also knew the risks associated with a total dependence on arms imports and initiated the production of explosives: As the local Jewish population was primarily engaged in metalwork, Abd-el-Krim commissioned them to produce hand grenades using Spanish sardine cans and unexploded ordnance (Abd-el-Krim 1927, p. 95; Coon 1931, p. 65). At the end of the war, the Spanish confiscated 1,480 such handmade explosives (Sasse 2006, p. 132 and p. 203). Empty cartridge cases were refilled; new ones were manufactured in a production unit employing 60 workers (Sasse 2006, p. 192).

The Rifis were heavily reliant upon know-how from outside the borders of their own country, particularly with regard to technology-intensive weapons systems. Some of the guns, tanks, and even aircraft which were shot down needed repair. No Riffian was trained for this purpose, and European deserters as well as volunteers had to be employed for this task (Sasse 2006, p. 130, 133, 199). Desertions were not least encouraged by Abd-el-Krim's communist supporters orchestrated from the Soviet Union, pacifists, and social democrats. Their efforts incorporated propaganda through flyers and speakers inducing several French soldiers to join Abd-el-Krim's forces. The number of European deserters between 1921 and 1926 was estimated to have been at least 150, and the majority of these were Germans (Sasse 2006, p. 105). Increasing number of German deserters was recorded especially in 1924 due to Abd-el-Krim's plans to attack the French-occupied Morocco. Among the deserters, Abd-el-Krim was especially keen on those who were able to impart their technical skills on the usage of the arms confiscated during the Battle of Annual and Monte Arruit. The most prominent trainers are known by name (see Sasse 2006, pp. 100–101).

Abd-el-Krim, like his father, stood also for modernization. He saw that building a road

network would be a major advantage militarily as it would facilitate the transportation of confiscated heavy artillery (Sasse 2006, p. 125). In 1921 the road between Ajdir and Ait Kamara was built under the supervision of Si M'hammed, while in July 1922, about 60 Germans, mostly deserters from the French Foreign Legion, took over the supervision and management of further roads (Sasse 2006, p. 126).

Espionage service and intelligence support from the populace and the Rifi guerilla fighters also played a significant role for the success of the Rif resistance. Abd-el-Krim's scouts would inform him about every negligence in the guard duty and security service of the enemy so that an advantage could be taken instantly. Thus, setting up a telephone network was one of Abd-el-Krim's priorities (Sasse 2006, p. 122). The task of setting up a telephone system was accomplished Rifis who had gained experience from the Algerian telephone services as well as deserting Europeans (Sasse 2006, pp. 117–119, 122–123). Abd-el-Krim was connected with all sections of his front by cable reel telephone. The maintenance and operation of about 77 telephone stations – mostly located in the conquered Spanish block-houses – were also done by deserters and local youngsters trained for the purpose (Sasse 2006, p. 119 and 123). In 1925 Abd-el-Krim availed of about 30 radio transmitters and receivers and 4 telegraph stations, which kept him informed about the latest military reports of the French and Spanish (Sasse 2006, p. 121 and 124). Even the cavalry availed of wireless and impact resistant "saddle apparatus" (Sasse 2006, p. 121). Chain of command and transmission was set up excellently: Behind the front there was a row of headquarters which were connected with the reserves by telephone and light cars.

Conclusion

Abd-el-Krim repeatedly pleaded for peace and end of the war and asked for negotiations, but his requests remained unanswered. In this regard Krim said that the Spanish intended to annihilate the Rifis and pointed to the futility of the accusation that the Rifis were defending their freedom and religion only (Abd-el-Krim 1927). The refusal of his demands for self-determination in accordance with international law only prolonged the war, led to more deaths, and caused immense costs and massive political turmoil – a development that was to have a decisive influence on the later history of Spain, France, and ultimately Europe: Given the hardships and difficulties of fighting in the Rif, the Rif provided the perfect venue for advancing military and political ambitions for few unscrupulous officers. One such officer was the Spaniard Francisco Franco (1892–1975), who had joined the Moroccan colonial troops in 1913. When 23 he became a captain in 1916 and then the youngest major in the Spanish army after receiving a medal for bravery in 1917 for surviving a severe injury in 1916. Franco was second-in-command for the Spanish Foreign Legion which had experienced a crushing defeat in 1921 at Annual, and in 1923 he had become a commander of the legion. As colonel – supported by French troops invading from the south – he led troops ashore at Al Hoceima in 1925, marking the beginnings of the end of the Rif War. He was then promoted to the rank of brigadier general in 1926. The Rif War could be suppressed entirely in 1934, but it had left severe marks upon the Spanish political climate. The calamities of the ensuing Spanish Civil War in 1934 ending with Franco's victory in 1939 and the World War II were worse than what the Rifis had ever experienced. Abd-el-Krim's (1927) concluding remarks in his memoires that the war was imposed upon the Rifis and that not only the Rifis have been defeated but that the imperial powers had lost the war too, as the successes of the Rifis had given them pride, hope, and self-confidence that could not be annihilated by any defeat, seems to have been a prelude for Franco's dictatorship and the consequences this had upon France and later history.

Definition

Chinua Achebe, born Albert Chinualumogu Achebe in Ogidi in eastern Nigeria on 16 November 1930, was a writer, novelist, poet, and critic.

Chinua Achebe, born Albert Chinualumogu Achebe in Ogidi in eastern Nigeria on 16 November 1930, was a writer, novelist, poet, and critic. Achebe's father Isaiah Okafo Achebe was baptised by the missionaries of the Church Missionary Society and took on missionary teaching. His mother Janet Iloegbunam Achebe belonged to the blacksmith community of Umuike village in Awka. Achebe excelled at school and won a scholarship for higher studies. He graduated in English Literature in 1953 from the University College in Ibadan.

After a short span of teaching at the Merchants of Light School at Oba, Achebe joined the Nigerian Broadcasting Corporation in 1954. He was subsequently elevated to the position of director of external broadcasting in 1961, attained 'the Voice of Nigeria' position, and served the corporation until the 1966 Igbos massacre in western and northern Nigeria. During the Nigeria–Biafra war (1967–70), Achebe served the Biafran diplomatic service and undertook extensive trips abroad to speak on behalf of the Biafran cause. At the end of the war in 1970, he joined the University of Nigeria at Nsukka and then held a number of teaching positions at universities in the US and Canada.

Achebe was the recipient of many honorary degrees from universities in the US, Canada, England, Scotland, and Nigeria. He was awarded the Order of the Federal Republic, the Nigerian National Merit Award, the Commonwealth Poetry Prize (1974), the Lotus Award for Afro-Asian Writers (1975), the Campion Medal (1996), the Peace Prize of the German Book Trade (2002), the Man Booker International Prize (2007), and the Dorothy and Lillian Gish Prize (2010). He was a Fellow of the Royal Society of Literature, London (1981) and an Honorary Fellow of the American Academy of Arts and Letters (1983) and the American Academy of Arts and Sciences (2002). In 1998 he was appointed as the prestigious McMillan Stewart Lecturer at Harvard University.

Achebe was the author of five novels: *Things Fall Apart* (1958), *No Longer at Ease* (1960), *Arrow of God* (1964), *A Man of the People* (1966), and *Anthills of the Savannah* (1987). This compendium of work maps the transition of Nigeria from colonial to neo-colonial rule. Achebe's radical departure from

the colonialist historical narratives made crucial differences in representing Nigerian society and character. In *Reading Chinua Achebe*: *Language and Ideology in* Fiction (1991), Simon Gikandi aptly says:

> there is in all of Achebe's novels a fundamental link between the idea of the nation, the concept of a national culture, and the quest for an African narrative. Fanon's famous dictum that the liberation of the nation is 'that material keystone which makes the building of a culture possible' finds its parallel in Achebe's desire to liberate the African mind from the colonial complex and the 'crisis of the soul' which it triggers in the colonized. (Gikandi 1991, p. 7)

Regarded by many as the father of the modern African novel, Achebe was induced to write his novels as counter-narratives to Eurocentric discourses, which denigrated Africa. He pointed out how European mythology had constructed Africa, and worked to provide a counter-discourse that took part in the reconstruction of the African self. Achebe imagined a pre-independence national community with shared history as both progressive and useful for writing. In 'The Novelist as Teacher', he wrote:

> Here then is an adequate revolution for me to espouse – to help my society regain belief in itself and put away the complexes of the years of denigration and self-abasement …. For no thinking African can escape the pain of the wound in our soul …. I would be quite satisfied if my novels (especially the ones I set in the past) did no more than teach my readers that their past – with all its imperfections – was not one long night of savagery from which the first Europeans acting on God's behalf delivered them. (Achebe 1975, pp. 71–72)

Achebe's resentment at the European representations of Africans in literature incited him to write his maiden and classic novel *Things Fall Apart* (1958). Written during the same period in which Frantz Fanon was formulating his ideas, the novel delineates a critical study of the Igbo village, Umuofia. In the story, the protagonist Okonkwo lives during the colonisation of Nigeria, struggles with the legacy of his father, a shiftless debtor, as well as grapples with the complications which arise with the visit of white missionaries to his village of Umuofia. Okonkwo, the tragic but flawed protagonist, resists the onslaught of

colonial culture. Achebe was keen to remind his readers that European colonialism is not entirely responsible for all the turmoil in Umuofia. Wole Soyinka described the novel as 'the first novel in English which spoke from the interior of an African character, rather than portraying him as exotic, as the white man would see him' (Jaggi 2000, pp. 6–7). The novel explores the cultural conflict and encounters between Christian doctrine and Igbo traditions, and resists the racist images of Africa as depicted in such literary works as Joseph Conrad's *Heart of Darkness* and Joyce Cary's *Mister Johnson*. In an interview with Lewis Nkosi in *African Writers Talking,* Achebe spoke vociferously against the racial portrayal of Nigerian character by Cary in Mister Johnson. Achebe declared that:

> one of the things that set me thinking was Joyce Cary's novel, set in Nigeria, *Mister Johnson,* which was praised so much, and it was clear to me that it was a most superficial picture of – not only of the country – but even of the Nigerian character, and so I thought if this was famous, then perhaps someone ought to try and look at it from the inside. (quoted in Pieterse and Duerden 1972, p. 4)

As an anti-colonial novel, *Things Fall Apart* narrates the story of a society which has been irretrievably changed by the colonial power and culture. The scene in which Okonkwo's son Nwoye is alienated by the sacrifice of his foster brother is reminiscent of the biblical story of Abraham's willingness to obey his god's command to slay his son. Through these allusions, Achebe's novel engages with the Eurocentric representations of Africans as barbaric, marginal, and lacking coherence or speech. There are scenes in which the narrator promotes one perspective and simultaneously develops the negative side of that point of view. This double perspective surfaces in the language that Achebe adapts in the novel. For instance, there is a brilliant description of the missionary Mr. Smith's attitude: 'He saw things as black and white. And black was evil. He saw the world as a battlefield in which the children of light were locked in mortal conflict with the sons of darkness' (Achebe 1994/1958, p. 164).

Achebe's second novel *No Longer at Ease* explores the dilemma faced by young Nigerians in

contemporary Nigeria. Obi, the protagonist, is the grandson of Oknonkwo, the main character of *Things Fall Apart*. After attaining university education in England, Obi comes back to the newly independent Nigeria with the hope that he will rise by becoming an important part of the leadership. However, he is trapped between divergently pulling forces of tradition and modernity. This dilemma becomes apparent when he falls in love with a girl of the despised *osu* caste and faces stiff resistance from his orthodox family.

Arrow of God, published in 1964, narrates the interaction of Igbo tradition with European Christianity. Ezeulu, the chief priest of Ulu, is taken aback by the British intervention in the region and encourages his son to learn the secret behind the power of the foreigners. The message conveyed through Umuaro's political conflict with Okperi, the cultural conflict with the white man, and the religious conflict with the Church is that one should abide by the laws of the society that one belongs to. In the novel, the coloniser despises the culture of the colonised. Mr. Winterbottom summons Ezeulu, and when the latter fails to comply, he is detained in prison. The novel reaches its climax when the quest for power transforms into the quest for revenge.

A Man of the People (1966) is an acerbic satire on an un-named, African, post-colonial state. The protagonist Odili Samalau is seduced by the power and rhetoric of the corrupt minister of culture named Nanga. This seduction appears as a central motif for Nigerian politics, as various groups of voters in the region are symbolised by Nanga's loyal wife Elsie, his city mistress, and Edna, the young rural girl he is tempted to make his second wife. Finally, Odili courts and gets Edna, but at a substantial cost. One crucial problem that Achebe focuses upon in the novel is the search of a language that can be an authentic and appropriate mode of expression. Throughout the novel, Odili narrates the story and gives clichéd justifications for his shifting political allegiance; by doing so, he simultaneously enables the reader to discern his own unreliability as a narrator. The novel ends with a military coup, which prefigured an actual coup in Nigeria a few months after the publication of the novel,

triggering the bloody massacre of Igbos in northern Nigeria.

Achebe's fifth novel *Anthills of the Savannah* (1987) has a strong resemblance to the contemporary socio-political setup of Nigeria. There are reflections of *The Trouble with Nigeria* in the novel. This is a polyvocal text in which there are multiple narrators. The novel is about a coup in the fictional West African nation of Kangan, where Sam, a Sandhurst-trained military officer, has become president. His friends Ikem Osodi and Chris Oriko die while opposing the savage abuse of power. A military coup annihilates everything and eliminates Sam and Beatrice Okoh, an Honours graduate, a senior official in the ministry of finance, and girlfriend of Chris. As the narrator of this complex novel, she becomes a leader as well as representative of a group of women who envision an optimistic future for Nigeria.

In 1983, upon the death of Mallan Aminu Kano, Achebe became deputy national president of the People's Redemption Party and wrote a booklet *The Trouble with Nigeria* in which he gave his analysis of the failure of Nigeria leadership (Achebe 2010). As the director of Heinemann Educational Books in Nigeria, Achebe promoted many African authors by encouraging them to write creatively. In 1984 he founded *Uwa ndi Igbo*, a significant bilingual magazine for Igbo studies.

Edward Said argues that if non-European peoples are to be represented with justice it must be in a narrative in which they may themselves be the agents. Then they will appear as the creators of their own universe. Achebe, in his writings, draws heavily upon the Igbo oral tradition. By interspersing folk tales in his narrative, Achebe illuminates the community values in the form and content of his storytelling. For instance, in *Things Fall Apart* he dwells upon the interdependency of masculine and feminine by bringing the tale of earth and sky into the fabric of the novel. Similarly, the singing of folk songs and ceremonial dancing in Things *Fall Apart* are the sum total of the oral Igbo tradition. Achebe sprinkles proverbs throughout the narrative and with this technique he throws light upon the rural Igbo tradition.

Achebe's writings constitute interpretative spaces and critique of the post-colonial aesthetic. His works evince his ability to reverse the status of colonial language as a tool of colonial ideology to the language as a medium of new forms of expression. Achebe's choice of writing in the English language was due to his desire to write back to the empire. By altering the idiom, usage, and syntax of the English language, he transforms the language into African style. In 2007, when Chinua Achebe became the second writer to be awarded the international Man Booker Prize, the distinguished novelist Nadine Gordimer commented that he had attained 'what one of his characters brilliantly defines as the writer's purpose: "a new found utterance" for the capture of life's complexity. This fiction is an original synthesis of the psychological novel, the Joycean stream of consciousness, the post-modern breaking of sequence. He is a joy and an illumination to read' (Jaggi 2000, p. 7) On Achebe's 70th birthday in 2000, Wole Soyinka said: 'Achebe never hesitates to lay blame for the woes of the African continent squarely where it belongs' (quoted in Nare 2005, p. 149).

Bruce King in his Introduction to Nigerian *Literature* sums up Achebe's achievement as a Nigerian writer in the following words:

> It could be argued that the real tradition of Nigerian literature begins with Chinua Achebe's *Things Fall Apart* (1958). It begins a tradition not only because its influence can be detected on Nigerian novelists, such as T.M. Aluco, but also because it was the first solid achievement upon which others could build. Achebe was the first Nigerian writer to successfully transmute the conventions of the novel, a European art form, into African literature. His craftsmanship can be seen in the way he creates a totally Nigerian structure for his fiction. (King 1972, p. 3).

King rightly said that Achebe had a sense of irony and was especially excellent at satire. He compared Achebe to the nineteenth-century English novelists, such as George Eliot and Thomas Hardy, in presenting a detached and tragic universe in which exceptional individuals are crushed by the larger cultural forces. Fondly called the 'grandfather of Nigerian literature', Achebe died after a short illness on 21 March 2013 in Boston. At his death, *The New York Times* described him in his obituary as 'one of Africa's most widely read novelists and one of the continent's towering men of letters'.

Definition

From the colonial age to the present, Adivasi peasants in India have been resisting the ongoing brutal, planned, and discontinuous processes of commoditization of land, commercialization of forests, and proletarianization of labor, by resort to insurgency. The Kol insurrection of 1831–1832, the Santal hool (rebellion) of 1855, and the Birsaite ulgulan (great tumult) of 1899–1900, against the Sarkar–sahukar–zamindar (colonial government–moneylender–landlord) trinity in the colonial age; and the Naxalite/Maoist–Adivasi insurgency against the Indian state–big business combine, which has been directing the twenty-first century land grabs in the Bastar region of Chhattisgarh State, in independent India, are emblematic of such resistance to imperialism. The latter, understood as a process by which ruling and dominant, collaborating classes and the state team up to advance their activities, their interests, and their power in the so-called noncapitalist areas of the nation and beyond.

Introduction

Considered the "indigenous peoples" of India, this not without sharp controversy, Adivasis – specific "tribes," for instance, Gond, Kol, Koya, Munda, and Santal in the central-eastern region of India – have been at the forefront of peasant insurgency against "imperialism," both in colonial and independent India. In this chapter, I present the big picture on such insurgency, drawing on the Kol insurrection of 1831–1832, the Santal *hool* (rebellion) of 1855, and the Birsaite *ulgulan* (great tumult/uprising) of 1899–1900, the latter a Munda rebellion named after its leader Birsa Munda. I then cover the ongoing Gondi Adivasi–Maoist insurgency in the Bastar region of Chhattisgarh in independent India, resisting twenty-first century land grabs over there. I thereby seek to throw light on Adivasi resistance to "imperialism" in the colonial age and in the present, covering Adivasi peasant-insurgent politics and collective action over the long haul, albeit

in the contemporary period, led by a Maoist intelligentsia largely coming from the Indian middle class. This is an analysis of imperialism and the resistance to it in two different phases. There is thus a need to theorize imperialism and anti-imperialism as processes and apply that theory in the two different contexts.

The Adivasis have been resisting imperialism ever since the colonial state extended its control over land and forests, and labor relations by bringing in place "modern" administrative, legal, market, and repressive structures. The colonial and independent Indian states used such structures to modulate the discontinuous processes of commoditization and commercialization of land and forests, respectively, and the intermittent process of proletarianization of labor; all three underway over historical time, brutal planned undertakings, and still ongoing. In this massive endeavor, in the nineteenth century, the colonial government, the *Sarkar*, forged a symbiotic relationship with the *sahukar* (the merchant-moneylender) and the *zamindar* (landlord), constituting an exploitative and oppressive trinity that was the root cause of the Adivasi peasant rebellions. So also, in the Adivasi–Maoist resistance to the twenty-first century land grabs in the Bastar region, part of the ongoing process of commodification of land over historical time. But here the Adivasi–Maoists have been resisting an Indian state–big business combine that has been extending its activities, interests, and its power in these "noncapitalist areas."

Just like the Adivasi peasant insurgent of the colonial period grasped the nexus of the officials of the Sarkar (then the colonial authorities) with Indian exploiters, so also the Adivasi peasant insurgent of the twenty-first century understands the bond between the ruling politicians and officials of the Indian state and big business, whether Indian or multinational, in finance, production, and commerce. In both cases, then and now, the Adivasi peasant insurgent knew/knows that the business deals and settlements of the latter are dependent and contingent on the power of the former. The Adivasi peasant insurgent had/has a gut understanding of the mutuality of their activities, interests, and power.

Before I get any further, I need to clearly state the following: (a) There were a whole series of Adivasi *and* non-Adivasi insurgent-peasant struggles in the nineteenth century (Gough 1974); Adivasi peasants constituted only around one-tenth of the peasant population. (b) The overall national movement for independence in the twentieth century was multi-ethnic and multicultural; "tribal" persons, constituting around 8% of the Indian population, could only be a small part of that movement. (c) My characterization of the Adivasi peasant insurgencies of the nineteenth century and the ongoing Adivasi–Maoist insurgency as anti-imperialist resistance does not, in any way, imply that the peasant insurgents had/have a conscious leadership with an anti-imperialist strategy and program formulated in advance, and based on a theory of imperialism and anti-imperialism, or even that the leadership thought/think of imperialism the way I am now going to do, trying, as I am, to decipher the real meaning of their heroic resistance of the past and the present. All I can say is that the insurgent-Adivasi peasants had/have a gut understanding of the nature of the beast they were/have been confronting and why they needed to confront it.

Let me then come to the layout of this chapter. What immediately follows is a theoretical section dealing with imperialism as a process inherent in the development of capitalist underdevelopment. This is followed by a section on what being "tribal," or Adivasi had/has meant for such people who have been the victims of the process of development of capitalist underdevelopment in colonial and in independent India. I then go to the three Adivasi peasant insurgencies, the Kol, the Santal, and Birsaite rebellions, focusing on what led to insurgency; the Adivasi insurgent's consciousness as a class; the Adivasi peasants' view of themselves as rebels; the forms of struggle; the nature of solidarity of the oppressed; and the essentially local character of the revolts. This is followed by an account of the ongoing Adivasi–Maoist insurgency against the Indian state–big business combine's land grab in the Bastar region. Characterizing these insurgencies as anti-imperialist resistance certainly calls for a clarification of what I mean by imperialism, to which I now turn.

Imperialism: Theory and History, Inspired by Rosa Luxemburg's

For my purpose over here, I think that the theory, despite its incongruencies, and the historical material in Rosa Luxemburg's *The Accumulation of Capital* (1951/1913), subtitled "A Contribution to the Economic Explanation of Imperialism" (this did not appear in the title of the English translation), is particularly pertinent. This is because the book focuses on the relations between the capitalist and the "noncapitalist areas" of the world and has the intention of explaining imperialism for the entire period of capitalist expansion. Moreover, despite its theoretical inconsistencies, Luxemburg's intuition about *effective* demand – demand, at a profitable price, for the volume of goods and services that can be produced with existing capacity – being capitalism's most fundamental macroeconomic problem, proved to be correct. This insight came to be validated analytically by J M Keynes and Michal Kalecki, independently of each other, in the 1930s. As Kalecki, in his 1939 *Essays in the Theory of Economic Fluctuations*, has written, "the necessity of covering the 'gap of saving' by home investment or exports was outlined by her [Rosa Luxemburg] perhaps more clearly than anywhere else before the publication of Mr Keynes's *General Theory*" (Kowalik 2014/1971, p. 4).

Luxemburg rooted her *theory* of imperialism completely in the problem of *effective* demand, what in Marxist terminology is called the "realization" problem. The markets provided by workers and capitalists in a closed economy prove to be insufficient to support investment over the long term because the surplus produced cannot be realized. To fulfill capitalism's growth imperative, therefore, business enterprise and the state have to team up to capture external (noncapitalist) areas and markets and engage in armaments production and militarism, and this quest for external markets and resort to

militarism leads to imperialism (Magdoff 1978, pp. 263–269; Kowalik 2014). Aware that fixed definitions squeeze the lifeblood out of history, nevertheless, to help her readers, Luxemburg defined imperialism as "the political expression of the accumulation of capital in its competitive struggle for what remains still open for the non-capitalist environment" (1951, p. 446), within and beyond a capitalist country's borders, through militarism and war.

Of course, theory is necessarily abstract; it singles out for analysis the most important factor (s) that drive the process of change. But there are many other forces making for change, and so, in order to grasp the whole matter, one must go intelligently back and forth from theory to reality and vice versa (Magdoff 1968, pp. 18–19). Luxemburg's historical material also stresses the search for alternative sources of raw materials, fresh investment opportunities, and new sources of labor. The historical material and the analytical framework can be a guide to understanding the "development of (capitalist) underdevelopment" – the development of a country that entered the capitalist world-system, a global system of exploiting and exploited nations, as a colony/semi-colony. The progress of countries that had been through the processes of the *primary* accumulation of capital and industrial revolution much earlier was at all stages of their development the most important cause of the retrogression of those countries/regions they had turned into colonies/semi-colonies (Baran 1957; Sweezy 1967; Frank 1966).

For instance, upon India being subjugated and turned into a colony, its economy entered the world-capitalist economy. The brutal, discontinuous processes of commodification of land, commercialization of forests, and proletarianization of labor in India's colonial economy (within the world-capitalist economy) then followed over historical time (for an overall perspective on these processes, see Wallerstein 1976). Private property in land came with the coalescence of landlord and bourgeois. Such property in land in India was, at first, a cross-breed of landed property (with debt-induced bonded labor attached to it) and bourgeois property, and contingent upon the payment

of land revenue to the colonial state, and thus constituted "capital" as a combination of "estate" and class forms. There was even serial multiple leasing of land, with a number of intermediaries getting a share of the surplus. The actual tillers, the real peasants, tenants-at-will, could be evicted at the whim of their lessors. Exploitation was based on extra-economic coercion and from being compelled by lack of ownership of land to offer one's capacity to labor for a fraction of the value-added of the agricultural commodities produced. Societal arrangements reflected a blend of the manifold gradations of social rank, as in the oppressive social institution of caste, and class antagonisms. And the power exercised by the landlord and the moneylender stemmed from an organic unity of polity and economy (as in tributary social formations) in the countryside, this despite a formal functional separation of economic, political, and legal roles (as in a bourgeois system).

Such exploitative land and labor relations were forms of employment of labor and of dividing up land as capital in relation to the profitability they were expected to yield on the market, giving the colonial economy its worth in world trade by it providing a market and a source of raw materials for modern industry in the colonial power's home country. What came in place was a combination of free and "unfree" labor, the latter as a potential wage-labor reserve, and of quasi-commodified and commodified land, the former kept in reserve, with both these reserves retained in anticipation of significant changes in the international division of labor, or enhanced demand, that would require the relocation of certain lines of business or the expansion of capacity in the underdeveloped countries. Part of the "unfree" labor and quasi-commodified land would then come to be released from these labor and land reserves (as explained in Wallerstein 1976). A much higher rate of exploitation in the periphery and lower costs of land and minerals, with the adoption of the same technology, would lead to a higher rate of profit there, and the surplus would be shared among the owners of the companies and professional elites, and the respective states/governments, both at the center and the periphery. This has been the modus

operandi that has for long constituted the core of the world-capitalist system's exploitative institutional structure.

In the recent phase of significant changes in the international division of labor, India has been witnessing the expansion of its steel and aluminum industries, and with much of the mineral deposits of iron ore and bauxite in the Adivasi areas of central and eastern India, integrated steel plant and bauxite–alumina–aluminum complexes need to be located there. So, the land grabs and the Adivasi insurgent resistance to them in this region. Such resistance also stems from the fact that as far as the Adivasi peasantry is concerned, capitalism has been relatively unsuccessful in imparting its ideology, culture, and values to it.

When it comes to the acquisition of agricultural lands by the government for, and on behalf of, big business, from the non-Adivasi peasantry, this usually boils down to a question of the "price" at which it will be willing to settle the matter. But, in the case of the Adivasi peasantry, an offer of a favorable price far from resolves the matter, for there is a notion of *joint* holding of land, rivers, pasture, and forests as their community habitat, with a socio-religious responsibility to their ancestors, protective-guardian deities, and nature spirits to preserve and sustain it. So much so that the penetration of the Indian state, Indian big business, and the multinational corporations into the Adivasi areas of central and eastern India and their bid to usurp the *jal, jangal,* and *zameen* (water, forests, and land) of the Adivasis, thereby assaulting their *izzat* (sense of dignity), have been militantly resisted, even to the extent of resort to insurgency in places where the Maoists have been politically active in their communities.

Here the process of "accumulation by dispossession" (Harvey 2007, p. 159) has turned exceedingly violent and catastrophic, what with the escalation of militarism and war by the Indian state leading to cultural and economic ruin of these communities. Yet the Adivasi peasants have persisted. As Luxemburg wrote, albeit with respect to what the colonial powers did in the "noncapitalist areas" of their colonies, and her passionate account, in parts (Luxemburg 1951, pp. 365, 376, and 452), might well apply to what

has been happening in the undeclared civil war that the Indian state has unleashed against its own people in central and eastern India:

> . . .primitive conditions allow of a greater drive and of far more ruthless measures than could be tolerated under purely capitalist social conditions. . . . The unbridled greed, the acquisitive instinct of accumulation . . . is incapable of seeing far enough to recognise the value of . . . an older civilisation. . . . Force, fraud, oppression, looting . . . [is] openly displayed without any attempt at concealment, and it requires an effort to discover within this tangle of political violence and contests for power the stern laws of the economic process.

Under capitalism, the underlying basis of the dispossession of people from their lands is what potentially brings the highest rate of return from the private profitable use of those lands. Such dispossession usually takes place by the application of the law *and* the use of the threat or the actual use of force. These are the means by which land is "liberated" from the obstructions to its most private profitable use. One of these obstructions is "customary rights," which are put an end to because they interfere with the capitalist process. Property rights are made "private" and "exclusive" (Magdoff 2013, pp. 1–3).

In India, the Land Acquisition Act (LAA) of 1894 was the culmination of a series of colonial laws from 1824 onwards. The year 1863 marked the first incorporation of the provision for the colonial government's use of the legal doctrine of "eminent domain" to acquire land on behalf of the private sector, ostensibly for the "public purpose," the latter, itself quite all encompassing. The colonial period, with its "development" projects, land settlements, Forest Acts of 1865, 1878, and 1927, de-proto-industrialization, forced commercialization of agriculture, and the setting up of plantations and mines, spawned a vast segment of displaced persons by the time India became independent in 1947. This immiserated segment of the Indian people became a huge contingent of marginalized people in the wake of further displacement as a result of the development projects of the postindependence period (Bharati and Rao 1999, pp. 1374–1375).

The Government of India, in the erstwhile Planning Commission's *Twelfth Five-Year Plan*

(2012–17), admits that the number of people displaced following development projects since 1951 was 60 million persons by the year 2011, and only a third of these are "estimated to have been resettled in a planned manner. . . . Around 40 per cent of those displaced . . . [were] Adivasis [who make up only 8% of the Indian population] . . . Given that 90 per cent of our coal, more than 50 per cent of most minerals and most prospective dam sites are in Adivasi regions, there is likely to be continuing tension over issues of land acquisition in these areas" (Planning Commission 2013, para 6.33, p. 196). From the beginning of the new millennium, with the entry of big business into energy, mining, telecommunications, civil aviation, infrastructure (ports, highways, etc.), banking and high finance, a segment of Indian big business, with close political links in the upper echelons of the government, has emerged as a "financial aristocracy." The latter has enhanced its net worth by pocketing the already available wealth, public, community, and private, by means of the government's application of the law in their favor *and* the threat or actual use of force to dispossess people.

With neo-liberal policy and ideology in command, the exploitation of natural resources – water, electricity, coal, bauxite, iron ore, etc., for industries such as steel and aluminum – has been "managed" by giant mining companies supported by their home states, if they are multinational corporations, and the Indian state, and a network of financial institutions, national and international, all of which have been driving the process of accumulation by dispossession. The Indian government and the State governments that administer its "internal colonies," the Adivasi areas, have been striving to ensure cheap labor-power, low-cost, low royalty rate, high-profit minerals, water, electricity, coal, and huge capital gains in the exercise of options, along with a predatory public administration, paramilitary, and armed police to overwhelm the Adivasis in these regions.

It was Immanuel Wallerstein who did much to disseminate a crucial insight of Fernand Braudel of the Annales School of historiography that it has not been capitalism per se that has transformed "noncapitalist regions" but significant entry of capitalist big business that has brought this about, for big business comes with all the necessary political support to accomplish the mission (Wallerstein 1986). One can think about this in the light of the inroads of the East India Company in the Indian subcontinent, backed by the British state, and the transformation of India from a tributary social formation in decline to capitalist underdevelopment over a hundred years after 1757. Much later, Indian big business and the multinationals in our day and age, in a close nexus with the Indian state, have directed and steered the process of development of capitalist underdevelopment to make India an "emerging economy." With political support from the Indian state, Indian big business and the multinationals have driven the land grabs that threaten further dispossession and displacement of Adivasis from their habitats in central and eastern India. Structurally bred on "rent" (monopoly profit) – the antithesis of what the classical economists regarded as profit – constantly seeking monopoly positions, and accumulating vast amounts of capital derived from "rent," big business, able to get the necessary political support from the Indian state, has sought to transform many a "noncapitalist area" over the last three decades.

At the heart of the economic process – and discovery of what Luxemburg (1951, p. 452) calls the "stern laws of the economic process" – in the contemporary period is high finance. Wealth fundamentally originates in the exploitation of labor and the appropriation of nature in the process of production, but goes through all kinds of markets to become commodities, money, stocks and bonds, and other financial instruments, and back into money, commodities, and so on, with the hindmost appropriated by the financial aristocracy and other sections of big business. In this Age of Financial Capital, a relatively independent financial complex sits on top of the world's *real* economy and its national units and significantly influences the structure and behavior of those real economies and the corporations therein. The latter are driven more and more to mobilizing their cash reserves for financial speculation and entrepreneurship [Sweezy 1994].

In the specific setting of accumulation by dispossession in the so-called "noncapitalist areas" – areas not yet under the influence of big business enterprise that has all the necessary political support to transform them – the creation of huge capital-gains opportunities begins with the state virtually driving peasants, including those dwelling in and cultivating patches of forest land, out of their habitats. The state then under-prices its sales of the grabbed lands and other natural resources to big business enterprises, the very resources they covet for their manufacturing, industrial, mining, electricity generation and transmission, real estate, or infrastructural projects. For mining, the state hands over lucrative leases for a pittance – that is, the extractive rents of the increasingly scarce minerals are appropriated by mining capital that pays mere symbolic royalties to the *rentier* state. Having gained ownership over scarce natural-resource assets, the market valuation of which turns out to be a multiple of the under-valued prices at which they were bought, massive capital-gains opportunities are almost guaranteed, and the political brokers who fix the original deals get their cut (D'Mello 2018, p. 200).

The capital-gains opportunities come not merely from the bonanza of getting the natural resources dirt cheap. There is also an element of pure speculation, for instance, betting on expectations of such bonanzas in the future, which spurs further inflation of their underlying finan-cial-asset values. Indeed, the whole dynamic of accumulation by dispossession in the "non-capitalist areas" that promises cheap natural-resource hoards on the asset side of big-business balance sheets seems to be at the root of the unbridled greed and the political violence esca-lating into a war of the state against one's own people where the victims uncompromisingly resist their dispossession by resort to peasant insurgency. The prospect of big cuts for the likely political brokers leads to big money-backed elec-toral contests for political power. Accompanying the unbridled greed and the political violence of the counterinsurgency are, besides fraud and looting, the incapacity to recognize the value of older, nature-revering cultures, and the abuse of tribal habitats and ecosystems (D'Mello 2018, pp. 200–201).

Given the leading role of high finance in the world-capitalist system from the 1990s onwards, at the economic core of the new imperialism in the first two decades of the twenty-first century is "globalized monopoly-finance capital" (Foster 2015). The land grabs *steered* by the Indian state–big business combine in the Adivasi areas of central and eastern India, the expropriations of Adivasi habitats there, are driven, as I have argued earlier, by the financialization of the accumulation-by-dispossession process that serves the interests of globalized monopoly-finance capital. The Indian state–big business combine is subordinate to globalized US monop-oly-finance capital and the US Treasury, which has foisted neo-liberal financial-sector policies on the Indian economy.

At the core of this excursion into certain aspects of the theory and history of modern impe-rialism are the activities, interests, and powers of corporations and states (also see Sweezy 1978). From the foregoing, it seems clear that imperial-ism is a process by which big business and the state team[ed] up to expand their activities, their interests, and their power beyond the borders of the nation and in the nation's so-called "non-capitalist areas." Rosa Luxemburg hit the nail on the head when she showed that imperialism, which was barbaric in the colonies, was in the very nature of capitalism, the way of life of capitalism. Capitalism has been Janus-faced – life largely subject to the rules of civilization at the center; life under inhuman conditions in the periphery with the state disregarding those rules that stemmed from the eighteenth-century Enlightenment.

Of course, as the reader would have noticed, I have all along put the description "noncapitalist areas" in double-inverted commas and even, at times, called them "so-called." From this it should be evident that I do not consider capitalism as only an economic system where practically all labor-power and land are available as commodities and all production leads to the generation and appro-priation of surplus value, and this view of mine is contrary to what Luxemburg was arguing in

her *The Accumulation of Capital*. However, Luxemburg chose to examine a pristine pure capitalism precisely in order to show that its very existence is predicated upon its imperialist behavior. Quoting from the end of Marx's chapter 31, "The Genesis of the Industrial Capitalist," in *Capital, Volume I*, with reference to the original accumulation of capital, that "capital comes dripping from head to foot, from every pore, with blood and dirt," she writes that this "characterizes not only the birth of capital but also its progress in the world at every step, . . ." (Luxemburg 1951/1913, p. 453). I agree. After India was subjugated and turned into a colony, forcibly made to enter the world-capitalist economy, the discontinuous processes of commodification of land, commercialization of forests, and proletarianization of labor, brutal planned processes have been underway over historical time right up to the present. Let me then get to the community – the Adivasis – worst affected by those processes over the last two hundred years.

Being Adivasi: Theory, History, and Roots

Adivasi is a twentieth-century term by which a large section of the "tribal" people of India generally refer to themselves. The various Adivasis – specific "tribes," for instance, Gond, Kol, Munda, and Santal in the central-eastern region of India – are distinct communities of people, with their own dialects, customs, culture, and rules which structure how they act towards and in regard to each other. What distinguishes them from mainstream Indian society, whether Bengali, Bihari, Odiya, or Telugu, is internal social relations based much more on perceived kinship bonds, frequent cooperation to achieve common goals stemming from a collectivist tradition, and maintenance of a certain distance from the state and mainstream society because there is a historical memory of such contact – with state officials, traders, usurers, and contractors – as having brought oppression, exploitation and degradation (Hardiman 2015, pp. 3–4; Shah 2010, pp. 9–35; Xaxa 1999).

Are the Adivasis really India's "indigenous people"? The eminent archaeologist and historian, Shereen Ratnagar, whose work has focused on the Indus Valley Civilization, writes that "to claim that the Aryan immigration of the second millennium BC was a watershed that divided indigenes from colonizers is fraught with problems. . . . There has not been uninterrupted settlement in the same villages since prehistoric times in any part of the country. Instead we have archaeological evidence for abandonment of not only villages but entire regions; there would have been migrations, and colonization of new lands through the ages. Second, claims that forest-dwellers are indigenous to their area disregard the fact that ethnic identities change over periods of time, and often imply that forest-dwellers have not changed since the stone ages—and that may be more pejorative than the nomenclature 'tribes'" (Ratnagar 2003, pp. 19–20).

I have been putting the word "tribe" in double-inverted commas because for some, and for Indian officialdom, as in "Scheduled Tribe," it implies "primitiveness" and "backwardness." Tribes, of course, predate class society, characterized as they are by the social relation of kinship, socially recognized and culturally formed, and *joint* ownership of the natural resources from which they made a living. Associated with ancestors and jointly held, all the members of the tribe had rights to a share of the land as part of that natural resource base, and the group exercised its sovereignty over it.

As regards actual tribal society, as Ratnagar puts it: "For prehistorians, tribal society represents a stage of social evolution that took shape in the neo-lithic 'revolution'—the transition when, any time after about 9000–8000 BC, in various phases and places in West and South Asia, diverse groups took to cultivating crops and taming and breeding animals, thereby ceasing to rely exclusively on hunting, gathering, foraging and fishing for their food. ... ... In pre- and proto-historic India, there were dozens of such societies. Common to them are small villages, simple material culture, a limited range of tool types, mostly one-room huts, a few crafts like the production of pottery and clay figurines,

and diverse food-procurement strategies" (Ratnagar 2003, pp. 22, 23).

In later periods, following the social evolution of class societies, tribes coexisted with such societies, whether petty-commodity, tribute-paying social formations in India's precolonial period, or later in the colonial period with the development of capitalist underdevelopment. But they were no longer tribes in the original sense of the term, more so in the nineteenth century, when colonial ethnographers, steeped in a racist anthropology, characterized them as "primitive tribes." From the precolonial period, the upper-caste elite characterized forest dwellers – *pulkasas* in the *Laws of Manu* – as "the lowest of men" (Hardiman 2015, p. 3). So, it comes as no surprise that the upper-caste elite readily appropriated nineteenth-century colonial anthropology's characterization of caste status and tribe in a racist idiom.

Colonial empire building, territorial expansion, and domination of the weaker princely states, unlike in precapitalist times, no longer left the economic basis of the conquered or the dominated territories intact. The economic base of these territories, including the forests, was transformed and adapted to serve the imperatives of the accumulation of capital in Britain. The relative political autonomy that the various Adivasi communities had was now the nostalgic stuff of their precolonial past. The forests were at first demarcated but disregarded because they were areas that did not bring in the revenue that accrued to the (East India) Company-state from agriculture. But later, when their commercial value was recognized, and in the face of the huge demand for durable timber from the British Royal Navy and the railways, they were sought to be "enclosed" and managed by a forest department (created in 1864) of the colonial government as part of the process of commercializing them.

With the coming of the forest acts of 1865, 1878, and 1927 on the statute, "transgression," especially in the "reserved forests" but also in the "protected forests," even if this was merely to collect some fuel wood, or to graze cattle, or collect minor forest produce, was dealt with severely. Not only were the forests subjected to

Enclosure, even "wastelands" meant for grazing were sought to be "reclaimed," so much so that the precolonial fluid extension of occupations related to forests, grazing, and cultivation of fields was disrupted with the colonial demarcation of the three. The so-called "forest people" were forced to remain in their defined domain (terrain) and occupation, and militant political assertion of hitherto shared customary rights over all three, forests, grazing, and cultivation of fields, was deemed to be "criminal." Cultivation of lands in areas demarcated as forests was also deemed illegal. The "customary rights" of the Adivasi peasants were disregarded. The commodification of wood and other forest products attracted more sahukars (mahajans), merchants, and contractors into the forested and hilly areas.

Earlier, the Company-state's extension of the land tenure system to the peripheries of these areas that were cultivated by the Adivasis and the settling in of moneylenders and traders from the plains pushed many of the former into debts they couldn't repay. This led to dispossession of their lands (the collateral security for the loans), and desperate forced-migration as "coolies"/indentured laborers, through a recruitment system akin to that of slavery, to plantations in far-off Mauritius or British Guiana (in the Caribbean) and, later, from central India in the mid-nineteenth century, to the tea gardens in Assam and Darjeeling (Ghosh 1999; Dasgupta 1981).

After suppressing the insurgencies, the colonial administration instituted reform in the form of protectionary measures. For instance, following the Kol rebellion of 1831–1832, the Wilkinson rule that provided for a degree of self-governance by tribal village councils. After the Santal *hul* of 1855–56, the Santal Parganas Settlement Regulation Act of 1872, which legally blocked the transfer of lands to nontribal persons in the Santal Parganas. The Scheduled Districts Act of 1874 too. And subsequent to the 1899–1900 Birsaite (Munda) *ulgulan*, the Chotanagpur Tenancy Act of 1908 (Shah 2010, pp. 14–15, 18). Certainly, these were gains that had been won for Adivasis by their peasant-insurgent comrades. But unlettered in the official language of the courts, and anyway, with power still in the hands of the

Sarkar–sahukar–zamindar trinity, these gains were never secure.

By the end of the nineteenth century, most of the "tribes" in central and eastern India no longer occupied coherent areas. Their languages were in the process of being lost. The economic structure, the material culture, and the social practices in the areas they inhabited were significantly permeated by those of class–caste society within which the Adivasis found themselves. The surpluses they generated were appropriated by mercantile capital. With the commodification of land, and hence individual ownership and tenancy, the social fabric of kinship had been torn apart. Moreover, many tribal peasants, heavily indebted to moneylenders and landlords, had lost their lands and were forced into bonded or indentured labor. Large-scale displacement, in the colonial period itself, to make way for the railways, plantations, army and paramilitary cantonments, and coal mining and stone quarrying, had fragmented many a tribal community. Importantly, class formation had proceeded further within the Adivasi communities as they faced the pressures of class society more deeply under capitalist underdevelopment.

Over time, bitten by the capitalist bug, some of the Adivasi village, tehsil and district headmen turned into large landowners, imperiling community rights. Adherence to the norm of individual rights being subsumed within community control began abating. Some of the large landowners even appropriated the *gairmazurwa khas* (the non-revenue paying wastelands) for themselves (Roy Burman 2009). Their progeny are the Adivasis who have forgotten their own history of resistance to capitalism's way of life or do not want to be reminded of it. They have been assimilated into the socio-economic system on that system's terms. Co-optation has, to an extent, corrupted the Adivasi peasantry's social fabric of cooperation, community, and solidarity, or what remains of it. Adivasi ethnicity must thus be seen in an historical context, and Adivasi culture must be tied to historical tradition (Devalle 1992).

Overall, the Adivasis transformation process over the longue durée – if one were to use that expression from the French Annales School of historiography – has been towards a peasantry (Devalle 1981), albeit without complete obliteration of the attributes that characterize a tribe. The latter is evident in the social recognition of kinship; "kinsmen" helping one another with labor and instruments of cultivation on one another's plots of land on the basis of reciprocity, not exchange; individual rights still considered to be embedded in community rights; an exceptional degree of self-sufficiency of Adivasi peasant households; a better-off Adivasi peasant household generally not exploiting the labor or the goodwill of its poorer kinsmen; and greater relative gender equality. The peasant attributes of rural Adivasis have been/are evident, as I will show when I discuss the core aspects of the insurgencies, in their very definition of themselves, in alliance with other tribes and oppressed castes, and in opposition to the *Sarkar–sahukar–zamindar* trinity then, and the Indian state–big business combine now, defending their rights to the lands they had/have been inhabiting and tilling for generations. The class alliance, though it did/does not constitute the principal element of rebel solidarity, was/is of all exploited Adivasis and oppressed castes, and hence it transcended/transcends Adivasi affiliation. In other words, there has been no "isolated tribalism" in such resistance. Let me then get to the three most-significant Adivasi insurgencies in nineteenth-century India.

The Kol, Santal, and Birsaite (Munda) Insurgencies

The Kol Rebellion of 1831–32, the Santal Hul of 1855–1856, and the Birsaite (Munda) ulgulan of 1899–1900 – "the most massive and powerful of all such uprisings … bordered on peasant wars" (Guha 1983, p. 159). They were part of Indian peasant resistance to their oppression and exploitation in colonial India that took on the attributes of insurgency. In analyzing the three rebellions as Adivasi peasant resistance taking on the attributes of insurgency, I draw on Ranajit Guha's classic, *Elementary Aspects of Peasant Insurgency in Colonial India* (1983) that has done much to throw light on peasant-insurgent

politics and collective action in India during the period 1783–1900, from the Rangpur *dhing* in 1783 to the Birsaite *ulgulan* in 1899–1900.

I must, however, state upfront the main point of difference I have with Guha. Underlying his analysis is the implicit view that in India in the colonial period, to maintain its rule, British imperialism had allied with Indian *feudalism*, and it was this which accounted for the prevailing state of backwardness and determined the *semi-feudal* character of the exploitation, oppression, and domination of the peasantry. I stress the fact that India came into the world capitalist system as a colony of Britain much after the latter had been through the process of original accumulation of capital and as the industrial revolution was underway in Britain. Under the sway of the policies of its oppressor and suppressor, Britain, which tailored those colonial policies – in the nineteenth century, mainly centered on the commoditization of land and forests, the commercialization of agriculture, and "deindustrialization" – to advance the accumulation of capital in Britain, India experienced capitalist underdevelopment, not "semi-feudal" backwardness.

Instead of chronological descriptions of the Kol, Santal, and Birsaite insurgencies, I will – viewing insurgency and counterinsurgency together, with the latter inevitably accompanying the former – comment on what led to insurgency; the Adivasi insurgent's consciousness as a class; the Adivasi peasants' view of themselves as rebels; the forms of struggle; the nature of solidarity of the oppressed; and the essentially local character of the revolts. In covering all these aspects, I draw mainly, but not uncritically, from Guha (1983), for his is a historiography not undermined or prejudiced by the "facts" and the views of the counterinsurgency about the insurgency.

All the three insurgencies, the Kol, the Santal, and the Birsaite, were war-like campaigns spread over several districts. The Kol insurrection of 1831–1832 over a greater part of the Chotanagpur region and Palamau, with the Larka Kols of Singbhum crossing over to assist the rebels. The Santal hul of 1855–56, with a rapid thrust and phenomenal spread over Damin-i-Koh and Birbhum and from there over a wide area up to

Bhagalpur. The Birsaite ulgulan of 1899–1900, with an abrupt beginning and a rapid advance over the Chotanagpur region.

The Kol insurrection took almost complete possession of the Chotanagpur region in a matter of four weeks. As the main leader of the insurrection, Bindrai explained, the rebellion was against "those who have deprived us of both honour & homes. … They have taken away from us our trees, fishes, lands and jagirs [land grants]" (Guha 1983, pp. 283, 287). It was even officially acknowledged that the "massive alienation of tribal lands to outsiders in the years preceding the insurrection" (Guha 1983, p. 287), with the Company-state desperate to increase its revenue through commoditization of the land, was the main cause of the "jacquerie," as the British called it. So one might say that the combined effect of the colonial government and its Indian collaborators who had come into the region following its ceding to the Company-state had led to the expropriation of the homeland of the Adivasi people, which led them to revolt.

The Santal hul was preceded in 1854 by gangs of hungry and famished "social dacoits" seeking justice in open acts of defiance, robbing food. Upon being dealt with by the Indian Penal Code (IPC) as criminals, even as the exacting merchant-moneylenders were favored by the police and the courts, the Santals were appalled by the double standards, and this was one of the main reasons that provoked the hul (Guha 1983, pp. 95–101). The Adivasi peasants felt that their own social–moral code, according to which the government had an obligation to provide for a subsistence minimum, was an overriding right of the starving food-robbers. They viewed themselves as rebels, but the police's "insistence on dealing with them as criminals is what triggered off the insurrection" (Guha 1983, p. 99). Moreover, it was the Santals that had earlier cleared forest land and brought it under the plough, but with the Company-state's commoditization of land and its alienation to zamindars and mahajans (sahukars), and the Sarkar intervening favorably on their behalf, the Adivasi peasantry made no difference between the Sarkar and the *diku* (the outsider–exploiter). The historic paravānā (warrant) – declaration of intent to wage war – issued by Sido and Kanhu,

leaders of the Santal hul, was a proclamation of Santal belligerence addressed to both the colonial government and its Indian collaborators, the native exploiters of the Adivasi peasantry (Guha 1983, pp. 283–284).

Among what caused the Birsaite ulgulan, as expressed by the Mundas, was the loss of their *khunt-katti* rights – claimed by Adivasi descendants over lands reclaimed from the forests at the time when their villages were founded. This was after their repeated appeals to the Sarkar and the missionaries brought no redress. Great hopes were kindled when Birsa, in the form of a prophetic savior, came on the scene. As the ritual chant of the Mundas when the hour struck for the ulgulan, translated by Kumar Suresh Singh in his 1966 classic, *The Dust Storm and the Hanging Mist: A Study of Birsa Munda and His Movement in Chhotanagpur, 1874–1901*, went: "... We shall not leave the zamindars, moneylenders and shopkeepers [alone] / They occupied our land / We shall not give up our *khunt-katti* rights /... / O Birsa, our land is afloat / Our country drifts away ... / The big enemy, the sahebs donning the hat / Seized our land" (Guha 1983, p. 288). Thus, recovery of the lost homeland of the Mundas was the main aim of the ulgulan, a homeland gone in the imperialist process of commodification of land and enclosure of their forests, from which they were banned or restricted.

In all the three rebellions, the Adivasi insurgents had what might be called an incipient form of class consciousness, for they made clear distinctions between the section of the non-Adivasi population that was their enemy, landlords, and mahajans (merchant–moneylenders), and the rest who came from the oppressed castes and classes. The Kols singled out the landlords and moneylenders among the *suds*, non-Adivasi outsiders, and when the Company-state came to the defense of these class enemies, a war-like campaign developed against the Company-state (Guha 1983, p. 26). In the hul, in many villages, the Santals burnt down the houses of the *mahajans* but spared those of the oppressed peasants. The Birsaite ulgulan, even as it was launched to liberate the Munda homeland from

British rule, clearly expressed its hatred for banias (traders) and mahajans (moneylenders) as exploiters (Guha 1983, pp. 22–23, 26). What had emerged in these three insurgencies was an incipient form of class consciousness – no longer reconciling themselves to their lowly conditions, the Adivasi peasants implicitly defined themselves as a class opposed to the zamindar, the sahukar, and the sarkari officials.

The three Adivasi insurgencies were, in their very nature, political resistance against imperialism. There was an *openness* in their affirmation of intent, with practically no attempt to conceal the violence by pretending to conform to law and order. The insurrections were *public* and *collective* political acts, with parleys and assemblies to establish their legitimacy, and forms of mass mobilization, and with explicit warnings in advance by the Kols and the Santals. Just as the Adivasis engaged in collective labor in the harvesting of their crops, so too did they decide to engage in collective violence against their oppressors (Guha 1983, p. 126). They were *destructive*, no doubt, what with all the wrecking, arson, and looting. In all this destruction, what stood out was "demolition of the symbols of enemy authority" and settling accounts with the Sarkar, the sahukar, and the zamindar. The insurgencies were near *class wars*, expressing the will of the oppressed and the exploited classes.

Nevertheless, killing was *not* the principal modality of the insurgents, although the few informers that surfaced and the few traitors that came to light were assassinated. Retributive killing, as in tenant murdering his landlord, or debtor his usurer, or untouchable his caste-Hindu tormentor, was minimal – although the degree of exploitation and oppression knew no bounds. Of course, as between insurgency and counterinsurgency, it was a very unequal confrontation, with largely axes, knives, and bows and arrows, but with a gut understanding of what it takes to fight as the underdog in an asymmetric war, all this on the side of the insurgency, and guns and sabres, and cavalries, and trained soldiers and officers of the British colonial army on the side of the counterinsurgency. Moreover, the counterinsurgency, expressing the will of the Sarkar and

committed to protecting the *sahukar* and the *zamindar*, invariably "made of killing a principal modality" (Guha 1983, p. 161). A village united in resistance was condemned as a "dacoit village" and marked out for destruction. Mass solidarity and fervor fostered by the rebellion was diagnosed as "contagion," as in the spread of a virus. The ones inspired by the ethics of the insurgent political project were labeled "fanatics." Defiance of criminal law as in the IPC, or unlawful application of it, was labeled "lawlessness," and insurgents bent on "turning the world upside down" were deemed to be "criminals" (Guha 1983, pp. 16–17).

As regards solidarity, in all the three insurrections, there were inter-tribal alliances of armed collaboration with most of the other tribal peasantry in the rebel areas, and so there was an Adivasi identity of the peasantry involved in them. The counterinsurgency tactic of inter-tribal divide and rule failed. In the Santal hul, the nontribal *Gwalas* (shephards), the *Lohars* (blacksmiths), and the *Doms* (Untouchables, the most persecuted in the caste hierarchy) came on the side of the insurgency. In the Kol and Munda insurrections, the Adivasi insurgents "were careful systematically to spare from violence many of the poorer classes of the non-tribal population with whom they had customary economic and social transactions in the rural communities where they lived as neighbours" (Guha 1983, p. 176). This might seem that class solidarity had cut across ethnic divisions among the rural poor, as fearful British officials at the time of the Kol rebellion seemed to think, but, in reality, class consciousness did not make up the principal component of rebel solidarity (Guha 1983, pp. 176–177).

One of the direct results of the colonialist creation of a highly centralized state in the Indian subcontinent, linking urban mercantile and credit capital with the businesses of the landlords and the moneylenders in the countryside, was the strengthening of the landlord's and the moneylender's authority when they got the backing of the sarkar. The coexistence of the *kacheri* in the district headquarters – the official buildings housing the court, the treasury, the police station,

and the jail – and the *havelis* (mansions) of the big merchants, indigenous bankers, and absentee landlords made it easier to put in place the legal cover necessary for the usurious and rack-renting transactions. Of course, I must add, following the Charter Act of 1813, which abolished the East India Company's monopoly over India's foreign trade, the triumph of the Industrial Revolution leading to the swamping of the Indian domestic market with British factory-made goods; the turning of India into a primary producer for the British industrial system; the more successful zamindars took to trade and commerce in collaboration with British concerns as junior partners. The peasants really hated and regarded with fear the *kacheri* and the *haveli*, the two main visible symbols of authority. The combination of the landlord's and the moneylender's authority with that of the Sarkar, the blending of the mores of landlordism and usury with the ruling culture of imperialism, complicity and legal cover that safeguarded the interests of the Sarkar and the landlords and moneylenders, all of this provided peasant insurgency with the objective conditions of its emergence and propensity to spread (for a similar view, but one that holds that colonialism allied with Indian "semi-feudalism," see Guha 1983, p. 226).

Peasant insurgency as the principal antithesis of imperialism took place alongside the growth and consolidation of the "colonial empire with its centralised bureaucracy, army, legal system, institutions to purvey a western-style education, its railways, roads and postal communication, and above all, the emergence of an all-India market economy" (Guha 1983, p. 297) in the nineteenth century with mercantile capital in India as an appendage to industrial capital in Britain. Certainly, the more the colonial state apparatus and infrastructure and the mercantile capitalist economy on an all-India scale grew and got consolidated, the more the peasant revolts – imbued as they were with "peasant localism," confined within local boundaries, and preoccupied with local considerations – got undermined. The "domain of rebellion" remained a small subset of the "domain of the nation" (Guha 1983, p. 331), and hence, more vulnerable to defeat. The domains of the three insurgencies were as large as

the areas the main tribe involved inhabited, what it called its homeland, and wherein there had been a massive alienation of Adivasi lands. "(C)oresidential solidarity and primordial loyalty" severely restrained the spread of such resistance against colonialism (Guha 1983, p. 331).

"Yet all such limitations notwithstanding," as Ranajit Guha asks, "where else except in this fragmented insurgent consciousness is one to situate the beginnings of those militant mass [anti-imperialist, I might add] movements which surged across the subcontinent in 1919, 1942 and 1946? . . . (N)ot to recognize in ... [the tribal and non-tribal] peasant insurgencies—limited as they were by 'the habit of thinking and acting on a small scale'—]the elements of what made the broader and more generalized struggles of the Indian people possible in the twentieth century would be to foreshorten history. . . . Many of the mass movements of the twentieth century[—the Rowlatt Satyagraha, Quit India, Tebhaga, Telangana, and, I might add, the Naxalite/Maoist insurgency—]bear at least some of . . . [the] hallmarks [of the nineteenth-century peasant-insurgent's consciousness]" (Guha 1983, pp. 331–332).

Adivasi–Maoist Resistance to the Land Grab in Bastar

This brings me to Adivasi resistance to imperialism in the present period. The development of capitalist underdevelopment makes for the element of continuity in the chequered careers of colonial and independent India. No wonder that from 1967 onwards, two decades after independence in 1947, Naxalite–Maoist peasant insurgency took shape in different local areas, especially Adivasi inhabited ones, in the States of West Bengal, Andhra Pradesh (Telangana), Bihar (Jharkhand), Madhya Pradesh (Chhattisgarh), Maharashtra, and Odisha, and has been resisting capitalist underdevelopment ever since (D'Mello 2018: Chaps. 1, 4, and 7). But even as mainstream nationalist and social-democratic left politics came into its own on a subcontinental basis in the twentieth century, this peasant

insurgency has remained localized, in severely underdeveloped areas in certain regions. It has failed to spread far and wide over the vast countryside of the Indian subcontinent.

At the heart of the conflict has been the alienation of land, the taking away of the means whereby a peasant lives, either in the course of class differentiation of the peasantry or in the underdevelopment that has accompanied industrialization and urbanization. The last two decades of the twentieth century and the first two of the twenty-first century have witnessed breakneck relocation of "old" industries out of the developed capitalist countries and into mainly the so-called emerging economies, especially China, but also India. Capitalist underdevelopment, as a process, has its roots in imperialism, which has been a way of life of capitalism as a world-system, constantly developing in a combined but uneven way. As the center has been relocating the "old" industries to the semi-periphery, it has been taking on "new," science-based, high-tech ones.

Space does not permit me to cover the long-running Naxalite/Maoist peasant insurgency in which Adivasis have always had a big hand. The processes of commodification/commercialization of land, forests, and other natural resources have yet to exhaust their historical potential. In their unfolding during the colonial period, they have invariably been brutal and violent. What I now do is look at one more phase of these ongoing processes, this in southern Chhattisgarh – what was once the dependent princely state of Bastar that acceded to India in 1948 – that has led to what could well have been one of the biggest and most brutal land-grabs for private corporations in independent India, as also militant Adivasi–Maoist resistance to it. But, of course, Adivasi peasants have not been the only victims of dispossession of their lands. There have been many resistance movements against acquisition of land, especially when the state has sought to grab lands for and on behalf of private corporations (Shrivastava and Kothari 2012, pp. 193–230).

In the first decade of the new millennium, the dynamic of accumulation by dispossession brought on a corporate land grab in some of the districts in the Bastar region. Tata Steel was

planning to set up a five million tons per annum steel plant in the district of Bastar. Essar Steel was lining up to build a 3.2 million tons per annum steel plant in the district of Dantewada. Tata Steel allegedly tried to rig *gram-sabha* (village assembly) consent in the Lohandiguda block of the district of Bastar, while Essar Steel reportedly tried to do the same in the Dhurli block of Dantewada district (Bharadwaj 2009; Navlakha 2012, pp. 26–39).

In 2003–2004, the then Union Home Minister, the Hindu-nationalist Bharatiya Janata Party's L. K. Advani assured "support" to so-called "people's resistance groups" to undermine the support the Maoists had in the Adivasi village communities and wean away the villagers from the Maoists (UMHA 2004, p. 44). In the financial year 2004–2005, grants were disbursed to "Nagarik Suraksha Samitis" (citizen defense outfits) under the budgetary heading "security-related expenditure" and to the state police for honorariums to be disbursed to "Special Police Officers" (SPOs) (UMHA 2005, pp. 47–48) – irregular recruits from the local population who are given basic arms training and made to perform certain functions in the counterinsurgency, for example, as informers.

The central government and its provincial counterpart in Chhattisgarh were thus able to create the wherewithal for the launch of a state-backed, armed private vigilante force to cut off the villagers from the Maoists. This force, called Salwa Judum (meaning "purification hunt," in Gondi), was launched in June 2005. It assisted the armed police forces in the counterinsurgency's attempt to create "strategic hamlets" – separation of the local population from the Maoist guerrillas by putting the former in small segregated settlements, thereby depriving the "fish" (the guerrillas) of the proverbial "sea" (the local population) in which they must swim in order to survive. Indeed, Essar Steel and Tata Steel reportedly began to contract with Salwa Judum for "protection and 'ground-clearing' services." A "land and power grab," with Salwa Judum "leaders' function(ing) as local warlords," was "masquerading as a local uprising" (Miklian 2009, pp. 442, 456; Navlakha 2012, pp. 116–120). "Warlords" to "landlords" – the "local warlords,"

under "contract" from the two big steel companies, were overnight turning into "landlords" to rake in the moolah!

In Dantewada, Bastar, and Bijapur districts, in the corporate land grab, entire villages were evacuated, and villagers forcibly herded into camps, that is, strategic hamlets, from which those who escaped were branded Maoists and hunted down. According to a 2009 draft report authored by Sub-Group IV of the Committee on State Agrarian Relations and Unfinished Task of Land Reforms, set up by the Ministry of Rural Development, New Delhi, Salwa Judum was "supported with the fire power and organization of the central forces." This report was quickly withdrawn from the ministry's website for it drew attention to, in its own words, "the biggest grab of tribal land after Columbus" in the making, initially "scripted by Tata Steel and Essar Steel who want seven villages or thereabouts each to mine the richest lode of iron ore available in India."

In Dantewada and Bijapur districts, backed by the security forces, between June 2005 and 2009, Salwa Judum razed 644 villages, hounded the inhabitants into roadside police camps ("strategic hamlets"!), and forced many more to escape in order to save life and limb. Around 350,000 Adivasis were displaced – 47,000 were forcibly herded into roadside camps, 40,000 fled across the state border into Andhra Pradesh, and 263,000 sought shelters in the forests. Perhaps this was the largest and most brutal displacement so far in independent India in the state's bid to grab lands for and on behalf of private corporations (D'Mello 2018, pp. 191–92).

Such brutality as part of the process of accumulation by dispossession of Adivasis from their habitats was unleashed to put cheap natural-resource hoards on the asset side of big-business balance sheets and thereby create huge capital gains opportunities. As I have explained earlier, this has been at the root of the unbridled greed and political violence. The diabolical Operation Dispossession escalated into a war of the Indian state against its own people, for the Adivasi victims, under Maoist leadership, ultimately got together to uncompromisingly resist their dispossession. Big money-backed electoral contests

for political power; fraud and looting; incapacity to recognize the value of older, nature-revering cultures; the abuse of Adivasi habitats and ecosystems. All these happenings remind me of what Rosa Luxemburg (1951/1913) passionately wrote, and I quoted from some of those passages earlier, about what colonial capitalism had done in the "noncapitalist areas" of the world.

The Salwa Judum operation, militarily backed by the security forces, had a devastating impact on the Gondi Adivasi peasants. From June 2005, for about 8 months, the Adivasi–Maoist People's Liberation Guerrilla Army (PLGA), including its militias at the village-level, could not prevent the killings of hundreds of ordinary Adivasi peasants, the razing of hundreds of villages, the forcible herding of people into camps, and the sexual atrocities against women. Vast stretches of cultivable land lay fallow; collection of minor forest produce was totally disrupted; people did not have access to the weekly *haats* (local markets); the schools had been turned into police camps. A complete trampling upon the rights of people and a total rupture of the social-cultural fabric of life were a stark reminder of rule under an occupation army (HRW 2008; PUDR–PUCL 2006; Independent Citizens' Initiative 2006).

It was only after eight months that the Maoists raised a Bhumkal militia – named after an historic Adivasi uprising, the Bhumkal rebellion, in Bastar in 1910 – which then led the resistance at the local level and protected the people who gradually resumed agricultural cultivation and collection of minor forest produce. On July 16, 2006, the PLGA attacked a Salwa Judum– SPO-organized, security forces-protected, Errabore camp in Dantewada and freed the detainees. On March 15, 2007, the PLGA attacked a police camp that had been set up in a girls' school in Ranibodli (in Bijapur police district) and killed 68 policemen, a significant proportion of them SPOs, and looted weapons. Of course, they ensured that all the schoolgirls in the hostel were safe. It is significant that after most of such attacks the Party appealed to the SPOs – who were locally recruited Adivasi youth – to quit their jobs and seek the people's pardon (D'Mello 2018, pp. 235–236).

But the Salwa Judum–SPO operation went on. On January 8, 2009, in the village of Singaram (Dantewada district), the Salwa Judum–SPOs displayed a level of savagery, indeed, barbarity, that was shocking. They took their hostages to a canal and butchered them, taking turns in raping the women before slaughtering them (D'Mello 2018, p. 236). Under the Union Home Ministry, a joint command to coordinate the counterinsurgency operations of the central security forces with the police forces of the seven Maoist-insurgency-affected states – Andhra Pradesh, Chhattisgarh, Jharkhand, Bihar, Orissa, Maharashtra, and West Bengal – was already in place. In September 2009, the Union Home Ministry directed this joint command to intensify the counterinsurgency with the launch of Operation Green Hunt (OGH). The Indian state forces have since been "hunting" Adivasis! Significantly, Dantewada, the epicenter of what the Indian state calls "left-wing extremism," was where OGH began, in the Kishtaram-Gollapalli area.

The Maoists responded with a major "tactical counter-offensive campaign." On April 6, 2010, PLGA guerrillas the size of a small battalion ambushed troops of the Central Reserve Police Force (CRPF), including members of COBRA (the CRPF's Commando Battalion for Resolute Action), between Tadimetla and Mukaram villages in Dantewada district. They killed 76 of the state troops in this ambush. In the statement issued after the attack, in a section entitled "why this counterattack was carried out?" the Communist Party of India (Maoist) mentions, among other things, the barbaric acts of the state forces, the Singaram incident (the atrocity mentioned above), in particular (D'Mello 2018, pp. 236–237).

The Adivasi–Maoist guerrilla army, much more accomplished in the art of guerrilla warfare, and with the Adivasi population its eyes and ears over the vast terrain, could not be subdued by the technologically better-equipped state forces. In January 2013, the Union Home Ministry directed the joint command to step up OGH. Not able to get at the PLGA guerrillas, the state forces began targeting the civilian support base of the Maoists more than before to show a larger

number of Maoists killed. Most of the dead have, however, been noncombatant civilians. Villages deemed to be supportive of the Maoists have been targeted with unilateral and indiscriminate firing on villagers, for instance, in Sarkeguda, Kothaguda, and Rajpenta (in Bijapur district in southern Chhattisgarh) on June 28, 2012, when nineteen noncombatant Adivasis were gunned down, even when there was no exchange of fire. The security forces reckoned that noncombatant Adivasis who supported the Maoists deserved to be killed, for the state intelligence had identified the "Maoist villages" (D'Mello 2018, p. 237).

On July 5, 2011, in a public interest litigation, "Nandini Sundar & Others vs. State of Chhattisgarh," the Supreme Court declared the practice of the state of arming local Adivasi youth as Special Police Officers and of funding the recruitment of vigilante groups like Salwa Judum to fight the Maoists, unconstitutional. But, ignoring this Supreme Court order, the State of Chhattisgarh did nothing to disband this state-backed, armed private vigilante force. The Maoists were left with little choice but to deal with the supreme "warlord" of the Salwa Judum, Mahendra Karma. An opportunity came their way when an armed convoy of provincial Congress Party leaders accompanied by Mahendra Karma were passing through the Darba Ghati valley in the Sukma area, 345 kms south of the state capital of Raipur, on May 25, 2013. In a daring operation, Adivasi–Maoist guerrillas ambushed the convoy, leaving the state's security and intelligence apparatus shocked. The Z-plus armed security personnel – entitlements of the "lords" of India's political establishment – were no match for the guerrillas. Mahendra Karma, founder of the Salwa Judum, was among the dead (Navlakha and D'Mello 2013).

The Indian state's war against its own people in southern Chhattisgarh goes on. The counterinsurgency operations have gone high-tech with "fortified" police stations and unmanned aerial vehicles (drones), deployed to "remote sense" the locations (and relocations) of the "left-wing extremist" Adivasi guerrillas. The government has reportedly deployed around 120,000 armed personnel, commandos, paramilitary, and police,

including "India Reserve" battalions, in the Dandakaranya region, the larger Adivasi inhabited terrain – of which Bastar is a part – in the guerrilla war. It cannot stomach the fact that Tata Steel was forced to give up its plans to locate a five million ton per annum steel plant in Bastar in the face of concerted militant resistance of the Adivasi people there. More generally, the militant resistance of the Adivasi–Maoists since 1967 has also forced the reluctant and resistant capitalist power to institute the following protective laws: (a) the Panchayats (Extension to Scheduled Areas) Act, 1996 (PESA) that grants self-governance through *Gram Sabhas* (village assemblies) for people living in the Scheduled Areas; and (b) the Scheduled Tribes and Other Traditional Forest Dwellers (Recognition of Forest Rights) Act, 2006 (the Forest Rights Act) that grants Adivasi and other forest dwellers individual and/or community tenures to forest land. But, with power remaining in the hands of the Indian state–big business combine, these laws have so far proved to be of little worth to the Adivasi peasantry.

Conclusion

Adivasi resistance to imperialism over the last two hundred years, as I have shown, has basically stemmed from the expropriation of what the Adivasi peasantry has considered its lands and forests, indeed, its homelands. This expropriation has been the consequence of the discontinuous processes of commoditization and commercialization of land and forests, respectively, and the intermittent process of proletarianization of labor, all three over historical time, as brutal planned undertakings, and still ongoing. The launch of the three processes followed the incorporation of India into the world-capitalist system as a colony of Britain, and they have yet to exhaust their historical potential. They have brought about forms of exploitative and oppressive land and labor relations that have persisted as long as they have met the profitability criterion and have proved to be amenable to adjustment with the changing international division of labor.

Clearly, the most brutal, indeed, barbaric forms of violence have been unleashed on Adivasis, in colonial and independent India, whenever they have taken recourse to peasant insurgency to resist the imperialism that has, through the above-mentioned planned processes, been expropriating their lands and forests, indeed, their very homelands, and mercilessly exploiting them. These insurgencies, of the past and the present, have invariably been open, public, collective, and violent in their modality, and in solidarity with the non-Adivasi oppressed, but local, confined to contiguous Adivasi areas. The domain of the insurgencies has always fallen far short of the domain of the nation. This has been their principal weakness, in effect, confining such resistance to imperialism and its local collaborators to the local level, never approaching the domain of the nation.

Expressing the will of the *Sarkar*, whether the colonial or the Indian, and committed to protecting the *sahukar* and the *zamindar*, and big business, the counterinsurgency, as I have shown, had/has invariably made killing its principal course of action. A village united in resistance was/is marked out for destruction. There was just a mere expression of "mild regret" from the government of India following "the indiscriminate slaughter of Munda women at [the village] Sail Rakab" in the course of the Birsaite ulgulan (Singh 1966, pp. 114–115 in Guha 1983, p. 161). And, in our times, in the ongoing civil war in Bastar, the killings of hundreds of ordinary Adivasi peasants, the razing of hundreds of villages, the forcible herding of people into camps (strategic hamlets), and the sexual atrocities against women.

The Indian state forces have violated practically all the limiting conditions for the deployment of violent means, specified in Common Article 3 of the Geneva Conventions of 1949 and Protocol II of 1977 relating to non-international armed conflict. The Indian state is *not* even a signatory of the two 1977 Protocols. Its forces have indulged with impunity in massacre, torture, rape, terror, killings of noncombatants and of guerrillas wounded, surrendered or rendered helpless in combat, with not even an utterance of "mild regret" on the part of the government of India. The most brutal forms of violence were unleashed by the colonial state in the Adivasi areas and on the Adivasis, and in independent India, the Indian state has, in this respect, followed in the footsteps of its colonial counterpart.

What might explain the cruelty, the destruction, the annihilation, the extremism with no compromise, the crimes against humanity, the expropriation akin to capitalism's original accumulation, the barbarism of capitalist imperialism unleashed against the Adivasis over the last two hundred years, behind the door of apparent civilization? For long, over historical time, Adivasis have been at the receiving end of the dominant Indian upper-caste attitude of antagonistic subjugation and associated exploitative and discriminatory behavior towards them. Given the dominant Indian awareness of imputed physical differences vis-à-vis Adivasis, buttressed by colonial anthropology in the nineteenth century, I would characterize such oppressive social relations as racial. But one must also keep in mind that the oppression of the Adivasis cannot be viewed in isolation from their exploitation, as poor peasants and landless laborers, and in, what used to be, slave-like labor conditions in the plantations. Adivasi oppression has been rooted in their alienation from what used to be their homelands, because of expropriation.

Fighting for the birth of a humane world, insurgent Adivasis have been averse to capitalist ideology, culture, and values. "Reciprocity should be the norm, not exchange. Prices and profit cannot settle the question of the ecological value of our lands, our forests, our rivers, indeed, our homelands. Our historical memory is of having always been the victims of unequal exchange when it came to be being forced to engage in commerce with the exploitative *diku*." I remember these words from conversations I had with two different Adivasi-Maoist intellectuals, the first, some time in the latter half of the 1970s, and, the second, some time in the first-half of the 1990s. I could find the means to express a message from these conversations of nature's ecological value only much later, a troubling thought, articulated in

Paul Burkett's *Marx and Nature* (1999). Simply put across, nature requires long cycles of evolution, development, and regeneration, whereas capitalism is governed by the imperative of short-term profits.

The persistence of the Adivasi legacy of communitarian traditions, the egalitarian consciousness, the consciousness of collective interests, and plebeian democracy, survivals from preclass society, suggest that, even in the face of all the odds stacked against it, the Adivasi peasantry has refused to give up these ways of life. Their long history of resistance to the imperialism inherent in capitalism; their fight against their dispossession and displacement, and the seizure of their lands to turn them into private property on a massive scale; their opposition to the capitalist-imperialist system's relentless drive to accumulate by extracting and privately appropriating nature's bounty; their resistance to all of this over the last two-hundred years has made for their survival and resilience. Frankly, Adivasi–Maoist resistance today has shaped my account of the real meaning of their resistance in the past, and I hope that over time, the domain of resistance to imperialism becomes a larger and larger subset of the domain of this whole wide world.

Maoism was shaped by China's vernacular revolutionary traditions, and, in India, it is being shaped, among other things, by Adivasi-peasant historical memory of their peasant insurgencies and what the Adivasi–Maoist guerrillas have been bringing to it. Already there is a kind of reciprocal recognition of this. Documenting the real meaning of the Adivasi resistance to imperialism in the past *and* the present is important, but more significant will be what might happen to the resistance over time.

Definition

This essay argues that there is little to sustain a credible, logical justification for the 2011 war on Libya as being about human rights, and describes how this perspective suffers from a severe deficiency of empirical substantiation. Conversely, while oil was not insignificant, it was neither the sole concern nor the single determinant of the US-led war. In narrow terms, the imposition of a no-fly zone would serve as a gateway for military action designed to secure regime change, an objective pursued by the US since 1969. In broad terms, what was at stake in Libya was the strategic repositioning of the US in Africa, guided by economic interests and pursued through its new unified combatant command (AFRICOM), in developing a militarised neoliberal relationship with African states.

One of the more successful results of US information operations and public diplomacy during the March–October 2011 war on Libya was to create a debate about the purposes of the war, and to even 'define down' war itself so that it was officially classed instead as a kinetic humanitarian action: not war, but rather 'protecting the Libyan people, averting a humanitarian crisis, and setting up a no-fly zone' (Rhodes 2011). Thus, on one side is an assertion that the military campaign, first led by the US Africa Command (AFRICOM) on 19 March 2011, invoking the mandate of UN Security Council Resolution 1973 of 17 March, and then led by NATO until the official cessation of its combat role on 31 October, was to be understood primarily as a humanitarian effort legitimised by the 'responsibility to protect' doctrine. At stake, in the latter perspective, were the lives of civilians, and a 'popular uprising' for democracy, pitted against the 'brutal dictatorship' of Muammar Gaddafi. On another side was strong scepticism that primarily emphasised that this was instead another war about oil. On closer examination, there is little to sustain a credible, logical justification for the war on Libya as being about human rights, and the position suffers from a severe deficiency of empirical substantiation. On the other hand, while oil was not insignificant, it was neither the sole concern nor the single determinant of the US-led war. In narrow terms, the imposition of a no-fly zone would serve as a gateway for military action designed to secure regime change, an objective pursued by the US since 1969. In broad terms, what was at stake was

the strategic repositioning of the US in Africa, guided by economic interests and pursued through its new unified combatant command (AFRICOM), in developing a militarised neoliberal relationship with African states.

Libya: America's Problem in Africa

On 1 September 1969, then Captain Muammar Gaddafi along with other junior officers overthrew King Idris in a bloodless coup. Soon after that it became clear to the US that Libya would embark on a radical Pan-Arab nationalist course. Gaddafi became chairman of the Libyan Revolutionary Command Council (RCC) and commander-in-chief of the Libyan armed forces from September 1969, and then prime minister and minister of defence from January 1970 to 1972. During that time, and only weeks after Gaddafi first came to power, members of the administration of President Richard Nixon met to discuss options for dealing with Libya. In November 1969, high-level meetings occurred between Secretary of State Henry Kissinger and various Pentagon and CIA officials to discuss the possibility of landing forces at the US's Wheelus Air Base in Libya as part of an armed takeover of the country, as well as covert actions to engineer a coup; other options included sanctions, freezing assets, reducing bilateral ties, or simple acquiescence (BACM 2011, pp. 79–119). This was largely in response to the RCC's announcement in 1969 that it would promptly expel the US from Wheelus, and the British from El-Adem airbase as well, with the expulsions executed in 1970. Also in 1970, Libya began to drastically revise the price agreements for its oil exports, and threatened nationalisation (Thornton 2001, p. 69). From then onwards, the US would develop an increasingly acrimonious relationship with Libya and with Muammar Gaddafi personally.

Tensions between the US and Libya escalated into outright conflict during the 1980s, under the US presidency of Ronald Reagan. Two of the immediate pretexts for US military actions against Libya in that period were the issue of freedom on navigation in the Gulf of Sidra (claimed by Libya

as territorial waters, which the US contested), and alleged Libyan support for terrorist acts against US targets. Thus, on 19 August 1981, US jets shot down two Libyan planes over the Gulf of Sidra. The US claimed its planes had been attacked first. During 24–25 March 1986, US forces fired missiles on Libyan targets, again claiming that they had been attacked first. On 16 April 1986, President Reagan ordered US air and naval forces to bomb various installations in Libya, among them Muammar Gaddafi's own residence, killing one of his daughters. On 4 January 1989, two US Navy F-14 s shot down two Libyan jets, 70 miles north of Libya, because of alleged hostile intentions demonstrated by the Libyans.

In addition to these overt instances of direct military conflict, the Reagan Administration worked on various plans for covert actions designed to overthrow Gaddafi, with the support of neighbouring countries and employing Libyan dissident groups armed and trained by the US. As early as 1981, the US planned for a coup to take place in Libya, with the provision of Egyptian military aid to Libyan rebels. In fact, it was within a mere 2 months of taking office that Reagan had the CIA draft a plan by the then deputy director for operations, Max Hugel, which examined various proposals for covert action, ranging from disinformation and propaganda, to sabotaging Libyan oil installations, and organising military and financial support for Libyan dissident groups in Morocco, Egypt, Sudan, and in the US itself. US media also produced dozens of articles and opeds encouraging the campaign against Gaddafi; and Tunisian and Saudi officials confirmed privately that they were 'told by officials of the Reagan administration that Qaddafi would be eliminated by the end of 1981' (Wright 1981–82, pp. 15–16). Among the strategies that were used was the CIA's creation of real and illusionary events with the goal of making Gaddafi believe 'that there is a high degree of internal opposition to him in Libya' (Woodward 1987, p. 481). Published accounts have documented the CIA's and the National Security Council's 'obsession' with Libya during Reagan's term, designing a set of escalating acts up to and including a proposed Egyptian invasion of Libya (Perdue 1989, p. 54; Woodward 1987,

pp. 181–186, 409–410, 419–420). In an approach that served as a preview of US objectives over 20 years later, the Reagan Administration sought to isolate Libya from the rest of Africa, and tried to pressure the Organisation of African Unity to censure Libya, refuse to hold meetings in Libya, and cancel the planned Libyan presidency of the OAU in 1981, with especially intense pressure on the Liberian government to persuade it to cut ties with Libya and expel its embassy. The various US pressure tactics used to sway African leaders included military and economic aid, naval port calls, and the employment of military advisers (Wright 1981–82, p. 14). All of these capabilities would be later combined and focused on Africa with the institution of AFRICOM, and Libya would it be its first military target.

Tensions with the US under President George W. Bush were dramatically reduced by Libya. In 2003, Libya decided to take responsibility for the 1988 bombing of Pan-Am flight 103 over Lockerbie, Scotland, and to pay compensation to the families of the victims, in return for the lifting of sanctions. In 2004, after Libya announced it would cease development of chemical and nuclear weapons, President Bush withdrew a ban on travel to Libya and authorised US oil companies with pre-sanctions holdings in Libya to negotiate their return to the country. The US also partially lifted sanctions, and approved US companies buying oil or investing in Libya. Most US sanctions were lifted by the end of 2004 after President Bush signed Executive Order 12543 (Klare and Volman 2006, p. 614).

Yet, mutual suspicion, friction, and new tensions developed soon after Barack Obama assumed the presidency in 2009. That year also marked a milestone in Libya's decade-long effort to gain a position of respected leadership and influence across Africa: 2009 marked the 40th anniversary of the officers' revolt against King Idris; the 10th anniversary of the Sirte Declaration that founded the new African Union (AU); the election of Gaddafi as AU Chairman; Libya taking up a non-permanent seat on the UN Security Council; and Ali Treiki, Libya's top diplomat on Africa, becoming the Secretary General of the UN General Assembly. Libya under Gaddafi was

taking an increasingly important leadership role in Africa and, dissatisfied with the paltry results of rapprochement with the US, was simultaneously blocking US opportunities for investment and economic opportunities in Libya itself as well as impeding greater US penetration into Africa by subverting US plans with what might be called 'dinar diplomacy'. Libya invested billions of dollars in industrial development across the continent, financed the creation of an African satellite communications network, and provided massive financial contributions towards the African Development Bank and the African Monetary Fund, which would specifically challenge the hegemony of the International Monetary Fund and the World Bank. Gaddafi was passionate about using Libyan oil money to help African allies industrialise and add value to their export commodities, helping even staunch US allies in Africa in achieving a measure of food self-sufficiency. The combined effect was to increasingly move the continent away from its role in the global economy as a supplier of cheap raw materials, which was a legacy of colonialism. All of this happened as the US had developed a new strategic view of Africa and aggressively began to expand military ties and business opportunities.

An eventual 'target of opportunity' presented itself with the outbreak of street protests in Libya in February 2011, the exposure of serious fissures within the government itself, and the manifestation of strong internal divisions around Libya's orientation towards Africa, which in previous years had already witnessed deadly mass riots against African migrant workers in the country. Ostensibly, the street protests began in Benghazi on 15 February after a human rights lawyer had been arrested. By 17 February, the protests escalated dramatically. Violent confrontations with security forces ensued: police stations were torched and army barracks were raided. African migrants and black Libyans were targeted once again by opposition protesters and rebels. Soon, whole towns were taken by anti-government forces. On 21 February the defected Libyan deputy permanent representative to the UN, Ibrahim Dabbashi, declared that 'genocide' was underway as the Libyan government was allegedly bringing

in groups of African mercenaries via the nation's airports. In addition, prominent Arab and then Western media outlets began to assert that Libya was using jets and helicopters against unarmed protesters. On this basis, from 21 February, the first calls were made for the imposition of a no-fly zone to halt flights into Libya and disable the Libyan air force.

The Aims of the 2011 War

Overtly, the stated aims of the US-led intervention revolved around protecting civilians, saving lives, and averting a greater humanitarian crisis. Thus, Obama declared on 28 March 2011, in terms that echoed Reagan's speeches: 'If we waited one more day, Benghazi, a city nearly the size of Charlotte, could suffer a massacre that would have reverberated across the region and stained the conscience of the world' (Obama 2011b). In a joint letter, Obama with UK prime minister David Cameron and French president Nicolas Sarkozy asserted: 'By responding immediately, our countries halted the advance of Gaddafi's forces. The bloodbath that he had promised to inflict on the citizens of the besieged city of Benghazi has been prevented. Tens of thousands of lives have been protected' (Obama et al. 2011). US Secretary of Defense Robert M. Gates reiterated that, 'this administration's approach has been guided by a core set of principles . . . opposing violence, standing for universal values, and speaking out on the need for political change and reform' (Gates 2011).

However, two distinct sets of considerations require alternative explanations to be advanced instead. One has to do with the fact that the official explanation continually meandered and changed shape during the course of the war, morphing into varied and repeated justifications for regime change, along with extensive evidence showing that the assassination of Colonel Gaddafi himself was a persistent objective, and proclamations about the 'democratization' of Libya as a goal, all of which at one point or another had previously been sworn against as objectives of the intervention (see Forte 2012a, pp. 121–130; Hague 2011;

Obama 2011b). The then US secretary of state encapsulated this alternative narrative when rejoicing to a US news reporter 'We came, we saw, he died!' following the murder of Gaddafi on 20 October 2011. That the narrative was clearly unsettled is something which requires that we do not take the opening justifications at face value.

Another set of considerations has to do with the alleged humanitarian goals of the intervention: saving lives, protecting civilians, averting a 'massacre' in Benghazi. There are several reasons, with ample evidence to support each, that render these goals as questionable in the context of US and European actions leading up to and during the course of the conflict. For example, well prior to any alleged threat by Gaddafi against Benghazi, and as early as a few days after the first street protests began in mid-February 2011, there were already groups of CIA agents on the ground to 'gather intelligence for military airstrikes and to contact and vet the beleaguered rebels', joined by more agents later. President Obama had 'signed a secret finding authorizing the CIA to provide arms and other support to Libyan rebels' even before the international press had begun to speak of an organised, armed rebellion (Mazetti and Schmitt 2011). Also in that period, USAID deployed a team to Libya, as announced by early March (DipNote 2011; Lee 2011). 'In the early days of the Libyan revolution', as Hillary Clinton recounted, Christopher Stevens, then the Chargé d'Affaires at the US Embassy, was dispatched to Benghazi to work with the insurgents (Clinton 2012). Thus, before any serious diplomatic initiatives could be organised, before the development of a multinational coalition, prior to establishing the facts of any humanitarian crisis on the ground, and even before a local insurgency could gain strength on its own, the US was already leading the way to intervention designed to secure the overthrow of the Libyan government.

There are many more reasons for questioning the official justifications for military intervention. By all accounts, Libyan government forces had quickly routed insurgents, retaking a number of key towns by late March 2011; foreign military intervention had the immediate effect of slowing the government's advance and started to equalise

the military fortunes of the insurgents who were now backed by the most powerful combined air forces of the world. In effect, the conflict between Libyan forces was thus prolonged for several more months, with more cities destroyed in the process, most notably Sirte, which was a bastion of government support. Thus, with many more inevitably killed than 'saved' as a result of the prolonged war, one of the key justifications for intervention was invalidated. US-led forces prolonged the war by also arbitrarily extending their mission in Libya: on 28 March 2011, President Obama had already declared, 'In just one month, the United States has worked with our international partners to mobilise a broad coalition, secure an international mandate to protect civilians, stop an advancing army, prevent a massacre, and establish a no-fly zone with our allies and partners . . . we've accomplished these objectives . . .. I want to be clear: the United States of America has done what we said we would do' (Obama 2011b). Nonetheless, the war was continued for seven more months and only ended for NATO once Colonel Gaddafi had been murdered and Libya's government had been overthrown. Indeed, as a precondition for ending the war, Obama himself stipulated that government forces should withdraw even from the cities where a majority of residents stood with the government, with the list of cities expanding as the war progressed (see Obama 2011a). In other words, the US continually exceeded a military mandate that it had already exceeded, while allowing no solutions except a military one.

In addition, rather than protecting civilians, US and/or other NATO forces targeted civilian infrastructure (water, power, roads, government buildings, and select residential areas), and in a number of documented instances they deliberately targeted civilians themselves (government workers, public broadcasters, and civilian rescuers). Among the more notable, recorded and verified cases occurred on 15 September 2011 in Sirte, when 47 civilian rescuers were targeted as part of the 'double-tapping' practice for conducting drone strikes (where first a military target is struck, then all adult, able-bodied men who arrive on the scene thereafter to rescue

victims are attacked; see FFM 2012, pp. 44–45). Western human rights organisations also confirmed cases where apartment blocks in Sirte were targeted by NATO bombardments: one case occurred on 16 September 2011 when several airstrikes targeted a large apartment building in Sirte containing roughly 90 apartments and 'at least two residents were killed', while NATO did not even list an apartment building as one of its targets, opting instead to produce the following list: 'Key Hits 16 SEPTEMBER: In the vicinity of Sirte: 5 Command and Control Nodes, 3 Radar Systems, 4 Armed Vehicles, 8 Air Missile Systems' (see AI 2012, pp. 13–14; HRW 2012, pp. 50–53; NATO 2011a). On 25 September 2011, just before dawn, NATO carried out an airstrike against the home of Salem Diyab in Sirte, killing four children and three women. The apparent target was Mosbah Ahmed Diyab, a brigadier-general, who in fact 'lived in another area of the city' (AI 2012, p. 15; HRW 2012, pp. 47–50). Once again, NATO described this civilian residence as a 'command and control' facility and deliberately obfuscated the fact that it was deliberately targeting civilian structures: 'Key Hits 25 SEPTEMBER: In the vicinity of Sirte: 1 command and control node 2 ammunition/vehicle storage facility, 1 radar facility, 1 multiple rocket launcher, 1 military support vehicle, 1 artillery piece, 1 ammunition storage facility' (NATO 2011b). In yet another case documented and verified by both Human Rights Watch and the UN's own Commission of International Inquiry on Libya, on 8 August 2011 in the town of Majer, NATO planes bombed a farming compound, in and around which there was no evidence of any military activity. It was struck a second time when civilian rescuers arrived. NATO bombs killed a total of 34 civilians and injured 38 in that attack (HRW 2012, pp. 27–32; UN 2012, p. 16).

Instead of protecting civilians, we have evidence of the contrary practice. In some notable cases, NATO forces ignored African refugees adrift at sea, even as they passed NATO vessels that were enforcing a strict naval blockade and had the sea off Libya's coast under close surveillance. In fact, on NATO's watch, at least 1,500 refugees fleeing Libya died at sea during the war.

They were mostly Africans from south of the Sahara, and they died in many multiples of the death toll suffered by Benghazi residents during the initial protests there that had captivated media attention in the West. Even the Italian government, a party to the NATO campaign, publicly complained that international humanitarian law had been violated when NATO vessels ignored distress calls and passed by boats adrift at sea without aiding them. One might also note that when NATO repeatedly stated it was protecting civilians, this in practice usually meant it was protecting armed civilians opposed to the government, against other armed civilians who supported it.

Thus, if the practice of military intervention belied the proclaimed humanitarian objectives, and the narratives that justified the intervention shifted and then contradicted the original stated aims, then an alternative explanation becomes necessary as the official ones simply fail to convince, as they inadequately account for enough facts in an accurate, logical, and credible manner. Moreover, there is the critical question concerning historical context. Why now? For decades, US leaders and mainstream media in the global North had cast Colonel Gaddafi as a villainous, brutal dictator, long accused of torture and assassinations at home, and seen as key perpetrator of international terrorism. Yet from 2003–10, there had been an official rapprochement. So what was it about 2011 that seemingly caused the US to suddenly discover 'human rights abuses' as a justification for military intervention? Indeed, 2011 offered a further twist to this issue: just a little over a month before the first calls for foreign military intervention, the UN Human Rights Council received and discussed a report on human rights in Libya, and of the 46 delegations that commented on the report a majority 'noted with appreciation the country's commitment to upholding human rights on the ground', and further commended 'the Libyan Arab Jamahiriya for the preparation and presentation of its national report, noting the broad consultation process with stakeholders in the preparation phase' (UN 2011, p. 3). Was 2011 different then because of the local uprisings? There had been multiple armed uprisings, coup attempts, and assassination plots throughout Gaddafi's 42 years at the helm, and yet none of those had been used to justify a concerted military campaign to overthrow the government, nor were they read as a sign of government illegitimacy. Nor were the human rights credentials of the rebels pristine and unquestionable for that matter, as many African migrant workers and black Libyan civilians were targeted for rape, robbery, and murder on the basis of the colour of their skin and their perceived allegiance to Gaddafi, while pro-government protesters in Benghazi were also killed (Cockburn 2011). Human rights, therefore, explain very little. Also, why was there such intervention in Libya, and yet the opposite in Yemen and Bahrain? Arguing that 'just because the US cannot intervene everywhere, does not mean it should not intervene in Libya' still does not answer why Libya was targeted. Of course, 2011 did offer a new political context that created openings for intervention, particularly around what was much vaunted in the global North as the 'Arab Spring' and 'calls' from elite quarters for the US to 'do something' to aid in ushering a new, democratic Arab world. While that political conjuncture was not insignificant, the only real change that had transpired within the last decade was a new US strategic shift towards Africa, with the creation of a unified military command just 3 years before 2011, that being the US Africa Command (AFRICOM) which would in fact take the lead in the opening weeks of the military campaign. Since we have very little of what was made public from official quarters that is reliable and can help us answer 'why Libya in 2011', we have to look at long-term, and short-term historical contexts beyond Libya alone, and understand broader and deeper US political and economic objectives. We thus require answers that take into account multiple factors and varied determinants, and that connect them logically. In this effort, what US officials said to each other privately (as revealed in the several hundred diplomatic cables from the US Embassy in Tripoli that were published by WikiLeaks) becomes especially useful, particularly in light of US strategic and economic concerns.

AFRICOM, Oil, and Leadership

A broad outline of the array of US objectives that could and in some respects would be fulfilled by pursuing the path of aggression against Libya in 2011 can be discerned in terms of the immediate strategic geopolitical gains to be had from the opportunities presented by the Libyan crisis, as well as benefits for longer-term political and economic interests both in Africa and the Middle East, if not more globally.

There were at least nine areas where the US could maximise gains to be had by overthrowing the Libyan Jamahiriya Government, presented here in no particular rank of importance. The first would potentially involve increased access for US corporations to contracts funded by massive Libyan expenditures on infrastructure development (and then reconstruction), from which US corporations had frequently been locked out when Gaddafi was in power (USET 2008, 2009c, d). Second and closely related to the first, the US would thereby also expand its hold on key geostrategic locations and control over access to lucrative petroleum resources much sought after by China and others. Third and stemming from the first two, the US and its allies would potentially be able to ward off any increased acquisition of Libyan oil and construction contracts by Chinese and Russian firms. Fourth, the overthrow of the Jamahiriya could ensure that a friendly regime was in place that was not influenced by ideas of 'resource nationalism' (USET 2007). Fifth, the US could increase the presence of AFRICOM in African affairs, in an attempt to effectively substitute for the African Union and to entirely displace the Libyan-led Community of Sahel-Saharan States (CEN-SAD), whose membership encompassed nearly half of Africa and rivalled the US's Trans-Sahara Counter-Terrorism Partnership (TSCTP) (USET 2009e). Sixth, by intervening for declared 'humanitarian' reasons in support of something cast as a 'popular uprising' for 'democracy', the US could bolster its claims to being serious about freedom, democracy, and human rights, and present itself – unlike the image created by the Iraq war – as being on the side of Arabs and Africans. Seventh, a successful

intervention could work to ensure a politically stable North Africa, guided by the belief that democratic states are the best defence against radical extremism. Eighth, by drafting other nations (in NATO and the Arab League) to undertake the work of defending and advancing US political and economic interests, the US could efficiently achieve dominance at a minimised political and economic cost. Ninth, a successful intervention could help to spread the neo-liberal model of governance and development by removing a major impediment. Joseph Biden, who would later become vice president, recounted: 'I told Qaddafi there are certain basic rules to playing in the global economy ... no one will invest in your country without transparency or without stability. To deliver the promise to your people is going to require significant change ...' (Timmerman 2004, p. 19). Taken together, these present a far more convincing picture of US objectives, than that presented in the humanitarian narrative analysed earlier, especially because they fit a historical pattern of US–Libyan relations and global context of neo-liberal intervention.

In leading the war in its opening phases, AFRICOM's role as part of a US strategic shift towards Africa deserves further elaboration, especially as AFRICOM bridges and combines the political, economic, and military goals of the US in Africa. AFRICOM came about as a result of what was at least a decade-long process of rationalising, strategising, and organising (AFRICOM 2011, p. vi). From 1990–2000, the US intervened militarily in Africa more than 20 times (Catoire 2000, p. 102). There was increased discussion among military planners of the deficiencies in taking a reactive, piecemeal approach, focused only on contingencies, when 'shaping the environment' could reduce the need for 'expensive and uncertain military interventions' (110, 111). To shape the environment, the military would require a single, unified command devoted exclusively to Africa, rather than have US-African affairs parcelled out to various commands with responsibilities primarily in the Pacific, Asia, and Europe. A US military force was definitely needed, it was argued, in light of France's announcement in 1997 that it would

reduce its military forces on the African continent by 40%, creating a perceived vacuum (105–106). While the purpose of a command would be to 'enhance access and influence while communicating regularly with senior foreign civil and military leaders on a variety of issues', it would do so by 'building better security relations' with African nations, 'endeavoring to build trust and "habits of cooperation" that permit quick agreement and common action to resolve regional conflict'; this would be particularly necessary at time when 'US resources are limited' (102).

Military strategists also recognised that Africa had 'tremendous mineral wealth, huge hydro-electrical power reserves, and significant under-developed ocean resources', with the 'better part of the world's diamonds, gold, and chromium', added to the fact that 'copper, bauxite, phosphate, uranium, tin, iron ore, cobalt, and titanium are also mined in significant quantities', and 'some 20 percent of America's oil' was being imported from Africa, while Africa itself was seen as a potentially large, new market for US commodities (104). The US military itself is totally dependent on an imported supply of cobalt, among other strategic minerals that belong to the US's stockpile programme, the loss of which would constitute, as was understood already in the 1950s, 'a grave military setback' (Magdoff 2003, pp. 55–56).

Adding to the Pentagon's work, a high-level body was appointed by President George W. Bush in February 2001 (the National Energy Policy Development Group, NEPDG), which was chaired by Vice President Dick Cheney. The NEPDG's final document is known as the 'Cheney report'. The Cheney report focused on Africa as a strategically valuable supply of oil as it could be relied upon in the event of major crises and disruptions in the Middle East and elsewhere; moreover, African oil was deemed to be of high value given its low sulphur content and its relative ease of access (NEPDG 2001: sec. 8, p. 11). In order to expand US access on the continent, the Cheney report argued that African nations, under US guidance, would have to 'enhance the stability and security of trade and investment

environments' (NEPDG 2001: sec. 8, p. 19). Building on the Cheney report, and mindful of the concerns voiced by military strategists before that, oil industry lobbyists were joined by a select group of members of Congress and military officers in producing a White Paper submitted to the US Congress and the Bush Administration in 2002. The group called itself the African Oil Policy Initiative Group (AOPIG 2002). AOPIG tightly linked military and economic goals, emphasising African oil as a vital interest to the US. AOPIG called for 'a new and vigorous focus on U.S.-military cooperation in sub-Saharan Africa, to include design of a sub-unified command structure which could produce significant dividends in the protection of U.S. investments' (2002, p. 6), and reproduced elements of the prior two reports. Like Catoire (2000, p. 107), AOPIG also singled out Libya as an adversary state and a 'threat possibility' that exposed US personnel and assets to 'heightened dangers and diminished opportunities' (2002, p. 15).

In 2004, an advisory panel of Africa experts, authorised by Congress to propose new policy initiatives, identified five factors that had shaped increased US interest in Africa over the past decade: 'oil, global trade, armed conflicts, terror, and HIV/AIDS'. They indicated that these factors had led to a 'conceptual shift to a strategic view of Africa' (Kansteiner and Morrison 2004: vi, 2). This strategic view, they argued, required that the US should 'significantly increase' its 'presence on the ground' (4). As with previous reports, this one also combined military with economic goals, the former to preserve and reinforce the latter. Noting that Africa had proven reserves of more than 60 billion barrels of oil – with Libya, as the panel would have known, having the highest proven oil reserves on the continent (39.1 billion barrels) (Frynas and Paulo 2007, p. 240, 241) – the panel noted that Africa had already become the fourth-largest source of US oil imports, and with a slew of major US oil corporations active on the continent accounting for more than 100,000 energy-based jobs in the US, these actors had 'a stake in the promotion of a stable investment climate' (Goldwyn and Ebel 2004, p. 6, 11, 12).

Like Catoire (2000), the panel also recognised that 'the leverage the United States can muster, in coalition with others, is not overwhelming and will diminish by the end of the decade' (Goldwyn and Ebel 2004, p. 7). 'Stability and development' could only be achieved if African political leaders pursued 'a modernising vision' (9). The US could exercise leverage via its military and international financial institutions such as the World Bank and IMF; in addition, by 'engaging' the continent on 'common principles for the promotion of transparency, development, and respect for human rights, the more effective U.-S. leadership will be' (10). As with the prior policy papers, this panel also called for the Department of Defense to create a unified command focused on Africa (Morrison and Lyman 2004, pp. 115–116); AFRICOM was created on 1 October 2007, and became functional 1 year later. This panel also singled out Libya in 'fomenting arms trafficking and instability in Africa, and it proposed an initiative that would implicitly counter the work of Libya's World Islamic Call Society in its proposal for 'a major continent-wide Muslim outreach initiative on a dramatically large scale' (Morrison and Lyman 2004, pp. 115–116, 105). Other panellists also cited Libya's 'adventurism' and 'destabilisation' activities in Africa, pointing out that it funded rebel movements in West Africa, a key strategic location of oil (Herbst and Lyman 2004, p. 119 133).

'Africa doesn't need strong men, it needs strong institutions', US President Barack Obama declared in Ghana in 2009, a sentiment that would be echoed in the policy to establish transparency, good governance, economic growth, and democratic institutions as envisioned by the US in the 2012 US *Strategy toward Sub-Saharan Africa* (White House 2012, p. 2). The National Security Strategies of 2002, 2006, and 2010 had all highlighted what was perceived as the growing strategic value of Africa (Ploch 2011, p. 14). In the preface to the 2012 document, Barack Obama wrote: 'the United States will not stand idly by when actors threaten legitimately elected governments or manipulate the fairness and integrity of democratic processes' (White House 2012: i). The 'democratisation' of Africa thus became a US national security concern. Added to the US strategic agenda was humanitarian intervention: 'We have been the world's leader in responding to humanitarian crises' (1). As a US military article had constructed this issue, Africa is 'a world leader in humanitarian crises, failed states, and deadly conflict' with more UN 'peacekeeping missions than any other continent' (Garrett et al. 2010, p. 17). Africa was the problem, and the US was the source of solutions. This was felt urgently by some as Africa loomed larger: 'by 2050, there may be two Africans for every European' (16).

Not far removed from the political imperatives for US leadership as constructed in the National Strategy, economic concerns and moulding African institutions to suit transnational capitalist penetration – shaping the environment – weighed heavily. Barack Obama adverted, 'Africa is more important than ever to the security and prosperity of the international community, and to the United States in particular. Africa's economies are among the fastest growing in the world, with technological change sweeping across the continent and offering tremendous opportunities in banking, medicine, politics, and business' (White House 2012: i). Identified as important to US prosperity, Africa would need 'to remove constraints to trade and investment' and open itself to global markets, and promote 'sound economic governance' (i, ii). As a result of such a transformation, President Obama vowed to 'encourage American companies to seize trade and investment opportunities in Africa . . . while helping to create jobs here in America' (ii). However, there would be further obstacles to remove from the path of US expansion: 'Transnational security challenges pose threats to regional stability, economic growth, and U.S. interests' (1). As Vice Admiral Robert Moeller declared in 2008, AFRICOM was about preserving 'the free flow of natural resources from Africa to the global market' (Glazebrook 2012).

Both AFRICOM and the TSCTP were vigorously opposed by Libya under Muammar Gaddafi's leadership, as both the US ambassador to Libya and the head of AFRICOM, Gen Ward,

were both aware (see USET 2009a, b). There was also opposition from the Northern African Community of Sahel-Saharan States (CEN-SAD), led by Libya (Campbell 2008, p. 21). It also seemed that most of the African continent rejected AFRICOM as well, just as Nelson Mandela, a key ally of Gaddafi, had previously rejected President Bill Clinton's plans for a US-led Africa Crisis Response force. Thus, in October 2007, members of the Pan-African Parliament, the African Union's legislature, voted in favour of a motion to 'prevail upon all African Governments through the African Union (AU) not to accede to the United States of America's Government's request to host AFRICOM anywhere in the African continent' (quoted in Ploch 2011, p. 25). The defence and security ministers of the Southern African Development Community (SADC) stated 'that sister countries of the region should not agree to host Africom and in particular, armed forces, since this would have a negative effect. That recommendation was presented to the Heads of States and this is a SADC position'; the 25-member body then backed the position and, 'flatly refuses the installation of any military command or any foreign armed presence of whatever country on any part of Africa, whatever the reasons and justifications' (quoted in Campbell 2008, p. 21). The Arab Maghreb Union 'also voiced strong opposition to the placement of US bases anywhere on the continent' (ibid.). Similarly, the Economic Community of West African States (ECOWAS) issued the following statement: 'ECOWAS has stated resolutely its opposition to American bases in the region. At the forefront of this effort stands Nigeria, whose leadership unequivocally denounced the possibility of American troops being based in West Africa' (quoted in Campbell 2008, p. 22). In summary, it can be safely concluded that in every single respect of what the US identified as the strategic value of Africa, Gaddafi's leadership stood opposed, which itself might not have been significant except for the fact that Libya had both the financial leverage and political clout to exercise a significant competing presence in Africa that raised walls against US expansion.

Interventionist Methodology

The intervention to overthrow the Libyan government relied upon an array of methods, some borrowed from previous US plans from the late 1960s and 1980s. One of these involved arming anti-government insurgents, and bombing the way ahead of them, while targeting personnel and institutions of the Libyan state. At every single point, peace talks between the opposition and the government were halted or undermined by the US, and diplomatic action by the African Union was equally thwarted and side-lined both by the US and the UN. After unsuccessfully seeking legitimacy in the form of an endorsement from the AU, the US later decided that it was totally dispensable, and claimed authority for its intervention in Libya thanks to a vote in the Arab League, where less than half of its members voted in support of foreign military intervention. The government of Libya was barred from representing itself at the UN in an unprecedented and almost certainly illegal silencing by the body, while the US government refused to issue visas to representatives of the standing government in Tripoli. At the UN, largely unknown 'human rights' NGOs held full sway in propagating unqualified and unsubstantiated exaggerations and fabrication of numbers of protesters killed by the government, while never mentioning atrocities committed by the opposition. In at least one case, one of the Libyan human rights groups speaking at the UN Human Rights Council had not disclosed its overlapping membership with the anti-government National Transitional Council. The general approach at the UN was to take everything stated by the opposition at face value, while refusing to hear the Libyan government. Put simply, virtually nothing was done to avert war, and everything was done to accelerate it. In this respect, the creation of an ambience of 'emergency' became a significant part of the interventionist methodology as it could be used to rush to war, stifle debate, and predetermine who would have the authority and legitimacy to speak.

Within relatively short order, it became apparent that humanitarian concerns served as a thin veil for the pursuit other goals. Even in the

statements by leading US officials, there was little effort to conceal this fact once the bombing was underway. Nearly 2 weeks after the US fired the cruise missiles that opened the campaign, then Defense Secretary Robert Gates explained in a congressional hearing how and when the US chose to intervene: 'it became apparent that the time and conditions were right for international military action', not because all diplomatic options had been exhausted, and not with reference to a humanitarian crisis, but due to the statements of support for intervention from the Arab League and Gulf Cooperation Council (GCC) and once 'our European allies expressed a willingness to commit real military resources' (Gates 2011).

The US led overall military operations in Libya, from the official opening of AFRICOM's Operation Odyssey Dawn on 19 March 2011 until the official end on 31 October 2011. By the end of the campaign, NATO had completed a total of 9,634 strike sorties against Libyan targets, out of a total of 26,156 sorties overall as part of what it called Operation Unified Protector (NATO 2011c, p. 2). Of the 28 member states of NATO, only eight actually took part in combat sorties, which was reduced to six by the end of August 2011. The primary participants in combat were the US, France, Italy, the UK, Canada, Denmark, Belgium, and Norway. The US provided the majority of refuelling, resupply, surveillance and reconnaissance missions, and fired nearly all of the 214 cruise missiles apart from seven (Bomb Data 2014). The US also deployed the majority of drones. In terms of 'boots on the ground' – which the Libyan insurgents proclaimed they did not want, but welcomed nonetheless – there were US CIA agents and untold number of 'private contractors' of various nationalities (Mazetti and Schmitt 2011); there were also British MI6, SBS, SAS, and SFSG troops, in total numbering as many as 350 and deployed from as early as the time of the first street protests at the end of February 2011 (Mirror 2011; Williams and Shipman 2011; Winnett and Watt 2011); hundreds of troops from Qatar fought on the front lines in nearly every region (Black 2011); also, Jordan had troops on the ground (Barry 2011), and, according to the governments of Sudan and post-Gaddafi

Libya, Sudan's military also participated actively in combat and in arming the insurgents. What confuses matters, aside from NATO and US secrecy, is the extent to which non-US air missions were in fact non-US—as Barack Obama himself revealed: 'In fact, American pilots even flew French fighter jets off a French aircraft carrier in the Mediterranean. Allies don't get any closer than that' (Obama 2011c).

Sirte, as Gaddafi's hometown, a major stronghold of popular support for the government, and the birthplace of the African Union in 1999, was to be the war's most devastated city, coming under particularly intense NATO bombing. Sirte was targeted from the very opening of NATO's bombing campaign, lasting until the end. Indeed, out of the total number of days spent bombing by NATO, Sirte was targeted for 42% of those days. As the final offensive against the city began in August 2011, NATO flew more than 130 air strikes at the end of the month. In just 3 days after the insurgents first tried entering Sirte on 15 September 2011, NATO bombed 39 targets in the small city. In a period of 3 weeks in September, NATO struck 296 targets here, even before the final month of bombings. The most conservative assessments found that 70% of the city had been destroyed in fighting on the ground and by NATO bombardment. The total number of civilians killed in Sirte, or in all of Libya during the war, is still not known and no credible investigation has been undertaken, either by the UN, or NATO, or by the transitional governments that followed; if anything, there has been a deliberate effort not to unearth these facts by those with the authority and resources to do so, and successive Libyan administrations, indebted to NATO, have explicitly rejected any calls for an investigation.

That one of the immediate goals of the military intervention was regime change is an inescapable conclusion derived from substantial evidence that Muammar Gaddafi was personally targeted in a series of bomb and missile strikes (Forte 2012a, p. 122–129). Moreover, in addition to US drones targeting Gaddafi's convoy as it fled Sirte on 20 October 2011, one of the prominent opposition leaders, Mahmoud Jibril, later revealed that a foreign agent (likely French) was the one who

actually executed Gaddafi (Forte 2012a, p. 129). Regime change is a violation of international law, as it is a violation of US law to assassinate a foreign head of state. However, in invoking the mandates of the UN, specifically UN Security Council Resolution 1970 and even more so 1973, the US and its NATO partners persisted in presenting every action as legal and authorised. Article 4 of UNSCR 1973 specifically mandates member states 'to take all necessary measures . . . to protect civilians' (UNSCR 2011, p. 3). The political and military leadership of NATO would thus present every single action as consistent with that broad and open language, resorting to semantic games in portraying wherever Gaddafi was located as being in and of itself a 'threat to civilians'. Even as Gaddafi fled, and was struck by missiles fired by US drones, he was still represented by NATO as 'endangering civilians'.

From a perspective concerned with human rights, protecting civilians, and defending civil liberties, it is interesting to note that in January 2011, France under President Nicolas Sarkozy offered the Tunisian government of Zine El Abidine Ben Ali security support, and dispatched riot-control equipment to put down anti-government protests in Tunisia, right down to the final days of Ben Ali's rule; additionally, the GCC had itself sent troops to quash protests in Bahrain in March 2011, the same month that the bombing of Libya began; also in March 2011, in the face of massive anti-government protests in Yemen demanding the resignation of President Ali Abdullah Saleh, the US continued to offer its political support and military co-operation. If taking the humanitarian claims at face value, it is difficult to understand what it was about Libya in particular that presented such a crisis of conscience and a moral imperative to intervene on the side of government opponents, even in the same month that the US and its allies were doing the opposite in Bahrain and Yemen. However, pretending that there was a unique and urgent moral demand in the case of Libya certainly aided in 'shaping the environment' so as to create an ambience of emergency, and to create that effect public communication became essential in deploying numerous ideational counter-

measures to offset questions, criticisms, and potential delays.

Complex Ideational Counter-Measures

Symbolism, myth, morality, and emotion were called upon by supporters of the war with the desire to produce an ambience of 'emergency' around the events of February–March 2011, serving a variety of purposes (while complicating or adding to classical theories of imperialism which tend to downplay such factors). Here we are dealing not just with hegemonic norms, but also potentially more intimate belief-systems, learned cultural values, and emergent structures of feeling that seemingly impel 'humanitarian intervention'. In the rapid lead up to the US-led war in Libya, symbolism, myth, morality, and emotion were used as countermeasures by: (a) dampening or arresting any international mass movement against the impending war; (b) altering the terms of debate by channelling attention to issues of morality; (c) dividing potential leftist opposition by turning the left in the global North into mutually hostile camps divided along anti-imperialist versus pro-democracy lines (and thus achieving the construction of a choice between alleged freedom under imperial dominance versus local authoritarian autonomy); (d) placing obstacles in the path of the articulation and audibility of anti-imperialist critiques from the global South; (e) creating an international chorus of voices, predominantly in the global North, predominantly in the mass and 'social' media, demanding immediate action which was reduced to specifically military action. The alleged 'consequences of inaction' were culturally constructed and socially distributed, with the hope of both spreading accountability and acquiring legitimacy, while also depoliticising the intervention by turning it into a purely moral choice and a question of witnessing, solidarity, and conscience. 'Not another war in a Muslim country' was a fear felt in the Obama Administration, and voiced by then Defense Secretary Robert Gates, haunted by the spectre of the recent war of occupation in Iraq. While no significantly new weapons technologies

were tested in the war in Libya, some of the newer ideational and communicative technologies of the last 20 years were reworked and deployed.

With reference to symbolic constructions, the long-standing US demonisation of Colonel Muammar Gaddafi was particularly compelling for many members of the mass audience, especially in the US itself, and the Obama Administration sought to capitalise on that. Over the course of three decades, US government officials spoke in terms that suggested they favoured the overthrow and death of Gaddafi. Successive US presidents thus demonised Gaddafi in ways that suggested he was evil, or subhuman. President Richard Nixon said Gaddafi was 'more than just a desert rat' but also 'an international outlaw', and urged an international response to Gaddafi; then, President Gerald Ford said Gaddafi was a 'bully' and a 'cancer'; after President Jimmy Carter spoke of Gaddafi as 'subhuman'; more than all, President Ronald Reagan responded to a question about whether he would 'not be sorry to see Qaddafi fall' by stating 'diplomacy would have me not answer that question'; Reagan's secretary of state, General Alexander Haig, referred to Gaddafi as 'a cancer that has to be removed', while Vice President George H.W. Bush described Gaddafi as an 'egomaniac who would trigger World War III to make headlines' (Wright 1981–82, p. 16). One should also recall Reagan's famous statement about Gaddafi: 'this mad dog of the Middle East [who] has a goal of a world revolution, Moslem fundamentalist revolution' (Reagan 1986a: n.p.). To this Reagan added about Gaddafi, 'I find he's not only a barbarian but he's flaky' and 'I think he's more than a bad smell' (quoted in Bowman 2011: n.p.). Reagan also asserted in a televised address to Americans that Gaddafi 'engaged in acts of international terror, acts that put him outside the company of civilized men' (Reagan 1986b). Gaddafi thus stood for the barbaric, the uncivilised, the animal, the disease that stood against international order. For longer than Saddam Hussein, Gaddafi had been symbolised in mainstream narratives as a demonic presence, with little in the way of dissenting or critical voices being heard. The fact of the hegemony of this narrative, over an extended period and with the weight of presidential and mainstream media authority, could help to inculcate a popular belief in Gaddafi as a singularly malevolent, dangerous, and unstable creature. It would take little effort for this narrative to be reanimated in 2011, with the desire to secure popular support for regime change.

In terms of myth, numerous fabrications of atrocity and methods of committing atrocity were conjured up by proponents of intervention in ways that spoke to deeply ingrained beliefs around race and sex, and the violence of non-Western others. Some of these unproven allegations simply recapitulated the narrative of Gaddafi as a perpetrator of egregious and lurid crimes, in a manner that sexualised Orientalist discourse. This was especially the case with the charge that Gaddafi had ordered systematic mass rape against Libyans during 2011, a charge made by both the chief prosecutor of the International Criminal Court and the US ambassador to the UN. The additional charge was that troops, ordered to rape, where fuelled by Viagra. If sex performed an internalising function of graphically vivifying the nature of Gaddafi's domestic 'tyranny', race performed an externalising function that forged a convergence between anti-black racism in Libya and US desires to remove Libya as a leader in Africa. Here we are dealing with the myth of African mercenaries being flown in to massacre protesters, and even to indiscriminately terrorise ordinary Libyans with rape and murder. While not a single African 'mercenary' was ever produced to substantiate such claims, nor any evidence recorded in the many photographs and videos of protests and fighting in the streets, there was instead ample evidence documented by international human rights organisations and the media of black Libyans and African migrant workers being indiscriminately assaulted, abducted, tortured, and often murdered by the Libyan insurgents. Thus, the African mercenary myth was useful for cementing the intended rupture between 'the new Libya' post-Gaddafi and Pan-Africanism, thereby realigning Libya with Europe and the 'modern world', which some in the Libyan opposition explicitly craved. The myth also became a useful cover for mass murder along

racial lines. Indeed, Amnesty International itself found that 'some Libyan rebels seem to regard the war against Gadhafi as tantamount to a battle against black people' (Ghosh 2011). Other myths produced by Western and Arab media, as well as Libyan activists at home and anti-government exiles, involved stories proven to be false that concerned alleged atrocities by the Libyan government. These included stories of: Libyan jets, helicopter gunships, and anti-aircraft artillery being used against unarmed protesters; mass defections from government ranks; peaceful protests; and, of course, of a threatened 'genocide' against Benghazi (see Forte 2012a: ch. 5, b). Taken individually or together, these myths could be useful in producing an international perception of emergency by heightening fear, rooted in prior beliefs of the monstrosity of non-Western regimes and the sexual violence of black people.

Morality played a paramount role in compelling and justifying foreign military intervention (as counter-intuitive as this statement might seem at this point). In particular, a series of *moral dualisms* acted as the central justificatory principles. One such moral dualism could be characterised as follows: 'If we do not act, we should be held responsible for the actions of others. When we do act, we should never be held responsible for our own actions'. A second moral dualism involves selecting certain lives as being better, more important, and thus worthy of being saved than others – thus, while an alleged massacre to come in Benghazi could not be tolerated by Western leaders and key opinion shapers, the actual devastation of Sirte did not occasion any outcry. A third moral dualism comes into play with the selectivity in practice of what in theory claims to be a universal and non-discriminatory defence of human rights: intervention is only justified in some parts of the world, but not in others, regardless of the presence or scope of human rights violations. A fourth moral dualism came into play with the shifting labelling practices employed by US officials and the dominant media: while the US labelled armed civilians in Afghanistan as either 'terrorists' and/or 'insurgents', in Libya they became 'revolutionaries'

and their deaths in battle were counted among 'civilian' deaths. Hence, 'protecting civilians' in NATO's public parlance became a practice of spearheading the Libyan insurgency by attacking government troops and armed civilians who supported the government. However, the broader role of moralising discourse was to depoliticise military intervention, to arrest opposing discourses, and to remove the motivations for intervention from question.

Emotions which, when given voice, supported and demanded intervention, were themselves moulded and motivated by the skilled use of language, within the context of what media commentators dubbed the 'Arab Spring'. Vicariously experienced through messages from activists on the street posted to social media, a certain fervour acquired momentum that hailed all protesters in any streets in North Africa and the Middle East as agents of a new progressive order of freedom, democracy, and human rights. The Iraq War was seemingly forgotten as some Westerners now saw themselves as part of an alliance with Arabs against local tyranny (while preserving US dominance). What remained to shape these emotions into a direction that favoured military intervention in Libya (and potentially in Syria) was the deployment of stock narrative tropes that themselves evoked emotional responses. Thus, the 'international community' of 'civilised' nations 'not standing idly by' as assaults on protesters stained 'the conscience of the world' meant intervening on 'the right side of history' to 'save lives' and 'protect civilians' with 'surgical strikes' that respected 'human rights'. Intervention thus became not a geopolitical act, but something akin to therapy, or a mode of health-care provision. That Libya was made to stand out as the special subject of direct intervention, and be accepted as such by some, owes a great deal to the prior demonisation of Gaddafi, moral dualisms, and the powerful pull of racial and sexual myths. An anti-imperialist stance could thus be made to look as dark, sinister, and seemingly a part of 'the problem'. Emotional responses, however, were highly dependent on attention spans, and as Libya began to fall into ever deeper chaos

as a result of the intervention, and violence continued steadily past 2011, the emotional outcry diminished considerably. Moreover, there is little evidence to suggest that such emotions resonated outside of social media, revealing dominant opinion formations in social media spheres not to reflect mass opinion on the whole.

Libya may thus also offer a case study of how the regimentation of emotion can inform new theorising about imperialism. However, considerable caution is necessary. On one side, it is largely true that social and corporate media resonated with calls for a no-fly zone to be imposed, from late February to early March 2011. As an example, the online activist organisation Avaaz (2011) collected more than 800,000 signatures petitioning the UN to impose a no-fly zone over Libya. Meanwhile, it did not clarify to signatories that the UN had no power of its own to implement this, and that such action would involve direct military intervention to destroy Libyan airfields and air defences, as Defense Secretary Gates had to explain emphatically (HAC 2011). Indeed, Avaaz's campaign director obfuscated this latter fact, saying the petition was not a call for military intervention (Hilary 2011). Major human rights organisations in the global North, along with numerous newspaper editorials, made similar calls. On the other side, it is largely not the case that these views were representative of a plurality or majority of citizens, and there is little evidence that they succeeded in persuading the public to back such calls for intervention. A series of opinion polls conducted in the US showed large majorities were against the idea that the US had a responsibility, moral or otherwise, to intervene in the Libyan civil conflict, and even while significant majorities reaffirmed their dislike for Gaddafi and even supported his removal, they were against US military intervention aimed at regime change. The national survey by the Pew Research Center for the People and the Press, conducted from 10–13 March 2011, during a critical period of especially heightened dissemination of most of the elements discussed above, found that: 63% rejected the idea that the US had a responsibility to intervene, lower than was even the case for the

wars in Kosovo and Bosnia; only 16% favoured bombing Libyan air defences, an essential part of imposing a no-fly zone; 69% of US respondents rejected providing arms to Libyan opposition groups; and 82% were against sending US troops. Even so, among those favouring military intervention, moral arguments tended to win over arguments for regime change (Pew 2011, pp. 1–2). A number of polls by other organisations, also conducted in March 2011, tended to produce results very similar to those reported by the Pew Research Center (see e.g., ABC 2011; Polling Report 2011), with some reporting that fewer than 10% of Americans supported US military intervention to remove Gaddafi (Angus Reid 2011). As something of an exception, a CNN poll found greater support for establishing a no-fly zone and sending arms to the insurgents, with 76% reporting an unfavourable opinion of Gaddafi; yet even here, 62% were opposed to military intervention for the purpose of regime change (CNN 2011, pp. 2–3). By June 2011, what limited US public support existed for the Libyan War had declined further (Condon 2011). In addition, most elected representatives in the US Congress consistently voted to deny support for the war. As one example, on 24 June 2011, the US House of Representatives voted 295–123 against a resolution authorising the limited use of force in support of the NATO mission in Libya (AP 2011).

Protecting Libya: Imperial Humanitarianism

The culmination of all of these factors was the intent to continue fortifying a system of globalised *humanitarian abduction,* ultimately rooted in the civilisational projects of nineteenth-century British and American colonisation. This system involves claims to be better at administering the world, and being entitled to administer it, according to either divine, moral, political, economic, or technological endowments. Humanitarian interventionism thus points to a way of administering the world that goes beyond brute force alone, and harkens back to the older

philosophical premises of settler colonialism. Part of this claim to administrative enlightenment involves the idea of protection, which assumes that some exist in a natural state as hapless and incapable victims who require the aid of powerful outsiders. It also assumes that natives are ruled either by brutish or irresponsible chiefs and parents, and thus redemption necessitates external correction. The construction of 'humanitarian emergency' as if it were a simple fact, one that occurs naturally or due to innate deficiencies in a given (usually non-Western) sociopolitical system, tends not only to reinforce notions of pathological primitiveness, but goes further by creating the 'need' for a custodial relationship between the tutors from the global North and their racially differentiated wards. It is not surprising, then, that the 'responsibility-to-protect' doctrine – articulated by key proponents such as Gareth Evans, Lloyd Axworthy, and Michael Ignatieff – should arise from settler states such as Australia, Canada, and the US, with long histories of missions, residential schools, and 'Indian schools', along with the office of 'Protector of the Aborigines' in British colonies. Aboriginals were to be saved from themselves, rescued from their own inborn defects and savage habits while their lands and political self-determination would be surrendered to their rescuers.

Humanitarian interventionism is premised on an understanding that the sovereignty of others should not matter when others prove themselves incapable of proper self-rule, as implied by the construction and application of international programmes of good governance, transparency, accountability, and aid to civil society via non-governmental organisations in order to 'save failed states' (see Helman and Ratner 1992–93 vs Gordon 1997). This updated version of the civilising mission is found in new reprises of the white man's/woman's burden in saving others from barbarity, what some call the 'white savior syndrome' (Cammarota 2011). This syndrome usually involves creating decontextualised ahistorical binaries (using mythological principles of demonisation and sanctification): bad guys and good guys, dictators and civil society, extremists and moderates, black and white, them and us.

To the extent that contemporary notions of protection reflect a prior history of settler colonisation and extant philosophies of liberal humanitarianism, we should expect to see an updating of the processes of abduction beyond the straightforward acts of seizure of the past, when indigenous children were forcibly removed from their parents and relocated to white-run schools. Abduction in the contemporary sense can involve, in broad terms, the assumption of responsibility for/over others, thus appropriating control of their social formation; it can also involve varied forms of removal, from the adoption of children to international scholarships and other forms of retraining; it can involve destabilisation, regime change, and forms of military destruction, so that intervention today may beget intervention tomorrow; abduction may also involve the capture of local leaders and placing them on trial in international tribunals or local courts under foreign occupation; and it can involve various ways of creating the suffering of others and then pleading the need to come to their rescue.

Aggression on Non-western Cultures

A

Agrarian Labor and Peasantry in the Global South

Rémy Herrera[1] and Kin Chi Lau[2]
[1]CNRS (National Centre for Scientific Research), Centre d'Économie de la Sorbonne, Paris, France
[2]Department of Cultural Studies, Lingnan University, Hong Kong, People's Republic of China

The food crisis, which erupted in 2007–2008 and resulted in catastrophic effects on the peoples of numerous countries of the South, especially Africa, as well as popular rebellions, represent two of the many dimensions of the crisis of the capitalist world system. Other very worrying aspects include socioeconomic, political, ideological, energy, or climatic ones. The food and agricultural dimensions of the current systemic crisis reveal the global failure and deep dysfunctions that characterize the agricultural "model" imposed worldwide by financial capital and transnational agribusiness corporations since the beginning of the neoliberal era in the late 1970s, along with the implementation of the structural adjustment plans (SAPs) in the Global South and austerity policies in the North. For more than three and a half decades, the peasantries of the world have been suffering an intensification of attacks by capital on their land, natural resources, and means of production. These attacks have also been eroding national sovereignty and the role of the state; destroying individuals, families, and

communities; devastating the environment; and threatening the survival of huge numbers of human beings across the world.

The dysfunctions affecting the agricultural sectors can be perceived by identifying a series of striking paradoxes. As a matter of fact, approximately three billion people on the planet today continue to suffer from hunger (one-third) or malnutrition (two-thirds), although agricultural productions are greatly exceeding food needs, with an effective overproduction of at least 150%. Furthermore, a huge majority of these people are themselves peasants or living in rural areas: three-quarters of those suffering from undernourishment are rural. Meanwhile, the expansion of the areas for cultivation worldwide is accompanied by a significant decline in peasant populations compared to the populations in the urban areas, which absorb the massive and persistent rural exodus, mainly into growing miserable slums. Moreover, an increasing proportion of land is cultivated by transnational corporations, which do not direct their agricultural production toward food consumption, but rather toward energy or industrial outlets (e.g., agro-fuels). In most countries of the South that are excluded from the benefits of capitalist globalization, particularly sub-Saharan Africa and South East Asia, a relative dynamism of agricultural exports derived from rental commercial crops coexists with increasing imports of basic products to meet food needs. Clearly, and urgently, things must change.

This chapter is an attempt to make sense of how these urgent global problems are manifested in the Global South and the North, and while there are common traits in how global capital goes after profit, the receptions on the ground differ. Hence, it is important for struggles in different parts of the world – affected differently but also sharing related features – to develop a concerted understanding of the problems and prioritize strategies that take heed of the differences and share common visions for the future.

Theoretical and Historical Framework

To begin with, a theoretical and historical framework is needed. Samir Amin proposed a series of analytical elements to answer major questions about the appropriate kind of agriculture (capitalist, socialist, or peasant) to guarantee the objective of food sovereignty; the agricultural productions to be prioritized to reach a development model able to conciliate the improvement in food supply and the preservation of the environment; and the reflection on the resolution of the agrarian question.

He analyzed family agriculture and the differences between North and Global South. In the North (North America, Western Europe), a modern and highly productive family agriculture dominates, supplies these countries' food demands, and produces exportable surpluses. However, while integrated into the capitalist system, this agriculture does not share a characteristic of capitalism: its labor organization generally requires a reduced and polyvalent workforce. Within the capitalist logic, a significant part of the income generated by farmers – even land owners – is controlled and collected by segments of high capital, implying that their remuneration does not correspond to their productivity. Thus, family agriculture can be assimilated to the status of a subcontractor or an artisan working in a putting-out system, and squeezed between supermarkets, agribusiness, and banking.

In the Global South where peasant families constitute almost half of humanity, the types of agricultural systems vary, with wide differences in productivity among them (from mechanized latifundium to micro parcels, with lands for self-consumption or cash crop exports, etc.). But, taken as a whole, these Southern agricultures – often peasant ones – suffer from a (growing) productivity gap as compared to the North. Most family agricultures of the South are under-equipped, noncompetitive, and destined for subsistence food, which explains the poverty of the rural world or the inefficiency to supply food to cities. But the Southern peasant agriculture is also largely integrated into the local and dominant global capitalist system and their profits are consequently siphoned by dominant capital.

Here, the key question is whether agriculture in the South could be modernized by capitalism. Amin says no, and criticizes the notion of "food

security" according to which the Global South should rely on a specialization in cash crop products for export to cover food deficits. It results in disaster, as the recent food crisis has shown. What is necessary is food sovereignty, and a sine qua non is access to land for all peasants, to be considered a goal toward which most struggles in rural areas are oriented.

Amin differentiates the types of land tenure systems in the South, depending on the ownership status. The first system is land tenure based on private ownership. Since the "enclosures" process in early capitalism in Western Europe, this is seen as the "modern" form of landownership by the "liberal" ideology's rhetoric and management rationale by making land a "merchandise" exchangeable at market price. Opposing this idea, Amin asserts that it is unsustainable to draw from the construction of Northern modernity rules for the advancement of the peoples of the global South. To change land into private property, the present reactivation of the "enclosures" process involves dispossession of peasants, as in the colonial times. Other forms of regulating the right to use land are conceivable and can produce similar results, avoiding the foreseeable destruction by capitalism.

Land tenure not based on private ownership is the second system, which takes heterogeneous forms and where access to land is regulated by rules derived from institutions involving individuals, communities, and the state. Among these are "customary" rules that traditionally guarantee access to land to all families – but it does not mean equal rights. These rights of use by communities are limited by the state and only exist today in deteriorated forms, attacked by capitalist expansion. Frequently, European colonial powers left surviving customary practices to retain their domination. The same phenomenon is occurring today under imperialist pressures. Popular revolutions in Asia or Africa sometimes challenged this legacy. China and Vietnam (or Cuba in Latin America) constitute unique examples of the success of a land system based on the rights of all peasants within the village. This constitutes equal access to and use of land, with the state as the sole owner and equal land distribution among usufructuary families. Amin examines the evolution of this system based on the suppression of private landownership, up to now, and its ability to resist the attacks it is suffering.

Elsewhere, agrarian reforms implemented by nonrevolutionary hegemonic blocks generally only dispossessed large landowners to the benefit of middle (or even rich) peasants, ignoring the interests of the poor. New waves of agrarian reforms are needed today to meet the legitimate demands of the poorest and landless peasants in India, South East Asia, Kenya, South Africa, the Arab countries, and many parts of Latin America. This is true even for other Southern regions where capitalist private ownership rights have not yet penetrated deeply (or formally), such as in intertropical Africa.

This could be done through an expansion of the definition of public property to include land, along with a democratization of the state and the minimization of inequalities. However, the success of these agrarian reforms always remains uncertain because such redistributions maintain tenure systems led by the principle of ownership and even reinforce the adherence to private property. In the dominant discourse, serving the interests of capital and its agribusiness model, a "modern reform" of the land tenure system means privatization, which is the exact opposite of what the challenges of building of democratic and alternative agricultural projects based on prosperous peasant family economies really require. Therefore, the only obstacle to the fast trend of commodification and private appropriation of landownership is the resistance and organization of its victims: the peasants (Amin 2005).

Latin America

João Pedro Stedile examined the forms and tendencies of capital penetration in the agricultural sector in Latin America, and studies the current challenges imposed on peasant movements of this continent and their programs, in particular La Via Campesina. He begins by analyzing the mechanisms through which capital accumulated outside of agriculture has taken control of this sector and

concentrated it worldwide in the current phase of financialized capitalism (Stedile 2007).

He elaborates how, due to the current crisis, large Northern corporations fled to peripheral countries to save their volatile capital by investing in fixed assets, such as land, minerals, raw materials, water, biodiversity territories, or tropical agriculture, and by taking over renewable energy sources, particularly productions for agro-fuels. This generated speculative operations in the futures markets and a rise in the prices of agricultural goods traded in the global stock exchange markets, without any correlation to production costs and the actual value of the socially needed labor time.

Stedile then analyzes the consequences of the imposition of corporate private ownership of natural resources on the life and organization of the peasants, with people and states losing sovereignty over food and productive processes. The destructive "model" of capital for agriculture – agribusiness, or "agriculture without people" – brings deep and insuperable contradictions.

With this aim, Stedile defends what could be the main elements of a peasant program that promotes workers' control, anti-capitalist agricultures, food sovereignty, and environmental protection in the countries of the South. This alternative platform includes: prioritizing policies of food sovereignty and healthy foods; preventing the concentration of private land and nature ownership; diversifying agriculture; increasing labor and land productivity and adopting machines that respect the environment; reorganizing agricultural industries into small and medium scale, controlled by workers and peasants; controlling food production by domestic social forces and prohibiting foreign capital from owning land; stopping deforestation; preserving and disseminating native improved seeds and preventing the spread of genetically modified seeds; ensuring access to water as the right to a common good for every citizen and developing infrastructure in rural communities; implementing a popular energy sovereignty and reviewing current models of transportation; ensuring the rights of indigenous communities; promoting socially oriented public policies for agriculture; universalizing social welfare for the entire population; generalizing educational programs in rural areas and enhancing local cultural habits; changing the international free-trade agreements that function to the detriment of the peoples; and encouraging social relations based on human values built over millennia, such as solidarity and equality – which are the very values of socialism.

Stedile presents some organizational and political challenges for peasant movements, at the local and global levels, in order to face the current disadvantageous balance of power, where global capital is on the offensive to control nature and agricultural goods. Such an analysis results from the experienced realities in Latin America, and from the resistances of these peasant movements against capitalist destructions. And last, he suggests addressing the interests of transnational capital and its control mechanisms by: building a popular, alternative development model of agricultural production managed by the peasants and workers; by transforming the struggle for land into that for territory; developing a technological matrix based on agroecology, free schools in the countryside, training programs at all levels and alternative means of mass communication; and creating opportunities for mass social struggles and building alliances against the class enemies gathering all sectors living in rural areas as well as city workers, nationally and internationally.

Africa

With a specific focus on Southern Africa, Sam Moyo studied the peasantries who have suffered attacks under colonialism, post-independence, and neoliberal capitalism. He goes on to outline the perspectives of rebuilding them on the reaffirmation of the inalienability of land rights and collective food sovereignty. His starting point is the desperate situation of most African peasants, who are facing a crisis of social reproduction, food insecurity and insufficient incomes from farming, and their survival strategies despite the state's withdrawal. Regardless of the diversity of African agricultures, their persistent and generalized failure to increase productivity and supplies as well as to

resolve agrarian questions of enhancing the social reproduction of the majority of the peasantries – conceived as elements of democratization and national development – is clear and dramatic.

Centuries of systemic land alienation and exploitation of peasantries' labor, through unequal integration into the capitalist world system during colonial and post-independence periods, resulted in the underdevelopment of the agrarian systems. SAPs exacerbated extroversion, extraction of surplus value, land concentration, food imports, and aid dependency. Recently, a new assault led by foreign land-grabbing actors dispossessed the peasantry of its lands and natural resources and intensified its labor exploitation. Such accumulation processes undermine the social value of peasant production based on self-employed family labor and self-consumption as well as its ability to adopt technologies and crops to expand low energy-intensive production for its social reproduction. These evolutions, which are driven by financialized capital and agri-business at the expense of marginalized peasantries, fuel local conflicts and accentuate the polarization of agrarian accumulation (Moyo and Yeros 2005).

Moyo presents an overview of the long-run history of the destruction of African food production systems by analyzing the trajectory of primitive accumulation and disarticulation of these agrarian societies. He describes the various phases, forms, and trends of land alienation, dispossession, and incorporation of the peasantries, from colonialism, post-independence developmentalism, to neoliberalism and its re-institutionalized primitive accumulation. He touches upon the current crisis involving land grabbing and "contracted farmers." Then, he explains the underdevelopment of the agrarian productive forces, using examples from countries of the mal-integrated Southern African Development Community (SADC), and the qualitative changes in the agrarian surplus extraction and its externalization through the unequal world and subregional trade regimes under neoliberalism. Here, the recent global food price and agrarian crisis, especially in the SADC region, as well as South African capital's hegemony are studied. Moyo assesses the social consequences of such processes on the collapse of

basic food consumption and the increase in food-related poverty – except in a few "secure" enclaves – and on the more recent "alternative" strategies within the neoliberal context and the "push" to universalize the commodification of land.

The real alternative is one that supports priorities given to food sovereignty and a sustainable use of resources by autonomous small producers, in which democracy is inclusive and solidly founded on social progress. This requires a range of public policy decisions of restructuring these food systems, including the choices of the basic commodities to be produced in order to satisfy social needs, a redistribution of the means of food production (land, inputs, and water), substantial infrastructural investments, and enhancing the peasantries' human resources. This task will also include regional integrations. A reorientation of the SADC region's agricultural policies toward more collective strategies to defend food sovereignty and land rights is needed, in order to reverse the present free-trade and market-based approach of this regionalization.

China

Erebus Wong and Jade Tsui Sit, following Wen Tiejun's theses, attempted to rethink the problematics of "rural China" in the development of the country in order to argue for rural regeneration as an alternative to a destructive "modernization." The latter is often reduced to industrialization and the empowering of the state, pursued through several phases from the middle of the nineteenth century to the revolutionary period. It seems to be relevant to reconsider the intellectual heritage of the rural reconstruction movement – active during the 1920 and 1930s but much neglected today – in post-developmental China, where the rural sector has been historically exploited.

To understand the present situation of China's peasantry – the majority of its population – it is necessary to examine the mechanisms involved beyond the collectivization-liberalization dichotomy. Land is a key issue for China, which has to nourish 19% of the world's population with 8% of the world's arable land. In spite of agricultural

output, only 13% of its total land area can be cultivated. The explanation is to be found in the fact that land is collectively owned by village communities and distributed within peasant households, who use it mainly for food production to maintain self-sufficiency. Wong and Sit propose a historical overview of China's modernization to capture the essence of its trajectory in the last 60 years. After 1949, the new regime underwent a period of Soviet-style industrialization, installing an asymmetric dual system unfavorable to the peasantry. However, despite the industrialization strategy, the peasantry has benefited from the radical land reforms.

Nowadays, many peasants are suffering from exploitation and injustice, but a few residual socialist practices subsist, including the legacy of land reforms. In the mid-1980s, the promotion of export-oriented growth generated flows of migrant workers from the rural areas to cities – mostly comprised of surplus labor force from rural households that owned a small plot, without land expropriation. The rural sector took up the cost of social reproduction of labor and served as a buffer to absorb social risks in urban areas caused by current pro-capital reforms. It also revealed its stabilizing capacity by regulating the labor market and reabsorbing unemployed migrant workers in cities during cyclic crises (Wen 2001).

However, mainstream intellectuals support the neoliberal ideology to advocate land commodification. Under the pressures of construction projects led by fiscally constrained local governments and real estate speculators, land expropriation accelerated in the 1990s. About 40–50 million peasants lost their land; the landless appeared in the 2000s, especially after the 2003 law modifying collective arable land legislation and excluding a new generation from land allocation through redistribution. Wong and Sit explain the dangers associated with such evolutions, which weaken the mechanisms of risk management through internalization in rural community, in a time when 200 million peasant migrant workers are living in cities and evolving into the working class. This is why, inspired by Wen Tiejun's analysis of the agrarian and rural problem of China, they defend collective landownership in rural

areas as the most precious legacy of the 1949 revolution.

China's take-off is largely based on the exploitation of its rural sector. Today, the export-oriented model has become such a path dependency and internal disequilibriums are so deep that China has to make great efforts to switch its trajectory of development to invest into rural society, to guarantee social progress, and to preserve the environment. Solutions for an alternative path could be to reactivate and revalorize the status of the peasantry, to rediscover the pioneering ideas of the rural reconstruction movements, and to support the experiments of rural regeneration currently developed in the country, as renewed and powerful insights, both popular and ecological, to overcome the destructive aspects of contemporary global capitalism.

India

Utsa Patnaik exposed the political-economic context of the peasant struggles for livelihood security and land in India. She begins by recalling that peasantry and rural workers of the global South are under historically unprecedented pressures today by attacks by capital, especially on the means of securing livelihood, and among them land, in order to control the use of lands for its own purposes, and divert agricultural land for nonagricultural purposes. Such a movement looks similar to that of primitive accumulation in Western Europe of the sixteenth to nineteenth centuries, but today, the Southern peasantry has nowhere to migrate, except to the slums of the megalopolis. Peasants are now turning from passive resistance to active contestation of global capital domination, transforming them from objects to subjects of history.

She examines the agrarian distress, suicides, and unemployment in India and states that inequalities have increased considerably from the 1990s under neoliberal policies and that the living condition of the masses of the laboring poor today is globally worse – except where positive interventions have taken place to stabilize livelihood. In rural India, this situation results from

attempts to take over peasant lands and resources by domestic and foreign corporations, supported by the state. In parallel, unemployment is partly due to the inability to translate higher economic growth without income redistribution into job creation, while purchasing power has been eroded by inflation prices of basic needs for ordinary people, forgotten by the ruling classes' strategy of submission to financial capital.

The author points out that the main trend observed in the Indian economy – which has two-thirds of its workforce occupied in agriculture – is that the relative share of agriculture, forestry, and fishing in the gross domestic product, especially for crops like food grains, has declined, while that of industry has stagnated, but of services has increased. In a context of trade openness, fiscal contraction, price-stabilization system dismantling, and land acquisition for SEZs, the state has launched an attack on small farmers, in the name of "development" but in fact for the benefit of a small minority of real estate speculators, thus creating an agrarian crisis intensifying into the struggle for land.

As a consequence, small producers have been exposed to the ups and downs of prices, forced to be indebted to money lenders and banks, have lost lands against unpaid debts or even committed suicide. With the implementation of the neoliberal agenda, land ownership concentration is happening at an all-India level and livelihood insecurity is spreading. Therefore, farming is becoming unviable. The author analyzes the ongoing resistances of farmers to land acquisition or to change in land use (setting up extractives). She describes the repression suffered by peasant rebellions, and also the victories won when the state governments have had to withdraw their projects or concede compensations.

Patnaik recalls the economic characteristics of land, which is not produced by human labor, and the implications of its pricing, different from that of agricultural commodities (prices are anchored to amounts of labor used for producing them). Based on market capitalization of incomes, the price of land – in a capitalist system – can vary considerably, depending on its use and the associated yield. Here lies the root of the discontent of farmers, constrained (and cheated) by the state governments to sell their lands at low prices, that is, with compensations far below the profits earned by private investors or speculators, who parcel them for lucrative purposes. One adverse effect, among others, is that the total cropped area becomes stagnant and the growth in output slows down, leading to inflation in food prices and a contraction of demand. The author finally asserts that to think – like the corporates in collusion with the state do in India – that peasants can be treated as dupes is a mistake because they are now aware of their rights and are strongly resisting their exploitation (Patnaik 2011).

Oceania

Rémy Herrera and Poeura Tetoe studied Oceania, specifically Papua New Guinea. They tried to elucidate the "*Papua Niugini* Paradox," that is, the striking coexistence of an alleged "archaic" (i.e., not based on private property) system of landownership – as in most Oceanian insular countries – and the vivacity of the peasants' resistance against neoliberal capitalism, such as the penetration of FDIs in mining, hydrocarbons and natural resources, including forestry and water. Access to land is a real issue in this country where a majority of the population is still involved in subsistence crops for self-consumption, "customary" rules persist on more than 90% of the soil territory, and the use of land is the source of acute conflicts between transnational corporations, the state and the society.

Herrera and Tetoe examine the people's attachment to land. European colonization integrated the indigenous people into global capitalism, transforming most of them into small farmers and making them dependent on colonial plantation companies. Despite this tendency, a feature characterizing this peasant society today is the persistence of traditional institutions to defend collective landownership. The authors analyze this connection to land, customary practices and management, and collective ownership of land in a context where land is always the object of desire of private interests and under pressure to be

registered and privatized. They also explain the ambivalence in the position of the state, which faces pressures from foreign investors and international donors, to the point that the dominance of traditional collective forms of social organization within the unusual structure of land tenure has not prevented increased exports of minerals, hydrocarbons, and agribusiness products. The protective role of the state over customary land use has only been effective where private interests are not involved and no natural resources have been discovered. Elsewhere, the state has been taking over land to sell the exploitation of all resources. The access to natural resources and their exploitation by foreign firms are being carried out with the support of the state, which articulates this process of land appropriation with the previous ancestral structures of collective landownership, without introducing "free" land markets.

Even though the logic of "ideology of landownership" is gaining ground and many peasants have been receptive to financial compensations, the social structures instead of collapsing have adapted to it. Despite pressures toward individualization of landownership, Papua New Guinean authorities have not succeeded in challenging customary collective landownership. The reason is to be found in the popular resistance by the peasant society against privatization of land, the imposition of modern register for lands, and their management by capitalist laws.

Herrera and Tetoe trace the history of the registration of customary land and the establishment of cadastral systems from the Australian colonial administration to the recent "land reform" component of the SAPs, that has been jointly imposed by the Papua New Guinean state and foreign donors. They affirm the legitimacy of popular mobilizations gathering large sections of civil society (and even of the military) against privatization of customary land as common patrimony and of their revendication for social progress, in one of the countries with the lowest social indicators in the world.

What is defended is the legitimacy of the principle of collective landowning and free access to the peasant community land; what is demonstrated is the possibility of other rules for land use; what is recommended is to maintain the existence of noncapitalist peasant farming. Constraints obliterate the struggles of a people longing to master their collective destiny. The government has little room for maneuver. But an alternative to neoliberalism is required, along with the emergence of a class alliance around the peasantry, to draw a modern development strategy that benefits the people (Herrera and Lau 2015).

Facing the Domination of Financial Capital

All these authors, whichever region they consider, emphasize the general failure of capitalism to solve the agrarian and agricultural issues. The deterioration of the situation of peasant agricultures following the exacerbation of the food dimension of the current systemic crisis of capitalism has confirmed once again the structural inability of such a system to resolve the internal contradictions it has generated since its very origins, not only at the local, national, and regional levels but also worldwide.

Even in the richest countries of the North, where productivity boosted by technological progress is very high and food provision is available for a large majority of the population, the problems experienced by most family agricultures to keep their smallholding farms, maintain their productive activities and work in satisfactory conditions, the problems faced by consumers to master both the variety and the quality of their food as well as the problems encountered by every citizen to conserve natural resources and protect the environment, are exceeding the bounds of the bearable.

The team of European Coordination of La Via Campesina examined the difficulties of European agriculture, which is diverse in its productions and structures, as well as the farmer struggles in this continent. Most of these farmers receive incomes lower than the minimum wages of other professional categories and live under the pressure of repeated sectorial crises due to neoliberal policies and the risk of elimination of their small- or medium-sized farms. While agricultural work is

poorly recognized and the environment is threatened, subsidies intended to compensate prices that are often below production costs primarily benefit a minority of large producers and agribusinesses and impose dumping on the Southern countries. The confrontation is not between North and South but between two visions of agriculture: agricultural liberalization versus food sovereignty. The authors demonstrate that a Europe without farmers would not be proof of its development. Things will change only if European farmers and citizens act together, in solidarity with Southern peasant movements, to draw societies out from their submission to transnational firms.

The European Coordination of La Via Campesina explains the common problems encountered by farmers, in spite of their diversities, who are dealing with industrialization and globalization: productivism, disappearance of small farmers, attacks on peasant agriculture by agribusiness, indebtedness, outsourcing of agricultural production, monoculture plantations, dissemination of GMOs, pollution, etc. In the face of such destructions and the inertia of professional organizations defending the interests of dominant economic powers, European farmers have started to resist. The authors describe the evolutions of these struggles, culminating in the emergence of a European farmer movement, connected with civil society and international movements, to propose alternatives, from local-national to globalized struggles: against the concentration of lands by agribusiness, the introduction of GMOs, the appropriation of seeds by seed industrial firms, or neoliberal agricultural policies and rules of international trade promoted by the WTO.

La Via Campesina's European authors analyze the alternatives opened by the global crisis of the dominant system. According to them, the tasks of the European farmers should be to make food sovereignty (conceived as a right and a duty) the framework of agricultural policies and to build a large alliance of European citizens – producers and consumers – to achieve this goal; to promote a new farming model generating employment, a well-nourished population and respect for the environment; to work toward global food governance; and to participate in international

mobilizations for the defense of nature, climate, and biodiversity under attack by WTO free-trade agreements. Grassroots initiatives to relocate food production have multiplied today in the continent.

Finally, the European Coordination of La Via Campesina team concludes that another European common agricultural and food policy is possible, which presupposes deep changes in priorities. The latter should strive to maintain and develop a sustainable and social peasant agriculture, feeding the people, preserving health and the environment, and keeping rural landscapes alive; guarantee peasants decent living conditions thanks to stable and sufficient incomes and recognition and attractiveness of their profession; relocate food when possible; and allocate public supports in priority to productions effectively beneficial for employment and the environment.

In the Global South, where average levels of productivity and mechanization in agriculture are often weaker, the difficulties are more worrying. Today, nearly half the Southern countries have lost the capacity to produce and supply what their people demand and need to eat. Post-independence Africa was self-sufficient for its food provisioning at the beginning of the 1960s but is today a net food importer continent. Even as we highlight it here, around three billion undernourished persons – mostly poor peasants or landless – are suffering from hunger, while masses of rural families who have lost their lands do not anymore have access to land and means of food production. In most peripheral societies pauperization is spreading, and the living conditions in rural areas – as well as in huge urban slums congested with the rural exodus – are dramatic, that is, simply inhuman and unacceptable.

Clearly identified by all the authors, the common enemy of the people – wherever they may be living (or just surviving), working, and resisting, in the South or in the North – is financial capital, which pushes people deeper and deeper into indebtedness and subjects them to super-exploitation. Despite the numerous, multidimensional, and complex contradictions of the world system, it is precisely high financial capital, in crisis, that has launched a modern *conquista*, characterized by repeated assaults on all public

goods and common heritage of humanity, through a commodification of life including land and the environment, and an attack on livelihood, along with an overexploitation of labor – peasants and workers taken as a whole.

As finance capitalism becomes more barbaric and destructive than ever, the structural problem for the survival of late capitalism is downward pressure on the profit rates. Financialization as an answer creates only a debt-driven economy and the only thing that this system will offer, until it is in its death agony, is the worsening exploitation of labor and life. The peasantries of the Global South will continue to be dispossessed from their land and means of livelihood. The contradictions of the capitalist global system have now become so deep and so unsolvable that the system brinks on collapse. To be able to relaunch a cycle of expansion at the center of the world system, the current systemic crisis must destroy gigantic amounts of fictitious capital and transfer the costs to the global South – to the majority of the world's population – as well as to the environment.

The present situation does not resemble the beginning of the end of the crisis, but rather the beginning of a long-run process of implosion and collapse of the present phase of financialized capitalism. For humanity to get out of this impasse, radical change is the only hope. This forces us to reconsider the alternatives of social transformation which must be beyond capitalism.

The difficulties are significantly complicated by the choices made by most of the states in the Global South – especially in the so-called "emerging" countries, such as China, India, Brazil, and South Africa – in favor of (one of the many varieties of) capitalism. Beyond their recent success in terms of high GDP growth rates and despite their differentiated contents and implications, such pro-capitalist development strategies are illusory and unsustainable.

Converging Peasant Struggles Today

Hence, for the great majority of the people in the Global South as well as in the North, the struggle against deteriorating conditions is at the same time the struggle against processes of the globalization of capitalistic relations spearheaded by financial capital, that is, against capitalism itself. Among the programmatic demands are: agriculture should be withdrawn from the WTO; agro-fuels should be banned; and control of technology, pricing, and market by transnational agribusiness firms should be rejected. Demands put to the state to defend national food sovereignty are legitimate and necessary. But it has to be reckoned that in the era of the hegemony of financial capital, the role of the state is, more often than not, compromised. Global capital has bonded interest blocs across local, national, and international levels. Thus, exerting public pressure for critical policies against the aggression and manipulation of transnational agribusiness is a necessary strategic move for mobilization. While it needs to be stressed that a state's reason of existence is to protect the society, failing which it might as well not be, the people and the movements need to at the same time actualize all potentials for reduction of their dependency on capital, debt, and the market. This is all the more necessary for peasant and family agriculture. The guiding principle is community's control over and management of land and water as commons, which must not be allowed to be privatized or commodified. Agrarian reform to redistribute land to the tiller is high on the agenda in most countries in South and Southeast Asia, Africa, and Latin America. The struggle is not just for "land," but also for "territory," which involves cultural, social, economic reorganization of communal relations to produce and live in a cooperative or collective manner. This necessitates that the "commons" are not objects for control or appropriation still operating in the capitalist logic but focal nodes supporting a different relationship of the community members among themselves and in relation to nature.

Food sovereignty remains at the core of the struggle. To attain food sovereignty, a mode of production other than the capitalist mode of production has to be practiced. This even calls into question national boundaries, for sustainable food production, distribution, and consumption is based on bioregions and watershed systems,

rather than the political borders of modern nation-states. What is also called into question is the mode of consumption and circulation with its destructive impacts on nature and value systems of communities that have acquired the wisdom through the centuries to live in sustainable ways. One important insight is the practice of sharing beyond monetary measures that reduce social relations to calculations of gain and loss. The people's struggles and demands show that in relating to each other, what needs to be envisioned includes modes other than those of capitalistic relations. They also demonstrate the importance of the ecological dimension by recognizing that the current capitalist crisis is at the same time a profound ecological crisis brought about by the extractive industries that exhaust the earth's resources and contaminate water, land, and air; the industrializations that contribute to global warming and climate change; or the capitalistic systems of food production and supply dependent on petrol as fuel.

Strategies to reduce dependence on or control by finance capitalism are to be devised, ranging from establishing the state's control over financial capital to the protection of food and livelihood items from price speculation and market manipulation. For the social movements, the paramount task is to defend food sovereignty at the national and local levels. Local self-organization at the grassroots level to place food sovereignty and environmental security as priority and to fend off attempts at manipulation by financial capital requires direct actions innovative in their intellectual and affective dimensions for going beyond the dead end of capitalism. In this connection, we see more and more debates in the social movements on the defense of the commons, re-ruralization, rebuilding of rural and urban communities that practice values different from capitalistic ones – values of reciprocity and communality.

A reimagination of the ways in which human societies produce and consume is the only way out of the catastrophic crisis that humanity is in. Without food sovereignty, i.e., autonomous communal self-management in the production, distribution, and consumption of food, no

sustainable, diversified economy or political autonomy will be built. Without reversing the logic of the maximization of profit and the concentration of private ownership, especially that of land and the means of production, no state policy and leadership will be consistent or effective. Without radically questioning the hyper-concentration of power in the hands of high finance, no genuinely substantive democracy, with social progress and participation of the people at all levels and in all the processes of decision-making concerning their collective future, will be possible.

Thus, a key question in front of us is that of subjectivity and agency, i.e., the question of the production of subjectivities by the struggling people themselves in going beyond contradictions that inform their struggles. How can we envisage the classes and masses for this social transformation or revolution? What can be the role of family farmers, small peasants, and farm workers? We know that many progressive movements and leftist thinkers have historically had ideological difficulties to understand the peasantries and political difficulties to build class alliances with them. Yesterday as today, peasant and family agricultures are sometimes stereotyped as being underproductive, inefficient, backward, and condemned to disappear in the very movement toward "development." "Modernization" is too often conceived as (and reduced to) industrialization, and more recently as extending services, that is, as being antagonistic to maintaining small or medium-sized family agricultures oriented toward self-sufficiency and local demand.

Consequently, and unfortunately, the anti-capitalist nature of family agricultures is unheeded; hence, its potential ability for structural changes and transformation of the societies and economies we are living in is underestimated. In social movements or worker organizations, many leftist theoreticians still feel that peasants are "residuals" of the past, defending corporatist or sectorial interests, and they are not seen as fighting for common objectives convergent with those of other workers and citizens. For this to change, it is necessary to take a radical critique of modernization, where urbanization and industrialization

have been presented as progress and development, the violence and plunder of imperialism and colonialism have been concealed or understated, and racism brought in to justify the pillage. Alongside this progress, privileging an anthropocentric exploitation of nature, what used to be the commons are seized from the users, especially food producers in rural and indigenous communities.

In this predatory onslaught on the commons, production, rather than for the reproduction and enhancing of lives, is put into motion for the accumulation of more and more money – capital that seeks to command labor power and take control over every aspect of social life through mechanisms of privatization. Thus, the processes of globalization of capitalistic relations can be seen in a way as the spread of cancerous cells traversing the entirety of social life. Exploitation takes place by subsuming every form of labor into the valorization machine that produces values through the domination of fantasies and desires with an overflowing supply of monetary garb, the symbol of wealth and well-being that is in fact the instrument of the exploitation of life.

Hence, the struggle to recover the commons is to assert the right to autonomous life and self-management for the majority across the wide global spectrum. In the face of the difficult task of offsetting the almost irreversible damages to the very existence of the earth as habitat for humans and other species under global warming, climate change and human-induced catastrophes like the nuclear crisis, farmers, as much as workers or other social sectors, are the protagonists and actors for change. It is a question of alliance of struggles on all fronts, building interdependent and mutual support as well as learning from one another that enhance our capacities for autonomous life and self-management.

Access to land and other resources necessary for the reproduction of life, as commons, is a legitimate right for all peasants, workers, and common people. If food sovereignty is to safeguard modes of autonomous collective self-management, it is necessary to accept the continuation of family agricultures in the foreseeable future in the twenty-first century. If agrarian and

agricultural questions are to be solved, it will be obligatory to liberate ourselves from the destructive logics that currently drive capitalism under high finance domination. If the present rules of the imperialist domination of international trade are to be modified, we, peasants, workers, and people of the North and the South, must unite and together face our common enemies – financial capital and its local allies – in order to recreate viable visions, rebuild alternative strategies, and participate in the long arduous road to communism.

This chapter is dedicated to the problems faced by the Southern (and Northern) family agricultures in the current neoliberal era of financial capital domination worldwide, and to the revival of peasant struggles for their social emancipation and legitimate right of access to land and food. Obviously, such struggles also concern all categories of workers and the people as a whole because what is at stake is the challenge to reach food sovereignty and to build our societies, at the local, national, and global levels, on the principles of social justice, equality, and real democracy.

Definition

World agriculture is marked by extreme imbalances that are among the most durable economic legacies of European imperialism. Many of the world's poorest countries in the tropics are net food importers despite having large shares of their labor force engaged in agriculture and large amounts of their best arable land devoted to agro-export commodities. This commodity dependence has deep roots in waves of dispossession, the establishment of plantations, and the subjugation of peasantries to increasing competitive pressures at the same time as they were progressively marginalized in landscapes. On the other hand, many of the world's wealthiest countries, including Europe and other temperate regions with heavy European settlement, supply a large share of all agricultural exports despite having extremely small shares of their labor force engaged in agriculture. The rise of the world's temperate breadbaskets is also steeped in the violence of imperialism, and the sweeping enclosure of vast and rich agricultural frontiers by European settler farmers at the expense of indigenous peoples, which brought immense productivity gains that were later amplified by input-intensive industrialization. Appreciating the roots of these imbalances helps cut through the myths of comparative advantage that shroud global market integration and center agriculture and food in struggles to build more equitable and sustainable societies.

Introduction

Despite the immense bounty of world agriculture, about one in nine people on earth are chronically hungry or malnourished, and many more face micronutrient deficiencies. Hunger and food insecurity are overwhelmingly concentrated in tropical and subtropical regions, especially sub-Saharan Africa and South Asia, which are together home to about two-fifths of humanity. Another glaring feature of global hunger and food insecurity is that they are disproportionately concentrated in rural areas, among small-scale farmers, farmworkers, and landless people. These patterns are bound up with a stark contradiction: the world's poorest countries tend to have the highest shares of their labor force engaged in agriculture and yet import more agricultural products than they export, as can be seen clearly in the group of low-income food-deficit countries (LIFDCs) identified by the FAO (see: http://www.fao.org/countryprofiles/lifdc/en/).

A

One of the most significant commonalities between LIFDCs is that they depend on a narrow set of agricultural or other primary commodities for a large share of their total exports, and the earnings of these commodities have fallen over the long-term relative to the more diverse imports these countries rely on (UNCTAD 2017). Crops like sugar, cotton, coffee, tea, palm oil, cocoa, bananas, and tobacco typically occupy large shares of the best arable land across the tropics, as well as dominating the marketing infrastructure and capital invested in agriculture. Meanwhile, a small number of industrially produced cereals, oilseeds, and livestock species have become increasingly crucial to global food security, while a small number of exceptionally large transnational corporations dominate flows of seeds, chemicals, fertilizers, and animal pharmaceuticals on the input side and food processing, distribution, and retail on the output side (IPES 2017). Industrial surpluses and corporate concentration increasingly bear on earnings of small farmers everywhere, who typically receive little to no state support with respect to things like extension, inputs, and credit.

It is important to appreciate the historical foundations of these contemporary imbalances, in part to help dispel celebratory accounts of global market integration and the premise that comparative advantage is a natural or inevitable arbiter of production. This chapter sets out to explain key aspects of how European imperialism ruptured and reconfigured agricultural production and food consumption, establishing durable structural problems that took on some new elements beyond independence and were exacerbated by neoliberal economic policies.

Localized Metabolisms: Friction and Diversity in Agrarian History

The development and diffusion of agriculture revolutionized the socio-ecological metabolism of our species, or the dynamics of how people relate to each other, their habitats, and other animals. The rise of farming and herding around 10,000 years ago involved qualitatively and quantitatively larger transformations of the earth than occurred with societies based on hunting, fishing,

and gathering (although small human groups did drive some very significant ecological changes prior to agriculture, manipulating some ecosystems through fire and hunting many large mammalian species to extinction in the course of migrating around the earth). It also involved fundamentally different interspecies relations, as animals selected for particular physical traits and behaviors became increasingly dependent upon human interventions over time. The practices of farming and animal husbandry and the ensuing food surpluses, along with associated granaries and markets, had a pivotal part in the rise of class and gender differentiation, cities, and civilizations.

Ancient granaries and markets for cereals, seeds, spices, and livestock indicate that there was some degree of trade from the early origins of agriculture, and techniques, crops, and domesticated animals gradually dispersed over long distances, transforming the nature of farming and herding. Nevertheless, a *heavy friction of distance* prevailed over the great majority of agrarian history, even within large and complex societies, in the sense that most farm outputs and inputs could only circulate within a relatively small radius from season to season. In the first instance, it was hard to ship bulky items very far over space when movement depended upon animal labor and (to a lesser extent) wind-powered boats along coasts and rivers. Perishability magnified these barriers, with drying and salting techniques used largely for in situ storage rather than trade. A clear reflection of this friction of distance appears in the fact that the first truly long-distance trade network premised on cultivated goods involved spices, dried and ground plants that could hold value at vastly smaller volumes than things like dried cereals or animal flesh.

For millennia, farmers had to save some of the seeds from each harvest to replant the next season, which did not begin to change in a big way until the development of hybridization in the twentieth century, accelerating further with genetic modification. As discussed later, the capacity to mine, manufacture, and ship fertilizers over long distances did not take off until the nineteenth century, which meant that farming societies had to develop

localized ways of reducing erosion and sustaining nutrients and soil organisms. This included practices such as cultivating nitrogen-fixing crops (prior to knowing what nitrogen was); digging crop residues into the soil; planting specific crops for soil cover; and having small populations of livestock graze on crop stubble or fallowed land and return condensed nutrients to land. Similarly, before the advent of modern pesticides in the late nineteenth and early twentieth centuries, efforts to contain undesirable species depended on localized ecological knowledge and complimentary associations of species, such as fostering habitat for certain insects to control others that threaten crops.

The essential point here is that the interconnected practices of growing and preparing foods were, for most of agrarian history, deeply embedded in bioregions, augmented occasionally by introductions of new plants and animals. Thus, we can read aspects of the long history of agriculture as a sort of collective genius: myriad innovations in response to varying biophysical conditions, each occurring somewhere on a spectrum from deliberate experimentation to serendipity (Mazoyer and Roudart 2006). The multiplicity of both ecological endowments and human innovations together contributed to the great diversity of cuisines that is an important aspect of the earth's cultural diversity, and some agrarian civilizations successfully maintained the biophysical conditions of production over millennia – most fundamentally, healthy soils (Montgomery 2007).

However, the long history of agriculture should not be romanticized in either social or ecological terms. As indicated, the emergence or diffusion of farming tended to generate sharp new social hierarchies, with the history of peasantries characterized by exploitation on two fundamental levels. First, a small minority ruling class tended to dominate the surplus production, with peasant households compelled to turn over a share of their harvest by some combination of laws, customs, taxes, and force, as well as sometimes being conscribed for labor or military service (Mazoyer and Roudart 2006). Second, patriarchal decision-making prevailed widely within peasant households, kin groups, and communities (Wolf 1966). The net result is that peasant societies were often marked by high infant mortality, low life expectancy, recurrent risks of disease epidemics, and chronic conditions of undernutrition, with women and girls generally the worst off. Further, many agrarian civilizations failed to maintain the biophysical conditions of production, with soil degradation a recurring factor in the decline of civilizations, from Mesopotamia, to Rome, to the great city states of the Mayan world (Montgomery 2007).

The Great Rupture: The Onset of European Imperialism and the Rise of Global Agricultural Commodities

The ability to secure and store surplus grains was a key element of political power in the rise of large and complex societies, as managing periods of shortage had an important part in social control and legitimizing ruling classes. Yet, until recently, even the largest empires could not conquer the heavy friction of distance associated with farming and food, meaning that their socio-ecological metabolism tended to remain highly localized, whether relations and exchanges are conceived at the scale of agricultural landscapes, villages, or capital cities. This localizing imperative held even in contexts where political power stretched over large areas, with the Roman Empire the first partial exception, as it came to rely heavily on trans-Mediterranean flows of grain from North Africa. But this exception only proves the rule, as Rome's reliance on long-distance grain imports was fleeting, simultaneously reflecting its political and military might and its cracking agrarian foundations (Montgomery 2007).

It was not until the onset of European conquests in the late fifteenth century that the localized character of farming and food began to be broken apart, sometimes slowly, sometimes suddenly. One especially dramatic rupture occurred in the insular Caribbean where the violence of the Spanish conquistadors and the devastating diseases they carried annihilated the Tainos and the Carib peoples within just a few generations. Across the Americas, similar combinations of

military superiority, apocalyptic disease vectors, forced or coerced labour, and undernourishment weakened or destroyed many cultures and helped Europeans rapidly appropriate immense amounts of the best arable lands. The appropriation of indigenous land was also aided by the introduction of new crops and livestock animals, including cattle, pigs, horses, donkeys, sheep, goats, and chickens. Livestock were especially transformative. Whereas domesticated animals had previously had a minimal role in the farming systems of the Americas, these new species exploded in population and geographic distribution, sometimes in deliberate ways (i.e., on farms and ranches) and sometimes (having gone feral) racing ahead of the frontiers of European conquest and permanent settlement (Crosby 1972, 1986).

Radical transformations of agriculture in the Americas contributed to the expansion of European imperialism in three basic ways. First, tropical agricultural commodities provided immense sources of profit and accumulation and helped unleash a wave of technological innovation in Europe, especially England. Second, agriculture and ranching provided a key foundation for the extraction of mineral wealth, especially in central Mexico, the Andean region, and southeastern Brazil. Third, the opening of new farming frontiers provided a means to absorb some of Europe's "surplus" population, created as peasants were squeezed off the land by the changing dynamics of surplus extraction amid the long transition from feudalism to capitalism.

Two crops alone, sugar and cotton, made the colonies of the Caribbean basin, east coast of South America (stretching from Brazil to the Guianas), and southern United States among the most lucrative of all European imperial possessions into the eighteenth century. Booming demand for these crops together with the decimation of indigenous populations and the failure of a yeoman model of migrant farmers initially created a vexing problem of labor that was resolved with the rise of the transatlantic slave trade and the development of the plantation system (Mintz 1985; Beckford 1972). Sugar and cotton plantations had a momentous role in the making of the

modern world system, at once stoking demand for slaves that carried roughly 10 million Africans across the Atlantic (with many more dying in transport) and providing key inputs for the mills of the early Industrial Revolution (Beckert 2014; Mintz 1985). The devotion to profit-seeking cultivation was so complete on the insular Caribbean that it became the first region of the modern world where food security was systematically wedded to long-distance flows of food, as imports like wheat and salted cod were needed to supplement the provisioning grounds of slaves on the margins of the plantation landscape.

For the Spanish Empire in the Americas, minerals like silver and gold were the primary source of profits from the conquests of the early sixteenth century up to the waves of independence in the early nineteenth century, while mineral extraction became increasingly important to the Portuguese in Brazil from the late seventeenth century onwards. The mining enterprise was enabled by a dualistic agricultural system of very large-scale *haciendas* and, in the Spanish realm, small-scale indigenous farms in those regions where indigenous populations rebounded after their initial devastation. Haciendas were essentially ranches with some grain cultivation, which quickly sprawled over extensive areas of natural grasslands as well as the former agricultural heartlands of the Aztec and Incan Empires and other densely settled indigenous populations. As Wolf (1982) encapsulates it, "an agriculture of clean-tilled fields and open pasture replaced a horticulture based on the meticulous cultivation, drainage, and terracing of small plots," and it had an important role providing the mining economy with food and other key resources (e.g., leather, tallow), including animal labor for haulage. From modern-day Mexico to Chile, the surviving and eventually rebounding indigenous populations were confined to more marginal lands, often at higher elevations, where they mostly lived in small farm communities. Although these communities had some degree of autonomy meeting their subsistence needs, they also faced economic and extra-economic pressures to provide the food, supplies, and especially labor needed for mining (Wolf 1982; Galeano 1973).

In the American colonies with the heaviest European migration – the northern and western United States, Canada, and Argentina – the agricultural systems that emerged had strong resemblances to those of Europe along with some distinctive socio-ecological characteristics. On one hand, European colonists, many of them floundering or recently displaced peasants, largely sought to replicate the grain and livestock mixed farming systems they were familiar with, while also integrating some "New World" crops like maize and potatoes. On the other hand, colonists faced different economic circumstances, gaining access to much larger amounts of land than was typical in Europe, at relatively little cost. Initial settler payments to the Crown did help to pay for the administration and military defense of the colonies, but the vastly greater (indeed immeasurable) cost of this "cheap" land was borne by indigenous peoples, as sweeping enclosures tore at the fabric of societies and cultures that had no previous conception of private property. Although early European pioneers in the eastern United States and Canada had a degree of subsistence orientation, the new archetype of family farming that emerged quickly became oriented toward commodity production (i.e., selling in markets) without the commodification of labor (i.e., relying mostly on unpaid family labor rather than waged labor) (Friedmann 1978). The market orientation of family farms was augmented by the large land sizes and rich soils underneath converted forests and grasslands, both of which contributed to unprecedented per farmer surpluses. This cheap land would later become a major source of cheap food for European empires (especially the British) as they industrialized.

The dynamics of European imperialism in Africa and Asia ruptured the socio-ecological metabolism of agriculture in very different ways than the Americas. Like the Americas, Africa and Asia contained a wide array of societal trajectories prior to the arrival of Europeans, from large empires with sizable cities and agricultural surpluses to nomadic groups living at low densities with limited technology. Unlike the Americas, however, neither African nor Asian lands were conquered swiftly, in part because disease vectors did not ravage the populations. In Africa especially, the dynamics of disease transmission served to inhibit rather than facilitate European settlement for centuries.

From the early fifteenth to the late nineteenth century, the landed European presence across much of Africa was largely confined to a series of slave-trading forts. The one exception was in southern Africa, where the dispossession of land began earlier with the establishment of the Dutch Cape Colony in the late seventeenth century. Yet this limited spatial footprint belies the transformative impacts of the slave trade over the course of four-and-a-half centuries, as the tentacles of slave raiding reached far across the continent, wreaking violence, heightening ethnic conflicts, and causing incalculable demographic losses and cultural trauma as millions of young working age people were seized from their communities. This profoundly altered the trajectories of farming and herding and innovation more generally, long before the onset of direct rule following the Scramble for Africa in 1884–1885 (Rodney 1982). However, it was not until the ensuing period of direct colonial rule that the intensely localized metabolism of African agriculture began to dramatically change.

In Asia, the long-standing European mercantile ambitions (spurred in part by the historic movement of spices) were unleashed by improvements in seafaring, led by the Portuguese, Dutch, British, and French, and initially focused on the Indian subcontinent and Indonesian archipelago. Similar to Africa, the landed presence of Europeans was for centuries largely confined to coastal settlements and dominated by joint-stock companies, though without the same ferocity or demographic impact as the slave-dominated trade in Africa. Another difference was that the shift from trading relations to direct European rule also came earlier in Asia, with the Dutch East India Company governing parts of the Indonesian archipelago and the British East India Company governing parts of the Indian subcontinent. These companies significantly increased the scale of commodity production, including cotton, sugar, tea, and spices, prior to the widening and deepening of European imperial control in the nineteenth

century. The British East India Company not only began to alter the course of agricultural development but also its handicrafts, deliberately undercutting the previously thriving textile production in the Indian subcontinent. Its goal in this, which had an enduring legacy, was to ensure cheap exports of raw cotton to British mills along with a large export market for manufactured British textiles.

Industrialization, Imperial Expansion, and the Intensification of Agricultural Commodity Flows

By the eighteenth century, tropical agricultural commodities from parts of the Americas and Asia were moving on a global scale in significant volumes. As indicated, sugar and cotton plantations had central part in the early Industrial Revolution, and combinations of sugar plus coffee, tea, or cocoa became a basic expectation for working people far beyond the tropics, as well as a means to help mask nutrient-poor diets (Mintz 1985). However, in general flows of food continued to be limited by the heavy friction of distance into the nineteenth century. It might have been lucrative to ship crops like sugar, cotton, coffee, tea, cocoa, and spices on wooden ships with wind and sail, but shipping core food staples was less viable due to lower margins per unit, risks to food (and thereby national) security, and political pressures from domestic farmers.

These barriers began to break down with the accelerating industrialization and urbanization in Europe in the nineteenth century, foremost in Britain. In the middle of the nineteenth century, captains of British industry successfully lobbied to liberalize the importation of grains against the opposition of Britain's landed elite. This reflected the key role of cheap food in sustaining cheap labor (i.e., containing wage pressures) and thereby enhancing the competitiveness of British manufactures in world markets (Moore 2015). The decisive shift was the repeal of the Corn Laws in 1846 that opened British markets to imported grains. The economic motives of industrial capital were enhanced by the political value of cheap

food in moderating social discontent in burgeoning cities, as Britain went from having a large majority of its population living in rural areas at the beginning of the nineteenth century to having a large majority in urban areas by the end of it. The economic and political pressures to encourage cheap food imports into Britain subsequently unfolded in other parts of Europe undergoing rapid industrialization and converged with technological revolutions that made them much more accessible, namely, the proliferation of railroads, rise of steamships, and development of transoceanic telegraph cables. Together, coal-fired combustion engines and steel reduced the friction of distance for bulky agricultural commodities, starting with wheat from the bountiful agricultural frontiers of the United States, Canada, Argentina, and Australia. Europe's "breadbasket" became truly globalized (Cronon 1991).

As discussed in the previous section, farming in these regions was significantly market oriented from early on, with the typically large scale of farms and rich soils – especially as the great grasslands were enclosed, parcelled, and plowed up – leading to much greater labor productivity and lower unit costs than in Europe. The fact that European migrant farmers in these regions could produce more and cheaper grains than the farmers who remained in Europe contributed to a reinforcing pressure. Further migration from Europe was spurred as farmers there struggled to survive against this rising competition. This competitive pressure was augmented by the increasing industrialization of agriculture in the late nineteenth century, as tractors and combines helped extensive grain farmers overcome the limited supply of labor and grow even bigger in scale. Advantages in scale and labor productivity also held with livestock production, and once refrigeration units were developed, these new breadbasket regions also began exporting surplus meat and dairy products (Cronon 1991).

While the new breadbasket regions had some decided competitive advantages as the world market in grains was developing, the spread of extensive monocultures was a radical biophysical experiment, and soils that had never previously been tilled were not as limitless as they seemed at

first to European colonists. This began to come into focus in the nineteenth century with advancing scientific knowledge about the role of key nutrients in plant productivity (most of all nitrogen, phosphorous, and potassium) and the dynamics of soil degradation. The rise of modern soil science informed the pursuit of new sources of external fertilization that was needed not only for tired European soils but also as productivity declined in some of the earlier settler frontiers like the eastern United States (Montgomery 2007; Worster 1990). This gave rise to an unlikely resource: nutrient-rich guano, accumulated excrement from seabirds and bats that was found in great volumes on some ocean islands. The first major site of guano extraction and exports occurred off the Pacific coasts of Chile and Peru, and this boom sparked the United States to seize a series of small, remote islands, an episode Clark and Foster (2009) call "guano imperialism." Though this lucrative resource was quickly depleted, it had an important role in establishing global flows of fertilizers, which were needed to respond to the accelerating problems of soil degradation associated with the industrialization of agriculture. The manufacture and movement of fertilizers began to unfold on a much greater scale in the twentieth century with the development of phosphorous and potash mining and processing and the revolutionary Haber-Bosch process for turning atmospheric nitrogen – and vast amounts of fossil energy – into synthetic nitrogen fertilizer (Smil 2001).

Along with a globalizing breadbasket, the rapid industrialization of Europe also catalyzed the race to directly colonize large areas of Africa and Asia in the nineteenth and early twentieth centuries, as imperial powers determined to secure greater flows of cheap agricultural commodities and other raw materials. Although some export-oriented production was already engrained in parts of the Indonesian archipelago and Indian subcontinent through joint-stock companies, the establishment of the Dutch East Indies and British India reflected the desire to intensify it. Imperial powers also saw abundant possibilities for tropical commodity production in vast regions like Africa and French Indo-China, where export-

oriented agriculture was virtually starting from scratch. In addition, while most of Latin America gained its independence in the early nineteenth century, the region continued to be heavily influenced by these same imperial designs, entering a sort of neocolonial position in the world system. Britain quickly moved into the power vacuum left by Spain and Portugal and dominated trade and investment in various agricultural and resource sectors across the region before giving way to ascendant US economic and political influence as the nineteenth century wore on (Galeano 1973).

Efforts to expand export commodity production in new African and Asian colonies were complicated by the fact that European migration tended to be very small relative to the native populations. A common response was to "divide and rule"; that is, to exacerbate inequalities along class and ethnic lines and cultivate allegiance from existing or newly positioned elites. This translated to a few distinct approaches to transforming agriculture. The first approach was to advance new plantations based on wage labor by forcibly dispossessing local inhabitants or enclosing common lands. This entailed a twofold subsidy to European investors and local elites, both in the acquisition of plantation land and the creation of a pool of cheap labor, as workers were compelled not only by lost livelihoods in some instances but also by the compulsion to pay new "head" or "hut" taxes used to finance colonial administrations and militias. The second approach was to graft export production onto already existing property regimes. This was accomplished partly through market forces, as landholding elites and upwardly mobile peasants became more commercialized in response to new prospects for accumulation and partly through the pressure of taxation, with subsidence-oriented peasants forced to generate earnings to meet new obligations (Davis 2001; Watts 1983). Prospects for upward mobility were profoundly gendered, as any efforts to promote access to new crops, technologies, and markets and foster private land ownership tended to privilege male household heads (FAO 1995). The third, less widespread approach to transforming agriculture was to

promote extensive grain farming and livestock ranching. Although this model was generally not well suited for the moist tropics, conditions were viable in a few places, most notably the Punjab region of the Indian subcontinent, where it was propelled by Punjabi farmers, and parts of southern and eastern Africa, where enclosures of grasslands made way for extremely large white settler properties.

The rapid expansion of agro-export commodities across the tropics was wildly destabilizing for many societies, especially for the poorest among them. The heightened focus on selling and buying food widely undermined customary social protections for coping with periods of scarcity, including both institutions (e.g., community-managed food storage systems) and perceptions about collective entitlements and responsibilities. Meanwhile colonial administrations paid little heed to social safety nets, with the basic result that food security became more wedded to market successes or failures (Davis 2001; Watts 1983). Moreover, the pressure to produce commodities uprooted practices tailored to local biophysical conditions and experiences with climatic variability, such as the use of specific crop varieties and intercropping patterns to manage long dry seasons or spells of intensive rainfall. The destabilization of small farming cultures was also affected by demands for labor in mineral-rich regions that drew some of the male population into seasonal or long-term migration patterns, heightening both the farming and household responsibilities of women.

These social and ecological vulnerabilities came together with devastating effect in the late nineteenth and early twentieth centuries, when millions of impoverished people starved to death in a series of famines that stretched across Asia, Africa, and Latin America. Mike Davis (2001) has evocatively called these famines the "Late Victorian Holocausts" to mark them as a direct outcome of British imperialism. In making this case, Davis acknowledges that weather extremes associated with El Niño and La Niña Southern Oscillations contributed to widespread crop failures, while stressing that cyclically adverse conditions used to bring hardship rather than catastrophe. However, the extent of famine is only comprehensible

by taking the preceding agrarian change into account, along with the merciless imperial responses. British authorities consistently denied the magnitude of the crises and the part played by imperial policies, while blaming local people for their suffering, providing scant and slow relief, and using harsh disciplinary measures to quell dissent (the capacity for which was already depleted by the emaciated conditions of populations). A striking example of the brutality of imperial rule is that large volumes of wheat exports continued flowing out of British India amidst widespread starvation (Davis 2001). This response can be seen to represent an early instance of "disaster capitalism" (Klein 2007), whereby the ruling authority seizes upon a crisis as a strategic opportunity to amplify the political economic transformations in motion, insisting the root problem is not the trajectory of change but that it has not advanced far enough.

These catastrophes severely weakened large areas of Asia, Africa, and Latin America and helped solidify their place as externally dominated commodity producers in the context of an expanding world economy, whether these ruts were centuries in the making or very recent. Davis (2001) signals this in the subtitle to *Late Victorian Holocausts*, which highlights the role of the famines in the 'Making of the Third World.' Two characteristic features of this commodity dependence made it especially problematic. First, for most individual colonies, the lion's share of export earnings came from a small number of crops or minerals, while their economies came to rely on a much wider range of imported products, especially as the twentieth century wore on (e.g., consumer goods, farm implements, pharmaceuticals, electronics, automobiles, military equipment). Second, value-added segments of commodity chains were generally located within the imperial power. In a few instances, local processing capacities were deliberately undercut, as in the famous case of cotton and textiles in India alluded to earlier. More often they were stunted from the start, from sugar in the Caribbean to cocoa in West Africa. This contributed to overwhelming imbalances in technological dynamism, which were further affected by the

dominance of imperial planners and engineers in constructing the key infrastructure of the export economy like rail and road networks, irrigation projects, and electricity grids.

As far-reaching as the conditions of economic dependence were, the colonies of Africa and Asia did not import much food prior to the great waves of decolonization in the mid-twentieth century. But here too, the proverbial seeds of dependence had been sown.

The Colonial Inheritance: Agricultural Imbalances Old and New

Much as in Latin America in the nineteenth century, independence did little to alter the subordinate position of the newly independent countries of Africa and Asia in the world economy. Exports continued to pivot around a small range of primary commodities, foreign corporations continued to dominate the value and decision-making in commodity chains, and agro-exports continued to be a key source of foreign exchange needed to sustain import patterns. These dependent relations were typically associated with the outsized political power of plantation owners, successful commercially oriented farmers, and large-scale merchants. However, commodity dependence was also connected to deep social tensions, given the strong association between agro-export production and land inequalities and the fact that populations were still overwhelmingly rural and agrarian.

Struggles for land redistribution were a pivotal part of some anticolonial liberation movements, helping rally small peasants and landless workers (Wolf 1969), and were embedded in the politics of decolonization everywhere to varying degrees following independence. While these politics were always rooted in specific histories, they were also influenced by comparative perspectives and geopolitical pressures. Land inequality played a significant part in revolutionary struggles in Mexico, Russia, and China in the first half of the twentieth century, and aggressive appropriations of private property were a central pillar of postcolonial development strategies for countries within Soviet

and Chinese spheres of influence. Although the social transformations and conflicts associated with building new forms of collectivist agriculture did not involve democratic processes or meet the aspirations of most peasants, fears of the volatility of the rural poor in the context of the Cold War helped incline the United States and the West to support variations of land reform. This support was especially notable in Japan, South Korea, and Taiwan in the wake of the Second World War, reflecting the strength of communist forces in East Asia. There it was hoped that a substantial class of medium-sized, commercially oriented farmers could provide a bulwark against more radical social pressures in the countryside and the perceived "communist threat" to business interests in the region.

Approaches to land reform in the 1950s and 1960s were also influenced by Keynesian ideas about development policy and planning, or what is often referred to as the era of the "developmental state." Developmental states were seen to have a number of essential roles including: managing markets and investment; investing in infrastructure, public services, and state-run enterprises; and pursuing a degree of redistribution (Leys 1996). For agriculture specifically, developmental states retained flexibility to use tariffs and quotas to protect domestic markets (though they often didn't) and generally supported domestic marketing agencies, extension services, seed banks, research facilities, and subsidized credit. Many also attempted to transfer some publicly and privately held land to the rural poor. Mainstream development thinking openly acknowledged the social and economic benefits of land reform, including its potential to improve food access, employment, income distribution, and demand for goods and services in rural areas, in turn providing improved footing for economic diversification and generally reducing tensions (Borras 2008; Weis 2007).

Yet despite this case and the evident success of land reforms in East Asia, in general the United States worked to resist or dilute struggles over land reform across the rest of its sphere of influence (Weis 2007). This opposition was rooted in both the direct threat they posed to US corporate

interests in some instances, especially in parts of Latin America and the Caribbean, and ideological hostility to left-wing social movements and political parties demanding sweeping land reforms. Where the United States did sanction land reforms in Latin America under the Alliance for Progress, they were framed with the similar hope to broaden the base of commercial farmers as in East Asia. However, the scale paled in comparison, in the context of a region with the world's most severe land inequalities, as the United States was unwilling to confront the vested power of landholding elites who formed a key base of support for right-wing military regimes and staunch Cold War allies.

Regardless of the nature of land reform pursued between the 1950s and 1970s, reforms tended to replicate the colonial focus on male household heads, in many cases overriding customary rights of women within households and communities (FAO 1995). Land reforms also unfolded amidst an embrace of industrialization and urbanization that cut across the ideological spectrum, with agriculture expected to decline in relative economic terms (i.e., as a share of both GDP and employment). The pursuit of industrial and urban growth in developing countries converged with booming agricultural surpluses across much of the temperate world, led by the United States, which suddenly made food imports cheap and abundant (Friedmann 1990, 2004). In the first instance, the profusion of cheap food resulted from the combination of continuing mechanization, the development of high-yielding hybrid seeds, and dramatic increases in fertilizers, pesticides, and irrigation, which dramatically increased labor productivity. Fast-declining numbers of farmers in industrialized countries could each feed fast-rising numbers of non-farmers.

Surging labor productivity was, however, only part of the story of cheapness; it was also amplified by both explicit and implicit subsidies. The explicit subsidization involved a combination of Keynesian-era support programs together with rising food aid and export-directed payments, which allowed exports to sell in foreign markets below the prices that held in domestic markets.

The period of aggressive surplus dumping (including both aid and subsidized exports sold below the prices in domestic markets) stemmed from both the fear that domestic gluts would devastate farm earnings and the opportunism of rapidly growing and consolidating food processing corporations, big farmer lobbies, and states, that recognized the long-term benefits cultivating new outlets could have, paving the way for rising commercial exports over time (For the United States, aid and subsidized trade was also a powerful lever of geopolitical power, flowing disproportionately toward Cold War allies) (Cochrane 2003; Friedmann 1990, 2004). The implicit subsidization relates to the resource intensity and wide-ranging environmental costs associated with industrial agriculture, including soil degradation, water pollution and overdraft, persistent toxicity, biodiversity loss, and greenhouse gas emissions. Because these costs are partly or wholly unaccounted, or externalized, they can be understood to brace the competitiveness of industrial foods (Weis 2010, 2013).

For governments in newly independent countries it mattered little why food was cheap. Aid and subsidized food imports were generally welcomed as a way to support development transitions by containing wage costs and social pressures, which were complicated immensely by the rapid population growth that was occurring. The resulting surge in cheap grains flowing from rich to poor countries was most dramatic in sub-Saharan Africa, which went from being a negligible food importer at the cusp of the independence era to having food security heavily wedded to imports in the space of just a few decades (Friedmann 1990; Andrea and Beckman 1985). While food imports were expected to help facilitate industrial and urban development, diversification proved elusive for the world's poorest countries. Instead, there was an unprecedented phenomenon of urbanization *without* industrialization, marked by rising urban squalor (Davis 2006).

Widespread failures to diversify meant that many agro-exports established under colonial rule continued to have central roles generating foreign exchange and enabling import patterns.

Amid the global economic boom of the 1950s and 1960s, the danger of these continuing ruts was somewhat obscured by relatively strong commodity prices. However, as rates of global economic growth slowed, tropical agricultural commodities began a long-term decline in relation to the much wider range of imports these countries had come to depend upon (Robbins 2003). In addition to flagging global growth, declining terms of trade were also affected by a range of other factors including: the structural overproduction of tropical commodities; the failure to establish strong supply management initiatives like OPEC among major tropical agro-exports (or the decline of fledgling efforts, like the breakdown of the International Coffee Agreement in 1983); the substitutability of some products from the temperate world (e.g., high fructose corn syrup and artificial sweeteners for sugar; a range of fibers for cotton); the wage gains achieved by organized labor in the Keynesian era (which tended to increase the cost of manufactured goods); and the rising energy prices after the 1972–1973 oil price shock.

In sum, at the same time as food import dependence was taking root in many poor countries, their stubborn dependence on a narrow range of agro-exports was poised to become more problematic.

Deepening Dependence: Neoliberalism and Agriculture

A wildly regressive spiral emerged in the 1970s and 1980s. Declining terms of trade facing many countries in Latin America and the Caribbean, Africa, and South and Southeast Asia produced persistent balance of payments deficits, which led to heavy government borrowing and sharply rising debt. By the early 1980s, with payments deficits persisting and interest rates rising, many governments struggled to meet their obligations to creditors. This is often referred to as the "Third World Debt Crisis," which was essentially a crisis of state solvency that threatened global financial markets, as billions of dollars of loans were poised to evaporate, erupting in 1982 with two very large

debtors, Brazil and Mexico, teetering on the brink of defaults). The IMF and World Bank emerged as the key crisis managers and, in turn, the dominant architects of development policy and planning across most of Latin America and the Caribbean, Africa, and South and Southeast Asia in the 1980s and 1990s. The first step of financial crisis management was to provide loans to states to ensure that debts were repaid. The second step, dismantling the developmental state and institutionalizing neoliberalism, was compelled through the conditions on these loans. Together, loan conditionalities added up to a policy prescription known as structural adjustment that included demands for: increasing liberalization trade and investment; the deregulation of prices and wages; cutbacks in government expenditures; currency devaluation; the privatization of state enterprises and services; and the promotion of exports based on comparative advantage.

Structural adjustment was guided by the ideological assumption that development policy and planning should prioritize aggregate growth rather than equity (with the latter seen to impede the former) and that growth was best ensured by entrenching the competitive discipline of global market forces. Global market integration was expected to optimize the efficiency of production everywhere and, accordingly, the availability of the lowest priced or highest quality goods. For states, this meant that the overarching development objective should be to enhance export production rather than pursue diversification or redistribution. One implication was that the rising food imports flowing into the world's poorest countries were not in themselves a concern so long as export growth could be achieved elsewhere. The extension of this logic was that agriculture should be further oriented toward areas of comparative advantage, that is, on those commodities that can be produced more cheaply than elsewhere, to maximize foreign exchange and the ability to import foods produced more cheaply elsewhere (Weis 2007).

The focus on export growth together with the retrenchment of the state swept away concerns for redistributive land reform. In the neoliberal

vision, the only viable redistribution of land should occur through "non-confrontational" buying and selling which, unsurprisingly, did not tend to produce progressive outcomes (Borras 2008). This approach was known as *land market reform* because the goal was to make land markets more transparent and accessible, improving knowledge and reducing taxes and the costs of land transactions. However, as Borras (2008) demonstrates with a wide range of cases, the shift from state-led redistributive reforms to land market reform generally failed to encourage transfers of land from rich to poor, at worst producing regressive outcomes and at best benefitting a middle-strata of commercialized farmers. This shift was a key precursor to the surge in corporate land deals (or "land grabbing") in the 2000s, as finance capital, sovereign wealth funds, and transnational corporations increased acquisitions of large tracts of land, most dramatically in sub-Saharan Africa (White et al. 2012). Along with land reform, adjustment also ravaged other supports for domestically oriented production once pursued by developmental states with respect to marketing, extension, research, seeds, and credit. The lynchpin of this development model, export growth, had two main paths. The first was to improve the output and efficiency of "traditional" agro-exports (i.e., those established under imperial rule), with increasing mechanization envisioned as one key path to improving labor productivity and reducing costs. The second was to build markets for new or "non-traditional" agro-exports, such as tropical fruits (e.g., mangoes), "off-season" fruits and vegetables (i.e., in relation to industrialized countries), cut flowers, and intensive livestock and aquaculture (Weis 2007).

Encouragement to grow traditional agro-exports paid no regard to the problem of structural overproduction, which had been a key aspect of declining terms of trade. Not only did this dynamic not disappear, but it got much worse with long-standing producers and some new entrants simultaneously encouraged to grow more. The result was what Robbins (2003) called the "tropical commodities disaster": further declines in relative prices in world markets, which were most damaging for those countries with the greatest reliance on a narrow range of

traditional agro-exports and highly advantageous to the transnational corporations dominating the value within commodity chains (Robbins 2003). While there were some notable successes establishing non-traditional agro-export growth, in general these were concentrated in comparatively wealthier developing countries (e.g., Brazil, Chile, Thailand, South Africa) and with benefits concentrated among foreign and domestic corporations involved in trade as well as narrow segments of the agrarian populations, especially landed elites and sometimes medium-scale commercial farmers.

The neoliberal approach to agricultural development was further entrenched with the establishment of the World Trade Organization (WTO) in 1995. The WTO set in place new rules that strengthened investor rights, limited the flexibility of governments to intervene in markets in the future, and extended US-styled patent protections on intellectual property, which was heavily pushed by leading seed and input corporations to help lock in the annual purchase of proprietary seeds. Strong intellectual property regimes are an important part of ongoing efforts to displace seed saving and selecting practices, that began with the development of high-yielding hybrid seeds and have been increasingly focused on the extension of genetically modified seeds since the 1990s (Kloppenburg 2004). This marked a major shift in the scale at which the growing power of corporations could be exerted, posing new challenges for movements of small farmers, landless workers, and indigenous peoples around the world. Efforts to organize beyond national and subnational scales grew into transnational agrarian movements, most notably Vía Campesina, with rural alliances allied by shared opposition to the WTO and the corporate power it was seen to represent. This unity-in-negation was reflected in an early rallying cry of Vía Campesina to get the "WTO Out of Agriculture" and in the strong oppositional presence it mounted at WTO Ministerials from Seattle in 1999 onward. However, social movements cannot draw vitality only from opposition powerful ideologies like neoliberalism and institutions like the WTO; they also need inspiring counternarratives, and for transnational

agrarian movements, these have increasingly come to hinge around demands for food sovereignty (Edelman and Borras 2016; Edelman et al. 2014).

Food sovereignty is premised on the basic demand that agriculture and food systems should be subject to local and democratic controls as far as possible, along with the belief that the small farming wisdoms and cultures that have endured and adapted over the past 500 years are not relics of the past but the agents of a more equitable and sustainable future. Rather than simply a job that can be displaced in qualitative or quantitative terms, farming is regarded as something with the capacity to sustain far more dignified livelihoods than any other sector, while food is seen to possess social and cultural meanings and values that transcend the commodity form. Vía Campesina has also increasingly stressed agro ecological arguments for small farming in its conception of food sovereignty, as well as the centrality of gender equality from household relations to governance Climate change is at the forefront of the agroecological case for small farming (Altieri and Toledo 2011). Part of this involves drawing attention to the major role industrial agriculture plays in climate change and how this is bound to make the regressive dynamics world agriculture much worse, affecting conditions of production most immediately and negatively in the semiarid tropics and tropical coastal regions. The flipside is a case that biodiverse small farms have the potential to help "cool the earth" and to increase prospects for climate change adaptation (Vía Campesina 2009). Still, there is a danger of largely replacing unity-in-negation with unity-through-ambiguity, and critics stress that prevailing conceptions of food sovereignty give too little attention to things like rural class differentiation (both past and present), the role of markets (and the nature of market intervention envisioned), and the question of what institutional form should rightful sovereignty take (Bernstein 2014). Nevertheless, if advocates of food sovereignty are willing to work through difficult ideological terrain it seems poised to have a prominent role enlivening anti-systemic struggles into the future (Borras 2019; Edelman and Borras 2016).

Conclusions

For millennia, the socio-ecological relations between agriculture and food have been a fulcrum of cultural diversity. As capitalism has advanced unevenly across the world since the fifteenth century, commodity relations have increasingly swept aside the biophysical basis of farming – including localized ecological knowledge, managed diversity, and regionally rooted cuisines – over large areas of the world's agricultural land. Agriculture is ever more governed by amoral compulsions of comparative advantage and profitability and the biophysical illogic of rising distance (of both inputs and outputs), narrowing diversity, and externalized costs. Food is ever more a de-spatialized commodity, with access increasingly governed by money. The apex of this is large-scale monocultures producing for global markets, worked by immense machines or wage laborers. Competition from these monocultures is reverberating in increasingly precarious small farm livelihoods the world over, with rural poverty driving levels of migration that are entirely disconnected from prospects of achieving stable work, which is producing a new scale and form of urban marginality (Davis 2006).

In short, the dynamics of contemporary agriculture and food systems are central part of global inequality and the deterioration of ecological conditions, not only for agricultural production but for all life. By better understanding their long imperial roots, and how key imbalances have gotten worse not better beyond independence and especially under neoliberalism, it can help to inform struggles to build a more equitable and sustainable world.

Agriculture, Underdevelopment, and Imperialism

Prabhat Patnaik
Jawaharlal Nehru University, New Delhi, India

Definition

A view has gained currency of late that 'imperialism', in the sense of a 'world system of colonial oppression and financial strangulation of the overwhelming majority of the population of the world by a handful of "advanced countries"' (Lenin 1977, p. 637), is no longer a useful category in the era of globalisation. The notion of imperialism, it is argued, has necessarily a 'spatial' dimension, captured for instance in Lenin's reference to 'a handful of advanced countries' in the above remark; but, with 'economic superpowers' now emerging from within the ranks of the Third World, that spatial dichotomy has ceased to be relevant, which makes the concept of imperialism itself irrelevant.

On the one hand the monopoly capitalists in the emerging Third-World countries have been integrated into international finance capital; and on the other hand the oppression and dispossession of the non-monopoly segments of the population, not just the workers, is not confined to Third-World peasants and craftsmen, but extends also to vast sections of the population in the advanced countries, who are pushed into penury for instance by financial crises. Hence the tendency is towards a homogenisation of the two

segments of the globe, the advanced and the backward countries, which undermines the meaningfulness of the concept of imperialism.

Introduction

The purpose of the present essay is to critique this view and establish the abiding relevance of the concept of imperialism. It argues that capitalism simply cannot exist as an isolated self-contained system; that it can do so only within a pre-capitalist setting, by exercising domination over its pre-capitalist surroundings (which no longer therefore retain their original pristine form); that this domination necessarily has a 'spatial' dimension, in the sense that whether or not capitalism in the metropolis also dominates its own internal pre-capitalist or small producers, it cannot do without dominating such producers located in a particular 'outlying' geographical region; and that no difference is made to this phenomenon of domination, and hence to the phenomenon of imperialism, by the fact that capitalism and capitalists (including monopoly capitalists integrated with international finance capital) emerge powerfully within this region too.

I

Modern industrial capitalism in Western Europe was associated from the very beginning with the processing of raw materials that were not produced, and indeed were not *producible,* in Western Europe itself. Cotton, whose processing into cloth pioneered the industrial revolution, was not producible in Britain, the pioneer industrial capitalist country. It had to be imported from the tropical and sub-tropical colonies. Likewise a variety of consumer goods, from fresh fruits to tea and coffee, which entered into the daily budgets of the bulk of the population in the capitalist metropolis, were simply not producible in the metropolis itself and had to be imported from distant tropical and subtropical lands, where again their cultivation had to be either introduced or augmented for meeting metropolitan needs.

Indeed the economic historian Phyllis Deane (1980) sees the industrial revolution as following from, and being conditional upon, the development of a certain pattern of world-wide trade. This pattern however was *imposed* upon the rest of the world, especially upon the tropical and subtropical lands, characterised by pre-capitalist production, by the emerging metropolitan capitalism itself.

Dependence of Metropolitan Capitalism

This dependence of metropolitan capitalism upon the pre-capitalist producers of the tropical and subtropical lands for supplying it with a range of raw materials and consumer goods has not changed to this day; indeed it cannot change, given the fact that these goods are simply not producible in the temperate regions where metropolitan capitalism is predominantly located.

This fact, however, is so thoroughly obscured by the extreme smallness of the weight of such primary commodities in the total gross value of output in the advanced capitalist countries that it is scarcely ever taken into account, even by radical authors. But this smallness is a result of the specific *valuation* process. Such valuation itself in other words expresses a relationship of domination. It expresses the domination characterising the metropolis's relationship with the 'outlying regions': with its pre-capitalist and small producers, and also with its low-paid plantation workers, who produce the primary commodities needed in the metropolis. It is ironic that this fact of domination, which underlies the low value of these commodities, is sought to be denied on the basis of such low value itself (I emphasis the social basis of this valuation process in Patnaik 1997).

To borrow Harry Magdoff's argument (2000), one cannot make steel without using iron ore, no matter how much is paid for the latter. If iron ore is obtained *gratis* by snatching it from regions where it was earlier used, and hence its value has zero weight in the gross value of steel produced, then this fact, far from expressing the absence of domination, expresses rather the extreme severity of it. Relative value comparisons therefore are irrelevant to the argument about the absolute necessity of a whole range of products of the 'outlying regions' for metropolitan capitalism.

As accumulation occurs, the need for such products increases, for any given output-mix in metropolitan capitalism; and as the output-mix in the latter changes owing to product innovation, newer goods from the 'outlying regions' begin to be demanded (which also happens because of process innovation). *Metropolitan capitalism must not only have these goods supplied from the 'outlying regions', but have them supplied at prices that do not increase at a rate which can threaten the value of money in metropolitan capitalism.* It is not enough in other words that the 'outlying regions' should just be opened up for trade and made to supply these goods to the metropolis, which *per se* is just a once-for-all process. It has to be continuously ensured that their supply price does not rise to threaten the value of money, since any such threat can have a seriously destabilising effect upon the capitalist system, which is quintessentially a money-using system. (The threat to the value of money in the metropolis posed by increasing supply price of primary commodities is independent incidentally of the weight of their value in the gross value of metropolitan output.)

Primary Commodities, Land, and Investment

The fear of such an increase in the supply price of primary commodities (and hence in their terms of trade vis-à-vis manufactured goods) haunted David Ricardo, who saw the accumulation process under capitalism grinding to a halt, and the arrival of a 'stationary state', as a consequence of it. What Ricardo had failed to appreciate, however (because, being a believer in Say's Law, he never saw money as a form in which wealth could be held under capitalism), is that long before the arrival of the stationary state, money as a form of holding wealth would have been subverted by the rising supply price of primary commodities, disrupting the functioning of the capitalist system. (I use the term 'money' throughout this essay to refer only to currency and bank deposits irrespective of whether 'money' in this sense has a commodity link.)

The danger of such disruption was recognised by John Maynard Keynes, who even paid an oblique tribute to Lenin while doing so. In his opus *The Economic Consequences of the Peace*, Keynes wrote (1919, p. 112): 'Lenin is said to have declared that the surest way of destroying the Capitalist System is to debauch the currency... Lenin was certainly right.'

And yet, in addition to the money prices of primary commodities produced in tropical and subtropical regions rising to 'debauch' the currencies of metropolitan capitalist countries, even the terms of trade between manufacturing and primary commodities have not moved secularly in favour of the latter as visualised by Ricardo. Indeed, on the contrary, barring war years, when in any case the capitalist state intervenes so heavily in the functioning of markets and in wealth-holders' choice of assets that the danger of a spontaneous subversion of the money-form loses all relevance, *the secular movement of the terms of trade between primary commodities and manufacturing has been against the former.*

This is not because the *output* of these commodities has increased in keeping with the requirements of the capitalist metropolis, *and done so at decreasing unit costs*, or at the very least non-increasing unit costs, for given money wages (or unit money incomes of producers). In other words, the decline in terms of trade for tropical primary commodities is not because Ricardo's prognostication of a limited land mass constraining the output increase of agricultural products has been proved wrong. On the contrary, not only has the tropical land mass that can sustain such production remained fixed in size, but land-augmenting technological progress and land-augmenting investment, like in irrigation (which makes multiple cropping possible), has been quite conspicuous by its absence under the regime of metropolitan domination. In the entire history of the British Empire, for instance, there was hardly any significant investment in irrigation undertaken in any part of the empire, other than in the Canal Colonies of the Punjab (Bagchi 1982).

This is hardly surprising. Such land-augmenting investment and technological progress necessarily require a substantial spending effort by the state; but prior to the Keynesian revolution in economics the very *idea* of the state moving away from the tenets of 'sound finance' (i.e. of balancing the budget), let alone playing a proactive role in undertaking investment, was considered anathema. Even after Keynes had advanced the argument in the midst of the Great Depression that government expenditure financed by borrowing was not to be shunned, it took several years, indeed until after the Second World War, before significant public investment became acceptable as practical policy in the metropolis itself; in the colonies of course such acceptability had to await decolonisation.

The question therefore arises: since the size of the tropical land mass, on which alone can several of the commodities required by metropolitan capitalism be produced, is given, and since land-augmenting investment and technological progress in the tropics were conspicuous by their absence during the entire period before decolonisation, how was the rising requirement of metropolitan capitalism for such commodities met, even as the terms of trade moved adversely for them?

The simple answer to this question is that even though the output of tropical primary commodities as a whole did not increase, *there was a compression of their use within the regions where they are produced, to make more of them available to the metropolis.* The mechanism of such compression was, to borrow Utsa Patnaik's argument (1999, p. 354), an 'income deflation'. Income deflation, imposed on these 'outlying regions', made available to the metropolis the commodities that it needed. This happened either directly, through a shift of such commodities from local absorption to meeting the needs of the metropolis, or indirectly, through a shift of land use from crops whose absorption declined because of income deflation to those which the metropolis needed.

What is true of commodities produced on the tropical land mass, which has a more or less fixed size, is also true more generally of exhaustible resources. They too will be generally subject to increasing supply price (for given money wages). This poses a threat to the value of money in the

metropolis as accumulation increases the demand for such commodities. One way of warding off this threat, even as accumulation proceeds, is to impose an income deflation in the 'outlying regions' so that more of such commodities become available for metropolitan needs by squeezing their absorption outside the metropolis. Income deflation imposed on the 'outlying regions' in short is one of the means of ensuring that the value of money remains intact in the face of capital accumulation. *The imposition of such income deflation is a major characteristic of imperialism.*

Colonial Extraction from Pre-capitalist Economies

The two chief means through which income deflation was imposed in the colonial period were the system of colonial taxation, which led to a 'drain of surplus' from the colony to the metropolis, and the displacement of local crafts through competition from metropolitan capitalist products, which was called 'de-industrialisation' in Indian nationalist writings. How these two mechanisms worked can be clarified through a simple example.

Consider a pre-capitalist economy, where 100 peasants produce 200 units of food, of which they consume 100 and give the rest to the overlord as revenue. The overlord in turn supplies this to 100 artisans, who give in exchange 100 units of artisan products. The overlord, we assume for simplicity, consumes no food, and the peasants and artisans, who have identical value productivity, consume only food. Now, suppose the capitalist sector encroaches upon this economy, removes the overlord, imposes taxes worth 100 upon the peasants, and takes the proceeds for its own use.

For accounting purposes it can show its imports of 100 as being balanced by an export of 'administrative services' to the pre-capitalist sector, that is, as payment for ruling the latter; and this would also figure as an expenditure item in the government budget in the pre-capitalist economy. Both the government budget and the trade account will then actually *appear to be balanced*, while in fact the capitalist sector is appropriating the surplus from the pre-capitalist sector. The

consequence will be the displacement of the artisans, who would now be unemployed, and the use of the 100 food, which they were consuming earlier, by the capitalist sector. The latter in this way has got its requirement of food (or other raw materials for the production of which the land earlier devoted to food production can now be used), without there being additional output in the pre-capitalist sector, and hence any scope for the phenomenon of 'increasing supply price' to manifest itself and threaten the role of money.

The second mechanism, 'de-industrialisation', operates as follows. In the above example, even if there are no taxes, that is, the overlords are not replaced and continue to obtain the same income as they were doing before, but are induced to consume imported goods from the capitalist sector in lieu of domestic artisan products, even then while trade will be actually balanced, with 100 of food being exported against 100 of imported manufactured goods from the capitalist sector, domestic employment (of artisans) will have fallen by 100, and so will domestic output by 100. In other words, even with balanced trade (i.e. no appropriation of surplus from the pre-capitalist sector by the capitalist sector), the pre-capitalist sector's industrial sector will have shrunk by 100 (whence the term 'de-industrialisation'). This will have entailed an income deflation in the pre-capitalist sector, and the export of primary commodities to the capitalist sector (in this example food, but in actual fact all sorts of products which the tropical land mass devoted to food production can otherwise produce). The two forms of income deflation we have discussed so far are additive in their effects.

II

A hallmark of income deflation is that even as it restricts demand in the 'outlying regions' for the commodities produced there, it *ipso facto* also restricts their production, not just of the commodities it does not require (in the above example, artisan products) but even of commodities it does take away (in the above example, food). Land-augmenting investment and technological

progress, the scope for which is, as we have seen, in any case limited in the regime of 'sound finance', even becomes unnecessary, as the capitalist metropolis can meet its requirements of such commodities through income deflation. And since such income deflation squeezes the peasantry and petty producers in the Third World (the squeeze on the petty producers in turn increasing the demand for land for leasing in, and hence the magnitude of land rents, to the detriment of the peasants), whatever incentive there may have been for such producers for raising output is snuffed out. The result is absolute impoverishment of the Third-World population, uneven development between the two segments of the world economy, and stagnation or even decline of output in the Third World, all of which were visible during the colonial period.

The Third-World states that came up after decolonisation not only broke with this pattern of income deflation, but even undertook land-augmenting investment and technological progress, and a number of measures supporting the peasants and petty producers, in their respective economies, all of which broke with the stagnation in their traditional sectors. While this meant that the requirements of metropolitan capitalism could be met through a rise in the output of these commodities, which did not even necessarily entail increasing supply price (at given money wages) because of the land-augmenting investment and technological progress being undertaken by the post-colonial Third-World states, the absence of income deflation *left open the scope for a rise in commodity prices and hence an undermining of the value of money in the metropolis*. This is exactly what happened at the beginning of the 1970s when world commodity prices rose sharply.

This increase is often interpreted incorrectly. The interpretation goes as follows: the persistent US current account deficit, on account *inter alia* of its maintaining a string of military bases all around the globe, meant, under the Bretton Woods system where the US dollar was ordained to be 'as good as gold', that other countries were forced to hold on to the dollars pouring out of the US. This outpouring became a torrent during the Vietnam War, and France under President De Gaulle became unwilling to hold dollars any more. It demanded gold instead, which forced the suspension of the dollar–gold link and the subsequent collapse of the Bretton Woods system. This collapse created panic among speculators who, suddenly denied a secure monetary form of holding wealth, moved to commodities, causing the worldwide commodity price explosion. This interpretation in short sees the price explosion only as a temporary panic reaction.

A more plausible explanation however is as follows. In the context of the *generally* high levels of aggregate demand maintained through state intervention in metropolitan capitalist economies, including above all through high US military spending, escalating expenditure on the Vietnam War gave rise to a state of excess demand, especially for primary commodities; since the scope for imposing income deflation on the 'outlying regions' did not exist as in colonial times, this pushed up their prices, which the speculative factors underscored by the first interpretation further aggravated. The commodity price explosion in short was the inevitable denouement that capitalism, enfeebled by decolonisation which robbed it of its traditional weapon of income deflation against Third-World producers, faced in the post-war period. Post-war capitalism, though it kept up its level of aggregate demand through Keynesian demand management, did not have any means of keeping down raw material prices in the face of growing demands for such raw materials arising from accumulation, and hence warding off threats to the value of money. This fact was exposed in the early 1970s.

France's move to gold instead of US dollars then becomes explicable not as an act of intransigence on the part of President de Gaulle but simply as an expression of the 'debauching of the currency' that Keynes had talked about. And the weakness of the Bretton Woods system, in comparison with the Gold Standard, is then seen to consist in the fact that the latter was based on a colonial system which made possible the imposition of income deflation on the 'outlying regions', while the former was crippled by the fact of decolonisation, and hence a loosening of the bonds of imperialism.

The experience of the early 1970s incidentally clarifies an important point. Strictly speaking, wealth-holders would shift from holding money to holding commodities as wealth-form only when the expected price appreciation of commodities exceeds the sum of the carrying cost and the risk-premium on commodities. (The risk arises because nobody can be certain about the degree of price appreciation, and because commodities are illiquid compared with money.) But a general belief among wealth-holders which has persisted for millennia is that the price of gold will never fall permanently compared with commodity prices, while currencies can be permanently devalued in terms of commodities. And *gold itself has a relatively small carrying cost.* Hence if wealth-holders expect a permanent rise in the money price of commodities (as they would in conditions of increasing supply price, with given money wages), then they will shift from money to *gold.* And an increase in the money price of gold because of such a shift would further strengthen expectations about a rise in commodity prices in general.

It follows that if there are some people who are either cavalier about risk-taking or have absolutely certain expectations that commodity prices are going to appreciate, then they will trigger an inflation whose very persistence will make others less scared of the risk of holding commodities or gold, and hence more willing to desert money as a wealth-form. Since such people will generally exist, one can say that metropolitan capitalist economies are always haunted by the fear of a 'debauchment' of currency; and the larger the edifice of money-denoted financial assets they have built up, the greater this fear is (which is why 'inflation-targeting' becomes an obsession in the current era of financialisation).

Money and the US Dollar

The undermining of the value of money which arises from developments in commodity markets expresses itself as a shift from money to gold. The fact that historically there have been very few episodes of currencies being destabilised because people actually hold vast amounts of commodities

is therefore not surprising. First of all, any shift to commodities is countered by appropriate income deflation so that inflation and any associated shift to commodities are not *actually* allowed to persist. Secondly, the shift to commodities expresses itself as a shift to gold. Episodes of shifting from currencies to gold are plentiful, and the early 1970 provide one example; a good deal of Marx's writing on money is in fact concerned with such shifts.

The 'debauchment' of the US dollar, the leading currency of the capitalist world, in the early 1970s gave rise to a drive to re-establish an international regime akin to what prevailed in colonial times, which would re-open the scope for income deflation, and this brought forth the regime of globalisation under which we live today. *Globalisation in other words represents a rolling back of the post-colonial situation where the peasants and petty producers of the 'outlying regions' obtained some reprieve from income deflation.*

To say this is not to suggest some 'conspiracy theory'. Capitalism being a spontaneous system as opposed to a planned one, the ushering in of globalisation, and with it of an income-deflationary regime, was not some calculated measure. It arose through the functioning of the system itself: the inflationary episode of the early 1970s gave rise to a recession during which commodity prices, other than that of oil (which increased because of the Organization of Petroleum Exporting Countries), came down. But the recession contributed to the process of globalisation of finance (and the coming into being of an entity that has, appropriately, been called 'international finance capital'), which was under way in any case during the period of Keynesian demand management. International finance capital is the key entity behind the contemporary phenomenon of globalisation (Patnaik 2010).

It follows from this that the view that imperialism as a phenomenon persisted only before globalisation came into being, and has lost its relevance under globalisation, is the very opposite of the truth. In fact postwar decolonisation meant some loosening of imperialism, and the contemporary globalisation has actually strengthened its hold.

III

How little this fact is understood can be illustrated with reference to an argument advanced by no less distinguished an economist than Paul Krugman. Krugman, who is a regular columnist of *The New York Times*, had argued in his column of 21 April 2008 that the state of excess demand in the markets of primary commodities in the early 1970s was overcome through supply adjustment, such as new oil-strikes in the North Sea and the Gulf of Mexico, and the entry of new land into cultivation. This however is not correct.

The resource crisis of 1972–75 was hardly overcome through supply adjustment. In the case of the most vital primary commodity, namely food grains, it was overcome not through any appreciable stepping up of supplies, but through a severe compression of demand, and the latter happened through a fresh round of income deflation imposed over much of the world. *The regime of 'globalisation' inter alia was a means of enforcing such an income deflation.*

According to the Food and Agriculture Organization (FAO), the total world cereal output in the triennium 1979–81 was around 1573 million tonnes for a population (for the middle year of the triennium, 1980) of 4435 million. For the triennium 1999–2001 the cereal output increased to around 2084 million tonnes for a population (for the middle year of the triennium, 2000) of 6071 million. This represents a decline in world per capita cereal output from 355 kg in 1980 to 343 kg in 2000 (FAO 2015). Given the fact that during this period per capita income in the world increased significantly, and given the fact that the income elasticity of demand for cereals (*consumed both directly and indirectly via processed food and animal feed*) is markedly positive (even if less than one), a stagnant or declining per capita cereal output should have spelled massive shortages, leading to a severe inflation in cereal prices. Such an inflation, since it would have occurred in a situation where the money wage rates in the manufacturing sectors around the world, to which manufactured goods' prices are linked, were not increasing *pari passu* with cereal

prices, would have meant a shift in the terms of trade between cereals and manufactured goods in favour of the former.

Third World, Globalisation, and Finance Capitalism

But this did not happen. On the contrary, cereal prices fell in relation to manufactured goods prices by as much as 46% over these two decades (Chakraborty 2011)! This suggests that the decline in per capita cereal output, in a situation of rising world per capita income, did not generate any specific inflationary pressures on cereal prices. The reason for this was the income deflation imposed over much of the world. It is this, rather than any supply increase, as Krugman (2008) suggests, that explains the absence of any specific trend-inflationary pressures in cereal prices (i.e. ignoring fluctuations) until recently. And this income deflation was imposed over much of the Third World via the phenomenon of globalisation.

There are at least three processes through which income deflation occurs over much of the Third World in the era of globalisation (Patnaik 2008). The first is the relative reduction in the scale of government expenditure. Because economies caught in the vortex of globalised finance can be easily destabilised through sudden flights of finance capital, retaining the 'confidence of the investors' becomes a matter of paramount importance for every economy, for which their respective states have to show absolute respect to the caprices of globalised finance.

Finance capital in all its incarnations has always been opposed to an interventionist state (except when the interventionism is exclusively in its own favour). An essential element of this opposition has been its preference for 'sound finance' (i.e. for states always balancing their budgets, or at the most having a small pre-specified fiscal deficit as a proportion of the gross domestic product, or GDP). The argument advanced in favour of this preference has always been vacuous, and was pilloried by Professor Joan Robinson of Cambridge as the 'humbug of finance' (Robinson 1962). The preference nonetheless has always

been there, and has become binding in the era of globalised finance, when states willy-nilly are forced to enact 'fiscal responsibility' legislation that limits the size of the fiscal deficit in relation to GDP. At the same time, this move towards 'sound finance' is accompanied by a reduction in the tax–GDP ratio, owing to tariff reduction and to steps taken by states competing against one another to entice multinational capital to set up production plants in their respective countries.

The net result of both these measures is a restriction on the size of government expenditure, especially welfare expenditure, transfer payments to the poor, public investment expenditure, and development expenditure in rural areas. Since these items of expenditure put purchasing power in the hands of the people, especially in rural areas, the impact of their curtailment, exaggerated by the multiplier effects which are also to a significant extent felt in the local (rural) economy, is to curtail employment and impose an income deflation on the rural working population.

The second process is the destruction of domestic productive activities under the impact of global competition, from which they cannot be protected as they used to be in the *dirigiste* period, because of trade liberalisation, which is an essential component of the neo-liberal policies accompanying globalisation. The extent of such destruction is magnified to the extent that the country becomes a favourite destination for finance, and the inflow of speculative capital pushes up the exchange rate.

Even when there is no upward movement of the exchange rate and not even any destruction of domestic activity through the inflow of imports, the desire on the part of the getting-rich-quick elite for metropolitan goods and lifestyles, which are necessarily less employment-intensive than the locally available traditional goods catering to traditional lifestyles, results in the domestic production of the former at the expense of the latter, and hence to a process of internal 'de-industrialisation' which entails a net-unemployment-engendering structural change. This too acts as a measure of income deflation.

The third process through which income deflation is effected is a secular shift in income distribution against the *producers of primary commodities* because of the increasing hold of a few giant corporations in the *marketing* of those commodities. This has the effect of curtailing the consumption demand of the lower-rung petty producers owing to the income shift towards the higher-rung marketing multinational corporations. Globalisation thus unleashes income deflation, which curbs excess demand pressures and keeps commodity prices in check, and hence the value of money intact, exactly as happened in the colonial period.

IV

The preservation of the value of money in the metropolis however requires something more in addition to income deflation in the 'outlying regions' which ensures the availability of supplies to the former without an increase in supply price of commodities at given money wages (or money incomes of producers) in the latter. *This additional requirement is that the money wage itself should not go up in the 'outlying regions'.* In other words, apart from reduced absorption of commodities in the 'outlying regions' it also requires that the wage-unit in the latter should remain stable. And this is ensured by the existence there of substantial labour reserves.

The Reserve Army in the Periphery
The fact that capitalism requires a reserve army of labour was emphasised by Marx. This is both to keep the level of real wages restricted for any given level of productivity, so that the rate of surplus value remains positive at all times, and also to instil work-discipline among the workers by threatening them with the 'sack'. The role that custom backed by force plays under feudalism in enforcing work-discipline is played under capitalism by the threat of dismissal and hence unemployment. And this threat remains real precisely because unemployment remains a real phenomenon.

But in addition to the reasons mentioned by Marx there is a further overriding need for labour reserves, which arises from the system's need to have a group of 'price-takers' who supply it with essential inputs but who cannot enforce money wage claims (or money income claims) even to

maintain their *ex ante* income share. There is in other words the need for labour reserves for maintaining the value of money itself, and these labour reserves have to be quite substantial, so substantial that the workers located in their midst cannot even maintain their real wages in the face of a rise in prices, let alone push for an autonomous rise in their money wages (this argument is discussed at greater length in Patnaik 1997). The maintenance of such labour reserves has typically been in the 'outlying regions', where they surround petty producers producing for the metropolis (who therefore are forced to act as 'price-takers') and have been created and preserved by metropolitan capital.

The domination by metropolitan capital of its surroundings where petty producers are located and are drawn into producing for the capitalist metropolis, and where a substantial reserve army is maintained and income deflation is imposed to preserve the value of money and the entire edifice of finance erected upon it, is thus essential for its very existence. To what extent this domination, which is the essence of imperialism, is adequate to serve its requirements in the present era is a separate problem; indeed it is possible to argue alongside Rosa Luxemburg (though for reasons different from those that she cited) that with the development of capitalism it becomes increasingly difficult for such domination to act successfully as a stabilising factor for the system (Luxemburg 1963), but that is not the same as saying that the system ceases to have any need for such domination. Imperialism is as necessary today as it ever was; indeed, if anything, it is even more necessary today than ever before, because the edifice of finance that capitalism has today is far larger than anything it has ever had. Once this fact is accepted, then profound implications follow from it for the nature, strategy, and tactics of the revolutionary struggle that has to be engaged in for transcending this system.

Algeria: From Anti-colonial Struggle to Complicity with Imperialism

Hamza Hamouchene
Transnational Institute, Amsterdam, The Netherlands

Synonyms

French colonialism; Imperialism; North Africa; Revolution

Definition/Description

The Algerian resistance to French colonialism began decades before one of the most significant revolutions in the twentieth century. The Algerian revolution is an archetype of the anti-colonial revolution in the post-Second World War era and embodied an example for independence struggles throughout the Third World.

Introduction

The year 2014 marks the commemoration of the 52nd Anniversary of the national political independence of Algeria and the 60th birthday of the Algerian revolution that started in November 1954. The Algerian people resisted French colonial oppression for decades before leading one of the greatest and most important revolutions in the twentieth century against the NATO-supported second colonial power in the world.

Any discussion around decolonisation and anti-imperialism cannot ignore the importance of Algeria and how its revolution was so inspiring to many oppressed people all over the world.

However, nowadays, Algeria is neither the revolutionary of 1954–62 nor the anti-imperialist of the 1960s and 1970s.

Algeria has been run by a dictatorship since its independence in 1962 and despite undeniable achievements on many fronts, the Algerian people, after regaining their national sovereignty from the French colonialists, have not yet achieved popular sovereignty that will fulfil the emancipatory vision of the Algerian revolution.

This essay will attempt to outline Algeria's trajectory from an assertive anti-imperialist stance to a position of submission and complicity with imperialism.

The Colonial Era and the Revolutionary Struggle

For in a very concrete way, Europe has stuffed herself inordinately with the gold and raw materials of the colonial countries: Latin America, China and Africa. From all these continents, under whose eyes Europe today raises up her tower of opulence, there has flowed out for centuries towards that same Europe diamonds and oil, silk and cotton, wood and exotic products. Europe is literally the creation of the Third World. The wealth which smothers her is that which was stolen from the under-developed peoples.

Decolonization, which sets out to change the order of the world, is, obviously, a program of complete disorder. But it cannot come as a result of magical practices, nor of a natural shock, nor of a friendly understanding (Fanon 1961: 81).

No revolution resembles another. This is because all of them are rooted in a specific national or regional history, are led by particular social and generational forces, and happen at a given moment in the development of the country. However, they present a common point, without which they wouldn't be called revolutions: the seizing of state power. Despite all the elements that might point to continuity, it is this rupture that marks a revolutionary change: the arrival of a new bloc of classes to the direction of the state or the transition from a colonial dependence to a national independence, even if the latter can be formal only.

The Algerian independence struggle against the French colonialists was one of the most inspiring anti-imperialist revolutions in the twentieth century. It was part of the decolonisation wave that had started after the Second World War in India, China, Cuba, Vietnam, and many countries in Africa. It inscribed itself in the spirit of the Bandung Conference and the era of the 'awakening of the South', a South that has been subjected for decades (in some cases more than a century) to imperialist and capitalist domination under several forms from protectorates to proper colonies as was the case with Algeria.

Retrospectively, French colonisation of Algeria was unique as it was the first Arabic-speaking country to be annexed by the West and the first country in Africa to be subjugated by a Western empire; way before the Berlin Conference in 1884, when different European empires (British, French, German, Belgian, Italian, Spanish, Portuguese . . .) met to carve up the continent between themselves.

Algeria was invaded in June 1830 and the immediate pretext was revenge for an incident in 1827 when the then reigning Dey of Algiers, Khodja Hussein, angry at the French refusal to repay loans from the Napoleonic wars, attacked the French consul with a fly whisk, shouting: 'You are a wicked, faithless, idol-worshipping rascal'. But the real motivations were mainly political and economic. Politically, the invasion of Algeria was intended to distract attention from the domestic problems of the Bourbons and the unpopularity of Charles X's regime by the pursuit of *la gloire* abroad. Economically, Algeria was seen as a country of enormous untapped potential; and French traders wanted to expand outwards from the trading posts they had already established on the Algerian coast (Evans and Phillips 2007: 2).

The French army would spend the next 50 years suppressing an insurgency; 15 of them would be spent fighting the brilliant, fierce, and dedicated resistance-leader Abd-El-Kader. The 25-year-old holy man (*marabout*) was dubbed the Algerian Cromwell by the writer Alexis de Tocqueville and the extent of his success can be measured by the Treaty of Tafna in 1837, whereby he was recognised as the sovereign over two-thirds of Algeria. The war of conquest was relentlessly resumed 2 years later under the command of the ruthless Marshal Bugeaud who adopted a scorched-earth policy, causing barbarian atrocities that ranged from population displacement, to land expropriations and massacres including by asphyxiation with fire of more than 500 men, women, and children from the Ouled Riah tribe who had taken refuge in caves. In the face of a stronger and better equipped army, Abd El-Kader eventually surrendered in December 1847 (Fisk 2005: 637).

Along with Marshal Bugeaud's 'pacification', colonisation was actively encouraged. In a renowned statement before the National Assembly in 1840, Bugeaud said; 'Wherever there is fresh water and fertile land, there one must locate colons, without concerning oneself to whom those lands belong'. By 1841, the number of such colons already totalled 37,374, in comparison with approximately 3 million *indigènes* (Horne 2006: 30). By 1926, the number of settlers had reached some 833,000, 15% of the population, reaching just under 1 million by 1954.

French rule in Algeria lasted for 132 years, as opposed to 75 years in Tunisia and 44 years in Morocco, a depth and duration of colonial experience unique within Africa and the Arab world. It was in 1881 that Algeria was administered for the first time as an integral part of France. With the extension of civilian rule, the second-class status of the Muslim population became the foundation stone of French Algeria, and Muslims' exclusion was reflected at all levels of political representation. Anti-Muslim discrimination was also built into the electoral system and the inferior status of Muslims was inscribed into the law with the introduction of the loathsome Code de l'Indigénat in 1881 (McDougall 2006: 89–90). This was a uniquely repressive set of rules that closely controlled the Muslim population and imposed harsh penalties for a multitude of infractions, including vague crimes such as being rude to a colonial official or making disrespectful remarks about the Third Republic (Evans and Phillips 2007: 33).

Frantz Fanon in his powerful book *The Wretched of the Earth*, a canonical essay about the anti-colonialist and Third-Worldist struggle,

describes thoroughly the mechanisms of violence put in place by colonialism to subjugate the oppressed people. He wrote: 'Colonialism is not a thinking machine, nor a body endowed with reasoning faculties. It is violence in its natural state, and it will only yield when confronted with greater violence …. The violence which has ruled over the ordering of the colonial world, which has ceaselessly drummed the rhythm of the destruction of native social forms and broken up without reserve the systems of reference of the economy, the customs of dress and external life, that same violence will be claimed and taken over by the native …' (Fanon 1961: 31, 48).

According to him, the colonial world is a Manichean one, which goes to its logical conclusion and '*dehumanizes the native, or to speak plainly it turns him into an animal*'. Sartre does not disagree. In his essay 'Colonialism is a System', written in 1956 (2 years after the start of the Algerian revolution), he wrote: 'The conquest was achieved by violence. Over-exploitation and oppression required the maintaining of violence including the presence of the army. … Colonialism denies human rights to men whom it subdued by violence, whom it maintains by force in misery and ignorance, therefore, as Marx would have said, in a state of "sub-humanity". In the facts themselves, in institutions, in the nature of exchange and production, racism is inscribed' (Sartre 1964).

Colonialism Denied Algeria Its Own History, Nationalism Reinvented It

> National liberation, national renaissance, the restoration of nationhood to the people, commonwealth: whatever may be the headings used or the new formulas introduced, decolonisation is always a violent phenomenon. (Fanon 1961: 27)

After the French succeeded in violently suppressing the rebellions, the last of which was in 1871 in Kabylia, it took over half a century for the Algerian resistance movement to surge again and to morph into a proper Algerian nationalism. Broadly speaking, we can distinguish three strands of Algerian nationalism, each identified with a particular leader. There was the religious movement embodied by the Association of the Ulema of Sheikh Abdul-Hamid Ben Badis; the revolutionaries following Messali Hadj; and finally the liberals led by Ferhat Abbas. (For more detail on the Associations of the Ulema and the liberals led by Ferhat Abbas, see McDougall 2006.)

Messali Hadj is considered to be the founding father of Algerian nationalism and the first one to call explicitly for total independence (for all three Maghreb nations), part of the programme of the political grouping he founded in 1926 in France called the Etoile Nord-Africaine (ENA), which under his leadership had become the most radical of all nationalist organisations.

In February 1927, in Brussels and during the Congress of the League Against Imperialism, he was charged to present the ENA's programme. It was the first time that an orator on an international rostrum demanded independence for the Algerian colony and the Tunisian and Moroccan protectorates: 'The independence of one of the three countries will only succeed if the liberation movement of that country is sustained by the other two' (Ikdam, October 1927, cited in Kaddache 2003).

Originally linked to the French Communist Party (PCF), the grouping set out to organise the North African proletariat base, and unlike other organisations had social demands such as the redistribution of land among the *fellahs* (peasants) and confiscation of all property acquired by the French government or colons. Messali fell out with the French communists because they relegated the Algerian anticolonial struggle to the background of the international fight against fascism. The PCF went a step further in 1939 when it introduced the concept of Algeria as a 'nation in formation'. This concept, which argued that Algeria was not yet a fully fledged nation, was perceived as an apology for colonialism by Messali and his followers. The ENA was dissolved, and then reconstituted by Messali in 1937 as the Parti du Peuple Algérien (PPA), this time concentrating its activities on

Algeria alone. During the Second World War, the PPA operated as a clandestine organisation and after the war, it assumed another name: Mouvement pour le Triomphe des Libertés Démocratiques (MTLD).

'Victory in Europe Day' and Massacres in Algeria (8 May 1945)

> It was at Setif that my sense of humanity was affronted for the first time by the most atrocious sights. I was sixteen years old. The shock which I felt at the pitiless butchery that caused the deaths of thousands of Muslims, I have never forgotten. From that moment, my nationalism took definite form. (Kateb Yacine, Algerian writer and poet, quoted in Horne 2006: 27)

While across Europe there were fervent celebrations to mark the Nazi capitulation, and while France was rejoicing at the deliverance from a 5-year occupation, Muslim Algerians were massacred by the thousands because they dared to demonstrate for something they had been denied for more than a century. In that Victory in Europe Day, they marched in Setif in favour of Algerian independence and they deployed banners bearing slogans such as: 'For the Liberation of the People, Long Live Free and Independent Algeria!' They also brandished for the first time a flag that would later become that of the FLN liberation movement.

The French colonial authorities repressed the march in blood, and an insurrection ensued leading to the murder of 103 Europeans and the slaughter of tens of thousands (some estimates go up to 45,000) of Muslims in Setif, Guelma, and Kherrata by French gendarmerie, troops, and vengeful European settlers.

These massacres had significant repercussions for the Algerian nationalist movement and for the young generation of militants. The Algerian war had already started and the preparation for an armed struggle imposed itself. Most historians agree that these massacres of 1945 marked every Algerian Muslim alive at the time and every one of the Algerian nationalists who was prominent in

the FLN traces his revolutionary determination back to May 1945.

Ben Bella, a future leader of the FLN and head of state, a much-decorated sergeant of the 7th Regiment of Algerian Tirailleurs, a unit that had distinguished itself in battle in Europe, wrote: 'The horrors of the Constantine area in May 1945 succeeded in persuading me of the only path; Algeria for the Algerian'. Also convinced was Mohammed Boudiaf, another revolutionary FLN leader and also future head of state, who rejected electoral politics, rejected assimilation, and saw violence and direct action as the only way forward (Evans and Phillips 2007: 52).

In effect, these tragic events represented the first volley of the struggle for independence.

The War of Independence (1954–62)

> Each generation must, out of relative obscurity, discover its mission, fulfill it, or betray it. (Frantz Fanon)

Breaking with Messali's classical scheme of progressive raising of Algerians' consciousness, some young militants formed a small autonomous nucleus, issued from l'Organisation Spéciale (OS, a clandestine structure of the MTLD that was charged to prepare for a future armed struggle) and pressed for the concrete preparation of an armed insurrection. The idea was announced through the formation of the Comité révolutionnaire pour l'unité et l'action (CRUA) by Hocine Aït Ahmed, Ahmed Ben Bella, Mostefa Ben Boulaid, Larbi Ben M'hidi, Rabah Bitat, Mohammed Boudiaf, Mourad Didouche, Mohamed Khider, and Belkacem Krim. The insurgency erupted on 1 November 1954, and to mark a rupture with the past, a new name was given to the CRUA: Front de Libération Nationale (FLN) (Ruscio 2012).

The Algerian struggle for independence cannot be divorced from the then international context of decolonisation and the first wave of the awakening of the global South: the formation of the Arab

League committed to Arab unity in 1945, Indian independence from Britain in 1947, the success of the Chinese Maoist revolution in 1949, and the Bandung Conference in Indonesia in 1955 that united 29 non-aligned countries from Africa and Asia challenged colonialism and neo-colonialism in a setting of Cold War tensions.

The FLN leaders were under no illusion about the scale of the task confronting them and their confidence was bolstered by France's humiliating defeat in Indochina in May 1954. The great victory of the Vietnamese people at Dien Bien Phu, as Fanon described it, was no longer, strictly speaking a Vietnamese victory. 'Since July 1954, the question which the colonised peoples have asked themselves has been "What must be done to bring about another Dien Bien Phu? How can we manage it?"' (Fanon 1961: 55).

The importance and impact of Dien Bien Phu on the psyche of colonised people can hardly be overstated. Benyoucef Ben Khedda, president of the Gouvernement Provisoire de la République Algérienne (GPRA), recalled: 'On 7th May 1954, the army of Ho Chi Minh inflicts on the French expeditionary corps the humiliating disaster of Dien Bien Phu. This French defeat acted as a powerful catalyst on all those who have been thinking that an insurrection in the short term is by now the only remedy, the only possible strategy . . .. Direct action took precedence over all other considerations and had become the priority of priorities' (Ben Khedda 1989).

In 1962, the nationalist leader Ferhat Abbas wrote: 'Dien Bien Phu was not only a military victory. This battle remains a symbol. It is the Valmy of the colonized people. It is the affirmation of the Asian and African man vis-à-vis the man of Europe. It is the confirmation of human rights at a universal scale. In Dien Bien Phu, France has lost the sole legitimation of its presence: the right of the powerful' (Abbas 1962).

What followed the declaration of war on 1 November 1954 in Algeria was one of the longest and bloodiest wars of decolonisation, with merciless atrocities committed by both sides (for a history of the war see Horne 2006; Stora 1994). The FLN leadership had a realistic appreciation of the military balance of power, which was in favour of the fourth largest army in the world. Their strategy was inspired by the Vietnamese nationalist leader Ho Chi Minh's dictum 'For every nine of us killed we will kill one – in the end you will leave'. The FLN wanted to create a climate of violence and insecurity that would be ultimately intolerable for the French, internationalise the conflict, and bring Algeria to the attention of the world (Evans and Phillips 2007: 56). Following this logic, it was the decision of Abane Ramdane and Larbi Ben M'hidi to take the guerrilla warfare to the urban areas, and specifically to launch the battle of Algiers in September 1956. There is no better way to fully appreciate this key and dramatic moment of sacrifice in the Algerian revolution than the classic realist film of Gillo Pontecorvo: *The Battle of Algiers*, released in 1966. There is a dramatic moment when Colonel Mathieu, a thin disguise for the real-life General Massu, leads the captured FLN leader Larbi Ben M'Hidi into a press conference at which a journalist questions the morality of hiding bombs in women's shopping baskets. 'Don't you think it is a bit cowardly to use women's baskets and handbags to carry explosive devices that kill so many people?' the reporter asks. Ben M'hidi replies: 'And doesn't it seem to you even more cowardly to drop napalm bombs on defenceless villages, so that there are a thousand times more innocent victims? Give us your bombers, and you can have our baskets' (Fisk 2005: 640).

Eventually, the urban insurgency was crushed mercilessly using torture on a systematic scale to extract information, including fitting electrodes to genitals (Alleg 1958). By October 1957, the FLN networks had been dismantled in Algiers after the blowing up of the last remaining leader Ali La Pointe in his hiding place in the Kasbah. Despite losing militarily, the FLN scored a diplomatic victory as France was isolated internationally because of the scandalous methods of repression that had been used.

Official estimates claim that in fact 1.5 million Algerians were killed in the 8-year war that ended in 1962, a war that has become the foundation of modern Algerian politics.

Support for Revolution, Delinking from the Imperialist-Capitalist Global Order

In 1962, the Algerian people not only celebrated their newly found sovereignty but also expressed their dreams and aspirations for a different, more just and egalitarian society. Proud of its victory and animated with a revolutionary fervour, Algeria wanted to build a new socialist order, to halt underdevelopment, put in place an agrarian reform, and achieve mass education.

For a big part of what was already called the Third World, especially those countries that were still under the grip of colonial domination, Algeria opened the way, represented a model and a hope. Its capital Algiers was the Mecca of all revolutionaries all over the world, from Vietnam to southern Africa, who desired to bring down the imperialist and colonial order. Algeria was the first country in Africa to regain its independence by force of arms. In 1964, the charter of Algiers declared that: 'The development of socialism in Algeria is linked to the struggles of other people in the world … The resort to armed struggle might prove decisive to regain national sovereignty. For every revolutionary movement, support to this struggle is sacred and is not subject to any bargaining' (quoted in Deffarge and Troeller 2012: 20). Hence, Algeria's decisions to give asylum and financial support for many movements all over the world that were fighting for independence, against racism, colonialism, and imperialism.

In the Arab world, the new regime established ties with the Egyptian president Gamal Abdel Nasser, and rode the wave that chased the French and the British after their pitiful adventure in the Suez in 1956, a wave that imposed independence for Tunisia and Morocco, a wave that overthrew the monarchy in Iraq in 1958 and in Northern Yemen in 1962. Palestinians also initiated the first actions to put back their country on the political map, from which it has been removed (Gresh 2012: 6).

In the first year of independence, with an incredible spontaneity and voluntarism, Algerian workers took over operations of modern farms and units in industrial settings abandoned by the Europeans fleeing to France and engaged in an amazing grass-root experience of self-management and socialism from below (Gauthier 2012: 12).

For 15 years from 1962–78, Algeria was fully engaged in a delinking experience to break away from imperialist domination. Hence, its role as one of the leaders of the Non-Aligned Movement (NAM) that was aspiring for a new world order and seeking economic independence. The Algiers Charter of the 77 in 1967 was a significant step in shifting the fight against colonialism and neo-colonialism from the political sphere to the economic one. It strongly denounced the intolerable logic of an unjust global system where the continuous enrichment of the already privileged countries was obtained through the growing impoverishment of the proletariat nations, which were seen on the one hand as a market for the dominant Western economies, and on the other, as a reservoir of cheap labour and natural resources. Che Guevara also argued in this direction in a speech delivered in Algiers in February 1965. In this he demanded that countries claiming to be socialist should eliminate 'their tacit complicity with the exploiter countries, with the West' in their relationships of unequal exchange with people fighting imperialism (Guevara 1970: 574).

In the 1960s and 1970s, the Algerian nation state had a clear and ambitious programme of ideas and the will and ability to realise them. A significant and inspiring industrialisation project was pursued. Nationalisations to recover the resources of the country were initiated and culminated in February 1971 when the oil industry was nationalised, the first successful nationalisation of oil ever to be carried out in the Arab-Islamic world (Roberts 2003: 13).

Inspired by Fanon, the regime under Ben-Bella in 1963 nationalised lands belonging to foreigners; and, under Boumediene, an agrarian revolution was initiated in 1971 to eliminate the agrarian bourgeoisie and to support the peasants, who had been the principal victims of the war operations.

Dictatorial and military, the regime of Colonel Houari Boumediene did not represent a right-

wing military dictatorship (like that of Augusto Pinochet's in Chile) that served the interests of an oligarchy linked to imperialism. Boumediene's economic policies were accompanied by progressive social achievements such as democratisation of education, the access of huge segments of the popular masses to health services, guarantees for employment and social upward mobility. In the 1960s and 1970s, Algeria alongside Egypt occupied a prominent and leading position during the first wave of the 'awakening of the South' in the era of Bandung and the Non-Aligned Movement. By 1980, they were the most industrialised states in Africa, aside from South Africa, with a solid experience in industrial management and technological expertise. This autonomous project served a majority of the population and thus achieved a form of social consensus; indeed, denying its significant accomplishments would be nihilistic. However, this attempt of delinking from the imperialist and capitalist global order had its own limitations and internal contradictions (Amin 1990). These included the continuing food dependence, reliance on oil revenues, the infiltration of foreign capital in the economy, and, more importantly, the dictatorial character of the regime, which concentrated powers in the hands of one person, Houari Boumediene.

The political rule of Boumediene suppressed the democratic practice, depoliticised the masses, and reduced them to passive spectators instead of encouraging them to actively participate in public life. Moreover, this project was piloted by a national bourgeoisie in the Fanonian sense of the word, which led to popular discontent in the form of open criticisms during the debates around the National Charter of 1976 and through strikes in the public sector in 1976 and 1977, contesting the development of inequalities, repression, and lack of freedoms. The crux of the matter was how to remedy these serious shortcomings, and how to overcome the contradictions in order to take the nascent development project to the second phase of consolidation, and achieve genuine economic independence. However, after the death of Boumediene in 1978, these considerations were unfortunately not on the agenda of the Algeria's ruling elite in the 1980s and 1990s.

From Resistance to Submission to Imperialism

Algeria, an Immense Bazaar: The Politics and Economic Consequences of *infitah*

With the global neo-liberal wave gaining momentum in the 1980s, sweeping away the Soviet Union and the Eastern European bloc, eventually spreading to the whole world from Argentina to Poland and not sparing China on the way, and with the plummeting of oil revenues, the Algerian national development project was abandoned by the Chadli clique. It was dismantled as a process of deindustrialisation was carried out to give way to neo-liberal policies and the submission to the dictates of the International Monetary Fund (IMF) and its structural adjustment programmes (1992–93, 1994–99). This had heavy consequences on the population: job losses (more than 500,000 in a few years), decrease of purchasing power, cuts to public spending, increasing precariousness of salaried workers, opening-up of foreign trade, and the privatisation of public companies. Algeria paid around $90 billion in debt service between 1990 and 2004, and paid its debt several times, in fact, seven times. This does not constitute a necessary imperative, but a choice of a regime that abdicated to Western hegemony (Belalloufi 2012).

The dignitaries of the new neo-liberal religion declared that everything was for sale and opened the way for privatisations. This allowed an explosion of import activity, which pronounced a death sentence on the productive economy. Rachid Tlemçani notes that by 1997, 7,100 companies (5,500 private) controlled the non-hydrocarbon foreign trade, the majority of which were specialised in import activities resulting in the transformation of the Algerian market into an immense bazaar for foreign goods with its reservoir of corruption (Tlemçani 1999: 118).

Under President Bouteflika, from 1999, this neo-liberal logic of undermining national production while promoting an import-import economy (imports increased from $9.3 billion in 2000 to $27.6 billion in 2007 and $54.85 billion by 2013) was pushed even further, aiming for a complete integration into the global economy. This is

evidenced by the dismantling of all custom barriers, the progress in WTO membership negotiations, the adherence to the Greater Arab Free Trade Area (GAFTA), and the signature of an association agreement with the European Union in 2002.

It is in the name of the sacrosanct principles of the neo-liberal dogma that industrial investment halted for 30 years. It is because of their profiteering disciples that industrial figures mutated into traders-importers. It is also in their name that the share of industry in GDP went down from 26% in 1985 to about 5% in 2009 (Belalloufi 2012: 25). The successive governments made all the necessary arrangements for the foreign investors to rush into Algeria and confirmed their mission of offering the lion's share of the revenues to multinational companies. As a matter of fact, they have hastened to rescue the crisis-ridden European car industry by importing 200,000 cars a year, perpetuating the logic of an economy based on import, trade, sheer consumption, and shunning local production and industry (Hamouchene 2013b).

The *infitah* (economic liberalisation) of the last three decades ended up assigning the country to the status of a dependant of the imperialist-capitalist system and an exporter of energy within the neo-colonial framework of the international division of labour. Instead of re-industrialising, building a productive economy far from the bazaar import-import activities, and investing in Algerian youths who still risk their lives to reach the northern shores of the Mediterranean in order to escape the despair of marginalisation and relegation as Hittistes (literally, those with their backs to the walls referring to the unemployed who ceased to be stakeholders in post-colonial Algeria), the Algerian authorities confirmed their surrender to foreign capitals and multinationals by the Renault fiasco (Charef 2012) and destructive shale gas exploitation (Slate Afrique 2013), placed its considerable foreign reserves (around $200 billion dollars) in foreign bonds, mainly American, and also offered financial support to the IMF ($5 billion dollars), a neo-colonial tool of plunder that crippled the country's economy in the 1990s.

Algeria's Foreign Policy: Complicity with Imperialism

In the last 2 years, several articles and analyses have attempted to decrypt Algeria's ambiguous position towards Western imperialist interventions in Libya and Mali. In contrast to its assertive and resolute diplomacy of the 1960s and 1970s, the Algerian regime confused many people as it was not easy to tell whether it supported or opposed these recent wars.

On the one hand, those who were reductionist failed to analyse the situation objectively and resorted to the easy explanation that Algeria is being pragmatic and that the seeming contradictions in its decisions and actions are only a reflection of its realist approach. However, those who adhere to a binary view of the world, divided into an imperialist North and an anti-imperialist South, had a Pavlovian attitude which advanced the idea that Algeria is under immense pressure and is being targeted for its resource nationalism and resistance to Western hegemony (Glazebrook 2013).

Will these claims stand the test of scrutiny? Is the Algerian position towards these imperialist interventions justified? Why has Algeria failed to play a more proactive role in solving the crises in Mali and Libya, given that it is a regional military and economic power that should have been at the forefront in these conflicts? This is even more important as Algeria was very concerned about its security and warned against the risks of destabilisation and spill-overs in the whole region if the conflicts escalated after Western intervention. Finally, is Algeria really resisting Western hegemony and challenging imperialist domination?

Tacit Complicity with NATO's Intervention in Libya

The Algerian regime was generally hostile to the uprisings that took place next to its borders, and adopted its so-called 'neutralist' position in relation to the momentous events in nearby countries. How could it be otherwise for an authoritarian regime whose survival was threatened by the risk of the revolutionary wave reaching its shores? Several high-ranking officials declared that Algeria had its 'Arab Spring' in 1988, insisted on

maintaining the 'false' stability of the country, and used the card of the 1990s traumatising civil war to dissuade the population from going down the same path as the Egyptians and Tunisians.

The Libyan National Transitional Council (NTC), irritated by the 'neutralist' position of the Algerian authorities and their refusal to recognise it as an interlocutor, claimed – without any documentary evidence – that Algeria gave support to the Gaddafi Regime and provided him with mercenaries to curb the revolution. The NTC also reacted angrily to Algeria's decision to grant members of the Gaddafi family asylum and considered this an act of enmity (Guardian 2011). The Algerian ambassador to the UN told the BBC that Algeria was simply respecting the 'holy rule of hospitality' and was accepting the family on humanitarian grounds. Moreover, some sources have reported that the government had promised to hand over Muammar Gaddafi should he try to follow his family into Algeria.

A closer look at the seemingly ambiguous position of the Algerian regime will reveal that the latter was trying to adapt to a fast-changing situation in the region and was mainly preoccupied about its survival and stability. Algeria voted against a resolution endorsing a no-fly-zone adopted by the empty-shell Arab League, and declared that it was up to the United Nations Security Council (UNSC) to decide on such a matter, which it did by passing resolution 1973 allowing for a NATO intervention in Libya.

Algeria *did not* oppose the intervention and did not even question its imperialist motives, and only resorted to vague criticism of the Western powers' implementation and interpretation of UNSC resolution 1973. Algeria's hostility towards the intervention can be explained by its fear of what it would mean for the border zone and by what has become a spiritless and perfunctory opposition to foreign meddling in other countries' internal affairs.

Collusion in the French Intervention in Mali

While Algeria was actively pushing for a diplomatic solution to the conflict in northern Mali and was a mediator in negotiations between the Malian authorities and the National Movement

for the Liberation of Azawad (MNLA) and the Islamists of Ansar Al-dine, France was not too keen on this approach from the start and ended up intervening unilaterally in January 2013. The Algerian regime surprisingly declared its respect for the French decision to intervene because Mali had requested help from 'friendly' powers!

Since when has the ex-colonial master been a 'friendly' power that cares about the livelihood of Malians? Since when has France, with its neo-colonial tools (Françafrique, Francophonie . . .), cared about the fate of Africans?

Two explanations can be put forward to understand the Algerian reaction: (a) the Algerian regime naively believes that the Western powers have suddenly become altruistic, abandoning their imperialist mission of dominating and controlling the world according to their narrow interests; or (b) the regime simply abdicated to Western hegemony and is willing to co-operate.

A few days after the French intervention in Mali, the Algerian people had to suffer the humiliation of being informed by the French foreign minister that their authorities had 'unconditionally' opened Algerian airspace to French planes, and he demanded that Algiers close its southern borders. Who said that neo-colonial attitudes are anachronistic (Hamouchene 2013a)?

Some journalists also reported that a US drone was allowed to monitor the hostage stand-off in the BP plant in In Amenas, in south-eastern Algeria; and more recently, it came to light that the Algerian authorities were giving precious support to the French operations in Mali by discreetly providing much-needed quantities of fuel to the French military. This in fact amounts to collusion with the French neo-colonial expedition (Le Point.fr 2013).

Algeria and the Military Threat on Syria: Words Are not Enough

Algeria was among the 18 countries (from a total of 22) which voted in November 2011 for Syria's suspension from the Arab League and for implementing sanctions over its failure to end the government crackdown on protests. It is a staggering majority-decision coming from countries like Bahrain, Saudi Arabia, Sudan, and

Algeria, which possess dazzling records on democracy and human rights.

In a move perceived as a withdrawal from the process of searching for a political settlement for the Syrian crisis, the Qatar and Saudi Arabia–led Arab League made the decision, on March 2013, to offer the Syrian National Council (SNC) Syria's place in the Arab League. Algeria and Iraq voted against the motion, arguing that such a decision contradicts the Arab League Charter on the inadmissibility of any actions aimed at regime change in the Arab states.

The summit's final document says that, 'each member state of the Arab League has the right to supply defensive means as it so wishes – including military defence – to support the resistance of the Syrian people and the Free Syrian Army (the armed wing of the Syrian opposition)'. With such a statement, one only wonders if the Arab League has not become a sycophant to the Western powers (France, Britain, and the US) and a legitimising tool for their agendas in the region.

On 1 September 2013, the Arab League urged international action against the Syrian government to deter what it called the 'ugly crime' of using chemical weapons. It was a major step towards supporting Western military strikes but fell short of the explicit endorsement that the US and some Gulf allies had hoped for. Echoing its position in the Libyan crisis, Algeria, alongside Egypt, Iraq, Lebanon, and Tunisia expressed its opposition to a foreign military intervention in Syria outside of the 'international law', a concept it knows very well to be a euphemism for the rule of the powerful. Fortunately, this time, Russia and China are not on the side of the Western powers.

It is inconceivable to deem such a stance anti-imperialist or reconcile it with an outright collusion in the French intervention in Mali. Such behaviour is utterly inconsistent with a coherent anti-imperialist line and it can hardly be qualified as resistance to Western hegemony. Algeria has adopted a very low-profile diplomacy in the Libyan conflict, and toward the Arab League and Turkey's reactions to the Syrian crisis; a position that no longer captures its heavyweight and daring diplomacy of the 1960s and 1970s, and which exemplifies the erosion of any semblance of an anti-imperialist line once attached to the FLN Regime. However, this behaviour is not contradictory with the Algerian regime's narrow survival policy, even if it means going by the dictates and decisions of the powerful and manoeuvring within this framework of Western and US domination over the world.

If Algeria really wanted to play an active role in the momentous changes happening in the region (including firmly opposing the intentions of the Gulf monarchies and Turkey in Syria) and to be a relevant actor in managing the multiple crises in its immediate neighbourhood, it would need to change itself first.

Resistance to Imperialism: A Definition

Let's put the Libyan and the Malian examples aside, and assume that these are isolated cases or that they could constitute exceptions to Algerian foreign policy; and let's examine together whether Algeria can qualify as anti-imperialist in other respects. To do that, we need to have some objective criteria to make a judgement.

Samir Amin – an Egyptian economist, social theorist, and leading radical thinker – identified five privileges of the contemporary imperialist centres that must be challenged to call into question the logic of imperialist domination (Dembélé 2011: 45):

- domination over technologies with the over-protection of the World Trade Organisation (WTO)
- exclusive access to the natural resources of the planet
- control of the integrated and globalised monetary and financial system
- control of means of communication and information
- control of weapons of mass destruction.

We can already see that certain states are challenging or resisting one or more of these monopolies in a more or less important fashion: China, India, and Brazil in the field of technological development; South Africa, Brazil, and China in access to natural

resources; China, Iran, and Venezuela in accessing the globalised capital markets and managing their own financial systems; Qatar, Venezuela, and China in the domain of communications and information; and Iran, India, North Korea, Pakistan, and Brazil in the field of weapons of mass destruction.

However, challenging one or more of these monopolies does not necessarily constitute an anti-imperialist position. For instance, Qatar, India, and Pakistan are close allies of Western powers and qualifying them based on these criteria as anti-imperialist states would be an aberration. China is particularly interesting, as many observers have argued that it could be an aspirant and potential rival imperialist (Klare 2012). 'Rebellious' regimes such as Iran have a double nature. On the one hand, they are part of the global capitalist/imperialist system because they are keeping their own people under its domination as well as applying to them neo-liberal potions. On the other hand, these regimes resist and refuse to align entirely with the big powers. Resistance to these exclusive controls is therefore a necessary but not sufficient condition to become an anti-imperialist state and represents a start on the road towards a fully coherent and principled anti-imperialist position. An anti-imperialist stance should be inscribed in a well-thought-out vision that not only attempts to contest these five monopolies, but also strongly opposes imperialist interventions and meddling in other states' affairs. This stance should also challenge the profoundly unjust political and neo-liberal economic order, and fully support the emancipation struggles for people all over the world. Surely, there will be some contradictions along the way, but these need to be addressed within an appropriate framework in which the principal aim is to bring an end to imperialist domination.

Algeria is Submissive to Imperialism

Is Algeria challenging the imperialist monopolies mentioned above? Is it trying to break away from global imperialist domination? A simple look at the facts on the ground will reveal that this is not the case.

Long gone are the days when the capital Algiers was seen as the Mecca of revolutionaries all over the world. Times have passed when Algeria was audacious and undeterred in its foreign policy, when: (a) it supported anti-colonialist struggles all over the world; (b) the question of Palestine and Western Sahara were at the top of its foreign-policy priorities; (c) it significantly supported (in financial and military terms) the Palestinian cause in the Arab-Israeli wars of 1967 and 1973; (d) it broke its diplomatic relations with the US in 1967; (e) it played a leading role in the Non-Aligned Movement and hosted its 1973 summit in Algiers, which strongly denounced the structural inequality in the global system benefiting already-privileged countries at the expense of the other ones in the global South. Long gone is the era when Algeria engaged in a delinking experience to break away from imperialist-capitalist domination. It sadly renounced the pursuit of an autonomous national development that involved a certain degree of economic and political confrontation with imperialism.

Alas, recovering the national sovereignty from French colonialists was not accompanied by recovering the popular sovereignty through building a strong civil society and actively involving the masses in public life in a democratic way. These are absolutely necessary conditions in sustaining the resistance to Western domination. The new pathology of power (to borrow Eqbal Ahmad's words), observed in the authoritarian and coercive practices of the nationalist bourgeoisie (Said 1994: 269), the demobilisation and depoliticisation of the rural and urban masses, was at the heart of the subsequent dismantling of the national development project and replacing it with an anti-national one. In his chapter on 'the pitfalls of nationalist consciousness' in the *Wretched of the Earth,* Fanon foresaw this turn of events. He strongly argued that unless national consciousness at its moment of success was somehow changed into a political and social consciousness, the future would not hold liberation but an extension of imperialism with its divisions and hierarchies (Fanon 1961).

Algeria nowadays, and especially after 9/11, closely co-operates with NATO, an organisation that not only supported the French military against the Algerian people in the War of Independence (1954–62), but recently invaded Afghanistan and intervened in Libya. The regime also collaborates with the American and British armies that invaded Iraq and equally with the French army that intervened recently in Ivory Coast to impose a presidential candidate and in Mali to supposedly fight Islamist fundamentalists. The secretive and authoritarian regime – dubbed by Algerians 'Le Pouvoir' – participates alongside the CIA, FBI, MI6 and DGSE in the 'Global War on Terror', which constitutes another alibi for imperialist interventions (in fact and according to the report "Globalizing Torture: CIA Secret Detention and Extraordinary Rendition" by the Open Society Justice Initiative released on February 2013, Algeria is complicit in the human rights abuses associated with the illegal CIA secret detention and extraordinary rendition programme, as it permitted use of its airspace and airports for these operations). And not content with all of this, it plays the role of a guardian to fortress Europe by protecting it from poor African immigrants who are escaping the misery caused by the European powers in the first place (Morice and Rodier 2010). Algeria also joined the Union for the Mediterranean alongside a criminal and colonialist state like Israel and now has a 'moderate' position towards the Palestinian question. Likewise with the Western Sahara situation, Algeria is now backing the outrageous principle of a solution accepted by both parties. Since when do the dominated need to wait for the dominant to accept the terms of their liberation? There was also a rapprochement with the world organisation of the Francophonie, one of the principal instruments of French political domination in the world. This bleak picture of a reactionary and shameful foreign policy is truly disgraceful to the memory of the historical revolutionary FLN.

Having said that, Algeria has not yet become a simple valet to imperialism like the petro-monarchies of the Gulf, the Egypt of Hosni Mubarak or the Jordanian monarchy, but it has renounced the logic of resistance. It embraced another logic, that of abdication, submission, and collusion, which will only worsen. The Algerian regime does not contest the profoundly unjust international order and seeks instead to adapt to it. It is far from the courageous and conscious resistance of certain Latin American countries like Chavez's Venezuela and Morales's Bolivia.

Anti-imperialism and the Democratic Struggle

The Comprador Bourgeoisie

The analysis above suggests that an antinational, sterile, and unproductive bourgeoisie is getting the upper hand in running the state affairs and hegemony in directing its economic choices, albeit with some resistance from a quasi-non-existent national bourgeoisie (e.g. amendment of the unashamedly anti-national hydrocarbon Khelil Law in 2006, after Hugo Chavez lobbied against it). It is enough to look at the unproductive nature of the Algerian economy, with the preponderance of import-import trade activity and de-industrialisation to realise that this bourgeoisie has a character, which is essentially rentier, commercial, and speculative. It is only interested in exporting its own profits abroad, hoarding them in tax havens, or investing them in non-productive sectors/assets such as restaurants, hotels, and properties. (On how this bourgeoisie is striving to sell off the economy in the most anti-national manner, see Belalloufi 2012.)

This comprador bourgeoisie does not produce but consumes what it imports and seriously undermines vital public services such as health and education, which are deteriorating year after year. The Mafia-like oligarchy is neo-liberal by religion and has no regard for the future of the country and its population. It is parasitic and rapacious as it preys on the economy and maintains an endemic corruption (responsible for a series of major corruption scandals that touched important sectors of the economy, including the most strategic of them all: the energy sector). It is entirely subordinated to the international system of economic, political and military domination, and therefore, represents the true agent of imperialism and is its useful accessory.

No to imperialist meddling, no to the status quo
This largely comprador regime is the biggest threat to the sovereignty of the nation and must surely be overthrown. However, it is necessary to make sure that this fall occurs within a national context and won't lead to the instauration of another regime submissive to imperialism. This is an extremely challenging task for the democratic opposition and necessitates an adequate understanding of imperialism and its workings to avoid becoming an instrument of destabilisation for the country in favour of imperialism. However, an absolute vigilance towards imperialist designs must not lead to accepting or defending the status quo and the fake stability, namely supporting a regime that is denying its own people the right of self-determination. This caution must not lead to renouncing the struggle for democracy and the hegemony of the oppressed masses.

We must not be blinded by a narrow and simplistic anti-imperialist stance that is based on a Manichean view of the world: an imperialist North and an anti-imperialist global South. This view ignores the realities on the ground where people are suffocated by corrupt and authoritarian regimes, most of which are clients of the Western powers. It also dilutes with its distasteful lack of nuance the importance of building strong democratic states and comforts certain parasitic comprador classes that posture as superpatriots. Unfortunately, this view is reinforced by what has been happening to the inspiring 'Arab Spring', especially its hijacking by the Western intervention in Libya and the proxy war in Syria.

It is therefore of paramount importance to realise that authoritarianism and corruption are the twins of any neo-colonial enterprise, and are objective allies of imperialism (reactionary political Islam being another example). Non-democratic regimes (like those of Saddam Hussein, Gaddafi, Bashar Al Assad, and Bouteflika) can be managed more or less easily by the imperialist centres and are weakened and threatened by a system that dispenses with popular legitimacy to seek the Western powers' approval instead. As long as these regimes are vassals to the imperial powers, they can repress and oppress their people at will, and when they are no longer useful they are abandoned and replaced (Saddam, Moubarak, Ben Ali, Gaddafi, Ali Saleh ...). This refusal of democracy is hence very perilous for the sovereignty of the nation and its territorial integrity.

Moreover, these 'patriotic' dictatorships serve perfectly the imperial designs of redrawing a greater Middle East within a strategy of weakening nation states. Along with Western military supremacy and massive propaganda, our dictators are key elements in this plot. They repress their own people, participate in proxy wars for the empire (Iraq against Iran) and can be used at the end as a justification for a direct intervention/occupation. The Iraqi scenario is not something of the past; it has been replicated rather efficiently in Libya and is currently underway in Syria, albeit taking a different approach. It can potentially be extended to other countries including Algeria to fully eradicate any unwillingness to be dominated. It doesn't happen only to others, so how can we avoid re-colonisation, the direct management of our energy resources, the control of our territory, as well as the subordination of the country to interests that are not ours?

There is no better quotation to respond to this question, to emphasise the extreme danger of dictatorial systems to national security and to underscore the necessity of a national cohesion based on citizenship and freedom than what the late Abdelhamid Mehri, an intellectual of the Algerian revolution, said about Algeria in the aftermath of the historic events in Tunisia and Egypt in 2011: 'If you don't want to be changed by the others, you have to change yourself. Democracy is not only an ethical necessity; it is equally a national security imperative. Therefore, dictatorship and authoritarianism are real existential threats and objective allies to imperialism'. More than 50 years after its independence, Algeria has to reconnect with its revolutionary past by instigating a democratic revolution to end tyranny and injustice, as well as dismantling the comprador state and installing an audacious antiimperialist regime that will truly liberate the people and also strive to build an equitable multi-polar world order. This can be done through transcending national constraints and establishing strong

alliances worldwide, in particular South–South in order to rise, emerge, and achieve freedom from imperialist domination.

Ali Shariati (1933–1977)

Dustin J. Byrd
Philosophy and Religion, Olivet College, Olivet, MI, USA

Ali Shariati Mazīnānī was an Iranian sociologist, philosopher, and revolutionary. Blending left-wing Western philosophy with Shi'a Islam, creating a form of Islamic socialism, he is often cited as one of the most influential Iranian intellectuals in the twentieth century and the "ideological father" of the Iranian revolution of 1979 (Jackson 2006, p. 221). Being among the "seminal figures in the prehistory of the Islamic Revolution," his writings and lectures focused primarily on the progressive and/or revolutionary nature of Islam, especially Shi'a Islam, and how it can address the fundamental problems of the contemporary world, including Western imperialism (Algar 2001, p. 87). Shariati called for a rejuvenation of Iran through a radical yet modern embrace of its Shi'a roots in an attempt to liberate it from foreign domination as well as the Pahlavi monarchy. Although his core ideas were marginalized after the successful removal of Mohammad Reza Pahlavi Shah and the institution of the Islamic Republic of Iran, his revolutionary form of Shi'a Islam continued to influence other Third World anti-imperialist theorists, well beyond his early death in 1977. Furthermore, although Shariati died before the overthrow of the Shah, his life and work did the most to prepare Iranian youth for the Islamic revolution to come (Keddie 1981, p. 215).

According to the historian Nikki R. Keddie, Shariati became influential at a time when (1) Iran was modernizing, including the development of a higher education system that incorporated a high degree of subjects and disciplines thought to be "Western," and (2) due to the educational divide, many new social groups were forming, and such groups were confronted by "new cultural problems – accelerated urbanization, Westernization, industrialization, spectacular speculation and corruption" (Keddie 1981, p. 222). Additionally, Iran was falling for what the Iranian philosopher, Jalal Al-i Ahmad, dubbed *ġharbzadegī*, translated as "Westoxification," "Euromania," or "Occidentosis." In other words, Iranian society was suffering from a massive infatuation with all things Western, so much so that native culture was abandoned as being "backward" or even "primitive" (Ahmad 1984; Byrd 2011, pp. 88–92). These radical shifts in society were also compounded by the dominating influence of the British Empire and its Anglo-Persian Oil Company, which had established itself in Iran soon after the discovery of oil in 1908. In the absence of the British withdrawal from the Middle East post World War II, the United States would become Iran's "protectorate." In order to secure the maximum benefit of Iran's natural resources, especially its oil wealth, the United States worked closely with the Shah of Iran to maintain stability in the country, which included selling the monarch tens of millions of dollars' worth of weapons, which were mainly used for internal repression of opposition groups (Byrd 2011, pp. 12–13). Coupled with the Shah's "White Revolution," a series of modernizing reforms that overwhelmingly benefitted the wealthy and the Shah's family, Iranian society grew wrestles and was prepared for a messiah-like figure to deliver it from its travails. If not the return of the Shi'a Twelfth Imam from his "major occultation" (*al-ġaybat al-Kubra*), that earthly messiah-like figure would either come from a modern background or a traditional one, but he would inevitably have to be rooted in Shi'a Islam. The two men that filled that emancipatory role more so than anyone else were Sayyid Ruhollah Mūsavi Khomeini (Ayatollah Khomeini), the revolutionary Shi'a cleric, and Ali Shariati, the Shi'a intellectual dedicated to the renovation, modernization, and radicalization of Islam (Byrd 2011; Byrd and Miri 2017).

Biography

Ali Shariati was born in Mazīnān, a village near the desert in Khorâsân, into a long-standing clerical family. His father, Muhammad-Taqī Shariati Mazīnānī, studied theology at the holy city of Mashhad between 1927 and 1928, but did not finish. Although he was a scholar of Qurʾānic interpretation (*Tafsīr*), he followed a different, yet still religious, course of life; he became a teacher in the national education system and founded the Centre for the Propagation of Islamic Truths (*Kanun-i Nashr-i Haqa'iq-i Islami*), wherein he attempted to highlight the progressive aspects of Islam, demonstrating how they were compatible with modernity. According to his biographer, Rahnema (2008), Ali Shariati's father believed that "educated youth who would constitute the responsible citizenry of the future had to be exposed to an Islamic teaching compatible with the requirements of modern times" (p. 208). In doing so, he rejected the Western-oriented secularism that was growing in Iran as well as the petrified worldview of the Shi'a *'Ulamā'* (clerics). Although he saw certain aspects that were truthful, Mohammad-Taqī rejected the anti-religious Marxism that was prevalent among the intellectuals, especially those within the Tudeh Party (Iran's Communist Party). This reconciliation between secular leftist thought emanating from the Western philosophical tradition, and traditional Shi'a Islam, would have a lasting effect on Muhammad-Taqī's son Ali, who was continuously educated by his father throughout his childhood, as he was an active member of his father's center and fully participated in their activities. It was Ali's philosophical amalgamation of these two intellectual trends that would later make him the most important Iranian intellectual during the revolutionary period of the 1970s.

Although he was shy and a bit reclusive as an adolescent, preferring to study at home in his father's library, his intellectual capacity was never in question, as he showed interest in subject matters well beyond the traditional educational curriculum of Iran. His genius for such probing questions was augmented in the late 1940s when he began to read philosophical works, some of which were Western and anti-religious, such as Arthur Schopenhauer and Franz Kafka. According to Rahnema (2008), his study of heterodox works caused a severe crisis of faith, wherein "the thought of existence without God was so awesome, lonely and alien that life itself became a bleak and futile exercise" (p. 212). In the face of philosophical antinomies, he even contemplated suicide. It was only through his contemplation of Mawlānā Jalāl ad-Dīn Rūmī's *Masnavi* that he was pulled from the pit of despair.

In 1950, having finished the ninth grade, Shariati entered the Teacher Training College in Mashhad, graduating just 2 years later, and began teaching at a nearby high school. The existential angst that plagued him with the study of philosophy was put to rest. According to Rahnema (2008), it was Shariati's discovery of Abū Dharr al-Ghifārī (d. 652 CE), a companion to the Prophet Muhammad, which eased his anxiety about life, as it gave him an "epistemological medium [for] recognizing and defining the idea life and society" (p. 212). Often thought of as the first "Islamic socialist," Abū Dharr was an early convert to Islam in Mecca. He is remembered for his strict adherence to Islamic piety, his fierce loyalty to the Prophet Muhammad, and his defense of 'Ali claim to succeed the prophet. After the prophet's death in 632 CE, he stood in opposition to Mu'āwiya, who later established the Umayyad dynasty of caliphs. Shariati's study of Abū Dharr al-Ghifārī was followed by the writing of two important books, *Tarikh-i Takamol-i Falsafe* (A History of the Development of Philosophy), which is commonly known as *Maktab-i Vaseteh-i Islam* (The Median School of Islam) and *Abu Zar-i Ghifari: Khoda Parast-i Sosiyalist* (Abū Dharr: The God-Worshipping Socialist). Both of these books attempted to augment Islam above other prevalent philosophical and political-economic ideologies while simultaneously interpreting their core ideas through an Islamic lens. In fact, the later book *Abu Zar-i Ghifari* explains succinctly the reconciliation of Islamic theology and socialist core of Islam that he was attempting to resurrect (Dabashi 2011, p. 53). He was especially concerned with the Islamic/Western encounter, arguing that Western colonialism

weakened Islamic identity to the point that it could hardly resist Westernization. However, such Westernization had allies within Iran. By reflexively favoring all things Western, Iranian intellectuals did an enormous amount of damage to Iran's sense of self. It was the intellectuals' dependence on Western thought that drained Iran from creating its own modern identity from its own Islamic resources. This dependence on the West for its intellectual substance had to be remedied if Iran was ever to be truly independent.

Although he was critical of the West, Marxism, and other Western ideologies, these two books are an expression of Shariati's lifelong attempt to rejuvenate Islam in dialogue with Western thought. Additionally, by maintaining the importance of Islam within the context of Western modernity, globalization, and Western hegemony, his work filled a "spiritual vacuum" left by the secular Iranian intellectuals, one that was also distinct from the traditional Shi'a orthodoxy (Jackson 2006, p. 222). Because of this, his work spoke to both modernists and the religious.

Shariati's study of Abū Dharr al-Ghifārī was especially important to his life. His book was based on the radical Egyptian novelist Abu'l Hamid Jaudat al-Sahhar's Arabic text on the same subject, which the teenage Shariati had translated into Persian (Algar 2001, p. 88). In it, Shariati depicts Abū Dharr as a model for the real Muslim, one whose submission to God impels the believer to struggle against all forms of oppression, exploitation, and denigration. Rahnema writes that in Abū Dharr al-Ghifārī, Shariati "creates a hero, a model and a symbol, who defied wealth, power and even religious authority to save the 'authentic' Islam of the poor, the oppressed and the socially conscious. One man against the mighty ruler of the Islamic empire" (2008, p. 213). Following the thought of Abū Dharr, Shariati believed that the success of the early Muslim empire caused the abandonment of the initial prophetic spirit of Islam. Islam became *affirmative*, in that it became worldly and invested in the status quo and in doing so relinquished its inherent *negativity*: its critique of the unjust world

as it is. The division between affirmation and negation within religion would later become the dominant theme in his work *Religion* vs. *Religion.*

For Abū Dharr, the Islam of the Prophet Muhammad was constitutionally critical. Based in the central notion of *tawḥīd* (the "oneness of God"), Islam relentlessly called for justice in an unjust world; it demanded equality in an unequal society; it attempted to eradicate racism and tribalism; and it struggled against all forms of vice and corruption in governance. This was not the Islam of the Muslim ruling classes, who had become complacent in their opulent palaces since the Umayyad Caliphate (661–750 CE). For Shariati, Abū Dharr followed in the footprints of the Prophet Muhammad, not as a prophet but as a revolutionary attempting to overthrow all conditions that debased humanity. As such, Abū Dharr was Islam's first "socialist" reformer – whose critique was forever the thorn in the side of the ruling class. Thus, in Abū Dharr, Shariati found a "universal revolutionary archetype" that he could personally follow (Dabashi 2011, p. 53). Abū Dharr was a socially committed Muslim who embodied all the progressive values of "authentic" Islam: "equality, fraternity, justice, and liberation" (Rahnema 2008, p. 213). Echoing the lessons his father taught him, Shariati's study of Abū Dharr al-Ghifārī convinced him that those progressive social values that he was initially attracted to in his studies of Western Leftist philosophy were in fact constitutional values, principles, and ideals of the Islam of the prophet. These revolutionary concepts were not made in the West and imported into Iran as the secular Marxist intellectuals tended to argue but were rather central tenets of the Islamic tradition that had been buried under the weight of Shi'a conservatism, clerical quietism, and the compromise of Islam with the monarchy, capitalism, and imperialism. The task of the responsible Muslim intellectual, Shariati thought, was to resurrect and reload these prophetic ideals in an attempt to revive the religion of the Prophet Muhammad and continue the struggle against all forms of oppression. Thus, Abū Dharr al-Ghifārī remained Shariati's personal model for revolutionary praxis for the rest of his

life, and he continued to interpret Islam through the lenses of al-Ghifārī's radical critique of injustice. According to Rahnema, Shariati felt so close to the exemplar of Abū Dharr that he may have even believed himself to be some kind of "reincarnation" of him (2008, p. 214). Later, conservative clerics used Shariati's attachment to Abū Dharr as a source of ridicule, arguing that Abū Dharr was a "common thief" who only embraced Islam so he could share in the booty of conquest (Rahnema 2008, p. 214). Nevertheless, Abū Dharr remains today highly regarded, especially among the Shi'a.

The Mossadeq Years

While at the Teacher's Training College in Mashhad, he was a member of the God-Worshipping Socialists (*khudaparastan-i susialist*), a group of young men who espoused a modern Islamic nationalism that attempted to combine Islam with socialism and anti-imperialism. Outside of the classroom, Shariati's time in college was informative; it brought him into close contact with individuals from the lower classes, with whom he began to fully understand the real pain of poverty that was on the rise in Iran at the time. He also continued his routine of unconventional study, reading the works of both Islamic reformers, such as Sir Allama Muhammad Iqbal and Jamal al-Din al-Afghani, as well as other Western thinkers. The ideas of the God-Worshipping Socialists were distributed through Shariati's writings in the Mashhad daily newspaper, *Khorasan*, which called for the rejection and removal of capitalism and Iranian feudalism while rooting their critiques in teachings of Prophet Muhammad and 'Ali ibn Abū Ṭālib – the first "legitimate" successor to Muhammad according to the Shi'a. The God-Worshipping Socialists' demands for a more just society contributed to the growing unrest with the Shah's regime, which had become increasingly rigid with its own population and deferential to British oil interests.

In 1951, the Shah appointed the Iranian Nationalist Dr. Mohammad Mossadeq as Prime Minister of the *Majlis* (Parliament) in an attempt to appease the growing unrest. Shariati supported Mossadeq's reforms, which included the 1952 *Land Reform Act* and which redistributed a portion of the land from the landlords to the tenets; factory owners were forced to pay employee benefits, including unemployment, and peasants were liberated from forced labor. The most controversial reform of Mossadeq was his nationalization of the Anglo-Iranian Oil Company, wherein Britain lost its control of the extraction, production, and distribution of Iranian oil. Considering the oil stolen, Britain removed all its oil workers, enforced a blockade of Iranian oil exports, and pressured the United National Security Council to intervene on its behalf. With these and other measures fully implemented, Iranian oil production came to a halt, thus depriving Mossadeq of the funds he needed to continue his domestic reforms.

Having grown tired of Mossadeq's nationalism and his move toward socialism, which drew him further into the sphere of influence of the Soviet Union, the British and the Americans hatched a plan to overthrow Mossadeq in a coup d'état. This was orchestrated by the US Secretary of State John Foster Dulles and his younger brother, Allen Dulles, who was then the director of the CIA. "Operation Ajax," the plot to remove Prime Minister Mohammad Mossadeq, was approved of by President Eisenhower and directed in Tehran by Kermit Roosevelt, the grandson of US President Theodore Roosevelt. Conspiring with anti-Mossadeq elements of the government, conservative clerics, and the Shah, who had left Iran for the safety of Rome, Prime Minister Mossadeq was removed from office on August 19, 1953. On August 22, the Shah returned from his temporary exile and resumed power; this time he was massively supported by Britain and the United States, who in return received the near-exclusive rights to develop Iran's oil. While numerous individuals in Mossadeq's government were tortured and executed, the former Prime Minister's life was spared; he lived under house arrest in Ahmadabad until his death in 1967.

Shariati's support for Mossadeq's nationalism and socialism never waned, and his removal from

power weighed heavily on him. Earlier in 1953, he had become a member of the Mossadeq's National Front and fully supported the socialist reforms that had been implemented. The coup d'état cemented in Shariati's mind the evils of the "trinity": the United States, the Pahlavi monarchy, and the conservative clerics, the latter of the two having sacrificed Islam for their own personal gain (Rahnema 2008, p. 216). Due to this interjection of imperial power and its alliance with reactionary religion, revolutionary Marxism, which condemned both imperialism and religion, continued to rise among the politicized youth. Being a part of this resistance movement, Shariati "coined and popularized" the catchphrase in Persian, *Zar-o Zoor-o Tazvir*, the "evil trinity" of "wealth, coercion and deceit" (Rahnema 2008, p. 216). This short phrase encapsulated the growing critique of the entrenched power of capitalism (wealth), the Shah, the ruling class, the imperialists (coercion), and the conservative Shi'a clerics that legitimated the unjust and tyrannical conditions (deceit) (Jackson 2006, p. 223).

As Shariati continued his engagement in political actions opposing the "evil trinity," mostly through demonstrations and writing for newspapers, he also continued his formal studies. In 1954, he passed his examination and received his diploma in literature. Soon after, he entered the University of Mashhad where he continued to study Arabic and French as well as Western thought, laying down the foundations for his progressive, modernist, and revolutionary interpretation of Islam, one that was more applicable to the turbulent events that had happened in the years prior (Abrahamian 1988, p. 291). As a member of the National Resistance Movement (NRM), he, as well as his father, was continually harassed by the Shah's government, and both were briefly arrested and imprisoned in 1957. In July of 1958, he married Pouran-i Shariat Razavi and in 1960 received his bachelor's degree in Persian literature. Seeing promise in this young scholar, Shariati was awarded a scholarship to study abroad at the Sorbonne in Paris. This began, in the words of Hamid Algar (2001), the "second formative period" in Shariati's life (p. 88).

The Paris Years (1960–1964)

Upon arrival in France, the provincial young scholar quickly suffered culture shock. Paris in the early 1960s both repelled him and fascinated him. Socially, he was appalled by the level of libertine decadence, with its sexual licentiousness, alcoholism, gambling, and devious nightlife. The secular society of Paris was a free and open society, one that was detached from any traditional moral systems closely associated with Abrahamic religions. For Shariati, conspicuous consumption and the relentless pursuit of pleasure attempted to fill the void where religion once stood, but it was a poor substitute. In his view, it made Parisians amoral, shallow, and hedonistic. Additionally, according to Rahnema (2008), Shariati saw Europe as a "pitiless iron monster," prepared to "swallow everyone despite their different cultures and identities" (p. 218). He witnessed how the great democratic amalgamation of cultures in cosmopolitan Paris led to the death of traditional beliefs and moral systems, creating a new kind of man that was neither Western nor of Eastern; he was a one-dimensional creature of Western capitalist modernity. On the other hand, Shariati found his time in Paris enlightening. He was drawn to the various world-class educational institutions, the scholars that animated them, and the dissident academic climate that filled the air in the local coffee houses. Shariati would later write how indebted he was to his French professors for his academic enlightenment. Although he was already well-read for a young Iranian, these mainly Christian or atheist scholars challenged him to think beyond the confines of his intellectual provincialism. While remaining committed to his Shi'a convictions, Shariati began to see ever more clearly the universality of truth; if a claim was true in a Western philosophical framework, it then must also have validity within an Islamic framework, especially as it pertained to the conditions and nature of humanity. His discovery of truth both in Western thought and Shi'a Islam reinforced the education he received from his father and his work as a God-Worshipping Socialist and pro-Mossadeq activist.

While studying sociology and literature in Paris, Shariati came under the spell of a variety of social thinkers, whom he later called "idols," including the famed French Islamologist, Louis Massignon, who Shariati believed taught him the skills of inner critique or the ability to remain devoted to his Islamic faith while simultaneously being critical of it. The Christian mystic Massignon, according to Rahnema, served as Shariati's "Western substitute" for the poet and mystic Mawlānā Jalāl ad-Dīn Rūmī, who was central to his spiritual formation back in Iran. Indeed, he likened his meeting to Massignon to Rūmī's meeting of his spiritual master, Shams-i-Tabrīzī, the wandering dervish that sparked Rumi's spiritual genius. Without the influence of the Catholic Massignon, Shariati believed he would have remained trapped in his "impoverished spirit, mediocre mind and stale vision" (Rahnema 2000, p. 121). From 1960 to 1962, Shariati served as Massignon's research assistant and developed a near-religious adoration of the senior scholar. According to Shariati's biographer, Ali Rahnema, the budding Iranian scholar's presence rekindled Massignon's Catholic faith, and Massignon's mystical and gnostic influence on Shariati allow him to overcome his own religious doubts (Rahnema 2000, pp. 122–123). Furthermore, Massignon's belief that all adherents to the Abrahamic religions were bonded in a fraternal unity greatly affected Shariati's views on Judaism and Christianity. Indeed, under the influence of Massignon, Shariati became religiously ecumenical. He believed that the prophet Abraham was the central axis point of the three faiths. Shariati even gave Abraham's iconoclasm a new meaning: following his example, especially when Abraham destroyed his father's idols, Shariati believed it was the role of the three Abrahamic faiths to destroy the idols of the modern world – the domination of the ruling class, social injustice, and economic inequality. The influence of Massignon, the Orientalist Catholic and spiritual guru of Shariati, can be seen throughout Shariati's later works.

After Massignon, Shariati became engrossed in the thought of George Gurvitch, a sociology professor at the Sorbonne who Shariati discovered was a Jewish-Russian émigré who fled Stalin's Soviet Union. A staunch supporter of Algerian independence, Shariati found in Gurvitch another model for being a professional intellectual and a social justice activist. Being captivated by Gurvitch's thought, in a defiant letter home to his father, Shariati even remarked that the Jewish ex-communist Gurvitch embodied the essence of Shi'ism more closely than Iran's senior clerics, who never sacrificed anything for their beliefs (Rahnema 2000, p. 123). Thus, the Jewish scholar who fought for social justice embodied the qualities of *tawḥīd* (radical monotheism), while the reactionary and "quietest" Shi'a clerics legitimized the rule of the polytheist (*shirk*) Pahlavi monarchy, thus betraying the essence of Islam. Shariati benefited greatly from Gurvitch's expansive knowledge of Marxism. It was in his time with Gurvitch that he began to understand Marx's philosophy from within, and in doing so, was able to critique Marx's deficiencies as well as appropriate those aspects of Marxism that ringed true. Many of Gurvitch's critiques of Marx, especially his materialist definition of class, would later end up in Shariati's public lectures, some of which were published by the Shah as a way of undermining Shariati's appeal to left-wing Iranian students (Algar in Shariati 1980, pp. 13–14). Nevertheless, it was during Shariati's time with Gurvitch that he studied Marxism and was able to rescue certain elements of dialectical materialism that remained a fundamental part of his sociology of religion.

When one reads Shariati, one is often struck by the creative ways he interprets both Western and Islamic terms. Words that were once seen as the domain of conservative religion and politics are reinvented, reloaded with new symbolic meaning, and redeployed in the struggle against oppression and imperialism. Although he was always philosophically eclectic, this practice of salvaging and transforming stale concepts came from Shariati's brief engagement with the French Islamologist Jacques Berque, and his *degrée de signification* method, wherein the essential meaning of a word is identified, liberated from its formalism and

traditionalism, and radically reignited. Rahnema (2000) explained this phenomenon in this way: "words could thus be transformed from passive means for idle chatter and tools of stupefaction into instruments for socio-political change. Berque had ignited something in Shariati. He took each commonly used term in the vocabulary of every Muslim and reinterpreted it until gentle lullabies became electric currents" (p. 126). Shariati became an expert in using Western philosophy to reclaim the original radical impulse of the Islamic lexicon; it was as if traditional Islamic verbiage became impregnated with a new revolutionary spirit. Many of his reclaimed words and phrases would end up linguistically defining the Islamic Revolution of Iran in 1979. Much of his radicalized vocabulary was appropriated and furthered by the religious leader of the revolution, Ayatollah Khomeini, who, although he never publically admitted it, knew he owed much of his revolutionary rhetoric to Ali Shariati. For example, it was Shariati who transformed the otherwise somber Shi'a holiday of "Āshūrā," which marks the assassination of Imam Hossein ibn "Alī in Karbalā," Iraq, into a revolutionary slogan, propelling the masses to follow Hossein's revolutionary example and rebel against unjust authority: "Every day is 'Āshūrā', every land is Karbalā'."

While in Paris, Shariati participated and worked closely with many Algerian Independence groups and their leaders in exile and contributed numerous articles to their French language publications. In the course of these involvements, he became an avid reader of Frantz Fanon, the Martinique revolutionary psychiatrist and author of the 1952 book *Les Damnés de la terre* (*The Wretched of the Earth*), which was a major influence throughout the Third World liberation movement. Fanon's work, especially his earlier book *Peau noire, masques blancs* (*Black Skin, White Masks*), gave Shariati a framework for understanding the psychological alienation brought about by Western imperialism and how such alienation contributes to the domination of the West over the rest (Algar 2001, p. 89). Despite the fact that Fanon was thoroughly secular, his works pressed upon Shariati the need for colonized peoples to reject their blind mimicry of the

West, embrace their own cultural resources, and create a new revolutionary identity out of the old that is both appropriate for modernity and capable of resisting the political, economic, and cultural hegemony of the colonizing nations. This task, Fanon insisted, and Shariati agreed, may include revolutionary violence (Fanon 1963, pp. 35–106). Most importantly, Shariati's engagement with the work of Fanon instilled in him the imperative for international solidarity that the colonized nations of the world, despite their cultural, religious, and linguistic differences, had to ban together in one anti-imperialist front. Along with three other Algerian sympathizers, Shariati began to translate Fanon's *Les Damnés de la terre* into Persian as *Mostazafin-i Zamin*. It was later published entirely under his name. Although Shariati invited Fanon to write a preface for his Persian translation of Fanon's 1959 book *L'An V de la Révolution Algérienne* (*Five Years of the Algerian War*), later published in English as *A Dying Colonialism*, such a preface never happened. However, there were three letters exchanged between the two men, wherein they discuss what is expected of an "authentic intellectual" and the role of religion in the struggle to emancipate the colonized Third World (Rahnema 2000, p. 127; Fanon 2018, pp. 667–669). After lamenting the divisiveness sectarianism brings into the global struggle against Western imperialism, Fanon writes to Shariati, "although my path diverges from, and is even opposed to, yours, I am persuaded that both paths will ultimately join up toward that destination where humanity lives well" (Fanon 2018, p. 669). Despite their disagreements of the nature of religion and its potential to contribute to revolutionary change, both men agreed upon the ultimate destiny: the destruction of imperialism and the creation of nation-states free from foreign domination.

While finding a home in the intellectual milieu of Paris' left-wing philosophers, sociologists, and exiled revolutionaries, Shariati absorbed the existentialism of Jean-Paul Sartre, which filled the air of the early 1960s Paris. Sartre's attempts to reconcile Marxism with existentialism greatly impressed Shariati, as it demonstrated the fruitfulness of philosophical cross-pollination, as well as

the usefulness of Marx's class analysis. Sartre's philosophy, which argued that man is "condemned to be free," challenged Shariati to live an authentic life, taking full control of his destiny and full responsibility for its subsequent consequences. While he elevated Sartre's existentialism to the level of importance with socialism and Islam, he did not agree with the assumed foundations of Sartre's philosophy: materialism and atheism (Rahnema 2000, p. 127). Rather, Shariati insisted that man needed a moral and ethical guide, one that pronounced realistic absolutes. The relativism that animated Sartre's merely formal ethics would not lead to man's individual emancipation, but rather it would further his enslavement to his own desires. God, for Shariati, must ultimately determine what is right and wrong, not the "common sense" (*bon sens*) of individuals, as Sartre believed (Rahnema 2000, pp. 127–128). Nevertheless, according to the Iranian scholar Hamid Dabashi, it was through Shariati's combination of Frantz Fanon's anti-colonialism and his own interpretation of Jean-Paul Sartre's existentialism that he "championed the ideal of an autonomous and independent person fully in charge of history," and in doing so, became a real threat to both the "Pahlavi monarchy and the Shi'i clerical establishment" (Dabashi 2011, p. 269). Furthermore, the ongoing translation of the revolutionary ideas he acquired in Paris into Islamic concepts made him all the more a threat to the monarchical and clerical establishment, for he represented an alternative *Islamic* authority, one that reclaimed the charismatic and prophetic spark of primordial Islam, before it was routinized and institutionalized by the clerics. As such, his form of Islamic intellectualism avoided the pitfalls of the "assimilated intellectual," who knew all the latest philosophies of the West but couldn't relate to their own native culture nor the Iranian masses, and it avoided the reactionary quietism of the traditional Shi'i *'Ulamā'*. In addition to his own theoretical work, he had become convinced of the need for a revolutionary vanguard in Iran (Rahnema 2008, p. 224). Based on Régis Debray and Che Guevara's *Foco Theory*, which was born out of the guerilla experience of the Cuban Revolution on 1959, such a small cadre of highly trained revolutionaries and intellectuals would initiate and lead the nation in

revolt against the corrupt regime. Understanding the threat that Shariati's call for revolution posed, the monarchy waited patiently for the prodigal son to return home.

The Revolutionary Scholar Returns Home (1964–1977)

In 1964, with his Ph.D. (in literature) in hand, Shariati was immediately arrested and imprisoned upon entering Iran for his subversive activities in France. After being detained in Azerbaijan, he was later transferred to Qezel Qal'eh prison near Tehran, in which he spent 1.5 months. For Hamid Algar (2001), Shariati was not a "dangerous opponent" of the Shah's regime for the normal reasons, but rather the monarch took notice of him "because of the role of leadership that he had exerted" and because of the "intellectual dimension" of his radical thought. Such thought, Algar states, "transcended the normal agitation and concentration on demonstrations and shouting of slogans that was current among the Iranian opposition abroad" (2001, p. 90).

Upon release, Shariati moved his family back to Mashhad in search of a university appointment (Rahnema 2008, p. 225). The first 3 years back Iran were disappointing to him; he could only find employment teaching in a variety of high schools. While he continued to develop his revolutionary form of Shi'i Islam, he found that the audiences he had access to outside of a university setting were ill equipped to understand his analyses. Being away from Paris, the center of revolutionary intellectualism, was depressing, and he missed the stimulation of being in the center of it all. He kept himself busy translating Louis Massignon's book on Salmān al-Fārsī (Solomon the Persian), who was a compassion of Prophet Muhammad, and wrote his literary biography, *Kavīr* (*The Desert*), which spelled out his personal mission to liberate all the *wretched* of his country (Rahnema 2008, p. 227).

In 1967, Shariati was offered a position in the sociology department at the University of Mashhad (Algar 2001, p. 90). In an atmosphere of mediocrity, his genius for synthesizing both

Islamic and Western ideas was on full display. His lectures were well attended, as the students were attracted to his knowledge of the West and the fact that he didn't disparage Iranian culture and Islam as so many other Western educated intellectuals did. In fact, he made it clear that his form of sociology wasn't "value-free," but rather was rooted in Islam and emancipatory thought, and was committed to reforming Iranian society (Algar 2001, p. 91). This was a formative period of Shariati's thought, as it gave him access to students who were both yearning for political change and concerned with the loss of authentic Iranian culture. Shariati stressed to his student the need for political-economic change in Iran, as well the need to return to Islam and a God-centered way of life. He argued that the young revolutionaries committed to undermining the status quo could not do so from a foreign perspective, but rather must root themselves in their own traditional Shi'i resources, as it would be through those religious resources that progress in society would occur. In other words, the "foreignness" of a Western, especially Marxian, analysis would limit an understanding of such an analysis to the intellectual class. However, to make the same analysis through Islamic terms would deliver the message to the entire Iranian population. What was needed was an "Islamization" of the analysis, and for that the students needed to return to their own culture. In this process, the quietism, conservativism, and reactionary nature of the Shi'i clerics would have to be challenged and eventually purged so that the revolutionary nature of Islam could be rescued and restored.

In pursuit of his consciousness raising goals, Shariati published one of his most important books in 1969: *Eslamshenasi* (*Islamology*). Based on his lectures at the University of Mashhad, in book Shariati first takes aim at the "assimilated intellectuals," charging them with being incapable of thought independent of their Western models, thus abandoning their Islamic, Iranian, and Shi'i roots. Based in his reading of authoritative sources of Shi'i Islam, the Qur'an, Sunnah (example) of Prophet Muhammad, the teachings of the Shi'i Imams, as well as the example of the first "four rightly guided Caliphs" (*al-Khulafā'u*

ar-Rāshidūn), Shariati argued that *Eslamshenasi* served a tripartite purpose: (1) it argued for an modern Islam that paradoxically returned to its egalitarian and democratic roots; (2) it identified the barriers to reclaiming the original revolutionary spirit of Islam, including monarchy and the *'Ulamā'*, and (3) it forwarded the idea that it was an obligation of all true believers to struggle against the ills of modernity in the name of Islam's radical anti-idolatry monotheism (*Tawḥīd*) (Rahnema 2008, pp. 229–230). Furthermore, Shariati distinguished between two forms of Islam; the first is affirmative in nature, in that it is institutionalized and invested in the status quo; the second is negative in nature: it displays a dynamism that is critical of the status quo, which corresponds with the original emancipatory and liberational geist of Muhammad's religion. According to Rahnema, this recharging of Islam with its original negativity created many enemies for Shariati among the conservative Shi'i clerics (Rahnema 2008, p. 233). He cites Shaykh Muhammad-Ali Ansari as writing, "We warn the Royal government of Iran, the Iranian people and the Iranian clergy that during the past 1,000 years, the history of Islam and Shi'ite Islam has never encountered a more dangerous, dreadful and bolder enemy than Ali Shariati" (Rahnema 2008, p. 233). Islam, for Shariati, had to be wrenched away from its conservative caretakers, who used it for the purpose of social statics. He believed that it must be returned to the people in order for it to once again be a source of social dynamics and radical change. Creating a cleavage between the conservative clerical establishment and Shi'i Islam was one of Shariati's main goals, and with the publication of *Eslamshenasi*, those clerics began to take notice of that growing cleavage.

In June of 1971, Shariati was released from his position at the University of Mashhad, and was sent to Tehran, the capital of Iran. Once there, he became a fixture at the Hosseiniyeh Ershād, a nontraditionalist religious institute that was established by the Iranian politician Nasser Minachi, and dedicated to actively changing Iran's state of affairs (Algar 2001, p. 91). Shariati believed that the Hosseiniyeh Ershād could become the spiritual center for his kind of

modernist Islam. He frequently gave lectures there on a variety of topics, most of which were infused with the ideas he wrote about in *Eslamshenasi*. This was an especially formative time in Shariati's life, as his condemnation of the Shah and the clerical establishment was juxtaposed to the height of the Shah's arrogant rule. While the masses were grumbling, struggling under the weight of increased poverty, Westernization, the repression of the Shah's secret police (SAVAK), as well as the disastrous effects of the Shah's pro-Western reforms he dubbed the "White Revolution" (*Enqelāb-i Sefīd*), the Shah was being praised on the international stage for his management of Iran – the "island of stability" as the US President Jimmy Carter called it in 1977 (M.R.P. Shah 1967). Furthermore, the Shah never wasted a chance to praise the pre-Islamic Persian Empire, reminding his people that he and his regime were the inheritors of that glorious past. Iran, which had been a thoroughly Shi'i country for hundreds of years, saw little use for the legacy of the Persian Empire outside of a historical appreciation. Thus, as the Shah became more and more distant from the religious life and culture of the Iranian people, powerful forces were on the move, including Ali Shariati and his appeal to younger, disaffected, yet politically active Iranians, as well as the growing influence of the radical cleric Ayatollah Khomeini, who had been expelled from Iran in 1964 by the Shah because of his critiques of the Pahlavi regime. It was at the Hosseiniyah Ershād that many of Shariati's most important lectures were transcribed and published in book form or disseminated by mimeograph, similar to Ayatollah Khomeini's speeches made during his exile from Iran (Keddie 1981, p. 216).

Shariati's tendency for binary thinking, which according to Hamid Algar is a by-product of his study of Marxism, appeared once again in his November, 1971, speech, "The Responsibility of being a Shi'a," wherein he distinguished between the "'Alawī Shi'a," who were the true followers of Imam 'Ali ibn Abū Ṭālib, and the "Safavid Shi'a," those who institutionalized Islam and made it into an ideology for the ruling class and an opium religion for the masses. In Shariati's time, those who followed the Shah, whom he believed to be a

modern incarnation of Yazīd ibn Mu'āwiya (647–683 CE), the murderer of Hossein ibn 'Ali (the prophet's grandson and third Shi'a Caliph), were the Safavid Shi'a *par excellence.* They had abandoned the true Islam of the poor, the broken, and the oppressed, for the Islam of the wealthy, the powerful, and the rulers (Rahnema 2008, p. 236; Algar 2001, p. 89; Keddie 1981, pp. 217–218). Although he had already rejected Che Guevara's *Foco Theory* of guerilla warfare as unsuitable for Iran, Shariati began to openly call for the removal of the Shah through a mass revolt of the people. Armed struggle, in the manner of 'Ali ibn Abū Ṭālib and Hossein ibn 'Ali, was the responsibility of every true believer, not just a small intellectual cadre, Shariati claimed. Martyrdom in the cause of justice was not to be rejected, but to be embraced, just as it was for the central figures in Shi'a Islam, who became the models for revolutionary Islamic praxis in Shariati's reading. Because of his open hostility toward the Shah's regime, the open calls for its removal, and the frequent street battles that Shariati's followers were involved in, the Hosseiniyah Ershād was forcibly closed down in 1972 (or 1973 depending on the source). Additionally, some of the highest ranking clerics wrote books attacking Shariati's "misleading and deceiving" interpretations of Islam (Rahnema 2008, p. 237). With the urging of these and many other senior clerics, Shariati's works were confiscated and banned, although they continued to circulate both in Iran and abroad (Jackson 2006, p. 224; Keddie 1981, p. 223). His life being continually threatened, Shariati attempted to evade SAVAK by going into self-imposed hiding. However, after the arrests of his family members, including his father, were used as leverage against him, he eventually surrendered in September of 1973. He was imprisoned for 18 months in Komiteh prison, spending most of that time in solitary confinement.

Refusing to publically recant his anti-Shah, anticleric, and anti-imperialist positions, the Shah's regime resurrected one of Shariati's old lectures (1967) entitled *Ensan*, *Eslam*, *va Maqrebzamin* (*Man*, *Islam*, *and Western Schools of Thought*), in which Shariati condemned Marxism and other revolutionary

political philosophies as being incompatible with Islam and published it in the newspaper *Keyhan*, giving the impression that Shariati had rejected his radical thought while in prison (Rahnema 2008, p. 239). Although he did criticize Marxism for reducing mankind to a mere units of production, Shariati never rejected all aspects of Marxism, nor did he change his mind about the Shah while imprisoned. He remained steadfast in his demand for the overthrow of the Peacock Throne. Additionally, he did not view Marxism as a being an ideological threat to Islam, rather it was a secular competitor, since both were inherently anti-imperialist, anti-colonial, and anti-capitalist. It was *limited* due to its lack of what he thought were humanistic values, as well as its dogmatic anti-religious stance, but in its class analysis, Marxism was at its core truthful (Jackson 2006, p. 224).

From when he was released in March of 1975, to when he fled Iran in May 1977, Shariati lived a life of isolation. While the revolt against the Shah was increasingly growing, so too was the stature of Ayatollah Khomeini, who was still influencing much of the Shah's opposition from his exile in Najaf, Iraq, and in doing so becoming the unofficial leader of the coming revolution. Through his students and associates in Iran, Khomeini, who had also criticized the apolitical stance of clerical "quietism," had come into contact with Shariati's work, which later proved to be quite influential on the senior Ayatollah. Meanwhile, Shariati's influence was still growing despite the fact that he was effectively barred from participating actively in the protests and demonstrations. Nevertheless, his writings at the time reflected his isolation, as he became more introspective, examining both love and mysticism as aspects within the sociopolitical realm (Rahnema 2008, p. 241). During this time, he laid down his definitive philosophy of religion, which condemned capitalism and the bourgeois values that it exports around the world, as well as the imperial powers that impose such social arrangements of less powerful nations. In opposition to the liberal world order, he argued for a just society, an ideal society, which is defined by a form of Islamic socialism predicated on a true and devout devotion to God (Rahnema 2008, p. 242).

Exile and Death (1977)

Without the permission from the Shah's government, on May 16, 1977, Shariati fled Iran for the safety of London. Alerted of his absence, the SAVAK arrested his wife Pouran and their 6-year-old daughter Mona but allowed their two older daughters, Soosan and Sara, to fly to London unaccompanied. Shariati, wracked by fear of what the SAVAK would do to his wife and children, retrieved his two daughters at Heathrow, but could not spend much time with them: his body was found dead the next morning, June 19, 1977 (Keddie 1981, p. 216). While the official cause of death was determined to be the result of a heart attack, many believe that Shariati's mysterious and sudden death came at the hands of SAVAK, which had a long reach outside of Iran. Although the Shah denied it, very few of Shariati's closest associates believed that this committed enemy of imperialism, at the age of 43, wasn't murdered upon the order of the Shah. Because he died a believing Muslim within a just struggle against tyranny, he was bestowed the title "martyr" (*shahīd*) by the Iranian people (Algar 2001, p. 93). Nevertheless, Shariati's body was not returned home to Iran but rather was flown to Damascus, where he was buried within the compound of Sayyīdah Zaynab Mosque, close to the tomb of Zaynab, the daughter of 'Ali and the Prophet Muhammad's granddaughter. The shrine/mosque complex is the center of Shi'a religious studies in Syria and is a pilgrimage site for Shi'i and Iranian pilgrims. Although he was removed from being an active agent in the fall of the Shah and the ousting of the United States in Iran, his works, especially the revolutionary spirit that he infused into traditional Islamic vocabulary, continued on until the overthrow of the Shah in January of 1979 (Jackson 2006, p. 226). According to Nikki R. Keddie, after the death of Shariati, his books were "sold everywhere, by the hundreds of thousands," not only in the capital of Tehran but also in the holy city of Qum, as well as Mashhad, where he spent much of his life (Keddie 1981, p. 223). Even in the small provincial villages that didn't have bookstores, one could find copies of Shariati's books, as he had grown into a

"mythical figure of militant Islam," martyred for the liberation of his people (Keddie 1981, p. 223).

Major Themes of Ali Shariati's Anti-Imperialist Sociology of Religion

When one reads Shariati, one has to bear in mind that he is dedicated to two revolutions: the first is the rebirth of Shi'a Islam as a transformative force within the modern world. Second, he is dedicated to the overthrow of the Shah and removal of the imperial power of the United States in Iran's affairs. Academically, Ali Shariati is best known as a sociologist of religion. Although he was not trained in any of Iran's prestigious seminaries, some scholars, including John Esposito, believe that Shariati is best understood as an Islamic liberation theologian (Shariati 1986, p. xi). Drawing from many different sources, his theoretical analyses of various religious phenomena were eclectic, and for that he was often criticized by traditional Shi'i authorities for his use outside sources, including Sunni jurisprudence and Western philosophy. Although his work was expansive, there are a few distinct themes that run throughout Shariati's work that are key to understanding his overall sociology of religion and how it pertains to his involvement in Iran's revolution.

In a series of lectures entitled *Religion* versus *Religion* (*Mazhab 'Alyhi Mazhab*), Shariati demonstrates the dialectical nature of the historical religions. Similar to Marx's claim about class struggle, Shariati argues that all of history is a history of religious warfare, wherein one form of religion opposes another, and in a Hegelian sense, one determinately negates (*aufhaben*) the other. In order to illustrate this claim, Shariati reminds us that the Arabic word "*kāfir*," which is generally translated as "atheist" or "non-believer," came into the Islamic lexicon in seventh-century Arabia, when there was no such thing as a non-religious society or individual; all individuals believed in some form of divinity, as atheism is a modern phenomenon. Thus, the struggle between the believers and the *kāfirūn* (disbelievers) is not between religious voices and atheists, but rather between religious voices and other religious

voices; it is between the religion of *tawḥīd* (radical monotheism) against the religion of *shirk*, the Arabic term for polytheism, or what Shariati says is the "enslavement of humanity in bondage to the idols," whatever those idols may be within a given time and place (Shariati 2003, p. 30). On the face of it, it would seem that his tendency for binary thinking has pitted one religion against another. On closer look, Shariati's view is more sectarian and interreligious. He argues the following:

> Two basic religions have existed in history, two groups, two fronts. One front has been oppressive, an enemy of progress, truth, justice, the freedom of people, development and civilization. This front which has been to legitimate greed and deviated instincts and to establish its domination over the people and to abase others was itself a religion, not disbelief or non-religion. And the other front was that of the rightful religion and it was revealed to destroy the opposite front. (Shariati 2003, p. 61)

Shariati maintains that these "two basic religions" are essentially two basic forms that can be found *within* the same religion. One form is *affirmative*, in that it invests itself into the status quo; it is worldly; it rejects revolution; it is "priestly" in that it's authority is routinized; it justifies and helps maintain the social structure as it is: it is the religion of the ruling class. In the hands of the masses, such an affirmative religion is what Marx says religion is: opium (Byrd 2018, pp. 118–120; Shariati 2003, p. 35). In their opiated condition, Shariati states that "people surrender to their abjectness, difficulties, wretchedness and ignorance, surrender to the static situation which they are obliged to have, surrender to the disgraceful fate which they and their ancestors were obliged to have and still have – an inner, ideological surrender" (Shariati 2003, p. 35). In light of this form of ruling-class religion, Shariati argues for a different kind of Islam, one with an active social conscience. In his *Eslamshenasi*, he states that

> It is not enough to say we must return to Islam. We must specify which Islam: that of Abu Zarr [Abū Dharr al-Ghifārī] or that of Marwan the Ruler. Both are called Islamic, but there is a huge difference between them. One is the Islam of the caliphate, of the palace, and of the rulers. The other is the Islam of the people, of the exploited, and of the poor. Moreover, it is not good enough to say that one should be "concerned" about the poor. The corrupt

caliphs said the same. True Islam is more than "concerned." It instructs the believer to fight for justice, equality, and elimination of poverty. (Shariati in Abrahamian 1988, p. 295)

The influence of Marx's class analysis is apparent in much of Shariati's work, although he was critical of the "vulgar Marxism" pushed by the Soviet Union and adopted by many anti-religion Iranian intellectuals.

Against the affirmative polytheistic form of religion is prophetic religion, which is inherently *negative*, as it is *contra mundum* (against the world as it is); it seeks revolutionary change; it maintains the recalcitrant spirit of the prophets; it is critical of the prevailing social structure, and it opposes all forms of opiate religion. For Shariati, the role of the true believer, who follows the oneness of God (*tawḥīd*), is to unveil the polytheism that hides behind the hijab of monotheism (Shariati 2003, p. 55). He writes, [the believer] "must be able to distinguish the religion of multitheism under the deceitful mask of monotheism and remove this covering of hypocrisy – whatever form it has taken – throughout the world" (Shariati 2003, p. 57). Therefore, Shariati believes that religion must be self-critical, willing to look within itself in order to purify itself of all reactionary, oppressive, and idolatrous pollutants, which he saw in the "quietest" clerics of Iran, who were unwilling to join their fellow Iranians in their struggle against the idolatrous Shah (Abrahamian 1988, pp. 295–296). For Shariati, the only way to be faithful to the emancipatory religion of Prophet Muhammad was to struggle against the modern idolatry created by reactionary clerics, capitalism, monarchy, and imperialism, which made false idols out of status, money, privilege, and power.

Debate continues as to how Shariati ultimately related to Western philosophy, especially Marxism, with some scholars, such as Hamid Algar, believing that Shariati studied Marxism ultimately to undermine it from within, whereas other scholars, such as Ervand Abrahamian, believing that Shariati "synthesiz[ed] modern socialism with traditional Shi'ism" (Abrahamian 1988, p. 289). Ali Gheissari argues that when Shariati invoked the term "Islam," he meant "Shi'ism combined with an eclectic synthesis of non-Muslim and non-Iranian ideas" (Gheissari 1998, p. 97). Despite the varying

opinions, an objective reading of Shariati's work cannot fail to see the large degree of influence that Marxism, neo-Marxism, and other forms of radical left-wing thought had on his understanding of Islam and his analyses of Iran and Western imperialism. The vocabulary of Karl Marx, Frantz Fanon, Che Guevara, and Jean-Paul Sartre is ever-present in Shariati's books and speeches, although obscured by an Islamic veil. Although he deployed their concepts, he did not simply accept Western thought uncritically, but consciously discarded what he thought was untrue or was not applicable to Iran, while preserving what was truthful and applicable through a process of Islamization. According to Hamid Dabashi, Shariati "internalize[ed] and digest[ed] the revolutionary projects" of rival ideologies and in the process "Islamize[d] them" (Dabashi 2011, p. 273). In this sense, Shariati allowed the categories of Western emancipatory thought to enliven, enrich, and resurrect what he determined was the original revolutionary spirit of Islam, especially Shi'a Islam, which had gone dormant under the domination of the apolitical clerics, corrupt Islamic empires, and Western modernity. According to Dabashi, Shariati's creative engagement with "wider emancipatory movements" rescued Shi'ism from its "sectarian cul de sac," thus giving new life to old ideas (Dabashi 2011, p. 300). It is interesting to note that Western philosophy, especially political philosophy, has since its inception determinately negated religion, wherein certain religious ideas would be translated into secular political ideas. For example, the idea of Christian charity (*caritas*) became the basis for the welfare state, and the belief that all humans are created in the "image of God" (*Imago Dei*) became the basis of universal human rights. In the case of Shariati, the determinate negation went in the other direction: secular philosophy was translated into religion, which was more appropriate for the still-religious country of Iran in the 1970s.

Shariati's attempt to revivify (*tajdīd*) Shi'a Islam distinguishes him from other Third World revolutionaries, who followed more closely Marx's arguments about religion being a barrier to political emancipation. For example, Shariati disagreed with Frantz Fanon's position that in order for a people to emancipate themselves

from their colonial masters, they must abandon their religious identity, as such identity is inherently reactionary and divisive. Shariati argued that oppressed peoples must rediscover and return to their cultural roots, their cultural identities, and their inherited religions, as such authentic resources would be the basis of resistance to Western cultural, political, and economic hegemony (Abrahamian 1988, p. 291). Psychologically, they must define who they are, and regain their "sense of belonging" (*ta'assob*), or they will be defined by the West (Gheissari 1998, pp. 99–100). If they have no independent sense of self, and their identity is fractured or ill-defined, they have no capacity to resist how the West will define them according to their self-interests. Shariati was especially concerned that the Iranian intelligentsia (*rushanfekran*) return to their cultural roots, as it was the role of the intellectuals to guide the masses to their emancipation (Abrahamian 1988, p. 292; Byrd 2018). They're uncritical "assimilation" to Western standards was a precondition for a successful Western takeover of the Third World.

While Shariati's work did influence numerous Iranian intellectuals, the most important person it influenced was Ayatollah Khomeini, the radical Shi'a cleric who would eventually come to lead the Iranian revolution from his exile. While he did not discount the role that the Shi'a clerics *could* have in the Iranian revolution, he did not expect that one would become its unquestioned leader. As can be witnessed in his fiery speeches, Khomeini learned a lot from the nonclerical "liberation theologian," who was just as critical of the quietism of the clergy as Khomeini was. Not only did Khomeini resists his fellow clerics' demand that Shariati be condemned on the account that he distorted the Shi'a tradition, according to Abrahamian, Khomeini himself began to adopt the class-consciousness-infused language that Shariati had Islamized (Abrahamian 1993, p. 47; Moin 1999). Abrahamian writes that under the influence of Shariati, Khomeini

> depicted society as formed of two antagonistic classes (*tabaqat*): the oppressed (*mostazafin*) and the oppressors (*mostakberin*). In the past, Khomeini had rarely used the term mostazafin, and when he had, it had been in the Koranic sense of "the meek,"

"the humble," and "the weak." He now used it to mean the angry "oppressed masses," a meaning it had acquired in the early 1960s when Shariati and his disciples translated Frantz Fanon's *The Wretched of the Earth* as *Mostazafin-e Zamin* (Abrahamian 1993, p. 47).

The clear parallels to Marx's ruling class and the proletariat are evident in this and many more of Khomeini's public announcements. A class analysis, as opposed to a sectarian analysis, saturated Khomeini's anti-Shah lectures and speeches, in which he used the precise terms that Shariati devised. However, Khomeini brought clerical authority to the language and analysis, whereas Shariati forwarded a nonclerical "reformist" type of prophetic authority. With Khomeini, Shariati's "eclectic synthesis" of Western philosophy and Shi'ism penetrated and radicalized many traditional clerics, who were willing to following Khomeini's lead against the Shah where they resisted following the layman Shariati, who, by virtue of his religious critique, trespassed upon their territory (Byrd 2011, pp. 98–102).

Conclusion

Although Ali Shariati is not well-known in the west, as his reputation was eclipsed by the revolutionary Shi'a cleric Ayatollah Khomeini, he was nevertheless one of the most influential intellectuals of the twentieth century. His thoughts and ideas, which were born both in the *dār al-Islam* (abode of Islam) and the west, animated one of the twentieth century's most impactful revolutions. However, the form of Islamic radicalism he forwarded was, like his reputation, eclipsed by the theocratic regime that followed the 1979 Revolution. His "Islamic socialism" gave expression to those who wanted to create an Islam that was both modern and committed to maintaining the radical truths of Islam. Today, his form of Islamic radicalism has unfortunately been overshadowed by the violent extremism of terrorist organizations, such as Al-Qaeda and the Islamic State of Iraq and Syria (ISIS), who share very little of Ali Shariati's commitment to the Islamic values of peace (*salaam*) and justice (*'adl*). Unlike these

terrorist groups, Shariati represents a future-oriented remembrance of the primordial Islam, with the practical intent to rejuvenate (*tajdīd*) the original progressivity of the Islamic tradition, especially its commitment to the poor, the oppressed, and the discarded. Thus, Shariati's gaze at the past was always in service to the future. By fusing the concept of *tawḥīd* and social justice, which included his uncompromising opposition to imperialism, he embodied the original *contra mundum* spirit of Prophet Muhammad and his mission to overturn the injustices of his time and place. Ultimately, while Shariati may not be the figure whose image adorns the walls of Iran, his influence on a generation of revolutionary Iranians cannot be diminished nor forgotten.

Definition

"Anti-Apartheid, Anti-Capitalism, and Anti-Imperialism: Liberation in South Africa?"

The entry analyzes the strengths and weaknesses of three movement strategies to achieve liberation in South Africa. The core of anti-apartheid strategy was to unite forces to overcome the racist white domination of the Nationalist Party regime in power since 1948. The anti-capitalist strategy stressed the connection between apartheid's political and social discrimination with an underpinning capitalist exploitation, promoting independent working class organization and socialist objectives. The anti-imperialist strategy emphasized that apartheid was built on the foundation of African labor's super-exploitation that had been established by Britain at the beginning of the twentieth century, and that liberation has to overcome the continuing alliance between white capital and imperialism. Employing the political vocabulary of Marxism-Leninism, these competing strategies are articulated as distinct interpretations of the national democratic revolution in South Africa. These strategies have abiding consequences for diagnosing the process of transition and post-apartheid structural dynamics.

Introduction

On 16 August 2012, heavily armed South African police ambushed and hunted down striking mine workers. They killed 34 miners, wounded another 78, and then arrested a further 177 strikers, incredibly charging them with murder. The miners worked at Marikana platinum mine owned by British company Lonmin and were on strike for a living wage (Alexander et al. 2012). A tough hand had been called for by Cyril Ramaphosa, once a leader of the miners' union, but now a multi-millionaire and a Lonmin shareholder. The Marikana Massacre was a turning point, demonstrating beyond reasonable doubt that the ANC government sides with big business against the workers.

Little over a year later, on 5 December 2013, Nelson Rolihlahla Mandela, the personification of dignified resistance to apartheid, and his country's first democratically elected president, died aged 94 years. The world's media recalled Mandela's role in leading the ANC liberation struggle, his

27 years in prison, and dwelt at length on the generosity of his spirit in the reconciliation with his former oppressors. Honoring a great man whom they had spent decades fighting was not simple hypocrisy; the international bourgeoisie let out a detectable collective sigh of relief that matters had not turned out worse.

To bracket the Marikana Massacre with Mandela's passing captures the deep ambiguities of contemporary South Africa, where apartheid has gone, but capitalism seems as entrenched as ever. What had the liberation struggled achieved? Where did it go wrong? What still needs to be done? Those who see Mandela as untouchable locate the problem as a post-Mandela degeneration in presidents Mbeki and Zuma. Others see the deal that Mandela struck as the source of the problem, delivering an end to apartheid but on terms that guaranteed private ownership of the means of production. In the early 1990s, the ANC leaders certainly felt faced with a stark choice between a pragmatic peace and revolutionary war. Was the ANC's strategy wrong, or was it just as far as it could get given the balance of forces?

This essay takes the long view on these questions, outlining a series of critical debates concerning the relations between apartheid, capitalism, and imperialism. We focus on the connections between theoretical perspectives and movement strategies, with special reference to the nexus between British imperialism and capitalism in South Africa. Our lens excludes as it magnifies; we do not cover vital related topics including especially the struggle experiences of the African masses, South Africa's occupation of Namibia, and wars against the Frontline States, the impact of the divestment movement led by African Americans, and the role of the US and international finance in apartheid's end game, all of which are needed for a rounded picture.

The theoretical perspectives considered are successively anti-imperialist, anti-apartheid, and anti-capitalist. The essay argues that a new synthesis of these perspectives is possible and necessary. The nub of the debate is the dominant, orthodox, communist strategy of transition summed up in the term "national democratic revolution." We will see "national democratic revolution" had two distinct versions rooted, ultimately, in distinct class interests, and that the concept needs to be rescued from the pro-bourgeois, orthodox communist version. The essay concludes that South Africa today is a particular case of neocolonial capitalism generating particular forms of resistance that involve fighting racism and imperialism on class terms.

South Africa and Theories of Imperialism

The conquest and domination of African peoples in Southern Africa feature in the classical Marxist theories of imperialism. Beyond the direct reportage and commentary by Hobson (1900, 1988/1902), the Marxists Hilferding (1981/1910), Luxemburg (2003/1913), and Lenin (1916a, b) all sought to build this history into a wider theoretical explanation. Between them, these authors address economic, social, and political aspects of the relation between Britain and South Africa. In general, this literature treats the relation as an archetype of modern world imperialism. Moving from the abstract to the concrete, in this section we will ask what did these theorists of imperialism from Middle and Eastern Europe learn from South Africa?

Starting with the most strictly economic approach, Hilferding concentrates on the reorganization of capital's corporate forms. He was involved in a simultaneous exposition and critique, a sustained dialogue between the categories of Marx's *Capital* and capitalism as it had evolved a generation later. Hilferding sets up a dialogue with *Capital*, especially volume 3, Part 5 on the division of profits, which he seeks to extend. Although he does not entirely lose sight of production, Hilferding leaves the labor process in the background. In the foreground are changes in the forms of capital as value-in-circulation, the creation of capital markets, the socialization of capital, futures markets, joint stock corporations, the stock exchange, and credit as capital that are still recognizable and of enormous significance today.

Hilferding fastens onto the significance of what Marx termed "fictitious capital," defined as a

property claim on future income (Hilferding 1981/1910, p. 597). He highlights that shares in joint stock companies are a form of fictitious capital, a capitalized claim on the future profits of the company, and so the turnover of these shares "is not a turnover of capital, but a sale and purchase of titles to income" and that "aside from the yield their price depends upon the rate of interest at which they are capitalized"; it is therefore "misleading to regard the price of a share as an aliquot part of industrial capital" (111). When shares are issued and sold for money, "one part of this money constitutes the promoter's profit … and drops out of circulation in this cycle. The other part is converted into productive capital and enters the cycle of industrial capital" (113). Hilferding's step forward is to identify the inversion of form, how the socialization of industrial capital is mediated through finance, and that this actually further disguises the source of profits. This is relevant because companies offering shares in South African gold mines were being launched on the London stock market, thousands of miles away from the site of production, and gave *both* the London banks and financiers like Cecil Rhodes enormous windfall "promoter profits."

Hilferding claimed that his study of "dividends as a distinct economic category" took the analysis of the corporation "considerably beyond" Marx's "brilliant sketch of the role of credit in capitalist production" (114–115). This opened the question that Lenin would make explicit: the character of changes in capitalism beyond those analyzed by Marx. Marx had already perceived in the capitalist joint stock company "a necessary point of transition towards the transformation of capital back into the property of the producers, though no longer as the private property of individual producers, but rather as their property as associated producers, as directly social property" (Marx 1981/1895, p. 568). For Marx, the socialization of capital showed the real possibility of a mode of production controlled by the associated producers, that is, socialism. Without directly refuting Marx's optimism, Hilferding's analysis registered that the joint stock company had actually become the vehicle for imperialist surplus profit. The potential for socialist transition that Marx foresaw in the form of socialized capital had turned in a reactionary direction. Hilferding highlighted the export of industrial capital in the production of raw materials, pointing out that price fluctuations and hence profit variability lead to a strong tendency to the formation of cartels in this sector. Capital investment in these new territories, he argued, "turns towards branches of production which can be sure of sales on the world market."

> Capitalist development in South Africa … is quite independent of the capacity of the South African market, since the principal branch of production, the working of the gold mines, has a practically unlimited market for its product, and depends only upon the natural conditions for increasing the exploitation of the gold mines and the availability of an adequate work force. (Hilferding 1981/1910, p. 317)

Hilferding did not delve into the racial colonial processes involved in procuring "an adequate work force," but he did mark a change in the role of certain colonies within capitalism as a whole, from commodity consumers to producers of surplus value.

Rosa Luxemburg gave a stirring critique of the racism and violence of colonial capitalism. Her *The Accumulation of Capital* has a chapter on capitalism's struggle against the peasant economy and takes South Africa as the major example. Luxemburg charted the dispossession of the original African peoples by the Boer farmers and then their ousting by the British mining interests. The history is excellent, but there is an issue with her theory. At its most general form, Luxemburg stated:

> Imperialism is the political expression of the accumulation of capital in its competitive struggle for what remains still open of the non-capitalist environment. (2003/1913, p. 426)

While Luxemburg's framing is sensitive to the battles of first nations at the frontiers of expanding capitalism, it is incomplete as a theory of their incorporation as oppressed nations within the capitalist mode of production. She sees the mode of production of the conquered society as persisting in a subordinated relationship to the conquerors,

rather than a new synthesis of extended capitalist social relations that also changes the conqueror's mode of production (for elaboration of this idea, see Higginbottom 2011). A form of Luxemburg's argument has been influential in Wolpe's articulation of modes of production approach (see below).

Whereas Luxemburg's theory of imperialism emphasized that capitalism inherently requires sources of value from societies external to it, Lenin's theory is of a capitalism that has been *transformed in its expansion*. As did Luxemburg, Lenin ascribed great significance to the Anglo-Boer War of 1899–1902, which he placed with the US war with Spain in 1898 as a historical turning point of global significance. In *Imperialism the Highest Stage of Capitalism* (1916a), Lenin argued that these two wars marked a new stage in which a handful of imperial powers fought each other in order to gain colonial possessions and that these wars served to *re*divide the world between them. Lenin acknowledged that he had learnt much from the "social reformer" Hobson's 1902 work based primarily on South Africa, describing it as "a very good and comprehensive description of the principal specific economic and political features of imperialism." He saw those features most pronounced in Britain as a "rentier society" enjoying "superprofits," and the domination of finance that had sprung from the spectacular profits extracted from South Africa, India, the West Indies, and other colonies.

Most distinctive in Lenin's theory of imperialism is that it has a political side (imperialism as generalized and intensified national oppression) and an economic side (imperialism as monopoly capitalism, the domination of finance) which he did not have time to integrate with Marx's critical political economy. In contrast to Hilferding's detailed extension of the categories of volume 3 and Luxemburg's robust critique of volume 2, Lenin's "popular outline" on imperialism (1916a) does not reference back to *Capital*. He was more concerned to present the totality of contradictions, to connect the military conflict in Europe with the economics of imperialism. In this regard there is a greater theoretical leap with Lenin than with his contemporaries, and because not all the conceptual mediations were filled in, perhaps a leap of faith *by Lenin* that he had applied

Marx's spirit of revolutionary dialectics to the new reality (Anderson 1995).

What Lenin did achieve was the filling out of his concept of modern imperialism as a new stage of capitalism to encompass a fresh look at social class relations. He was especially concerned to chart the social roots of "opportunism" in Europe, the tendency to reconciliation with the ruling class even as it engaged in imperialist oppression and war. In the rich countries, the working class had become more differentiated, with an upper stratum merging with the petit bourgeoisie that was socially corrupted and bound to the benefits of imperialism, a "labor aristocracy" that for material as well as ideological reasons backed its own state in the war. Although imperialism had created a split in the working class, resistance had at the same time created the possibility for unity of workers in oppressor and oppressed nations on the political basis of support for national self-determination. In the poor countries, specifically the colonized nations, national liberation movements were agents of rebellion and revolution that the poorer strata of workers in the rich countries should unite with as allies against their own imperialist state and its labor aristocratic defenders (Lenin 1916b).

Another aspect of Lenin's analysis of imperialism was the class relations within the oppressed nation and the social basis of their distinct political objectives. This aspect was quite undeveloped in Lenin's initial analysis, which was challenged by Indian M.N. Roy in debates at the second congress of the Communist International. Together they developed a position that recognized the distinct experiences and role of the working class in the oppressed nation (Lenin 1920; Roy 1922).

The recognition that capitalism had created structural divisions and splits within the working class internationally resonated strongly in South Africa, from where, quoting a contemporary observer Mr. Bryce, Hobson reported an "absolute social cleavage between blacks and whites":

> The artisans who today come from Europe adopt the habits of the country in a few weeks or months . . . the Cornish or Australian miner directs the excavation of the seam and fixes the fuse which explodes the dynamite, but the work with the pick axe is done by the Kaffir. (Hobson 1900, pp. 293–294)

Half a century later, and this "absolute social cleavage between blacks and whites" would be pushed yet further.

Debating the Struggle Against Apartheid

The apartheid system was introduced in 1948 and lasted until South Africa's first nonracial elections in 1994. Apartheid was intense racism across all spheres of life, justified as a program of "separate development" for racially identified groups.

After the Second World War, the increasingly urbanized African workforce was employed in manufacturing (men), services and domestic labor (women), as well as on the mines and farms. The entire African population was denied citizenship of South Africa; instead, Africans were designated citizens of ten remote, impoverished, ethnicized Bantustan homeland states to where around four million would be forcibly removed as "surplus people." Black Africans constituted over 70% of the population but could hold only 13% of the land. The barrage included racial classification of "Indians" and "Coloureds" as well. Apartheid's segregation laws meant that all political and economic power was reserved for "Whites," only 15% of the population (IDAF 1983; Mamdani 1996; Platzky and Walker 1985).

The racist assault called forth a defiant response from the oppressed majority. The ANC Youth League played a leading part in a Defiance Campaign that built up over the 1950s, the era that gave birth to the *Freedom Charter* whose story is told in Nelson Mandela's autobiography and rightly celebrated in most accounts (Mandela 1994). The Charter remains for many the foundational anti-apartheid document. "The People Shall Govern! . . . All National Groups Shall have Equal Rights!" it declared. Moreover, its economic demands centred on sharing the country's wealth: "the mineral wealth beneath the soil, the banks, and monopoly industry shall be transferred to the ownership of the people as a whole . . . and all the land redivided amongst those who work it, to banish famine and land hunger" (ANC 1955). The ANC formed a multi-racial coalition around

the Charter, including the Indian Congress, the Coloured People's Congress, the (unmarked white) Congress of Democrats, the trade unions, the South African Communist Party (SACP) and so on, designated "the Congress Alliance."

Less well known, but of lasting significance, is the emergence of the Pan Africanist Congress (PAC) at this time. The "Africanist" PAC was against white supremacy; it had split from the "Charterist" ANC on several related grounds including disagreement with the excessive influence of white communists in its leadership. The PAC pointed out that different national groups were not the same; Africans were the absolute majority and that to put the exploiting, European white minority on the same footing as Africans as a national group was to reproduce white privilege within the Congress Alliance in the name of equality. The PAC identified their commonality with other African liberation struggles and emphasized the land question, in which regard the PAC saw South Africa as a case of settler colonialism. See especially the PAC's leader Robert Mangaliso Sobukwe's inaugural speech for a clear explanation of these themes (Sobukwe 1959). In practice, the PAC showed a stronger commitment to mass initiative but weaker organizational infrastructure than the ANC working with the Communist Party. For example, the 1960 protest at Sharpeville against the pass laws, brutally shot down by the police, was in fact called by the PAC. As both liberation organizations turned to guerrilla armed struggle in the wake of the Sharpeville Massacre they were both banned, their activists hunted down, killed, tortured, and imprisoned. The racist regime even passed a special law allowing it to imprison Sobukwe, as well as Mandela and ANC comrades (Lodge 1983; Pogrund 1990).

The SACP Version of the National Democratic Revolution

So it was in the immediate context of the Communist Party's rivalry with Pan-Africanism that its version of the national democratic revolution crystallized in the early 1960s. The SACP's forerunner, the Communist Party of South Africa (CPSA) founded in 1921, had originally been oriented to the white workers and supported their

strike in 1922, infamously behind the racist slogan "Workers of the world, unite and fight for a white South Africa!" The party then shifted attention to the black majority of workers, although the Executive Committee of the Communist International still found it necessary to admonish its South African comrades: "the CP cannot confine itself to the general slogan of 'Let there be no whites and no blacks.' The CP must stand the revolutionary importance of the national and agrarian questions." It urged the party to invite black workers "without delay into much more active leadership" (ECCI 1928).

In stating its political strategy 30 years later, the Soviet-inclined "Marxist-Leninist" SACP still found the use of Lenin's thought to be ideologically central, and so we turn now to that legacy. In his *Two Tactics* booklet written in 1905, Lenin (1905) had analyzed that there needed to be two revolutions in Russia: first, a democratic revolution to sweep away the Tsarist feudal dictatorship and bring in a democratic republic; then a socialist revolution to get rid of capitalism. Lenin argued an energetic interventionist tactic in the first, democratic revolution, so that it be pushed to its fullest limit, toward a "revolutionary-democratic dictatorship of the proletariat and the peasantry," and that this would be against the bourgeoisie whose instincts were to compromise, to do a deal with the Tsar and the landlord class. In this way the ground would be prepared for passing on to the socialist revolution. The actual course of the revolution confirmed Lenin's general orientation, albeit in a way that was unexpected due to the realignments of the First World War which saw the Russian bourgeoisie turn ever more decisively against the mass of workers and peasants.

The struggle for independence was of course a long-standing issue for oppressed peoples in countries occupied by European colonialism that was posed afresh by the national movements in the twentieth century. The idea of the national democratic revolution was widely debated in the early years of the Communist International including, as we have indicated, with reference to strategy in South Africa. It was from these antecedents that the SACP constructed its own version of the national democratic revolution. In 1962, the SACP adopted the thesis of "colonialism of a special type" arguing that the:

> "The combination of the worst features both of imperialism and of colonialism with a single national frontier," maintained in the interests of all whites, but particularly the monopolies which "are the real power." In this "white colonialist system" the task of the Communist Party "is to lead the fight for the national liberation of the non-white people, and for the victory of the democratic revolution." (Davies et al. 1984, p. 291)

From this perspective, the party gave its "unqualified support" to the *Freedom Charter*, arguing that, although not itself "a programme for socialism," nonetheless:

> Its aims will answer the pressing and immediate needs of the people and lay the indispensable basis for the advance of our country along non-capitalist lines to a socialist and communist future. (SACP 1962)

This ambiguous formulation was to leave many questions open as to how the democratic revolution would connect "along non-capitalist lines" to a socialist future.

Several crucial points were overlooked in the SACP's rendering of Lenin. First, the whole point of *Two Tactics* was that the working class should ally with the peasantry to together play the leading role in the democratic revolution against feudalism; Lenin warned that the Russian bourgeoisie would vacillate and seek to make a deal short of full democracy. Second, while the political goal of the democratic revolution was to gain a republic, as that afforded the best grounds for working-class organization to flourish, its social purpose must be to destroy private ownership in the land. Learning from the experience of peasant revolts against the landlord class, Lenin (1907) went on to emphasize that the land should be nationalized to complete the democratic revolution. As circumstances changed again in the First World War, he added "nationalisation of the land is not only the 'last word' of the bourgeois revolution, but also a *step towards socialism*" (Lenin 1917). Third, while Lenin retained an analytical distinction

between the democratic revolution and socialist revolution, their relationship changed in practice. As the class struggle changed reality, Lenin changed his conceptualization. In his later understanding, he presented them more and more as phases in one continuous, complex revolutionary process. This applies to the actuality of the Russian revolution itself as well as to anti-colonial struggles; throughout, there was a sense of revolutionary dialectics on how the two could be connected to the best advantage of the working class.

How then would the national democratic revolution to get rid of apartheid be prosecuted to the best advantage of the African working class? The SACP's "colonialism of a special type" has drawn one line of criticism from Trotskyism on the grounds that it justified armed struggle and turned away from the specific mission of the working class (Callinicos 1988, pp. 61–72). For Hirson, the SACP's "two-stage theory" of revolution "became the hallmark of Stalinism in South Africa" (1992, p. 48). The Trotskyists' critique of "two stages" (actually two revolutions in the SACP interpretation) and their preferred "permanent revolution" thesis based on (Trotsky 1906) suffers from two problems, both of which were forms of abstraction. First, it was abstract politically: there was an urgent need for a democratic national liberation movement uniting forces to end racist apartheid, including by violent armed struggle as required. Second, the critique was theoretically schematic: it harked back historically but was disconnected from an actualized political economy of current realities. The left critique of the "Stalinist" SACP needed to be grounded in the concrete debate about apartheid's connection with capitalism and imperialism, which was about to surface.

SACP theorist Brian Bunting's book *The Rise of the South African Reich* clarified the direction the party had taken: it sought liberalism as an ally. Bunting identified two wings of Afrikaner political leadership in response to the British state-building strategy that forged the Union of South Africa in 1910. The orientation of "Milnerism"

was the offer of an alliance between the predominantly British mining magnates and Afrikaner settler farmers as the dominant class. Generals Smuts and Botha were for conciliation with the British, whereas Hertzog was for a separate path for Afrikaners (Bunting 1964, pp. 22–23). Bunting emphasized that Hertzog's Nationalist Party supported Hitler in the 1930s. If the point was not sufficiently clear, his book was published with swastikas on its cover. The Afrikaner "Nats" stood for *wit baaskap* in the 1948 election. Bunting translates *baaskap* literally as "mastership": Charles Feinstein (2005, p. 161) translates *wit baaskap* more meaningfully as "white domination." The Nationalists gained 70 out of the 150 seats and, as the biggest single party, formed the government that implemented a series of measures to stop all forms of integration and to enforce racial exclusion of the black majority, bringing in *apartheid*, otherwise known as "separate development." Bunting portrayed these as "South Africa's Nuremberg Laws." He framed apartheid as a *policy* that was the product of Afrikaner nationalism's convergence with Nazi ideology. This in turn implied a "popular front" opposition strategy that involved uniting with all possible forces, in particular with British liberal democratic capitalism, against the greater evil. This view of apartheid was widely shared internationally at the time and in that sense is not exceptional. The significance was that Bunting was an SACP guiding light, yet his analysis suppressed entirely the legacy of Marxist theorizing South Africa in its relation with capitalism and imperialism.

In many respects, the strengths and weaknesses of the final outcome of the anti-apartheid struggle were already present in Bunting's decidedly pro-liberal capitalist and pro-British "Marxist" analysis. The persistence of this line of thought, despite its obvious one-sidedness, can only be because it corresponds to certain class interests.

Apartheid as a Stage of Racial Capitalism

In the 1970s there was a flourishing of Marxist scholarship, mostly written in exile, influenced by

ideas of the "New Left" and motivated by the liberation of Angola and Mozambique from Portuguese colonialism and the recovery of struggles inside South Africa, most especially after the Soweto Uprising in 1976.

The South Africa Connection by First, Steele, and Gurney on Western investment in apartheid is a classic that deserves to be republished. After the Sharpeville Massacre there was a brief dip, and then foreign investment surged. Two-thirds of the investment came from Britain, such that "it is hard to imagine how some sectors, like banking … would keep going without British backing" (First et al. 1973, p. 9). The explanation for the investment surge was simple: the spectacular returns to investors "is exactly what apartheid is all about" (15). First et al. recognized specifically Afrikaner prejudices, but they argued, the difficulty with this description of apartheid:

> As the result of a clash between two aggressive nationalisms – African and Afrikaner – does not explain, for one thing, why and how apartheid grew so naturally and effortlessly out of the state policies pursued, not in the *Boer* Republics but in the *British* ones, when South Africa was a colony run from Whitehall. (16)

Although they do not critique him directly, First et al. were challenging Bunting's analysis. The emphasis in this new approach was on apartheid *as the latest stage of capitalism* in South Africa, as well as a set of ethnic/nationalist policies. The starting point of the revisionist school of analysis was the relation between class and race in the formation of a modern, industrial "racial capitalism." Harold Wolpe (1972) and Martin Legassick (1974) were founding contributors to this new school, both of whom focused on the system of migrant African labor for the gold fields from 1890 onward. Frederick Johnstone (1976) and Bernard Magubane (1979) wrestled with theorizing the role of British imperialism as colonial capitalism. What is distinctive here is the concentration on the establishment of the corporate mining system as the foundation of modern South Africa, historically *prior* to apartheid as such.

The new analyses engendered a debate with liberalism, which is reviewed in (Alexander 2003). Could big business become a force against apartheid? Could, as the liberals claimed, foreign investment be portrayed as at all beneficial for the African working class?

The general point that the new Marxists argued is that, contrary to the liberal claim that capitalist growth "would in the long run undermine the racial structure of apartheid," it was actually accompanied by "ever-increasing repression" (Legassick and Innes 1977, p. 437). Liberal author Merle Lipton's response argued that, in absolute and relative terms, the condition of African labor was improving. "If important groups of capitalists are increasingly tending not to support apartheid, then this makes possible the option of cooperation with them" (Lipton 1979, p. 75). Consequentially, for Lipton, a "constructive engagement" with big business to end apartheid was viable.

Apart from the empirical grounds of the dispute, and the political consequences, of which more later, there was a theoretical Achilles heel in the Marxist response to the liberals. Although approaching the issue in historical materialist terms, most of the new Marxists balked at a concept of greater exploitation which was required to anchor their argument, and would connect racial capitalism with imperialism theoretically.

Debate over the Rate of Exploitation

The critique of Wolpe by Michael Williams (1975) is infrequently cited but worth close attention. Williams applied Marx's theory of commodity money to stress the particularity of gold production in South Africa. Wolpe and Williams made a serious attempt to use the concepts of Marx's *Capital* in their analysis of the specific social relations constituting South African capitalism. Wolpe highlighted the reproduction of migrant labor power in pre-capitalist societies with low money costs, allowing mining capital to pay low wages to African workers. South Africa emerged as a social formation in which the capitalist mode of production draws value from pre-capitalist modes. Echoing Luxemburg, Wolpe interpreted this relation of exploitation relying on reproduction outside capitalism as the continuation of Marx's "primitive accumulation."

Williams's intent was to critique both Wolpe and the more standard SACP thesis. He fastened

on the particularities of value production by African labor in the gold fields. Williams replaced Wolpe's outer contradiction with pre-capitalist modes as the source of extra surplus value with an inner contradiction peculiar to the capitalist production of gold as the money commodity. Gold mining capitalists had a privileged position that allowed them to draw surplus profits: "the gold mining industry is in a unique position to reap the benefits of exploitation directly in accordance with the quantity of immediate labour it employs" (Williams 1975: 23). This draws on Marx's theory of absolute rent and needed further development using the theory of differential rent, but which nonetheless was a big step forward. For a discussion of Williams and Wolpe which argues that the "articulation of modes of production" is better theorized as a rearticulation of the capitalist mode of production itself, in which race is internalized as part of the capital-labor relation, see (Higginbottom 2011). In place of the notion of colonialism of a special type to explain South Africa's exceptionalism, Williams argued in effect for a fuller concept of capitalism of a special type. With the idea of "archaic surplus value," he came close to the categorical breakthrough achieved by Marini in Latin America, with the concept of the super-exploitation of labor.

In a paper published by the British Anti-Apartheid Movement, Good and Williams (1976) reached a high point from which to take the theoretical debate forward. Their purpose was to convince British workers that their solidarity would serve a common interest. What was innovative in their argument was the application of Marx's explanation of the declining rate of profit to the problem, in relatively popular form. They opened their discussion in similar vein to Legassick (1976, p. 437), who argued that although African workers were paid significantly less than workers in Britain, British workers were nonetheless in a technical sense actually more exploited because they were more productive and hence received relatively less for their labor. This is more than a view, but rather a deeply and widely held ontological assumption of Trotskyism and north-centric Marxism in general. In line with this thinking, Good and Williams offered a worked example to demonstrate the difference in value relations between an "advanced country" (such as Britain) and a "neocolony" (such as South Africa). In their example, productive technique and hence the ratio of capital invested to labor is much higher in the advanced country, thus:

> Let 4:1 be the capital–labour ratio in the advanced capitalist country and 1:4 in the neo-colony; and let 100 per cent be the rate of exploitation in the former and 50 per cent in the latter. (Good and Williams 1976, p. 8)

The analysis was bounded by these two assumptions; but were they correct?

On the first assumption, Good and Williams's data showed that in 1970, the gross fixed capital formation per manufacturing worker in South Africa was just marginally below that in the UK. But investment in South Africa was increasing faster, so, by 1973, fixed capital per worker was slightly *higher* in South Africa than in the UK. Insofar as gross fixed capital formation per worker is a reasonable proxy for the mechanization that led to greater productivity, what Marx termed the technical composition of capital (1976/1867, p. 762), the UK and South Africa manufacturing averages were roughly equivalent. A Land Rover production line in Pretoria was in fact technically quite similar to one in Solihull, and the workers were similarly productive.

The second assumption of the illustrative example concerned the rate of exploitation, yet this was precisely what had to be investigated rather than assumed. Marx explained that within the capitalist mode of production, the rate of exploitation of labor is the same as the ratio of surplus value to variable capital, which he called the rate of surplus value. The rate of exploitation of the workers is the surplus value they produce (s) divided by variable capital (v) exchanged in wages to purchase their labor power (1976/1867: ch. 11). The ratios of 100% rate of exploitation in the advanced country and 50% in the neocolony are similar to the ones given by Marx, in a questionable example comparing a European country "where the rate of surplus value might be 100%" and "in an Asian country it might be 25%" (Marx 1981/1895, p. 249), which he did not justify empirically, and which bears no relation to the

international production relations of contemporary capitalism, but which has been clung onto as a crutch by subsequent north-centric Marxists. Good and Williams assembled data that showed there could not possibly be a lower rate of exploitation in South Africa than in the UK, because on the basis of a similar technical composition, investors were able to make a significantly higher rate of profit. "We can only conclude that the relatively high rate of profit in South Africa is more a function of the high rate of exploitation than of low capital–labour ratios" (Good and Williams 1976, p. 10). The investigation obliged Good and Williams to move beyond their initial assumptions and conclude that the rate of exploitation in South Africa was indeed higher. When we add here that white labor was remunerated on average nine times more than African workers (Martin 2013, p. 26) and that by this time there were few white workers, rather white *supervisors*, this higher average rate of exploitation was entirely due to the *drastically lower wages paid to the African workers for the same value produced*.

We have arrived at a vital point for the political economy of apartheid, capitalism, and imperialism: the rate of exploitation considered quantitatively to demonstrate the material "cleavage between black and white." To illustrate, gold mining in South Africa publishes industry figures. This allows us to estimate the degree of exploitation of African gold-mine workers over decades. Selecting the same year that Good and Williams studied (i.e., 1970), the ore milled per worker was 193 metric tons; the average working revenue was R11.24, the working costs R7.34, and the working profit R3.90 per ton. In 1971, the average annual African wage was R209, at 1970 prices. Assuming the 1970 annual wage was also R209, the average wage cost was R209/193, that is, R1.08, per ton (Feinstein 2005, p. 170; Lipton 1986, p. 410). Assuming that working profit is realized surplus value, and wage cost stands for variable capital, on these figures the gold mining industry average rate of exploitation of African labor was R3.90/1.08 (s/v), or 361%, *nearly four times higher* than the 100% rate typically cited by Marx. Rather than, as Marx often observed, workers toiling half the working day for themselves and half for the capitalist, the African workers' wages were the equivalent of less than a quarter of their labor time, with nearly four-fifths of their time going to the capitalist.

The above analysis corresponds with solidarity initiatives that some trade unionists in the UK, such as the British Leyland workers, were taking against their own bosses (Luckhardt and Wall 1980, pp. 481–483). On theoretical terrain, it fills the gap left by Hilferding, who viewed the international class relation from its European end, where the benefit to finance was apparent. The promoter's profit made in the launch of new mining companies and income from shares as fictitious capital had, eventually, to come from somewhere. What underpinned the new generation of joint stock companies and other forms of finance capital was at the other end of the relation, fundamentally the system of cheap labor, or super-exploitation of African workers, as the source of the expected surplus profits (in this case nearly identical to the "superprofits" in Lenin's terminology).

The History of Imperialism and Racial Capitalism

The relation of imperialist super-exploitation is the axis around which racial capitalism in South Africa was built, and which buoyed up the monetary system of British colonialism, extending its life. Within two decades of the initial production on the Rand in the early 1890s, the gold industry employed a quarter of a million African workers at any time, with several times more than that number rotating through the migrant system. The British prosecuted the Second Boer War to wrest control of the Rand from the Afrikaner farmers, who themselves had dispossessed the Africans two generations before. Victorious Lord Milne inaugurated a regime tailored to the needs of mining capital: land laws, the color bar, and pass controls (Callinicos 1981). The African National Congress came together in 1912, just 2 years after the birth of the South Africa Union, to protest "the repression of all blacks in every conceivable form" (Meli 1988, p. 34).

Around two-thirds of the mine labor force came from outside the borders of the Union

(Wilson 1972). In their first two decades, the Johannesburg mining houses were mostly financed from London, with some capital from Germany and France. Milne's project was foundational, shaping the contours of the state as a functioning apparatus of racial repression, and it situated South Africa's location in international political-economic relations. African labor was pulled in from neighboring colonies, while profits flowed out to London. London moreover consolidated its control over the world's biggest source of gold. Gold bullion boosted the value of pound sterling and the City of London as a financial center, and with that extended Britain's imperial privilege (Ally 1994). Once they had secured the Union, the British pursued rapprochement with the Afrikaners to secure internal political stability through white supremacy, in exchange for a share in the spoils. This power shift is seen as one of the "systemic periods" in South African history that would transition again into apartheid in 1948 (Terreblanche 2002).

A distinctly South African mining monopoly capital emerged when Ernest Oppenheimer formed the Anglo American Corporation in 1917. Using capital investments mostly from the USA, Oppenheimer set about bringing the diamond and gold industries under the sway of centralized holding companies. The story is well told in Lanning (1979) and the dedicated book-length study by Innes (1984). These authors point out that underlying Oppenheimer's financial wizardry was an inherent tendency toward monopoly characteristic of gold production. As identified by Williams (1975), insofar as gold is the money commodity, the universal equivalent exchangeable with every other form of abstract human labor, capitalist gold producers have an unlimited demand for their product. Any increase in productivity, reducing production costs and expanding volume, increases profits without undercutting the "price" of other gold-producing capitals. This gave rise to a unique attenuation of competition in certain aspects. The gold mining capitalists of the early Rand were united in their determination to keep labor costs down through industry-wide "maximum wage agreements," and they had a mutual interest in sharing knowledge on production techniques and output data. Corporate organization passed quickly from hundreds of individual joint stock companies to just six financial groups that switched capital around a portfolio of gold mines according to their performance (Innes 1984, p. 55). Monopoly over the diamond industry started at the sales end, a cartel limiting sales to keep the price up. Oppenheimer's innovation was to build on these tendencies and take them to another level. He centralized existing mining corporations into a single conglomerate that rapidly rose to preeminence in South Africa and beyond that into sub-Saharan Africa.

On its internal projection, Anglo-American opened up mine production in the Orange Free State after the Second World War, requiring increased investment in plant and machinery to cope with the mines' extreme depth. The company concentrated its portfolio on the more profitable mines and emerged as a "dove" within the Chamber of Mines, lobbying for an increase in black wages that would reduce its reliance on foreign labor, which it was in the best position to afford. Anglo's intention was *not* to get rid of the color bar but to *reposition* it. The corporation's reforming pressure was within narrow limits defined by self-interest and in any case could only ameliorate the growing gulf between white and black as captured in their earnings ratio, which had risen from 12 times in 1946 to over 20 times in 1969 (Lanning 1979, p. 156).

The external projection of the Oppenheimer Empire is documented by Lanning and Kwame Nkrumah. Nkrumah argues that imperialism entered a new stage of neocolonialism after the Second World War. He sees the essence of neocolonialism being that although the subordinate state "is, in theory, independent and has all the outward trappings of international sovereignty. In reality its economic system and thus its political policy is directed from outside" (Nkrumah 2002/1965 ix). Outside direction was targeted at the profitable extraction of Africa's mineral resources. In this regard, Nkrumah showed South Africa in a double relation with the rest of Africa. On the one hand, "the whole of the economy is geared to the interests of the foreign capital that dominates it" (12), and, on the other hand, white South Africa's

mining giant had spread neocolonial tentacles of its own across Africa. Oppenheimer's De Beers diamond group drew profits from Sierra Leone, the Congo, Tanganyika, Angola, and South West Africa (today Namibia); and Anglo-American subsidiaries mined in Rhodesia (today Zimbabwe) and Zambia.

Neocolonialism and Black Consciousness

What is striking in Nkrumah's account is the leading role of mining corporations alongside finance as the principal vehicles of Africa's continuing neocolonial domination. In his analysis, the main contradiction is between externally based capital and internally based democracy. This view is deepened by class analysis of neocolonialism that confronts the voluntary alignment by an aspiring African middle class, choosing to align itself with the interests of the corporations and imperialism. Fanon (2000/1963) and Cabral (1966) analyzed the class aspect of neocolonialism in its subjective and objective dimensions. They warned against and fought against the neocolonial alliance as an outcome of the liberation struggle (Saul 2012).

Fanon's mode of thought had its correlate in racist South Africa, Black Consciousness. Writing under the pseudonym "Frank Talk," Steve Biko urged his fellow blacks to realize that "the most potent weapon in the hands of the oppressor is the mind of the oppressed" (2002/1978, p. 68). The government banned Biko in 1973 and made it illegal to quote his words, and yet his thought contributed to a new generation of struggle, the workers revolt in the early 1970s, and most especially the school students' rejection of Afrikaans as the language of their education that animated the Soweto Uprising. Biko was assassinated in 1977, and the next year his comrades formed the Azanian People's Organisation (AZAPO).

Under the pseudonym "No Sizwe," Neville Alexander wrote *One Azania, One Nation* to dissect the Nationalist Party apartheid ideology in the construction of groupings of people through the prism of "race," with the Bantustans as the lynchpin. Alexander brought a fresh perspective into the debate. He argued that understandings of race held by different currents "tend to become tied to

the related question of which class should lead the national liberation movement" (Alexander 1979, p. 98). He identified three conceptions of national liberation in South Africa. The first, which had been advocated in the ECCI 1928 memo, was for an independent native republic. The second conception was "the democratisation of the polity within the existing capitalist framework . . . that the black people should be *integrated* in the existing system by being given formal political equality" (285–286), as advocated by the SACP/ANC alliance (whether this is a fair characterization of the *Freedom Charter* is part of the debate). Alexander advocated a third conception: the unity of the non-Europeans to overcome the white bourgeois class strategy of division and fragmentation in which "the nation . . . consists of all the people who are prepared to throw off the yoke of capitalist exploitation and racist oppression" (290). "Azania" was the term adopted to relay the idea of one nation of all the oppressed.

Black Consciousness drew in some measure from the transition that took place among African Americans from civil rights to radical nationalism. These debates over how to defeat racism arose in different contexts, yet began to overlap.

Debating Solidarity Strategy

Another aspect of the debates internal to the movements, that indeed throws light on them, was the parallel external debate on international solidarity strategy.

As we have seen, First et al. (1973) had pointed out the vital importance of the South African connection for sustaining the imperialist character of British capitalism, with 10% of its direct investments and 13% of its foreign profits worldwide (1973, p. 334). To the economic we should add military collaboration, on which Labour Governments in the 1940s, 1960s, and 1970s had an appalling record, especially with regard to purchasing uranium from South Africa and illegally occupied Namibia (Brockway 1975; Moorsom 1982). Far from banning the nuclear bomb, the British Labour Party had connived with apartheid to make it. This raised again Lenin's analysis of

the labor aristocracy, a privileged layer expressed through the official labor movement that would block effective moves to undermine the very relation from which it drew its privilege (Yaffe 1976).

The debate over solidarity strategy has been resurrected in two recent publications. Fieldhouse (2005) offers a history of the British Anti-Apartheid Movement (AAM) as a pressure group. Thörn (2006) conceives of "anti-apartheid" as a social movement, a successful campaign that he presents as a model for transnational action. Both works downplay the degree of British involvement with apartheid, that is, they express the AAM's standpoint in the debates of the time, drawing at least one sharp review (Brickley 2005). There is an ongoing research project that investigates the views and actions of participants in what became known as the militant wing of anti-apartheid and which offered a distinct strategy, the City of London Anti-Apartheid Group (Brown and Yaffe 2014, 2017). It is timely to review the debate, not least for any lessons that may be drawn for future international solidarity campaigns.

Even by its own terms of maximizing unity against apartheid, the AAM made a strategic error. In practice, its mobilization against British collaboration with apartheid was constrained to what was acceptable to the official trade unions and Labour Party in Britain, and since Labour had in government itself collaborated fully with apartheid, the extent of AAM action was generally no more than formal lobbying. In fact, most purposeful initiatives to break the routine of collaboration came from *outside* the official AAM, the clearest indicator being the Stop the Seventy Tour (Hain 1971, pp. 120–125).

The question of unity needs to be considered dialectically in relation to the struggle. The right point of unity in the struggle cannot be defined in the abstract, but in the concrete (Cabral 1989). It was the masses in South Africa, in Namibia, their liberation movements, and the Frontline States who were fighting apartheid directly, and their struggle was the primary motor for the entire movement. The solidarity movement was a support base that could only fight apartheid indirectly, a secondary but nonetheless important role, and to

do that effectively, it had to have its own clear strategy. In its close cooperation with the SACP and the ANC, the official AAM strategy confused roles, whereas there was a need to distinguish between them. If the solidarity movement had a single issue to concentrate on, it was to *isolate* apartheid, to weaken it from without, and that meant fighting collaboration between its own establishment and the apartheid regime, to work for sanctions. To do otherwise would be to renege on its specific responsibility. The greater the collaboration, as in the case of imperialist countries such as Britain and the USA, the more this was so. In fighting British collaboration with apartheid, solidarity forces in Britain were providing the most effective contribution they could to fighting apartheid (Brickley et al. 1985).

A further problem became ever more evident. The mobilizing activity of the City of London Anti-Apartheid Group came across a second constraint that given its position as a solidarity campaign was at first difficult to accept and later even harder to comment on publicly. Despite their anti-imperialist rhetoric, the SACP and ANC were in practice opposed to an anti-imperialist campaign that risked alienating their allies in the Labour Party and other sectors of the British establishment. They were closely tied to the AAM; its orientation was theirs too. Once this was realized, the sectarianism of the ANC toward solidarity with other currents arising in South Africa, its tendency to put itself forward as the sole representative, to discourage direct trade-union solidarity links, and to court only social-democratic support all fell into a new light.

In the meantime the struggle had taken a leap forward. The racist regime was confronting manifold political and economic challenges that led it to instigate a phoney reform program of controlled internal changes (Price 1991). The combination of co-option and repression failed to stem the upsurge in popular protest. The United Democratic Front (UDF) was formed in 1983 to oppose a stooge "tricameral parliament", a national organization with an international audience. The UDF was the above-ground internal correlate of the ANC, linking it to the mass upsurge on the program of anti-apartheid unity.

Murray (1987) relates the widespread eruptions of popular revolt, "stay away" strikes, civic protests, and the broadening of political struggle in the mid-1980s. Every time the regime turned the screw, the resistance grew. The Vaal Uprising in 1984 was an explosion of working-class rebellion. Even the State of Emergency in 1985 could not halt the protest spreading nationwide. To his lasting credit, Mandela steadfastly refused to countenance any deal short of one person one vote, even at the expense of staying in prison. Toward the end of the decade the regime was reaching an impasse, every move it made was thwarted by the preparedness for insurrection, not by the increasingly concerned ANC/UDF leadership but from grassroots forces, whether UDF aligned or not. It was doubtful they could be held back, raising the possibility of an internal people's war to match the wars going on immediately outside South Africa's borders.

Ten years of Kissinger's policy of "constructive engagement" had failed to rescue Pretoria; cracks were appearing in the alliance of international forces protecting the regime. The State of Emergency had the unintended consequence of unsettling international lenders, who from the credit crisis of 1985 began to look for an exit strategy (Ovenden and Cole 1989: ch. 4). Sanctions had really begun to bite (Commonwealth Committee 1989; Orkin 1989). South Africa's "total strategy" security doctrine meant saturation terror in Namibia and took an awful and devastating toll on the adjoining populations of Mozambique, Angola, and the other frontline states (Hanlon 1986). At the close of several months of fighting, at the Battle of Cuito Cuanavale, in early 1988, Cuban-piloted planes and tanks helped Angola's MPLA Government defeat the invading South African forces. After having inflicted tens of thousands of African casualties, hundreds of white South Africans were now also being killed. Not only had South Africa's invasion of Angola been repulsed, its ability to maintain the occupation of Namibia without further morale-sapping losses was doubtful. Forced back on its external front, and facing internal insurrection, the racist minority regime's capacity to sustain total warfare had been tested to breaking point. The apartheid

state could no longer guarantee capital accumulation and racial domination; *the question of reform or revolution had truly arrived*. On the side of white supremacy, P.W. Botha's resignation in 1989 cleared the way for new president F.W. de Klerk to address the previously unthinkable: steps toward a negotiated non-racial settlement (Price 1991, p. 11).

Beyond Apartheid: Managed Transition

By the mid-1980s, the racist regime had entered into a prolonged "organic crisis" (Saul 1986). As reflected in publications such as *Work in Progress*, *Transformation*, *South Africa Labour Bulletin*, and *South African Review*, the debate on the opposition side had returned with fresh immediacy to the question of political power and what would happen beyond apartheid.

Two Class Interpretations of the National Democratic Revolution

Under the pressure of an intensifying class struggle, two distinct and, in class terms, opposing interpretations of the national democratic revolution emerged. What the different interpretations of Lenin's "two tactics" meant for the South African revolution was about to become clear.

The general history of workers' organizations and trade unions in South Africa is told up to 1950 from the SACP perspective by Simons and Simons (1983). Luckhardt and Wall (1980) provide a comprehensive history of the pro-ANC South African Congress of Trade Unions (SACTU) until the end of the 1970s. At this time there was a resurgence of trade unionism inside South Africa, especially in the Eastern Cape, and with it came a new debate between "workerists" and ANC "populists." Eddie Webster's study of workers' arduous conditions in metal foundries linked changes in the labor process to the radical form of trade unionism that these workers created, based on the role of the shop steward. Webster saw the rise of the shop stewards' movement as "a challenge from below" (1985, p. 231) and "the birth of working class politics" (261). Webster worked with the FOSATU federation formed in

1979, the "workerist" tendency that emphasized rank-and-file trade unionism. Steven Friedman (1987) covered the black trade unions as a journalist, telling the story of the Durban strikes in 1973 and the debate inside the movement about whether to register with the state after the Wiehahn reforms, which FOSATU did, but the SACTU/ANC-aligned unions refused seeing registration as tacit collaboration. The SACTU/ANC "populist" tradition came forward into a new generation of general unions linked with community-based struggle organizations. Leaders like Moses Mayekiso emerged who embodied both strands.

COSATU was formed in 1985 from the convergence of unions led by the "workerist" and "populist" tendencies and the 180,000 strong National Union of Mineworkers (NUM) that broke away from another federation, CUSA. The independent union movement had swollen from just 10,000 members in 1976 to COSATU's 600,000 members (Naidoo 1986), with 250,000 more in other federations. The first years of COSATU bore great promise of possibilities for united worker resistance, and within its first 8 months, the federation led the two biggest strikes in South Africa's history. It was mobilizing against the immediate challenge of the regime's restrictive Labour Bill and in a wider sense to bring apartheid to an end. General secretary, Jay Naidoo, made the point that COSATU was engaged in the general democratic struggle, *both* as an independent organization of the working class *and* an essential component of the democratic forces:

> It is clear that in the specific conditions of our country it is inconceivable that political emancipation can be separated from economic emancipation. (Goddard 1986, p. 10)

COSATU's inaugural congress was a high point, calling for disinvestment and resolving to support all sections of the oppressed:

> To call for a national strike should the apartheid regime carry out its threat to repatriate any migrant workers . . .
>
> ... under capitalist conditions of exploitation unemployment is a reality facing every worker at all times. To establish a national unemployed workers' union as a full affiliate . . .

> ... women workers experience both exploitation as workers and oppression as women and that black women are further discriminated against on the basis of race . . .(ibid.)

In terms of strategy, Naidoo asserted:

> We are not fighting for freedom which sees the bulk of workers continuing to suffer as they do today. We therefore see it as our duty to promote working-class politics. A politics where workers' interests are paramount in the struggle. (cited in Goddard 1986, p. 10)

This was a militant reformulation of the national democratic revolution strategy in terms "*where workers' interests are paramount*" (emphasis added). Meanwhile some distance away, in London in fact, SACP leader Joe Slovo was likewise reformulating the concept of national democratic revolution, but moving it in the opposite direction, onto pro-capitalist terms:

> For some while after apartheid falls there will undoubtedly be a mixed economy, implying a role for levels of non-monopoly private enterprise represented not only by the small racially oppressed black business sector but also by managers and business people of goodwill who have or are prepared to shed racism. (cited in Reed 1986, p. 10)

This latter formulation was an olive branch to the multinationals. As David Reed pointed out, Slovo was deliberately imprecise, "his failure to specify that the land and monopoly industry will be expropriated" tailored to assure "disparate forces" ranging from Anglo-American to the British Labour Party that private enterprise would be safe (Reed 1986, p. 10). This was a retreat from the 1962 program, whose "non-capitalist lines" had become capitalist lines and a long step away indeed from Lenin's "nationalisation of the land is not only the 'last word' of the bourgeois revolution, but also a *step towards socialism*," which in the South African context could only translate into nationalization of the mines and mineral resources. Slovo, then, reformulated the national democratic revolution, into terms *where the interests of big capital would remain paramount*.

Still, the message was coded. Wolpe's insistence upon contingency in the concept of national democratic revolution (1988, p. 32) was an adroit supporting move to Slovo; any realistic strategy

needed to take into account the unknowns of political struggle. Those more schooled in Marxism might recall that Lenin himself updated his view on how the analytically separable democratic revolution and the socialist revolution were connected in practice. Yet, for all the sophisticated pseudo-theoretical argumentation (Slovo 1988), the SACP's revived version of the "national democratic revolution" proved to be so elastic that it meant all things and none. It took some time for the realization to emerge that the SACP's version of "contingency" in the national democratic revolution meant something altogether different to Lenin's; in fact, it was not contingent at all but its opposite, an enforced separation between ending apartheid and bringing down capitalism. In practice, it was used to cover up not only the ANC's historic compromise but whatever venal opportunism was attendant upon it (Bond 2000; McKinley 1997).

Regulation Theory, Orthodoxy, and Alternatives in the Moment of Transition

Meanwhile, as the endgame of apartheid approached, a particular school of political economy arose temporarily like a fashion. At the end of the 1980s, a group of scholars working with the union federation COSATU developed an analysis of organic crisis in South Africa based on the "regulation" approach from France. They were to pave the way and give a radical economics gloss to the political turnaround that was about to take place. The approach theorizes changes to capital accumulation in any given capitalist society using the interrelated concepts of regime of accumulation, mode of exploitation, and regulation. In this view, regulation is broadly "the way in which the determinant structure of a society is reproduced" (Aglietta 1980, p. 13). Applying this to South Africa, Stephen Gelb argued that the postwar accumulation model crystallized by apartheid was best conceived as a "racial Fordism." Henry Ford had not only pioneered mass production but linked this to a society of mass consumption in the USA: his workers should earn enough to own one of the cars they produced. Gelb saw a similar accumulation model combining mass production and consumption in

South Africa, with the crucial qualification that it was racially structured: wages were limited, and consumption was limited, only *white* workers were paid enough to afford a car. Racial Fordism was necessary to cement the support of the white population and possible so long as it could be built on the continuing success of mining. South Africa has chosen an accumulation strategy that "made possible the importation of the capital equipment necessary to expand manufacturing" (Gelb 1991, p. 15).

Contingency is built into the regulation mode of analysis, too, as it seeks to explain why one strategy is adopted rather than another. In Gelb's analysis the "racial Fordism" strategy relied on the dollar price of gold and other mineral exports to pay for the imports. There was a competition for investment between mining and manufacturing. Their growing demand for skilled but cheap labor led capitalist organizations to press for the color bar to float, to allow some African workers into occupations previously reserved for whites and into more settled urban living. These changes were resisted by the political regime, putting "racial Fordism" into crisis. In this regard, Gelb noted without irony the convergence of his analysis with the calls for reform by Harry Oppenheimer, inheritor of the Anglo-American Corporation (19–20).

Gelb argued the need for an alternative economic strategy in which the "developmental state" was the central actor that would lead social restructuring to the benefit of the working class. The agency of the state was "an essential counterweight to the inevitable reluctance of extremely powerful private economic agents, especially the conglomerates, to bring about a fundamental shift in economic development" (31). The strategy the regulationists proposed was a series of industrial-sector plans requiring the cooperation of business and labor under the direction of government. Redirecting finance to invest in state priorities would be a particular challenge given South Africa's "highly concentrated corporate structure, which dominates the provision of external finance to industrial firms" (31). Behind the apparent pragmatism of the approach was a huge dose of utopianism: wishful thinking that the

conglomerates would accept an arrangement in which their profitability would be subordinated to a social justice agenda through state-directed plans for each industry. Bond (2000) and many others point out that in practice the opposite happened: big business controlled the economic policies of the postapartheid state.

There are weaknesses at the heart of the regulation theory that correspond to its exponents' technocratic tendency. The theory, Gelb argued, "focuses above all on the process of exploitation in class societies; that is, the appropriation by one class of the surplus produced by another. The various processes through which this surplus is expanded or contracted, comprise the major driving force in the accumulation process" (Gelb 1991, p. 9). This claim is not substantiated. On the contrary, regulation theorist Aglietta doubts the essentiality of surplus value as a concept (1980, p. 15) and rejects the concept of imperialism "as an ambiguous notion" (29). In Gelb's book, none of the sector chapters actually look at the issue of surplus value and exploitation. What emerged from the regulation school's apparent sophistication was actually a watered-down version of Marxism. It recognized class struggle, but without relating it to workers' production of surplus value and its conversion into capital, that is with the general law of capital accumulation; it recognized monopoly capital is a social power and yet hung back from its conversion into social property, as we have seen Marx had anticipated.

There was a second attempt to promote a reform-led strategy, the Macroeconomic Research Group "think tank" team that produced the MERG Report in 1993. The principal authors of this report came from the SACP and the British Communist Party, and were heavily influenced by the latter's "Left Alternative Strategy" (Sender 2014; Fine 1983). The MERG Report was critical of orthodox economic policy and advocated a leading role for state, with a special role for public sector investment leading a mixed economy in a progressive direction (MERG 1993, pp. 7–8). The proposed framework opposed privatization and advocated a moderate expansion of public expenditure to foster job creation, yet it also relied on a high rate of investment from the existing

corporate sector and on attracting further foreign investment (1993, pp. 9–10). The report promised that private investors would "reap handsome rewards" if they cooperated with the state in addressing inequalities and inefficiencies (1993, p. 11). The MERG's optimistic projection of public sector and private sector growth through partnership *avoided* the political crunch issue of nationalization linked to popular political power. But even this "realistic" and "affordable" center-left policy was rejected by the ANC leadership, who had set themselves on a more orthodox path (Habib and Padayachee 2000).

At the vital moment, these theoreticians bestowed a left patina to the SACP/ANC's historic compromise with capital. But what about the third party in the triple alliance: the trade unions? Despite being positioned as advisers to COSATU, the crucial political factor that the regulationists ignored, and despite its connections with COSATU the MERG downplayed, was the revolutionary potential of the working class mass movement, the only actor capable of breaking the power of the banks and conglomerates to enforce their nationalization. The mass movement was in both frameworks reduced to a mere lobbyist within the alliance, rather than striking out as an independent political actor. Both groups of economists advocated a "developmental state" to counterweigh big capital. This set the regulationists in particular on a trajectory; the trade-union researchers became ANC government advisers and then reluctant co-authors of the neoliberal program.

From Regulation to Reconciliation

The commitment of the political executive is pivotal in the power play between state and capital. By 1991, the ANC had already sufficiently indicated its accommodation with big business to bring into serious doubt its intention of implementing the regulationists' or MERG advised alternative strategy. While the tensions within the triple alliance would take several years to eventually play out, the ANC leadership was already courting big business. On 4 July 1990, Nelson Mandela addressed British businessmen on the "critical need" for rapid growth

that "cannot happen without large inflows of foreign capital" (cited in Padaychee 1991, p. 108). The transition was going to be managed top-down. As Marais puts it:

> The ANC's historical privileging of the political over the economic invited a settlement that would allow for significant restructuring of the political sphere, and broad continuity in the economic sphere. (2011, p. 70)

The lynchpin of the continuity was the arrangement made with a core group of multinationals led by Anglo-American, as detailed by Terreblanche (2002) and Marais (2011). Their analysis has been further validated by the publication of the inside story of British diplomacy, penned by Thatcher's ambassador to South Africa who testifies to the enormous effort that was put in to ensure that Mandela accepted continuity of ownership of big business (Renwick 2015). The die was fully cast in 1993 when, as part of the power-sharing interim government, the ANC applied secretly for an IMF loan, with the standard conditions attached (Martin 2013, p. 163). The outcome was a reconciliation with white-owned capital and imperialism that pushed socialism firmly off the agenda (Bond 2013, pp. 575–576).

South Africa After Apartheid

Democratic rule was welcomed, but class divisions have polarized. The unemployment rate actually increased from 28% in 1995 to 42% in 2003 and by 2013 stood at 34% (Di Paola and Pons-Vignon 2013); (Kingdon and Knight 2009). Fifty-five percent of 23-year-olds are not in education, employment, or training (Lolwana 2014). Sixty-five percent of African women are unemployed (Ntlebi 2011). Income distribution is still highly racialized, "in 2005/06, whites accounted for 9.2% of the population but netted 45% of total household income" (Marais 2011, p. 209). The African population suffers one of the worst levels of HIV/AIDS and tuberculosis in the world (264). Migrant mine workers still suffer silicosis and other crippling diseases on an industrial scale (McCulloch 2013). Johannesburg is threatened by rising acid mine water, Soweto is still rimmed

by poisonous tailings dumps, and communities in the Mpumalanga coalfield are engulfed by a cocktail of pollutants. According to environmental activist Matthews Hlabane, "the soil is burning and full of salt, the water is contaminated, the air is dangerous," cited in (Munnik 2008, p. 52).

Black economic empowerment (BEE) has meant business opportunities for some, but it is no more than a minority who have prospered, "the real beneficiaries of the democratic breakthrough have been the various fractions of the black middle classes, which have seen rapid growth" (von Holdt 2013, p. 593). South Africa after apartheid has not been a utopian experience for the working-class majority of the black majority. The decision of the ANC to embrace the neoliberal model has layered a new set of ills over the apartheid legacies of debt, disease, violence, exclusion, poverty, and environmental disaster. Good entry points into the critical literature that grasp the real content of the transition are Brickley (2012), Marais (2011), Satgar (2012), Terreblanche (2002), and von Holdt (2013).

A critical perspective from within liberal democracy is exemplified by Andrew Feinstein (2009) and R.W. Johnson (2010), who are scandalized by defense minister Joe Modise's corrupt arms deal with a British Aerospace consortium. Their justified exposure of the ANC in power is, however, shorn of any critique of its neoliberalism. In similar fashion, Plaut and Holden (2012) ask "Who rules South Africa?", and answer narrowly and only in terms of political parties rather than the socioeconomic structures of class (and race) power. Liberals do not like the ANC's corruption, advancing to degeneracy under Mbeki and Zuma, but they nonetheless back its economic program. Liberal historian Leonard Thompson's *History of South Africa* identifies that once reconciliation was achieved, the Mandela government had two major goals: "to create growth and to improve the quality of life for the majority of citizens," but, he asserts, "if both goals were pursued simultaneously from the beginning of the new regime, they would not be compatible" (2001, p. 278). That is, within the liberal paradigm, a challenge to private property relations is even now off the agenda; what is needed to

deepen democracy is first and foremost more cap-italist economic growth providing the base for a future redistribution of wealth. Recognizing growth first, redistribution later was the ANC's "crash course in reality." But we have been here before; this is trickle down, the mantra of neoliberalism.

Neoliberalism After Apartheid

The South African state is not a "developmental state," as it is not pursuing any substantive strat-egy of state-led industrialization and redistribu-tion. After apartheid, the ANC aligned South Africa with the post-Washington consensus ver-sion of neoliberalism. The state interventions that take place are to facilitate market efficiencies, capital investment, and accumulation. The eco-nomic structural roots are to be traced back to the late 1980s and the outward movement of finance capital that continued through the 1990s into the postapartheid era. Through a series of programs, the ideology of the ANC as the ruling party has indigenized and given "an African voice to neoliberalism" (Satgar 2012, p. 43). With the goal of competitiveness in global markets, ANC governments have sought to impose trade liberal-ization, with tight monetary and fiscal policies, but in so doing, they have dismantled a relative degree of self-sufficiency. It was in this latter respect that the peculiarities of apartheid's politi-cal economy were most strongly present. The legacy included a comprehensive array of para-statal energy corporations across the steel, coal, electricity, and hydrocarbon sectors, as well as arms manufacture and transport infrastructure that in the ANC's initial Reconstruction and Development Programme (RDP) would continue as the crucial hub to endogenous development. The approach was quickly undermined by the adoption in 1996 of the misnamed Growth, Employment, and Redistribution (GEAR) framework.

State programs have provided 14 million peo-ple with social grants and have built a million houses, an example of "post-Washington" poverty alleviation measures; nonetheless, "underpinning this reality is a state incapable of stemming the tide towards deepening inequality" (2012, p. 54).

Many in social movements targeted by the ANC machine might go further to argue that the state is not only incapable but decidedly unwilling.

Postapartheid into Globalization: Global Apartheid

Fine and Rustomjee make an important analysis of South Africa's economy, arguing that the "min-erals energy complex" (MEC) remains at its cen-ter and furthermore plays "a determining role throughout the rest of the economy" (1996, p. 5). "Complex" suggests interconnection, and these authors delineate the inputs and outputs that were constructed over decades around three prin-cipal actors: the mining corporations; formerly state, now privatized, state energy corporations; and, at its hub, finance. The complex gives the economy unusual characteristics. Coal is largely exported or turned into gas or electricity, rather than consumed in homes. The South African economy is "uniquely electricity intensive," with 40% of electrical energy used "in mining and mineral processing" (8). These authors recognize the continuing central importance of Anglo-American and its association with "South Africa's highly developed financial institutions," and point out that in this system of accumulation, finance is the epicenter of the complex (91–92). Drawing on Davies (1979) and O'Meara (1983), Fine and Rustomjee (1996) analyze the process, whereby Afrikaner capital emerged in the inter-war period to compete and converge with English capital. They trace the inputs and outputs to the mining and energy complex, note the growth of uranium and platinum mining, and review debates on industrial policy. Critical responses by Bell and Farrell (1997) and Nattrass and Seekings (2011, p. 549) argue that the MEC interpretation overstates the weight of the minerals energy complex by including all related manufacturing and under-states the extent of diversification of manufactur-ing sectors.

The restructuring of mining capital and other conglomerates throughout the transition is a vital topic. Cross-sector shifting of investments com-plicates the picture. In the late 1980s, a lot of foreign corporations, especially US ones, divested from South Africa. Sanctions penned the mining

corporations into their domestic capital markets, so they bought into the businesses previously owned by foreign capital, for example, the automotive industry, as analyzed in (Barnes 2013). From its inception in the 1920s, the auto industry's production combined imported kits with increasing local content. The1980s saw "South African mining houses and pension funds acquiring the assets of the departing MNCs" (249), a consequence of the pressure of sanctions. By 1993, mining capital dominated vehicle production. The sole exception was Volkswagen, which stayed throughout. The other multinationals returned in the 1990s to form joint ventures with local capital, and then further buyouts such that since 2008 all the seven major vehicle manufacturers have been 100% owned by global brand multinationals.

In correlation with these movements has been the "offshoring" of big mining capital's headquarters as soon as it was able to do so after 1994. Fine and Rustomjee highlight the "extent of capital flight" (1996, p. 11, 177) that was at first illegal but has since been officially allowed. The phenomena are investigated in a series of studies that probe:

> A particular combination of short-term capital inflows (accompanied by rising consumer debt largely spent on luxury items) *and* a massive long-term outflow of capital as major 'domestic' corporations have chosen offshore listing and to internationalize their operations while concentrating within South Africa on core profitable MEC sectors. (Ashman et al. 2010, p. 178)

Capital flight averaged over 9% of GDP from 1994 to 2000, rising to 12% between 2001 and 2007. Major corporations "such as Anglo American, De Beers, Old Mutual, South African Breweries, Liberty, Sasol and Billiton" have relisted on the London Stock Exchange (Ashman et al. 2011, p. 13). The moves are a combination of push and pull factors. Moving out corporate HQs means that dividend payments escape South Africa's exchange controls and removes the corporations from any risk of nationalization. Moving to London provides security, a better access to credit, and an enhanced platform for global operations. These corporations that were the principal economic beneficiaries of more than a century of racial capitalism have internationalized their operations through London and repositioned themselves as global players.

Ashman and Fine (2013) link the offshoring process with the restructuring of the financial sector in South Africa itself, which by 2010 was dominated by just four conglomerates: Standard Bank, ABSA, First Rand, and Nedbank, which between them control 84% of the market. Two of these "Big Four" have a London connection. UK-based Barclays Bank bought a controlling share in ABSA in 2005; and Nedbank is controlled by Old Mutual, the insurance conglomerate that moved to London and is "placed thirtieth of the world's most powerful corporations" (165).

As well as capital flight, relocating the site of capital ownership, there is the distinct question of capital flows into and out of the country. South Africa was "the single largest investor in FDI projects in Africa outside of South Africa itself in 2012" (Ernst and Young 2013, p. 5). South Africa is also the destination for more FDI projects than any other African country (31). The top five source countries for FDI projects in Africa from 2007 to 2012 were the USA, UK, France, India, and South Africa. China is ninth on the list. The UK had three times more projects. Of the top ten global mining corporations with direct investments in Africa, three (arguably four) are UK-based, and three are South Africa-based (Fig 2014). Each of the UK-based global mining corporations has significant connections with South Africa.

We started this essay with Hilferding, to whom Ashman et al. (2010, p. 175) wrongly ascribe the idea that industrial and banking capital fuse to form finance capital. As we have seen, his argument is rather that they are "intimately related" through credit and capital markets, and the form of the linkage is fictitious capital. More generally, there is yet to be a positive connection between theories of imperialism and the particular form of neoliberalism and capital restructuring in contemporary South Africa.

William Martin (2013) takes a world-systems approach to framing South Africa within international racial hierarchies of core and periphery

countries. Like Fine and Rustomjee, he gives special emphasis to the industrialization that took place in the inter-war period. He looks closely at the policies of the Nationalist and Labor Pact Government from 1924 with case studies of railways, banking, and tariffs. The government built a fully national railway system, whose extension and tariffs were geared to the needs of white farmers and white labor rather than the mining magnates. South Africa created its own reserve bank so that monetary policies, specifically decisions to go on and off the gold standard, were not so directly tied to British imperial interest. Similarly, South Africa sought a customs union with its neighbors, on terms that would favor its interests. The state steel corporation ISCOR was constructed in the 1930s to locally supply mines, rail, and incipient manufacturing industries. Martin argues that with these changes South Africa managed to industrialize and emerge as a "semi-peripheral" state, a relation that has seen major continuity into the postapartheid period as South Africa continues to export manufactures and capital to its sub-Saharan neighbors. Bond reads this unequal relation as "aspirant sub-imperialism" (2008, p. 25), whereas Southall and Melber take a more benign view of the internationalisation of South African capital as "primarily a case of market forces at work" (2009, p162).

Social Movement Struggles and Politics

This essay cannot do justice to the depth and diversity of social struggle movements in post-apartheid neoliberal South Africa. It is nonetheless essential to appreciate the creative mainspring, the energy of the working class in resistance. *Challenging Hegemony* collects excellent essays on social movements in peri-urban Johannesburg, the National Land Committee of rural farm dwellers, and the Treatment Action Campaign's patient-led fight for state support and treatment of HIV/AIDS (Gibson 2006).

Ashwin Desai's *We are the Poors* relays the eruption of community-based class struggles. Community movements have sprung up among the poor in Chatsworth near Durban and other townships nationwide, fighting against the effects of neoliberalism on their lives. The trigger issues

are the state's callous determination to drive through market solutions to problems of service provision. Metropolitan councils insist on "cost recovery," rent debt collection, and disconnection for nonpayment for water and electricity services. With ever more workers unemployed or at best casually employed, they simply cannot pay. The impoverished find ways to reconnect their homes, to resist evictions, and to stand up to ANC local councillors and the police. Drawing on past struggle experiences, but also overcoming old divisions, people in the new movements are taking collective action for their very survival, putting themselves onto the frontline with innovative direct-action tactics. Starting from their immediate need to stop cutoffs and evictions, communities united around the Durban Social Forum, "New Apartheid: Rich and Poor." Durban in 2001 was "the first time a mass of people had mobilized against the ANC government" (2002, p. 138).

The ANC's neoliberal program continues to evoke counter-movements. In the Western Cape, Mandela Park is another community that found itself under armed assault by the state, its leaders either imprisoned or on the run, for resisting mass evictions from privately built housing. The evictions were consequent on the ANC's adoption of a Structural Adjustment Programme in 1996. The company manufacturing the prepaid water meters is Conlog Holdings, the same corporation that Modise took directorship of as reward for the British Aerospace fighter deal (Pithouse and Desai 2004).

Social movements face considerable problems in finding a way to consolidate an ongoing political project. Trevor Ngwane was an ANC councillor in Johannesburg who refused to implement party policy to privatize domestic services. He was thrown out of the ANC and then stood against them on an anti-privatization platform. The Anti-Privatisation Forum was formed in 2000 to unite struggles by grassroots campaigns fighting the electricity cutoffs and the privatization of workers' jobs at Wits University (Ngwane 2003; Buhlungu 2004). It was from independent social struggles like these that Ngwane and other socialists began to advocate the formation of an

independent workers party; see Bond et al. (2012). Against this perspective, Buntu Siwisa (2010) recognizes the breakdown of social citizenship exemplified by the APF but disputes that "intellectuals-cum-activists" have a mandate from the urban poor for forming an electoral alternative to the ANC. Another explanation for the difficulty that social movements have is that they are subject to dirty tricks and repression by the ANC at the local level (Zikode 2013). The rural poor, farmworkers, went on strike in 2012 (Jara 2013). The persistence of these social struggles from below is a constant reminder that, despite the difficulties, there is a possibility of a party emerging to the left of the ANC. Several populist pretenders have thrown their hats into the electoral ring, but the more difficult challenge remains of constructing an inclusive and nonhierarchical social and political national movement.

The recovery of the mass movement is ongoing. In the communities, despite ANC-directed state violence against it, the shack dwellers movement Abahlali baseMjondolo continues to resist and "walk the talk" of advocating socialism from below (Zikode 2013).

Barchiesi (2011) emphasizes the precarious and insecure conditions of the working poor. He encountered "disorientation, apprehension and disillusionment" (xvii) of municipal workers in Johannesburg and industrial workers in the East Rand. On the demoralization and decline of collective solidarity in the NUM, see Beresford (2012). There are developments in trade unions across many sectors breaking from the ANC alliance (Amandla! 2013). There is a fight to recover the independence of COSATU from the ANC/SACP; as a result, the now biggest affiliate, the metal workers union, has declared the need for a united front and a new workers party (NUMSA 2013).

In party-political terms, the biggest turnaround has been the emergence of the Economic Freedom Fighters (EFF) under the leadership of Julius Malema, former president of the ANC Youth League. The ANC expelled Malema in February 2012 for fomenting divisions and tarnishing the party's reputation. The criminal charges against him for money laundering and corruption may have been politically motivated; they may be true; either way, Malema's radical discourse has resonated with a growing audience among those disillusioned with 20 years of ANC rule. The political issue that got Malema into trouble with the ANC hierarchy was pushing for nationalization of the mines and the land. Malema visited the striking Marikana miners 2 days after the Massacre, the first national political figure to do so. He condemned the shootings, attacking the mine's British owners and Cyril Ramaphosa, "the ANC in government eat with the British" (City Press 2012). Malema returned in October 2013 as the EFF launched itself at a mass rally in Marikana with the slogan "Economic Freedom in our Lifetime" (Mvoko 2013). The EFF has combined the left wing of the ANC with the Africanist and Black Consciousness traditions, both in its imagery and radical program (Fogel 2013), and has mounted enough of an electoral challenge to the ANC to take over 6% of the votes, gaining 25 seats and a platform of opposition in the National Assembly (EFF 2014; Sowetan 2014).

Some Conclusions

This essay has looked over a long trajectory of anti-imperialist, anti-apartheid, and anti-capitalist Marxist theories concerning South Africa. I have argued that the anti-apartheid struggle was legitimately conceived as a mass democratic revolution against racism, but I have sought to return working class content to the notion of national democratic revolution, and rescue it from the formulaic, reformist compromise and ultimately pro-capitalist interpretation of the SACP. African nationalism is not inherently reformist; it takes revolutionary directions that can be bolstered by a strategy of unity of the oppressed against all exploitation. The motor of the revolution has been the resistance of the black masses that emerged in the form of the ANC's Congress Alliance and Pan Africanism, reappeared as Black

Consciousness, and finally erupted as multifaceted working-class insurrection of sufficient threat to force regime change. The national democratic revolution in South Africa was an alliance of classes as well as races. The impetus of the revolutionary movement was harnessed and channeled by privileged class interests leading the ANC alliance in its crucial phase.

In the fight against apartheid, the ANC had the most successful strategy in that it concentrated on unity in the struggle against apartheid. The strength of being "anti-apartheid" was, however, turned into its opposite: a source of weakness. In abstracting apartheid from its connections with capitalism and imperialism, the ANC has become a vector for the exploitative system. The SACP and ANC's strategy was a bourgeois class project. Black empowerment was for a select few millionaires. The "us" in the slogan "South Africa belongs to us!" is not the African masses but a black bourgeoisie that seeks to own and control the postapartheid democracy as its property.

In the South African context, nationalization of the mining conglomerates and their transformation into social property would be the last word of the democratic revolution and the first word of the socialist revolution, a measure that great energy was spent to ensure did not happen. This is the connection with socialism, which remains an unavoidable fight against capitalism and imperialism.

Politically, one chapter has ended, and new terms of struggle based on a split from the ANC alliance are being addressed. Questions of how the movement is built, from within or outside the trade unions, from above or below, whether there will be participatory workers' control over social struggles, and the form of political representation of the oppressed are all in contention.

The mission of critical political economy should be to reinforce the efforts of the masses, not to offer up alternative economic policies for the consideration of the bourgeoisie. The system of accumulation of capital wrests on the conversion of surplus value into capital and must therefore encompass the mode of exploitation of the working class and how this is reproduced systemically. I have argued that the mode of exploitation of the racially oppressed before and during apartheid was a form of super-exploitation. Marikana demonstrates the continuation of super-exploitation in postapartheid class relations as well. The classical Marxist theories of imperialism that owed so much to material relating South Africa and Britain need to be refreshed in the light of this experience.

Most of the writers cited in this survey, including the present author, are white males and academics, many based in the global North. Allow then a penultimate comment on the diluting effects on theory that is mediated through layers of social privilege. Critical political economy can only make a step forward if it embraces theories and perspectives that originate in working-class experiences in the global South. So informed, it can help illuminate the fundamental continuities of racially oppressive class exploitation and investigate super-exploitation in South Africa today. Yet the outright rejection of dependency theory by still influential authors (Callinicos 1994; Fine and Harris 1979; Legassick 1976) is holding back the revolutionary contribution of Marxism. To avoid recognition of the greater exploitation of workers in the global South is as incorrect theoretically as it is unedifying morally; above all, it is misleading politically as to the principal agency of revolutionary change that will come from the oppressed. I have argued that a generation ago, such evasion of super-exploitation missed the essence of apartheid in South Africa; today it misses the essence of global apartheid.

Cabral's and Fanon's thesis has been realized in the negative in South Africa. The paradox of postapartheid has been that so long as the masses trusted the ANC, any substantive alternative strategy would be politically inoperable. The Marikana Massacre changed that. Although the ideological spell has been broken, the deal that the ANC and its allies struck means that the legacies of racial capitalism are still being reproduced. The profits that flow into South African corporations from across Africa, and

simultaneously flow out from its workers to the global centers of financial power, indicate that postapartheid has descended into a particular set of neocolonial relations of collaboration, a *neocolonialism of a special type*.

Azania is still on the way. The full potential of the African masses is yet to be realized, but they are once again finding the way forward.

Anti-colonialism and Imperialism (1960s–1970s)

Christos Mais
Universiteit Leiden, Leiden, The Netherlands

Synonyms

Anti-Imperialism; Antiwar Movements; Imperialism; Socialism

Definition

The 1960s was crucially marked by anti-colonialism, as the states that gained their independence during that decade were twice as numerous as those of the previous two decades combined. This essay aims at addressing the different aspects of anti-colonialism in the 1960s and 1970s, both in the way it was expressed in the former colonies and in relation to the impact it had within imperialist countries. This impact was visible in the formation of antiwar and anti-imperialist movements, as well as movements inspired by anti-colonial struggles.

Introduction

In 1971, Ariel Hoffman and Armand Matterlard published *How to Read Donald Duck: Imperialist*

Ideology in the Disney Comic in Chile during the short period of Salvador Allende's presidency. Soon after Pinochet's coup d'état, the book was banned and the remaining copies were destroyed. In just a decade, this title had been published in 15 different countries and translated into 16 different languages. This example is emblematic of the depth of the struggle between the imperialist camp and the (former) colonies and dependent countries that went beyond politics and economics to include the cultural field. In basic Marxist terms, it can be argued that during the 1960s and 1970s, imperialism was heavily criticised not only at the level of the economic base, but also at the level of the superstructure.

This essay aims at addressing the different aspects of anti-colonialism in the 1960s and 1970s, both in the way it was expressed in the former colonies and in relation to the impact it had within imperialist countries. This impact was visible in the formation of antiwar and anti-imperialist movements, as well as movements inspired by anti-colonial struggles (e.g. The Black Panther Party for Self-Defence in the US, or ETA in Spain). Before proceeding to the analysis, we will need to outline the evolution that the Second World War brought about in the world capitalist system with respect to the end of colonialism in its original form and its transformation into neo-colonialism. An enlightening periodisation of decolonisation is provided in Betts (2004) and Rothermund (2006), both of whom provide glossaries of terms or historical events that can help the reader conceptualise the issues dealt with in this essay.

The post-Second World War period was undoubtedly marked by national liberation movements in the former colonies of Western imperialist countries. Decolonisation was initiated in the 1940s with the formation of six independent states, followed by ten more in the 1950s. But it was the decade of the 1960s that was crucially marked by anti-colonialism, since the states that gained their independence during that decade were twice as numerous as those of the previous two decades combined (Betts 2004: 112–113). The need to study imperialism and anti-colonialism when investigating the aforementioned period has been stressed by historians and

other social scientists who have studied this era. As Frederic Jameson emphasises in his milestone article on the 1960s:

> It does not seem particularly controversial to mark the beginnings what would come to be called the 60s in the third world with the great movement of decolonization in British and French Africa. It can be argued that the most characteristic expressions of a properly first world 60s are all later than this, whether they are understood in countercultural terms – drugs and rock – or in the political terms of a student new left and a mass antiwar movement. Indeed, politically, a first world 60s owed much to third-worldism in terms of politicocultural models, as in a symbolic Maoism, and, moreover, found its mission in resistance to wars aimed precisely at stemming the new revolutionary forces in the third world. . . . The one significant exception to all this is in many ways the most important first world political movement of all – the new black politics and the civil rights movement, which must be dated, not from the Supreme Court decision of 1954, but rather from the first sit-ins in Greensboro, North Carolina, in February of 1960. Yet it might be argued that this was also a movement of decolonization, and in any case the constant exchange and mutual influences between the American black movements and the various African and Caribbean ones are continuous and incalculable throughout this period. (1984: 180)

In this context, adopting the notion of the 'Long Sixties' – as elaborated by Arthur Marwick (2012) – can help conceptualise the period, whose beginnings may be said to coincide with the emergence of decolonisation struggles of the mid-1950s, as in Algeria or the Second Indochina War (Vietnam War), and their influence on the youth and radical movements in the rest of the world.

Post-Second World War Imperialism and Colonialism

The Second World War brought about momentous changes in the global balance of forces, with the US now being the leading imperialist country, the Axis-related imperialisms not only having been defeated, but also subjugated to (mainly US) imperialism. The East, from the Balkans to China a few years later, was now largely red. And the former colonies had initiated a process of decolonisation through a variety of means, from pleas to the United Nations to armed

struggle. The impact of these changes on imperialist countries was felt on three levels:

- The first level concerned the changes that decolonisation brought to each imperialist country's position on the geopolitical chessboard, since the loss of former colonies entailed not only economic losses but also loss of the political and military control of geographical regions.
- The second level concerned changes to the equilibrium between the West and the East, understood in terms of the two mutually exclusive worlds of capitalism and that of socialism.
- The third level reflected the contradictions within imperialist countries that were intensified by the emergence of anti-war and anti-colonial/anti-imperialist movements, and, in some cases, movements of various minorities with demands ranging from equality to separatism or autonomy. These movements were to a great extent inspired by the anti-colonial struggles in the so-called 'Third World' (on the lack of concrete conceptualisation of this term, see Tomlinson 2003: 307–321). The most distinctive case was that of the Vietnam War and the impact it had on a global scale on the rise of the anti-war movement and the radicalisation of youth movements.

Each imperialist country had to face the new reality and develop its own strategy and tactics towards this decolonisation process. There were a variety of different approaches on the part of each imperialist country towards each former colony's demand for independence. There were cases in which independence was granted without the necessity for armed struggle. Nevertheless, in every case, the former colonial forces focused on safeguarding their interests, either by denying independence or by imposing – or attempting to impose – their successors, drawn from the local ruling classes. The end of formal empires did not bring the end of colonialism *ex facto* (Hobsbawm 1995: 199–222). What it actually did was to transform the nineteenth and early twentieth- century

imperial–colonial nexus into the post-Second World War imperialism–neo-colonialism nexus. In this latter nexus, independence would be nominally granted to the former colonies while, in reality, imperialism aimed at retaining control and perpetuating its regime of domination and exploitation (on the transition from colonialism to neo-colonialism, see Rothermund 2006: 258–274). The global geopolitical realignment was also determined by the fact that, apart from the US in the West and the Soviet Union in the East, all the other major players on the international chessboard had been either defeated or weakened during the Second World War.

Workers and Oppressed Peoples and Nations of the World, Unite!

The above exhortation was used by the Communist Party of China in its document 'A Proposal Concerning the General Line of the International Communist Movement' http://www.marxists.org/history/international/comintern/sino-soviet-split/cpc/proposal.htm (03 June 2013). This document, published in 1963, captures the momentum of the anti-imperialist, anti-colonial struggles of the period I am dealing with. Important anti-colonial struggles exploded in formerly French colonies such as Algeria and Indochina, and Dutch colonies such as Indonesia. Despite these significant anti-colonial and national liberation struggles that took place in the vast majority of the so-called 'Third World', the milestone of the era was the struggle in Vietnam. As a consequence of this view of Truth, Gandhi was always ready to amend his ideas and change his mind about actions already undertaken and underway. This has been criticised by many, even in his own times, as being inconsistent or opportunistic. This is not only due to the fact that the Vietnamese anti-colonial struggle lasted for almost three decades – having been initially formed in order to fight against French rule in the 1940s and 1950s, later struggling against US imperialism until the defeat of the latter in the mid-1970s – but mainly because

this defeat was inflicted upon the main force within the Western camp, the US. The Vietnam War led to a global solidarity movement, and had an impact on the formation or radicalisation of many social movements – especially youth movements – as well as on the emergence of anti-US, anti-imperialist sentiment throughout the world.

Anti-colonialism cannot be viewed or treated *en bloc*. Different political and social forces led anti-colonial struggles and the overall decolonisation process in each country. On the one hand, there were conservative or progressive bourgeoisies that sought an independent state – i.e. political independence – through which they could gain a bigger share of the wealth and power than was possible during the colonial period. On the other hand, there existed radical and revolutionary forces whose aims were not limited to merely gaining political independence, but included transforming their societies as well. Questions regarding what was to be done the day after independence were not restricted to the geographical framework of the former colony, and led to the development of ideologies such as Pan-Africanism, Pan-Arabism or the use of the term 'Third World' as a global framework within which individual anti-colonial struggles were part. The ideologies of Pan-Africanism and Pan-Arabism were developed, echoing voices in the anti-colonial camp that articulated how national liberation and social emancipation of the formerly colonial world could only be achieved through a project of unifying the newly liberated areas, rather than through upholding singular paths for each one taken separately. One of the most distinctive representatives of this approach, Kwame Nkrumah, a leader of the anti-colonial struggle in Africa and the first president of Ghana, wrote:

> Three alternatives are open to African states; first, to unite and to save our continent; secondly, to continue in disunity and to disintegrate; or thirdly, to sell out and capitulate before the forces of imperialism and neo-colonialism. As each year passes, our failure to unite strengthens our enemies and delays the fulfillment of the aspirations of our people. (Nkrumah 1973: 125)

It emblematic of this trend that Nkrumah, who found himself in exile in the mid-1960s after his rule had been overthrown in a coup (Birmingham 1995: 22), created a publishing house named 'Panaf Books', specialising in Pan-Africanism and other related issues. (See http://www.panafbooks.com/History.html, (04 June 2013).

The anti-colonial struggle not only involved the imperialists and the anti-colonial forces. The situation was often complicated by the position of the two main forces in the communist camp, China and the Soviet Union. The communist camp faced a split in the early 1960s that affected the struggles in the former colonies. The communist forces that played a significant role in the anti-colonial struggle aligned themselves either with China or the Soviet Union. There have been cases, especially in the 1970s, where the anticolonial camp within a country splintered into two or more different sides, often leading to civil war (e.g. Angola; see Rothermund 2006: 231–238).

In order to analyse the anti-colonial struggles of the period, either in a single case or in general terms, the following factors ought to be taken into consideration:

- The sociopolitical and economic forces that formed and led the anti-colonial struggle
- The colonial forces and their potential for forging alliances and for transformation according to shifting circumstances (e.g. the transition from the French to the US in Vietnam)
- The position of the Soviet Union and China towards the anti-colonial struggle as a local focus of a wider ideological and political conflict, which must be assessed both in terms of diplomacy (statements, speeches in international fora and organisations) and in terms of material support (supplying arms and ammunition, military training).

In the Belly of the Beast: Struggles within Imperialist Countries

'[T]he revolutionary movement has never been so powerful in the world, now that the Third World

movements for liberation and economic independence have been joined to the anti-capitalist struggle in the imperialist centres.' This quotation, by Etienne Balibar (1977: 194) addresses the significance of the relation between, on the one hand, the anticolonial struggles and, on the other hand, struggles within the imperialist countries. The interpenetration of the two struggles cannot be stressed enough. The interaction of the two struggles – of those in the 'Third World' and those in imperialist and capitalist countries – should not be perceived as equal. The struggles in the 'Third World' were, as we will see later, inspirational – mainly for the youth and the oppressed minorities – in the so-called 'First' and 'Second' Worlds; but there is no evidence, or at least evidence of an equal impact, of inspiration also flowing in the opposite direction.

The impact of anti-colonial movements on the imperialist and other capitalist countries, or on non-colonial countries, is visible in two different categories that have historically interacted with each other. The first was the development of anti-war and anti-imperialist movements in imperialist countries. These emerged as a direct result of expressions of solidarity with anti-colonial struggles. The second was the development of both theoretical positions and movements that were either inspired, guided, or otherwise affected by anti-colonial struggles.

As far as the former category is concerned, Vietnam should be considered the anti-colonial struggle that played the most significant role in creating a global anti-war movement. Vietnam was the womb from which emerged what we now refer to as the 'Long Sixties'. Although the seeds had already been there since the period of the Algerian War and the Cuban Revolution, among others (Kalter 2013: 24). As Christoph Kalter states:

> [T]his war was perceived by contemporary 68ers as being part of a larger Third World problematic shaped by the confrontation of 'imperialism' and 'anti-imperialism'. (2013: 24)

Kalter underlines the fact that the notion of 'Third World' was also crucial for many of the protesters of the 1960s since:

> [t]he concept allowed for a radical critique of existing systems of power and representations while permitting them at the same time to elaborate equally radical alternatives. The Third World stimulated the transnational mobilization of protest movements. It had profound effects on worldviews and self-images of intellectuals and activists. (ibid.)

Regardless of the national particularities and dimensions of each movement, activists of the 1960s and the 1970s regarded themselves as part of a global movement with the anti-colonial struggles at the vanguard. 'The storm of the people's revolution in Asia, Africa and Latin America requires every political force in the world to take a stand. This mighty revolutionary storm makes the imperialists and colonialists tremble and the revolutionary people of the world rejoice' (Communist Party of China 1963). It is no coincidence that this was a high tide for separatist movements in imperialist countries, including movements of the Basques in Spain, then Corsicans in France, and Francophones in Quebec. Anticolonial struggles also constituted the ideological and political basis for groups like the German 'Red Army Faction' (Moncourt and Smith 2009). Furthermore, the fact that race issues were placed at the top of the agenda in countries like the US, culminating in the formation of political organisations focusing on people of specific race/ethnicity such as the Black Panther Party for Self-Defence (see Seale 1991) or the Young Lords (Enck-Wanzer 2010) cannot be fully comprehended outside of the context of anti-colonialism. An incident that highlights this relationship is featured in the documentary *Eldridge Cleaver: Black Panther* (1970), directed by William Klein. The documentary was filmed in Algiers where, in addition to Cuba and France, Eldridge Cleaver had found refuge while in exile. William Klein met Cleaver at the Pan-African Cultural Festival in 1969, where Cleaver had been officially invited by the Algerian government to participate along with his African-American Information Centre.

One should not forget the impact of revolutionary figures like Ho Chi Minh and Ernesto 'Che' Guevara 'on the youth all over the world. Their names became slogans chanted

during demonstrations and their figures were printed in posters hung on the walls in university dormitories and political hangouts. Che's quote urging the creation of 'two, three, many Vietnams' (Guevara 1998/1967) became an inspiration and a motivation for activists in both the West and the East.

Fighting with Cameras and Typewriters

The anti-colonial struggle not only had an influence in terms of revolutionary practice, but also in terms of political and ideological theory per se and in terms of art and literature. In this connection, we must note the effect of anti-colonialism on the 'most valuable means of mass agitation', namely cinema (J.V. Stalin, 'Thirteenth Congress of the R.C.P. (B.)', http://www.marx2mao.com/Stalin/TPC24.html [5 June 2013]). More broadly, we must discuss the impact of anti-colonial struggles on Western intellectuals.

The aforementioned William Klein (IMDb n.d.) is just one example of many artists who aligned themselves with the anti-colonial forces through their work. Klein's films, such as *Far from Vietnam* (1967; co-directed with Chris Marker, Agnès Varda, and Jean-Luc Godard), *Mr. Freedom* (1969) and Festival *Panafricain d'Alger* (1969), are directly related to the anti-colonial struggles of the 1960s. Another example is the Dutch filmmaker Joris Ivens (Europese Stichting n.d.), who had been influenced by anti-colonial struggles as early as the 1940s, when he filmed *Indonesia Calling*! (1946). He also made films about Cuba, China, Laos, and Vietnam during the 'Long Sixties': *Six Hundred Million with You* (1958), *Pueblo Armado* (1961), *Carnet de Viaje* (1961), *Far from Vietnam* (1967), *The 17th Parallel* (1968), *The People and their* Guns (1970), *Meeting with President Ho Chi Minh* (1970), *How Yukong Moved Mountains* (1976). And of course, one must mention one of the most influential films of this period, Gillo Pontecorvo's *The Battle of Algiers* (1966), a film that 'painted one of the most vivid pictures of Western colonialism and Third World resistance ever put on film' (Elbaum 2006: 23). The trend of political films during the 1960s and 1970s focusing on the anti-colonial struggles of the Third World (Wayne 2001) was so strong and pervasive that it acquired the term 'Third Cinema':

> The original ideas of Third Cinema, as with all such political and aesthetic movements, were a product of both the social and historical conditions of the time, particularly those prevailing in the 'Third World.' Poverty, government corruption, fraud 'democracies,' economic and cultural neo-imperialisms, and brutal oppression affected many Third World countries. These conditions required an appropriate response, and radical revolutionary movements rapidly sprang up to contest reactionary politics and to champion those whom Frantz Fanon called 'the wretched of the earth.' Third Cinema was in many ways an effort to extend the radical politics of the time into the realm of artistic and cultural production. (Gabriel n.d.)

In addition to the arts, like cinema, which were at once inspired by, and provided inspiration to, the struggles and activists worldwide, we must note a sharp transformation in academic thought in its relationship to anti-colonialism. For example, the formation of academic disciplines such as Colonial/Post-colonial Studies and Black Studies in American Universities (now usually known as African-American Studies) has been a direct result of anti-colonial struggles. One impact these struggles and movements had on the student mobilisations, especially in the US, was that the student movement took on as one of its central tasks dissemination of the history of the oppressed. In addition, students connected the anti-colonial struggle to the struggle for their own future – that is, to their demands for an education better suited to their needs. This led to the emergence of intellectuals from the heart of these movements, like Amiri Baraka, or the rise in popularity of intellectuals like C.L.R. James or Edward W. Said who, despite having been born in the colonies, had been active mainly in imperialist centres.

Another direct impact was the orientation that Economic Development studies took during that era, especially in the growing popularity of the dependency theory, some of the best-known proponents of which have been Samir Amin, Arghiri Emmanuel, Andre Gunder Frank, Paul Baran, and

Paul Sweezy. One of the most popular periodicals of this school of thought has been *Monthly Review,* first published in 1949. Dependency theory first appeared before the 1960s but reached its peak during the 1960s and 1970s, precisely due to the high tide of anti-colonialism.

However, anti-colonialism not only influenced fields of studies and research as a whole, but also impacted intellectuals on an individual level. One typical case is that of Jean-Paul Sartre, whose contribution on this topic has often been neglected (Paige 2010: 227–228; Wolin 2010). Sartre took a highly active anti-colonial stand, and joined his thought to that of thinkers like Frantz Fanon, one of the best-known and most influential anti-colonial writers, for whose infamous *The Wretched of the Earth* Sartre wrote a preface (Fanon 1963). Other thinkers published works on a variety of academic fields such as history and political science, like the now conservative David Horowitz (then part of the New Left), who produced important literature such as *From Yalta to Vietnam* (1969), and Herbert Marcuse, who *published An Essay on Liberation* (1969) and *Counterrevolution and Revolt* (1972).

Conclusion

During the 1960s and 1970s, the only certain thing was that everything was uncertain. Revolution was in the air, and the Absaloms of the world, who believed that their societies were mired in boredom and indifference, were proven wrong. One of the reasons that not only boredom was absent, but in reality there was a constant movement and upheaval, was the existence of anti-colonialism, the theory and practice of which affected not only the (former) colonies and colonial powers, but the whole world. The globe was a theatre of war and revolution. For almost two decades, every social and cultural practice, from music and film to books and reading habits, was transformed in the light of anti-colonial struggles. That period led to the emergence of intellectuals from below, with political activists becoming researchers for the needs of the struggle.

There is a very popular anecdote in Greece which tells how, during the 1970s in the Greek universities, one of the key questions that troubled the student movement was whether China had sent rice to Pinochet's Chile. Radicals worldwide were troubled during the period under consideration by similar questions on issues concerning countries far away, with which they had no actual relation, apart from being part of an imaginary global revolutionary process. Yet, what is the legacy of the anti-colonial movement of the 1960s and 1970s? A very popular phrase in contemporary social movements is 'think globally, act locally'. The essence of the 1960s and 1970s is that a national liberation or an anti-colonial victory was regarded as one's own by people who acted on a local or national level, but at the same time had a strong belief that their struggle was essentially helping the Vietcong, for example, move one step forward towards seizing power.

This spirit of being part of a transnational project helped intellectuals and artists to overcome the limits of national cultures and perceptions and try to place their works in a wider context. (see Klimke and Scharloth 2008). And along with the war(s), a hope for a better future was brought home. 'Bring the war home' was a popular slogan of the anti-war movements during the Vietnam War (http://www.tompaine.com/articles/2006/08/09/bring_the_war_home.php [04 June 2013]). A lot seemed to be changing during the 'Long Sixties'. As shown in this essay, this period, as well as the issues involved in it, should be elaborated in a critical manner, without an attempt to either idealise or demonise what took place.

Anti-imperialism

Anti-imperialism in Greece and Turkey Regarding Cyprus (1950s and 1960s)

Nikos Christofis
College of History and Civilization and Center for Turkish Studies Shaanxi Normal University, Xi'an, China

Synonyms

Anti-Imperialism; Cyprus; Greece; NATO; Turkey

Definition/Description

The Greek and Turkish in the membership in the North Atlantic Treaty Organization has inhibited anti-colonial resistance in Cyprus to American, British, and Western European foreign domination. As a result of the foreign presence in Cyprus, while the country is nominally independent, it remains subordinate to the military, political and economic influence of the United States and foreign powers. The country exhibits the characteristics of a semi-colony rather than an independent state and remains economically backward in Europe.

Introduction

Since the Second World War, the US has managed to become an informal empire (Pantich and Gindin 2012), with 'Washington able to set the parameters within which the other capitals [have] determined their course of action' (Lundestad 2003, p. 64). Together with the advance of imperialist rule, however, resistance to it also advanced (Said 1994, p. xxiv). In Greece and Turkey, resistance to imperialism rested upon one basic premise: the asymmetric alignment with the US and the North Atlantic Treaty Organisation (NATO) had turned Greece and Turkey into a US dependency, even a semi-colony. Although colonial status was not actually imposed in either country (Bozarslan 2008, pp. 423–427), genuine democracy was deemed to have become impossible and economic underdevelopment inevitable.

The left presented imperialist powers as foreign conquerors who were maintaining their countries in a state of virtual occupation (EDA 1961a; TİP 1963). Greece and Turkey had been transformed into the colonial, or semi-colonial, subjects of imperialist powers, chiefly the US, which exploited these nations by using their geographical, military, strategic, and economic positions. In other words, it was believed that Greece and Turkey were among those countries of the periphery that supplied imperialist powers with an important market and sources of raw materials and soldiers for imperialist wars, as in the Korean War (1950–53). Thus, both countries could neither form nor execute an independent national policy as imperialist powers were oppressing, denationalising, and colonising them.

The purpose of this essay is to demonstrate in what way anti-imperialism was used in the case of Cyprus; an issue with national meaning for both countries. Indeed, Cyprus presents 'an episode of contention' for two (Greek and Turkish) conflicting nationalisms. As anti-imperialism

was one of the leftist 'weapons', our analysis will limit itself to the leftist parties: the United Democratic Left (EDA) in Greece, and the Workers' Party of Turkey (TİP) in Turkey. Instead of trying to define what anti-imperialism is, we will try and place anti-imperialist rhetoric and actions in the domain of practical politics. In other words: 'socialism becomes what socialists do' (Sassoon 2001, p. 50).

Eniaia Dimokratiki Aristera (EDA, 1951–67)

After the arrival of a British colonial presence in Cyprus in 1878, Greek irredentist nationalism, under the guise of *enosis* (union of Cyprus with Greece), gradually became a massive movement. The Hellenic ethnic character of Cypriot society, the role of the Church, and the political programme of *Megali Idea* (Great Idea), aimed at encompassing all ethnic Greek-inhabiting areas in a Greek state, provided the foundational elements and legitimacy for this process (Anagnostopoulou 2004a, pp. 198–228), in which Britain was instrumental because it 'not only created the space for the introduction of Hellenism, it planted its seeds' (Varnava 2012, p. 33). Encapsulated particularly in the concept of *Megali Idea,* irredentism soon developed into a sort of political and cultural orthodoxy, 'the only ideology', of the Greek state (Stefanidis 2007, p. 17). After the Second World War, and especially after the Greek Civil War (1946–49), irredentism came to be expressed by the right and was associated with patriotism and anticommunism, excluding the left from the 'patriotic scene' of the country, especially, since the consequences of the Civil War were attributed *en bloc* to those of that political persuasion. *Ethnikofrosyni* (national-mindedness/loyalty to the nation), the updated ideological orthodoxy of pre-war Greece, emerged as an anti-communist platform; it was institutionalised in the security apparatus of the Greek state, and it served as 'a measure of loyalty to national integrity and the "prevailing social order"' (30).

Against this background, the Greek left, represented legally in Parliament by the EDA,

had constantly to prove its patriotism in order to be incorporated anew into Greek society. This was managed, painstakingly and not always successfully, through the national issue of Cyprus, the *Hellenicity* of which, as the EDA also claimed, was 'beyond argument'. As a matter of fact, 'nobody dared to question the Greekness of Megalonisos [Great Island] and the inalienable right of her people to unite with the national whole' (CQGP 1997: vol. 1, 40); a transition that, according to the left, would be achieved through self-determination; a stage that, because of the island's population being 80% Greek, would eventually lead to *enosis*. Self-determination however, could not be exercised because of Greece's dependency upon US imperialism (EDA 1961a, pp. 13–14), the primary goal of which was to 'preserve the state of vassalage' (EDA 1961b, pp. 8–9). Imperialism for EDA, in all of its aspects (economic, military, political), held the country captive, and made it unable to exercise an independent foreign policy that would set Cyprus free from British colonial administration and the imperialist designs in general. The party argued that the country's national independence was being removed, as demonstrated by US objections to Greece bringing the issue to the United Nations, or the lack of any direct or indirect reference there to Cyprus's self-determination (EDA 1955).

Both the left and the right held that Anglo-Saxon imperialism provided extensive assistance and support to Turkey; a belief that gained additional credence in Greek political circles after the events of September 1955 (19), when the Turkish government organised a pogrom against the Greek population of Istanbul in response to the anti-colonial events in Cyprus a few months before. These events signified for the left the grave need for all agreements that had been made with the Great Powers and Turkey to be terminated immediately (ASKI, EDA Archive, Box 478), because they 'turned the situation in Cyprus to a critical state, [. . .] which could lead to genocide' (CQGP: vol. 1, 267). The common politics and tactics of Turkey and Great Britain in Cyprus, and those of the US through NATO, were presented by the EDA as those of a 'common

imperialist camp' which acted on the basis of a common agenda: the perpetuation of the imperialist system through Cyprus. The increasing US interference in the domestic affairs of the country marked also the dynamic presence of Greek youth, which in large part supported the EDA and its belief that 'the restoration of its [the people's] dominant rights and *enosis* with Motherland Greece' (*Avgi*, 20 April 1955), would also mean the liberation of the country and Hellenism from its *par excellence* enemies the Americans and NATO; the 'New Perses' (the Titan god of destruction) that aimed at subjugating the people (*Avgi*, 6 December: 1958).

Following the bi-communal bloody events of December 1963, the Cyprus crisis reemerged along with the vehemence of anti-imperialism/anti-Americanism, in which 'the American imperialists and the Greek reactionaries organize in common a big conspiracy to close the issue of Cyprus, and overthrow democracy in Greece' (*Avgi*, 23 September 1964). The US stance on the Greek positions, as well as the Johnson Letter, with which the Turkish invasion of the island to stop the atrocities was stopped by the US, and the Fulbright Mission that followed, were all perceived as a grand conspiracy targeting Greece and the people of Cyprus (*Avgi*, 5–8 May 1964); see also the centrist newspaper *Ta Nea*, 8 and 11 April 1964); a conspiracy that aimed at turning Cyprus into a NATO base (CQGP: vol. 3, 281) to control and fulfil the imperialist countries' military designs in the region (CQGP, vol. 3: 200). The imperialist goal of transforming Cyprus into a NATO military base was a living proof that the Greek government wished to close the issue of Cyprus, while its propaganda tried to persuade the Greek people that only the US could 'give her [Cyprus] to us [the Greeks]', as happened with the London-Zürich Agreements of 1959. The government failed, however, to see that the interest of the Atlantic community came 'above any national interest' (CQGP: vol. 2, 262). As the party emphasised, the US always aimed at including Cyprus under the authority of the 'imperialist and colonialist NATO', a fact that was revealed every time by the speedy US acceptance of any plan the British proposed (EDA 1959, pp. 4–12).

For the EDA, the issue of Cyprus never stopped being an anti-colonial issue that could be solved through the united antiimperialist struggle; a consistent stance of the anti-Western, anti-NATO, and generally anti-imperialist climate of the period. The anti-imperialist, anti-Western agenda of the EDA was not always expressed through an open support of the Soviet Union's positions, mainly out of fear of the party being targeted for communistic actions, but there was a constant support of the Non-Aligned and Third-World countries and of the anti-colonial and anti-imperialist climate as this was taking shape during the Cold War. Indeed, the EDA was very often referring to the anti-colonial, anti-imperialist struggle in Latin America and the Third World as comprising those forces whose support Greece should seek in relation to the Cyprus question (Odysseos 1964, p. 49). By hitting Cyprus, the imperialists 'wish to numb the morale of the liberation movements. They want to establish an offensive military base facing the "worrying" voices of the Afro-Asian shores' (Odysseos 1965, pp. 79–89). The imperialist conspiracy, one of the party supporters wrote, also managed to drag the Greek government in, because 'the Greek government never realized that, behind the official declarations, *enosis* through the establishment of an independent Cypriot state and ensuring self-determination means a national and fortified solution' (Diamantopoulos 1964, p. 3). This fortified solution was no other than the position of 'Independence–Self-determination–*Enosis*' (*Avgi*, 9 February 1967); the position that was shared also by the Greek Cypriot leadership.

Türkiye işçi Partisi (TİP, Workers' Party of Turkey, 1961–71)

For Turkey, the Cold War realities and her alliance with the West was a realisation of her vision of belonging to the West, as this was envisioned and dictated by Mustafa Kemal Atatürk and his circle. Within the Cold War and following the NATO needs and 'directives', the Kemalist state adopted anti-communism and transmuted it into one of the main state ideology elements, appropriating at the

same time those Cold War elements that it deemed necessary to secure both national unity and the Western orientation of and identification with the nation. The result was a nationalist, anti-communist Kemalist right, adapted to the Cold War conditions, fighting the 'enemy' that came to be defined as 'the communist internal enemy that threatens the unity of the Turkish nation and as the external national enemy that threatens the security of the Turkish nation' (Anagnostopoulou 2004b, p. 180). The identification of communism with national threat, a common characteristic of Cold War, in the Turkish context meant 'nationalisation' of Islam, the Turkish pre-Cold War enemy, and putting it to the service of the nation.

The re-signification of Islam helped Turkey to *Turkify* the Ottoman past, or, at least, some aspects of it. In the case of Cyprus, being a former Ottoman territory, this meant that those elements deemed necessary were also attributed to Cyprus. It was expressed through an irredentism, in which the Turkish Cypriots were part of the Turkish nation. The Turkish Cypriots became, from that time onwards, part of the Turkish nation, who were threatened both by communism and by the national 'imperialist' enemy: the Greeks (182). The Greek threat of the early twentieth century, during the Turkish National Liberation period (1919–22), was developed and adapted in the Cold War context. In this, the Greek irredentist agenda of enosis worked as a catalyst to prove that the Greek threat was still evident and imminent, and helped to elevate the Cyprus Question as *milli dava* (national issue). Finally, by providing a national content and dimension to Cyprus, Turkey managed also not to distance herself from the Kemalist principle of *Misak-i Milli* (National Pact), another significant element for the Turkish left during the 1960s.

The Turkish left during the 1960s, represented in the National Assembly by the TİP, was characterized by two distinct characteristics: anti-imperialism and Kemalism, the former gaining its legitimacy and impetus through the latter. The anti-imperialism of the Turkish left came to be identified with an independent Turkish foreign policy, having as its main point of reference the

Cyprus question (Christofis 2015). As the party chairman Mehmet Ali Aybar argued, 'beneath the Cyprus question lie the interests of imperialism', and, therefore, Turkey 'is not able to pursue an independent foreign policy' (Aybar 1968, p. 322). Independent foreign policy, however, meant equal distance both from the Soviet Union and the US (97). Following the example of the Third World and Latin America (Ünsal 2003, pp. 247–252), the TİP associated, anti-imperialism among other things with nationalism, the latter being 'the ideological expression of our [Turkish] people against the foreign yoke, against imperialism and capitalism. [Nationalism] is resolutely attached to the idea of independence' (Aybar 1963, p. 9).

The TİP's significance lies in the fact that it managed to become one of the main anti-imperialist voices in Turkish politics. The main argumentation of the party was based on criticising the bilateral agreements and friendly relations of the Demirel Government with the US, which was responsible for the '35 million m^2 of Turkish land [that] are under American occupation' (Aybar 1965, p. 176). Not only the Demirel Government and the Justice Party, but all Turkish governments, the *comprador* bourgeoisie as the party referred to them, were severely criticised for betraying Turkey's national interests since Mustafa Kemal's death.

The Cyprus question demonstrated, according to the TİP that Turkey was in a *déjà vu* situation, and that the crisis in the island after 1963, caused by Makarios's attempt to amend the Constitution, proved to Turkish people that their country was confronting the same imperialist powers that she had fought during the Turkish National Liberation Struggle. In other words, Turkey was confronting anew the Anglo-Saxon imperialism and the ambition of the Greek bourgeoisie to fulfil the imperialism of the *Megali Idea* (Boran 1965). The party referred to the dependency on foreign capital that the country had fallen into as the trap of Anglo-Saxon imperialism. This dependency, and the true nature of Turkish–US relations, became apparent with the Johnson Letter, and at the same time forced the Turkish government to acknowledge how far it had been drawn away from Kemalist

principles (IISG, *Kemal Sülker Papers*, folder 558).

This feeling, that Greece had become the channel of imperialism, was verified and empowered by the Acheson Plan a few months later. The Plan was of US invention, promoting the *enosis* of Cyprus with Greece by vesting part of Cyprus to Turkey. The Turkish government should not accept the Acheson Plan, the party claimed, because it signified another imperialist intervention. It was enosis in 'disguise' and acceptance of it would mean approval of a solution contrary to the national interest, by giving the false impression of a country orbiting around Anglo-Saxon imperialism (Boran 1965).

The TİP's reaction to the US president's Johnson Letter (which deterred a possible Turkish military landing on Cyprus) and the Acheson Plan was to call for a common antiimperialist front of 'all the socialists and Atatürkists to unite their power for an independent foreign policy' (IISG, *Kemal Sülker Papers*, folder 551). Similarly, during the general congress held in the city of Malatya in 1966, it was decided that Turkey's primary agenda was to reach full independence by turning back to the foreign policy of Atatürk's Turkey during the National Liberation Struggle (TİP 1966). The national liberation war was portrayed by the TİP as the historical basis of its understanding of national independence. In the party's narration of that period, those years were depicted as ones of national awakening for the people living within the borders of the national pact. Aybar stated that 'forty-four years after the completion of the first one, we must begin a second National Liberation Struggle [. . .]. We are determined in the struggle until such time as the last American soldier has left our country' (IISG, *Kemal Sülker Papers,* box 610, folder 1). Atatürk's nationalism was the battle-standard against Western imperialism (Doğan 2010, p. 160).

Not a single government, TİP argued, 'had not realized, and did not want to realize, that Great Britain and the US, in relation with the Cyprus question, would be on the side of the Rum and the Greeks [Yunan]', because their interests are best served that way (IISG, *Kemal Sülker Papers,* box

610, folder 1). The British bases in Cyprus, and the support of *enosis* with Greece in order to make Cyprus a NATO member, were of prime importance to British and US interests: so what the Turkish governments called 'alliance' and 'friendship' was not a policy to be trusted by the people. With the Johnson Letter, the people realised this, and so participated in an anti-imperialist struggle in which, a party report notes, 'the Cyprus Question is the most tangible, the most scrutable and sensitive issue of the anti-imperialist struggle and the Second National Liberation movement for the masses and the public opinion' (IISG, box 558). 'The Cyprus Question is the point of reference', the party report continues, 'and of highest importance for the anti-imperialist struggle', but the government seemed unable to realise this and to oppose the US. Therefore, the Cyprus question presented a lost cause for the party, especially, since the undisputed right of the Turkish people to 'define its own fate' was taken away by imperialism and its domestic collaborator. Since Cyprus could not return to its rightful owner (i.e. Turkey), and the 'double enosis – partition' would be stopped by the Greek and Anglo-Saxon imperialists, then the best solution for Turkey and other smaller states, including the Third-World countries, would be a demilitarised, federated Cyprus. This became one of the fundamental positions of the TİP throughout the 1960s (Boran 1967, p. 79).

Conclusion

Since the end of the Second World War, the left had to operate in societies where nationalism was well entrenched and disseminated by powerful ideological state apparatuses (Althusser 2001), while Marxism was usually considered a non-patriotic foreign-driven ideology. Nationalism, in the distinct forms of Ethnikofrosyni and Kemalism, was the effective means by which the state was identified with society, and provided at the same time the fitting basis on which to construct the image of a homogenised will. The image of the national unity and the quest of the national interests proved to be substantially effective for

parties that sought legitimisation. In the attempt to present the left also as patriotic, and gain credentials and popularity by presenting itself as the vanguard of the whole nation, it came to adopt similar, if not identical, ideological tools to those of the dominant ideologies, filtered of course, through a leftist discourse, most notably, anti-imperialism and anticolonialism. During that process, the concept of nation's primacy became basic also to the actions of the anti-imperialist movement. While, on the one hand, anti-imperialism becomes the means for the left to mobilise the people, the mobilisation took place in the name of nationalism, and not in the name of anti-imperialism, or internationalism. In other words, socialism was subordinated to national ends, placing the anti-imperialist values of socialism at the service of the particularistic irredentist values of nationalism.

Thus, although always dominated by a consistent anti-imperialism/colonialism, the left aimed to fulfil the interests of the respective national centres. Furthermore, the goal of the left was not to acquire national independence for Cyprus that would lead to an independent nation state. Rather, in the Greek case, national independence would be a transitory stage to enosis; while, in the Turkish case, it meant that national independence was the necessary solution since Taksim (partition), or accession to Turkey, had been strongly opposed by Greece and the Great Powers. In other words, it seems that the left also got trapped in the anachronistic irredentism of the Motherlands; *enosis*, as demonstrated by the Greek and Greek Cypriot elite, was presented as the only national solution for the Greek Cypriot community. As a national solution, Turkey and the Turkish Cypriot community adopted a federated, demilitarised Cyprus only because the other choices did not present a feasible alternative and would eventually have led, according to the party, to serious problems.

Arab Socialism

Definition

Championed by prominent figures like Baath movement leader Michel Aflaq, Arab socialism was a dominant, almost hegemonic ideology of the Arab World throughout the 1960s and early 1970s. In addition to the Baath Party movement, Arab socialism also influenced Nasser's Egypt, Algeria, Yemen, Palestine, and Lebanon. Even though it identified itself with the term socialism, there were vast differences between Western Marxism and Arab socialism in their interpretations of reality, one glaring example being Arab acceptance of the importance of spirituality and the role of religion in societal culture. Other differences included Arab socialists' relatively benign treatment of private property, the bourgeois class and its role in exploitation of labour, their emphasis on the revolutionary role of the whole Arab nation rather than just the working

class, and finally their tendency to equate non-Arab socialism with Soviet practice. Hence, stemming from these philosophical differences, one may argue that Arab socialism, rather than being a movement of genuine resistance against prevailing conditions by the working class in the Arab world, was instead a pragmatic choice by Arab military/civilian bureaucratic elites in modernising their respective nations in the wake of their struggle for independence against Western imperialism. This then, leads us to an exploration of the historical causes that gave rise to what we call the modern state and its associated ideologies in the Middle East.

History of Modern Middle Eastern Societies

The most important determinant regarding Middle Eastern societies in their pre- and post-colonial history has been the structure of the state and how other prominent social forces position themselves and act against it. Although some Western writers have tended to view Ottoman and Middle Eastern precapitalist formations as identical to European feudalism, Ottoman-style land administration and the general organisation of agricultural production differed from that of the European model. First of all, the existence of huge tracts of state-owned land and communal properties in the Middle East played a primary role in preventing the emergence of a European-style feudal aristocracy within the empire. Second, peasants had more freedom in deciding which crops to cultivate: their main responsibility was tax paying and care of military men the state assigned to their land. In Ottoman lands, the state strictly controlled the use of its properties, since the entire edifice of government depended on the nexus between expansion of arable lands through conquest and their distribution among prominent military men (Quataert 1994). However, these military men largely acted as representatives of the sultan (a kind of a tax collector), rather than as the fully fledged landlords of medieval Europe. Another significant sign of the sultan's control over relationships in rural areas was the

appointment of *kadis* (religious judges) to supervise law and order, a system wholly dissimilar to the unbounded power of European feudal landlords in judicial matters within their territories. One should add that central control over land administration was not entirely homogeneous throughout the Empire: in some parts of the Middle East (such as Egypt, Lebanon, and Iraq), privately owned land happened to be more widespread, leading to more pressure by landlords on peasants in the organisation of production (Gibb and Bowen 1957).

When European development began to surpass Ottoman technology and push the Empire from Central Europe in the late sixteenth century, military conquests which had formed the backbone of the perennial land administration system under Turkish rule came to a halt. The loss of a crucial source of revenue from conquests meant sultans faced the prospect of increasing taxes and other revenues from within their existing borders. The *iltizam* (tax farming) system was implemented to fulfil the urgent need for an intensive accumulation model to replace obsolete territorial expansion. This system envisioned a spur in revenues through delegating tax collection to regional *ayan*s (landlords). After bidding for a region's tax collection rights, the *ayan* tended to restrict the peasants' freedom in organisation of production (Pamuk 1994). This development was concurrent with the erosion of confidence in the justice system of the Empire. Although ayans gradually became a source of regional power, their pattern of behaviour did not echo that of the European bourgeoisie: their fortunes generally fluctuated according to the political climate at the centre. Rather than being interested in overseas excursions and capital accumulation through investment, or in the formation of a political alternative, Middle Eastern *ayan*s opted simply to increase the burdens on their peasant tenants and to buy political titles (symbols of power) from the Ottoman centre. The power of *ayan*s varied greatly according to the specificities of certain regions. While land distribution in Anatolia was relatively fairer than in Arab regions, issues of irrigation, transportation, and proximity to markets determined the state–*ayan* power

relationship. In this context, one may say that Egypt, Syria, Lebanon, and Iraq witnessed a more unequal distribution of land and a more burdened peasantry, with the result that the first peasant rebellions against agrarian conditions erupted in these regions (Beinin 2001). From Anatolia to other parts of the Middle East, peasant rebellions opposed existing land distribution, arbitrary taxes and worsening regional living standards, but they were far removed from establishing any coherent political and economic alternative to the prevailing *İltizam* system. At the same time, the existence of these rebellions conflicts with Eurocentric Orientalist accounts depicting the regions' history as largely stagnant.

By the late eighteenth century, major European companies had begun to penetrate the Middle East and the Napoleonic wars and British industrial revolution had facilitated military and trade expeditions to the region. The region's rulers, mainly Ottomans, usually opted to collaborate with foreign merchants through benign trade deals with Europeans. The 1838 Baltalimani trade agreement, and ensuing capitulations given to foreigners by the Ottoman sultan in İstanbul and Mehmed Ali Pasha in Egypt, not only put local merchants and guilds at a disadvantage (since these deals meant that local traders paid more taxes than importers), but also accepted free-trade rules which greatly advanced the position of British and French manufacturing as opposed to Ottoman economic development needs (İnalcik and Quataert 1994). For example, in Egypt all manufacturing capacity was diverted to cotton-related businesses, which limited these regional economies to a single crop and indirectly made them dependent on British textile demands. These capitulations mainly stemmed from the Turkish Empire's lagging behind Europe in economic and technological developments, especially since the Empire's ill-fated second expedition to Vienna in 1688. Moreover, in the lands of the Middle East, industrialisation could not follow the same pattern of development as Europe. While European merchant and traders gradually freed themselves from the yoke of feudal aristocracy and initiated a town-based autonomous economy, the Ottoman manufacturing and trade system, dependent as it

was on strictly controlled small-scale guilds and large land owners, resisted competition and delayed the emergence of the wage–labour relation in terms of a capitalist economy. According to Charles Isawi, these guilds, small property owners, and their production and competitive capacities were hugely diminished in the wake of European penetration into regional markets. Even early signs of factory-level production and efforts at industrialisation came from Christian minorities in the Empire, who had connections with foreign merchants and were thus protected by capitulation agreements (İssawi 1980). Furthermore, the nature of the relationship of dominance in the Middle East – landlord–peasant, guild master–worker – meant production was less efficient and more locally focused, which in turn narrowed the dynamism and scale of the markets. State-led industrialisation attempts, especially in the weapons industry, also adhered to the same methods, and were beleaguered by official corruption and inefficiencies that failed to create a healthy working class that could be counted on as a source of demand.

In retrospective analysis, from 1838 to 1918, the Ottomans and Egyptian elite opted to create an economic growth that led to ever increasing indebtedness and capitulations to Europe, and in which local landlords and bureaucrats were the bridgeheads linking the Middle Eastern economy to the developing world markets. The foundation of Duyun-i-Umumiye and official surrendering of the Empire's finances to European control serve to summarise the hopelessness of the situation. Efforts at unionisation by the urban working class in the late nineteenth century were also precluded by ethnic and religious divisions, since most of these efforts were led by minority workers such as Jews, Greeks, or Armenians, and as we have mentioned above, peasant rebellions questioning existing power relationships and worsening living standards never came close to formulating a real political alternative that could be a source of social change. From 1918 to the end of the 1950s, what one saw in the Arab world was a relatively quickening economic development. This came about as a result of the Great Depression, which had the fortunate effect of leaving

Middle Eastern societies to their own local means, since the great powers such as the British and French had to struggle with their own domestic problems. However, the semicolonial Western-supported monarchies of the Arab world at this time failed to diminish either rural or urban economic inequality, or to address the problem of independence. Moreover, their mostly urban-based development of industry and service sectors also brought with it a young generation of intellectuals and rural migration to the cities, both of which would help form the base of future populist regimes (Beinin 2001). Since the Sykes-Picot agreement, the French and British had taken over mandate of areas stretching from Palestine, Lebanon, Syria, and parts of the Arabian peninsula, in addition to their direct rule over Algeria and Egypt. The Arab revolt of 1936 greatly influenced the psyche of the region's inhabitants, as Arabs witnessed the brutal colonial suppressions of nationalist movements from Palestine to Algeria. Under those historical conditions, Arab radical socialists like Michel Aflaq, seeing no hope of real independence under Western-supported monarchies, decided to organise and rebel against the region's comprador powers.

Era of Change: Populist Regimes and Socialism

The mainly populist regimes of Gamal Abdul Nasser in Egypt, Arab Socialist and Baath Party regimes in Syria and Iraq, and the Algerian FLN all came to power through military coups, a fact that made the backbone of these regimes radical military and civilian bureaucrats rather than a wide cross-section of the popular classes. However, that does not mean that these regimes lacked ideological hegemony over wide sections of their populations. The ruling parties espoused the idea of Arab socialism to embrace the lower classes, but an inquiry into working-class influence on the political process reveals that only upper-income, highly skilled and unionised sections of the class were influential in decision-making circles (excluding poorer sections). In terms of their reformist and 'revolutionary

nature', these authoritarian regimes opted for the highly protectionist state-led import substitution model, and large-scale agrarian reform that aimed to redistribute lands from the wealthier classes to the peasantry. Through these two policies, the ruling elite gradually built up a paternalistic relationship with both the countryside and the urban working class; a development which, in the words of Joel Beinin, empowered and disempowered the popular classes at the same time (Beinin 2001).

In order to understand the ideological framework of Arab socialism, one has to grasp the meaning of Arab nationalism, since it forms the kernel from which other associated ideologies like Baath emerged. Militaryled governments in the Middle East after the Second World War, seeing their movement as a response to Arab humiliation by Ottomans and then Western powers, defined their eventual goal as unification of the Arab nation. Centuries-long colonial ties and struggles determined the very essence of these regimes as anti-Western, a stand which unequivocally paved the way for adaption of the socialist development idea, in opposition to a post-war Western world strictly identified with capitalism. The last nail in the coffin of western credibility among Arabs was the uncritical support Western governments provided to the state of Israel and the division of historic Palestine. The predicament of Palestinians against a pro-Western force in the heart of the Middle East not only damaged the psyche of the region's population, but also entirely undermined the position of pro-Western forces in these countries. In the words of two main ideologues of Arab nationalism, Michel Aflaq and Gamal Abdul Nasser, their cause was different from ordinary nationalism, and aimed to unite the spirit of the Arab nation, since they saw perennial subordination to colonial powers and internal divisions as the main causes of underdevelopment and backwardness (Sluglett 1992). In this grand conceptualisation of Arab identity, cultural components of that identity – such as Islam, Arab belief in social justice and so forth – were attributed uncritical positive qualities. Thus, the military coups of patriotic officers and the Baath Party were undertaken to overcome this apparent

contradiction between Arab spirituality and material conditions on the ground in the Middle East.

After situating Arab socialist regimes in an economic and political framework, one may begin to dissect the glaring differences between Arab and Marxist socialism in terms of ideological and ontological subjects.

Theoretically, the main divergence between Arab socialists and what they consider Western Marxism is how the former understood the issue of exploitation. The movement's leaders, like Aflaq and Egyptian intellectual Muhammad Haykal, identified exploitative practices with the decades-long Arab experience of Western colonialism and its collaborators in monarchies (Haykal 1968). Rather than trying to find a social foundation for the term, these authors had an arbitrary manner of diagnosing what constituted exploitation. Unlike Marx's argument that it is the appropriation of surplus value during the production process, Arab socialists tended to see it as a form of contemptuous human behaviour, especially apparent in some upper-class greed for disproportionate wealth and the desire to display this wealth. Thus, logically, they stressed that if an individual truly subsumes the essence of Arab nationalism and works for national unity, that individual will not resort to exploitative practices. Hence, Arab socialism attributed the basis of exploitation to human volition. In fact, this idealist thinking pattern was not surprising, since it justified Arab military and civilian bureaucracies' own position towards various social classes, as it theoretically facilitated the separation of loyal capitalists from exploiters. Also, this political understanding helped them control trade-union and communist organisation activities, since any proceeding from Marx's original conceptualisation inevitably brought forth the question of the proportion of working-class involvement in the Arab socialist project. As a further step, and in light of the explanation above regarding the nature of exploitation, writers like Haykal and Aflaq refuted the Marxist notion of class struggle. According to them, the Marxist class struggle is too extreme in its conception and in its consequences of annulling human freedom and individualism for the sake of society's well-being (Aflaq 1968). On this point, these authors, rather than engaging with Marx's original writings on the subject, tended to divert their criticism to the practices of existent socialism in the Soviet Union. Like their counterparts in Baath, Mohhamad Haykal and Clovis Maqsud tried to abstract the USSR experience both from the historical and social conditions that influenced Soviet reality and from the intra-Marxist disputes pertaining to the nature of bureaucratisation and Stalinism. As a concomitant fact, one may stress the following: if the foundation of the class struggle is not the production process itself, then objectively determining the egalitarian distribution of society's wealth in Arab socialism is controversial. Since the nature of trade-union activities were also evaluated on the basis of their primary loyalty to Arab national unity, Arab socialism further disempowered civil society, while criticising communism as an ideology that kills individual spirit (Maqsud 1968). Furthermore, emphasis on the free individual (accepted as an achievement of Western capitalism) by these writers ignored the historical struggles of Western working classes to gradually win their democratic rights against the powers that be. In the Arab socialist understanding, an Arab worker was already a free individual, as their government saved them from the yoke of tyranny and imperialism. In addition to all of the above, Arab socialist regimes tried to balance the USSR and the Western blocs in their quest for development aid, as a result of which the aforementioned authors were at pains to emphasise the differences between their socialism and what they called the crude materialism of the Soviet Union.

One significant issue that we can point out in terms of the variance of Arab socialists from Western Marxism was the role of religion in everyday life and politics in their countries. Unlike Karl Marx's argument depicting religion largely as the opium of the masses, in the Middle East, socialist writers crafted a revolutionary role for religion, especially Islam. For example, in his writings on co-operative socialism, Ramadan Lawand argued that Marxism's insistence on materialism turned it into a thought pattern that lacked spirituality (Lawand 1968). Former

Al-azhar preacher Mahmud Shaltut, in his quest to reconcile Islam and socialist ideas, wrote that issues like social solidarity and the fight against behavioural excesses (i.e. luxurious consumption) were also part of Islam's indispensible agenda. As a corollary to this, Shaltut pointed out the programmatic similarities between Islam and Arab socialists (Shaltut 1968). In a further demonstration of these opinions, Michel Aflaq tried to save Arab socialism's secular leanings by referring to the erroneous application of genuine Islam in the Arab world, which in itself justified a renewal of religion through the socialist governments, this time by implementation of the correct and progressive nature of Islam. Hence, Aflaq professed the essence of Arab identity to be Islamic, and since their cause was a call for betterment of Arab society, their religion could not be anything but revolutionary (Aflaq 1968). All these attempts to integrate religion into Arab nationalist and socialist paradigms, albeit without a strong philosophical foundation, were the results of Arab socialists' search for quick legitimacy among the population, since otherwise the narrow social base of the ruling elite would be too transparent. Also, in the Arab experience, a history that did not witness any secular struggle against religious institutions or any call for social justice and equality inevitably anchored its ethical reference to Islam, since the reversal of that would mean tacit acceptance of the Marxist critique of the social roots of religion.

In a short summary of these historical and ideological discussions, one may argue that Arab socialism and its immediate predecessor Arab nationalism were historically specific ideologues of Arab ruling elites, which were used by them to overcome problems of modernisation and underdevelopment (Karpat 1968). The heavy presence of bureaucratic authoritarianism, coupled with passive acceptance by trade unions and the Arab left of the status quo under Nasser or Baath Party rule, greatly disempowered the working class and prevented the emergence of a reliable opposition. This partially forced silence of the left was another reason – the biggest factor being the humiliating defeat of Arab armies by Israel in 1967 – that facilitated the transition from Arab socialism to neo-liberal forms of rule, beginning with Anwar Sadat's rule in Egypt. In terms of their economic and social development goals, Arab socialist and nationalist regimes were more successful than their neo-liberal counterparts, which acted to integrate the region's economies into the global economy under IMF tutelage (Kadri 2012). However, in the final analysis, Arab socialism was insufficient in constructing a viable alternative either to Western capitalism or Soviet socialism. As mentioned earlier, Arab intellectuals and statesmen lacked an ontological analysis of the system in their own time, which reminds us of Marx's premise that any socialist ideology should be a ruthless critique of existing order.

Arafat, Yasser (Abu Ammar) and the Palestine Liberation Organization

Saeb Sha'ath
Belfast, Ireland

Definition

Yasser Arafat, (Abu Ammar), affectionately known as El Khityar (the old man) lived from 1929–2004. He was at the heart of the Palestinian struggle and the uncontested leader of the revolution for four decades. The struggle of the PLO, under Arafat's leadership, had a huge global impact, particularly on the global South.

Arafat, Yasser (Abu Ammar) (1929–2004) and the Palestine Liberation Organisation

Yasser Arafat, (Abu Ammar), affectionately known as El Khityar (the old man) lived from 1929–2004. He was at the heart of the Palestinian struggle and the uncontested leader of the revolution for four decades. The days following his death showed the man's immense popularity in Palestine and the world. Arafat was the embodiment of his people's cause; an iconic freedom fighter who actively led his people in their struggle to liberate their homeland. He was a major force in uniting his people under the umbrella of the Palestine Liberation Organisation (PLO) and was devoted to the cause. He spent time with the fighters in the bases, the families in the refugee camps, the activists, and the militants. He lived as they did. His people saw him as the only member of the PLO leadership who was truly one of them. Moreover, the struggle of the PLO, under Arafat's leadership, had a huge global impact, particularly on the global South.

On January 1958, Yasser Arafat and nine other Palestinian activists set up the first cells of the Fatah movement in Kuwait, advocating armed struggle to liberate Palestine. On 17 March 1964, the first Palestinian delegation, comprising Yasser Arafat and Khalil Al-Wazir, arrived in China to confer with premier Chou-En-Lai in order to forge a relationship which would be vital to the future of the Palestinian struggle.

The People's Republic of China (PRC) recognised the Palestinian people as a nation in 1964 and the PLO as their only legitimate representative. More importantly, China's leadership refused to recognise the authority of Israel over Palestine. The PRC identified with the Palestinian guerrillas and provided them with military aid and training. The leadership in China recognised a common dynamic in the Palestinian struggle against capitalism and imperialism, and in their confrontation against US imperialism as represented by its advanced base 'Israel'. Consequently, on 1 January 1965, Al-Asifa ('The Storm'), the newly formed military-wing of Fatah, initiated its guerrilla raids against Israel with an unsuccessful bombing of the national water carrier (which transfers water from the Sea of Galilee in the North to the highly populated Centre and arid South).

In the wake of the June 1967 War, Israel, assisted by the US, devastated the air forces of Egypt and Syria in large-scale, surprise, pre-emptive attacks. Israel occupied the Sinai peninsula, the Gaza Strip, Jerusalem, the West Bank,

and the Golan Heights. Arab masses were devastated by this second catastrophic defeat inflicted on them by Israel (also referred to as the 'Zionist entity' by Palestinians). On 24 December 1967, Ahmad Shuqayri resigned as chairman of the PLO and made way for the 'Fedayeen' organisations (Palestinian armed organisations). On 21 March 21 1968, the Israeli army attacked the 'Fedayeen' base at Karameh, Jordan. Despite heavy losses, the Palestinian fighters managed to counter the Israeli forces and destroy many of their attack tanks, inflicting heavy casualties on the enemy troops and pushing them back to the west bank across the River Jordan.

Vietnamisation of the Palestine Struggle

Arafat, along with George Habash (leader of the Popular Front for the Liberation of Palestine, PFLP) were able to present the Arab nation with the victory at Karameh as the first victory against Israel since the earlier defeat. The official Arab armies were discredited. Arabs were yearning for a victory over the 'undefeatable' Israeli Army. Karameh represented a paradigm shift in the Palestinian armed groups. Arab men and women flocked to join the ranks of the Palestinian resistance in their thousands.

Arafat's Fatah movement interpreted this momentum as a mandate from the Palestinian resistance (Al-Muqawama Al-Filistiniyya) to assume leadership of the by now discredited PLO and its ineffective military wing the PLA (Palestine Liberation Army) in order to radicalise them and make them relevant to a new phase in the armed struggle. At the 5th Palestine National Council (PNC) session, held in Cairo, Arafat succeeded in fulfilling that mandate. The leadership of the resistance groups dominated the PLO's newly elected executive committee and Fatah leader Yasser Arafat was elected chairman of the Executive Committee.

Chairman Arafat started in earnest the task of transforming the PLO into an effective dynamic organisation capable of representing Palestine and of bringing the plight of its refugees, and the injustices inflicted on the Palestinian people

under occupation, to the attention of the international community. The 'Vietnamisation' of the Palestinian struggle began as the Palestinian resistance groups, within a remodelled PLO, advocated the amalgamation of the Viet Cong's 'people's war' model for insurgency and Algerian FLN guerrilla warfare tactics for the liberation of Palestine from Zionist occupation.

Toward a Secular Democratic State

In July 1968, Arafat succeed in garnering the support of all the factions of the Palestinian resistance movement to amend the Palestine National Council's Charter, with a majority vote to stop the Arab regimes meddling in the PLO's affairs. They summarised the PLO's strategy and goals in the liberation of Palestine and the establishment of a secular, democratic state for Arabs and Jews in its liberated land. In November 1969, in Cairo, Arafat publicly secured the vital backing of Egypt's revolutionary leader Nasser. Meanwhile, the radical new PLO leadership was receiving huge public support from the Arab masses and Arab revolutionary governments such as the FLN Government in Algeria, and the leftist Arab Socialist Ba'athest Governments in Syria and Iraq.

This concerted support was translated into military aid and training, financial aid and large numbers of volunteers joining the Palestinian resistance movement, thus beefing up the ranks across the spectrum of Arab resistance that included nationalists and socialists, as well as emergent Marxist-Leninist organisations such as the PFLP. The PFLP had a profound unifying impact on liberation movements worldwide. Its leader, George Habash, identified imperialism, led by the US, as humanity's main enemy and characterised Israel as its advanced military base in Palestine.

Arafat Invents a Revolutionary Theory

PFLP ideology identified the Palestinians as victims of capitalism and, with other PLO factions

and socialists within Fatah, represented the Palestinian struggle as a fight against imperialism. Following the success of the FLN in Algeria, the Marxist-Leninist guerrillas in China, and of the Viet Cong, the Palestinian model became the people's war. Many Palestinian fighters adopted the revolutionary ideologies of anti-imperialist Pan Arabism, Arab socialism, Soviet Marxist-Leninist ideology, or Maoists' Marxist-Leninism. Arafat, however, wanted to widen the scope of Arab involvement in the revolution, unhindered by ideologies. He asserted: 'We have just launched a non-ideological revolution; together we are going to invent a theory for it'.

This bold reasoning found great support among some cadres of the resistance movement, who perceived it as a way to preserve the local character and culture of the Palestinian struggle between the late 1960s and the 1980s. Arafat transformed the Palestinian national struggle into a diverse hub for an international campaign against imperialism. The PLO supported and influenced the anti-imperialist struggles of resistance movements globally, and for national liberation movements across the globe, Arafat became the de facto leader of the international liberation movement.

Black September

British colonial power created Jordan (The Hashemite Kingdom of Jordan) essentially as a buffer state; a security belt to protect the future entity of 'Israel' from Arab attacks from its eastern border. The region's imperialist sponsors (the British and the US) were therefore not impressed with local developments after the Israeli occupation of the West Bank (June 1967), which was under Jordanian control. Global news of the Fedayeen victory over Israel at Karameh was disturbing for the Western powers. The US accelerated and redoubled its efforts in rebuilding, equipping, and retraining the Jordanian army, which was ordered to provoke Palestinian fighters, to ambush their units and to eject them from Jordan. This created a previously unheard of Jordanian nationalism. Bedouin tribes in Jordan

were manipulated into conflict with the PLO, under the regime's slogan 'Jordan for the Jordanians', and to resolve the regime's elite's 'contradiction of a state and a revolution', in which 'a revolution cannot coexist on the same territory within the kingdom'.

Following the PFLP's hijacking of three airliners (6 September 1970), the Jordanian Army attacked the Palestinian guerrillas throughout Jordan (16 September 1970), marking the beginning of a bloody confrontation between the highly trained, Western-supplied Jordanian Army and the paramilitary Palestinian groups. Jordan inflicted heavy defeat on the PLO groups, pushing them out of Jordan. The Palestinians headed north through Syria and on to Beirut.

In November 1974, Palestine witnessed the political implications of 1970's 'Black September', through Arafat's historical 'gun and the olive branch' speech to the UN General Assembly. The speech, in which Arafat made a peace offer from the PLO, appeared to be the unspoken recognition of the State of Israel. The PLO was given a UN observer status, as part of its new upgrade to the international status, with the codicil that the PLO must recognise the UN charter and its resolutions. Israel was recognised by a UN resolution. This was a high political price, demanding recognition of Israel's occupation of 72% of Palestine, especially for the Palestine refugees, scattered in refugee camps or around the world as stateless people.

The Israeli 1982 War on the PLO

After 1974, Israel aimed to weaken the PLO further and to impose new political realities with a series of incursions and invasions of Lebanon. On 6 June 1982, Israel took on the task of eliminating the PLO (after receiving the green light from US secretary of state Alexander Haig) by deploying its land, air, and naval resources until Beirut was besieged. Haig anticipated that 'the Israeli Defence Force (IDF) should smash the PLO's military capability, send its political leadership running for whatever safety they could find, and in the process destroy whatever of

Hafez Assad's Syrian military got in the way. This would, he thought, gut Soviet influence in the Middle East' (Boykin 2002).

Israel's 1982 invasion of Lebanon did not succeed in destroying the PLO forces as planned, in spite of the political and logistical support Israel received. The Palestinian fighters fiercely fought the advanced Israeli army for 88 days, but to save Beirut and its residents from threat of total annihilation, the PLO accepted a US deal, brokered by Ronald Reagan's special presidential envoy Philip Habib. The PLO leadership agreed to leave Lebanon, and the Palestinian guerrillas departed, with their weapons. This was not an ignominious retreat. The PLO had held their own against the 'undefeatable' army for 88 days and left Lebanon with their guns.

Arafat's analysis of the 1982 war on Lebanon revealed a steep decline in the official Arab system, and a widening of imperialist influences (if not yet a total domination of the region) that emerged during the war through the active involvements of the US, Britain, and France. On the other hand, the USSR was exposed as a fragile, declining superpower. This analysis led many within the PLO leadership to see a clearer picture of a waning Soviet Union ceding its spheres of influence in the region to Western powers. Furthermore, a political shift was emerging within the PLO, with huge implications for its position and political agenda.

The PLO's departure from Lebanon exposed Arafat and weakened the leadership. Having lost his last foothold in a bordering Arab state, Arafat understood that the only course open to him was political action. Immediately after leaving Beirut, he did the unthinkable; he stopped in Egypt to restore his relationship with the US's main man Husni Mubarak. Needing political support, Arafat and the PLO leadership were subjected to political designs of the wealthy and reactionary Arab regimes. Their interference influenced Arafat's decisions and PLO policy, which transformed to facilitate the Western-backed Arab regimes' proposals for a peaceful solution.

This political compromise caused conflict in Arafat's Fatah, and the PLO at large, leading to the gradual weakening of the PLO and the reduction of Arafat's influence over his people. Losing his grip over the PLO, he also lost his stature as de facto leader of the Arab liberation movement and his overall standing within the global liberation movement began to diminish as a result.

Arafat in the Intifada

The eruption, on 9 December 1987, of the Intifada (a large-scale popular uprising), was the explosion of Palestinian frustration at living under repressive Israeli military occupation and it grabbed international headlines.

The Intifada shifted the centre of gravity of Palestinian political initiative from the PLO leadership outside Occupied Palestine, to Occupied Palestine. The revolutionaries in Occupied Palestine began to form popular committees, consisting of local leadership drawn from the grass roots and including resistance factions, trade unionists, and students. The Intifada's activities were planned and co-ordinated largely by the new radical young leadership and represented a new generation of freedom fighters.

This deeply worried Arafat and his aides. The Intifada revealed the extent to which they were losing touch with their grass roots. Arafat rapidly designated his second in command Abu Jihad to co-ordinate with the active resistance factions to find a way to rein in those committees not part of the PLO factions. The PLO's main armed factions (Fatah, the PFLP, the DFLP – comprising the United National Leadership of the Uprising) commanded strong popular credibility and respect in Occupied Palestine. Using the umbrella of the UNLU (joined by the Communist Palestinian People's Party), the PLO successfully regained direct control over the Intifada.

People's committees channelled all necessary logistics and support to sustain the Intifada, and maintain Palestinian morale. Arafat drew international attention to the plight of the Palestinians, effectively engaging the financial support of wealthy Arab regimes in rebuilding destroyed homes and in supplying medical resources.

During the First Intifada, over 1,000 Palestinians were killed by Israeli forces, including 237 children under the age of 17. Many tens of thousands more were injured. According to an estimate by the Swedish branch of Save the Children, as many as 29,900 children required medical treatment for injuries caused by beatings from Israeli soldiers during the first 2 years of the Intifada alone (Btselem n.d.). Approximately 120,000 Palestinians were imprisoned by Israel during the First Intifada.

The UNLU deployed effective civil disobedience and non-violent resistance tactics, which were inherited from the first phase of the 1936–39 'Arab revolt in Palestine' against the British. This first phase was directed primarily by the urban and elitist Higher Arab Committee (HAC) and was focused mainly on strikes and other forms of political protest (Norris 2008). The popular resistance employed rock throwing against the occupation soldiers. The Israeli reaction was ruthless. Defence minister Yitzhak Rabin implemented the infamous 'broken bones' policy (Hass 2005), ordering his soldiers to break the limbs of any Palestinian caught hurling rocks at the occupation forces. The Israeli soldiers used brutal force to repress the unarmed Palestinian youth of the Intifada. This broad-based resistance drew unprecedented international attention to the situation facing Palestinians in the West Bank and the Gaza Strip.

Arrival of Muslim Brotherhood

Arafat sensed the ground shifting beneath the PLO. In 1987, Hamas was founded in Gaza, formed from the Palestinian branch of the Egyptian Muslim Brotherhood. During the 1980s, the Israeli occupying authorities viewed Hamas as a counterbalance or alternative to the Marxists and the secular nationalists of the PLO. They implicitly supported its emergence, hoping that it would sow seeds of future feudalism among non-ideologically homogeneous armed Palestinian factions. Divide and conquer was a lesson learned from British imperialism, as in 1928 during the British occupation of Egypt. On this

occasion, the British encouraged the Egyptian Muslim Brotherhood, rightly perceiving that its ideological existence would clash with the Egyptian nationalist movement.

Arafat Calls for an Independent Palestine

The convening 19th Palestine National Council (PNC), from 12–15 November 1988, endorsed UN Security Council Resolution 242, linking it to the 'national right' of the Palestinian people. The PNC affirmed the PLO's determination to reach a comprehensive political settlement of the Arab-Israeli conflict based on the principles of international law, including all related UN resolutions and the resolutions of Arab summits; on 15 November, Arafat presented the delegates with The Declaration of Independence of the State of Palestine. A few weeks later in Geneva (13 December), Arafat addressed the UN General Assembly, reaffirming the PLO's rejection of all kinds of terrorism, and inviting Israel to talk peace.

The Madrid Conference (30 October 1991) was co-sponsored by the Soviet Union and the US. It was an early attempt by the international community to initiate a peace process through negotiations involving Israel, the Arab countries (including Syria, Lebanon, and Jordan), and the Palestinians. The PLO went to Madrid based on the principle of Land for Peace. Soon Arafat was encouraged by some of his aides to open a secret negotiating channel with Israel.

Subsequent justifications centred on the defeat of Arafat's major Arab supporter, Iraq, at the hands of the US-led Western coalition, and the vanishing of their international sponsor, the USSR, what led to the emergence of the US as the only world superpower.

There is another perspective, however, which is that, rather than supporting the delegation at Madrid, Arafat opened secret negotiating channels in Norway, fearing that the UNLU (along with their new partners in the Intifada, Hamas) would be diplomatically strengthened by the Madrid concessions. These secret negotiations

led Israel and the PLO to sign the Declaration of Principles, giving the Palestinians partial control of the Gaza Strip and the West Bank. On 1 July 1994, a triumphant Arafat returned to Palestine for the first time in 26 years. On 5 July 1994, he formed the Palestinian National Authority, tasked to run Palestinian affairs in the occupied West Bank and Gaza Strip. And in December 1994, Arafat won the Nobel Peace Prize (along with Rabin and Israeli foreign minister Shimon Peres), Arafat was elected president of the Palestinian National Authority in the first Palestinian elections on 20 January 1996.

The Road to al-Aqsa Intifadas

Arafat made a promise to the PLO Central Council, before the convening of the Camp David II summit: 'We are going to fight a harsh battle, which my comrades and I will fight in your name, and we shall not concede our rights. ... neither Arafat nor any other leader can concede our rights in Jerusalem, and the rights of the refugees that have been guaranteed by international legitimacy' (Arafat 2000).

The second Palestinian Intifada was, in many ways, similar to the second phase of the 1936–39 Arab revolt in Palestine, which violently targeted the British occupation forces. The British used collective punishment measures combined with brutal force against the Palestinians.

In 1999, Arafat agreed with DFLP leader Nayef Hawatmeh to aim for a united national position at the Israeli-PA final status talks. A month later, he welcomed Abu Ali Mustafa (PFLP's second-in-command) returning to Palestine after 32 years in exile. In July 2000, US president Bill Clinton convened Camp David II, with Arafat and Israeli PM Ehud Barak aiming to reach a final peace deal. But Arafat rejected the Israeli proposals on Jerusalem, stating that 'The Arab leader who would surrender Jerusalem is not born yet' (quoted in Jamal 2006). Arafat described the talks to me, among others, saying 'I felt I was held against my will or being kidnapped by Bill Clinton at some stage' (ibid.). After 9 days, The White House declared the summit a failure.

On 28 September 2000, 2 months after the failure of the Camp David talks, Ariel Sharon, then leader of the Opposition, stormed the holy Haram al-Sharif and al-Aqsa compound in the company of 2,000 Israeli soldiers. Palestinians exploded in anger over Sharon's incursion, not forgetting that, at Camp David, Israel had (for the first time with US backing) explicitly claimed sovereignty over the sacred compound. The insult prompted Arafat to tell the Palestinian leadership, 'The Battle for Jerusalem, which began at Camp David, has just been transported here' (ibid.). Arafat predicted that the battle would be long and stated that Sharon's visit had been intended to provoke a military clash. Soon, Sharon arose to power and the military clash began.

Arafat never gave up his guerrilla persona, frequently emphasising his readiness to resume armed struggle if needed. Now had to be that point, in defence of Palestinian national rights and Jerusalem. While Sharon continued to escalate his military action against the Palestinians, Arafat continued to deny Israeli demands. And Israeli public relations (with the help of mainstream Western media), portrayed the ferocious Israeli attacks on the Palestinians as self-defence.

Israel was deploying F-15s and F-16s, helicopter gunships, navy gunships, tanks and heavy artillery in its assaults on Palestinian infrastructure and people, besieging most Palestinian towns and villages, and targeting refugee camps and homes. Palestinian paramilitary groups, in return, targeted any Israeli installation within reach, civil or military. Arafat merely restated his commitment to the peace process and called for the resumption of negotiations where they had left off at Camp David and Taba. Sharon labelled all Palestinian forms of struggle for liberation terrorist attacks, and began an international campaign to de-legitimatise the Palestinian national struggle.

Arafat spent the last 3 years of his life a prisoner in Ramalla, from December 2001 until he was allowed to leave for medical treatment in Paris, only days before his death. He remained confined to his headquarters at 'the Muqata', which was subjected to daily shelling by the besieging Israeli Army. Arafat believed that his treatment was a punishment for his refusal to

betray his people at Camp David. He always pointed to the complicit silence of the international community, and the absence of any feasible demand to lift the Israeli siege or for the cessation of Israeli shelling of his headquarters. Arafat said: 'I know that the siege will be long and that I am paying the price for my refusal to surrender to American and Israeli demands at Camp David' (ibid.).

Yasser Arafat (Abu Ammar) or – El Khityar – was the embodiment of his people's cause, the iconic freedom fighter who actively led his people in their struggle to liberate their homeland. He helped protect his people's lives, culture, and identity from the blades of the Zionist's neo-colonial eraser, and he was a major force in uniting his people under the PLO. Under Arafat's leadership, the Palestinian people displayed immense pride in being Arab Palestinians. And he was the Arab leader who reminded imperialism that Jerusalem was not for sale.

Definition

From the earliest contact, Britain's view of Australia was underpinned by economic motives: extension of the Empire through possession, possibilities of trade and investment, as well as the protection of property, reduction of overcrowding in jails, and the relief of poverty at home. But more insidious than these explicit economic motivations was the way in which economic progress was understood in relation to different races or human types. The known peoples of the world were ranked within a hierarchy of civilisation, with the British race and its advanced industrial economy at the apex and the Aborigines said to lack precisely those attributes and capacities which explained Britain's economic success. From this perspective, they were always a problem to be managed in one way or another by government authorities. From an indigenous perspective, Australia remains a colonising power, and Aboriginal people remain, on the whole, dispossessed. This chapter charts the history of that dispossession, but highlights the ways in which, despite this sorry story, the history of Australia's colonisation has also been one of Aboriginal resistance and tactical use of the colonisers, their laws, culture, and institutions; and one of humanitarian feeling and support for Aborigines, even if some of that support was offered from within a Western frame of reference.

Introduction: the Colonisation of the Australian Aborigines

The violent transition to the capitalist system over the centuries preceding 1778, the date of the first British convict ship to arrive on Australian shores, produced new criminalities to protect property and create the dependence on monetary exchange required for the widespread creation of a wage labour force. Extreme poverty amongst those dispossessed by the enclosures of land maintained a steady rate of crime and hence a steady flow of criminals sentenced to transportation. Given the loss of the North American colonies in 1776, and a disastrous attempt to set up convict settlements in West Africa, the British government sought new possibilities of colonization for both the transportation of criminals and for the emigration of its impoverished working classes. Captain James Cook's 'discovery' of Australia's eastern coast in 1770 provided the opportunity to set up penal/settler colonies in New South Wales and Van Diemen's Land (Tasmania), followed by Western Australia and Port Philip Bay (Victoria). South Australia became a colony in 1834, and in 1863 the area of the Northern Territory was included within its boundary, to be ceded to the federal government in 1911. Queensland was declared a British colony in 1859. Granted self-government from the 1850s, the several distinct areas of settlement remained colonies of the British Crown until they united as states of the Commonwealth of Australia in 1901.

Cook had been issued secret instructions by the Lord Commissioners of the Admiralty to search for the continent that was thought to exist to the west of New Zealand. Such a discovery, the instructions suggested, 'may tend greatly to the advancement of the Trade and Navigation' of the British Crown (Lord Commissioners 1768). Upon discovery of the continent, Cook was, with the consent of the natives, to 'take Possession of Convenient Situations in the Country in the Name of the King of Great Britain', unless the land was uninhabited, in which case Cook was to 'take Possession for his Majesty . . . as first discoverers and possessors' (ibid,). Cook observed

indigenous natives, the Aborigines, but believed them too few in number and too primitive in development to be able to lay claim to ownership of the land, and hence he did so for the British Crown. Thus, from the earliest contact, Britain's view of Australia was underpinned by economic motives: extension of the Empire through possession, possibilities of trade and investment, as well as the protection of property, reduction of overcrowding in jails, and the relief of poverty at home. But more insidious than these explicit economic motivations was the way in which economic progress was understood in relation to different races or human types. Civilisation itself was an economic achievement consisting of a division of labour within production and within the family, property, and individual property ownership, and a political system which managed the protection of property and freedom of exchange (see e.g. the writings of Australia's first chair of Political Economy Edward Hearn 1863, 1883). The known peoples of the world were ranked within a hierarchy of civilisation, with the British race and its advanced industrial economy at the apex. Early descriptions of the Australian Aborigines focused on their simple and primitive lives, including their tribal and communal existence, nomadic tendencies, lack of cultivation or herding, and the absence of mechanisms of governance. The Aborigines lacked, therefore, precisely those attributes and capacities which explained Britain's economic success. From this perspective, they were always a problem to be managed in one way or another by government authorities.

Thus, while broadly similar (see McGrath 1995), the colonies', and later the states', administration of the Aborigines reflected a host of ninetheeth and twentieth-century discourses around civilisation, racial difference, and economic progress, all of which were underpinned by Western understandings of the civilised economic subject. Although in recent decades Aborigines have won some land rights and some semblance of self-governance, there remains within policy a strong element of this colonial problematic of the fit between Aboriginal people and the Western economic subject, evidenced

most obviously in the management of the economic lives of the Aborigines of the Northern Territory under the so-called Intervention of 2007 and the Stronger Futures legislation of 2012 (see Harris 2012; Vivian 2010). From an indigenous perspective, Australia remains a colonising power, and Aboriginal people remain, on the whole, dispossessed (see, Cooke et al. 2007). This chapter charts the history of that dispossession, but it should be noted that despite this sorry story, the history of Australia's colonisation has also been one of Aboriginal resistance and tactical use of the colonisers, their laws, culture, and institutions; and one of humanitarian feeling and support for Aborigines, even if some of that support was offered from within a Western frame of reference.

Governance of the Indigenous: Dispossession

The Aborigines' failure to develop the land in ways consistent with Western ideas of economic progress provided the British government with an economic justification for its assertion of ownership over Australian territory. Despite this dispossession, however, from white settlement until the colonies were granted self-government from the 1850s, interactions between the settlers and Aborigines were, according to British policy, to be guided by respect and fairness. Governors of the colonies were instructed:

> To endeavour by every means in his power to open an intercourse with the natives, and conciliate their good-will, requiring all to live in amity and kindness with them; and if any of our subjects should wantonly destroy them or give them any unnecessary interruption in the exercise of their several occupations, it is our will and pleasure that you do cause such offenders to be brought to punishment, according to the degree of the offence. (Colonial Office quoted in Reece 1974, p. 104)

In reality, the British government had little interest in the Aboriginal people until after the Reform Bill of 1832, which brought to office men of humanitarian sympathies (Foxcroft 1941, p. 22). And because all land had been decreed the property of the British Crown, Aborigines had no

formal rights to remain within their traditional areas in the face of the expanding settlement as freed convicts were joined by British immigrants in demanding land grants. Frontier violence was rife, practised by both settlers and Aborigines (see Reynolds 1987). Such was the neglect of the orders of the Colonial Office that when the 1838 massacre of 28 Aborigines at Myall Creek led to the hanging of seven white men, following an initial trial in which they were found not guilty, the public was outraged (see Reece 1974, Chap. 4). Settlers felt entitled to protect their property since the government refused to do so:

> The lives of these men – the lives of all who have been slain in contests between the blacks and the whites, might not have been sacrificed, but for the successive Governments of this Colony, who have hitherto refused protection to the settlers, by means of an effective armed force; and by this refusal given rise, in all probability, to a war of extermination (Sydney Morning Herald 1838).

Thereafter 'it became almost impossible to prosecute whites for the murder of Aborigines' (Reece 1974, p. 191).

The first decades of Australia's colonisation saw the dispossession of the Aborigines around the coastal settlements as wool became the source of wealth both in Australia and Britain. The ability of the colonial governments to sell or lease land to graziers maintained the colonies' financial independence of the mother country, and cheap land lowered the cost of resources to Britain's expanding industries. Thus, despite official policy, both the colonial and British governments were committed to developing the pastoral industry, and encouraged, by omission or commission, the extension of the frontier further and further inland (Christie 1979; Dunn 1984). Cattle replaced sheep as the frontier extended into northern and inland regions, and frontier violence persisted well into the twentieth century (see Reynolds 1987).

The early decades of Australia's colonisation were also, however, characterised by efforts to civilise the Aborigines. Most reports of these experiments were negative, leading the constitutional scholar, politician, and founder of the system of primary education in New South Wales William Wentworth to argue that:

> The aborigines of this country occupy the lowest place in the gradatory scale of the human species. They have neither houses nor clothing: they are entirely unacquainted with the arts of agriculture; and even the arms, which the several tribes have, to protect themselves from the aggressions of their neighbours, and the hunting and fishing implements, with which they administer to their support, are of the rudest contrivance and workmanship. Thirty years intercourse with Europeans has not effected the slightest change in their habits; and even those, who have most intermixed with the colonists, have never been prevailed upon to practise one of the arts of civilized life (1820, pp. 27–28; see also Woolmington 1988).

Nevertheless, with the tide turning in Britain in favour of the self-government of the colonies, and with the strength of humanitarian feeling toward the natives of the British Empire following the abolition of British slavery (see Aborigines Protection Society 1837), the period in which the dispossession of the Aborigines dominated was followed by one of protection within the context of pastoral labour shortages, a widespread belief that the Aborigines were doomed to a natural extinction, and a commitment within legislation to instil some form of work ethic within, in particular, the younger generations of Aborigines, a policy position which would continue until the 1960s.

Governance of the Indigenous: Becoming Workers

Shortages of labour in settler colonies was a major concern of Edward Wakefield's system of colonisation. The problem with the British colonies in the New World, he argued, was that land was so plentiful that new settlers could become landholders without the need to become wage workers. A labour force could be ensured only if the price of land was high enough to force newly arrived settlers into the labour market. After saving for some time, workers would buy land from the government, and the government would use these funds to pay the fares of new emigrants. Wakefield's vision of the successful settler colony was a re-creation of the factors which had led to British economic growth: 'the greatest division

of labour; the greatest production; the utmost excess of production over consumption; the greatest accumulation of wealth – in other words, the utmost prosperity of the colony – the greatest progress of colonisation' (Wakefield 1829, p. 21).

Wakefield's policies were adopted to various degrees by the British and Australian authorities, and systematic emigration from the United Kingdom to Australia began in 1831 (see Goodwin 1966, Chap. 3). Consistent with the demands of the emerging economies, most likely to receive free passage were agricultural workers and their families, and single women in domestic service (see Haines 1994). Aboriginal labour was also a solution to the shortages of workers, as well as the expense of white workers, particularly in the expanding pastoral lands throughout the continent. Although frontier violence remained significant in these areas, Aborigines began to be seen more as potential workers, albeit a reserve army of labour to whom no long-term commitments needed to be made, than threats to property. Several factors bolstered this view. In eastern Australia the supply of labour fell from the 1830s as the assignment of convicts to remote settlers waned and finally ended with the 1840 ban on transportation to Australia's eastern coast. From the early 1850s, agricultural and pastoral workers were lost to the newly discovered goldfields. And Aborigines were superb bushmen, highly valued for their tracking skills, and Aboriginal women could be trained as domestics. They were willing to settle on the station as a means of maintaining connection to their ancestral lands, and were extremely cheap compared to white labour, frequently working merely for scant rations for themselves and their tribe until equal wages were legislated in the 1960s. By the early 1870s the employment of Aboriginal labour was widespread in the northern pastoral industry and by 1892 Aborigines made up the majority of station workers in the Northern Territory (May 1983, Chap. 3; Reid 1990, p. 174).

In coastal regions, government reserves joined missionaries in trying to instill a sedentary lifestyle in order to civilise and Christianise the Aborigines. Rations kept Aborigines tied to these areas – it was not until formal 'Aboriginal Protection' legislation was introduced that many Aborigines were required to maintain residence on these properties. From 1850, the government of Victoria, for example, began to 'vigorously' form stations and missions 'and every attempt was made to civilise the tribal derelicts and half castes' (Foxcroft 1941, p. 101). A new attitude around rations had emerged: 'Food and clothing was not to be issued gratuitously except in case of extreme emergency' (102). As *The Empire* declared in 1854, 'The sacred law – "If any man will not work, neither should he eat" – is at the very foundation of political economy' (quoted in Goodwin 1966, p. 356). Children were also to be instilled with the work ethic. Although there were a variety of views on the efficacy of the formal education of Aboriginal children, rations were used to encourage school attendance (see Fletcher 1989; Christie 1979, p. 125).

While Aboriginal children (who by this time were frequently partially white) were being schooled, 'full-blood' Aborigines were increasingly thought of as destined for extinction. A mid-century reformulation of the notion of race cast Australian Aborigines as biologically incapable of modernisation (Anderson and Perrin 2008; McGregor 1997). This belief in the natural disappearance of the Aboriginal race persisted, despite evidence to the contrary, and it comforted white Australians to think that this was simply a 'natural law' of evolution: 'reserves have been made and aids to soothe the sufferings of a dying race. . . . Their disappearance is a natural necessity' (Collier 1911, pp. 129–130).

Governance of the Indigenous: Consolidation of the White Breadwinning Male

The federation of Australia entrenched an imaginary nation of racial homogeneity. The Constitution excluded Aborigines from Australian population statistics, and the federal Immigration Restriction Act (1901), also known as the White

Australia policy, articulated this vision of Australia as a civilised outpost of the Empire by excluding non-white immigrants. The indentured Melanesian workers upon whom the Queensland sugar industry relied were deported (see Moore 1988). As John Watson, the leader of the Australian Labour Party, argued, the new nation 'reserved the right to say who shall be citizens. We ask that they shall be on a moral and physical level with ourselves, and that they shall be such as we can fraternise with and welcome as brother citizens of what we hope will some day be a great nation' (Commonwealth of Australia 1901, p. 5177). Clearly, this vision excluded the Aborigines.

In this vision, Australia's development relied not simply on white people, but on white families. The economically productive family was one in which men worked and women kept house and looked after children (Hewitson 2013). In 1904, the federal government was alarmed at the falling birth-rate of white women, with a Royal Commission finding that the waning birth-rate undermined 'the value of the family as the basis of national life; … the character of the people; … their social, moral, and economic progress; … their national aims and aspirations; … their capacity to survive in the rivalry of nations' (1904, p. 53).

A host of related policies centralised the well-being of the white male breadwinner and his family as the basis of Australia's economic progress. Immigration policy kept out productive Asian workers unused to Australian standards of living: 'It is not the bad qualities, but the good qualities of these alien races that make them so dangerous to us. It is their inexhaustible energy, their power of applying themselves to new tasks, their endurance and low standard of living that make them such competitors', argued Alfred Deakin, the Commonwealth's first Attorney General (Parliamentary Debates 1901). Tariff policy provided protection to those businesses which paid 'fair and reasonable' wages (New Protection 1907–8). Wages policy formally defined 'fair and reasonable' wages in 1907, when a manufacturer of harvesters applied for tariff protection. The Commonwealth Court of Conciliation and Arbitration found that unskilled white male workers would thereafter receive a wage sufficient to support 'the normal needs of the average employee, regarded as a human being living in a civilised community' (Higgins 1907, p. 3). The average employee was a white man supporting a family of five. To encourage population growth, the Maternity Allowance Act of 1912 granted £5 to every new white mother. Assisted immigration targeted families and breadwinner family formation: 'Men for the land, women for the home, employment guaranteed, good wages, plenty of opportunity', claimed an Australian Government (1928) poster encouraging British emigration.

Aborigines, on the other hand, were subjected to more and more regulation and supervision under the state Aboriginal Protection Acts (see Rowse 2005a, pp. 244–245). These Acts established that Aboriginal wages, which were in the region of 20% of the white male wages established in the Harvester decision and less for Aboriginal women, would be paid directly to the Aboriginal Protector who would dispense funds as he saw fit. The Acts also controlled where Aborigines lived and whether and where they could travel. In keeping with the biological perspective on race which had become dominant in the second half of the nineteenth century, these Acts formalised systems of child removal which would keep young Aborigines from being incorporated into Aboriginal culture (see Commonwealth of Australia 1997). Another widely held and comfortable assumption on the part of many white Australians was that Aboriginal mothers did not miss their 'half-caste' children. As one Aboriginal Protector remarked in 1906:

> The half-caste is intellectually above the aborigine, and it is the duty of the State that they be given a chance to lead a better life than their mothers. I would not hesitate for one moment to separate any half-caste from its aboriginal mother, no matter how frantic her momentary grief might be at the time. They soon forget their offspring. (Isdell 1906, quoted in Commonwealth of Australia 1997, Chap. 7)

Aboriginal families, then, were decimated, while white families were encouraged, supported, and centralised within Australia's vision of its national development.

A

Governance of the Indigenous: Becoming the Productive Economic Citizen

In 1937, the state Chief Protectors of Aborigines met for the first time to co-ordinate their administration of the Aborigines. A resolution as to the 'Destiny of the Race' was passed, wherein:

> That this Conference believes that the destiny of the natives of aboriginal origin, but not of the full blood, lies in their ultimate absorption by the people of the Commonwealth, and it therefore recommends that all efforts be directed to that end. (Commonwealth of Australia 1937)

This policy of assimilation was further defined at a subsequent meeting of the states to include all Aborigines:

> The policy of assimilation means that in the view of all Australian governments that all aborigines and part-aborigines are expected eventually to attain the same manner of living as other Australians and to live as members of a single Australian community, enjoying the same rights and privileges, accepting the same responsibilities, observing the same customs and influences by the same beliefs, hopes and loyalties as other Australians. (Commonwealth of Australia 1961; see also Rowse 2005b).

In keeping with these intentions, Commonwealth government welfare benefits (such as old-age and widows' pensions and payments to mothers) were extended to Aborigines over the post-Second World War period, though payments were usually made directly to state governments or managers of reserves and missions rather than to Aborigines themselves. Unlike white women, though, Aboriginal women eligible for government payments were subjected to intense surveillance by State Protectors and by the agents of the Commonwealth welfare system. Aboriginal women were visited by inspectors from Aboriginal welfare boards, and taught, through required attendance at clinics and the viewing of government-produced films, how to act like white Australian housewives. In the film *Why Clean?,* for example, Aboriginal mothers are shown appropriate standards of hygiene. *A House in Town* educated Aborigines about suburban nuclear family life (see Moore 1984). State governments introduced ways in which Aborigines could be exempted from the operation of the Aboriginal Protection Acts. This entitled Aborigines to freedom of movement and to white wages. These rewards again came at the cost of adopting the institutions of white Australian culture to the exclusion of Aboriginal culture. The Western Australian Government (1944), for example, required applicants to have lived as a 'civilised' person and to have dissolved all relationships with Aborigines except for immediate family members for the two years before application for exemption. Thus, the adoption by Aborigines of Western marriage and nuclear family life, proper motherhood, and breadwinning status were essential components of the policy of assimilation into Western notions of productive economic citizenship, though missionaries and government reserves had long tried to impose this family form on Aborigines as part of their civilising and Christianising project (Attwood 2000; Perkins 1936, p. 196).

Conclusion

Throughout white Australia's history of interaction with Aborigines there have run themes of exploitation as well as compassion, fear, and ignorance as well as deep caring and appreciation, but these humanitarian impulses, and Aborigines' own agencies, were dominated by those which have sought the dispossession and disappearance of Aborigines. Aboriginal policy making reflected colonial and twentieth-century Australia's visions of economic development and nation building, themselves premised in significant ways upon a Western imaginary of the productive economic agent. Although in recent decades Aborigines have won numerous battles for land rights and self-governance, many Aborigines, if not most, remain economically marginal and dispossessed. In short, for Aborigines, Australia remains a colonising power.

Definition

This essay explores the life and work of US actor, teacher, theater director and producer, author, black liberation activist, and poet Amiri Baraka (1934–2014).

> I tried to defend myself. 'Look, why jump on me? I understand what you're saying. I'm in complete agreement with you. I'm a poet. . . . what can I do? I write, that's all. I'm not even interested in politics.'
>
> She jumped on me with both feet, as did a group of Mexican poets in Habana. She called me a 'cowardly bourgeois individualist'. The poets, or at least one young wild eyed Mexican poet, Jaime Shelly,

almost left me in tears, stomping his foot on the floor, screaming: 'You want to cultivate your soul? In that ugliness you live in, you want to cultivate your soul? Well we've got millions of starving people to feed, and that moves me enough to make poems out of.' (Jones/Baraka, 'Cuba Libre', in *Home: Social Essays*, 2009: 57)

Amiri Baraka, formerly Everett LeRoi Jones, was born in Cuba, July 1960. It was in the heat of a 14-h train journey, as it rolled through the fervour of the people's revolution, that Baraka came into being. Prior to a phone call he had received early that year, Baraka had been Leroi Jones, the poet. When Richard Gibson, an organiser with the Fair Play for Cuba Committee, rang to offer him a place on a trip to post-revolutionary Cuba, with 12 other black writers from the US, he had been fully ensconced in the role of the poet. Answering the phone drunk, in a Greenwich Village apartment, he was most likely surrounded by the likes of Diane di Prima, Allen Ginsberg, and Joel Oppenheimer, the set he had assembled around his publishing ventures *Floating Bear* and *Yugen.* Even when he arrived at Idlewild Airport to join the delegation to Cuba, Baraka was still very much Leroi Jones, the beat poet, outwardly disinterested, but inwardly sizing up career opportunities, disappointed that the 'name' writers who were supposed to be in the travelling party (James Baldwin and Langston Hughes) had cancelled. Dismissing many of the others on the trip (aside from Robert Williams) as 1920s and 1930s 'kinds of Negroes' (Jones and Baraka 2009: 25), Jones was embodying the milieu he had set his sights on since dishonourable discharge from the Air Force: a certain mode of New York intellectuality.

In the essay 'Cuba Libre', Baraka gives an account of a series of increasingly intense conjunctural moments, which arose from the material contradictions between the ideal persona he had been trying to realise in the Village, and the material reality of the Castroled revolution erupting all around him. These moments led him to fundamentally question the nature of the promising literary career he had begun to carve out for himself. Although the Bantuisation of his name did not take place until 1967, it was in Cuba that the shift from Jones to Baraka began.

Most assessments of Baraka's career tend to focus on the regularity of his ideological, social, artistic, one could even say racial, transformations. Researchers ascribe the arrivals at bohemia, Black Cultural nationalism, and Third-World Marxism, to the sheer force of his individual will (Harris in Baraka 1990). In fact, these transitions were indicative of Baraka's position at the intersection of various race and class lines. This unstable position allowed him to respond to the key social, political, and cultural questions of the moments in which he operated. The close scrutiny given to his shifting perspectives often leads to a fetishisation of the nature of those changes, and the way Baraka committed himself zealously to a modernist pursuit of the new. What is not given as much attention is that which remained constant for Baraka over the range and type of his actions. Those consistent features of Baraka's career were put in place during that brief but almost overstimulating trip to Cuba.

The combination of dysentery, dehydration, and elation Baraka experienced hiking up in the searing heat of the Sierra Maestra to hear a two-hour Castro speech left two things engraved on his psyche. First, the undeniable potency of what he was encountering in Cuba meant he could never return to the status of 'just' being a poet:

the wild impression one gets from the country, is that it is being run by a group of young radical intellectuals, and the young men of Latin America are *radical.* Whether Marxist or not, it is a social radicalism that they want. No one speaks of compromise. The idea never occurred to them. (Jones and Baraka 2009: 52)

It was in Cuba that he came to the realisation it was possible for a poem, and a poet, to function as part of a revolutionary consciousness, to be utilised in the service of a mass intellectuality. The relative sanctuary afforded to the North American and European artist was the model Baraka had been seeking ever since he left the Air Force in 1957. Although he had, to some extent, found it, this model began to fall to pieces in free Cuba.

Secondly, the other gilded cage Baraka lived within, his American-ness, began to disintegrate in the Caribbean. Although he had access to a Du

Boisian second sight, and could therefore comprehend the absurdity and limitation of the claims his country made for self-evident freedoms, Baraka still only understood his blackness in relation to the US. It took leaving the country, if only for a short time, to attune his senses to the series of anticolonial revolutionary movements beyond those borders:

> The young intellectual living in the United States inhabits an ugly void. He cannot use what is around him, neither can he revolt against it. Revolt against whom? Revolution in this country of 'due process of law' would be literally impossible …… That thin crust of a lie we cannot detect in our own thinking. That rotting of the mind which had enabled us to think about Hiroshima as if someone else had done it, or to believe vaguely that the 'counterrevolution' in Guatemala was an 'internal affair.' (Jones and Baraka 2009: 54)

In Cuba, the US became an entity which stretched far beyond Washington State, Maine and Texas, and he shared his blackness with insurgents in Southern and Latin America, Africa and Asia:

> We are *old* people. Even the vitality of our art is like bright flowers growing up through a rotting carcass.
>   But the Cubans and the other *new* peoples (in Asia, Africa, South America) don't need us, and we had better stay out of their way. (Jones and Baraka 2009: 78)

When conducting an overview of Baraka's career, it is vital a researcher acknowledges the antagonisms that occupied his actions and work. It is accurate to say that at various moments of his career, it was possible to label Baraka a chauvinist, misogynist, homophobe, anti-Semite, and egotist (Watts 2001). In many ways Baraka is toxic, but that does not mean he should be set aside. To do so would represent an act of grave irresponsibility, because all the inexcusable violence he sent out into the world, via his pen and voice, was inseparable from the deep commitment to transform himself into a revolutionary propaganda machine, one that saw no distinction between art and politics, and pointed its ammunition at the heart of US capital. This drive was first implanted in June 1960. For Baraka, after Cuba, the work became as serious as his life.

The commitment to producing art in the service of liberation, and framing the task of making revolution as one that had to imagine itself beyond the borders of the US, can be traced throughout his career after 1960. These were the two consistent lines running throughout his range of ideological shifts, and he adapted them to suit each 'problem space' out of which he was operating (Scott 2004: 4).

Baraka's new orientation revealed itself soon after his return from Cuba. The assassination of Patrice Lumumba in 1961 had a deep resonance with young black Americans, who were increasingly aligning themselves with liberation movements in the Third World. Lumumba, a charismatic and bold figure, offered a new model for black leadership in the US. Therefore, the suspected influence of the US government in the Congolese leader's murder, combined with the United Nations' refusal to intervene, became a source of rage. On 15 February 1961, a group of black men and women, wearing black armbands and veils, burst onto the floor of the UN Security Council meeting, leading to violence. Outside there were larger protests organised, this time drawing equally blunt repressive responses from the New York Police Department. The chant that went up from the crowds was 'Congo Yes! Yankee No!', an echo of the slogan which could be heard on the streets of Havana: 'Cuba Si! Yanqui No!' (Woodard 1999). It is no surprise to learn that Baraka was in the mix on the day:

> Patrice Lumumba was assassinated by the C.I.A to stop the newly freed Congolese people from nationalising Union Miniere and other Rockefeller properties. I found myself marching outside the U.N. in demonstrations, while others, mostly blacks, took off their shoes and threw them down in the gallery as the gallery guards were called in to toss the demonstrating blacks out. Sisters were bashing the guards in the head with their shoes and throwing shoes down in the gallery. Ralph Bunche said he was ashamed and scandalised by such niggerism, while we were scandalised and ashamed of his negro-ass tom antics. (Jones and Baraka 1984: 181)

The second assassination which served as a foundation for both the emerging Black Nationalist movement and Baraka's own political horizon was that of Malcolm X, on 21 February 1965. The murder of another towering Black leader

(this time home-grown), who was forging a black politics which was decidedly militant and internationalist in outlook, was monumental for Baraka. It prompted him to leave Greenwich Village, shed the bohemian poet persona, and relocate uptown. In Harlem, Baraka went about the task of rethinking the role of black art as a determining factor in a mass black revolutionary movement.

His immediate response was to establish the Black Arts Repertory Theater School (BARTS) in 1965. The working experiment gathered musicians from the nascent black avant-garde, playwrights, poets, and cultural commentators. Their role was to both practise and teach, in order to develop black art which directly communicated to, and participated in, the struggles of the black community around the school. Although the project fell apart violently within the space of a year, BARTS became the touchstone for a flourishing nationwide Black Arts movement. Similar organisations quickly began to establish themselves in black locales across several US cities (Smethurst 2005). Baraka soon learnt the lessons from the failures of BARTS, returning to Newark to set up the 'Spirit House', this time along more focused organisational lines.

Ideologically, during this period, Baraka put together a response to the question of black nationhood which adapted the forms of Third-World liberation represented by Castro and Lumumba. It was Malcolm X, though, who was the mimetic and strategic model for much of Baraka's early nationalist thought, due to the way X had been able to reposition black people in the US as a colonised population. The problem for the radicals who took up X's legacy was the question of land. The anticolonial national liberation movements were built upon claims over stolen territory. Such an organisational lever was never truly on the table for black Americans (Dawson 2002).

Baraka's skill in the early flourishing of his nationalism was to improvise a politics of nationhood which did not require an attachment to a singular piece of territory. He was able to open up the forceful sentiment of anti-colonialism and make it applicable to the black nationalist movement in the US. The ideological focus shifted,

under his influence, to collective consciousness and the geographical multiplicity of blackness in the US. Baraka pointed out that there were concentrated pockets of black populations locked within almost every major urban centre in America. With the right kind of organisational structures and strategic planning, these areas could be taken over and controlled by black people and become the basis for a mass black power base. But for such a plan to work as a national project, it needed to be contained within a collective consciousness which could bypass the fact that all of these black locales were relatively isolated within the physical terrain of the US:

> Black Power is the Power first to be Black. It is better, in America, to be white. So we leave America, or we never go there. It could be twelve miles from New York City (or two miles) and it could be the black nation you found yourself in. That's where your self was, all the time. (Jones and Baraka 1968: 122)

Baraka was recasting a territorial issue into a metaphysical one. The concentrated pockets of blackness may have been locked within major US cities, but psychically they existed beyond the US. Harlem and Watts were separated geographically, but they were unified by blackness. Consciousness was deployed to bridge the strategic gaps in the nation. The concept of territory was reorganised by Baraka so that the black nation was not a coherently singular site, yet it remained unified by its blackness: a one that was not a one. The thrust of Third-World liberation and the historical specificity of slavery in the US came together through Baraka's politics of national consciousness, which sought to refigure black as a country (Jones and Baraka 2009).

At the turn of the decade there were a series of subtle changes in Baraka's politics. He took up a more formalised Pan-Africanism, and along with it shifted towards organised electoral politics. As a result, his framing of the nation question changed. All of these factors came together at the Congress of African Peoples, held in September 1970 at Atlanta, Georgia. The congress was designed to bring together a variety of black interest groups, ranging from radical community organisers to those within the Democratic Party structure, in

order a assemble a coherent national black political agenda.

Whilst there were still significant strains of his earlier politics at work during this moment (such as an internationalist focus on developing a 'World African Party', and calls for a psychic, rather than physical, separation from America), it is the issue of land that fundamentally altered. Baraka made calls for the annexation of much of the former Confederate South, the eventual aim being a black plebiscite over secession from the US. Such a call was justified because of the degree to which black labour had been exploited in order to build the southern economy, and the region contained the largest concentration of black people over a wide geographical area. Baraka spent much of the 1970 congress pushing the line: 'If there is enough of you standing on it, you ought to claim it' (Baraka 1990: 101).

The hope for a 'World African Party' flourishing in the US soon began to fall apart, as did Baraka's investment in the politics it espoused. This was largely due to the actions of the professional black political class, whose members would, at best, only ever pay lip service to any revolutionary aims. It was in 1974 that, ideologically at least, Baraka found his way back to Cuba, formally announcing his adherence to 'Marxism-Leninism-Mao Tse-Tung thought' (Baraka 1990: 257). Whilst the move amplified the already operating internationalism that had been with him since 1960, what is noteworthy about this period is that despite Baraka's fervour for scientific Marxism, his aesthetic commitments never wavered. The demands he made upon himself as a poet, after returning from Havana, never ceased. There was never a distinction drawn between his commitment to socialist revolution and black art. This was made evident in the 1979 poem 'AM/TRAK'. It is customary to couch Baraka's work in jazz, and especially John Coltrane, through the prism of his black cultural nationalism. Baraka's furious examination of questions of blackness sits more comfortably with a set of ideas associated with the racial nature of Coltrane's artistry. With 'AM/TRAK', Baraka retells the giant of modern music's narrative, but turns the open secret of Coltrane's music into one

that was produced by, and offers an escape route from, the morass of exploitative capital:

> From the endless sessions
>   money lord hovers oer us
>   capitalism beats our ass
>   dope & juice wont change it
>   Trane, blow, oh scream,
>   yeh, anyway.
> . . . .
>   And yet last night I played *Meditations*
>   & it told me what to do
>   Live you crazy mother
>   fucker!
>   Live!
>   & organize
>   yr shit
>   as rightly
>   burning!
> (Baraka 1990: 270, 272)

To open this essay with the statement that Baraka was born in Cuba in 1960 was, of course, intended to provoke. But such a claim is built on the idea that familial and political genealogies are never quite one and the same thing. This sentiment applies to no one more appropriately than Amiri Baraka. Despite, or perhaps even because of, the zeal and brutality of his myriad ideological transformations, which have always left him exposed to scrutiny by more rigid ideologues, two questions appear to have consistently driven his public life, ever since that 14-h train journey to the Sierra Maestra: What does a revolutionary poem do, and how does a poet go about making that kind of revolution?

Definition

This essay explores the life and work of Algerian politician, soldier, revolutionary, and first President of Algeria Ahmed Ben Bella (1918–1912).

From 1830 to 1962 Algeria was a French colony. The French occupation was marked by a long period of bloody conquest, and a mixture of disease and violence caused the indigenous population of Algiers to decline by a third between 1830 and 1872. Arab Algerians were discriminated against and were denied basic rights while hundreds of thousands of Europeans emigrated to Algeria. Under French colonialism two societies evolved in Algeria, a Muslim society based on a traditional economy and a European society which was heavily dependent on French capital and markets but also relied on Muslim labour. The two societies had relations of extreme inequality. French authorities had introduced capitalist property relations in landholding in the late nineteenth century, and European settlers expropriated many hectares of land from native holders; by 1936 40% of the land owned by indigenous people had been taken over. By 1960 the Muslim population had expanded from three million to about nine million. While some new farmland had been made available, Muslim farmers had been pushed into largely marginal areas, and with the French enforcement of property rights, farmers were unable to move freely, a situation which led to land exhaustion

and diminished grazing. Native agriculture was heavily dependent on wheat, and it was difficult for farmers to break into the cultivation of more profitable crops such as cotton or wine grapes. As the Muslim population grew it became impossible for peasants to grow enough food to support the population. Destitution forced people to move into the cities, and there were famines throughout the first half of the twentieth century. Vast slums, referred to as 'bidonvilles', circled the larger cities, with those surrounding Algiers containing 150,000 people.

By 1954 there were about a million European settlers in Algeria, the vast majority of them living in cities. Three-quarters of Europeans worked in the liberal professions, trade, transport, and administration or as skilled workers and could be regarded as middle class. Their average income in 1960 was about the same as in metropolitan France. The Native Code denied the vast majority of Muslims basic civil rights and French citizenship. Muslims could in theory opt to live under the French Civil Code and be granted citizenship rights, but this could mean severing ties with their own community and was in practice discouraged by the French authorities. The provision of education was highly unequal: as late as 1957 all European children were receiving an education but over 80% of Muslim children had no schooling.

Settler politics in Algeria developed in a deeply authoritarian direction. Direct action, through civic organisations or ad hoc groups, was preferred to party politics or representative democracy. Authoritarian French leaders such as Pétain were popular. Before and after the Second World War the French governments made some attempts to improve conditions for the native population, but any attempt to change the dominant role of the European settlers over Muslims was fiercely resisted.

Ahmed Ben Bella was born in Marnia, a small market town on the Algerian–Moroccan border, one of five sons of a farming family. There is some uncertainty about his date of birth: it has been suggested that his father changed the date originally given, 25 December 1918, to indicate that Ahmed was born in 1916 so that he could leave school early and work on the family farm. According to Robert Merle's transcribed biography (1967) Ben Bella grew up on a relatively poor farm of 70 acres with poor soil and no water supply, the family's main income coming from a small business that his father owned. His four brothers all died young: the oldest brother received wounds in the First World War of which he later died, the second died of disease at Marnia, the third went to work in France and disappeared in the evacuation of 1940, and the fourth was called up by the French army in 1939, but contracted tuberculosis and died in the same year. Bella also lost his father in that year.

Ahmed spent his early childhood in an environment where Arabs, Jews, and a small number of French mixed amicably. After receiving the certificate for completing primary school Ahmed attended a middle school nearby in Tlemcen, a town bigger than the village of his childhood. Here he first experienced the racism and harassment suffered by Muslim students. At one point he was threatened with expulsion after he talked back to a teacher who had insulted Islam. During this time Ahmed became active in sports, especially football, which was then one of the few activities where status depended on talent and performance rather than ethnicity. Despite this the sport was still segregated, with the Algerian team playing against the French settlers' team only once a year. At school Ahmed also became involved in Algerian nationalist politics. At 15 he joined the Union Nationaliste des Musulmans Nord-Africains, a nationalist organisation which appealed to Algerian youths in the Arab-speaking madrasa schools during the 1930s. In 1937 it became the Parti du Peuple Algerien (PPA).

In 1934 Ahmed sat the *brevet* examination required for entry into secondary school in the French education system, but did not pass. Rather than strain the finances of the family friend with whom he was staying, he elected to return to the family farm in Marnia, where he helped with farm work, worked for an insurance company, and continued with sport. He also enlisted for military training; in 1937 he was called up for service in the French army and was posted to the 141st Alpine infantry regiment at Marseilles. This

regiment included both French and Algerian conscripts, but its officers were all from metropolitan France. Ben Bella recalled being treated fairly; he took the non-commissioned officers' examination and passed with high marks, becoming a sergeant. Service in the French army may appear incongruous for someone attracted to Algerian nationalist politics, but Ben Bella stated that he felt military training was important and he was opposed to fascism.

Ben Bella was due to be released from the army in 1939, but this was deferred with the outbreak of the Second World War and he was posted to an anti-aircraft battery near Marseilles. He experienced the German Stuka bombing of that city in 1940; the men under his command, mostly young soldiers, abandoned their stations when the bombing began. Ben Bella then recruited a group of Corsican reservists, who were more reliable. He was awarded the Croix de Guerre for heroism in the attack. After his demobilisation in 1940 Ben Bella was invited to remain in Marseilles as a professional footballer. Although he was tempted he turned the offer down, concerned about worsening conditions in Algeria.

The defeat of France in 1940 brought appalling poverty to Algeria. The country experienced inflation, shortages of consumer goods, starvation, and typhus epidemics; Ben Bella's close friend and mentor Abdelkrim Baraka died of typhus, and in Marnia Ben Bella found one brother desperately ill and his father and another brother dead. He spent much of the early 1940s rebuilding the family farm, which had been abandoned. He also started a local football team. He resisted the anti-semitism of the French Vichy regime and gave protection to a Jewish player.

In 1943 Ben Bella was recalled to the French army and was posted to the 6th Algerian regiment at Tlemcen. Here he witnessed racial segregation and discrimination and became active in a campaign against segregation. He was next transferred to the 5th Moroccan infantry regiment, which was made up of Moroccan professional soldiers and commanded by a Corsican. After a discussion with a commander Ben Bella agreed to discontinue agitation in order to continue the struggle against fascism. Despatched to Italy, Ben Bella's regiment fought at Naples in December 1943, relieving an American unit near Montano, and participated in the liberation of Rome, encountering members of the Italian resistance. It then fought the Germans at Siena. After this battle the unit was relieved and sent into the reserve in order to take part in the invasion of France. Ben Bella was sent to train recruits.

The Setif Uprising was a turning point in Ben Bella's life. On 8 May 1945, as Nazi Germany was officially surrendering, an anticolonial march in Setif, a city 200 miles east of Algiers, turned violent and several dozen French settlers were killed. In retaliation European vigilantes and French troops killed between five and ten thousand civilians. This event had a traumatic and electrifying effect on Algerian troops returning home, and Ben Bella, shocked by the fierce repression at Setif, turned down an offer to stay in the French army on the grounds of needing to care for his mother and sisters.

At this time the Algerian electoral system was rigged in favour of the French community. One million Europeans elected two-thirds of the municipal councillors, who made up the *Premier Collège,* while ten million native Algerians elected the remaining one-third to the *Second Collège.* Upon returning to Algeria Ben Bella joined the Movement for the Triumph of Democratic Liberties (MTLD), created in 1946 to replace the outlawed PPA and, like the previous organisation, promoting the full independence of Algeria. Ben Bella put his name on a list of candidates for the municipal council of Marnia and won a seat. At this time much of Algeria, including the area surrounding Marnia, was ravaged by typhus and starvation. The French socialist mayor of Marnia, Gerbaud, put Ben Bella in charge of food supplies and rationing, where he did exemplary work. In a political standoff with the *Premier Collège,* Ben Bella and other members of the *Second Collège,* in protest against being denied any meaningful authority, resigned en masse; Ben Bella was regarded as one of the ringleaders.

Ben Bella found, in a situation that appeared to have been set up by the local authorities that a

family of squatters had taken his family farm and house. The local *gendarmes* refused to help. Attempting to repossess his house, he wounded a squatter and was forced to flee, initially to Algiers, where he went underground in 1947.

In 1948 the MTLD lost all its seats, and in 1950 it was suppressed by the police. Losing public support, it split into various factions which pitted the more radical leadership against moderates favouring electoralism. During this crisis in the organisation, Ben Bella became leader of the Organisation Spéciale (OS), a semi-secret internal faction which was created to bypass what was regarded as the opportunism of the moderates. It was sharply opposed by other elements of the MTLD.

In 1949 Ben Bella was part of a group which planned a robbery of the post office in Oran. His involvement in this was discovered in the following year, and he was arrested in Algiers. Ben Bella and other members of the OS sought to turn their trial into a debate on French rule in Algeria, but this was opposed by the MTLD. He was sentenced to 8 years' imprisonment at Blida. The MTLD sought to distance itself from the bank robbery, and it abolished the OS immediately after Ben Bella's arrest. Plans for escape by Ben Bella and his OS colleagues were sabotaged by the MTLD, but they managed to escape in 1952, using a file that had been hidden in a loaf of bread. Ben Bella went first to Tunisia, then secretly to Paris and in 1953 Egypt.

Egypt at this time was in the early stages of its nationalist revolution under Gamel Abdul Nasser. The Egyptian leaders had proposed a united north African liberation movement, which they would finance and presumably control. The OS leadership in Egypt turned this down, but Ben Bella nevertheless regarded himself as a Nasserist and an Arab nationalist; Egyptian support was important throughout the Algerian struggle. On meeting Nasser and other Egyptian leaders, Ben Bella felt sorrow at his inability to communicate in his Algerian dialect, at one point bursting into tears.

The FLN (National Liberation Front) was formed from mergers of the OS and several smaller groups at meetings in France, Algeria, and Switzerland and became officially known as the FLN on 10 October 1954. Ben Bella emerged as one of the leadership group of nine and continued to be based in Cairo until 1956 (Horne 1977, p. 79). Partly in reaction to a speech by the French premier Mendes France, who, while recognising the French withdrawal from Indo-China, declared Algeria to be an 'irrevocable' part of France, it was agreed that a campaign of militant action would begin on 1 November. An FLN radio broadcast from Cairo called for the 'restoration of the Algerian state sovereign, democratic, and social, under the framework of Islam' (quoted in Horne 1977, pp. 94–95). The FLN began attacks on military and civilian targets throughout Algeria on what became known as the 'Toussaint Rouge', or 'Red All Saints' Day', in November 1954. The November attacks are regarded as the beginning of the Algerian Revolution, or Algerian War of Independence. The purpose of the attacks was to rally the Algerian people with a show of resistance by a militant minority, further a polarisation within the Algerian nationalist movement, and provoke the government into finally dissolving the opportunistic MTLD. The latter goal was successfully achieved, with the French arresting the leadership of the organisation. At this time the FLN received some aid from Morocco, but the additional aid that it hoped for did not materialise. Later, aid from other Arab countries, especially Egypt, was important in the struggle.

By 1955, when the FLN moved into urban areas, it was apparent to the French that they faced a serious insurgency. A dramatic escalation in the war occurred with the Philippeville massacre in August of that year, in which the FLN and supporters killed 123 people, 71 of them French, including elderly women and babies. Before this time FLN's policy had been to attack only military and government targets, but the local commander of the Constantine region believed that an escalation was required. The French army and colonists carried out extensive massacres in retaliation, with, according to some accounts, 12,000 civilians being killed by the army, police, and settlers. The events at Philippeville also led to a hardening of attitude within the government and increased repression.

By 1956 the FLN was divided into two sections: the leadership operating in Algeria, known as the 'Intérieur', and the leadership in Tunisia and Morocco, known as the 'Extérieur'; Ben Bella was prominent in the latter group. In August and September of that year rifts appeared and the two groups began operating separately.

In 1956 Ben Bella was targeted in two assassination attempts. The first one was foiled when he refused to accept a package delivered to his Cairo hotel by a taxi driver; as the taxi drove away a bomb exploded, killing the driver. Later that year a gunman entered his hotel room in Tripoli, Libya. In a brief struggle Ben Bella was wounded before the gunman escaped, to be killed later by guards at the Libyan border.

In 1955 and 1956 the FLN took part in indirect peace negotiations with the French government of Guy Mollet. In September 1956 a provisional peace agreement, arranged through intermediaries, appears to have been arrived at. To ratify the agreement before it could be made public Ben Bella and leaders of the Extérieur were to fly from Rabat to Tunis on a safe-conduct pass. In what became known as the 'airplane coup', Ben Bella's DC3 was ordered by the French army to land in Algiers. The passengers were arrested and they were then held for the duration of the war.

In Algiers Ben Bella and the other Extérieur leaders were harshly interrogated by French officers. From there Ben Bella and his comrades were transferred to the Sante prison in France, where they remained for two and a half years; Ben Bella remembered this as the worst part of the six-year imprisonment. In 1959 De Gaulle had the prisoners transferred to the Isle of Aix, where conditions were much better. Ben Bella and his colleagues went on several hunger strikes for the right to be treated as political prisoners. During his imprisonment there was increasing agitation by French extremists against the prisoners. In May 1958 an apparent attempt by a rightist group to seize the prisoners was pushed back, and at one point Ben Bella and his colleagues had to be guarded by 200 mobile police. The leadership of the Extérieur group at large had formed the Provisional Government of

the Republic of Algeria (GPRA) to co-ordinate international relations. While this was meant to be a temporary organisation Ben Bella became alarmed by reports of it evolving into a bureaucratic mandarinate, ignoring the needs of the civilian refugees and the Intérieur fighters. Ben Bella mentioned that he was worried about a 'facile and corrupt regime' taking power after independence (Merle 1967, p. 119).

In 1961 serious peace talks began, and in March 1962 the Évian Accords were signed by France and the GPRA at the French town of Évian-les-Bains. They granted sovereignty and self determination to Algeria but made stipulations protecting French interests, including access to Algerian oil and protection for the European French community. Ben Bella initially opposed the Évian Accords because he felt they were too stringent, but he signed them after modifications were made, and an agreement was reached for the GPRA to summon a congress immediately after the ceasefire in order to decide the direction of the Algerian government.

On Ben Bella's release from prison in 1962, De Gaulle wanted him to be flown to Rabat and delivered to King Hassan of Morocco, but having previously had a bad experience with the French in relation to a flight to Morocco, Ben Bella insisted on being flown to Switzerland. From there he went to Morocco, Tunisia, and Libya, where he was received as a hero. Rifts in the Algerian independence movement widened, however. Ben Bella felt that the Algerian Revolution was backsliding in a neo-colonialist direction caused by a lack of ideological direction. He sought to remedy this and to give a clear direction to independence. Meetings between the Intérieur and Extérieur factions were held in Tripoli, and a socialist programme for Algeria was agreed on, although Ben Bella felt that the apparent agreements were based more on cynicism. Shortly thereafter an opposing 'Bureau Politique' broke away from the GPRA. The rift approached outright war. At one point the GPRA attempted to have Ben Bella arrested in Tunis and began arresting his supporters in Algeria.

A period of chaos threatened. Remnants of the French Organisation de l'Armée Secrète (or Organisation Armée Secrète, OAS) remained strong in the Oran district, and it was feared that the OAS would attempt to set up a separate state. In addition *harkis* forces, native Algerians recruited by the French, were still in existence, and there was the possibility of them intervening in an open FLN split. Throughout Algeria local *willaya* forces, who often fought the French with little outside help, refused to cede their control over regions. The armed wing of the FLN, the Army of National Liberation (ALN), was divided into guerrilla units, which fought the French in Algeria and struggled for control of the expatriate community in France, and a component, based primarily in Morocco and Tunisia and with ties to the Berber communities, which more resembled a conventional army. The latter, led by Colonel Hourari Boumediene, saw less combat than the guerrilla units in Algeria.

With the aid of Colonel Boumediene's forces Ben Bella was able to outmanoeuvre the GPRA and prevent what appeared to be a looming civil war. In July 1962 the ceasefire agreement with France was ratified in a popular referendum and the country became independent. Ben Bella entered Algeria though his home town of Marnia, marking a triumphal return. In 1963 he was elected premier of Algeria unopposed.

Upon independence Algeria faced huge problems. The educational system was in disarray, as the OAS had destroyed schools and burned the Algiers University library. Thousands of teachers had left their posts. The French army still occupied parts of the country while the emigration of most of the French population in 1962 had led to an economic collapse. Two million Algerians, a fifth of the population, were unemployed, and the cities were filled with starving people from the countryside. In this situation reorganising the agricultural sector was felt to be a priority. Agricultural policy was centralised and aid was promised from the socialist bloc. Some success was achieved, with an outstanding harvest in 1963.

In the conditions prevailing in a developing country like Algeria it was felt that a single party would best unify the various elements of society. Ben Bella outlawed the Communist Party, although he maintained respect for communist militants. He put much effort into reviving and developing the educational sector. The University of Algeria was reopened, and Ben Bella was proud of the fact that Algeria dedicated a quarter of its budget to education. In February 1963 the *Petits Cireurs* or 'Small Shiners' operation was begun, a massive programme to aid, educate, and organise the large orphan and destitute child population of the country.

After independence European interests still controlled much of the economy. Much agricultural land was still owned by big French or Algerian landowners, but in March 1963 most of these estates were nationalised when the ANL, now called the National Popular Army, simply marched on the big estates and gave land to peasant families. Many businesses in the cities were bought out cheaply by native Algerians, and it was feared that an exploitive Algerian business class would emerge in place of the French. Ben Bella, who was influenced by the Trotskyist economist Ernest Mandel, initiated a system of worker selfmanagement known as *autogestion* which was even stipulated in the Algerian constitution.

The results of the land reform and *autogestion* programmes were chaotic. Unrest and resentment against what were seen as Ben Bella's autocratic style grew. In May 1964 a bomb exploded in front of his official residence in Algiers. Unrest grew in the Kybilya region, and there was a revolt by the Sahara regional army. On 19 June 1965, Ben Bella was deposed in a coup led by his former ally Colonel Boumedienne. He was held for 8 months in an underground prison and then taken to a villa outside Algiers, where he was held under house arrest for 14 years. In 1971 he married Zohra Sellami, an Algerian journalist. The couple adopted two children.

Boumediene died in 1978 and restrictions on Ben Bella were eased in July 1979. In 1980 Ben Bella was allowed to leave Algeria for Switzerland, where he lived in Lausanne for

10 years. Returning to Algeria in 1990, he re-entered politics and led the Movement for Democracy in Algeria, a moderate Islamist party that he had founded in exile in 1984 in the first round of Algeria's abortive 1991 elections. This party was banned in 1997. Ben Bella participated in negotiations to end the bitter Algerian civil war which had begun in 1991. At this time he advocated greater democracy in Algeria.

Ben Bella opposed the US war against Iraq of 2003 and was elected president of the International Campaign Against Aggression on Iraq. He was present when the 'Arab Spring' protests began in Algeria and the Arab world. He remained critical of the US's role in world affairs and of global capitalism. Although a lifelong religious Muslim he was critical of radical Islamists, believing that they misinterpreted Islam. Ben Bella died at his family home on 11 April 2012. The exact cause of death is unknown but is believed to have been respiratory illness.

In the 1970s and 1980s Algeria experienced an economic decline after a drop in the price of oil, which impacted on the working class and poor. After a military-backed government shut down an election in 1992 which the Islamic Salvation Front was expected to win, an action supported by France and NATO, a bitter civil war broke out in which over 200,000 people were killed. In 1999 Abdelaziz Bouteflika was elected president, amid allegations of electoral fraud. According to Louisa Hanoune, the 2014 presidential candidate of the Algerian Workers' Party, the implementation of an International Monetary Fund structural adjustment plan led to the closing of hundreds of state-run companies and the loss of thousands of jobs, and the Association Agreement with the European Union has devastated agriculture and industry, as such programmes have done elsewhere in the developing world (*Socialist Organizer* 2014).

Biko, Steve (1946–1977)

Hesham Zakai
London, UK

Definition

Steve Biko was born on 18 December 1946 in King William's Town, South Africa. A prodigiously talented thinker and speaker, his life is a symbol of the sacrifices made when national liberation movements are confronted by the forces of history that seek to repress and subjugate them.

They had to kill him to prolong the life of apartheid.
(Nelson Mandela quoted in Somerville 2002*)*

It is both sad and timely to reflect that many of the leaders on whose vision and bravery anti-colonial movements are built do not live to see the fulfilment of their struggle. Stephen Bantu Biko is one of those leaders. A prodigiously talented thinker and speaker, his life is a symbol of the sacrifices made when national liberation movements are confronted by the forces of history that seek to repress and subjugate them. But if his life is a symbol for sacrifice, then so too is it a symbol for the liberatory maxim articulated by Burkina Faso's late revolutionary president Thomas Sankara: 'While revolutionaries as individuals can be murdered, you cannot kill ideas' (Kasuka 2013: 294–295).

Steve Biko was born on 18 December 1946 in King William's Town, South Africa. King William's Town is situated in the Eastern Cape, which is home to the greater proportion of one of the country's largest population groups, the Xhosa people. Biko was a Xhosa, a status that he shared with fellow antiapartheid icons Nelson Mandela, a Xhosa chief, and Archbishop Desmond Tutu, whose father was Xhosa.

Yet his heritage also positions him in a more complex anti-colonial trajectory. The Eastern Cape was the ground on which were fought the Frontier Wars, a century-long period of battles between the Xhosa people and colonial settlers that began in 1779. It comprised nine separate wars, varying in brutality, and interspersed with oases of calm. Ultimately, the wars, which came at great cost to the indigenous population, culminated in the annexation of Xhosa lands and entrenchment of British colonial rule. Nonetheless, the anti-colonial tradition of the Xhosa people was firmly fixed both in the history of resistance in the Eastern Cape and in the psyche of the resistance movement that the Eastern Cape would go on to produce; including Biko, who has been described as a 'Xhosa prophet', albeit problematically, given that this is both an essentialist and messianic description (Mangcu 2014: 11). Xolela Mangcu, whose indepth biography of Biko provides a brilliant conspectus of his politics

and proliferates the process of correcting his relative absence from the public consciousness, tackles this problematisation: 'Steve Biko was as much a product of South Africa's multi-ethnic political heritage as he was a child of the Xhosa people of the Eastern Cape' (ibid.).

Biko lost his father at a young age and was raised by his mother, who worked as a domestic servant employed by white families in the town in which he and his three siblings grew up. It is difficult to envisage that the racist servitude to which his mother would have been subjected did not influence the political ideology of the young Steve Biko during his early years.

In 1963 he joined Lovedale Institution where his older brother was also studying. After his brother was arrested and jailed for one year on suspicion of belonging to the military arm of the Pan Africanist Congress (PAC), a black nationalist political party, the police questioned Biko. Arrests such as this, Biko would go on to say, led to 'some kind of political emasculation of the black population', with the result being that blacks were discouraged from articulating their political and economic aspirations (Biko 1987: 143). Unshackling blacks from this mental and oral incarceration was an integral part of Biko's pioneering Black Consciousness ideology.

Following police questioning, Biko was not arrested but did find himself expelled from his school. His expulsion meant having to temporarily give up his studies, which he resumed when he joined a Roman Catholic boarding school. Close friendships with a nun and priest here paved the foundations for his later ideas on Black Theology.

After graduating from his boarding school, Biko won a scholarship to study medicine, which he pursued at the University of Natal, where he first became involved with student politics. It was also where the conclusions Biko had initially drawn from his brother's arrest were to become manifest.

Opposition from blacks to their treatment by the government at the time was diminishing, Biko felt, and their participation in the struggle was becoming increasingly marginalised by white-dominated organisations like the National Union of South African Students (NUSAS). The

cosmetic make-up of these organisations was unlikely to change given the significantly higher number of white students who were able to attend university in apartheid South Africa. Thus, these ostensibly multi-racial organisations paradoxically reproduced the racial inequalities in South African society and led Biko to notice a recurring pattern: 'Whites were in fact the main participants in our oppression and at the same time the main participants in the opposition to that oppression' (ibid.). Biko's disavowal of multi-racial organisations like NUSAS stemmed, then, from the recognition that such bodies represented not the interests of the black minority amongst their membership but the liberal white majority. They were representative of the existing structural forms of race-privilege in such organisations, and the ordering of dissent in ways that were, in reality, ambivalent to the consciousness project Biko was trying to create. For blacks to advance their political struggle, they must first seize control of it.

Accordingly, in 1968, the golden year for political and social movements across the world, Biko led the founding of the South African Students' Organization (SASO). A structure had been put in place that would restore to blacks the inalienable right to commandeer their own fight against apartheid. SASO can be seen as the first formalisation of the Black Consciousness Movement in that it exalted the virtues of black solidarity and placed pride in blackness at the heart of the political spectrum. No longer did black students have to rely on white spokespersons to articulate their suffering, nor did they have to accept the structural stifling of their demands for equality. Blacks began to associate much more readily with each other, setting them on course for the psychological emancipation with which Black Consciousness is synonymous.

Here Biko engages with the sentiment of the Pan-Africanist pioneer of the 'Back to Africa' movement Marcus Garvey, whose hope was that blacks would 'emancipate ourselves from mental slavery because while others might free the body, none but ourselves can free the mind' – a political ideal popularised by Bob Marley's iconic *Redemption Song* (Garvey 1990: 791). In order

for blacks to free their bodies for themselves, Black Consciousness demonstrates, they must *first* free their minds.

It would be wrong, if fathomable, to assume that Biko advocated total segregation. On the contrary, he recognised that the success of South Africa's anti-colonial movements would depend to a large extent on their ability to ultimately transcend ethnic boundaries. However, all movements are shaped by the conditions in which they are created and the political challenges they address. SASO's politics of distancing itself from existing establishment liberal white organisations was a necessary response to a climate in which blacks were made to feel inferior and whites, thus, correspondingly superior. Much more reflective of SASO's race politics and the Black Consciousness Movement as a whole was its welcoming right from the start of coloured and Indian activists, overcoming existing barriers in the process. As Biko's long-time friends Malusi and Thoko Mpumlwana state, 'Black Consciousness sought to unite the "non-whites" into a socio-political block recognized as "blacks"' (Biko 1987: xxvi). In this way the Black Consciousness Movement helped not only to organise but to *define* 'black' as a broad coalition of the non-white oppressed, recognising it was not just Africans who suffered from unjust material conditions. The Black Consciousness Movement's broader black solidarity also distinguished it from some of the narrower elements of both the PAC and the African National Congress (ANC).

As SASO expanded, its following diversified to incorporate a wider representation of blacks beyond the relatively educated university demographic. This drive was boosted by a practical outlook and applied language that focused on the needs of ordinary Africans, avoiding the trap of an aloof discourse disconnected from society at large that similar organizations had fallen victim to. This trajectory culminated in the creation by black communities in 1972 of the Black People's Convention (BPC), which expressly excluded whites, and took Black Consciousness as its central philosophy. Black Consciousness extolled the virtues of blackness, including all aspects of its history and culture. In order to be able to do this,

the Black Consciousness Movement argued, the black community had to rid itself of the palimpsestic remains of centuries of oppression, enslavement, and subjugation; such a process of psychological liberation could only be undertaken by black communities themselves. This is what distinguished the Black Consciousness Movement from the more compromising approach of Nelson Mandela, for example, who placed greater hope in multi-racial struggle.

The reach of Black Consciousness extended further still when Biko joined the Black Community Programmes (BCPs), which focused on the social and economic empowerment and independence of black communities. The BCPs established health centres, disseminated literature, supported the families of political prisoners, and built schools and crèches – all of which sought to improve the material welfare of blacks while increasing their self-reliance. This was in part driven by a belief that individual mental liberation could not be satisfactorily reached *prior* to changing circumstances.

Biko's Black Consciousness Movement represented the convergence of these three aforementioned organisations: SASO was the radical student body that was instrumental in setting political direction; the BPC was the wider body in society that brought people together; and the BCPs were the self-help welfare arm. It was a holistic approach that reflected Biko's understanding of society and the need for systemic change if emancipation were to be achieved. In an interview with a European journalist on his vision for an egalitarian society, Biko outlined the BPC's road to meaningful change as 'reorganizing the whole economic pattern and economic policies', including the redistribution of wealth (Biko 1987: 149). Moreover, he had a prescient warning for his fellow activists: 'If we have a mere change of face of those in governing positions what is likely to happen is that black people will continue to be poor, and you will see a few blacks filtering through into the so-called bourgeoisie' (ibid.).

The effectiveness of Black Consciousness caused the apartheid establishment to be unnerved, and they instigated a crackdown on its members in the first half of the 1970s. Leaders of the movement were arrested, while Biko was initially confined to his hometown before being banned from further work with the BPC in the mid-1970s. By that point, however, he had spread the influence of Black Consciousness far and wide across South Africa. The increasing militancy of black communities, linked to this dispersion, found its sharpest expression in the Soweto Uprising of 1976. The principal spark for the protests was the Afrikaans Medium Decree of 1974, which made compulsory the use of Afrikaans as a medium for teaching in schools. The rebellion to this was a reflection of the increasing consciousness and determination of the young followers of the Black Consciousness Movement to assert their own history and identity.

Biko's death came after a period of heightened harassment by the state. However, he remained defiant throughout and refused to cease his political organising, knowing that the movement for liberation was gathering pace. He was arrested and detained under the Terrorism Act in 1976 and again the following year. On 18 August 1977, while travelling with a comrade, he was stopped at a roadblock. The police did not recognise Biko, while his friend, Peter Jones, refused to reveal his identity – despite the dangers he knew this entailed. Sensing the danger his friend was putting himself into, it was Biko who came forward and revealed himself to the officers. They promptly took Biko and Jones away to separate stations. Jones's bravery came at a cost of repeated beatings and torture; Biko's came at a greater cost. At the police station he was stripped naked and badly beaten, resulting in a brain haemorrhage on 6 September. Despite his rapidly deteriorating condition, he was kept in prison for days, before being driven – shackled and naked – to a prison hospital hundreds of kilometres away. He died in a prison cell in Pretoria on 12 September 1977. The apartheid government tried to suppress news of what had really happened to Biko – a brutal assassination at the hands of the state – but his murder resonated around the world and galvanised the fight for freedom.

Those who die fighting for freedom are never truly murdered, only martyred. That is not to romanticise their deaths but to exalt their lives,

as it returns us to the maxim with which we began: states can kill individuals but not the effects of their ideas on the lives of others. The Black Consciousness that Biko represented lived on to the dismantling of apartheid in South Africa – an anti-colonial and anti-racist victory for which Stephen Bantu Biko will forever be remembered.

Biko's hope to bring together the BPC, ANC and PAC is evident in the collection of his writings *I Write What I Like.* He believed that a united front would create the most formidable challenge to apartheid. Mandela has suggested that it was in the run-up to a meeting with the then-leader of the ANC, Oliver Tambo, to progress this hope that Biko was killed. The prospect of that triumvirate forming a coalition against apartheid alarmed the apartheid government. It is that sentiment which lay behind Mandela's assertion in the epigraph to this chapter: in order for apartheid to live, Biko had to die. As an individual, his magnitude equalled that of the armoured apartheid nation he confronted; and so his murder equalled the creation of a martyr, his physical destruction, a stride towards the political destruction of the very state that carried it out.

Definition

Since arriving on American shores, struggle has characterised much of African and African-American people's experience globally and in the US. Blacks' struggle against political subjection and domination has characterised much of their social relations with the capitalist world economy, has been ongoing, and has taken

multiple forms. It has been black resistance to racism and oppression which has been the major form of protest to the domination of black peoples since the sixteenth century. It is in this context that we must situate the resistance and struggle of the Black Power Movement (BPM) over time more generally and the Black Panther Party (BPP) more specifically.

Introduction

Since arriving on American shores, struggle has characterised much of African and African-American people's experience globally and in the US. Blacks' struggle against political subjection and domination has characterised much of their social relations with the capitalist world economy, has been ongoing, and has taken multiple forms. It has been black resistance to racism and oppression which has been the major form of protest to the domination of black peoples since the sixteenth century. It is in this context that we must situate the resistance and struggle of the Black Power Movement (BPM) over time more generally and the Black Panther Party (BPP) more specifically.

The BPM is arguably one of the most important forms of modern resistance in African-American history. It can be traced back to the slaves, the African Blood Brotherhood of the 1910s (who fed from the Communist Party USA [CPUSA]), the 1920s with Marcus Garvey's Universal Negro Improvement Association, and through the 1930s, 1940s, 1950s and 1960s with the National Negro Congress, A. Philip Randolph's March on Washington movement, as well as the Nation of Islam and the ideologies of Malcolm X (Austin 2006, pp. 2–9; Haywood 1978; Kelley 1990). This long and enduring history set the stage on which the BPP would emerge.

The BPP was one of many organisations that was created and continued under the umbrella of the modern phase of the BPM during the 1960s, 1970s and 1980s. It earned its place in history because of its militancy and the revolutionary stance its members took at the tail end of

the Civil Rights Movement. They grabbed the attention of those around them because of the resurrection of a more militant and vigilant stance against discrimination as well as their emphasis on mobilising the masses. It was this stance that led to the BPP's greatest success.

Although much has been written in recent years about the BPP, its organisation, programmes, and activities, very little has been written about the structural conditions which contributed to its ideologies and militant stances. A thorough examination of the Party's ideology in response to these structural conditions over time has yet to be undertaken. In examining the Party and its many actions and activities, central questions are: What was the ideology of the BPP? Where did it come from? Did the ideologies of the BPP change over time, and if so, how and why did they change? Who influenced this ideology? And did changes in ideology change the perceptions and activities of the Party over time?

The thesis of this essay is that the BPP's ideology was grounded in a critique of the dominant perspectives on black equality. Over the course of the BPP's existence, however, this critique and the substance grounding it would go through continuous ideological transformations as a result of larger structural conditions that led to changes in the posture of Party members. There was thus a continuous evolution of perspectives on the part of Party members based on their continuous struggles to make sense of the world. Over the course of the Party's existence, it came to be guided by a number of ideologies that continuously built on and corrected deficiencies in the dominant and more widely accepted ideologies of Black Power and Black Nationalism. Conflicts within the group about what the Party was fighting for shaped each of these ideologies that were promoted at different points in time. At each stage, these ideologies served as guides for the Party's changing activities. Ranging from Black Nationalism to Revolutionary Nationalism to Revolutionary Internationalism to Revolutionary Inter-communalism, each of these ideologies represented different phases in the Party's history and evolution and each brought changes to Party

activities and activism. For instance, early on, the Party took on a version of Black Nationalism because of relationships to the Black Power Movement and agreement with its critiques about the Civil Rights Movement. This ideology influenced the Party's early belief that the struggle was predominantly an African-American one to reclaim the manhood of African-American males. At the height of the Party, in response to the repression and many conflicts and contradictions arising out of these conditions, new coalitions were formed. The Party then took on the ideology that the struggle was one against capitalism and that the fight waged had to be one of African and African-American revolution. Later the Party would again augment this ideology based on new interpretations of old influences and relationships with international organisations. It would take on the belief that the struggle was for all oppressed peoples, and that efforts should be geared toward achieving the selfdetermination of destiny and life goals absent among many if not all oppressed populations within the US and abroad.

In this essay, I will examine the changes in the ideology of the Party between 1967 and 1971 through an analysis of the BPP's major media and vocal outlet, the organisations newspaper *The Black Panther*. I will particularly focus on the published poetry, speeches, and essays of Party members gathered from the Binghamton University library archive. I will utilise this in conjunction with other methods of acquiring data including biographies and other forms. The hope of this essay is to add to the larger dialogue on the BPP and particularly discussions of Party dynamics and their many functions in order to promote the continuance of its important legacy.

Black Power, Black Nationalism and the BPP (1966–67)

Michael West and many others argue that the rise of modern black resistance began with the global mechanisms of the quadripartite revolutions (global abolitionism, the American Revolution, the French Revolution, and the Haitian Revolution) (West 2005, p. 87). This is because this period led to Blacks being freed from slavery and being educated by whites. For West, one major consequence of this education was the internalisation of western values and principles on the parts of African elites and intellectuals which, although not inevitable, led to an integrationist black consciousness and ultimately an integrationist Black protest that was foundational to movements such as the US Civil Rights Movement (West 2005, pp. 89–91). Importantly, capitalism (and in many cases scientific socialism), industrialisation, secularisation, and urbanisation for the African-descent patterned after the Western world was for many intellectuals the way of rising above darkness and getting equality. It was a means to move beyond the conditions that set blacks up for servitude. However, for Michael West and many others it was clear that a large population did not benefit from the strategy of these intellectuals (102). For West, those who benefited least from the quadripartite schema, the end of slavery, decolonisation, and desegregation began to believe that this posturing was limited, and they contested its worth. This opened up spaces for critique centred on the Black Power ideology (102). In noting the lack of ability for integration in some cases and the limitations of integration in others, the non-intellectual masses played a crucial role in this critique.

Black Nationalism, as I argue, was the first form of Pan-Africanism and also dated back to slavery. It began even before integrationist approaches and was the more revolutionary stance of the slave tradition that began in Africa and the Americas with maroons and slave revolts and with field slaves or the non-elite. The integrationist project and approach, however, aligned more thoroughly with dominant white perceptions about civilising blacks, and Black Nationalism in slave form was subsequently hidden and obscured. However, Black Nationalism, in clear opposition to the dominant approach of striving for integration, was always the integrationists' strongest critique. It emphasised self-sufficiency, race pride, and black separatism as opposed to integration and the Westernisation of Africans and Africa (Encyclopedia Britannica 2014;

Stanford Encyclopedia 2014). This critique later gained ground because of the lack of changes in the structural conditions of black people in their negotiations for uplift following the integrationist approach. It is only in this context that we may understand the modern phase of the BPM.

The modern phase of the BPM of the 1960s and 1970s began as the result of the disillusionment of many African-Americans with the outcome of the dominant approaches to subjugation such as Intellectual Pan-Africanism, Négritude and the Civil Rights Movement. Positioning itself against middle-class movements that emphasised the 'talented tenth's' uplift, the BPM found its roots in the maroon communities and revolutionary fervour of slave revolts as well as in organisations and movements such as the African Blood Brotherhood of the 1910s, the CPUSA, the Marcus Garvey's Universal Negro Improvement Association, and the ideologies of Malcolm X. It became a force and mobiliser for the empowerment of African-Americans in its own right and with its own dynamic historicity (Austin 2006, pp. 2–9; Haywood 1978; Kelley 1990; Umoja 2006, p. 225). It was within this tradition that the BPP emerged and became an important fixture within the African-American community, successfully changing the focus from an isolated African-American struggle against racism in the US to capitalism and imperialism everywhere.

Amidst the turmoil of the 1960s and 1970s, the BPP was formed and proved to be a substantial force within the modern phase of the Black Power Movement. Arriving on the heels of the Civil Rights Movement, the BPP was first established in 1966 by Huey P. Newton and Bobby Seale as a nuanced response to the many injustices still plaguing the African-American community. A large part of what made the Party so appealing was its reaching-out to the most downtrodden or the lumpenproletariat, the militant stance the Party was taking at the tail end of the Civil Rights Movement, and its revolutionary activities and actions that came at a time when the pull of non-violence was wearing thin. It was because of these major premises and actions that within the course of a few years (between 1966 and 1971) the BPP became one of the most successful organisations

within the BPM, succeeding in transforming the struggle for many African-Americans as well as many others both nationally and internationally.

The world that the BPP knew and understood in its earliest years was heavily influenced by the ideologies and organisation of both the historical and modern phase of the Black Power Movement. From its earliest inception, the BPP identified with and worked with organisations in the Black Power Movement and identified itself as a Black Nationalist organisation. Some of the major influences on the Movement were also influences of the BPP. For instance, both considered themselves to be the 'heirs of Malcolm X' and took up his ideas about the way the struggles for equality should be approached, including his ideas about the position of whites in the movement (Jeffries 2006, p. 7). The Party followed the example of many such Black Power Movement organisations by not admitting whites and shunning co-operation with white organisations (ibid.).

Others who contributed to their ideas about liberation and revolution were Robert F. Williams with *Negroes With Guns* and Frantz Fanon with *The Wretched of the Earth* (ibid.). Also, early on, expanding upon and incorporating protection groups of the 1950s and 1960s, the Party defined the struggle as one for racial solidarity and liberation, and geared its activism toward bettering the African-American community. The Party thus sought in its very beginnings to actualise this form of Black Nationalism, particularly by putting an end to the brutality inflicted on many African-Americans within the community, which, for them, was aiding in black liberation (Austin 2006, p. 7; Calloway 1977, p. 58; Courtright 1974, pp. 249–267; Umoja 2001, pp. 3–19). In its early years, the Party's emphasis on revolution and liberation centred on the liberation of African-American males from the dominance of the 'White man'.

For instance, Huey P. Newton in the early years of the Party took from Eldridge Cleaver when he spoke of the struggles of the Black community as struggles between the African-American male and the white male, the slave and the slave master, stating that:

The historical relationship between black and white here in America has been the relationship between the slave and the master; the master being the mind and the slave the body. The slave would carry out the orders that the mind demanded of him to carry out. By doing this the master took the manhood of the slave because he stripped him of a mind. He stripped black people of their mind. In the process the slave-master stripped himself of a body . . .. This caused the slave master to become envious of the slave because he pictured the slave as being more of a man . . . in order to reinforce his sexual desire, to confirm, to assert his manhood he would go into the slave quarters and have sexual relations with the black woman (the self-reliant amazon) . . .. The slave was constantly seeking unity within himself; a mind and a body. He always wanted to be able to decide . . .. (Cleaver in Matthews 1998, p. 280).

Many Party members also espoused similar beliefs. For instance, the April 1967 issue of *The Black Panther* published the article 'Why Was Denzil Dowell Killed?' in which the struggles are outlined as a need for protection against the American white power structure and against police brutality in the community. This particularly highlighted the need for African-American males to begin organising, become aware, and fight for Black power. The author wrote that:

Let us organize to defend ourselves . . .. We believe we can end police brutality in our black community by organizing black self-defense groups that are dedicated to defending our black community from racist police oppression and brutality . . .. These brothers have become aware of something that the white racists have been trying to keep secret from Black people all the time: that a citizen has the right to protect himself . . .. Black people must realize the time is short and growing shorter by the day . . .. Black people want and need the power to stop the white racist power structure from grinding the life out of the Black Race through the daily operation of this system which is designed to exploit and oppress Black people . . .. The Black Panther Party For Self-Defense really has something going. These brothers are the cream of Black Manhood . . . Black Men!!! It is your duty to your women and children, to your mothers and sisters, to investigate the program of the Party. There is no other way. (quoted in Foner 1995, pp. 9–12)

Many of the subsequent activities of the Party at this time appear to have grown out of these ideologies and understandings. This seemed to be the Party's way of carrying out action based on these ideologies. For instance, members were

quite specific in the case of African-Americans in the Bay Area. At their foundation, they developed a ten-point programme entitled 'What We Want, What We Believe' based on what they saw as the needs of and injustices perpetrated against the African-American community. Their aims included freedom, full employment, an end to the robbery of the black community, decent housing, education, exemption from military service for black men, an end to police brutality, freedom for all black men in prisons and jails, black people to be tried by a jury of their own peers, and land, bread, housing, clothing, justice and peace (Austin 2006, p. 353; Foner 1995, pp. 2–4; Holder 1990, p. 28; Jones 1998, pp. 473–475; Major 1971, pp. 291–293; Newton 1980, pp. 119–122). Upon its foundation, the Party took on the title of the Black Panther Party for Self-Defense. Its first task was the orchestration of armed patrols of the police and community as well as beginning to advocate for armed struggle (Austin 2006, p. 7; Calloway 1977, p. 58; Courtright 1974, pp. 249–267; Rodriguez 2008, pp. 119–141; Seale 1970, p. 37; Smith 1999, p. 31; Umoja 2001, pp. 3–19).

In addition to the armed patrols that were set up, many of the activities that the Party engaged in during this time were also quite specific to the mobilisation of African-Americans in general and particularly the African-American community in the Bay Area. The Party worked within the African-American community to have stop lights installed at dangerous intersections and to have community review boards set up (Fletcher et al. 1993, p. 223).

Throughout 1966 and 1967, the Party was strongly committed to the traditions and ideology of the BPM which was specific to blacks in the US. However, these ideas as well as many of the other ideas of the Party would change. The Party would eventually see these organisations' ideologies as limited interpretations of the struggles of African-Americans as their ideology began to move more steadily and heavily to a Marxist-Leninist and Maoist viewpoint. This occurred in tandem with the Party beginning to establish coalitions with other organisations, including aligning with the Peace and Freedom Party

(221–223). It would thus be forced to expand its truths, ideologies, assumptions, and actions. These alliances would come to have an enormous impact on the Party's understandings throughout 1968 and 1969. At the start of 1968 and continuing in 1969, its ideologies began to change rapidly, along with which changes came shifts in Party perceptions, activism, and activities.

Black Nationalism, Revolutionary Nationalism, and the BPP (1968–69)

Throughout 1968 and 1969, the Party was faced with many contradictions in relation to the ideology of the larger BPM. For the Party, many in the BPM just did not sufficiently answer these contradictions with their actions (Hayes and Kiene 1998, p. 164). Beginning in 1968, the Party began to take great issue with black and cultural nationalists' arguments for black-only struggles, with the emphasis on the black male struggle and with black and cultural nationalists' ultimate goals for a 'Black nation'. The BPP argued that this form of thought was limited and problematic in its goals and struggles, particularly in regard to its analysis of race and class as separate struggles (164). This came as a result of its desire and need for alliances. It then began to draw links between many struggles going on throughout the nation and the world which led it to conclude that the black/cultural nationalist ideology was not wholly sufficient to deal with the power structures and processes of oppression that plagued the African-American community. The BPP believed that there were better truths out there to explain things. Because of the many conflicts with the ideologies of black and cultural nationalism which resulted in conflict between the Panthers and other Black Nationalist groups surrounding these issues and turf, the BPP came to define black and cultural nationalism as a reactionary and chauvinistic and part of the problem within the US (ibid.). Though the Party in essence retained some of the central premises that had guided them in their early years (for instance, continuing to stress ideas of black liberation and the need to resolve the problems of

the American power structure), it also began to emphasise the importance of coalitions and that the goal of the struggles in the US should be for socialism. No longer able to look to Black Nationalist organisations, the BPP began to depend more heavily on Marxist-Leninist theory as well as that of Che Guevara and Mao Zedong, and looked to different revolutions around the world for guidance (164–165). The Party began to emphasise these new sources as its ideological examples of what should be done about the struggles.

The liberation struggles and revolutions that had been taking place around the world became a prime example for the ideology of the BPP at this time. The principles of Karl Marx, Lenin, Che Guevara, and Mao Zedong thus began to be actualised in the Party in greater and more explicit ways (Abu-Jamal 2004, p. 105; Hayes and Kiene 1998, p. 164). The Cuban revolution and its subsequent enactment of socialism, as well as Vietnam, became the dominant influences on the Party during this time, as did the liberation struggles/revolutions in Africa, driven by the writings of Franz Fanon with the case of Algeria and Ghana's Kwame Nkrumah (Hayes and Kiene 1998, p. 164; Abu-Jamal 2004, p. 105). These became the BPP's point of departure. With these struggles as its example, it reconfigured how it saw the struggle.

A reassessment of the situation of African-Americans in light of these new sources led to the development of the idea of revolutionary nationalism during this time. The Party began to define class as an important feature of the struggle, capitalism as the source of the problem, and socialism as its ultimate goal (Hayes and Kiene 1998, p. 164). Taking from Huey Newton, the BPP began to see race struggles as a part of larger struggles against imperialism and capitalism, and the African-American situation as similar to that of others who had been colonised (165). At this time, the Party began to define African-American struggles as colonisation struggles, and argued that they were synonymous with struggles for decolonisation (ibid.). It began to stress that African-Americans were among the many who had been colonised with the expansion

of Western Europe and the US, and that this created a relationship with other forces internationally. All represented a fight against colonisation and the evils of capitalism, imperialism, and racism (Hayes and Kiene 1998, pp. 164–165). The Party began to stress that struggles of African-Americans required international intervention, drawing connections between the US police and military force and other international colonial forces. This began to be reflected to a greater extent in Panther writings.

Within the writings of BPP members, there were increasingly notions of revolution and liberation suggesting that the only way to achieve the wants of the community was via revolution. They now more directly called for guerrilla warfare. They described police in the US as a fascist military organisation that served with the national guard to subordinate African-Americans and subversives. For instance, an article in *The Black Panther* compared the struggles of African-Americans to those in Vietnam and also emphasised the belief that genocide was upon the nation and revolution:

> Just as the Vietnamese people refuse to be controlled by the capitalist racist American government, and are fighting to retain control of their own country, black people in America are fighting to have control of their communities in their hands. With a potential mass of fifty million blacks moving together to control their communities across the nation, the first assault by the political leadership of the racists is to destroy the leadership of the black struggle in order to be able to move against the masses without organized resistance …. The advent of fascism in the US is most clearly visible n the suppression of the black liberation struggle …, The police departments nationwide are preparing for armed struggle with the black community and are being directed and coordinated nationally with the US Army and the underground vigilante racist groups for massive onslaught against black people. But the billy clubs and mass arrests and guns are no longer just for black people: the white peace movement and the student power struggle is also beginning to get a taste of police violence …. The day when the state and its police power ceases to protect the community but in turn attacks the people of the community has arrived in this country. This is the first stage of building the police state …. The next step is genocide. The black community faces two alternatives: total liberation or total extinction. (Cleaver 1968, p. 8)

In 1969, the Party continued to believe that immediate revolution was needed and would occur. For instance, Huey Newton appeared to believe that revolution would be sparked because of the nature of the system and that dealing with corrupt political officials was a top priority. Huey Newton, in a message to the Party for the celebration of his birthday (published in *The Black Panther* in February), described the Party's efforts in mobilising the community as a revolutionary force, and emphasised the belief that the revolution would be sparked by some significant event. He foresaw it being brought about in the way the Mao Zedong laid it out. He believed the people would finally turn on the corrupt politicians and the nation's political means and create new systems in similar ways to what was going on in Vietnam (Newton 1969).

This new ideology clearly influenced and changed many BPP members' perceptions of the struggle. For instance, much of Party writing suggests that members redefined their notions of the problems of African-Americans as struggles centred on the enemy as the capitalist and imperialist power structure. They redefined the solutions to these problems as socialism.

Eldridge Cleaver also goes about discussing the struggle as one against capitalism and colonisation, outlining the nature of the struggle and how revolution could and would be successful in America. In an interview he stated that:

> … we don't look upon this situation as being something confined to the geographical boundaries of the United States or the North American continent. We see this as a world-wide contest, and in this world-wide contest, you are in very much the minority, and we are the majority. So you don't have 20 million black people to deal with, you have 700 million Chinese, 300 million Africans and un-numbered billions and millions and millions, and millions, and millions of mad black, red, yellow people to deal with. And you know that. (Cleaver 1968, p. 6, 14)

This new ideology also guided many of the subsequent BPP actions at the time. In addition to many of its chapters opening nationwide, the Party began to operate some of its earliest survival programmes developed to 'help people survive until their consciousness' was raised to the

necessity and importance of revolution (Abron 1998, pp. 178–179; Holder 1990, p. 78). These survival programmes served as a means of demonstrating to the people a new world (of socialism) through the means of creating community-controlled institutions, but they also developed revolutionaries for the struggle through maximising safety, nourishment, and health care (Abron 1998, pp. 178–179; Holder 1990, p. 78). No longer centred on the 'Black Man's' struggle, coalitions became central to BPP organising. It began forming coalitions with Chicanos, Puerto Ricans, Native Americans, and Asian-Americans such as those with the Student Non-Violent Coordinating Committee and Students for a Democratic Society as well as those with African-American, Puerto Rican, and white street gangs in Chicago (Holder 1990, pp. 124–130). The BPP also began to branch out internationally. For instance, in June 1968, Eldridge Cleaver took the case of African-Americans to the United Nations, while Bobby Seale attended the World Peace conference in Montreal, Canada in December 1968 (Fletcher et al. 1993, p. 228; Major 1971, p. 297). In addition to this, the Party began giving widespread support to both national and international organisations such as the National Liberation Front of South Vietnam (ibid.). The BPP at this time also developed and fostered important ties with the Black Liberation Army, an underground group of revolutionaries who aimed at disrupting the American/capitalist system (Umoja 2006, pp. 224–225). Within the Party there also developed a secret society of revolutionaries (an underground wing) for guerrilla-type warfare, through its affiliation with the Black Liberation Army. This emphasised military training, particularly with the arrival in the Party of Geronimo Pratt and his training of many chapters (Umoja 2006, pp. 227–228). These changes also culminated with the BPP removing the 'Self-Defense' from its name, a move reflecting its growing and changing connections with other struggles of the world (Matthews 1998, p. 277). These important changes also prompted massive repressive efforts on the part of the US authorities.

Because of the Party's message and their appeal during this time, the BPP became the target for mass repression on the part of US government agencies. Throughout these years, it continued to be the prime target for government and local law enforcement officials who followed J. Edgar Hoover. Local law enforcement on a national level as well as the FBI and CIA worked to infiltrate the Party, and in doing so killed many of its members, arrested many more, and caused inter-group strife among the different organisations like the BPP and the US organisation, a competing nationalist group, as well as between the Panthers and the Black Stone Rangers and within the Party itself (Ngozi-Brown 1997, pp. 157–170). The political repression of the BPP, orchestrated and carried out by organisations like the CIA and the FBI under COINTELPRO (Counterintelligence Programme) in conjunction with local law enforcement, heightened in 1969 and escalated throughout 1970. Such actions were instrumental in changing the organisation and mobilisation of the Party. For instance, in 1969, the BPP went through massive reorganisation and conducted a purge of members (the first of many expulsions that followed) to remove suspected law enforcement moles as well as to cleanse the organisation of any who were seen as non-productive while at the same time closing off membership for three months (Le-Blanc-Ernest 1998, p. 310; Smith 1999, p. 48). These events led to the positioning of many women in the roles once overwhelmingly held by men. Women, because of repression, also increasingly began being seen in a different light as their roles changed, with them becoming central to the functioning and leadership of the Party. As a result, women began taking on more of the leadership and rank-and-file roles, as well as running by far the majority of Party programmes. By all accounts, women became the structure and backbone of the Party. Men and women began working side by side, and in so doing created a gender-neutral setting that was new to the BPM. This was reflected at a national level. The repression of these years influenced greatly the Party's ideology, particularly in regard to women and their role in the struggle.

As a result of the many changes in the ideology of the BPP between 1968 and 1969, Party perceptions and activism went through important and notable transformations that made much of its organisation between 1970 and 1971 possible and were the preconditions for organising at this time. With its beginning very much in the reactionary nationalism the Party would later come to shun, the BPP transformed between 1968 and 1969 from an organisation specifically for the African-American lumpenproletariat to an organisation which also embraced the lumpenproletariat of other cultures and the oppressed proletariat of the world. These processes contributed greatly to the Party's further growth and expansion in becoming both a national and international organisation during this time and to the particular shifts in its ideology between 1970 and 1971.

Revolutionary Internationalism and Inter-communalism, and Survival Pending Revolution (1970–71)

The period between 1970 and 1971 was critical for the BPP, marking its zenith and the start of its decline. Although the Party continued until 1982, when its last programme, the liberation school, closed its doors, the year 1971 marked its end as a revolutionary organisation. During this time, the Party's ideology would again shift based on its need to again reconcile its position with new understandings of the world. Repression had an immense influence on the ideology and truths of the BPP, with many members beginning to again branch out, this time internationally through forced exile abroad to escape the authorities. The many changes in the Party's ideological views influenced shifts in how members perceived their role in the struggle and their activities and mobilisation.

As a result of repression, many members were forced underground and fled the US. This however facilitated deeper connections with struggles being carried out around the world. For instance, Eldridge Cleaver went into exile and travelled the world forming coalitions in Cuba and with Al Fatah before settling in Algeria (Abu-Jamal 2004, pp. 106–107). Others who fled were Party captain Bill Brent, who went to Cuba; field marshal Don Cox, Sekou Odinga, Larry Mack Michael Tabor, and Connie Matthews who all ended up in Algiers where the Party formed its international wing (ibid.). Black Panther organisations also began in Britain, Bermuda, Israel, Australia, India, and Canada (Umoja 2001, pp. 3–4).

Influenced more heavily than ever by Marxist-Leninists, and a certain utopianism of Marx and Mao Zedong, Huey Newton articulated a new ideology upon release from prison in 1970: Revolutionary Internationalism. This, he believed drew heavily from Revolutionary nationalism and particularly its coalitions, but emphasised new things (Hayes and Kiene 1998, p. 169). This ideology centred on the belief that the US was more of an empire of nations that dominated the world rather than a nation in itself, and saw the US as an international enemy (Hayes and Kiene 1998, p. 169). He believed that the only way to combat this enemy was through international efforts and strategies and through the unity of all oppressed peoples (ibid.). Shortly after this change, another was made. That same year, at the Revolutionary People's Constitutional Convention, the ideology shifted again, this time to one of Inter-communalism (170). This ideology extended upon internationalism, only breaking down the idea of nationhood and nation states and emphasising that rather than international coalitions, territories were a part of a world community brought about by the imperialism and oppression of the US (ibid.). These changes were directly reflected in the perceptions of the Party in its paper.

Within the writings of many members, much of this ideology was perpetuated and heightened. This was exemplified in the belief that the role and objective of the BPP was to enlighten the people and aid in their awakening to the truth about the American system and about capitalism and capitalist, imperialist organisations of societies. The Party refined the definition of themselves and emphasised their role as a revolutionary political programme. This, for them, meant they were an armed political programme focused on survival until there was a world revolution. They emphasised their role in serving the people

and survival while educating them and showing them a better way until universal revolution occurred. For them, this universal revolution required struggle in all places to destroy the oppression for all. While the Party still advocated a preparedness to die for what they believed in, they ultimately came to believe that in order to change the structure their mission had to be change people within the US and worldwide before revolution could occur. Throughout 1970 and 1971, much of the Party's writings reflected this great shift.

For instance, Huey Newton in 1971 suggested that the revolution would eventually come and that what was important was focusing on survival. He also describes the importance of the community in bringing about revolution (Newton 1971). The Party, furthermore, begins to describe its role as dedicated to the survival of the people until the universal revolution. Many members followed these beliefs and traditions wholeheartedly. For example,, in an article entitled 'Survival Pending Revolution', an anonymous author emphasises the importance of the survival programmes to the survival of the masses and the need to focus on them until the revolution comes about (Anonymous 1971). It was with these ideologies as the Party's foundation that the Party went about conducting its actions.

Between the years 1970 and 1971 the Black Panthers continued to go through dramatic changes organisationally as a result of the war waged against them by the FBI, but also because of their changes in ideology (Calloway 1977, p. 69; Holder 1990, p. 288; Newton 1980, p. 55). The most important change that occurred was the Party dropping the ten-point programme because they felt it no longer represented the needs of the community (Anonymous 1971). Other big changes came with a shift in the BPP platform, with the Party gradually moving from a paramilitary, revolutionary organisation to more of a political programme centred on serving the community. Because of these changes in ideology, many of the actions of the Party members changed. They began emphasising the survival programmes during this time, expanding them to include the liberation school, multiple free breakfast programmes, welfare rights advocacy,

and youth activities as well as the free clothing programme and free health clinics (Abron 1998, pp. 177–188).

Throughout 1970 and 1971, critical changes in the ideology of the Party and its organisation brought about important changes in activism as well as mission that, along with repressive measures, directly influenced the BPP's decline as a revolutionary organisation and served as the precondition for Huey Newton officially putting down the gun in 1972. All of these changes over the brief six-year existence of the Party as a revolutionary organisation were a part of the growth and expansion of the BPP and why it was so successful during its short run. It is this legacy that must be remembered.

Conclusion

The struggles against capitalism have been multiple and various as have the repressive measures to maintain them. The struggles of African-Americans within the US are just one example. The BPM was one of the most important movements for African-Americans within the US, and was the culmination of all struggles that had taken place up until that point. Despite great gains on the part of these movements, much remained to be done. It was within this tradition and this continuation of repression that the BPP emerged and became important. In its short existence, it attempted and succeeded to a certain extent in changing the very fabric of American society at the same time as it too continually changed.

As has been shown, over the course of the Party's existence it was guided by a number of ideologies that served to build on and correct conflicts within others. As a result of many occurrences and influences, Party members and particularly Party leadership were forced to re-think many of its major organising premises as well as strategies and tactics for attaining success in its efforts to adapt the Party to a changing environment in order to remain useful within the community. Ranging from Black Nationalism to Revolutionary Inter-communalism, the Party was continuously adapting to the environment around it and expanding upon its thought to fit into

growing and enhanced consciousness and understandings. As the BPP's ideologies changed, so did its perceptions and activities, which added to the success and widespread appeal of the Party over time. Connecting the struggles of African-Americans to the struggles throughout the world, though not new, placed the Party on a higher plateau than many others in the BPM and caused wider rifts between them. While the Party began as an organisation seeking to liberate the African-American community through the reclaiming of the masculinity of African-American men (and initially organised in a way that gave precedence to African-American males), it ultimately took on a more politically relevant stance that represented the way in which the world that they lived in was organised. For this, the BPP should be recognised as an innovator of its time that trod territory little explored before and whose legacy continues to this day.

Anticolonialist Agitator and Socialist Seafarer

The Barbadian agitator and organiser Chris Braithwaite, better known under his adopted pseudonym 'Chris Jones', was one of the leading black political radicals in 1930s Britain and, as a founding member and chair of the Colonial Seamen's Association (CSA), perhaps the critical lynchpin of an anti-colonial maritime network in and around the imperial metropolis of inter-war London. His talents as an anti-imperialist and anti-capitalist activist came to the fore during the 1930s when he was briefly in and around the Communist Party of Great Britain (CPGB), and then in militant Pan-Africanist organisations such as the International African Friends of Ethiopia (IAFE) and the International African Service Bureau (IASB) led by the outstanding black Trinidadian socialists George Padmore and C.L.R. James.

Born in the materially impoverished British Caribbean colony of Barbados, Braithwaite encountered 'the problem of the colour line' early in life, having found work as a seaman in the British merchant navy when still a teenager. Braithwaite's self-education and awakening consciousness of race took place while he 'sailed the seven seas'. As he later put it in a speech in 1941, while for 'forty years he has been a rolling stone in every part of the world . . . he had yet to find a spot where under white domination elementary freedom is granted to the subject races' (*New Leader*, 23 August 1941, quoted in Høgsbjerg 2014: 62). After a few years' break from the sea, spent on land in Chicago in the US, Braithwaite returned to serve with the British merchant navy during the First World War, when the recruitment of colonial seamen reached its height to fill the places left by recruitment of native seamen into the Royal Navy. After the war, Braithwaite moved to the 'black metropolis' of New York and found work for a period in a bar.

Many black Caribbean mariners settled in America, and some became leading politically radical militants in the American working-class movement, such as Ferdinand Smith, the

Jamaican-born co-founder of the National Maritime Union, and the equally remarkable figure of Hugh Mulzac, born on Union Island in the Grenadines, who after travelling to New York from Barbados worked for a period as a ship captain on Marcus Garvey's Black Star Line. However, Braithwaite himself now undertook the 'voyage in' to imperial Britain, where he settled down in 1920s London working for the employers' Shipping Federation. Braithwaite's work, based in London's Docklands, home to many black seamen, was a highly responsible job, one usually reserved for whites only. As a Shipping Federation agent in 'the Pool', part of the River Thames where many ships came to dock, Braithwaite was charged with finding and supplying colonial seamen, engineers, stokers, and others, often at a few hours' notice. However, and quite remarkably given the relatively privileged job he had acquired, he was soon politically radicalised and immersed himself in the British working-class movement, becoming an activist in what became the National Union of Seamen (NUS) (see Padmore 1944).

In Britain, Braithwaite challenged the exploitative and oppressive experience of colonial seamen in the inter-war period, which saw state racism and the threat of deportation as well as a more informal racism which the shipowners encouraged and in which the NUS openly colluded. The NUS's collaboration with employers and state meant that black seamen required identification cards and had to join the union – despite its racism – in order to have any chance of employment (for more on this institutional racism see Tabili 1994). Braithwaite personally seems to have been better positioned to survive the dangers resulting from widespread racist state practices in shipping, including the threat of deportation under targeting of 'aliens', through his job and his relationship with and marriage to Edna Slack, a white woman originally from Derbyshire. The couple took up residence in Stepney, in the East End of London and in close proximity to the West India docks, and would ultimately have six children.

In 1930, Chris Braithwaite would join the newly launched Seamen's Minority Movement (SMM), a rank-and-file grouping of militant seamen organised by the CPGB to lead a fightback against an attempt by shipowners to make seamen pay for perhaps the greatest economic crisis in the history of capitalism. Adopting a pseudonym, 'Chris Jones', to avoid victimisation by his employer, Braithwaite found that his experience as an NUS militant and the nature of his work made him an extremely important recruit for the SMM, and he was soon elected onto its central committee. Indeed as early as April 1930 'Chris Jones' was chairing the second meeting of the SMM 'Committee of Coloured Seamen', and by 1931 he had joined the CPGB itself (for discussion of Braithwaite's activism in this period see Sherwood 1996). As early as 1930, according to Stephen Howe, Braithwaite was regarded by one undercover police officer as 'the CP's most valuable contact among colonial seamen' (see the 'Secret Report on Communist Party Activities in Great Britain among Colonials' submitted to the Colonial Office by Superintendent E. Parket on 22 April 1930, quoted in Howe 1993: 186). As well as organising the distribution of such 'seditious' publications as the Negro *Worker,* he played an important role in launching the Negro Welfare Association (NWA) alongside his comrade and compatriot Arnold Ward and rallying solidarity with the Scottsboro Boys (see Adi 2009). By 1933, through his association with the NWA and his tireless campaigning, Braithwaite had also struck up a remarkable friendship with the radical Nancy Cunard, great-granddaughter of Sir Samuel Cunard, the founder of the famous shipping fleet, which refused to allow black seamen anywhere near the decks of its passenger liners until the 1950s. Cunard was then editing her monumental 800-page fusion of Pan-Africanism and communism, *Negro: An Anthology*, for publication in London. They would both serve together for a period on the NWA committee, and there is a famous picture taken of Braithwaite on a May Day demonstration in London in 1933 – just one of several photographs of 'Comrade Chris Jones' published in the *Negro Worker*, now edited by the Trinidadian revolutionary George Padmore – and reprinted in Cunard's Negro: *An Anthology* (1934: 567).

However, the great 'zig zag' from ultra-left to right which characterised the Stalinised Communist International as it shifted from the catastrophist perspectives of 'class against class' to an attempt to build a deeply respectable 'Popular Front' against fascism and war, in the hope of enabling a diplomatic alliance of Britain, France and the Soviet Union against Nazi Germany, was to spell the end for organisations like the SMM and would ultimately end the involvement in international communism of many black radical activists like Chris Braithwaite. In 1933, as anti-imperialist agitation against the 'democracies' of Britain and France was increasingly sidelined, Braithwaite followed George Padmore's lead and resigned in protest from the Communist Party, though he remained supportive of organisations such as the NWA (see Høgsbjerg 2014: 43–44).

However, despite his relative political isolation, in July 1935 'Chris Jones' would emerge as the foremost tribune of black and Asian seamen opposing the new British Shipping Subsidy Act, which threatened the very presence of black colonial seamen on British ships (see Tabili 1994: 78, 82). Braithwaite took the initiative, with support from the League Against Imperialism and the NWA, to form a new organisation, the CSA. Impressively, from the very start the CSA embraced not only black colonial seamen, but also other Asian seamen, such as the Indian 'Lascars'. As the Indian communist seamen's organiser and future secretary of the group, Surat Alley, recalled, the CSA 'started at the time when Italian Fascism threat[ened to] attack Abyssinia [Ethiopia]. The Association was the expression of the discontent existing among the colonial seamen and its aim was to redress their grievances' (Sherwood 2004: 443).

Chris Braithwaite threw himself into building solidarity with the people of Ethiopia in the face of Mussolini's war plans. By August 1935, George Padmore had arrived in London from France, and was soon helping his friend and compatriot C.L.R. James organise what became the International African Friends of Ethiopia (IAFE). Braithwaite was a leading activist in this new Pan-African organisation, speaking out alongside the likes of Amy Ashwood Garvey, the Jamaican

Pan-Africanist and first wife of Marcus Garvey, and the Kenyan nationalist Jomo Kenyatta of the Kikiyu Central Association. Braithwaite was involved in mobilising his networks of colonial seamen to organise direct action to undermine the economy and trade of Italy and possibly even smuggle weapons to Ethiopia through the maritime industry (Quest 2009: 122).

Late November 1936 saw the first annual conference of the CSA in London. Braithwaite, who was elected chair, 'stressed the need of organisation as the one salvation of the colonial peoples'. The range of support for the organisation was unprecedented and historic, given the ethnic divisions and hierarchical racial stratifications of British shipping encompassing not only black seamen but also Indians, Arabs, and Chinese seamen – testament in part to the respect for Braithwaite's tireless work and dedication (Tabili 1994: 159). The CSA demanded removal of the 'disabilities' imposed on colonial seamen by 1935 Shipping Subsidy Act, which gave preference to white seamen, and also demanded that 'the seamen of the British Empire be given full democratic rights – the right to trade union organisation, freedom of speech and assembly'. This was a great advance on the 1920s, when there had been no solidarity articulated between the various colonial seamen, and there had been no demands particular to their conditions. Initially the CSA concentrated its efforts on the effects of the Shipping Subsidy Act, and by late 1937 the stringency of the application of the provisions of the Act were slackened, so some success could be recorded (Sherwood 2004: 443).

One CSA activist from early 1937 onwards, the West Indian Ras Makonnen, born George Thomas Nathaniel Griffith in British Guiana, has perhaps left historians the most vivid description of the work of the CSA. Makonnen described it as 'a welfare and propaganda grouping', and recalled that since 'we did not want a separate black union' for colonial seamen, part of the CSA's work involved trying to persuade west African seamen resident in Britain to join the NUS, despite all its appalling failings. He remembers that 'Chris's role . . . was to act as a mouthpiece if there was any injustice that needed taking up . . . he was

looked on as a leader in the same way as some of the outstanding Irish dock leaders in New York' (Makonnen 1973: x, 129).

What might be called Braithwaite's 'class struggle Pan-Africanism' found expression and flourished not simply in his leadership of the multi-ethnic CSA but in his key role as organising secretary for the new 'International African Service Bureau for the Defence of Africans and People of African Descent' (IASB), formed in May 1937. In solidarity with the heroic arc of labour revolts which swept the colonial British Caribbean – including his native Barbados – during the late 1930s, Braithwaite again repeatedly took to the podium of Trafalgar Square alongside the likes of James and Padmore. Ever since the turn to the 'Popular Front', Braithwaite, together with James and Padmore, also used to go to CPGB meetings to heckle and expose the communists' 'pretensions at being revolutionists' by raising awkward questions about British imperialism. As James remembered, they would speak about the struggles of French and British colonial subjects who now had been forgotten as Britain and France were declared grand 'peace-loving democracies' and bulwarks against fascism. 'While I would ask a question, and Padmore might say a word or two, it was Chris Jones who made a hell of a row.' 'Chris would get himself into a temper and explode and make a revolution at the back of the hall . . . at the shortest notice, he could generate indignation at the crimes of imperialism and the betrayals of Stalinism as to shock into awed silence hundreds of British people in the audience' (Høgsbjerg 2014: 54).

Critically, the IASB attempted to help ideologically arm, build solidarity with, and develop networks with the colonial liberation struggles across the African diaspora. Braithwaite wrote a monthly column for the IASB journal, *International African Opinion,* entitled 'Seamen's Notes', and organised the distribution of this illegal 'seditious' publication into colonial Africa through his network of radical seamen. The contacts Braithwaite and others made in turn fed information and reports back to the IASB in London (for more on this see Quest 2009: 121–122). Despite the poverty and hardships of Blitz-hit London, Braithwaite kept up his political work for African emancipation throughout the Second World War until his sudden death from pneumonia on 9 September 1944, just over a year before the historic Fifth Pan-African Congress in Manchester.

In 1925, the long-serving president of the NUS, Joseph Havelock Wilson, had declared, 'I have always believed that British seamen have done more to discover and establish the British Empire, and to develop it. It will be the task of the same men of the sea to keep it' (Tabili 1994: 81). From the moment Chris Braithwaite arrived in Britain in the aftermath of the First World War until his death he refused such a 'task'. He instead fought against almost impossible odds and in the face of the most bitter racism for black and white unity and an alternative, anti-imperialist, and socialist vision for seamen both in Britain and internationally, based on struggle from below. As well as forming the CSA, he worked alongside the likes of Amy Ashwood Garvey, C.L.R. James, and George Padmore to form and build militant and political Pan-Africanist organisations such as the IAFE and the IASB. As the historian Winston James notes, the 1930s represented 'one of the most crucial decades in the history of black Britain' as it witnessed 'the birth and emergence of a number of new black organisations and a level of black activism that was unprecedented' (James 2004: 363, 365–366).

From the mid-1930s, Chris Braithwaite, like George Padmore, had worked closely with the socialist Independent Labour Party (ILP), and both developed close links with ILP-supporting intellectuals around it, such as the writers Reginald Reynolds and Ethel Mannin. Both Reynolds (1956) and Mannin (1947) paid fine tributes to Braithwaite's oratory and activism after his passing. Padmore must have felt particularly moved by the passing of this older, dedicated militant, who must have in many ways represented his very ideal of a black 'organic intellectual' of the international working-class movement, and his obituary of his friend and comrade serves in many ways as a worthy tribute:

> His death is a great loss to the cause of the colonial peoples as well as International Socialism, the finest ideals and traditions of which he upheld to the very

end . . . He never spared himself in rendering aid to the cause of the oppressed. Many were the working-class battles and campaigns in which he gave his best . . . his memory will long remain as a symbol of the hopes and aspirations of his race. (Padmore 1944)

Brexit and the End of Empire

Sally Tomlinson
Department of Education, University of Oxford, Oxford, UK

Synonyms

Empire education; European union; Race brexit

Definition

This chapter examines the ending of the British Empire and its imperial myths. It discusses who voted to leave the European Union (the Brexit vote) and why. It discusses the importance of the education system which misinformed and mis-educated generations of young people, and it comments on the nostalgia many people feel for a "white" country comfortably ruling an empire.

Introduction

Imperial nostalgia is not only a feeling but a catalyst. It takes social discontent and transforms it into a dangerous form of political tribalism. (Shafak 2018)

The sun is finally setting on the British Empire. Although an Honours system still awards recipients The Most Excellent Orders of the British Empire, the pomp and the circumstances which characterized the empire have slowly disappeared. Britain is also leaving the European Union, after a 40 year membership. The vote to leave the EU in June 2016 quickly described as Brexit, pushed what was still a United Kingdom, into an uncertain future, two of its four countries, Scotland and Northern Ireland, seriously considering independence from England and Wales. Despite Boris Johnson when Foreign Secretary publishing his "vision of a bold and thriving Britain after Brexit" (Johnson 2017), the signs are that with no empire and fewer ties with the rest of the European continent, the imperial sunset does not look rosy. An election in December 2019, won by the Conservative Party with the slogan "Get Brexit done," was greeted in the Daily Express newspaper with a whole page headline "The British Lion Roars for Boris and Brexit" (Hal 2019) and a leaving date in January 2020 was promised. But there can be no certainty what a postimperial post-Brexit Britain will look like, or even if "Britain" will stay a United Kingdom, and no agreement as to who will be considered citizens. One certainty is that although other European countries were shedding their (smaller) empires following the Second World War, the British government and public found it hard to come to terms with colonial countries gaining their independence, often through vicious conflict. They also found it difficult to accept the invited arrival of former colonial people to work in the country. Nostalgia for lost imperial glories is not confined to Britain but forms the background for nationalistic beliefs in reclaiming sovereignty, and economic control, and it encourages the populist and racist appeal of right wing individuals, parties, and fascist groups.

This chapter offers a brief history of imperial myths and the effect of myth and mis-information on the Brexit decision. It discusses who voted for the Brexit decision and why and notes the long "goodbye" as countries left the empire, Britain became poorer as a result, and vast increases in inequality and poverty followed, with immigration taking most of the blame rather than policies which favored the rich. It especially discusses the dismal failure of the education system which both helped to produce an increasingly corrupt elite, often descended from those who created the empire, and mis-educated generations of children about empire. It points out that for over a 100 years schools and higher education institutions misinformed or lied to the majority of young people about the realities and cruelties visited on imperial "subjects." The chapter illustrates that the British (especially the English) have a dangerous misconception of their national identity, fed by promises that great trade deals with the world will somehow make Britain "Great" again, but with fewer migrants or "foreigners," apart from rich investors and property owners. Migrants and refugees from global conflicts often created by former imperial wars have been made scapegoats, with race and migrant hatreds intensifying after the Brexit vote. It concludes that despite the promises of the Conservative government at the end of 2019 to limit the ravages of austerity, cut migration, and create a workable relationship with the European Union, without the land, loot, and labor that an empire brought, the future for a majority of the population seems uncertain.

The Imperial Mindset

Despite a very large literature on the British Empire and its creation and decline, most white British people, including the supposedly well educated, know little about the empire their grandparents were born into, which gradually after the Second World War turned into a Commonwealth of some 53 countries. Thirty-one of these countries had fewer than three million people, with 14 being tax havens. For 3 years after June 2016 when 17.4 million people voted to leave the EU, with 16.3 wanting to remain, the question of a border with Northern Ireland and the Republic of Ireland became a crucial issue, as the Republic was part of the European Union. Few people knew that the English colonized the whole of Ireland in 1169 (Wales in 1536), and it was not until 1707 that the Act of Union joined England and

Scotland. It was only in 1922 that a United Kingdom of Great Britain and Northern Ireland came into existence. Many of the "traditions" of these countries, as in the rest of the British Empire, were invented by imperial rulers imposing their culture and beliefs, although in 1715 an attempt by the government to ban the Scottish kilt on the grounds that it was not acceptable to "respectable" people as when men bent down or it was a windy day the kilt was "indecent" was defeated (Trevor-Roper 1983). Historians of internal colonialism have documented the expansion of an English state as it attempted to anglicize the three other countries, especially through the colonial plantation policy in Ireland (Canny 2001). England has always benefited from the economic and political dependence of the Celtic countries (Hechter 1975) and it is not surprising that antagonisms between the countries still persist. The histories of subjugated states have always been marginalized or misrepresented in national history stories. Former Education Secretary Michael Gove told the Conservative party conference in October 2010 that "Children are growing up ignorant of one of the most inspiring stories I know- the history of the United Kingdom." But that would be his version of the national story and did not include the miseries inflicted on the Irish population, or the millions of unnecessary deaths in Indian famines (Tomlinson 2019, p. 54).

While the start of the British Empire is still debatable, the actual takeover of land is usually claimed to be the island of Bermuda, following a shipwreck there in 1609. The island is now a tax haven for wealthy individuals and multinational companies. Through conquests and exploitation Britain emerged as a major sea power and trading nation. The East India Company, forerunner of the imperial conquest of India, was, as historian William Dalrymple noted, a corporation with an army, taking over Bengal and other states from the Mughal Emperors and sending out Robert Clive, an "unstable sociopath" to run the company, loot the country, and enrich himself (Dalrymple 2015). The famines in India which killed tens of millions, and the famines in Ireland in the 1840s, were largely unknown to several generations as school ignored or mis-informed

young people, who knew that even in famines Clive was insisting people pay taxes, erecting gibbets in streets to encourage this. Clive is generally still celebrated in history texts as a hero, just as Cecil Rhodes, famously enriching himself in South Africa and Rhodesia (Zimbabwe) is celebrated. A billionaire by the age of 22 controlling 90% of the world's output of diamonds and believing that the Anglo-Saxons were "the finest race in the world" (Tomlinson 2019, p. 40). Rhodes has even survived student demands that his statue be removed from outside Oriel College in Oxford. A close friend of Rhodes, the poet and writer Rudyard Kipling, was one of many who encapsulated the British views of their colonized peoples. Although even in his life time much of Kipling's work was regarded as imperialist propaganda, his poem "Take up the White Man's Burden" was taught in schools around the country. It actually demonstrated how deluded the British were over empire, as far from being a burden, the labor of the colonized gave the British unjustified goods and privileges.

By the mid-nineteenth century Britain was an industrial nation and described itself as the "workshop of the world." Much of this industrial revolution depended on slave and indentured labor overseas. While imperialists originally believed in free trade to sell British products around the world, by the early twentieth century governments were introducing notions of "imperial preference" which imposed taxes on good from outside the empire. In 1926, an Empire Marketing Board was set up which produced some 72 reports extolling imperial trade. These included recipes for "housewives" made from foodstuffs imported from the empire. The restricted diets of the colonized as even their food was plundered were never an issue to the colonists. In the early twentieth century, attempts were made to boost patriotism through Empire Days, when school children were given free mugs and chocolate, and there was an Empire Exhibition in Wembley in 1926. Imperial propaganda as well as food nourished enthusiasm for empire, although ignorance persisted. In 1948 a survey found that fewer than 50% of people could name one colony, although a majority of the English persisted in regarding the vanishing

empire as a "good thing." An imperial mindset has been a long time dying, as an editorial in the *New York Times* pointed out in 2017, "Britain is undergoing an identity crisis ... the nineteenth century myth of Britain as the workshop of the world,... with an empire on which the sun never sets, confronted a post WW2 reality when a lot of these tales stopped being true... Britain no longer has an agreed upon national narrative" (Erlanger 2017).

Imperial Identity

Ignorance of the territories of the Empire continued into the twentieth century, people being confused in 1982 when the Argentineans invaded the Falkland Islands which many thought were Scottish islands. They were actually the Malvinas Islands, taken by force by the British in 1833. A naval officer David Tinker wrote that "the navy felt that we were British and they (the Argentineans) were wogs, and that made all the difference" (Tinker 1982, p. 178). The common assumption that the empire and imperial beliefs all happened long ago is mistaken. Beliefs in white racial superiority present from the early conquests and underpinned by the eugenic thinking of the Victorian era has hardened into a current imperial identity based on (English) assumptions of genetic, cultural, linguistic, and nationalistic superiority. As Aminul Hoque has noted, the rhetoric of colonizer versus the colonized, powerful versus the powerless, civilized versus the uncivilized, modern versus backward has shaped race, class, and gender relations between white people and those from the "dark continents" of Africa and Asia (Hoque 2015). Hostility to European and other "foreigners", although white, was evident in the 1905 Aliens Act, the first Act to control immigration and intended to keep Jews and Eastern European people out of the country. Despite some 17 immigration control Acts passed over the twentieth and early twenty-first century, the campaign to leave the EU used the successful slogan "Take Back Control" suggesting that there was no control over immigration to Britain. European, Irish, and colonial immigrants have over the

years been regarded as suspect entrants and unworthy of acceptance as equal citizens, with refugees and asylum seekers even less welcome. A British (largely English) identity was created by defining who was not British.

An imperial mindset never died and continued to shape views of a British national identity. National Servicemen, drafted into fighting colonial wars 1946–1962, and now the grandfathers and fathers of today, were among many who regretted the ending of the British Empire and retained the notions of imperial superiority their overseas trips encouraged. As one officer explained, "We all thought the empire was a marvellous thing and a force for good throughout the world. When Britain chose to give her empire away we were saddened. The colonial people had all the blessings of colonial rule and look how casually they dismissed them" (Shindler 2012, p. 92). The giving away included conflict and killings in a number of colonies – Malaysia and Kenya in particular. Reparations are currently being paid to Kenyans tortured during the 1960 conflicts for independence.

The man who is still regarded as a significant figure in supporting notions of a sovereign state, unencumbered by immigrants and foreigners, is Enoch Powell, first elected a Member of Parliament in 1950 after 19 attempts at selection. Powell's nationalism and anti-immigrant stance articulated a romantic view of a white nation "united in its island home" (Powell 2012). In a speech in 1987 reflecting on his 37 years as a member of parliament Powell recalled how he found it incredible that the Indian Raj was no longer in British control and the "remainder of the empire which Britain had taken into the second world war" was gone, especially after the loss of the Suez Canal in 1956 (Powell 1987). He also commented in this speech that "anyone would have been dismissed as raving mad who in 1950 told the people of Britain that by the end of the century a third of London's population would be Negro or Asiatic." In a hagiography celebrating Powell's life the Rt. Hon. Iain Duncan Smith, returned again as a Conservative MP in December 2019 to Parliament, praised Powell's "fight to ensure the British people did not lose power to

supra-national institutions" meaning the European Union (Duncan Smith 2012, xxii).

Brexit and the European Union

A Bill to join the European Economic Community was presented to Parliament in 1972 and the UK voted in a referendum to join the EEC in February 1975. Margaret Thatcher signed a Single Market Act in 1986 and in 1992 Conservative Prime Minister John Major signed the country into a European Union. Labor Prime Minister Gordon Brown signed a further Treaty in Lisbon in 2009. This ratified an EU remit which extended to foreign, security, and defense policy, citizenship, a single market, agriculture, fisheries, free movement, border checks, asylum and immigration, civil, criminal and police issues, justice, tax, economic, and monetary policy, employment and social policy, public health, consumer protection, industry, the environment, energy including nuclear, commercial, and financial provision and other issues (Geddes 2013).

The UK by 2019 had become deeply embedded in European institutions and organizations, benefiting on many levels, not least subsidies for agriculture and trade. The Lisbon Treaty also included Article 50 which allowed for any EU country to withdraw from the Union. Although Britain was engaged in all these areas, ignorance about the EU and what being in a European Union meant was widespread. A small group of mainly rich, influential right-wing men were deeply opposed to remaining in the EU, especially with workers' rights policies, and lobbied over the years to take Britain out (Dorling and Tomlinson 2019). In 2015 Prime Minister David William Donald Cameron, attempting to placate these men, called for another referendum, in which a "Vote Leave" campaign, with the slogan "Take Back Control," was won by Leavers with 51.7% of the electorate who voted choosing leave and 48.3% voting to remain in the EU. Some 28% of those eligible to vote did not bother, and overall only 37.5% of the adult population voted for Brexit. Scotland and Northern Ireland had majority votes to remain in the EU. A week before the

referendum, in June 2016, a young member of Parliament Jo Cox was murdered outside her constituency rooms by a man who shouted "Britain first and death to traitors" as he killed her. Hate crime increased after the referendum with a 58% rise in reported hate crime the week after the vote.

Three and a half years of hostile debates and antagonisms from all sides followed the referendum, especially over the border between Northern Ireland and the Republic of Ireland, a country in the EU. The issue was supposedly settled in December 2019, when a Conservative government with a majority was elected using the slogan "Get Brexit Done." Prime Minister Alexander Boris de Feiffel Johnson brought in a Bill declaring that the country would leave the EU on 31 January 2020, making it illegal to extend negotiations to leave the Union after December 2020. He also declared that the language of leave and remain and even Brexit should no longer be used. This proved be difficult as a majority of the electorate actually demonstrated in the December 2019 General Election that candidates for Remain voting political parties (Liberal, Labour, Green, Northern Irish Parties, and others) received 16.5 million Parliamentary votes, whereas those candidates supporting Leave voting parties received only 14.8 million.

Leaving the EU

Many reasons for voters returning a majority for "Leave" in the 2016 referendum were put forward. A major view was that many people, especially in the north of England and coastal towns, had suffered from a rise in inequality and the decimation of public services since a program of austerity was forced on them by a Conservative government after 2010. The irony of northern people supposedly voting for an elite who had caused austerity was noted in some of the media. In early 2019 even the right-wing newspaper *The Telegraph* reported that income inequality in the UK was still growing with the poorest facing cuts in social security benefits. The richest fifth of households saw their incomes rise with low rates of taxation, while the poorest households lived on

£36 per day (Dorling 2019, xv). Food banks and homelessness became commonplace in Britain – one of the most wealthy countries in the world. However, the blame for this was largely directed away from the rich and the governing party. Instead the blame for austerity and inequalities fell on immigrants, refugees and asylum seekers and a barely articulated resentment that lives had become worse since the empire disappeared. The 1950s are often quoted as a time when Britain was a happier "white" country (Kynaston 2007). The anti-immigrant speeches of Enoch Powell MP in the late 1960s and his romantic views of a sovereignty continued to resonate. The romanticism did not extend to colonial immigrants encouraged by himself when a Minister of Health and by other politicians, to come to work in Britain. His sneering at "negroes and picaninnies" was echoed by current Prime Minister Johnson who when a journalist described black children as "picaninnies" with "watermelon smiles" (Nagesh 2016). As Foreign Secretary, Johnson also demonstrated a remarkable lack of sensitivity, attempting to quote a racist poem by Rudyard Kipling in front of a Buddhist shrine in Myanmar. The poem included the line "blooming idol made of mud" (Dorling and Tomlinson 2019, p. 118) and infamously described Muslim women wearing the burka as resembling letter-boxes.

Brexit, Nostalgia, and the Middle Classes

The northern working classes were in reality unfairly blamed as being the majority who voted to leave the EU. As subsequent analysis showed, a majority of those who voted Leave were in southern areas of England and were from the middle classes. Combining much of the information from a variety of polls, notable Lord Ashcroft Polls, Sky data, the Electoral Commission and other analysis, analysis of who actually voted to leave or remain demonstrated that while 28% of the electorate did not vote in the referendum, older white people were the major leavers and were living predominantly in southern counties of England. Some 59% of all who voted Leave were middle class (as indicated by being in census

categories A, B, and C). The proportion of leavers in the lowest social class categories, D and E, were just 24%. Middle class Leavers were crucial to the vote in 2016.

While many who voted Leave were influenced by the long term anti-immigrant rhetoric, it was older middle class voters who were more likely to remember empire and be nostalgic for a British identity which was both white and imperialistic. As writer Elaine Shafak, quoted at the beginning of this chapter has pointed out nostalgia is not just a feeling, it can combine regrets for a past, however mythological, with anger and anxiety about the current situation, even though for some that may be relatively privileged. There has been little analysis or explanation as to why so many people, who might be regarded as comfortably off, voted as they did. Immigration and the lies told about immigrants taking up work, benefits, housing, hospital treatment, and schools to the detriment of the "native" British resonated in all social classes. In the 10 weeks up to voting in June 2016 over 14,000 newspaper and magazine articles mentioned immigration, all overwhelmingly negative. Migrants were blamed for many of Britain's economic and social problems. Anecdotes and comments made by middle-class voters suggest that even those with houses and pensions from secure past jobs were worried about the future for their children and grandchildren and were able to overlook the benefits migrants' work brought, especially in health, social care, transport, and education services. It was the middle classes, voting Conservative after 2010 who saw money spent on the health services fall and their social care deteriorate, despite the work of young educated European migrants in hospitals and care work, yet they still complained about immigration.

Fewer middle-class women than men voted to leave, which might suggest that it is middle-class men who continue to feel more entitled to comfortable lives for themselves and their descendents. But even those who are ignorant or misinformed about the realities of empire cling to the visceral feeling beyond mere nostalgia that somehow they have been wronged. The secure life, the assumed superiority by race, color,

culture, and geography, the lack of control of global events, where even pensions can be threatened by multinational businesses and global organizations, the deteriorating public services which older middle as well as working class people were subject to, were implicated in Leave votes. But there was still a sense of an entitlement to greatness, hence the persistence of the label "Great Britain." The attempts by right wing populists during the referendum to conjure up fantasies of a return to an Empire 2.00 resonated with many people, although a later attempt to create a Brexit Party dedicated to the mythologies of empire and led by Nigel Farage, a public school educated politician who failed seven times to be elected to parliament, failed to become a parliamentary party.

Education and Empire

The education system at all levels in Britain, especially England has failed dismally over a 150 years to alleviate ignorance and xenophobia in young people. It has instead contributed to the misinformation and lies about an empire which subjugated millions of people around the world, and inculcated notions of superiority, especially to those who were described as "black and brown inferiors'" (Lloyd 1984, p. 180). Schools and text books have been largely places of myth-making and evasions with the truth. Until the 1960s, maps of the world on classroom walls still had large sections colored pink, because the countries "belonged to us." A curriculum tacitly supporting the merits of empire and silent on exploitation and cruelty was the norm. The 1880s through to the 1930s was a period when after vast areas of Asia and Africa had been taken over, the empire was at its height, and this period coincided with a social class based expansion of mass education in England.

The social class hierarchy was supported by Social Darwinist and eugenicist notions of the intellectual inferiority of lower social classes and also of the people colonized overseas, which have persisted into the twenty-first century. Francis Galton, a cousin of Charles Darwin, helped popularize these theories through his writings on *Hereditary Genius* (Galton 1869). Passion for the classification of supposed "race" along biological lines developed around the same time that eugenic theories were spreading. A white Caucasian "race" was supposedly superior to the Mongoloid and Negroid race. The stereotypes of the defective, ignorant, and idle working classes in England were similar to stereotypes of the lazy and stupid native overseas and the struggle to deliver education to the working classes over the nineteenth century placed their schooling firmly in the lower layers of the social class pyramid. But what was actually taught in elementary state schools was always influenced by the "public" (private nonstate) schools attended by upper class children. Robert Roberts, describing his childhood upbringing in a Salford slum and elementary schooling, wrote that "school was a gaunt and blackened building, made exciting by learning that there were five oceans and five continents, most of which seemed to belong to us" (Roberts 1971, p. 140). The upper classes really believed this.

Public School Influence

The social and political values of the upper classes filtered down into the elementary and developing secondary schools of the twentieth century. Imperial values permeated education and the curriculum. As Robert Verkaik pointed out in his book *Posh Boys: How the English Public Schools run Britain* "Public schools helped to write British history. They have been cheerleaders for empire and controlled the narratives of empire" (Verkaik 2018, p. 45). Even in 1985, Keith Joseph leaving office as Secretary of State for Education could reiterate a mythological view of British narratives and values.

> British history and cultural traditions are or will become part of the cultural heritage of all who live in this country... schools should be responsible for trying to transmit British culture, enriched as it has been by so many traditions. (Joseph 1986, p. 8)

The problem with this was that many of the traditions and values were and are highly

questionable in terms of democracy and justice, with imperial contacts taking the form of military conquest, appropriation of land and wealth, slavery, forced labor, and denial of human rights. Headteachers and religious leaders well into the twentieth century remained convinced of the duty of public school educated boys to run the empire. As one wrote in *The Contempory Review* in 1899 "The energies of the British race have given them their empire... and British rule of every race has brought within its sphere the incalculable benefits of just law, free trade and considerate government" (Lawson-Walton 1899). The Head of Shrewsbury school believed that God had entrusted England with creating a Christian empire held together by military means and set up a Cadet Corps in his school so that "boys with brains and character would be available for the preservation of English dominions" (Mangan and Mackenzie 1986, p. 119). The Head of Harrow school, attended by Winston Churchill in the early 1890s, was another enthusiastic proponent of empire and wrote in a paper for the Royal Colonial Institute in 1895 that the "the boys of today are the statesmen and administrators of the future, in their hands is the future of the British Empire" (Mangan and Mackenzie 1986, p. 121). In 1955 Prime Minister Churchill suggested the slogan "keep Britain White" for the general election campaign of that year. The Head of Loretto school in Edinburgh claimed that God's purpose for the British was to guide world history and a major task of public schools was to create neo-imperial warriors. This was a role enthusiastically embraced at Fettes, another Scottish public school, whose school magazines excelled in "strident jingoism" (Mangan and Mackenzie 1986, p. 123), confident that "Britain ruled the waves." This school was attended from 1966 to 1971 by Anthony Charles Lynton Blair, later the New Labour leader and British Prime Minister, who led the country into seven wars during his tenure.

Although the public schools had been largely set up to educate poor scholars, this is ideal rapidly disappeared and it was upper and upper middle class boys, and later a smaller number of girls, who were privately educated in them. Many of the schools were funded by money from imperial

looting and a slave trade. The Dollar Academy in Scotland, attended by Fraser Nelson, the current editor in 2019 of the right-wing magazine *The Spectator* was founded in 1818 by John McNabb, a sea captain whose fortune came from transporting slaves to the West Indies. Prime Minister David Cameron, instigator of the EU referendum, had five Ministers (and himself) educated at Eton, regarded as the top public school. There was a majority of privately educated men in his Cabinet who had gone on to Oxford University, an institution notorious for the riotous behavior of young men usually excused on the grounds of "high spirits." Theresa May, who followed him as Prime Minister, had attended a state grammar school before going on to study geography at Oxford, in a Department setup in 1899 by Professor Halford Mackinder, a keen imperialist who had developed a series of Empire lectures for teachers. May promised to examine the inequalities created by private schools, but never managed this. Alexander Boris de Feiffel Johnson, becoming Prime Minister in July 2019, included in his first Cabinet 60% privately schooled men, with four old Etonians.

Schooling for the Masses

The values and curricula from public schools filtered down from the later 1800s into the now obligatory elementary schooling for the working classes and an expansion of secondary schools for the middle classes. Even public school boys, set to govern colonies, needed help from grammar schools boys who could calculate in rupees the profit to be made from building railways in India. There was also a need to justify colonial wars and imperial expansion beyond Social Darwinist ideas of racial superiority, although the working classes and the Irish were frequently referred to as inferior "races." Charles Kingsley, author of the well-known children's book *The Water Babies* and later a chaplain to Queen Victoria, commented that even though the Irish looked like "human chimpanzees" at least they were white (Kingsley 1863). Justification for imperial conquests and domination over colonized people was

reproduced in Victorian and Edwardian text books and juvenile literature, much of it reproduced into the 1970s. The Geographical Society proposed a study of empire in 1896 and geography, history, English, and religious study became vehicles for imperial propaganda, although working class children, confined to a diet of basic literacy, numeracy, and manual training, did not get the full benefit of this until after 1945. The magazine National Geographic eventually managed to apologize to readers for endlessly presenting bare-breasted "native women" in its photographs with Europeans fully clothed.

A popular text originally published in 1902 *Men of Renown* (although it included three women, all Queens) was recommended by the Board of Education in 1902 as suitable for higher elementary classes. In this and other texts, "the natives" who fought to resist imperial rule were presented as possessing evil ill-feeing towards their benevolent rulers (Finnemore 1902). Geography Professor A. J. Herbertson, a prolific writer of text books, wrote a series of commercial geography books in which the necessity of "natives" doing manual labor supervised by Europeans produced sound economic benefits for Britain. References to people toiling for the empire persisted even after India had gained independence in 1947, and there was seldom any reference to the many Indian troops who had fought in the world wars for the empire. An Empire Youth Annual published in 1948 extolled what became the "Groundnuts Scheme" – a government scheme funded by Unilever to grow peanuts in East and West Africa. An article described how "native women" threshed the plants and "native dockers" carried the bags on their heads. It told its readers – the grandparents of today – that "the scheme will raise the standards of life of the natives in these possessions and keep valuable money within the Empire" (Fawcett 1948). The scheme was actually a total failure, but textbooks into the 1970s presented Europeans as opening up Africa for the good of Africans rather than looting the countries to provide the raw materials which kept Western countries wealthy and "developed."

From the 1880s, an expansion of popular publishing came at the same time as the development of mass education and wider imperial adventures, and these have persisted over the years. Rudyard Kipling produced works that have been influential over the years in film and musicals, (*The Jungle Book, The Lion King)* and as noted, his poetry continued to be popular, especially extolling public school boys to oversee the "sullen peoples" of empire (Kipling 1949). Much of the literature for juveniles came replete with militarism and patriotism in which violence became legitimized as the right of a superior race. Both public school boys and slum boys shared the same values in which fighting, racism, and sexism figured large. Tarzan (actually English Lord Greystoke) was a white man forever fighting black men in jungles and rescuing white women. He remained popular in books (written by Chicago born Edgar Rice Burroughs) and on film, a new Tarzan film being released as late as 2016. After the Second World War youth literature demonizing German Nazis added to the xenophobia against foreigners, with Russian spies and Islamic terrorists added to both adult and youth literature to feed distrust of all those not considered to be truly British (Le Carre 2019).

Education for Ignorance

During the second half of the twentieth century and into the twenty-first education for ignorance about a decaying empire no longer available to provide loot and labor overseas persisted. Even post-war Prime Minister Clement Attlee, venerated for creating a welfare state, was still describing his excitement and youthful imperialism over large portions of the world map being colored pink, declared in the Chichele lecture he gave in Oxford in 1960 that "We believed in our great imperial vision" (Attlee 1961). But an alternative story was hard to uncover. Much of the documentation of colonial administration and its cruelties were deliberately destroyed as colonies achieved independence, and much remains in files and archives that are difficult to access. Ian Cobain has described *Operation Legacy,* a project designed to remove files relating to darker deeds of the empire, and attempts to conceal information

not only about overseas decolonization, but also the history of the 30 year long "Troubles" in Northern Ireland (Cobain 2016).

Into the twenty-first century, education policy in England has been dominated by unprecedented levels of testing and assessment of children from preschool to university, demand for accountability of schools and teachers in a marketized competitive ethos and with no clear idea as to how a traditional curriculum could develop into an education for a democratic multicultural society. Governments have used a rhetoric of inclusion and diversity to disguise increased social and economic segregation and exclusion and to defend a curriculum that has remained largely nationalistic. Teachers, themselves unschooled in understanding empire, have found it difficult to teach about an imperial past or the relationship with the European Union. Citizenship education compulsory from 2002 came nowhere near facing the realities of being either white or not-white in a disunited Kingdom. Nor could teachers combat any hostile and mythological reporting about the activities of the EU, which as a journalist in the 1990s Boris Johnson indulged in. The Blair government's early claims to respect for diversity gave way to promises to be tough on immigration and asylum seekers, a revival of antisemitism, fears of Islam, and blaming black youth for violence. There was no information, as wars in the Middle East were undertaken, that there had been decades of imperial domination. There had been little teaching about the Sykes-Picot Agreement in 1916 whereby the British and French governments agreed to carve up Iraq, Syria, and the Lebanon? Who learned that the problems of Palestine and the future Israel were due to a British colonial presence? Who remembered that Michael Gove, a journalist about to be elected to Parliament, wrote a book in 2005 which likened parts of the religion of Islam to fascist and communist ideologies and when Education Secretary in 2010 reinstated a traditional subject-centered curriculum which "should not become a vehicle for imposing passing political fads on our children" (DfE 2010). The fads included race and racism, multiculturalism, immigration, and gender issues. Gove's advisor on the history curriculum was

Niall Ferguson, a believer in the "Greatness" of the British Empire (Ferguson 2004).

In 2013 an even more tightly controlled curriculum was presented. All schools were required to teach "Fundamental British Values." These were defined as democracy, the rule of law, individual liberty, and mutual respect for different faiths, although when Carol Vincent asked people to describe British values, the people gave top billing to the Queen, tea, fish, and chips and queuing (Vincent 2019). Research into the views of those who had studied the Gove curriculum suggested that ignorance and xenophobia still prevailed, and that the vote to leave the EU had increased levels of race hatreds of all kinds. In 2018 a group of students at Nottingham University were filmed chanting racist abuse outside a black female student's door, "We hate the blacks" and "sign the Brexit papers" (Tomlinson 2019, p. 221). In 2016 the Director of the South Asian Centre at the London School of economics noted that:

> Students arrive at university completely ignorant about empire, that vital part of history. When we talk of Syria they have no notion of Britain's role in the Middle East... they have no clue about the history of immigration, they don't understand why people of other ethnicities came to Britain... they haven't learned about it in school. (Mohsin 2016)

Universities have begun to present critiques of empire. Postcolonial studies, increasingly researched and taught by black and minority academics, are developing, and literature presented by juveniles, fiction writers, and other well-known people are published. Nikesh Shukla noted that the people writing in his edited book are not just writing about race, they are writing about the systemic racism that runs through the country today and "race is everything we do, because the universal experience is white" (Shukla 2016 editorial). Similarly award winning hip hop musician Akala has written on *Race and Class in the Ruins of Empire* (Akala 2019) and journalist Afua Hirsch has described her experiences as a mixed race girl descended from Jewish and African immigrants in Britain, where the failure to turn what should be a rich asset of multiculturalism into an identity crisis of epic proportions for the whole population (Hirsch

2018). Other historians have focused on the largely untold stories of the writers, politicians, and activists who opposed the development of the British Empire, the treatment of the colonized, and anticolonial resistance in Britain and abroad (Gopal 2019).

Post-Brexit Britain, Fantasy or Reality

In 2017 *The Times* newspaper reported that the then Trade Secretary Liam Fox was suggesting a resurgence of trade with the remaining empire – the Commonwealth countries – that would lead to an Empire 2.00. Supporters of Brexit have consistently claimed that when the country leaves the EU, there is scope for great trade with the rest of the world under World Trade Organisation rules. Although a Department for Exiting the European Union was set up and progressed some way in trade discussions, it quickly became apparent that this was something of a fantasy as the deals politicians continued to boast about would take years to finalize. The only other country to leave the EU, Greenland, took 7 years to complete any trade negotiations. As Britain is no longer the "workshop of the world" and manufacturing had shrunk to less than 10% of the economy, the question as to what the country would be able to depend on to trade and provide employment became crucial. The main possibilities appeared to be the arms trade, in particular providing killing weapons for Middle East buyers, banking, although the reputation of British banking had become tarnished after the 2008 collapse, tourism, where the Royal Family and its castles and characters continue to draw in tourists, especially from the rising middle classes of China and Japan, and perhaps spying. Although even here the spy agencies seemed to spend more time on the activities of Labour party members, ban the bomb and environmental activists and trade unions than on foreign dangers.

The rise in hate attacks and demonization of foreigners and immigrants affected the country in ways not planned for. In 2017 there was a 90% drop in applications from nurses from European countries to work in Britain and a 60% rise in nurses and midwives leaving the country.

Bursaries for nurses, midwives, paramedics, and other crucial health services were discontinued in 2016. Infant mortality rose in 215 and 2016, as did death rates. At the other end of the scale all but one of the top 12 people in the Sunday Times Rich List in 2017 were immigrants, and in 2018 it was reported that wealthy Chinese had been given 146 out of the 355 "investor visa" given to rich overseas people to invest in Britain. It was also reported that the rich were having trouble getting servants as the pound slumped and even as the new Conservative government with a majority in Parliament refused to make public a report on Russian influence on the EU referendum at the end of 2019, Prime Minister Johnson on attended a "caviar-fuelled victory party in London" hosted by former KGB agent Alexander Lebedev, now owner of the London Evening Standard newspaper (Harding and Sabbagh 2019). On the same day, despite having promised in the election manifesto to keep jobs in the country, the government approved the sale of UK defense firm Cobham to an American private equity company for £4 billion.

By 2020 in failing to come to terms with the end of empire, and voting to leave the European Union, Britain has become a state far removed from the post Second World War beliefs in liberal democracy, with more co-operation and a promise that all should have decent housing, health care, social security, and education. The arrival of people from former colonies and their reception, despite the labor and lives they have given to the country, remains a disgrace. Under poor political leadership, the country has gradually become more competitive, greedy, xenophobic, and racist, with a misplaced nostalgia that seeks scapegoats for social and economic problems and tolerates high levels of inequality. But if leaving the European Union makes the country poorer, overall people may cease to tolerate high levels of inequality and work to become more equal. The white British may even come to realize that they live in a multiracial and multicultural country which is not going to change, except for the better. If that happens then the country will not be "Great," but it might be a decent normal society that people could be proud to live in.

British Empire

British Left and Imperialism: The Fainthearted Internationalists

Neil Redfern
Modern European History and Politics, Manchester, UK

Synonyms

Britain; Imperialism; Internationalism; Labour Party; Marxism; Socialists; V.I. Lenin.

Definition/Description

British and European socialists have historically advocated socialism at home while advocating militarism and imperialism abroad. The British left typically supported imperialism and war to advance nationalism as opposed to internationalism.

There is one, and only one, kind of real internationalism and that is – working whole-heartedly for the development of the revolutionary movement and the revolutionary struggle in *one's own* country, and supporting (by propaganda, sympathy and material aid) *this struggle*, this, *and only this*, line in *every* country without exception. (Lenin 1965, p. 80)

Lenin was moved to offer this adamantine definition of internationalism during the First World War when millions of workers and peasants from Britain, Germany, Turkey, India, and China and many other nations and states were slaughtering each other at the behest of their imperialist rulers. For Lenin, colonialism was but one aspect of imperialism or monopoly capitalism (Lenin 1952). He therefore had had no hesitation in denouncing the European war which erupted in 1914 as an imperialist war. But for most European socialists imperialism was taken to be a synonym for colonialism. It was fairly easy then for those socialists who supported the war to rationalise it as (in the German case) a war against Russian autocracy or (in the British case) a defence of Belgium against 'Prussian militarism'.

But even when the colonial objectives of the various powers became crystal-clear – when, for instance, the war spilled over into Africa or when the Bolsheviks revealed the Anglo-French plot to take over the Middle Eastern possessions of the Ottomans – very few European socialists desisted from supporting the war. As it is war which provides the most searching test of internationalism and which most clearly reveals fundamental attitudes to imperialism, this essay on the British left and imperialism (using this concept in the Leninist sense) will focus on the two imperialist world wars of the twentieth century and their aftermath. It will concentrate on the two most important parties of the British left, the Labour Party and the Communist Party (CP).

It is not particularly surprising, given that until relatively recently Britain was in possession of a huge empire, that the British left tended to see only the colonial aspect of British imperialism. Moreover, the most influential theorist of imperialism among the British left was the liberal J.A. Hobson, who saw colonialism as the essence

of imperialism. But concentration on colonialism can easily lead to ignoring one of the most important internal aspects of imperialism – the use of social reform to bolster working-class support for the capitalist order. In Britain in 1914 working-class support for war was solid, but later a price – post-war reform – began to be demanded for support.

The imperialist powers could not have attempted to wage imperialist war without the support of the working class. To many on the left the influence of a 'labour aristocracy' benefiting from imperialism could be the only explanation for such support. Lenin was a pioneer of this trend (Lenin 1965). But is the influence of a labour aristocracy sufficient to explain the existence and persistence of such social-patriotism? (Communists tended to use the terms 'social-chauvinism' and 'social-patriotism' interchangeably. But it is inappropriate to use the same term for the simple patriotism of most working-class people and the conscious priority given by many on the left to the national interest over their internationalist responsibilities. Here, the term 'social patriotism' is used for the former tendency, 'social-chauvinism' for the latter.)

A school of Marxist scholars argues that the explanation for working-class support for imperialism is not merely the influence of a 'labour aristocracy'. It is argued that in the imperialist countries all working-class people – even the poorest – benefit to some degree from imperialism (Amin 1977; Lotta 1984; Nabudere 1977). This materialist explanation for the strength of social patriotism in the imperialist countries is convincing. In Britain, for instance, the growth of imperialism in the late nineteenth and early twentieth centuries was accompanied by, to name but two reforms, an expansion of the franchise to a majority of working men and the introduction of old-age pensions.

Needless to say, especially given that they tended to come from the intelligentsia and the better-off sections of the working class, the leaders and members of the parties of the British left were not immune to bourgeois influence. Indeed they used their influence among the working class to subvert internationalism. The largest

party of the British left, the Labour Party, has throughout its history taken a consistently pro-imperialist stance.

The party was not a Marxist party. It was founded by the trade unions, which were anxious for representation in parliament to secure legislation favourable to trade unionists on such matters as the right to strike. Another major influence on Labour was the Fabian Society, whose members argued for social reform in the national interest. George Bernard Shaw argued that 'a Fabian is necessarily an Imperialist', while Sydney Webb declared his support for the Liberal imperialist Lord Rosebery on the grounds that he was the most likely among the Liberal leadership to create a '"virile" collectivist, imperialist opposition party' (Porter 1968, p. 111), before deciding that Labour would be the best vehicle for social reform.

Though affiliated to the Second International, Labour took little part in its agonised debates regarding the circumstances in which it might be possible to support a national war. Though a substantial minority argued that a war of national defence could be supported, majority opinion was that a general European war would be an unjust war (Braunthal 1966). The parties of the International were committed to organising general strikes to oppose such a war. British socialists were still discussing the general strike option when the race to war began in late July 1914. The majority capitulated to war-fever. Labour's leader, Ramsay MacDonald, resigned in order to lead a pacifist opposition to the war and was replaced by the pro-war Arthur Henderson.

Labour's stance on the war was twofold. On the one hand it gave it full support. On the other hand it attempted to defend working-class interests on such matters as the rights of trade unionists and food shortages and demanded post-war reform as the reward for working-class support for the war. Its War Committee issued a series of reports demanding reform on such matters as housing, education, and welfare. In 1915 Labour joined the government and quickly demonstrated its imperialist credentials. Labour eventually took over the Ministry of Labour, becoming responsible for ensuring that the working class

co-operated in the production of war materials. The party was in government in 1917, when British troops entered Jerusalem to initiate the Anglo-French takeover of the Ottoman Empire. Locally, many Labour people served on tribunals, which, after the introduction of conscription in 1916, decided on who could and who could not be exempt from military service and were thus party to the continuing carnage.

The other main parties of the British left in 1914 were the Independent Labour Party (ILP) and two Marxist parties, the British Socialist Party (BSP) and the much smaller Socialist Labour Party (SLP). Led by MacDonald, the ILP maintained an ineffective pacifist opposition to the war. It might be expected that the Marxist and thus nominally internationalist BSP would oppose the war, but it too declared its support for war. An internationalist minority was outraged when at the start of the war a manifesto called on the membership to participate in army recruiting campaigns. As many as 15 out of 18 London branches called for the manifesto to be withdrawn. In Glasgow, John Maclean argued that 'Our first business is to hate the British capitalist system. . . It is mere cant to talk of German militarism when Britain has led the world in the navy business' (Crick 1984, p. 268). The SLP, particularly active in Scotland and the north of England, also resolutely opposed the war. Though large anti-war demonstrations were held in London and other places, the anti-war minority proved unable to mobilise significant numbers of workers against war.

Though few workers came to oppose the war in principle, considerable working-class discontent arose over such matters as conscription, food shortages, and inflation (prices outstripped wages throughout the war; by 1918 average real wages of cotton workers were only 75% of pre-war levels: Jones 1987, p. 37). A sense that working-class people were bearing an unfair share of the burden of war emerged. In Scotland, the BSP and SLP led vigorous battles against rent increases and in defence of working conditions. By 1917, after nearly three years of war, unrest was becoming widespread. In Lancashire, weavers were angered by increased prices,

arguing that 'profitmongers' had exploited food shortages while 'some six million men have been giving their blood on the battlefields' (Amalgamated Weavers Association 1917). In 1917 and 1918 large-scale strikes erupted in many industries. In Lancashire, for instance, there was a mass strike of engineering workers and a general strike in the cotton trade. The Russian Revolution of 1917 prompted ruling-class apprehension that the British working class too would revolt.

Not coincidentally, the government began to respond to demands for reform. Its Reconstruction Committee, established in 1917 in response to working-class discontent, promised reform. Much of this was delivered. An Education Act, for instance, raised the school leaving age to 14 and abolished halftime education (until the passing of the Act children aged 11 and 12 were allowed to work half-time and go to school half-time). But the most important reform was the huge expansion of the electorate in 1918, which gave the parliamentary vote to virtually all men of 21 and over and to householder women of 30 and over; previously only around 30% of working-class people had been able to vote in parliamentary elections (further legislation in 1928 gave the vote to women on the same basis as men). This Act, which massively expanded Labour's potential electoral base, was instrumental in transforming the fortunes of the party: it went from third-party status to becoming the principal party of social imperialism.

It was never likely that Labour could have won in the jingoistic and pro-government ideological climate in which the general election of December 1918 was held (shortly beforehand Germany had sued for peace). But from 1919 there were several years of acute class conflict and rising working-class class consciousness, of which the Labour Party was the principal beneficiary. In the municipal elections of 1919 – the first held under the expanded householder franchise (under which the voting age for women was 21, not 30) – Labour made impressive advances in many industrial towns and cities. These advances were probably due to Labour's vigorous demands for housing reform. Housing had become a crucial electoral

issue by 1919. The British prime minister Lloyd George's famous 'Homes Fit for Heroes' speech was the result of grasping the electoral potential of promoting improved working-class housing. The king too advocated a much more interventionist approach to housing. At Buckingham Palace he had told representatives of local authorities that 'it is not too much to say that an adequate solution of the housing question is the foundation of all social progress' (Burnett 1978, p. 215).

Britain's failure to eradicate slum housing – though local authorities did build more than a million good houses for working-class people between the wars (Malpass 2005, p. 40) – gave rise to the myth, widely held among labour movement activists, that wartime promises of social reform had been broken. In fact, significant reforms were enacted between the two world wars. One of the most important was a series of Unemployment Insurance Acts passed between 1920 and 1922, which provided for unemployment benefit for all industrial manual workers and lower-paid white-collar workers. Meagre and increasingly under attack as unemployment relief was in the inter-war period, such relief should be contrasted with the almost total absence of poor relief in India and the rest of the empire (a point made by Gandhi during his famous visit to Lancashire in 1931), as should the expansion of the electorate in Britain with the increasingly repressive regime in India.

Such matters were regarded as reprehensible by those European socialists who took any notice of them. But even they usually regarded the colonial question as a peripheral matter. Socialists believed that it was in the advanced capitalist countries that the decisive revolutionary battles were to be fought, after which the colonies would be given their freedom. The annual conferences of the ILP, 'while maintaining a certain interest in such issues as conscription and war, made virtually no effort to discuss the colonies' (Porter 1968, pp. 96–97). Moreover, what interest there was in colonial matters tended to be tinged with paternalism. Hobson, socialists' mentor on imperialism, opposed enfranchising black Africans on the grounds that they were 'still steeped in the darkness of savagery' (Young 1989,

pp. 53–54). At the 1904 Amsterdam congress of the International, a resolution on India from British delegates, while opposing the existing form of colonial rule in India, nevertheless affirmed that the International recognised 'the right of the inhabitants of civilised countries to settle in lands where the population is at a lower stage of development' (Braunthal 1966, pp. 311–312).

At Easter 1916 the revolutionary wing of Irish nationalism staged an armed revolt and issued a proclamation of independence (at that time the whole of Ireland was part of the United Kingdom, but effectively a colony) and thus presented a test of the British left's internationalism. Few on the British left were prepared to support the revolt. It was hardly to be expected that official Labour would support a colonial revolt at the height of the war with Germany. Sylvia Pankhurst's Workers' Socialist Federation (WSF), one of the organisations which were to found the CP a few years later, was the only organisation of the British left to give unqualified support to the rebellion in Ireland. Far more typical was the response of the ILP, which announced that 'In no degree do we approve of the *Sinn Fein* rebellion. We do not approve of armed rebellion at all, any more than any other form of militarism or war' (Beresford-Ellis 1985, p. 232). The BSP, by then in the hands of the internationalists, was equivocal. It had nothing to say for several weeks and then disdainfully remarked that 'In every demand made by the Sinn Fein movement there is the spirit of nationalism. . . to rise, as the men in Dublin rose. . . was foolish', but it could 'understand this effort of the Irish people to throw off the alien yoke' (The Call, 9 July 1916). It was not until after the formation of the CP that British Marxists began to take seriously such national movements as that in Ireland.

In post-war opposition, the Labour Party criticised the British Government's savagery in the Anglo-Irish War of 1919–21 and its bloody suppression of the independence movements in India: but in office its record was little better, despite affirming during the general election of 1918 its support for 'freedom for Ireland and India' and pledging to 'extend to all subject peoples the right of self-determination' (Labour Party

1918, p. 3). J.H. Thomas, the colonial secretary in the first Labour Government of 1924, famously remarked on taking office that he was there 'to see that there is no mucking about with the British Empire' (Ward 1998, p. 185). Labour took office not long after Britain had conceded a measure of independence to Egypt after a revolt which had begun in 1919 (though never a formal British colony, Egypt, nominally part of the Ottoman Empire, had been under British control since 1882). Naively, the leaders of the Egyptian independence movement assumed that a Labour government would be sympathetic to their demand for full independence. They were disappointed. Moreover, an upsurge in the independence movement was ruthlessly suppressed.

As for India, Labour had the opportunity during its second term of office in 1929–31 to make some progress towards independence, but showed its Euro-centric paternalism by refusing to accept Nehru's draft constitution for an independent India (Porter 1984, p. 297). While it is true that Labour could not command a parliamentary majority for Indian independence, it did possess executive authority over India and in 1930–31 presided over the savage repression of an upsurge in the Indian independence movement. Thousands were injured and hundreds killed, including the leaders of an uprising in Sholapur, who were hanged (Ahmed 1987, p. 261).

Such was Labour's response to the postwar upsurge in national liberation movements. What of the CP? Founded in 1920, mainly by the BSP and a minority of the SLP, the party inherited much from the Second International, including its half-hearted commitment to supporting colonial independence. Only months prior to the party's founding congress, British troops had killed 379 and wounded around 1200 people at a peaceful pro-independence gathering at Amritsar. Yet the congress did not find it necessary to discuss the colonial question. But home truths regarding the party's indifference to the colonial question heard at the second congress of the Communist International (Comintern) led to a greater theoretical appreciation of the importance of the national and colonial question. The influence of Comintern theses – which asserted that the national revolutionary movement in the colonies was an integral part of the world revolutionary movement against imperialism and must be fully supported by the communist movement (Hessel 1980, pp. 68–76) – could from then on be clearly discerned.

A long article in the party's journal *The Communist* referred to 'the belief in some quarters [clearly in the CP itself] that the national idea is being overemphasised'. It was right to reject 'Rule Britannia and all that rubbish [but there is] a vast difference between the nationalism of a dominant nation and that of an oppressed nationality' (*The Communist, 7* October 1920). Nevertheless, there was considerable tardiness into translating this theoretical appreciation into practice. In 1921 the party leadership set up several committees to direct the party's practical activities (*The Communist Review,* October 1921), but a colonial committee was not established until 1924. In 1922, in its report to the party's annual conference, the leadership had nothing to say on imperial matters, nor did any branch submit a resolution on such matter (CP 1922).

One problem, of course, for any party wishing to support movements against British imperialism is that most British workers would have regarded such a stance as treachery, a point made by a British delegate to the first congress of the Comintern. This may well explain why the CP seems to have devoted more energy to lending assistance to the movement in India than to trying to raise support for that movement in Britain. Certainly, these had been the priorities of those attending the first meeting of the party's Colonial Committee (CP Colonial Committee 1924). While the party's publications did begin to cover the colonies more frequently and supported national movements within them, they made only spasmodic attempts – one such was 'Down with Empire' demonstrations on Empire Day (an annual event aimed at raising popular enthusiasm for the empire) in 1930 – to build practical support for anti-colonial struggles among British workers.

Even so, some credit should be given to the internationalist sentiments which led quite a few of its members to travel to India to help the Indian party. Two of these members, Ben Bradley and

Philip Spratt, were among those arrested in 1929 and charged with conspiracy. Bradley and Spratt were eventually sentenced to long prison terms, but were released after an international outcry. Relations between the British and Indian parties at this time were difficult. The manifesto of the first congress of the Comintern had shown the lingering influence of the paternalism of the Second International when it declared 'colonial slaves of Africa and Asia: the hour of proletarian dictatorship in Europe will also be the hour of your liberation!' (Riddell 1987, pp. 227–228). Thus, the CP insisted in 1925 that it should exercise leadership over the Indian party (Overstreet and Windmiller 1969, p. 75). It was no doubt this attitude which led Indian communists to complain of the 'Empire Consciousness', 'bossing', and 'big brotherly' attitude of the British party towards its Indian counterpart (Gupta 1997, p. 78). It seems very likely that British communists took to India with their internationalism a side-order of paternalism.

Even such lukewarm commitment to internationalism began to fade away as a new international crisis developed in the 1930s. The Wall Street Crash of 1929, the resultant international depression, and the victory of fascism in Germany in 1933 were all the product of the fundamental contradictions of imperialism, which had led to, but had not been resolved by, the imperialist war of 1914–18. A second imperialist world war began to seem probable. The Labour Party and, increasingly, the CP both viewed the threat of war through Euro-centric spectacles. Both parties saw the looming war as an antifascist war and, in the case of the CP, as a war in defence of the USSR. Its essentially imperialist content was increasingly hidden by a fog of anti-fascist rhetoric.

Only the tiny Trotskyist sects argued that war was the inevitable result of the contradictions of capitalism and saw in the looming war the possibility of revolutionary advances. Labour and (eventually) the CP both argued that diplomacy and resolute action against the axis powers of Germany, Italy, and Japan could prevent war. The CP and (to a lesser extent) the Labour Party were keen too that Britain, France, and the US should ally with the USSR. A strong pacifist

element in Labour led it to oppose rearmament at first, but this opposition was dropped as the threat to British from German imperialism became clearer. The CP too initially opposed rearmament, arguing that only a left-wing People's Government could be trusted not to use arms for imperialist purposes. But the threat of Germany led the CP to begin to support the government's war preparations, eventually ending its opposition to conscription.

When diplomacy inevitably failed, both parties declared their support for the British war effort (the ILP took refuge in pacifism). Labour's support for war is perfectly explicable; in office it had shown that its internationalism was only skindeep and that it was an imperialist party. But how could the CP, born out of the revolutionary left's opposition to the first imperialist war, support the second imperialist war? The conventional answer is Soviet diplomacy (the USSR had sought to build anti-German alliances with Britain, France, and the US). There is much truth to this, but a more fundamental factor is that the Comintern and the CP had not made a clean break with the Euro-centrism and social chauvinism of the Second International. In 1935 the Comintern held its seventh congress, which was marked by a breach with the revolutionary internationalist outlook adopted at its first two congresses. The congress adopted a new Euro-centric strategy in which the general revolutionary interest was subordinated to the defence of socialism in the USSR. Central to this strategy was the defence of democracy (in practice, the defence of the national interest) in France and Britain.

Until 1935 the CP had been insistent that it would never support its 'own' government in war because, it argued, any war in which an imperialist Britain participated would be an imperialist war. But at the seventh congress it was claimed that the bourgeoisie of those imperialist countries threatened by fascism could no longer be trusted to defend the nation. The policy of the dominant section of the British imperialists towards the expansionist axis states was to appease them, to make concessions in the hope that war could be avoided, perhaps to turn Germany and Japan against the USSR, and, if war did come, to have

had time to prepare for it. This was a policy of national survival, not national betrayal; but many, from Winston Churchill to Harry Pollitt, the leader of the CP, saw it as such. At the seventh congress, the leaders of the European parties argued that the communists must take up the role of defenders of the nation. Pollitt took up this theme with alacrity: Communists, he argued:

> must prove that we love our country so well that our lives are dedicated to removing all the black spots on its name, to removing poverty, unemployment and the bloody oppression of colonial peoples. We must show that the working class alone is the true custodian of the honour and rights of the British people. (Pollitt 1935)

This outlook chimed with the sentiments of many others on the British left, including influential elements of the Labour Party. In the mid-1930s fascism seemed to many a serious threat in Europe, where the Nazi triumph in Germany had encouraged the European far right. In France in 1934 monarchists and fascists had united in an attempt to overthrow the republic. In Britain the British Union of Fascists was attacking Jews in London's East End.

Probably the most influential of the left-wing bodies fighting for left unity was the Socialist League, the rump of the ILP. In 1932 its members had elected to remain in the Labour Party after the ILP majority split from Labour. Many of the most influential members of the Labour left were active in it, including G.D.H. Cole, Stafford Cripps, Aneurin Bevan, and Harold Laski. Inspired by the victories of popular fronts of all antifascist parties in Spain and France, the league hoped to build a popular front in Britain. In the autumn of 1936, prompted by the fascist revolt against the Spanish republic, unity negotiations began between the CP, the Socialist League, and the ILP.

Euro-centric indifference to the struggles of the colonial peoples surfaced at the first of the negotiating meetings. Pollitt asked the representatives of the Socialist League why all reference to the colonies, including a demand for independence for India, had been dropped from their draft of the proposed joint manifesto. Bevan replied that the labour movement paid too much attention to international matters and that another member of

the Socialist League was opposed to Indian independence because it would cause difficulties for India. Pollitt did not press the matter (CP Political Bureau 1936). As a result of these negotiations, a unity campaign with a popular front programme, not including colonial freedom, was launched in January 1937 but lasted only until Labour disaffiliated the Socialist League in the spring.

There was some success in forging unity between the CP and elements of the ILP. Attempts to build anti-fascist unity between the two organisations had started shortly after the Nazi victory in Germany, and 40,000 people took part in an antifascist rally in March 1933. But the main spur to unity came from an Italian threat to the British Empire. In the autumn of 1935 Italy invaded Abyssinia (today Ethiopia). This constituted a clear threat to British interests in the Middle and Far East, in particular the passage to India through the Suez Canal. In response, the CP unsuccessfully demanded that the British Government join with other states in the League of Nations to institute sanctions against Italy. The ILP opposed this policy, prompting a substantial number of its members to leave for the CP.

The CP was still adamant that only a left-wing People's Government could be trusted to defend Britain against fascism, but as the threat of war loomed ever closer, CP discourse increasingly stressed German aggression rather than the international economy in which Britain was the principal imperialist exploiter. Pollitt remarked, shortly after the German reoccupation of the Rhineland in March 1936, that 'one of the important differences between 1936 and 1914 is this, that in 1914 you could not say which is the aggressor. In 1936 it stands out for all to see' (CP Central Committee 1936).

The implication was clear. But before the CP could urge the working class to assume the responsibility of defending the nation there was an apparently insuperable ideological and political obstacle to overcome. Had not Marx and Lenin argued that the working class had no country? Of course, it could be argued that now the working class did have a country, the USSR. But even so, how could working-class support for the war effort of an imperialist country be justified?

Shortly after the Munich agreement of 1938, which the British and French imperialists hoped would help to turn Nazi Germany against the USSR, the Comintern tackled this issue: Once, it was argued, the idea that 'the proletarian has no country was a profound and bitter conviction'. But things had changed. Through the class struggle the working class had 'gradually won a place in the nation for themselves' and 'began to revise its relationship with the nation... the working class and the Communist Party are [now] the only consistent defenders of national independence' (Communist International 1938, p. 24).

A year later Britain and France declared war on Germany after Germany invaded Poland. The Labour Party had no hesitation in giving its full support to the war. Labour ministers were appointed to the War Cabinet in the spring of 1940, as the 'phoney war' ended with the German invasion of Norway, France, and the Low Countries. The party was not deflected from its support for the British war effort even when the imperialist nature of the war became very clear indeed as the initial European war which had broken out in 1939 spilled over into North Africa, the Middle East, and the Far East.

But what of the CP? Early in 1939, when war seemed inevitable, a pamphlet issued in Pollitt's name, *Will it Be War?*, suggested that if war came British Communists would not be found wanting:

> Our country and our people will never fall victims to fascism. The people of Britain will fight if necessary better than any other people in the world. They stand now unafraid in a land led by capitulators... people who are afraid to stand on their own feet, people who will whine about the 'horrors of war', blind to the fact that a real policy of defence means the only sure shield for preventing war. And if it fails, the people of Britain will fight as never before.

It would be cynical not to see here an emotional commitment to fighting fascism. The CP's stance on the war was complex and ambiguous. It had no doubt that Britain should be defended, but other factors – distrust of what it regarded as a pro-fascist government, a desire to defend the USSR, and even simple patriotism, as opposed to social chauvinism – were at play. Immediately after the outbreak of war it therefore called for a 'war on two fronts' – against Germany certainly, but also against the 'enemies of democracy' in Britain (*Daily Worker*, 2 September 1939).

But shortly afterwards the Comintern intervened to declare that the war was an imperialist war and could not be supported. Most CP members fell into line. Neither the Comintern nor the CP had suddenly rediscovered Leninism: their opposition to the war was the result of British and French refusal to ally with the USSR against Germany. The CP was therefore well placed to resume its support for war once the Soviet–German pact of mutual convenience, concluded shortly before the outbreak of war, was ended by the German invasion of the USSR in June 1941. But by then the ambiguity and complexity present in 1939 had dissolved into a determination to support the British war effort and defend the USSR, fuelled no doubt by Britain's desperate situation in the war and the disastrous defeats of the Red Army. There were no more calls for a 'war on two fronts'.

Working-class support for another war with Germany was firm, though not enthusiastic. There was no repeat of even the limited anti-war protests of 1914, but neither was there a repeat of the enthusiastic scenes which had then greeted the outbreak of war (though they were much exaggerated by propagandists and historians). Labour movement support was however given with some misgivings. Continuing deprivation in the industrial districts, where there was still much poverty, poor housing, and unemployment, had led to the belief that the sacrifices of 1914–18 had not been adequately rewarded, that promises of reform had been broken to grow deep roots (though, as we have seen, there had been significant reform).

In Ashton-under-Lyne, Lancashire, a leading trade unionist doubtless spoke for many when asserting that working-class people would not be '"led up the garden path" after this war like they were after the last'. Trade unionists were 'watching the workers' interests at the same as they were backing the country 100 per cent' (*Ashton Reporter*, 9 February 1940). The implicit assumption here, of course, is that the problem is not that the working class had supported an

imperialist war, but that they had been inadequately rewarded for doing so. But Labour movement doubts were assuaged after promises of reform emerged in the wake of the British defeats in Norway and France in 1940. Once in the Cabinet, Labour ministers dominated domestic politics and mainly determined the shape of post-war politics. Anti-fascism and complacent talk of a 'people's war' cloaked labour's social-imperialist collaboration with capital.

Assumptions that there would be substantial post-war reform accelerated after the British victory over German and Italian forces at El Alamein in North Africa in late 1942. Not coincidentally, the Beveridge Report, which urged an end to the five 'giant evils' of squalor, ignorance, want, idleness, and disease, was published shortly afterwards. This report and the other two principal wartime foundations of the post-war welfare state, the 1944 White Paper on Employment, which promised full employment, and the 1944 Education Act, which provided for post-war free secondary education for all and the further raising of the school leaving age, were all broadly welcomed by the labour movement.

Chimerical hope of colonial reform emerged in the course of the war, notably after the adoption in 1941 by Britain and the US of the Atlantic Charter, which promised post-war self-determination for all. But the Labour Party's support for war was not at all diminished when Churchill made it clear that he did not regard the promise of self-determination as applicable to the British Empire. Nominally, Labour was in favour of post-war self-determination: but its record in post-war office suggests that Labour's fundamental attitude was revealed when one of its most senior leaders, Herbert Morrison, remarked that the notion of self-government for many of the colonies was 'ignorant, dangerous nonsense... it would be like giving a child of ten a latch-key, a bank account and a shotgun' (Louis 1977, p. 33).

Labour's stance on India revealed in practice Labour's social chauvinism. Nominally committed to Indian independence, Labour ministers were as adamantly opposed as the Conservatives to granting wartime independence, leading to the abject failure of the 'Cripps Mission' in 1942.

Stafford Cripps (known to leaders of the Congress Party of India as 'Stifford Crapps') flew to India in 1942 with an offer of independence after the war. The Congress Party of India was unimpressed and launched the 'Quit India' movement, a campaign of civil disobedience intended to force the British to grant independence. The campaign was savagely repressed. Congress leaders, who had earlier been released from prison as a concession to the independence movement, were sent back to gaol.

The precondition for domestic and colonial reform was of course a defeat of the Axis powers and a defence and, where necessary, reconquest of British bases, colonies, and spheres of interest in the Mediterranean, North Africa, Middle East, and Far East. But it became clear in 1944–45, as the war turned decisively in the allies' favour, that promises of self-determination for the colonial peoples were false. British rule was forcibly reimposed in such places as Burma and Malaya. In late 1944 Britain also militarily intervened in Greece, long a British dependency, to prevent communist-led partisans from taking power. There were protests from left-wing Labour people over these matters, but they continued to give overall support to the war.

The CP's overriding concern was the defeat of fascism (in which category, with some dialectical ingenuity, it included Britain's principal Far Eastern rival, Japan) and the defence of the USSR. It was therefore reluctant to fully support anti-colonial campaigns. While it supported demands for wartime reform for India, including some measure of selfgovernment, it tried to use its influence with Congress to persuade it not to resort to civil disobedience when these demands were not met. In the final stages of the war British colonial reconquests in the Far East were given a warm welcome, if usually accompanied by platitudinous remarks that desires for colonial freedom should be respected. The CP maintained this ambivalent stance – for instance criticising the use of British troops to restore Dutch rule in Indonesia – until the eruption of the Cold War in 1947 necessitated a more militant position.

Labour won a landslide victory in the general election of 1945. Labour's programme was a

settlement of the imperial bargain struck between labour and capital in 1939–40. Making full employment the primary objective of economic policy and establishing a comprehensive system of social insurance and free health care greatly improved conditions for working-class people, thereby bolstering British imperialism's social base. The Conservative Party quibbled about some aspects of Labour's programme, but raised no fundamental objection.

Internationally, Labour was the main agent of British imperialism's attempts to restore the pre-war imperial order. Ernest Bevin, foreign secretary in the 1945–51 Labour Government, was quite unapologetic about this, telling the House of Commons in 1946 that he was 'not prepared to sacrifice the British Empire... I know that if the British Empire fell... it would mean that the standard of life of our constituents would fall considerably' (Ramdin 1987, p. 132). Indeed it would: Malayan rubber, for instance, sold for dollars, played a crucial role in financing post-war reconstruction at home (Cain and Hopkins 1993). Not long after Bevin's remarks, Britain began a war against a communist-led national liberation war against British rule in Malaya. Labour's apologists usually refer to the granting of independence to India in 1947 to affirm the party's internationalist credentials. But in truth, there was little alternative. Unrest in India made attempts to prolong British rule unfeasible. Moreover, pressure from the US to grant independence could not be resisted, given Britain's increasing dependence on US finance and arms.

Overall, this is a sorry tale. The co-operation of the labour movement with British capital in the two world wars meant that British imperialism felt relatively secure at home while it pursued imperialist objectives abroad. Moreover, the reforms enacted after both wars bolstered imperialism's domestic social base and made it even less likely that British labour would seriously threaten the rule of capital. There always have been and still are British people who have opposed British imperialism – Sylvia Pankhurst, for instance, was a consistent opponent of British rule in India and Ireland – but these have tended to be on its margins or not even on the left. Its mainstream

organisations, especially when faced with the test of war, have either, like the Labour Party, unquestioningly supported imperialism or, like the CP, ultimately capitulated to it.

British Museum, Imperialism and Empire

Paige Elizabeth Rooney
California Polytechnic State University,
San Luis Obispo, CA, USA

Museums have a long history rooted in colonialism and imperialism, but none come close to the lasting legacy of the British Museum. Since its opening 260 years ago, the British Museum has welcomed more than 350 million visitors who stroll through its endless galleries and gaze at thousands of objects from faraway places. Many of these objects were acquired, or rather appropriated, from the British colonies in the eighteenth and nineteenth centuries, which has become a point of contention in recent decades. With repatriation requests from former colonies growing exponentially, it is imperative to look back at the

relationship between the British Museum and the British Empire as well as how the museum came to be a "universal museum." The museum was built on imperialistic ideals and became a symbolic representation of overseas British wars and expeditions, and grew out of a developing interest in personal collections and world fairs. As the British Empire expanded throughout the nineteenth century, people living in Britain began to view objects in the British Museum from the perspective of difference - the difference between their own culture and that of the colonies they conquered - which led to an overall sense of cultural superiority. The colonies, as well as their objects, contributed to the creation of a national British identity in this way. This feeling of superiority over "less civilized" cultures as embodied in the British Museum has continued to the present day. By refusing former colonies' requests to repatriate objects, the British Museum upholds Britain's "superior" status in relation to the former colonies, and the British Empire therefore survives through the displays and exhibits at the museum. Hence, the British Museum is an imperialist institution that continues to use its vast collections from the former colonies to sustain a British national identity, preserve its power over its former colonies, and maintain the legacy of the British Empire.

The Evolution of British Interest in Cultural Objects

Founded in 1753, the British Museum became one of the first national, public, and secular museums in the world, in which neither church nor monarch owned the institution (Duthie 2011). The museum would not have started without the donation of collections from Sir Hans Sloane, an Irish physician and avid collector. Sloane began collecting in 1687 during his voyage to Jamaica, where he served as a physician to the governor of the colony. He returned to Britain with 800 plant and animal specimens, which would become the foundation of his encyclopedias on natural history. Upon his return, he built up his collection by absorbing the collections of his colleagues as

well as buying items from travelers and explorers throughout the British Empire. He eventually obtained 32,000 coins and medals, 50,000 books and manuscripts, 334 volumes of dried plants, and thousands more miscellaneous "natural and artificial rarities" (The British Museum Story n.d.). Sloane wrote in his will that his collection would be left with King George II in exchange for 20,000 pounds for his son and on the condition that the government would create a museum to house his collection (Sloane 1753). The trustees of the newly created British Museum chose to buy and convert the sixteenth-century Montagu House into a museum for Sloane's objects. Thus, Sloane's collection of assorted items became the foundation for what would become the British Museum, and so began its imperial legacy.

Today, the British Museum is the most visited museum in the United Kingdom, but this was not always the case. The museum opened its doors in 1759, 6 years after its founding. During the early years, people who wished to visit the museum had to apply for tickets, and the visiting hours were extremely limited. Entry was initially restricted to the wealthy or to those who had donated personal connections to the trustees and curators. At this time, the collection consisted mostly of the library, which filled the ground floor rooms of the Montagu House, and the natural history specimens from Sloane's collection, which covered most of the second storey. Other early exhibits included classical antiquities such as Egyptian mummies as well as Greek and Roman antiquities. By the 1830s, the daily operating hours of the museum were expanded, making the museum more open and accessible to the general public (The British Museum Story n.d.).

Although the early British Museum had already possessed a large collection of natural history and some cultural artifacts, the British public was predominantly disinterested in objects from the colonies in the eighteenth century. This was due in part to the exclusivity of the British Museum, as well as the fact that objects of natural history, such as plant and animal specimens, outnumbered cultural objects at the time. In addition, before cinema, photography, and illustrated newspapers, Londoners led "culturally insulated

lives" their curiosity confined to their own area of the world (Breckenridge 1989). However, a number of factors led to the museum's growth during the height of the British Empire in the nineteenth century and the eventual growth of public interest in cultural objects. These factors included a series of victorious overseas wars throughout the eighteenth century, late eighteenth- and early nineteenth-century voyages of exploration, the increase in personal collections and wonder cabinets, and the advent of world fairs.

The eighteenth century is largely defined by the abundant wars and conflicts between powerful European countries and their respective colonies. Just as these wars shaped the course of history, they also greatly impacted the pride of the British people. The fourth Mysore war fought in 1799 between the British East India Company and the Kingdom of Mysore is merely one example of a war which shaped British perceptions of the colonies and themselves. The Siege of Seringapatam was the final battle of this war; the British killed Tipu Sultan and reinstated the Wodeyar dynasty. This victory was one of the most important ones on the Indian subcontinent because it provided a symbol of hope and brought confidence to the British people (Breckenridge 1989). In 1800, painter Robert Ker Porter created a panoramic scene of this battle. The painting was so realistic and powerful that viewers became overwhelmed with emotions, feeling as though they were at the scene of the battle themselves. This panorama turned the British population's attention to India; as Londoners gazed upon the 200-foot-long canvas, they became more convinced of the British Empire's superiority of their culture over Mysore, India as a whole, as well as the other British colonies. This feeling grew stronger as the British Empire continued to be victorious in countless wars throughout the eighteenth and nineteenth centuries. According to John M. MacKenzie, this imperial outlook led to an influx of patriotism and nationhood that soon defined the British Empire (MacKenzie 2019).

With the growth of national pride came Enlightenment voyages of scientific discovery in the late eighteenth and early nineteenth centuries.

Such voyages, led by those such as Captain James Cook, Lieutenant Edward Belcher, and Sir Joseph Banks, produced the first real collections of ethnographic artifacts for study in England. During his first voyage from 1768 to 1771 in the Pacific, Cook collected numerous ethnographic objects that survive in the collections of the British Museum and other British institutions. The British Museum began displaying Cook's objects in 1778, which began to fascinate visitors who had never seen these faraway lands. Belcher led an Arctic expedition from 1825 to 1827, where he collected Alaskan Eskimo artifacts and donated many to the British Museum while keeping the majority for his own personal collection. Joseph Banks, president of the Royal Society from 1778 to 1819 and an avid patron of the natural sciences, advocated for the central role of scientific discovery in achieving Britain's imperial aspirations. Areas prioritized for exploration and scientific discovery also happened to be of economic importance to the British Empire as well as areas of competitor interest (Owen 2006). These explorer vessels soon became symbols of Britain's maritime power that stretched across the globe. As a result of these expeditions, the British Museum's colonial collections grew immensely into the nineteenth and twentieth centuries. By 1800, the museum began to outgrow the Montagu House due to the overwhelming number of visitors flocking to see the colonial objects on display.

Many British explorers also returned home with incredible amounts of artifacts to display in their homes for their own personal collections. During the late eighteenth and early nineteenth centuries, objects were often displayed in a trophy paradigm. By displaying objects in this fashion, collectors, many of whom were colonial officials, politicians, or explorers, felt a sense of authority and superiority over the indigenous people whose objects they housed (Wintle 2008). These collections were often called "wonder cabinets," in which artifacts were disorganized and eclectically displayed, with their value derived more from its decontextualized uniqueness than its meaning. Following the success of the Seringapatam panorama, the British East India Company created an

"Oriental Repository," which housed cultural objects brought back to the metropole from the colonies. Here, Londoners gazed at Tipu's regalia, and it soon became one of the most popular exhibits at the time (Breckenridge 1989). In addition, the Londoners who came to see these "wonder cabinets" traveled vicariously through these collections rather than visiting the colonies themselves, which gave them a biased and exotic view of the colony whose artifacts were on display. For example, Sir Richard Temple, British politician and administrator in India, had his own personal collection that included bows, arrows, and spears. These artifacts were used for pig hunting and fishing in India, but he described them as deadly weapons and "arms of savages," reflecting the British imperial project: the civilizing mission (Wintle 2008). Nonetheless, people who came to see Temple's collection as well as other cabinets of curiosities felt an overwhelming sense of wonder, mystery, intrigue, and allure. This sense of wonder people felt while viewing these collections led to the ultimate success of personal collections as well as the fairs and museums that followed.

Similar to personal collections, world fairs were large events which also reduced cultures to their objects through selective representation (Breckenridge 1989). These fairs were a result of advances in transportation, photography, advertising, and the overall growth of capitalism. The most famous world fair was the Crystal Palace Exhibition of 1851, held in London. This event was the first of its kind; millions of visitors attended this fair during the 5 months it was open. As a result, an era of "exhibition mania" commenced not only in Britain, but around the world. More than 30 colonies and countries were represented here by their raw materials, manufactures, and paraphernalia at the fair. India was the most well-represented colony at the exhibition, placed in the center of the court with more floor space than every other country present. The India transept began at the main entrance of the fair and led to the Queen's retiring room, offering the Queen a "continuous gaze on objects of what were to become her distant and cultural others" (Breckenridge 1989). India's section at the fair included native village scenes, which included street vendors and dancing women who were brought to London specifically for entertainment purposes. Visitors gawked and gazed with curiosity and amusement at such a drastically different culture than their "civilized" European lifestyle. The Crystal Palace Exhibition was imperative to the changing of British attitudes toward colonial artifacts, especially ones from India; millions of British citizens attended this fair and marveled at the colonies' objects in contrast to their own "sophisticated" culture.

The Growth of a British National Identity

Because of the many wars and expeditions which resulted in personal collections, world fairs, and the objects brought back to the metropole, the British public's initial disinterest in cultural objects from the colonies suddenly evolved into massive interest. As a result, British visitors began to view ethnographic objects from the perspective of cultural difference. The sense of national pride and patriotism from expeditions and exhibitions gave rise to feelings of cultural superiority over the "other." For example, the most notable sections of the Crystal Palace Exhibition were India and the United States, which stood in stark contrast to one another. India's artifacts and display included royal regalia, elephant trappings, weapons, and textiles. The United States' exhibit, on the other hand, contained inventions, machinery, and mass produced consumer products. The disparity between these two displays illustrates how the British compared cultures based on their objects (Breckenridge 1989). Following the Crystal Palace Exhibition, the British Museum in the nineteenth century became a powerful symbol of empire with representations of various cultures that were displayed in a deeply imperialistic fashion. As Janet Owen (2006) claims,

> "The British Museum incorporated ethnographic material brought back from exploration into displays that organized material geographically into regions across the world. The public who visited these galleries were more interested in the exoticism

of difference represented by these artifacts and how they defined their own European identity through contrast rather than any interest in a deeper understanding to the cultures that created them."

As a direct consequence of war, exploration, and colonialism, these displays ultimately led the British public to consider their culture "superior" to non-Western cultures.

When it was first established, the British Museum was mainly a home for objects of natural history, such as Sloane's plant and animal specimens. However, due to the aforementioned wars and expeditions resulting in personal collections and world fairs, the British Museum shifted from a largely natural history museum to an ethnographic and cultural one. This shift encapsulates one of the most important features of colonial museums (MacKenzie 2010). The British Museum's collections reflected the interests of the Empire: both were involved in constructing a hierarchical view of the world (with European civilizations at the top), and both were primarily interested in the economic gain the colonies gave Britain. In fact, the museum did not collect British and medieval European objects until 1851, nearly a century after the museum's founding. By primarily collecting artifacts from its colonies, the British Museum was a key colonial institution that contributed to establishing Britain's hegemony over its overseas colonies. Just as the British Empire's expansion into Asia and Africa were key to creating a sense of national pride back in the metropole in the late eighteenth and nineteenth centuries, so the colonial objects housed in the British Museum were essential in promoting a sense of cultural superiority and national prestige that would never have been achieved had the museum been restricted to only displaying British artifacts (Clunas 1998).

The British Museum as an Imperialist Institution

The British Museum thus became an "imperial archive" and was the "most spectacular repository of the material culture of empire" (Duthie 2011). Until the 1930s, exhibitions in the British Museum were described as "encyclopedias of knowledge about empire" (MacKenzie 2010). Artifacts from India, Nigeria, Greece, Egypt, China, and many more colonies and countries of economic interest were looted from their homeland and displayed in the British Museum during the height of the British Empire. The act of possessing these objects from the "peripheries" and moving them to the "center" symbolically depicted London as the heart of the empire (Barringer 1998). In this way, the British Museum became a "world museum" and still classifies itself as such.

One example of such an object relocated to the metropole is the Rosetta Stone. It was one of the earliest and most famous artifacts from a colony acquired to the British Museum. The stone is inscribed with Ancient Egyptian hieroglyphs, demotic scripts, and Ancient Greek which depict a royal decree from 196 BC during the Ptolemaic dynasty. It was discovered in 1799 by French soldiers occupying Egypt, who were soon defeated by the British. Under the Treaty of Alexandria in 1801, the French ceded the Stone and the British transferred it to the British Museum, where it has been almost continuously displayed since 1802. By 1803, the Greek text on the Stone was translated, thus becoming a crucial key to translating and understanding Egyptian hieroglyphs (Edwardes and Milner 2003). The Rosetta Stone is now the most visited single object in the British Museum. In addition, merchandise such as postcards and shirts with the text of the Rosetta Stone have been sold in the museum gift shop and are incredibly popular.

Although Greece was never an official British colony, with the exception of the Ionian Islands from 1815 to 1862, the British Empire was especially interested in Greece for economic, naval, and even cultural purposes. The looting of the Parthenon Marbles provides a perfect example of opportunism and imperialism in Greece. Thomas Bruce, the seventh earl of Elgin, traveled to Greece to bring back drawings and antiques to Britain. Instead, between 1801 and 1812, he forcefully removed numerous Parthenon sculptures and took them to London, where these items are now housed at the British Museum

(Duthie 2011). These sculptures have been on display since 1817 and have become one of the most popular exhibits at the museum.

In 1897, the British led a punitive expedition in Benin, which is now in modern-day Nigeria. This mission was carried out 2 months after Lieutenant James Phillips, and eight other British officers were ambushed and killed while approaching Benin City. As retaliation, nearly 1,000 bronze art pieces were seized by force from the royal palace of the Kingdom of Benin, and 200 of those went straight to the British Museum's collection. The remaining bronzes were intended to be sold in order to provide compensation for the families of the British officers (Jones 2003). This type of expedition was typical of the British Empire, resulting in the plundering of art and the looting of cultural items. Interestingly, some Europeans believed these bronze plaques and figures to be so beautiful that they could not have been created by Africans, but instead claimed that these pieces of art were created by Portuguese sailors who had traveled through Benin (Duthie 2011). Nonetheless, the looting of Benin bronzes and their display in the British Museum made African art visible to Europeans, resulting in a sense of "surprise and mystification" toward the artifacts (Jones 2003).

The British victory of the Opium War (1839–1842) resulted in a change of British perceptions of Chinese culture. This victory, as seen with other British wars, established a sense of cultural and economic superiority over the Chinese. However, Chinese art was praised, described as interesting, splendid, and magnificent. Thus, China was both the "land of the uncivilized" and a country which produced admirable and exotic goods (Pagani 1998). In 1907, Sir Aurel Stein removed an entire library of ancient Chinese documents and artwork from the Dunhuang Caves. He persuaded a monk to sell this library for only 220 pounds. Stein returned to England with 24 wagonloads of papers, art, and ancient objects, including a copy of the *Diamond Sutra*, the world's earliest known printed book (Duthie 2011). In the British Museum, Chinese art and documents were included in the Department of Prints and Drawings, curated alongside European objects (Clunas 1998).

As the British Empire gradually waned in the twentieth century, these "souvenirs" from the colonies began to play an even greater role in the British national image of themselves, resulting in a feeling of nostalgia for the declining empire (Clunas 1998). At the same time, former colonies were beginning to request repatriation of cultural objects in the British Museum. The issue of repatriation has been prevalent since the early twentieth century, but demands for repatriation of cultural items have increased exponentially since then, especially in more recent decades. Due to legislation, the British Museum has refused to return artifacts on more than a few occasions. The British Museum Act of 1963 prohibits the museum from selling or disposing of any valuable objects; the trustees can only dispose of or sell objects that are duplicates or that are made of paper and created after 1850 (British Museum Act 1963). Although this Act could be amended or overturned, the British Museum has used it as a justification to refuse repatriation requests and will not return artifacts for "moral reasons."

There are many reasons why former colonies are requesting these items to be returned to them, despite the legislation that prohibits it. Since gaining its independence from the Ottoman Empire in 1832, the Greek government has been tirelessly working to restore their stolen art. In the case of the Elgin Marbles, the Greek government argues that the marbles are important pieces of heritage that represent the "Greek soul" and should be fully returned to their mother country. The British Museum may display such artifacts for their beauty and uniqueness, but "the colonized have been deprived of objects that are central to their historical narratives of identity" (Duthie 2011). The Parthenon Marbles were originally created as a single piece of artwork. Unfortunately, because fragments of the marbles are scattered around the world, it is now decontextualized and cannot be appreciated in its intended form. In addition, new museums are being created in these countries, such as the Acropolis Museum in Greece, that are prepared to house their own cultural objects with modern technology to protect their exhibits. However, the

British Museum has made no progress towards fulfilling this Greek demand. In fact, one of the marbles was loaned to Russia's State Hermitage Museum to celebrate its 250th anniversary in 2015. Much to the displeasure of the Greek government, the marbles have not touched Greek soil since they departed in 1812.

Egypt followed in the footsteps of Greece and has been requesting the return of the Rosetta Stone, as well as other Egyptian artifacts, since 2003. Dr. Zahi Hawass, director of the Supreme Council of Antiquities in Cairo, hoped that the British Museum would return the Stone with little hesitation. However, this was not the case. He states: "If the British want to be remembered, if they want to restore their reputation, they should volunteer to return the Rosetta Stone because it is the icon of our Egyptian identity" (Edwardes and Milner 2003). Hawass discussed the possibility of a 3-month loan of the Rosetta Stone to the Cairo Museum. This would be a short-term solution that Hawass hoped would lead to the eventual repatriation of the Stone. In return, the Cairo Museum was prepared to give the British Museum a replica, but the British Museum has not accepted this offer to date. Some museum officials say that Egyptians only became interested in the Rosetta Stone after its significance was revealed by the British. This perpetuates the imperialistic notion that the colonies do not care about their own cultural objects as much as the British do.

Nigeria, too, has been longing for the return of the bronzes since its independence from Britain in 1960. However, the British Museum has resisted the permanent return of the bronzes due to the legislation that bans it from permanently disposing of their collections. However, the British Museum lent 35 of its 200 Benin Bronzes to the museum at the University of Pennsylvania in the 1960s. In fact, this was the first loan of any artifacts from the British Museum outside of England (Canaday 1965). The British Museum was willing and eager to loan these items to the United States but was wary about repatriating, or even loaning, the bronzes to their country of origin. As of 2018, Nigeria has been open to accepting a loan of the artifacts rather than full

repatriation as a compromise with the British Museum, and current efforts are being made, albeit slowly, to work out a loan agreement.

Chinese academics since the 1930s have publicly condemned Stein for the looting of the Dunhuang Caves objects. Fu Sinian, director of the Academia Sinica in Nanjing and influential Chinese scholar, believed that Western sinologists who acknowledge the work and contributions of Chinese scholars are worthy of praise. However, Stein had no interest in sharing his findings with these scholars and instead gave the antiquities to the British Museum (Jacobs 2010). Today, these documents and artworks have not been repatriated; however, the International Dunhuang Project (IDP) was created in 1994 with the intent to digitize and catalog these objects on the Internet so that a wider audience can learn about and research these items.

Scholars, historians, and museum professionals have long debated about whether or not these cases are examples of looting or legal acquisition. Excerpts from explorers' journals suggest that there was a two-way exchange, at least from their perspective, between themselves and the native people. A journal entry from Belcher's expedition to Alaska states:

> On meeting with the Eskimo, after the first salutation is over an exchange of goods invariable ensues, if the party have anything to sell, which is almost always the case; and we were no sooner seated in the tent than the old lady produced several bags, from which she drew forth various skins, ornamental parts of the dress of her tribe, and small ivory dolls, allowing us to purchase whatever we liked.

In return, the British explorers bartered with necklaces, brooches, and cutlery (Owen 2006). These consensual exchanges of goods did occur, but are often overlooked. However, there are many more examples, such as the Benin bronzes, where artifacts and cultural objects were undeniably appropriated without the consent of the native people. Even still, the British Museum continues to justify the taking of the Parthenon Marbles. On the British Museum website, there is a page dedicated to the Parthenon Marbles, its history, and the controversies surrounding repatriation efforts. The website states:

> Lord Elgin, the British ambassador to the Ottoman Empire, acting with the full knowledge and permission of the Ottoman authorities, removed about half of the remaining sculptures from the fallen ruins and from the building itself. Lord Elgin was passionate about ancient Greek art and transported the sculptures to Britain. Their arrival in London was to make a profound impression upon western ideas of art and taste. It promoted the high regard that the European Enlightenment already had for ancient Greek civilization. (The Parthenon Sculptures n.d.)

This paragraph from the British Museum website exemplifies their imperialistic view that is still prevalent in the twenty-first century. The use of strong, compelling words such as "passionate," "profound," and "high regard" by the authors seem to be used in order to persuade the audience that the taking of the Parthenon Marbles was justified not only at the time they were looted, but also in the present day. The British Museum, under the British Museum Act of 1963, cannot repatriate colonial objects for "moral obligations," even if they were looted without the colony's consent.

Whether or not cultural objects were looted is debatable, but the Elgin Marbles, Rosetta Stone, Benin Bronzes, and the Dunhuang Caves artifacts remain prominent examples of how the British Museum has maintained their imperial power over "weaker" countries by refusing to return their highly prized cultural objects. Repatriation of these artifacts is important for building up the self-esteem and sense of nationalism of the former colony. Repatriation efforts also give former colonies a voice on the world stage, empower them to stand up to their former colonizer, and demand the return of their own cultural objects. These cultural objects are also central to a country's historical narrative of identity.

Despite these repatriation efforts by governments of former colonies, the British Museum has refused or ignored the majority of these requests and believe that the museum's collections should remain intact. There is a major paradox concerning this institution's collections: the museum no longer accepts objects to its collections unless they were legally acquired, yet the museum insists that the objects taken and

looted during the era of the British Empire are "now part of the museum and, more broadly, the cultural heritage of the nation" (Duthie 2011). Neil McGregor, director of the British Museum from 2002 to 2015, claims that the institution is a "universal museum" and that it has evolved from being an "imperial war chest" to a "global resource," therefore still indirectly laying claim to the objects acquired under the British Empire (Duthie 2011). Because the British Museum sees itself as a resource of knowledge, McGregor argues that cultural objects should remain in London because it is a widely visited city and will be seen by a large number of people from around the world. In addition, many believe that if the British Museum were to repatriate its colonial objects, their museum would be nearly emptied. This belief perpetuates the assumption that the source nations of the antiquities are incapable of housing and maintaining their own objects and that they need an institution such as the British Museum to preserve the culture's history and heritage, which is a common imperialist view that has not changed. This is especially true of the Dunhuang Caves documents and the Elgin Marbles. For example, a newspaper article entitled "Concerning the Ethics of Loot" from 1904 states:

> For the possession of [the Elgin Marbles] by the British Museum has proved the most efficacious means of preservation of some of the grandest masterpieces of the plastic art of ancient Athens, the sculptures which were left in their place at the Parthenon at the time of the conveyance to England having been subjected since then to the most lamentable injuries and deterioration through lack of proper care and wanton destructiveness. (Concerning the Ethics of Loot 1904)

In the 1930s, many British people acknowledged Stein's efforts to keep the Chinese antiquities in perfect condition during the journey from the Dunhuang Caves to the British Museum. If not for Stein, these people believed that the antiquities would have been lost forever at the hands of "stupid local peasants, who in their ignorance would have burned the manuscripts and idols in order to cure a disease" (Jacobs 2010). Still today, there are advocates who claim that the British

Museum is the rightful home of cultural artifacts belonging to other nations because they believe that they are the only ones capable of taking care of the items. Although this may have been true at the time the artifacts were taken, it does not pertain to the present-day. In short, the British Museum's claims to ancient artifacts and its reluctance and refusal for repatriation further reinforce its past imperial policies and characteristics.

Since the days of the British Empire, the British Museum has improved in some ways. Objects are labeled more accurately and are displayed in a less random and more orderly fashion. In addition, in a postcolonial context, it is considered inappropriate and culturally insensitive for museum curators to treat the material objects of other cultures as "exotica." The British Museum has improved in this regard, treating objects with more respect and equality than in previous years. Despite these improvements, the British Museum still carries on the imperial legacy from the days of Empire. For example, in 2017 the official Twitter account of the British Museum had an "Ask a Curator" session in which the public could ask them any questions about the museum and its exhibits. One question concerned the labeling of exhibits and making information available, to which the museum replied: "We aim to be understandable by 16-year-olds. Sometimes Asian names can be confusing – so we have to be careful about using too many" (Belam 2017). The British Museum, and ethnographic museums as a whole, needs to "redefine their priorities in response to an ever more globalizing and multicultural world" by being transparent about the colonial history of exhibits with museum visitors, and by understanding that context is extremely important in reflecting the meaning of an object, and that the way in which an object is displayed has the capability to alter the audience's interpretation of that object (Harris and O'Hanlon 2013).

Museums, especially one that has existed for as long as the British Museum, are not only sites for accessing history but are also historical sites of significance in themselves. Displays and objects in the nineteenth-century British Museum, which remain to this day, have been deeply imperialistic and are key to understanding the British Empire as a whole. The transition from being part of a powerful empire to a post-imperial institution has been challenging for the British Museum. By holding onto antiquities and cultural items from Britain's former colonies and claiming to be a "universal museum," the British Museum has further perpetuated the issue of imperialism in the museum setting. Cultural objects from the colonial era that remain in the British Museum metaphorically depict the British as maintaining control over their now former colonies. In this way, the British Museum continues to hold onto the days of the British Empire. Until the British Museum repatriates artifacts that remain in their possession, or at the very least acknowledges their deeply rooted imperialist history in a more sympathetic way, the sun will never truly set on the British Empire.

Definition

This entry explores the intersecting histories of British slavery and the anti-slavery movement and the colonization of Australia. Focusing on the crucial period between the American Revolution and the French and Caribbean revolutions (1776–1793), I review the ways that debates about slavery, penal discipline, and transportation map changing ideas about race, labor, and rights. This history reveals the role of the anti-slavery movement within imperialism and its imbrication with the apparatus of colonial government. The celebration of British abolition of Caribbean slavery has tended to obscure the impact of slavery on the development of a global labor system in two related ways: First, the prominence of transatlantic slavery has masked the long-term, global story of the role of coercive labor in imperial expansion, including its racial dimensions. Second, it has obscured the ways in which, for the British, race and class were articulated social categories that constituted competing objects of reform. British convicts, overwhelmingly working class, were seen by many as white slaves, and their status remained the focus of tension throughout the operation of transportation. In this way transportation was shaped by slavery but also subsequently determined key aspects of global post-emancipation labor flows. Conversely, as one of

the most powerful humanitarian social campaigns ever seen in the Anglophone world, the anti-slavery movement became a fertile source of affective imagery, language, and stories that could be applied to a range of causes in the colonies. Slavery and its abolition shaped desires for freedom and justice and were invoked to contest the oppression of convicts, Aboriginal people, indentured laborers, and women, to the end of the nineteenth century and beyond.

Introduction

On the 13 May 1787, the 11 ships now known as the "First Fleet" sailed from Portsmouth with their cargo of convicts, effectively initiating the British colonization of Australia. In the same month, the organized anti-slavery movement began, with the establishment by Granville Sharp and other evangelical Christians of *A Society for Effecting the Abolition of the Slave Trade*. This correspondence was no coincidence but reveals the profound imbrication of the seemingly distinct histories of the anti-slavery movement and Australian colonization. In the months before the First Fleet departed, the first governor of New South Wales, Captain Arthur Phillip, presented his ideas regarding the colony's management. He pictured a future colonial society in which convicts would both remain apart from civil society and, at the same time, retain their freedom, writing that:

> As I would not wish convicts to lay the foundations of an empire, I think they should ever remain separated from the garrison, and other settlers that may come from Europe, and not be allowed to mix with them, even after the 7 or 14 years for which they are transported may be expired. The laws of this country will, of course, be introduced in [New] South Wales, and there is one that I would wish to take place from the moment his Majesty's forces take possession of the country: That there can be no slavery in a free land, and consequently no slaves. ("Phillip's Views" 1787)

Phillip's assertion may at first sight appear odd, given that at the time Britain was the world's leading slave-trading nation and was not to abolish the trade for another 20 years (1807). The practice of slavery itself was not to be outlawed across the British Empire until 1833, 45 years after the colonization of New South Wales. So what did Phillip mean by the "laws of this country," and what did he know of slavery? Phillip probably shared the general view that the condition of slavery did not exist under English law, promulgated following the landmark Somerset case of 1771–2. Often considered to mark the unofficial beginning of the abolition movement, Chief Justice Lord Mansfield held that chattel slavery had no basis in common law in England and Wales and had never been positively established by legislation (Temperley 1972; Wise 2006; Paley 2002). But as a junior naval officer, Phillip had observed slavery at first hand while on a tour of duty to the Caribbean between 1760 and 1762. He had also served in the Portuguese navy, fighting in Brazil against Spain in the Third Colónia War. At this time, Brazil was both a depository for *degredados*, or convicts, and was permeated by slavery at all levels (Blackburn 1988; McIntyre 1984, pp. 98–101; Frost 1987). In his brief comments, Phillip expressed a somewhat ambivalent view of white convicts as morally undeserving and yet also as British subjects with rights. During the tumultuous 1780s, a decade of change sandwiched between the American Revolution and the French and Caribbean revolutions, debates about slavery, penal discipline, and transportation intersected in important ways, revealing shifting ideas about race, punishment, and rights.

Imperialism and Unfree Labor

Increasingly, scholars have emphasized the ubiquity, longevity, and global reach of the diverse forms of unfree labor "flows" that were key to European expansion overseas, emphasizing the relationship between diverse forms of coerced labor migration, including African and Asian enslavement and indenture. Several historians point out that the Atlantic slave trade, operating from the mid-fifteenth century until the end of the nineteenth century, was only the most visible and

well-known of these flows (e.g., Allen 2014; Anderson 2016; Anderson and Maxwell-Stewart 2013; Engerman 1986; Nicholas and Shergold 1988). The British had first entered the Atlantic slave trade during the sixteenth century but from the early seventeenth century enlisted naval and military resources to protect the trade from rivals and the threat of revolt, becoming the world's leading slave traders (Blackburn 1988). Its most intense phase constituted the "triangular trade," which involved European ships taking goods to Africa to buy slaves and then transporting enslaved Africans to the plantation societies of the Americas (the Caribbean, the American South, and Iberian America), before returning to Europe with slave-grown products such as sugar, tobacco, and cotton. In consequence, the numbers of Africans imported to the Americas was staggering: by the time the British ended their own slave trade in 1807, they had shipped 3.25 million Africans across the Atlantic (Burnard 2012; Walvin 2001; Beckles 1991).

Alongside slavery, two long-standing labor systems had supported British imperialism: the indentured servant system, in which migrants agreed to work without wages for a number of years in exchange for passage, and the transportation of criminals to North America (Maxwell-Stewart 2007, 2010, 2015; Grubb 2000). Until the late eighteenth century, plantations both in the Caribbean and in Virginia (which was considered part of the West Indies until well into the eighteenth century) fuelled demand for both African slaves and British convicts, although they were worked separately from the early eighteenth century onward (Butler 1896; Ekirch 1990). Nonetheless, over the second half of the eighteenth century, white convicts in the American colonies were increasingly treated like slaves and legally and practically disqualified from membership in civil society (Burnard 2015). Following the loss of her American colonies in 1778, Britain was forced to find alternative destinations for her criminals and for imperial investment. During this decade, as Britain searched for solutions to her perceived problems of overcrowding, poverty, and crime, the status of black people throughout the empire, and the question of penal discipline were especially challenging (Atkinson 2016, pp. 58–59). Reformers rethought the status

of slaves and convicts, especially after the 7 Years' War, as the empire expanded to include various categories of subjects (Brown 2006; Burnard 2015).

By the end of 1775, gaols were overflowing, and Home Office secretary William Eden decided to place felons on hulks moored in the Thames. A series of inquiries addressing the problems of transportation and prisoner accommodation resulted in the continuation of the hulk system and proposals for transportation, despite those who advocated categorization, behavioral monitoring, and reform. From 1784 legislation specified that the transportation contractor was granted a "property and interest in the service of the offender," referring to a 1717 precedent applied to American destinations (*Journal of the House of Commons* 1782–1784, p. 844; Brooks 2016, p. 167). Imprisonment with hard labor was first introduced into English law with the Criminal Law Act 1776 (6 Geo III c 43), also known as the "Hulks Act"; however many were concerned about its inhumanity and the infringement of prisoners' rights (Atkinson 1994, pp. 94–98; Bolton 1980; Gray 2016). By adding bondage to exile, convicts began to look more like slaves – a category increasingly coming under attack.

Many transportation schemes were proposed, and a number of experiments, especially in Africa, were progressively ruled out between 1775 and 1786 (Gillen 1982; Christopher 2010; Christopher and Maxwell-Stewart 2015). In August 1783 James Matra, who had sailed with Cook on the Endeavour, submitted plans to the Home Office for uses for New Holland. The House of Commons committee set up in April 1785 under Lord Beauchamp inquired into the operation of transportation act and sought a destination for settlement which would eventually be of some benefit to Britain. It heard a range of proposals, from figures such as Matra, Wilberforce, botanist Joseph Banks, and naturalist Henry Smeathman, who had visited Sierra Leone and proposed it as a site for African redemption. In 1786 hysteria about the convict problem increased and in August Sydney finally announced the Botany Bay decision (Clark 1999; Frost 2012; *Historical records of New South Wales* 1892, pp. 14–16).

Almost simultaneously, another colonizing experiment was made, as Smeathman's proposal of Sierra Leone was seized upon by anti-slavery campaigner Granville Sharp and the *Committee for the Relief of the Black Poor* in 1786–1787. Sharp's particular concern was to resettle some of the "Black Poor of London," comprising black loyalist refugees from the American Revolution. He persuaded the Treasury to finance the ships and embarking settlers and named the settlement the "Province of Freedom"; founded on free black labor, anti-slavery campaigners also believed that the project would refute proslavery arguments and sited in the midst of the slave-trading region might ultimately transform it. Braidwood argues that the government supported the Sierra Leone venture, not to rid itself of an unwanted population of African descent but because the Black Poor were regarded as British subjects with a legitimate claim on the state (Braidwood 1994). About 400 blacks and 60 whites reached Sierra Leone in May 1787, just as the First Fleet left for Botany Bay (Christopher 2010; Coleman 2005; Land and Schocket 2008).

A third British settlement was sponsored at this time: located in the Bay of Honduras in Central America, now Belize, 2214 displaced settlers from the Mosquito Shore in Spanish territory joined a small existing community of timber-getters in 1786. They were superintended by Lt. Colonel Edward Despard, who was instructed to allocate land to the new arrivals and who initially attempted to assign "40 yards of River course for each and every persons of all colours, free or Slaves, Male or female, of which a family consisted" (Bolland and Shoman 1975, p. 21). But the local families ignored him, and Sydney also admonished Despard, responding that "people of Colour, or Free Negroes . . . [are not] considered upon an equal footing with People of a different Complexion" (Atkinson 2016, p. 63). As Land and Schockert (2008) argue, the many schemes advanced at this time implied "various significantly different destinies for the settlers." Debates about these various schemes, and especially Sierra Leone and Botany Bay, map the contested and changing contemporary category of race and its relationship to British subjecthood.

Race

In their review of the long-term, global flow of forced labor that formed the background to convict transportation, Emma Christopher and Hamish Maxwell-Stewart note a growing association between race and "unfreedom" at this time, expressed in concerns to maintain racial labor hierarchies (2013, p. 80). The East India Company, for example, refused to accept Irish and English convict labor at the same time that it began to send Indian convicts to tropical sites such as Sumatra and Penang (Yang 2003; Allen 2009). These policies demonstrate the ways in which contemporary ideas about "race" linked to skin color conceived specific "constitutions" to be acclimatized to climatic zone (Christopher 2007, 2008, 2010; Coleman 2005, pp. 57–58.). Many historians have argued that late eighteenth-century concepts of human difference referred not to "scientific sets of physical characteristics" but rather that "savages" in the early modern period, whether African or Irish, were "seen as more culturally than racially different from Europeans." Skin color was "just one signifier that could be trumped by culture" (Wilson 2003, p. 11; Wheeler 2000).

However, historians of science also identify a shift during the 1770s toward the emergence of recognizably modern ideas of race as fixed inherent differences (Stepan 1982). One prominent response to the Somerset case, for example, was Edward Long's influential 1774 *The History of Jamaica. Or, General Survey of the Antient and Modern State of that Island*, in which he made the polygenist argument that "negro" and "white" constituted distinct species (Bohls 1999; Hall 2002; Long 1774; Meijer 1999, p. 60; Swaminathan 2003). Some scholars have argued that polygenism remained a controversial minority viewpoint in British racial thought into the 1860s (Kidd 2006, p. 85; Stepan 1982, p. 3). However it is clear that by the 1770s identities such as Englishness – while defined through government, institutions, and language – nonetheless included recognizably racialized assumptions (Wilson 2003). During this decade implementing the global labor schemes required for imperial expansion was increasingly structured by ideas about race, labor, and rights.

Race and Class

Sometimes downplayed in accounts of British abolition is the classed nature of the movement, and the way that for the British, race and class were articulated social categories that constituted competing objects of reform. Yet this tension is apparent as early as Long's 1774 *History of Jamaica*, which compared the happy situation of West Indian slaves with the wretched state of white British laborers and indentured apprentices (Long 1774, p. 571). This comparison marked the inception of what historian of slavery David Brion Davis termed "the contest between the two systems of oppression" (2014, p. 307). Davis argued that British abolitionism had the dual character of both promoting broader moral progress and providing "moral capital" for the ruling classes but at the same time supporting the status quo by "unintentionally diverting attention from domestic issues like 'wage slavery'." (Davis 2014, p. 311). Fuelled by a familial "sort of fascinated antagonism," Britain and the United States perceived each other as "negative reference" groups (Cunliffe 1979, pp. 37–38). This led to the seeming paradox that abolitionist Britain maintained a highly unequal aristocratic monarchy that employed wage slavery for industrialization – while the world's leading democracy obstinately defended slavery (McDaniel 2013). After 1833, the success of the abolitionists made them a model for other causes, and the tension between concern *either* for slaves *or* for convicts was largely overcome; in addition, alliances were embodied, for example, in the work of Joseph Sturge and the Chartists (Fladeland 1984). However, the association of "levelling" ideals with abolition was very damaging to the cause, particularly after 1793 when the Jacobins provided a terrifying example of what social reform might lead to. Specifically, the increasing opprobrium attached to slavery meant that the treatment of white British convicts during the late eighteenth century was defined in relation to African slavery, even as many aspects of the system endured. The slave-like status of white convicts, overwhelmingly working class, remained a central problem throughout the system's operation.

Already in the late 1770s, perceptions of transportation as a form of slavery drove opposition to the system's renewal. Reformer Jeremy Bentham saw felons this way, responding to the Hulks Act by advocating the construction of "hard-labor houses" instead and proposing that in order to "inculcate the justice, to augment the terror, and to spread the notoriety of this plan of punishment," a sign should be erected above the doors of penitentiaries, reading "Violence and knavery/Are the roads to slavery" (Bentham 1778, p. 32). During the 1780s, as the various African experiments were made, including the disastrous Sierra Leone venture of 1786–1787, and transportation to Botany Bay began, convictism and slavery intersected in complex ways (Christopher 2007, 2010). Transportation provided the proslavery lobby with much ammunition as they sought to emphasize the similarities between slavery and British worker oppression – while abolitionists insisted on the distinction between what Thomas Clarkson (1786, pp. 56, 49) termed the "voluntary slaves" of Botany Bay and the legitimate victims of African slavery. In May 1789 the anti-slavery cause aroused great public attention as Wilberforce gave his first speech attacking the trade and describing the terrible middle passage – 2 months before the notorious Second Fleet, or "death fleet," sailed for Botany Bay. In April 1792 Wilberforce made a famous speech before calling for a vote on his proposed bill, in which he told the story of Captain Kimber's brutal treatment of a 15-year-old African girl on the slave ship *Recovery:* she was suspended by the ankle and whipped and subsequently died from her injuries. Following tremendous public scandal, Kimber was prosecuted in what was a landmark case for the anti-slavery movement: for the first time, the treatment of slaves was framed as "murder" (Cobbett 1806–1820; Pollock 1977; Swaminathan 2010, 490, 495–96). The case was tried over 3 days in June 1792, in the same Admiralty session at the Old Bailey in which Captain Donald Trail and his chief officer were prosecuted for their treatment of convicts and crew aboard the "death fleet."

Considering these two important trials together reveals the shared status of convicts and slaves at this time, as well as its contestation at a key moment in imperial history. Following the safe passage of

the well-funded and carefully monitored First Fleet in 1788, the second fleet was seen as an opportunity to cut costs. Leading slave-trading firm, Calvert, Camden and King was contracted for the voyage, and the six ships that sailed in July 1789 arrived with only 75% of her passengers living, while around 40% more were to die within 6 months of reaching Australia (Flynn 1993). As one observer of the diseased and dying passengers exclaimed, "the slave trade is merciful compared to what I have seen in this fleet" (Hill 1790, p. 2; Christopher 2007). Trail's trial for the murder of an 'unknown convict' revealed many shocking features of the convicts' treatment that were reminiscent of the Atlantic 'middle passage'. Witnesses described the harshly restrictive slave shackles that allowed little movement, extreme physical violence, the reeking stench and screams in the night, and starvation (Christopher 2007, pp. 116–120; King V Trail and Elrington 1792).

Both trials were attended by powerful supporters of the West Indian interest: naval hero Horatio Nelson, the Duke of Clarence, Admiral Barrington, and Lord Sheffield – who actively interfered to cause the acquittal of all the defendants (Wilberforce and Wilberforce 1838, p. 357; Sugden 2011, p. 400). At this time there were very strong links between British sea power, national security, and colonial affairs and especially between the Royal Navy and the valuable West Indies plantations. As the possibility of war loomed in 1792, many were concerned to support these interests in the face of French naval power (Petley 2016). Clarence's maiden speech in the house of Lords just 4 weeks earlier had rejected Wilberforce's Abolition Bill, and he had suggested that "the proponents of the abolition are either fanatics or hypocrites, and in one of those classes I rank Mr. Wilberforce" (*The Parliamentary Register* 1792, pp. 1349–1350). Clarence's close friend and mentor Nelson shared these views, and later, as debate reached a climax in 1807, the proslavery lobby was to publish a letter Nelson had written to a sugar planter promising to protect their interests, while he still had a "tongue to launch in my voice against the damnable and cursed doctrine of Wilberforce and his hypocritical allies" (Laughton 1902, pp. 438–

439; Knight 2005, pp. 26–27, 43–117). Both Kimber and Trail had been employed by Calvert, Camden and King (Sturgess and Cozens 2013), but Trail had also served in the navy, under Nelson, who was there to provide a character reference. Barrington and Sheffield were also outspoken proslavery advocates (e.g., Holroyd 1790). During the trial, Clarence had tried to influence the result by "gestures" and "improper conduct" – and his party also dined with the judges (Sugden 2011). As Wilberforce's sons later told, the case was lost "through the shameful remissness of the Crown lawyers, and the indecent behaviour of a high personage [Clarence, then King William IV of England] who from the bench identified himself with the prisoner's cause" (Wilberforce and Wilberforce 1838, p. 357). In both cases, Justices Sir James Marriott and Sir William Henry Ashurst, both strong opponents of reform, dismissed the prosecution as malicious, and in a shocking reversal, the accusers were instead prosecuted for perjury.

In one sense, both trials argued for recognition of the passengers' humanity, whether slave or convict, in prosecuting their treatment. Despite this setback for reform, the Kimber trial has been argued to mark the inception of using newspaper culture to publicize debate, arouse public feeling, and bring the case to trial in the first place (Swaminathan 2010; Carey 2005) – also applicable to the Trail case. Many officials and members of the public were outraged by the treatment of the convicts, and a long and substantial parliamentary paper was printed in March 1792 providing reports on conditions on board the convict vessels, including letters from senior government officials (*Accounts and Papers relating to Convicts* 1792). Surely for many, the 1792 report, with its appalling description of shipboard conditions, evoked the terrible "middle passage" Wilberforce and his supporters had publicized to great effect just as the death fleet set sail.

Ending Slavery, 1807–1833

In 1793 the war with revolutionary France began, which hindered all reformist causes, including

abolition, as official attention focused on trade and colonial interests (Swaminathan 2009, p. 198). After the ratification of the French Constitution of 1793, marking the onset of the Jacobin phase of the French revolution, the abolitionist cause became divided, as many of the elite saw a connection between abolition and radical republicanism. This "new racism" fuelled arguments for the slave trade, and so for the anti-slavery leaders, it was essential to maintain a sharp distinction between the evils of the colonial slave world and the ostensibly free social institutions that had been imperiled both by French tyranny and English "Jacobins" (Davis 2014, pp. 307–308, 311–312; Lambert 2005; Oldfield 1995). Wilberforce, an ardent anti-Jacobin, acknowledged that their friendliness toward abolition "operates to the injury of our cause" (Blackburn 1988, pp. 146–147). Contemporaries accused him of hypocrisy in his concern for slaves, yet commitment to Britain's deeply unequal social order: opponents such as William Cobbett accused Wilberforce, "[n]ever have you done one single act, in favour of the labourers of this country; but many and many an act have you done against them" (Cobbett 1823, pp. 516–517). However, despite Cobbett's accusations, Wilberforce and other members of the anti-slavery movement were in fact very concerned for convicts and for religious life in the new colonies. As his biographer James Stephens later wrote, "While others were regarding the Australian continent only as a vast receptacle for convicts, [Mr Wilberforce's] Parliamentary influence was used for laying the foundations of the Church which now [1849] occupies every inhabited district of New South Wales" (1849, p. 511).

Finally, as Britain mastered France, and as the effect of events in the Caribbean such as the St. Domingue revolution of 1804 were felt, new pragmatic abolitionist arguments were made for making slave society a productive and loyal workforce of citizens. Following parliamentary debate, the Foreign Slave Trade Bill passed, forbidding British ships to engage in the slave trade after 1 January 1808.

The movement to finally abolish slavery itself across the Empire gathered pace after the end of the Napoleonic Wars in 1815. In January 1823 the anti-slavery movement was revitalized when William Wilberforce, Henry Brougham, and other veteran abolitionists established the "Society for Mitigating and Gradually Abolishing the State of Slavery throughout the British Dominions." During the 1820s the British anti-slavery movement legitimated the precepts of free-market capitalism, emphasizing the distinction between slave and "free" labor first popularized by Adam Smith's *Wealth of Nations* (Turley 1991). Anti-slavery campaigners argued that free labor would expand markets, by allowing the worker to become a consumer – while wage labor would motivate productivity (e.g., Davis 1999; Drescher 2002, p. 54). However in place of the harsh physical constraints of slavery, many advocated the economic, legal, and moral disciplining of workers. As Eric Williams first claimed, and as recent analysis has affirmed, the slave colonies' economic value to the empire diminished during the 1820s, and only protection ensured the viability of West Indian sugar (Williams 1944; Draper 2009; Blackburn 1988, pp. 433–435). Abolition was not due solely to the moral persuasion of the humanitarians, but was eventually achieved when ending slavery became economically and politically advantageous.

In the decade leading up to the triumph of abolition in 1833, the colonies began to offer an alternative for the investment of capital, goods, and people, as instantiated by the life-journeys of figures moving from the plantations of the West Indies to Australia. As British policy-makers and investors pondered how to colonize, the question of a colonial labor force became pressing. The now-ascendant anti-slavery movement insisted upon the distinction between "black" slavery and free "white" labor. Debates about the establishment of the Swan River Colony on the west coast of Australia in 1829 map the ways in which "free labor" emerged as a central principle in debates about both emancipation and colonization. While Swan River was the first free Australian colony, links to slavery are particularly visible in the form of arguments against free labor and the advocacy of racial, as well as class, labor hierarchies. The failure of *laissez-faire* at Swan River made it an example of how *not* to colonize, helping Edward Gibbon Wakefield to argue for the "concentration" – that

is, disciplining – of white labor in his formulation of systematic colonization. Concurrent with the making of the English working class, Swan River was formative in the making of a colonial working class, entrenching the principle of regulated but free white labor as constitutive of the settler colony (Lydon forthcoming).

Conversely, in the older penal colonies of New South Wales and Van Diemen's Land, in spite of Governor Phillip's early proclamation, by the 1820s, the transportation system was being criticized for its likeness to the slave trade.

In August 1833 British Parliament abolished slavery in the British Caribbean, Mauritius, and the Cape when it passed the "Act for the abolition of slavery throughout the British Colonies, for promoting the industry of manumitted slaves, and for compensating the persons hitherto entitled to the services of such slaves." In place of slavery the negotiated settlement established a system of apprenticeship and granted £20 million in compensation, to be paid by British taxpayers to the former slave-owners (Draper 2009). Arguments against transportation also strengthened, and the new reformist Whig government immediately lowered the rate of convict transportation to New South Wales. In 1838, the scandalous Molesworth report declared that "[t]ransportation is much more than exile; it is slavery as well." For critics, opposition to transportation – and especially corporal punishment, and particularly flogging – focused on anxieties about the legitimacy of the wider British imperial project. In 1840 the system was halted altogether in favor of the Probation System in Van Diemen's Land (Hirst 1983; Maxwell-Stewart 2010; Meyering 2010). Nonetheless, slavery continued to be central to domestic and imperial histories until at least the mid-nineteenth century (Hall et al. 2014).

Slavery in the Colonies During the Nineteenth Century

"Slavery" was frequently invoked in the settler colony of Australia, seemingly so distant from the Atlantic slave trade and its canonical forms of subjection and exploitation. The British anti-

slavery campaign accumulated tremendous cultural, moral, and affective power and was subsequently adopted for many different social causes throughout the nineteenth century. Following abolition, the movement's leaders sought to redirect popular interest toward the empire's Indigenous peoples, as exemplified by the 1835–1836 "Select Committee on Aborigines" inquiry (Aborigines Select Committee) chaired by abolitionist parliamentarian Thomas Fowell Buxton. The Aborigines Select Committee applied the language of anti-slavery to British settlers and attempted to define principles that would uphold the rights of Indigenous people across the empire (Elbourne 2003). The Aborigines Select Committee represented a high point of humanitarian influence and laid the foundations for the establishment of the Aborigines Protection Society. Yet during the 1830s white settlers in the Australian colonies sought to consolidate their possession of Aboriginal land, prompting tension between colonists and Aboriginal people, and between settlers and British humanitarian interests. Humanitarians deploying anti-slavery rhetoric arguments collided with the realities of the frontier in 1830s New South Wales, and those caricaturing Aboriginal people as inhuman savages. However, focusing blame upon the convict perpetrators also allowed upper-class humanitarians to displace responsibility from the system of colonization itself (Lydon 2018).

Historians have often overlooked popular humanitarian politics during the later nineteenth century, assuming that abolitionist zeal had died out by the end of the American Civil War. However while the older anti-slavery organizations may have declined, they were replaced with newer forms of anti-slavery, sometimes termed an anti-slavery "pluralism," that were particularly evident in literature and culture (Huzzey 2012). Abolitionist arguments became more diffuse over the second half of the nineteenth century but continued to be drawn upon by a range of social reformers. In Australia, a diverse range of relations between colonists and Indigenous peoples were characterized as slavery, including forced indenture, trafficking, and prostitution. As the frontier moved north, attempts to control violence and the ill-treatment of Indigenous people

evoked anti-slavery arguments in Queensland and northwestern Western Australia (e.g., Lydon 2014; Paisley 2014). Like other forms of humanitarian politics, anti-slavery ideals were profoundly imbricated with the apparatus of colonial government, challenging simple oppositions between moral and political, philanthropic, and colonial interests. Conversely, abolitionist and imperial ideologies could be mutually sustaining among the British public and were drawn upon to argue for the expansion of empire. Such analogies reveal how metropolitan ideas about humanity, freedom, and ultimately human rights have been tested against colonial experience, while domestic Australian interests were adjudicated by imperial humanitarianism, in a dialogue that was global in scope.

By the 1890s Britain witnessed the largest revival of anti-slavery protest since the early nineteenth century, focused on condemning the coercive systems of labor taxation and indentured servitude of the so-called new slaveries of European imperialism in Africa. Britain's identity and imperial reputation were at stake in these debates, as safeguarding free labor assumed central importance as a marker of progressive colonial rule that distanced Britain from an earlier era of slavery. The late nineteenth century was a pivotal period in British anti-slavery protest, bridging the gap between the Victorian era of abolition and the rise of human rights protest under international government (Grant 2005). Regarding Australia, however, accusations of slavery prompted an embarrassed silence, as granting responsible government and federation entailed bargaining away Indigenous people's rights.

Conclusion

Many important studies of the British anti-slavery movement and its aftermath have focused on European domestic reform (e.g., Drescher 2009). Critics such as Saidiya Hartman, however, have argued for including the colonial dimensions of this global story (Hartmann 2010). On one level, the prominence of the Atlantic slave trade can be linked to the success of the anti-slavery movement and its continuing celebration in collective

memory. However, as historians have recently shown, unfree labor "flows" enabled European expansion and comprised diverse forms of coerced labor migration (e.g., Allen 2014; Anderson and Maxwell-Stewart 2013; Anderson 2016). This focus on the category of labor is an important shift in analysis that transcends national and Anglocentric interests. Situating Australia in the context of international anti-slavery networks reveals the importance of colonial experience within the global history of anti-slavery and in shaping post-emancipation racialized labor regimes within a global history of unfree labor.

However it is also important to acknowledge that such distinctions emerged and have remained powerful due to the centrality of racial taxonomies in Western thought and culture and their relationship to definitions of rights. In addition, adding the category of white convict to the broad opposition between British concern for blacks but not for white workers (by contrast with US concern for democracy but adherence to slavery) extends and destabilizes this binary framework. Convicts and their slave-like but contested status reflected a deeply classed British world view. Finally, by including colonial experience, we are reminded of the near-total abnegation of Indigenous rights. Celebration of abolition in the Caribbean has acted to obscure British complicity in invasion and dispossession of Australian Aboriginal people. The inception of Australian transportation and the emergence of the anti-slavery movement at the same time was not a coincidence, but rather expresses the growing concern for the treatment of labor and the rights of British subjects as the empire expanded. Tensions around the status and treatment of white felons were perhaps most visible through the lens of arguments regarding African slaves, but the many shared features of both systems of forced labor generated enduring ideas about race, labor, and rights.

British socialism; Harold Laski; Henry Brailsford; Imperialism; Interwar period; Leonard Woolf

Definitions

There are key concepts used in this chapter. Socialism is understood as a broad intellectual tradition that includes other theoretical approaches such as Fabianism and Marxism. However, while the first two are generally pro-democratic and nonviolent, the latter supports revolution and it may compromise democratic values in order to achieve or maintain socialism. While the beginnings of socialism can be traced back to the 1820s with the writings of Robert Owen, Saint-Simon, and Charles Fourier,

Marxism emerged in the second half of the nineteenth century with the contributions of Karl Marx and Engels. Fabianism, which favored a gradual achievement of socialism through democratic means, started in the late nineteenth century with the writings of Bernard Shaw, Herbert Wells, Sidney Webb, among others (Fabian Society 2019).

New imperialism is a period in history during the late nineteenth and early twentieth century when the industrialized powers of the time, such as Britain, France, Germany, and even the United States, expanded their dominions into Africa and/or Asia. Finally, the chapter embraces Anthony Brewer's (1990: 20) meaning of the term "classical Marxist theory of imperialism," which includes the writings of Hilferding, Luxemburg, Bukharin, and Lenin.

Introduction

As this encyclopedia demonstrates, imperialism has been one of the major themes in world history. Yet, one particular period of importance of this phenomenon is the so-called new imperialism, usually dated from the 1870s until the First World War. This was an epoch when the industrialized powers of the time, such as Britain, France, Germany, and even the United States, expanded their dominions into Africa and/or Asia. Moreover, This was an international episode in which many renowned Marxian writers contributed intellectually during the first two decades of the twentieth century. Rudolf Hilferding (1981 [1910]), Rosa Luxemburg (1913 [1951]), Karl Kautsky (1914), Nikolai Bukharin (2003 [1917]), and Vladimir Lenin (1975 [1917]) are notorious examples.

The analyses of the above thinkers have been taken into consideration by many surveys of imperialism, books, doctoral theses, and articles (see, for instance, Callinicos 2009: 23–66; Marshall 2014: 317–333). However, beyond them and John Hobson's work, which has also been widely acknowledged as a result of its profound influence on Marxian theorizations, there have been only few studies aiming to recover the contributions of thinkers of the early twentieth-century writing

about the so-called new imperialism (for an exception, see Etherington 1984). In fact, it is commonly asserted that after Lenin's *Imperialism: The Highest Stage of Capitalism* (1917), there were no important Marxist-based contributions on the topic in consideration until the 1940s or 1950s. For instance, Anthony Brewer's seminal *Marxist Theories of Imperialism: A Critical Survey* (1990) explores Hobson, Luxemburg, Hilferding, Bukharin, and Lenin's work and then jumps until the 1950s to consider Paul Baran's *Political Economy of Growth* (1957). The reason: "the period between the wars produced no notable innovations in the Marxist theory of imperialism" (Brewer 1990: 136. For two other examples disregarding the contributions on the theme during the interwar period, see Noonan 2010: 14–90; Milios and Sotiropoulos 2009: 9–33).

Is it really the case that there were no meaningful Marxist-related theorizations on imperialism from 1917 until the late 1940s? Contra this position, this chapter shows that there was an important cohort of British intellectuals that, around the interwar period, embraced key Marxist tenets to theorize about imperial affairs. Through the cases of Henry Noel Brailsford, Leonard Woolf, and Harold Laski, this writing illustrates the closeness of a loose British tradition to Marxist analyses of imperialism. Nevertheless, the chapter also shows that the British theorizations in consideration were original in their proposed solution to imperialism. In this sense, it is claimed that they represent an alternative to "classical Marxist approaches" on the theme. To sustain the main argument of this manuscript, the chapter studies the three British thinkers previously mentioned by considering their political thought, their main insights on imperialism, and their proposed solutions to it.

Henry Noel Brailsford

Political Thought

Henry Brailsford's political thought moved increasingly to the left as his career advanced. He (1873–1958) was born in Yorkshire and raised in Scotland. He studied classics and philosophy at

Glasgow University obtaining a Masters of Arts degree in 1894 with first class honors and winning the Thomas Logan award for being the most prominent arts graduate of his generation. In 1944, he was awarded an honorary Doctorate of Laws by Glasgow University as a result of his distinguished career (Leventhal 1985: 20–21, 284). One of the earliest indications of Brailsford's move toward the left is evidenced by his involvement with Fabianism. While doing his studies, he was one of the founders of the Fabian Society at Glasgow University in the early 1890s. He nonetheless left the association in 1899 as a result of its lack of determined criticism against British imperialism, particularly in South Africa (Blaazer 1992: 10). Brailsford became a member of the Liberal Party during the 1890s. Nevertheless, by the early 1900s, he had commenced a more serious reading of Marx; and by 1907 he left the Liberal Party and joined the leftist Independent Labour Party (ILP), which was affiliated to the Labour Party (LP). This year, in a letter to Robert Ensor, Brailsford asserted: "I have always been a Socialist- I used to be a Fabian. The ILP does not exactly draw me like a magnet. Still I believe in its possibilities..." (quoted in Leventhal 1985: 95).

The ILP opened important opportunities for Brailsford. He became, for example, a member of the Advisory Committee on International Questions of the LP, which housed other important intellectuals of the time writing about imperialism, such as John Hobson and of course Harold Laski and Leonard Woolf (Sylvest 2004: 412). In addition to this, in 1922 he became an editor of the ILP's the *New Leader*. Under his leadership, the weekly newspaper was clearly leftist. At that time, Otto Bauer, one of the intellectual fathers of Austro-Marxism, considered the *New Leader* to be "the best Socialist publication in the world" (Leventhal 1974: 91).

Although Brailsford strongly rejected violent means (see, for instance, Brailsford 1921), he was sympathetic to the communist revolution in Russia. He was a member of the 1917 Club and also the Society of Friends of Russian Freedom, which were groups congenial to the communist movement. In 1904 he helped Lenin, Trotsky, and other Russian revolutionaries to get false passports and fare tickets to travel secretly to Russia, which, as a result of this, Brailsford was found guilty in court and had to pay a fine (Blaazer 1992: 82; Brailsford 1940: 206). After the Russian Revolution took place in 1917, Brailsford asserted: The earth "has become a more habitable planet since the Russian autocracy has been destroyed" (Leventhal 1973: 88).

Thus, Brailsford's affinities toward socialism are clear. In fact, he (1936: 257) considered Marx to be "a great and seminal teacher." Moreover, he and other contemporary intellectuals considered that he was a socialist. For example, in a chapter of *Fabian Colonial Essays* (1944), he affirmed: "Socialists... we should also be the pioneers in showing how the... colonial peoples can be integrated..." (Brailsford 1944: 21). In addition, in a letter sent to the socialist Fabian Herbert Wells, Brailsford said to him: "I'm more of a Marxist than you are..." (Leventhal 1974: 99). Brailsford's contemporaries also regarded him within the socialist tradition. For instance, Michael Foot, who was member of Parliament, named him "the greatest Socialist journalist of the century" (Ashworth 2007: 40).

Insights on Imperialism and Their Closeness to Marxism

Not only was Brailsford's political thought closely related to socialism and to some extent to Marxism but also his theory of imperialism. His view on the primacy of economics to understand world affairs, his anti-capitalism, and his instrumentalist view of the state were key components of his understandings of imperial affairs.

Brailsford's views of imperialism in particular and the world in general were mediated by the Marxist position that argued for the supremacy of economics over other factors, such as politics and culture. For example, when explaining the reasons of the First World War, Brailsford considered that neither armaments nor power was the main cause of that military conflict. During the interwar period, he (1925: 49) argued: "It is true that when the Great War broke out, questions of nationality played their part in it. But its actual origin lay in... the economic motive...."

In *The War of Steel and Gold* (1918), probably Brailsford's magnum opus, he explained that the causes of imperial conquests were to be found in issues related to economics. The accumulation of capital, for instance, was key to make sense of imperialism. Capitalists of developed countries produced more than their domestic consumers could buy. As a result, they were impelled to conquest foreign markets (Brailsford 1918: 86). Additionally, "another powerful economic factor upon the growth of Imperialism... [was] the pressure of the armament firms." Given their interest in selling weapons, Brailsford (1918: 88) claimed that they might drive states into war.

Thus, Brailsford embraced the Marxian economic deterministic view of the world. In fact, he acknowledged that. In a lecture delivered in 1947, Brailsford asserted that he had adopted his view of imperialism from Marx and Engel's tenet that privileges economics to understand how the world operates. In addition, he disapproved John Hobson for believing this was an inadequate approach (Brailsford 1952: 6, 26).

Another way in which Marxism was key for Brailsford's theory of imperialism was in its anti-capitalism. Like Marxism, Brailsford thought that capitalism was unfair and produced severe inequalities and exploited workers:

> Always, by the injustice and folly of its distribution of the product of industry, it creates for itself a haunting anxiety... It has taken in profits what ought to have gone in wages, and the result is that the home market, which is, in the main, composed of the wage-earning masses of the population, is unable, by reason of their poverty, to absorb the goods which its perfected machines pour out. (Brailsford 1925: 50)

Moreover, Brailsford opposed capitalism because he believed it was closely related to war and imperialism. According to him, the capitalist system was responsible for imperial conquests because they benefited the privileged classes economically. He explicitly joined other socialists, such as Karl Kautsky, to criticize Norman Angell's belief that there would be no more military conflicts between the great powers. Brailsford thought this was not the case, because imperial states, impelled by their respective capitalist class to acquire foreign markets for their products, were

destined to fight for those limited spaces (Brailsford 1918: 163–166).

One more way in which both Marxist and Brailsford's insights were closely related was in their understanding of the state. According to Marx and Engels (1848), the state is merely "...a device for administering the common affairs of the whole bourgeois class." Similarly, Brailsford (1938: 39) perceived the state as "...an apparatus of force that serves at home and abroad the economic interests of an owing and ruling minority." Brailsford often proved this idea with examples of small privileged groups benefited by military imperial interventions of the British state (see, for instance, Brailsford 1925: 46, 1918: 54).

Remedies to Imperialism

As a result of Brailsford's committed anti-imperialist standpoint, he provided solutions to capitalist imperialism. One of his remedies was influenced by Marxism, but also differentiated his international theory from other Marxian popular approaches of the early twentieth century. Like orthodox Marxists, Brailsford believed that the capitalist system was composed of two antagonistic classes. To finish with the exploitative organization of society, it was necessary to replace the system with a utopian classless socialism. In Brailsford's (1925: 36) words:

> The main purpose of Socialism must be the conquest for the whole community of economic power... we are engaged in the most formidable class-struggle which history has ever witnessed. It is a struggle for economic power between the many who do productive work and the few who exercise the authority which ownership convers. It cannot end until this usurping class has been disposed by the transference of the capital to the community. The struggle cannot be avoided, but victory, will mean, not merely the triumph of one class over another, but the abolition of class itself.

Where Brailsford differed significantly from orthodox Marxists was in the means to reach a socialist society. As already mentioned, Brailsford was critical of the violent means used by Russia. Instead of revolution, he thought that it was possible to achieve the utopia through democracy. Accordingly, Brailsford (1936: 261)

believed that "...to advance to socialism by constitutional means involves us in the use of democracy as our instrument." This was of course a position embraced by other socialists of the time, such as Kautsky (1918: 88). Nevertheless, it is in this that Brailsford's approach differs significantly from the writings of the Marxist classical theories of imperialism, such as Bukharin, Luxemburg, and Lenin.

The other solution provided by Brailsford to solve imperialism was related to the establishment of a collective security mechanism. In 1917, he wrote a book that shaped his future reputation: *A League of Nations*. Among other things, Brailsford (1917: 289, 302) proposed that the international organization to be created after the Great War should have a "Permanent Court of Arbitration at The Hague," a "Permanent Executive" formed by the great powers, and a "Council of Conciliation for all nonjusticiable disputes" between states. The key for Brailsford was that the League should have to enforce sanctions to ensure that the issues of war and imperialism would be solved (Brailsford 1917: v, 292–3, 299–301). As a result, after the creation of the League of Nations, Brailsford became disappointed of how the organization was designed. According to him, the institution was framed to tackle international issues on a purely political foundation. However, with that framework, Brailsford considered that "the economic motives for imperial expansion would remain as potent as they were in 1914." The League therefore needed to address the economic impulses of imperial actions. It would need, for example, to make sure that all great powers would have access to unlimited imports of raw materials (Brailsford 1925: 122–123, 126).

Leonard Sidney Woolf

Political Thought
Leonard Woolf (1880–1869) was another intellectual writer about imperialism during the interwar period and whose political thought was considerably socialist. He was born in London and studied at Cambridge University. After his graduation, he joined the British Colonial Civil Service and was sent to modern-day Sri Lanka. There, Woolf observed the abuses of the British Empire, became an anti-imperialist, and returned to Britain in 1912. In 1913, he became a Fabian and joined the socialist Fabian Society, where he published his influential *International Government* (Woolf, 1916), which proposed a mechanism of international collective security and was influential in the creation of the League of Nations. Two years later, his main political association became the LP. There, he was appointed Secretary of the Advisory Committee on International Questions (1918–1945) and also of the Advisory Committee on Imperial Questions (1924–1945). It was under the auspices of the LP that Woolf wrote his second most influential book, *Empire and Commerce in Africa* (1920b). In addition to his previous associations, he was one of the founders of the 1917 Club, the same group that embraced Brailsford (Wilson 2003: xii, xiii).

Woolf's leftist associations informed his thought significantly. He was in fact notably interested in Marxist ideas. This is reflected in several book reviews he elaborated. He, for example, reviewed *To the Finland Station* (1940) written by Edmund Wilson, which explores the ideas of several Marxists, including Trotsky, Engels, and Marx (Woolf 1941: 234). One more example is his written assessment of Martin Buber's *Paths in Utopia* (1949). This book provides an examination of important socialists, among which are Marx, Engels, and Lenin (Woolf 1949: 624).

Beyond his interest in Marxism, Woolf and others have labelled his political thinking as socialist. For example, Noel Annan, who has written considerably about Woolf, typifies the English as "a socialist, an anti-imperialist, and a supporter of the League of Nations" (Annan 1990). Similarly, Elleke Boehmer (2000: 25) describes Woolf as an "anti-imperial socialist economist and internationalist." Woolf, in fact, characterized himself as socialist. In *Socialism and Cooperation*, for instance, he (1921: 4) asserts: "The author of this book is a socialist...." Elsewhere, he even described his thought as "Marxian socialist" (Woolf 1940: 152). However, it is important to stress that he considered to be a Marxist only to a

limited extent. In *Barbarians at the Gate*, he (1939: 123–124) explains that he regarded himself a "Marxian Socialist – but only up to a point." The reason was that he was against being dogmatic about any set of beliefs, as many communists of his time were. In addition to this, Woolf, as the two following sections show, differed from orthodox Marxists in other important aspects.

Insights on Imperialism and Their Closeness to Marxism

While there are some deviations, there are substantial similarities between Woolf's insights on imperialism and Marxist analyses. First, like orthodox Marxism, Woolf believed in the significance of economics to understand world affairs. In *Empire and Commerce in Africa*, for instance, he (1920a: 7) argued: "It is clear that. . . the national economic interests are the primary concern of the State, and the whole machinery of government and Government Offices. . . [are] mainly directed to the promotion of the commercial interests of the nation." In 1920, he also wrote *Economic Imperialism*. The main argument of the book is that the primary causes of imperialism are economic. According to the author, imperial conquests were impelled by the desire to obtain new markets, to acquire raw materials, and, more generally, to gain monetary profits (Woolf 1920b: 26–29).

Nevertheless, Woolf often criticized "communists" of his time for blindly ignoring noneconomic aspects, such as political and ideational factors (Woolf 1928: 23, 1939: 194). In spite of this, Woolf considered that his approach was close to classical Marxism. For him, Marx and Engel's original method included the interaction between ideas and economics, which was something that Woolf applied to his analyses (Woolf 1939: 194, 220–221).

Another key element that was part of Woolf's theory of imperialism was his critique of capitalism. Like Marxists, Woolf regarded this system as exploitative. According to him (1921: 11), the "capitalist, in the pursuit of his own profits. . . exploit[s] the worker and consumer." Clearly in tune with Marxism, Woolf conceived capitalism as a system of competition and struggle between two main classes. In his own words, in a capitalist structure "every individual or class is compelled to take part in a ceaseless struggle against other individuals or classes for the ownership or control of the means of production or the commodities produced" (Woolf 1921: 19). Moreover, in the international level, the privileged classes used imperialism to acquire markets and raw materials from the undeveloped regions (Woolf 1920c: 5). This is of course parallel to the claim of classical Marxism which holds "the need of a constantly expanding market for its products chases the bourgeoisie over the entire surface of the globe" (Marx and Engels 1848: 6).

As already seen in the section on Brailsford, in order to seek economic profits around the world, Marxists assert that capitalists utilize the machinery of the state. This is a tenet also embraced by Woolf. In *Imperialism and Civilization*, for instance, he (1928: 11, 61) asserted that the state ". . .was invoked by the capitalist to aid him in developing or exploiting the other continents." In the case of European empires, the state had been used to conquest African and Asian territories in order to give concessions to its own privileged classes and to protect them from capitalists of other empires who also wanted to pursuit profits in subjugated economies.

While Woolf was a firm critic of the capitalist system, his criticism to individual capitalists was often nuanced. This standpoint was in fact taken from Marx, who famously stated (1867):

> I paint the capitalist and the landlord in no sense *couleur de rose* (i.e., seen through rose-tinted glasses). But here individuals are dealt with only in so far as they are the personifications of economic categories, embodiments of particular class-relations and class-interests.

Similarly, but applied to the international level, Woolf stressed (1920a: 321):

> The capitalist imperialist is only a human being who has yielded to the tyranny of his own desires and of the social and economic system in which he blindly believes. The social and economic system allows him to regard personal profit-making as in itself a legitimate motive for either personal or political action.

Remedies to Imperialism

Woolf, like many intellectuals who had experienced the Great War and were specialized in

world affairs, supported the creation of an international organization to combat international anarchy (i.e., the absence of a supreme authority above states) and other major related problems of the time, such as war and imperialism. His *International Government* (1916) was, in fact, influential in how the League of Nations was framed (Wilson 2003: 54–55). For example, Woolf's proposal of a world collective security mechanism included (1) a "Council of all the constituent states" which was a legislative body (called the Assembly when the League was eventually created), (2) a "Council of the eight Great Powers" to solve issues related to the more powerful states of the time (named the "Council" when the League was created), (3) an "International Secretariat" in charge of the official communication of the organization (baptized as the "Secretariat" during the League's life), and (4) an International High Court to settle legal disputes between states (later known as the "Permanent Court of International Justice" in the created League, which even though it was not one of its main organs, it was an important part of its system) (Woolf 1916: 379–95; Pedersen 2015: 5–7).

While Woolf often defended the League as a possible solution to imperialism (Woolf 1928: 132), he also provided another remedy to this international malady. Since he considered that imperialism was the result of the capitalist system, he consequently believed that socialism could solve imperial maladies (Woolf 1921: 17). After the creation of the League, he argued that it would work ineffectively as a result of its capitalist composition. In his own words (Woolf 1920b: 105):

> The League, as it exists to-day…is simply being used to obscure the fact that France and Britain are obtaining large accessions of territory for economic exploitation in Africa and Asia. This is not surprising. The States which are members of the League are capitalist States, organised on a basis of capitalistic imperialism.

Thus, besides internationalism, socialism was a key component in Woolf's international theory to solve the issue of imperialism. Nevertheless, his socialist society should not be achieved through orthodox Marxist methods. Like Brailsford, Woolf often opposed radical violent means. Instead, influenced by Fabianism, he favored a gradual transition to socialism. Accordingly, Woolf (1921: 111) reasoned with other socialists: "…we shall not attempt, perhaps, by a cataclysmic revolution, to break up the whole framework of our existing society." Instead, he (1940: 89) considered that socialism should be advanced gradually through democracy. Therefore, Woolf's most ideal remedy to solve imperialism included the ingredients of collective security and a democratic socialist society. This is why in the middle of the Second World War he warned: "If the international government which our society demands is not established on a democratic and socialist basis by free national communities, it may be established in the form of slave empires by dictators" (Woolf 1940: 231).

Harold Joseph Laski

Political Thought

Of the three thinkers considered in this chapter, it is Harold Laski who was most strongly influenced by Marxist ideas. Yet, his conversion to a type of non-radical Marxism was gradual. He (1893–1950) was born in Manchester, England, and raised in a Jewish family. Before starting his studies at Oxford University, in 1911 he married Frida Kerry, a fervent feminist socialist (Lamb 2004: 5). During his studies, he had two major theoretical influences. His main mentors were the liberal Ernest Barker and the Fabian Herbert Fisher (Hoover 2003: 25). It was also the time when Laski admired F.W. Maitland's liberal pluralism and G.D.H. Cole's guild socialism (Lamb 2004: 5–6). In addition to the above, Laski was part of the Fabian Society at Oxford University (Laski 1944:164).

Since Laski's graduation in 1914 until the mid-1920s, his political thought was predominantly guided by liberal pluralist notions. After that, he was more influenced by socialist and Marxist ideas. Laski explicates this in *A Grammar of Politics*, which was first published in 1925. There, he explains that during the Great War, he was a pluralist who was critical of the concept of sovereignty. At that time, he conceived the state as one among many institutions in society. Consequently, during those years Laski believed that

the state did not have the right to claim the monopoly of violence within a determined territory (Laski 1938: x–xi). While during the mid-1920s, 1930s, and 1940s, Laski still valued his previous point of view, he now reasoned:

> The weakness, as I now see it, of pluralism is clear enough. It did not sufficiently realise the nature of the state as an expression of class-relations... [my] pluralist attitude to the state and law was a stage on the road to an acceptance of the Marxian attitude to them. (Laski 1938: xi–xii)

The gradualist Fabian socialism that considerably influenced Woolf also informed Laski's thought during the late 1920s. In fact, he was an executive member of the Fabian Society from 1921 to 1936 (Cole 1961: 198). In 1925, he wrote a booklet called *Socialism and Freedom*, where he supports this ideology, but he strongly criticized any authoritarian deviations. Nevertheless, by 1927 he still questioned Karl Marx's legacy. That year he wrote a letter to his friend Oliver Wendell Holmes: "I dislike Marx intensely" (DeWolfe 1953: 998). Thus, during the late 1920s, while Laski supported Fabian socialism, he rejected Marxism. This changed during the next decade.

During the 1930s and 1940s, Laski's political thought became closer to classical Marxism. In 1932, he joined the Socialist League, a faction of the LP that wanted to move the party more toward the left. Moreover, in 1939 he wrote an article called "Why I am a Marxist" in which he regarded himself as both a socialist and a Marxist (Laski 1939: 76). Nevertheless, he often detached himself from radical Marxists of his time. In a public meeting, a communist once asked Laski if he was really a Marxist, to which he answered: "Yes, my friend, we are both Marxists, you, in your way, I in Marx's" (Mathur 1988: 458). Thus, during the last two decades of his life, Laski identified his theoretical perspective with Marx but rejected the views of contemporary communists. Yet, while Laski's main theoretical influence during the 1930s and 1940s was Marxism, he kept close ties with Fabianism. In fact, he held the chair of the Fabian Society from 1946 to 1948 (Fabian Society 2019).

Insights on Imperialism and Their Closeness to Marxism

Laski's insights on imperialism were significantly informed by Marxist understandings, especially during the 1930s and 1940s. In 1933, for example, he wrote "The Economic Foundations of Peace" as one of the chapters of Woolf's edited *The Intelligent Man's Way to Prevent War*. In it, he claimed that the main causes of imperialism and war were economic. For Laski (1933: 507), "No one now denies that the British occupation of Egypt was undertaken in order to secure the investments of British bondholders; and that the South African War was simply a sordid struggle for the domination of its gold-mines." Thus, like Marxism, Laski (1935b: 122) considered: "the economic factor, then, is the bedrock upon which the social superstructure is built."

Despite Laski acknowledged the significance of economics to explain imperial factors, he took a similar approach than Woolf's in that he also rejected the idea of disregarding other factors. In fact, Laski conceded that his theoretical standpoint was Marxian. According to him (1935b: 158):

> That there is an interweaving reciprocity between all the different factors of any culture-pattern was emphasised by Marx and Engels at every stage of their analysis. The claim of historical materialism is simply that the economic factor defines, in Engels's phrase, the 'fundamental necessity' within the framework of which all other ideas will be selected as significant.

Since Laski's insights on imperialism were mediated by Marxism, he was very critical of the capitalist system. First, he considered that capitalist imperialism enlarged inequalities. According to Laski (1932: 98), "the essence of a capitalist society is its division into a small number of rich men and a great mass of poor men." Capitalist imperialism perpetrated this because it benefited only the small class of investors who were causing imperialist adventures because they were interested in obtaining new markers for their products (Laski 1933: 524). Second, Laski reasoned that capitalism produced imperialism and that the latter generated war (Laski 1933: 505). Thus, capitalism

was an undesirable system because as long as it survived war would not be eradicated. In fact, he believed that war was an indispensable element of capitalism (Laski 1935b: 229). Third, Laski was critical of the capitalist system because he believed it had connections with fascist regimes. He thought that fascism prospered because of the support of industrialists who were afraid that socialism would replace capitalism. For him, fascism was a counterrevolution used to prevent the rise of socialism (Laski 1935a: 41). It is important to mention that Laski acknowledged (1937: 88) the Marxian inspiration of his ideas about the relationship between capitalist imperialism and fascism.

In addition to the above, Laski embraced the Marxist view of the state. As already seen, until the early 1920s, he had understood the state through pluralist eyes. Since the late 1920s, however, his view of this institution was filtered by Marxist lenses. Like Marxism, Laski (1938, x–xi) believed that "the State is the instrument of that class in society which owns the instruments of production." He (1935a: 27) considered this was dangerous for world peace because different imperialist states would be competing for the exploitation of the undeveloped world. He was of course conscious that he was borrowing his understandings of the state from Marxism (see, for instance, Laski 1944: 71).

Remedies to Imperialism

Of the three intellectuals analyzed, Laski was the most cautious with respect to his support of the League of Nations. He conceded that "despite its weakness and its setbacks, it is difficult to doubt both the value of the League and the necessity for an organisation of this kind." Yet, he was conscious that this institution needed to be reformed (Laski 1931: 100–101, 1933: 512). Like Brailsford and Woolf, Laski considered that the central problem of the League was that it was composed of capitalist states that had an interest in imperial practices. The main problem of the organization was that it was not "transforming the inherent nature of economic imperialism"

because of its capitalist membership. Therefore, Laski's solution to imperialism required that states would adopt socialism. Because a socialist state would distribute wealth more efficiently in the domestic level, there will be no more incentives to conquest new markets abroad through imperial activities given that the workers would have the economic capacity of buying the products offered by capitalists (Laski 1933: 523–524, 543). This is why Laski (1935b: 258) believed "socialism and economic imperialism are incompatible."

How did Laski propose socialism should be reached? In the early 1920s, he was clearly against revolutionary means. In 1923, for example, he criticized Marx, Lenin, and communists for believing that socialism could only be attained through violence. Nonetheless, he also clarified: "What is here in dispute is not the end the Russian Revolution seeks to serve... The question is whether the overthrow of institutions by violent means is every likely to serve its intended purpose" (Laski 1923: 46–48).

During his socialist years, Laski became less critical of Marx's writings on revolution. While he formally denied to support insurgencies, he became more conscious about the difficulty of establishing a socialist society through gradualist means. In *Democracy in Crisis*, for example, Laski argued (1935a: 255) that the likelihood of socialist revolutions was favored by the unsecure international circumstances of his time, where the workers' standard of life was precarious. The other alternative, capitalists supporting the socialist cause, would be frankly implausible (Laski 1935a: 233). Because of this, he claimed that a socialist insurgency was almost inevitable. However, despite Laski advanced the socialist cause and believed that a revolution was unescapable, he did not favor violent means. Instead, he believed that revolution, like war, caused dead and suffering. While unrealistic, he considered that the democratic path toward socialism was ideal (Laski 1935a: 105, 266). In fact, during the 1940s he urged British capitalists to agree on a "revolution by consent," where they would willingly favor a nonviolent movement toward the socialization of

the means of production (Laski 1946: 16). Thus, Laski's utopian society "must not only be socialist, but also democratic" (Laski 1949: 14).

Conclusion

Although it has been frequently neglected by mainstream surveys on theories about imperialism, there was an influential British socialist cohort of intellectuals writing about this topic during the interwar period and the 1940s. This chapter has employed Brailsford, Woolf, and Laski as examples of this group of theorists. Other thinkers, such as G.D.H. Cole and G.B. Shaw, might as well fit adequately within this loose tradition. Further research, however, would be needed to rescue their contributions on imperial affairs.

The cohort of theorists covered in this chapter recognized a direct influence from Marx and Engels. Specifically, within their contributions on imperialism, they acknowledged the primacy of economics over other factors, they were strong critics of the classist exploitative nature of capitalism, and they embraced an instrumentalist view of the state. Moreover, they believed that socialism was a key remedy to eradicate imperialism. They were, nonetheless, less comfortable with Leninist understandings because they considered them economic determinist and because they favored systematic violence for the sake of socialism. The intellectuals analyzed here, on the other hand, opposed violent means and supported a democratic type of socialism. Because of all these reasons, the British socialist approach covered in this chapter provides an alternative to the Marxist classical theories of imperialism.

British Twentieth Century Imperialism and Anti-imperialism in South Asia

Faisal I. Chaudhry
University of Pennsylvania, Philadelphia, PA, USA

Synonyms

British colonialism; Imperialism; Indian Independence; Pakistan; Partition; South Asia

Definition

The 'short' half-century from 1905 to 1947 in South Asia was framed by two partitions that say much about the contours of imperialism and anti-imperialism during this final phase of British rule in the Indian subcontinent. With the decision to partition the colonial province of Bengal along its east–west (and Hindu–Muslim) axis in 1905, mass agitation in India was given its most visible platform since the so-called 'sepoy' mutiny or Indian rebellion of 1857. By once more dividing a Bengal that nationalist fervour had successfully reunited by 1911, while splitting the Punjab in two as well, the end of British imperialism in the subcontinent in 1947 brought not only independence but also the carnage and tragedy that yielded the two new states of India and Pakistan.

The 'short' half-century from 1905 to 1947 in South Asia was framed by two partitions that say much about the contours of imperialism and anti-imperialism during this final phase of British rule in the Indian subcontinent. With the decision to partition the colonial province of Bengal along its east–west (and Hindu–Muslim) axis in 1905, mass agitation in India was given its most visible platform since the so-called 'sepoy' mutiny or Indian rebellion of 1857. By once more dividing a Bengal that nationalist fervour had successfully reunited by 1911, while splitting the Punjab in two as well, the end of British imperialism in the subcontinent in 1947 brought not only independence but also the carnage and tragedy that yielded the two new states of India and Pakistan.

Swaraj, the Partition of Bengal, and the Growth of All-India Party Nationalism

While the origin of official party nationalism in India dates to the middle of the 1880s, the English-educated 'middle classes' who launched the organisations that became the Indian National Congress (INC) were reformist more than anti-imperialist in bent. The demands articulated by the most visible among these early nationalists thus focused on increased opportunities for participation in the Government of India. These included calls for easing access to posts in the Indian Civil Service and for increased representation within the ranks of the limited institutions of quasi-parliamentary government that the Raj first established after the rebellion of 1857 and until the Indian Councils Act of 1861.

While the INC can scarcely be described as heading a mass-based people's movement in its early years, events like the so-called Ilbert bill controversy of the 1880s did mean that even the politics of reformism harboured the seeds of more significant oppositional tendencies. Already prior to the INC's formation, moreover, figures like the Parsi intellectual Dadabhai Naoroji (1825–1917), the renowned forefather of party nationalism in India and a member of the UK parliament from 1892 to 1895, had begun to voice key points of a nationalist indictment of the economic effects of imperial rule. By the time selections from Naoroji's speeches and writings were prominently collected in his *Poverty and Un-British Rule in India* in 1901, he was joined in this effort by figures like the Maharashtrian nationalist and Bombay Supreme Court Judge Mahadev Govind Ranade (1842–1901) and, especially, the Bengali intellectual and Indian Civil Service member Romesh Chunder Dutt (1848–1909). Together such figures articulated ideas about the drain of wealth from India to Britain, the de-industrialization of the subcontinent's economy through the stifling of handicraft production and

the attendant consequence of de-urbanization, and the beginnings of a thesis about distorted agricultural commercialization. The latter, in particular, highlighted the Raj's privileging of the production of export commodities and their movement by rail to coastal cities over grains for domestic consumption, the creation of a robust internal market, and the prevention of the spate of famines that haunted the Indian countryside throughout the late nineteenth century (Habib 1985; Roy 2000).

By the 1890s Congress nationalism was showing new and more vigorously agitational tendencies as well as signs of the tensions around religious communitarianism that would continue to complicate the politics of anti-imperialism in India throughout the first half of the twentieth century. The early 1890s marked the high point of the popular movement for cow protection that had been gaining momentum across much of north-west India for some two decades, especially with the support of the Gujarati religious luminary Swami Dayananda Saraswati (1824–83) and his orthodox Hindu reformist organization the Arya Samaj. This was a budding sore point between increasingly mobilised members of the Hindu community and segments of Indian Muslim society – for whom the cow could be a more ready option than the goat for performing the rite of sacrificial slaughter associated with certain festival days in the Islamic calendar – and rioting around the issue broke out in 1893 in various parts of north India. Clearly symbolising growing inter-religious tension, such turbulence was also indicative of a new phase in the expression of nationalist discontent with the colonial government, whose registration scheme for licensing cow slaughter was taken both as an unfulfilled prohibition of the practice by the protection movement's advocates and as express sanction for it by Indian Muslims.

One of the more prominent exponents of the majoritarian brand of nationalism that emerged from this mix of anti-imperialist agitation and communitarian strife was the Maharashtrian social reformer, lawyer, and early Congress 'extremist' Balwantrao Gangadhar Tilak (1856–1920), who along with Lala Lajpat Rai (1865–1928) in the Punjab and Bipin Chandra Pal (1858–1932) made up the famous triumvirate of 'Lal, Bal, and Pal', usually portrayed as moving the Congress away from its reformist origins and towards a more militant stance. Especially with partition of Bengal in 1905 by the notoriously high-handed Viceroy George Nathanial Curzon (in office 1899–1905), a more extremist 'hot faction' emerged within the Congress. This so-called *garam dal* faction was counterpoised against the more moderate *naram dal* or 'soft' faction headed by figures like Tilak's rival, the Congress leader Gopal Krishna Gokhale (1866–1915), a fellow Maharashtrian from the Ratnagiri district who was 10 years his junior.

While the 'moderate'–'extremist' split certainly speaks to the terms on which majoritarian party nationalism negotiated its own evolving temperament, as contemporary historians observe, it does a disservice to the diversity of elements that underpinned the first truly mass and geographically expansive episode of anti-imperialist nationalist agitation that developed around the call for *swadeshi* ('self-sufficiency') in Bengal from 1905 to 1908 or 1911. Along with the old moderates who favoured constitutional methods while being 'deeply offended at Curzon's aggressive measures' (Bose and Jalal 2004, p. 95) in Bengal, such as Gokhale and the forefather of Bengali nationalism Surendranath Banerji (1848–1925), the historian Sumit Sarkar distinguishes three other orientations. While the 'extremist' politics favoured by Lal, Bal, and Pal, as well as figures like the Calcutta-born poet and yogi Aurobindo Ghose (1872–1950), clearly did leave room for tactical violence if necessary, more generally such figures called for passive resistance through the boycott of British goods and institutions. At the same time, already prior to 1905 other more diffuse strands – such as those emanating from the Nobel laureate, the famous Bengali poet Rabindranath Tagore – had been calling for Indians to ready themselves for a more confrontational stance against the Raj through a process of self-strengthening (*atmashakti*). Finally, at the most militant end of the spectrum were individuals, both male and female, who used tactics of revolutionary terror, including bombings and political assassinations (Bose and Jalal 2004, p. 96; Sarkar 1988).

While the highpoint of *swadeshi* agitation had passed by 1908, in the previous 3 years notable achievements had been made, with cotton imports declining by up to a quarter in the first year of boycott and a concerted effort to avoid other imported consumer goods as well as major institutions of the colonial state such as courts and educational facilities. At the same time, events in Bengal provided a rallying point for anti-imperial nationalist sentiment to deepen in other parts of the subcontinent as well. They also provided a basis for Congress to increase its visibility and press its claim to the status of ostensible spoke for the nationalist cause outside Bengal, primarily in parts of Madras, the Punjab, and Bombay. As the historian Burton Stein notes, for example, in the south of India the *swadeshi* movement and the larger moderate–extremist split within Congress that it precipitated by 1907 was used by different elements of Madras's Brahmin community to jockey for leadership over the regional Congress. While the Mylapore Brahmins of Tamil Nadu had dominated Congress activity in Madras until 1905, their upstart northern Telugu-speaking Brahmin adversaries opted to side with the more radical stance of figures like Tilak and Aurobindo. Supporting the singing of the banned Bengali anthem 'Bande Mataram' ('Hail Mother India') and pledging to unite the Madras and Calcutta division of the Congress, it was this same faction of Telugu-speaking Brahmins who would form the Andhra Mahasabha in 1910. A half-century later, the same body would succeed in its call for a separate Telugu-speaking province to be carved out from the old colonial province of Madras (Stein 2010, pp. 282–283).

In the Punjab *swadeshi* activism in Bengal ended up resonating with unrest or discontent that had its own independent cause. The main point of anger in this crucial wheat-growing bread-basket of the subcontinent was the colonial state's decision to raise rates for canal waters. Some 30 years after irrigation in the province started to be transformed through large-scale canal construction – which, along with the railways, ended up being one of the only forms of heavy capital investment that the late colonial state would sponsor – the years 1906–07 saw the outbreak of significant peasant unrest in the Punjab. At the same time, the province was another site that proved only too well equipped for anti-imperialist social unrest to blend into inter-communitarian tension, owing to its mixed population of Hindus, Muslims, and Sikhs. Therefore, so too were the Arya Samaj's efforts at consolidating support among the lower middle-class Punjabi Hindus just past their third decade (Fox 1985).

By the end of the first decade of the new century, much of the more militant leadership that had assembled around *swadeshi* – including Lajpat Rai and Tilak – would see their campaigning result in imprisonment or exile. By this time, moreover, the spirit of boycott had already been largely broken – in no small part because of the opportunistic decision of Bombay's textile industrialists to ramp up prices and profits amid diminished competition, which sapped the Bengali peasant's ability to persist in support of the boycott. Nonetheless, by 1911 they also saw victory, as the new viceroy Hardinge (who replaced Curzon's own successor, the Earl of Minto, in 1910) opted to annul the partition decision. In the process, the colonial state's about-turn also served to discredit the class of landed Muslim interests in East Bengal who had been the only group to support partition, thus further opening the way for the All India Muslim League, which it played a significant role in founding in 1906, to be seized by a new style of leaser by the time of the First World War.

The First World War, the Shifting Economics of Colonial Rule, and Political Leftism

It is telling that among the myriad effects of the First World War on the context of early twentieth-century imperialism and antiimperialism in India the movement of some one million Indian troops to foreign theatres of operation rarely ranks high on the list. While well over 60,000 would perish in foreign battlefields, those who returned proved greatly transformed by the traumas of battle as well as by what was, for most, their first sight of

Europe, Africa, and the Middle East. Though it is difficult to quantify the effect that such exposure had on the views of those who returned to a home society ruled by Britain, the numbers underlying other aspects of the war's impact are less difficult to capture. Used widely to protect Britain's broader imperial interests in Asia and Africa throughout the late nineteenth century, on the eve of the war the British Indian Army was already among the largest volunteer forces in the world, if not the largest. In the 4 years after 1914 its ranks had swelled enormously, totalling some 1.2 million by 1918 with some 350,000 absorbed just from the Punjab (Bose and Jalal 2004, p. 102; Bose 2006, p. 125). Not surprisingly, such a vast increase in manpower together with the need to support the wider military endeavour that Britain was fighting entailed a large-scale expansion of India's war-related production, as well as of prices and the money supply.

This combination produced decidedly polarising effects at the different ends of the class spectrum. With the free coinage of silver rupees suspended since the early 1890s, Indian currency policy was controlled by the Secretary of State for India sitting in London, on the basis of a so-called gold exchange standard. With both a gold reserve and a paper currency reserve at his disposal, the Secretary of State's policy throughout the 1890s was to stabilise the exchange rate of the rupee at 1 shilling 4 pence. If the general tendency towards deflationary policy became too much of a bottleneck, as was becoming the case during the first decade of the twentieth century as economic activity expanded, the mints could be selectively reopened to coin more silver rupees. With the enormous expansion in the price of silver during the war, however, the relationship between the nominal and intrinsic values of the rupee suddenly reversed. Whereas for the previous 20 years actual value was well below nominal value, when the opposite became the case after 1914 there was no choice but to allow the rupee to appreciate. The latter effect was exacerbated by the growing demand for silver fostered by the ramping up of wartime production, which necessitated increased coinage given what was then a still limited paper currency. The supply of silver rupees thus

expanded from 1.8 billion to 2.9 billion during the war years (Rothermund 1993, pp. 72–73).

With the colonial state also resorting to an outright printing of money that was secured by accumulating credits on India's behalf in the Bank of England, in the 5 years from 1914 to 1919 circulating paper notes jumped from Rs. 660 million to Rs. 1530 million (Bose and Jalal 2004, p. 103). Given its multiple sources, war-induced inflation would persist for a significant period after 1919, a fact that helped expand the windfall profits that the war had brought to India's ascending capitalists. Among the emergent industrial bourgeoisie who benefited most were west India's textile mill owners, concentrated in Bombay and Ahmedabad, with the jute mill owners of East Bengal also seeing significant gains after a decline in orders at the very start of the war (though British jute magnates were dominant in the province); coal-mining capital also fared well. While these were among the few sectors that had already managed to establish themselves under imperial rule, the war marked a coming-out party for cement and, especially, steel, with the famous conglomerate of the Tatas capitalising on the de facto protection that the war brought with it (Rothermund 1993, pp. 67–69; Sarkar 1988, p. 171).

Further complicating these tendencies was the Government of India's unchastened revenue demand, a virtual necessity in light of its priority of reorienting Indian society and economy towards serving Britain's war-related needs. While the hated Indian land tax – which had been the principal mechanism for effecting the drain of wealth ever since the late 1700s – had by the 1880s already started to decline in importance in relation to other means of surplus appropriation, it remained a significant burden all the same. Given the increasing reliance on other sources of government demand during the war years – especially through the income tax and customs duties – it was India's great mass of agriculturalists as well as its much smaller, though significant, band of urban workers who were hardest hit.

As prices of industrial goods and imported manufactures increased precipitously, the war had the opposite effect on the prices of agricultural

commodities destined for export. This made for a particularly perilous circumstance for the Indian peasant, whose livelihood had been definitively fastened to the world market ever since the reversal of the long price depression that had characterised the East India Company's rule in the years from 1820 to 1850. While the blow to the agrarian export economy produced a grave decline in earnings for the wealthier peasantry, as Sarkar notes, the agricultural poor and the landless were confronted with an even more dire situation; the fact that the price of the coarse food grains on which such groups relied for subsistence was increasing faster than the price of more expensive crops like rice and wheat became a particular source of distress. For urban workers as well, the high price of food grains meant that the wartime industrial boom amounted to little in the face of the erosion of their real wages. Overall, therefore, 'the war meant misery and falling living standards for the majority of the Indian people' (Sarkar 1988, p. 171).

As a harbinger of great economic dislocation, the war also portended the extreme volatility of social forces that would underpin Gandhianism during the 1920s and the attendant process by which Gandhi himself would transform Congress into the head of a true mass movement. Already before the 1920s, however, both mainstream party nationalism and other anti-imperialist forces experienced other crucial developments that bear mentioning. From 1915 to 1918, for example, the famous poet and Hyderabadborn Bengali activist Sarojini Naidu (1879–1949) travelled the breadth of the subcontinent talking about nationalist themes and the empowerment of women. Well before sitting in jail alongside the men who dominated Congress nationalism in the 1930s, she had helped to launch the Women's Indian Association in 1917 to call for female suffrage and the right to hold what limited legislative offices existed for Indians within the colonial government.

In these same years, other new varieties of radicalism, internationalism, and leftism were accumulating as well. It was in the years after 1918 that trade unionism became truly substantial, paving the way for significant strikes, especially in Bombay in the mid- to late 1920s. It was also in

1920 – at the October meeting of the Second Congress of the Communist International in Tashkent – that the Communist Party of India is often said to have been started. (The main wing of the party, however, records its birth as dating from a conference for Indian communists held in Kanpur, the largest city in contemporary Uttar Pradesh, in 1925.) The spirit of internationalism inspired by the Bolshevik Revolution absorbed a broad range of Indian figures who had already become convinced of the need to solicit foreign assistance – including that from Kaiser Wilhelm's Germany – during the war. They included the eminent socialist (and eventual exponent of a self-made philosophy of 'radical humanism') M.N. Roy. Well before the Bengali revolutionary had appeared at the Second Congress of the Communist International, Roy's initial involvement in what the British feared would become a vast Indo-German conspiracy had brought him to Japan, Korea, China, the US, and then Mexico, where he proved instrumental in starting that country's Communist Party as well.

Roy's tireless intellectual production, together with his relentless and penetrating criticism of the mainstream of Indian nationalism, including Gandhi's 'counterrevolutionary leadership' in calling an end to the first campaign of civil disobedience in the early 1920s, is indicative of the great diversity in Indian anti-imperialism that is typically obscured by the focus on better known-figures and organised party activity (Roy 1926, p. 47). In this respect, the origins of Gandhi's role as anti-imperialist tactician in his struggles on behalf of the Indian community of South Africa (though, as is worth noting, not in any significant way the black one) should not be regarded as unique. Already prior to war and outside a path of intrigue as extensive as that which Roy would travel, for example, an institution like the Ghadar Party had been set up among Punjabi emigrants in North America. With the goal of supporting India's liberation, assorted Ghadarites had made their way back to the Punjab on the outbreak of war in order to organise revolutionary activities by 1915, persisting in their oppositional activity for the next 30 years until independence was finally won. In a very different example, it was in this

same period that in Malabar the beginnings of the modern state of Kerala's communist tradition began congealing with the emerging, if often symbolically conflicted, low-caste empowerment politics of temple entry (Menon 2007).

Gandhianism, Islamic Universalism, and the Development of a Mass Basis for Politics in the 1920s

Before the 1920s, there was ample reason to believe that the relative quiescence that characterised the beleaguered Congress movement during the first years of the war had come to an end. With leaders like Tilak back from imprisonment or exile (the latter having been jailed in Mandalay), by 1916 Congress had reached its historic Lucknow Pact with the Muslim League. While the pact would continue in the spirit of moderate reformism in its demands on the British, it was more notable for what it suggested about efforts to forge an all-India anti-imperialist politics capable of bringing together the subcontinent's extremely heterogeneous Muslim community during these years.

As would remain the case well into the 1940s, and much more than the Congress at the same point, the Muslim League was a party in search of a base. What it did have was a new generation of leadership, with the Karachi-born and English-trained barrister and INC member Muhammed Ali Jinnah (1846–1948) having joined the League in 1912 after being elected as the Muslim representative to the Imperial Legislative Council in 1909. Tellingly, Jinnah's political career thus began in the wake of the so-called Morley–Minto reforms legislated through the Indian Councils Act of 1909. While portrayed by Congress leaders as a stalling tactic in lieu of real self-government, the Morley–Minto reforms increased the number of Indian representatives to the district, municipal, provincial, and central legislative bodies, while expanding their selection through elections rather than appointment. Partly in response to the 'middle-class' reformist Muslim leadership, Morley–Minto also inaugurated a system of reserved seats (at a proportion tending to exceed population

levels) for Muslim representatives as well as separate electorates for those seats that were to be restricted to Muslim voters. Jinnah himself initially opposed such a system, given its tendency to ghettoise Muslim politics. After he separated himself from any official role in Congress by 1916, however, his ascent within the command structure of the League by championing Hindu–Muslim unity through the Lucknow Pact would be premised on persuading the Congress to accept separate Muslim representation and elections.

While it is true that by this time separate electorates and seats reserved on a 'communal' basis were becoming a nonnegotiable issue for the Muslim elite, the politics of imperial divide and rule was not confined to Muslims alone. This would be made most dramatically evident in the rift between Gandhi and the great leader of India's Dalit community Bhimrao Ramji Ambedkar (1891–1956) over the 'communal award' of 1932, through which the British proposed to mandate a separate electorate for untouchables as well. Yet it had been cemented well before with the Government of India Act of 1919, which reaffirmed electoral 'communalisation' by providing for reserved seats not only for Muslims but for various other groups as well, including Sikhs, non-Brahmins, and landowners. The other crucial feature of the 1919 Act was to formalise the so-called Montagu-Chelmsford reforms of 2 years earlier. Setting the pattern for imperial strategy for the next quarter century, the 1919 Act thus sought to appease the increasingly vociferous demands articulated by the nationalist mainstream for home rule by offering a system of dyarchy or dual government. By expanding the franchise and devolving a variety of non-essential powers of government to the provinces, where Indian politicians would be dominant, the offer of dyarchy proved effective in splitting the mainstream of party nationalism after 1917 once more.

It was against this backdrop that Mohandes Karamchand Gandhi (1868–1949) would step into the void of official leadership, with his charisma, invocation of traditional Hindu imagery, and unique blend of cultural traditionalism, agrarian anti-materialism, and tactical ingenuity accelerating Congress into his orbit. The symbolism to

which Gandhi appealed allowed a much-needed expansion of populism within the mainstream of the nationalist movement. As Thomas and Barbara Metcalf observe, for example, Gandhi's appeal to the imagery of *khadi* (hand-spun or hand-woven cloth) and *charkha* (the spinning wheel) 'opened new opportunities for India's women'. This took place by shifting the emphasis of the most audible stream within nationalist discourse from the notion of woman as guardian of an inner 'spiritual' order to woman as a lead sponsor in actively *creating* the nation by her own hand (Metcalf and Metcalf 2006, p. 185).

Born to a Gujarati *bania* family, educated as a lawyer, and having made his way to South Africa by 1893, Gandhi would remain keenly aware of the goings-on in India, with his earliest well-known tract, *Hind Swaraj*, appearing in 1908. By 1915 Gandhi had returned from Natal, initially remaining distant from Congress nationalism and dipping his toes into the waters of several local agitations instead. From 1917 to 1918 he thus involved himself in Gujarat in an episode of agrarian protest over the colonial state's land revenue demand, followed by a second experiment in the industrial centre of Ahmedabad where he helped to conciliate a labour dispute in the city's textile mills. His third major campaign during these years found him in the eastern province of Bengal, where he lent his support to peasants against the European indigo planters who supervised the forced regime of production to which they were subject.

By 1919, with mainstream party nationalism able to win no more than dyarchy, with the hated wartime emergency powers for detention and trial without jury (inaugurated by the so-called Rowlatt Acts) retained, and with seething discontent among the urban and agrarian poor, Gandhi saw fit to expand his strategy for agitation far and wide. After he set up his own organisation Satyagraha Sabha, drawing on the existing infrastructure of home rule leagues and allying with the leaders of 'Pan-Islamist' (or, perhaps less derisively, 'Islamic universalist') sentiment, the Muslim brothers Mohamed and Shaukat Ali, the protests of 1919 were the most significant in India since the 1857 rebellion. They also marked the inauguration of a new method of hartals or work stoppages which were designed to unfold in co-ordinated fashion with urban marches and other forms of direct action. Alarming to the British, the new emphasis on such tactics elicited a resort to martial law in various areas; the most notorious consequence of this took place in the Punjabi city of Amritsar, where on 13 April 1919 the commanding general Reginald Dyer ordered his troops to open fire on peaceable protesters gathered at the Jalianwalla Bagh, killing 379 and injuring more than 1200 (Bose and Jalal 2004, pp. 111–112; Metcalf and Metcalf 2006, p. 168).

Now more vocally calling for the old strategy of 'passive resistance' to be supplemented by a confluence between *ahimsa* (nonviolence) and his new philosophy of 'questing for truth' through *satyagraha,* Gandhi ascended rapidly over the next few years. Both on its surface and at a much deeper level for the great many, especially in the north Indian belt from Gujarat to the Uttar Pradesh, where so many revered the Mahatma (or 'the great soul'), it was a *Gandhian* nationalism that became the idiom for confronting British imperialism en masse. Fresh from capturing leadership, Gandhi continued his alliance with Muslim political leaders attempting to spearhead a mass movement among Indian Muslims to express concern over the fate of the Ottoman Empire's claim to the Islamic caliphate, the survival of which was feared to be in jeopardy after the Treaty of Versailles in 1919. Allying with these 'pro-*khilafat*' Muslims, Gandhi once again expanded his tactic of organised mass agitation through what became the truly all-India 'non-cooperation movement' of 1920–22. As Sarkar notes, even in a relatively isolated province like Assam, non-cooperation would attain a strength that no later episode of nationalist anti-imperialism would again rival (Sarkar 1988, p. 217). Likewise, so was the 'Malabar Rebellion' of 1921 a chapter in noncooperation. (It was also, more immediately, a chapter in pro-*khilafat* agitation among a Mappila community of Muslim tenants in south-west India who had been invoking Islamic imagery in protest against their largely Nair and Nambudiri landlords since the mid-nineteenth century.)

Again taking British imperialism by storm, the ferocity of non-cooperation was scarcely contained. Gandhi's decision to muster the immensity of his reputation to call for its end in February of 1922 – not, as suggested earlier in the quotation from M.N. Roy (1926), without criticism – followed from peasant unrest in the Uttar Pradesh district of Gorakhpur, which resulted in the burning of a police station in the town of Chauri Chaura and the deaths of 22 officers trapped inside. As the incident at Chauri Chaura suggests only too well, mass agitation may have found crucial inspiration in Gandhian nationalism but was never exhausted by it. Throughout the 1920s, as significant episodes of *satya-graha* continued, there was also a dramatic upsurge in labour and peasant unrest, both through highly visible organised action and on a more spontaneous basis. The textile mills of Bombay played host to their first widespread strike in September of 1925, with some 250,000 millhands participating and communist trade unionists playing a significant role in its organization. This was only a prelude, however, to the much bigger industrial action that would be conducted among Bombay's millhands 3 years later in 1928, with worker participation roughly doubling (Chandravarkar 1981). Likewise, during these same years the subcontinent witnessed a dramatic expansion in the membership of the new *kisan sabhas* ('peasant associations'). Marching largely to the beat of its own drummer, such peasant (and also 'tribal') resistance was more often than not feared as a source of potentially uncontainable unrest in the countryside, by British colonialists as well as mainstream party nationalists. With the growth of such subaltern movements, the demands and ideologies of those at their forefront also proved varied and nimble. Calls for abolition of *zamindari* landlordship, threats of rent and revenue strikes against government and private landed interests alike, and agitation against the government's attempts to increase its tax demand – as in the Krishna–Godavari river delta in 1927 – would become an important feature of these years and a sign of things to come (Sarkar 1988, pp. 241–242).

At the same time, it was not just Gandhi who displayed a knack for charismatic leadership coupled with tactical ingenuity. By 1927 Ambedkar had emerged as the crucial figure giving voice to the demands for caste equality (and abolition), especially among his own community of Mahar untouchables in Maharashtra. As his visibility increased, he would also become unsparing in criticising Gandhi's paternalistic and ineffectual approach to India's Dalits, which focused on conciliation rather than confrontation by calling on upper castes to treat untouchability as an unwanted accretion rather than a fundamental feature of Brahmanical domination. In Tamil Nadu, these same years witnessed Erode Venkata Ramaswami (1879–1973), known to his followers under the title of Periyar, break with Congress after supporting non-cooperation in the south of India to launch his anti-Brahmanical 'self-respect' movement.

The Political and Economic Contexts of the 1930s

In terms of the high politics of British rule in India during the period from the late 1920s to the end of the 1930s and before the Second World War, there occurred a continuation of already established patterns of imperial retrenchment. In the face of ever more vociferous demands for autonomy and, by December 1929, *purna swaraj* ('complete self-rule'), London persisted in offering only vague possibilities of constitutional reform by increasing the franchise, expanding legislatures, and devolving non-essential powers to the provinces. True sovereignty through control over the political centre and key issues like defence and finance remained off-limits. To an observer in the 1930s it would hardly go without saying that the days of British imperialism in the subcontinent were numbered.

The historic *purna swaraj* declaration itself was meant as a direct response to the parliamentary 'Simon' Commission of 1928 and its tepid recommendations along the above lines in the wake of the extreme anti-imperialist tumult of the 1920s. Gandhianism had dealt the final blow to Congress's old moderates long ago, and by 1930 it was a younger, more left-leaning, and

still almost entirely male leadership that was taking over the party, which had now become the premier font of majoritarian nationalist politics in India. This included figures like Jawaharlal Nehru (1889–1964) and Subhas Chandra Bose (1897–1945), both of whom would play ever more important roles in the years to come. After the failure of the Simon Commission, it was with Gandhi's historic 'salt march' in March 1930 that the next great wave of all-India anti-imperialist agitation would be unleashed. This took shape through the civil disobedience campaigns of the early 1930s. While the salt tax was deemed an obscure target to inaugurate this new phase of struggle, the symbolic richness of the choice was made manifest as Indians of all stripes supported the Mahatma's procession to the coastal city of Dandi. The insistence of a figure like Naidu on participating alongside the largely male group that Gandhi had assembled portended what would also become of the thousands of largely rural women (along with some urban-based elite women) who would consciously break the law, openly selling and buying salt in countless market towns. It was the subcontinent's women, above all, in other words, who would vindicate Gandhi's tactic.

While civil disobedience would be renewed several times over the next 4 years, amid large-scale arrest and repression, the first phase of the campaign reached a limit in March 1931. At this point Gandhi once more found himself with cold feet when faced with the possibility of uncontained peasant radicalism and the possibility of revolutionary violence. (It was during this period that the young Punjabi revolutionary and Marxist Bhagat Singh (1907–31), along with his fellow revolutionaries Sukhdev Thapar (1907–31) and Shivaram Rajguri (1908–31), would be tried for the last time and convicted in the famous Lahore Conspiracy case that resulted in their execution.) Ongoing calls in the agrarian context to suspend the payment of rent, for example, fell foul of Gandhi's general preference for 'national unity' over arousing excessive inter-class and inter-caste discord by too freely sanctioning a national liberation movement focused on the inequities of Indian society rather than just the goal of independence. By March 1931 Gandhi would enter into his much-reviled pact with Viceroy Irwin in advance of the second of the three Round Table Conferences that would take place on constitutional reform in London and as part of which he would call to end the first phase of the civil disobedience campaign. Unfortunately, Gandhi banked on obtaining more than would be in the offing at the second conference, which took place at the end of 1931. He would miss the third conference at the end of 1932 altogether, although from his jail in Pune his vow to fast to the death in the name of opposing the fractionalization of Hindu unity did succeed in persuading Ambedkar to sign the so-called Poona Pact. (It was by the terms of the latter that Ambedkar withdrew his support for Prime Minister Ramsay MacDonald's communal award, which would have created separate electorates for India's untouchables. In exchange, Ambedkar won Gandhi's support for an increased number of seats for the 'depressed classes' instead.)

While the first inkling that Britain might one day leave India would emerge with the Government of India Act of 1935, that piece of legislation was roundly condemned by anti-imperialist forces across the political spectrum. Although it would do away with the system of dyarchy and bring all government offices under the control of elected Indian officials, the Act's arrangements for power at the federal centre were deemed too little, too late. Among the condemnations were those that came from Jinnah, now the leader of the Muslim League, who used the Act's deficient though explicit proposals for the future structure of a federal centre as an occasion to return to politics after the League had been largely sidelined from the mid-1920s. (The 'Pan-Islamist' politics of the Gandhi-allied *khilafat* movement proved to be little to Jinnah's staunchly secularist liking.)

Despite their outrage at the 1935 Act, mainstream party nationalists opted not to boycott the proposed elections for provincial ministries in 1937, with Congress's sweeping success proving nearly unqualified and the Muslim League's dismal performance a sign of how little support Jinnah still had as the 'sole spokesman' for India's Muslims. Winning a total of only 4 percent of the Muslim vote, as the historian Ayesha Jalal has

been most important in demonstrating, Jinnah's League was caught in the basic contradiction that would bedevil any brand of all-India Muslim politics for the next 10 years. With the two most populous Muslim states of the Punjab and Bengal dominated by elites and politicians whose interests favoured maximal provincial autonomy, there was scarcely any convergence with the interests of elites and politicians in the Muslim minority provinces, whose fate would be tied to the prospect for power over the federal centre. According to this view, there was no straight line from the demands of the Muslim League to a demand for secession in order to form an Islamic homeland (Jalal 1985). Of course, outside the realm of high politics the notion of a Muslim state in north-west India, consisting of what would become the provinces of the eventual West (though not East) Pakistan, had initially been articulated in 1930 by the famous poet Muhammad Iqbal (1877–1938) and again in 1933 by Chaudhri Rahmat Ali, a student at Cambridge. As such, it was also gaining popular momentum within the broader context of mounting anti-imperial agitation in the years that followed.

Setting the larger context for the high and popular politics of India anti-imperialism during these years was the shock of the Depression, which was heard around the world and reverberated across the decade. From the standpoint of a colonial economy like that of India, still dealing with the dislocation produced by the First World War, the Depression initially manifested itself through the sudden collapse of a wheat price that had become acclimatised to a general increase in agrarian prices following the First World War. While internal supply and demand conditions in India remained the same, the release of American wheat stores took their toll on world market prices. A similar fate (though for very different reasons) was met by the price of rice.

Yet it was not simply cash crop production that was hit by the Depression. With British imperialism's dominant mode of surplus extraction having already shifted since the 1870s and 1880s to appropriation via credit rather than tax-based mechanisms, by 1929 the Indian peasant had grown deeply dependent on borrowing.

Therefore, even if the path of credit terminated in the person of the reviled moneylender, it clearly commenced in the esteemed high streets of London. The larger collapse in liquidity was thus anathema to the subsistence agriculturalist as well, given the reliance of the peasant on usurious loans to service revenue, rent, and debt payments. All of these burdens thus increased when prices for agricultural commodities plummeted, given that both government and landed and moneyed power-holders refused to lower their respective demands.

It can be no surprise that Gandhi's decision to call off civil disobedience before the Second Round Table Conference took place just as discontent was spreading from the subcontinent's wheat-producing areas to its eastern and southern rice-growing regions (Rothermund 1993, pp. 98–99). With the colonial state's refusal to accept the nationalist demand for a prohibition on the export of gold, it is equally unsurprising that from 1931 to 1936 some Rs. 3 billion worth of gold left India. The product of distress sales by a desperate peasantry selling off ornaments, trinkets, and, in effect, the last reserves of what little wealth they had, the outflow was the direct consequence of the marked appreciation of gold and the inability of anyone but the Secretary of State in London to control India's monetary policy. Once it became more lucrative for the moneylender to demand the surrender of objects made of precious metal rather than whatever nominal debt he was owed, there was little choice for the peasant but to comply. In the process the enormous disinvestment from the Indian countryside that took place maintained Britain's allimportant imperial interest and self-image as creditor, including that to an India with which it had long run a trade deficit but upon whose exports the imperial centre's traditional surplus with the rest of the world was based (Rothermund 1993, p. 102).

Finally, in urban areas the Depression produced a more varied set of effects. While unemployment and low wages were common in many important sectors, such as jute and cotton textiles, for industrialists in others the limited tariff protections that were allowed in these years proved significant. Sugar, pig iron, and cement are three

notable examples. Ultimately, however, 'the 1930s were good times for urban consumption' though much less so for 'urban investment', with the Rs. 155 million worth of alcohol imported in this time, rivalling the total invested in machinery for cotton textile production (Bose and Jalal 2004, p. 122).

War, Partition, and the End of British Imperialism

To continue with the focus on economic context, the last years of the British imperial enterprise in the subcontinent once again produced a whiplash effect wrought, in major part, by the consequences of international geopolitics for world capitalism. Viceroy Linlithgow's unilateral declaration of India's entry into the war alongside Britain on 3 September 1939 inaugurated a new phase of anti-imperialist outrage among party nationalists, though much less within the Communist Party of India. (The latter's anti-fascist stance in support of the Allied war and its eventual opposition to the last great Gandhian episode of civil disobedience that took place through 1942s Quit India movement would largely sap the goodwill it had been building up since the high point of communist–socialist unity after 1936.)

While the effects of the Second World War were not wholly different from those of the First, they were also much more dramatic. Initially at least the war brought with it increasing prices that reversed the pattern of the Depression years, with the full employment of existing industrial resources, another windfall in the profits of India's capitalist class, and significant difficulties for the agrarian and urban poor. With little new capital investment, even though wages and profits should have increased purchasing power for ordinary consumption, the prioritisation of export for provisioning Britain's war effort ended up seriously compounding what Rothermund calls the regime of 'forced saving' to which India was being subjected (1993, p. 115). With goods from the subcontinent bought by the British government on credit, in the longer term the vast sterling balances that India was accumulating in London would

fundamentally alter its foundational role as debtor to Britain's creditor. Although the heart of the economic relationship on which British imperialism had come to be premised would thus be inverted, in the immediate term such balances could not be touched. Moreover, the enormous increase in the Indian money supply on which such expansion was based made for a grave inflation shock. While in the 10 years from 1929 to 1939 the money supply increased from Rs. 3.4 to 4 billion in coins (and dropped from Rs. 2.6 billion to 1.6 billion in paper notes), by 1945 it had reached Rs. 22 billion. Overall, during the war the printing presses thus produced the equivalent of Rs. 11 billion in sterling balances in the Bank of England and another Rs. 5 billion in other credits. Herein was to be found not only the inversion by which the war would result in a national debt of Rs. 9.5 billion and credits totalling approximately Rs. 16 billion but also one source of the extreme duress that the rural poor, labour, and the urban salaried would face. With a dramatic decline in what the economist Amartya Sen calls 'exchange entitlements', it was the millions in rural Bengal who would suffer the worst of this duress, with the catastrophic famine of 1943–44 taking some 3.5 to 3.8 million lives (Bose and Jalal 2004, p. 129; Rothermund 1993, p. 116; Sen 1999).

While by the end of the war the fate of British imperialism was in many ways sealed, the 1940s would witness questions of independence that were increasingly consumed by questions about the structure of the proposed federal centre. The renewed rift within Congress after 1937, which pitted an increasingly pronounced left wing led by Subhas Chandra Bose against the organization's more conservative right wing and what was, by then, Gandhi's often stifling moderation, was only temporarily repaired by the shared outrage over the declaration of war on India's behalf. The reinvigorated spirit of unity that resulted did lead the rejection of Sir Stafford Cripps's Mission to India in March 1942, the gestures of which towards self-government proved insufficient for party nationalists in the Congress. However, this unity could not conceal the lasting difficulties that were to result from the crisis that Congress had experienced in its conference of early 1939 at

Tripuri, a village in the then Central Provinces, where Gandhi up-ended Bose's attempts to win re-election as president. Despite the latter's electoral victory, Gandhi had used his great personal stature to persuade both Congress's right and left, Nehru included, to make it effectively impossible for Bose to lead. Combined with the general failure of the Congress left to resist the anti-labour and anti-*kisan* policies of its party ministries in the provinces, the atmosphere was such that Bose was left with little choice but to withdraw his candidacy. Opting in June 1939 to form a new 'Forward Bloc' within Congress – with communist support – he would be altogether ousted from the INC by the end of 1939 (Sarkar 1988, pp. 373–374).

In this sequence of events are to be found the origins of Bose's later efforts to launch the last great internationalist chapter in Indian anti-imperialism with his Azad Hind Fauj ('Indian National Army', INA), with its widespread participation of women and its famous female 'Rani of Jhansi' regiment as well as its tilt towards the Axis powers. Escaping from India in 1943 and making his way towards Japan, Bose sought to recruit a religiously and ethno-linguistically diverse range of Indian expatriates and surrendered soldiers from the British Indian Army in East and South-East Asia. These he planned to use to lead a march back to Delhi in order to strike at a Britain embroiled in the Allied war. While the INA would be halted in 1944, and Bose himself would die in a plane crash in 1945, the British decision in that same year to try three INA officers – one Hindu, one Muslim, and one Sikh – would incite the last great episode of mass people's protest during the anti-imperialist struggle.

In the story of Bose's exile from Congress, there can also be found evidence of the conflicting nature of the forces that comprised Indian anti-imperialism at nearly every level. While the politics of Hindu–Muslim strife had hardly begun in the 1940s (or even in the twentieth century), whatever clear momentum towards partition that had developed in these years was not ultimately determinative of the choice of partition. Instead, the rush of events that followed the end of the war derived principally from the inability of mainstream party nationalists to come to consensus over what the federal structure of the post-colonial state should look like. Amid the squabbling, recrimination, and back and forth, almost nothing was certain with respect to how 'nations' and 'states' in the subcontinent were to be aligned once the British were finally to leave.

With the Simla conference of June 1945 bringing together Gandhi, the Congress, and Jinnah, with the 1945–46 elections in which Jinnah's Muslim League had finally won any semblance of right to call itself an All-India Party for the subcontinent's Muslims, and with the so-called Cabinet Mission Plan of 1946, exactly what the Pakistan demand was supposed to mean remained largely up in the air. From the standpoint of Jinnah's brand of Muslim League anti-imperialism, the idea of binding together the Muslim-majority areas of the north-west and Bengal in the north-east was meant largely as a means for creating a loose confederal structure.

In this latter vision – as the Cabinet Mission of 1946 found the British largely endorsing – the 'Pakistan' entity, complete with its large Hindu and Sikh minority communities, was to function as a counterbalance to a 'Hindustan' entity that would have its own large community of Muslim minorities. Therefore, that Jinnah's endgame should have eventually come apart may not have been an entirely obvious outcome, even if it was, perhaps, naive to imagine that Congress's leadership – now securely in the hands of figures like Nehru and Vallabhbhai Patel (1875–1950) – would ever prefer a weakened centre over a non-partitioned Bengal and Punjab. That the ultimate fruit of antiimperialism in India was to be both independence and the enormous human tragedy of partition, however, cannot be doubted. With an effective population exchange across religious lines of some 12 million persons and widespread, gruesome, and semi-organised communitarian slaughter, Britain's sudden insistence on quitting India as fast as it could in 1947 would pave the way to a new era of American neo-imperialism, complete with its Cold War battles against the Soviet Union. The latter itself being no stranger to neoimperialism in Asia, it would be a very different constellation of global forces that would have to be met by the states that the

struggle against British imperialism in the subcontinent gave rise to, India, Pakistan, and eventually Bangladesh as well.

Amílcar Lopes Cabral was an African intellectual
revolutionary trained in Portuguese Marxism,
who made a significant contribution to the inde-
pendence movement of Guinea Bissau and Cape
Verde islands.

Amílcar Lopes Cabral was an African intellec-
tual revolutionary trained in Portuguese Marxism,
who made a significant contribution to the inde-
pendence movement of Guinea Bissau and Cape
Verde islands. In his monumental *Post-
colonialism: An Historical Introduction*, Robert
J.C. Young says: 'From the perspective of African
Socialism … the greatest figure of those who
were forced to resort to violence in order to
achieve liberation was from neither a Franco-
phone nor an Anglophone, but a Lusophone cul-
ture: Amilcar Cabral' (2003: 283). Born in Bafat,
Guinea Bissau on 12 September 1924, Cabral
attained his elementary education in Infante Don
Henrique primary school in the town of Mindelo,
Cape Verde. His father, Juvenal Cabral, was a
mulatto from the Cape Verde islands. The people
of Cape Verde archipelago, unlike those of Guinea

Bissau, were mulattos whom the Portuguese
assimilated with their hegemonic cultural
practices.

Growing up under Portuguese colonialism,
Cabral experienced at first hand the oppression
of the common masses of Cape Verde. The colo-
nial regime of Portugal's fascist dictator Antonio
de Oliveira Salazar created a virtual hell for the
working classes of Cape Verde. This was the time
when the seeds of revolution started germinating
in young Cabral. He assumed the name Labrac,
and began his political activities of resistance
during his school days. Cabral graduated from
the University of Lisbon in 1950 as a colonial
Agronomy engineer. During university days, he
founded revolutionary student movements and
proposed active resistance to the ruling dictator-
ship of Portugal. In Lisbon he met several African
students from Mozambique and Angola and incul-
cated the ideas of Third-World nationalism in
them. Among these students were: Agostinho
Neto and Mario de Andrade, two of the future
founders of the Movement for the Liberation of
Angola (MPLA), a guerrilla organisation which
from 1956 onwards would fight for independence
from Portugal; Vasco Cabral, who was later to join
the PAIGC (African Party for the Independence of
Guinea and Cape Verde) and become the eco-
nomic minster of Guinea-Bissau; Eduardo
Mondlane, later leader of the Front for the Liber-
ation and Independence of Mozambique. These
students established the Centre for African Stud-
ies (CAS) at the home of Alda Espirito Santo, a

rich man from Sao Tome. CAS was a loose colloquium of students who conducted weekly seminars on African history and politics. These young Africans often meditated over the fact that while many colonial powers were anticipating the disintegration of their empires, the Portuguese were consolidating their hold over their African empire. By 1951, CAS came under the scanner of the Portuguese authorities. Fearing persecution at the hands of Portuguese security forces, Cabral and his associates disbanded the colloquium.

After the completion of his degree, Cabral returned to Africa in 1952 and became an iconic figure for the movements which sought liberation of the Portuguese colonies in Africa. Cabral joined the colonial Provincial Department of Agricultural and Forestry Services of Portuguese Guinea, and travelled extensively across the country. The pathetic condition of Guineans living under colonial rule kindled revolutionary thoughts in the mind of young Cabral. While serving the Agricultural and Forestry Service in Guinea-Bissau, he came into intimate contact with the local masses. He went to villages far and wide and made peaceful efforts to make the people aware of their exploitation at the hands of the coloniser. However, this incited the Portuguese administration of Guinea-Bissau, and Cabral was forced to leave his job. He went to Angola, joined the Movimento Popular Libertacao de Angola (Popular Movement for the Liberation of Angola or MPLA), and with the help of revolutionaries like Antonio Agostinho Neto, made this movement instrumental in the revolutionary practices within the country. Cabral's political concerns provoked the colonial administrators, and he was exiled to Portugal. He was given permission to visit his mother annually. It was the phase of an epistemological shift in the theory and praxis of young Cabral. He abandoned the peaceful path of liberation and looked upon armed struggle as the only hope for independence. On 19 September 1956, on one of two subsequent visits to Guinea, Cabral founded the Partido Africano da Independencia da Guine e Cabo Verde (African Party for the Independence of Guinea and Cape Verde, PAIGC). He led the guerrilla movement of PAIGC against the colonial Portuguese

government in Portuguese Guinea and Cape Verde. The goal of this conflict was to capture territory from the Portuguese. With the help of Kwame Nkrumah, Cabral set up training camps in Ghana and, besides training his lieutenants in guerrilla warfare, trained them in effective communication skills that would enable them to muster the support of Guinean tribal chiefs for PAIGC.

In 1960, Cabral attended the Second Conference of African Peoples in Tunis, and the same year during a visit to Canakry he established the party headquarters of PAIGC at the Guinean capital. For co-ordinating liberation struggle against the Portuguese empire in Africa, Cabral facilitated the formation of the Conference of Nationalist Organisations of the Portuguese Colonies (CONCP), a joint front comprising PAIGC, the Liberation Front of Mozambique (FRELIMO) and Angola's MPLA. Cabral actively started inculcating the revolutionary ideology in the minds of his followers, so that a violent struggle might be launched in the near future to liberate Guinea-Bissau and the Cape Verde archipelago from the Portuguese clutches. He established training camps in the Republic of Guinea and in Senegal, both of which had recently got freedom from France. The first PAIGC-led offensive against the Portuguese began in March 1962, and severely hit Praia, the capital of Cape Verde. However, PAIGC cadres were logistically inferior to the Portuguese military and this forced the PAIGC leadership to avoid a direct armed struggle on the Cape Verde Islands. Cabral suggested guerrilla warfare and on 23 January 1963 PAIGC forces clandestinely attacked the Portuguese formations at Trite fortress in the southern part of Guinea-Bissau. Cabral, as the secretary-general of PAIGC, was the guiding spirit behind the armed liberation struggle against the atrocious Portuguese colonial regime, and trounced vastly superior Portuguese forces supported by NATO, the US, Spain, and South Africa.

Cabral emphasised the role of culture in resisting the repressive forces of Portuguese colonialism and asserted that the psychological and social reconstruction of the colonised was the foundational premise for the armed struggle against the coloniser. Cabral believed that the national fight for liberation

enabled the marginal human beings, who were dehumanised by colonialism, to recover their personalities as Africans. This regional assertion was more than a mere local issue and in a broader perspective it was a challenge to Eurocentric theories. The PAIGC was a revolutionary movement firmly grounded in the social reality of Guinea. It was revolutionary precisely because its guiding framework was drawn from the indigenous circumstances. Cultural assertion and psychological reconstruction, for Cabral, were the processes integral to the cause and effect of the struggle for national liberation. Robert Young succinctly sums up the anti-imperialist oeuvre of Cabral in these words:

> His work stands out for the ways in which he extends his analyses from the practicalities of the creation of resistance movements, to the military strategies involved, to the vanguard role of the party in the formation of anti-colonial unity, to the forms by which cultural identity and dignity – [as] essential components of the liberatory process – can be asserted. (285)

At the First Tricontinental Conference of the Peoples of Asia, Africa, and Latin America, held in Havana in January 1966, Cabral delivered his lecture under the title of 'The Weapon of Theory' (1966). Rejecting the universalised model of the Bolshevik Revolution, Cabral emphasised that national and social liberation was the outcome of 'local and national elaboration ... essentially determined and formed by the historical reality of each people' (Cabral 1969: 74–75). Cabral had first-hand knowledge of the situation in Guinea-Bissau, which he had gained during broad agricultural research for the Forestry Department. This was the period when he assembled detailed information about the cultural and material life of various ethnic groups and their interpersonal relations within Guinea-Bissau, and a deep understanding of the ground realities faced by the peasantry, especially the land-tilling women. Cabral was deeply conscious of promoting an ideological apparatus for the liberation movements, oriented towards the dialectics of 'foundations and objectives of national liberation in relation to the social structure' (Cabral 1969: 75). Robert Young judiciously says in this context: 'It was to be Cabral himself who would formulate the fullest realization of a workable African socialism' (2003: 246).

Political liberation, for Cabral, was incomplete if it didn't accompany a severe setback to the 'imperialist domination on the social structure and historical processes of our peoples' (Cabral 1969: 81). His emphasis on culture as an essential tool of resistance to the foreign domination inspired future revolutionaries throughout the world.

Cabral accentuated the necessity of giving due consideration to the internal stratification of the colonised nations, where each class had different interests in relation to the metropole. This was because Cabral could envisage the tentacles of neo-colonialism looming large on the continent. The influence of Mao Zedong, Che Guevara and Fidel Castro is clearly visible in these words of Cabral: 'the principal aspect of national liberation struggle is the struggle against neo-colonialism' (83). Cabral's 'Weapon of Theory' is not just aimed at ending the colonial rule, but takes the end of foreign domination as the ultimate target. An independent nation, according to him, can either become a victim of neocolonialism, or take a turn towards socialism. Cabral redefined the goal of revolution in his two-pronged agenda of defeating the colonial power and bringing a violent social revolution, which could be realised by giving equal emphasis to the material as well as social and cultural aspects of revolution. He differentiated liberation from independence and argued for the pursuit of liberation from neo-colonialism: 'the neo-colonial situation (in which the working classes and their allies struggle simultaneously against the imperialist bourgeoisie and the native ruling class) is not resolved by a nationalist solution; it demands the destruction of the capitalist structure implanted in the national territory by imperialism, and correctly postulates a socialist solution' (86). Complete liberation, according to Cabral, could only be achieved if national revolution cultivated the ground for a social revolution.

Cabral was of the firm belief that the petty bourgeoisie benefited from colonialism but were never completely incorporated into the colonial system, and because of this ambivalent position only a small fragment of this class was revolutionary. Trapped in the conflict between colonial culture and the colonised culture, the petty bourgeoisie had no

coherent interest in carrying out the revolution. Cabral was conscious of this weakness:

> In fact history has shown that whatever the role – sometimes important – played by the individuals coming from the *petite bourgeoisie* in the process of a revolution, this class has never possessed political control. And it could never possess it, since political control (the state) is based on the economic capacity of ruling class, and in the conditions of colonial and neocolonial society this capacity is retained by two entities: imperialist capital and the native working class. (Chabal 1983: 176)

About the role of the revolutionary petty bourgeoisie in the liberation struggle, Cabral echoed the words of Lenin by concluding that the ruling classes never voluntarily give up their power: 'the revolutionary petty bourgeoisie must be capable of committing suicide as a class in order to be reborn as revolutionary workers, completely identified with the deepest aspirations of the people to which they belong' (Cabral 1969: 89). He asserted that the fundamental step in the liberatory praxis of a nation was the recognition of the link between the colonised elites and the coloniser at the level of culture and acculturation. The hegemonic culture of the colonisers suppressed the ability of the colonised elites to construct an identity free from colonial determination.

Cabral felt that their people were at a specific historical stage, which was characterised by the backward conditions of their economy. He believed that the anti-colonial struggle was not only aimed at liberating the colonised people from the sufferings and miserable conditions of their lives, but also aimed at restoring the right of Africans to write and narrate their own history, which had been denied to them by the colonialists. In *Revolution in Guinea,* Cabral aptly says:

> The colonialists usually say that it was they who brought us into history: today we show that this is not so. They made us leave history, our history, to follow them, right at the back, to follow the progress of their history. Today, in taking up arms to liberate ourselves, in following the example of other peoples who have taken up arms to liberate themselves, we want to return to our history, on our own feet, by our own means and through our own sacrifices. (63)

Laying stress on the education and indoctrination of his comrades, Cabral urged: 'Oblige every responsible and educated member of our Party to work daily for the improvement of their cultural formation' (71). He equally emphasised the need to educate women, who could play a vital role in the liberation struggle. According to Cabral, the germ of the liberation struggle was encapsulated in the endurance and revival of culture, defined as 'simultaneously the fruit of a people's history and a determinant of history' (Cabral 1974: 41–43). He claimed that people could reclaim their own history only through the optimum realisation of their own culture, which he considered an indispensable tool for the masses to confront the foreign domination. Cabral believed that liberation meant personal and active commitment. Basil Davidson aptly says in this context:

> Liberation . . . had to mean an active and personal commitment to a process – perhaps above all, in Cabral's concept, a cultural process – for the advancement of which a mere sympathy or 'support' could never be enough. With whatever shortcomings, this commitment which Cabral asked of those who followed him was the central project of his discourse, the measure of his originality. (1989: 136)

Re-contextualising the Marxist discourse that history began with class struggle, Cabral argued that the driving force of history was dependent on the mode of production instead of on class struggle. The emphasis on the cultural-historical dimension of the liberation struggle forms the crux of his philosophical oeuvre. In contrast to the Marxist presumption that history began with class struggle and hence the peoples of Asia, Africa, and America were living beyond history before colonialism, Cabral appropriated the Althusserian model and developed a new inclusive historical model within a continued Marxist framework.

Cabral's undogmatic left-oriented analyses of the ground realities of the colony has affinities with the Gramscian model of combining theoretical ingenuity and local knowledge with emphasis on culture in the nationalist struggle for emancipation. Throughout the period of the liberation struggle in South Africa, Cabral epitomised the hope of African people for recovery and restoration. The war of liberation led by Cabral in the Portuguese colonies of Cape Verde and Guinea Bissau ended with the declaration of their independence by the Portuguese government in October 1974.

Unfortunately, Cabral did not live to see independence, as he fell victim to a coup in 1973. He was assassinated by a corrupt former PAIGC comrade Kani Inocencio, on behalf of an opposing group that aimed at taking over the leadership of PAIGC. In death, Cabral was honoured at home and abroad. In 1973, the World Peace Council declared the annual Amílcar Cabral Award would be conferred on the individuals and groups who had shown exemplary courage in their struggle against colonialism and imperialism. Cape Verde's international airport was renamed The Amílcar Cabral International Airport. In 1979, a soccer tournament for the West African countries was renamed the Amílcar Cabral Cup. However, the best tribute echoes in a common saying in Guinea-Bissau *'Cabral ka muri'* (Cabral is not dead), which invokes the spirit of struggle and sacrifice that Cabral resurrected.

Definition

Fidel Castro (1926–2016) is often seen as the "apostle" of anti-imperialism in Latin America. Due to his unrelenting spat with the United States, the leader of the Cuban Revolution appears as the most charismatic figure from the Latin American left. His legendary struggle in the Sierra Maestra, his unbending position with regard to "American imperialism," and his apparent independence from Havana's closest ally – the Soviet Union – have made Castro a beacon of resistance and independence in Latin America and beyond.

After meeting Fidel Castro in the *Sierra Maestra* in February 1957, 2 years prior to his revolutionary triumph, the American journalist Herbert Matthews sketched a revealing portrait of the insurgent leader: Castro was not a Marxist, and his political agenda, although "vague and couched in generalities," amounted to a radical and democratic "new deal" for Cuba. It was, concluded Matthews, an "anti-Communist" program (Matthews 1957). Later, in the 1960s, when Castro's authority was solidly enshrined in a full-fledged revolutionary Cuba, the historian Theodore Draper coined the term "Castroism" to describe a rather undefinable ideology that, for tactical reasons, changed in order to justify past inconsistencies (Draper 1965, 49). Indeed, it is difficult to place Castro's political commitments within one coherent and unchanged category. Castro's leadership before and after Fulgencio Batista's fall in January 1959 was marked by instability as well as pragmatic adaptation: he embraced socialism more than 2 years after his successful insurrection; Castro's relationship with the Soviet Union (USSR) was frequently tainted by tensions, and a conscious effort was made to differentiate the Cuban Revolution from the Soviet experience; the initial nationalist discourse seemed to dilute in the 1960s and 1970s, when the Cuban authorities fostered internationalism with Third World countries, including far-reaching intervention in Africa.

Nevertheless, one term pervades most of Castro's political itinerary: anti-imperialism (adopted as a rejection of American hegemony in the hemisphere). It could be argued that Castro's most dramatic cause was the relentless fight against US imperialism and its hostile policy toward the island, which he pursued until his final days despite his declining health.

Fidel Alejandro Castro Ruz was born in 1927 in a country located fewer than 100 miles from the US coastline. This "geographic fatality" was far from being irrelevant for Cuba's history, since US proximity resulted in American domination of the island. US troops played a crucial role in the outcome of the Cuban War of Independence (1895–1898), securing a key position in Cuba's affairs for US officials until the revolution that ousted Batista in 1959. The American ambassador in Havana was often depicted as the real power in the shadows, holding a position enshrined by the 1901 Platt Amendment and that stipulated several conditions entrenching Washington's dominance of the Caribbean country. These included the right

to intervene for the preservation of Cuban independence and a government adequate for the protection of individual liberties. Despite the amendment eventually being dropped in the 1930s, the USA maintained a strong grip on the Cuban political system, as well as retaining the contentious military base in Guantánamo. Not surprisingly, in order to characterize Cuba's submissive position with regard to the USA, post-revolutionary historians have labelled the Republican era (1902–1959) as a "neocolony," a "pseudo-republican" phase.

However, in Birán – a small agricultural hamlet and birthplace of Fidel Castro – the controversial nature of USA–Cuba relations did not considerably affect the daily rhythm of life. Amidst the calmness of a small village situated in the *Oriente* province nearly 500 miles from the capital, Havana, nothing indicated Castro's future meteoric rise into world politics. Fidel's father, Don Ángel Castro, was a Spanish migrant who successfully secured financial stability by growing sugarcane. His mother, Lina Ruz, second wife of Don Ángel, was a fervent Christian with a modest educational background (Vayssière 2011, 47), and her wealth would later be expropriated by her own sons as a result of the implementation of the 1959 agrarian reform. In spite of Fidel's young rebellious character, little in his childhood and adolescence suggested the radical turn his life would eventually take.

The anti-American leanings that shaped the Cuban Revolution were not yet shared by a young Fidel Castro, who, in 1940, addressed a letter to US President Franklin Delano Roosevelt to express his admiration in the wake of his most recent, and final, reelection (Skierka 2004, 5). Castro's Jesuit education had a strong and lengthy influence on him. Even during the *Sierra Maestra* campaign (1957–1959), it was still possible to see Castro wearing a scapular around his neck. He would later acknowledge to the Brazilian priest Frei Betto that the "Jesuits clearly influenced me with their strict organization, their discipline and their values. They [...] influenced my sense of justice" (Skierka 2004, 19–20).

Castro's younger brother, Raúl (born 1931), who became the first Minister of Defense under revolutionary rule, also studied with the Jesuits, but he drew different conclusions. Raúl Castro's childhood differed from the evolution experienced by Fidel. Less independent and more attached to his family, he evinced a controversial and complex behavior. In preparatory school, where he nourished growing hostility toward religion, his performance was modest and in contrast to the outspoken personality of Fidel. In Havana, Raúl was soon approached by members of the Popular Socialist Party (PSP), the Cuban equivalent of the pro-Soviet Communist parties. Assuming an active political commitment, he benefited from the opportunity to travel to Europe and took part in the Youth International Festival held in Vienna in February 1953, before moving on to Czechoslovakia and Rumania, describing the latter as "a paradise" (Merle 1965, 120). This is not to imply that Fidel Castro's insurrectional movement was a Communist-oriented organization from its inception. On the contrary, apart from Raúl, few combatants of the action that gave birth to the 26th of July Movement ("M-26-7"), the Moncada Barracks attack, had any notion of socialist ideas. Fidel Castro himself was not a Communist.

In 1942, Castro took the train to Havana, where he was enrolled in a prestigious Jesuit school. He excelled as an athlete and was introduced by his teachers to the work of the "Apostle of Cuban Independence," José Martí (Vayssière 2011, 72), who held the crown among the revolutionary chain of heroes. Castro's interest in politics accelerated in 1945, when he began studying law at the University of Havana. This is probably the least known period of Castro's life. Some observers have suggested that he was involved in the widespread culture of gang violence (*gangsterismo*) that permeated student activism under the presidencies of Ramón Grau San Martín (1944–1948) and Carlos Prío Socarrás (1948–1952). What seems undeniable is that those university years fed Castro's anti-imperialistic inclinations. He unsuccessfully attempted to become president of the University Students Federation (FEU), and he became enmeshed in two "initiatory experiences." The first was an aborted expedition designed to overthrow the Dominican dictator Rafael Trujillo

in June 1947. The second was the tragic event traditionally known as *Bogotazo*. Castro landed in Colombia as a Cuban representative for a Latin American student congress, which was conceived to be held in parallel with an Inter-American Meeting of Foreign Ministers (Skierka 2004, 27). This international encounter represented an unhidden defiance of the US position in the hemisphere. During his stay in Colombia, Castro managed to meet the popular leader of the Liberal Party, Jorge Eliécer Gaitán, before the latter was dramatically assassinated. The future "Comandante" witnessed firsthand the massive violence that destroyed Bogotá, provoked thousands of deaths, and triggered the infamous period known as *La Violencia* (1948–1958).

The end of the 1940s was indeed a pivotal time in Castro's life: he became affiliated with the Orthodox Party (from which he organized the clandestine and armed faction that would later conduct the Moncada attack), married the bourgeois student Mirta Díaz-Balart, and visited the country that would haunt Castro forever, the USA. But Castro had not yet clearly defined his ideological identity. His friend Alfredo Guevara tried to convince him to join the PSP, but quickly realized that Fidel was a "free electron" (Vayssière 2011, 88). As Castro acknowledged during his trip to Chile in 1971, at that time, "I had a few thoughts in my head [. . .] I had indoctrinated myself. [. . .] But, was I a Communist? I was not. [. . .] I was involved in the vortex of political crisis in Cuba [. . .] and I started to fight" (Castro 1972, 277). Castro's main contemporary political inspiration was the Orthodox Party's Eduardo Chibás, whose speeches against corruption exerted a strong influence on him (de la Cova 2007, 28). Thus far, Castro's political skills had already heralded a promising career in the electoral arena. However, Batista's coup d'état in March 1952 led to a general reassessment of the necessary political strategies. Institutional attempts to transform the country no longer appeared to be an adequate tactic, and the appeal of an insurrectional stance to overthrow Batista swiftly gained ground.

Fidel Castro was certainly not the first militant to engage in armed struggle. The National Revolutionary Movement (MNR), Women's Civic Front, Triple A, *Acción Libertadora*, and large sections of the FEU were all movements that adopted an insurrectional position prior to the Moncada events (Mencía 2013, 192–303). Among this plethora of revolutionary organizations and growing rejection of Batista's authoritarian shift, Fidel Castro began gathering together young members of the Orthodox Party, eventually amassing between 1,500 and 2,000 potential combatants. The aim of his group, initially called *El Movimiento*, was to facilitate military training in order to start carrying out armed actions against the dictatorial government. After months of preparation, they were finally ready to attempt a first blow: the Moncada Barracks attack – the "Cuban Bastille" – a failed assault that, according to Cuba's revolutionary "vulgate," has become the "birth of the Revolution" (de la Cova 2007).

In order to discredit Castro's insurgency, the Batista regime linked the "moncadistas" to the PSP – a false theory that was nonetheless sustained by the coincidental fact that the head of the Cuban communists, Blas Roca, was in Santiago in July 1953 celebrating his birthday with other party members. Accused of complicity with Castro, the Communists faced soaring repression, with their party banned and their official newspaper, *Hoy*, closed down (Cushion 2016, 36). The PSP was not the only organization affected by Batista's authoritarian rule.

More than 60 combatants were killed after the attack, and Fidel Castro, his brother Raúl, and most of the assailants were jailed. However, paradoxically, the government's counterattack offered Castro an extraordinary opportunity to gain wider public visibility. Put on trial in September 1953, Castro opted to take up his own defense and delivered his legendary speech "History will absolve me." Castro's defense was memorable in more than one respect, and it provided the first public and coherent political outline of the M-26-7, unveiling Castro's strong reformist leanings and ideological proclivities. In addition, the manifesto was widely disseminated during Castro's months in prison, giving voice and popularity to the movement that became known as the M-26-7. Interestingly, "History will absolve me" does not refer to the Cold War's ideological clash

but instead highlights the local roots of the anti-Batista struggle: "the intellectual author of this revolution is José Martí, the apostle of our independence," stated Castro. He also stressed the need to restore the 1940 Constitution, sketched the main contours of an agrarian reform, decisively attacked corruption, and outlined a wave of nationalization. It was indubitably a far-reaching and liberal agenda, but it did not bear the anti-imperialist stance that would later characterize Castro's discourse. The only mention of Cuba's geographical surroundings was rather reassuring: the island's future policy in the Americas would be one of "close solidarity with the democratic people of the continent" (Gott 2004, 50). Nothing was hinted at with regard to the Soviet Union and the Socialist sphere of power.

Batista decreed an amnesty, granting Castro and many other political opponents their release. Fidel's years in prison had been a highly formative phase, allowing him to become acquainted with the works of Marx and Lenin. This is not to say that Castro had become a socialist, but he certainly gained a more sophisticated political understanding that would encourage him to perceive his revolution within a broader international framework. In an article published by the magazine *Bohemia*, Castro was pictured reading a report on the overthrow of the leftist Guatemalan President Jacobo Árbenz (de la Cova 2007, 240). Released in May 1955 and utterly convinced that there was no electoral resolution to the crisis, Castro and his brother Raúl fled to Mexico, where they would articulate their movement and prepare an armed insurrection aimed at ousting Batista. Castro's departure did not imply a complete transfer of the revolutionary movement from Havana to Mexico City, as sectors of the M-26-7 were still active on the island and had established growing international connections, including in the USA. Moreover, other organizations were also vigorously fighting in Cuba with the purpose of dismantling the Batista regime. The Revolutionary Directorate (DR), headed by José Antonio Echeverría, who met Castro in Mexico City in August 1956, assumed a determined insurrectional stance (Mencía 2007, 190), as well as the

Authentic Organization and the PSP, but the latter without immediately adopting armed struggle as its fundamental strategic line.

It was in Mexico that Castro met the Argentinian traveler of the Americas Ernesto Guevara, who had recently witnessed the consequences of the US-funded coup against Árbenz in Guatemala and nurtured a Marxist political thinking (Reid-Henry 2009). In December 1956, together with *Che* Guevara and 80 fellow combatants, Castro embarked on the yacht *Granma* in order to initiate the next phase of the struggle on Cuban territory. They landed in the *Oriente* province, but the initial plan, aimed at triggering a wide popular outburst by coinciding with an uprising in Santiago, failed. Castro and his crew stepped onto the island later than expected, which allowed the government to launch a fierce counterattack, killing and capturing several revolutionaries. The Castro brothers managed to escape, finding shelter in the *Sierra Maestra*, where they quickly established contact with an outlaw rural leader, Crescendo Pérez (Wickham-Crowley 1992, 141). The cooperation between the M-26-7 and the peasants was indeed a key feature of the Cuban Revolution, which has not been sufficiently emphasized.

Under these circumstances, Castro's guerrilla movement rapidly gained traction across the *Oriente* province, allowing the M-26-7 to split its rebel army into multiple revolutionary columns, including Column 8 Ciro Redondo led by *Che* Guevara, Second Front Frank País led by Raúl Castro, and Column 3 led by Juan Almeida. As a result of this insurrectional expansion, the M-26-7 created a large *territorio libre* (free territory), within which the *barbudos* ("bearded men") provided the local population with essential social benefits such as hospitals and schools (Useem 1977, 104). As stated in a document sent to his brother Fidel in April 1958, Raúl Castro was particularly successful in rallying the local population and organizing the "free territory," thereby benefiting from the support of the peasants, who were "willing to help to infinity" (Castro 1961, 218).

The M-26-7's growing popular legitimation has to be viewed as a critical component that

boosted Castro's position within the insurrectional movement. Early in 1958, the PSP validated the "armed path" promoted by the M-26-7 (Cushion 2016, 162–163), and in April 1958, as a result of a failed strike conducted by the *Llano(the M-26-7's urban underground)*, the core of the movement was transferred to the *Sierra* (Sweig 2002, 151). Castro became the indisputable leader of the Cuban Revolution.

Batista's 1958 military offensive aimed at dislodging the rebels from the mountains did not succeed, further consolidating the position of Castro's troops. Guevara headed to Las Villas, where he was welcomed by Faure Chomón, leader of the DR, and together they planned a final assault. Doomed by an irreversible revolutionary surge, alienation of the Cuban elites, and Washington's reluctance to back his regime, Batista eventually fled the island on January 1, 1959, paving the way for Castro's spectacular entry into Havana a week later.

Castro enjoyed an impressive popular support, but initially he only kept his position as head of the rebel army. Manuel Urrutia – a lawyer who had previously defended the insurgents and vindicated their armed struggle – was nominated, with Castro's green light, as first president of the revolutionary government. He was not a radical, and he wished to maintain a cordial relationship with the USA. The first cabinet reflected the new government's ideological moderation. No Communist members held a ministerial position, and the anti-imperialist discourse was expressly silenced to avoid unnecessary strains with the White House. Having replaced José Miró Cardona as prime minister on February 13, 1959, Fidel Castro led a goodwill mission to the USA in April. While giving a speech in Princeton, he evinced a moderate stance and attributed the success of the revolution to the fact that the insurgents "had not preached class war" (Gott 2004, 166). He also remarked: "We are against all kind of dictatorship. [...] That is why we are against Communism" (Fursenko and Naftali 1997, 9). In spite of Castro's restraint, President Dwight Eisenhower made sure to be absent during the Cuban's visit to Washington, instead opting to play golf. Castro was outraged. Some observers have pointed to Eisenhower's snub as a crucial factor establishing an irreversible distance between Havana and Washington (Castro 2009, 220).

However, as announced in "History will absolve me," the Cuban Revolution soon adopted a reformist and social inclination. A new institution was created to organize large-scale land redistribution: the National Institute of Land Reform (INRA), led by Castro since 1959. As the Cuban Revolution slipped into political radicalization, the cabinet's influence was undermined, while INRA became the "genesis of the *real* Cuban Revolution" (Anderson 2000, 386). The final blow to the moderate sectors of the government came in July 1959, when Castro appeared on television and threatened to resign "in view of the difficulties issuing from the Presidency," which, due to Castro's overwhelming popularly, forced Urrutia to step down (Brown 2017, 32). This political crisis heralded further radicalization and allowed a number of PSP members to secure more prominent positions.

Although in 1959 the Cuban Revolution went rather unnoticed in the USSR (Karol 1970, 190), Castro's mounting tensions with the USA drew attention from Moscow, eventually prompting Nikita Khrushchev to send an envoy to the island. The chosen emissary was the prominent politician Anastas Mikoyan, who returned to Moscow with an optimistic prospect of the revolution (Khrouchtchev 1971, 464). Cuban–Soviet economic connections were quickly reinforced, raising concern in the White House. American companies (e.g., Shell, Texaco, Standard Oil) refused to refine Soviet oil, and in retaliation, the Cubans confiscated US assets in June 1960. A few months earlier, a tragic event had already cemented the irreversible rift between Washington and Havana. In March 1960, a Belgian arms shipment arrived in Havana on board *La Coubre*, a French freighter. The ship suddenly exploded, killing more than 100 people and destroying its valuable cargo. For Fidel Castro – as he stated in a speech at the funeral of some of the victims – there was no doubt that the explosion was a "premeditated attempt to deprive" the island of weapons, and he pointed to Washington as responsible for the sabotage. The blast served as

an appropriate justification to push the revolution forward and adopt an increasingly hostile stance toward the USA (Fursenko and Naftali 1997, 40–42).

Castro's unmistakable anti-American posture adopted in 1960 was coupled with a belligerent international stance and a resolute willingness to operate a rapprochement with the Socialist world. The First Declaration of Havana (September 1960) formalized Castro's leftist turn and delineated the island's controversial foreign policy. He spelt out his agenda by first stressing that "the People of Cuba strongly condemn the imperialism of North America for its gross and criminal domination," before delivering a call to "fight for a liberated Latin America." The right model to attain the expected liberation was, in Castro's view, "to take up the arms of liberty" (Gott 2004, 184–185). Needless to say, the Americans were outraged with the *Comandante*'s message. They struck back in November 1960 with an embargo on US exports to Cuba. In April 1961, a CIA-trained force of Cuban exiles landed at the Bay of Pigs in an attempt to invade the country, but Castro's successful military operation delivered a major strategic defeat to the USA, boosting his authority and international prestige.

However, as the revolutionaries embraced a more defined and radicalized ideological character, the institutionalization of the political structure became indispensable. The variety of revolutionary organizations was therefore replaced by a more centralist structure. The establishment of the Integrated Revolutionary Organizations (ORI) in July 1961 responded to the need of unifying the leadership by merging Castro's M-26-7, the DR, and the PSP. But the growing ascendency of the Communists and the marginalization of several former M-26-7 and DR members provoked rising grievances, which eventually forced Castro to speak out and condemn what he qualified as "sectarianism." As a result, the first secretary of the ORI – the orthodox Marxist Aníbal Escalante – and his followers were ousted (Blight and Brenner 2002, 90), while the Soviet Ambassador in Havana, who was suspected of conspiring with the former PSP leader, was replaced by a well-known sympathizer of Castro's revolution: Aleksandr Alekseyev.

In spite of Alekseyev's goodwill, the advent of the Cuban Missile Crisis in October 1962 further deteriorated the alliance with the Soviets. When the Americans detected the installation of Soviet missiles in Cuba and quarantined the island, Nikita Khrushchev and John Kennedy engaged in negotiations to solve a crisis that threatened to escalate into nuclear war. The Soviets agreed to remove the weapons, but Khrushchev did not consult the Cubans first. Castro was furious, and Cuba's fidelity to the USSR waned for nearly a decade: "The October Crisis influenced Soviet–Cuban relations for years," he acknowledged in a 1987 interview with an Italian journalist (Minà 1987, 111).

In this strained and delicate scenario, the island's ideological definition seemed unclear. Although Fidel Castro had firmly proclaimed the socialist character of his revolution in April 1961, and later claimed to be a "Marxist–Leninist" (December 1961), Cuba resisted outright "Sovietization." The Missile Crisis intensified Castro's independence and defiant stance, but he knew that Cuba needed to normalize relations with the Soviets, the only foreign partner able to support and defend the Caribbean island. With that goal in mind, Castro travelled to Moscow in April 1963 and again a few months later in January 1964. However, despite the spectacular staging of both trips, these gestures of goodwill exerted a short-term effect.

The tension between Havana and Moscow was shaped by the unrelenting debate over the appropriate path for a revolution. While the USSR and its Communist allies in Latin America favored "peaceful coexistence" and an institutional road to Socialism, Cuba defined a belligerent revolutionary theory based on armed struggle. The Cubans started to train Latin American guerrillas in its territory and contended that Castro's insurrectional scheme (known as *foquismo*) was applicable across the hemisphere (Spencer 2008, 98–104). As relations with the Soviets deteriorated, Cuba's stern anti-imperialist discourse tended to emphasize the disparity between Third World countries and the superpowers, rather than the Cold War's East–West scheme. Che Guevara

was the most vocal critic of "Soviet imperialism." In 1965, the Argentinian gave a controversial speech in Algeria, in which he accused the Socialist countries of being "accomplices of imperialist exploitation" and urged them to "put an end to their tacit complicity with the exploiting countries of the West" (Reid-Henry 2009, 304). Fidel Castro shared Guevara's views, but he was aware of the damaging effect that this rhetoric might have on his fragile partnership with the East. While the defiant tone with regard to the USSR persisted, Cuba's solidarity with Third World states and revolutionary movements increased. In Havana, Castro hosted the Tricontinental Conference (January 1966), an international meeting gathering representatives from Asia, Africa, and Latin America sharing a "common anti-imperialist stance" (Castro 1966). The meeting offered proof that Cuba had opted for favoring connections with Third World revolutionaries instead of pro-Soviet Communist parties (Lévesque 1988, 141–146). Beyond the affiliation to the Socialist ideology oriented by Moscow, what truly justified the convergence between revolutionaries across the globe was a shared combat against "imperialism." Castro made this clear in his closing speech: "What the peoples have most in common to unite the people of three continents [. . .] is the struggle against imperialism." He later attributed all worldwide contemporary injustices to the perverse effect of US domination: "the struggle against colonialism and neo-colonialism, the struggle against racism and, in short, all the phenomena which are the contemporary expression we call imperialism, whose center, axis, and principal support [is] Yankee imperialism" (Castro 1966). Beyond the concept of Communism, it is apparent that during the second half of the 1960s, the Cuban ideological pillar shaping its international policy was, first and foremost, anti-imperialism.

Castro was explicitly spelling out his reservations with regard to the Soviet model, considered too mellow and incapable of frontally defying "bourgeois" countries. He also criticized Moscow's ambition to propound a unified scheme

to reach socialism and constantly highlighted Latin America's distinctiveness, such as when he singled out "the abuse of the [Soviet] manuals of Marxist-Leninism," which, in light of contemporaneous global developments, had "become outdated and anachronistic" (Fagen 1969, 136–137).

Many indications reflected Cuba's uneasiness concerning the Soviet approach based on promoting a Socialist economic system rather than emphasizing anti-imperialist struggles: while visiting the island in June 1967, Alexei Kosygin was conspicuously scorned by Cuban authorities; the first conference of the Latin American Organization of Solidarity (OLAS), held in Havana in 1967, was closed with a speech in which Fidel Castro defined guerrilla warfare as the "fundamental route" for revolution, and hinted at criticism regarding the Soviets' "financial and technical aid [. . .] to countries [such as Eduardo Frei's Chile and Raúl Leoni's Venezuela] that are accomplices in the imperialist blockade against Cuba" (Castro 1967); in January 1968, allegations denouncing a plot designed by Cuban "conspirators" in connection with staff members of the Soviet Embassy in Havana led to the "micro-faction affairs" (Blight and Brenner 2002, 134).

This strained situation soon became unsustainable. Moscow was no longer willing to support such an unreliable international partner, threatening to curtail its aid to Cuba. In addition, the armed path promoted by Castro suffered a major blow in 1967 with the death of Guevara in Bolivia, and new "revolutionary" governments (such as that of Juan Velasco Alvarado in Peru and Omar Torrijos in Panama since 1968) showcased unexpected routes to progressive transformation, mollifying the island's belligerent posture. In this renewed context, Castro became aware of the need to resolve issues with the USSR, and he thus departed from his previous radicalism. He first announced the revolution's new approach in August 1968, after the invasion of Czechoslovakia by Warsaw Pact forces, when he expressed his support for the Soviet action. Contrary to his former emphasis on the clash between "small" and "big" countries, this time, Castro stood up in defense of the "entire socialist community,"

justifying the military intervention in Prague by the fact that the Eastern country was "heading toward a counterrevolutionary situation, toward capitalism and into the arms of imperialism" (Castro 1968).

Cuba entered an era of increasingly cordial ties with the USSR. Henceforth, in most of his speeches, the Cuban leader made sure to stress Moscow's generosity and even encouraged his allies, such as the Chilean President and socialist activist Salvador Allende (1970–1973), to tighten links with the Kremlin. Anti-imperialism was now a mental scheme directed exclusively at the Americans, while US allies were usually deemed "puppets" of the superpower. When Augusto Pinochet's coup d'état ousted Allende in 1973, Castro viewed it as nothing more than work of the "hand of imperialism," which was "behind the Chilean events" (Castro 1973). Allende's fall was a painful setback for the Cubans. The Chilean left-wing coalition, Popular Unity, facilitated Cuba's reintegration within the Latin American scene. Santiago resumed diplomatic ties with Havana immediately after Allende's electoral victory (November 1970), and Castro made a controversial 3-week *tournée* of the South-American country at the end of 1971. It was the first time that the Cuban leader was officially hosted by a Latin American head of state since 1959, which helped to dismantle the island's isolation in the hemisphere. Allende's overthrow was seen in Cuba as a signal demonstrating that, in Latin America, the necessary conditions for a revolution had not yet been attained. Therefore, Havana redirected its "international duty" to Africa, where Castro found fertile ground for social and radical transformation (Harmer 2013, 85). "Our homeland is not just Cuba," stated Castro, "our homeland is also humanity" (Skierka 2004, 209). Hundreds of thousands of Cubans landed on the African continent to provide military and medical assistance, which led to renewed tensions with the Carter administration (1977–1981). Cuban intervention was particularly striking in Angola, where Castro sent 36,000 soldiers between November 1975 and April 1976, eventually achieving an unusual

success that "prevented the establishment of a government beholden to the apartheid regime" (Gleijeses 2008, 126).

Havana's intervention in Africa became one of the few signs of independence with regard to the USSR. The Cuban 1970s constituted a period of increasingly friendly relations with Moscow, which also entailed the adoption of a harsher domestic policy. In a 1971 speech, Fidel Castro announced what Ambrosio Fornet has coined the *Quinquenio Gris*, a new era in which any expression of dissidence would be severely repressed, particularly in the cultural field: "Our evaluation is political. [. . .] Aesthetic values cannot exist when there is hunger, where there is injustice. [. . .] For a bourgeoisie, anything can have aesthetical value – anything that entertains him, that amuses him, that helps him to linger in his laziness and boredom as an unproductive bum and parasite. But we cannot evaluate a worker, a revolutionary, a communist, in such a way" (Castro 2001). The *Quinquenio Gris* was accompanied by a Soviet-oriented political and economic institutionalization: Cuba entered the Council for Mutual Economic Assistance (CMEA) in 1972; in 1975, the Cuban Communist Party held its first National Congress since its foundation in 1965, with Fidel Castro nominated as first secretary; a year later, the first revolutionary Constitution – which assumed its affiliation to "Marxism–Leninism" – was approved.

In 1979, a significant year, Cuba hosted the Conference of the Non-Aligned Movement, during which Castro's speeches highlighting the disparity between rich and poor countries were enthusiastically welcomed by world leaders. This could have been wrongly perceived as an effort to distance the island from Moscow, but Castro's refusal to speak out against the Soviet intervention in Afghanistan at the end of 1979 proved the opposite. That same year, the Sandinista Revolution successfully seized power, reviving hopes of a revolutionary outbreak in Latin America. Havana's links to the Nicaraguan government – as well as the "Cuban-Sandinista support structure [. . .] elsewhere in Central America" (especially to the insurgency in El Salvador) –

created new strains with the "imperialist enemy" and ultimately led to a series of US-backed covert actions against the Sandinistas (Hager and Snyder 2015, 28).

Under Jimmy Carter's rule, however, détente had seemed plausible. An agreement of mutual recognition was signed in 1977, but any prospect of reconciliation was destroyed by Cuba's presence in Africa and by the "Mariel affairs." The latter was a rare moment of popular discontent. In April 1980, more than a thousand Cubans occupied the Peruvian Embassy, which became a protest site for and against Castro's government. To diffuse the situation, the authorities allowed those who Castro had called *escoria* to leave the country from the port of Mariel, resulting in an exodus of 124,779 Cubans, including a significant number of criminals purposely released from prison by the authorities (Kapcia 2009, 41).

Prospects regarding Cuba–USA relations further deteriorated in 1981, when Ronald Reagan was elected president. The landing of 9000 US soldiers on the Caribbean island of Grenada (October 1981), where Castro had sent 800 Cubans – 24 of whom were killed – led the "líder máximo" to compare the Reagan administration with Nazi Germany (Quirk 1993, 822). While clashes with the White House continued to escalate, the 1980s were years of intimate ties with the Eastern world. Due to the growing access to Soviet equipment, canned food, cars, magazines, and many other products, large portions of Cuban society remember this decade with "nostalgia" (Puñales-Alpízar 2012).

However, with Mikhail Gorbachev and the advent of his reformist international agenda, the "Cuban–Soviet friendship" was put in serious jeopardy. Havana remained overwhelmingly dependent on the USSR and its sphere of influence. More than 86% of Cuban foreign trade was established with a CMEA adherent (Skierka 2004, 252). In the USSR, the willingness to continue helping Havana started to wane. The politburo decided to unveil the official figures regarding Soviet foreign assistance. In 1986, many USSR citizens realized with consternation that Cuba's

annual cost amounted to 25 billion rubles (only exceeded by the expenses concerning Vietnam, which represented 40 billion rubles per year) (Zubok 2007, 299).

Fidel Castro was one of the few world leaders who anticipated the outcome of Gorbachev's perestroika (Pavlov 1994, 111), and consequently, he launched a broad national program to counter the effects of Soviet reformism. The "Rectification of errors and negative tendencies" campaign unfolded in an opposite direction to what happened in the East. It was designed to further strengthen the Socialist character of the Cuban Revolution and reject capitalist openings (Jatar-Hausmann 1999, 37) while also silencing numerous activists within the Communist Youth who openly sought to emulate Gorbachev (Kapcia 2009, 41).

With Soviet–Cuban relations deteriorating and worries of a freezing of USSR aid to Havana, Castro began to spell out his concern. In August 1989, the official newspaper *Granma* announced a ban on the distribution of *Sputnik* and *Novedades de Moscú*, two of the most popular Soviet magazines distributed on the island. Castro's apprehensions soared after Soviet participation in a 1990 meeting with leaders of the Cuban diaspora in Miami, which pushed the Cubans to condemn a gesture "that played into the hands of the enemies" (Pavlov 1994, 161). Unable to hide the now inevitable rupture with the Kremlin, Castro did not hesitate to criticize Moscow's renunciation. He distinguished between "two types of communists: good [the Cubans] and bad ones [the Soviets] [...] Those who do not submit to imperialism [...] they call inflexible. Long live inflexibility" (Skierka 2004, 247). By accusing the USSR of excessive complicity with "imperialism," Castro was preparing his own people to face the worst crisis that the Cuban Revolution has ever experienced: the so-called "Special Period in Time of Peace."

Indeed, with the demise of the USSR and an extremely hostile international landscape, living conditions in Cuba soon crumbled. Bicycles substituted cars, constant blackouts interrupted

everyday life at home and at work, the water supply was erratic, and the Cubans started to lose weight (Jatar-Hausmann 1999, 41). Economic reforms soon followed, and Castro was forced to open the country to tourism and, by doing so, to an uncontrollable flow of foreign influences. The end of the Cold War also led to a major ideological reassessment of the revolution. References to the Soviet model disappeared, while Castro repeatedly acknowledged "our mistake of deification of the USSR." To find the authentic foundations of the Cuban Revolution, the official discourse increasingly referred to the 1st years of post-Batista Cuba, resulting in a growing vindication of those who embodied the real roots of the revolution: José Martí and Che Guevara. Castro wanted to "re-Cubanize" his revolution (Miller 2003, 150), which led to a 1992 constitutional amendment.

By 1996, the Cuban economy began to recover as a consequence of subsequent waves of reforms. In spite of Castro's concerns regarding the psychological impact of a potential influx of foreign visitors, tourism eventually displaced sugar as the principal source of wealth (Jatar-Hausmann 1999, 83). The situation was still unstable when a favorable event offered the Cubans an unexpected opportunity to remerge within the Latin American scene: the election of Hugo Chávez in Venezuela in 1998. The US embargo was reinforced throughout the 1990s, increasing the international isolation of the Castro administration, but the Cuban–Venezuelan alliance under Chávez, soon followed by the Latin American "Pink Tide" – a hemispheric leftist turn allowing rapid institutional integration for Cuba – gave "oxygen to Cuba." A commercial accord was signed in 2000, in which Caracas agreed to provide Cuba with 53,000 barrels of oil a day in exchange for money, goods, and services (Jones 2008, 288). As a result, Cuban doctors, physical education teachers, agricultural experts, military advisers, and intelligence operatives flocked to Venezuela, engaging in a decisive cooperation between two countries that saw themselves as "revolutionary" and "anti-imperialist" partners.

Growing ideological convergence with sympathetic Latin American governments (Lula Da Silva in Brazil, Evo Morales in Bolivia, Rafael Correa in Ecuador, and Daniel Ortega in Nicaragua, among others) allowed Fidel Castro and Hugo Chávez to launch an ambitious regional project designed to buttress hemispheric connections while simultaneously undermining US preeminence on the continent. The Bolivarian Alternative for the People of Our America (ALBA) was founded in 2004 with the mission of achieving economic integration while purposely excluding the White House. First planned in discussions between Venezuelan and Cuban representatives, ALBA was conceived as an alternative of the US-promoted Free Trade Agreement of the Americas (ALCA). ALBA's first declaration signed by Castro and Chávez in Havana claimed a Bolivarian "Latin Americanist vision" in opposition to "the other America, the expansionist one with imperialist appetite" (Gott 2011, 315). Emboldened by the "commodity boom," Chávez sponsored a series of initiatives meant to outweigh the US influence – the new regional currency *SUCRE*, the Bank of the South, and the television network Telesur – all of which were initiatives that Castro had been dreaming of for years. The battle against "imperialism" in the Americas, thanks to Chávez's vital commitment and financial backing, was seriously threatening the US position in the region.

But Castro could not lead this "golden age" for the Latin American Left, as, due to health issues, he was forced to temporarily delegate his presidential duties in 2006. Unable to recover from an intestinal disease, the *Comandante* finally decided to retire, passing the torch to the long-standing "number two" of the revolution, his brother Raúl Castro. Significant opportunities were enacted under the new leadership, leading to striking economic reforms, the removal of members of Fidel Castro's inner circle, and a steady normalization of Cuba–USA relations (at least until Donald Trump took office). Although Raúl Castro repeatedly claimed to be taking his brother's advice into account, it clearly appeared that the new

administration was following its own path. Fidel Castro's interaction with the Cuban people was limited to his *Reflexiones* in *Granma*, in which he continued to evince his inexhaustible obsession with American imperialism. Throughout the last 10 years of his life, it became increasingly rare to see Castro in public events. The international press was always eager to speculate about Castro's medical condition. The old revolutionary was often caught wearing an Adidas tracksuit while hosting a foreign head of the state – usually an "anti-imperialist" dignitary, such as Evo Morales, Nicolás Maduro, or Mahmoud Ahmadinejad.

Castro's "reflections" covered various topics ranging from environmental issues, world politics, agricultural innovations, and nuclear weapons. "Imperialism" always remained at the core of his preoccupations, as in his 2012 press article entitled "World Peace Hanging by a Thread," in which he accused Washington and "its contradictory and absurd imperial policy" of plunging the globe into chaos (Castro 2012). Regarding US authorities, Castro remained unrelenting until his final days. When, in March 2016, Barack Obama became the first American president to visit Cuba in 88 years, thereby crowning the Havana–Washington "thaw," Castro wrote: "We don't need any gifts from the empire," before recounting "nearly 60 years of ruthless blockade" (DeYoung 2016).

Weak and with a trembling voice, Castro gave a last party address in April 2016. He appeared in public once again to celebrate his 90th birthday along with his brother Raúl and the Venezuelan President Nicolás Maduro. On the night of November 25, 2016, President Raúl Castro suddenly appeared on television to give a brief speech and announce the death of the "Commander in Chief of the Cuban Revolution." Drinking alcohol and live concerts were forbidden during a 10-day mourning period, and a funeral procession from Havana to Santiago was organized, tracing, in reverse, Castro's triumphal march to the capital after Batista's fall in January 1959.

Fidel Castro's image proliferated in the following months, while his definition of revolution – originally a speech made in 2000 – was widely displayed in public buildings: "Revolution means to have a sense of history [...], it is achieving emancipation by ourselves and through our own efforts; it is challenging powerful dominant forces from within [...]; it is a profound conviction that there is no power in the world that can crush the power of truth and ideas" (Castro 2000). Sure enough, while the US administration under Donald Trump is imposing new restrictions affecting the Cuban economy, Castro's anti-imperialist legacy remains unlikely to disappear.

Definition

This essay explores the life and work of French poet, author, politician, and philosopher Aimé Césaire (1913–2008).

Born on 26 June 1913 into a modest family of Basse-Pointe, Martinique (then, a French colony), Aimé Césaire was a brilliant student at the Lycée Schoelcher, Fort de France. Leaving for Paris with a scholarship to attend the prestigious Lycée Louis le Grand in Paris, he met the future poet and Senegalese president Léopold Sédar Senghor who became his closest friend. In Paris, Césaire discovered that he was a 'Negro' (he confessed later that until he left Martinique in 1931 he did not know what it meant to be black) and African. In 1934 Césaire founded with Senghor and Léon Gontran Damas the journal *L'Étudiant Noir* (Black student) and developed the concept of 'Negritude', embracing blackness and African-ness to counter a legacy of colonial self-hatred. In June 1935, Césaire entered the Ecole Normale Supérieure in Paris, where he studied American black writers, especially the poets of the Harlem Renaissance. He passed the *agrégation des lettres*, the national competitive examination that leads to a career in teaching. In 1937 he married Suzanne Rossi.

In 1939, the first version of *Cahier d'un retours au pays natal* (Notebook of a return to the native land) appeared in the journal *Volonté's*. The poem was considerably revised before the definitive version in 1956.

As the Second World War began, Césaire and his wife returned to Martinique to take up teaching positions at Lycée Schoelcher. The colonial governor, Admiral Robert, was a staunch partisan of Vichy, and Césaire became increasingly critical of his regime. In 1941 he and Suzanne founded the journal *Tropiques* (Tropics). Césaire travelled to Haiti in 1944, which at the time was still the only independent black republic in the Americas, and he came back with, on the one hand, an admiration for the Haitian Revolution and the people and culture of Haiti, and on the other hand, a contempt for the Haitian elite which had betrayed the revolution.

Upon his return, he gave lectures on Haiti and was asked to run on the French Communist Party ticket for mayor of Fort-de-France and for the new French National Assembly. He won by a landslide in the election of 27 May 1945. Césaire would remain mayor of Fort-de-France for nearly 56 years, until 2001, and serve as a deputy in France's National Assembly until 1956 and again from 1958 until 1993.

Césaire was appointed in 1945 to defend in the National Assembly the proposal to abolish the colonial status of the four French colonies which had all experienced slavery: Guadeloupe, Guiana, Martinique, and Réunion. In his report, he drew up a severe indictment of their situation after 300 years of French colonisation. The four colonies became French departments on 19 March 1946.

Meanwhile, he continued to write, and published a collection of poetry, *Les Armes miraculeuses* (Miraculous arms, 1946) and *Soleil cou-coupé* (Sun cut throat 1948). In 1947, Césaire was with Alioune Diop a confounder of *Présence africaine* (African presence), which evolved in the 1960s into a publishing house of the same name.

In 1956, Césaire participated in the First Congress of Negro Writers and Artists in Paris, broke with the French Communist Party, and turned to theatre. In 1958, at the First Congress of the Martinican Progressive Party, which he had created, he called for federalism.

While he performed his duties as an elected deputy and mayor, he continued to write. In 1959, he was at the Second Congress of Negro Writers

and Artists in Rome. He wrote two more collections of poetry on Africa and the slave experience: *Ferrements* (Iron chains, 1960) and *Cadastre* (1961; translated, 1973).

In 1993, he retired from national political life but remained mayor of Fort de France until 2001. He died on 17 April 2008.

Colonial Racism and Emancipation

As a student in Paris in the 1930s, Césaire had discovered that he was *'Nègre'* (Negro). He rejected the French programme of assimilation, writing in 1939 that, 'The Black youth wants to act and to create. It wants to have its own poets, its own authors who will tell its sorrows and hopes. The Black youth wants to contribute to universalism, to the humanization of humanity' (*Nègreries*, cited in Ngal 1975: 75). But to reach that goal, blacks had to remain true to themselves. *'Negro I am, Negro I will remain',* he declared as late as 2004. Being black and Antillean 'is not about difference; it is not about degree of difference. It is about alterity and singularity'.

During his long political career, Césaire remained a staunch enemy of European colonialism and anti-black racism. In his plays, in his poems, in his essays, in his speeches and in his interventions in the National Assembly, he never ceased to indict colonialism for its violence and brutality, its destructive power and its contempt for non-European civilisations and cultures. He denounced colonial repression and supported anti-colonial insurrections and wars. As a member of the French Communist Party, he participated in peace congresses in the Soviet Union where he travelled widely. As a contemporary of the 1947 insurrection in Madagascar and of its savage repression by French colonial troops, of the war in Indochina (1946–54), of the 1955 repression in Cameroon, of the crushing of revolts in Berlin (1953) and Budapest (1956), of the Cuban Revolution (1959), of the US war against Vietnam (1955–75) and of revolts in the French Antilles, Césaire demonstrated a constant interest in the worldwide struggle of peoples for emancipation.

To Césaire, the National Assembly was an agonistic space in which to deploy his attacks on a French republican government that was betraying its promises and violating human rights in its empire. He pointed to the deep shadow that colonial slavery, colonialism, and racism had cast over republican principles. He was sharp and direct in his interventions, pointing out French racism among its political representatives. In March 1946, as he was condemning the government's policies of repression against the communists who had demonstrated against the colonial war in Indochina, he was insulted by Conservatives. He declared that the manoeuvres to shut him down were 'manifestations of a racism unworthy of the Assembly'. In 1947, he loudly protested against the arrest and condemnation of Malagasy deputies. In 1949, he warned the minister of the interior: 'In colonial countries, it is almost always the perception of injustice which determines the awakening of the colonized peoples'. During an exchange in 1950, he answered a colleague who had asked 'What would you be without France?' with the words 'A man from whom you would not have tried to take away his freedom'; and to, 'You should be very happy that we taught you to read!' he said, 'If I have learned to read, it is thank to the sacrifice of thousands and thousands of Martinicans who wanted their sons to be educated so that they would be able to defend them one day' (Toumson and Henry-Valmore 1993: 112).

He often spoke against the inequalities between France and the Antilles, discussed the problem of Antillean identity and non-development of their economy, criticised a public education that ignored their social and cultural context, and mentioned the persistent question of their administrative status. In the 1960s, he called the French government's encouragement of migration by thousands of young Antilleans to France a 'genocide by substitution'. As late as 1980, 34 years after his speech against the colonial status of Martinique, Guadeloupe, Guiana, and Reunion, Césaire continued to protest against recurrent colonial privileges and to argue that France willingly maintained its overseas departments in a state of non-development and showed a continuous denial of their cultural identity. (The summaries of his interventions at the French National Assembly can be found at [http://goo.gl/xTeqU0].)

His criticism of colonialism was rooted in his own experience of inequalities, injustice, and racism in Martinique, and of the cultural mediocrity of colonial society. Overseas societies in their movement towards equality would come up sooner or later, he argued, against French politics of abstract universalism and denial of cultural identities; and they would have to decide the course of their own emancipation.

The Native Land, Slavery and Colonialism

Césaire's poems, theatre, speeches, and essays all dealt with the experience of being black and colonised and of going through the difficult process of emancipation. In his texts, he explored what it meant to free oneself from a legacy of hatred, contempt, and barbarism in the name of the 'civilising mission'. He had observed how colonised people, 'those whom they inoculated with degeneracy' (Césaire 2001: 38), could become complacent about poverty, colonialism, and self-loathing. Decolonisation was thus first and foremost a process of getting rid of self-hatred produced by racism, of recovering dignity and pride in one's own past and of affirming the worth of all cultures and civilisations. But emancipation was full of obstacles and pitfalls, and in his plays he wrote about the tragedy of being in power, about the impatience the leader felt with the people, about the betrayals and the solitude of the leader.

'My mouth shall be the mouth of those calamities that have no mouth/my voice the freedom of those who break down/in the prison holes of despair', Césaire wrote in *Cahier d'un retours au pays natal.* He spoke for 'those without whom the earth would not be the earth', writing the history of the vanquished, of those made

anonymous by colonial and post-colonial national narratives. Colonial slavery, the matrix of colonial and imperialist policies, had transformed Africans into 'Negroes', human beings with no memory, no pride, and no self-respect. Negroes had to recover the glorious past of their ancestors and remind themselves that even in the slave ship they had remained 'standing and free'.

Colonial slavery had created the inhuman condition; post-slavery colonialism had expanded the system to the whole world. Césaire, however, wanted to be preserved 'from all hatred'. His goal was a new humanism, which he developed again in *Discourse on Colonialism*. Césaire made a connection between Nazism and European colonialism. The corollary of colonial despotism was Nazi warmongering. With colonialism, 'a poison has been distilled into the veins of Europe and, slowly, but surely, the continent proceeds toward savagery' (Césaire 2000: 36; originally published as *Discours sur le colonialisme* by Présence Africaine, 1955). Yet, what Europeans could not forgive Hitler was not the 'crime against man' but the 'crime against the white man, the humiliation of the white man' (ibid.).

Discourse on Colonialism was written in the midst of the Cold War when Césaire was still a member of the French Communist Party. He had written positively about Soviet society and had dedicated poems to French communists and to Soviet leaders. US imperialism was a threat to peace, and towards the end of *Discourse*, Césaire warned that it would surpass the barbarism of Western Europe which had nonetheless historically 'reached an incredible level' (2000: 47). 'The barbarism of the United States' would bring 'The modern barbarian. The American hour. Violence, excess, waste, mercantilism, bluff, conformism, stupidity, vulgarity, disorder' (76). 'This Empire' (the US) would be much more destructive than European colonialism. 'American domination – the only domination from which one never recovers. I mean from which one never recovers unscarred' (77).

The bourgeois class and the bourgeois nation state were the enemies of a new humanism and

Césaire named in his conclusion the proletarian revolution as curing universal wrongs. Yet, he never forgot how deep colonial racism had contaminated European thought. His strategy was to put side-by-side quotes by infamous racist writers and by famous and revered humanist writers, all Western, to show how much both had been seduced by racial thinking. The European working class itself had more than often given its consent to the colonial racialised order. Césaire called again for a new humanism that would go beyond racism, the desire to dominate in the name of 'civilisation' that would not seek to erase differences but rather to recognise cultural differences.

In 1956, Césaire resigned from the French Communist Party. In his letter to the general secretary Maurice Thorez with whom he has had good relations, he made reference to the revelations concerning Stalin's crimes in Khrushchev's famous 'Secret Speech'. He wrote that 'The dead, the tortured, the executed' were 'the kind of ghosts that one can ward off with a mechanical phrase'. The French Communists, however, had not been up to the task and had 'shown reluctance to enter into the path of de-Stalinization'. His 'position as a man of color' had allowed him to observe the problems of the Communists and of the European left: 'their inveterate assimilationism; their unconscious chauvinism; their fairly simplistic faith, which they share with bourgeois Europeans, in the omnilateral superiority of the West'. He hoped for an 'African communism' and for 'a universal enriched by all that is particular, a universal enriched by every particular: the deepening and coexistence of all particulars (*un universel riche de tout le particulier, riche de tous les particuliers, approfondissement et coexistence de tous les particuliers)*. European theories of emancipation lacked the capacity to understand the problems faced by black and Asian peoples. The struggle against imperialism was economic, political *and* cultural.

In his plays as well as in his book on Toussaint Louverture, Césaire raised questions about the

difficulties of being in power in a post-colonial situation. He had witnessed the betrayal of the Haitian elite, he foresaw the control that colonial forces would exercise over the fate of the newly independent state, and he observed the fascination of post-colonial leaders for the practices of their white oppressors, and the rise of dictators and their reigns of terror.

Independence

Césaire never fought for Martinique's independence, explaining his position by his respect for the people's will which had chosen to be integrated into the French Republic. Often asked how he could reconcile the scathing tone of his writings with his political position, he answered that he accepted that hiatus and that, in his political life, he had to take into account the general context. His politics at home were driven by his wish to get rid of the legacies of racism and that poor people should get better education, better health, and better opportunities.

Though he testified at the 1962 trial of a young Martinican accused of having written 'Martinique to the Martinicans!' on the walls of the island, he thought that they were taking unnecessary risks; true, the 1946 law had failed to establish equality but 'independence will mean chaos and poverty'. One should not underestimate the hold that successive French governments have put on overseas societies. Repressive policies coexisted with greater dependency on France. At the time of Césaire's death in 2008, Martinique was still deeply dependent on France. An ageing society, it has a middle class of civil servants receiving higher salaries than they would in France (a remnant of the colonial past), from where all appointed posts and political leaders come, 40 per cent of its population is without a high-school diploma, 22 per cent live under the poverty level and more than 37 per cent are unemployed. For €367 million worth of exports there are €2.76 billion worth of imports from France.

Repeatedly tested about the 1946 integration, he explained that national consciousness had not still emerged in the French Antilles. It was understandable, he argued, that Antilleans had first sought to have their citizenship fully recognised and that, sooner or later, they would discover that their naïve belief in equality had been thwarted. In his preface to Daniel Guérin *Les Antilles décolonisées* (Decolonized Antilles, 1956), in which the author criticised the consequences of the 1946 law, Césaire argued that it had paradoxically awakened a sentiment of national consciousness. One had to acknowledge obstacles, he argued, among them the psychological dimension of the legacy of the slave trade and slavery. Before Frantz Fanon and Albert Memmi, Césaire understood that the colonised's psychological emancipation was fundamental in the process of decolonisation. He shared with other post Second World War writers of the European colonies an interest in the psychology of the colonised and the coloniser, both entangled in a murderous embrace.

Chile, Globalization, and Imperialism

Jose Miguel Ahumada[1] and Miguel Torres[2]

Introduction: Imperialism, Free Trade, and Latin America

One of the characteristics of modern capitalism is its global scale. This has implied that capital accumulation positions the different political units in the international system in an economic hierarchy where some units control the main productive and military forces, while others are constituted as dependent economies and specialized in areas of less dynamism and technological content. That international division of labor has resulted in a growing inequality in the distribution of income and power among nations and among the classes within each nation (Hickel 2017).

That dynamic does not function spontaneously. On the contrary, the accumulation and circulation of capital on a global scale require a set of institutions and rules that ensure its operation. These rules focus both on building markets where they did not exist before (what Harvey (2005) defined as "accumulation by dispossession") and on securing preservation of market relations, via the protection of the profit appropriation of foreign investments, the assurance of the commodities flows, the protection of private property over natural resources, and the maintenance of labor discipline.

How are these rules imposed? One of the key roles of the States where the productive forces are concentrated in the international order is to maintain this global hierarchy, and their actions are imperialist when their goal is to impose

those norms to the peripheries, either through formal (military invasions) or informal means (negotiations with local elites, trade agreements, etc.) (Gallagher and Robinson 1953). Thus, although in the capitalist dynamic the global economy and the interstate system of sovereign nations are formally separated, the first dimension depends on the imperialist interventions in the second one to ensure the institutional matrix of its operation (Wood 2003).

Thus, capitalist imperialism traditionally refers to the set of actions of the states from core economies aimed at building, securing, and perpetuating the rules of the global capitalist market in the peripheries either through formal or informal actions. The success of these measures at a global scale generates what is conventionally identified as "globalization." This dynamic was identified already in 1841 by Friedrich List, when he characterized the hegemonic power of the time, England, as the protector of the international free trade regime and the key actor that restricted peripheral countries the policy space to erect protectionist measures in order to consolidate their own industrialization process (List 1841; Chang 2002).

But imperialism not only is a unilateral phenomenon (going from the imperialist core to a passive periphery) but also implies the active participation of the capitalist classes from the peripheries. In particular, the exporting class, whose sources of capital accumulation are the areas in which the periphery has comparative advantages (the latter being less a neutral outcome of the international market and more an active imposition of the empire on the colonies), are active in promoting internally the agenda of the imperialist core (free trade and policy space restrictions).

How were these actions deployed in the Latin American periphery during the contemporary period?

The financial crisis of the 1980s marked a break in the political-economic trajectory of Latin America. The regional growth of the 1970s was largely sustained by increasing indebtedness derived from a sudden increase in liquidity in the financial system from the developed world. That cycle of indebtedness had an end with the

financial panic during the Mexican moratorium of 1982, which ended with a cut in the financial flows and a region tied to a massive debt with international banks (mainly from the USA) equivalent to 400% of exports (see Bértola and Ocampo 2012).

The debt was not only a problem of the debtor but also of the issuer. One of the possibilities of the region was to default, which would extend the crisis to the US economy. In this context, the USA together with the International Monetary Fund (IMF) and the World Bank (WB) offered financial assistance and active collaboration to the region to renegotiate the debt in exchange for a series of structural reforms that unleashed the capitalist market economy from the series of regulations, policies, and restrictions that the region implemented since the postwar period (focused on consolidating a process of industrialization together with income and wealth redistribution). This US-IMF-WB agenda implied, as is well-known, fiscal austerity, privatizations, and the radical trade opening that laid the foundations for neoliberalism in the region (Stallings 1992).

In this way, US-IMF-WB imperialist actions forced the periphery (under the threat of making the region a pariah in the international financial system) to establish the minimal institutional bases for free trade (Peet 2009). These reforms (latter named as the "Washington Consensus") reinserted the region into the global capitalist market and repositioned it as a supplier of raw materials and low-skilled labor-intensive goods for the core regions.

A second moment of the US imperialism came during the 1990s, and it focused on the multilateral and bilateral fields. In 1995, the World Trade Organization (WTO) was established after almost a decade of negotiations and pressures from the USA and Europe to modify trade rules and impose new stricter measures on intellectual property rights (IPRs) and increase protection of investors' property rights (Chang 2008; Wade 2003). In parallel, since the late 1990s, the USA began its strategy of "competitive liberalization" to, through a series of regional and bilateral free trade agreements (FTAs) with the elites from peripheral countries, strengthen free trade rules

beyond the WTO norms, especially in the area of financial deregulation, more stringent IPRs, and new protections of foreign investments (Gallagher 2008). In this way, the informal mechanism of imperialism consolidated a vast network of institutional arrangements that ensured the circulation of capital on trade, investment, financial, and property protection areas in the peripheries.

The results of this imperial free trade agenda in Latin America were deep: intense regional deindustrialization, stagnated growth, and strong financial instabilities during the 1990s and mid-2000s (Torres 2019). The region could only temporarily recover economically with the exogenous shock of the commodity boom (an outcome of both financial speculation on commodities from the core financial institutions and the rise in demand from China). However, this recovery deepened the tendencies of deindustrialization and reprimarization of the region's export basket and has strengthened the trade dependence with China (Gallagher 2016). Is China becoming today a new imperial actor that disputes US hegemony over the region, in the same way as the latter did with the UK since the end of the nineteenth century?

In these international dynamics of building an imperial free trade framework in Latin America, Chile has been considered by the liberal academy as an example of the economic success of this strategy for the peripheries (Kuczynski and Williamson 2003). Indeed, Chile is nowadays the most economically open country, with the largest number of free trade agreements and with the highest GDP per capita in the region. Is Chile a case that represents the positive outcome of the imperialist strategy?

Trying to answer that question and understand the nature of the imperialist relations in Chile is the objective of this chapter. As will be shown in the next sections, in the Chilean case, it is possible to detect all the imperialist actions that have been presented so far: the constant US imperialist pressures to impose a free trade agenda in the peripheries, the emergence of China and its impact on the peripheries' productive matrix, and how these dynamics set strong limits on the policy space that countries need in order to pursue their own

autonomous industrial policies. In the last section, a summary of the argument will be presented, and certain general ideas for a national program that challenges the imperialist structure and addresses the objective of autonomous development will be considered.

Chile: The Forerunner of Globalization

Chile began its transition to neoliberalism in the mid-1970s, around a decade before the imperialist imposition on the region through the structural reforms during the debt crisis. However, that does not imply that US imperialism has not played a key role in the country, on the contrary.

The intensification of the class struggle during the socialist government of Allende ended with the Pinochet military coup in 1973 that repressed the leftist political forces. During Allende's government, the USA actively financed opponents and economically blocked the socialist government, especially after the nationalization of the copper industry in the hands of US companies (Kornbluh 2013; Shiraz 2011; Petras and Morley 1975).

In turn, those who imposed the pro-free trade agenda during the military dictatorship were a group of economists trained at the University of Chicago, where the neoliberal vision of economics and politics was taught and promoted. This academic training project was actively promoted by the US government, and its objective was, in a kind of "cultural imperialism," to influence regional economic policies. As Juan Gabriel Valdés pointed out, these academic training programs at the University of Chicago were "a striking example of an organized transfer of ideology from the United States to a country within its direct sphere of influence... the education of these Chileans derived from a specific project designed in the 1950s to influence the development of the Chilean economic thinking" (quoted in Klein 2007, p. 62).)

In this way, through financing the destabilization of Allende's government and via the preparation of technical cadres for Pinochet's reforms, the USA was a key player in actively promoting the new Chilean economic order (Kornbluh 2013). This new order was characterized by two dynamics: a cycle of accumulation by dispossession and a strengthening of free trade rules.

The first involved the consolidation of large financial conglomerates in the economy and the expansion of capitalist accumulation to the area of social services. The wave of privatization of public companies permitted the financial capital to take a leading role in the economy. In 1969, financial conglomerates controlled 41 companies, while in 1978 it jumped to 278, particularly in the financial and natural resource areas (Fernández 2004). Although Allende had successfully eliminated the landholding and redistributed the property to the peasants, the dictatorship cut all subsidies and protective measures to that sector, initiating a massive transfer of ownership from smallholding to nascent capitalist conglomerates and thus initiating the capitalist accumulation of agriculture (agro-capitalists went from controlling 36% of total agricultural land in 1973 to 53.2% in 1979) (Kay 2002). In the area of social services, the dictatorship dismantled the former Chilean Welfare State and commodified the pension, educational, and health system, resulting in a massive expansion of the areas for capitalist accumulation.

The second dynamic involved the complete integration of Chile into the global capitalist economy. The tariffs dropped down to 10% at the end of the 1970s, the property rights of foreign investors were highly protected, the financial system was liberalized, and the capital account was opened. Chile, in this way, became the first economy to adopt what in the 1980s and 1990s would be the US imperialist agenda for the periphery: the construction of a market society where material reproduction and the pattern of productive specialization of the economy would be determined exclusively by the imperatives of capitalist accumulation (Ahumada and Solimano 2019).

However, this project quickly entered a crisis. The radical trade and financial liberalization, together with the cuts in subsidies and protections to the national industry and the wage repression, generated a sharp fall in both consumption and internal investment, which led to high unemployment and increasing deindustrialization

throughout the 1970s. This situation only managed to sustain itself temporarily through a cycle of indebtedness derived from the growing liquidity in the financial system. Financial capital, in this way, sustained a repressed productive order based on an unsustainable credit flow (what is nowadays defined as the "financialization" of the economy) (Ahumada 2019).

The regional crisis of 1982 destroyed the Chilean model. The sudden cut in the financial flows particularly impacted an economy with fragile productive bases such as Chile. The crisis completely destabilized the dictatorship and rearticulated the political opposition.

In the middle of this internal process, Pinochet accepted the IMF and WB credits in exchange for new measures that were required such as a radical export turn of the economy in order to ensure the debt payment. That was in line with the project of the nascent exporting capitalist class that had consolidated during the 1970s. The forestry, fishing, and agricultural areas had initiated a modernization of their productive bases that, during the trade opening, permitted a radical export expansion. The export capitalists offered Pinochet a package of pro-export policies in the areas in which the country had displayed comparatives advantages (on how this economic modernization had its origin in an active entrepreneurial role of the state in the 1960; see Lebdioui 2019).

This export capitalist class demanded the dictatorship of the implementation of package of policies such as a strong exchange devaluation, subsidies to nontraditional exports, and protection of traditional agriculture (Silva 1996). Those measures were implemented in order to restore economic growth, ensure the political support of agricultural sectors to the dictatorship, and lay the foundations for an economic dynamism around the nascent areas of economic competitiveness.

At the end of the 1980s, Chile had, on the one hand, consolidated an export-led growth around natural resources, with a growing power of the exporter capitalists in the economic order, and, on the other hand, the opposition had succeeded in the plebiscite, opening the doors to a new democratic period at the beginning of the 1990s. It will be during this period when Chile definitively consolidated its insertion into the capitalist globalization and where the USA deployed a new imperial strategy to consolidate its economic hegemony.

Chile in the Orbit of the US Free Trade Imperialism

As noted in the introduction, at the beginning of the 1990s, the US imperialism (via structural reforms) had already made Latin America dismantle the social-developmental institutional framework that it had installed during the second half of the twentieth century and established the fundamental bases for free trade (the so-called globalization). With that order already established, the USA moved to a multilateral consolidation strategy via the nascent WTO and the attempt to establish regional free trade agreements (this section is based on Ahumada 2018, 2019).

In that context, Chile joined the nascent "globalization" under the leadership of an extractive-technocratic power block: the extractive sector (forestry, fishing, mining, fruit) was the source of Chile's export dynamism and a nascent liberal technocracy anchored in the Ministries of Finance and Economy, which would become in the 1990s in key political actors in establishing the main state policies (Silva 2010). This power block, in order to expand the export dynamism, implemented three key measures in the early 1990s: tariff reduction (to reduce the price of inputs), establishment of capital controls (to discourage speculative financial capitals and privilege entry of productive FDI), and the beginning of a series of free trade agreements to ensure the exporters' elimination of non-protectionist regulations for their commodities in foreign markets.

Within this insertion strategy, Chile joined the nascent WTO, begun a wave of trade agreements with regional countries, and tried to become a member of the new NAFTA. Both the WTO and the idea of extending NAFTA to other countries in the region were keys for the US imperialist strategy of securing a framework that would make permanent pro-free market rules in trade, foreign

investment, and patent areas. For Chile, becoming a member of the WTO gave the power bloc a legitimacy in the international sphere that it needed. In turn, the invitation to join NAFTA allowed exporters to have better terms of access in these markets than their competitors. In this sense, the interests of the Chilean power bloc were in line with the US imperialist strategy.

Already during the negotiation of Chile's entry into NAFTA, the USA required Chile to substantially modify its investment rules, financial regulations, and IPRs. In effect, the USA demanded Chile to eliminate capital controls, eliminate export subsidies, and increase the protection of patents. While Chile failed to make the changes because the US Congress did not approve Chile's membership in the end, these demands will reappear again when Chile's power bloc subsequently attempted to negotiate a bilateral free trade agreement (FTA).

Chile's entry into the WTO reproduced the same principle that the USA sought to impose on the regional agenda. In fact, under pressure from the WTO, Chile modified its IPRs (expanding the duration of patents from 15 to 20 years), deepened foreign investment safeguards, and virtually eliminated export promotion measures that it had imposed since the 1980s. That affected exporters but not so much as to refuse to be part of that agreement.

The Chilean strategy of securing foreign markets for its exports (through bilateral trade agreements and becoming a member of the WTO) supported their competitiveness and produced an important economic expansion. In fact, during the 1990s, the country grew by around 6% per year, and manufacture exports jumped from around 4.5% of the total exports at the beginning of the 1990s to 10% at the end of the decade (Data from World Development Indicators). Chile had gone from a growth anchored in an unsustainable indebtedness during the 1970s to the one anchored in export extractivism during the 1990s. As will be seen in section "The Stagnation of Chile's Periphery and Its Social Contradictions" although this new type of growth allowed Chile to overcome the crisis and gave it a decade of economic dynamism, it undermined key economic pillars necessary for long-term sustainable development.

This dynamism, however, was interrupted by the Asian crisis of 1998 and its impact throughout the region. The crisis generated a half-decade of regional economic stagnation and the end of the Chilean boom (Bértola and Ocampo 2012; Ffrench-Davis 2018). Not only did the Asian crisis undermine the Chilean boom, but the exporting classes themselves began to modify their strategy at the end of the decade: from an export diversification around natural resources (strongly supported and subsidized by the state since the 1960s until the mid-1990s) to favor its regional expansion maintaining the same productive structure. That is, it was decided to "export" the business structure to other countries without redirecting investments toward deepening the diversification process. In other words, after diversifying their exports via state support and new markets, the capitalist exporters stick around these sectors abandoning the strategy to continue the diversification process.

The stagnation of the Chilean model, both in its growth and diversification, generated a series of doubts in the political sphere regarding the efficacy of the trade and development strategy policy that the country had taken. A more heterodox alternative (suggested by a series of economists from the government) was to integrate Chile into the Mercosur in order to establish a unitary regional voice in the international system and privilege the regional market for exports with higher-technological content. However, this strategy, which had gained support in the political system in the early 2000s, was abandoned when, on the one hand, the export sector demanded a more intense agenda of free trade, particularly toward signing free trade agreements with megamarkets (e.g., USA, EU, and China), and the financial sector demanded to deepen the capital market liberalization and, on the other hand, the USA offered Chile to begin the negotiation of an FTA immediately.

The USA saw in the strengthening of Mercosur a threat to its regional hegemony. Chile's potential entry into the Mercosur was a threat to its intention to strengthen its regional free trade rules. The

offer of a FTA to Chile was, thus seen, a short-term tactical movement to stop the growth of Mercosur. But it was also part of a more long-term strategic action.

Why did the USA have such an interest in Chile, a country that represented less than 1% of its exports? The interest was geostrategic. The strategy of "competitive liberalization" (i.e., consolidating free trade rules through a series of bilateral free trade agreements that would impose rules in the various economic areas even more stringent than in the WTO) required signing agreements with small countries that had a position of trade dependence with the USA and that would be willing to yield some regulatory framework for better access to the US market (Feinberg 2003). Chile was useful to the USA because the internal financial and export elites were willing to accept its demands in order to have better market access to Chile's main export economy (in the early 2000s, the USA represented about 25% of its total exports) and because, if the agreement was reached under the terms demanded by the USA, it would serve as the basis for future free trade agreements with other countries in the region (as was later with the FTA with Peru, Colombia, and CAFTA).

The Chile-US FTA (signed in 2003) implied that the Chilean extractive capitalist class would gain better access to the US market for its commodities (e.g., elimination of protectionist tariffs, make the tariff privileges given under the GSP mechanism permanent), but in return the government accepted US pressures to eliminate capital controls and strengthen IPRs. The agreement between the extractive capitalist class and the USA marked a milestone in Chilean trade policy: Chile abandoned its intention to collaborate in forming a more united region and turned to a strategy of market opening with the developed world yielding to US pressures.

From then on, Chile deepened its insertion in the world market through a wave of new FTAs (China, South Korea, Japan, P4, Vietnam, etc.) in order to position the extractive class as a global competitor. Such competitive positioning, however, not only did not prevent but also deepen the stagnation in export diversification, anchoring Chile into a typically extractive and peripheral economy. For example, in the trade relations with the USA, copper still accounts for around 30% of Chile's total exports, processed fish around 15%, low-processing forest products 10%, and fruits 20% (Data taken from the Observatory of Economic Complexity for the year 2017).

However, since the mid-2000s, a new key player in Chile's economic relations emerged. China has quickly become the main trading partner for the extractive class, displacing even the USA and substantially modifying the Chile's trade structure. The following section will briefly discuss the Chile-China relations in the context of the emerging power of China vis-à-vis the USA and Latin America.

The Dragon in the Room: China Coming to Chile

As transnational capitalism developed since the 1950s, the economic hegemony of the USA weakened in the mid-1970s with the emergence of other competitors on the global scene: Japan and the Southeast Asian tigers, which sustained since the 1960s' average growth rates of 6.5–7.0% per year. However, it has been China who has become nowadays the greatest threat to the USA in the dispute over global economic hegemony. Indeed, since 1980, China has sustained annual average growth rates of almost 10% during four decades, thus becoming the fastest-growing economy during the current phase of globalization and the second largest economy in terms of GDP, after the USA.

In complete opposition to the imperialist free trade agenda of the USA, China since the 1980s (and for that matter, Japan and South Korea before) has implemented a series of industrial, financial, and trade policies that have focused on protecting and promoting a quick export-led industrialization. In fact, the entrepreneurial role of state-owned enterprises, the political use of the exchange rate as a measure to increase its export

competitiveness, the national content requirements to foreign FDI, and the active support (through subsidies, long-term credits, and R&D financing) to "national champions" in high-tech industries (such as telecommunications) are part of a general strategy of economic integration that is in complete opposition to the agenda imposed by the USA to Latin America since the 1980s (Burlamaqui 2015).

In the context of the last 20 years, characterized by the intensity of technical progress and the emergence of new competitors, such as China, India, and Asia Pacific in general, the world economy (and Latin America) has undergone strong changes in its patterns of competitiveness, particularly with the emergence of global value chains. In this way, the new productive pole of Asia, but fundamentally the Chinese dynamism, has reconfigured the core-periphery relations, challenging the current hegemony of the USA and the West (Rosales 2009).

Indeed, after a series of successive cyclical crises that occurred between the end of the twentieth century and the beginning of the twenty-first century, starting in 2003, Latin America, but especially South America, was favored by the upward cycle of commodity prices exported by the region. The key factor in this price boom (which would bring the highest growth rates to the region since before the debt crisis of the 1980s, through an export expansion and a substantial improvement in the terms of trade) was the expansion of China's demand for commodities such as oil, soybeans, and copper, among other (Jenkins 2011). These regional goods were largely intermediate inputs that China required for its accelerated pace of growth and structural change (Perrotti 2015).

This boom generated a short-term "virtuous" core-periphery scheme for the region so far as its terms of trade improved in its favor, allowing left government to increase social expending, resulting in an important period of poverty reduction. In this context, various Latin American countries led by governments of different political signs made a deep trade and financial cooperation bet with China, thus gaining more autonomy

from US-IMF-WB complex, partially reconfiguring the core-periphery geopolitical relationship. However, this favorable price cycle came to an end in 2014, and the final balance for the region was a deep deindustrialization and reprimarization of its economies (Mavroeidi and Ahumada 2017).

The case of Chile is key for understanding these trends, since the expansion of the copper demand by China in its process of structural change made Chile a nation highly benefited from the price boom. The relations between Chile and China began 50 years ago, when in December 1970, after being elected as president of Chile Salvador Allende, it became the first country in South America to recognize the Chinese mainland government.

During the Pinochet dictatorship, these relationships were characterized by their pragmatism and based on the principle of noninterference, mainly in geopolitical terms. With the end of the Chilean dictatorship and the beginning of the democratic governments since the 1990s, these relations intensified and expanded toward economic exchange. During the government of Eduardo Frei Ruiz-Tagle (1994–2000), these relationships were further deepened by the signature of three agreements, the Agreement on Stimulation and Mutual Protection of Investment (1994), the Maritime Transport Agreement and the Memorandum of Understanding on Cooperation in Fisheries (1995), and in 1996 the Space Cooperation Agreement to which the Cooperation Agreement in Agriculture, Livestock and Science and Technology was added. Also, during the period, and as a way to confirm these strong relations, Chile was also the first Latin American country to support China's entry into the WTO that materialized in 2001. (A detailed description of the evolution of Chile-China relations can be found in Lee and Hongying (2011).)

In 2006, in the context of the commodity boom, China and Chile signed an FTA. Even though most of Chile's exports were copper, China was also becoming an important market for the extractive class as a whole. As forestry, fruits, fish, and wine sectors expanded their

exports to the Asian giant, the extractive class demanded the government to consolidate better market access to China, which resulted in the signature of the FTA.

This FTA, then, came as a way to institutionalize the bilateral trade expansion that began since the end of the 1990s. In fact, in the beginning in the 2010s, about 25% of Chile's total exports went to China and that bilateral trade was of the order of about 20 billion dollars. By the middle of this decade, China had already become Chile's first trading partner, and Chile is nowadays the most trade-dependent country to China in the region. In fact, if in 1999 Chile's trade with China represented less than 2% of its GDP, by the end of the 2010s, it represented around 15% (the   biggest share in the region) (Data from UNCTADstat).

Despite these significant export flows, and beyond various agreements and cooperation treaties that have been concluded between both countries since the signing of the FTA, especially in various areas of technology transfer and adaptation, trade patterns have not exceeded a classical core-periphery logic: China exports to Chile mainly medium- and high-tech goods, while Chile exports to China mainly non-processed copper. Chile's exports to China are, at the end of the 2010s, around 50% primary commodities, and the rest is natural resources with low levels of processing (Ibid.).

In other words, since the FTA, Chile has not taken advantage of these relations to diversify its productive structure and export basket with China; on the contrary, it has deepened the reprimarization of its exports. One reasons that this trade relation has not been able to spark a process of productive transformation lies in China's specific strategy toward foreign natural resources and energy supplies. As Rocha and Bielschowsky (2018) have analyzed, China has different strategies depending on the type of foreign economic sector and product it needs. In contrast to oil imports (where Chinese's strategy has been to offer credits to countries in exchange for secure future oil supply, as in Ecuador or Venezuela), in the case of copper, of which 66%

comes from Chile, the main strategy has been to secure the supply through transnational operations (buying the commodity to foreign or national firms through market exchange).

In summary, the situation of contemporary Chile is one of two different types of dependencies, functioning at the same time but in a tense complementarity. First, Chile is still part of the US imperialist geopolitical area of influence: the formal ties with the US agenda have led Chile to apply trade, financial, IPR, and FDI regimes that overprotect the interest of the financial rentiers (through the elimination of the capital controls mechanisms), techno-rentiers (through the enforcement of IPRs), and extractive rentiers (through the deregulation and prohibition of pro-development policies toward FDI, most of which go to extractive areas) and legally restrict the space for the state to implement pro-development policies (Ahumada 2019). These regimes, as indicated above, have been actively promoted by the USA through multilateral, regional, and bilateral agreements and by the national exporter class, which interests lie in the increase competitiveness of the extractive exports (Rodrik 2018).

Second, Chile's trade dependence to China has reinforced a typical nineteenth-century core-periphery trade relation: non-processed natural resources in exchange for high-tech goods. While this has considerably increased the demand for the commodities in which Chile has comparative advantages, it has also put pressure for deepening the deindustrialization of the internal economy, the reprimarization of the export basket together with the intensification of a dynamic of "extractive land-grabbing" to feed this increasing demand.

Both dynamics (US pro-rentier rules adopted by Chile and trade dependence with China) lock Chile into a peripheral kind of economic growth *without* the necessary policy space for the state to implement active policies to redirect resources toward sectors beyond the extractive ones and with more technological content. As the next section will show, this challenges the economic, social, and political sustainability of Chile's order.

The Stagnation of Chile's Periphery and Its Social Contradictions

The decade of the 2010s has shown clear signs of the exhaustion of the Chilean extractivist strategy of insertion into the world economy. This pattern, an outcome of the national export class interests and the US imperialist geopolitical strategy to the region, has produced four key economic structural limitations: (i) an export basket highly dependent on extractivist sectors, (ii) a poorly diversified productive structure with low technological complexity that does not allow greater productivity gains to increase long-term growth, (iii) a loss of policy space to strengthen an autonomous industrial sector (as explained in the previous sections), and (iv) exacerbation of the structural productive heterogeneity and its consequent effect on inequality and job insecurity.

The previous tendencies help to explain the contemporary growth stagnation of the Chilean economy. Its annual average growth between 2008 and 2018 has been 3.1%, and a rate significantly lower than 7.4% reached between 1990 and 1998, when neoliberalism promised greater benefits and progress to the region in general and Chile in particular. The boom in prices of raw materials, such as copper, failed to replicate the growth rates experienced during the first years of the 1990s: between 2004 and 2007, the Chilean economy grew 5.7% and between 2008 and 2013 just 3.8%. (For a detailed analysis of the data, see Ffrench-Davis (2018).)

The direct causes behind the stagnation are (i) the end of the commodity price boom boosted by China (2013) and (ii) the global geopolitical context given by various tensions such as the "trade war" of China-USA (2018–2019). However, deeper causes are the stop of transnational companies to invest in mining (at the beginning of 2019, several investment projects were frozen), a cycle of diminishing returns in natural resource sectors (forest plantations, fishery catches, aquaculture production of salmon and trout, and manufactures based on natural resources in general). To this must be added lower domestic productive investment in infrastructure areas and advances in technological innovation in broad terms (see Díaz and Ffrench-Davis 2019).

The upward price commodity cycle, as mentioned at the beginning of this section, generated a reprimarization of the national economy but also the increasing dominance of the service sector. Indeed, the value added of primary activities (including large copper mining) in 2010 represented 11% of the total GDP, while in 2018 it reached 15.7%. Also, the value added of the tertiary sector, strongly dominated by financial services and retail, went from representing 58% in 2003 to 65% in 2018. The sector that lost weight during the upward cycle was the manufacturing, moving from a 23% to 19%. The premature deindustrialization that the Chilean manufacturing industry suffered from 1973 with the shock policies implemented by the dictatorship, accentuated by the debt crisis in the 1980s, and "normalized" during the 1990s and 2000s is now deepening again since the 2010s (Torres 2020).

In relation to exports, the reprimarization and deindustrialization are even more evident. In 2005, the primary sector represented a 42% of the total exports, while in 2018 it rose to 44%. This rise has been at the expense of natural resource-based manufacture exports that have felt from 49% to 44% during that period. Also, before and after the upward price cycle, exports of high-, medium-, and low-technology manufactures – historically marginal – fall from 10% to 7%. This reality is far from the ones of economies that have always been considered a feasible pattern of development for the Chilean case: South Korea and Finland. In the case of South Korea, exports of high-, medium-, and low-technology goods represent nowadays more than 60%, and its exports based on natural resources are around 20%. In Finland, meanwhile, exports of goods with high technological content are close to 55%, and those of manufactures based on natural resources 40%, leaving natural resources with a share of total exports below 5%.

A particular feature of Latin American underdevelopment described by Pinto (1970) is the so-called structural or productive

heterogeneity, according to which, in the peripheral countries, there are very high labor productivity gaps between sectors and firms (which is also expressed in high wages and profit gaps). One key outcome of this phenomenon is the persistent situations of income inequality. In the current context of globalization, and as a consequence of the pattern of international insertion adopted by Chile since the 1990s, structural heterogeneity has tended to intensify, among companies differentiated by size, productive sector, between national or transnational property and geographical location. Strong productive gaps coexist between large companies (whether they belong to national economic groups or multinational conglomerates) and small- and medium-sized enterprises (SMEs). The wage differentials play in favor of those workers employed in large national or foreign companies, preferably exporters in detriment of workers in SMEs, where the majority of the labor force is employed (see Infante and Sunkel 2009).

The economic area that most clearly reflects this income inequality, as a consequence of the productive heterogeneity, in the historical and also more recent context is the labor market. In Chile, a high degree of precariousness and labor flexibility has been maintained along with the deepening of the external insertion. With this, low effective unionization rates have become a persistent characteristic of Chile's labor market. For example, while in 1973 a 33.7% of the labor force was unionized, in 2013 it was just the 14.2% (Durán and Kremerman 2015).

The impact of the structural heterogeneity, as well as labor flexibility and prevailing labor practices, has been the maintenance of a very unequal income distribution both at class and individual levels. In relation to the class income distribution, between 1950 and 2013, the share of wage in the total product has fallen from 43% to 34%, well below countries with higher union density such as Argentina and Brazil (46% and 44%, respectively) and the OECD average, where this participation has remained stable at around 65%. Regarding personal income distribution, Chile still shows very high inequalities, with a Gini index close to 50%. Recent literature on top income shares also reveals that the richest 1% of the population accumulates 16% of the total income. Based on these data, it is possible to conclude that Chile is one of the most unequal countries in Latin America and in the OECD during the period 1964–2015 (Flores et al. 2019).

Conclusions: Toward an Autonomous Development Path

Imperialism represents the set of political actions that the capitalist core countries perform on the peripheries to ensure the circulation and accumulation of capital at a global scale. For this purpose, core countries seek both to ensure the institutional order of free trade (protection of the property rights and the right of commodity flows within and between countries) and expand capitalist accumulation toward new non-commodified areas (accumulation by dispossession).

In the case of Chile, these actions by the USA have varied. Initially, imperialism expressed in a very direct way: from financing the overthrow of the Allende government to investing on the training of technicians who would impose a free trade agenda in Chile during the dictatorship. However, in the early 1990s, imperialist actions turned to more informal tactics. This shift toward informal imperialism led many academics to consider that imperialism as a phenomenon had disappeared from the Chilean reality. However, this was mainly because they were unable to identify the new imperial tactics and their goals.

Indeed, the 1990s were characterized by Chile's insertion into the WTO (which led the country to eliminate export promotion policies and strengthen its patents' regime) and then, in early 2000s, to negotiate the FTA with the USA (which it undermined the project of a united South America at the international level and eliminated the possibility of implementing capital controls for Chile).

This project was led by a Chilean extractive export class that emerged in the mid-1980s and that constitutes the key pillar of Chilean insertion into the global economy. Indeed, much of the interests in adhering to the US geopolitical strategy in the region (wave of FTAs) was actively promoted by this class. In this way, US imperialism was articulated with internal sectors in

promoting a Chile's neoliberal pattern of economic insertion.

This insertion, which has made Chile dependent on an export structure anchored in natural resources, has received a demand shock with China's industrial growth and demand for new raw materials. In fact, China has now become Chile's main trading partner, with the cost of consolidating a type of exchange that has not been seen since the nineteenth century: exporting raw materials in exchange for consumer goods with high technological content.

However, this type of insertion is displaying a series of economic, social, and political contradictions. Chile has lost its former economic dynamism while the productivity of the economy has stagnated since 20 years ago. An important cause of this is the overdependence of Chile's growth regime on the exploitation of natural resources, which has entered a phase of profound decreasing returns. In turn, the structural productive heterogeneity has produced a deep inequality and job insecurity, which has generated a social outbreak at the end of 2019 that has dismantled the political stability of the national order.

In parallel, the environmental unsustainability that the extractive pattern has generated has deployed a new wave of revolts in different regions of the country. In this sense, the pattern of insertion is nowadays in a period of deep stagnation and questioning. What kind of solutions are possible to build that could permit a type of development sustained in a non-extractive and autonomous growth of national productive capacities?

The option for a non-extractive development implies a series of green industrial policies that could allow the building of new knowledge-intensive sectors beyond natural resource areas and that could allow to diversify exports beyond the extractive exploitation done by the exporter capitalist class (as the case of Finland's economic boom through export diversification in the 1970s has shown). Also, it is necessary a new financial regime that can redirect capital to sectors with greater productive potential and protect the economy from the international financial instabilities (as did the national banks in Germany, Japan, and South Korea during their economic takeoffs). Finally, it is necessary to make the patent regime more flexible, encouraging free use and reducing the power of patent monopolies (as China and South Korea have done in their respective takeoffs).

These measures demand a new social pacts and a new active role of the state in controlling key economic dynamics and imposing new pro-development (and not pro-rent accumulation) rules to foreign and national capitalist's investments.

This pro-development agenda is a complex possibility in the current context of dependence and subordination to the hegemonic powers of global capitalism. In this sense, the Chilean development challenge is a political one, both in the national and international dimensions. The great challenge that lies ahead is how to build a pattern of insertion in order to increase the space for developmental policies (which implies reformulating the multilateral and bilateral agreements promoted by the USA) and implementing measures that reduce the power of capital over local aggregate investment, thus undermining its sovereignty over that sphere. That challenge is probably the deepest that lies ahead and is the one that will only be resolved in the field of politics.

Rutgers University, Newark, NJ, USA

Synonyms

Anti-imperialism; China; Communism; Imperialism; Nationalism

Definition

This essay explores China's struggles against imperialism from the eighteenth century to the establishment of the People's Republic of China (PRC) in 1949.

Renowned American historian Charles Beard in 1947 warned that a US policy of military interventionism in defence of economic interests would lead to 'perpetual war for perpetual peace', a phrase that would be used over and over again by critics of US foreign policy, from the historian William Appleman Williams to the playwright and man of letters Gore Vidal. Imperialism would lead to this in China and much of the world.

There are three major organisational systems which have been used by imperialist powers in modern history. The first and best known is colonialism – the establishment of formal colonies; for example, the British in India and later Chinese Hong Kong, the French in Indochina, the Japanese in Korea and later Chinese Taiwan, and the US in the Philippines, all before the First World War. The second, establishing 'protectorates' or 'satellites', is characterised by indirect control: establishing military bases and economic control through direct investment or marginal taxation on investments, one-sided trade agreements, with military intervention when its power is threatened. The third and broadest is sphere of influence, characterised by multilateral and bilateral trade and investment agreements granting the imperialist nation special privileges compared to its international rivals.

Until the rise of industrial capitalism in the nineteenth century, imperialists sought to establish colonies to which they could export raw materials. These colonies would purchase finished goods from metropolitan centres, and expand protected markets at the expense of rivals, leading to wars in which colonies were often used as pawns.

In the later eighteenth century, these wars led to the first successful anti-colonial revolution in history: the American Revolution against the British Empire. Within two generations, this was followed by South and Central American anti-colonial revolutions against the Spanish and Portuguese Empires as Europe and Britain were embroiled in wars against first the French Revolution and then Napoleon.

While these wars and revolutions swept Europe and the Western Hemisphere, an industrial revolution developed, firstly in Britain. Despite the loss of its American colonies, Britain would use its new economic power to establish the largest empire in human history, inaugurating a world system which would come to be termed 'imperialism' by the end of the nineteenth century.

Imperialism and the Chinese Empire

China, with its landlord-scholar bureaucrat power structure and its rationalist Confucian ideology, existed for millennia in large part because it absorbed conquerors and prevented internal capitalists and others who might threaten its Empire. It had engaged in trade (silks, porcelain, tea) with European powers, restricting their access to China. It had expanded over much of East Asia for centuries by a policy of assimilating groups to Chinese Confucian culture (a process known as 'Sinification'), defining itself as the 'Middle Kingdom', the centre of civilisation, seeking to limit contact with all outsiders. But the landlord class, its mandarin state machine ruling through Confucian ideology, could not withstand the assault of British-led industrial capitalism, which in the name of 'civilisation and progress', 'free markets', and 'the rule of law' sold opium that destroyed the bodies and minds of millions of Chinese people, seized Chinese territories, and established unequal treaties between China and the imperialist powers.

The powerful East India Company, which controlled all of India as a corporate fiefdom, found itself by the late eighteenth century losing to Chinese tea in the international tea trade on the world market. Furthermore, the Chinese state sold tea only for silver, leading to a major British deficit in the balance of payments for trade. The British government and East India Company responded by exporting large quantities of Indian opium to China. The opium trade expanded in 1834 when Britain, committed to a policy of 'free trade,' ended the East India Company opium monopoly and opened up the trade to 'entrepreneurs', including Americans who sold Turkish opium in China.

'Free-market' competition worked to lower opium prices and increase sales in China, where local merchants and corrupt officials profited from the trade, which was centred in Canton, through which all Chinese trade went. When a Chinese official, Lin Lexu, governor of Canton, banned the trade, an international crisis followed in which, in the name of 'free trade' and bringing China under 'international law,' Britain launched the First Opium War (1839–42). The British won, seizing Canton and Shanghai and compelling the Chinese court to sign the Treaty of Nanking (1842), a model for later imperialist incursions into China. First, Hong Kong was ceded to Britain (as a gateway to China). Five new ports (including Shanghai) were also opened to foreign commercial interests, who were given both residency rights and 'extraterritoriality,' meaning that they were not subject to Chinese law but to the laws of their respective nations.

As a final humiliation, China was compelled to pay an indemnity to the opium sellers for the lost opium confiscated and destroyed during the war. France and the US then demanded similar concessions, as China found itself in the midst of a civil war, the Taiping Rebellion (1850–68), which would cost more lives than any conflict in history until the First World War. Although the Taiping Rebels adopted a hybrid version of Christianity to advance a revolutionary populist programme (their leader, Hung Hsiu-ch'uan, claimed that he was the younger brother of Jesus come to establish a 'heavenly kingdom' of economic and social equality in China), Britain, France, and the US supported the Manchu dynasty while treating the civil war as a further opportunity to force new concessions.

Britain demanded the opening of all ports and exemption from all tariffs against British imports, joining with France, the US, and tsarist Russia to launch the Second Opium War in 1858. Over the next 2 years, China suffered humiliating defeats at the hands of British and French naval and land forces, culminating in the destruction of the emperor's Summer Palace in Beijing and widespread looting of Chinese treasures by civilian and military forces. China again was compelled to pay large indemnities to foreign governments and business interests, and to open itself up entirely to foreign business travellers and missionaries. Also, a British subject, Sir Robert Hart, was brought in to serve as the inspectorgeneral of China's Imperial Maritime Custom Service, collecting tariff payments for the Manchus, 'modernising' the port system, and serving essentially as a representative of all the imperialist powers over the 'China market'.

Imperialist powers now demanded more of everything (raw materials, markets; most of all, cheap indigenous labour). They also had devastating new weapons. In Asia and Africa, traditional ruling groups found themselves caught between foreigners whom they did not want and masses of people whom they feared to mobilise. China was much larger but no different. Its leaders sought policies of 'self-strengthening' to produce or purchase modern weapons with which to retain the existing system. But they could no more do that than keep opium out of the country. They were fighting a world system, which they never understood.

The treaties which followed the Second Opium War included provisions for the export of Chinese indentured labour throughout the world, labour which, for example, was crucial in the construction of the western tier of the US transcontinental railroad after the US Civil War. A Chinese diaspora was created. In the aftermath of the Taiping Rebels' defeat, the commanders of the Manchu armies began to become regional warlords, further undermining the central government.

Finally, Japan, itself a target of imperialism, saw a section of its nobility launch the 'Meiji Restoration' in the 1860s. This was a revolution against the feudal system which, over a generation, suppressed both Samurai and peasant rebellions and established a government committed to the rapid development of industrial capitalism at home and an aggressive imperialist foreign policy abroad, seeking to join the imperialist powers. China by the 1890s had become and would remain the centre of Japanese imperialism's attempt to develop an Asia-Pacific Empire.

And the incursions multiplied. France colonised Indochina against feeble Chinese opposition in the 1880s. Semi-feudal tsarist Russia threatened Chinese Manchuria. Reformist elements began to develop inside China and in the growing Chinese diaspora. For example, Sun Yat-sen, a resident of the Independent Kingdom of Hawaii and a Christian convert, returned to China and involved himself in a failed plot to overthrow the dynasty in 1895. Japan declared war on China and won a decisive victory over it, seizing Chinese Taiwan as a colony and acting for

the first time in its history to extend its influence on the Asian mainland, an unwelcome member of the imperialist 'club' whom the German Kaiser called the 'Gelbe Gefahr' (Yellow Peril).

After Kang Yu Wei, a Mandarin reformer, failed to advance moderate reforms in 1898, dividing the imperial court, all the imperialist powers began to actively carve up China into regions for themselves: a 'race for concessions', as it was called. These events prompted the US to seize the Philippines in the 'Spanish American War' of 1898, abandoning its anti-colonial traditions. In US thinking, the Port of Manila was a stepping stone to the 'China Market', a myth that energised all the imperialist powers, who found it convenient to believe that a capital-poor China could purchase huge quantities of their goods.

Secret societies had long played a role in China, both as a centre of popular resistance to the Manchus and as a tool for various factions. In 1899, secret societies touched off anti-foreign uprisings directed against Christian missionaries and all foreigners. The Manchus first sought to use this movement to improve their position against the imperialist powers, but were pushed by the rebels to declare a half-hearted war, laying siege to the foreign legations district of Beijing which they could easily have overrun. After that, the imperialist powers launched a multinational naval and land-based military intervention (the largest of its kind ever until the First World War), to crush the rebellion.

The European and US press were filled with accounts of the atrocities of the 'Boxer' rebels (their use of martial arts suggested the name 'Boxer Rebellion'). The looting in Beijing and other cities, and the rape and murder of Chinese bystanders, received limited recognition, although there were accounts of these events for which the imperialist powers generally blamed each other. In the aftermath of the Rebellion, the Manchu Government, saddled with a huge indemnity, lost all influence as its regional commanders increased their power and the imperialists fought over its territories.

Russia and Japan then fought a war over Manchuria and Korea, resulting in a de facto Japanese victory in 1905. The US, committed to

an 'open door in China', was in negotiations with the Japanese even before the Russo-Japanese War had officially ended. In the Taft-Katsura Agreement, it accepted Japanese control of Korea in exchange for Japan's acceptance of US colonial control of the Philippines. Access to the Chinese trade and investment stood behind the US 'open-door' policy, which did not extend to either Korea or the Philippines.

Britain, still seeking to control the most valuable region inside China (the Yangtze Valley), negotiated an alliance with Japan against Russia directly and Germany and the US indirectly, both of whom, as Britain's major industrial rivals, were pursuing noncolonial imperialist policies. Imperial China found itself an onlooker to these developments: deteriorating into something like a national slum; cities filled with impoverished masses; foreigners living in luxurious protected enclaves; and a class of Chinese compradors, merchant middlemen growing rich through their connections with the imperialist powers. In the countryside, bandits and warlords made the hard life of poor peasants and landless labourers even more miserable than before.

Imperialist Powers and the First Chinese Revolution

The Confucian Mandarin state had for centuries connected status and political power with formal learning, producing a great respect for formal education. As this system decayed rapidly, a large number of students and scholars who had studied to obtain positions found that these posts no longer existed. Western ideas ranging from Social Darwinism to Marxism began to reach Chinese students and intellectuals via Europeans and Americans in China, the Chinese diaspora, and groups in Japan interested in bringing 'modern civilisation' to China.

Sun Yat-sen, in exile in Japan, had organised the Kuomintang (KMT): a political party which called for the overthrow of the Manchu dynasty and the establishment of a Chinese republic. In 1911, uprisings among workers, peasants, and students with the support of urban merchants brought down the Manchu state, and Sun and the KMT moved forward in an attempt to channel the revolutionary movement into the creation of a republic. Although Sun clearly represented the sort of China which the imperialist powers had spoken of since the First Opium War, they gave him no support.

Instead, an International Banking Consortium representing these powers gave their support to a Manchu general and de facto warlord, Yuan Shih-k'ai, who had failed to use his army to support the Manchus and now turned on the revolutionaries. Yuan would give the imperialist powers the economic concessions they wanted, even though he had no real popular support and rapidly began to act as a military dictator. Frank J. Goodnow, the president of Johns Hopkins University and the former president of the American Political Science Association, served as his most important foreign political adviser, drafting the two constitutions that Yuan sought to inflict on the Chinese people. His response to US critics was that the Chinese were not 'mature enough' for political democracy. But Yuan's attempts to consolidate his power largely collapsed in face of opposition from the popular masses, peasants, and workers, and a nascent, urban, Chinese, national, capitalist class. After a failed and ludicrous attempt to make himself emperor, Yuan died in 1916, and China was in effect governed by the remnants of the imperial Mandarin civil service while cliques of warlords, former henchman of Yuan, fought with each other for power, backed by the various imperialist powers as the First World War raged elsewhere.

In China itself there were important new developments. Intellectuals organised journals which became the centre of a 'new culture' movement. This condemned Confucianism's emphasis upon social harmony through obedience to familial elders and a scholar Mandarin class as the major barrier to progress. There spread an eclectic interest in the political and social philosophies that were being imported into China along with the goods of the imperialist powers. Like many Chinese students and intellectuals, Chen Tu-shiu (a leading figure in this new movement) and Li Ta-chou (chief librarian at the University of

Peking) turned to Marxism with the coming of the Soviet Revolution, attracted by its call for an antiimperialist world revolutionary movement.

The Soviet Revolution and Germany's defeat eliminated two of the imperialist powers jockeying for power in China. But the victorious Britain, France, US, and Japan remained. During the war, Japan had made '21 demands' on China, demands which would have transformed it into a Japanese protectorate/satellite and left Manchuria subject to Japanese colonial settlement. The US vigorously opposed this and negotiated in 1917 the Lansing Ishi Treaty. By its provisions, Japan pulled back from direct action to enforce its demands but conceded nothing, while the US restated its commitment to an 'open door' in a unified China. When the Versailles Conference 'transferred' German economic concessions in northern China to Japan, protest demonstrations by students, workers, and national capitalists spread throughout urban areas from 4 May 1919 onwards. These demonstrations ignited a much higher level of organised resistance. Sun Yat-sen, once more in China, found himself organising military forces to fight warlords, and established a KMT-led military government at Guangzhou (1921), dedicating himself to a united China.

The Comintern, committed to fighting imperialism and organising both Communist parties and anti-imperialist movements in the colonial regions of the world, worked with Chen, Mao, and other pioneers of Chinese Marxism to establish a Communist Party of China (CCP) in 1921. At the same time, Chinese students in Europe (many on exploitative 'work-study programmes') organised a student section of the Chinese Communist Party abroad. Chou En-lai and his younger protégé Deng Xiaoping were drawn from the ranks of these students, and later became major figures in twentieth-century China.

The communist movement grew rapidly among urban workers and intellectuals in China while the imperialist powers continued to support their warlords. With Comintern representatives playing a central role, a United Front was forged between Sun's KMT and the CCP. The Whampoa military academy, headed by Sun's protégé Chiang Kai-shek with Chou En-lai as political commissar, was established, along with a policy of uniting China through a Great Northern Expedition that would defeat the warlords and their imperialist political backers. Through the United Front, the KMP and the CCP strengthened their positions and both were actively opposed by all the imperialist powers.

The death of Sun Yat-sen in 1925 led to a complicated power struggle in which Chiang Kai-shek emerged as the dominant figure in the KMT. This created a crisis in the United Front, as many CCP members feared that Chiang, supported by capitalists connected to the compradors, would turn on the United Front. However, the United Front was maintained and the Great Northern Expedition was launched against the warlords in 1926, with nationalist and communist forces uniting to win major victories against the warlords and their allies.

But the imperialist powers, who had never supported Sun or the KMT, much less the KMT-CCP alliance, used their power to defeat the campaign. In March 1927, a combined force of US and British ships and troops attacked KMT troops in Nanking as they assaulted the property of the foreign legations. A month later, an event which changed both the history of imperialism in China and Chinese history itself took place: the April Shanghai massacre. As communist workers and students gained control of Shanghai to welcome troops they saw as liberators, Chiang Kai-shek ended the United Front with great brutality, ordering his soldiers to join with Shanghai criminal gangs to massacre workers, students, and all communists. Li Ta-chao, the CCP's most important founder, was murdered as KMT forces invaded the Soviet embassy. Chou En-lai barely escaped with his life. An estimated 80,000 were killed, and the terror continued as Chiang's forces and local warlords united to hunt down and kill suspected communists.

Now, for the first time, the European imperialist powers and the US recognised and threw their support behind Chiang, who could be counted on to protect their interests in a way they had hoped Yuan would do a dozen years before. Japan, which sought to control all of China, did not support Chiang. The urban CCP was decimated. Attacks

launched by communist military forces against urban areas were repulsed. A commune established by communist activists in Canton was crushed. New CCP leaders, supported by the Comintern, failed to implement policies to reverse the tide.

However, Mao Zedong, a CCP founder and leader who had, in an analysis of the peasant masses in his native province of Hunan, come to see them as not simply an ally of the working class but, given Chinese conditions, a prime revolutionary force, emerged as both the theoretical and practical leader of the party. He established a liberated territory in the northern Kiangsi province (the Kiangsi Soviet) as a base area and a model for a peasant-supported revolutionary army, one in which the party, army, and the masses would be united.

Chiang's KMT regime then focused its attention on destroying the Kiangsi Soviet, prosecuting a civil war with the aid of various warlords. While the world depression intensified, Japanese imperialist penetration advanced. The various imperialist powers had their warlords and some warlords shifted alliances between the KMT and the imperialist powers. The Japanese however, were different from the other imperialist powers in that they sought to control all of China for themselves.

First, the Japanese-controlled Manchurian warlord Chang Tso-lin participated in the anti-communist terror of April 1927, which spread to other cities. He invaded Beijing and helped to murder the leading communist Li Ta-chao, who was instrumental in Mao joining the communist movement. The following year, when he tried to break with the Japanese and join Chiang, the Japanese murdered him and replaced him in Manchuria with his son Chiang Hsueh-liang. When the latter, who inherited his father's position and warlord army, tried to break with the Japanese in 1931, they invaded Manchuria and established a 'protectorate' which they called Manchukuo. Here they installed Pu Yi (the last Manchu emperor, ousted when he was a small child in 1911) as their puppet ruler.

Japan expanded its role in northern China, buying off local warlords and seeking to turn their regions into protectorates. Meanwhile, Ch'iang's army, with US and German military advisers (the Germans had begun their activities here in the late Weimar period, and continued into the early Nazi era), successfully encircled the main forces of the Kiangsi Soviet. Under Mao's leadership, the revolutionary Chinese communist army began a 2-year march to escape a myriad of murderous enemies and establish a new base area. It was a trek through northern and western China which claimed the lives of two-thirds of its fighters and represents in contemporary Chinese history what Lexington Concord, Bunker Hill, and Valley Forge put together stand for in US history.

By 1936, a series of events rapidly transpired that would lead to full-scale war in China within a year. Chang Hsueh-liang, the former Manchurian warlord who had participated in Chiang Kai-shek's war against the CCP, now urged Chiang to end the war and join with the CCP to fight the Japanese. When Chiang refused at a conference in Sian, Chang held him hostage and threatened to kill him if he did not establish the United Front. CCP leader Chou En-lai then negotiated a United Front settlement which in effect saved Chiang's life. The Japanese, threatened by the United Front (like the Italian and German fascists in Europe, they had used anticommunism to rationalise their attacks on China), then signed a treaty with Nazi Germany. This Anti-Comintern Pact (an anticommunist alliance that served as the origin of the Axis alliance) was designed to intimidate Chiang (who had previously received aid from Nazi Germany) to break the United Front. When that failed, they provoked an incident in Beijing to justify launching a full-scale (albeit undeclared) war against China. In reality, this was the beginning of the Second World War. Within a year, the Japanese military had conquered the major eastern and northern Chinese cities, carried out the infamous mass killing in Nanking, and initiated a war which would claim an estimated 10–20 million Chinese lives.

The response of the imperialist powers was 'neutrality' and continued business with Japan. While the Roosevelt Administration had begun by 1938 to provide limited aid to Chiang's regime,

which had relocated to the western Chinese city Chung-king, the US did not invoke its neutrality legislation, since Japan had not formerly declared war. US oil companies and other corporations continued to supply fuel and other goods used by the resource-poor Japanese Empire for its war machine. Britain's Chamberlain Government, which pursued an appeasement policy in Europe towards Nazi Germany, also pursued a pro-Japanese appeasement policy in Asia in the vain hope that it could turn them away from a fully fledged alliance with Nazi Germany.

While millions of Chinese civilians perished, the CCP in the North expanded its revolutionary armies and mobilised an increasingly effective guerrilla war against Japan. Although the United Front was still in effect, KMT and CCP forces clashed in many instances and Chiang's regime, especially after war broke out in Europe, began to look to the US, in particular, and Britain to eventually defeat the Japanese so that he could continue his civil war against the CCP later.

After the Japanese invasion, Chiang had said famously 'The Japanese are a disease of the skin, the Communists a disease of the heart', a statement with which all of the major imperialist powers (save of course the Japanese themselves and possibly the US under the Roosevelt Administration) would have agreed. After the Nazi conquest of Western Europe, Japan negotiated a 'tripartite pact' with Nazi Germany and Fascist Italy in which the three powers pledged to come to the aid of each other if any of the three became involved in conflict with a power not involved in either the European war or 'undeclared' war in China, a treaty aimed at the time at both the US and the Soviet Union.

When Nazi Germany invaded the Soviet Union, the Japanese militarist leadership, divided over whether to join its European allies against the Soviets or to attack British, Dutch, and US positions in Asia, decided on the latter course. By arrangement with the Vichy French collaborator government, Japan occupied French colonial Indochina. The US responded by freezing Japanese assets, and establishing a complete embargo on exports to Japan, especially oil. This had the effect of strengthening the Japanese plan to attack

Pearl Harbor and destroy the US Pacific Fleet, a plan that had been developed before the Nazi invasion of the USSR and the Japanese invasion of Indochina. For the Japanese militarists, the war in China, which was tying down millions of Japanese soldiers and the foundation of their imperialism, was the decisive factor in their decision to attack the US and Britain in the Pacific.

Chiang's China now joined the Allies and received extensive aid from the US in the war. Japan intensified its anti-guerrilla war against the CCP, launching a campaign of 'loot all, burn all, kill all' which led to massacres of Chinese civilians comparable to the Nazi slaughter of the Soviet people. The CCP, although its ranks were initially decimated, grew stronger as the war progressed, winning over millions of poor peasants and landless labourers as it merged a war of national liberation with one of social revolution. US officials in China were aware of this, some foreign-service officials and military officials coming to respect and admire the CCP activists for their courage and honesty compared to the corruption of KMT military and civilian officials. US attempts to encourage Chiang to advance land and other social reforms to liberalise his government failed completely.

As the war ended, the CCP became the de facto government of over 100 million people in northern China. Chiang's regime, having used the US to defeat Japan, now hoped to use it to defeat the CCP in a new civil war. The Truman Administration, in the very early stages of what would by 1947 be called a 'Cold War' against the Soviet Union, the global communist movement, and diverse anti-imperialist revolutionary forces emerging from the war, was glad to try and oblige. The Japanese armies were not demobilised after the Japanese surrender but kept initially by the US as a police force to prevent, as Truman would later admit in his memoirs, CCP forces from sweeping to victory throughout northern China, gaining control of Beijing, Shanghai, and other major cities.

The mission by General George Marshall to establish a coalition government of the KMT and the CCP in 1946 broke down. The CCP was willing to participate, believing that it would triumph in elections, but Chiang was not. The

Truman Administration then provided more than £3 billion in aid to the KMT, and arms and advisers for its elite divisions as it launched a major military offensive against the CCP in war-weary China. Although the Truman Administration knew through its internal reports that Chiang lacked mass support, it continued its aid as the military tide turned decisively against the KMT and rampant inflation devastated the Chinese economy.

In Western Europe, the US Marshall Plan was put in place to rebuild infrastructure destroyed during the Second World War. But there was no such plan to rebuild the devastated Chinese economy. The US offered only military aid for a corrupt regime seeking to restore the pre-1937 status quo ante. Tens of millions of Chinese actively joined the revolution and hundreds of millions simply withdrew any support from the KMT. The Truman Administration ended its aid in mid-1949, shortly before the fall of Beijing, blaming the defeat entirely on the KMT leadership but offering nothing to the new People's Republic of China.

There were to be important consequences for China, the US, and the world from these events. First, in the developing Cold War, Truman's Republican opposition blamed his administration for the 'loss of China', reasserting the imperialist fantasy that the country was theirs to begin with. Senator Joseph McCarthy built upon these charges to transform the anti-communist Cold War consensus into a national hysteria. McCarthy was even to accuse General Marshall of being a communist and Soviet agent because of his earlier failed mission to negotiate a KMP-CCP coalition.

Unlike Britain and its other allies in the newly formed North Atlantic Treaty Organisation, the US refused to recognise the People's Republic of China and used its veto in the to block the country's admission to the new United Nations. The successful Chinese Revolution was also a factor in encouraging the newly created National Security Council (part of the reorganisation of US Military/Overseas Intelligence in response to the Cold War, created by the National Security Act of 1947) to advocate a globalising of the US 'containment' policy which would require a quadrupling of US military expenditures.

These events prompted the Truman Administration to intervene in late June 1950 in the civil war that broke out in Korea, the former Japanese colony which the US and the USSR had divided into occupation zones at the 30th parallel with no consultation of the Korean people. After the outbreak of the Korean War, the US intervened directly in the Chinese civil war, preventing the People's Republic, which now controlled all of mainland China, from gaining control of Taiwan, where Chiang's KMT Government had retreated and whose fall virtually all international observers considered inevitable. No one expected Chiang's forces on Taiwan to survive, since they had no navy to stop a People's Liberation Army invasion, and had already put themselves in a bad position with the Taiwanese who had been a Japanese colony since 1895 and were in conflict with the KMT mainlanders. In fact, a number of high officials in Chiang's government, including relatives, had already resettled in the US, expecting Taiwan to fall rapidly. When US troops of the UN, led by General MacArthur, ignored warnings from the People's Republic and advanced to the Yalu River on the Korean–Chinese border (six months after the US had sent the Seventh Fleet into the Formosa Strait to protect Chiang's new Taiwan government), hundreds of thousands of Chinese troops intervened.

The newly created US Central Intelligence Agency began to work with anti-communist elements in Chinese Tibet and former Chinese warlords who had fled to Indochina and gone into heroin production to support attempts to destabilise the People's Republic. Finally, fearful of 'communist expansion' and the 'Sino Soviet World Communist Conspiracy against the Free World' following the victorious Chinese Revolution, the US began to fund the French colonial war in Indochina in 1950. Following the French military defeat, it created a protectorate in 'South Vietnam' in violation of the Geneva agreement which had ended the conflict. These were contentions that the British imperialists who fought the Opium Wars in the name of 'free trade and the rule of law' and all of the imperialist powers who put down the Boxer Rebellion to defend 'civilisation' would have well understood.

The Placement of Discussion

When discussing about "colonialism" and "imperialism," one is immediately related to the policy and practice of domination of Western powerful nations over Africa, America, and many parts of Asia in the past history. Western imperialism and colonialism have been seen by Marxist critical schools of theory, such as the dependency theory and world-systems theory, as the most important factor in causing underdevelopment in the Global South. Underdevelopment is a situation that has been systematically created by colonist exploitation (Frank 1966).

According to critical scholars, one of the distinctive features of Third World industrialization process is the fact that unlike European industrialization, such a process was taking place alongside already industrialized Western countries and was therefore tied to these colonial masters by various socioeconomic and sociopolitical relations. In line with their conceptual understanding, the global system is not a uniform marketplace (free market) with actors freely making mutually beneficial decision and interaction, rather, the system has been historically shaped into powerful *central* and weak *peripheral* economies with the former playing an active and dominant role and the latter a passive and reflexive role, i.e., structural asymmetrical relationship. It is thus assumed that imperialism, which is the mechanism of domination, still exists and still keeps Third World countries from developing, leading to worldwide uneven development. The developed economies of the Northern Hemisphere of the world especially Western Europe and the USA have been at the gaining end of the parasitic and asymmetrical relationship between the wealthy North and the impoverished South.

In the case of China, the European "Age of Imperialism" in the late nineteenth and early twentieth centuries was driven by similar economic imperativeness. It coincided with the Chinese "Age of Humiliation," which refers to the "Century of Humiliation" (1839–1949). The period from the first Sino-British Opium War (1839) to the end of the Chinese Civil War (1949) marked the political incursion, economic

exploitation, and military aggression by Western imperialist countries, which undermined the historical glory of the Chinese civilization and humiliated the Chinese nation. China itself was a victim of Western imperialism's pursuit of overseas market and surplus.

The penetration of Western imperialism and the Chinese struggle against imperialism were the central components of its modern history (Ding et al. 1973; Fairbank 1992; Hu 1955). Ever since the last Chinese Qing Empire gradually collapsed as a result of the Sino-British "Opium War," such a history of humiliation has been embedded in the national memory of the aggression and invasion by Western imperialist powers. "Anti-imperialism" reached its initial political climax in the aftermath of World War I, in which China, the allied winner of the war, had to accept the Treaty of Versailles arrangement by Western imperialist powers to grant Japan the right to take over from Germany the resource-rich province, Shandong, which was also the birthplace of Confucius. Since then, "anti-imperialism" became one of the core national missions and the symbol of the Chinese Revolution (Li 2018b).

"Anti-imperialism" continued to be Chinese Communist Party's uninterrupted undertaking even after the founding of new China in 1949. The major internal political movements and external international conflicts and wars in the following decades were in many ways inseparable from the anti-imperialism mission, such as the Korean War, the Vietnam War, the Cultural Revolution, the China-Soviet split, the export of revolution to China's neighbors, economic and political support to African and Third World independent movements, etc. "Anti-imperialism" had been, among others, the most frequently used political terms in China shaping both its domestic and international politics until the economic reform started in the late 1970s.

However, since the 2000s the world is witnessing the rise of a different China: the country's size, population, and its integration in the world economy have contributed to both prospects and uncertainties; its currency has been a subject of contention; its trade has raised concerns for both developed and developing countries; its demand for energy resources has led to competition and conflict; and the effects of its overseas investments in the Global South have begun to be felt across the world. Beijing's economic performance and its policies on finance, currency, trade, security, environment issues, resource management, food security, raw material, and commodity prices are bearing worldwide implications beyond its boundary. Suddenly, China, a historical victim of Western imperialism, is finding itself to be a "middle kingdom" surrounded by jealousy, admiration, anxiety, worry, and even resentment. It is in this context that the global attention and discussion on "Chinese imperialism" began to emerge.

Furthermore, since 2013 China's Belt and Road Initiative has added lots of input into the global debates (Li 2018a). Some observers view it as "an imperial project" or as an imperial move toward "restoring its historical status as Asia's dominant power (Griffiths 2017; Millward 2018). In addition, China's industrial policy of "made-in-China 2025" is seen as Beijing's plan for hi-tech dominance, aiming at rapidly expanding its high-tech sectors and developing its advanced manufacturing base. Even "Chinese Dream," raised by the Chinese President Xi Jinping, is interpreted as an attempt to restore an "imperial" China (Chellaney 2017a; Daly and Rojansky 2018).

Understanding the Debate on China's Global Rise and Neoimperialism

How to understand the emergence of global debates and discussions on the relationship between China's global rise and the Global South? For example, how do we define China-Africa relations: a South-South partnership or North-South dependency? Many intellectual debates on China-Africa relations have been responsive in associating Africa's past relations with the Global North. Currently, the debates brought about by China's economic expansion and its economic relations with the developing world are related to three conceptual notions, i. e., "neocolonialism," "neoimperialism," and "creditor imperialism."

Chinese Neocolonialism?

"Colonialism" is a historical process through which a more powerful nation takes control of another territory; rules that territory politically, economically, and socioculturally; and exploits the territory's resources for the benefit of the homeland. The notion mainly refers to the world history, as the *Stanford Encyclopedia of Philosophy* describes: "the process of European settlement and political control over the rest of the world, including the Americas, Australia, and parts of Africa and Asia." Colonialism is fundamentally tied up with the process of "empire building" or "imperialism."

Comparing with "colonialism," a notion denotes the direct control or governance of a nation over a dependent country, territory, or people (various English dictionaries), the essence of "neocolonialism" refers to the practice of using the power of capital, the impact of globalization, and cultural supremacy to influence a developing country in lieu of direct control (imperialism) or indirect political control (hegemony). The modern concept of "neocolonialism" was coined by Kwame Nkrumah, the first post-independence president of Ghana, in the context of African countries undergoing decolonization in the 1960s. He referred it to a phenomenon that "the State which is subject to it is, in theory, independent and has all the outward trappings of international sovereignty. In reality its economic system and thus its political policy is directed from outside" (Nkrumah 1965). Some Western writers, such as Jean-Paul Sartre (2001), whose Colonialism and Neocolonialism is a collection of his series of essays on colonialism, echoed Nkrumah's definition. This collection remains a powerful and relevant critique that brings the full force of the author's intellectual reflections on France's conduct in Algeria, and its implication is extended to the West's conduct in the Third World in general. "Neocolonialism" in the current era, which is different from the historical notion of "colonialism," connotes two core aspects of the policy of a strong nation in seeking (1) cultural imperialism and (2) political and economic hegemony.

In recent years the global debates about "Chinese neocolonialism" have been long standing, and they are re-emerging with new force due to a number of reasons. One of them is the fact that China is playing an indispensable role in strengthening its sociopolitical and socioeconomic ties with the Global South, particularly with the two continents, Africa and Latin America, which were historically Western colonies and under the Western sphere of interest. Depending on one's perspectives of assessment, Chinese investment patterns and new diplomatic initiatives are bringing about tangible economic and social transformations in these two continents. Another reason is that China's capital outward expansion to the Global South, such as the Belt and Road Initiative, anticipates billions of dollars' worth of infrastructure projects and resource investments. This will inevitably "affect" and "disturb" the existing "global relationships" and "global arrangements," i.e., the "structural power" of the existing world order (Li 2018a). Beijing is seen as attempting to redivide the already divided world.

The critique on "Chinese neocolonialism" is essentially founded on the general patterns of China's economic relations with many developing countries today. These patterns of relationship are claimed to bear close resemblance to the previous European colonial powers' economic relations with colonial countries in the nineteenth and twentieth century. One of the key features of Beijing's relationship with developing countries is that it repeats the "unequal exchange" trade relations, i.e., developing countries export their primary products in exchange for Chinese manufactured goods. The outcome is perceived to generate an old situation under colonialism that "the economy of certain countries is conditioned by the development and expansion of another economy to which the former is subjected," and consequently, "some countries (the dominant ones) can expand and can be self-sustaining, while other countries (dependent ones) can do this only as a reflection of that expansion" (Dos Santos 1970: 231). The eventual consequence is alleged to be that developing countries are becoming heavily indebted to China, China is

able to exert greater weight on local political, cultural, and security dynamics.

Chinese Neoimperialism?

In a close analogy to "colonialism," the notion of "imperialism" characterizes a period of global colonial expansion by European powers from the fifteenth century to the nineteenth century driven by the pursuit of overseas territorial acquisitions and new overseas markets and resources. Likewise, the USA and Japan did in the similar way during the late nineteenth and early twentieth centuries.

"Neoimperialism," derived from the historical legacy of the old "imperialism" concept, can be defined as "a collection of thoughts and principles whose advocates critically examine the current social, political and economic implications that structurally result in uneven power relationships in international relations within distinct categories of winners versus losers in a capitalist world economy (Lumumba-Kasongo 2011: 245). It is essentially important to understand the nexus between the inherent unequal structures of the world system conceptualized by imperialism theories and the continuous vulnerabilities and inferior positions of countries and regions in the world system. In line with the world-systems theory's understanding, the system's embedded inequalities have never been changed.

Today, the portray of China as "neoimperialism" power is widely covered in Western media (Harper 2017; Larmer 2017; Manero 2017; Okeowo 2013), which reflects the change in the perceptions of China in the Western mind. The crude stereotypes of the "Yellow Peril" (an xenophobic theory of colonialism imaging the danger of Oriental hordes overwhelming the West) that dominated Western culture in the late nineteenth and early twentieth centuries have given way to a fear that China will follow in the West's imperial footsteps and dominate the world. In other words, the legacy of imperialism underpins today's Western and certain developing countries' perceptions of China's foreign policy and development objective.

"Chinese creditor imperialism" is a quite new notion. This concept refers to the fact that Chinese global outward expansion, in the Global South in general, and in South Asia in particular, is facilitated through financial credit. The concept implies that in order to finance and build the infrastructure that poorer countries need, China demands favorable access to their natural assets, from mineral resources to ports (Chellaney 2017b). It is also posited that unlike International Monetary Fund and World Bank lending, Chinese loans are collateralized by strategically important natural assets with high long-term value (even if they lack short-term commercial viability). It is a good comparison between China's current "imperialist expansion" and the Chinese own history when China had to lease its own ports to Western colonial powers due to the loss of the Opium War (Britain leased Hong Kong from China for 99 years in 1898). It is claimed that China is now applying the similar imperial "99-year lease" concept in order to access to geopolitically and geoeconomically import resources and ports, such as Hambantota and Djibouti (Chellaney, ibid.). In addition, Beijing's Belt and Road Initiative is perceived as an imperial project aiming to use its financial power to have weak and small states caught in debt bondage to China so that these countries "risk losing both their most valuable natural assets and their very sovereignty" (Chellaney, ibid.).

Objective

Faced with the above varieties of discussions, debates, and opinions, the author intends to (1) point out that it requires more complex inquiries than any simple verification of the two interrelated concepts – neocolonialism and neoimperialism – whose stems were originated centuries ago and (2) provide a framework for understanding these discussions and debates in the current context of the rise of China and the impact it has brought to the existing world order.

This chapter aims to argue that, on the one hand, China's economic success signifies Beijing's movement toward a more positive structural position in the distribution of global wealth, while at the same time it also challenges many "enduring aspects" and "global arrangements" defined by the core powers of the existing world

order. On the other hand, the rise of China's capital and trade expansion in developing countries of the Global South provides them with both opportunities and challenges. China's global rise represents capitalist world system's new rhythmic cycle of the rise of a new hegemon. It offers an opportunity to developing countries in terms of enlarging their "room for maneuver" and increasing their "upward mobility" (Vadell et al. 2014). On the other hand, China's rise also poses a great challenge to many developing countries in terms of outcompeting their market share and technology development and causing their economic "deindustrialization" and "primarization." It is in the latter context that China-associated "neocolonialism" and "neoimperialism" emerge to become a catchy phrase.

Theoretical Conceptualization

Conceptually and theoretically, the study of imperialism can be approached from different perspectives and at different levels of analysis. Metrocentric theories focus on the internal necessity of imperialist states to export their surplus capital. Like Marx, Hobson, Lenin, Wallerstein, and many others, the author intends to emphasize the organic link between growth in capitalism and the expansion of imperialism. In other words, the driving force behind the expansion of imperialism is historically linked with economic factors in terms of capital, wealth, market, resource, and trade. Whereas, systemic theories of imperialism, often identified by realist theories of IR and IPE, see imperialism as an unavoidable competition between great powers (Cohen 1973). Interstate struggle for survival and dominance leads core powers to seize territories, and peripheral territories become target for competition over resources in order to maintain an effective balance of power. The so-called race for Africa was a classic case of imperialism driven by systemic competition in the late nineteenth century.

In line with Marx's understanding, capitalism as global system cannot be constrained within the boundaries of a single country or nation-state

(Marx and Engels 1848). Likewise, Marx's claim of capitalism's inherent tendency of imperialism, i.e., colonialism, is shared by historian Bipan Chandra, who posits that: "by its very nature capitalism could not exist in only one country...it expanded to encompass the entire world, including the backward, noncapitalist countries...it was a world system" (Chandra 1981: 39). Ironically, the imperialist nature of capitalism in Marx's time seems to be much truer today than ever, as one distinguished scholar notes:

> ….. for the first time, capitalism has become a truly universal system. It's universal not only in the sense that it's global, not only in the sense that just about every economic actor in the world today is operating according to the logic of capitalism, and even those on the outermost periphery of the capitalist economy are, in one way or another, subject to that logic. Capitalism is universal also in the sense that its logic – the logic of accumulation, commodification, profit-maximization, competition – has penetrated just about every aspect of human life and nature itself…. (Wood 1997: 1)

Other scholars, such as Hobson, see imperialism as resulting from a capitalist inherent pursuit of additional/overseas markets (Hobson 1965). As productive capabilities in mature capitalist countries increased over time, and following harsh competition among Western nations on existing and emerging industries, Hobson believed that overproduction would sooner or later outgrew the needs of domestic market. In addition, the rise of financial capitalism also began to look for foreign markets for investment so as to increase the profit margin – "surplus capital" (Hobson, ibid.: 82). As Hobson sharply states, "Imperialism is the endeavor of the great controllers of industry to broaden the channel for the flow of their surplus wealth by seeking foreign markets and foreign investments to take off the goods and capital they cannot sell or use at home" (Hobson, ibid.: 85). Accordingly, newly occupied overseas markets would provide financiers a golden opportunity to further expand their investment operations (Hobson, ibid.: 29). Colonialism (direct political dominance) provided the basis for protecting these overseas expansions.

Chinese Capitalism and Imperialism: From a World-Systems Perspective

Being fundamentally in line with the Marxist and Leninist worldview on the expansion of capitalism and imperialism, the world-systems theory (WST) developed by Wallerstein (1974, 1979, 1997, 2004) provides a comprehensive theoretical framework for understanding the historical evolutions and transformations involved in the rise of the modern capitalist world system. Seen from the WST, the world system expanded over a long historical spectrum and brought different parts of the world into its division of labor. It is the rigid division of labor imposed by Western imperialism that has led to a perpetual condition of economic core-peripheral relations. Under this single division of labor within one world market, a political structure consisting of sovereign states and multiple cultural systems interacts within the framework of an interstate system (Wallerstein 1974).

The world system is conceptualized as a dynamic one in which changing positions within the system's structural stratifications is not easy, but possible by taking advantage of the "upward mobility" and "room for maneuver" brought about by global capital mobility and relocation of production. Historically, capital mobility and redivision of labor within the capitalist world economy have been taking place continuously, which have periodically brought about and resulted in flows of commodities, labor, and capital across different geographical areas through chains of production, exchange, and investment. China and India are seen as the last reserves (unexploited areas) that have been integrated in the capitalist world system (Li 2008). The WST explains the system's *embedded inequalities* in which nation-states have quite different development stages within a seemingly unified global economy. In other words, different countries are located at different stratifications of the capitalist world system

According to the WST, the world capitalist system is understood to be embedded with fundamental features, characterized by a series of cyclical rhythms – economic prosperity or crisis, upward or downward mobility, and rise and fall of new economic powers. More importantly, this series of cyclical rhythms was followed by the rise and decline of new guarantors (new hegemons) of the world system. The new and each one had its own unique pattern of control (Wallerstein 1997). In line with this understanding, the emergence of China is perceived as a good example of the system's rhythmic cycles in the upward mobility. Despite the fact that China is politically ruled by the Communist Party, China is believed to continue to follow the core features of the capital accumulation and the law of value. Seen from the perspective of liberalism, emerging powers, such as China, are currently the winners in the era of globalization because their economic growth and wealth accumulation are generated from within, not from without, the world capitalist system under the US-led liberal world order (Ikenberry 2008, 2011). It is thus believed that due to its economic integration and market dependence in the system's mode of production and capital accumulation, China will continue to shape and constrain the system's law of value.

When this chapter, like other literatures, establishes the nexus between the expansion of capitalism and the extension of imperialism, it argues that the establishment of capitalism and its global expansion is the outcome of a political economy project (Li and Hersh 2004). The capitalist mode of production was born in Europe, and its starting point was the imposition of ruthless coercion through the compulsory enclosure and enforced formation of new property relations and legal systems. With the restrictive access to land accompanying industrial transformation began a new form of production relations based on capitalist accumulation. Europe's expansion overseas, which began with military conquests and imposed trading relationships, resulted in the imperialist extension of the capitalist system of production. The globalization of the capitalist world system was realized through slave trade, colonialization, "free trade," and world wars, including three historical development phases: a merchant phase of trade, a phase of industrial expansion, and an expansive period of financial capitalism. The capitalist world system has been maintained through fixed "social, political, and economic *arrangements*" (Strange 1988, *italic* added). These

imperialist arrangements are what we know as the current "world order." They "are not divinely ordained, nor are they outcome of blind chance," but rather, they "are the result of human decisions taken in the context of man made institutions and sets of self set rules and customs" (Strange 1988: 18).

Is the global economic and political rise of China represents a contemporary new round imperialist expansion of the capitalist world system? The author, in his newly published ed. volume *Mapping China's One Belt One Road Initiative* (Li 2018a), argues that on the one hand, the economic rise of China is an integral part of the continuously historical process of the global expansion of capitalism, while on the other hand, Chinese production and capital outward expansion would unavoidably challenge the status quo of the patterns of relationships shaped by the existing global arrangements (world order).

The Kautsky-Lenin Dichotomy

In his article in 1914 on "Ultra-imperialism" (Kautsky 1914), Kautsky argued that core capitalist countries were able to find a way out of vicious competition and destructive wars among the industrial powers. He believed that there would emerge a new stage, termed by him as "super-imperialism," in which monopoly had reached such a high stage that it could effect "the joint exploitation of the world by internationally united finance capital" (Kautsky, ibid.). According to Kautsky's analysis, the only way that could enable core capitalist countries to sustain the basic profit of the exploitation system, while avoiding economic stagnation, was for powerful core nations to form a "cartel" in order to maintain their export markets and super-exploitation. As a result of capital alliance, he postulated that war and militarism were not necessarily the inherent features of capitalism and that a peaceful "ultra-capitalism" (imperialism) was likely. In the stage of ultra-capitalism, core powers understood the importance of coalition and cooperation as well as the necessity of subsuming their economic contradiction and antagonism to a system of coordination, whereby they would jointly exploit the underdeveloped world.

Contrary to Kautsky, Lenin in his *The Highest Stage of Capitalism* (Lenin 1948) strongly opposed Kautsky's postulation of an "ultra-imperialism" world order. He understood capitalism as being in the transition from the stage of free competition to the stage of monopoly. In a similar manner to Hobson's analysis, Lenin argued that capitalism had transformed itself from being a nation-based competitive system in Marx's day into imperial capitalism characterized by huge monopolistic or oligopolistic corporations. As capitalist corporations continued to grow over time, Lenin was convinced that financial banks and industrial companies were quickly developing into monopolies involving "cartels, syndicates and trusts" that would expand and "manipulate thousands of millions" across the globe (Lenin, ibid.).

Lenin added another aspect to Marx's theory of capitalism, i.e., a "fourth law" of capitalism – the law of capitalist imperialism. According to Lenin's analysis, "Imperialism is capitalism in that stage of development in which the dominance of monopolies and finance capital has established itself; in which the export of capital has acquired pronounced importance; in which the division of the world among the international trusts has begun; in which the division of all territories of the globe among the biggest capitalist powers has been completed" (Lenin, ibid.). It is precisely in this connection that Beijing's Belt and Road Initiative is perceived as the coming dominance of monopolies of Chinese financial capital. It is also seen as a means to reintegrate Africa and the Middle East into China's system of accumulation, as a countermeasure or an alternative system to the dominant Western-led system of accumulation (van der Merwe 2018).

In Lenin's view, as industrial nations at the core of the world economy competed to expand their exploitative profit sphere, their interests intersected and conflicted, leading to inevitable wars over overseas markets and sources. Thus, colonialism and imperialism were the consequence caused by economic competition between core states. It is also in this regard that major Western countries, particularly the USA, are resistant to China's Belt and Road project worrying about Beijing's long-term hegemonic objective. An Australian

professor even straightforwardly declares that China's One Belt, One Road is a challenge to the US-led order (White 2017).

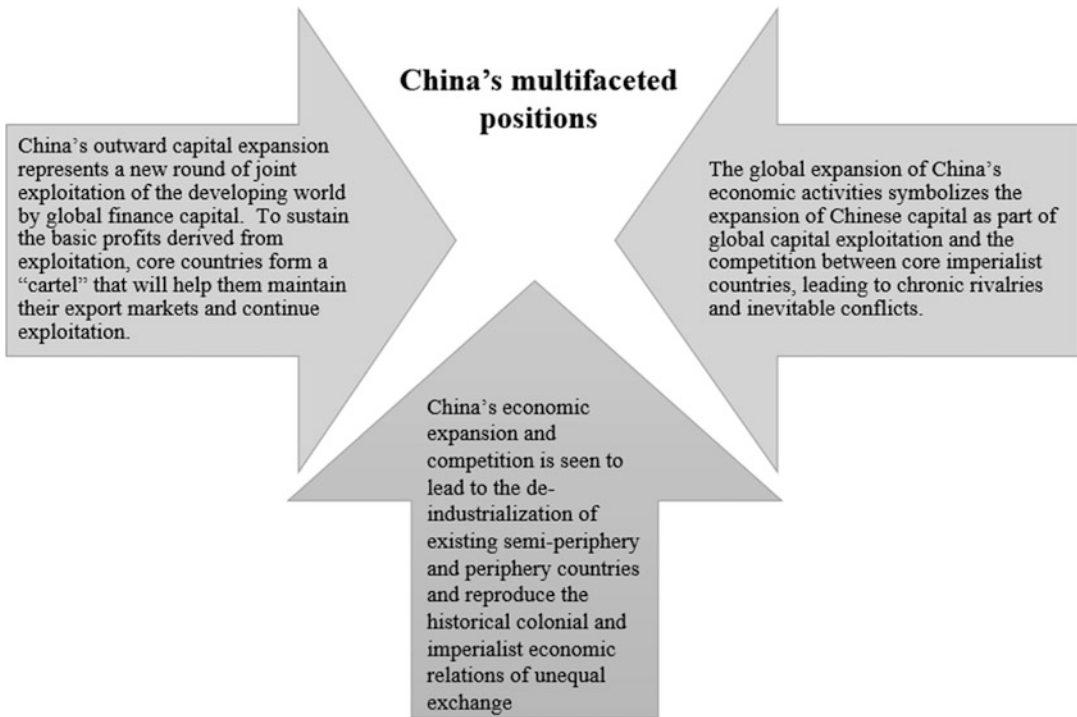
Both Kautsky and Lenin intended to raise Marx's analytical level of domestic capitalism to a level of international economic relations among capitalist core states. Ironically, the Kautsky-Lenin debate is perhaps more relevant today than in their time. Kautsky's notion of ultra-imperialism perhaps fits better today's globalization and transnational capitalism in terms of capital alliance not only between national and multinational capitals but also between state companies and state elites of both developing and developed countries. Lenin's comprehension of the crisis of "imperial capitalism" characterized by monopolistic or oligopolistic corporations integrated with financial capital depicts today's financial crisis and global competitions more actually than his time. What we are witnessing today is the fact that inter-capital competition is intensifying not only between core capitalist countries but also between them and emerging powers.

For example, the China-led financial institutions, such as the Asian Infrastructure Investment Bank (AIIB) and the new Silk Road Foundation, intend to support Beijing's "Belt and Road Initiative." Almost all Western powers (excluding the USA and Japan) joined the AIIB. The situation reflects Kautsky's ultra-imperialism theory: Chinese and global capitals intersect and merge in order to jointly extract profits from the rest of the world in a form of amalgamated finance. Ironically, one scholar even argues that the rise of China/BRICS will not lead to any substantial change in the capitalist world system; rather, what we are witnessing is a process of adaptation and co-optation of emerging powers, especially their economic elites, by existing core powers and leading transnational economic classes (Taylor 2016). Today the world has entered into a new age of "imperialism of the corporate state" (Kapferer 2005:12). The incorporation of Chinese capital and its outward expansions is leading the world into a stage of oligopolistic imperialism in which core capitalist countries, including China,

are accelerating both bargaining and conflict over profit distribution, market share, and resource security. In this context, China is obviously torn between coalition and cooperation with the USA and other core capitalist countries on the one hand and competition and conflict with the very same countries on the other. The China-USA trade war since early 2018 seemingly proves Lenin's arguments on inter-imperialist rivalry right.

The Complexities of China's Multifaceted Positions in the Capitalist World System

To put China in the context of the variety of discussions and debates on imperialism presented in the previous sections, the author maintains that China's global economic rise and expansion reflects the key theoretical tenets both by metrocentric theories in terms of internal necessity and driving force and by systemic theories of imperialism in terms of interstate competition for survival and dominance. However, the Chinese case indicates a complexity in which China's economy simultaneously occupies all three stratifications (core, semi-periphery, and periphery) of the world system, and the country is having economic relationships with different countries at different stratifications of the capitalist world system. This implies that the Chinese situation embodies a dual complexity underlining the Kautsky-Lenin dichotomy. Who is right: Kautsky's capital coalition and joint exploitation or Lenin's capital conflict and war? Or the Chinese case actually represents two sides of the same coin?

When looking at China's economic integration with the capitalist world system in the past decades, the world is witnessing the rise of a country that is having multifaceted positions in the current capitalist world system (see Fig. 1). These multiple positions raise a number of interesting questions regarding the interrelationships between China's rise and the different countries that are located in the different stratifications of the world system.


China's Global Rise and Neoimperialism: Attitudes and Actualities, Fig. 1 The complexities of China's multifaceted positions in the world system. (The author's own figure)

China: From a Victim of Imperialism to an Imperialist Comprador?

During the following decades of China's economic reform in the late 1970s, China had been a *victim* of Kautsky's "joint exploitation of Ultraimperialism." The Chinese elites believed that economic mobility in the hierarchical structure of the world economy entails dramatic structural changes and requires higher levels of production and technology. This implies that China had to push forward greater vertical linkages to the capitalist market place and deepen its internal accumulations through exploitation of surplus labor. Rapid industrialization, in the view of the Chinese neoliberal elites, must attract foreign investment by providing "favorable" concessions to global capitalists and multinational companies and by reducing welfare costs. By doing so, it is hoped that the external linkage of the Chinese economy with the global economy could reinforce the ruling elites and promote internal expansion.

Beijing had been acting as a comprador for global imperialist capitalism during the early reform period. The country was seen as the biggest savior of the capitalist world system by subjecting its economy and vast population to the capitalism's "law of value" and labor exploitation as well as by taking over the low-end, labor-intensive manufacturing in the global supply chains. The penetration of imperialism into the Chinese society and economy was achieved through "(i) investments by transnational corporations, (ii) the activities of global finance, (iii) the influence of international financial institutions like the World Bank and the World Trade Organization, and (iv) the channels of culture and ideology" (Lotta 2009: 29).

Today, China's four-decade capital accumulation has enabled it to create its own alternative financial institutions, such as the New Development Bank (the BRICS Bank), the Asian Infrastructure Investment Bank (AIIB), and the new Silk Road Foundation. These institutions

purposefully aim to facilitate China's emergence as a global power. Not denying the anti-imperialism and counter-hegemony elements that underline these China-led global financial institutions, they also reflect Kautsky's ultra-imperialism theory in which Chinese capital and the capital of others core countries merge and intersect in order to jointly exploit the rest of the world in a form of amalgamated finance. The decision by the International Monetary Fund to include the Chinese currency (RMB) in the Special Drawing Rights (SDR) basket paved the way for a broader use of the RMB in global trade and finance, securing China's standing as a global economic power.

But, it will be a mistake to draw an analogy between China as an emerging power and the bloc of Western developed countries. China's accumulation of surplus value extracted from its enormous proletariat and through trade surplus with the USA is also leading in international aid and foreign investments in Africa and Latin America.

China: A Rising Counter-Imperialist Force?

The rise of China with its global economic expansion is invariably "affecting" and "disturbing" a number of established imperialist "global relationships" and "global arrangements" as well as imperialist "structural power" of the existing world order.

After a high economic growth for four decades, China is increasingly becoming an integral force of Lenin's global "financial oligarchy" and "imperial capitalism." Beijing is now engaging in competition with the core capitalist states in terms of capital expansion, overseas resource acquisition, and periphery labor exploitation (Li 2016). Consequently, the incorporation of Chinese capital and its global economic expansions leads the world into a stage of oligopolistic imperialism in which core capitalist countries, including China, are accelerating the conflict over profit distribution, market share, and resource security. The "menace" of the world's most populous country in commodity consumption and wealth collection has largely reduced the profit margin of the traditional core states. China's struggle to move its position up in the global supply chains and to take a larger share of global wealth and resources

is perceived as an attempt *to redivide the already divided world*. To put it more directly, Beijing's rampant capital and wealth accumulation together with its rising military power potentially challenges the capacity of the core countries of the capitalist world system to defend gross inequalities in the world order and the tremendous privilege and power this global disparity of wealth has brought for the core countries in general and the USA in particular.

While most analyses focus on the economic arena (hard power), the Chinese challenge is definitely not only material but also ideational. The Chinese state-led development model is ideologically unacceptable to the defined norms and values of the liberal order. Even today China is not recognized as a "market economy" by many of the existing core powers of the liberal world, such as the USA and EU. The "Beijing Consensus" (Ramo 2004), in opposition to the "Washington Consensus," is a message China sends to the Global South: developing nations must not be constrained by the modernization paradigm defined neoliberal imperialism, and they should establish their own path of development according to their challenges. "China is writing its own book now. The book represents a fusion of Chinese thinking with lessons learned from the failure of globalization culture in other places. The rest of the world has begun to study this book" (Ramo, ibid.: 5). "The Beijing model has grown to become an unavoidable process which can only be neglected at the cost of standing on the wrong side of economic history" (Asongu et al. 2018). As one commentator points out in *The Times*, the global debate some years ago was about whether the Chinese authoritarian-capitalist model would be able to survive in a global free market, and today "China's political and economic system is better equipped and perhaps even more sustainable than the American model" (Bremmer 2017).

Through a double-track strategy in joining and modifying the existing international institutions while setting up its own international financial institutions, China's economic rise is changing Beijing's position from a passive rule-follower to a proactive rule-maker leading to an emerging

world order "with Chinese characteristics." In other words, China has two optional choices today: First, it can choose "to operate from within existing institutions to enhance its position through seeking the redistribution of decision-making authority, or by using its influence to obstruct and contain the progressive evolution of the liberal rules, practices, and norms of an institution in ways that threaten China's interests" (Ikenberry and Lim 2017: 2). Second, if the first choice does not give Beijing the expected result, and then Beijing can create its own international institution. Both choices are affecting in different degrees the *patterns of global relationships* that generate gross inequalities in the world order and tremendous privilege and power this global disparity of wealth and power have brought for the core countries, especially the USA. Currently China is implementing both choices at the same time.

One of the Chinese ways to modify the existing world order which is historically shaped and maintained by Western imperialism is to form across regional alliance, such as the BRICS (Li 2014, 2019, forthcoming). Despite its many weaknesses, the five BRICS countries are playing an important role on the global political stage as they are coordinating foreign policy positions on key issues and are providing direction to different aspects of global and regional governance. BRICS has been converted to an "institutional agency" (Contipelli and Picciau 2015: 93). Many of BRICS' policy positions on, among others, climate change, poverty reduction, nuclear proliferation, etc. are legitimized as an active voice in the claim for a transition toward a multi-lateralism in global governance. In particular, the rise of BRICS as a new actor within the international system accelerates the evolution of a *new agenda* within global governance, such as the G20, the IMF, etc. (Duggan 2015).

A specific area for investigating the changes in patterns of global relationships is international aid system, a Western-led imperialist system dominated by North-South relations. Beijing's increasing role in the international aid system can be seen from two perspectives: (1) China has emerged to become a major actor in the international aid

arrangement, challenging institutions and norms which have been long established by the West; and (2) within the aid system itself, the size and volume of Chinese aid together with global expectations will continue to increase. A major indicator is that China's aggregation of aid resources is increasingly pricing out many Western actors, who a decade ago were undisputable leaders in the field. As one African scholar points out:

> The entry of China into the aid system is changing this power of the traditional aid system to shape the development route, as it offers a new set of ideas and practices that, first, is breaking the monopoly of Western aid to define, and second, is also proving attractive to aid recipient countries, particularly in Africa. (Opoku-Mensah 2009: 12)

China: An Emerging Imperialist?

In the Global South, China has one historical advantage when discussing about imperialism and colonialism. That is China has no history of imperialist aggression or colonial domination, and the country itself was a victim of European imperialism in the nineteenth and early twentieth centuries. This shared history with many countries in the South puts China in a good position to project the image of rising China as a benevolent power.

Although it is against China's long-standing self-identity as a leader of developing countries, China's new status as a world economic and political power is paradoxically and inevitably turning Beijing into an image of a global *hegemon*, a perceived imperialist. Today, the debate about whether China is an emerging colonialist predator or development partner to the Global South is still going on, and the majority of the discussions in both media and academia have been ideologically and politically guided by West-dominated opinion makers. Economic relations between China and the Global South are increasingly portrayed as "neocolonialism" for "neoimperialism" (The Economist 2008; Sharife 2009).

Numerous literature point to the fact that China's global competition is causing the peripheralization of existing semi-periphery countries within the current world system. One Chinese researcher within the field bluntly predicted more than a decade ago, "China's competition

will completely undermine the relative monopoly of the existing semiperipheral states in certain commodity chains. The value added will be squeezed, forcing the traditional semi-peripheral states to accept lower wage rates close to the Chinese rates [which they cannot do it]" (Li 2005: 436, 2008). China's competition breaks down the relative monopoly of the existing semi-peripheral states in certain global commodity chains and causes a certain degree of deindustri-alization or peripheralization of many existing semi-periphery countries due to the change of their position from being an exporter of manufacturing goods to being a commodity supplier.

This above line of thinking and argument is shared by many scholars in Latin America (Bernal-Meza 2012; Dussel Peters 2016; Guelar 2013; Sevares 2015). Although trade relations between China and Latin America and Africa brought about "commodity boom" in the regions during the 2000s, the stimulation of the trade was largely due to the fact that China's internal capac-ity to produce commodities was much insufficient to satisfy its worldwide "made-in-China" devel-opment. Following the type of trade pattern, China's capital and production expansion in the Global South unavoidably brings about a new circle of "unequal exchange" reflected in the con-ventional North-South dependent relationships. Some analyses conclude that China is simply implementing a pragmatic mercantilist trade pol-icy that reconfirms Africa's economic position in the world economy as a commodity supplier and a modest consumer market (Holslag 2006; Taylor 2016). The logic goes: when China moves to the core position, it still needs the periphery.

Given by the above arguments supporting Chi-nese "neocolonialism" or "neoimperialism" which focus on a few economic indicators, such as natural resources and trade, it must be empha-sized here that these arguments are too econocentric, and they often ignore other impor-tant transformative role China is playing beyond the economic realm. Beijing is using its influence in the Global South, particularly in Africa, as a leverage to influence economic and political deci-sions in global governance (Kofigah 2014). In

many situations China has repeatedly and increas-ingly been seen as the leader championing the concerns of the South, for example, at the WTO during the Doha round negotiation.

Another critical aspect to remember is that when Western neoliberalism has been shaping and dominating the global development of both theory and practice since the end of the Cold War under "the end of history" paradigm (Fukuyama 1989), China's "economic success with Chinese characteristics" seemingly offers an alternative economic development model to the Global South. Regardless of the depiction of China as imperialism, China's emergence as an alternative aid donor, investor, and economic partner seems to be one of the major sources of attraction for developing countries. According to a report from the World Economic Forum, "To become more like China" has turned the African continent to a positive direction: "The top 10 performing Afri-can countries have a combined growth rate that averaged 7.6% over the past decade. Nigeria, Ethiopia, the Democratic Republic of the Congo, Tanzania, Kenya, Uganda, Ghana, Mozambique, Angola and Zambia also have a combined popu-lation of around 700 million people" (Borg 2016).

Africans are generally receptive to China's developmental approach, and they treasure the long-standing historical connections built over decades with their Chinese partners; and they feel that China shows Africa far more understanding, sympathy, and respect than paternalistic Western countries (Brautigam 2010). On the one hand, China is indeed investing on and exploiting Africa's natural resources based on economic moti-vation and market dictum, but this must not be automatically identified as the foundation of "neo-imperialism." On the other hand, as one research article sharply points out, "based on the data avail-able, there is no tangible evidence that supports the view that consciously China's intention is to con-trol Africa politically or that China has a hidden agenda to divide some African territoriality for its political gains" (Lumumba-Kasongo 2011: 259).

If neoimperialism refers to the use of eco-nomic, political, and military pressures to control or influence other countries, China is arguably a very different world power who stands in stark

contrast to Western powers. The Chinese principles of "non-conditionality" and "noninterference," among others, have laid the foundation for China's aid and foreign policy strategy since the 1950s. The pillars, which support Beijing's international aid and financial loan principles, deviate in many ways from those of traditional Development Assistance Committee (DAC) donor countries and international banks and stand upon noninterference, mutual benefit, and non-conditionality. Despite the challenges to the long-term feasibility and sustainability of these principles, they have strong "symbolic power" and "norm diffusion" effect that disassociates China with the notion of neoimperialism.

Concluding Remarks: Two Sides of the Same Coin

Very often media tend to apply eye-catching and sensational terms such as neocolonialism and neoimperialism in discussing and interpreting China's recent surge of influence on the Global South, without even understanding the historical context and the very nature of these terms. Even in the imperial history of the Chinese empire characterized by the Chinese historical imperial "tributary system" in Ming and Qing dynasties, the Chinese system was fundamentally different from that of European imperialist relationship with the colonies. The notion of Chinese "tributary system" was coined by Fairbank to refer to "a set of ideas and practices developed and perpetuated by the rulers of China over many centuries" (Fairbank, cf. Lee 2017: 29). It consisted of a network of loose international relations with China as the center, and the "tributary states" were largely autonomous and virtually independent. A worldwide consensus in China is not historically and culturally a Western colonial type of core country that is coercive to impose a relationship between political entities characterized by hierratical core-periphery relations driven by either metrocentric or pericentric interest.

A heuristic way to understand the discussion about "Chinese neoimperialism" is to contextualize China's rise and expansion as part of and within the logic of the capitalist world system's uninterrupted cycles of capital mobility and redivision of labor. In other words, China's global economic rise and outward expansion must be conceptualized as an inevitable consequence of capitalist world system's modus operandi.

Lenin (1917) understood imperialism as a capitalist country's endeavor to find overseas markets and investment opportunities when its domestic economy reached to a maturity with excess surplus and production overcapacity. According to Lenin's theoretical assumption, unless the country were able to keep finding new markets abroad to swallow its domestic overcapacity, it would face an economic implosion, causing internal socioeconomic and sociopolitical instabilities. This is exactly the kind of situation China is facing today. The circumstance is, in line with Lenin's expectation, pushing China toward one option – outward expansion. Beijing's gigantic expansionist "Belt and Road" project was first and foremost designed to sustain domestic economic growth.

When we place China's recent rise in the context of discussing imperialism and anti-imperialism, definitive conclusions do not exist, because we are still in the midst of the process we seek to comprehend and assess. Yet multiple phenomena can be observed, and multiple implications can be generated. The difficulty to make a convincing conclusion is the fact that multifaceted phenomena and multidimensional interpretations are intertwined, which makes it impossible to answer questions, such as "is China a rising imperialist power?" "is China's economic relations with the Global South north-south or south-south?" "is China's Belt and Road initiative an imperialist project?" "does China's global financial role lead to Chinese credit imperialism?" and so on.

When decomposing the Chinese economy, it is not difficult to find that the country is simultaneously occupying multiple positions in all three stratifications of the capitalist world economy – core, semi-periphery, and periphery – by taking into consideration global supply chains (GSCs) and global value chains (GVCs). China's multiple positions are enabling the country to challenge and compete with core countries in high-tech sectors and financial institutions and with semi-

periphery and periphery countries in manufacturing and commodity industries.

In a word, China's capital and trade expansion in developing countries of the Global South represents two sides of the same coin, with one side showing great opportunities in terms of political and economic room of maneuver and upward mobility and another side exhibiting serious challenges in terms of the risk of being outcompeted.

C

China's National Question Since 1949

Colin Mackerras
Department of Business and Social Innovation, Griffith University, Nathan, QLD, Australia

Description/Definition

The Chinese nation is conceived as a unified state composed of 56 ethnic groups, the majority Han and 55 state-recognized ethnic minorities. In theory they are all equal, though in practice the immense population and other dominance of the Han makes that impossible (in 2010, the ethnic minorities made up only 8.41% of China's total). There is a political system of limited autonomy in the places where the ethnic minorities are concentrated, the five main ones being equivalent in status to provinces. These are the Inner Mongolian Autonomous Region, the Xinjiang Uyghur Autonomous Region, the Guangxi Zhuang Autonomous Region, the Ningxia Hui Autonomous Region, and the Tibet Autonomous Region.

The minority economies have greatly expanded and modernized, especially in the twenty-first century, and absolute poverty has been vastly reduced. However, serious inequalities persist both within and among the minorities themselves and, with a few exceptions, they are poorer than the Han. Many of these inequalities are due more to regional disparities than to ethnic. Tourism has been greatly promoted since the 1980s and had contributed to economic growth and to preserving ethnic cultures, but has been criticized for exacerbating inequalities and for showing tourists a false and reconstructed culture.

The Chinese state has zero tolerance for separatism. In practice only two minorities have spawned major, though so far unsuccessful, separatist movements, the Tibetans and the Uyghurs. In suppressing these two movements, China has been charged with colonial attitudes and serious human rights abuses. In both cases, China's defence is the preservation of the unity of the Chinese nation.

China has been accused of a new imperialism, and its attitude toward its ethnic minorities and insistence on its territorial space are among the reasons. However, neither the theory of ethnic minorities and limited autonomy nor the concept of the unity of the Chinese nation is imperialist.

Introduction

In October 2019, the People's Republic of China (PRC) celebrated its 70th anniversary. Although United Nations demographers believe that India's population will shortly overtake China's, the PRC has since its foundation been the world's most populous nation-state, with United Nations data estimating the total number of people in China in mid-2019 at 1,433,783,686. In terms of territory, China stands in third place, exceeded only by Russia and Canada.

In discussing China's "national question," we need to consider precisely who makes up the population of China in terms of nationality, particularly questions relating to ethnicity.

The Chinese term meaning "Chinese nation" is *Zhonghua minzu* 中华民族. In a major Chinese-language dictionary, Chen Yongling 陈永龄 (1986, p. 573) defines it as "the general term covering all ethnic groups," of which the PRC state has come officially to recognize 56. China's foremost anthropologist and ethnologist Fei Xiaotong 费孝通 (1910–2005, also romanized in the old Wade-Giles system as Fei Hsiao-tung) conceived of the Chinese nation as diverse, because of the different ethnic cultures among the 56 ethnic groups, but also essentially united. He summed up his concept in the phrase "plurality and unity in the configuration of the Chinese nationality" (Fei 1988), the title of a major lecture he gave in Hong Kong in 1988. As scholar Zhou Minglang (2016, p. 128) interprets Fei, the Chinese nation "is a national entity that has developed from a common emotion and morale for a shared destiny of successes and failures."

Certainly, the idea of the Chinese nation has been used by many Chinese leaders to promote national unity. The "great rejuvenation of the Chinese nation" (*Zhonghua minzu weida fuxing* 中华

民族伟大复兴) has been a common theme since the late twentieth century. Chinese President (since 2013) and General Secretary of the Chinese Communist Party (CCP) (since 2012) Xi Jinping equates it with his notion of the "China Dream" (*Zhongguo meng* 中国梦).

The term *minzu* 民族 raises questions in the sense that it has two distinct meanings. One is close to the nation-state that is an internationally recognized entity, with borders, an independent government, and its own national institutions, an example being "the Chinese nation," mentioned above, which is currently coterminous with the PRC. But *minzu* is also a nationality or ethnic group *within* a nation-state. Among the 56 state-recognized ethnic groups in the PRC, the Han is the dominant and most populous one, accounting for over 90% of China's total, while the other 55 are counted as the "minority nationalities" (*shaoshu minzu* 少数民族). The term *shaoshu minzu* is used in Chinese-language publications coming from the PRC. English translation varies, possibilities including "minority nationalities" and, more recently, minorities, minority ethnic groups, and minority ethnicities. This sense of the term *minzu* is interrogated more thoroughly below.

The PRC is a nation-state dominated by the Chinese Communist Party (CCP, *Zhongguo Gongchan dang* 中国共产党). The CCP led by Mao Zedong won the civil war against the previously dominant Nationalist Party (*Guomin dang* 国民党) in 1949, leading to the founding of the PRC on October 1 that year. Since that time the PRC has held power in most of those territories claimed as part of China. At the end of 1978, 2 years after Mao died in 1976, Deng Xiaoping instituted policies of reform and modernization, which have exerted profound effects on China's economy, society, politics, and culture.

Territories in which the CCP claims full sovereignty and rules as part of China include some with extensive minority populations, making up about 60% of the total territory. These include Xinjiang in the far northwest, Tibet in the southwest, Yunnan in the south, and Inner Mongolia in the northeast. From time to time diasporas and others have contested Chinese rule in particular minority areas, but the PRC is very firm that Chinese unity is a core principle. There will be separate discussion of Tibetan areas and Xinjiang.

This chapter relies mainly on printed sources, primary and secondary, both in Chinese and English. However, it also appeals to extensive personal experience in ethnic areas in China, the author having traveled frequently in many of them since 1982. (An extensive bibliography of the main items relevant to ethnic minorities is available in Mackerras 2018.)

Politics in the PRC and Ethnic Minorities

The minorities make up only a small proportion of China's population but inhabit a large part of China's territory, much of it near borders. Put another way, most of China's borders are minority areas (*minzu diqu* 民族地区). So the political importance of minorities is far greater and out of proportion to their population.

The Concept of a *Minzu* and Identity

Minzu in the sense of an ethnic group within a larger nation-state has always been officially understood in the PRC according to Stalin's definition of 1913 (1953, p. 307): "a historically constituted group of people, having a common territory, a common language, a common economic life and a common psychological makeup, which expresses itself in a common culture." It is this definition that spawns the concept of minority nationality or minority ethnic group (*shaoshu minzu*).

The Nationalist Party recognized five ethnic groups in China: Han (the majority and the one most commonly associated with "the Chinese"), Manchus (who had ruled China under the Qing dynasty from 1644 to 1911 but were overthrown by Sun Yat-sen and his Republicans in 1911), the Tibetans, Mongolians, and the Hui or Muslims. When the PRC was established, many groups came forward to express their identity, because the new government promised a better life for all oppressed groups. Classification of these ethnic groups was a major project of the 1950s, with "extensive field work" beginning in 1953 to

establish which were genuine ethnic groups and which were not (Fei 1980, p. 94). The final number of 55 minorities was reached in 1979, when a small population ethnic group called the Jino (living in Yunnan Province) was formally recognized as a *minzu*. (For a range of articles on theoretical and identity questions, especially ethnic classification, see Mackerras 2011, Vol. I, pp. 27–203.)

Stalin's definition applies much more readily to ethnic minorities of the past than to those of the present. Migration processes have tended to dilute inhabiting a "common territory," and modernization has affected any "common economic life," while globalism has made "common culture" much less easy to define. However, despite difficulties, Stalin's definition does at least establish some firm criteria, upon which a judgment can be made about who and what make up a specific ethnic group.

Two case studies exemplify important difficulties and raise interesting issues. They are the Hui and the Manchus.

Hui 回is the name applied to people who are Muslim by religion but Han in other ways. They speak and write Chinese and have contributed to Chinese literature. They inhabit areas generally not too different from other Chinese and live all over China, even including the Tibetan capital Lhasa. In general, their "economic life" is very similar to that of the Han. Being Muslim by religion has a very important implication. This is that Han cannot be Hui. Han who change religion to become Muslim also change their ethnic group to be Hui.

The Manchus come originally from the northeast of China. When they ruled China, they greatly expanded its territory but gradually lost their identity and became absorbed into the Han. Nowadays, the Manchu written and spoken language is very rarely used. It is interesting that Cao Xueqin, the main author of the late eighteenth-century social novel *A Dream of Red Mansions* (*Honglou meng* 红楼梦), often considered China's greatest, was Manchu.

In the early days of the PRC, especially during the Cultural Revolution (1966–1976), Hui and Manchu ethnic identity was very blurred. People who might otherwise be considered Han were not too keen to emphasize their Muslim identity. Manchus might conceal their ethnic identity, because they feared discrimination or contempt as belonging to the minority group that had dominated the Chinese state for so long in the past. In the 1980s, however, ethnic identities revived strongly in China. Referring to the Hui, Dru Gladney (1991, p. x) writes of "the emergence of a new ethnoreligious identity in China." Bai Lian has likewise found that a "reawakened Manchu identity has made the Manchus one of the conspicuous minority nationalities in China." According to the 1982 census, the Manchu population was 4,304,981, but had grown to 9,846,776 according to that of 1990. The main reason for such a rapid growth in so short a time was re-registration by people who had been reluctant, or even ashamed, to claim themselves as Manchu in 1982 but were proud to do so in 1990 because of the political change that allowed for the strengthening of their ethnic identity (Bai 2005, pp. 183–184).

Policy Toward the Ethnic Minorities

The CCP's essential policy on the ethnic minorities is that all ethnic groups are equal, but those in China may not secede. However, they may practice a form of autonomy within the areas where they form a concentrated community. The organs of self-government of the autonomous areas can pass their own laws, though these must be submitted to the central government for approval. The head of the organs of autonomous government must belong to the specific ethnic group exercising autonomy.

The details of this policy of autonomy are spelled out in the Law of the People's Republic of China on Regional National Autonomy of 1984, as amended in 2001. They are quite liberal, including the rights of minorities to develop and maintain their own cultures, use their own languages, and follow their own social practices. Article 11 ensures the protection of "normal religious activities," but the same article specifies that "Religious bodies and religious affairs shall not be subject to any foreign domination." The Autonomy Law also provides preferential policies (*youhui zhengce*) in various areas (discussed in Leibold 2016). An example is in education.

Article 71 states that the government will help poor minority families with the education of their children and "in enrollment, institutions of higher education and secondary technical schools shall appropriately set lower standards and requirements for the admission of students from minority nationalities," and special consideration will be given to the "admission of students from minority nationalities with thin populations."

A major limitation to this autonomy system should be noted. Although the head of the governing organ of autonomous places must by law belong to the ethnic group exercising autonomy, this prescription does not apply to the CCP. So, for example, the head of the Tibet Autonomous Region (TAR) must be an ethnic Tibetan, but the Secretary of the CCP in the TAR can belong to any ethnic group, including the Han. In practice, the Party secretary is much more powerful than the government head.

The degree of actual autonomy has fluctuated over the years, depending in large part on the policy of the day. During the Cultural Revolution, autonomy was very restricted, but with the period of Reform under Deng Xiaoping, it broadened greatly and allowed for a much greater degree of freedom. (For a general rundown on autonomy, see Lai 2016.) The policies of greater Sinicization that have followed since 2015 have resulted in a reduction in the degree of autonomy and greater insistence on national unity, both of which have had the effect of restricting freedoms. Personal experience suggests that preferential policies in such areas as education are not affected by these changes.

As of 2003 there were 155 autonomous areas in China including regions, prefectures, and counties. Autonomous regions are equivalent to provinces in level. There are five autonomous regions in China, the earliest being set up before the PRC. The five are, in chronological order of establishment:

The Inner Mongolia Autonomous Region, set up May 1, 1947

The Xinjiang Uygur Autonomous Region, October 1, 1955

The Guangxi Zhuang Autonomous Region, March 15, 1958

The Ningxia Hui Autonomous Region, October 25, 1958

The Tibet Autonomous Region, September 1, 1965

The Chinese authorities have always been clear that they have zero tolerance for separatism or independence movements. International relations specialist Enze Han (2013, p. 5) has developed a theory according to which an ethnic group must satisfy two conditions for aspirations toward separation from China to be realistic. These are (i) that independence must offer an "achievable better alternative" to current conditions and (ii) that the ethnic group must get "substantial external support" for political mobilization, with diasporas a major source. In practice there have been enduring separatist movements only among the Tibetans and Uyghurs, both considered separately. There have been occasional suggestions that Inner Mongolia might join with the independent Republic of Mongolia, but such movements have never posed a serious threat to the Chinese state.

Population

The population of ethnic minorities is very small by comparison with China's total but has risen both in absolute and relative terms. As of the end of 2019, there have been six population censuses under the PRC, held in 1953, 1964, 1982, 1990, 2000, and 2010. The 1953 census counted the minorities at 34 million or 5.89% of the total population; that of 1982 showed them at 66.4 million, or 6.62% of the total. By 2000 the ethnic proportion had risen to 8.41% or 106.46 million people, while the 2010 census put the ethnic minorities at a total of 113.79 million people, which was 8.49% of the total population of China. (See also Mackerras 2016, pp. 117–118.)

Reasons for the rapid rise between 1982 and 2000 are manifold. But we may single out two. One is re-registration, to which reference was already made in discussing the Manchus. The

other is that, at the time the Han were subjected to the one-child-per-couple policy, policy toward the minorities was much more flexible, people in areas with sparse populations being allowed more children. Although most minorities did suffer restrictions, they were far more lenient than those imposed on the Han. Rural Tibetans were allowed as many as they wanted (Mackerras 1994, pp. 233–245). At the end of the twentieth century and beginning of the twenty-first, this writer randomly found several families in rural Xinjiang with nine children each.

Populations among the 55 individual minorities vary widely. Figures from the 2010 census show the most populous as the Zhuang, whom we saw above as concentrated mainly in Guangxi, which borders Vietnam, the smallest in population being the Lhoba (3,682) of Tibet and the Tatars (3,556) of Xinjiang. Those with over five million (2010 census) are Zhuang, 16,926,381; Hui, 10,586,087; Manchus, 10,387,958; Uyghurs, 10,069,346; Miao, 9,426,007; Yi, 8,714,393; Tujia, 8,353,912; Tibetans, 6,282,187; and Mongolians, 5,981,840. (See Zang 2015, pp. 4–5.)

Han Immigration

One highly controversial issue is that of Han migration into minority areas. A frequently heard charge is that Han are taking over land that formerly belonged to other ethnic groups and in that way establishing domination over them. China's official position is that, since these territories are all integral parts of China, the ethnic group of residents there is immaterial. Still, three important cases can indicate some realities of the population composition. These are Inner Mongolia, Tibet, and Xinjiang.

When the Inner Mongolia Autonomous Region was set up in 1947, Mongolians were only 14.81% of the total population. Although the 1990 census showed the proportion somewhat higher at 19.38% (Mackerras 1994, p. 252), the 2010 census saw a drop to 17.11%, still higher than 1947. In other words, the extensive migration of Han into Inner Mongolia preceded the PRC.

In the case of Xinjiang also, we find that Han migration is not new to the PRC. Early in the

nineteenth century, the Han proportion was already quite high (Millward 2007, p. 306). However, it later fell back in the mid-nineteenth century, and, though it had to some extent recovered by the middle of the twentieth century, Han migration under the PRC has been unprecedented.

Census and other figures show that about three-quarters of Xinjiang's population were Uyghurs at the time the CCP took over. In 1954, the Xinjiang Production and Construction Corps, designed to promote economic development and assure security in Xinjiang, functioned as an organization which Han settlers could join for work purposes. This involved extensive Han immigration into Xinjiang. According to census figures, the proportion of the Uyghurs in the Xinjiang population fell from 75.42% in 1953 to 45.48% in 1982, while over the same period, the Han proportion rose from 6.94% to 40.41%. Absolute numbers rose for all ethnic groups, and the total population climbed from 4,783,608 in 1953 to 13,081,633 in 1982 (Mackerras 1994, p. 253). In other words, there was a major reshaping of the population, with most of the Han immigration going to the north and east of the Autonomous Region. The extent of immigration caused great resentment to many Uyghurs, who felt they were being taken over, but justified by the government on the grounds of helping with economic development and national security.

Since the early 1980s, the population has continued to rise in absolute terms. In relative terms, the proportion of Uyghurs and Han has remained reasonably stable. The 2000 census put the Uyghurs at 43.6% and the Han at 40.6%, while official figures for the end of 2015 from the Xinjiang statistical yearbook showed the Uyghur percentage rising to 46.42, that of the Han falling to 38.99.

Some Uyghurs have moved to places outside Xinjiang. Han immigration includes a good deal of rotation, that is, people who go to Xinjiang for short-term work and then return home. In general, the Uyghur population remains concentrated more in the southwest, while Han tend strongly to live in the north and east.

As for Tibet, the issue of Han immigration is extremely fraught, because there is a literature

condemning China for this phenomenon. In July 1996, the Dalai Lama gave a speech to the British Parliament in London in which he claimed that "The destruction of cultural artefacts and traditions coupled with the mass influx of Chinese into Tibet amounts to cultural genocide." In other words, he saw immigration of Chinese into Tibet as on a scale amounting to mass influx, which, combined with the destruction of cultural artifacts and traditions, was equivalent to cultural genocide.

Census data for the TAR suggest that the proportion of Han has always been small. The percentage of Han was 3.68 in the 1990 census, growing to 5.9 in the 2000 census, and 8.17 in that of 2010. Although there are a few Hui, Lhoba, and others, the overwhelming majority of the TAR population is Tibetan.

When talking of a mass influx of Chinese into Tibet, the Dalai Lama includes not only the TAR but also all Qinghai Province and parts of Sichuan, Yunnan, and Gansu Provinces as well. His concept of Tibet is very much larger in area than that of the Chinese authorities. Moreover, when he refers to "the Chinese," he includes not only Han but also Hui. Even including those areas, his charge that Han immigration is one of the two main factors in "cultural genocide" is an exaggeration. Among the studies done on this subject, the most credible is that of Ma Rong, professor of sociology at Peking University. He has access to the most reliable data and has undertaken the most thorough investigation. His conclusion (Ma 2011, p. 79) is that "although the Han population in the Tibetan-inhabited areas has increased to a certain extent, it still comprises a small proportion of the local population, especially in the TAR."

Economic Development

Since the reform period began at the end of 1978, China has experienced an unprecedentedly rapid growth in the economy. This has raised China to be the world's largest economy but one (the United States). The standard of living of the people has risen all over the country.

However, the growth has been uneven. In general, the minorities have always been, and remain, poorer than the Han. Among reasons for this are that they are caught up in two of the biggest inequalities in China.

One of these is the contrast between the urban and rural regions. Leaving aside ethnic issues, cities have always attracted more industry, investment, and money than the rural areas. Minorities tend to be rural, with major cities comparatively few in the ethnic areas.

The second is the regional distinction, between richer north and poorer south, and between much more prosperous east and poorer west. Governments have for a long time focused more attention and money on the north and east than the interior, southwestern, or western regions. The traditionally richest parts of China are mostly Han, not minority.

We should note a few important exceptions to these generalities. The Koreans of Jilin, near the border with Korea, are just as rich as the Han and, according to some indicators, better off. Their literacy rates are the best in China. They have always enjoyed good relations with the Han and share a tradition dominated by Confucianism. The government regards them as a "model" minority (Zang 2015, p. 118). Two others that are probably no worse off than the Han in many ways are the Manchus and Mongolians, while the Hui are hardly different from the Han in matters affecting economic life.

Still, the fact remains that economic inequality has always been a feature of China's ethnic minorities. This inequality applies especially to the relationship between Han and minorities. However, it also applies within and among ethnic minorities. Those of the south are generally much poorer than those of the north. Class distinctions within minority society are not necessarily worse than in Han, but they are traditionally severe all the same. In the past, the Yi practiced a particularly ghastly form of slavery.

The CCP authorities have tried to alleviate these inequalities. They have invested large sums of money in special attempts to raise the living standards of the minorities. We saw earlier that minorities enjoyed "preferential policies."

These applied to many areas, including not only exemption from the one-child-per-couple policy and quotas for educational services but also tax alleviation, employment opportunities in government organizations, and government subsidies of various kinds.

In 2000, the government launched its Great Western Development Strategy. This applied to six provinces (Gansu, Guizhou, Qinghai, Shaanxi, Sichuan, and Yunnan), five autonomous regions (Inner Mongolia, Ningxia, Guangxi, Tibet, and Xinjiang), and one province-level municipality (Chongqing), altogether about 400 million people. Although not all these are minority areas, they do include some 90% of China's minority populations. The three main aims were to improve the welfare of the poor, develop the natural resources of the western provinces in environmentally friendly ways to reduce dependence on other countries, and further China's national security and unity (see Bhalla and Luo 2017, p. 117). The main policy is preferential taxation and national investment in key projects of all kinds. After a decade or so of implementation, one scholarly account reached the evaluation that "although the western region has experienced impressive rates of economic growth, regional disparities in China have continued to widen in spite of the western regional strategy" (Grewal and Ahmed 2011, p. 161).

As for the main aim of alleviating poverty, the following quotation from two Chinese scholars suggests that there was indeed improvement but that *region* is actually a greater indicator in accounting for poverty than *ethnicity*. The minorities are poor because of where they live rather than because they are minorities:

> Descriptive analysis reveals that ethnic differences in terms of poverty narrowed from 2002 to 2013. Regression analysis suggests that this might be attributed to the fact that ethnic minorities are mainly located in less-developed regions where their ethnic identity does not make any difference. In fact, when controlling for the regional variables, the level of poverty among Han is even more serious than that among ethnic minorities. It is also worth noting that the coefficient of education among ethnic minorities is significantly larger than that among Han, indicating that the development of education may be a very effective

antipoverty strategy for ethnic minorities. (Liu and Lu 2017, p. 2)

The point about education is also very telling. Literacy and education certainly improved greatly over those years. But regional disparities between east and west were not reduced. If anything, they increased.

Another attempt to improve the economy in areas with large minority populations came with the Belt and Road Initiative (BRI), which President Xi Jinping launched in 2013. The main aim of the BRI is to link China much more with countries to its west, including those of Central Asia, South Asia, Europe, and Africa. Infrastructure, including railways and roads, is vitally important to improving intercommunications. It is still too early to cast authoritative judgments on the success of the BRI, but some main points already stand out.

A very important concept is that of the China-Pakistan Economic Corridor (CPEC), which Xi Jinping launched during a visit to Pakistan in 2015. CPEC links Kashgar in southwestern Xinjiang, now a special economic zone, with the port of Gwadar in Pakistan, and has become important for the economic development of the regions along the corridor. Admittedly, the CPEC is controversial, because it goes through some territory claimed by India, which is consequently vehemently opposed. However, the CPEC is certainly bringing about economic and infrastructural progress in Xinjiang and Pakistan.

One of the most important aspects of development in contemporary China is urbanization. Indeed, the degree of urbanization under the PRC is possibly the most rapid and thorough in world history. China's urban population was only 13.3% of the total in the 1953 census. According to Liu Baokui (2019), associate research fellow at the Institute of Spatial Planning and Regional Economy of National Development and Reform Commission under the State Council, the urbanization percentage rose from 17.92 in 1978 to 59.58% in 2018, thus increasing by an average of more than one percentage point per year over the first 40 years of the reform policies. Because, with exceptions such as the Koreans, Mongolians,

and Hui, the Han tend to be more urban than the minorities, they have enjoyed much better access to the improved facilities that urban life can bring about, such as hospitals, schools, universities, cinemas, big hotels, good restaurants, clubs, and so on. What this means is that, while the standard of living has risen impressively everywhere, it tends to do so more in the places where Han live than those where the minorities have their home.

So the main points concerning economic development among China's ethnic minorities can be summarized as follows:

1. As with all China, the economy has grown enormously, especially in the twenty-first century, with the standard of living among ordinary people improving dramatically.
2. Absolute poverty has been greatly reduced and in 2019 is nearing elimination, but in general the minority areas remain considerably poorer than the nation as a whole.
3. Serious inequalities persist both within and among the minorities themselves, and, with a few exceptions like the Koreans, Manchus, Hui, and Mongolians, they are somewhat poorer than the Han. Many of these inequalities are due more to regional disparities than to ethnic.
4. The PRC has undergone an intensive urbanization process, which has affected minority areas less than Han but contributed to improving living standards greatly.

Tourism

Because it raises major issues connected with the economy and culture and because of its enormous growth since the period of reform began in the late 1970s, tourism has become an important theme in discussing the ethnic minorities. In the increase in domestic tourism that has accompanied the rise in the standard of living, the number of Han visiting minority areas has been far greater than the converse. As for international tourism, World Bank statistics show the number of arrivals in China from outside rising from 20.034 million in 1995 to 60.74 million in 2017, the second figure being the highest in the world after France (86.861 million), Spain (81.786 million), and the United States (76.941) (World Bank Group 2019).

The economy benefits greatly through tourism and vice versa. Good roads and railways enable people to travel more extensively than they have ever been able to do before, while the hospitality trade leads to improvements in hotels, restaurants, theaters, and so on. In recent years, tourism has been used directly to eliminate absolute poverty by enabling the poorest villages to find enterprises capable of enriching them. There is a great deal of inequality in tourism in ethnic areas, because inevitably some regions are more attractive than others or easier to access.

It is true that the cities in the ethnic areas rarely figure near the top of the list of tourist destinations. Yet in recent years, tourism has been a major government enterprise in the ethnic areas. There are two basic aims: to promote and facilitate economic development and to showcase and preserve cultural and ethnic heritage.

Tourism gives traditional cultures a viable commercial reason to survive. Villages with the people dressed in traditional clothing charm tourists. Public and private buildings are cleaned up and have modern facilities like electricity, but they maintain their traditional style.

One aspect of traditional culture displayed very commonly for tourists is the performing arts, especially dance. "They love to sing and dance" is a familiar introduction phrase. Dance is readily appreciated through its beautiful costumes and movements, irrespective of language, while its styles are easily linked to particular ethnic groups. Performances can be short, requiring little concentration. In China, ethnic dances do not need stages. They can be performed readily for tourists in any open space. Moreover, it is customary to invite the tourists to take part toward the end of a show, so that they have the additional feeling of being part of the society they are visiting.

As the trend toward learning about and appreciating ethnic cultures has increased, the idea of authenticity has grown more significant. In order to attract tourists, Chinese people, including those of the ethnic minorities, revive and recreate traditions that may claim to be authentic, but actually

differ somewhat from originals. Timothy Oakes (1998, p. 229), a foremost Western scholar on China's ethnic tourism, has argued that such tourism is a "false modernity." It is true that the "tourist dollar" and the "tourist gaze" both affect how people display their traditions and their culture. It is also true that traditions shown to tourists are no longer an integral part of the society that created them. But by their nature living cultures change, and it is natural that people should present themselves to the outside world in the best light.

One category of tourist attraction is museums, which are very much about cultural memory and the preservation of histories and traditions. China's museums are not universalist and do not show cultural objects from all over the world. Yet the localized function of showcasing a regional or ethnic culture is also a legitimate function of a museum.

Museums in China, including ethnic areas, share several features in common. Firstly, the buildings that house them are quite impressive relative to the area where they are located. An example is the Regional Museum in Ürümqi, capital of Xinjiang, which is enormous and well maintained. Secondly, these museums exist at various levels, even in small towns, where they showcase the local culture. Thirdly, they cover defined cultural categories. For example, one quite small museum in the Dong town of Zhaoxing in Guizhou Province has sections on Dong history, and the customs; marriage and family practices; arts, including performing arts; clothes; diet; and ideologies special to the Dong people. Local governments and people care enough about their ethnic traditions and histories to allocate money and effort to remembering them.

A brand of tourism to have drawn attention is sex tourism. According to Dru Gladney (1994), there is a tendency among the majority Han to objectify minority women as "colourful, exotic and erotic" (e.g., p. 110) and, by implication, inferior. A town that can illustrate sex tourism is Jinghong, the capital of Xishuangbanna Dai Autonomous Prefecture in Yunnan Province, the Dai being culturally and ethnically close to the Thais of Thailand. In the mind of many Han men,

Dai women are more "sexually promiscuous and licentious" than their Han counterparts (Hyde 2001, in Mackerras 2011, p. 329), and in the 1990s, Jinghong became a major destination for Han men seeking sex tourism. Actually, according to Sandra Teresa Hyde, many of the women practicing prostitution to make money from the desires of these men were not in fact Dai, but Han. However, they could dress as Dai and behave as Dai and thus make money from sex tourism as Dai.

Language

There is one aspect of traditional culture that is generally not showcased to tourists, namely, language. It is not that minorities wish specifically to hide their own language. However, for domestic tourists, which is the great majority, the language used is Modern Standard Chinese (Mandarin), while for overseas tourists it is English or the language most appropriate to the particular tourists.

Language is not only a major part of culture. It is also a highly significant way of expressing and remembering culture. The culture of an ethnic group can survive without its language, but only with the greatest difficulty, and the extinction of a language is also likely to involve the crucial weakening or disappearance of the culture it expresses.

Apart from the Hui, virtually all the ethnic minorities have their own language, many more than one. Among these languages, the Sino-Tibetan phylum is best represented and spoken by peoples living in the central, south, and southwest China. Some minority languages belong to the Altaic language phylum, being spoken by peoples in northeast and northwest China. Remaining languages belong to the Indo-European or other phyla (Tsung 2009, pp. 11–12).

Only a small proportion of the minority languages have their own script, the main ones being Tibetan, Mongolian, Yi, Dai, and Manchu, though this last is now more or less extinct. Some languages like Zhuang use the International Phonetic Alphabet, which is based almost entirely on Latin

script, while others like Uyghur use Arabic script. Nowadays, most of the minority languages are written with Chinese characters.

Official policy promotes the use of minority languages. For example, in autonomous places, government buildings and precincts must have names both in Chinese and the relevant minority language. Every single bill in Chinese currency, from 100 *yuan* RMB to 10 cents (one *jiao*), has "the People's Bank of China" written in Chinese characters, *pinyin* Romanization, Tibetan, Mongolian, Uyghur, and Zhuang.

However, according to a study by Huang Xing from the Chinese Academy of Social Sciences, in fact only five minority languages are in regular use in written form in the public sphere, such as government, the media, publishing, and education. These are Uyghur, Tibetan, Mongolian, Korean, and Kazak (Huang 2003, p. 2). Chinese is the national language and the one that makes it easier to advance in society and gain employment. "At present the language situation in China is that Chinese is prestigious and influential whereas minority languages are weakening" (Huang 2003, p. 4).

The use of minority languages as a medium of instruction in school varies throughout China. But as Linda Tsung points out, real literacy and familiarity with one's own language shows one's ethnic identity:

> Although minority parents are already sending their children to Han Chinese schools for further education and expanded career perspectives, there are still those who want their children to remain in minority schools or classes. In doing so, they believe that they can maintain their language and culture, as well as their ethnic status and identity. (Tsung 2009, p. 201)

The overall trend in the last few years has been for minority languages to weaken, and many will likely disappear altogether over the next decades. Some scholars regard that prospect with alarm, considering that it will not only diminish China as a multilingual society, but could even lead to conflict. One writes that "Many minority languages have become endangered and Beijing's integrative policy has had the perverse but predictable effect of helping to create the inter-ethnic conflicts that it had hoped to avoid, with scenes of ethnic tension in minority regions over the last few years" (Tsung 2014, p. 210).

The Tibetan Areas

Overall, relations among people of different ethnic groups are not necessarily any better or worse than among those of the same group. However, two of China's ethnic minorities have exemplified persistent disunity and conflict. These are the Tibetans and Uyghurs.

Of all regions of China, the one most relevant to the issue of Chinese unity is Taiwan, because China insists as a core value that Taiwan is part of China, whereas many in Taiwan, the West, and elsewhere are unsure of or hostile to that position. Taiwan is not an ethnic issue and need not be considered here.

Among ethnic minorities, the one most relevant to China's unity is the Tibetans, who believe in an esoteric form of Buddhism, headed by the Dalai Lama. Tibetan Buddhism and its icon the Dalai Lama enjoy a very positive image in the West, where this religion partly fills the gap of a spiritual life inherent in the rapid decline of Christianity.

An agreement between the Dalai Lama's government and the central government in 1951 affirmed that Tibet was indeed an integral part of China, but an unsuccessful rebellion in 1959 and the Dalai Lama's escape to India and subsequent establishment of a government-in-exile there reopened the question. Many in the Tibetan diaspora pushed for independence or a degree of autonomy far greater than China was prepared to tolerate. Large-scale demonstrations by monks wanting independence occurred in the Tibetan capital Lhasa in the late 1980s, with the international community appearing to offer support through the award of the Nobel Peace Prize to the Dalai Lama in 1989.

In a speech in Strasbourg in 1988, the Dalai Lama proposed "genuine autonomy," not independence. He later repeated the suggestion many times, most notably in his speech in London in July 1996. Two issues should be noted here.

One is that "genuine autonomy" involves free elections that could easily remove the CCP from power in Tibet. It also makes the government subservient to the Dalai Lama responsible for education in Tibet. Both might seem reasonable. However, the Chinese government will never tolerate the removal of the CCP from power in a substantial section of China, especially since it believes (with some reason) that the Dalai Lama's government would use its influence in the education system to discredit the CCP in all ways and to win the total support of the population. The result would be that a "genuinely autonomous" Tibet would inevitably later press for full independence.

The second issue is even more important. The Dalai Lama's supporters have a different conception of Tibet from the Chinese government. For the Chinese government, Tibet means the Tibet Autonomous Region, while the Dalai Lama's government considers "Tibet" to cover, in addition, Qinghai Province and other regions, so that the TAR would be only about half the area of Tibet. This means that the Dalai Lama's government is asking for effective political and ideological control over about one-quarter of Chinese territory. In the estimation of this writer, Chinese leaders will do everything they can to prevent such an eventuality and are supported by the overwhelming majority of China's people in this stand.

China's attempts to maintain control include CCP cells everywhere, including in monasteries and units involved in Tibetan culture, and cracking down on what it interprets as signs threatening to the Chinese government rule in Tibetan areas. Although the United States and many other governments and human right activists condemn such activities as serious human rights abuses, including suppression of religious freedom, the Chinese authorities claim them as defensive and as legitimate preservation of Chinese unity.

In March and April 2008, serious disturbances broke out in Lhasa and many other Tibetan areas of China. The Western press interpreted these disturbances as resistance against Chinese oppression and human rights abuse, whereas the Chinese blamed outside interference, especially from the United States. The demonstrations were suppressed and have not recurred up to now. However, the situation remains tense with a great deal of bitterness and resentment. This is evident from a series of self-immolations beginning in 2009 and reaching a peak in 2012, when about 85 Tibetans set fire to themselves (International Campaign for Tibet 2019).

China's response to the problems in Tibet has been to try to develop the economy and modernize. This has been broadly successful in material terms, raising the standard of living to an extent unprecedented in Tibetan history. However, activists still charge that the Han population gets an unfair proportion of the wealth increases, employment opportunities, and improvements in welfare and that ethnic inequalities remain not only profound but unacceptable. (See bibliography on the Tibetans in Mackerras 2018, "Tibet and the Tibetans" and a selection of articles on the same topic in Mackerras 2011, Vol. IV, pp. 1–110.)

Xinjiang and Its Islamic Minorities

As with Tibet, there is a long-standing independence movement in Xinjiang, hoping to set up an "East Turkestan Republic," as well as an active diaspora, the great majority of them actively hostile to China and broadly sympathetic to independence. Unlike the Tibetan case, there is no major disagreement on the borders of this "republic," which are those of Xinjiang. Also in contrast with Tibet, there is no universally admired icon of independence with fame and influence comparable to the Dalai Lama's.

In April 1990, an uprising took place in Baren Township in the southwest of Xinjiang, which a local television report attributed to the separatist Islamic Party of East Turkestan. Although easily suppressed, it showed the existence of Sunni Islamic fundamentalist thinking. For the Chinese authorities, it implied a rise of separatism, extremist religious thinking, and even terrorism among the Sunni Muslim minorities in Xinjiang, especially the Uyghurs.

Meanwhile, the collapse of the Soviet Union at the end of 1991 changed the architecture of

relations to the west of China. It added to the number of Muslim-majority independent republics just to the west of China. The renewed separatism in Xinjiang was undoubtedly among the flow-on effects of the Soviet Union's decline and then collapse, and the rise of ethnic nationalism in an era of globalization.

In April 1996, the Presidents of China, and four newly independent republics of the former Soviet Union, namely, Russia, Kazakhstan, Kyrgyzstan, and Tajikistan, met in Shanghai to discuss problems like terrorism and separatism. In mid-June 2001, the leaders of these five countries, plus that of Uzbekistan, met again in Shanghai and established the Shanghai Cooperation Organization (SCO). They also signed a document pledging to cooperate to combat separatism, terrorism, and extremism, a clear reference to Islamism or Islamic fundamentalism.

Islamist terrorism was thus already a problem in Xinjiang by the last years of the twentieth century. The destruction of the World Trade Towers in New York on September 11, 2001, just 3 months after the SCO's establishment, worsened the cauldron by increasing the role of the United States in Central Asia. China gave strong support to the war on terrorism, which United States President George W. Bush had declared following the September 11 Incidents.

In the first decade of the twenty-first century, the Uyghur diaspora reorganized itself to exert international influence, especially in the West. In 2004, the World Uyghur Congress was established in Munich, aiming to represent Uyghur interests, both inside and outside China. One of the key members of the Uyghur diaspora is Rebiya Kadeer, a female entrepreneur, who became the richest woman in China. Imprisoned in 1999 for "passing on classified information to foreigners" and for subversion, she was released in 2005 after the intervention of American Secretary of State Condoleezza Rice and went to take up residence in the United States. Though never as influential or famous as the Dalai Lama, she attained leadership positions in such organizations as the World Uyghur Congress and the Washington, DC-based Uyghur American Association, becoming a kind of icon for the Uyghur diaspora.

Throughout the twenty-first century, the balance of China's ethnic problems has tended to move more toward Xinjiang and away from Tibet. One event of crucial significance was in July 2009. Ethnic riots in the Xinjiang capital Ürümqi killed 197 people, according to Chinese official sources, mostly Han Chinese. China puts the blame on outside forces, especially Rebiya Kadeer and terrorism in Central Asia, while in the West, governments, media, and popular opinion blamed Chinese repression, including Han Chinese takeover of Xinjiang through extensive Han immigration and inequalities in employment, wealth, living standards, health, and power.

Whatever the causes of the disturbances, one thing was very clear, namely, that ethnic resentment in Xinjiang had deepened and, with it, the scourge of terrorism. Over the years following 2009, there were numerous terrorist incidents in Xinjiang and even in the capital Beijing. The war in Syria worsened the problem. Some Uyghurs went there for terrorist training. When the leader of the Islamic State of Iraq and Syria (ISIS) Abu Bakr al-Baghdadi (1971–2019) made a speech in Mosul, Iraq, in July 2014, announcing himself as caliph of all Muslims, he stated that "Muslim rights are forcibly seized in China, India, Palestine" and more than a dozen other countries and regions. "Your brothers all over the world are waiting for your rescue, and are anticipating your brigades," Baghdadi is reported to have told his followers (Olesen 2014). While it is doubtful how much trouble ISIS can really cause in Xinjiang, it would be a foolhardy government that ignored such provocative statements.

Since 2017, reports have emerged of camps where some million Uyghurs and other Muslims are forcibly held under inhumane conditions. There is an increasing number of Western reports, both journalistic and scholarly, on the subject (an example being Zenz 2019), some of it likening these places to internment or even concentration camps. Chinese spokespeople have countered that they are aimed at eliminating radicalism and terrorism and educating people to live productively. They argue that Muslims are still free to practice their faith, provided that they do not disrupt

Chinese unity and that Uyghur culture is being preserved and promoted.

In general, the advanced industrial democracies, especially the United States, have condemned China for human rights abuse and religious and cultural suppression in Xinjiang. In October 2019 the United Kingdom represented 23 advanced industrial democracies, almost all Western, in issuing a statement in the United Nations General Assembly (UNGA) condemning human rights abuses in Xinjiang, and in December 2019 the United States Congress adopted its severely condemnatory Uyghur Human Rights Policy Act.

However, international opinion has not been unanimous. For example, in October 2019, Belarus led 54 countries in the UNGA to oppose Britain's statement and supported China's deradicalization measures in Xinjiang. What is even more striking is that the Organization of Islamic Cooperation (OIC), which describes itself as "the collective voice of the Muslim world," in May 2019, issued a public statement in support of China's attempts to "provide care to its Muslim citizens." In October a dozen or so OIC members sided with Belarus' stand in the UNGA in support of China's deradicalization program in Xinjiang.

China is unlikely to bow to Western pressure over Xinjiang, which its leaders regard as unwarranted interference in its affairs. They are determined to uproot terrorism and to hold Xinjiang within China. The likelihood is for more conflict in Xinjiang, and the situation is very troubling for the minorities and for any form of Islam the CCP regards as hostile to Chinese culture or threatening to its rule.

Meanwhile, as in the rest of China, modernization processes have gathered momentum. Xinjiang is highly relevant to the Belt and Road Initiative, and railways and other infrastructure linking China to Central Asia and Europe pass through it. As noted above, Kashgar is now a special economic zone. It is important for the BRI's success that the region at least remains stable. (See bibliography on the Xinjiang issue in Mackerras 2018, "Xinjiang and the Uighurs" and a selection of articles on the same topic in Mackerras 2011, Vol. IV, pp. 111–211.)

Conclusion: Summary and Relevance to Imperialism and Anti-imperialism

Considering the problems ethnic issues have caused internationally in recent decades, the PRC's overall record over most of its years of control has been positive. It has strengthened the economic life and prosperity of ethnic minorities, along with the country as a whole. It has maintained national unity and its system of limited autonomy for ethnic minorities. The populations of the minorities have grown not only in absolute terms but in relation to China's total. Cultural rights have survived, although modernization and political processes have tended to weaken them. Specialist Michael Dillon sums up compellingly when he writes (2018, p. 220) that "many non-Han people live peaceful and uneventful lives, even as others endure privations and severe repression."

What does this material tell us about imperialism and anti-imperialism? Some observers conceive of China's policy and behavior toward its ethnic minorities as imperialistic, because the majority ethnic group dominates the minorities and state power is in effect in the hands of the Han. They consider the increasing dominance of Chinese, as against ethnic languages, not in terms of strengthening national cohesion, as the state does, but as attempts to undermine legitimate multilanguage diversity. They regard Han immigration as a form of colonialism and takeover of other people's territory. They regard ethnic tourism as an example of "the tourist gaze" and thus as insincere and false attempts to showcase minorities as if in a zoo, not as legitimate and rational attempts to preserve traditional culture at the same time as strengthening ethnic economies. And the issues regarding the Tibetans and Uyghurs are for such observers no more than illegitimate attempts to colonize foreign peoples, not to maintain national unity.

Human rights have played a significant part in discourse in recent years, with China gaining the image of a country where ethnic minorities suffer abuse. To cite one example, China is accused of suppression of religion among minorities, amounting to serious breaches of human rights. And critics regard the excuse that religion in Tibet

and Xinjiang sometimes functions as a threat to the state simply as a pretext for what are in fact naked violations of human rights.

For the Chinese state, there is absolutely nothing imperialistic about a policy of the equality of nationalities, which it aspires to practice within its own borders, even admitting that practice falls far short of policy. While it is true that the Chinese language is increasing in dominance over minority languages, there has been no linguicide (the killing of languages) in China. Nobody doubts continuing inequalities among ethnic minorities in China, but the greater prosperity and vastly improved livelihood of the mass of the people, combined with the radical reduction of poverty, amounts to a good human rights performance, according to Chinese authorities.

We turn finally to look again at the concept of "the Chinese nation" (*Zhonghua minzu*). Some commentators regard it as imperialistic, because it sets the boundaries of China to include some ethnic groups over which the Chinese state has no legitimate control. With a couple of major exceptions, it determines the borders according to a historical time (the eighteenth century) when the control of the Chinese empire extended far beyond the core Han China.

On the other hand, the current Chinese state holds as a core value that "the Chinese nation" legitimately includes ethnic groups other than the Han. Most of the ethnic minorities live in territory that has been part of China for many centuries. If one started to question that the territory inhabited by the Miao, to take but one example, should devolve into an independent state, the breakup of China into numerous states would have the potential to loose many wars upon China and the world. Chinese unity is a core value no Chinese state will sacrifice unless forced by extreme circumstance. It is worth adding that virtually all states share China's position on this issue and resist independence movements vigorously. Certainly, they do not regard insistence on territorial unity as imperialistic.

The PRC regards itself as strongly anti-imperialistic and opposed to the domination it sees as coming mainly from the Western powers, especially the United States. Chinese leaders typically cite the century of humiliation that preceded the founding of the PRC as a time when China was prey to foreign powers, especially the United States, Britain, Japan, and France, which ate pieces of its territory and opposed attempts to unify the country. Many of those territories where foreign powers confronted Chinese power were the border regions where ethnic minorities live. Britain was heavily involved in Tibet; Russia (including the Soviet Union) and Britain in Xinjiang; and Japan in Manchuria (the northeast). To this day, the PRC feels its territorial unity and integrity threatened by outside interference in its ethnic affairs. In particular, there are many people in China, both inside and outside the leadership, who still believe that the United States is keen to use terrorism in Xinjiang to tear China apart and bring down the CCP. In this sense, the PRC leadership claims to oppose imperialism, certainly not to take part in it.

As for the future, current signs are that Chinese unity will hold but that the circumstances will remain difficult, despite continuing modernization and improvements in the economy and living standards. Full-scale war will break out in Tibet or Xinjiang only if a foreign power intervenes militarily, and that is highly unlikely. But neither is there any sign that ethnic resentments or small-scale conflict will dissipate any time soon. Dillon (2018, p. 221) suggests that:

> A successful accommodation between minority activists and the Chinese state is unlikely, but there will be periods of relative calm and episodes of great but probably localized violence. What is certain is that the destiny of the minorities is inextricably intertwined with the political culture of the Chinese state.

In other words, despite ongoing conflict, national disintegration is not on the horizon.

Definition

One of the most remarkable developments in world politics in the last two decades has been the rise of China as a great power. Today it is the most important challenger of the USA – the long-time, but now declining, absolute hegemon among the imperialist states – on economic, political, as well as military levels. China's rise has been the result of the combination of a rapid process of capital accumulation based on the super-exploitation of the domestic working class as well as foreign and internal colonies, the existence of a Stalinist-capitalist one-party dictatorship, China's foreign policy projects (e.g., the "Belt & Road Initiative"), and the building of a powerful army.

Introduction

History has experienced repeatedly the rise and fall of Great Powers – the Roman Empire, the Byzantine Empire, or the Ottoman Empire – to name only a few. In the last two centuries, we have seen colonial empires which later either lost its significance (Britain, France, Japan) or simply collapsed (Austria-Hungary, Tsarist Russia). In recent times we see the decline of the USA – the absolute hegemon in the imperialist world order since 1945. Throughout history such periods of decline have always taken place in parallel with the rise of new, rivaling Great Powers.

Today, there exist several imperialist Great Power beside the U.S. – mainly the European Union, the United Kingdom, Russia, Japan, and, most importantly, China. The later has experienced a dramatic rise in the past two decades. Today, it represents the second largest imperialist power and the most important rival of the USA. In the following essay, we will demonstrate China's rise into the circle of the imperialist Great Powers – on economic, political, as well as military levels.

Economic Power

A process of rapid capitalist accumulation during the 1980s and the 1990s laid the basis for the rise of China as an economic power operating on the law of value. The new bourgeoisie was able to take advantage of several key factors which, in combination, resulted in an extraordinary process of capitalist economic growth. Among these factors were a huge population with a massive reservoir of internal migrants (more on this below), a powerful dictatorship with an experienced repression apparatus and a strategic plan, and, finally, a working class which suffered a historic defeat (Tiananmen Square in June 1989) and hence was massively weakened in its resistance against capitalist exploitation and super-exploitation.

We note in passing that China's economic success is extraordinary but not exceptional. According to one study, China's annual per capita GDP rose from $1,300 in 1980 to $7,700 in 2010, an increase of almost 500% (Jiang and Yi 2015, p. 8; Wang 2014). However, some other capitalist countries – like South Korea and Taiwan – also experienced similar periods of economic growth when a combination of favorable factors was in place (Pröbsting 1996/97). South Korea's GDP per capita increased from 1,537 US dollar in 1960 to 11,985 in 1990 – in other words, it had increased nearly by eight times in the preceding three decades (U.S. Bureau of Labor Statistics 2018). Other sources even claim a higher growth rate (Kim 1991, p. 5).

The regime, unbothered by its official "communist" ideology, managed to advance a rapid process of privatization which ensured the creation of a powerful class of capitalists including monopoly capitalists (Pröbsting 2012). According to a study published by the *World Bank* and the *Chinese Development Research Center of the State Council* in 2013, about 70% of the country's GDP as well as of its employment are located in the non-state sectors. The state sector's share in the total number of industrial enterprises (with annual sales over 5 mn RMB) fell precipitously from 39.2% in 1998 to 4.5% in 2010. During the same period, the share of state-owned enterprises

(SOE) in total industrial assets dropped from 68.8% to 42.4%, while their share in employment declined from 60.5% to 19.4% (The World Bank and Development Research Center of the State Council 2013, p. 104). Since then, this process has gone much further. According to recently published book, "the state share of industrial production (on a value-added basis) is about 25 percent" (Kroeber 2016, p. 101). Liu He, top economic adviser of China's President Xi, estimates that the country's "private sector generates 60 percent of the nation's output, 70 percent of technological innovation and 90 percent of new jobs" (Bloomberg 2018).

In addition to this, the regime restructured the state-owned enterprises so that most of them operate on a highly profitable basis – both on the domestic as well as on the world market. In the years between 1995 and 2005, the regime fully or partly privatized around two-thirds of its SOEs and state assets. From 1998 to 2004, about 60% of the SOE employees, some tens of millions of workers, were laid off (OECD 2017, p. 35).

As a result of this process of rapid economic growth and the creation of capitalist monopolies, China was able to become a major player in the world market. This becomes even more evident if one compares it with the parallel decline of the USA. When we look at the basis of capitalist value production – global industrial production – we see that the USA's share decreased from 25.1% (2000) to 17.7% (2015), and Western Europe's share also declined from 12.1% to 9.2%, while China's share grew from 6.5% (2000) to 23.6% (2015) (see Table 1). Likewise, while the USA's share in world trade declined from 15.1%

Chinese Imperialism and the World Economy, Table 1 Share of the USA, Western Europe, and China in global industrial production, 2000–2015

(2001) to 11.4% (2016), China's share rose in this period from 4.0% to 11.5% (see Table 2).

We see the same development when we look to the changes in the national composition of global capital accumulation. According to the data from the OECD about the historical development of global gross fixed capital formation – a bourgeois economic category that reflects the process of capital accumulation – there has been a radical change since 1960 and, in particular, in the past two decades. As Table 3 illustrates, the USA – the postwar, global hegemonic imperialist power – enjoyed, by far, the largest share until the early 2000s. (This leading position was briefly but unsuccessfully challenged by Japan in the early 1990s.) However, since the 1990s, China rapidly caught up to the USA. While its share of global investments was about 6% in the year 2000, this rose to exceed 26% of the world total by 2015. By 2011, China overtook the USA as the world's number one, and the gap between these two biggest imperialist powers has only continued to increase.

Capitalist Monopolies

The same process of China's rise as an imperialist power can be observed when we look at the composition of the world's leading corporations and the global elite of billionaires and millionaires. Let us look at the national composition of the leading capitalist monopolies.

Table 4 shows where the Fortune 500 world's largest companies are headquartered and how that changed in the years between 2000 and 2018. The most important changes have been the dramatic rise of China and, at the same time, the corresponding decline of the old imperialist powers (USA, Japan, UK, Germany, etc.).

The US *Fortune* magazine, a prominent mouthpiece of global capital, is fully aware of the implications of this development and titled a commentary "It's China's World." "As the Chinese Century nears its third decade, Fortune's Global 500 shows how profoundly the world's balance of power is shifting. American companies account for 121 of the world's largest corporations by revenue. Chinese companies account for 129 (including 10 Taiwanese companies). For the first time since the debut of the Global 500 in 1990, and arguably for the first time since World War II, a nation other than the U.S. is at the top of the ranks of global big business." The report continues: "It's true that Chinese companies' revenues account for only 25.6% of the Global 500 total, well behind America's 28.8%. But that's to be expected. China is the rising power, economically smaller but growing much faster" (Colvin 2019).

Source: Forbes 2017

The same picture emerges when we compare the *Forbes Global 2000* list – a list of the world's 2000 largest corporations – of the year 2003 with the year 2017; we see that while the USA remains the strongest power, its share has declined substantially from 776 corporations (38.8%) to 565 (28.2%). At the same time, China's share grew dramatically, and it has now become the number two among the Great Powers (see Table 5).

Another study, published by UNCTAD, also confirms China's rise among the biggest global monopolies. It reports that China's share among the largest 2,000 transnational corporations (TNC) has grown so massively in the past two decades so that by 2015 they took 17% of all profits of these top monopolies. The UNCTAD report adds: "Interestingly however, the share of Chinese financial TNCs in top TNCs profit expanded rapidly to more than 10 per cent to total top TNCs profits, exceeding those of

United States financial top TNCs in 2015" (UNCTAD 2018a, p. 58).

These figures demonstrate very clearly that it is an extremely one-sided and wrong view to see China primarily as a kind of global workbench for Western corporations. Chinese capitalist corporations have joined prominently the list of the global leading monopolies and are among the most profitable.

This process is also reflected in China's rise among the world's billionaires. Depending on which list one takes, China has become home to the largest number of billionaires or the second largest in the world. According to the 2017 issue of the *Hurun Global Rich List*, 609 billionaires are Chinese and 552 are US citizens. Together they account for half of the billionaires worldwide (Hurun 2017; Zhu 2017; Pröbsting 2015). The *Forbes Billionaire List*, which is US-based, while *Hurun* is China-based, sees the USA still ahead. According to Forbes: "The U.S. continues

to have more billionaires than any other nation, with a record 565, up from 540 a year ago. China is catching up with 319. (Hong Kong has another 67, and Macau 1.) Germany has the third most with 114 and India, with 101, the first time it has had more than 100, is fourth" (Kroll and Dolan 2017). The 2018 edition of the annual *Billionaires Insights* report published by the Swiss Bank UBS, jointly with Britain's PwC, arrives at similar conclusions (UBS/PwC 2018). While the detailed figures vary in the different reports, the trend in all available studies is the same: the weight of China's monopoly capitalists is increasing.

It is important to recognize that China's capitalism is based not only on a tiny minority of super-rich (in contrast to countries like India or Saudi Arabia) but rather on a broader stratum of small and middle capitalists. As we show in Table 6, China is number two in all categories of millionaires – only behind the USA and ahead of all other imperialist Great Powers like Japan, Germany, France, and Britain.

Belt and Road Initiative: An Imperialist Hegemonic Project

The *Belt and Road Initiative* (BRI) is China's famous initiative to massively globally expand both its economic relations and its political influence. The Xi regime launched this initiative in 2013, and its financial volume stands currently at a staggering $1.1 trillion. The BRI includes more than 132 countries in Asia, Europe, the Middle East, East Africa, and Oceania as well as 29 international organizations, among them the *World Bank* and the *Asian Infrastructure Investment Bank* (founded by China in 2016).

On the one hand, the *Belt and Road Initiative* incorporates a sea-based *Maritime Silk Road* initiative (also called the *twenty-first Century Maritime Silk Road*). The Chinese government has recently published a more detailed plan, dividing the project into three "blue economic passages": the *China-Indian Ocean-Africa-Mediterranean Sea blue economic passage*; the *China-Oceania-South Pacific blue economic passage*; and the one that will lead to *Europe* via *the Arctic Ocean* (Zhao 2017).

On the other hand, the BRI includes the so-called Silk Road Economic Belt involving six land-based economic corridors: the *New Eurasian Land Bridge*, the *China-Mongolia-Russia Economic Corridor*, the *China-Central Asia-West Asia Economic Corridor*; the *China-Indochina Peninsula Economic Corridor*; the *China-Pakistan Economic Corridor*, and the *Bangladesh-China-India-Myanmar Economic Corridor* (this last one has been dropped recently as India refused its participation) (Derudder et al. 2018).

The BRI contains numerous infrastructure projects (ports, highways, railways, etc.) as well as the intensification of trade. Hence, it allows China monopoly capital to find foreign markets for its excess industrial capacity as well as for its abundant capital looking for profitable investment opportunities.

Most countries which participate in the BRI are semi-colonies in Marxist terminology, i.e., they are countries which are formally independent states which are however dependent on and

Chinese Imperialism and the World Economy, Table 6 The rich and the super-rich by country, 2018

Country	Wealth range (in million US dollar)					
	1–5 m	5–10 m	10–50 m	50–100 m	100–500 m	500+m

exploited by the imperialist powers. However, some Western European imperialist countries also participate in the project.

According to a statement of China's vice-minister of commerce Qian Keming in September 2019, "[t]he cumulative investment of Chinese enterprises in countries along the [BRI, Ed.] route has exceeded 100 billion US dollars. Foreign contracted projects exceeded US $720 billion, and investment from countries along the route reached US $48 billion" (China News Portal 2019).

In summary, the BRI is a key project to globally expand the hegemonic role of Chinese imperialism.

China's Capital Export

As a rising economic power, China plays an increasing prominent role in global capital markets. China's rapid growth as a capital exporter has taken place on two levels: productive investment and finance capital (bonds, loans, etc.). As a result of its tremendously rapid accumulation of capital from production, Chinese imperialism has also accumulated huge volumes of finance capital. This finds expression in the extraordinarily rapid growth of the country's foreign exchange reserves. Today, China is the world's largest holder of foreign exchange reserves with $3.1 trillion in October 2019 (People's Bank of China 2019). Most of these reserves are money capital which is put in circulation as loans to return to the holder a share of the surplus value created by the borrowing country. Prominent among these countries is the USA where China has the second greatest amount of US debt held by a foreign country (behind Japan and ahead of Britain).

China is also an active lender in bilateral loans resulting in a substantial and rising indebtedness of so-called low-income countries. According to a recently published study, the geographic scope of China's lending has increased notably. The share of countries receiving Chinese official grants or loans has increased from about 40% (2000) to almost 80% as of 2017. With almost

full global coverage, US official lending is still further-reaching than Chinese official finance, but the gap is narrowing fast (Horn et al. 2019, p. 11).

As a result, the average indebtedness of low-income developing countries to China was 11% of GDP as of 2017. In comparison, so-called emerging market countries owed 6.5% of GDP in debt to China. As of 2018, "the government of China holds more than five trillion USD of debt towards the rest of the world (6% of world GDP), up from less than 500 billion in the early 2000s (1% of world GDP)." If one adds foreign equity and direct investments "China's total financial claims abroad amount to more than 8% of world GDP in 2017. This dramatic increase in Chinese official lending and investment is almost unprecedented in peacetime history, being only comparable to the rise of US lending in the wake of WWI and WWII" (Horn et al. 2019, pp. 5–6).

This rapid rise of indebtedness of semi-colonial countries which are involved in the BRI reflects that this is an imperialist project which results in increasing dependence of these countries to the new imperialist Great Power of the East.

Likewise, China has massively increased its foreign direct investment particularly in the industrial and raw material sector. As China has only recently emerged as an imperialist power, it is still a weaker player in the global market than the USA. However, as we can see in Table 7, China's FDI outflows play a major role. As a result, China was able in the past decade to rapidly catch up with all other imperialist powers except the USA. Hence, as Table 8 shows, China's foreign direct investment outward stock reached about the same level as Germany, Japan, Britain, or France – i.e., those imperialist powers that have dominated international finance for more than a century – as of 2017. This is particularly remarkable as China started its massive foreign investment drive only a few years ago. As of 1990, China's share of global FDI stock was only 0.2% and 0.4% in 2000.

As a result, Chinese monopolies achieved a dominating position in a number of semi-colonial countries. According to a study from McKinsey, Chinese corporations already play a dominant role

Chinese Imperialism and the World Economy, Table 7 Foreign direct investment outflows by country in 2017 (in millions of US dollars and as share of global FDI outflows)

Country	2017	Share of the global FDI outflows (%)

Source: UNCTAD 2018b, pp. 188–191

in Africa. About 10,000 Chinese corporations (90% of which are private capitalist firms) operate in Africa. They control about 12% of the continent's total industrial production and about half of Africa's internationally contracted construction market. In Africa, China is also a leader in "green field investment" (i.e., when a parent company begins a new venture by constructing new facilities outside of its home country); in 2015–2016, China invested 38.4 billion US dollars (24% of total greenfield investment in Africa) (Sun et al. 2017, pp. 10, 29–30).

Internal Colonies

China has not only semi-colonies in Asia, Africa, and Latin America but also internal colonies. About 1/10 of its population belong to national and ethnic minorities, altogether 56 different groups with more than 135 million people (Guo 2017, p. 3). (We note in passing that the regime vehemently denies that any of these groups represents a "national" minority since they all supposedly belong to the "Chinese nation"!) The

most important regions where such national minorities play a central role are East Turkestan (called Xinjiang by the regime), Tibet, and Inner Mongolia.

East Turkestan/Xinjiang has become particularly notorious in recent time because of the brutal oppression of the Uyghurs – the native Muslim population of this region. There are at least about 11–15 million Muslim Uyghurs – according to the *World Uyghur Congress*, it is even up to 20 million (World Uyghur Congress). However, a growing number of them have been forced to flee their native country because of the national oppression by Beijing. In recent past, the Muslim Uyghurs have become a minority in their own country. According to official figures, they constitute 46% of Xinjiang's population. The background of this development is the fact that the Beijing regime systematically suppresses them and colonizes the province by settling Han Chinese people in order to change the ethnical balance. However, ethnic minorities still account for nearly 60% of Xinjiang's population.

In 2018, horrific reports have been published by the United Nation which arrive at the

"estimates that upwards of a million people were being held in so-called counter-extremism centres and another two million had been forced into so-called "re-education camps" for political and cultural indoctrination" (UN Office of the High Commissioner for Human Rights 2018). In many cases, the Chinese authorities even take the children away of parents who are detained. They are brought to schools were they are forced to speak in Mandarin and to adopt the Han Chinese culture. Such assimilationist policy of the regime even goes so far that the regime launched in 2016 the "Becoming Family" initiative forcing Uyghur families to host cadres of the ruling party at their homes for at least 5 days every 2 months (Turdush 2018).

Another example of the massive scale of oppression is the fact that, according to official Chinese government data, criminal arrests in Xinjiang accounted for an alarming 21% of all arrests in China in 2017. This is a dramatic figure given the fact that the population in Xinjiang (of which officially less than half are Uyghurs) is only about 1.5% of China's total (Chinese Human Rights Defenders 2018).

Cynically, the regime justifies the mass detentions as measures "against extremism and terrorism." In an interview, published by the state-run news agency Xinhua, the Xinjiang governor, Shohrat Zakir, said: "Xinjiang conducts vocational skills education and training according to law. The purpose is to fundamentally eliminate the environment and soil that breeds terrorism and religious extremism, and eliminate the terrorism activities before they take place." Zakir added that residents at the internment camps in Xinjiang learn Mandarin "to accept modern science and enhance their understanding of Chinese history and culture" (Kuo 2018).

East Turkestan/Xinjiang is also of substantial economic significance for China. The region is the third largest oil-producing region in the country. Yet the region can be expected to climb to higher ranks in the near future. Only 33% of China's oil reserves are estimated to have been discovered so far, and Xinjiang hosts large amounts of undiscovered oil reserves, particularly in Tarim Basin. Furthermore, Xinjiang is the

China's largest producer region of natural gas (Atli 2016). Add to this the fact that Xinjiang is the leading cotton producer in China on a regional basis, accounting to 74.4% of the total output (Abdulla 2019).

Even more important is the strategic location of all three regions – Xinjiang, Tibet, and Inner Mongolia. Since they cover nearly the whole Northern as well as Western border areas, these regions play a key role as transit routes of energy resources imported from abroad. Nearly all oil pipelines from Russia and Kazakhstan cross one of these three regions. Furthermore, four of the six land corridors of the gigantic BRI project cross through Xinjiang, Tibet, and Inner Mongolia.

For these reasons, the regime in Beijing is determined to brutally clamp down any desire of the minorities to implement their right of national self-determination.

Exploitation and Super-Exploitation of the Domestic Working Class

As mentioned above, a key reason for the "Chinese miracle" has been the massive exploitation and super-exploitation of the working class in China. This development is reflected in the drastic decline of the share of wages in income and the corresponding rise of profits. According to a report: "China has kept wages low: wages and salaries as a percentage of GDP fell from 57% in 1983 to just 37% by 2005 through to 2010 – one of the lowest in the capitalist world." This decline has been particularly drastic in the industrial sector – the core of capitalist value production. The share of industrial workers' wages in China's manufacturing value added dropped from 52.3% in 2002 to 26.2% in 2008 (Froud et al. 2012, pp. 12, 20).

The Chinese researcher Qi has published figures indicating a huge rise of the rate of exploitation of China's working class in the past two decades: "Wages constitute less than 10 per cent of total cost of Chinese enterprises, while that for developed countries is about 50 per cent. In the Pearl River Delta, productivity is about 17 per cent that of the US, but workers' wages

are only about 6.7 per cent that of the US. (...) From 1993 through 2004, while Chinese GDP increased by 3.5 times, total wages increased by only 2.4 times. From 1998 to 2005, in SOEs and large scale industrial enterprises, the percentage of total wages/profit dropped significantly from 240 percent to 43 percent" (Qi 2010, p. 420).

In the same period, correspondingly, the Chinese bourgeoisie was able to enrich itself massively. We have already mentioned above the huge increase in the number of Chinese millionaires and billionaires. There are also various other indication which demonstrate that China's social and economic development in the past three decades has been characterized by very similar features like other capitalist countries in the world. Contrary to the official socialist ideology, the share of wages has declined, while profits for the capitalists have gone up. As a result, the income share of the richest top 1% of the population has doubled between 1980 and 2016 from 7% to 14%. If we take the share of the richest 10%, equivalent to the bourgeoisie and the upper middle class, we see the same dynamic. According to the *World Inequality Report 2018* "the share of total national income accounted for by just that nation's top 10% earners (top 10% income share) was 37% in Europe, 41% in China, 46% in Russia, 47% in US-Canada, and around 55% in sub-Saharan Africa, Brazil, and India. In the Middle East, the world's most unequal region according to our estimates, the top 10% capture 61% of national income" (Alvaredo et al. 2018, p. 9).

A crucial instrument for the rising capitalist exploitation has been the utilization of the old household registration system set up in 1958. According to this system (called *hukou* in China), "residents were not allowed to work or live outside the administrative boundaries of their household registration without approval of the authorities. Once they left their place of registration, they would also leave behind all of their rights and benefits. For the purpose of surveillance, everyone, including temporary residents in transit, was required to register with the police of their place of residence and their temporary residence. By the 1970s, the system

became so rigid that 'peasants could be arrested just for entering cities'" (China Labour Bulletin 2008).

This *hukou* system has resulted in the creation of a huge sector of so-called migrants. This category is usually applied to those who move from one country to another. However, in China – a "continent" in itself with a population of nearly double as many as Europe – former peasants or peasant youth, who move to the cities because of the rural poverty and the opportunity for jobs in the cities, are called "migrants." In these cities they are often forced to live illegally and – because of the *hukou* system – have no access to housing, recognized employment, education, medical services, or social security. Their living conditions are very poor; most of them reside in decrepit housing, tents, underneath bridges, inside tunnels, or even in the trunks of cars.

These migrants represent a huge sector of the urban working class. According to an ILO study, their number rose from 143 million in 1995 to 307 million in 2013 (Majid 2015, p. 43). Hence, migrants play a central role in key sectors of the economy where they are usually employed in hard-labor, low-wage jobs. By the late 2000s, the proportion of migrant workers in manufacturing industries and in construction reached as high as 68% and 80%, respectively (China Labour Bulletin 2008). According to another study, rural-to-urban migrant workers have also become the largest proportion of the workforce, making up some two-thirds of all nonagricultural workers. They have become dominant in a number of major sectors: 90% in construction, 80% in mining and extraction, 60% in textiles, and 50% in urban service trades (see Table 9).

Related to this is the existence of a huge so-called informal sector which given its precarious conditions is a breeding ground for super-exploitation. According to official figures of the World Bank and a Chinese state institute, the informal sector accounted in the 2000s for 30%–37% of the total urban labor force (The World Bank and Development Research Center of the State Council 2013, p. 351).

Such super-exploitation of the migrants is the material basis for another important

Chinese Imperialism and the World Economy, Table 9 Rural-to-urban migrants as a proportion of total workforce

Industry	Proportion of total workforce (%)
Construction	90
Mining and extraction	80
Textiles	60
Urban service trades	50

2004	0.47	1.19	2.11	3.32	4.71	6.47	8.91	12.51	18.18	42.12
2017	0.44	1.11	2.02	3.24	4.62	6.38	8.84	12.49	18.24	42.62

Source: International Labour Organization 2019

development – the massive inner differentiation of the Chinese working class. Similar to other imperialist countries, the share of the lower and middle layers of China's proletariat is much lower than the share of a small upper layer.

According to a recently published study of the ILO, the lower 3/5 of China's laborers earn a combined share of less than 28.7% of the total labor income in 2017. On the other hand, the top decile earns 42.62% – more than the combined share of the mass of the proletariat! And, as we can see from Table 10, the income share of the lower eight deciles of the laborers has even slightly declined in the years between 2004 and 2017, in contrast to the top two deciles.

We note, in passing, that according to the same ILO study, the income share of the upper decile of China's laborers is even larger than the equivalent figure for the upper decile in the USA (33.12%), Germany (27,32%), or Japan (27,64%)!

This figure demonstrates that the process of capitalist exploitation in China in the past three decades resulted in the creation of a top, more privileged layer. Marxists call this uppermost part of the working class the *labor aristocracy*. This is a layer that consists, primarily, of sections of the better compensated, skilled workers. This section of the proletariat is, in effect, bribed by the bourgeoisie with a better standard of living. In the imperialist countries, this layer constitutes a much larger proportion of the working class

than it does among the semi-colonial proletariat (Pröbsting 2016).

In summary, China's leap to imperialist power has been the creation of a massive amount of surplus value through the super-exploitation of its working class. Throughout the twentieth century, with the exception of the imperialist fascist regimes, there has been no other capitalist power that could so effectively exploit its working class. This is the "secret" behind the Chinese economic miracle.

China's Military

China's rise as an imperialist Great Power has not been limited to the economic field but is also reflected in the rise of its military as well as of its arms industry. As this is a relatively recent development, China lags still behind the USA as well as Russia. However, it is rapidly catching up and has already joined the top league of Great Powers.

According to the *Stockholm International Peace Research Institute* (SIPRI), China today has the world's second largest military budget, surpassed only by the USA. It has also become the world's fourth largest nuclear-power country behind the USA, Russia, and France (see Table 11). Furthermore, China has become number three among the top exporters of weapons, only behind the USA and Russia (see Table 12).

Chinese Imperialism and the World Economy, Table 11 World nuclear forces, 2018

Country	Deployed warheads	Other warheads	Total inventory
USA	1,750	4,700	6,450
Russia	1,600	5,250	6,850
France	280	20	300
China	–	280	280
UK	120	95	215

Exporter	Global share (%)
1. USA	33
2. Russia	23
3. China	6.2
4. France	6.0
5. Germany	5.6
6. UK	4.6
7. Spain	2.8
8. Italy	2.7
9. Ukraine	2.6
10. Israel	2.3

Source: Stockholm International Peace Research Institute 2017, p. 15

China is also home to large monopolies in the arms industry. According to a recently published SIPRI report, "China is the second-largest arms producer in the world, behind the United States but ahead of Russia." SIPRI also estimates that among the top ten arms companies, three are from China. One should add that SIPRI believes that "[t]hese new estimates are most likely still an underestimate. A lack of transparency in the arms sales figures of Chinese arms companies continues to hinder a complete understanding of China's arms industry" (Stockholm International Peace Research Institute 2020).

The Cold War Between the USA and China

The decline of the USA and the rise of China as well as other Great Powers constitute the background for the rising global economic, political, and military tensions. Faced with historic stagnation and decline of capitalism – particularly since

the Great Recession in 2007/2009 – the USA, China, Russia, the European Union, Britain, and Japan increasingly push to expand their spheres of influence at the cost of their rivals. As the USA and China are the two largest powers, their rivalry constitutes the central axis of these rivalries (Pröbsting 2019).

The global trade war which started in early 2018 has been the most obvious but by no means only manifestation of this rivalry. The Trump administration imposed punitive tariffs on Chinese imports in order to contain Beijing's economic rise. This has been a cycle of respective countermeasures, and, as a result, the majority of Chinese as well as of US exports was covered with such tariffs. By 1 October 2019, 66% of all US imports of Chinese goods and 60.9% of all Chinese imports of US goods were affected by the tariffs of the respective rival (European Commission 2019, p. 13). Given the fact that these two Great Powers alone represent about 40% of the world economy, this development had massive negative effects on world trade in 2018 and 2019.

While Washington and Beijing agreed to declare a truce in their trade war in January 2020 (the so-called "phase one" deal), this agreement did only mean avoiding a further short-term escalation. First, most punitive tariffs remained in place. Secondly, it is pretty clear that this truce is only of fragile and temporary nature and will sooner or later collapse (Pröbsting 2020).

This is even more so the case since, as demonstrated above, the rivalry between the USA and China is not limited to trade but rather based on a comprehensive strive for hegemony on all levels. True, in terms of general productivity, China is far behind the USA. However, China is a huge country with a highly uneven developed

economy. It contains backward regions with a high share of agriculture as well as hubs of modern industries with advanced high-technology sectors. As a result of concerted efforts, China has made substantive investments on key sectors of informational technology like artificial intelligence or in 5G (the latest generation of mobile networks). Today, China is the world leader in patent applications with 40% of the global total, a share more than two times larger than that of the USA and four times larger than that of Japan (Schoff and Ito 2019, p. 2). The Chinese private corporation Huawei has become a global leader in information technology and the number two among the world's leading smartphone companies – trailing only the South Korean technology giant, Samsung. There are also other Chinese corporations which have become global leaders in information technology like Weibo, Alibaba, JD.com, Baidu, Tencent, and Lenovo.

Hence, it is hardly surprising that US imperialism is highly worried to lose its long-time dominance and tries, mostly without success until now, to force its allies to ban the Chinese giant Huawei. Clearly, there is a lot at stake as the analysts of Stratfor, a bourgeois US think tank, acknowledge: "Huawei represents but one facet of the sprawling global tech competition that will continue to rage between the United States and China. There is much at stake: Winning the race to develop a specific new technology will allow the victor, whether Washington or Beijing, to begin to set that technology's global standards by default" (STRATFOR 2020).

Likewise, the rivalry between the two largest Great Powers takes also place on the military level as we see in the increasing tensions in the South resp. East China Sea. The USA has already shifted its focus when the Obama administration announced its "Pivot to Asia" (Pröbsting and Gunić 2017). Likewise, Beijing also acknowledges the accelerating rivalry between the Great Powers. In the latest issue of its biannual defense white paper, titled "China's National Defence in the New Era," the Chinese government states: "International strategic competition is on the rise. The US has adjusted its national security and defense strategies, and adopted unilateral

policies. It has provoked and intensified competition among major countries. (. . .) As the world economic and strategic center continues to shift towards the Asia-Pacific, the region has become a focus of major country competition, bringing uncertainties to regional security" (The State Council Information Office of the People's Republic of China 2019, pp. 3, 4).

Sooner or later it will result in a kind of decoupling between the two economies, the creation of definite political and military blocs, and, ultimately, this development will raise the specter of another World War. It is hardly surprising that bourgeois analysts are deeply worried about such developments. Such write the *Eurasia Group* in its recently published annual report: "As this decoupling occurs, US-China tensions will lead to a more explicit clash over national security, influence, and values. The two sides will continue to use economic tools in this struggle – sanctions, export controls, and boycotts – with shorter fuses and goals that are more explicitly political. Companies and other governments will find it harder to avoid being caught in the crossfire. This struggle has hard-edged realism – great power rivalry – at its core. It's not yet as starkly ideological as the classic Cold War formulation of capitalism vs. socialism. But as tensions escalate, divergences between the two countries' political structures are bringing irreconcilable differences to the fore. The US-China rivalry will increasingly be waged as a clash of values and animated by patriotic fervor" (Eurasia Group 2020, p. 8).

Finally, it is also worth pointing out that China's rise as an imperialist Great Power is also reflected on the ideological level. As is well-known, Britain and France justified their colonial empires with bourgeois ideologies emphasizing their role as "guardians of civilization." Likewise US imperialism accompanies its global hegemonic role with claiming to defend "human rights" and "democracy."

As a rising power, China is also increasingly elaborating and advocating its specific ideology. The Xi regime takes up the ancient Chinese concept of *Tianxia* (which literally means "all under heaven"). This concept was historically based on an understanding of the world in five concentric

zones with the Emperor ("Son of Heaven"), resp., the royal domain in the center, the domains of the princes, the pacification zone, the zone of allied barbarians, and the zone of savagery (Wang 2012; Dessein 2014; Huang 2013). An alternative interpretation is to divide the world into three areas with diminishing Chinese influence: inner vassal area, outer vassal area, and temporary non-vassal area (Zhang 2010). Despite modifications throughout history, the concept of *Tianxia* has always been a classic Confucian concept legitimizing the empire of the ruling class of Han Chinese empire.

China's rising ideological self-confidence results in viewing itself as a power which should play a central role in world politics. President Xi emphasized China's global leading role in a speech in autumn 2017 when he said: "It is time for us to take centre stage in the world and to make a greater contribution to humankind" (BBC 2017). The CCP's flagship newspaper, *People's Daily*, stated in a substantive editorial that China faces a "historic opportunity" to "restore itself to greatness and return to its rightful position in the world." It emphasizes: "The world has never focused on China so much and needed China so much as it does now." It states: "The historic opportunity is an all-round one, which refers to not only economic development but also the speeding up of science, technology and industrial revolution, the growing influence of Chinese culture and the increasing acknowledgement to the Chinese wisdom and Chinese approach (...) We are more confident, and more competent, than any time in history to grasp this opportunity." Furthermore, the editorial points out that "the global governance system is undergoing profound changes; and a new international order is taking shape." Reflecting the imperialist drive, *South China Morning Post*, Hong Kong's biggest daily newspaper owned by Jack Ma's *Alibaba*, titled a report about this manifesto "*Make China great again*" (Bishop 2018; Gan 2018; Xinhua 2018)!

Clearly, this is the ideological accompaniment to China's rise as an imperialist Great Power. It is inevitable that the Cold War between the USA and China will accelerate, and this remains one of the most defining issues of world politics in the coming years if not decades. An editorial of the British *Guardian* reflects the increasing nervousness of a bourgeoisie that continues to be haunted by the catastrophes of twentieth-century capitalism. "There is something eerily reminiscent of the summer of 1914 about the state of US-China relations. Neither side wants a trade war. Both countries would be damaged by a trade war. But step-by-step a trade war comes closer. The latest US tariffs come into force in less than four weeks' time. Without question these are the most crucial weeks for the global trading system since the 1930s. If Mr Trump and China's president, Xi Jinping, miscalculate, as all the signs suggest that they might, the upshot will be a full-blown trade and currency war that will shred business confidence, close factories and increase unemployment" (The Guardian 2019).

Excurse: Modern China and Lenin's Theory of Imperialism

This essay has presented sufficient evidence to show that China has become not only a capitalist country but even a new imperialist Great Power. Such a conclusion has to be drawn also from the viewpoint of Marxist theory. Let us briefly look for this to the understanding of Great Powers as it was elaborated by V. I. Lenin – the originator of the Marxist theory of imperialism.

Lenin described the essential characteristic of imperialism as the formation of monopolies which dominate the economy. Related to this, he pointed out the fusion of banking and industrial capital into financial capital, the increase in capital export alongside the export of commodities, and the struggle for spheres of influence, specifically colonies.

In *Imperialism and the Split in Socialism* – his most comprehensive theoretical essay on imperialism – Lenin gave the following definition of imperialism: "We have to begin with as precise and full a definition of imperialism as possible. Imperialism is a specific historical stage of capitalism. Its specific character is threefold: imperialism is monopoly capitalism; parasitic, or

decaying capitalism; moribund capitalism. The supplanting of free competition by monopoly is the fundamental economic feature, the quintessence of imperialism. Monopoly manifests itself in five principal forms: (1) cartels, syndicates and trusts – the concentration of production has reached a degree which gives rise to these monopolistic associations of capitalists; (2) the monopolistic position of the big banks – three, four or five giant banks manipulate the whole economic life of America, France, Germany; (3) seizure of the sources of raw material by the trusts and the financial oligarchy (finance capital is monopoly industrial capital merged with bank capital); (4) the (economic) partition of the world by the international cartels has begun. There are already over one hundred such international cartels, which command the entire world market and divide it "amicably" among themselves – until war redivides it. The export of capital, as distinct from the export of commodities under non-monopoly capitalism, is a highly characteristic phenomenon and is closely linked with the economic and territorial-political partition of the world; (5) the territorial partition of the world (colonies) is completed" (Lenin 1916).

As we have demonstrated in the previous chapters, China has become a leading power among the world's dominating corporations and banks, in the field of capital export, in the military field, etc. Furthermore, it has become a dominating power – through the BRI project, loans, foreign investment, etc. – in numerous semi-colonial countries of the South. And, finally, China has also proven to be a formidable rival for the USA – the long-time hegemon among the imperialist Great Powers.

It is true that China's economy as a whole is less developed than that of the old imperialist powers like the USA, Western Europe, or Japan. However, it is a widespread misunderstanding of the Marxist theory of imperialism to apply the category of an imperialist Great Power only to the most modern developed capitalist country. Marxist theoreticians knew both highly developed *as well as* less developed imperialist powers. In the first quarter of the twentieth century, Marxists usually agreed to characterize not only the USA, Britain, and France as imperialist but also powers which were much less capitalistically developed (e.g., Tsarist Russia before 1917, Austria-Hungary, Japan, Italy). The difference in labor productivity between these different powers at that time was certainly not smaller than it is today between the old imperialist powers and China (Pröbsting 2014, 2019).

This becomes evident from Table 13 where we can see figures of GDP per capita and relative levels of industrialization for several imperialist powers on the eve of World War I. Similar to what we see today, in 1913, there were huge differences in productivity between the Western imperialist powers and their Eastern rivals. Britain's industrial production per capita (serving as the base of comparison with a value of 100) was, for example, more than three times as large as Austria's, four times bigger than Italy's, and six times the size of Russia's.

It would be also mistaken to reject China's characterization as imperialist because of the official adherence to "communism" by the regime. This is not only the case because this ideology is thoroughly infested by chauvinist patriotism or by the comprehensive adaption to the market ideology. More fundamentally, it is simple nonsensical to characterize a given regime by the ideology which it gives itself. Marxists never considered the USA as a beacon of democracy and human rights just because it proclaimed to be the champion of such ideas. Neither could one seriously claim that the Catholic Church represented in the Middle Ages the original ideas of the New Testament despite all its claims.

Chinese Imperialism and the World Economy, Table 13 Relative GDP per capita (column A) and relative levels of industrialization (column B) in 1913

Country	A	B
Britain	100	100
France	81	51
Germany	77	74
Austria	62	29
Italy	52	23
Spain	48	19
Russia	29	17

Source: Crouzet 2001, p. 148

Another argument could be to refer to the small numbers of foreign military bases of China and to compare this with the hundreds of such bases of US imperialism on all continents. This fact certainly demonstrates that the USA has been the hegemonic imperialist powers for more than seven decades, while China is a new, emerging Great Power. However, it would be mistaken to conclude from this fact that China would not be imperialist. The USA has been the strongest imperialist power for a long time. But it was never the only imperialist power. There have been several other imperialist powers which did not possess any foreign military bases since World War II and which did not conduct any military operations abroad. Just take Germany until 1990 or Japan until today. Neither do these powers have any nuclear weapons until this very day. But one could hardly conclude from this that Germany or Japan were not imperialist in this time.

Conclusion

In this essay we have demonstrated that China has become a new imperialist Great Power on the basis of a process of rapid capitalist accumulation in the past three decades. Today, China is a leading power in terms of production of capitalist value, in foreign investment, among the world's top corporations as well as among the global elite of billionaires. It is one of the most important creditors of semi-colonial countries. Furthermore, it has become a significant military power.

As a result, it plays a crucial role in world politics as, among others, the global trade war demonstrates. In summary, China has become the most important challenger of US imperialism – the long-time absolute hegemon in the capitalist world order.

Chinese Nationalist Settler Colonialism and Indigenous Rights Movements in Taiwan

Lin-chin Tsai
University of California, Los Angeles, Los
Angeles, CA, USA

On August 15, 1945, the Japanese government declared its unconditional surrender to the Allies after the bombings of Hiroshima and Nagasaki. Taiwan, an island colonized by the Japanese Empire for 50 years (1895–1945) after the first Sino-Japanese War in 1894, was handed over to the Chinese Nationalist regime, known as the Republic of China (ROC), at the end of World War II.

Soon after the arrival of the Nationalist troops taking control of Taiwan at Keelung, on October 25, 1945, Chen Yi (1883–1950), then the governor of Fujian Province, attended the ceremony in the Taipei City Public Auditorium (now known as Zhongshan Hall in honor of the founding father of ROC Sun Yat-sen [or Sun Zhongshan, 1866–1925]) as the Nationalists' official delegate as ordered by Chiang Kai-shek (or Jiang Jieshi, 1887–1975). Chen signed the instrument of surrender along with Andō Rikichi (1884–1946), the last Japanese governor-general of Taiwan. Chen, the chief commander of Taiwan Provincial Garrison, announced that October 25 was the "Retrocession Day of Taiwan," and this marked a new beginning of Taiwan after Japan's colonization.

Prior to the handover from Japan to the Chinese Nationalist government, Taiwan was inhabited by Indigenous peoples, who are members of the Austronesian language group for thousands of years. Taiwan Indigenous peoples have been dominated by various imperial powers throughout history, notably the Dutch (1624–1661), the Spanish (1626–1642), the first Han Chinese-style regime established by the Zheng family (1661–1683), the Qing Empire (1683–1894), and the Japanese (1895–1945) (Chou 2015; Tsai 2009). The influx of Han Chinese settlers into Taiwan beginning in the Dutch colonial era and the dramatic growth of Han population under the Zheng regime's encouragement had transformed the demographics and ethnic landscape of Taiwan significantly and gradually shaped a typical settler colonial structure between different colonial authorities, Han settlers, and Indigenous population, as theorists of settler colonial studies such as Patrick Wolfe and Lorenzo Veracini have elucidated (Wolfe 1999; Veracini 2010, 2015, 2016; Shih 2011, 2016). As a consequence, the Indigenous peoples in Taiwan have been subjected to the dominant settler society and Han-centered colonial structure since the late seventeenth century.

The end of World War II and Taiwan's handover to the Nationalist government did not bring peace or harmony to the island. The expectation of the Nationalist regime and the hope for a better future after the 50-year Japanese colonization was soon replaced with widespread disappointment among the Taiwanese locals (namely, the earlier wave of Han settlers who lived through the Japanese colonial era) due to the authorities' corruption, deteriorating economic conditions, inflation, food shortage, mismanagement by the Taiwan Provincial Administrative Executive Office, as well as the cultural and linguistic barriers between mainlanders and Taiwanese locals. The Nationalists' violent military crackdown during the 1947 anti-government uprising – known as the February 28 Incident – unfortunately intensified the conflicting tension among the two groups of Han settlers (the Taiwanese locals and the mainlanders who moved to Taiwan after the handover), as well as Indigenous peoples. All of this resulted in the 38-year long Martial Law from 1949 to 1987 and the Nationalist subsequent authoritarian rule of the White Terror in Taiwan's history.

The tremendous social, political, and economic turmoil during the Civil War (1945–1949) between the Chinese Nationalist Party (*Guomindang* or *Kuomintang*, abbreviated as the KMT) and the Chinese Communist Party (CCP) after the end of the second Sino-Japanese War brought about a new wave of Han settlers (mainlanders) moving to the island and

establishing a different settler colonial relationship in Taiwan. Around one to two million mainlanders, including soldiers, civil servants, intellectuals, and social elites, as well as numerous civilian refugees, retreated to the island of Taiwan with Chiang Kai-shek, the leader of the KMT. Mao Zedong (1893–1976), the leader of the CCP, proclaimed the founding of the People's Republic of China (PRC) on October 1, 1949, with its capital in Beijing.

Even though at first the USA showed no interest in interfering in the conflict between the ROC and the PRC, the American government's involvement in the Korean War in 1950 marked a turning point for the Taiwan-US relationship. Owing to the outbreak of the Korean War, Taiwan under the Nationalist rule became one of the most critical geopolitical sites of the Western Pacific region in the global Cold War structure. With the new American policy of "anti-Communist containment" to prevent the expansion of Communism, the alliance between the USA and the ROC created a space for the defeated Nationalist settler regime to establish its power base in Taiwan. The Mutual Defense Treaty between the USA and the ROC in 1954, as well as the military, economic, and technological assistance from the USA in the following decades, helped strengthen the authoritarian settler state and contributed to Taiwan's "economic miracle," making the island one of the Four Asian Tigers along with Singapore, South Korea, and Hong Kong during the second half of the twentieth century. In other words, the US global hegemony and its imperialist intervention in Asia during the Cold War era (Shor 2016, p. 599), or the American suzerainty, played a pivotal part in consolidating the Chinese Nationalist settler reign in postwar Taiwan (Wu 2004, p. 18).

In the following sections, this essay will investigate the Chinese Nationalist settler colonialism by looking into the postwar cultural production in Taiwan to see how the Han settler colonial consciousness has been formulated and expressed in cultural texts. Next, this essay will explore Taiwan Indigenous rights movements against the Nationalist settler colonial dominance, with particular focus on the Indigenous cultural revitalization movements as a significant form of decolonial practice in Taiwan since the 1980s.

Chinese Nationalist Settler Colonial Project

At the inception of the Martial Law era, in order to consolidate its ruling power and political legitimacy as the only and authentic Chinese polity; the Chinese Nationalist settler regime, on the one hand, continued to address itself as the ROC and asserted its territorial claim on China, Taiwan, and other surrounding islands. On the other hand, it imposed a unified Han Chinese national and cultural identity upon every person in Taiwan. Mandarin Chinese was promoted as the national language, whereas Indigenous languages, Japanese, and other local languages (such as Hoklo and Hakka that the earlier waves of Han settlers used) were restricted by the authorities. With its goal to retake the mainland and the support from the USA in the anti-Communist containment policy during the Cold War era, the Nationalist settler regime launched a cultural policy to promote propagandistic writing of "anti-Communist literature" (*Fangong wenxue*) and "combative literature" (*Zhandou wenyi*).

In the inaugural preface to *Literary Creation* (*Wenyi chuangzuo*) in 1951, Zhang Daofan (1897–1968), a core member of the Nationalist propaganda committee and one of the founders of the state-funded organization, the Chinese Literature and Arts Association (*Zhongguo wenyi xiehui*), clearly expounded the Nationalist settler propagandistic principle: "As a result of the rising tide of anti-Communist and anti-Soviet fervor, the last two years of literary activity in Free China has experienced an unprecedented flourishing. Countless patriotic writers have fully developed their intelligence and skills by penning works with flesh and blood that sing and cry. The contribution to our fellow soldiers and citizens engaged in combat makes us take pleasure in the fact that the Chinese renaissance is following fast on the national restoration in opening up an infinitely glorious horizon" (Zhang 2014, p. 161). By the same token, the inaugural preface to *Military*

Literature (*Junzhong wenyi*) published in 1954, "Establishing a Modernized, Populist, Revolutionary, and Combative National Literature," also stated that "Today, in our effort to oppose the Communists and resist the Soviets, the most important thing is to inspire the hearts and minds of the people so that they will be unified, and to strengthen the people's nationalist thought so that they will be united. Only then can we fully exercise the strength of our people to resist the encroachment of the Soviet imperialists and destroy the sellouts of our nation. . ..Thus, nationalist literature is an important weapon in fighting the Communists and the Soviets. The establishment of a nationalist literature is an important issue for literary workers today" (Editors of *Military Literature* 2014, p. 164). In addition to the genre of "anti-Communist literature," *Wake Up from Nightmare* (*E meng chu xing*, dir. Zong You, 1951), a propaganda film produced by a state-owned studio, the Taiwan Agricultural Education Studio (*Taiwan nongjiao zhipianchang*), articulates the Nationalist anti-Communist ideology by telling about the tragedy of the patriotic female protagonist's involvement in the Communist Party and her final disillusion. In brief, the anti-Communist state ideology, as well as the Nationalist political and cultural agenda, set the tone for the formation of Han settler colonial consciousness in the 1950s and 1960s.

In addition to trumpeting an anti-Communist ideology, the Nationalist settler government also tried to smooth over the increasing tension between the two groups of Han settlers due to the "provincial conflict" after the February 28 Incident via its propagandistic project. *Descendants of the Yellow Emperor* (*Huangdi zisun*, dir. Bai Ke, 1955) serves as a typical film for the settler state to achieve its aims. This film revolves around a group of elementary schoolteachers with different provincial backgrounds from China and Taiwan. These teachers, particularly the film's female protagonist Lin Xiyun, hold important positions in conveying an orthodox narrative of Chinese civilization to their students. They also take up the heavy responsibility of solving a quarrel between students regarding their distinct "provincial origins" by consistently stressing that all

people in Taiwan today are "descendants of the Yellow Emperor (a mythological figure who is commonly believed the founder of Chinese civilization and ancestor of Han Chinese people)" as they share the same ancestral and cultural roots. Moreover, by recalling the national heroes' stories in Taiwan's settler history either via in-class verbal lecture about the Nationalist leaders, such as Sun Yat-sen and Chiang Kai-shek, or via theatrical performances, such as "shadow puppet theater" and "Gezai Opera" (in which the ruler of the first Han settler regime, Zheng Chenggong, and a martyr-like Han merchant during the Qing period, Wu Feng, are presented on the stage), the film articulates tactically the Nationalist pedagogy through emphasizing the bond between Taiwan and China via its official narrative of Han settler historiography and visual performance.

The teachers' cultural tour to southern Taiwan in the second half of the film embodies the Nationalist settler pedagogy further through their on-site investigation of the Han settler historical monuments, such as the Wu Feng Temple, the Chihkan Tower, and the Temple of Zheng Chenggong, during their journey. The cultural and ancestral ties between China and Taiwan are accentuated through the film's visual manifestations of Chinese traditional architecture and artistic elements, including calligraphy, scrolls, paintings, statues, and several others items at these historical sites. The journey to southern Taiwan therefore serves not merely as "an intensive multimedia exploration," but more importantly, as "a territorial extension/expedition from the north to the south" – a political claim of the Nationalist postwar settler project in Taiwan (Tsai 2018, p. 31). Finally, a very well-organized and highly symbolic group wedding of these schoolteachers on the Retrocession Day of Taiwan at Zhongshan Hall concludes the film with its celebratory atmosphere, indicating that the "provincial conflict" between mainlanders and locals after the February 28 Incident has been resolved smoothly. It is also worth noting that the language used in the film was Hoklo (although it was also dubbed into Mandarin), so that it could reach a larger body of local audience in Taiwan. In contrast to the film's harmonious tone and its propagandistic intention,

Bai Ke, the director of *Descendants of the Yellow Emperor* and the manager of Taiwan Motion Pictures Studio, was accused of spying for Chinese communists and then executed by the Taiwan Garrison Command in 1964 during the White Terror period.

Since one of the chief purposes for the Nationalist government's production of *Descendants of the Yellow Emperor* was to smooth over the provincial conflicts between the old and new groups of Han settlers, the Indigenous characters are almost entirely absent in the film. The only exception is the scene of the "Gezai Opera," in which the story of Wu Feng is presented. In the mythologized version of Han-centric popular tradition, Wu Feng was a Han tradesman and an official in charge of Han-Indigenous relations during the Qing period. According to the folktale in popular tradition, in order for the Indigenous people to abandon their tribal practice of headhunting, Wu decided to dedicate his life to Indigenous civilization by sacrificing his own head. This folktale of Wu Feng had been deployed by the Japanese government to forge its propagandistic project about the backwardness of the Indigenous cultures in Taiwan so as to fortify the legitimacy of the Japanese colonial policies of assimilation and civilization. The assimilative narrative of Wu Feng was adapted into *The Legend of Ali Mountain* (*Alishan fengyun*, directed by Chang Ying and Chang Cheh, 1949), which was the first feature-length narrative film shot and completed in Taiwan after the handover of Taiwan to the ROC in 1949 (Huang and Wang 2004, pp. 146–147; Lu 1998, pp. 33–34). The story was later incorporated into school textbooks by the Nationalist government to rationalize its settler colonial governance (*Research on Wu Feng and Related Issues* 1990; Chang 2015, pp. 181–182).

The 1962 film, *No Greater Love* (*Wu Feng*, dir. Bu Wancang, 1962), produced by the Taiwan Motion Picture Studio, continued to publicize the stereotypical and primitive representation of Indigenous people and glorify Wu Feng's sacrifice in an undisguised manner. Toward the end of *No Greater Love*, the Indigenous people's visit to the Wu Feng Temple implies that Wu has not only been deified and become the supreme spirit of the Indigenous people but also suggests that the Indigenous people will adopt a Han Chinese lifestyle while abandoning their own culture and tradition (Sterk 2015, p. 84). These assimilative and discriminatory narratives based on Wu Feng's folktale, in Hsieh Shih-chung's words, have strongly stigmatized the Indigenous people as backward, violent, and uncivilized and caused them to feel ashamed of, or even to conceal, their ethnic and cultural identity as indigenes (Hsieh 1987, pp. 42–45).

The political legitimacy of the Nationalist settler regime upheld by the American imperialist intervention during the Cold War period had gradually been shaken and diminished due to a series of diplomatic setbacks of Taiwan in the international arena since the 1970s. In 1971, the United Nations recognized the PRC as the only legitimate representative of China. In the same year, the ROC was expelled from the UN, and many countries then declared the severance of their diplomatic ties with the ROC after Taiwan's withdrawal from the UN. US President Richard Nixon's (1913–1994) 1972 visit to Beijing and the issue of the Joint Communiqué with Chinese Premier Zhou Enlai (1898–1976) in Shanghai acknowledged the normalization of relations between the USA and the PRC. Although Japan and the Nationalist government maintained diplomatic relations after the end of second Sino-Japanese War according to the Sino-Japanese Peace Treaty in 1952, the Japan-China Joint Communique was signed in Beijing to build up diplomatic relations between Japan and the PRC in September 1972. On December 15, 1978, President Jimmy Carter (1924–) delivered a speech via a television announcement, proclaiming that the USA and the PRC "have agreed to recognize each other and to establish diplomatic relations as of January 1, 1979." As a result, the Mutual Defense Treaty between the USA and the ROC was abrogated after the USA's shift in diplomatic relations from the ROC to the PRC.

Responding to the above diplomatic setbacks and crises that Taiwan suffered in the international arena during the 1970s was a revitalization of anti-Japanese war films based on the second Sino-Japanese War (1937–1945).

Mei Chang-ling (1924–1983), the manager of a major state-run studio, the Central Motion Picture Corporation (CMPC), launched a series of film projects to produce a number of anti-Japanese war films in order to galvanize the audience in Taiwan with highly dramatized and epic cinematic representation of heroism and patriotism. Examples of this film genre include *The Everlasting Glory* (*Yinglie qianqiu*, dir. Ding Shanxi, 1974), *Eight Hundred Heroes* (*Babai zhuangshi*, dir. Ding Shanxi, 1975), *Victory* (*Meihua*, dir. Liu Jiachang , 1976), *Heroes of the Eastern Skies* (*Jianqiao yinglie zhuan*, dir. Chang Tseng-chai, 1977), and so forth. The story of *The Everlasting Glory* is based on the historical figure Chang Tsu-chung (1891–1940), a general of the Nationalist army who participated in the second Sino-Japanese War and died in a battle in Hubei in 1940. *Eight Hundred Heroes*, a remake of the 1938 film of the same title, tells the story of the Nationalist soldiers' defense of Sihang Warehouse in 1937 in order to cover the Nationalist forces retreating west. In the film, Yang Huimin (1915–1992), a young Girl Scout, swims across the Suzhou River to deliver a national flag of the ROC, known as "Blue Sky, White Sun and a Wholly Red Earth," to the troops at the warehouse during the battles of Shanghai. This film carefully presents and highlights the plot of her story, and Yang's image in the film has become one of the iconic images of Taiwanese movie star Brigitte Lin (Lin Ching-hsia, 1954-) who plays this character. *Heroes of the Eastern Skies*, a film produced to commemorate the death of Chiang Kai-shek in 1975, is about a Nationalist commander of the Chinese Air Force, Kao Chih-hang (1907–1937). *Victory* was a blockbuster and a winner of Golden Horse Award for Best Feature Film in 1976. *Victory*'s theme song of the same title in Mandarin Chinese, "The Plum Blossom" (the floral emblem of the ROC), composed by the director Liu Jiachang, was even more popular than the film and has become one of the most well-known patriotic songs in Taiwan. In short, by recalling the courageous and patriotic spirits of these national war heroes via cinematic representations, the Nationalist settler government endeavored to restore its status as a legitimate Chinese polity and, more importantly, to mobilize the Taiwanese people so that they would be united while suffering from international isolation since the 1970s.

The anti-imperialist consciousness embedded in these anti-Japanese war films extended further and evolved into a collective resentment against the American government after the USA terminated its diplomatic relations with the ROC in 1978. *The Land of the Brave* (*Long de chuanren*, dir. Lee Hsing, 1981) serves as a perfect case that manifests this anti-American sentiment among people in Taiwan between the late 1970s and early 1980s. The film begins with the sequence of President Carter's recognition of the PRC and the reaction of the Taiwanese people to this shocking news. In the sequence, the feelings of distress, disappointment, anxiety, and anger among the Taiwanese people are dramatically presented via the interviews, protest slogans, posters, and students' demonstrations against the USA in a pseudo-documentary style, synchronized with the non-diegetic melody of "Descendants of the Dragon" (*Long de chuanren*), the theme song of the film's original title in Mandarin Chinese, performed by a symphony orchestra. The opening sequence is followed by the next scene in which the arrival of Deputy Secretary of State Warren Christopher in Taiwan on December 27, 1978, is broadcast via a television news report, coupled with the noises of the indignant protesters and their voices singing the song called "I Love China" (*Wo ai Zhonghua*).

The anti-American sentiment expressed explicitly in the opening sequence is translated into a mode of settler nationalism through the unfolding of the film. The story of *The Land of the Brave* revolves around two main characters: Lin Chaoxing, a US-trained doctor in agronomy who returns to Taiwan and works at an agricultural research institute, wishing to dedicate what he specializes in to his country, and Fan Jitao, a college student who gives up the opportunity to study musicology in Italy and instead organizes a choral group to promote "campus folk song movement" (a grassroots music movement that emerged from Taiwan's colleges during the late 1970s in reaction to the American neocolonial

cultural and economic domination in Taiwan during the Cold War era) in Taiwan after the USA's annulment of diplomatic relations with the ROC.

The film actualizes further the patriotism and passion of the two young men through their "tours" to the countryside of Taiwan. Jitao and his cohorts of the choral group visit different rural locales in Taiwan, including logging areas, stackyards, and temples, where they form an intimate connection with the villagers by performing campus folk songs. Chaoxing, on the other hand, initiates an agricultural investigation team to explore the agrarian development in Taiwan's rural areas more closely in order to improve the production and technology for agriculture. These two tours led by the two masculine, energetic, and enthusiastic male protagonists, or more precisely, the two settler expeditions to the countryside of Taiwan, display the Han settler projects of nation-building in both spiritual and physical ways by inspiring the collective national and patriotic consciousness via the music and controlling land by scientific surveys. To borrow Arif Dirlik's words, the process of nation-building itself is exactly a form of colonialism, and settler nationalism in a settler society like Taiwan should therefore be seen as an expression of settler colonial consciousness and a mode of coloniality (Dirlik 2018, pp. 5–6).

The Land of the Brave climaxes with the very last scene, in which all of the main characters in the film attend a flag raising ceremony with numerous other people in front of the Presidential Office Building on the National Day in celebration of the ROC's seventieth anniversary in 1981, watch the national flag waving in the twilight, and together wait for the sunrise. The theme song, "Descendants of the Dragon," one of the most famous songs composed in the trend of "campus folk song movement," is utilized again in the final scene to generate a collective consciousness of settler nationalism and patriotism and, more importantly, to reiterate the Nationalist pedagogy that people in Taiwan are all "descendants of the dragon," because the mythological imagery of the dragon is a symbol of imperial power and a cultural totem for Han Chinese people. No

different from the Han-centric settler ideology that we have seen in *Descendants of the Yellow Emperor*, *The Land of the Brave* employs the same political rhetoric via the song to advocate for the historical continuity and ancestral affinity between Taiwan and China in order to construct a unified Han settler historiography. If the American suzerainty and the US Cold War imperialist intervention in Taiwan had strongly solidified the governance of the ROC and its political legitimacy as an authentic Chinese polity, then the anti-imperialist sentiments against Japan and the USA expressed in the above films after their termination of diplomatic ties with Taiwan, very ironically, were mobilized to provoke a collective consciousness of Han settler nationalism and patriotism to recentralize the ruling power of the Nationalist settler regime that suffered from the international setbacks and the crises of its legitimacy since the 1970s.

Another trend of Han settler cinematic narrative in this period was to explore a collective historical memory of the earlier waves of Han settlers coming to Taiwan since the seventeenth century. Inspired by the "nativist literature movement" (*Xiangtu wenxue yundong*) since the 1970s, films, such as *The Pioneers* (*Yuan*, dir. Chen Yao-chi, 1980) and *The Heroic Pioneers* (*Tangshan guo Taiwan*, dir. Lee Hsing, 1986), attempted to engage with the history of the earlier Han settlement in Taiwan by visualizing the early Han settlers' dangerous venture of immigration, arduous efforts of settlement, and their iron-willed and unbending spirits as pioneers settling in the frontier of Taiwan. *Gone with Honor* (*Xianghuo*, dir. Hsu Chin-liang, 1978) integrates the above tendencies of the earlier Han settlement narrative and the anti-Japanese war genre by telling the story of the Lin family's settlement in Taiwan from the late Qing period to the second Sino-Japanese War. By connecting the hardship of the Han settlement in Taiwan with the Lin family members' participation in the anti-Japanese resistance in China, *Gone with Honor* not only effectively incorporates the anti-Japanese sentiment encapsulated in its cinematic representation of the second Sino-Japanese War into the larger historical narrative of Han settler historiography of

Taiwan but also foregrounds the unbreakable bond between China and Taiwan (as we have already seen in many of the aforementioned films) by laying emphasis on the significance of the family lineage (as the original title in Mandarin Chinese symbolizes) via the Lin family in the film. Although these films to an extent were influenced by the nativist discourse of the 1970s, the Nationalist ideology and official historiography still played a prevailing role in their narratives, treating the island of Taiwan merely as a frontier settlement, an integral part of the mainland.

Concurrent with the Nationalist orthodoxy of the early Han settler history articulated in the above films was a series of opposition movements against the Nationalist authoritarian party state. These political opposition movements against the Nationalist regime since the late 1970s, particularly the 1979 Formosa Incident (*Meilidao shijian*, also known as the Kaohsiung Incident, a pro-democracy demonstration initiated by the members of *Formosa Magazine* in Kaohsiung on December 10, the International Human Rights Day, 1979), facilitated the rise of "Taiwanese consciousness" that called for solidification and deepening of Taiwan's distinct national identity and cultural subjectivity in contrast to the Nationalist China-centered historiography and ideology. They also paved the way for the founding of the Democratic Progressive Party (abbreviated as the DPP) in September 1986. Additionally, the tide of sociopolitical movements advocating democratization and localization also provided a ground for the following Taiwan Indigenous rights movements and cultural revitalization beginning in the early 1980s.

Taiwan Indigenous Rights Movements and Cultural Revitalization

Developing along parallel lines with a series of social and political movements, as well as the global Indigenous rights movements around the world, Taiwan Indigenous rights movements and cultural revitalization movements emerged from the early 1980s. The release of the inaugural issue of *High Mountain Green* (*Gaoshanqing*), a magazine founded mostly by Indigenous students at National Taiwan University in May 1983, marked a milestone for the subsequent Indigenous rights movements from the 1980s to the 1990s. With its calls for political democratization, equality of socioeconomic status, and education between the Indigenous and non-Indigenous people, as well as critiques of the mainstream Han-dominant settler society of Taiwan, *High Mountain Green* played a pivotal part in arousing a collective awareness of Pan-Indigenous consciousness and cultural identity among various Indigenous communities based on their shared experience of colonization and exploitation for hundreds of years.

In December 1984, the first Indigenous nongovernmental organization, the Alliance of Taiwan Aborigines (*Taiwan Yuanzhuminzu quanli cujin weiyuanhui*, ATA), was established by Indigenous and non-Indigenous activists and intellectuals. After the Martial Law was lifted by President Chiang Ching-kuo (1910–1988) in July 1987, the Alliance announced the "Declaration of the Rights of Taiwan Indigenous Peoples," clearly stating that Taiwan Indigenous peoples are members of the "Austronesian language group," rather than the "descendants of Yellow Emperor" of which the Nationalist settler regime had imposed upon them and that they are the earliest inhabitants and owners of the island of Taiwan before the arrival of the Western colonial powers (Icyang et al. 2008, p. 192). Based on the demands of the declaration, the ATA called on the mainstream settler society to acknowledge the status of Indigenous peoples, as well as to respect and protect Indigenous cultures, customs, languages, and traditional practices. Additionally, the Alliance actively took more radical actions of street protests against the Nationalist settler government centering on the issues, including Indigenous name rectification, Indigenous autonomy, land claims, environmental justice (e.g., the antinuclear protests against the radioactive waste storage site in Lanyu, an island off the southeastern coast of Taiwan on which the Tao Indigenous people reside), and so forth (Hsieh 1987; Icyang et al. 2008; Yang et al. 2015).

Motivated by the Indigenous rights movements since the 1980s, more and more Indigenous authors began to participate in the trend of social, political, and cultural transformation by creating their literary works in the Sinitic script. In fact, before the 1980s wave of Indigenous rights movements, Paiwan Indigenous author Kowan Talall (Chen Ying-hsiung, 1941–) already has published the earliest volume of Indigenous literature in the Sinitic script, *Traces of Dreams in Foreign Land* (*Yuwai menghen*) in 1971. In 1983, Bunun Indigenous writer Topas Tamapima (Tian Yage, 1960–) published his first short story using his own tribal name as the title, "Topas Tamapima," in *Taiwan Times*, and became well-known after he won the prestigious Wu Cho-liou Literary Award with the story "The Last Hunter" (*Zuihou de lieren*) in 1987. The Indigenous authors during the wave of Indigenous movements not only used their pens to voice their shared experience of successive and multilayered colonization and unjust exploitation under the intersection of various colonial/neocolonial powers and the Han-centric settler structure throughout history but also endeavored to reconstruct different Indigenous historiographies, cosmologies, and epistemologies as a means to resist the dominant Han settler culture in Taiwan. They published in different Indigenous magazines and journals, such as the ATA's newsletter *Indigenous People* (*Yuanzhumin*)*, Aboriginal News* (*Yuanbao*, founded by Rukai author and scholar Taban Sasala in 1989), *Hunter's Culture* (*Lieren wenhua*, founded by Walis Norgan and Liglave A-wu in 1990), and *Taiwan Indigenous Voice Bimonthly* (*Shanhai wenhua*, founded by Paelabang danapan from the Puyuma tribe in 1993), and several other non-Indigenous publications in Taiwan (Sun 2005; Balcom 2005; Pasuya Poiconu 2009, pp. 759–777; Huang 2013; Wei 2013, pp. 262–301).

Echoing the calls of the ATA during the 1980s wave of Indigenous movements, one of the most crucial agendas of Taiwan Indigenous Literature is to reconstruct Indigenous cultural and ethnic identity and call on the mainstream settler society to acknowledge the status of Indigenous peoples as owners of Taiwan. Paiwan Indigenous writer

Monaneng's (1956–) poem, "Recovering Our Names," expresses the marginalization, stigmatization, and alienation that Taiwan Indigenous peoples have long suffered from in history, and his proposal to recover their names and dignity in order to restore Indigenous history, tradition, and culture:

> From "raw savages" to "mountain compatriots"
>   our names
>   have been forgotten little by little at the corner of
> Taiwan's history
>   From the mountains to the plains
>   our fate, alas, our fate
>   receives serious treatment and concern
>   merely in anthropological surveys
>   . . .
>   Our names
>   Have been submerged in the forms of ID cards
>   The selfless view of life
>   wavers on the scaffolds on constructions sites
>   lingers on ship dismantling plants, mining pits,
> and fishing boats
>   The sublime myths
>   have been turned into vulgar plots of TV dramas
>   The traditional morals
>   have been ravaged in red-light districts
>   Heroic spirits and
>   have been silenced along with the church bells
>   . . .
>   If someday
>   we refuse to wander in history
>   please first remember our mythology and
> traditions
>   If someday
>   We are to stop wandering on our own land
>   Please first recover our names and dignity
> (Monaneng 1989, pp. 11–13)

By the same token, in her poem, "Moving beyond Accusation, Living with Dignity," Atayal Indigenous writer and activist Lyiking Yuma (1958–) offers a critical reflection on Taiwan's settler colonial history from the late seventeenth century to the present and calls on Taiwan Indigenous peoples to stand in solidarity by political activism and cultural revitalization for ethnic empowerment and dignity:

> Accuse
>   Of four hundred-year history of sadness
>   From
>   The Netherlands
>   Spain
>   Zheng Chenggong
>   Qing Empire
>   Japan

> To the Chinese Nationalist Party
> Alas. . .
> Continuous oppression by one invader after another
> Owners' lives have gotten worse year after year
> . . .
> Alas. . .
> Rise up! Indigenous peoples
> Transform sadness into strength
> Turn accusation into action
> Let us once again
> Pick up the dignity of our hunting knives
> Honor the spirit of our ancestors
> Move beyond accusation
> Live with dignity
> On our land (Lyiking Yuma 1996, pp. 158–160)

However, the path toward cultural revitalization and ethnic empowerment is never a smooth process, because the Indigenous peoples in Taiwan have long been subjected to a multilayered structure of marginalization co-constructed by Han-dominant settler colonialism and global capitalism in contemporary Taiwan. Inequality of treatment, such as education, employment opportunities, cultural capital, and other resources, has led to a number of Indigenous people to leave for the cities to receive mainstream education or to find jobs. In "Who Is Going to Wear My Beautiful Knit Dress?", Liglave A-wu documents an elder woman's concern about the younger generation that has forgotten the Indigenous cultural practice and tradition due to such alienation from their own Indigenous communities: "I wanted my daughter to grow up to be a useful person, so when she was little, I sent her down the mountain, to a city far away to attend school like those young overseas students from the cities. . .we have been practicing Amis songs and Amis dances. Each time I sing, I get sadder; each time I dance, I feel like I am slapped in the face by my ancestors. For I know my daughter will never learn how to sing and dance the way our ancestors did. Just like my *Ina*, who used to teach me how to draw patterns and make clothes, no matter how hard I try, it is useless. Like a little bird in the sky, my daughter has flown far, far way to the city down the mountain. I don't know when she will come back and who is going to wear the beautiful cloth I weave?" (Liglave A-wu 2014, p. 405).

On top of alienation from their cultural roots and communities, urban Indigenous people in Taiwan have also suffered from exploitation of labor and unfair treatment while working in the cities. As Monaneng's poem "Recovering Our Names" has already revealed, many of the urban Indigenous people work as construction laborers, miners, ocean-liner fishermen, or even juvenile prostitutes. In another poem "The Hundred-Pacer Snake Is Dead," Monaneng portrays a pathetic scene of an Indigenous juvenile prostitute in the urban jungle of Taiwan:

> The hundred-pacer snake is dead
> Stuck in a transparent bottle of medicinal wine
> The label on the bottle reads: *Aphrodisiac*
> A teaser for the guys roaming the red-light district
> The hundred-pacer snake of myth is dead too
> The Paiwan people once believe its eggs were their ancestors
> But today it sits in a transparent bottle
> Now the agent for promoting lust in the big city
> When a man drinks the medicinal wine
> And struts his false majesty into the red-light district
> There, at the brothel door to meet him,
> Is the descendent of the hundred-pacer snake:
> A young Paiwan girl. (Monaneng 2005, p. 163)

In this poem, the hundred-pacer snake, a divine totem of Paiwan Indigenous culture and has been considered the ancestral figure of the Paiwan people in their oral tradition, is degraded as an aphrodisiac to promote lust, which signifies both commodification of Indigenous culture and inhuman exploitation of young Indigenous girls who are forced into prostitution in Taiwan. Without detailed elaboration on the Paiwan girl who struggles for survival, this poem tells a tragedy by the encounter of two Paiwan Indigenous people in the brothel, both victims of Han settler colonialism and capitalism in Taiwan's society.

In brief, the Indigenous authors' intervention in the mainstream settler society via their literary demonstration in the Sinitic script played an indispensable part in Taiwan Indigenous rights movements and cultural revitalization. The Sinitic language, although as "the language of the settler colonizers" to Indigenous writers, had already become a weapon to challenge the Han settler colonial structure and an accessible vehicle to

create a public space for alternative discourses for both Indigenous and non-Indigenous audiences. In Huang Hsin-ya's words, "In 'reinventing' the Sinitic script and turning the indigenous into a writing subject, there is hope that they will turn the process of colonization around. Their literature represents a form of cultural survival, which is read and viewed as a process of resistance, opposition, and decolonization" (Huang 2013, p. 246). Recently, more and more Indigenous authors have engaged in literary experiments through the creolization of Indigenous languages and the Sinitic script, working as translators or mediators among multiple languages and cultures more actively and creatively.

Taiwan Indigenous rights movements since the 1980s have not only been part and parcel of the process of democratization and localization but also played an indispensable role in shaping and developing the alternative media practice in Taiwan. More precisely, in addition to the Indigenous literary journals such as *Hunter's Culture* and *Taiwan Indigenous Voice Bimonthly*, Taiwan Indigenous rights movements also stimulated the transformation of Han-oriented cultural production and inspired the alternative media practice that are far different from the mainstream mode of media within the Han-dominant settler society. One of the important examples was the founding of the Green Team in 1986, a small media collective that had been regarded as the precursor of the New Taiwan Documentary by scholars (Chiu 2015). Wang Chih-chang, a Han cinematographer and member of the Society of Editors and Authors outside the Party (*Dangwai bianji zuojia lianyihui*), had become acquainted with the Indigenous activists and authors from the Council of Minority Ethnicity (*Shaoshu minzu weiyaunhui*, the predecessor of the ATA), and involved in reporting events regarding Indigenous issues and movements of Taiwan, including the 1984 mining disaster in Tucheng of New Taipei City (many of the miners who died in the disaster were Indigenous), the charity concert named "Singing for Mountains" at Taipei New Park (currently known as the 228 Peace Memorial Park) initiated by Indigenous musician and activist Hu Defu (Parangalan, 1950–) in search of support and

funds for the bereaved families in the mining disaster, and the founding ceremony of the ATA at Mackay Memorial Hospital in Taipei on December 29, 1984. Wang was also one of the founding members of the ATA and worked as an art editor for the ATA's newsletter *Indigenous People*.

In October 1986, Wang founded the Green Team with other independent documentary filmmakers, striving to document alternative images and publicize marginalized voices of different minority groups through their direct involvement in various social and political movements, particularly the Indigenous rights movements. During the Martial Law period, Taiwan's media had been dominated by three main broadcast television stations: Taiwan Television (TTV), China Television (CTV), and Chinese Television System (CTS), as well as three major daily newspapers, including *China Times*, *Central Daily News*, and *United Daily News*. Working very closely with activists and protestors, the Green Team played a pivotal role in documenting the social movements that could hardly be broadcast via mainstream media due to the Nationalist government's censorship and distributed these images through underground, independent outlets, such as night markets, street vendors, election headquarters, regional chapters or offices of the DPP, and other campaign events. The alternative cultural practice and involvement in social movements of the Green Team as a small media collective thus served as a critical vehicle of oppositional discourses that were able to mobilize or facilitate a mass movement and as a channel of communication that created "cultural networks" and "webs of political solidarity" (Sreberny-Mohammadi and Mohammadi 1994, p. xx). According to Wang, the establishment of the ATA as a critical milestone in the process of Taiwan Indigenous rights movements had significantly inspired the founding of the Green Team and its social and political involvement in Taiwan's society.

The images of Taiwan Indigenous peoples, as a consequence, have been becoming more visible since the 1980s. Han Taiwanese filmmaker Huang Ming-chuan's (1955–) film, *The Man from Island West* (*Xibu lai de ren*, 1989), has been widely

taken as the first independent fiction-feature film in Taiwan's film history that takes Indigenous figures as its main characters and deals with the Indigenous themes. The Taiwan Public Television Service Foundation (*Gonggong dianshi*, PTS) also has served as a crucial platform for promoting alternative media regarding Taiwan Indigenous peoples. In 2005, the Taiwan Indigenous Television (*Yuanzhuminzu dianshitai*, TITV) was established to produce and broadcast Indigenous television programs in order to publicize the Indigenous issues further. Moreover, Indigenous and non-Indigenous filmmakers and documentarians in Taiwan, such as Bauki Anao (Pan Chao-cheng, 1956–), Pilin Yabu (1966–), Mayaw Biho (1969–), Laha Mebow (Chen Chieh-yao,1975–), Lee Daw-ming (1953–), Hu Tai-li (1950–), Cheng Wen-tang (1958–), Wei Te-sheng (1969–), and several others, actively dedicated themselves to the creation of Indigenous images.

In addition to transformation in the cultural realm, many political changes, education, and legal reforms have been made thanks to Taiwan Indigenous rights movements since the 1980s. The Wu Feng Township of Chiayi County was renamed into Alishan Township since 1989, and the lesson of Wu Feng was removed from school textbooks and the curriculum in the same year. In 1994, President Lee Teng-hui (1923–) first used the term, *Yuanzhumin*, literally, the original inhabitants, to address the Indigenous people, which indicated that the Indigenous peoples are autochthonous to Taiwan. In the same year, the National Assembly passed a series of Additional Articles of the Constitution of the ROC to amend the discriminatory and assimilative designation, *shanbao* (namely, "mountain compatriots"), into *Yuanzhumin*. The Council of Indigenous Peoples (*Yuanzhuminzu weiyuanhui*), a ministry-level rank under the Executive Yuan, was established in December 1996 to deal with Indigenous affairs and serve as an important platform between various Indigenous communities and the government in Taiwan. In July 1997, the term, *Yuanzhuminzu*, was written into the Constitution of the ROC to acknowledge the constitutional status of Indigenous peoples and their collective human rights in Taiwan.

After the peaceful transition of power from the Chinese Nationalist Party to the Democratic Progressive Party, the DPP government affirmed the "new partnership between the Indigenous peoples and the government of Taiwan" in 2002 and further promulgated the Indigenous Peoples Basic Law (*Yuanzhuminzu jibenfa*) to protect "the fundamental rights of Indigenous peoples" and build reciprocal "inter-ethnic relations based on co-existence and prosperity" in 2005 (Council of Indigenous Peoples). On August 1, 2016, President Tsai Ing-wen delivered her formal apology to the Indigenous peoples on behalf of the ROC government and promised to establish the Presidential Office Indigenous Historical Justice and Transitional Justice Committee in order to promote social fairness and historical justice for the Indigenous people in Taiwan.

Nevertheless, as many of the settler colonies around the world, the above legal and social reforms since the late 1980s do not mean that the Han settler colonialism in Taiwan has come to an end. On February 14, 2017, several months after President Tsai's apology to Taiwan Indigenous peoples, the Council of Indigenous Peoples organized a press conference on the "Regulations for Demarcating Indigenous Traditional Territories" and proclaimed these new regulations officially on February 18. This policy disappointed many Indigenous communities, as the new regulations for their land rights confined the notion of Indigenous traditional territories only to government-owned public land and excluded private property. In the eyes of Indigenous activists, the exclusion of private land from Indigenous traditional territories was, in fact, a justification of settlers' land dispossession, because a great portion of Indigenous land has been designated as private property.

On February 23, 2017, Indigenous activists, including documentarian Mayaw Biho, musician Panai Kusui, and several others, set up a campsite in front of the Presidential Office Building on Ketagalan Boulevard to protest these new regulations, where they held informal concerts and forums to popularize the issues related to Indigenous traditional territories and land rights in the

public sphere and communicate persistently with Taiwan's society. They painted stones, and invited people to paint with them, and placed their artworks on Ketagalan Boulevard, which made their protest camp a creative gallery of activism. On June 2, the campsite and their artworks were demolished by the government ruthlessly, and these Indigenous activists were evicted from the campsite on Ketagalan Boulevard by police. The demolition of the Indigenous protest campsite on Ketagalan Boulevard, a street name derived from the Ketagalan Indigenous tribe, epitomized ironically various forms of forceful eviction and relocation that continue to take place and harm Indigenous peoples' rights to land and sovereignty in contemporary Taiwan. The rise of the DPP and Taiwanese consciousness since the 1970s, although playing a crucial part in the process of democratization and localization in Taiwan should be viewed as rejuvenation of the earlier form of Han settler consciousness against the Chinese Nationalist Settler regime. Settler colonialism is not yet finished; Taiwan Indigenous peoples' efforts in decolonization continue.

Anti-imperialism; Geo-political Hegemony; Instrumentalism; Neo-colonialism; Realpolitik; Regime change; Unilateralism; US exceptionalism; US foreign policy; US imperialism; US nationalism

Definition

Noam Chomsky remains a relentless critic of US foreign policy: in particular, the instrumental realpolitik, which displays to advance Geo-Political Hegemony and what as the world's only super power, can be defined as Imperialism. This expanded 2nd edition essay develops in substantial detail Chomsky's anti-Imperialism over the last five decades.

In a very recent article, Noam Chomsky notes of US foreign policy: 'Hegemonic power offers the opportunity to become a rogue state, freely defying international law and norms, while facing increased resistance abroad and contributing to its own decline through self-inflicted wounds' (2013a). Such a statement crystallises well Chomsky's critique of US foreign policy and self-defined 'exceptionalism' on the world stage; a critique he has had (but consistently developed and furthered) for more than 45 years. In a 2010 interview Chomsky gives his critical analyses of US foreign policy which is also an effective summary of this in the second half of the Twentieth

Century and indeed the first 20 years of the Twenty First Century.

> "The problems with American foreign policy are rooted in its essential nature, which we know about. Or we can know about it if we want to. So you go back to say the Second World War. That's the point at which the US became a global power. Before that it had conquered the national territory, pretty much exterminated the population, conquered half of Mexico, pretty much taken control over the Western Hemisphere, invaded the Philippines, killed a couple of hundred thousand people but the real global power up to that time was Britain and others. The United States was not a global power. But it became so after the Second World War. And planners met and carefully laid out plans – they're perfectly public – for how they would run the post-war world." (2010)

Chomsky has remained a relentless critic of US foreign policy and the foremost role given to what he has called its 'Imperial Ambitions' in many decades of overthrowing democratically elected governments and overseeing their replacement by various (often extremely violent, indeed murderous) dictatorships, support for right-wing paramilitaries, embargoes and trade blockades on states it finds unfavourable, and outright military force against all others it has determined must be brought into line. Additionally, Chomsky excoriates the US's historical fondness for ignoring, or 'opting out' of, international law and treaties: perhaps observed most recently and notoriously in the 2003 invasion of Iraq, similar in some ways to the first such invasion in 1991 by George Bush Sr and allies, but without the pretext of it being a response to Iraq's invasion of Kuwait. The 2003 intervention was of course part of the so-called 'War on Terror' declared by then president George W. Bush. No link at all could be made between Al-Qaeda's attacks of 9/11 and Saddam Hussein, nor was any evidence of 'Weapons of Mass Destruction' found. However, the US and UK ignored the UN and all countries opposed to military intervention and invaded anyway, and as such, it can be seen as arguably the apotheosis of US exceptionalism, supported and endorsed by the UK prime minister Tony Blair: bilateralism truly coming into its own. The protracted conflagration of Iraq, in which at least one million civilian lives were lost during the Anglo-US

occupation and civil war, and the further vast loss of life that followed, was supposed to have 'ended' with the withdrawal of US troops in December 2011; however, the suffering of the country continues. The invasion of Iraq was supposedly because Saddam Hussein had some link to 9/11 however, following the US invasion of Afghanistan in 2001, there was the further black irony of the fact that the Islamist Mujahedeen and one of its most prominent guerrilla leaders Osama Bin Laden had received considerable US support in the 1980s war against the Soviet Union's invasion of that country.

Chomsky was and is an incisive critic of the war and its retrospective justification through erroneous 'proof' of the threat of Saddam Hussein's military capabilities; capabilities that were previously supported by the Pentagon and different Washington administrations. Saddam Hussein's Iraq may have played no part in the events of 9/11 but since it was deemed a 'Rogue State' international law could be 'interpreted' to mean whatever the administration of George W. Bush wanted it to mean, when it was not bypassed altogether as the US acted unilaterally with the UK in invading Iraq. The newly created realpolitik term 'Rogue State' as well as 'Weapons of Mass Destruction' effectively sanctifying invasion and occupation since these terms served as 'the next best thing' in the absence of actual evidence that such newly classified states posed any threat to the US or its allies.

At the time of the invasion, Chomsky noted, 'The most powerful state in history has proclaimed that it intends to control the world by force, the dimension in which it reigns supreme' (2003). Indeed, the severity of the damage done to US and British standing in the international community cannot be underestimated, and the fact that millions of the citizens of both countries protested against invasion and occupation, but were completely ignored, bares distinct similarities to the US's intervention decades earlier in Vietnam, another imperial adventure Chomsky did not spare criticising. Vietnam set the precedent for future decades, in that the war displayed the US military machine's apparent disregard for international opinion, much less international law, something first properly observed through shocking

images of weapons not used or considered acceptable by other states against the civilian population: napalm searing human flesh and the defoliating Agent Orange doing the same to vegetation; all justified and explained as 'necessary' to vanquish the Viet Cong enemy. The war in Vietnam met with monumental resistance in the US, and Chomsky noted at the time (1975) that it was not merely the Republican hawks Nixon and Kissinger who engaged in continuous bombing of the country and (not so) covert efforts to find local support on the ground, but also Democratic president Kennedy whose various military mobilisations earlier had 'involved US forces in counterinsurgency, bombing, and "population control"' (1975). Cambodia and Laos were to meet a similar fate. The 'necessity' of using weapons technologically developed to devastate life, and terrorise 'enemies' into submission at the time set the tone for further Cold War imperial machinations by the US and its Western allies; the US always being, however, the primary actor. Vietnam was 'an indescribable atrocity', Chomsky observed (ibid.).

The year 1973 is an appropriate one in which to pick up the further development of Cold War imperialism. It saw the CIA depose the democratically elected government of Salvador Allende in Chile, and install the murderous right-wing Pinochet dictatorship. The date of September 11 was not lost on critics 30 or so years later, and Chomsky was one of (if not the most) stringent of voices to remind the US public that another nation in South America also suffered appalling and brutal loss of life decades earlier courtesy of a lawless and fascistic regime put in power by the US. The fact that the Allende Government had been democratically elected but, being perceived as 'too left-wing' by Washington, was seen as fit to remove, brought out in glaring contrast the contradictions of US foreign policy that Chomsky would underline in all his subsequent political work on the subject. Reflecting on those events 19 years later in a 1994 interview, Chomsky noted: 'They [the CIA] really pulled out the stops on this one. Later, when the military coup finally came [in September, 1973] and the government was overthrown (and

thousands of people were being imprisoned, tortured and slaughtered) the economic aid which had been cancelled immediately began to flow again. As a reward for the military junta's achievement in reversing Chilean democracy, the US gave massive support to the new government' (Chomsky 1994). To be sure, US imperialism was to be violently felt across Latin America throughout the 1970s and 1980s; South America in the 70s under the CIA's 'Operation Condor' programme to destabilise and remove any government it saw as 'left-wing', usually involving considerable support for right-wing and reactionary elements, while other arms of the US state saw to more practical matters such as arming and training them. Chomsky has always been among the many critics pointing out that support for state terror and death squads has been the repeated tactic of the CIA and military, with both Republican and Democrat administrations helping in their facilitation.

Focused on Latin America, Chomsky has remained a tireless critic of US imperialism, against Pinochet's Chile, and also offering incisive criticism of Argentina's military regimes. Argentina experienced a 'Dirty War' under the 'National Reorganisation Process' of successive military dictatorships beginning with Jorge Videla's, every bit as murderous as Pinochet's. Bolivia experienced something similar under Hugo Banzer who took power 1971 with of course strong support from Washington in this case Richard Nixon's administration before its termination following Nixon's demise in 1974 over Watergate. Banzer's military regime was followed by that of Luis García Meza.

Brazil found itself under military rule for a period of no less than 21 years (1964–85), beginning with Humberto de Alencar Castelo Branco, the typical 'strongman' preferred by Washington. Castelo Branco's successor Emilio Garrastazu Medici met with Nixon in 1971, and in a badly kept secret, discussed the removal of both Allende and Castro. (Cuba has been the Central American sore point for US imperialism, something else Chomsky has never tired of pointing out.)

Paraguay saw the longest unbroken single dictatorship of any Latin American country in Alfredo Stroessner's 35 year rule 1954–89,

seizing power in a coup: 'El Stronato' the decades-long period of Stroessner's authoritarian regime playing a leading role in the CIA facilitated 'Operation Condor' across South America in the 70s which involved assassination, 'disappearances', the use of death squads, torture and terrorizing opponents to enforce political repression in every area of society and in all aspects of life.

Chomsky was one of the original critics of the ideology of 'National Security Doctrine' which was propagated by South American juntas – and the CIA throughout the decade. Speaking in 1979, Chomsky's critique of the mass media and its propaganda function meets his thoroughgoing critique of instrumental US foreign policy in the co-authored article with Edward Herman, *The Nazi Parallel* excerpted from *The Washington Connection and Third World Fascism*,

> "The ideology designated the "National Security Doctrine" has three main elements: (1) that the state is absolute and the individual is nothing; (2) that every state is involved in permanent warfare, its present form being Communism versus the Free World; and (3) that control over "subversion" is possible only through domination by the natural leadership in the struggle against subversion, namely the armed forces. Because the National Security State is U.S.-sponsored and supported and meets U.S. criteria on the fundamentals, there is another important international consequence: the mass media in the United States play down and essentially suppress the evidence of the enormous inhumanities and institutionalized violence of these U.S. satellites." (1979)

Post-war US realpolitik supporting instrumental US foreign policy and 'Regime Change' in the Caribbean and Latin America can be traced back to the Bay of Pigs invasion of Cuba in 1961 by Cuban exiles opposed to Fidel Castro's regime. The CIA covertly financed the operation which was undertaken with the planning of President Eisenhower's administration then with the full knowledge of the Kennedy administration, despite Kennedy having been ostensibly hostile to archetypal right-wing military 'Strongman' Fulgencio Batista and sympathetic to the original Cuban revolution.

Batista's Cuba was an impoverished authoritarian and oppressive one party state but had nevertheless been a stopping off point for moneyed international elites whilst maintaining a murderous regime of political repression and Cold War anti-communist paranoia: effectively a bloody Latin American embodiment of McCarthyism which had taken hold of the US the same decade, the 1950s. Bastista's Bureau for the Repression of Communist Activities (Buró para Represión de las Actividades Comunistas, BRAC) used terror against its opponents and carried out torture and public executions but also had the support of the US throughout the decade it held power just as the largely shambolic attempted invasion of the Bay of Pigs had funding from the CIA.

The Bay of Pigs Invasion would in turn help bring about the Cuban Missile Crisis in which the world came perilously close to nuclear annihilation for the first time, as Nikita Khrushchev upped the ante by stationing nuclear missiles in Cuba accelerating Soviet alarm and reaction to American missiles with nuclear warheads being based in Turkey thus capable of launching a 'first strike' against which the USSR would not be able to retaliate. Khrushchev stationing missiles in Cuba primed with nuclear warheads meant that in the crack pot 'logic' of Mutually Assured Destruction (MAD), a 'second strike' would be possible against the US: it was The Week the World Stood Still, and "The Most Dangerous Moment" yet for humanity, as Chomsky reflected 50 years later.

Secretary of Defense Robert McNamara who would go on to be one of the leading figures associated with the carnage of the Vietnam War in the latter part of the 1960s and into the early 1970s, "recognized that Cuba was justified in fearing an attack. "If I were in Cuban or Soviet shoes, I would have thought so, too," (2012) he observed at an international conference on the 40th anniversary of the missile crisis.

US interventions in the Caribbean would not become immediately apparent again for almost 11 years and the October 1983 deployment by US President Ronald Reagan of US troops into Grenada in the Caribbean under 'Operation Urgent Fury'. The invasion was ostensibly because Grenadian Prime Minister Maurice Bishop had seized power and suspended the country's constitution in 1979 and to protect

Americans in the country, however the pretext for the invasion is unconvincing when is considered that Reagan and his administration's Hawks previously never had any problem with the disputed 1976 election result which returned Eric Gairy to power or his lawless 'Mongoose Gang' secret police trained by security forces from Pinochet's Chile or the intimidation and violence they used against the opposition and the population. Similarly, Bishop and his left-wing New Jewel Movement had considerable popular support in deposing former incumbent Gairy and implementing social policies aimed at reducing inequality and the upward leveling of society in the country, these radically egalitarian measures being unpopular to say the least with Reagan's administration, as they had been with Carter's, hostility to Bishop's "popular socialism", and its notable successes such as increasing literacy to around 98% and reducing unemployment by 35% could not be tolerated being as they were the embodiment of what Chomsky called "the threat of a good example" (1992a)

It should also be borne in mind that the supposed reasons for invading Grenada confected by the Reagan administration were in large part the right-wing conservative consolidation and aggressive furtherance of its Democrat 'liberal' predecessor the administration of Jimmy Carter which severely limited aid to the country and refused to provide emergency assistance after 40% of its key banana crop was destroyed by the hurricane of August 1980. Carter also imposed an additional conditionality that Grenada should be excluded from rehabilitation aid provided to affected countries through the West Indian Banana Exporting Association – something refused by the Association thus US aid was never offered. Additionally following Bishop's coming to power in 1979, Carter's administration granted asylum to exiled former Prime Minister Eric Gairy who used this to broadcast propaganda against Maurice Bishop and the New Jewel Movement. Carter's administration also tried to discourage US tourism to Grenada and refused to recognize the Grenadian ambassador to the US.

Prior to independence from British colonial rule in 1974, the British- approved proposal for a new airport, had been a project which involved international co-operation in the planning and design stages and proved uncontroversial unlike nearly 30 years later when Maurice Bishop's government began construction of Point Salines Airport. Reagan believed that the new commercial airport would be used to facilitate Soviet military buildup in the region and allow both Russia and Cuba a permanent military base and a hub for armaments to left-wing guerrilla groups operating in Central America.

The Bishop government argued that its construction of the new airport was built to allow commercial aircraft carrying tourists, adding that commercial aircraft were unable to land at Pearls Airport at the island's 5,200 feet north end nor could it be expanded because the runway was adjacent to a mountain at one end with the ocean at the other.

Reagan also claimed that Bishop's Grenada allowed the Soviet Union to expand its political presence and influence in the region, an unproven and largely nonsensical claim and again one which can be counter posed with the inconvenient reality over many decades of both Republican and Democrat administrations operating in the region and indeed globally, purportedly to advance US interests but which undermine elected governments because their policies apparently run counter to those of the US just as arming, training and funding anti-democratic and anti-popular groups it finds favorable or malleable is always explained and justified as 'necessary' and, however disingenuously, about 'freedom' and 'democracy'.

The US invasion of Grenada easily overwhelmed resistance in the space of 4 days by the deployment of over 7,000 troops. As to the legality of the military intervention, the United Nations General Assembly voted against Reagan's invasion and condemned it as being "a flagrant violation of international law and of the independence, sovereignty and territorial integrity of that State" calling on the US for an "immediate cessation of the armed intervention." This was ignored altogether however, as was international condemnation and the UN Security Council's own resolution that it violated international law by being simply vetoed by the US.

Chomsky's critique of US foreign policy and the role the supine corporate media play in cheerleading and promoting it is encapsulated well in his excoriation of both the Carter and Reagan administrations' treatment of Grenada and the mass media's de facto blackout of both Carter's severe limitation and then refusal of aid to the country and engaging in threatening military exercises around the island

"The large-scale military operations simulating an invasion of "Amber and the Amberdines," clearly intended to intimidate the government of Grenada and the Grenadines, passed without mention in the *New York Times.* The only hint was a tiny item noting Grenada's charge that it was the target of "an imminent attack" by the United States, dismissed by the State Department as "ridiculous," with no further details or inquiry." (1989)

Carter's Democrat administration had merely staged military maneuvers around Grenada and mock sorties – not to say all of its political hostility to Bishop's experiment in what he called "popular socialism", but Reagan's conservative Republican administration actually invaded the island using the full force of the US military machine. The media effectively acting as the US President's press office and Public Relations department in this case by remaining largely silent on the US's military 'leaning' on Grenada since it clearly did not wish to publicize the actions undertaken or allow informed debate as to their necessity or desirability: something Chomsky has consistently set out in both his criticism of US foreign policy and the propaganda function of the media at the time and in the 37 years since.

By the time of Reagan's 1983 invasion, the US media had assumed its traditional role spinning a narrative of "rescue" and "liberation" to underscore the aggression as being both necessary and justified, Washington itself choosing obfuscation over such falsities the incursion and military overkill by a Superpower against the small island nation, being to prevent the Soviet Union gaining this Caribbean outpost as a satellite threatening Americans in Grenada and the might of America itself.

Staying in the Caribbean and moving to Haiti, Jean-Bertrand Aristide became President in 1990

winning with 67.5% of the vote and achieved substantial social and political progress in a very short period of time. Reducing corruption and stemming the long running exodus of Haitians to the US, Aristide's social reforms were unpopular with elites in the country that had previously supported the dynastic Duvalier dictatorships of François 'Papa Doc' Duvalier and then his son Jean-Claude 'Baby Doc' Duvalier and as Chomsky has since noted, "The only question in the mind of anybody who knows a little history should have been, How is the US going to get rid of Aristide?

In *Secrets, Lies and Democracy* Chomsky critically elaborates further,

"All of this made Aristide even more unacceptable from the US point of view, and we tried to undermine him through what were called-naturally-"democracy-enhancing programs." The US, which had never cared at all about centralization of power in Haiti when its own favored dictators were in charge, all of a sudden began setting up alternative institutions that aimed at undermining executive power, supposedly in the interests of greater democracy." The 80s Republican administrations of Ronald Reagan had been alarmed by Aristide a decade before he was the Haitian President. Aristides's Liberation Theology meant that "US policy must begin to counter (not react against) . . . the "liberation theology" clergy" (1994)

Following the 1991 military coup ousting Aristide from office, international condemnation was comprehensive, and a trade embargo was initiated by the Organization of American States (OAS), in which the US reluctantly participated. As the country descended into bloody chaos refugees fled Haiti but the administration of George Bush blocked them from entering its borders.

Bill Clinton who won the 1992 US Presidential election and became President in 1993 had admonished the Bush administration for returning refugees to the terror and bloodshed of Haiti after Aristide had been deposed by the military junta "a flat violation of the Universal Declaration of Human Rights, which we claim to uphold" (1994) Chomsky noted the following year. Clinton had made promises to end the callous refusal of Bush to grant refugees from Haiti fleeing for their lives entry to the US, but pointedly adopted these policies himself as President-Elect.

Following Bill Clinton's inauguration as US President, Chomsky noted in the same interview in *Secrets, Lies and Democracy*,

"The US Justice Department has just made a slight change in US law which makes our violation of international law and the Universal Declaration of Human Rights even more grotesque. Now Haitian refugees who, by some miracle, reach US territorial waters can be shipped back. That's never been allowed before. I doubt that many other countries allow that." (2014)

From the time of Aristide's electoral victory in 1990 to the military putsch which ousted him 8 months later, he was asked – instructed may be a better description – to make concessions to the junta, Chomsky reflected on this in 1994,

"It's perfectly understandable. The Aristide government had entirely the wrong base of support. The US has tried for a long time to get him to "broaden his government in the interests of democracy." This means throw out the two-thirds of the population that voted for him and bring in what are called "moderate" elements of the business community-the local owners or managers of those textile and baseball-producing plants, and those who are linked up with US agribusiness. When they're not in power, it's not democratic." (1994)

Aristide being left-leaning and with a background in Liberation Theology was not prepared however to follow such 'advice' from the US.

Despite participating in international efforts to remove the ruling junta from office, the Clinton administration refused to deport paramilitary leader Emmanuel 'Toto' Constant who was wanted and due to stand trial in Haiti. Constant founded the notorious FRAPH death squad: *Front pour l'Avancement et le Progrès Haitien* (Front for the Advancement and Progress of Haiti) with the covert support of the CIA and the Defence Intelligence Agency (DIA) and had been a spy paid by the CIA, the DIA encouraging Constant and helping fund his paramilitary group in undermining Aristide for as long as it saw fit, distancing itself and cutting ties as soon as it did not – what it must be said, has been a recurrent pattern. Constant was convicted *in abstentia* over the 1994 Raboteau massacre in which the FRAPH in an unprovoked attack on Aristide supporters killed at least six people and injured many more.

Indeed, the US's involvement in covert campaigns to undermine popular support for Aristide somewhat contradicts its leading international efforts to remove the military junta who ousted him and in which the CIA and DIA were instrumental. This is what is meant by US 'realist' foreign policy following a familiar pattern: in Haiti like elsewhere throughout the 1970s, 80s, 90s and 2000s, and regardless of whether the President was Republican or Democrat the US has done everything possible – using both covert and overt means – to hamstring and politically counter any and all governments it sees as being 'left-wing' or 'socialist'. This has also meant of course, at its worst, making cynical use of right-wing and ultra-conservative fronts and paramilitaries as in Haiti and many other places across the world. The US being the world's only Superpower, also sets the bar for what is understood internationally as being acceptable: having so much influence on the UN Security Council, it simply vetoes any decision or voting outcome with which it disagrees and continues to do so.

It is not a straightforward question of comparing and contrasting Republican and Democrat administrations although there have been and are noticeable differences and the CIA and DIA whilst being independent federal government agencies have operated in large part according to Presidential mandates and the policies of incumbent administrations where already powerful individuals such as Henry Kissinger have come to prominence and exerted an undue influence to lasting and thoroughly malign effect.

The US in Haiti in the early-90s is in many ways an unusual example of its textbook operations of indirectly and covertly and *directly* and *overtly* intervening against any overseas government it deems incompatible with its interests. As this expanded 2nd Edition essay on Chomsky and Anti-Imperialism elaborates further taking the many other countries and events which necessarily could not be included in the shorter First Edition version, the unusual and 'atypical' example of Haiti deserves special attention.

Haiti was and is one of the poorest counties in the world whose history is has been shaped by Colonialism and the Atlantic Slave Trade, and the

revolt of the population against both: the 1792 Haitian Revolution dealing a fatal blow to the Slave Trade across the Americas decades before it was finally abolished everywhere, likewise attempts to re-impose it were successfully resisted.

The US had occupied the island in the early Twentieth Century and there was considerable antagonism from Colonial and Imperial powers toward the rebellious former Slave Colony which had revolted and freed itself rejecting Empire and Colonialism wholesale. This historical background aims to give a brief overview of modern Haiti and the US's intervention in it which was from a distance and covertly at first, then directly intervening to remove the right-wing military junta it had helped bring to power in its ousting of the Liberation Theologian Aristide. The 1994 intervention to remove the formerly favored military junta is unusual because despite this being called 'Operation Uphold Democracy' to re-install Aristide the US had been instrumental in both his removal and in his replacement by the same military regime in late 1990. The fact that Emmanuel 'Toto' Constant and his FRAPH and indeed General Raoul Cédras the latter being de facto Haitian head of state, had overstepped their informal mandate and Bill Clinton saw fit to commit 25,000 troops to ending this, after Diplomatic negotiations involving former US President Jimmy Carter and former US General Colin Powell amongst others failed to persuade Cédras to relinquish power is an interesting example of the US employing both 'soft' and then 'hard' power to 'correct' its own earlier mistakes. In an otherwise pretty standard instrumental foreign policy of helping oust a democratically elected regime it deemed 'hostile' to its interests – after Diplomatic negotiations failed, Cédras was offered USD 1 million to leave office which he took and to go into exile in nearby Panama and where he has remained ever since some 26 years later.

Emmanuel "Toto" Constant nicknamed "The Devil" also quietly went into exile in the United States: "The United States overthrew the military regime, Constant had finally been arrested and ordered deported, he had in 1996 mysteriously been released under a secret agreement with the

U.S. government—even though the Haitian government had formally requested his extradition and U.S. authorities had found photos of his group's victims, their bodies mutilated, pasted to the walls of his Port-au-Prince headquarters like trophies" Grann (2001).

The 1980s saw an escalation of Cold War hostilities, intensified by the presidency of Ronald Reagan and the election of the UK's Conservative prime minister Margaret Thatcher. Aggressive overtures were made toward the Soviet Union, and nuclear war (Mutually Assured Destruction [MAD]) seemed a very real possibility for at least the first half of the 1980s. US bases in the UK and Western Europe (notably West Germany) further increased tension, as did Reagan's 'Star Wars' missile programme and withdrawal from the Strategic Arms Limitation Talks (SALT) in Reykjavik in Iceland in 1986.

Focusing again on Latin America, as Chomsky observed looking back in 2013, "Reagan waged a murderous assault on Central America" (2013b). From Honduras to El Salvador and from Guatemala to Nicaragua, the US backed right-wing paramilitaries against both civilian populations and any political elements seen as 'left-wing'. Chomsky's ceaseless criticism of such cynical US realpolitik won many enemies as well as friends. In Guatemala, the genocidal dictatorship of Efrain Rios Montt, which massacred many tens of thousands of predominantly indigenous Mayans, received strong and enduring support from Reagan, who as Chomsky quotes in the same article, was unequivocal: "My administration will do all it can to support his progressive efforts". The regime's massacres "were carried out with vigorous US support and participation". Among the standard Cold War pretexts was that Guatemala was a Russian "beachhead" in Latin America.

In Nicaragua, paramilitary 'Contras' were used to fight the Sandinista government of Daniel Ortega, which Washington viewed with special disdain, being happy to use lethal force against civilians the better to 'promote democracy'. Nicaragua had been under the dynastic Somoza dictatorship across successive generations for 43 years until the overthrow of Anastasio Somoza

Debayle in 1979 by the Sandinistas. As Chomsky noted in 'Teaching Nicaragua a Lesson' *In What Uncle Sam Really Wants*,

> "When his rule was challenged, by the Sandinistas in the late 1970s, the US first tried to institute what was called "Somocismo [Somoza-ism] without Somoza"- that is, the whole corrupt system intact, but with somebody else at the top. That didn't work, so President Carter tried to maintain Somoza's National Guard as a base for US power. The National Guard had always been remarkably brutal and sadistic. By June 1979, it was carrying out massive atrocities in the war against the Sandinistas, bombing residential neighborhoods in Managua, killing tens of thousands of people. At that point, the US ambassador sent a cable to the White House saying it would be "ill advised" to tell the Guard to call off the bombing, because that might interfere with the policy of keeping them in power and the Sandinistas out." (1992b)

Before the Sadinista revolution which overthrew Anastasio Somoza Debayle in 1979 ending the dynastic and authoritarian tyranny of the Somoza family, Democrat President Jimmy Carter's support had been unwavering flying Somoza's Guard commanders out of the country using Red Cross planes – an act constituting a war crime – and began reforming it on Nicaragua's borders with the participation of Argentina's military regime in doing so. In Nicaragua's civil war of the 80s, the remnants of the National Guard re-appeared in the incarnation of the notorious Contras funded, trained and armed by Ronald Reagan's administration also using the conduit of the CIA, Reagan calling these right-wing paramilitaries who terrorized the population, 'freedom fighters'.

The Somozas' authoritarian klepotocracy had as Chomsky shows, received the unstinting support of Democrat President Jimmy Carter, in the mid-late 70s Carter did everything he could to contribute to maintaining their grip on power. From the start of the 1980s Ronald Reagan's right-wing Republican administration went one better of course, in its unconditional support for the right-wing Contras, not least military support to fight the 'red menace' of the left-wing Sandinistas which it combined with what Chomsky calls "economic warfare" (1992b) against the civilian population. Having cancelled aid to the

country in 1981, Reagan's first administration then began its long battle against the popular government of the Sandinistas: it used all available means to do this, one of which was to also insist other states reduce or limit aid to the country whose radical socialism initiated by the Sandinista revolution it saw as having started the 'Domino effect' of communism and anti-capitalist revolutions across Central America.

Initially, the Contras were primarily Somoza National Guard loyalists and although they comprised a sizable number of right-wing guerrilla fighters through most of the 80s, their numbers were bulked by mercenaries who also had little compunction in drug trafficking, specifically crack cocaine. The CIA – especially certain agents – likewise had a flexible approach to the proceeds from crack which flooded US cities and Black neighborhoods in particular, and would become embroiled in the Iran-Contra Scandal the case of Oliver North in 1987 having ramifications still being felt 33 years later. This very 'dirty war' was of course undertaken using the favored catch-all term of 'counter-insurgency', the covert and largely blatantly *overt* operations of US involvement Chomsky has never ceased to critically incise.

The recent history of Nicaragua and far-right armed groups being aided and abetted by the US military machine and 'Black Ops' of the CIA could be a whole reference entry in itself and the breathtaking scale of covert 'counter-insurgency' measures used over the course of the 1980s against the Sandinistas cannot be compressed here in its entirety, but will nonetheless receive some further attention.

In 1983 the CIA issued two guerrilla warfare booklets to the Contras: the *Freedom Fighter's Manual* was airdropped to known Contra camps, a 15 page manual with illustrations since those it was aimed at were mostly illiterate and consisted of tips for sabotage and other forms of 'economic warfare' aimed at incrementally paralyzing the economy the idea being that this would mean the population turning against the Sandinista government and help weaken it to the point of collapse, it also included instructions for carrying out acts of vandalism and how to make Molotov cocktails.

Psychological Operations in Guerrilla Warfare (1983) meanwhile, advocated the use of 'neutralization' (assassination) of Sandinista leaders and governmental officials involving "selective use of violence for propagandistic effects" (1983) Reagan feigned ignorance of this 'Psy Ops' instruction manual written by the CIA of course, whose very existence was for the express purpose of destroying the Sandinistas.

As the Nicaraguan civil war continued through the decade so did US covert and not so covert involvement. In 1984 the CIA directly involved itself in asymmetric military operations against Nicaragua, mining Crinto, Puerto Sandino and El Bluff harbors with 'acoustic mines' which apparently were not meant to harm just 'scare'. However, they disrupted shipping damaging at least seven vessels and destroyed many fishing boats as well as causing damage to international vessels. The mining of these harbors would form one of the two primary submissions by Nicaragua in the case *Nicaragua v. United States* lodged at the International Court of Justice, launched the same year and settled in 1986. The ICJ ruled in favor of Nicaragua and against the US which it found had violated numerous international laws in ignoring the sovereignty of another state and being in breach of multiple human rights laws in arming, funding and training the Contras and its own covert operations in fighting a 'Dirty War' within the protracted Nicaraguan civil war. The ICJ's summing up decided the US had engaged in the "unlawful use of force" (1984) (1986) in its treatment of Nicaragua and to "cease and refrain" (1984) (1986) in doing so, in addition that it must make reparations to the country however the US refused to acknowledge the ruling or pay reparations to Nicaragua.

Chomsky neatly summarizes US self-defined exceptionalism as well as its long track record of ruthless unilateralism imposed globally regardless of what the international community may think in a 2014 interview with *The Nation* Chomsky reflected on this recurrent pattern,

"Control of Latin America – "our little region over here," as Secretary of War Henry Stimson described it [in 1945], when he called for the dismantling of all regional alliances while explaining that our own

must be strengthened – has always been a core principle of US planning. "Successful defiance" of US policies going back to the Monroe Doctrine was one of the primary charges leveled against Castro in internal documents. When Nixon was plotting to overthrow the Allende government, the National Security Council warned that if we cannot control Latin America, how can we expect "to achieve a successful order elsewhere in the world": that is, to rule the world effectively. In the past decade, "defiance" has spread through South America, so successfully that not a single US military base is left – even in Colombia, the last holdout, considered secure after huge US aid (keeping to the well-established principle that US aid correlates very closely with severe human rights violations). Hence Central America and the Caribbean gain greater significance. One factor in Obama's support for the coup regime in Honduras, breaking ranks with most of Latin America and even Europe, was probably concern over the Palmerola air base, called the "unsinkable carrier" when it was used for terrorist attacks against Nicaragua. The bases are no longer justified as defense against Kennedy's "monolithic and ruthless conspiracy" dedicated to global rule, but on other grounds: often the "war on drugs," which has little to do with drugs but a lot to do with counterinsurgency and driving campesinos off the land to facilitate mining and other profitable enterprises (something I've seen first-hand in several trips to peasant areas in southern Colombia); at home, it has to do with sequestering mostly African-Americans, a population rendered economically superfluous in the era of financialization and the off-shoring of production. This might be considered our more civilized version of our clients' *limpieza social* [social cleansing]." (2014)

In almost all the countries in Latin America which experienced right-wing dictatorships in the 70s, 80s and 90s which different US Presidents and the CIA helped into or kept in power, these predominantly military regimes had leaderships that were products of the notorious School of the Americas, since re-named the Western Hemisphere Institute for Security Cooperation but known by the original title it has found all but impossible to shake off.

This survey of US Imperialism in Latin America and Chomsky's Anti-Imperialist critique of it concludes with George Bush's invasion of Panama and removal of former US and CIA asset Manuel Noriega in 1989. Noriega was what could be called an organized crime boss, or 'Don' whose extensive wholesale drug trafficking

matched those of any international cartel, Noriega also went in for wholesale arms trafficking and money laundering but being a general and politician one who consolidated governmental and military power in the early-80s and effectively becoming President heading up a junta over the rest of the decade. However in spite of this, Washington and indeed the CIA considered him a useful asset something Chomsky has offered wry commentary on,

> "The US government continued to value Noriega's services. In May 1986, the Director of the Drug Enforcement Agency praised Noriega for his "vigorous anti-drug trafficking policy." A year later, the Director "welcomed our close association" with Noriega, while Attorney-General Edwin Meese stopped a US Justice Department investigation of Noriega's criminal activities. In August 1987, a Senate resolution condemning Noriega was opposed by Elliott Abrams, the State Department official in charge of US policy in Central America and Panama. And yet, when Noriega was formally indicted in Miami in 1988, all the charges except one were related to activities that took place before 1984 – back when he was our boy, helping with the US war against Nicaragua, stealing elections with US approval and generally serving US interests satisfactorily. It had nothing to do with suddenly discovering that he was a gangster and a drug peddler- that was known all along." (1992c)

The Bush administration had been vocal about the War on Drugs continuing Reagan's previous policy and rhetoric which also continued the mass criminalization and incarceration of African-Americans who received a disproportionately undue number of convictions and overly harsh sentences. The CIA and Drug Enforcement Agency (DEA) had paradoxically used Noriega as an asset in the War on Drugs, despite his having accumulated a vast fortune from cocaine trafficking and distribution.

The Bush administration offered unconvincing justifications for the invasion of Panama in 1989: the standard claims to be protecting US Citizens in the country, as well as 'defending democracy' and, with a straight face, so as to combat drug trafficking. In advance of the invasion as Chomsky noted,

> "Since we could no longer trust Noriega to do our bidding, he had to go. Washington imposed economic sanctions that virtually destroyed the economy, the main burden falling on the poor non-white majority. They too came to hate Noriega, not least because he was responsible for the economic warfare (which was illegal, if anyone cares) that was causing their children to starve." (1992c)

US foreign policy at its worst, what can be broadly defined as Imperialism or a version of Neo-Colonialism, has spanned the whole world: Central America, South America and the Caribbean closest to home, South East Asia in its most remote outposts, but everywhere in between including of course the Middle East but also Africa which cannot be overlooked.

Angola's war of independence from Portugal which spanned 13 years beginning in 1961 began as an anti-Colonial uprising and became a very complex and protracted war against the last remaining European dregs of Empire: what Frantz Fanon called A Dying Colonialism. The Portuguese Colonial War or 'Overseas War', involved Angola, Guinea-Bissau and Mozambique, and saw the Portuguese determined to defeat anti-Colonial guerrilla campaigns which it was itself eventually defeated by after more than a decade.

The Angolan war of independence subsequently became a bloody civil war involving multiple actors pitched in conflict against one another but primarily fighting against the former Colonial power of Portugal struggling to hang onto its African conquests pre-dating the British and French on the Continent.

US involvement was both covert and overt and ruthless in what it saw as a Cold War test of its mettle. Opposing Angola's membership of the UN as an independent nation, the administration of Gerald Ford supported Jonas Savimbi's conservative anti-communist National Union for the Total Independence of Angola (UNITA) in the civil war. The Carter administration tried and failed to broker an agreement between Apartheid South Africa and the South West Africa People's Organization (SWAPO), the independence grouping in Namibia and neighboring countries, as independence insurgencies becoming civil wars reached varying levels of intensity in at least seven African states during this time. Meanwhile, the CIA funded, armed and trained mercenaries to fight against the left-wing nationalist and

communist Popular Movement for the Liberation of Angola (MPLA), as Chomsky noted in 2014, Washington was instrumental in

> "Providing crucial support for Jonas Savimbi's terrorist Unita army in Angola. Washington continued to do so even after Savimbi had been roundly defeated in a carefully monitored free election, and South Africa had withdrawn its support. Savimbi was a "monster whose lust for power had brought appalling misery to his people," in the words of Marrack Goulding, British ambassador to Angola." (2014)

The Reagan Doctrine of 'roll back' which had substantial support from the right-wing fringes of the Republican Party to aid anti-communist insurgents was very much in evidence in Angola and overlapped with the wider cross border Namibian civil war or South African Border War a conflict taking place in a number of African states bordering Apartheid South Africa, to which the US also gave support.

Apartheid was racist white minority rule which was formally in existence by that name in South Africa, and was uniquely oppressive but to all intents and purposes similar systems of white minority rule also existed in what is now Zimbabwe then Rhodesia and also Namibia, then South West Africa. Apartheid as for the Southern African states with their own white supremacist legislatures enforced racist ideology and pseudo-science through segregation and legal, political and economic subjugation of black majorities in all aspects of life: Apartheid was a form of anti-black Colonial fantasy created in 1948 and lasted until the release of Nelson Mandela in 1990.

The right-wing Republican administration of Ronald Reagan unlike virtually every other Western European country in the world did not oppose Apartheid South Africa or treat it as a pariah and disgraced itself by its policy of 'Constructive Engagement' for the first half of the 80s overlapping both Reagan's Presidential terms until it was vetoed by the US Congress in 1986. The intervention of the US Congress against the President was after Reagan blocked attempts by the UN to impose economic sanctions on South Africa which Reagan had vetoed and rejected. The policy was the creation of Reagan's

notoriously reactionary Assistant Secretary of State for African Affairs Chester Crocker who made disingenuous play of the 'communist influence' of the anti-Apartheid and anti-Colonial independence movements. The fact that Apartheid was a racist system of anti-black subjugation and subordination that had many similarities with segregation-era America and whose details and origins went back to Colonialism and before that Slavery, was ignored for the sake of making an 'ally' of the pariah state because it was 'anti-communist' and was engaged in the Border Wars against the MPLA and other anti-Colonial forces who had support from Cuba as well as to some extent the Soviet Union.

Congress over-rode Reagan's refusal to implement the UN's policy, and vetoing of the Comprehensive Anti-Apartheid Act which US lawmakers had sought to implement that imposed sanctions on Apartheid South Africa stopping all trade with and aid to the regime. Chomsky reflected on this and Reagan's insipid pandering to Apartheid-era South Africa,

> "The official policy was called "constructive engagement." I recall it during the 1980s, by then there was enormous pressure to end all support for the apartheid government. Congress passed legislation barring trade and aid. The Reagan administration found ways to evade the congressional legislation, and in fact trade with South Africa increased in the latter part of the decade. This is incidentally the period when Collin Powell moved to the position of national security adviser.
>
> The U.S. was strongly supporting the apartheid regime directly and then indirectly through allies. Israel was helping get around the embargo. Rather as in Central America where the clandestine terror made use of other states that served as – that helped the administration get around congressional legislation. In the case of South Africa, just look at the rough figures. In Angola and Mozambique, the neighboring countries, in those countries alone, the South African depredations killed about million- and-a-half people and led to some $60 billion in damage during the period of constructive engagement with U.S. support. It was a horror story." (2004)

As was noted in the shorter first edition entry for Chomsky and Anti-Imperialism, in outlining US realpolik Chomsky makes his point well when he quotes the Reagan State Department's Thomas

Carothers, who freely admitted that Washington would only accept 'limited, top-down forms of democratic change that did not risk upsetting the traditional structures of power with which the United States has long been allied [in] quite undemocratic societies' (ibid.)

What is most important, as Chomsky shows in his indictment of US imperial ambitions, is that US interests, as understood by a thoroughly instrumental 'realist' theory of international relations, should prevail; that is, geo-political hegemony should be sustained at all costs.

Such geo-political hegemony is of course felt presently by the US's application of 'extraordinary rendition' in removing those it suspects of involvement in terrorism to Guantanamo Bay's Camp Delta and Camp X Ray. The absolute legal limbo into which detainees are thrown for many years (being held without charge but subject to all sorts of interrogation methods widely seen as torture, such as 'waterboarding') is one of the favourite weapons wielded by the US, as the world's self-appointed policeman. The fact that the world's only superpower has sought to underwrite that power by recourse to actions condemned by the rest of the world and the UN, not to mention its own internal critics, can be seen, as Chomsky notes, in the following terms:

> "Principles are valid only if they are universal. Reactions would be a bit different, needless to say, if Cuban Special Forces kidnapped the prominent terrorist Luis Posada Carriles in Miami, bringing him to Cuba for interrogation and trial in accordance with Cuban law. Such actions are restricted to rogue states. More accurately, to the one rogue state that is powerful enough to act with impunity: in recent years, to carry out aggression at will, to terrorize large regions of the world with drone attacks, and much else." (2013a)

Chomsky's anti-imperialism does not absolve a much smaller power's own imperial ambitions, since Israel is certainly a power in the Middle East, not just in its apartheid exclusion and subordination of the Palestinians within its own borders, but in bellicose posturing toward other countries in the Middle East, being well aware that it has the unstinting support of the US. The Israeli state exerts contempt toward the Arab population of the West Bank and Gaza that it

seemingly believes cannot ever face serious opposition since it has the strength of the US behind it.

It can certainly be contended that the state of Israel has long found it hard to even acknowledge the existence of the Palestinians, finally ceding a limited amount of recognition, but continuing to maintain de facto apartheid with securitised and punitive measures: Israeli 'settler' settlements in the West Bank, the notorious 'wall', ID checks and Israeli military checkpoints, military strikes against civilian homes in pursuit of 'terrorists' and the fact that the Arab population is vastly, and conspicuously unequal economically, politically, and socially. The fact that all of this is in very large part in contravention of international law, and is continuously pointed out as such by the UN and the rest of the international community, is largely ignored by the Israeli state, since whilst Israel sometimes has minor disagreements with the US (variable according to the different incumbent administrations in both countries), the strength of the relationship is never seriously in question, any more than is the country's own use of arbitrary and disproportionate force against its own displaced Arab population. Chomsky has been a tireless critic of Israel and the US's unflinching support for it, as well as the continued non-status of the Palestinians: a 'Fateful Triangle' as he calls it. 'There are in fact two rogue states operating in the region, resorting to aggression and terror and violating international law at will: the United States and its Israeli client' (Chomsky 2013c).

Chomsky maintains that imperialism can be seen primarily in the foreign policy of the US, and largely irrespective of whether the president is Republican or Democrat. Obama's use of drone strikes on Pakistan (ostensibly targeting Islamist fighters, but often involving an extraordinarily high civilian death toll) being a very contemporary example of that.

The fact that imperialism remains something that can only be imposed by a superpower, and there remains only one of those means US imperialism is really without comparison or equal. Its 'client state' of Israel, and former imperialist power the UK, act internationally (and at least in the case of the latter, some if not all of the time) with the supreme imperial might of the US state behind them.

This being *The Palgrave Encyclopedia of Imperialism and Anti-Imperialism, 2nd Edition* this long essay for the entry on Chomsky and Anti-Imperialism could not conclude without arriving in the present of 2020 and the administration of Donald Trump and Chomsky's own critique of this seemingly unreal Presidency.

Trump of course gained the Republican nomination for US President to the surprise of many commentators in an overcrowded field of largely interchangeable and forgettable candidates. The 2016 election was against Hilary Clinton who won the popular vote but lost the election thanks in large part to the arcane Electoral College system and her personal unpopularity with Middle America.

Trump the extremely rich real estate mogul styled his campaign and has done the same as President as being 'against the Washington elite', despite doing everything he can to further the upward transfer of wealth to the rich and super-rich from the majority though tax cuts for the 1% and indeed the 0.1%, the latter of which he is part and cuts to public services and all social programs which benefit the 99% including most of the electoral demographic which voted for him. However, despite all this Donald Trump dismisses all critics as 'fake news' whilst being happy to spread 'fake news' himself, the term having originally been coined to refer to the output of Breitbart News the online right-wing platform Steve Bannon Trump's first White House Chief Strategist helped found which presents its own right-wing and ultra-conservative op-ed pieces with eye-grabbing headlines and in a format so as to appear as if they were factual news items; cynically aware that such propaganda will be seen and believed and crucially, 'shared' on social media.

Trump ignores all Presidential protocol and all niceties observed by his predecessors as well as what is usually expected from a public figure, something else which would do untold and irreparable damage to anyone else, but which plays very well to his fans wearing 'Make America Great Again' (MAGA) baseball caps. Trump's 'America First' crude non-policy of meshing nationalism and Isolationism is well documented by Chomsky, in an interview in a 2019 interview with Truth Out he noted,

"One of the most appropriate comments I've seen on Trump's foreign policy appeared in an article in *The New Republic* written by David Roth, the editor of a sports blog: "The spectacle of expert analysts and thought leaders parsing the actions of a man with no expertise or capacity for analysis is the purest acid satire – but less because of how badly that expert analysis has failed than because of how sincerely misplaced it is . . . there is nothing here to parse, no hidden meanings or tactical elisions or slow-rolled strategic campaign." That seems generally accurate. This is a man, after all, who dismisses the information and analyses of his massive intelligence system in favor of what was said this morning on "Fox and Friends," where everyone tells him how much they love him. With all due skepticism about the quality of intelligence, this is sheer madness considering the stakes." (2019)

Indeed Trump's opportunist populism, the peculiar mix of nationalism and Isolationism in which the reality of cross border cooperation and international agreements are jettisoned for crude and bellicose lowest-common-denominator demagoguery has played well with the far-right and its 're-branded' 'Alt-Right' incarnation, as well as the Christian Right. Ever since the campaign trail of 4 years ago when Trump started talking about 'building the wall' across the southern US border with Mexico, 'immigration' and the supposed ease and harm it does to Americans is constantly talked up and returned to. Facts are irrelevant and can be ignored, or contradicted at will, the words of one of the founders of defunct data harvesting outfit Cambridge Analytica, which worked for Trump during his 2016 Presidential campaign summing up his own thinking "It needn't be true as long as it's believable" (2018). Kellyanne Conway, Senior Counselor to Trump and formerly his Campaign Manager and Republican Party Strategist offered "Alternative facts" when quizzed on what had been emerging from the White House, a new description for what most would call lies.

In the same 2019 interview Chomsky effectively summarizes his critique of Trump,

"Not that there is no coherent policy. There is one policy that emerges from the chaos – the kind we would expect from an egotistical con man who has one principle: Me! It follows that any treaty or agreement reached by predecessors (particularly the despised Obama) is the worst deal in history, which will be replaced by the Greatest Deal in History negotiated by the most accomplished deal-maker of all time and greatest American president.

Similarly, any other action carried out in the past was misguided and harmed America, but will be corrected by the "stable genius" now in charge of defending America from those who are cheating and assaulting it on all sides." (2019)

This expanded 2nd Edition essay for the entry for Chomsky and Anti-Imperialism finishes with coverage of Chomsky's critical commentary on the Trump Presidency and Trump's reactionary populism is crystallized in the slogans 'Make America Great Again' and 'America First': US nationalism combined with US Isolationism, and what could certainly be contended underwrite Imperialism fuelling the vanity of both Trump and US elites in the Military-Industrial Complex in such lowest-common-denominator flag-waving populism, and to re-work the closing words of the shorter first Edition entry for Chomsky and Anti-Imperialism: Anti-imperialism, of course, is the critique of imperial power, of imperialism, and Noam Chomsky remains its foremost practitioner in incising it in our urgent present of 2020.

Cinema and Anti-imperialist Resistance

Kostis Kornetis
Department of History,
University of Sheffield, Sheffield, UK

Definition

Olivier Assayas's seminal film *Après mai* (2011) includes a key moment when the protagonists, students from France travelling to Italy, participate in an open-air screening of revolutionary film-making on China and Latin America. The depiction of the young revolutionaries in early 1970s Florence, gathered around the screen in perfect counter-cultural outfit, endlessly debating the limits between bourgeois and radical film-making and whether cinema can provide the 'revolutionary syntax' for the new rebellious identities, encapsulates the entire meaning of cinema as a vehicle of anti-imperialist resistance at the time.

Introduction

The mass media explosion in the 1960s, Marshall McLuhan's idea of the 'global village', the technological advances in terms of mobile cameras, editing and film-making in general, but also a more politicised audience ready to be seduced by the cinematic stimuli, played a major role in the dissemination of information regarding revolutionary movements, both through fiction and non-fiction films. This short essay will try to identify the most important exponents of this tendency over time.

Historical Context

Revolutionary film-making has its recent origins in Soviet cinema, and in particular in Dziga Vertov's *kinopravda,* Sergei Eisenstein's intellectual montage, and Aleksandr Medvedkin's Kino-Trains. With a passage through the epic realism of the battles of the Spanish Civil War and the Chinese war against Japan – depicted respectively in the propagandistic documentaries *Spanish Earth* (1937) and *The Four Hundred Million* (1938) by legendary Dutch film-maker Joris Ivens, and *L'Espagne vivra* (1939) by renowned photojournalist Henri Cartier Bresson – film was only consolidated as a revolutionary tool in the 1960s. Several film theorists, predominantly André Bazin, promoted the idea of cinema as a way of 'educating' the masses, who, by way of this public entertainment, could acquire a political conscience and be shocked into awareness. Cinema, as a collective experience, was contrary to the passive consumption of television. The debates that typically followed the screening of the movies heightened, at the time, the feeling of direct involvement. By the end of the decade this attitude was reinforced by the democratisation of film-making – facilitated by technological advances through 16 mm production and distribution, which led to the creation of independent films. According to film theorist Amos Vogel, 'apart from the thousands of films produced by students, independent filmmakers, or political film collectives, there also exist[ed] distribution companies controlled by the New Left' (1974, p. 122). In France the so-called 'States General' of cinema (Les *États* Généraux du Cinéma) asked for a total reshaping and restructuring of the film industry. All the above posed questions regarding the necessity of revolutionary cinema, forming the context of the proliferation of film-making as a means of anti-imperialist resistance.

This trend was reinforced in the mid and late 1960s by the parallel rise of the cinema of denunciation and of social concern, which revolutionised cinema-making both in content and in form. A major exponent of this tendency was introduced by Italian film-maker Gillo Pontecorvo's anti-colonial masterpiece *Battle of Algiers* (1966) – arguably one of the most inspirational political films of all times – that led to the consolidation of this new genre: political cinema. Several French films had referred to the Algerian War beforehand – a conflict over the French Empire's last stronghold that started in 1954, eventually resulting in Algerian independence after years of brutal repression by the French authorities and the parallel rise of a strong local resistance movement, the Front de Libération Nationale (FLN). Both Alain Resnais, in his legendary *Night and Fog* (1955) and later with *Muriel* (1963), and Jean-Luc Godard in *Le Petit Soldat* (1963) included references to French atrocities during the war. Considering that it was a taboo at the time to refer directly to the war in a critical way in France, no-one did it as directly as Pontecorvo.

Seminal Cases of Anti-imperialist Resistance

Pontecorvo's film, shot on location, exposed the brutality of colonial violence, especially after the arrival of the French paratroopers under General Mathieu – a thinly disguised reference to General Massu – which escalated into the so-called Battle of the Kasbah, institutionalising to a large extent the use of torture as an interrogation technique. The film depicts in a powerful way the violence on both sides. The director clearly takes sides, without, however, eulogising FLN's indiscriminate bombings against civilians. The film's anti-colonial overtones soon rendered it a standard reference point for liberation movements, like the PLO, and even radical organisations such as the Black Panthers and the IRA. In cinematic terms, *Battle of Algiers* was shot on location, almost right after the actual events, with Saadi Yasef, FLN's number two in command, playing himself. The truthfulness of the depiction made it resemble real newsreel footage. Regardless of how uncompromised the film was politically, it nonetheless made use of devices of mainstream feature films, such as well-known actors, suspense, and Ennio Morricone's unmistakable score. Pontecorvo would continue making

political films touching on difficult subjects, including Portuguese colonialism in *Burn*! – starring Marlon Brando – and the gripping political thriller *Operation Ogre* (1979), starring Gian Maria Volonté, on ETA's assassination of Admiral Carrero Blanco in Madrid in 1973. Recent events related to left-wing terrorism in his home country, and in particular the kidnapping and assassination of Aldo Moro by the Red Brigades in 1978, prompted Pontecorvo to reduce his clear pro-ETA stance in the film's controversial ending.

As a contrast to Pontecorvo's pursuit of leftwing politics with popular cinema devices came Jean-Luc Godard, who was becoming increasingly intransigent, denouncing bourgeois aesthetics in film and establishing a collective cinematic process through the Dziga-Vertov group. Godard argued that cinema could not be truly revolutionary unless its radical content was coupled with an equally radical form. In films like *La Chinoise* (1967) and *Sympathy for the Devil* (1968) he challenged the conventions of 'bourgeois' cinema-making, introducing non-linearity, reflexivity, and the cinematic-essay form that also acted as an instrument of propaganda in favour of Maoism, Third-Worldism and against US imperialism in Vietnam. In the *Dziga Vertov Group* that he initiated together with Jean-Pierre Gorin and films such as *Un Film comme les autres* (1968), *British Sounds/See You At Mao* (1969), *Le Vent de l'est* (1969), *Lotte in Italia* (1969) and *Tout Va Bien* (1972) he brought the tendency of rejecting narrative in favour of incorporating political and social critique in the filmic process to the extreme. The ultimate goal was to force the audience out of its comfortable voyeurism to a more active stance and complicity with the subject matter. In the end, the self-awareness, which was the professed goal, was only achieved by small circles of intellectuals and students who had physical and conceptual access to these highly disjointed and cryptic films.

Even more radical were the Argentines Fernando Solanas and Ottavio Getino, who introduced anti-colonial films as 'critical essays' based on purely 'revolutionary' production values. This trend was later labelled 'Third Cinema': a non-commercial militant mode of cinema used as a weapon of political struggle, addressing specific political causes and directly calling on the viewer to take action. This was juxtaposed to first cinema (meaning studio-produced cinema) and second cinema, otherwise called 'auteur' cinema and characterised by formalism, intellectualism, and a leftist perspective, which reflected the director's creative personal vision when expressing a political message.

The most exuberant example of 'Third Cinema' was surely Solanas and Getino's *The Hour of the Furnaces* (1968). The film is a landmark moment in terms of anti-imperialist film-making. It bombards the viewer with super-imposed images of the European and American imperialist control of Argentina's national economy (i.e. through the beef monopoly or the control of the railway system), attempting to construct a condemnation not only of neo-colonialism, but also of the role of the media and information in manipulating the masses. It is also a complete condemnation of British and US neo-colonialism and a defence of Peronism, blended with the class struggle.

It has a complex structure (a more descriptive, a more reflexive and a more interactive part), including inter-titles that reference Frantz Fanon's idea of violence as a cleansing and liberating force for the colonised (Fanon 2007), Guy Debord's perception that the spectator who had been drugged by spectacular images should be awoken, and Jean- Paul Sartre's conclusion that 'the only way the European could make himself man was by fabricating slaves and monsters' (Sartre 2007, p. lviii). At a crucial point in the film, a shot of the eyes of the dead Che Guevara – the famous Christ-like image – dominates the screen with African percussion in the background, implying that his death was an act of liberation. The very title of the movie refers to Guevara's anti-imperialist revolutionary cry: 'Now is the hour of the furnaces. Let them see nothing but flames'.

Solanas and Getino attempted to be as reflexive as possible, by exchanging information with the militant groups with whom they were working. The film became legendary, particularly in the alternative circles in which it was shown, and it found faithful followers – such as the entire

Cinema Novo tendency in Brazil, and in particular Glauber Rocha (*Antonio-das-Mortes*, 1969), Saul Landau and Haskell Wexler (*Brazil: A Report on Torture,* 1971) and others. Indeed, Solanas and Getino had been screening their film, receiving feedback which made them think repeatedly about the relationship between film and revolution, which they eventually included in the film. This helped them draft their manifesto 'Towards a Third Cinema', showing this way that movies could be turned into a revolutionary tool and that culture could be decolonised. Famously, in their manifesto they argue that 'the projector [is] a gun that can shoot 24 frames per second'. Third Cinema was becoming a 'space of counter-imperialist collectivism' (Guneratne and Dissanayake 2003, p. 148).

Vietnam and Chile: Ivens, de Antonio, Alvarez, Guzmán

A prominent place in anti-imperialist cinema was reserved for films that were programmatically against the war that the US was waging in Vietnam. Joris Ivens is one of the most illustrious exponents of this tendency with such films as *The Seventeenth Parallel* (1967) and *The People and Its Guns* (1968) – which he completed after a trip to, and several films on, Maoist China during both the Great Leap Forward and the Cultural Revolution. As 'being there while it takes place' was one of the major issues in anti-imperialist cinema, crude realism became part of this tendency. At the same time, however, Ivens's films offer a romanticised version of the Vietnamese peasants, with a tone of Brechtean didacticism over a plethora of inter-titles (Waugh 1988). This compares well with the cinema of Godard and Jean-Pierre Gorin, and in particular their *Letter to Jane* (1972), a highly reflexive treatment of Jane Fonda's anti- Vietnam involvement.

Jerry Snell's *Hearts and Minds* (1974), a documentary including footage from US helicopters bombing Vietnamese villages and *Mickey Mouse in Vietnam* by Lee Savage (1968) – whereby in just 1 min the trigger-happy cartoon volunteers for the war and dies immediately after reaching

Vietnam – are amongst the most interesting exponents of anti-Vietnam War movies. *Year of the Pig* (1969) by Emile De Antonio needs special mention in this category. An American Marxist, De Antonio tried to create an amiable image of Ho Chi Minh, condemning at the same time the French colonial rule of Indochina as blatantly as he could and the American contemporary involvement in Vietnam as a continuation of the same (neo-)colonial heritage. Combining original rare footage from the 1920s and 1930s and Roman Karmen's restaging of the battle of Dien Bien Phu in 1954 with 1960s footage of Vietnamese monks setting themselves ablaze, De Antonio created a dynamic collage that acted as a mighty indictment of Western involvement in South-East Asia.

Another director dealing with that very central conflict was Cuban film-maker Santiago Alvarez. In his film Hanoi, *Tuesday the 13th* (1967), he exposed 'the daily texture of life in Hanoi under bombardment' (Macdonald and Cousins 1996, pp. 291–297). He would later create an extremely influential film tracing Fidel Castro's trip to Salvador Allende's Chile, not long before General Augusto Pinochet's US-backed coup in September 1973 (*De America Soy Hijo U A Ella me Debo* [1971]). Chile and the downfall of Allende's socialist Government became the subject of Chilean director Patricio Guzmán's monumental documentary *The Battle of Chile.* The three parts of the trilogy – *The Insurrection of the Bourgeoisie (1975), The Coup d'Etat (1976), Popular Power (1979)* – chronicle the battle between revolution and counter-revolution in the country and the decisive role of the US in the triumph of the latter.

Between May 1968 and the Colonels' Dictatorship

A film-maker constituting a separate category of his own is Chris Marker – an idiosyncratic case of a director with a solid pedigree of anti-imperialist film-making who made an early appearance in 1955, with Alain Resnais in *Statues Also Die* (1955). This was one of the first films on the

African experience of colonialism, and was censored in France. Marker continued in the same direction with *Cuba Si*! (1961). His masterpiece is, however, *Grin Without a Cat,* offering a panoramic depiction of the 1960s. Linking May 1968 in France to the war in Vietnam, and the anti-war movement in the US to the disintegration of Che Guevara and Fidel's Third-Worldist movement and the bureaucratisation of the Cuban revolution, the film annoyed both sides of the political spectrum for its outspokenness. At the same time, in a gripping 45-min clip, a tie-wearing member of an American 'military training team' that drilled Bolivian soldiers hunting Guevara asks whether it would have been wiser to keep the guerrilla leader alive in order to prevent the myth that was created after his death. Very close to cinéma-vérité, Marker produced through the dynamic montage of his films a 'chorus of voices'. Instead of following the linearity of textbook history, he reinforced the 'fluidity of meaning and emotion' (Sinker and White 2012) in the depiction of historical processes and revolutionary utopias linked to the liberation movements of the second half of the twentieth century.

Very much in Marker's tradition was a major West German anti-imperialist film, *Germany in Autumn* (1978). The film was co-directed by a collective, comprising legendary director Rainer Werner Fassbinder alongside Alf Brustellin, Alexander Kluge, Bernhard Sinkel, and Volker Schlöndorff, who also excelled in political film-making on similar subject matters (e.g., *The Lost Honour of Katharina Blum* [1975]). The film provided a non-linear account of left militancy across time as it linked Rosa Luxemburg and Karl Liebknecht to the Red Army Faction, offering a strong critique against the presence of US bases and the Federal Republic's pursuit of American-inspired policies.

As far as the connection between 1968 and anti-imperialism is concerned, Guy Debord's *Society of the Spectacle* (1973) structured an anti-imperialist critique within the language and tools of a situationist *détournement* that rejects essentialist images of war and commodity fetishism. One also has to mention William Klein's powerful satire *Mr Freedom* (1969) – on an American action hero who comes to save France from a Communist takeover at around the time of the Parisian évènements – and his documentary *Eldridge Cleaver* (1970) on the political exile to Algeria of one of the leading figures of the Black Panthers in the US. An interesting feature about Klein is the fact that even though he was very close to a tradition of cinema of social concern – he covered the pan-African Festival among other things – he was also a famous fashion photographer, working for *Vogue.* The double, and somehow contradictory, nature of this occupation (*Vogue* by day, Black Panthers by night) bears the strong imprint of the 1960s counter-culture and is reminiscent of the most iconic representation of this very tendency: Michelangelo Antonioni's signature film *Blow-Up* (1966). On the subject of the anti-imperialist action of the Black Panthers, one has to mention Italian film-maker Antonello Branca and his seminal movie on that party from an insider's perspective in *Seize the Time* (1970). The movie is rich with documentary material, giving a nuanced depiction of the racial tensions within the US through a militant organisation that persistently and convincingly presented them as a guise of US imperialism.

Constantin Costa-Gavras's and Elio Petri's rendering of the political film-making mainstream is also worth mentioning. Gavras's *Z* (1969), *State of Siege* (1973), and *The Missing* (1982) condemn the US role in various contexts, such as the Greek pre-dictatorship police violence (1967–74), the CIA's role in Uruguay, and Pinochet's crimes in Chile, while *The Confession* (1970) is a gripping depiction of Stalinist totalitarianism in post-1948 Czechoslovakia. Raoul Coutard – Costa-Gavras's favourite cinematographer – had worked in Indochina, Africa and San Salvador filming battles with a hand-held camera – a fact that gave his cinematographic style a crisp documentary-esque feel. Elio Petri – with a masterful political thriller regarding the repressive state apparatus in *Investigation of a Citizen Above Suspicion* (1970) – shared Gavras's aversion for the purely militant film and the conviction that cinema should be mainstream enough to oblige a wider public to reflect on political issues. Interestingly,

C

both Gavras's *Z* and Petri's *Investigation* won Academy Awards in the Best Foreign Language Film category, which attests to their commercial and global impact.

At the opposite pole from *Z*, but always on the issue of the coming of the Greek dictatorship and the dubious role of the American Embassy and secret services in the coup, was *Kierion* by Dimos Theos (1968). This noir film did not have a global impact but acquired cult status, especially after the fall of the Greek Junta, despite (or maybe because of) its minimal production values, filmed in grainy black and white which 'ha[d] the frightening result of audience involvement', as critic Mel Schuster pointed out (1979, p. 132). It is an investigative thriller on the role of US authorities in framing Greek left-wingers and putting away American journalists in the troubled time around the Arab-Israeli conflict of 1967. *Kierion* is a typical case of *engagé* cinema of the national kind that fed into the creation of an idiosyncratic Greek political film-making by newly appearing directors, involving some of its own extras, such as Pantelis Voulgaris and Theo Angelopoulos. The latter, in particular, created an epic cinema that reflected on real pieces of recent Greek history, whereby foreign imperialist involvement had most of the time tragic results. His claustrophobic and dark *Days of '36* (1972) is a film on the authoritarian state of affairs Greece in the 1930s, clearly commenting on the 1967–74 dictatorship. Angelopoulos's masterpiece *The Traveling Players* (1975) is a non-linear piece of cinematic historiography, whereby the destructive role of the British and the Americans in Greek affairs is laid out poignantly. Similar to Bernardo Bertolucci's monumental *1900* (1976) – in its scope and sympathy for the heroic but defeated left – initiated a tendency for cinematic revisionism of recent historical events.

Anti-imperialist Films from the 'Eastern Bloc'

Last, but not least, one has to mention anti-imperialist cinema originating in socialist countries and the so-called Eastern Bloc. Mikhail Kalatozov's *I Am Cuba* (1964) is a very interesting case of a Soviet-Cuban co-production, with the great Soviet director attempting to recreate the conditions of the Cuban Revolution on screen and in socialist-realist terms, at a time in which de-Stalinisation was the order of the day in his own country. Long takes, mobile framing, and carefully choreographed sequences characterise the film, departing from the nervous editing of early Soviet cinema and aiming to reveal the material conditions of Cuban life and the on-going results of the revolution. The production values were very high – Kalotozov used a team of 200 people – and the result is visually magnificent, but the film instead of acting as a powerful propaganda weapon to spread the Cuban revolution was ignored after its debut. In Havana it was harshly criticised for exoticising the locals, and in Moscow for lack of revolutionary zeal, despite its evident hope in the socialist future. The film had little impact and remained virtually unknown to the public in the West until its triumphant rediscovery in the 1990s by Martin Scorsese and Francis Ford Coppola.

Of equal interest is *Time to Live*, a Soviet-Bulgarian propaganda film that documents the Ninth Annual Communist Youth Festival held in Sofia, Bulgaria in 1968. The film entails a strong anti-Americanism, demonstrated through condemnations of the Vietnam War, and parallel praise of people's solidarity, world peace, and freedom. Czechoslovak and Yugoslav cinema also stand out. Jan Nemec's *Oratorio for Prague* (1968), that documents both the 'opening' in Czechoslovakia during the Prague Spring and its violent repression, is the only documentary account of the 1968 Soviet invasion of Czechoslovakia. The film *Jan Palach* (1969), filmed and circulated anonymously outside Czechoslovakia, pays homage to the eponymous student who burned himself in Prague's Wenceslas Square in January 1969 in protest against the Soviet occupation. Yugoslav cinema is a further interesting exponent of anti-imperialism in the East: *Želimir Žilnik's June Turmoil* (1968) was an authoritative documentary manifestation of

1968 in the East and an indictment of repressive imperialist tendencies on the part of the ruling Communist elites. *Žilnik's* film documents the unrest in Belgrade in favour of more liberalisation, inspired by the Prague Spring. One would have to add here as well Dušan Makavejev's idiosyncratic films WR: *Mysteries of The Organism* (1971) and *Sweet Movie* (1974), with their parallel critique of both communist and capitalist excesses –typical of radical Yugoslav film-making. Polish director Andrej Wajda and his use of historical parallels – the period of Terror after the French Revolution in *Danton* (1983) – to refer to Stalinism or the 1981 military coup by General Jaruzelsky is also worth mentioning.

Cinema with a distinct anti-imperialist vocation eventually diminished in the 1980s, turning from being a major tendency to a minor and marginal one, despite the fact that some important film-makers such as Ken Loach (*Land and Freedom*, 1995), Raoul Peck (Lumumba, 2000) and Göran Olsson (*The Black Power Mixtape 1967–1975,* 2011), and even mainstream directors such as Michael Moore (*Bowling for Columbine,* 2002) built from its legacy.

Conclusion

This essay is non-exhaustive and far from all-inclusive. Rather, it has suggested a list of the major exponents of anti-imperialist cinema in the twentieth century, both in terms of alternative and mainstream film-making and the cross-overs between the two. It has tried to examine the reciprocal relevance of cinema for history and history for cinema, within the context of so-called 'political' film-making, by focusing on the politically inflected cinema and 'cinema of social concern' of the 1960s and 1970s, mainly – but not exclusively – in Europe and the United States.

Drawing on a range of films, it concludes that the social and political imaginary of these decades and anti-imperialist militancy and action went hand-in-hand with specific films and the radical messages they sought to convey. In this context, we can safely conclude that cinema's anti-imperialist resistance has left a strong imprint in both the history of film and radical politics, especially from the 1960s onwards.

Class and Race Complexities in Understanding Large-Scale Land Deals as New Forms of Imperialism in Zimbabwe

Definition/Description

The question of land in Zimbabwe and Southern Africa is fraught with conflict throughout the period of European colonization. This essay examines colonization in Zimbabwe from 1890 and its historical implications for the historic conflict over land with Zimbabwe's Black majority population. Land imperialism has remained an enduring conflict from the imperial era, independence, and into the twentieth Century.

Introduction

Zimbabwe has a historical land question, dimensions of which are interesting as a way to understand neo-imperial processes in post-colonial Africa. In this essay, we trace the land question through various epochs, highlighting how the first encounter with colonisation in 1890 has led to the current land situation. Our analysis provides different ways of conceptualising land imperialism from the colonial to the post-colonial periods. In the post-colonial period, we highlight the various land-reform processes that precipitated indigenous forms of imperialism through land occupations and black political capture of land post-2000. We also use large-scale land acquisitions for biofuel production, mining, and agriculture by various foreign and local actors to further unpack the class and race complexities of the land question in Zimbabwe. Post-2000 Africa has seen the emergence of a wave of land acquisitions from old imperial powers and new emerging rich nations in the Gulf, Middle East, and Asia. Experiences of large land deals in Zimbabwe are different from other areas across Africa. In Zimbabwe, most land is owned by the state and the dynamics of land ownership mean that most communities have usufruct rights. Thus, the experiences of small-scale farmers in Zimbabwe (especially those who got land post-Fast Track Land Reform in 2000) are different from other smallholder farmers across the world. The Zimbabwean case illuminates the interplay of complex political and economic forces that intermix to relegate small-scale farmers in the interests of vast biofuel production. The presence of Chinese government and firms offers a new dynamic which reorients our understanding of 'neo-colonial processes' where it is emerging economic powers and not traditional Western ones that are taking the lead in land deals in Zimbabwe. We also reflect on the complexities of the neo-patrimonial state in an obscure environment where the notion of class

and race plays a critical role in who gets what, when, and how in relation to land.

Large-scale land deals are not peculiar to Zimbabwe but rather have become a widespread phenomenon across Africa in the past 10 years. They represent another phase of continued exploitation of Africa's natural resources. This phase, however, has seen the emergence of new actors including China and oil-rich Arab states competing with traditional imperial powers including the US. Large-scale land deals in Zimbabwe have to be understood within a long history of contestation along race and class lines. The large-scale land deals have been fraught with different class interests that have led to the redefining of class in Zimbabwe, with a few black people entering into the wave of reacquisition of large tracts of land at the expense of the other poor blacks (Mutopo and Chiweshe 2014). Post-colonial Zimbabwe is imbued with contradictions concerning its survival as a nation state, and faces racial and class tensions which must be resolved through land-balancing policies that in close analytical modes reveal the different class dynamics that have led to a widening gap between the poor and rich. This has created new class configurations. Moyo and Yeros (2011, p. 7) argue that:

> to clarify the historical trajectory of sovereignty, we must locate it in four forms of modern imperialism, the rise and fall of mercantile capitalism 1500–1800, the rise of industrial and monopoly capitalism 1800–1945 and the recent phase of systemic rivalry between an evolved monopoly capitalism and the planned autonomous modes of accumulation ushered in by socialist revolutions and national liberation struggles 1945–1990. The fourth being the epochal demise of planned autonomous development and the decline of the capitalist system.

It is crucial to understand how the land question in Zimbabwe has been treated during these four phases of imperialist notions of history. However, as our essay gradually unfolds, answers will be unearthed as to whether the large-scale land acquisitions have created an egalitarian society where class interests have been submerged, or rather the national question has re-emerged through the same subjugation of other classes of people at this historical juncture of correcting the

colonial imbalances, becoming an addendum of the Zimbabwean policy-making fraternity when land issues are discussed.

Imperialism and the Land Question in Zimbabwe

An important point to note is that the colonial experience created laws that made the question of land a social justice issue that could be contested in courts but with the whites being privileged to do so. This created animosity that led to Zimbabwe's war and liberation struggle, centred on solving the land question and removing unequal class interest.

Palmer (1990) points out that the failure of the Rhodesian government to solve the land question during the colonial period meant that post-independent Zimbabwe could still effect changes that could end white supremacy over land ownership. Mabaye (2005) traces the land question in Zimbabwe to the Berlin Conference of 1884, where major European powers met to partition Africa amongst themselves. In September 1890, the Pioneer Column made up of 700 English and Boer white colonialist settlers crossed into 'Rhodesia' as they named it after English colonialist Cecil John Rhodes, seizing land and cattle. This led to widespread dispossession of land from black people, as seen, for example, in the creation of the Gwaai and Shangani reserves after the 1893 invasion of the Ndebele Kingdom. By 1914, 3% of the population controlled 75% of the land, while blacks were restricted to a mere 23% of the worst land in designated reserves (Chitsike 2003). The Land Apportionment Act of 1930 stated that white people were reserved 50.8% and black people 30% of total land area, mainly in poor soil areas. The 50,000 white farmers received 49 million acres while the 1.1 million Africans were settled on 29 million acres of Native Reserve Areas. This forced the blacks who had survived on agriculture to become cheap labourers for the farmers on the large settler farms growing tea, coffee, tobacco and cotton. In 1965, the name Native Reserves was changed to Tribal Trust Lands (TTLs). Mazingi and Kamidza

(2010) argue that the white settlers explicitly expressed unwillingness throughout history to share the land equally with the blacks, despite the fact that the majority of them had to live and subsist in the communal TTLs. The colonial regime, and indeed the white settlers, had established the TTLs as essentially reserves of cheap black labour. It is in light of this thinking that the 1925 Morris Carter Lands Commission recommended that, the members of the two races should live together side by side with equal rights. As regards the holding of land:

> they were convinced that in practice, probably for generations to come, such a policy is not practicable or in the best interest of the two races, and that until the Native has advanced very much further on the path of civilization, it is better that the points of contact in this respect between the two races should be reduced . . .. (cited in Yudelman 1964, p. 69)

The Commission's recommendations were taken into account in the enactment of the Land Apportionment Act (LAA) of 1930 and the Land Tenure Act of 1969. These pieces of legislation provided a platform for land alienation. Mazingi and Kamidza (2010) further point that, under these laws, white settlers seized the best of the land, about 18 million hectares in prime and fertile arable land which is mostly in agro-ecological regions I, II and III, with good rainfall patterns. The worst areas (remote, low-lying, in some cases tsetse fly-ridden, with poor soil, unreliable rainfall and less suitable for meaningful agricultural activities in agro-ecological regions IV and V) were left to black peasant farmers.

Post-independence Land Reforms: Race and Class Dimensions

At independence in 1980, whites (who constituted 3% of the population) controlled 51% of the country's farming land (44% of Zimbabwe's total land area), with about 75% of prime agricultural land under the large-scale commercial farming (LSCF) sector (Weiner et al. 1985). It was hence inaccessible to the black majority. Farms in the LSCF sector ranged between 500 and 2,000 hectares, with most of them located in the better

agro-ecological regions I, II and III. The Communal Areas (CAs), which were home to about 4.3 million blacks constituting 72% of the rural population, had access to only 42% of the land, three-quarters of which was in the poor agro-ecological regions IV and V. In 1980, the new black government was faced with a crippling land question. According to provisions of the Lancaster House Agreement, which ushered in independence, the government could enforce changes in land ownership structure for 10 years. Land policy in the 1980s followed a strictly willing buyer, willing seller policy. The government's plan initially targeted the resettlement of 18,000 households over 5 years; in 1981 the number increased to 54,000 and in 1982 it further escalated to 162,000 to be resettled by 1984 (Palmer 1990, p. 169). Palmer notes, though, that by the end of July 1989 only 52,000 families (around 416,000 people) had been resettled, which translated to only 32% of the 162,000 target. In terms of land transfer, 2,713,725 hectares had been bought for resettlement, which was 16% of the area owned by whites at independence. After the expiry of the 10 years stipulated in the Lancaster House Agreement, the government was free to increase the speed of land reform.

The Constitution of Zimbabwe Amendment Act (No 11) (Act No 30 of 1990) and Constitution of Zimbabwe Amendment Act (No 12) (Act No 4 of 1993) allowed for both commercial and unutilised land to be acquired for resettlement with 'fair' compensation being payable in a 'reasonable time' (De Villiers 2003, p. 17). This was a break from the Lancaster House Agreement which called for adequate compensation that had to be paid promptly. Although introducing the new reforms as a means of empowering the poor, 'the ruling elite have made little more than token resettlement of the landless peasant farmers on acquired land' (Makumbe 1999, p. 14). In 1992 the Zimbabwean parliament passed the Land Acquisition Act, authorising the government to buy land compulsorily. Two years later it was revealed that the first farms compulsorily purchased had been allocated to cabinet ministers, top civil servants, and army generals. Thus, land reform remained frustratingly slow. De Villiers

(2003, p. 18) notes that, by the government's own statistics, of the 162,000 families that needed to be resettled by 1995, only 60,000 had been resettled on 3.4 million hectares. Reasons for the snail-paced nature of land reform are multiple and complex but include government's lack of will, funding, corruption, and class biases that increasingly favoured black business people rather than peasants. While the Land Acquisition Act 1992 seemingly marked a break from the market-based land reform programme, the structural adjustment programme implemented in Zimbabwe ensured the continuation of and further support for large-scale white commercial agriculture. Zimbabwe officially embarked on structural adjustment in October 2001. Since 1980, the World Bank has been Zimbabwe's largest donor and has thus been able to exert critical pressure on government policies (Goebel 2005, p. 16). The process of adjustment (backed by the World Bank) meant the withdrawal of state interest in land redistribution issues as neo-liberal policies which promoted commercial agriculture took root (Gibbon 1995).

Native Imperialism? *Jambanja* and the Fast Track Land Reform Programme

In 1997 there was an attempt by the state to acquire over 1,471 commercial farms (Marongwe 2008, p. 124). These farms were designated for acquisition by government, but were later reduced to 841 in number following the de-listing of over 400. Most of the remaining farms were removed from the designation list after owners appealed to the courts: government failed to respond to the appeals within the legally defined period and it subsequently discontinued the process. This, coupled with lack of funding, led to serious frustrations over the pace of land reform among the landless, especially veterans of the armed struggle. Britain began reneging on its 'responsibilities' for land reform. For example, Claire Short (then Labour Government secretary of state), in a letter to Kumbirai Kangai (then Zimbabwe's minister of agriculture) in 1997 distanced the British government from the land issue in Zimbabwe. Part of the letter read:

I should make it clear that we do not accept that Britain has a special responsibility to meet the costs of land purchase in Zimbabwe. We are a new Government from diverse backgrounds without links to former colonial interests. My own origins are Irish and as you know we were colonised not colonisers. (quoted in Matondi 2007, p. 12)

The British government was not willing to fund any accelerated land reform programme and felt that it had no obligations to Zimbabwe. The Blair Government in fact claimed that it did not feel duty-bound to the agreements and obligations at Lancaster House; in the same vein, the Zimbabwean government was under no obligation to follow these agreements. In the face of this rebuttal, forced land takeovers without compensation became a viable policy option.

In 1998 the Zimbabwean government unveiled the Land Reform and Resettlement Phase II Programme (Matondi 2008, p. 18). Its objectives were spelt out as follows: acquire 5 million hectares from the LSCF sector for redistribution; resettle 91,000 families and youths graduating from agricultural colleges and others with demonstrable experience in agriculture in a gender-sensitive manner. A 1998 Donor's Conference in Harare saw the government making an effort to speed up land reform through democratic means. Some 48 major countries (including Britain, the US and South Africa) as well as donor organisations such as the United Nations, African Union, International Monetary Fund and World Bank, attended. But Masiiwa (2005, p. 218) notes that donor unwillingness to fund land reform in Zimbabwe was underscored at the Harare conference. Here, government unveiled a US$1.9 billion (about ZW$42 billion) fund for its Phase II land reform programme. To the disappointment of the Zimbabwean government, the donors only pledged about ZW$7,339 million, just a drop in the ocean. By early 2000, Zimbabwe was facing an unprecedented social and economic crisis. The deteriorating economic situation adversely impacted on the pace of land reform. The food riots in 1998 were the beginning of open protest against the ZANU-PF establishment in post-colonial Zimbabwe. The economy was severely compromised by the costs of the war in the Democratic Republic of the Congo, and war veterans'

pay-outs in the late 1990s also took their toll. The Zimbabwe Congress of Trade Unions took the lead as a conglomeration of civil-society organisations challenging the ruling hegemony. The formation of the Movement for Democratic Change (MDC) in 1999 was the first real threat to ZANU-PF's political hegemony in Zimbabwe. The rejection of the draft constitution in February 2000 was a precursor to the land occupations in Zimbabwe in 2000 and 2001, a period popularly known as *jambanja* (chaos) due to the violent nature of the process.

Post-2000, land has remained an emotive issue in Zimbabwe. The government then took over the occupation by instituting the Fast Track Land Reform Programme. The former 5,000 or so white farm owners owning 29% of Zimbabwe's land area were reduced in number to 400, now owning approximately 1% of the land. By 2008 there were a total of 145,000 farm households in A1 schemes and around 16,500 further households occupying A2 plots. There are many debates that centre on the fast track land reform programme that occurred in Zimbabwe from 2000. Two categories of academic simulation exist with regards to the debate on native imperialism and its importance in understanding the land issue in Zimbabwe. Revolutionary scholars argue that the spontaneity of the land question was prime because the liberation struggle centred on reclaiming lost land. The occupation of white commercial farms was inevitable as the blacks had to be accommodated in land spaces. They advocate that the fast track land reform was the best that could be attained in those circumstances (Hanlon et al. 2013; Moyo and Yeros 2007, 2011; Moyo and Chambati 2013). Evolutionary scholars argue that the land issue could have been dealt with systematically and following clear-cut policy-making processes that would have led to a sustainable land reform programme (Marongwe 2011; Zamchiya 2011; Zikhali 2008).

Academic debates in Zimbabwe as outlined above are polarised and tend to be pro- or anti-ZANU-PF. This creates a false debate that essentially turns political and is detrimental to any in-depth understanding of the complex character of land reform. In trying to grapple with the realities of the fast track programme in Zimbabwe, Derman (2006, p. 2) poses the following questions:

> How will fast track land reform be understood? Are Sam Moyo and Paris Yeros (2005) correct that there has been a land occupier's social movement that portends, if handled correctly, a national democratic revolution? Will Zimbabwe serve as the warning bell for South Africa to rapidly achieve its own land reform ...? Can it be successfully argued that the land reform has been so fundamentally flawed and unjust that it should be undone or is it the case that no matter how unjust, it will become the new starting point for all new policies and programmes? Or has the mishandling of land reform in Zimbabwe made further land and agrarian transformation more difficult?

In trying to unravel the native imperialism question, we can point to Marongwe's (2008) thesis which specifically addresses who benefited from the land reform in Goromonzi District near Harare. He concludes that the political and social processes governing land allocation created particular classes of beneficiaries whose qualifying characteristics were divorced from agriculture in terms of farming experience, and commitment and skills possessed. Sadomba (2008, p. 168) reveals that war veterans presented a corruption document at a Mashonaland West Provincial Stakeholder Dialogue meeting in 2004, accusing ZANU-PF officials of 'changing farms willy-nilly', leasing farms to former white farmers, and 'deliberately ignoring the mandatory twenty percent allocations for war veterans'. Selby (2006, p. 40) remarks that, in Matabeleland, land allocations among key ruling party and security elites were also strategically decided. For example, many A2 farms are along the course of the proposed Zambezi pipeline project. The spoils of 'fast track' have gone disproportionately to members and supporters of the regime. Virtually every senior party official, army officer, police chief or Central Intelligence Organisation officer has secured an A2 farm or part of an A2 farm. The war veteran leaders have similarly benefited from A2 farms, along with key individuals in the judiciary, the Church and state media houses.

Erlich (2011, p. 2), citing the two studies by Moyo et al. (2009) and Scoones et al. (2010),

concludes that (contrary to popular belief) land reform in Zimbabwe benefited ordinary Zimbabweans. He denies the prevalent reports claiming that fast track land reform was a 'land grab' by 'cronies' bringing about a more unequal distribution of land than what had preceded it. The surveys conducted by the African Institute for Agrarian Studies (Moyo et al. 2009) and the Institute of Development Studies (IDS) (Scoones et al. 2010) found that most beneficiaries of land reform are 'common' people, whereas those who might be categorised as 'elites' constitute a small minority. According to the IDS study, this minority amounted to less than 5%. Hanlon et al. (2013) show that in what has constituted the single largest land reform in Africa, 6,000 white farmers have been replaced by 245,000 Zimbabwean farmers, primarily ordinary poor people who have become more productive as a result. Scoones et al. (2010, p. 77) note that 'impressive investments have been made [by farmers] in clearing the land, in livestock, in equipment, in transport and in housing'. Fast Track Land Reform in Zimbabwe has thus provided livelihood opportunities for many ordinary people who are now highly productive on the farms in spite of various structural challenges such as the lack of financing. The experiences of these farmers are, however, varied, and thus it is erroneous and simplistic to attempt to provide a singular picture of what life on fast track farms entails.

Neo-imperialism and Land Acquisitions in Africa

The huge interest in 'land grabbing' discourse in Africa has sparked fierce debates over foreign ownership of resources on the continent. This is, however, a continuation of historical processes (from colonisation, the resurgence of the political and economic national question, to the rise of multinational companies) where resources in Africa have been controlled by foreign interests. This new wave of foreign ownership is just another phase in a long process of exploitation of Africa by foreigners. Africa's land and resources are not new to exploitation. Various

historical epochs of foreign (mainly white) accumulators have for centuries scourged the continent to finance their own profligate lifestyles. The Berlin Conference in 1884 marked the zenith of this scramble as powerful men sat around a table and shared Africa like a piece of cloth. Olusuga and Erichsen (2010, p. 394) would have us believe that:

> It is a common misconception that the Berlin Conference simply 'divvied up' the African continent between the European powers. In fact, all the foreign ministers who assembled in Bismarck's Berlin villa had agreed was in which regions of Africa each European power had the right to 'pursue' the legal ownership of land, free from interference by any other. The land itself remained the legal property of Africans.

The current discourse of land grabbing is specifically couched in language which claims that Africans remain owners of their land, yet the reality on the ground of communities fenced out and barred from their livelihoods tells a different story. European colonisation of Africa left in its wake a brutal legacy of land and resource conflicts, land litigation, loss of peoples' control over land and natural resources, exposition to alien land tenure systems and natural resources management. In the new dispensation, a neo-colonial agenda driven by transnational companies, oil and cash-rich countries, and Western nations provides a marque era in which African political elites are willing participants in exchange for money. This new era sees the emergence of new players apart from the traditional white accumulators. Cash-rich nations such as China, Saudi Arabia, Japan, South Korea, and some Gulf States are pursuing food-security strategies that seek to secure control of millions of hectares of fertile lands in target nations in the South, most particularly in sub-Saharan Africa.

Globalisation and neo-liberalism have ably assisted this process, championing liberalisation of land markets and promotion of foreign direct investments. What is clear is that farm grabs and subsequent dispossession of land from people are promoting processes of depeasantisation as opposed to peas-antisation processes. As land increasingly becomes commoditised, we see a

transition from rural communities characterised by large numbers of peasants to a situation that is increasingly based on expansion of corporate capital-intensive production. Peasants are forced into wage employment or to migrate to urban centres for survival. Yet in Zimbabwe post-2000, re-peasantization has been occurring through the radical redistributive programme of fast-track land reform (Moyo and Yeros 2005). People are returning to settle on the land, and rely on farming as an important source of livelihood (Mutopo et al. 2014). Liberti (2013) argues that there is effectively the global 'proletarianisation' of farm labourers. Using evidence from Brazil, he notes:

> I study the old man, the extended family around him, their lifeless expressions, their miserable cultivations, and can't help thinking that theirs is a lost cause. The prevailing model is all around them: the vast plantations. They have no part to play in this model, apart from providing labour as day workers, an agricultural proletariat who no longer control their means of production. Defeat is certain and there is no appeal: this old man and his group are residuals of a world that is bound to disappear. Extensive plantation is modernity, and it will brush them away. (146)

Poulton (2014), however, argues that this is fatalistic as land grabs are driven by an uneven, distorted, and new crisis-laden era of global capital which is subject to twists and turns. What we cannot escape, however, is that local communities have largely been displaced and excluded from their land.

Ferrando (2012) makes the distinction between 'public grabbing' and 'private grabbing'. Private grabbing comprises private sales of land at market price which are not common given that in most African states land is owned by the state and can only be leased to individuals or companies. In public grabbing, the land at the centre of the deal is considered by the host state as 'public or national' on the basis of its own legal order, or is expropriated on the basis of a declaration of 'public interest' or 'public necessity'. Thus, sovereign nations have the right to decide and determine legal and illegal occupation, used and unused land, available and not available land, and of determining who has the right to see his/her property title formalized. For example, in Ethiopia the

Federal Government has according to the constitution provided for a sovereign prerogative to expropriate and resettle people after having identified and declared the existence of a public purpose (Ferrando 2012). They have used this to expropriate 100,000 hectares leased by the Federal Government to Karuturi Global Ltd. Constitutional provisions giving the state power of land are problematic when the state turns into a predator. The predatory nature of the state in Africa has meant peasants and vulnerable groups are at the mercy of various forces without protection from elected officials. These land deals are just another occurrence in a long list of ways the state in Africa has become imperial and turned on its own people. Ferrando (2012) concludes:

> Extending what Erik Hobsbawn had already affirmed in the '50s of the last century about public interest, we can thus conclude that in many circumstances sovereign prerogatives are 'no more than the forces of profit-pursuing private enterprise' which seek 'to turn land into a commodity', 'to pass this land into the ownership of a class of men impelled by reason; i.e. enlightened self-interest and profit', and 'to transform the great mass of the rural population into freely mobile wage-workers'.

Nation states are thus intertwined with global capital to further dispossess citizens of land. The global mechanism of land deals forms a complex web of partnerships and ownership without geography. The relationships between investors, lenders, bankers, and multinational companies are boundless and difficult to define in physical space. To illustrate this, Cotula (2012, p. 659) notes:

> . . . the nationality of the land acquirer does not fully represent the geography of the interests at stake. A large Libyan deal in Mali reportedly involved contracting out construction work to a Chinese company, for example. Similarly, South African consulting engineers have been involved with contracts to build sugar mills and ethanol plants in different parts of Africa (Hall 2011). And some European or North American farmland investments in Africa involve leveraging agricultural know-how from Brazilian expertise (OECD 2010) . . . several biofuels companies active in Africa are listed on London's AIM – which is 'the London Stock Exchange's international market for smaller growing companies' (AIM 2011); but capital invested in these companies may originate from all over the

world. So different geographies of interests may be involved in a single investment project.

Land dealers across Africa are thus involved in complex relationships of global capital which provide a new era of imperialism based on transaction and not Western powers' military might. Imperial imperatives are negotiated within boardrooms and local elites are closely involved in selling away people's livelihoods.

Contextualising Large-Scale Land Acquisitions in Zimbabwe as a Neo-imperial Process

In this essay we avoid a situation of universalising attractive concepts such as 'land grabbing' which might not provide detailed understanding of the peculiar situation in Zimbabwe. Matondi (2011) has referred to the 'wacky politics of biofuel', yet in this wackiness is a clear pattern of accumulation propped by a neo-liberal ethos. Chiweshe (2013), however, argues that the Zimbabwean case is unique in its context, organisation, and ultimate goals. Firstly, it goes against the tide of government policy of promoting smallholder farming. Secondly, whilst the mode of displacement was cruel towards households, they complain more about the lack of consultation and alternative resettlement or compensation. For example, in Chisumbanje farmers acknowledge they had always known the land belonged to the government but the company and government could have offered alternative land for resettlement. At Nuanetsi Ranch, Scoones et al. (2010) described 'illegal settlers' who were not recognised by the government. Thirdly, most of the final products were meant for local consumption. Mujere and Dombo (2011) further highlight how Nuanetsi became a target for acquisition because it was defined as 'idle' land, yet families lived and worked there. They noted:

> Governments usually identify what they call 'idle lands' which they then parcel out to private investors. For example in Zimbabwe one of the arguments in support of the Nuanetsi Bio fuels project has been that the area is arid and for a long time there has been little production on the Ranch. The

land is therefore viewed as 'marginal' or underutilized in order to justify the displacement of people and biofuel production. The biofuel project is therefore projected to turn the hitherto arid area into a green belt thereby turning a formerly 'idle land' into productive land. (7)

This fits well into the overly used belief that there is vast unused land in Africa which can be turned into viable large-scale commercial products.

As we continue to understand the workings of international capital and its linkages with national capitalists, there is a need for a contextualised analysis which does not jump on the bandwagon. We require better research approaches that bring out clearly how government is implicit and complicit in whole communities losing access to resources. Such theorising should also begin to focus on agency amongst local communities and understand how they have responded to losing access to their land. Borrowed concepts will be useful up to a point but they may hide nuances of social networks, organisation and relationships that have been born out of these land deals. Analysis should go further to understanding the kind of communities that are emerging in areas affected by land deals. We need to ask about gendered relations, household dynamics; what type of productive and economic markets and relationships are informally emergent? Such an analysis needs to be rooted in rigorous fieldwork that takes into account the knowledge and experiences of people at the grass-roots level. We need to interrogate how valuable 'land grabbing' is as a conceptual tool to understanding large-scale land deals. This is not to deny 'grabbing' per se but to situate this grabbing within a specific socio-historical context. Not all grabbing and grabbers. Motives and implications of land grabbing differ, and, thus, there is a need for a context-specific analysis that provides in-depth insights into how local processes feed into the agreements over land.

Chiweshe (2013) highlights that the land deals in Nuanetsi and Chisumbanje are confusing given the drive towards small-scale production through the Fast Track Land Reform Programme post-2000. He argues:

In Zimbabwe there remains no clear land policy to guide land administration. Large scale land deals provide an example of *ad* hoc land administration. There is no clarity how these two large investments fit into the wider context of land reform which supports small holder commercial agriculture. Are these two the beginning of a much wider speculative era of land acquisitions or are they anomalies which have no bearing on the future land policy? It is difficult to understand how the promotion of foreign funded large scale agriculture fits into the anti-colonization rhetoric of the 2000s. The deals signal a clear warning of how small holder and communal farmers' claims to land remain fragile. The state retains ownership of land, having the deciding power to influence and affect people's claims to land. (69)

The table below provides a comparison of the positive and negative impacts of Zimbabwe's two recent large-scale land deals. It highlights the purported positive impacts of large-scale land deals have for rural communities, including employment, investments, and access to support for smallholder farmers.

Neo-imperialists: Unmasking the Politics of Race and Class in Zimbabwe's Land Deals

Billy Rateunbach, Themba Mliswa and ZANU-PF Cronies

The role of Billy Rateunbach in Zimbabwe's land deals remains murky and controversial. His story represents an interesting example of how race, class, and politics Comparison of Nuanetsi and Chisumbanje

Nuanetsi Ranch	Chisumbanje
Positive impacts of Naunetsi bio-diesel project on local communities	*Positive impacts on Chisumbanje communities*
i. Employment opportunities The sub-activities done within the project area, besides biofuels production, include crocodile farming, cattle ranching, and gamekeeping. These activities have provided employment opportunities for some members of the local communities. For instance, in 2010, it was reported that the crocodile department alone had already created more than 2,000 jobs. *ii. Potential exports?* Preliminary estimates suggests that once fully operational, Nuanetsi ethanol plant will produce about 500 million litres per year, far more than what the Zimbabwean market is able to consume, making it another ideal export product for the country to benefit from.	*i. In-kind compensation* Whilst the local communities, especially farmers were not involved from the start, the company running the project at Chisumbanje has tried to involve and compensate the farmers meaningfully. For example, Macdom Investment Pvt Ltd did set aside portions of land for smallholder farmers to engage in horticulture projects to compensate for their losses. The company also provides the farmers with irrigation services and gives them logistical support. Furthermore, some farmers are also contracted by the company to grow sugar cane which they sell to the company.
Negative impacts of Naunetsi bio-diesel proiect on local communities	*Negative impacts on Chisumbanje communities*
i. Eviction of farmers Although the project's activities (which include dam building, sugar mills and irrigation) are being discussed, all involving significant displacement of people (including perhaps up to 6,000 households from Nuanetsi), what is currently known is that soldiers and police were (in February 200 g) given authority to evict a large number of farmers on Naunetsi ranch so that the project could take off. Some farmers however continued resisting their evictions.	*i. Loss of farming land* Some local farmers had been using the now taken land as fields for their annual cropping in which they planted a variety of crops including maize, millet, sorghum etc. for their survival and livelihood. However, following the agreement between Agricultural and Rural Development Authority (ARDA) and the private company, the land was no longer available to these farmers. As such, they did lose their farming land.
ii. Boundary conflicts The project has also caused serious boundary conflicts between the traditional leaders of the areas involved. It is believed that Chief Chitanga (who is also Chivi/Mwenezi senator and supports the project) is campaigning for the removal of people under	*ii. Displacement of households* A number of smallholder farmers who had been using the land, especially on a permanent basis, decided to settle permanently on some parts of the estate. Following the launch of the project, these local farmers were asked to

Nuanetsi Ranch	Chisumbanje
the jurisdiction of Chief Mpapa. This has caused serious resistance from Chief Mpapa and his people and which has resulted in a lot of violence as the farmers try to keep what they have.	leave to pave the way for the ethanol project.
iii. Destruction of livelihoods The evictions of farmers in the area have destroyed the livelihood of most local farmers who lost the fields in which they used to plant both cash crops and food crops for their income generating and subsistence consumption	*iii. Increased poverty* As reported by one newspaper, 'Thousands of families are wallowing in abject poverty after their displacement from their communal lands to pave way for a bio-fuel project by the Agricultural and Rural Development Authority (ARDA) and Macdom Pvt Ltd outside the knowledge of local leadership'. The displacement of local community households has pushed some of them into poverty as they lost their means of viable survival.

Source: Makochekamwa (2012, p. 16)

intertwine to produce a land-administrative system in which certain factions of the state can become imperial at the expense of poor people's livelihoods. The emerging large-scale land deals in Zimbabwe, including mining, all seem to be linked to Rateunbach who appears to enjoy huge political favour. This is interesting given his race and the anti-whites rhetoric publicly espoused by ZANU-PF. The excerpt below provides a brief description of Rateunbach and his relationship to Zimbabwe's political elite:

Muller Conrad 'Billy' Rautenbach, born on September 23 1959, is a controversial Zimbabwean businessman who has parlayed his closeness to the Zanu-PF government into a personal fortune and an aura of untouchability – despite being a fugitive for a decade. Rautenbach fled South Africa shortly after the then Investigating Directorate for Serious Economic Offences launched a raid in November 1999 on his Wheels of Africa (WOA) Group, which included Hyundai Motor Distributors …. Camec was key to his ongoing relationship with the Zimbabwean government. The company, through its purchase of Lefevre (an opaque British Virgin Islands company thought to be controlled by Rautenbach), got access to two platinum concessions in Zimbabwe that had been wrested away from their original owner, a division of Anglo Platinum by the Zimbabwe government. In return Camec granted Lefevre a US$100-million loan 'to meet its obligations to the Zimbabwean government' – at a time, in April 2008, when the Mugabe regime was desperately short of cash. (Sole 2009: http://mg.co.za/article/2009-11-20-rautenbachs-fast-and-furious-ride-to-riches)

He is the face of large-scale land deals in Zimbabwe with vast influence on the political processes of natural-resource governance in the country. In 2014, his political connections were further exposed when ZANU-PF Mashonaland West chairperson and member of parliament, Themba Mliswa demanded US$165 million as facilitation fees for introducing Rautenbach to key political figures who facilitated his land and mining acquisitions. The extract below outlines the story, showing how political corruption fuelled large-scale land deals:

Zanu-PF Mashonaland West provincial chair and Hurungwe West legislator Temba Mliswa yesterday said the ruling party's secretary for administration and Minister of State in the Office of the President, Didymus Mutasa, facilitated an out-of-court settlement for him in a US$165 million plus dispute with Mr Conrad 'Billy' Rautenbach. The dispute stemmed from money Mliswa said he was owed for facilitating Mr Rautenbach's interests in Hwange Colliery, Unki Platinum Mine and the Chisumbanje ethanol plant. Mliswa said some of the deals guaranteed him shareholding in the projects … At a Press conference in Harare yesterday, Mliswa reiterated that Arda board chair and former Zanu-PF Manicaland provincial chairperson Basil Nyabadza – and other unnamed politicians – were in the deals. He claimed Mr Rautenbach bought Nyabadza a house in Mutare and gave 'brown envelopes' to several politicians whose names he said he would soon reveal to oil his deals claiming Mr Rautenbach, who he described as Zimbabwe's biggest land owner, owned the Government. Nyabadza yesterday said he was contemplating legal action against Mliswa over the allegation. Mliswa said his multimillion-dollar deals with Mr Rautenbach were entirely verbal and there was no paperwork to confirm them. The politician demanded at least US$i65 million from Mr Rautenbach as facilitation fees and shareholding in the three projects after linking him to several senior politicians pursuant to landing the contracts … On Nyabadza, Mliswa said: 'Basil Nyabadza benefited

with a house in Mutare. You can call him and ask where he got the house from. His companies are not doing well. Billy Rautenbach bought a house for him, no wonder he has become a spokesperson for Billy when you talk about Green Fuel. (Maoodza 2014: http://www.herald.co.zw/165m-saga-temba-mliswa-digs-in/)

International Financing Behind Rautenbach

Further analysis of Billy Rautenbach and the various investment vehicles he represents provides a complex picture of shady international deals that further complicate the true nature of actors in the Zimbabwean land sector. One report from a business news outlet highlights the intricate and complex nature of ownership and control. Simpson and Westbrook (2014) highlight the role of Wall Street hedge-fund firms in Zimbabwe's complex political picture, and allege that they have provided financing to ZANU-PF in exchange for mineral and land rights:

> ... a Wall Street consortium provided the $100 million for the dictator's government. These millions secured the rights to mine platinum, among the most valuable of minerals, from central Zimbabwe. Several firms were involved in the investment, including BlackRock (BLK), GLG Partners, and Credit Suisse (CS). The most vital player was Och-Ziff Capital Management (OZM), the largest publicly traded hedge fund on Wall Street. (http://www.bloomberg.com/bw/articles/2014-08-21/mugabes-bailout-och-ziff-investment-linked-to-zimbabwe-despot)

Och-Ziff is owned by American Daniel Och and it has an estimated US$45.7 billion in assets. The company is claimed to have had a stake in Central African Mining & Exploration Co (Camec), listed on the AIM exchange in London. Och-Ziff provided 75% of the US$150 million used by Camec to purchase a stake in platinum mines in a joint deal with the Zimbabwe Mineral Development Corporation. Billy Rautenbach is a shareholder in Camec and was involved in buying cars used by ZANU-PF before the 2008 elections. Och-Ziff later sold its stake in Camec, but what is interesting for us is this complex of ownership linked to Billy Rautenbach and how it relates to questions of sovereignty and neo-imperialism. Political elites and international capital are finding areas of convergence and it is the poor masses in Africa that suffer. Frantz Fanon (2002) offers a definitive statement of the economic and psychological degradation inflicted by the imperial powers on their colonies. This is the reason why, according to Fanon, the African state and its apparatus have in some instances become the worst institutions of colonialism rather than agents of development. The wave of large-scale land acquisitions being orchestrated by African governments and foreign capital provide further evidence to support this thesis.

Chinese Angle: Growing Threat to Rural Livelihoods?

Post-2000, the government of Zimbabwe embarked on a Look East policy which saw China emerging as the trading partner of choice. It centred on renewed, broader engagement with China and other Asian countries, which President Mugabe said could be an alternative economic co-operation partner to the West, which Zimbabwe had lost. He argued that 'In most recent times, as the West started being hostile to us, we deliberately declared a Look East policy ... We have turned east where the sun rises, and given our backs to the west, where it sets' (Maroodza 2011). Trade between Zimbabwe and China has increased significantly in recent years, from ZW$760 million in 1997 to ZW$6.9 billion in 2000 (Friedrich-Ebert-Stiftung 2004, p. 4). This move coincided with increased Chinese investments across Africa. Liberti (2013, p. 23) notes that 'The war for influence (and market control) between China and the western powers that is being fought throughout the continent, especially in those countries that produce raw materials, unquestionably strengthens the hand of many African governments'. This is especially true for Zimbabwe, given the economic sanctions imposed by Western countries after 2000. Whilst

China has seemingly concentrated on resource extraction rather than land grabbing in Africa, the Zimbabwean case shows an increased interest in agricultural land. In this section of the essay we highlight how this increased Chinese presence in Zimbabwe impacts on access and control over land. Chinese investments in agriculture highlight an emerging trend in land deals, which include direct ownership, lease agreements, and contract farming. The news report below highlights how the Chinese are taking over land which had been given to black farmers under the Fast Track Land Reform Programme:

> The Zimbabwean government has signed a deal with the Chinese government which will mostly affect farmers on previously white-owned land in the Mashonaland East province. Reports indicate that under this so-called 'twinning programme' between Zimbabwe and China, affected farmers will sign a 25-year-renewable contract with their Chinese partners. In return the Chinese will give them money to help them develop farming operations on their remaining farmland, and also buy the crops they produce. Some of these investors – reportedly from China's Hubei Province – are already on some of the targeted properties, according to dispossessed white Zimbabwean farmer Ben Freeth. (Farmer's Weekly 2011: http://farmersweekly.co.za/article.aspx?id=6466&h=Zimbabwe-Chinaland-dealupsetsdispossessedfarmers)

The Chinese have also adopted another model of land access based on government-to-government agreements over contract farming. In Zimbabwe the Tian Ze Tobacco Company represents the China National Tobacco Company. It came into being in 2005 following the signing of a Memorandum of Understanding between the Zimbabwean and Chinese governments. Its core business is tobacco contract farming, purchasing (from auction floors and contract farmers), processing and exporting to the Chinese market (Nyamayaro 2012). These contracts ensure the Chinese have unlimited access to tobacco without actually owning the land or being directly involved in agriculture. All this points to an increased Chinese interest in agricultural land which opens the way to new forms of unequal relationships in land between locals and powerful nations.

Accumulation by Dispossession

Large-scale land deals have to be understood within the historical processes of accumulation. There is a growing wave of capitalists who are manoeuvring to exploit the world's looming food and fuel crises. They defy geographical categorisation and come from varied nationalities. Their form of capitalism can best be described as accumulation by dispossession. Local elites are part of this class of accumulators where land has become an important resource. As the poor riot over shortages in places like Senegal and Bangladesh, investors are racing to corner the market on the world's dwindling farmland. Farmers in Mwenezi and Chisumbanje are being divorced from their means of production in a process Marx described as primitive accumulation. He defined primitive accumulation as:

> The process, therefore, that clears the way for the capitalist system, can be none other than the process which takes away from the labourer the possession of his means of production; a process that transforms, on the one hand, the social means of subsistence and of production into capital, on the other, the immediate producers into wage labourers. (Marx 1977/1867, p. 85)

De Angelis (2004) has noted that primitive accumulation is not so much a historical event as a continuous process by which the institutions that protect society from the market are dismantled. Corson and McDonald (2012) highlight the commodification of spaces and processes hitherto outside the 'circuits of capital', including new forms of nature, and the role of institutions in creating the conditions for global capital accumulation through 'extra-economic' means of dispossession. Accumulation by dispossession is an alternative to Marx's primitive accumulation. For Harvey (2005), accumulation by dispossession is a politically driven process which occurs simultaneously with capital accumulation. It works in a variety of ways from the subtle commodification of once communal property to outright theft. Large-scale land acquisitions are part of processes of commodification, privatisation and suppression of rights, appropriation of assets, and the creation

of institutions to enable these processes. As people are dispossessed from their land it creates a reserve of unemployed labour without any source of livelihood other than wage labour. At a grand-scale large-scale land deals are characterised by people being robbed outright of their livelihoods.

The Zimbabwean case highlights the complex nature of understanding who these accumulators are. Billy Rautenbach's presence is ominous in both Mwenezi and Chisumbanje land deals. In Chisumbanje, his company owns Macdom (part of the investment team); whilst in Mwenezi, DTZ has denied that he owns any shares, noting only that he has interests in projects that develop Zimbabwe. Rautenbach is a multi-millionaire Zimbabwean businessman with close links to ZANU-PF and President Mugabe. In Africa most deals on land require links to the government. Which is why political elites are intrinsically involved. These elites form part of a national bourgeoisie who have used political power to amass wealth, some of it through corrupt means. Elite capture is not a new process in post-colonial Africa. The workings of international capital and local power interests in creating enclaves of accumulation are well documented. Large-scale land acquisition is part of a historical process that has seen local livelihoods being mortgaged for the benefit of the rich and powerful. The environmental costs of such accumulation are borne by communities that remain long after the companies, plants, and factories have left. Dispossession is also spiritual and emotional. Land is an important spiritual asset for local people. It is the link to their ancestors and its value is intrinsic to how they define themselves. The dispossession is thus both physical and metaphysical.

Conclusion

In this essay we have investigated the phenomenon of large-scale land deals, and how they ought to be understood within the processes of historical accumulation and dispossession. We examined how the colonial vestiges in Zimbabwe

throughout history have also been assimilated into the post-colonial state with the post-colonial state also perpetuating the dispossession of communities in Chisumbanje and Mwenezi. Our case study material reveals the complexities that result when large-scale land deals unfold and communities lose land to elites. These elites are continuously involved in the process of land accumulation, in a politically charged environment where issues to do with flexi crops and the political, symbolic, and economic importance of land in a post-colonial state are coming to the fore. We have also investigated how notions of race and class have contributed to the problematic nature of the large-scale land deals in Zimbabwe, with the less powerful black classes under threat of losing land to the powerful political and economic elites. We further suggest the need for policy alternatives that meet the needs of rural populations without undermining their citizenship engagement when large-scale land deals are organised even by the so-called black-led governments.

According to popular Western understanding, the Cold War was a political, geopolitical, and ideological confrontation between capitalism and communism, pitting the advanced capitalist economies of Western Europe, North America, and Japan, led by the USA, against the Communist Soviet Union and allied Eastern Bloc. It began after the Second World War and turned nuclear when the Soviets acquired atomic weapons in 1949. Though the prospect of nuclear Armageddon prompted mass movements against nuclear weapons, and though the world came very close to it at least once, there was no nuclear war: deterrence worked.

The Cold War was conducted with armed alliances. On the model of its 1947 Rio Pact with most Latin American countries, the USA sought to encircle the Communist Bloc with the 1949 North Atlantic Treaty Organization (NATO) to its west, bases in Japan and the 1954 Southeast Asian Treaty Organization (SEATO) to its east, while the Central Treaty Organization (CENTO) to cover the Communist Bloc's southern underbelly failed. The Soviet Union formed the Warsaw Pact with Eastern European Communist countries and less durable alliances with the People's Republic of China (PRC) and later North Korea and North Vietnam.

When not blaming the Cold War on Communist aggression, the popular Western interpretation equalizes the two sides morally. Cold War antagonisms and propaganda were used for internal political control and repression on both sides. Both sides were also imperialist: if the USA and the West were continuing capitalist imperialism disguised by rhetoric of freedom and democracy, the USSR was also imperialist toward its own constituent republics and eastern satellites, smothering their national identities, and toward countries further afield in which it intervened. The competition of both sides for the allegiance of the newly independent countries of the Third World was rejected by most of them and the Non-Aligned Movement (NAM) of countries rejecting both coercive options emerged.

The Cold War ended when Communist Party rule ended in Eastern Europe in 1989 and in the USSR in 1991. Capitalism had won, proving communism was economically and militarily too weak and domestically too illegitimate. The Soviet Union did not live to celebrate the 75th anniversary of the Bolshevik Revolution. Henceforth, the world would become unipolar under US leadership with capitalist liberal democracy becoming the telos of human history (Fukuyama 1989) and would enjoy a "peace dividend."

Practically every element of this popular understanding is questionable: what the Cold War was, when and why it began and ended, who it was directed against, what its domestic and international effects were, whether the two sides were equally to blame, and how the two sides related to the newly independent Third World; the list could go on. In what follows, we seek to provide a more accurate view in which the West turns out to be the greater, if not the sole, aggressor. We begin by locating the Cold War in the geopolitical economy (Desai 2013, 2015) of the capitalist world. Here the Cold War appears as a particularly intensely contested phase in the long-term decline of capitalist imperialism. While historical accuracy alone would necessitate the reinterpretation we propose, recent developments have made it urgent. Neither of the two main expectations engendered by the so-called end of the so-called Cold War have been fulfilled; the world has become multipolar rather than unipolar, with Western capitalist societies failing to remain economic or political models, if they ever were, and, rather than a peace dividend, the level of Western military aggression, from Afghanistan to Iraq, Ukraine, Syria, and Venezuela, has been so great as to give rise to talk of a "New Cold War" (Desai et al. 2016).

Of course, the popular Western understanding was contested by the Communist side. That

interpretation, however, remains to be recovered in full, and our own understanding relies chiefly on critical Western scholarship. Western scholarly interpretations of the Cold War have been through four phases. In the first, orthodox, phase, work such as John Gaddis's (1972) stressed Stalinist and Communist aggressiveness and the West's defensive posture. The Vietnam War inaugurated a second phase, when the USA's aggressiveness (and ineffectiveness) could no longer be denied and critical revisionist historians, led by Gabriel Kolko (1969) and Walter LaFeber (1971), questioned the very notion of a Cold War, attributing pervasive international tensions and conflicts to long traditions of US imperialism whose peculiar long-term historical dynamics Williams (1972) laid bare. This interpretation not only agreed with the Soviet interpretation, it prevented a return, in the third phase, to the old blame game. Instead third phase mainstream scholarship was reduced to serving US and Western imperialist interests by stressing complexity and mutual misunderstanding (White 2000).

Since the demise of the Eastern Bloc, the underlying continuities of the Cold War with declining US and Western imperialism have asserted themselves, and many invoke a New Cold War (van der Pijl 2018; Woodward 2017), complete with mushrooming Russophobia. In this final phase, Western interpretations have returned to orthodoxy, blaming Putin and the Russians to justify Western aggression one-sidedly: "only purported 'minuses' reckon in the vilifying, or anti-cult of Putin. Many are substantially uninformed, based on highly selective, or unverified, sources, and motivated by political grievances" (Cohen 2018, 5). These phases of interpretation roughly correspond to those of the Cold War, and we discuss them after the following outline of the geopolitical economy of the Cold War.

The Cold War in the Geopolitical Economy of Capitalism

Critical revisionists, Joyce Kolko and Gabriel Kolko, found the Cold War an "egregious term" that "burdens one's comprehension of the postwar era with oversimplifications and evokes the wrong questions," focusing only on "the formal cold peace between Russia and the United States" and occluding the "conflict, war, repression and ever-mounting violence" of "the revolution, the counterrevolution, and the great, often violent, interaction between the United States, its European allies and the vast social and economic transformation in the Third World" (Kolko and Kolko 1972, 6). In effect, the Cold War was hot in the Third World. Official estimates, understated thanks to the Cold War and Eurocentrism, put its toll at 10 million lives compared to the 80 million toll of the Second World War, the world's most lethal conflict.

Cold War conflict in the Third World was not due to rivalry between the two camps: it was more one-sided. For the USA, "the Cold War has been a history of world-wide subversion, aggression and state terrorism" (Chomsky 1992, 21–22) against the Third World (Chomsky 1992, 28) to "block indigenous nationalist forces that might try to use their own resources in conflict with US interests" (Chomsky 1992, 54). Contrary to the popular view of the USA as "anti-imperialist" "reluctant hegemon," already in the early twentieth century, as US capitalism became more concentrated, corporate, and aware of declining British power, it aspired to replace Britain as the "managing segment of the world economy" (Parrini 1969, 13), thus joining the mainstream of Western imperialism.

While the Cold War was certainly an ideological contest between capitalism and communism, and US and Western hostility to communism was certainly unrelenting, it was the tip of the larger iceberg of long-standing imperial opposition to other economies transforming themselves "in ways that reduce their willingness and ability to complement the industrial economies of the West" (Chomsky 1992, 27). The Cold War was essentially motivated by a common imperialist opposition to essentially defensive resistance to Western economic penetration, whether by dint of economic nationalism or communism. If this is not widely known, it is because "[t]hough the principled opposition to independent Third World nationalism is spelled out emphatically in the

[US] internal planning record and illustrated in practice with much consistency, it does not satisfy doctrinal requirements and is therefore unfit to enter public discourse." So it is assumed, on the contrary, that the USA supports nationalism and self-determination (Chomsky 1992, 58) and that communism was a graveyard of nationalities.

Though "Red Scares" conjured out of these threats justified the transformation of the USA's already swollen arms production into its infamous post-war military-industrial complex, contrary to Western perceptions of an inherently expansionist USSR which had to be rolled back or, more "realistically," as George Kennan's 1946 "X article" recommended, contained, the Soviet posture was far more modest. Not only was Lenin's original internationalism replaced by Stalin's socialism in one country, just how far a poor, agrarian, and weak revolutionary regime under siege by powerful capitalist powers could have translated internationalism into effective support for revolution elsewhere can be questioned. This changed, of course, once Stalin successfully industrialized Russia. It could now aid the new socialist countries in Eastern Europe, China, and the People's Republic of Korea. However, even then, its foreign policy remained cautious and defensive. In keeping with the Yalta and Potsdam agreements on spheres of influence with the West, the USSR urged restraint on the strong Communist parties in France, Italy, Greece, Yugoslavia, and (initially) China, confining itself to defending itself and its satellites with "tanks in East Berlin, Budapest and Prague and other coercive measures in the regions liberated by the Red Army from the Nazis" (Chomsky 1992, 20–21). Khrushchev's 1959 initiative on Cuba heralded more support for socialist regimes and "targets of US subversion and attack," and the US debacle in Vietnam emboldened it further. Now "[m]aterial support helped these enemies [of the US] to survive, and relations with the Soviet Union imposed limits on US actions, for fear of a superpower conflict" (Chomsky 1992, 27). Nevertheless, the USSR repeatedly called for peaceful coexistence.

In reality, the Cold War was a phase in the dialectical evolution of the geopolitical economy of capitalism in which its advanced core has sought to force open the rest of the world as outlets form its commodities and capital and access their cheap food and raw materials and parts of it resisted (Desai 2013; Patnaik and Patnaik 2016). Critical understandings, stretching back to Alexander Hamilton and Friedrich List as well as to Karl Marx and John Maynard Keynes (Desai 2013, 29–53), recognize that, thanks to its contradictions, particularly the paucity of demand and the tendency of the rate of profit to fall, capitalism is inherently expansive, seeking outlets for excess commodities and capital and cheap sources of food and raw materials. Free market and free trade ideologies only justify industrially superior nations' subordination of weaker nations in *complementary* relationships where the former produce higher value industrial products and the latter produce lower value goods, typically agricultural goods and later cheaper manufactures. Economic nationalists going back to Hamilton and List rejected this fate for their respective countries, recommending industrialization behind protectionist walls to keep out cheap goods and reserve markets for national industries. Their aim was transforming national productive structures to achieve *similarity* with the most advanced countries instead (Desai 2013, 2015). Indeed, no successful industrializer has industrialized in any other way, not even the first, Britain (Chang 2002; Amsden 2007).

As new powers industrialized to challenge British initial industrial supremacy, there was now competition for markets, investment outlets and cheap sources of food and raw materials. Since the world still contained many stateless territories or weak states, this spurred imperial competition for colonies intended to serve as agricultural complements. This industrial and imperial competition, which culminated in the First World War (Hobsbawm 1989), critically foreshadowed the Cold War and its "hotness" in the Third World. War between industrial powers was costly; just how, they found out after 'sleepwalking' into the First World War (Clark 2013) and then into an umbilically linked second with which it formed a single 30 Years' Crisis of 1914–1945 (Mayer 1981). The preferred terrain for competitive capitalist expansionism has

always been what became the Third World, and there violent confrontation, whether between capitalist powers or between them and native forces of resistance, were common (Stavrianos 1981 is perhaps the best chronicle of this process).

A long, slow but inexorable unravelling of imperialism set in following its 1914 high noon. The 30 Years' Crisis profoundly destabilized the imperial order. Not only did it open and close with the Russian and Chinese revolutions and not only did they point to a radically different path to socialism that had been envisaged by the Second International, one that led through struggles against imperial as well as class domination, thus expanding the fronts of opposition to capitalism, three other developments transformed the manner in which the imperial quest for complementary subordination would now be conducted. Nationalisms in the colonial world crested, boosted by resentments against wars' exactions and privations as well as the difficulties caused by the Great Depression which did not leave the colonial world untouched (Rothermund 1996). They sought independence to pursue autonomous economic development.

Secondly, the rise of communism transformed the prospects for these nationalisms. Woodrow Wilson's famous Fourteen Points of January 1918 were less about Wilson's alleged "idealism" and more about countering the stunning popularity of the November 1917 Bolshevik publication of Tsarist secret treaties and their Peace Decree (Mayer 1959, 265). While echoing Bolshevik opposition to imperial conquest, Wilson's support for national liberation was confined to Europe, while the Bolsheviks endorsed the liberation of all Europe's colonies. Although limited, Soviet and Communist support for the Third World and its struggle for development tilted the balance against imperialism.

Finally, the hitherto warring capitalist world now united under US leadership: war had devastated its capitalist rivals faced with the further economic diminution of decolonization while boosting US growth to many times levels seen before or since. The USA was uniquely qualified to lead in this new phase. Having arrived at overseas imperialism late, only after completing its

internal colonization (Stedman-Jones 1970), and never acquiring sizeable territory, the USA developed early the arts of subjugating formally independent countries under the Monroe Doctrine (Grandin 2006). This international personality lay at the root of *The Tragedy of American Diplomacy*: for all its rhetorical support for national self-determination, the USA never learned to accept that some countries might choose to exercise it to refuse US trade and investment. Wars were inevitable, whether through aggressive US actions or defensive actions by the target country or both (Williams 1972). Under US leadership, the West remained hostile to communism: it had fought the fledgling Bolshevik Revolution for half a decade, and while US hostility abated somewhat under Roosevelt (1932–1944), Truman revived and even turbo-charged it.

After 1945, imperialist complementary subordination had to be accomplished against additional barriers: vast territories and populations had already been withdrawn from such subordination by the Russian and Chinese revolutions; newly independent countries were pledged to break out of it after decades and sometimes centuries of colonialism through autonomous industrialization; and the Communist world could and often did aid this effort. After all, the USSR had not only demonstrated its possibilities, its autonomous industrialization had proved (as Gatrell and Harrison 1993 showed) critical to the allied victory in the Second World War. This was why the Non-Aligned Movement, though theoretically equidistant from the two Cold War camps, was practically closer to the Communist world.

Just as the Cold War was not merely against communism, it was not confined to the military and the geopolitical: its political and geopolitical economy meant that, though members of the United Nations with the USSR one of the five permanent members of the Security Council, the Communist countries stayed out of the World Bank, the International Monetary Fund (IMF), and the General Agreement on Tariffs and Trade (GATT) which they rightly regarded as Western instruments of capitalist penetration. Indeed, the Russian Revolution sharpened the contest between the Western imperialism and Third

World resistance. If the former became more systematic, conscious, and entrenched (Chomsky 1992, 37), the latter also began to acquire a new consciousness, unity, and determination. Moreover, the postwar posture of the USA also had its unique political and geopolitical economy dimension. Bereft of colonies of any size, only wars had historically provided the USA with the essential external stimuli that every developed capitalism needs. The US leadership was very aware of this, timing entry in both world wars to benefit fully from their economic stimuli to the USA as a supplier of war material (Desai 2013, 74–6, 84–7, 2018).

At Bretton Woods, the USA parleyed its war-wrought dominance to foist the dollar on the world as its de facto currency and fashioned the World Bank, IMF, and GATT into instruments for blocking autonomous industrialization (per Block 1977, even in recovering Western Europe). US trade and investment in Europe and the Third World sought to extend markets, production, and raw materials access. While this is not news, what is clear in retrospect is how limited US and Western success was. As Western Europe erected trade barriers, US corporations were forced into foreign direct investment (FDI) to overcome them (Gilpin 1975). The USA and the West also failed to stop more and more countries from embarking on development projects. Their success may have been limited, particularly in relation to ambitions, but it laid the basis for twenty-first-century multipolarity, the shift in the world economy's center of gravity away from capitalism's homelands for the first time in its history, and a "New Cold War" has appeared to cast doubts on whether the old one ever ended.

The continuity of the Cold War with this longer history of the apogee and continuing decline of imperialism since 1914 does not merely confuse the matter of whether it ever ended or merely transmuted itself into a "New Cold War." It also makes it difficult to pinpoint its start. After the "bizarre and temporary alliance of liberal capitalism and communism" (Hobsbawm 1994, 6) saved the world from fascism, when did the Cold War actually begin? With the confrontations over Greece in 1948 and the announcement of the Marshall Plan? With Kennan's "Long Telegram" recommending containment of the USSR? With Churchill's "Iron Curtain" speech in early 1946? Or even earlier at Potsdam where, with the cessation of European hostilities, Truman informed Stalin that the USA had the atomic bomb and then demonstrated its horrific power on Hiroshima and Nagasaki a week later? Or did it start already with the Polish crisis which broke out immediately after Truman became president (Mukhina 2006)? These questions arise only because, in fact, no sooner had the prospect of victory appeared than the USA went back to considering the USSR, as Warren Harding put it "a menace that must be destroyed," a "beast" that had to be "slain" (quoted in Chomsky 1992, 37). George Orwell had first used the term "Cold War" in 1945 to deplore the undeclared war already erupting between recent allies, if only to characteristically pox both houses by predicting that if both sides acquired nuclear weapons, the ensuing stalemate would rob "the exploited classes and peoples of all power to revolt" and that "[u]nable to conquer one another' the opposed sides were 'likely to continue ruling the world between them" (Orwell 1945; Westad 2010, 3).

The sort of reinterpretation of the Cold War that is necessary should now be clear. We hope to flesh it out in the following discussion of its major phases and key elements.

The Phases of Cold War

The roughly half century of the so-called Cold War divides into three stages. Between 1945 and 1959, the opposed camps solidified. The Cuban Revolution in 1959 opened a new phase which continued to the end of the Vietnam War in 1975 and its immediate aftermath, a phase characterized by increasing conflict between the West and the Third World. It was marked by intense class and international conflicts that shook the foundations of the postwar order in the West and by rifts that also emerged in the socialist camp. The last phase began about 1980 when the Western position appeared to strengthen; the reform process in the USSR spun out of control, restoring capitalism in

Eastern Europe and the USSR by 1991; and the Third World was laid low by the notorious IMF and World Bank Structural Adjustment Programs following its debt crisis.

1945–1959: The Solidification of Opposed Camps

In retrospect, the momentous atomic bombing of Hiroshima and Nagasaki can be taken to mark the opening of the Cold War. Unnecessary as it was to win the Pacific War, it was a warning to the Soviet Union and the world in general: Secretary of War, Henry Stimson's diaries "clearly showed that before the atomic bomb had been tested, American leaders had begun to calculate that the new force might greatly strengthen their hand against their wartime ally, the Soviet Union" (Alparovitz 1985, 5).

Beginnings in the Middle East and the Balkans

By early 1946, the USSR's refusal to join the Bretton Woods institutions had already prompted Kennan's Long Telegram, whose "realist" policy accepted that Soviet power could not be "rolled back," only contained. Soon thereafter, Churchill had delivered his famous Iron Curtain speech. From here on, the lines of conflict cracked apart more and more of the world.

In the Middle East, the USA sought to displace British influence with its own and ended up confronting the USSR in 1946. It posed as the defender of Iranian sovereignty (Hasanli 2006). Its backing for Turkey against Soviet attempts to secure access to the Black Sea (İnanç and Yilmaz 2012) led to the American Sixth Fleet being on permanent station in the Mediterranean (Khalidi 2009). The following year, it intervened to defeat a Communist insurgency in Greece (Jones 1989). When Israel was founded in 1948, the USA acquired a permanent beachhead in the region though at the cost of provoking the radical Arab nationalism (Shavit and Winter 2016) that overthrew landlord monarchies in Egypt, Iraq, and Syria and looked to the charismatic army officer Gamal Abdel Nasser in Cairo for leadership (Batatu 1984).

The USA did all in its power to block such nationalist projects. In 1953, the CIA subverted a popular attempt to take over the Iranian oil fields and topple the Shah. The landing of American marines in 1958 frustrated the ambitions of the majority Shiite and Arab nationalists in Lebanon. The CIA then contributed to overthrowing the communist-backed Qasim regime in Iraq in 1964. Meanwhile Israel's defeat of Egypt in 1956 and again in 1967 tied Israel more closely to the USA and set back Arab radical nationalist forces, allowing anti-imperialist feeling to be channeled toward Islamic fundamentalism (Lesch and Haas 2018).

The Soviet response to this US aggression was muted. While Soviet economic and military support enabled Nasser to seize the Suez Canal from British and French investors (1956) in a spectacular move, the Soviets did not back communists in Greece, which they considered part of the British sphere of influence (Roberts and Suri 2011). For Marshall Tito, however, the Greek uprising was an integral part of the wider Balkan revolution, and he led Yugoslavia out of the Soviet camp, rejecting Stalin's control and continuing to aid the Greek rebels, thus embarking on a new foreign policy of nonalignment and experimenting with workers control (Vucinich 1982).

The Yugoslav secession and the announcement of the Marshall Plan, which proved attractive to some in Eastern Europe, threatened the Soviet sphere of influence there and provoked the Stalinization of the People's Democracies beginning with Czechoslovakia (February 1948). Communist parties now monopolized political life, and economic planning became more centralized, while purges, censorship, secret police surveillance, and severe labor discipline became pervasive. While such methods industrialized these hitherto mostly agricultural economies rapidly, they also provoked workers' revolts in East Germany (1953) and most spectacularly in Hungary (1956) and Poland (1956). Soviet troops were used in Germany and Hungary, but in Poland the new popular Communist leader Wladyslaw Gomulka armed the workers against a threatened Soviet intervention. Of course, repression was no monopoly of communists. The USA and its European and Japanese allies brutally repressed the extreme left and

reinforced authoritarian structures in occupied Japan and West Germany.

Nowhere was the intertwining of the political and geopolitical economy of the Cold War with its military dimensions clearer than in the case of the Marshall Plan, launched in the wake of the Greek crisis by means of a manufactured "Red Scare" to get Congressional approval. Much lauded for making European recovery possible, it was in reality unimportant to it. Instead, it served as an export credit for dumping surplus US production on Europe (Desai 2013, 96–99; Lens 2003, 349; Kolko and Kolko 1972, 359–61) and as a political weapon promoting the economic integration of Western Europe, beginning with the European Coal and Steel Community in 1951, and the founding of the NATO alliance in 1949. Western economic integration and rearmament in turn led to the establishment of the Comecon in 1949 and the Warsaw Pact in 1955.

The East Asian Theater

The 1949 Chinese Revolution surprised the USSR but stunned the USA. "Losing China" infuriated the China Lobby, invested in Chiang and banking on the victory of his nationalists. Now the stage was set for the Korean War between the USSR- and PRC-backed People's Republic and the American-backed Republic of Korea in 1950. Starting as a civil war, it turned into a contest between the USA and the PRC for control over East Asia, committing the USA to the defense and expansion of capitalist East Asia. Secretary of State, Dean Acheson's, decision to intervene, while undoubtedly motivated by anti-communism, was also part of his "great crescent strategy" linking northeast Asia and the Middle East. Moreover, "South Korea was . . . essential to Japan's industrial revival" (Cumings 2010, 24–5). While the Korean War ended in a stalemate that divided the peninsula by 1953, it made the USA more willing to back France in Indochina, beginning its involvement there.

Africa and Southern Asia

British and French colonialism also faced challenges in Africa, Tunisia, Morocco, and, more spectacularly, Algeria, while Nasser's seizure of the Suez Canal challenged the British and French power more fundamentally (Smith 2008). The 50 or so states of sub-Saharan Africa, mostly under British and French rule, began their march to independence beginning with Kwame Nkrumah's Ghana (1955) and Sekou Touré's Guinea (1958). The USA was ambivalent. While decolonization opened up markets and investment opportunities for US business, national liberation movements' drive for economic autonomy and friendship with the Soviet Union was threatening. Unsurprisingly, the USA supported countries willing to open themselves up to its business and military interests, such as the Philippines, which remained under US military and economic control after independence. While it could hardly oppose Indian independence, the USA rejected her neutralist foreign policy. It backed the nationalist Achmed Sukarno against Communist rivals (1949) but not other nationalists it deemed to be under Soviet influence. It eliminated radical nationalists: Patrice Lumumba of the Congo (1961) was assassinated and Mohammed Mossadegh of Iran (1953) and Abdul Karim Qasim in Iraq (1964) overthrown due to their Communist associations. It also backed the French and British drives to repress Communist anti-colonial movements in Malaysia and Vietnam.

Bandung

Meanwhile the Third World made its formal debut on the world stage at the 1955 Asian-African Conference in Bandung. Its leading figures, Indonesia's Sukarno, India's Nehru, Egypt's Nasser, and Ghana's Nkrumah, as well as China's Zhou and Vietnam's Ho, expressed concern about the laggardly pace of decolonization in Africa, about Cold War tensions diverting the Third World's scarce resources to military purposes and about continued Western domination, what Soekarno called colonialism in "modern dress" with its "economic" and "intellectual" control which needed to be replaced by what Zhou Enlai called "complete independence" (Kahin 1956 44, 53). The Third World's leftward tilt was in evidence as the conference supported an isolated China amid rising USA-China tensions

and drew her out of its US-led isolation just as the Sino-Soviet split was beginning to widen (Kahin 1956, 15). China's five principles of "peaceful coexistence" – nonaggression, noninterference in internal affairs, equality, cooperation, and peaceful coexistence – embodied in the recent Sino-Indian "Panchsheel Treaty", founded a distinct Third World perspective on international affairs, underlining sovereign equality against the universalism that camouflaged the West's imperial intentions and actions.

The Sino-Soviet Split

Before any anti-imperialist alliance between the Third World and the Communist world could solidify, however, differences between the Chinese and Soviet Communist parties began emerging. Khrushchev did not consult Mao before giving his secret 1956 speech denouncing the Stalin cult of personality, exacerbating their personal animosity. There were other problems too: the USSR refused to back China in its dispute with Taiwan and the USA (1958); it demanded a naval base on Chinese territory; it rejected Chinese requests for help with its nuclear program. Within China, economic difficulties following the Great Leap Forward divided Mao from Chinese moderates who Mao likened to the current Soviet leadership, both capitalist roaders seeking peaceful coexistence with the West rather than supporting revolution and anti-imperialism. While the Sino-Soviet split was complex, this political tension was arguably fundamental (Mingjiang 2012).

For his part, Khrushchev pursued détente and peaceful coexistence to avoid nuclear conflict, departing sharply from Stalin's Cold War reversion to the Leninist view that war and antagonism were essential to capitalism and the USSR had to guard against it. However, though he negotiated the neutralization of Austria and sought a unified and neutral Germany, Khrushchev was more aggressive than Stalin in supporting national Third World liberation movements. Soviet aid to Third World nationalist and Communist movements under Stalin had been limited by the postwar balance of forces and demarcation of spheres of influence. Khrushchev not only continued the long-standing Soviet connection to the

South African anti-apartheid movement, as the 1950s wore on, he covertly backed Lumumba in Congo and Arbenz in Guatemala and ventured into an economic and military alliance with Nasser in Egypt. Indeed, under pressure from the increasingly critical Chinese, Khrushchev even challenged Kennedy during the Berlin Crisis.

1959–1981: The Cold War Peaks – The Cuban and Vietnamese Revolutions

The 1959 Cuban Revolution and the 1961 Soviet-Cuban alliance opened the second phase of the Cold War which would end with the USA's humiliating defeat in Vietnam and its aftermath. In this phase, an assertive Third World, aided by the USSR, successfully challenged American dominance even in its own "backyard," Latin America (Hough 1986), revealing how far US and Western abilities fell short of their ambitions.

More broadly, the Third World followed up Bandung and the successes, greater as well as lesser, of national development plans with a fairly coherent international front. It was institutionalized, inter alia, in the Non-Aligned Movement (NAM), the United Nations Conference on Trade and Development (UNCTAD), the Organization of the Petroleum Exporting Countries (OPEC), and, to cap it all, the demand for a New International Economic Order (NIEO), which explicitly recognized the opposition between Western demands for openness and the need for protection in Third World development (Murphy 1984). Such Third World assertion was compounded by, and related to, the onset of the "Long Downturn" in the West (Brenner 1998). At least one major authoritative account (Patnaik 1996), emphasizes the central role of rising commodity, particularly oil prices in the economic troubles of the 1970s, which also exacerbated differences within the capitalist world.

By the 1970s, the USA had to close gold window as the dollar came under more and more pressure from European allies opposed to inflationary Vietnam War spending. Currency and trade volatility followed; stagflation plagued capitalist economies, while the Third World industrialized with practically free capital and the USSR provided limited but still substantial support for

these developments. Amid defeat in Vietnam, US and Western influence stood at their historical nadir, and a veritable "global fracture" in the world economy (Hudson 1973) was witnessed.

The Cuban Revolution

The USA had exercised informal control over Latin America since the Spanish American War of 1895–1898 (Grandin 2006). Though occupying only Puerto Rico and Cuba, it used armed intervention at least 25 times in the Caribbean and Central America to secure its interests (Smith 2005, 50–75). However, this control was not without its difficulties. By 1929 the USA was the leading foreign investor in Latin America, supporting landlordism and military dictatorship. However, the economic hardship of the Great Depression caused political turmoil in 11 of the 20 Latin American republics. In El Salvador (1932), Cuba (1934), and Nicaragua (1927–1934), there was revolutionary violence (Gould 2010, 88–120). Peru, Ecuador, Venezuela, Mexico, and Brazil installed populist regimes, coalitions of bourgeois nationalists, organized workers, and peasants, which directed national economic development and redistribution to suppress class conflict through national solidarity. They naturally restricted American corporations' activities (Conniff 2012). While Roosevelt's Good Neighbor Policy refrained from direct intervention, the USA remained wary of populist attempts, for example, to nationalize Mexican oil, or of cautious steps toward land reform in Guatemala.

Postwar, populism remained influential. Brazil's President Getulio Dornelles Vargas (1950–1954) and Argentina's Juan Peron (1946–1954) challenged resurgent American dominance (Bethell 2008; Turner and Miguens 1983) and the power of domestic landlords and capitalists, introducing social welfare and labor legislation and accelerating industrialization. Eventually, however, the combined forces of the USA and the dominant landed and merchant oligarchies forced them out of power. In this it was helped by the 1947 anti-Communist Rio Pact, into which it had corralled most Latin American republics. It considered an attack on one member

as an attack on all. Nearly all Latin America was caught in the US dragnet of counterrevolution. In Bolivia, partial land reform and stepped-up American military aid contained revolution in 1952 (Zunes 2001, 33–49). In Guatemala, the CIA overthrew the Arbenz government when it nationalized the United Fruit Company's plantations (Gleijeses 1991).

Though US control over Latin America appeared all but complete as the 1950s drew to a close, an unease lingered. There was widespread resentment at US domination and the resulting grinding poverty of the overwhelming majority. In an emblematic event, a crowd, angered by US support for the recently ousted military regime of General Pérez Jiménez (1952–1958) and US control over the all-important petroleum industry (McPherson 2003, 9–29), violently assaulted Vice President Nixon's motorcade during his 1958 visit to Caracas, Venezuela. The Cuban Revolution (1959) erupted out of these conditions and raised socialist and anti-imperialist revolutionary hopes throughout Latin America among intellectuals, students, workers, and peasants. Their dominance threatened domestic elites, and the USA intensified its efforts to suppress Communists and radical nationalists (McKelvey 2018).

US political and economic domination of Cuba had led to political instability and recurrent dictatorship. Cuba produced tobacco, coffee, and nickel but depended chiefly on sugar production and export to the USA. In the 1950s, as the Cuban economy stagnated, miring its largely rural population in poverty, Fidel Castro came to lead the Cuban Revolution against the US-backed dictator, Fulgencio Batista. Alongside the Argentinian revolutionary, Ernesto Che Guevara, Castro created guerrilla units among sympathetic poor tenant farmers of the mountains of Eastern Cuba (Huberman and Sweezy 1968). As they scored successes against Cuban regular forces, peasants, trade unionists, and other liberal, Communist and socialist opponents of the Batista dictatorship swelled rebel ranks. By late 1958 Castro had routed the Cuban army, the whole island was in upheaval with revolutionary general strikes, and the guerrillas advanced toward Havana. At the beginning of January 1959, Batista fled, having

looted the national treasury, the USA failed to find an alternative and Castro entered Havana in triumph (Cushion 2016).

Since the revolutionary middle class was small, Castro's radical current easily seized the initiative and put its stamp on the revolution with the land reform of May 1959, dispossessing the Cuban landed elite and US sugar companies (Paz 2011, 25, 7387). The USA was furious and, as early as December 1959, US President Eisenhower, flushed with success in Guatemala, ordered the CIA to prepare for an invasion and launched a campaign of sabotage to soften up Cuba's economy and defenses. With a force of 1500 Cuban exiles at friendly bases in Nicaragua and Guatemala, the CIA launched the invasion at the Bay of Pigs in 1960 under President Kennedy. It was easily defeated by the local militia and the Cuban regular army (Jones 2008).

The USSR had already offered economic aid, agreeing to purchase most of Cuba's vital sugar exports at advantageous prices, and it now agreed to defend Cuba from an expected second US invasion by installing short- and medium-range nuclear missiles on the island, a move that would also reverse the strategic nuclear imbalance favoring the USA and reinforce Soviet revolutionary credentials in the face of Chinese criticism. The clandestine installation of Soviet missiles precipitated the Cuban missile crisis of October 1962. It brought the world closer to all-out nuclear war than any moment before or since and was averted only because Kennedy stopped at imposing a naval quarantine of Soviet arms. This allowed Khrushchev to stall the merchant fleet carrying more missiles mid-ocean and agree to withdraw Soviet missiles and nuclear weapons in return for US undertakings not to attack Cuba and dismount intermediate-range nuclear missiles in Turkey and Northern Italy (Allyn et al. 1992).

The Cuban Revolution threatened the USA seriously by setting an example of socialist revolution and assertion of national sovereignty for the rest of Latin America chafing under American imperialism (Petras and Zeitlin 1968). Conditions there were not significantly different from those in pre-revolutionary Cuba. Seventy to ninety percent of Latin America's still largely rural population had no land. Monoculture, unbalanced economic development, and dependence on imports and foreign capital characterized most Latin American economies. Foreign, especially, US capital dominated key sectors like banking, mining, and petroleum. US companies were increasingly involved in new consumer industries like automobiles and pharmaceuticals. When the Cuban Revolution erupted, the $8 billion in direct American investment in Latin America represented a substantial percentage of total American foreign investment.

Guerrilla Warfare and Counterinsurgency in Latin America

The Cuban Revolution boosted US anti-revolutionary resolve which peaked under Kennedy. With the Cold War stalemated by the Berlin Crisis in Europe and US investment rising in the Third World, prevailing over Communist and radical nationalist forces became more urgent. Focusing on that also helped deflect attention from rising dissatisfaction at home manifesting itself in the civil rights movement and opposition to Cold War conformity (Latham 2011).

Developments in the Third World also contributed to expanding US involvement there. By 1960, Che Guevara's *Guerrilla Warfare* had outlined the foco theory of armed popular revolution against organized state militaries. Guerrilla nuclei or focos would create rather than await revolutionary conditions; and the countryside was the arena for revolutionary struggle and the vector for its transmission to other societies (Wickham-Crowley 2014). It became the manual of guerrilla movements inspired by the Cuban Revolution throughout Latin America, and a first wave of focos appeared in Panama, Nicaragua, the Dominican Republic, and Haiti and a second in Columbia, Venezuela, and Guatemala. Outflanking orthodox Communist parties prone to legal forms of struggle and mass organizing, these focos advanced a Bolivarian strategy of people's war which, it was assumed, the USA could not control. By 1967, Guevara had made Bolivia his base, fomenting revolution there, and in Peru, Argentina, Chile, Uruguay, and Brazil. However, he was captured and killed, and insurrectionary movements across Latin America

suppressed one by one (Besancenot and Löwy 2009). Their last gasp was an upsurge of urban foci in Uruguay and Argentina which continued into the 1970s. The foco concept had proved a dead end and indeed bespoke not a revolutionary strategy but the absence of one (Green and Branford 2012, 91).

In this aperture, the USA arranged a coup d'etat in Brazil and Bolivia in 1964 to quash populist forces (Weis 1993; Field 2014), fixed elections to oust a populist government in Guyana in the same year, and military intervention in the Dominican Republic to thwart what it deemed a Communist takeover the following year. The USA supplemented coercion with strengthening Latin America's substantial middle class of farmers, merchants, bankers, industrialists, and professionals through the Alliance for Progress to foster growth and eliminate poverty, so inoculating Latin America against revolution. Announcing the Alliance for Progress a month before the Bay of Pigs invasion, this alleged Latin American Marshall Plan was projected to combine $20 billion in public and private aid and an estimated $80 billion of local capital to spur growth. While its economic success was highly questionable, it certainly helped insure against revolution (Rabe 1999; Paterson 1989; Livingstone 2009, 39–49).

In the 1970s, coercion resurfaced in US strategy in Latin America's Southern Cone. Nixon ordered the assassination of René Schneider, Chile's constitutionalist army chief of staff, even before the socialist Salvador Allende of the Popular Unity coalition became president. As he began nationalizing public utilities, banks, and basic industries, including the American-dominated copper industry, and implementing a major land reform, the US government, US corporations, and the Chilean business elite responded with an economic and financial embargo as well as a campaign of terror and sabotage. In 1973, pro-American military officers including General Augusto Pinochet, acting in close concert with American naval intelligence officers, staged a coup d'etat, and President Allende preferred to commit suicide in the presidential palace than surrender (Harmer 2011).

When the military seized power in Argentina 30 years later (Munck 1998, 47–107), the Latin America's twentieth-century era of efforts to foster income redistribution and industrial growth by policies of state intervention and limited protectionism ended. Businessmen and bankers turned to the army and police forces to suppress the opposition, trade unions, and peasants. Multinational and American capital was welcomed. A new phase of American domination over Latin America under the banner of neoliberalism had begun, prefiguring the path the USA itself would take in the 1980s (Petras and Veltmeyer 2010, 29). Only the twenty-first-century Pink Tide would end it.

Revolution and War in Vietnam

However, while scoring successes in these in Latin American skirmishes, the USA was sliding inexorably into the biggest defeat of its lifetime: Vietnam. This ultimate proving ground would also unleash a wave of protest that shook not only the USA but also France, Italy, and many other capitalist states around the world. Moreover, the struggle of the Vietnamese people inspired revolutionary movements in Africa, the Middle East, and Central America.

After the French defeat in Indochina, the USA, in violation of the Geneva accords calling for national elections in Vietnam, divided the country, putting the Vietnamese republic in the south under conservative mandarin, Ngo Dinh Diem, and establishing SEATO in 1954 (Blum 1982). Ho Chi Minh's Democratic Republic of Vietnam (DRV), founded in 1945, still controlled the north and now faced the US-sponsored regime equipped with an up-to-date army and police force (Kiernan 2017, 400–11). For the USA, dividing Vietnam like Korea or Germany was preferable to conceding the entire country to communism. The client frontline regimes could also help contain communism, a task also made easier by the growing Sino-Soviet split (Kolko 1985).

The Democratic Republic of Vietnam (DRV), then isolated from its allies, the USSR and the PRC, which affected to be preoccupied with other matters, ineffectually protested US actions and called for national elections. Soon, however,

it acquired a unique military strength based on the deep and wide political legitimacy it cultivated through its radical land reform. Between 1954 and 1959, an estimated 15,000 landlords were killed and 20,000 imprisoned. The land was distributed to a peasantry organized into cooperatives, increasing agricultural output and strengthening rural solidarity and party and state control. These gains facilitated the conduct of the war between 1960 and 1975 immensely, even enabling industrialization over the next decade with some 200 large and 1000 smaller industrial plants constructed with Chinese and Soviet assistance. Run along the orthodox Soviet lines of one-man management, this industrialization forged a modern industrial proletariat working on the basis of cooperative labor. A comprehensive education system, including university-level scientific and technical training, reinforced the workforce's rising sophistication.

Mass solidarity and revolutionary commitment were, therefore, highly developed well before the American phase of the war in 1965. They also formed the modern educational, technical, and industrial infrastructure for the People's Army of Vietnam (PAVN) as an up-to-date and highly motivated military force capable of directly confronting not only the South Vietnamese army (ARVN) but, ultimately, the US military (Kiernan 2017, 422–30).

By contrast, political oppression and agrarian class struggle exacerbated by the institution of agrovilles or strategic hamlets, i.e., enclosed and guarded compounds of peasants, fomented widespread resistance to Diem in the south. By September 1960, the Lao Dang or Workers (Communist) Party of the DRV had called for full-fledged armed struggle to overthrow of the Diem government and unify Vietnam. By December, opponents of the regime led by Communist Party members created the National Liberation Front (NLF) in a secret meeting in the forests north of Saigon. As cadres flowed from the north, NLF forces began to win important engagements against the ARVN in the spring of 1963 amid growing rural political mobilization and despite stepped-up US military aid (Kiernan 2017, 411–22; Elliott 2003).

Paradoxically, the Sino-Soviet split redounded to the DRV's benefit with the Communist countries competing to lend support and prove their revolutionary commitment. As in the Korean War, moreover, China feared an American attack close to its own border (Mandel 1975; Khoo 2010, 3–42). Kennedy had dispatched 16,000 American advisors before he died in November 1963. They provided Diem's army with military advice, mobility, and firepower. The republic's army moreover began to be deployed more against its own population than the DRV. The problem was that Diem's social base lay in the Catholic minority (10%), and by the Spring of 1963, the repression of the Buddhist majority had already led to such widespread and spectacular demonstrations that Kennedy was forced to oust Diem and deepen US involvement.

Political chaos, upsurge of NLF attacks, and growth of neutralist sentiment ensued after Diem's ouster. Amid popular uprisings and land seizures across the countryside, military officers launched coup after coup in Saigon until General Nguyen Van Thieu stabilized matters through sheer military repression cloaked with a veneer of constitutional government, corruption of the highest ranks of the military, and alliances with the long-standing Chinese and emerging Vietnamese merchant and business classes. By the end of 1965, there were 180,000 American troops in Vietnam, and their number increased to more than 550,000 by 1968, backed by about 2 million more supporting them in neighboring countries or offshore.

Unable to confront massed US power in positional combat, the DRV resorted to a strategy of protracted conflict in which small units aimed to inflict a maximum of casualties and force the dispersal of enemy forces while awaiting a decisive response from the southern populace. This strategy proved effective against the political and military incapacity of the RVN and the ARVN and weakening American resolve and culminated in the famous Tet Offensive. On January 30, 1968, Vietnam's New Year's Day, some 84,000 troops of the NLF and PAVN attacked major southern towns and cities, massively supported by the rural population, while the PAVN stepped up its

offensive against the major American marine base at Khe Sanh close to the DMZ and the Laotian border. There, 6000 marines were besieged by some 40,000 PAVN troops.

The Tet Offensive stunned the Johnson Administration, discredited it politically and fueled the gathering anti-war movement, amplified by the civil rights, black liberation, and student movements. Johnson also had to contend with international dissatisfaction as budget and current account deficits, caused by the combination of runaway spending – on the Great Society domestically and the war abroad – undermined the value of the US dollar (Willbanks 2007). He was forced to abandon plans to send more troops to Vietnam, order the suspension of bombing in the north, and open peace negotiations. He also announced that he would not run for a second term as president leaving Richard Nixon to extract the USA from the Vietnam quagmire through his policies of Vietnamization and rapprochement with the People's Republic of China (Kolko 1985). The DRV won because its fighting capacity remained intact, indeed grew as the Communist regime fought the war not only militarily but politically, keeping their people solidly behind what they considered a just war, while the USA increasingly came up against economic, financial, and political limits.

The Vietnam War reverberated far beyond Indochina. While the protests of the 1960s proved to be a flash in the American pan, in France they fomented a genuinely revolutionary crisis in May 1968 which failed to achieve lasting change despite en masse working class support for the revolutionary general strike only because the Communist Party leadership refused to take charge (Abidor 2018). The French upheaval was echoed worldwide in countries as diverse as Great Britain, West Germany, Mexico, South Korea, Burma, Japan, the Philippines, Ethiopia, South Africa, and Turkey, and in Italy protests began earlier and were more prolonged than in France (Gassert and Klimke 2018; Christiansen and Scarlett 2013). Communist success in Vietnam also inspired Third World intellectuals and peoples to deepen the anti-imperialism of decolonization by confronting the landed and mercantile elites that stood in the way of autonomous and genuine development. Central America became particularly febrile. In Nicaragua, a popular revolutionary front toppled the long-standing dictatorship of Anastasio Somoza in 1978. A low-level, but increasingly well-rooted peasant insurgency re-emerged in Guatemala. In El Salvador, Marxist guerrillas mounted a challenge to the power of the coffee and cotton oligarchy during the 1980s. Unrest exploded even in the Communist world, where challenges to bureaucratic socialism developed in Czechoslovakia and China (Gassert and Klimke 2018).

Defeat in Vietnam handicapped US responses to these Marxist-inspired upheavals, in its "backyard" and farther afield in Guinea-Bissau, Angola, Mozambique, Southern Rhodesia, and even backward Ethiopia. In West Asia, the Marxist People's Democratic Party seized power in Afghanistan in 1978, while Marxist revolutionaries worked to overthrow the US-backed Shah in Iran the following year but lost control to religious revolutionaries riding the same anti-American wave. Inhibited by Vietnam Syndrome, the USA refrained from direct intervention but deployed indirect low-intensity warfare against Third World liberation movements, using counterrevolutionary social and military elements, new military technologies, and economic pressure to contain and tame them (Klare and Kornbluh 1988).

The oil crisis came amid all this. As late as 1968, British and American oil companies controlled nearly 78% of world oil production, about 61% of refining and more than 55% of marketing. However, the 1970s witnessed a wave of nationalizations of oil industries throughout the Third World (Fattouh and Sen 2018, 73–77), and in 1973 even conservative governments in Nigeria and Indonesia joined with radical nationalist regimes such as Libya and Algeria in OPEC to quadruple oil prices and double them again in 1978. It was arguably the most serious blow the Third World dealt to US power.

The USA scrambled to salvage its position. Being a major oil producer and home to major players in the world oil market helped. It rejected proposals to recycle OPEC's oil surpluses through

a multilateral facility to finance oil importers and, instead, persuaded Saudi Arabia and the other OPEC oil states to recycle petrodollars through Western banks. While this launched the long-term trend of financialization, in the short run, desperate to earn interest on funds they had accepted in an era low, even negative, real interest rates, unable to lend in the stagnant West, Western banks went on a lending spree in the Third World and even the Communist world, not only easing the oil crisis but also financing new phases of industrialization with practically free capital.

Saudi Arabia's new found oil money subtly influenced the evolution of the Middle East in a conservative direction favorable to the USA over the next decade, and with the September 1978 Camp David Accords ending the state of war between Israel and Egypt, the erstwhile enemies became allies and US clients.

1981–1991: US Victory?

Whether the West won the Cold War and proved the superiority of capitalism depends on the answer to two questions, those of the economic fate of the West and of why the USSR and the Communist regimes of Eastern Europe fell. They are often lumped together: the latter happened because the West was superior, it is believed. In fact, they are unrelated.

The Fate of Western Capitalism

The Long Downturn of the advanced industrial world had mired it in an unmanageable combination of lowering profits, low growth, employment and wage levels, rising inequality, and a declining dollar since the 1970s. Having spent the 1970s trying to overcome it with the postwar economic policy toolkit amid a resurgence of the left and union militancy, with the Volcker interest rate shock of 1979, Western economies radically changed the direction of economic policy-making to a neoliberal one where not high employment but low inflation was the overriding concern. Neoliberalism won chiefly because its opponents, organized labor, and its political parties proved surprisingly weak.

Zealous neoliberal ministrations, however, failed to revive productive economies but ensured the nearly universal financialization of the advanced capitalist economies which peaked in 2008 and is still with us. Specifically in the USA, Reagan inaugurated his presidency with the massive tax cuts for the rich that still distinguish Republican administrations, deregulation of the economy, attacks on organized labor, renewed Cold War rhetoric justifying what looked like a new arms race but turned out to be little more than massive subsidies to corporations to fund the Strategic Defense or "Star Wars" initiative, and covert support for insurgencies against radical governments in the Third World, from Nicaragua to Afghanistan, which were now added to the usual support for right-wing dictators (Kirkpatrick 1979).

The fate of the Third World in the 1980s and into the 1990s was determined by its debt crisis. The recycling of petrodollars through US banks, rather than through an IMF facility to channel oil surpluses to oil-importing countries in need of finance, flooded Western banks with deposits which they needed to lend to earn interest. Lacking borrowers in the stagnant core capitalist countries and subject to overcompetition in the low real interest rate environment, they went on a competitive lending spree in the Third (and even the Second) World. This lending not only covered the high import costs of many countries but, where conditions were propitious, financed a spate of (usually heavy) industrialization in the Third World. Not the least reason for the Volcker shock was to stem the flow of this practically free capital to the Third World (Desai 2013).

The Volcker Shock worked and, more than anything else, contributed to the appearance of Western triumph in this last phase of the Cold War. The Third World debt crisis erupted with the default of Argentina, Brazil, and Mexico in 1982 and soon ensnared most Third World countries. Faced with a collapsing financial system, the USA and the West responded with bailouts – the term "too big to fail" has its origins here (Ugarteche, forthcoming) – and enlisted the IMF and the World Bank as international bailiffs. Disregarding creditor responsibility, they imposed a particularly regressive burden of the financial crisis on Third World debtors alone, imposing

nearly two "lost decades" of development during which many countries actually registered negative growth. Dependent on imports of foreign oil, expertise, and advanced machinery, many Third World countries had no choice but to accept these economic dictates. OPEC's challenge also seemed to wither. The Iran-Iraq War (1980–1988) proved a means of dividing OPEC countries while strengthening American influence over the Middle East. Reduced demand and new supplies of North Sea, Alaskan, and Russian oil undercut the OPEC monopoly. While the West derived many benefits from laying the Third World low, including declining commodity prices (Patnaik and Patnaik 2016) and declining prices of wage goods produced in the Third World among them, it also paid the price of the accelerated financialization of its economies.

Rather than reviving Western productive economies, neoliberalism financialized them. Financialization was led by the USA and the UK, but by the 1990s, Western Europe has joined the game. Since then, US and Western economies have malingered, capable of little more than bubble-driven growth. By then too, important changes were appearing on the horizon. Having held so much of the Third World in their thrall, the pro-Western biases even more blatantly revealed by their intervention in the 1997–1998 East Asian financial crisis, IMF and World Bank's portfolios began to shrink. The now famous Goldman Sachs prediction about the fast growth of the BRIC economies displacing Western dominance was made. Communist China began giving the West an economic run for its money. India, despite a serious economic crisis in the early 1990s, continued the growth spurt that had begun in the late 1970s. Russia turned its back on the Shock Therapy era, stabilized, and grew robustly under Putin. And many Latin American countries began a new chapter of growth with equity as one by one, left-of-center governments took power in the so-called Pink Tide. Only a few years into the new century, as the 2008 bubble exposed the weaknesses of the West's financialized economic structure, multipolarity, not unipolarity, had become the byword.

Rather than giving the world a "peace dividend," the end of communism in the USSR and

Eastern Europe inaugurated a new era of US unilateralism supplemented by far from enthusiastic support from its Western allies in the form of ragtag coalitions of the willing, beginning with the 1990 Gulf War (Cooper, Higgot, and Nossal) and continuing into US actions in Afghanistan, Iraq, Libya, and elsewhere. Whereas as long as the USSR existed, NATO undertook not a single military intervention, it has been at war almost continuously since, albeit also increasingly incoherently (Desai 2017). However, while, with the USSR gone, at least for a time, the West was less deterred, it was also less capable of reorganizing the world to suit its interests. And by the middle of the 2010s, as Russia's determining involvement in Syria showed, it may no longer be so undeterred.

The Fate of European Communism
The fall of the Soviet Union and the Communist regimes of Eastern Europe are usually attributed to the USSR's economic failures, lack of political illegitimacy, or the stress of Reagan's second Cold War on its weakened economy. While these beliefs contributed much to keeping the left weak, they hold little water.

Rejecting these explanations, Kotz concludes that "the ultimate explanation for the surprisingly sudden and peaceful demise of the Soviet system was that it was abandoned by most of its own elite whose material and ideological ties to any form of socialism had grown weaker and weaker as the Soviet system evolved. It was a revolution from above" (Kotz 1997, 6). It occurred when an attempt to reform the Soviet system into a more efficient and freer society was derailed into a capitalist restoration by a section of the leadership that had lost its commitment to any form of socialism. Once it happened, however, it became irreversible. Contrary to those who had considered communism a "graveyard of nationalities," Gorbachev conceded the end of Communist rule in Eastern Europe with surprising ease and the USSR itself disintegrated into its component *national* units, revealing communism as something of a nursery of nationalities instead (on this matter, see Suny 1993; Martin 2001).

Polish Solidarity

The need for reform first asserted itself in the eastern periphery of the Communist Bloc.

For 12 years after the Prague Spring was suppressed, Eastern Europe had remained politically quiescent. With Comecon working to supply Eastern Europe's industrial economies with oil, they performed well, better than the stagflating West. Poland first disturbed this calm. Having borrowed from Western banks in the 1970s to finance a failed export drive, its debts mounted, its standard of living fell precipitously, and, beginning in the summer of 1980, factory occupations began. Under the leadership of Lech Walesa of Gdansk's Lenin Shipyards, a new national union, Solidarity, was formed, winning the support of dissident intellectuals and grassroots communists. Its growing following forced the Party to recognize its legality and the Party lost its monopoly of power. As the Party and Solidarity jockeyed for position, General Wojciech Jaruzelski's military asserted itself, promising order and defense of Polish sovereignty against any Soviet invasion. In February 1981 he became prime minister and first Secretary of the Communist Party, and by December he had imposed martial law (Kowalik 2011).

While matters in other Eastern European states were less dramatic, symptoms of economic stagnation and a loss of political will abounded. Matters now hung on developments in the USSR.

Soviet Problems

The long Brezhnev era (1964–1982) had delivered stability, a degree of prosperity and international respect as the Soviet bureaucracy, having ended Khrushchev's frequent political reorganizations and threats to bureaucratic tenure, settled down to a reformed Stalinism, softening police terror and the cult of personality. Soviet citizens were modestly affluent – with high education and urbanization levels, plentiful housing and consumer durables, job security, free medical care, education, and generous social welfare. They could take moral satisfaction in the greater degree of equality and economic and personal security in the Soviet Union over the West.

Internationally the USSR pursued strategic parity with the USA, peaceful coexistence, and Soviet predominance over China in the developing world. Parity in long-range nuclear forces had been achieved by the end of the 1960s. The USSR had also become a naval power with its permanent naval fleets in the Mediterranean and Indian Oceans. Exploiting differences within the Western alliance, the USSR also drew closer to de Gaulle's France and Brandt's West Germany, eventually forcing détente on the USA, concluding the ABM and SALT I Treaties in 1971 and the SALT II Treaty and Helsinki Accords in 1975. Internationally, notwithstanding the setback of the Chinese rapprochement with the USA and the loss or Egypt, Soviet confidence was also measured through its direct and indirect aid to Cuba and national liberation and revolutionary movements in Nicaragua, South Africa, Ethiopia, Angola, and Afghanistan.

However, by the 1980s, matters were made difficult, not by Reagan's tough rhetoric, which merely served to justify his military Schumpetarianism (Desai 2013, 171), but because growth slowed as extensive growth based on centralized marshaling of surpluses of labor and resources was exhausted. Further growth required more intensive use of these factors through technological improvements, a more efficient organization of production, and more effective allocation of resources between economic sectors, and this required reforming Soviet planning, with its inefficient allocation, obsession with quantitative growth, especially in heavy industry, and lack of feedback loops (Clarke 1996). However, the Party had atrophied under Brezhnev. Position and privilege were dispensed through patron-client networks. Corruption, complacency, and intellectual stultification crippled political and technological innovation. While the need for reform was clear by the 1980s, it was by no means necessary to return to capitalism. That outcome was a veritable trahison des clercs at the top of Soviet society (Cohen 2009).

Gorbachev took power from the second of Brezhnev's two short-lived successors in 1984. Leading a reform faction, he initiated *perestroika*, economic restructuring, with bold opening

moves: sweeping personnel changes, dramatically higher production targets, quality controls, higher performance and discipline standards, and a nationwide anti-alcohol campaign. Gorbachev aimed for a sort of market socialism combined with managerial and worker autonomy, cooperatives, small private businesses, and family farming on leased land. When Soviet bureaucracy resisted, Gorbachev mobilized public opinion as a counter. This was *glasnost:* greater openness in public life, more access to information, freedom of expression, press freedom, media, and cultural freedom.

Internationally, Gorbachev met Reagan's empty bellicosity by calling for the humanization of international relations amid growing international interdependence and backed it up with concrete actions: declaring a moratorium on deploying SS-20 intercontinental ballistic missiles, unilaterally suspending underground nuclear testing and meeting with Reagan in 1985, renouncing the arms race with a new military doctrine of reasonable sufficiency instead of parity and eliminating intermediate-range nuclear missiles in 1986, withdrawing Soviet forces from Afghanistan and abandoning the Brezhnev doctrine enjoining defense of socialism in allied countries in 1988, and unilaterally cutting Soviet military expenditures and troop levels in 1989. Soviet foreign policy statements no longer spoke of supporting national liberation movements, but of comprehensive systems of international security. States such as Angola and Nicaragua were left to their own devices.

So far so good. Then came Gorbachev's most fateful decision: permitting organizations outside Party control in 1986. Among the many that mushroomed were liberal and nationalist groups. Now the reform process began careening out of control. As planning broke down without markets replacing it, hoarding, scarcity, and inflation became serious. Growth, which had spurted to 4% in 1986, fell to less than two in the next 3 years. Officials became increasingly obstructive. To top it all, democratic elections to broaden support for reform produced a Congress of People's Deputies that became a cockpit for rivalries between so-called conservatives and emergent liberal and nationalist factions. Their struggles led to the end of the Soviet system (Cohen 2009). The liberal leader, Boris Yeltsin, had fallen out with Gorbachev in 1987, and he now united party leaders, intelligentsia, and elements of the underground economy who championed a rapid capitalist transformation based on liberal ideology with considerable encouragement from the West. At the same time, popular revolutions in Eastern Europe, many inspired by Gorbachev's initiatives, overthrew Communist regimes aided by divisions in the USSR.

The Cold War That Never Went Away

That was the so-called end of the so-called Cold War. Thanks to the first revolution against capitalism and imperialism taking place on the periphery of Europe, imperialism, already on the decline with the onset of the 30 Years' Crisis, took the form of the Cold War, entering a peculiarly European- and Western-centric phase. Despite the obscene destruction it has wreaked on the Third World in its attempt to impose complementary subordination, the scorecard since 1914 is filled with US and Western defeats and anti-imperialist advance, including successes at advancing the anti-imperialist project of achieving similarity of economic structure and strength.

The Cold War does not end in a "unipolar" world where capitalist societies are the only model for the world and where the world enjoys a peace dividend. Instead, by issuing to a New Cold War, it has sunk back as a mere chapter of the longer struggle between imperialism and anti-imperialism. The struggle is not completed but has certainly advanced further. As core capitalist economies malinger, they lose economic position, principally to China but also fast-growing Third World countries. Western inability to control events in the rest of the world is increasingly apparent as it reacts to these developments with more fits of wildly destructive but still largely impotent rage. The underlying motive for imperialism – preserving complementarity between the West and the rest – has not disappeared; only the resources of the west in pursuing it have

dwindled, and those of the rest in resisting it and achieving similarity instead have grown. This accounts for both the continuities of the Cold War with the stronger imperialism that went before and the weaker one that persists today. So we close our account of the Cold War with an inventory of the key factors making for the 1990s view that the Cold War had ended with a Western victory.

First and foremost, there was the sheer profundity of the crisis of the 1970s. The West's mere survival in its throes – defeat in Vietnam, ailing Western economies, a fracturing world economy, rising socialist and nationalist tendencies worldwide, and increasing divisions in the Western camp and domestic strife – was taken for a victory and given that it emerged from it under the leadership of an assertive right-wing capitalist leadership conveyed a certain capitalist triumphalism. However, both economically and militarily, the decades since demonstrated how vain its efforts to revive capitalism were, indeed, how perverse.

Secondly, disengagement from Vietnam was key. It had proved deeply destabilizing, producing the upheavals of the 1960s and the loss of confidence of the 1970s. Like wars before it, the Vietnam War produced revolutionary conditions, changing lives, mobilizing populations, and transforming consciousness in unexpected and radical ways. Nixon's step-by-step withdrawal from Vietnam was crucial to stabilizing American society and dampening down, if not extinguishing, unrest abroad. When in the decade after defeat in Vietnam, the Reagan administration appeared to score victories against the left in tiny states such as Nicaragua and Grenada, and against a disintegrating USSR, US and Western confidence was further boosted.

There was, thirdly, the weakness of the left. Its importance cannot be overemphasized. Internationally, the Sino-Soviet split had been an unexpected boon to the capitalist West. Open antagonism between Communist powers weakened communist and radical nationalist forces worldwide, and US diplomacy could pit them against one another politically and militarily. Meanwhile in the West, the power of reformist and bureaucratic Communist parties and unions, internal divisions within social democracy, and

New Left's lack of discipline disarmed revolutionary mass movements while also conceding victory to the forces of the New Right domestically.

Finally, neoliberalism appeared to many to have restored capitalism and restored it on capital's terms, rescuing it from its postwar bondage to labor domestically and to the Third World internationally. As the 1980s and 1990s wore on, capitalist governments appeared to impose one burden after another on working people and poor countries. It was only at the close of the century that the reality of the West's bubble-driven, financial crisis-prone neoliberal pattern of growth became clear and was spectacularly confirmed in the 2008 financial crisis. The victory of capitalists cannot necessarily ensure the health or longevity of capitalism.

Cold War and Latin America

Aldo Marchesi
Facultad de Humanidades y Ciencias de la Educación, Universidad de la Republica (Uruguay), Montevideo, Uruguay

Introduction: The Historical Background of US Imperialism in Latin America

In 1935, the US jurist James Brown Scott (1935) noted that Simón Bolívar was the leading precursor of the integration of the territory of the Americas from north to south, and he further suggested that Bolívar was the more obvious inspiration for the Pan-American conferences that had been held thus far. In the beginning of the twenty-first century, Commander Hugo Chavez pointed to Bolivarianism as the main source for his anti-imperialist policy, which he sought to spread across the continent, and he linked Bolívar to previous anti-imperialist experiences in the twentieth century. These two examples show the tension between two different ideas used to conceptualize the territory of the Americas: Pan-Americanism and Latin Americanism (Grandin 2012; Ardao 1980; Mignolo 2010). During the twentieth century, these two notions were intricately linked to the imperialism/anti-imperialism dichotomy.

Although the Cold War played a key role in the global construction of the US empire (Stephanson 2005; Arrighi 2010), relations between the United States and Latin America were shaped by a prior history that provided a historical framework and a particular political vocabulary. Dating back to the beginning of the nineteenth century, there was a Pan-American discourse that asserted the republican nature of states, criticized Europe's old imperial tradition, and, starting in the middle of the century, overshadowed any emerging differences, as well as the interventionist policies deployed by the United States in Central America and the Caribbean. On the other hand, the late nineteenth century saw the rise of an anti-imperialism current that focused on questioning the increasing cultural, economic, and political presence of the United States in the region. The essay *Ariel* by the Uruguayan writer José Enrique Rodó and *Nuestra América* (*Our America*) by the Cuban José Martí are two early examples that had a strong influence in that wave of anti-imperialism. This criticism in Latin America was linked to the emergence of new forms of popular Latin Americanism that impacted a generation of activists and intellectuals, such as José Carlos Mariátegui, Carlos Haya de la Torre, José Vasconcelos, and Julio Antonio Mella, in the first decades of the twentieth century. With their affinity to radical republicanism, these new revolutionary movements – such as the Mexican Revolution, the APRA (American Popular Revolutionary Alliance) in Peru, and the university reform movement in Córdoba, Argentina – questioned the growing role of the United States in Latin-American politics, which was consistently counterrevolutionary, and its links to the oligarchic republican order that these movements sought to transform.

With this background in mind, I will review the ways in which both concepts were used during the

Cold War in Latin America and the United States. By studying the various political and intellectual actors and analyzing certain events, I will attempt to reconstruct the political language of this period, with the aim of understanding the different ways in which US imperialism was imposed, legitimized, negotiated, and resisted. To do that, I will trace the diverse uses of the concepts of Pan-Americanism and Latin Americanism throughout the period.

The Multiple Faces of Pan-Americanism

Pan-Americanism emerged with some force in the context of the post-World War II years. Franklin Delano Roosevelt's Good Neighbor policy during the war, along with the transformations of the so-called Democratic Spring that enabled the restoration of democracy, the legalization of the political activity of leftwing parties and unions, and the promotion of social rights, created a climate in which a closer relationship between the United States and Latin America seemed possible. However, in the 1950s, an agreement similar to the one forged between Europe's social democracy and the United States would prove unfeasible. The social reforms that began in the post-World War era under what was known as the Democratic Spring were soon abandoned in 1948 in the wake of a conservative reaction backed by the United States as the Cold War advanced (Bethell and Roxborough 1997; Grandin 2004).

The United States furthered an institutional arrangement that had already been tested in the Pan-American conferences, but which was now reconceptualized through the free west/totalitarian east dichotomy touted by the imperial power. The establishment of the Organization of American States (OAS) entailed the gradual abandonment of a certain social progressiveness associated with political republicanism. Defending freedom against the communist threat became the increasingly prevalent discourse, delivered in a belligerent rhetoric. The treaty of nations that created the OAS was preceded by a military agreement. The Inter-American Treaty of Reciprocal Assistance (TIAR), signed in 1947, stipulated that in the

event of an attack by a foreign power, the contracting parties had to act together to defend the country under attack. While theoretically the treaty called for reciprocity, it was in fact a subtle way of aligning the Latin-American nations with the United States in the Cold War (Morgenfeld 2010).

In 1948, the Charter that created the Organization of American States defined the continent's identity as follows: "Confident that the true significance of American solidarity and good neighborliness can only mean the consolidation on this continent, within the framework of democratic institutions, of a system of individual liberty and social justice based on respect for the essential rights of man." However, as this Charter was being signed in Bogotá, liberal political leader Jorge Gaitán was being assassinated. Because of Gaitán's popularity and the expectations of social reform raised by his candidacy, his death sparked popular outrage. The strong reaction that followed was brutally squashed by the Colombian government, which was quick to justify its actions with claims that it was cracking down on communist-backed protests, drawing on the new discourse legitimized by the OAS.

In terms of the economy, the new world order marked by the Bretton Woods accords sets a scenario in which the centrality of the United States limited the chances that Latin-American countries had of aligning themselves with other powers. In the new global institutional arrangement, linked to the new economic order (International Monetary Fund, World Bank), the United States had significant influential power, which it used to further some of its policies in the region (Marichal 2008). In the 1950s, it worked to secure trade agreements aimed at opening up national economies to obtain complementarities and promote US investment in the continent's industries. While the United States advocated economic liberalization, it paradoxically refused to open up its own agriculture, textile industry, and other areas of its economy. Despite complaints that were aggravated as raw material prices fell and demands for greater cooperation increased, mirroring the situation in Europe with the Marshall Plan, several Latin-American politicians showed an interest

in promoting such agreements. Operation Pan-America, an economic development program proposed by Brazilian President Juscelino Kubitschek, is a clear example of the expectations raised by the possibility of a Pan-American development (Ioris 2014).

In the 1950s, there was still a space in Latin America for Pan-Americanism that focused on advocating freedom and enjoyed a measure of influence among progressive sectors. Patrick Iber (2015) has studied the meeting of intellectuals from various backgrounds – including Spanish republicans, Trotskyists, and members of the first generation of Latin-American organizations such as APRA, or intellectuals connected with the Mexican Revolution – convened by what was known as the Congress for Cultural Freedom (CCF), an organization financed by the CIA as part of the Cold War's cultural battle (Iber 2015). These encounters happened in a historical moment in which the communist block also began to develop its own cultural diplomacy, which gained a certain measure of influence in the region (Zourek 2013).

However, as soon as it was evident that US foreign policy was willing to sacrifice freedom in the fight against communism, this form of Pan-American identity grounded on republican values began to lose its appeal. Iber recalls Julián Gorkin's dismay at learning that most of the intellectuals participating in the CCF refused to sign a declaration in support of Colonel Carlos Castillo Armas, who had toppled the constitutionally elected president of Guatemala, Jacobo Arbenz, through a military invasion organized by the CIA.

In addition to that liberal disposition in the humanities, which found common ground in the idea of freedom expressed in the CCF, there was also a concern for economic prosperity. This was channeled primarily through a sociology and an economics of modernization that sought to build a cannon for economic and social development in Latin America based on the US experience. The work most clearly representative of this view was Walt Whitman Rostow's *The Stages of Economic Growth: A Non-Communist Manifesto*, which provided the rationale for a number of

international cooperation projects for the modernization of the Third World (Latham 2000).

Pan-Americanism had one last moment of vitality in the early 1960s. After the Cuban Revolution, the Alliance for Progress emerged as the last Pan-Americanist project that found echo in Latin-American reformist sectors. In his inaugural address, John F. Kennedy spoke of a revolution in freedom and tried to reconnect with the demands of the peoples of Latin America and with the identification of the republics as generators of liberty and prosperity.

> This political freedom must be accompanied by social change. For unless necessary social reforms, including land and tax reform, are freely made—unless we broaden the opportunity for all of our people—unless the great mass of Americans share in increasing prosperity—then our alliance, our revolution, our dream, and our freedom will fail. But we call for social change by free men—change in the spirit of Washington and Jefferson, of Bolívar and San Martín and Martí—not change which seeks to impose on men tyrannies which we cast out a century and a half ago. Our motto is what it has always been—progress yes, tyranny no—*Progreso sí, tiranía no!*

It was a fleeting vitality, however, as the program met with resistance in the United States and, shortly after, Kennedy was assassinated. Following Kennedy's death, Pan-Americanist policies revealed their limitations and their primarily rhetorical nature. The United States advocated economic liberalization but refused to open up its economy in areas that were of interest to the countries of Latin America. In politics, it defended liberal democracy, but since the late 1940s, with the argument of combating a communist threat, it had begun justifying multiple dictatorships that halted the social reforms that were furthered by progressive sectors from a range of ideological backgrounds. On the intellectual front, it championed the idea of a universalist scheme for modernization, but it was arguing more and more that modernization needed to be developed through political paths that were different from those taken by western countries. Paradoxically, the United States stopped using the term "America" and replaced it with "the west," thus conceptually locating Latin America in a place different from

the one it had supposedly been granted under Pan-Americanism. Once again the idea of US exceptionalism puts Latin-American countries at a distance, using metaphors that referred to their immaturity and were similar to those used in earlier times.

Moreover, the double standard of its foreign policy was laid bare in the contrast between, on the one hand, a rhetoric that focused on a strongly held political morality regarding liberal democracy and, on the other, the "realistic" implementation of that foreign policy through covert CIA operations and the backing of dictatorships. Operation PBSUCCESS, carried out to overthrow the democratic government of Guatemala, was one of the most representative examples of that double standard, and it made an enormous impact on Latin-American public opinion, prompting a major shift in attitudes toward the United States, which helps understand the growing anti-imperialism that emerged in the 1960s.

Samuel Huntington's book *Political Order in Changing Societies* reflects a post-Alliance for Progress moment in which US policy assumed that the notion of modernization did not allow for a similar process in the countries of the periphery and in which it systematically justified the need for authoritarian governments in order to ensure the process of capitalist modernization. This assumption coincided with the US military's growing influence on the armed forces of Latin America. French and US counterinsurgency tactics, the concept of national security put forward by the United States in the context of the Cold War, and a greater regional integration of the armed forces through the OAS system gradually shaped a particular ideology within the military that would be known as the National Security Doctrine. This doctrine, which was spread through various institutions – such as the School of the Americas in Panama or Brazil's Superior War School – proposed a radical transformation of the armed forces that involved reformulating the traditional task of national armies (Gill 2004; Loveman and Davies 1978).

This change entailed abandoning the traditional objective of the military, which was the defense of national borders, to concentrate instead on the defense of "ideological borders." The aim was to stop any form of socialism in Latin America. For the military, the war against communism – which had its own territories (the USSR, Cuba), but was also seen as infiltrating national societies – entailed reformulating its tasks, changing its practices, and taking over the state in order to guarantee a development and capitalist modernization that would reduce the risk of communism. This doctrine was used to justify the wave of military dictatorships that spread across the region with foundational aspirations, as well as the growing levels of state violence that had already begun in the late 1950s. This process fueled a fundamentalist sentiment among Latin-American military officers, who saw themselves as championing an anticommunist crusade. In that crusade, the notion of Pan-Americanism was overshadowed by the defense of Western Christian Civilization against the communist threat. In the late 1970s, as the Jimmy Carter administration expressed concern over human rights violations committed by South American dictatorships, the region's armed forces criticized the United States for its weakness in combating communism and in some international forums they positioned themselves in the frontlines of the war against communism (Dinges 2005; Armony 1997; Rabe 2012).

The ambiguous policy of the Carter administration, which criticized South American dictatorships while at the same time promoting or allowing massacres to occur in Guatemala and El Salvador, was an interlude that ended when the National Security Doctrine and the new US right came together under the Ronald Reagan administration. The aggressive policy of military intervention in Central America, which represented a great leap with respect to previous decades, and the religious discourse of the new US right, strengthened the anticommunist crusade spirit that limited the idea of a republican Pan-Americanism and justified the systematic perpetration of human rights abuses by the states. Moreover, this period saw a boost in the neoliberal reforms that had already been tested by the Chilean dictatorship through the collaboration of military officers and technocrats connected with the Chicago school.

In their book *When States Kill*, Nestor Rodríguez and Cecilia Menjívar argue that in the context of the Latin-American Cold War, US imperialism involved the development of a new mode of violence and of "different forms of terror, including torture and physical punishment, not in a primitive or 'traditional' manner, but in a politically rational, calculated, modern fashion" carried out by interstate regimes (Latin America-US). While this interstate effort furthered the geopolitical designs of the United States, it also favored the interests of local oligarchic elites and conservative sectors. Terror was used as a weapon against specific enemies, but it also served a disciplinary purpose in Latin-American societies. While a definitive quantification of this interstate violence has yet to be written, the number of individuals killed through political assassinations, massacres, and disappearances clearly runs into the hundreds of thousands. And generally speaking, with the exception of Colombia and Peru, the violence perpetrated by civilians was not even a tenth of the crimes committed by the state. And that does not include the mass incarceration systems and widespread systematic torturing that affected significant sectors of the population. This interstate violence can perhaps be identified as one of the leading legacies of US imperialism in the context of the Cold War.

Anti-imperialism and Latin Americanism

A Latin Americanism that antagonizes the monster of the north, in the words of José Martí, or goes against the Anglo-Saxon utilitarian tradition, as expressed by the elusive José Enrique Rodó, is the intellectual precursor of a political generation that came of age in the 1920s and 1930s and began forging an anti-imperialist identity that was close to popular sectors and distanced itself from what the urban elites first proposed in this sense in the second half of the nineteenth century. (José Martí, Carta inconclusa a Manuel Mercado, 2003) These movements had contradictory tendencies. There were even conservative streaks associated with a spiritualist tradition. But what seems to have prevailed in all of these movements was a radical republicanism that questioned the liberal republican model and asserted the role of popular sectors – and in some cases even indigenous and black sectors – in the construction of the state. In several places, this popular republicanism, together with a growing economic nationalism that emerged during this period, challenged US policies that favored local oligarchies and protected its economic investments. Roosevelt's Good Neighbor policy, however, with its limited interventions and its social reformism, had served to temper that anti-imperialist thrust. (See Samuel Moyn on the 1945 Chapultepec declaration and social reformers in connection with the idea of human rights.)

These initial forms of anti-imperialism were also questioned by the ideological order of the Cold War. Several of these groups that embraced republican traditions and were firm supporters of the idea of national sovereignty marked their distance with the socialist model in the Eastern Bloc that emerged in the postwar era. Many anti-imperialist movements adopted a third position in the Cold War conflict. Developing an anti-imperialism that appeared as an alternative to the Western imperial capitalism led by the United States and to the state-centered socialism of the post-1956 Soviet Union was appealing to many sectors of the Latin American left from the 1930s through the 1950s. Major Latin-American socialist sectors that had moved away from Europe's social democracy were drawn to that alternative stance and in the 1950s increased their support for the Non-Aligned Movement, the People's Republic of China, Yugoslavia, and with the Third-World movement (Drake 1978). There were also intellectual movements that sought to reconcile the European Marxist tradition with the popular republican struggles of the nineteenth century. These groups questioned the markedly Eurocentric nature of the urban internationalist lefts of the first half of the century, their connection with working and middle-class sectors of European descent in the cities, and their disregard of rural popular sectors, which were in many cases indigenous. For example, in Argentina, a group known as the National Left and initially formed by Trotskyist intellectuals, drew on the law of uneven

and combined development of capitalism and called for an emancipating relationship, rethinking the history of rural popular struggles in the nineteenth century in terms of contemporary national liberation movements. These movements' stance toward the United States was complex. While they were for the most part critical, there was a certain degree of ambiguity during the Good Neighbor policy years and the initial period of the Cold War. Several of them participated in a number of initiatives promoted by the United States, such as the CCF.

This moderate anti-imperialism can also be found in economic thinking. In 1949, Argentine economist Raúl Prebisch published *The Economic Development of Latin America and its Principal Problems*, which became a foundational manifesto of sorts of the Economic Commission for Latin America (ECLAC). This United Nations agency recognized the specificity of the subcontinent and called for the implementation of protectionist Keynesian policies to develop the region's economy (Dosman 2008). While written in a technocratic style, the ideas put forward in the text, together with the establishment of ECLAC, had a major political dimension. Ultimately, it challenged the idea that there was a single criterion for modernization and suggested that the subcontinent's path to economic development differed from that of its counterpart in the north. However, that did not mean that ECLAC proponents could not coexist with modernization theorists and even reach agreements with them. Prebisch participated in the Alliance for Progress because he believed it promoted a series of reforms that were in line with ECLAC's agenda.

By the mid-1960s, moderate anti-imperialism had run out of steam. As noted above, US policies were met with growing discontent in Latin America. That sentiment was expressed through a wave of critical protests sparked all over the continent by the coup d'état that toppled the democratic government of Jacobo Arbenz in Guatemala in 1954 (Gleijeses 1992).

In general, Latin-American Cold War periodizations have pointed to US intervention in Guatemala as a moment in which the United States increased its promotion of authoritarianism

and stepped up its anti-communism in the region (Grandin 2004; Bethell and Roxborough 1997). The region's democratic governments also questioned the restrictions placed on Latin-American commodity exports to the US market and the lack of US cooperation for development plans, demanding a "Marshall Plan" for Latin America. This discontent was evident when US Vice President Richard Nixon toured South America in 1958. In some countries, he even feared for his safety due to the mass – and in some cases violent – demonstrations that were staged throughout his visit. Criticism touched on a number of factors, ranging from US support for dictators and the pressure placed on governments to privilege US investments in the continent. The logic behind the criticism reiterated the idea that the United States was again countering the processes of social reform that were being attempted in different parts of the continent. The hostility and dismissal of the United States against Latin Americans created a leitmotif of mistrust and disdain for the United States in the region in the 1950s that preceded the Cuban Revolution.

In 1961, at the conference in Punta del Este that launched the Alliance for Progress, Ernesto Guevara, in representation of revolutionary Cuba, referred with irony to its initial document:

> According to [the document], a 'new stage is beginning in the relations between the peoples of the Americas.' And it's true. Except that the new stage begins under the star of Cuba, free territory of the Americas. And this conference, and the special treatment that the delegations have received, and the credits that may be granted, all bear Cuba's name, whether the beneficiaries like it or not. Because a qualitative change has taken place in the Americas: a country can now take up arms, destroy an oppressing army, form a new popular army, stand up to the invincible monster, wait for the monster's attack, and then defeat it.And this is something new in Latin America, gentlemen; and it is what makes this new language possible and what makes relations easier between everyone—except, of course, between the two great rivals of this conference. (Guevara 1961)

The Cuban Revolution, and Cuba's rapid withdrawal from the sphere of influence of the United States after the Bay of Pigs Invasion and the missile crisis, created a radically new geopolitical

scenario where escaping US hegemony emerged as a real possibility. The need to move away from that hegemony was not born out of anti-Americanism. Rather it was prompted by the confirmation of the reactionary or counterrevolutionary nature of US foreign policy; as in most cases, it appeared more attuned to the interests of local conservative elites than to those of the promoters of social reform. In order to carry out social reforms, it was therefore necessary to leave the US's sphere of influence.

Although the 1964 victory of Christian Democracy in Chile and its "revolution in freedom" discourse might suggest that the idea of a reformist Pan-Americanism was still alive, a coup d'état that same year in Brazil and the series of military dictatorships it kicked off revealed the tone of US foreign policy and the impossibility of implementing social reforms under the auspices of the United States. It was in that context that Cuba's influence grew. That influence did not just translate into the rural guerrilla *foquismo* efforts, which were ultimately short-lived. Cuba also made it possible for a range of political movements to expand – from left-wing armed organizations and progressive military groups to Liberation Theology Christians, left-wing populists, and left-wing electoral coalitions. Inspired by the Cuban Revolution, these movements found common ground in a strong anti-imperialist discourse and realized that in order to carry out social reforms it was necessary to come out from under the hegemony of the United States. In 1973, a Chilean leftist magazine spoke of a Santiago–Buenos Aires–Lima–Havana axis. The agendas furthered by the governments of these countries shared the same anti-imperialist policy (Harmer 2014). However, the duration of that axis was brief.

The Soviet Union's influence over the anti-imperialist movement in Latin America was limited. Some researchers are beginning to study the ways in which the Soviet bloc influenced these movements, but findings thus far show that most of the funding and support provided had to adapt to preexisting networks and that criticism of US imperialism was not necessarily accompanied by a positive stance toward the Soviet Union

(Rupprecht 2015; Pedemonte 2015). In 1967, Ernesto Che Guevara penned his famous and emblematic message to the Tricontinental Conference, where he declared: "Our every action is a battle cry against imperialism and a clamoring for the unity of all peoples against the great enemy of the human race: the United States of America." The role of the Soviet bloc in that anti-imperialist struggle was secondary, and the focus was placed on the peoples of the Third World.

Nonetheless, in the aftermath of the Cuban Revolution and the US support of the Cuban exiles, and especially the embargo, the government had no choice but to increase trade with the Soviet Union. The US isolation of Cuba through the blockade increased the influence of the Soviet Union in Cuba and opposition to US imperialism and intervention. In the 1970s, the Cuban economy began to develop greater self-reliance and particular socialist forms inspired by the Soviet Union model of socialism.

This political anti-imperialism suffered under the pro-US authoritarian onslaught of the 1970s and 1980s. But it reemerged in new political forms during the progressive cycle of the 1990s–2010s with the reappearance of center-left and leftist governments. Commonly known as the Pink Tide, it entailed a revival of certain Latin-Americanist ideas that was expressed in the development of Latin-American international organizations such as UNASUR (Union of South American Nations) and ALBA (Bolivarian Alliance for the Peoples of Our America). In political terms, there were various approaches to US imperialism. While Venezuela's Chavismo brought back the anti-imperialist narrative of the Cold War, after achieving power, others, such as the Brazilian Partido dos Trabalhadores (PT, or Workers' Party), initially leaned toward a multilateral stance and later sought to establish good relations with the Barack Obama administration.

The anti-imperialism of the 1960s was not just political. Very early on, it spawned various academic and intellectual expressions in North America and Latin America, giving rise, in both hemispheres, to a new intellectual and political left. The Cuban Revolution strongly influenced the denunciation of US foreign policy within the

United States. Already in 1960, the prominent sociologist and Columbia University professor Charles Wright Mills published *Listen, Yankee*, a critique of US foreign policy (Rojas 2014). Marxist economists such as Paul Baran, Paul Sweezy, and Leo Huberman started to rethink traditional notions of empire in light of capitalist transformations. Their reflections were clearly in dialogue with the political events unfolding in Cuba. In 1959, William Appleman Williams wrote *The Tragedy of American Diplomacy*, thus paving the way for a revisionist trend in US foreign policy studies, which applied the category of empire and looked at economic processes toward understanding the rationale behind US foreign policy. In 1967, after failing to find reliable information on US policies in the region, a group of university students formed the nonprofit organization NACLA (North American Congress in Latin America) with the aim of denouncing imperialist policies and conducting solidarity campaigns to support various political and social movements in Latin America. Besides these movements, which were for the most part connected with universities, in the United States, the Cuban Revolution also had a profound impact on the ideas of the black movement with respect to the imperial dimension of the construction of the American state (NACLA 2017).

In Latin America, the events of the 1960s also fostered a more systematic reflection on the phenomenon of US imperialism. During that decade, a growing literature produced by intellectuals, journalists, and political leaders took on the task of conceptualizing the role of the United States in the twentieth century. That literature drew on the legacy of intellectuals of previous generations and anti-imperialist struggles, but it also incorporated the debate that was underway in the new left in the United States (Trías 1977; Selser 1974).

In the mid-1960s, these reflections took on a more theoretical dimension with the dependency theory, a new school of thought that emerged within the field of economic sociology. This school combined aspects of ECLAC's developmentalism with Trotskyist influences and, in some cases, the historical revisionism of left-wing nationalist groups of the previous

decades. The result was a sharp criticism of the developmentalist ideas and modernizing proposals put forward by ECLAC and the United States, respectively. According to dependency theory proponents, Latin America's underdevelopment was caused by structural conditions determined by the position occupied by these countries in the world order. They argued that the possibilities of attaining development had more to do with that circumstance than with ensuring the best conditions for productivity, as Prebisch's initial manifesto had suggested. This new theory, conceived primarily by economists and sociologists, challenged the excessively technocratic view of the previous generation, which used only economic variables to explain underdevelopment, without taking into account how the international political order affected the region's conditions for development. Dependency theory proponents instead gave a range of responses to the problem of underdevelopment. For some, such as André Gunder Frank, Theotônio Dos Santos, Vânia Bambirra, and Ruy Mauro Marini, revolution was the only way to overcome underdevelopment. That involved changing the relationship of national states with the world order. For others, such as Fernando Henrique Cardoso and Enzo Faletto, the solution lay in forming new alliances around the state, to further a nondependent development.

Despite their differences, they all shared the view that the international political order was key for understanding the limits of development. They were all also critical of the modernizing discourses that looked at development through a teleological lens, ignoring the historical conditions that had allowed some countries to develop at the expense of the underdevelopment of others. The centrality of the phenomenon of imperialism was evident in these approaches. That centrality provided the starting point for analyzing other social phenomena through the dependency theory. For example, the book *How to Read Donald Duck*, by Ariel Dorfman and Armand Mattelart, was a cultural interpretation of imperialism from a dependency theory approach. The liberation approaches in the fields of pedagogy and theology also drew on certain aspects of this school of thought (Kirkendall 2014). The school also

produced texts that were widely read over the following decades. The clearest manifesto of this school was Eduardo Galeano's book *Las venas abiertas de América Latina* (*Open Veins of Latin America*), where the history of the continent is presented as a succession of imperial dominations, with the conquered moving toward their liberation (Marchesi 2006).

Historiographies of Empire

The earliest examples of historiography on US foreign policy in Latin America can be traced back to the Cold War years. Although Latin America lacked a specific historiography on the subject, a series of dependency theory studies offered a historical narrative for understanding US policy in the continent (González Casanova 1979; Flamarion Santana Cardoso and Pérez Brignoli 1999). The majority of the more contemporary works in the field of history, however, were centered on US bilateral relations with individual countries. While these works incorporated the imperial dimension, their localized focus at times hindered a more general discussion on the relationship between the United States and the continent. In the United States, there has been a more systematic reflection on US presence in the region. Several examples in this sense can be found in the country's historiography throughout the twentieth century (Kroeber 1953). Interest in foreign policy and public policy affairs also fostered a greater production of heuristic materials (archives and libraries), as well as the development of academic fields and experts.

Starting in the 1970s, studies on Latin America began to evidence the influence of the dependency theory and the critique from the new left. In a 1974 review of historical studies on the relationship between the United States and Latin America, Charles Bergquist (1974) warned of the emergence of a new conceptual framework that viewed Latin America as the underdeveloped west. However, most of those works focused not on the Cold War era but on the second half of the nineteenth century and the first half of the twentieth. It was in the 1980s that the first

historical studies on Latin America were published in which the Cold War appeared as a section of US foreign policy from the revisionist approach that had emerged in the 1960s. Walter LaFeber's *Inevitable Revolutions* and Stephen Kinzer's *Bitter Fruit* are representative examples of that moment and of the relationship of such studies with the debates then underway in US society concerning the Ronald Reagan administration's growing interventionism in Central America.

This trend continued to grow in the 1990s, but it was integrated into studies that incorporated political and ideological dimensions and to a certain extent sought to strike a balance between the revisionism of the 1960s and the post-revisionist approaches that focused again on issues connected with foreign policy and the ideology of the Cold War. These dealt primarily with US foreign policy, and while they drew on Latin-American case studies, in heuristic terms, the sources used were predominantly from the United States.

The cultural shift at the end of the decade impacted scholarship on the subject of empire. The book *Close Encounters of Empire* represented a major innovation in the way the category of empire was conceived in the case of the Americas. It proposed a cultural approach for examining imperial relations from a Gramscian perspective. But it also posited the idea of a contact zone for thinking about imperial relations, in an attempt to offer a more complex, non-dichotomous view of the concrete forms in which such relations were processed through the many circulations of people and ideas that interacted in relations with unequal dimensions. While this compilation presented a new agenda for examining the phenomenon of empire, most of the studies featured did not deal with the Cold War. That approach, however, was connected in different ways with studies conducted during that period, such as the work by Eric Zolov or Stefan Rinke.

The twenty-first century began with the attack on the World Trade Center, which created a new global scenario where discussing the imperial dimension of US foreign policy once again

acquired an indisputable centrality. Although in the 1990s, in the context of the post-Cold War, globalization discourses – even those that took a critical view – relativized the imperial force of the national state, the United States' aggressive policy brought the issue back into public and academic discussions.

In the case of US–Latin America relations, the works by Greg Grandin (2004) and Hal Brands (2012) are representative of the way in which the academic debate on this issue unfolded in the United States. Grandin suggested that the history of Latin America in the twentieth century was structured by the dynamic between revolution and counterrevolution and that the role of the United States tended to lean largely on the side of the latter. His work incorporated the revisionist tradition, along with cultural, social, and political aspects, in a history that had integral history aspirations in the manner of Pierre Vilar. In this approach, the Cold War was analyzed from a perspective centered on Latin-American politics in the broadest sense. The concern focused primarily on the ways in which Latin-American popular politics and social reformisms unfolded under a US-controlled Cold War order in the region. Hal Brands instead viewed the conflict in terms of authoritarianism and democracy. In his study, he described the polarization in Latin America as a phenomenon specific to the region, a phenomenon in which the United States had a limited role and to a certain extent was trapped by that dynamic. Brands argued that while it was in the interest of the United States for democracy, stability, and development to flourish in the region, at times, it was caught in the tension between the two extremes. His study could be considered, in a way, a US version of the so-called theory of the two demons that reduces the responsibility for polarization and political violence to ideological extremes. Paradoxically, in this history, the imperial dimension, although acknowledged at times, is downplayed in the more general narrative. The study repeats a traditional argument in US foreign policy, whereby the errors and horrors furthered by the United States are subsumed under noble aims and attributed to mistaken decisions made in the pursuit of

such aims through the implementation of concrete policies.

The two studies present almost opposing ways of interpreting, in a broader sense, the imperial policy of the United States during the Cold War. In addition to these more general approaches to the period in question, more specific lines of research have attempted to cover not only some particular characteristics of imperialism but also the concrete forms of the period's historical anti-imperialisms (Kirkendall 2014). Besides the many studies that have been conducted on national histories, there is an increasing scholarship on the transnational aspects of these imperialist and anti-imperialist dimensions. The compilation *In from the Cold*, in which Gilbert Joseph and others continue the discussion of several of the methodological concerns posed in *Close Encounters*, but incorporating a more political approach, constitutes an example of a particular way of thinking about imperialism and anti-imperialism in the political and cultural history of the Cold War that has become influential for other works (Harmer 2014; Marchesi 2018). Others have also focused on the history of authoritarianism and human rights movements as a form of resistance in which tensions and the multiple ways of conceiving the relations between empire and anti-imperialism also unfold (Markarian 2005; Green 2010).

US imperialism in the Latin-American Cold War marked a moment in the economic, political, and cultural expansion of the United States in the region. As Grandin and others have noted, this imperial expansion occurred in the context of existing political and social conflicts. In this sense, the revolution/counterrevolution dichotomy seems valid as a general paradigm that shaped the gradual imperial ascent in the region. In contrast to what happened in Europe, social reformism initiatives in the style of European social democracy for the most part had little to do with imperial policies, although there were exceptions. The predominant element in US policy was associated with the social and political elites that resisted the initiatives of political democratization when such initiatives were connected with social democratization. The

different anti-imperialisms were specific ways of articulating those demands for democratization. Moreover, the imperial thrust was connected to a greater openness and dependency of Latin-American economies with respect to the US economy, and something similar can be said about culture. In this sense, the Cold War experience consolidated the political, economic, cultural, and military hegemony of the United States in the region. While in the 1930s and 1940s that hegemony appeared to be disputed with other world powers, by the late 1980s, there was no doubt that the area of influence of the United States extended across all of Latin America.

Although old versions that attempt to hold the United States up as the champion of freedom combating the threat of communism resurface cyclically, the most evident balance of the Cold War in Latin America reveals that it left a great number of political massacres furthered by the United States, as well as economic regimes characterized by greater inequality and more closely integrated to the economic hegemony of the United States.

Cold war; Containment; Hegemony; Imperialism; Militarism; Solidarity

Definition

Although the emergence of the US as a global hegemon had roots in national and international conditions prior to the Second World War, that war provided it with the historical opportunity to expand its informal empire globally and establish a de facto global hegemony. Even before the end of the Second World War, the political elites of the

US were envisioning and planning for a post-war global order that would conform to long-standing economic and political imperatives for freer trade and a political order of pro-Western governments and institutions in the developed and colonial world. US global hegemony in the post-war period was not only a consequence of economic, political, and military superiority, but also a reflection of the diffusion of cultural and ideological orientations that advanced US moral and intellectual leadership. On the other hand, competition to US pre-eminence in the post-war period materialised in the form of the Soviet Union and the spectre of communism, especially as an alternative model for economic and social development. Not without its own messianic presumptions and imperial ambitions, the Soviet Union became the spur for a Cold War. In turn, the Cold War provided the US with an ideological cover for the domestic growth of a military-industrial complex and national security state while perpetuating its global hegemony. Under the geopolitical strategy of 'containment,' the US expanded the global reach of its interventions, especially in the post-colonial Third World, while tethering European and other allies, like Japan, to its imperial projects.

Although the emergence of the US as a global hegemon had roots in national and international conditions prior to the Second World War, that war provided it with the historical opportunity to expand its informal empire globally and establish a de facto global hegemony. Even before the end of the Second World War, the political elites of the US were envisioning and planning for a post-war global order that would conform to long-standing economic and political imperatives for freer trade and a political order of pro-Western governments and institutions in the developed and colonial world. Integral to the post-war global order were the economic arrangements promulgated at Bretton Woods in 1944 that established US financial dominance through institutions such as the International Monetary Fund and the World Bank. Additional post-war geopolitical projects were embedded in international and multilateral organisations such as the United Nations and the North Atlantic Treaty Organisation. For more covert imperial operations, the Central Intelligence Agency was developed to foster favourable governments around the world through interventions and regime change, albeit US interventions and regime changes predated the creation of the CIA (Kinzer 2006). US global hegemony in the post-war period was not only a consequence of economic, political, and military superiority, but also a reflection of the diffusion of cultural and ideological orientations that advanced US moral and intellectual leadership. Among those ideological postures was the articulation of the 'American Century'. On the eve of the US entrance into the Second World War, Henry Luce, editor and owner of *Time-Life* magazines, proclaimed the American Century in the pages of *Life*. Luce's vision of the American Century was predicated on the belief that the US had both the natural right and ordained responsibility to wield political and military power as a guarantor of progress and prosperity throughout the world. Accordingly, 'U.S. global dominance was presented as the natural result of historical progress, implicitly the pinnacle of European civilization, rather than the competitive outcome of political-economic power' (Smith 2005, p. 20).

On the other hand, competition to US pre-eminence in the post-war period materialised in the form of the Soviet Union and the spectre of communism, especially as an alternative model for economic and social development. Not without its own messianic presumptions and imperial ambitions, the Soviet Union became the spur for a Cold War. In turn, the Cold War provided the US with an ideological cover for the domestic growth of a military-industrial complex and national security state while perpetuating its global hegemony. Under the geopolitical strategy of 'containment,' the US expanded the global reach of its interventions, especially in the post-colonial Third World, while tethering European and other allies, like Japan, to its imperial projects. As noted by historian Bruce Cumings, 'the Cold War consisted of two systems: the containment project, providing security against both the enemy and ally; and the hegemonic project, providing for American leverage over the necessary resources

of our industrial rivals' (Cumings 1992, pp. 88–89).

Although the Cold War 'officially' ended with the demise of the Soviet Union in 1991, the 1980s witnessed flashpoints of conflict from Central America to the Middle East and from Afghanistan to Southern Africa. As a consequence of the aggressive foreign and military policies of the Reagan Administration, people in those regions were embroiled in 'proxy wars'. Even Europe did not escape the spectre of war, given the placement of nuclear-armed missile systems (McMahon 2003, pp. 143–168; Westad 2007, pp. 331–363). Yet, the transformations in Cold War imperialism, especially around intervention in Central America and nuclear weapons deployments, were not just the result of the decisions by the political elites and external and internal contradictions. Indeed, the active mobilisation by grass-roots campaigns implicitly challenged the legitimacy of Cold War imperialism and hastened its erosion. According to James Carroll (2006, p. 375), 'a groundswell of ordinary people brought the Cold War to a head'. However, as a consequence of how deeply Cold War imperialism was embedded in the politics and policies of post-1945 America, the anti-interventionist and nuclear disarmament campaigns of the 1980s were more often articulated as moral than political critiques, the latter implicit in the former. Therefore, in addition to an analysis of the anti-interventionist protests and projects against US policies in Central America, a comparative perspective will be offered in the instance of the nuclear disarmament campaigns in order to identify the national and ideological constraints that undermined long-term success of the anti-imperialist content of these protests while highlighting their transnational content.

In order to identify the anti-imperialist content of these protests in the 1980s, one needs to consider the transformations in US hegemony up to this period. Following Immanuel Wallerstein's interpretation of the 'Curve of American Power' in the post- 1945 period, one can see how the 1970s were a transformative moment in that hegemony. As a consequence of the defeat in Vietnam, the rise of OPEC, the declining legitimacy of US political systems, and the collapse of

the Bretton Woods system, fissures were created, both domestically and internationally, that opened up new terrains for ideologically driven economic and geopolitical strategies (Wallerstein 2006, pp. 77–94). In addition, the increasing globalisation of capital with its intensification of migrations and expansion of new systems of communication not only led to the reconstitution of imperial projects but also new sites of political engagement and resistance. Linked to what Christopher Chase-Dunn and Barry Gills call the 'globalization of resistance', new forms of grassroots participatory democracy were created that attempted 'to build bridges and solidarities' across national boundaries (Chase-Dunn and Gills 2005, p. 53).

What were the particular social spaces and political sites around which both national and transnational protests coalesced in the 1980s and the means by which they articulated their anti-imperialist critiques vis-à-vis the hegemonic project of US Cold War imperialism in Central America? Certainly, as noted by Odd Arne Westad, 'the Cold War system of domination was superimposed on nineteenth and early twentieth-century trends, especially as far as Central America and the Caribbean are concerned' (2007, p. 143). Beyond the continuities informing US imperial interventions in Central America, 'conservative activists used (Central America) to respond to the crisis of the 1970s, a crisis provoked not only by America's defeat in Vietnam but by a deep economic recession and a culture of skeptical antimilitarism and political dissent that spread in the war's wake' (Grandin 2007, p. 5).

Against this background, and facing insurgencies and revolutions throughout Central America, US policymakers turned to a variety of strategies to suppress and derail those insurgencies and revolutions. Although the Carter Administration tried to forestall the Sandinistas from coming to power in 1979 in Nicaragua, it was the Reagan Administration that committed itself to destroying the potential for the success of the Sandinista revolution. While the key to undermining the Sandinista Government was sponsoring the Contras, a collection of the remnants from Somoza's national guard and other disgruntled

individuals and groups, who, with the encouragement of Reagan operatives, wrecked havoc on the country while murdering and torturing Sandinista supporters, the US also pursued a strategy of influencing civil society in order to support and foster political opposition to the Sandinistas. Forced initially into covert campaigns against the Sandinistas because of active domestic opposition from religious and peace groups and their allies in Congress (who, in 1984, passed legislation prohibiting the funding of the Contras), the Reagan Administration pursued a wide range of activities from economic embargoes to illicit fund raising and arms brokering (embodied in the notorious Iran-Contra networks) to the internationally condemned mining of Nicaraguan harbours. At the same time, under the guise of 'democracy promotion', the Sandinista Government was kept under siege, losing in the process much of its capacity to deliver on its promises. Although the machinations of the Reagan Administration did face resolute opposition by the Sandinistas, its international supporters, and the US-based solidarity networks, such as Witness for Peace (more on these networks below), the Reagan Administration eventually managed to bleed Nicaragua and to alienate its besieged population into abandoning the Sandinista Government.

While the bleeding in Nicaragua, as a consequence of so-called low-intensity conflict, was insidious but steady, the bloodletting in El Salvador and Guatemala was even more evident and massive during the 1980s. In order to stem the growth of guerrilla movements in these two countries, the Reagan Administration relied on supporting authoritarian military regimes and their brutal counter-insurgency operations that, in turn, led to extensive repression and massacres. According to Greg Grandin, 'US allies in Central America during Reagan's two terms killed over 300,000 people, tortured hundreds of thousands, and drove millions into exile' (Grandin 2007, p. 71; on the Salvadoran and Guatemalan massacres, see p. 90 and passim). This violence and repression was rationalised by the Reagan Administration, especially by its UN ambassador Jeanne Kirkpatrick, as essential to demonstrating the political and moral resolve of the US to

contest so-called 'totalitarian' regimes like the Sandinistas, and any insurgent movements in the 'soft underbelly' of US imperial hegemony.

As a consequence of the violence aided and abetted by the Reagan Administration in Central America and its framing of the conflicts in terms of Cold War threats to US hegemony, there rapidly developed solidarity campaigns and anti-interventionist protests. Those protests built upon the extensive networks of Central American migrants and refugees. In particular, Salvadoran and Guatemalan migrants, along with religious and political networks in the US, organised a number of human rights and solidarity groups in the 1980s that addressed the human rights abuses in Central America and the problems encountered by refugees and migrants from these countries. Those organisations included the Committee in Solidarity with the People of El Salvador (CISPES) and the Network in Solidarity with the People of Guatemala (NISGUA). Given their stated solidarity efforts, continuing right-wing hysteria about 'communism', and budding government obsession with 'international terrorism', CISPES and other Central American solidarity activists were subjected to surveillance and even harassment and intimidation.

The fact that the Reagan Administration made Central America a prime target of its foreign policy meant that their framing of the public debates and the mainstream media parroting of Administration claims created an obvious opportunity to challenge and repudiate their ideological assertions (Grandin 2007, pp. 87–158; see also Smith 1996, esp. pp. 18–56). In effect, this protest was as much a consequence of the attempts by the Reagan Administration to set the public agenda as it was a result of the interactions between Central America and the US. It was out of these mobilised networks that key oppositional movements developed around Reagan's Central American policy. In addition to those mentioned above, three specific organisations – Sanctuary, Witness for Peace, and the Pledge of Resistance – mobilised tens of thousands of US citizens who were prepared to transgress whatever legal and/or legislative restrictions the Reagan Administration tried to

impose in order to manifest transnational solidarity.

One of the leaders of Witness for Peace underscored how Reagan's Cold War rhetoric on Nicaragua backfired, especially among those who visited that Central American country as members of Witness for Peace delegations: 'Ronald Reagan made such a big deal about Nicaragua . . ., and it wasn't hard to prove him wrong . . . We just took them down there and they could look around and see it wasn't a 'totalitarian dungeon' . . . We owe him a lot for the strength of the movement (because) his rhetoric was just so infuriating' (Nepstad 2004, p. 121). Another anti-interventionist and solidarity activist affirmed the power of visiting Nicaragua and observing how conditions there challenged the rhetoric and policies of the Reagan Administration: 'Nicaragua became the prime foreign policy obsession of the Reagan people and it was close enough that loads of people could go there and see for themselves. Ninety-nine percent of them came back disillusioned with the Reagan stance' (Nepstad 2004, p. 124). That disillusionment translated into both a discursive and action critique of Reagan's policies in Central America, implicitly and explicitly understood as functions of US imperialism.

As a consequence of the activities and protests of organisations like Witness for Peace, religious missionaries, Church delegations, and testimonies of Central American refugees, anti-interventionism and solidarity led to widespread and influential anti-imperialist protests. In particular, the first-hand stories of Central American refugees, who fled to the US to escape the violence in their countries in numbers close to one million during the 1980s, moved a lot of US citizens to become part of an anti-imperialist protest movement. After hearing some of these stories, one man asked a question many other listeners must have repeated: 'Why is our government sending all this money to a place where people were being slaughtered?' Another woman testified that the refugee narratives 'gave people a human face to the reality in Central America, to this foreign policy debate that was going on in Washington' (Nepstad 2004, pp. 131–133; see also Smith 1996, pp. 133–168). Taking note of how US policies during this period victimised Central Americans and how and why tens of thousands of US citizens 'committed themselves fully to the side of the victims', in a visceral and cognitive sense, Van Gosse helps to situate the solidarity networks in the context of moral protest (Van Gosse 1988, p. 43).

The impact was acknowledged by those protesting Reagan policies and those inside the Administration. One woman activist noted: 'We had a friend who worked in the State Department as this time who, with his wife, had been traveling around in all kinds of little towns throughout the US. He told us he couldn't understand before why this movement was so strong. Yet, in every single town they went to, at some bookstore, or on a corner or a bulletin board somewhere, there was an announcement of an event with someone who had been to Nicaragua, or someone who was coming to speak on El Salvador. He said it was everywhere, everywhere' (Nepstad 2004, p. 127). Catholic missionaries, in particular, motivated by the spirit of Vatican II and liberation theology, translated their experiences in Central America into active critiques of the Reagan Administration's policies. One Maryknoll nun's missionary experience in Nicaragua led her to conclude: 'I was very aware that there was something wrong with US policy' (p. 57). In turn, those religious orders and their lay supporters put increasing pressure on Congress to contest Reagan policies in Central America. William Casey, Reagan's first CIA director, deplored the influence that religious networks had on Congress, asserting 'if Tip O'Neill [the Democratic Representative from Massachusetts who was speaker of the House] didn't have Maryknoll nuns who wrote letters, we would have a Contra program' (p. 53). The Reagan Administration's first-term assistant secretary of state for inter-American affairs also deplored the impact that religious organisations and their moral critiques had on Central American policies: 'Taking on the churches is really tough. We don't normally think of them as political opponents, so we don't know how to handle them. They are really formidable' (p. 165).

Certainly, the faith-based communities created a moral context within which antiimperialist protests emerged. According to Sharon Nepstad, 'protest was not simply a strategic means of changing US foreign policy; it was an expression of commitment to ... religious principles and values' (p. 161). Using religious discourse helped to inform and motivate this constituency, as well as moving these individuals and groups to pressure political representatives both locally and in Washington. As a consequence of this activism and pressure, the Reagan Administration faced legal constraints on its Central American policies (e.g. the Boland Amendment that prevented Congressional funding of the Contras) that amounted to a provisional success for anti-interventionist activists. Unfortunately, as asserted by one study of Reagan policies towards Central America: 'Had the White House actually followed the provisions of the US Constitution and other statutes, the movement could have claimed much greater success, especially with Nicaragua' (Smith 1996, p. 372). Instead, Reagan's White House subverted both US and international law. The pursuit of these illegal activities by the Reagan Administration eventually led to criminal prosecution, especially for those involved in the Iran-Contra scandal. In effect, an anti-interventionist politics clearly influenced and, indeed, altered the terms of the debate and imperialist policies in Central America in the 1980s.

Another transnational protest of the 1980s owed its coalescence to a different aspect of Reagan's foreign policy. As a direct response to Reagan's intent to expand the placement of nuclear weapons and missiles in Western Europe, the traditional peace movements in the US and Europe saw a huge increase in their ranks. Although the new weapons systems, such as the MX and Pershing II missiles, had been given the green light by the Carter Administration in the late 1970s, Reagan entered the presidency in 1981 committed to ramping up not only the development and deployment of these and other new nuclear weapons systems but also the Cold War rhetoric. In particular, the unilateral and bellicose assertion by the Reagan Administration to deploy Pershing II and ground-launched cruise missiles in a number of Western European countries as a warning about US first-strike capabilities aroused massive opposition, resulting in demonstrations in late 1981 and early 1982 by hundreds of thousands in Bonn, London, Paris, Rome, and Amsterdam. For peace activists in the US, such European activism operated as a potential catalyst. Wrote one such activist: 'This movement has created hope and therein lies the hope for us all. They send us a challenge: Why do you not scream, America?' (Meyer 1990, p. 75).

Certainly, the Western European demonstrations and subsequent anti-nuke campaigns inspired US peace activists, as well as garnering attention from the mainstream media (pp. 124–126). As the US Nuclear Freeze campaign kicked into gear and mobilised for what would be the spectacular demonstration in June 1982 of one million people in New York City, it appeared that a significant protest would emerge. However, there were clear limitations to the Nuclear Freeze movement in the US that prevented it from developing a full sense of anti-imperialist politics, unlike what transpired in Western Europe. As argued by David Cortright and Ron Pagnucco, 'The US sociopolitical environment made it difficult for the (Freeze) to move beyond a bilateral Cold War orientation' (Cortright and Pagnucco 1997, p. 82). In highlighting some of the developments and limitations of the Freeze movement, as well as particular eruptions within the peace activist and anti-imperialist networks in the US and Europe during this time, the degree to which such protests were either able to emerge or hampered in their emergence will be underscored. Such an investigation should provide further insight into the formation of transnational solidarity and the globalisation of resistance against Cold War imperialism.

Of course, print communication and global exchanges by peace activists at the time provided vehicles for constituting transnational protests. Such intellectuals and activists as British historian E.P. Thompson and Australian paediatrician Helen Caldicott could be seen as cognitive catalysts in their work. Thompson wrote an impassioned essay in the January 1981 edition of the US progressive journal *The Nation* which implored

citizens of the US to mobilise against the installation of cruise missiles in Europe (Meyer 1990, pp. 151–152). While there were many more voices added to his, the eloquence of his plea and the persistence of the work of the Campaign for Nuclear Disarmament (CND), for which Thompson worked, inspired activists in the US. Caldicott's revival of the organisation, Physicians for Social Responsibility, and her outspoken dramatic appeals against nuclear weapons and nuclear power also had a major impact on public awareness (p. 102).

However, to the degree that public awareness was also shaped by the mainstream media, it placed certain constraints on the Freeze movement and its capacity to project its own political analysis and strategies. As the movement gained momentum in 1982, especially at the grass-roots level with New England town meetings passing resolutions aimed at calling on the US and USSR to impose a freeze on the production, testing, and deployment of nuclear weapons and missiles, both television news and mainstream newspapers began to run extensive news stories that actually helped to generate public sympathy and support. Nonetheless, many of those stories conveyed a media frame that trivialised and distorted the Freeze movement in a way that depoliticised that movement and added to its own internal contradictions (pp. 119–135). Although those contradictions were evident with the development of the Freeze as a public campaign to attract the middle class and lobby Congress for arms control measures, 'the media had legitimated and appropriated the nuclear fear underlying much freeze support and had translated it into a humanitarian concern that had little to do with policy. This concern was expressed as so moderate and apolitical that it could continue to demonstrate very high levels of support in public opinion polls without having any effect on politics or policy' (p. 133).

Certainly, for those who had been among the founders of the Freeze movement, such as Randall Forsberg, their vision of the movement did embody a more radical and transnational approach. In her presentation to the World Council of Churches International Public Hearing

on Nuclear Weapons and Disarmament in November 1981, Forsberg discussed the need to 'mobilize the middle class, to give them hope and to bring them actively into the ranks of those who oppose the arms race'. Such a mobilisation, then, 'would show that human beings can direct their own destiny; that we can harness the arms race; that together, we are stronger than the military-industrial complex . . .. It would demonstrate that we can "democratize" and therefore eventually abolish the ancient, pernicious, elite institutions of warfare and exploitative foreign policy' (quoted in Meyer 1990, p. 162; on Forsberg, see Martin 2011, pp. 5–9). In effect, Forsberg attempted to create a new constituency beyond the previous limited efforts by scientists and policymakers to control nuclear arms. Yet, Forsberg's idealistic rhetoric came crashing down around the narrowly constructed class constituency of the white middle class and the almost exclusive focus on lobbying Congress and electoral politics, impeding in the process the anti-imperialist thrust of the protest.

Nonetheless, within the arena of nuclear arms control, Forsberg and the Freeze influenced the national agenda. Commenting on the role of local and congressional Freeze resolutions, one of the most outspoken congressional Freeze supporters, Ed Markey (Democrat, Massachusett), noted: 'Within a very brief time, the Freeze had taken education at the grass roots and translated it into political muscle at the ballot box, delivering to the White House a resounding vote of no confidence in its nuclear buildup' (quoted in Cortright 1993, p. 21). Responding to this shift in public opinion, the Reagan Administration first tried to paint the Freeze as a tool of Moscow, but with increasing support from religious leaders, members of Congress, and former government officials, this charge was difficult to verify and sustain. Instead, according to one White House speech-writer, Reagan's rhetoric was readjusted: 'We tried to portray Reagan not as the crazy cowboy . . . but as having a more thoughtful position' (p. 94). Responding to the clamour over the Freeze, Reagan declared as early as 1982: 'To those who protest against nuclear war, I can only say I'm with you' (p. 95; on the Freeze and Reagan's

attempt to co-opt its rhetoric, in particular, see Carroll 2006, pp. 385–395).

Such rhetoric continued through the 1984 presidential election and into Reagan's second term, culminating in the Reagan-Gorbachev summit meetings of 1985 and 1986 which, in turn, led to the agreement in 1987 between the US and the Soviet Union on nuclear weapons, specifically entitled the Intermediate Nuclear Force (INF) treaty. To the hawks in the Reagan Administration, such as Kenneth Adelman, director of the Arms Control and Disarmament Agency, Reagan's nuclear policy 'metamorphosed ... into extreme anti-nuclear talk that resembled the nuclear bashers of SANE' (Cortright 1993, p. 98). On the other hand, Gorbachev acknowledged that without the anti-nuke activism the INF might never have been concluded. Moreover, according to one study of the impact of the INF and all that led up to it, 'the disarmament agreement was the central catalyst for the end of the Cold War' (Mekata 2006, p. 190; on the overall impact of the Freeze movement, see Wittner 2003).

While gaining legitimacy and creating a national agenda around arms control, the Freeze deliberately distanced itself from those peace and justice activists who wanted a broader and more radical and anti-imperialist agenda. This was especially evident in the June 1982 demonstration when voices urging denunciation of Israel's invasion of Lebanon and condemnation of US intervention throughout the Third World were dismissed (on the dissent within the 12 June coalition around such issues, see Mekata 2006, pp. 184–188). In effect, the Freeze created a public awareness and movement with limited national goals while constraining those who wished to generate transnational protests linked to anti-imperialism and global resistance.

On the other hand, the context out of which the Freeze operated did motivate other groups and networks, some of which existed prior to the Freeze, to move towards antiimperialist transnational protest. One such group was the Women's Pentagon Actions (WPA). Growing out of the radical pacifist organisation, the War Resister's League, the WPA mounted its first demonstration in November 1980, shortly after the election of Reagan. Poet and activist Grace Paley announced their solidarity with women and oppressed people around the planet, underscoring in the process their desire to build another world. The second demonstration in November 1981, built on the inspiration of the activism in Western Europe, linked their efforts to express a feminist anti-militarism with a larger political perspective.

While the WPA with its global vision was central to an emergent transnational protest, it was, nevertheless, marginal to the larger anti-nuke movement in the US. On the other hand, what materialised in Western Europe did qualify as an anti-imperialist transnational protest. As a consequence of its ability to look beyond the bilateralism and Cold War politics that constrained the anti-nuke forces in the US, those in Western Europe – such as the CND in Great Britain, the Interchurch Peace Council in the Netherlands, and the Green Party in West Germany – were able not only to challenge the deployment of cruise and Pershing II missiles in their countries but also to mobilise around a global vision of disarmament and peace. In Great Britain, women set up a peace camp outside of the Greenham Common US Air Force base in 1981 that became a lightning rod for transnational women peace activists. In West Germany, a traditional Easter Peace March dating back to 1960 that had been almost moribund gained momentum in the 1980s, reaching half a million by 1986 (Mekata, pp. 188–189; Rochon 1988, pp. 3–8, 11–14 and passim). Hence, at local and national levels, anti-imperialist transnational protests were flourishing in Western Europe as a response to the nuclear threat.

One of the most significant catalysts for that mobilisation and for an anti-imperialist transnational protest was one of the founders of the West German Green Party, Petra Kelly. Born in 1947 in Bavaria, Kelly adopted her last name from her stepfather, an American Army officer. Educated in both Germany and the US, Kelly became the perfect bridge to make transnational connections after she returned to West Germany in 1970 and began her work with the Greens at the end of the decade. That involvement and its connections to

the anti-nuke movement, chronicled in the compilation of her writings and speeches in *Fighting for Hope,* offers further insights into the political parameters of the transnational and anti-imperialist protest that contested the Cold War imperialism of the US *and* the Soviet Union (Kelly 1984).

Having spent extensive time in the US and being thoroughly versed in ongoing political activities among Catholic anti-nuke activists, Petra Kelly acknowledged the necessary links to America. 'The changes that have been taking place in the US, especially among American Catholics, have not sunk in yet over here. But we should look towards America with hope as well as apprehension. Over there, security is not necessarily identical with weapons, and people have not yet surrendered to a provincial cynicism where sentimentality is mistaken for morality, as is so often the case here' (p. 7). For Kelly, then, the moral witnessing and dramatic actions by Catholic activists served as an inspiration to those in Germany. Throughout her writings, Kelly cited the civil disobedience of priests Daniel and Philip Berrigan (pp. 61–62), Molly Rush (p. 62), their fellow Catholic co-conspirator who entered a General Electric weapons factory to hammer on a missile nose cone, and several Catholic bishops –Hunthausen of Seattle (pp. 59–60) and Matthiessen of Amarillo (p. 64) – who not only urged their parishioners to refuse working in any nuclear weapons facility but also declared, in the case of Hunthausen, a refusal to pay part of federal taxes as a protest against Pentagon weapons manufacturing. She also quoted from the long statement made at the first Women's Pentagon Action in November 1980. All of these instances were intended to move her German compatriots to new levels of militancy against the weapons of nuclear war being installed in their own backyard.

On the other hand, Kelly was also cognisant that there was a global movement embracing the power of non-violence not only as a form of resistance but also as a new way of living. In her essay 'The Power of Non-Violence' (pp. 27–32), Kelley cited both well-known classic and lesser-known recent advocates of non-violence from Thoreau to Gandhi to King to Cesar Chavez and German Catholic women activists Dorothee Solle and Ingeborg Drewitz. In addition, she alluded to wide-ranging examples of non-violent resistance from Poland to Bolivia, all of which reinforced her point about the constitutive role of non-violence in shaping what constituted transnational anti-imperialist protest. Bringing all of this home to the Greens, the emergent political movement in West Germany that Kelly helped to build, she posited: 'The Greens seek a new life-style for the Western world, as well as in their own personal lives. They would like to see an alternative way of life without exploitation, and they aim for non-violent relationships with others and with themselves . . ., relationships free from fear and based on mutual support' (p. 20).

Beyond those personal and social transformations, Kelly envisioned the Greens as a different kind of political party, one she designated as an 'anti-party party' (p. 17). Clearly, there was some thought being given to thinking and acting outside of a limited institutional framework. As she noted, 'Nuclear energy, the nuclear state, and the growing use of military force threaten our lives. We feel obliged to take public, non-violent action and to engage in civil disobedience outside and inside parliament, throwing a spotlight on the inhumanity of the system' (p. 18). For Kelly, it was the job of the Greens to expand and revitalise democracy through protests connected to anti-imperialism and global resistance. 'We are living at a time when authoritarian ruling elites are devoting more and more attention to their own prospects', she Kelly contended, 'and less and less to the future of mankind. We have no option but to take a plunge into greater democracy' (p. 11).

At almost the exact same time as Kelly was articulating the need for greater democracy, a leading intellectual luminary of the Hungarian democratic opposition, George Konrad, was completing his book Anti-Politics, which shared similar sentiments about war and peace and the need to get beyond the rule by authoritarian and imperialist elites, whether in the East or West. 'Anti-politics', argued Konrad, 'offers a radical alternative to the philosophy of a nuclear ultima ratio . . .. Anti-politics is the ethos of civil society

C

and civil society is the antithesis of military society. There are more or less militarised societies – societies under the sway of nationstates whose officials consider total war one of the possible moves in the game. Thus, military society is the reality, civil society is the utopia' (cited in Kaldor 2003, pp. 57–58). Along with other Eastern European dissident intellectuals, from Adam Michnik in Poland to Vaclav Havel in Czechoslovakia, civil society became the beacon around which transnational protests mobilised.

Linking the emergent ideas about civil society in Eastern Europe with the ferment in Western Europe around war and peace in the early 1980s, Mary Kaldor analysed the common thread of a demand to end the stultifying politics of the Cold War and to develop a mutual solidarity in the creation of another world (2003, pp. 50–77). For her, E.P. Thompson provided the clearest articulation of this need for mutual solidarity. 'We must defend and extend the right of all citizens, East and West, to take part in this common movement and to engage in every kind of exchange', asserted Thompson. 'We must learn to be loyal not to East or West but to each other and must disregard the prohibitions and limitations imposed by any national state' (quoted in 2003, p. 61).

From Kaldor's perspective, the political ferment unleashed by thinking beyond the binaries of the Cold War and the reinvention of civil society in a transnational context opened up new frames of meaning and new opportunity structures for citizens and nonstate actors to intervene on the global level. Thus, the fall of the Berlin Wall in 1989 had been prepared by the dismantling of Cold War mental blockades. According to Kaldor, 'the year 1989 did represent a profound rupture with the past that is difficult for us to comprehend. In the stirrings of thought that developed beneath the structures of the Cold War were the beginnings of some new concepts and practices that can help us analyze our immensely complex contemporary world' (2003, p. 77). For Kaldor, the key concept was global civil society that 'offers a way of understanding the process of globalization in terms of subjective human agency instead of a

disembodied deterministic process of "interconnectedness"' (2003, p. 142). In effect, new actors in a variety of formats and from diverse sites were prepared to engender and expand these emergent anti-imperialist and global protests beyond the 1980s.

However, while the tools of social media that blossomed in the 1990s and into the 21st century facilitated and complicated the emergence of new and diverse anti-imperialist protests, the residual effects of Cold War imperialism in the so-called 'war on terror' impeded those protests in the US. Perhaps, nowhere was the role of the new social media with its attendant transnational global consciousness and connections more evident than in the massive global demonstrations that mobilised tens of millions of people worldwide on 15 February 2003. As a response to the Bush Administration's threats to attack Iraq, protest marches were organised with the aid of new networks and technology that facilitated what has been called the first truly global anti-war demonstration. From Barcelona to Berlin to Buenos Aires to Bangkok, from Manila to Mexico City to Moscow to Madrid, from Nairobi to New York, from Sao Paulo to Sydney to Seoul to San Francisco, from Toronto to Tokyo to Tel Aviv to Tegucigalpa; in short, in hundreds of cities around the world, on every continent, millions marched, constituting in the process a post-modern version of an anti-imperialist protest. According to Joss Hands, 'the sheer diversity of participants across the globe was self-evidently not sharing a specific set of localised reasons for action but rather, on a global level, the marches were co-ordinated through an orchestration of aims, which were loose enough to mobilise the common interests of all participants: peace, democracy, and human rights, all made concrete by the injustice and illegality of the pending war' (Hands 2006, p. 232).

Even with this massive outpouring, the persistence of Cold War imperial policies in the aftermath of 9/11, especially in the so-called 'war on terror' and the US military intervention in Afghanistan, undermined the capacity to sustain

and develop such protests, especially in the US. Although the US attack on Afghanistan had supposedly been in response to the Taliban support for Osama bin Laden, the history of US involvement in Afghanistan and the actual prosecution of the war, under both Bush and Obama, once more demonstrated the residual repercussions of imperialist policies. Those policies, originally rooted in Cold War gamesmanship, had their covert inception in 1979 with the CIA supporting Afghan warlords and Muslim guerrillas fighting against a Soviet backed government in Kabul. Working in the 1980s with the Pakistan Inter-Services Intelligence (ISI) agency, the Reagan Administration began funding the mujahidin most favoured by the ISI, among them, Osama bin Laden. When the Taliban began to achieve prominence in the guerrilla war in the 1990s, the US under Clinton continued its support out of the desire, among other reasons, to help US oil companies construct a pipeline that would avoid going through Iran.

Through now almost a decade of US military intervention in Afghanistan, the war's lingering ghosts of Cold War imperialism are haunting a land often referred to as the 'graveyard of empires'. However, as the body count of dead in Afghanistan mounts, there has been a failure to develop robust antiimperialist protests. While there have been protests against the war in Afghanistan, they have been mostly sporadic and marginal. Certainly, in an era of heightened national security and increased privatisation, there may be a hesitancy to take up the banner of anti-imperialist protest. Given the remoteness of Afghanistan, the lack of pre-existing solidarity networks, the complications in identifying clear allies and alliances, the rise of anti-Islamic prejudices, and the deliberate marginalisation of the conflict by mainstream media, one can better understand why such an anti-imperialist project has not coalesced around the war in Afghanistan. And, yet, if this US imperial venture in Afghanistan and throughout Central Asia is to be challenged, one must recognise that the US military machine with its additional privatised

and secret operations will not collapse on its own, even as imperial overstretch erodes its hegemony. Perhaps, as noted by Mahmood Mamdani, 'Humanity is now left with a challenge: how to subdue and hold accountable the awesome power that the US built up during the Cold War'. Indeed, the final disappearance of Cold War imperialism still awaits more persistent and efficacious anti-imperialist protests.
