Definition

Environmental conservation is often perceived as a positive outcome, particularly in the context of climate change and extreme environmental degradation. However, the notion of conservation requires interrogation. Under colonial and postcolonial states, people living in resource-rich environments have been subject to dispossession both in the context of development as well as conservation. The natural environment, conventionally exploited for economic growth, has been conserved in formerly colonised states by excluding local communities with violence or the threat of violence, and regulation, all of which represent a hangover of colonial practices. Newer international markets in carbon offsets and credits offer additional avenues for accumulation and profit-making, the burden of which has been borne by indigenous and non-indigenous communities in former colonies. These conservation practices often display a combination of physical or psychological violence, regulation, and market incentives. Conservation is initiated or demanded by institutions of global capital, in conjunction with environmental NGOs, and facilitated by the state. These practices represent a loss of autonomy and democratic decision-making for local communities that may be both dependent on these natural environments for their livelihoods, and may conserve it as part of their aesthetic, spiritual, and

materialist practices. Resistance against both global capital-led environmental degradation and conservation of nature then becomes a space of anti-imperialist struggle.

Introduction

Protected areas (PAs) have historically been viewed as a desirable (and sometimes the only) way to engage in conservation of forests and biodiversity. In 2010, the World Database on Protected Areas recorded nationally designated PAs of 17 million km^2 (or 12.7%) of the world's terrestrial area, excluding Antarctica (including inland waters) around the world. A higher proportion of total area of the 'developing' world (13.3%), is classified as PAs than the 'developed' region (11.6%), with the Latin American region offering the highest level of 'protection' (20.4%) (Bertzky et al. 2012). Popular perception holds that PAs act as bulwark against overextraction by capitalists as well as the local populace.

Since European colonialism, however, the colonised and residents of dominated states, on the one hand, have been fighting against capitalist over-extraction (although this is not to suggest that they have not been incorporated into a consumer society). On the other hand, they have been resisting the imposition of conservation. Forest conservation is viewed as yet another way to control nature and the labour of the dominated population. While conservation is desirable from an ecological perspective, the specific form and nature of conservation require attention because they can mask imperialist aspirations. Conservation under these circumstances would either provide a source of capital accumulation or safeguard imperialist interests, but lead to what David Harvey refers to as accumulation-by-dispossession (Harvey 2003). The incorporation of conservation into the imperialist project forms the basis of resistance against conservation by regulation as well as conservation through market forms. In the interests of brevity, the discussion will focus on the incorporation of forest conservation into imperialism.

Fortress Conservation

Early colonialism was characterised by ecological imperialism (Crosby 1993) and highly intensive extraction of valuable minerals and biological matter (e.g. Clark and Bellamy-Foster 2009) to profit the colonisers. This effected a change in land use across vast swathes of forestland to agricultural and mining purposes. With increasing scarcity of raw materials affecting capitalist production, colonial governments adopted 'scientific' management of forests that dictated land use and land management practices. In the US, while scientific management was adopted with a view to stemming unbridled laissez faire capitalism in the interests of enhanced efficiency (Guha and Gadgil 1989), scientific management in the colonies maintained its efficiency objective but, without a thriving capitalist sector, directed its ire toward the 'natives'. Thus, indigenous (and in British India non-indigenous but local) populations, with their seemingly bewildering and overlapping usufruct rights and incomprehensible use of forest land, were viewed as anathema to advancing planned use and were often removed through the threat or actual use of violence. Thus, the dominant policy was to engage in fortress conservation and the forcible expropriation of the forest commons from its inhabitants.

For instance, the British in India enforced state monopoly by nationalising forests in the late 1800s. The main objective of the Indian Forest Act, 1865 and its subsequent amendment in 1878 was to establish PAs to secure a steady increase in timber production and silvicultural improvement. Forests were categorised according to their commercial value, and the degree to which local communities were excluded was determined accordingly. Images of severe scarcity, famine and environmental annihilation were invoked by colonial foresters to justify the severe social and political costs of expropriating the commons. Indian teak was used in building ships employed by the military in the Anglo-French wars in the early nineteenth century (ibid.). Also, timber extraction for railway sleepers, required to build an extensive rail network in India, exhausted large swathes of forests in the country. The rail network

transported raw materials needed by capitalists and the British state especially during the two world wars. Forests were thus transformed into instruments of state power that allowed the imperialists to discipline the local populations, and at the same time incorporate nature into the capitalist project and aid in war efforts.

The actions of the imperial state were consistent with seeking to resolve the crisis of capitalism. The resolution was through a piece of legislation but enforcement was assumed through means of violence and conflict. However, 'conservation' was undertaken not as a result of a crisis of over-accumulation, but a crisis in the availability of raw materials to fulfil the needs of the imperial state (Magdoff 2003). Colonial policies formed the basis of post-Independence neo-Malthusian forest conservation policies in Asia and Africa (e.g. Fairhead and Leach 2005).

Markets and Forests

While post-Independence states were free of direct control, imperialist interests continue to influence their economic and forest policies. This influence was accentuated with the debt crises of the 1980s and 1990s. Due to the subsequent structural adjustment programmes imposed by the IMF and World Bank, many economies (willingly or by force) liberalised their trade and investment regimes. Conservation policies were not immune to the tremendous impact of neo-liberalisation consequent to the intervention of the international economic regime. There has been a change in economic ideology, and discourses of the state and local communities. Despite the alleged progressive agenda of community participation and a 'bottom-up' approach, the associated focus on decentralisation has opened the field for market-based forest conservation (McCarthy 2005), and allowed international development and conservation agencies direct access to their intended audience. In many countries, PAs are heavily financially dependent on international organisations. In 2003, only 3% of funds for PAs in Bolivia were supplied by the Bolivian state (La Prensa 2005 cited in Boillat et al. 2008). Furthermore,

in many countries PAs are administered directly by international conservation NGOs (Boillat et al. 2008). This has not diminished the role of the state, which, with its monopoly on legalised violence and significant control on instruments of ideology, facilitates accumulation by dispossession.

Debt-for-Nature Swaps

The debt crises led to significant intervention by the Paris Club, a group of 19 creditor countries formed to resolve and manage international debt. The Paris Club includes debt swaps, including debt-for-nature swaps (DNSs), in its arsenal of debt management instruments. DNSs usually involve an international agency that buys the debt of a 'developing' country in the secondary market. It then sells the discounted debt back to the debtor country for local currency. This money is used by a local government agency or environmental group for use in an environmental programme agreed on by the agency buying the debt and the debtor country. In addition, swap agreements may also include the bank holding the debt. While the Paris Club has been forced to engage in debt forgiveness in some cases, its interventions have proved to be a boon for surplus capital (Harvey 2003). In 1987, the first DNS was agreed on between Conservation International, a US conservation group, and Bolivia. In exchange for the debt, Bolivia agreed to expand the 334,000 acre Beni Biosphere Reserve by 3.7 million acres. By 1993, conservation groups had raised $128 million at a cost of $47 million for 31 environmental projects primarily in Latin America and Africa (World Bank 1993 cited in Didia 2001).

DNS has been made possible by multiple actors – environmental NGOs, development agencies, and governments of the creditor and debtor countries. It has also allowed for a reorganisation of internal social relations to accommodate the needs of international capital looking for a spatio-temporal fix (Harvey 2003). For instance, the Canada/Costa Rica DNS investment was signed in 1995 and the conservation was to be overseen by the Costa Rican National Institute for Biodiversity (INBio), a Costa Rican NGO, and the

Canadian Worldwide Wildlife Fund (WWF-C). It led to the creation of the Arenal project over an area of 250,561 hectares, of which 116,690 hectares were declared as PA; local inhabitants from 108 communities were expelled (Isla 2001). Conservation of trees on this land is sold as pollution credits to countries including Canada. Local inhabitants, previously engaged in subsistence production, are employed by INBio under the direction of the World Bank and are 'service providers'. The employed inhabitants produce inventories of local species which are used in bioprospecting for new pharmaceutical and agricultural products (ibid.). The Arenal project also promotes microenterprises aimed at women's participation in small-scale marketing of biodiversity financed by international funds at an interest rate of 20–30% (ibid.).

As part of the Paris Club, the US has also played a significant role. The US Congress authorised three channels through which DNS was put into practice: (a) in 1989, the United States Agency for International Development (USAID; a federal government agency that disburses and administers foreign aid, and which reportedly has close ties to the CIA) was permitted to purchase commercial debt of foreign countries as part of a DNS agreement; (b) DNS transactions were included as part of the Enterprise for the Americas Initiative (EAI), which promoted free-market reform (Bush 1990), which restructured or sold Latin American debt equivalent to nearly $1 billion (of the total $1.8 billion) and generated $178 million in local currency for expenditure on environmental and developmental projects (Sheikh 2006); (c) an expansion of the EAI model resulted in the Tropical Forest Conservation Act (TFCA) to include tropical forests around the world, not just Latin America. Since 1998, this has led to the restructuring of loan worth $82.6 million and is expected to raise $136 million in local currency for tropical forest conservation in the next 12–26 years (ibid.). Eligibility for DNS transactions under EAI and TFCA include multiple criteria including co-operation with the US on drug control. Eligible countries are also required to undertake a structural adjustment loan or its equivalent from the IBRD (International Bank

for Reconstruction and Development) or IDA (International Development Association), or an agreement with the IMF and to implement economic reforms to ensure an open investment regime (ibid.).

As a debt-reduction instrument, DNS has not lived up to its promise (Didia 2001; Sheikh 2006). Nevertheless, advocates argue that it stimulates economic growth, international trade, and foreign investment in erstwhile low-income countries. On the issue of conservation, advocates argue that it generates significant conservation funds, though there has not been much evidence to show that this actually reduces over-extraction or increases forest conservation (Sheikh 2006). DNS agreements have resulted in conflict in some cases, especially due to the role of international agencies. In the Beni Biosphere Reserve, for instance, one result of the DNS was the formation of the Central de Pueblos Indigenas del Bolivia. This organisation accused the DNS of contravening the claims of the indigenous people who had lived on the land for centuries. The DNS deal collapsed in 1990 after negotiations between the indigenous Chicame people and the Bolivian government (Hobbs 2012). It was later revealed that government agencies involved in the negotiation received significant funding from concessionaire logging companies that would have potentially been affected by the Reserve (ibid). It nevertheless does not detract from the fact that indigenous communities would also have been subject to the exclusionary policy.

PES, REDD+ and Carbon Sequestration

Following the failure of the Kyoto Protocol, consecutive rounds of the Conference of Parties (COP) negotiations under the UN Framework Climate Change Convention have failed to arrive at any agreement on the limits on carbon emissions for individual countries. However, there is considerable excitement at the prospect of creating carbon offsets that can be traded in the market. One mechanism through which carbon offsets could be produced is carbon sequestration, presently referred to as REDD+ (reducing emissions

from deforestation and forest degradation). It combines offsets with payment for environmental services (PES), which compensates those individuals who contribute labour to the provision of environmental services (WWF 2006). It is expected that providing a market for carbon offsets will compensate forest communities for conserving forests and thus provide an incentive to maintain or restore them (UN-REDD Programme 2010).

The conservation organisation WWF has recently undertaken to experiment with REDD+ projects by creating protected areas (PAs) in 15.5 million hectares of land spread across three key tropical forest regions. These include the Maï-Ndombe region of the Democratic Republic of Congo (DRC), the Kutai Barat District of East Kalimantan Province in Indonesia, and the Madre de Dios region of Peru; these constitute three of the five largest rainforest countries in the world. WWF's report claims the use of participatory planning, recognition of customary rights, and community participation in decision making (WWF 2013). Including funds from recipient countries and the US (in the case of Indonesia), financing is expected through the Forest Carbon Partnership Facility, a World Bank programme created specially to facilitate REDD+-type projects; and Forest Investment Program of the Climate Investment Funds, of which the World Bank is a Trustee and has fiduciary responsibilities. Funds from the Forest Investment Program are disbursed through multilateral development banks such as the African Development Bank, Asian Development Bank, Inter-American Development Bank, World Bank, and International Finance Corporation. The WWF report does not mention the amount of carbon credits or certified emissions reductions, possibly because currently there is no fully developed and stable carbon market.

Despite the enthusiasm for REDD+, not everyone is convinced of its desirability. Peru, one of the countries in which WWF has undertaken the project, had received $350 million between 2008 and 2011 to implement REDD+ projects (Llanos and Feather 2011). A group of indigenous organisations affected by these projects released an analysis of REDD+ mechanism. One of the leaders of these organisations stated:

> We live here in the Peruvian Amazon where there is a new boom, a new fever just like for rubber and oil but this time for carbon and REDD. The companies, NGOs and brokers are breeding, desperate for that magic thing, the signature of the village chief on the piece of paper about carbon credits, something that the community doesn't understand well but in doing so the middle-man hopes to earn huge profits on the back of our forests and our ways of life but providing few benefits for communities. We denounce this 'carbon piracy' that is one side of the reality of REDD in the Peruvian Amazon. The other side is the big programs of the environmental NGOs, the World Bank, the IDB and the government who promise to act with transparency and respect our collective rights but will this include the respect of our ancestral territories and self-determination? The safeguards and guidelines of the big projects always say that they will respect our rights but the reality is always different. (Alberto Pizango Chota, President of the Interethnic Association for the Development of the Peruvian Amazon (AIDESEP) in Llanos and Feather 2011)

The report notes that more than 10 million hectares have been handed out to various timber, tourism, REDD+ and conservation projects to the detriment of indigenous communities. Notwithstanding criticism of the implementation of REDD+ projects and carbon offsets, the report also discusses the pressure put on indigenous communities to waive their rights to land on highly unfavourable terms; contracts are complex and rendered in English to an illiterate, Spanish speaking audience. Thus, the situation is set up to facilitate land grabs. The report further claims that REDD+ proponents have been manipulating the representation of costs and benefits, and that there is usually either no community consultation or that they are held only after the projects have been put in place (ibid.). Many REDD+ and REDD+-type projects have experienced land grabs, violent expropriation, human rights violations and militarisation; for instance, Papua New Guinea's indigenous leader was reportedly forced to abdicate carbon rights of his tribe's forest at gunpoint (Bond 2012).

Payment for environmental services, which forms the basis of REDD+ projects, requires monetising the value of nature and commodifying

it for market exchange. The benefits of these projects to global capital are manifold. The imposition and rationalisation of property rights, whether vested in the individual or community, provides a lien on the extraction of further surplus value. It could be used as collateral to incur debt (Mandel et al. 2009; Sullivan 2013) and it could lead to real-estate appreciation. Similar conservation projects around the world could potentially absorb surplus capital and hence represent capitalised surplus value, which would be incorporated into the reproduction of global capitalism (see Harvey 2003; Kemp 1967). According to a WWF report, while REDD+ projects only amassed $7.2 billion in actual or pledged funds by 2010, forest conservation could potentially tap into a $100 trillion bond market (Cranford et al. 2011). The actual impacts on sustaining nature and poverty alleviation, the stated objectives of REDD+, may be beside the point.

This explains the enthusiasm for REDD+ even though climate negotiations have been a failure (ibid.). The World Bank has consequently taken the lead in its implementation well before a global agreement about its use and framework has been reached. In addition, unlike previous fortress conservation projects, it is expected that there will be less opposition to conservation efforts even if it is not always clear what the benefits are for the local populace. In cases when local communities are resistant to such projects, the state steps in and uses a combination of physical or psychological violence, regulation, or dangles the possibility of higher market income.

Conservation as imperialism

Control of raw materials has been cited as one of the motivating factors propelling the control of distant territories (Luxemburg 1913/2003; Magdoff 2003). In contemporary times, however, imperialism has been manifested not through direct control of territories but through indirect control, influence of economic policies, and international relations. Capitalist businesses inherently attempt to manage risks through the control of raw materials among other factors, to influence not only the profit rate but also manage capital investment and competitive pressures (Magdoff 2003). This increases monopoly power that serves as a barrier to entry, and controls costs. Given capitalism's penchant for continuous expansion and growth, O'Connor (1998) argues in a Luxemburgian vein that capitalist expansion necessarily requires the degradation of the very conditions necessary for its survival, and that conservation would be viewed merely as costs for capitalism. While important in highlighting the limits to unfettered capitalist growth, O'Connor's analysis falls short in understanding the dynamic nature of capitalism.

Capitalism benefits not only from the current extraction of raw materials from nature, but also requires its maintenance for future extraction. Further, under incomplete substitutability between human-made goods and services and those provided by nature, capitalist production depends on what the Millennium Ecosystem Assessment (2005) refers to as the provisioning services of nature. O'Connor's (1998) analysis ignores the profit-making possibilities of environmental degradation (see Burkett 2005). Rather than be constrained by environmental degradation, the economic system has developed a number of solutions to the environmental problem such as free-market environmentalism evident in the rise of 'green' products in the market; cut-and-run environmental frontier approach, which is made possible due to high spatial displacement of capital and an approach often associated with international mining companies; regulation of consumption of nature and environment; and co-opting community management in market endeavours; or some combination of the above. These responses are rooted within the fundamentals of imperialism, though the form of these responses is influenced by historical, geographical, socioeconomic, and cultural factors; thus necessitating the combination of solutions to tackle the problem, and at the same time sharpening contradictions (Biel 2012). These contradictions lie beyond the scope of this essay.

Harvey (2003) argues that if global capital is in surplus and seeks to be valorised, owing to uneven development, it can undertake

geographical expansion, spatial reorganisation, and temporal displacement. This, he argues, explains the absorption of surplus capital into physical infrastructure that has use value and may also lead to appreciation of land value. The same argument could also be employed to explain the increasing attraction of forest conservation projects to finance capital (see Sullivan 2013). The most valuable forests have significant present and future use value. These long-term conservation projects also constitute temporal displacement as the value is realised for profit in the future through the employment of financial instruments. Further, these forests tend to be located in areas of low economic development and are often inhabited by indigenous people or the most marginalised section of society. Due to the current and future productive and consumptive possibilities, these forest conservation projects, whether voluntary or established by force, thus also become sites of asymmetric power and wealth, and unequal exchange.

While the imperial strategy has involved the use of some force in setting up and implementing forest conservation projects, this is not always necessary. The state may participate in the setting-up of institutions and the crafting of domestic and international regulation and treaties, as in the case of climate change agreements (or non-agreements). It may use the threat of economic fallouts and sanctions, as in the case of DNS. This draws our attention to institutions that govern the global circuit of capital, and the unequal exchange that displaces the burden of environmental contamination as well as environmental conservation to the Third World (Clark and Bellamy-Foster 2009; Sutcliffe 1999). For instance, poorer countries are the recipients of both e-waste and funds to reduce carbon and conserve forests (Bond 2012). This is not a contradiction for, as Sutcliffe (1999) argues, despite the existence of ecological limits, the 'privileged can afford to overpollute because the underprivileged are underpolluting'. Conserving forests in poorer countries using 'innovative' mechanisms such as PES and REDD+ displaces the burden of consumption reduction on those who are already underconsuming, so that

industrial and post-industrial countries need only marginally deviate from their high consumption path.

The intervention of imperialist states and international development and conservation agencies in forest conservation is reminiscent of a desire for reintroducing what Max Booth, an editor of the *Wall Street Journal* and an advocate of US imperialism against terrorism, described as 'enlightened foreign administration once provided by self-confident Englishmen in jodhpurs and pith helmets' (Max Booth quoted in Harvey 2003). If and when a global agreement on the combination of state intervention and market instruments to tackle the problem of environmental conservation is reached, control of nature is likely to lead to monopolies. It would then be appropriate to invoke Lenin:

> Production becomes social, but appropriation remains private. The social means of production remain the private property of a few. The general framework of formally recognised free competition remains, and the yoke of a few monopolists on the rest of the population becomes a hundred times heavier, more burdensome and intolerable. (Lenin 1916/1963: 205)

Resistance against certain forms of nature conservation as well as opposition against environmental degradation thus assume relevance; it becomes a site of anti-imperialist struggle.

Council on Foreign Relations and United States Imperialism

Laurence H. Shoup
Oakland, CA, USA

The Council on Foreign Relations (CFR), the high-command plutocratic body promoting US imperialism, is the world's most powerful private organization, the central think tank of American monopoly-finance capital. It is also a membership

organization and the ultimate networking, socializing, agenda setting, strategic planning, and consensus-forming organization of the dominant sector of the US capitalist class. The CFR's activities help unite the capitalist class to become not just a class in itself but also a class for itself. From its beginnings, it has been a behind-the-scene organization and network led by well-connected financial capitalists of New York's Wall Street. These capitalists are assisted by their expert allies in the professional class, especially from leading American universities, but also the nonprofit, government, law, and media sectors of American society. From its founding, the Council has promoted an imperialistic conception of the capitalist class based on "national interest" of the USA, promoting a hegemonic "primacy" of the USA both regionally and globally. It has been very successful in its aims, setting agendas, and policy as well as putting thousands of its members and leaders into high office in the USA (see Shoup and Minter 1977; Shoup 2015, 2019).

Origins in New York: The First CFR 1918–1920

The CFR had its origins during the World War I period, when the USA rapidly went from a debtor nation with a relatively modest global role to a decisive player in a world system best characterized as made up of competing but often cooperating imperialist societies and states. During the years 1914–1918, the key economic and political operators, European-American ("white") men in both New York and Washington, D.C., saw the carnage and destruction of the Great War as a wonderful opportunity for the USA to expand economically and politically into parts of the world, such as Russia, that had been previously largely closed. The key actors in New York were politically active financial capitalists. The Washington, D.C., protagonists centered around President Woodrow Wilson's postwar planning efforts, called "The Inquiry." Featuring leading American academics, The Inquiry was headed by Colonel Edward House and Walter Lippmann. Leaders of The Inquiry met with allied British

Empire imperialists in Paris at the 1919 Peace Conference, the latter group proposing a joint organization to coordinate efforts for future world domination. Today's CFR developed out of the 1921 merger of these three powerful sets of players. Virtually all were white men, as no women were allowed in the CFR until after 1970 and people of color were also mainly excluded until after that point in time.

New York City, especially the Wall Street financial district, has long been the nerve center of American capitalism and the key headquarters for those driving US imperialism. The late nineteenth- and early twentieth-century Gilded Age resulted in the creation of vast capitalist class corporate conglomerates, the two largest being the J.P. Morgan group and the National City Bank-Rockefeller-Kuhn-Loeb group. Each of these groups consisted of leading financial, railroad, and industrial corporations under the direction of financial capitalists.

Founded in London in the 1850s, the Morgan group was more centrally controlled and had a strong connection with London and the British Empire. It maintained strong English ties even after the New York branch of the firm became paramount. Already one of the world's most powerful banks by the 1890s, it was soon the premier investment bank of the USA. Over the following decades, it played a key role in financial and industrial consolidation, controlling corporations like the First National Bank, Guaranty Trust, Chase National Bank (later taken over by the Rockefellers), Bankers Trust, and New York Life Insurance, as well as helping to birth companies like General Electric, US Steel, International Harvester, and AT&T. The second and more loosely controlled corporate conglomerate was centered around the James Stillman-controlled National City Bank, with corporate alliances connecting this bank to the Rockefeller oil empire and the Kuhn-Loeb banking interests. National City was also the main influence in the giant American International Corporation (AIC) discussed below.

The outbreak of the imperialist First World War in the summer of 1914 galvanized these two conglomerates and their allies to think big about the role of the United States in the world. Wall Street and especially the British-connected House of Morgan was at the center of the economic boom which resulted from the immense demand coming from Britain and France for financial support and war-connected industrial materials of all kinds. The USA soon became the de facto allies of Britain and France due to its role in finance and supply, with the Morgan conglomerate in the lead. At the same time, New York corporate leaders began to collectively discuss and act on their perceptions of what the new situation demanded. The war among Europe's major powers was sidelining these economic competitors globally. Since the British and French corporations and states were preoccupied with the war, this created an opening for US economic penetration.

At the same time, demand in some key economic sectors in the USA was declining. For example, the international construction firm Stone and Webster concluded that there was not much railroad building still to be done in America and so they needed to go international. The National City-Rockefeller-Kuhn-Loeb leaders adopted this view, and they organized the American International Corporation (AIC) in 1915 to invest American capital globally on a large scale. This corporation was an early version of today's private equity firms. A large volume of capital was put into the AIC with the goal of taking over promising foreign enterprises all over the world, financing them into stronger firms, with the goal of immense profits (Vanderlip and Sparkes 1935, pp. 267–271). Fifty million dollars was quickly raised on Wall Street, and soon the AIC had a portfolio of at least 24 different foreign corporations. While the National City-Rockefeller-Kuhn-Loeb group dominated the AIC, they did reach out and secure representation from the Morgan group. This type of collaboration became the inclusionary model for the two main capitalist conglomerates when they formed a new "semipublic" organization, the Council on Foreign Relations, in 1918.

This, the first CFR, was a relatively small body of well-connected individuals active in the 1918–1920 years: 97 New Yorkers and 13 more from other US cities (Boston, Chicago,

Cleveland, Philadelphia, St. Louis, and Washington, D.C.), as well as one person from London. Each member paid an annual fee of $100, a cost generally too high for professionals, but not too much for the capitalists involved. Although small in numbers, the people brought into the organization were powerful and well-connected: high corporate officials, key lawyers from top Wall Street firms, ex-government officials, and opinion leaders. About a third were from the world of finance, especially many leaders of the two key conglomerates discussed above, and included four of the AIC's directors. The honorary chairman was none other than Elihu Root, a former Secretary of State and Secretary of War (Council on Foreign Relations 1919). A Wall Street corporate lawyer, Root was the first "wise man" of foreign affairs, the original foreign policy grandmaster who led the transformation of the USA from a regional into a world power during the 1899–1909 period. He was related to, as well as a friend and adviser to, J.P. Morgan. Root favored a large role for the USA in the world and so, of course, pushed for American involvement in World War I at an early date. Others who played key roles in this first CFR included Alexander J. Hemphill, chairman of Guaranty Trust Company, who was chairman of the Finance Committee; publisher Frank N. Doubleday who was treasurer; Kuhn-Loeb bankers Otto H. Kahn and Paul M. Warburg, who served on the executive committee and board of governors, respectively; and Darwin P. Kingsley, president of New York Life Insurance. Also on the executive committee was lawyer and author Richard Washburn Child, the editor of *Collier's Weekly*. Albert Shaw, editor of the American *Review of Reviews*, was chairman of the membership committee (Council on Foreign Relations 1919).

The views of some of these leaders of the first CFR are an important window into some of the ideological currents alive in the organization. For example, Darwin P. Kingsley, called one of the "great American business leaders of the twentieth Century" by the Harvard Business School, believed that world federation, based on the "reunion of the Anglo-Saxon world," would allow the USA and Britain to act as the masters "of war and the destinies of the human race." The British Empire and the USA should unify and establish the basis for the "United English Nations," the "Anglo-Saxon Republic" (Kingsley 1916). Albert Shaw was part of the broad left, a progressive interested in utopian communities. Richard Washburn Child, on the other hand, was an open fascist. In the 1920s he became a close friend of Italian dictator Benito Mussolini, even helping this fascist write his autobiography, later serialized in *The Saturday Evening Post.* Child and Morgan partner Thomas W. Lamont, a CFR member at least by the mid-1920s, were the two most influential promoters of Italian fascism in the United States.

The program of the CFR during this 1918–1919 period stressed one overarching aim, the economic expansion of the USA, led by people "concerned in the world's affairs in a large way." To promote this goal, the CFR organized a "continuous conference on foreign affairs" with "international thinkers" leading the discussions. Its aims included cooperation "with the Government and all existing international agencies and to bring all of them into constructive accord" (Council on Foreign Relations 1919). The organization had 14 major meetings in 1918–1919 focusing on trade and tariffs, press and public opinion, and single nations such as Mexico, bringing together top Mexican officials with US experts for two meetings over the course of a month (Shepardson 1960, p. 11). One of the meetings occurred in late 1918 with James W. Gerard, a CFR member and former US ambassador to Germany, speaking on "Radical Experiments in Foreign Lands and their Influence on the Investment of American Capital" (Shepardson 1960, p. 11; Reed et al. 1918).

Origins in Paris: 1919

While the New York capitalists and their professional allies were entertaining their dreams of super profits through foreign economic expansion, World War I was grinding to a bloody

conclusion. The victors soon gathered in Paris to impose their imperialist war aims on the defeated and overthrown powers: Germany, Austria-Hungary, Turkey, and Russia. But the British had an additional key agenda item, the same one previously articulated by Darwin P. Kingsley of the CFR: joining the Anglo-Saxon world into one empire, headquartered in New York and London. This scheme had British origins, and one key source was the super imperialist Cecil Rhodes, who made his vast fortune exploiting native peoples and resources in Southern Africa. His extreme ambition is captured by his statement that "I would annex the planets if I could; I often think of that" (Huberman 1936, p. 202). More practically, one of his life goals was to expand the British Empire and Pax Britannica, including recovering the United States and making it all part of a larger, even more globally dominating empire (Marlowe 1972). Rhodes' plan, which included the Rhodes scholarship program, was put into motion by Lord Albert Milner, a corporate executive for the Rothschild interests who was a former British Secretary of State for War. He was aided by historian Lionel Curtis with money from the Rhodes Trust (Quigley 1966, pp. 950–952). Beginning about 1908, Milner and Curtis established a network of semisecret organizations called the Round Table Groups in the British Dominions and the USA. Round Table members from the USA, such as the historian George Louis Beer, Morgan partner Thomas W. Lamont, and Round Table correspondent Whitney H. Shepardson, were at the Paris Peace Conference as participants in President Wilson's postwar planning effort, The Inquiry (Shoup and Minter 1977, p. 13).

On May 30, 1919, at the Majestic Hotel in Paris, members of the British and American peace conference delegations, including Curtis, Beer, Lamont, and Shepardson, met and decided to form a new Anglo-American organization. It was officially named the Institute of International Affairs with two branches, one in Britain and one in the USA. Lionel Curtis and Whitney H. Shepardson became the secretaries of the British and American branches, respectively (Shoup and Minter 1977, pp. 12–14).

1921 Merger: The Modern CFR

While the British Institute of International Affairs moved rapidly to become established as the Royal Institute of International Affairs (Chatham House), both the American Institute and the first CFR became inactive. In 1920 officers of the Council suggested a merger with the American Institute, and a committee was set up with Shepardson as executive secretary and Wall Street lawyer George W. Wickersham, a board member of the original CFR, as chairman. The new organization retained Elihu Root as honorary president and installed a Morgan attorney, John W. Davis, a former acting Secretary of State, as its president. Paul D. Cravath, another Wall Street lawyer and a fierce Anglophile, was the new vice president, with the Morgan and Harvard connected Edwin F. Gay as secretary-treasurer. Wickersham and Shepardson were among the new directors, as were Kuhn-Loeb bankers Otto H. Kahn and Paul M. Warburg from the original Council. Another Morgan-connected banker, Norman H. Davis, was also a director, as were several scholars who had participated in The Inquiry. These included the Boston Brahmin Archibald Cary Coolidge, a Harvard history professor and a great grandson of Thomas Jefferson. He was also related to soon-to-be President Calvin Coolidge. Another scholar was the geographer Isaiah Bowman, associated with Yale and Johns Hopkins universities and also the founding director of the American Geographical Society. The modern Council on Foreign Relations, an organization heavily influenced by the Morgan monopoly finance capitalist group and the concept of long term Anglo-American unity, was successfully incorporated in New York during the summer of 1921 (Shoup and Minter 1977, pp. 15–17).

The first Council program was the establishment of a magazine meant to be the "authoritative" source for guiding US foreign policy in an imperialist direction. The first issue of *Foreign Affairs* was published in September 1922 with Archibald Cary Coolidge as editor and Princeton graduate and social register listee Hamilton Fish Armstrong as managing editor. The process of

raising the $125,000 needed to establish this journal is instructive. Half this sum, very large for this period, was quickly raised from the CFR's new board of directors. The rest was raised in only 10 days through a solicitation letter addressed to "the thousand richest Americans" (Shoup and Minter 1977, pp. 17–18). *Foreign Affairs* largely followed what Gay, the CFR's new secretary-treasurer, had stated in 1898 about the US role in the world: "When I think of the British Empire as our inheritance I think simply of the natural right of succession. That ultimate succession is inevitable" (Heaton 1952, p. 51). *Foreign Affairs* rapidly became what *Time* has called "the most influential periodical in print," read by "the world's most influential minds in business and politics" (Shoup 2015, pp. 70–71).

The Council Between the Wars

While frequent meetings, the "continuous conference" on foreign policy, remained central at the new CFR, another key early program was its think tank, developed in the 1920s and 1930s. Study groups were formed which brought together leading capitalists, scholars, lawyers, and other professionals to study a problem or issue and produce a written product recommending the consensus course of action for the capitalist community and the government. One early such Council study group, called the "Far Eastern Conference Group" resulted in the 1927 book *Ores and Industry in the Far East* by H. Foster Bain. Bain was secretary of the American Institute of Mining and Metallurgical Engineers and a CFR member. He had conducted extended field investigations in China for a New York mining corporation to lay the basis for investment there, and the book covered the investment angle as well as strategic/war potential. Bain begins his book by pointing out that if we want to sell our products in the Far East, we need to know what "sources of untapped wealth exist there and how to bring them into use" to pay for the products we wish to sell (Bain 1927, p. 2). What followed was an immensely detailed study of the mineral and non-mineral wealth of the Far East, including oil

resources, as well as industrial conditions and issues affecting development. The study was no doubt useful to capitalists wanting to invest in and exploit the mineral, industrial, and human resources of various Asian countries.

Another focus of the CFR in the 1920s was aimed at assuring continued close US relations with Great Britain and its empire. In 1928, in cooperation with Chatham House, the Council created an Anglo-American study group. Its members recommended supporting expansionist-imperialist policies and that the two countries coordinate their foreign policies as far as possible (Gorman 2012, p. 178). CFR leaders saw US economic power as extensive as that of its ally, Great Britain. The Council, dominated by corporate bosses, also viewed expansion of US trade and investment overseas as central to preserving the status quo at home. As long time CFR board member Isaiah Bowman put it in 1928, foreign raw materials, imports, and exports were necessary to "avoid crises in our constantly expanding industries" (Bowman 1928, p. 14). This, the "open door," demanded an activist, imperialist foreign policy to assure that foreign markets, resources, and labor were available for US investment and control. During this era the Council was, however, not as dominant in making official foreign policy as it was later to be. Congress had vetoed an overtly activist foreign policy when it rejected full US membership in the League of Nations. The election of Hebert Hoover to the presidency in 1928 did increase the Council's influence in foreign policy formation since Henry L. Stimson, the new Secretary of State, was a CFR member and he tapped Herbert Feis, a member of the Council's staff, to be his chief economic adviser. But with the onset of the great depression in 1929, the USA turned in a more nationalist and domestic direction. Congress passed high protective tariffs in 1930.

The trend toward economic nationalism began a "great debate" over national self-sufficiency and economic independence. Left-wing scholars, such as Charles A. Beard in his book, *The Open Door at Home*, argued that a rational, planned economy could make sure that any "surpluses" could be consumed at home (Beard 1934). This would

require an efficient distribution of income and wealth and would result in full employment and a high standard of living for all Americans. The CFR strongly opposed this approach because it would end the monopoly of economic decision-making by the financial and corporate capitalists that dominated the Council. So the Council counterattacked with *Foreign Affairs* articles and a discussion group on the topic. The CFR's aims included influencing the incoming Franklin D. Roosevelt (FDR) administration in an imperialist direction. This was facilitated by Norman H. Davis, an intimate friend of both Franklin Roosevelt and the new Secretary of State Cordell Hull. Davis was the Council's vice president (1933–1936) and eventual president (1936–1944). The CFR discussion group on national self-sufficiency began meeting in late 1933 under the chairmanship of John Foster Dulles, a future Secretary of State. As was typical for the Council, the group was high level, with the current secretary of agriculture, budget director, and economic adviser to the State Department participating, along with CFR leaders, a former Secretary of State, a former secretary of the treasury, a Morgan partner, deans from Harvard and the University of Chicago, journalists, and several academic and corporate economists. With self-sufficiency debunked, the Roosevelt administration gradually dropped its initial nationalist stress on domestic reform as the answer to the depression, substituting foreign trade expansion as the solution (Shoup and Minter 1977, pp. 24–27). Part of this emphasis was closer ties with the strongest imperialist power of the time, the British Empire, long the favored approach of the CFR.

The Grand Area: The CFR and the Drive for Global Hegemony, 1939–1945

Near the end of the World War II, two of the CFR's senior directors wrote that the Council had "served an increasingly useful function in the period of the twenties and thirties; but it was only with the outbreak of World War II in Europe that it was proved to have come of age" (Shoup and Minter 1977, p. 117). It is emblematic of the exalted ambition of the Council that on September 12, 1939, only 12 days after the beginning of World War II and over 2 years prior to direct US involvement, CFR leaders were meeting at the State Department in Washington, D.C., with government officials to begin what was to become one of the largest and most important of the Council's "national interest" strategic planning efforts, its *Studies of American Interests in the War and the Peace*. In collaboration with the American government, the CFR study groups developed an imperialistic conception of the national interest and eventual war aims of the USA. This marked a move on the part of the CFR and the USA toward creating a full-blown, globally hegemonic imperialism, the largely successful attempt to organize a single, world-spanning political economy with the USA at the center. The Council had indeed come of age.

With the cooperation of the State Department and over $300,000 in funds from The Rockefeller Foundation, the Council set up five study groups of experts to focus on the long-term problems of the war and plan for a new world order afterward. Four of the groups – the economic and financial, political, security/armaments, and territorial – began meeting in early 1940. A peace aims group, focusing on the war aims of the European powers, was established in 1941. The key people guiding this effort included the seven men who headed up the five groups plus CFR President Norman H. Davis, who by this time was President Roosevelt's Ambassador-at-Large. Alvin H. Hansen, professor of political economy at Harvard, and Jacob Viner, professor of economics at the University of Chicago, chaired the economic and financial group; Whitney H. Shepardson took charge of the political group; lawyer Allen W. Dulles and *New York Times* correspondent Hanson Baldwin led the security/armament group; Isaiah Bowman chaired the territorial group; and Hamilton Fish Armstrong headed the peace aims group. About 100 individuals were involved over the 1940–1945 period. Collectively they prepared 682 separate documents for the State Department and President Roosevelt. That FDR used the Council's work to help formulate policy is indicated by the fact that he carried one

of the CFR memorandums to a cabinet meeting and cited it as the basis for policy conclusions he had reached (Shoup and Minter 1977, pp. 118–123).

The Council's grand-scale planning took on an even more serious tone after Germany conquered France and threatened the independent survival of Great Britain in the spring and summer of 1940. Faced with an increasingly powerful Germany and an aggressive Japanese Empire, the CFR war-peace planners asked and answered the key question: how much of the world's territory, resources, and labor did the USA need in order to maintain its prosperity and power? How much of this economic living space could it allow to be subtracted from its orbit by these two hostile powers and still avoid a crisis at home and a decisive loss of influence abroad? To answer these fundamental questions, the Council, led by the economic and financial group, began a large-scale study of the world's potential and actual economic blocs in the summer of 1940. The blocs considered were the Western Hemisphere, Britain and its empire, Continental Europe, and the Far East. The Soviet Union was omitted from the calculations. With Continental Europe under German control as a result of the defeat of France and with Britain facing great danger, CFR planners concluded that the global situation in 1940–1941 demanded that the USA frame its policies based on the imperialist control of the "great residual area" of the world open to the USA. The CFR defined this area as consisting of the Western Hemisphere, the British Empire, and the Far East, which included China, Japan, and Southeast Asia. The war-peace planners called this territory the "Grand Area" and saw it as the minimum economic, trade, and resource living space for the USA.

For the USA to become the dominant global power, the "Grand Area" had to be defended. This required rapid rearmament. As the Council planners expressed it in one of their memoranda, dated October 19, 1940, "The foremost requirement of the United States in a world in which it proposes to hold unquestioned power is the rapid fulfillment of a program of complete re-armament" (War-Peace Studies Memorandum E-B 19, October 19, 1940, cited in Shoup and Minter

1977, p. 130). A central contradiction of the "Grand Area" and the US imperialistic drive for "unquestioned power" worldwide was Japan's refusal to cooperate and play the subordinate role assigned to it. Just as Germany had its own living space theory and practice ("lebensraum" in the lands to the east of Germany), Japan had its own Asia-focused Grand Area, called the "Greater East Asia Co-Prosperity Sphere." Japan's attempt to implement their plan, together with the efforts of the USA to expand into and consolidate the "Grand Area," resulted in a clash of rival imperialisms. This clash became serious in 1941 when, at the CFR's suggestion in a January 1941 memorandum, the US government began a trade embargo, cutting off the sale of vital raw materials to Japan to try to force it to cooperate with US plans (War-Peace Studies Memorandum E-B 26, January 15, 1941, cited in Shoup and Minter 1977, pp. 131–133). This resulted in hardline military elements gaining more power in the Japanese government, and they made the fateful decision to go to war to implement their "Greater East-Asia Co-Prosperity Sphere" war aim, part of which involved the seizure of all of Southeast Asia, including the Dutch East Indies (today's Indonesia). Since the USA had made it clear that such Japanese expansion was unacceptable, the Japanese government made the portentous decision to attack the American military in Hawaii, hoping to strike a decisive blow to prevent a successful response. The US victory in the resulting all-out war allowed the Americans to implement their living-space plan an expanded "Grand Area" that included the entire world after the defeat of Germany. As Bowman, the leader of the territorial group of the war-peace studies, expressed it, the enlarged conception of American security interests was required to command areas "strategically necessary for world control" (Memorandum T-A21, January 16, 1942, cited in Shoup and Minter 1977, p. 163). The means used to unify the "Grand Area" during the war could also be adapted to integrate the entire global economy following complete victory. As early as the summer of 1941, Council planners had identified the need for both a top-down empire form of economic integration and a more horizontal

customs union form of economic combination. Such integration also required currency stabilization measures and an international banking institution to provide funds to increase capitalist economic demand in "backward areas." Thus, CFR planners had described the post-war need for an International Monetary Fund and World Bank even before the USA entered World War II (see Shoup and Minter 1977, pp. 135–139).

Protecting the Grand Area: Korea and Southeast Asia

The resulting world order that developed after victory in World War II was one in which the United States, led by the CFR and its members, was the hegemonic power, forcing on the world's people an informal imperialism usually operated by local clients who were often tyrants, instead of open colonialist imperialism run directly by outside powers. But there was opposition to US world control. The Soviet Union's version of state capitalism controlled a sizable chunk of the globe, and Mao's victory over the US-allied Chiang Kai-shek added another large piece in 1949. The expansion of state-controlled economic systems made the US ruling class very nervous since the CFR's prior studies – accepted by government leaders who were often Council members – had shown that America needed a very large amount of economic living space indeed. Thus, the CFR and government decision-makers feared the possibility of the loss of additional parts of the expanded Grand Area. This was manifested in June 1950 when a civil war broke out on the Korean Peninsula. To prevent such possible adverse consequences, the USA decided on a full-scale military intervention. Key background to this decision was NSC-68, an early 1950 report to President Truman by the department of state's internal think tank, its policy planning staff. Titled *United States Objectives and Programs for National Security*, this report and an earlier version produced in 1948 stressed, in an interesting case of psychological projection, that the USA believed that the Soviet Union wanted to "impose its absolute authority over the rest of the world" by

dominating the "potential power of Eurasia" and that this was "unacceptable to the United States." Thus, a line had to be drawn to prevent the erosion of the Grand Area and a shift of world power toward the Soviets. Those making this decision and the choice to draw that line and go to war in Korea in June 1950 and continue the war until the 1953 armistice were mostly members of the Council on Foreign Relations. A partial list of decision-makers favoring the war in Korea who were also members of the CFR in 1950 includes Secretaries of State Dean Acheson and John Foster Dulles; Directors of the Department of State's Policy Planning during the 1947–1953 period George F. Kennan (author of the famous containment memorandum regarding the USSR) and Paul H. Nitze; President Dwight D. Eisenhower; Assistant Secretary of State for Far Eastern Affairs Dean Rusk; Ambassador-at-Large Philip C. Jessup; and Presidential Adviser W. Averell Harriman.

At the same time that the USA was at war over the future of Korea, the Council on Foreign Relations was beginning to organize a series of study groups focused on the US interests in and relationship to Southeast Asia. The war-peace studies had identified Southeast Asia as a region that was a key part of the Grand Area, one that was economically complementary to the USA and other industrialized regions of the world. This region was seen as a unit that had important raw materials, market possibilities, rice production, and controlled key communication routes. Between 1948 and 1960, the CFR organized and implemented no less than seven policy study groups that discussed the importance of Southeast Asia. The national interest framework established by the Grand Area concept was invariably stressed as the conclusion for government officials to implement. This framework and conclusion were manifested by each of the seven study groups. To cite just one example, in 1954–1955 John Kerry King was the research secretary for a Council study group on US Policy and Southeast Asia headed by CFR member Edwin F. Stanton, a former US ambassador to Thailand. Stanton stated at the outset that Southeast Asia was of "vital importance" because of "strategic position and

rich material resources" (Shoup and Minter 1977, p. 228). After the study group concluded, King published *Southeast Asia in Perspective*, with a foreword by Stanton. King's conclusion about the importance of Southeast Asia to the US national interest was identical to what Council leaders and members had been saying for many years – in "geopolitical terms, Southeast Asia occupies a position of global strategic importance roughly comparable to Panama and Suez" (King 1956, p. 7). King also stressed the strategic importance of US imports of natural rubber and tin from Southeast Asia and the fact that this area was also a crucial trading partner for American allies in Western Europe and Japan (King 1956, pp. 9–10). Almost all of the key officials in the Eisenhower, Kennedy and Johnson administrations were CFR members who adopted the Council perspective on the importance of Southeast Asia. Perhaps most famous was President Eisenhower's statement at his April 7, 1954, press conference, when he stated that the possible "loss" of Southeast Asia was "incalculable" due to the "falling domino" principle and the world's need for tin, tungsten, and rubber from this area (Shoup and Minter 1977, pp. 236–237). Eisenhower remained a CFR member while in office, and later presidents based their views and decisions on similar thinking and publications from the CFR (see Shoup and Minter 1977, pp. 236–237 and 252, footnote 58).

In sum, in the 1950s the Council and US government feared the further erosion of the Grand Area, and this fear was manifested in the "stop communism" policies toward Southeast Asia and Vietnam. The numerous CFR study groups and the heavy overlap between Council leaders, members, and the US government helped to forge a strong consensus about the importance of the region among the American ruling capitalist class, a consensus which led to the full-blown invasion of Vietnam against nationalist and left forces beginning in 1965. Noam Chomsky called this war the "most destructive and murderous act of aggression of the post-World War II period" and "the worst crime since World War II" (Chomsky 2016, p. 67, 253).

Once the imperial policies and the resulting war were clearly failures, CFR members and leaders were central to the reversal that took place in 1968. The reversal and move toward a peaceful settlement had many points of origin, most fundamentally the resistance of the Vietnamese to US imperialist plans to force neocolonialism on the country, but rebellion in the USA and among the troops in the field was also important. These factors influenced the informal "Senior Advisory Group on Vietnam" which was advising President Lyndon B. Johnson behind-the-scenes to recommend de-escalation and peace talks. This advisory group was mainly Council members and leaders, including the then chairman of the CFR, John J. McCloy (Shoup and Minter 1977, pp. 242–248).

The CFR as an Organization, 1950s to Present

The modern CFR, like its earlier counterparts, is still a Wall Street-dominated organization. The Rockefeller family and its allies, led by John J. McCloy and David Rockefeller of the Chase Manhattan Bank, were the single most important force in the Council from 1953 to 1985, superseding the Morgan group, which had dominated the CFR in the earlier era. David Rockefeller, wealthy leaders of private equity firms like Blackstone and The Carlyle Group, and investment banks like Goldman Sachs and Citibank have provided most of the top leadership of the organization since 1985. The Council's current Chairman (2018) is billionaire David M. Rubenstein, a leading figure in Carlyle. Through its leaders, members, and activities, the CFR has a vast domestic and international network, connecting with the US and other governments, top corporations, leading universities, other think tanks, the large foundations, media, lobbying, and advisory groups. Parts of this network include about 170 multinational corporations who are corporate members of the CFR. These connections, the Council's recent programs, and other topics are covered in detail in the author's 2015 book (updated for the 2019 paperback edition), *Wall*

Street's Think Tank: The Council on Foreign Relations and the Empire of Neoliberal Geopolitics 1976–2014.

The Council on Foreign Relations was an entirely male, increasingly elderly, and overwhelmingly white Euro-American organization until 1970. In that year, realizing that it had an image as well as an aging problem, the CFR embarked upon a gradual program of allowing women, younger, and minority members into the organization. It should be noted, however, that the pace of this diversification was very slow, and by 2014, 44 years later, the Council's almost 5000 strong membership was still about 84% white and 73% male (Council on Foreign Relations 2014, p. 6). The rise of Condoleezza Rice represents an example of how diversifying the membership has benefited the CFR and the broader capitalist class. A member of the professional class, Rice was an obscure junior academic at Stanford University when she was elected to the Council in 1984. She became active in the organization, meeting people who could further her career, including gaining highly paid positions like corporate directorships at Chevron, Transamerica, and Hewlett Packard. As a trustworthy minority female, safely initiated in the CFR worldview and with the Council's help, she was able to rise to the position of National Security Adviser and Secretary of State in the George W. Bush administration before returning to academic life as a professor at Stanford. In office, Rice faithfully followed the CFR's foreign policy line, for example, in promoting the US war in Iraq.

The CFR and Neoliberal Geopolitics

Above all else, the Council on Foreign Relations remains a place where the ruling capitalist class, together with its professional class allies, develops the grand strategy and tactics for creating and sustaining an empire based on the global hegemony of the USA and its corporations. Since its founding, the Council has always been an imperialist organization, seeking to impose the needs and interests of the US capitalist ruling class on the national and international working class majority. Its dominant worldview and grand strategy today is best summed up by the term neoliberal geopolitics. Neoliberalism is simply "free-market" fundamentalism, the capitalist goal of unrestrained freedom and property rights for corporations and capital at home and abroad: including free trade, privatization, deregulation, and destruction of unions. It also strives to create new markets in sectors of the economy where public ownership is common, such as public utilities, land use, education, health care, and pollution control. Geopolitics refers to geographically oriented politico-economic thinking to guide the worldwide struggle for power. This includes alliance systems and naval, air, and land military power, as well as control of key world regions, such as the Eurasian global heartland. In a number of publications, CFR member and former Council director Zbigniew Brzezinski outlined what he felt should be the US global geopolitical perspective. As was true of other historic geopolitical thinkers, Brzezinski stressed the centrality of Eurasia to world power and the future of the USA:

> With Eurasia now serving as the decisive geopolitical chessboard, it no longer suffices to fashion one policy for Europe and another for Asia. What happens with the distribution of power on the Eurasian landmass will be of decisive importance to America's global primacy and historical legacy. (Brzezinski 1997, quoted in Shoup 2015, p. 183)

More recently, CFR employee and member Walter Russell Mead, wrote a CFR-published book in 2004, outlining the CFR and America's neoliberal geopolitical strategy for world hegemony in the twenty-first century. Early in the book, Mead points out that the USA took over the "British world system" of imperialism and built a US version of it, acting almost like "the policeman of the world" (quoted in Shoup 2015, p. 192). Mead first stresses that the "solid foundation" of the American system of global imperialist domination is military power, including a vast system of bases and alliances which, in turn, connects to control of sea lanes for trade and commodity delivery, especially oil to energy-short Europe, China, and Japan. His second point concerns the set of global economic institutions centered in the USA with incentives and disincentives

that attract others into neoliberal capitalism and make it very difficult for them to exit. A third point is the "soft power" of the USA – an attractive culture and positive values that create legitimacy and seduce people and governments into voluntarily doing what the CFR and US imperialists want them to do, especially to partake in and support the dominant neoliberal geopolitical system. Mead's fourth point is that hegemonic power/world empire results from the three prior points adding up to more than the sum of each part. Importantly, this includes the ability to set the agenda, determining the framework for discussion and debate, something that is also central to the Council itself (Mead 2004, pp. 25–44).

The system of neoliberal geopolitics immensely benefits wealthy plutocrats. They make up the ruling class, operating in coordination with the monopoly-finance capitalist corporations that they own and control. Rank-and-file people get austerity, low wages, no union protections, cuts to the programs they depend upon, inadequate and costly education, expensive wars, dangerous nuclear weapons, and a level of environmental destruction that threatens the future of humanity.

The CFR and Neoliberal Geopolitics in Action: The Iraq War

The Council's worldview and its overwhelming influence in Washington led directly to the disastrous US war in Iraq. Measured by lives lost and people injured on both sides, as well as resources wasted, this war was by far the most expensive for the USA in the twenty-first century. Noam Chomsky stated that the war was "utterly without credible pretext...the major crime of the twenty-first century" (Chomsky 2016, p. 250). A careful study by the British medical journal *Lancet* estimated that about 650,000 Iraqis were killed and an unknown number wounded. Almost 8,000 US citizens were killed and over 100,000 wounded (Shoup 2015, p. 234). The CFR set the climate of opinion about the importance of Iraq, and Council members in and out of government made the key

decision to go to war, set the war aims, and supplied the personnel to implement the resulting neoliberal policies within Iraq.

The strategic power of controlling the main sources of the world's oil was foremost in the minds of the CFR planners as they successfully set the US climate of opinion during the decades leading up to the imperialist decision to invade and conquer Iraq. Since Europe, China, and Japan all needed Iraqi and Middle Eastern oil to survive as relatively prosperous and powerful societies, whoever ruled over this resource could exercise immense power globally. During the 1980–1990 period, two different Council study groups stressed the strategic importance of controlling what was labeled the "oil heartland." Secretary of Defense Richard B. Cheney testified to Congress that whoever controlled this flow of this oil had a "stranglehold" over the American economy and "most of the other nations of the world as well" (Shoup 2015, pp. 202–203). By the mid-1990s, Cheney, a member and former director of the CFR, was part of a hardline imperialist pro-war organization called the Project for the New American Century. This organization, dominated by Council members and former directors, lobbied for a US war against Iraq to seize its oil resources (Shoup 2015, p. 204).

A CFR book written by Council staff member Kenneth M. Pollack soon followed. *The Threatening Storm: The Case for Invading Iraq* was a collective work in the sense that Pollack credits leaders of the CFR who "made the book possible" with paid time off, a foundation grant and the backing of the "full resources of the Council" (Pollack 2002, pp. 425–426). Pollack's advocacy of a war to control Iraq was based on the importance of its oil; he even wrote a follow-up *Foreign Affairs* article on the Persian Gulf in 2003 with a heading entitled "It's the Oil Stupid" (Pollack 2003, pp. 3–4). CFR leaders like former director Alan Greenspan and former head of US military operations and current (2018) CFR director General John Abizaid agreed that the US war on Iraq was based on seizing Iraqi oil. Greenspan said "the Iraq war is largely about oil" and Abizaid stated that "of course it's about oil." Numerous

other CFR leaders, members, and staff were pushing for a war on oil-rich Iraq during the same period, with only one prominent Council member, Princeton Professor G. John Ikenberry, speaking out against what he called a "neo-imperial grand strategy" (Shoup 2015, pp. 210–211).

The CFR's war drive and its view of proper US war aims were adopted by the US government in 2002–2003, resulting in a criminal imperialist war on Iraq and its people. A large majority of those in the key power positions deciding on the war and implementing its aims were members of the Council, including Vice President Cheney, Secretary of State Colin Powell, National Security Adviser Condoleezza Rice, CIA Head George Tenet, Undersecretary of Defense Paul Wolfowitz, State Department Policy Planning Director Richard Haass, and Iraq Administrator L. Paul Bremer. Secretary of Defense Donald Rumsfeld was a former CFR member. Five former top government officials consulted on the war, "wise men" types who basically agreed that the war should go forward, were all Council members (Shoup 2015, pp. 212–214).

Once the USA had conquered Iraq, the war aims that resulted from this CFR dominance of US policy-making became a disaster for the people of Iraq, and it resulted in mass rebellion. The goal was to rapidly turn Iraq's state-planned economy into a market-driven, globalized neoliberal economy. The first step was to disempower the Iraqi people and their former leaders by abolishing the Ba'ath Party, banning its members from public office, and dissolving the Iraqi Army. These dictatorial actions created millions of enemies for the new US neocolonialist regime. The Iraqi resistance only deepened when Bremer issued orders that caused mass unemployment: privatizing 200 state-owned enterprises; suspending all tariffs and customs duties; allowing 100% foreign ownership of large portions of the Iraq economy; and establishing a flat tax and other neoliberal policies. Once the resulting resistance by Iraqis had grown to levels that threatened the entire US enterprise in Iraq, the USA resorted to barbaric repression led by CFR members General David Petraeus and John Negroponte (Shoup 2015, pp. 215–226). The repression was ultimately successful, and many of the US war aims were achieved. For example, direct foreign investment in Iraq amounted to over $5 billion annually by 2013 and, despite a drop, was still at about $4 billion annually in 2016. The US-dominated International Monetary Fund approved a $5.3 billion bailout for the Iraqi regime in mid-2016, in exchange for "significant economic changes" (Kent and Nabhan 2016). Multinational oil corporations like Chevron, ExxonMobil, Hess, BP, Shell, TOTAL, and Eni (all of them are corporate members of the CFR) now have licenses to operate in Iraq and are exploiting its oil resources for their own profit. Furthermore, there is evidence that US corporations are receiving preferential treatment in regard to contracts for rebuilding Iraq. On October 18, 2018, the *Financial Times* reported that just as the Iraqi government was poised to give Siemens, the German-based engineering group, a $15 billion contract to supply power generating equipment, the Trump administration intervened, reminding the Iraqi government of the thousands of Americans who had died in the 2003 invasion and its aftermath and suggesting that US-based General Electric be given the contract. One adviser to the Iraqi prime minister stated that US pressure was intense, amounting to the US government "holding a gun to our head" (McGee and Crooks 2018). The result is that General Electric, a CFR corporate member for many years, will likely win out over Siemens, which is not a corporate member of the Council.

The CFR and the Growing Conflict with China

While US imperialism was attempting to dominate the oil-rich Persian Gulf region by conquering Iraq, China was rapidly expanding economically and geopolitically, soon becoming the world's second most powerful nation and the most important strategic rival to the North American colossus. The status quo of the CFR and US government's position on relations with China

was epitomized by a 2007 Council Independent Task Force report titled *U.S.-China Relations: An Affirmative Agenda, A Responsible Course* (Council on Foreign Relations 2007). In this report, CFR leaders recognized that the US-China relationship was the most consequential of the twenty-first century, stressing the need for dialogue, transparency, and coordination. Furthermore, they judged that China's behavior, although mixed, was overall "positive" and that China could become a "responsible stakeholder" in the US-created global order (Shoup 2015, pp. 244–251). By 2015, however, this perspective had radically changed, and a new study group published a Council special report: *Revising U.-S. Grand Strategy Toward China* (Council on Foreign Relations 2015). The 43-member strong study group, almost 75% of whom were also members of the CFR, included both Republicans and Democrats, scholars and business people, and numbered many who previously held high positions in the defense and state departments as well as the CIA. After numerous meetings, they concluded that the existing "integration" policy toward China was a failure and should be drastically altered and that a tougher US stance toward China was needed. Their view was that China had not evolved into a "responsible stakeholder"; instead, it was a dissatisfied power wanting to "replace the U.S. as the most important power in Asia" (Council on Foreign Relations 2015, p. vii). The Council's study group concluded that China's current goals conflict with US aims and argued that China's focus is on not just becoming a key "trading state" but rather that China intends to "continue along the path to becoming a conventional great power with the full panoply of political and military capabilities, all orientated toward realizing the goal of recovering from the United States the primacy it once enjoyed in Asia as a prelude to exerting global influence in the future" (Council on Foreign Relations 2015, p. 17). A new American grand strategy was therefore required, focusing on contesting and balancing China's rise so that the imperial "preeminence" of the USA will be maintained both in Asia and worldwide. As the report expressed it, "preserving

U.S. primacy in the global system ought to remain the central objective of U.S. grand strategy in the twenty-first century" (Council on Foreign Relations 2015, p. 4). In an attempted replay of "containment," the CFR recommended a variety of tactics to blunt China's rise, maintain US hegemony, and protect "vital US national interests." These include restricting trade with China in militarily critical technologies; strengthening the American military; challenging China in the South and East China Seas with a stronger naval and air presence; reinforcing US alliances with Japan, Taiwan, India, South Korea, Australia, and six Southeast Asian states (the Philippines, Indonesia, Vietnam, Singapore, Malaysia, and Myanmar); building up the military power of several of these allies; and improving the diplomatic management of the China-US relationship (Council on Foreign Relations 2015, pp. 24–33, 39).

Interestingly, one of the leading members of the 2015 Council study group was Harvard professor and former Defense Department official Graham T. Allison, a CFR member for over 40 years. In 2015, at the same time Allison was serving on the Council study group on China, he was writing on what he labels the "Thucydides Trap," named after the ancient Greek historian who wrote on the inevitability of conflict and war between a hegemonic power and a rising power who challenges that dominance. Allison wrote that China's rise represented a "tectonic shift." The "impact China's ascendance will have on the U.S.-led international order" represents the "preeminent geostrategic challenge of this era" for the USA. Allison concluded that "based on the current trajectory, war between the United States and China in the decades ahead. . .is more likely than not." He added that "war, however, is not inevitable." Sustained attention by the highest levels of both nations and "radical changes" in attitudes and actions by both leaders and publics could avoid the horrific loss of lives and destruction – perhaps the end of civilization as we now know it – that a war between these superpowers would entail (Allison 2015).

Another leading member of the *Revising U.-S. Grand Strategy Toward China* study group was

Paul D. Wolfowitz, another former Defense Department official and long-time CFR member. Wolfowitz was the main author of the famous defense planning guidance document of 1992, which stated, in the aftermath of the collapse of the Soviet Union, that the main objective of the USA should be to retain the status of the world's only superpower, forestalling the emergence of a new rival by preventing "any hostile power from dominating a region whose resources would, under consolidated control, be sufficient to generate global power." One region specifically mentioned by Wolfowitz was the "Eurasian heartland" (Tyler 1992). With its "Belt and Road Initiative," an infrastructure development plan, China is penetrating this heartland in a big way, setting up possible US-China conflict.

Despite having fewer members of the Council in top policy-making positions than is usual in a US administration (National Security Advisers H.R. McMaster and John Bolton are both CFR members, as is influential Trade Representative Robert E. Lighthizer, but not the secretaries of state, defense, and treasury), the aggressive, amoral policies on China followed by President Donald Trump, a billionaire who is supported by some and opposed by other CFR members, are dovetailing very well with the hard-line recommendations of the Council. Furthermore, Trade Representative Lighthizer appears to be the strongest voice on US-China policy. A report in the *Financial Times* points out that Lighthizer "really brings a lot of substance to the president's ideology. He's the man who has the plan and the thinking underpinning the vision" (Politi 2018). This indicates that the overall US climate of opinion on China has likely been heavily influenced by the CFR. The result is a strategic reset of the global trade and sanctions order, since the USA is trying to push its sanctions architecture onto other nations' relations with China. Now radical geopolitical uncertainty is being fostered by Trump and his Republican Party, along with sharply rising tension and conflict between the USA and China, with unknown longer-term outcomes. It is hard to overstate this development, since under CFR leadership, the USA has been the world's hegemonic imperial power for many decades and now must face a decline in its dominance, while a formerly subordinate power rises.

Conclusion: The CFR and the Two Existential Threats to Humanity's Future

As this essay has illustrated, the Council on Foreign Relations is the central organization linking plutocratic corporate capitalist class interests to the planning and execution of US imperialism. Their success has made this capitalist class immensely wealthy and powerful but has also created two major and potentially fatal long-term contradictions. First, while so far the Council and the US capitalist class have allowed geopolitical rivals like China to grow and become powerful, they have failed to create a peaceful world order, which would help solve the nuclear weapon problem. Since many states have these doomsday devices, they represent an existential threat to the future of our human species.

The CFR is now encouraging great power confrontation between the USA and China over who will be predominant in Asia, Eurasia, and worldwide. The dangerous and unstable Trump administration has taken up the Council's call for a more aggressive policy. The Council's approach is based on a narrow definition of nationalism and what is best labeled the "national capitalist class interest" in a perilous era where a wise, moral, and democratic policy should be followed, recognizing and promoting the interests of humanity as a whole in cooperation, peace, environmental preservation, full equality, and social justice.

Secondly, as capital rapidly accumulates and expands its reach under the neoliberal capitalist system promoted by the CFR, it impacts more and more of the planet's ecological foundations, upon which all life ultimately rests. As a result, an intensifying, planet-wide ecological crisis is now upon us, which also represents an existential threat to the survival of our species. Humanity currently faces an increasingly dire situation, arising out of the nature and needs of fossil fuel-based capitalism as well as imperialistic interests as promoted by the CFR. This is characterized not only by more intense weather events, such as droughts,

floods, and intense destructive storms, but also more and more ruinous fires, resulting in further destruction of the ecologies upon which all life on earth depend. During the past 30 years, the CFR has organized a number of study groups on what it labels "climate change," but the organization has proved itself incapable of developing any serious proposals to solve this problem. Complacent and intent on keeping their system of profit and capital accumulation going, they and their members prefer to create illusions that something serious is been done to solve this existential threat to our collective future as a species. The bald fact is that fossil-fuel mining and use must be severely limited through a rapid and massive just transition to sustainable transportation, energy, manufacturing, and agricultural techniques (e.g., agroecological farming). Since US military spending and activity require vast amounts of explosive fossil fuels to power its armada, by far the world's largest, it is the biggest single emitter of carbon on the planet and must be sharply curtailed. The best science warns us all of the increasingly ruinous effects of a failure to act decisively to preserve our planet. This blunder, if not reversed, will amount to the greatest crime in human history. It should be clear to all that infinite economic growth on a finite globe is impossible, so an ecologically sound, rational, scientific, decentralized, democratically planned, and controlled ecosocialist system is needed for humanity to not only survive and preserve our beautiful planet but to thrive as a developing species in harmony with the earth and other living things (see Shoup 2015, pp. 277–314). We must choose the dignity of rebellious aspiration and hopeful activism, representing united humanity's path to overcoming imperialism and realizing our dreams.

Definition

The counter-discursive practices of Vodou are strategies and actions adopted to foster solidary and achieve political, cultural, economic, and military aim against the discrimination, suppression, and exploitation of imperialism in Haiti.

Introduction

Haiti has a long history of struggles against imperialism. Throughout its history, imperialist nations have executed many destructive tactics that have obstructed Haiti's development. These tactics, such as indemnities against a French invasion, trading and political domination, high-interest loans, military occupations, embargoes, and laws against the practice of Vodou, can be traced to Haiti's independence in 1804. In the beginning of this newly formed country, which many nations adamantly opposed, some of these tactics were implemented as direct responses to Haiti's independence. From the onset, the people of Haiti have relentlessly fought these tactics through many discursive practices.

This article has two purposes. The first purpose is to highlight the destructive tactics of imperialism in Haiti. We use the US military invasion of Haiti from 1915 to 1934 to uncover the tactics. The second purpose is to reveal Haiti's resistance against imperialism through the use of its Vodou religion. To achieve our objectives, this chapter is divided into seven sections. The first section, "Galtung's Theory of Imperialism," provides the reader with a definition of imperialism and its functions. This section will assist the reader in identifying and understanding the imperialistic tactics in Haiti. The second section, "From Christopher Columbus to 1915," gives the reader a brief history of Haiti prior to its independence and the impetus for its long struggle against imperialism. In the third section, "The US Occupation of Haiti from 1915 to 1934," we focus on the first part of the first US military occupation of Haiti. We chose this intervention in Haiti's history because most of the tactics employed by imperialist nations were used in Haiti during the occupation. Furthermore, the current conditions of Haiti are partly the result of this occupation. Because Schreadley (1934)'s "Intervention: The Americans In Haiti, 1915–1934" (a doctoral dissertation) provides accurate details of the invasion, we recount the stories it provided in this section. The remaining sections focus on the "Anti-Vodou Laws," "The History of Vodou in Haiti," "The Functions of Vodou in

Haiti," and "Counter-Discursive Practices of Vodou."

Galtung's Theory of Imperialism

According to Galtung (1971), the world is divided into "Center" and "Periphery" nations, and the nations have their own centers and peripheries. For Galtung, imperialism is a dominance relationship between the Center and Periphery nations, in which the Center nations have power over the Periphery nations. This relationship is established when the center (the elites) of a Periphery nation forms a bridgehead for a Center nation. Three things could happen as a result of this relationship: First, there is harmony of interest between the center (elites) in the Center nation and the center (elites) in the Periphery nation. Second, there is more disharmony of interest within the Periphery nation than within the Center nations. Third, there is disharmony of interest between the periphery in the Center nation and the periphery in the Periphery nation (Galtung 1971).

It is important to explain what Galtung meant by disharmony of interest and harmony of interest. According to Galtung, disharmony of interest occurs if the two parties are coupled (interact) together in such a way that the living condition (LC) gap between them is increasing. On the contrary, there is a harmony of interest "if the two parties are coupled together in such a way that LC gap between them is decreasing down to zero" (Galtung 1971, p. 82). The indicators for the LC would be income, standard of living, quality of life, and the notions of autonomy (Galtung 1971).

Galtung (1971) identified two basic mechanisms of imperialism between the nations: the vertical interaction relation and the feudal interaction structure. The vertical interaction relation is the major factor behind the inequality between Center and Periphery. The interaction is vertical when it occurs across a gap in the processing levels. This is when the Periphery nations export primary goods to the Center nations and the Center nations export manufactured goods to the Periphery nations. However, the goods exchanged between the two nations are not the same; in fact, they are very different types of things. Thus, the

processing level generates external economies for the Center nation but not for the Periphery nations (Galtung 1971).

The feudal interaction structure is the factor that maintains and reinforces this inequality. That is, although there are high degrees of interaction between Center nations, there are lesser degrees of interaction between Center and Periphery nations. In addition, little interaction occurs between Periphery nations. The feudal interaction structure is very damaging because it has major economic consequences for the Periphery nations. For example, the Periphery nations mostly trade with one Center nation, whereas the Center nation can trade with multiple nations. That is because the Center nation dictates with whom the Periphery nation can trade and what the Periphery nation can trade. Furthermore, the Periphery nation tends to have one or few primary products to export (Galtung 1971).

The consequences of the vertical interaction relation and the feudal interaction structure are that the Periphery nations have no choice but to depend on the Center nations. It is very difficult for the Periphery nations to develop their own economy with just a few products to export. In essence, in the Periphery nation, its center grows and is more enriched than its periphery, depending on how the interaction is organized between the two. According to Galtung (1971):

> "[F]or part of this enrichment, the center in the Periphery only serves as transmission belt (e.g. as commercial firms, trading companies) for value (e.g. raw materials) forwarded to the Center nations. This value enters the Center in the center, with some of it drizzling down to the periphery in the Center. Importantly, there is less disharmony of interest in the Center than in the Periphery, so that the total arrangement is largely in the interest of the periphery in the Center" (p. 84).

Galtung identified five types of imperialism depending on the types of exchange between the Center and the Periphery nations: political, military, communication, cultural, and economic. Imperialism can start with any of them. Let us briefly discuss each type. Political imperialism indicates that the Center nations produce decisions, whereas the Periphery nations supply obedience. Therefore, the Center nations are viewed as having some superior

structures for the Periphery nations to imitate. The Periphery nations are expected to be obedient imitators of superior structures (Galtung 1971).

According Galtung, military imperialism depends on the economic power of the Center nation. The Center nations have the capacity to develop technical military hardware and possess a modern army. Military imperialism provides protection, officers, and instructors in counterinsurgency to the Periphery, and the Periphery provides the discipline and soldiers needed (Galtung 1971).

As it relates to communication imperialism, the Periphery nations may not have the capacity to develop the latest communication and transportation technology. Therefore, the Center nations sell those technologies, sometimes second-hand, to the Periphery nations as part of their trade structure. When it comes to the cultural and communication exchange between Center and the Peripheral nations, which Galtung referred to as *news communication*, the Center nations control the major agencies of the Peripheral nations. The Center news dominates the Peripheral news media. The Periphery nations do not write nor read about each other. However, they read more about their own centers than about other centers. What is also apparent is "that the Peripheral produces news events that Center turns into news" (Galtung 1971, p. 93).

Cultural imperialism is described as the division of labor between teachers and learners. The Center nations always provide the teachers and dictate what is worthy to be taught, as Galtung put it, "from the gospels of Christianity to the gospels of Technology" (Galtung 1971, p. 93). The Peripheral nations, in turn, provide the learners. Similarly, economic imperialism is the division of labor between Center nations and Peripheral nations, in which the Center nations provide manufacturing goods and means of production and the Peripheral nations provide raw materials and the markets (Galtung 1971).

To summarize, imperialism comes in different forms: economic, political, military, communication, and cultural. It is also an unequal relationship between two nations, a Center nation and a Peripheral nation. The Center nations have dominance over the Peripheral nations. As a result, the Center nations dictate and control every aspect of the Peripheral nations. The actions of the Center nations inhibit the growth of the Peripheral nations.

From Christopher Columbus to 1915

Prior to the arrival of Christopher Columbus in Haiti, no one knew the island existed. Furthermore, no one knew it was inhabited. After the arrival of Columbus, the island was under the control of Spain and France until its independence. Spain and France ruined the island and its people for their own economic gains. It is during this period that we began to see the destructive side of imperialism on the island.

Immediately after the independence of Haiti, many imperialist nations developed relations with the island. However, the relations were based on trade. The unequal exchanges allowed the trading partners to continue raping Haiti of its goods without investing in the island. The impact of those trades has had major consequences on Haiti to the present day. We begin this section with a discussion of Haiti's history from the time Columbus landed in Haiti to 1915. This period set the tone for the struggles that Haiti is currently facing.

On December 6, 1492, Christopher Columbus came ashore on the Caribbean island of Taino, which was already inhabited by Arawak Indians. The Indians called their island either Ayiti, Bohio, or Kiskeya, depending on the tribe. Upon his arrival, Christopher Columbus renamed the island as Hispaniola, disregarding the names that were already given to the island. Seeing that Hispaniola had gold, Columbus built a fort out of the timbers from the wreck of one of his ships, Santa Maria. This fort was meant to safeguard the commercial interests of the investors in Spain who financed Columbus's voyage. The fort has been viewed as the first European military base in the Western Hemisphere (Zinn n.d.).

By the 1520s, the Spanish had lost interest in Hispaniola, instead sailing to Mexico and other parts of the Americas where gold was newly discovered. They had nearly wiped out the Indian population through forced labor and diseases by the time they vacated the island. By 1664, the

French West Indies Company was controlling most of the island. However, the French did not have absolute control of the island until the peace treaty of Ryswick with Spain in 1697, after which they renamed the island Saint-Dominique. Because the Indian population was slaughtered by the Spanish and there was no labor force left, slaves were imported from the continent of Africa to labor on the sugar cane, tobacco, cocoa, cotton, and indigo farms. By the eighteenth century, most of France's wealth came from the African slaves' labor in Saint-Dominique. The French revolution of 1789, however, changed the trajectory of the slaves' future on the island and set the tone for the Haitian revolution (Colmain 2010).

The white aristocracy in Saint-Dominique did not recognize the new revolutionary regime in Paris. The French revolution was grounded on the principles of liberty, equality, and fraternity. However, these principles were not applied to the slaves and the mulattos in Saint-Dominique. The mulattos, who were light-skinned blacks, were better off than the slaves. They were middle-class and could own slaves. Nonetheless, they could not vote nor participate in government. However, everything changed when French commissioner Léger Felicité Sonthonx came to the island in 1791 to reinforce the new regime's policy. When the white aristocracy rebelled against him, Sonthonx assembled an army of local slaves, led by Toussaint Louverture, to crush the rebellion. After the defeat of the landowners, Louverture and his generals went on to free all the slaves on the island – a revolution that lasted from 1791 to 1803 (Colmain 2010).

On February 4, 1794, the French Convention voted for the abolition of slavery. On January 1, 1804, Dessalines declared Haiti's independence and restored the island's original name to Haiti. After the revolution against France, Haiti struggled to maintain normalcy because of its debts to France, a struggling economy, and political uprisings, mostly perpetuated by foreign governments (Colmain 2010).

In 1825, Haiti was forced to start paying the indemnity France had demanded for the loss of land, properties, and slaves that occurred when the French slaveholders were overthrown. By agreeing to pay the indemnity, Haiti had secured relief from political and economic seclusion and immunity from invasion by the French military. To pay back the debt, Haiti took out two significant loans. The first loan was to pay the indemnity France had demanded, and the second was for the excessive commissions of the first loan. Eighty percent of Haiti's government revenue was designated to pay those debts (Bauduy 2015).

While Haiti was scrambling to pay its international debts, it was also struggling to maintain internal stability. Domestically, Haiti was in chaos and President Wilson of the United States was worried. Between 1911 and the beginning of 1915, seven presidents of Haiti were either assassinated or ousted (Pressley-Sanon 2014). US business leaders were pressuring President Wilson to take control of Haiti's customs houses, the main source of Haiti's revenue. Consequently, 6 months before the United States invaded Haiti in 1915, its Marines entered the island and removed $500,000 worth of gold from the National Bank of Haiti in December of 1914 for safe-keeping in the National City Bank of New York. The gold was removed in case Haiti could not pay its debts to US bankers. The removal of Haiti's gold gave the United States unprecedented control over the government of Haiti (US Invasion and Occupation of Haiti, 1915–34 n.d.).

Haiti's internal disarray was not the only factor that worried President Wilson. World War I was underway in Europe and the German merchants in Haiti were integrating into Haiti's society. Because it was unconstitutional for foreigners to purchase land in Haiti, the German merchants circumvented the constitution by marrying Haitian women (Pressley-Sanon 2014). The assimilation of German merchants troubled President Wilson. He feared that Germany might set up a military base in Haiti near the Panama Canal, which the United States had completed in 1915. The United States also wanted to establish its own naval base in Haiti's northern port of Mole Saint-Nicholas, adjacent to Cuba's Guantanamo Bay. It took the brutal murder of Haiti's President Vilbrun Guillaume by a frenzied mob on July 27, 2015 for the United States to invade Haiti at the request of

the French Minister Girard (US Invasion and Occupation of Haiti, 1915–34 n.d.).

In summary, from the time Christopher Columbus arrived in Haiti to the beginning of the first US invasion of Haiti in 1915, Haiti was under the control of the Spanish and French governments. These countries exploited Haiti. The Spanish, under the leadership of Christopher Columbus, exterminated the entire Indian population through forced labor and the diseases they brought with them to the island. The French imported slaves from Africa to labor for free with no regards for human dignity. When the slaves rebelled and declared their independence, they were unable to develop their newly formed country because of accumulated debts and internal chaos, which were mostly set off by foreign nations that were against Haiti's independence. Clearly, the concept of imperialism had already been implemented in Haiti in different forms, then continued to take shape in the first US occupation.

The US Occupation of Haiti from 1915 to 1934
Galtung (1971) stated that imperialism is an unequal relationship between two nations: the center nation and the peripheral nation. The center nation dominates the peripheral nation through the five types of imperialism (economic, political, military, communication, and cultural) depending on the type of exchange between them. Based on the Galtung's theory of imperialism, the first US occupation of Haiti, which lasted from 1915 to 1934, can be viewed as an unadulterated example of the destructive nature of imperialism on the island. To recognize and understand the tactics of imperialism that the United States used during the invasion of Haiti, we retell the story of the invasion in this section.

On July 28, 1915 at 4:50 p.m., under the command of Captain George Van Orden, USMC, 340 officers of the United States Marines and seamen landed at Bizoton, a vacant naval yard about a mile southeast of Port-au-Prince. They then marched into the center of Port-au-Prince, disarming any Haitian soldiers they encountered. A significant number of weapons and ammunition were confiscated from Haitian soldiers. Two Haitian soldiers were killed and ten were wounded from

sporadic gunshots between the Haitian and American soldiers. The American soldiers were then posted at foreign legations, which was then the diplomatic representative office. At nightfall, bivouacs were made in the city. Two American soldiers were killed outside of their bivouacs in the street by their own soldiers, who were firing wildly in the dark on the night of January 29, 1915. By August 18, 1915, 88 Marines and 1941 enlisted had landed in Haiti (Schreadley 1934).

Throughout the initial occupation, there was little resistance from the Haitians. However, Admiral Caperton and his Chief of Staff, Captain Beach, were confronted with Haiti's current political quandary. There were two political factions who wanted to choose the successor of President Vilbrun Guillaume. The first faction, the Committee of Public Safety, who represented the latest revolutionists, supported Dr. Bobo. The Americans described Dr. Bobo as inflammatory, deranged, and anti-American. The second faction, the current Congress, favored Philippe Sudré Dartiguenave, the President of the Senate. To determine who would be the President of Haiti under the occupation, Captain Beach met frequently with the two factions and was convinced that Dartiguenave was a rational and honest Haitian politician – likely because he promised the United States everything they had asked of him, including customs control and Mole St. Nicholas (Schreadley 1934).

On August 6, 1915, Admiral Caperton ordered all Haitian soldiers not living in Port-au-Prince to vacate the city. It was an attempt to weaken Dr. Bobo's movement. On August 7, 1915, Admiral Caperton received his first statement of policy from the Navy Department. He was directed to placate the Haitian people and guarantee them that the United States had no intention of keeping its military forces in Haiti any longer than necessary to achieve the re-establishment of a stable government by the Haitian people. On August 9, 1915, Admiral Caperton received further instructions which said, "Whenever the Haitians wish you may permit the election of President to take place. The election of Dartiguenave is preferred by the United States" (Schreadley 1934, p. 118). More instructions were sent to the American

Charge D'Affaires Davis, directing him to consult with Admiral Caperton and ensure that the following statement was communicated to Haitian politicians (Schreadley 1934):

> First: Let Congress understand that the Government of the United States intends to uphold it, but that it cannot recognize action which does not establish in charge of Haitian affairs those whose abilities and dispositions give assurances of putting an end to fractional disorders.
>
> Second: In order that no misunderstanding can possibly occur after election, it should be made perfectly clear to candidates as soon as possible and in advance of their election, that the United Sates expects to be intrusted with the practical control of the customs and such financial control over the affairs of the Republic of Haiti as the United States may deem necessary for an efficient administration. The Government of the United States considers it its duty to support a constitutional Government. It means to assist in the establishing of such a Government, and to support it as long as necessity may require. It has no design upon the political or territorial integrity of Haiti; on the contrary, what has been done, as well as what will be done, is conceived in an effort to aid the people of Haiti in establishing a stable Government and in maintaining domestic peace throughout the Republic. (Schreadley 1934, p. 119)

Early on August 11, 1915, Captain Beach delivered the statement verbatim to all Senators and Deputies at an informal meeting. Later that day, the Committee of Public Safety ordered that Congress be dissolved and sent Haitian soldiers to seal the chambers' doors in order to prevent the election of Dartiguenave. Nevertheless, the US Marines drove them away. Captain Beach confronted the Committee and asked them to dissolve themselves or they would be considered public enemies of the United States (Schreadley 1934).

Within a week of the invasion, on August 12, 1915, Captain Beach, on the floor of the Haitian Chambers, supervised the election of President Philippe Sudré Dartiguenave. He was elected with 94 of the 116 votes. President Dartiguenave served as President from August 12, 1915 to May 15, 1922. Without the interference of the United States, the Haitian Congress would have voted for Dr. Bobo, as they always voted on the recommendation of the Haitian Generals. On election day, an American military government was established in the city of Cape Haitian, the second largest city in Haiti. Days after, they occupied the cities of St. Marc, Petionville, and Leogane (Schreadley 1934).

On August 17, 1915, Mr. Davis, the American Charge d'Affaires, submitted to President Dartiguenave a proposed treaty between the United States and Haiti and requested that the Haitian Congress pass the resolution without delay. The next day, however, the secretary of the Navy instructed Admiral Caperton to take control of the Haitian customs service and to use the funds "for organizing and maintaining an efficient constabulary, for conducting such temporary public works as will afford immediate relief to the discharged soldiers and starving populace by giving them employment, and finally for the support of the Dartiguenave Government" (Schreadley 1934, p. 122).

On August 21, 1915, the United States seized the customs houses in Cape Haitian and in Port-au-Prince on September 2, 1915. Navy Paymasters were ordered from the United States to assume an office at each Haitian port as collector of Customs and Captain of the Port. An Admiral Caperton account was opened at the National Bank of Haiti. All funds collected by the Paymasters were deposited on this account. Military commanders were authorized to draw funds from the account for Public Works and for the Military and Civil Government of United States Forces. Additionally, they fixed the exchange rate to five gourdes to the dollar – a move that was opposed by the Haitian people. Furthermore, it became a policy for the Paymasters to give priority to paying Haiti's debts with customs revenue. This policy is said to have hindered the growth of the Haitian economy (Schreadley 1934).

While the Paymasters were overhauling the customs service, President Dartiguenave was having a difficult time getting the Haitian Congress to ratify the American treaty. The Haitian Congress was unhappy with the Americans taking control of the customs service. The Haitian constitution required that both the Chamber of Deputies and the Senate ratify the treaty. In an attempt to pressure the Haitian Congress, on September 3, 1915, Admiral Caperton declared martial law in Haiti

and proclaimed that trial before military courts was established for "the publishing of false or incendiary propaganda against the Government of the United States, or the Government of Haiti, or the publishing of any false, indecent, or obscene propaganda, letters signed or unsigned, or matter which tends to disturb the public peace" (Schreadley 1934, p. 127). When that pressure did not work on the Haitian Congress, more pressure was applied to force the Haitian government to comply.

Admiral Caperton froze the salaries of Senators and Deputies, including funds for the expenses of the Haitian Government pending the ratification of the treaty. On October 3, President Dartiguenave threatened to resign unless Congress was paid the overdue salaries. On October 6, 1915, the Chamber of Deputies ratified the treaty by a vote of 75 to 6. However, more opposition grew in the Senate. On November 8, 2015, the Haitian Senate issued a report declaring certain articles of the treaty unconstitutional and recommended a renewal of the treaty. However, on November 12, 1915, the Haitian Senate ratified the treaty by a vote of 25 to 9. The vote came after Admiral Caperton was instructed by Navy Secretary Daniels to make the following statement to President Dartiguenave (Schreadley 1934):

> I have the honor to inform the President of Haiti and the members of his Cabinet that I am personally gratified that public sentiment continues favorable to the treaty; that there is a strong demand from all classes for immediate ratification, and that the treaty will be ratified Thursday. I am sure that you gentlemen will understand my sentiment in this matter, and I am confident if the treaty fails of ratification that my Government has the intention to retain control in Haiti until the desired end is accomplished, and that it will forthwith proceed to the complete pacification of Haiti so as to insure internal tranquility necessary to such development of the country and its industry as will afford relief to the starving populace now unemployed. Meanwhile the present Government will be supported in the effort to secure stable conditions and lasting peace in Haiti, whereas those offering opposition can only expect such treatment as their conduct merits. The United States Government is particularly anxious for immediate ratification by the present Senate of this treaty, which was drawn up with the full intention of employing as many Haitians as possible to aid in giving effect to its provisions, so that

> suffering may be relieved at the earliest possible date. Rumors of bribery to defeat the treaty are rife, but are believed. However, should they prove true, those who accept or give bribery will be vigorously prosecuted. (Schreadley 1934, pp. 132–133)

In this section, we have outlined the types of imperialism employed by the United States during the first US military invasion of Haiti. Haiti was clearly the peripheral nation being dominated by the United States, the Center nation. Economically speaking, during the occupation, Haiti's economy, election, government revenue, and security were under total control of the forces of United States. The United States stated that it had to occupy Haiti in order to stabilize the island. Despite this claim, Haiti has not improved. From the perspective of Galtung's theory, Haiti was supposed to be the obedient Periphery nation, imitating the superior structure of the United States, the Center nation. In fact, Haiti was far from being obedient. Throughout its overwhelming history with the United States, the Haitians have used Vodou to fight against an imperialist's occupation.

In the following sections, we provide the history of Vodou in Haiti, its functions, the anti-Vodou laws that were implemented, and the counter-discursive practices of Vodou that have been implemented to fight against imperialism.

The History of Vodou in Haiti

Haitians often speak of "serving the spirits" rather than practicing Vodou. The term "Vodou" originated from the West African Fon and Ewe languages and means "spirit" or "god." The religious practices are typically traced to the Yoruba peoples (from Nigeria), the Fon people who mostly live in the area we now call Benin, and the Kongo peoples (from Angola and Bas-Zaire). Vodun is arguably a fusion of Roman Catholicism and native West and Central African religions (The Pluralism Project n.d.). Once blended, Vodou formed an idiosyncratic collection of rituals. It is a religion that came to Haiti around 1619 and was shaped by the interface between Catholic representations and African religions brought to the New World during the slave trade into the French

colony at Saint Domingue (Brown 2006). Though there are several synonyms for Vodou, this discussion uses the word *Vodun* to refer to these spiritual rituals of Haiti.

The Vodou religion began in Haiti with the West and Central Africans who were taken to Haiti as slaves. Enslaved in Haiti, they had several different languages and often could not communicate efficiently with each other. In fact, they were often forbidden from practicing their native African religions to which they were accustomed. Instead, as slaves they were converted to Catholicism and several restrictions were placed on their religious activities. Resulting from the restraints placed on their religious freedom, they creatively devised ways to continue their practices.

The Haitian citizenry of African descent innovatively used the Catholic images and terms to which they were exposed to represent things in their native religious practices. The blending of the two beliefs resulted in the intermingling of traditional Gods with that of the Catholic saints. The resultant mixture created the current religious practice of Vodou in Haiti. Catholic lithographs of saints are often used as visual representations of the invisible Vodou Gods or loas (Beyer 2019). The history of Haitian Vodou is rife with instances in which laws and other restrictions were imposed to stymie the practice and growth of the religion.

The Functions of Vodou in Haiti

Vodou practices play pivotal roles in Haitians' daily lives. First, they afford the living some sort of protection from evil as well as healing when they perform libations for dead spirits. Because there are no expectations of an afterlife in heaven, Vodou is considered to be a method of assuring healing and well-being in the present world. It is used as a means to better the lives of individuals and those in the wider community (Michel 2006). Commenting on this, Brown (1991) expressed that for Haitians, Vodou is a system that allows them to minimize the pain and suffering of life. For example, Vodou is used to protect and watch over those who believe, it tells them what is happening to their relatives who live abroad, and alerts them to the medicines that are beneficial if they are sick. It operates as a defense mechanism that cushions them against the anguish associated with disasters, pain, loss, and other atrocities. The cultural influence of Vodou is formidable (Hurston 2009).

In addition to providing fortification and other everyday cultural benefits, Vodou possesses the power to uplift and inspire action (Hurston 2009). The pivotal role of Vodou in the Haitian revolution, described as the "the most dramatic revolutionary transformation to occur in modern history," was emphasized by Lundy (2009, p. n.p). Lundy (2009) asserted that grasping the role of Vodou is critical to actually comprehending what ensued. During the Haitian Revolution, Vodou was the galvanizing sway. It fueled and sustained the subjugated Africans' notions of defiance. As a religion, Vodou allowed the slaves to develop what Émile Durkheim (1893) called "collective consciousness." For Durkheim, collective consciousness was the totality of beliefs and sentiments common to the average members of a society. He acknowledged that religious symbols, discourse, beliefs, and rituals easily bind together members of a society, especially in societies where the social group is homogenous. This binding together, Durkheim theorized, produces the collective consciousness. It allows the society to achieve what he termed "mechanical solidarity" – an automatic binding together of people into a collective through their shared values, beliefs, and practices.

In the case of Haiti, the collective consciousness as defined by Durkheim can be readily noted when the events prior to, during, and after the Haitian revolution are examined. Vodou was the glue that bound the African slaves together. It was the essential mystical influence that gave the Africans reprieve. Though the colonists tortured, degraded, and did everything to break their spirits, the Africans maintained their sense of self and culture when they united in their celebrations, dances, rituals, and prayers. Vodou gave them a sense of independence, peace, human dignity, and strength. Durkheim's theory suggests that Vodou allowed the Africans to feel a sense of solidarity with each other. The collective consciousness, as he postulated, allowed the people to work together

to achieve community and functional societies. Vodou allowed the African slaves to establish connections and wage war against the brutalizing structure.

Vodou was used to fight political battles. During several slave revolts in Haiti, for instance, Vodou was repeatedly the subversive influence. Vodou was used as a tool to epitomize the organization of resistance and accord. It regularly functioned as a formidable political force and was used as an anti-establishment influence for accord. This view is supported by the fact that slaveholders made resolute attempts to utterly divest slaves of their African traditions in general, and more specifically, African Vodou. The fear was that the slaves' native beliefs would afford occasions for them to surreptitiously synchronize uprisings (Lundy 2009).

Several African resistance schemes in Saint Domingue targeted the French. Although there were several smaller slave revolts, the 1791 insurrection wrecked more than 200 sugar plantations and about 1,200 coffee plantations, and implicated tens of thousands of escaped slaves. The revolt was orchestrated during clandestine Vodou assemblies that were both coordinated and backed by Vodou priests. In this rebellion, priests performed key roles. Prior to the beginning of the revolution, a Bois Caïman ceremony was held – a ritual that allowed the slaves to formalize their agreement in a Vodou ritual.

The central role of Vodou priests and priestesses must be noted here. For the 1791 slave revolt, for instance, Boukman Dutty, a maroon leader and Vodou priest, officiated the ceremony along with a Vodou high priestess. The role of Vodou is notable because the ceremony involved animal sacrifices, Vodou deities, and other Vodou celebrations (Shen 2015). Similar accounts are given for the US invasion of 1915–1938. The US Marines were so afraid of the power of Vodou that instead of focusing on their mission of attaining peace, justice, and ensuring Haiti recognized and performed its duty towards others, they spent their time trying to eradicate Vodou beliefs and behaviors, which they found very threatening (Woody 2019).

Anti-Vodou Laws

To avert impending insurrections, slaveholders wanted to supplant African Vodou with French dogma to better control the enslaved. In fact, the practice of Vodou has been legally challenged throughout Haiti's history. By 1835, practicing Vodou was a punishable offense by law. The frequency with which such laws had to be enacted and enforced indicate that the success of such laws against different forms of slave healings, assembly, ritual "profanation," and the like were mostly ineffective. The enslaved people continued surreptitiously or with the consent of planters and their agents to practice and transform their religion at both the individual and community levels. Other examples of the use of Vodou in inspiring revolts include Macandal's (a practitioner of Vodou) 1757 poisoning plot against the French planters on the Plaine du Nord and the overthrow of Emperor Henri Christophe.

The first three Haitian founding fathers – Toussaint Louverture, Jean-Jacques Dessalines, and Henri Christophe – all publicly opposed Vodou, mainly because they recognized (or had firsthand knowledge of) its power. These leaders may have privately feared Vodou's power and often venerated it. However, although they publicly rejected Vodou, some leaders may have privately consulted the Vodou priests for advice (Lundy 2009). Toussaint was more likely to have Vodou practitioners killed, but Dessalines and Christophe permitted some level of Vodou practice. For François Duvalier (Papa Doc), Vodou was seen a part of Haiti's cultural heritage. He used Vodou priests as advisors in his political career. By 1972, the practice of Vodou was allowed in Haiti. This was again reinforced during the rule of President Bertrand Aristide in 1986. In 2003, Vodou gained recognition as an official Haitian religion. Currently, this status remains. Vodou continues to be used as a tool of resistance in Haiti (Universe in Universe 1997).

Counter-Discursive Practices of Vodou

Several counter-discursive practices exist in the practice of Vodou. These practices support the multiple possibilities as to why Vodou is an

effective tool of revolt. First, Vodou has no real leaders. Rather, all participants are leaders; they can all incarnate God. Hence, Vodou is a movement that can endure, as there is always someone who can be the leader (Bell 1995).

Second, Vodou worshippers believe that the dead can reenter the world of the living. They believe that these persons are able to come back and assist them in their fights. *Les invisibles,* as they are called, are always with them to help boost their numbers, especially during revolutions. Thus, at the ceremony at Bois Caïman (mentioned previously), the Vodou believers may have felt that they were uniting with the dead. This may have given them both physical as well as spiritual strength. Similarly, Boukman, the Vodou priest who led the Haitian revolution of 1791, believed that if he called on the Lwa and waived a bull's tail around his head, he could not be killed by the French soldiers' bullets (Bell 1995). Vodou is a faith with deep roots. It has been alive for centuries and continues as a cultural movement.

Conclusion

Since its discovery, Haiti has had a depressing history as a result of military occupations and the commercial interests of foreign countries. We have a particular interest in understanding how the people of Haiti have navigated through the destructive nature of imperialism and the tools they have used to rid the country of imperialism. This understanding was captured in this chapter through two periods of Haiti's history: the discovery of the island by Christopher Columbus and the US occupation from 1915 to 1934. Through those timeframes in Haiti's history, we discussed the motives, the processes, and the destructive nature of imperialism.

According to Galtung's theory of imperialism, there are different types of imperialism: economic, political, military, communication, and cultural. Imperialism is an unequal relationship between two nations, a Center nation and a Peripheral nation, in which the Center nations have dominance over the Peripheral nations. Consequently, the Center nations dictate and control every aspect of the Peripheral nations, which hinders the growth of the Peripheral nations for the benefit of the economic development of the Center nation.

From the time Christopher Columbus landed in Haiti to the duration of the United States' first invasion of the island, Haiti has been under the control of Spain, France, or the United States. These countries exploited Haiti with no regards for human dignity. Since its independence, Haiti has struggled to develop itself as a result of accumulated debts, internal chaos, and foreign occupations. Imperialism has destroyed Haiti. As discussed in this chapter, Haiti was clearly the Peripheral nation being dominated by many countries throughout its history. From the standpoint of Galtung's theory, Haiti was expected to be an obedient Periphery nation and an imitator of the superior structures of the all the Center nations that controlled it. The Haitian people, however, mobilized themselves through Vodou to fight against the imperialism, despite the anti-vodou laws against their religion.

Definition

The role of sporting cultures in the sustenance as well as the dismantling of the British Empire has been a vibrant field of enquiry within Postcolonial Studies, and the major studies on cricketing cultures (eg. Appadurai 1996; Bateman 2009; Gupta 2004, 2009; James 2005 [1963]; Majumdar 2011; Malcolm 2013; Mangan 1998 [1986]) have provided significant insights into the cultural politics of the British Empire as well as the various postcolonialities that have emerged in its wake. Drawing upon such works, this essay delineates three key ways in which the sport of cricket has shaped imperialist and anti-imperialist cultures: 1) Cricket, as constructed by mainstream discourses of England in the eighteenth and the nineteenth centuries, was projected as an element of national culture which could foster ideal imperialist subjects and thus contribute to the sustenance of the imperialist hierarchies in the colonies. 2) Post-independence, the erstwhile imperialist sport became a site of virulent postcolonial nationalisms in several former colonies, especially in South Asia and the Caribbean. 3) The political economy of cricket in the era of televised, commercialized cricketing spectacles (since the 1980s) has resulted in the emergence of a new hierarchy wherein India has emerged as a super power in the world of cricket administration. This essay therefore seeks to provide a critical overview of the extant scholarship, outlining the ways in which the semiotics and/or the political economy of cricket have

contributed to the processes of imperialism, post-colonialism, and neo-imperialism.

Introduction

Critical appraisals of cricketing cultures have traced the sport's imperialist manifestations as well as the postcolonial transformations of the sport. This essay's discussion of such readings has been arranged in two sections:the first section deals with the Victorian era conception of cricket as a national sport which is capable of moulding imperial heroes as well as civilizing the natives whereas the second section is concerned with the questions of symbolic appropriation, postcolonial nationalisms, and neo-imperialist cultures.

Batting for the Empire

Although cricket is often simplistically described as 'the imperial game', the sport's role in the sustenance of the British Empire is complex and heterogeneous. Several aspects of cricket's imperialist functions have been identified by various scholars, out of which four will be discussed here: the politics of its association with Englishness; its supposed ability to prepare the upper classes to lead the imperial mission; its role in the civilising mission of the Empire; and a problematic portrayal of the (non)-cricketing Other which establishes an exclusive and elite notion of Englishness.

By the nineteenth century, the English began to see cricket as a game that embodies Englishness and this can be attributed to historical contiguity and consequently, the narrative construction of a myth. Dominic Malcolm (2013, chs. 1–2) has argued that this notion is a result of cricket and the very idea of a distinct English character emerging concurrently, subject to the influence of the same social processes: parallel to the process of English political culture becoming more peaceful and orderly with the emergence of the parliamentary system, the rules of cricket were amended to make it a non-violent sport. Malcolm has pointed out that the social class who pioneered both these reforms – the aristocracy – viewed the peaceful resolution of conflicts as a typically

English trait and hence cricket, with its stature as a non-violent sport, was reinvented as a symbol of Englishness by many writers (see Breuilly 2014, p. 172). The key role played by discourse in establishing a link between cricket and the supposed national character has been accepted not only by Anthony Bateman (2009), whose framework is that of literary studies, but also by Malcolm, who analyses English cricket through the lens of figurational sociology. From the latter half of the eighteenth century onwards, a large corpus of English cricket writings celebrated the Englishness of cricket, the most significant works being John Nyren's *The Cricketers of My Time* (1907 [1833]) and Rev. Pycroft's *The Cricket Field* (1859 [1851]). A widely discussed instance of this discourse can be found in the latter:

> The game of cricket, philosophically considered, is a standing panegyric on the English character: none but an orderly and sensible race of people would so amuse themselves . . .. Patience, fortitude, and self-denial, the various bumps of order, obedience, and good humour, with an unruffled temper, are indispensable. . . . As to physical qualifications, we require not only the volatile spirits of the Irishman *Rampant*, nor the phlegmatic caution of the Scotch-man *Couchant*, but we want the English combination of the two; though, with good generalship, cricket is a game for Britons generally. (pp. 25–26)

This passage exemplifies not only the explicit connection that is forged between cricket and the supposedly English character but also the 'imperial' nature of this Englishness. Implicit in this notion of Englishness is a sense of cultural superiority vis-à-vis the Celtic nations (Bateman 2009, pp. 1–2; Malcolm 2013, ch. 2). The argument is that an ideal cricketer should be English, an identity that, it is claimed, subsumes that of Irish and Scottish and this is an instance of what Malcolm terms England's 'imperial nationalism'. English nationalism of the nineteenth century was an 'imperial nationalism' wherein the 'imperialists must define their distinctiveness and/ or superiority in terms of their mission and their creation – the Empire – rather than in terms of the people who created it' (Malcolm 2013: 'Conclusion'). According to Malcolm, this often enabled the English to see the (cricketing) success of the colonies as a sign of their own superiority and thus

the English imperial identity was one which often sought to accommodate the colonial other. He observes that the Celtic nations were subject to a process of 'internal colonialism' and, as a result, the cricketing discourses saw these identities as subsets of Englishness (2013, ch. 3, 'Conclusion').

From the late eighteenth century onwards, the inclusive character of cricket waned gradually. While cricket was once an inclusive, rural sport, a distinction gradually emerged between the 'Gentlemen' or amateurs and the 'Players' or professionals. Not only was the captaincy of the side reserved for the amateurs, but the professionals also dined separately and entered the field through a different gate, and were generally treated as second-class citizens. By the late nineteenth century many cricket fields in both England and the colonies had become an elite social space where the upper and the upper-middle classes mingled with each other and the sport was not only a favoured pastime of the elite classes but it also played a role in the forging of such social groups (Allen 2012, pp. 210–211; Scalmer 2007, p. 434). The Victorian public schools fostered what J.A. Mangan has termed the 'cult of athleticism' (that is, the belief that sports can inculcate moral values), and the upper classes were thus influenced by a pedagogic philosophy which believed that cricket and other sports could train the students to be imperial heroes (Malcolm 2008b, pp. 58–59). Under the influence of Muscular Christianity, a doctrine which equates manliness and spiritual virtue, cricket (and other sports) came to be seen as a means for developing in the students '. . . the basic tools of imperial command: courage, endurance, assertion, control and self-control' (Mangan 1998 [1986], p. 18; see also Stoddart 1988, pp. 653–654). It was widely held that sports would inculcate these qualities in the students and create a generation of imperial administrators who were simultaneously able to control their subordinates and deferential to their superiors (Mangan 1998 [1986], p. 18). One of the key influences on the public school system of the day was Thomas Arnold, the headmaster of Rugby School, who preached the need for Christian earnestness, discipline, and self-control.

Arnold's pedagogy was transformed into one in which sport became the locus of all these virtues (James 2005 [1963], pp. 215–217), an appropriation that can be best understood via Thomas Hughes's cult novel *Tom Brown's Schooldays* ([1857] 1993).

A pioneering work of the genre of public school fiction, *Tom Brown's Schooldays* was extremely influential in shaping the imperialist sporting ideology of the day, a claim attested by the fact that the headmasters of public schools (both at 'Home' and in the colonies) used to read out the passages on cricket to their students (Mangan 1998 [1986], p. 133). The novel's imperialist leanings are revealed at the very outset when the narrator notes that the Browns are a family of warriors who are spread all over the Empire, and he asserts that this presence of Browns is the reason for the stability of the Empire (p. 25). The novel features Thomas Arnold as the 'Doctor', the revered headmaster who encourages the virtues of manliness and piety. Ian Baucom (1999) has analysed the text's celebration of Muscular Christianity and has noted that Tom Brown, the protagonist, is a manly sportsman who has become indifferent to spirituality whereas the physically weak George Arthur is a true disciple of the real-life Arnold in that he abounds in faith and moral convictions. Tom's Christian spirit is rekindled under Arthur's influence and the latter is introduced to games and thus made 'manly' by the former. In this way the novel fuses together the two worldviews and celebrates the ideal hero figure of Victorian England: a sportsman who is a Muscular Christian (Baucom 1999, pp. 145–146). In the penultimate chapter of the novel, cricket is praised as a noble game which promotes teamwork, and it is dubbed 'the birthright of British boys old and young, as *habeas corpus* and trial by jury are of British men' (p. 225), thereby emphasising both the Englishness of the game and the pre-eminence of the English culture. In the ensuing conversation, the leadership qualities required of the captain of the cricket team are compared to that of the Doctor, and it is announced that the Doctor's school is the most ably administered part of the British Empire (p. 226). By the logic of synecdoche, the

captain of the cricket team is likened to an imperial administrator who is able to maintain complete control over his subordinates.

The idea of school sports preparing the students for battle was very popular during the age with various newspapers and school magazines tracking the exploits of the public school alumni in the distant outposts of the Empire, reporting both their martial and sporting endeavours (Mangan, 1998 [1986], pp. 63–68). The most well-known expression of the military role of cricket can be found in Henry Newbolt's poem 'Vitai Lampada', which draws a comparison between a batsman bravely fighting for his team during the last moments of a cricket match and a soldier fighting for his nation in a faraway desert (Bateman 2009, p. 42). The unselfish nature of teamwork that is valorised in both the cricket team and the army, and the warrior's obedience towards his superiors (the captain and the colonel) make the poem representative of the imperial sporting discourse of the day. The cricket captain's exhortation, 'Play up! Play up! and play the game!' (Newbolt n.d.) – which the soldier recalls while fighting for his nation – evokes both the loyalty towards the school and the nation, and the role that school sports played in fostering a commitment towards the imperial project.

For the Victorian upper classes, cricket was not only an ideal means of equipping the English to head the empire; it was also a means of imperial control, an ideological tool for disciplining and civilising the natives (Malcolm 2008b, p. 59). These twin functions of imperial cricket have been forcefully articulated by the contemporary writer Cecil Headlam: '[C]ricket unites, as in India, the rulers and the ruled. It also provides a moral training, an education in pluck, and nerve, and self-restraint, far more valuable to the character of the ordinary native than the mere learning by heart of a play of Shakespeare' (cited in Kaufman and Patterson 2005, p. 92). The first line of the passage indicates the widespread belief that cricket would act as a cultural bond, an umbilical cord connecting the colony and the 'mother country', thereby containing the native challenges to colonialism. This hegemonic idea gained acceptance in many colonies (Allen 2009, p. 474;

Bateman 2009, p. 2; Scalmer 2007, p. 435) as evidenced by the Anglophilia in the early cricket writings of colonies as diverse as Australia, the Caribbean, New Zealand and India (Bateman 2009, pp. 124–130). The latter part of the passage indicates the sport's mandate to civilise the natives. The writer has no doubt that the natives' characters needed to be reformed and that cricket was the best way to achieve this aim. The discourse of civilising mission played a huge role in the diffusion of the imperial sport (Kaufman and Patterson 2005, pp. 91–92; Malcolm 2013, ch. 3). The Victorians staunchly believed in their moral obligation to civilise the rest of the world (the infamous 'white man's burden') and in the moral worth of the sport of cricket. Cricket was thus exported to colonies as diverse as Australia, New Zealand, South Africa, Sudan, India and the Caribbean in the last decades of the nineteenth century (see Allen 2009; Bateman 2009; Mangan 1998 [1986]; Ryan 1999). These sporting missionaries tried to introduce sports in the colonies, mostly through the British-model public schools and the army, in order to 'create a universal Tom Brown: loyal, brave, truthful, a gentleman and, if at all possible, a Christian' (Mangan 1998 [1986], p. 18). The civilising mission enabled the English to see the cricketing successes of the colonies as a result of their efforts at reforming the colonials, and thus fed into the idea of imperial nationalism outlined above (Malcolm 2013, 'Conclusion').

While the discourses of cultural bond and the civilising mission were definitely influential, cricket's introduction and dissemination in the colonies cannot be solely attributed to such intentional aspects of imperialist ideology. Malcolm (2013) has argued that for many imperialists, playing cricket was a way of establishing that their physical prowess had not been affected by removal from the supposedly healthy environment of England and exposure to the tropical climates of the colonies. While an intentionally ideological use of cricket became prevalent later on, the attribution of civilising intentions to the early cricket in the colonies might just be instances of 'post-hoc rationalization' (ch. 3). In a similar vein, Ramachandra Guha has noted that the early cricket in colonial India was a means for

the homesick Englishman to recreate 'Home' in the colony, and, far from having any intentions of promoting the sport, the early cricket clubs were racially exclusive (2002, pp. 4–11). Moreover, as Stoddart (1988) has argued, the diffusion of cricket cannot be attributed simply to the policies of the British colonial governments. In many instances, the sports were adopted by the native communities in order to share the culture of the colonial masters in a subconscious attempt at gaining upward social mobility (pp. 660–661).

The imperialist cricket (and indeed, imperialism itself) was so rife with contradictions that cricket's imperial nationalism with its assimilatory tendencies coexisted with exclusionary discourses. The Othering of non-white cricketers was a prevalent feature of cricket writings and it served to project cricket as an exclusively (white) English game. The narratives on Ranjitsinhji – the Indian prince who became a cricketing sensation in England – are a case in point: Ranji and the discourses on him represent both the supposed power of the cricket field to anglicise the Other, and rather contradictorily, the exclusively English nature of cricket (Bateman 2009, pp. 135–140). While Ranji's cricketing prowess led him to be considered as an English gentleman, his cricket was often depicted in orientalist terms (Sen 2001, pp. 241–243). For instance, Neville Cardus writes, 'The style is the man, and Ranji belonged to the land of Hazlitt's Indian jugglers, where beauty is subtle and not plain and unambiguous' (1977, p. 139). Similarly, the early English accounts of cricket in India suggest that the natives are, by nature, disinterested and inept at the game (Guha 2002, pp. 5–11). Another instance would be the English press's racist portrayal of the touring West Indies cricketers in 1900, wherein the black cricketers were depicted as infants learning the game from adult, white cricketers (Bateman 2009, pp. 158–159).

The practical consequences of cricket's imperialist ideology were numerous and not restricted to the assimilation, exclusion, or disciplining of the colonised. For instance, in countries such as India and South Africa, the intentional diffusion of organised cricket mirrored the regional organisation of the colonial government and thus reinforced the Empire (Allen 2012, pp. 214–215). The hierarchical relationships created by the Othering of the non-whites were reflected in the field of play, with the early non-white cricketers in the colonies being relegated to the plebeian roles of bowlers and fielders. In Victorian England, batting was seen as a genteel activity and was often the preserve of the amateurs, while bowling and fielding were seen as more naturally suited to the working-class professionals, cases in point being the slaves in early Caribbean cricket (Yelvington, cited in Malcolm 2013, ch. 5) and the servant paid to bowl to the English gentlemen at the Calcutta Cricket Club in the mid-nineteenth century (Bagot, cited in Guha 2002, pp. 9–10).

Anti-imperial Playing Fields

Cricket's challenges to, or deviations from, the imperialist ideology consist of: the (post-) colonial appropriation and indigenisation of the imperial cultural artefact; the sport's embodiment of post-colonial nationalisms; and the emergence of neo-imperialist cricketing cultures in the era of globalisation.

The appropriations of the imperial sport have been effected through counterdiscourses and through the modification of the conventions of the sport. The foundational text of post-colonial cricket literature is C.L.R. James's *Beyond a Boundary* (2005 [1963]), which was heavily influential in shaping a post-colonial approach to cricket. This complex and layered text makes several significant interventions in the cultural politics of imperialist cricket, two aspects of which need to be discussed here: firstly, James challenged the very foundation of the imperialist cricket discourses when he insisted that sport is political. His famous question 'What do they know of cricket who only cricket know?' (p. 309) succinctly captures the sociopolitical significance of cricket and counters the imperialist discourses which project cricket as an apolitical field (Malcolm 2008a, p. 25). Throughout the book, James points out that, in the face of the racial inequalities in colonial West Indies, cricket has been a medium through which the (racial) pride and the nationalist sentiments of the native Black

community have been expressed (pp. 72–73). For James, cricket is a popular art which is at once aesthetically pleasing and socially relevant (Bateman 2009, pp. 157–158, 173–178).

Secondly, James refuses to consider cricket merely as an ideological tool of the empire (Smith 2006, p. 95). He asserts both the centrality of cricket to the colonised's notion of their self, and their agency in transforming the meaning of the imperial cultural artefact. Rather than seeking to completely dismantle the imperial culture, James lauds the strict moral code associated with Victorian cricket (2005 [1963], pp. 32–34) and seemingly concedes the success of the civilising mission of the colonisers by suggesting that cricket can transform colonials into Englishmen. However, by implying that Englishness is not territorially bound and that it can be embodied and transformed by the colonials, he is challenging the exclusivity of the Englishness associated with cricket (Baucom 1999, pp. 157–163; see also Bateman 2009, pp. 190–194). Although *Beyond a Boundary's* influence in decolonising cricket is second to none, it must be noted that James's position has attracted some amount of criticism. Scholars such as Brian Stoddart and Helen Tiffin have been troubled by his celebration of cricket's moral codes and have interpreted it as a sign of his inability to critique the English culture when it pertains to his favourite sport (Smith 2006, pp. 96–97). Instead of lauding James's appropriation of Englishness, one may argue that this does not qualify as a challenge and that it can be seen as part of England's imperial nationalism (see above) wherein Englishness is an identity that can be acquired by the colonised as well. Andrew Smith (2006) has strongly defended James's position by arguing that James was not unaware of the illusory nature of cricket's moral codes and that he has noted that cricket in the Caribbean was marked by various kinds of hierarchies and discriminations (pp. 101–102). Smith holds that James valued the 'formal autonomy of the cricketing field' (p. 102) – that is, the perception that cricket is a domain set apart from the everyday world – because he believed that such mythologies enabled cricket to question various imperialist and/ or elitist ideologies. Thus, the various assessments of *Beyond*

a Boundary have been divided along the twin poles of strategic appropriation and assimilation. Ultimately, there can be no absolute resolution of such a debate because the distinction between the two is often one of perception.

The appropriation of cricket can also involve drastic changes to its rules and conventions as in the case of the South Asian spectators in England and elsewhere whose spectator styles are celebratory and passionate as opposed to the calm, dignified behaviour expected of English cricketing culture (Crabbe and Wagg 2005, pp. 210–214; Malcolm 2013, ch. 7). An extreme case of such an appropriation is that of the Trobriand Islands, where the sport was introduced by British missionaries with the intention of containing tribal warfare. The natives sabotaged the civilising mission and introduced into cricket practices associated with their tribal culture. The bowling action of Trobriand cricket was modelled on spear throwing, the width of the stumps was modified, and tribal markings and war dances were incorporated into the game (Stoddart 1988, pp. 825–826).

If in some countries, such as New Zealand and Canada (Mangan 1998 [1986], pp. 162–165; Ryan 1999, p. 62), the imperial sport lost its popular appeal with the emergence of other, nationalist sports, in countries such as India and the Caribbean the game flourished as a symbol of anti-colonial as well as post-colonial nationalisms. Studies on these cricketing cultures (Appadurai 1996; Beckles 2011) stress the indigenisation of the sport by which the performance styles as well as meanings associated with them are modified and – following the Jamesian tradition – the ability of the masses to recognise and consume the anti-colonial and nationalist sentiments associated with the sport. If white loyalism coexisted with Black nationalism in the cricket of the colonial West Indies (Beckles 2011, p. 160), much of early Indian cricket was loyalist with the Indian princes who patronised the sport adopting it as a royal spectacle and way of strengthening the bond with the colonial master (Appadurai 1996, pp. 94–95). At the same time, cricket also became one of the earliest sites where the Indian nation was imagined because the

visiting England teams needed a national team to which they could be opposed and, subsequently, the sport was indigenised through the emergence of media in the Indian languages (Appadurai 1996, pp. 98–99). Indian cricket's role as a vehicle of nationalist sentiment, which began in the 1970s as a result of the national team's improved fortunes, intensified with the expansion of the television networks from the 1980s onward (Mehta 2009; Sen 2002). While West Indian cricketers are no longer the nationalist heroes they were during the early decades after independence (Beckles 2011), the Indian male audience continues to find in cricket 'the erotics of nationhood' (Appadurai 1996, p. 111). The economic globalisation intensified, rather than hampered, the nationalist frenzy associated with cricket, and the sport in contemporary India is located at the intersection of nationalist and capitalist ideologies with the culture industries marketing cricketing nationalism for financial gains.

If, for the bulk of its history as a multinational sport, the West has dominated the governing bodies of cricket, the past few decades have seen the balance of power swing in favour of South Asia, especially India. Scholars (Gupta 2004, 2009; Majumdar 2004, 2011; Rumford 2007) have attributed this shift of dynamics to the changes in the political economy of the sport as a result of globalisation.

Amit Gupta (2004) has argued that a confluence of factors has enabled the non-West to dominate the politics of world cricket. While globalisation of sport usually results in the Western nations dominating the international organisation, the International Cricket Council (ICC) steadfastly refused to exploit the financial potential of the sport. In fact, the commercialisation of cricket was intensified only when Kerry Packer, an Australian media magnate, poached players from the national teams of Australia, England, and the West Indies and formed a rebel league (for a full account of the 'Packer revolution', see Cashman 2011). Gupta has noted that with the emergence of satellite television and cable industries, South Asia and its huge cricketing audience became crucial to the finances of the sport by the 1990s (Marqusee, cited in Gupta 2004, p. 265),

and India emerged as a superpower in the world of cricket administration.

The administration of world cricket had long been the monopoly of England with the 'home of cricket' dominating the Imperial Cricket Conference and its successor organisation, the ICC. The change in the balance of power began in the 1980s and the key episodes in this shift included: the South Asian nations' securing of the hosting rights of the 1987 and 1996 World Cups; the Indian Premier League phenomenon; and, ultimately, the 2014 revamping of ICC's organisation structure. All these tussles are significant to the students of imperialism as the points of contention were the two-tier structures in the world of cricket administration whereby some nations wield a veto power, officially or unofficially.

India and Pakistan's successful joint bid for the right to host the 1987 World Cup was a momentous event in the East–West conflict in the world of cricket administration because it was the first time that the World Cup was held outside England. Majumdar (2004, p. 408) has noted that the sub-continental bid offered a higher compensation package for the participant nations and had the support of the majority of the members including such Western countries as Holland and Canada, but that there was stiff resistance from England and Australia who tried to invoke the ICC rule which stated all recommendations should be made by a majority which included a foundation member (England or Australia). Eventually, the bid was awarded to India and Pakistan on the basis of a simple majority (p. 409), thereby undermining the advantage of the veto power given to England and Australia. Significantly, the Indian administration lobbying for the joint bid saw the tussle as one between the imperial West and the emerging East as evidenced by the comment of N.K.P. Salve, the then president of the Board of Control for Cricket in India (BCCI) in his book *The Story of the Reliance Cup* (1987). He wrote that the sub-continent hosting the World Cup:

> would virtually threaten more than a century old era of England's supremacy in the administration of International cricket. The Mecca of cricket all these long years had been Lord's. If the finals of

the world cup, the most coveted international cricket event, were played at any other place, it would shake the very foundation on which the super edifice of international cricket administration was built. (quoted in Majumdar 2004, p. 408)

A similar struggle was waged over the venue of the 1996 World Cup. A joint bid was put forward by India, Pakistan, and Sri Lanka which was more financially lucrative for the member nations than that of England (p. 412). Once again, the foundation members' veto power became the bone of contention, with ICC solicitors arguing for the same and the three sub-continental nations successfully arguing that the venue should be decided by a simple majority of the member nations (p. 413). It should be noted that both these anti-imperial victories (as the veto can be seen as maintaining a hierarchical relationship between the two Western countries and the rest) were enabled by the South Asian nations' efficient exploitation of the financial potential of the sport. India's increasing influence in the ICC also resulted in Jagmohan Dalmiya being elected as president of the ICC despite the machinations of the Western lobby (pp. 414–417) and enabled Indian players to challenge the terms of the ICC contracts for the Champions Trophy of 2000 (pp. 426–446).

India's position as the cricketing superpower has been further strengthened with the success of the Indian Premier League (IPL), and Majumdar has argued that the IPL completes the 'decolonisation of Indian cricket' (2011, p. 173). Through the IPL, India has developed an Indian brand that has acquired global recognition (Gupta 2009, p. 204). Along with the financial and political clout the tournament has afforded India, it has also played a role in reversing the sense of racial inferiority that Indians used to experience and has gone to the extent of co-opting Western players (Majumdar 2011, pp. 177–178). As an instance of the latter, Majumdar refers to David Hussey – the Australian player who played for Kolkata Knight Riders – earning the moniker 'Hussey da' ('da' being a Bengali word which means 'elder brother'). Majumdar's formulation of the 'decolonisation of Indian cricket' notwithstanding, his own analysis suggests that Indian

cricketing cultures have acquired a neo-imperial dimension. By comparing the contemporary Indian acceptance of foreign players in the IPL with the reception of Ranji in the Victorian England, Majumdar has brilliantly argued that the acceptance is unstable and contingent upon the player's success, and that slightest failure can immediately relegate him to the status of the Other (2011, pp. 178–179).

The above account makes it clear that while India, Pakistan, and Sri Lanka often worked together as a bloc to foil the Western lobby, India has been the dominant player among the three nations. A telling instance of India's preeminence in the world of cricket administration is the short-lived 'Big Three' reforms of 2014, which ushered in a new organisational structure under which the ICC would be dominated by India, England, and Australia. The constitutional amendments, which were accepted after months of controversy, vested much of the power of the ICC in two five-member committees – the Executive Committee and the Finance and Commercial Affairs Committtee – in which India, England and Australia would have permanent representatives with the other two members being selected from other countries on a rotational basis (ESPNcricinfo staff 2014b). Even within this cabal, India was to be the first among equals, with an ICC media release stating that the BCCI will take 'a central leadership responsibility' (ESPNcricinfo staff 2014a, n.p.). The new revenue model adopted as part of the revamp would have also resulted in an increase in the income of the already wealthy cricket boards of India, England and Australia. India's dominance was justified on the grounds that it generates 70–80% of ICC's revenue (see ESPNcricinfo staff 2014c). Not only were such claims been contested (see Ugra 2014), but the formal adoption of a new hierarchy was an instance of neo-imperialism, a blatant adoption of plutocratic ideals. It is worthwhile noting that the imperialist overtones of these developments have been recognised by the media. The new system was termed an 'oligarchy', which afforded the Big Three an advantage reminiscent of the veto enjoyed by the founding members earlier (Bal 2014, n.p.). The irony of the

neo-imperial role of India, which was at the forefront of the struggle to abolish the veto enjoyed by England and Australia, was also noted (see Abbasi 2014). India's pioneering of this reform is a deviation from the policy of South Asian solidarity that BCCI used to adopt occasionally in the past, and while India's increase in clout was initially at the cost of the West's influence, the Big Three reforms saw the old and new powers in the world of cricket becoming allies in heading a new empire. (A detailed coverage of the controversies following the proposals for the revamp and the minor concessions made by the Big Three in the run up to the adoption of the model can be found at the popular cricket website *ESPN Cricinfo* [http://www.espncricinfo.com/ci-icc/content/story/712255.html].) Though this blatant neo-imperialist hierarchy in the administrative set up of world cricket was rejected through a series of further reforms in 2017, the very adoption of such a hierarchial governance model illustrates the power dynamics of contemporary cricket. Moreover, while the administrative set up was made egalitarian, the roll back of 2017 failed to completely negate the tiered system of revenue sharing put in place as part of the Big Three reforms. The short-lived set up left behind a lasting legacy in that it forsook the practice of sharing the ICC revenues equally among all full members, and allotted a disproportionately high share of profits due in the subsequent cycle of tournaments (from 2016 to 2023) to India (See Brettig 2017). Whereas the estimated allocation of US $440 million to the BCCI was reduced to US $293 million as part of the 2017 roll back, this was nearly double the amount allotted to other countries. Furthermore, the BCCI's influence was evidenced in subsequent negotiations over the sharing of profits. The BCCI initially employed confrontational tactics by demanding that their share be raised to US $570 million and hinted at a pull out from the upcoming Champions Trophy by deferring the announcement of the Indian squad. This threat was potent as the non-participation of Indian team, with its unparalleled fan following, would have had a devastating impact on the TV revenues. While this strategy was curtailed by the Committee of Administrators (a

Supreme Court of India appointed committee which was overseeing the functioning of the BCCI at that point), which insisted that the team should be declared immediately, the BCCI's share was subsequently hiked to US $405 million. This amounted to 22.8% of the total revenues whereas the shares of the other full members were between 7% and 8% (Sarkar 2017; PTI 2017). This resolution to the long drawn out tussle evidences the fact that the power hierarchies in contemporary international cricket – as regulated by the ICC – are subject to the dynamics of a transnational media industry and that the Indian cricket board continues to be a neo-imperial entity by virtue of its centrality to the global 'cricket industry'.

Since the nineteenth century, cricket has been associated with imperialist as well as anti-imperialist ideologies. However, it would be erroneous to pin down cricket to a single meaning and label it as an 'imperial', 'anti-imperial' or even a 'neo-imperial' sport. With regard to the last, it is worth remembering that even after the rise of India as a superpower, cricket has not entirely shaken off its imperial past; something proven by the Western media's representation of the sport in the Indian sub-continent which continues to evoke Eurocentric, racist assumptions (Sen 2001). Rather than attempting to fix the meaning of cricket, it would be more analytically fruitful to see it as a cultural practice whose meaning is never monolithic and always subject to change.

Definition

From Cuba's earliest history, many of its citizens have struggled against imperialism. The Taino Native Americans, African Cubans, and Cubans of European and Asian descent have fought to rid their homeland, and the wider world, of subjugation and oppression. Throughout these heroic struggles, the names of the Cuban revolutionary leaders have changed; the places in which historic battles were fought are varied; and, of course, the outcomes of these struggles are diverse. What has been, and continues to be, persistent in Cuban history is its people's anti-imperialist fight at home and abroad. This essay outlines Cuba's major struggles against US imperialism and hegemony in South America, Africa, and other parts of the world.

The Cuban people began confronting social, economic, and political oppression long before the modern Cuban Revolution (1953–59) challenged autocracy and imperialism at home and abroad. The first people to fight for their independence, in what became Cuba, were the Taino Native Americans. In 1492 Christopher Columbus claimed Cuba for Spain. In 1511 the Spanish began to systematically exterminate the Taino people. The first hero of Cuba was a Taino chief named Hatuey, who fought against Spanish

imperialism and aggression. Ultimately, in 1512, he was captured and executed by the European invaders. After Hatuey's death, the Spanish began enslaving the remaining Taino people, thus beginning a legacy of enslavement that would plague Cuba until 1886.

In 1526 the Spanish imported enslaved Africans into Cuba. By the mid-nineteenth century, Cuba was engulfed by 'slave' insurrections and revolts. In addition, marginalised Cubans of European and Asian descent began to challenge Spanish authority. These challenges began Cuba's long ascension towards freedom. In the Ten Years War (1868–78) and the Second War of Independence (1895–98), Cubans fought against Spanish hegemony and tyranny. During these legendary freedom struggles, many heroic leaders emerged who helped Cubans gain their freedom and security. Antonio Maceo y Grajales (1845–96), José Quintino Bandara Bentancourt (1834–1906), and José Marti (1853–95) were Cuban leaders who resisted foreign domination and control. These dynamic leaders gave their lives to ensure the eventual independence of Cuba.

The African Cuban, Antonio Maceo, also known as 'the Bronze Titan', was a brilliant and fearless leader who tirelessly struggled against Spanish domination. One of Maceo's best-known military feats occurred during the Second War of Independence. The East-West Invasion (1895), which lasted 3 months, was the first major battle of the war. Along with Antonio Maceo, José Q.B. Bentancourt was a Cuban revolutionary leader who fought against the Spanish. Betancourt and his comrade Maceo led the Mambi Army of Liberation, which was primarily composed of African Cubans who chose to fight for freedom and against enslavement, racism, and despotism. José Marti, known by some as the 'Apostle of the Cuban Revolution', was a journalist, diplomat, and military leader who battled for Cuban independence. He also advocated against one class or group taking complete control of the country once the Spanish were expelled from Cuba. These are just a few of the nineteenth-century Cuban nationalists who opposed Spanish and foreign control of Cuban human and material resources. They also became examples of Cuban

pride and resistance that would be emulated by future generations of Cuban revolutionary leaders.

The Cuban Revolution (1953–59) was inspired by Grajales, Bentancourt, and Marti, among others. The leaders of the Cuban Revolution, Fidel Castro (1926–) and Ernesto Che' Guevara (1928–67), were inspired by Cuban revolutionary history and, as a result, co-ordinated a revolution that was concerned with suppressing imperialism not only in Cuba, but also throughout the world. In 1959 the Cuban people struck a blow against imperialism by toppling the corrupt regime of Fulgencio Batista (1901–73) and initiating a socialist government. The success of the Cuban Revolution not only uplifted the masses of Cuban people, but, as importantly, began an effort of over 50 years to confront imperialism and oppression affecting African America, Angola, and Venezuela.

The relationship between African Americans and Cuba(ns) began in the mid-nineteenth century. It was during this turbulent decade that the anti-imperialist struggles of African Cubans began influencing African Americans such as Fredrick Douglass, Martin Delany, Henry Highland Garnet, and Isabella Baumfree (Sojourner Truth). In an article titled 'Back to the Future: African Americans and Cuba in the Time(s) of Race', Lisa Brock (1994) examines the impact that the large number of Cuban slave rebellions had on many African Americans. According to Brock, 'African Americans increasingly saw Cuba through the prism of their own desire for freedom' (1994, p. 6). This desire to be liberated from enslavement and dread inspired the interconnection between African Americans and their oppressed Cuban comrades. In addition, this call to action influenced the co-ordinated and intense responses of the American landed gentry. To this end, Brock writes, racial unrest in Cuba '... not only framed North American mobilization strategies, but became the standard against which Black nationalists, intellectuals, and activists measured freedom or lack of it in Cuba and the Diaspora' (ibid.).

Many motivational Cuban leaders emerged during these significant nineteenth-century battles

for freedom, justice, and equality. However, few Cuban revolutionaries of this period captivated African Americans to the extent of the poet Gabriel de la Concepcion. Brilliant, bold, and beneficent are adjectives that accurately describe this anti-imperialist/activist. The Spanish retaliated against Concepcion's abolitionism by assassinating him on 28 June 1844.

The proof of Concepcion's influence on nineteenth-century African American leadership can be found in the advocacy of Martin Delany, an early Black Nationalist and Pan-Africanist. Brock postulates that Concepcion, also known as Placido, was the inspiration of Delany's 1859 publication *Blake: or the Huts of America, A Tale of the Mississippi Valley*. According to Brock, this fictional story encouraged slave uprisings within Cuba and the US. She posits, 'In the novel, the central character Henry (Blake) travels throughout the United States and Cuba organizing a general slave insurrection ... Henry, in fact, spends considerable time in Cuba where he receives encouragement from numerous rebels but most significantly from a "thoughtful poet of the revolution" named Placido' (1994, p. 8). Delany was so taken by Concepcion's heroism that he named his son Placido.

It is important to highlight the fact that African Americans have also had a positive impact on Cuban efforts towards securing self-sufficiency and self-governance. During the nineteenth and twentieth centuries, African American institutions, movements, and leaders stimulated Cubans who aspired to create cross-cultural and diaspora linkages. In the book *Forging Diaspora: Afro-Cubans and African Americans in a World of Empire and Jim Crow* (2010), Frank Guidry submits that people of African ancestry in Cuba and America coalesced in order to combat racism at home and abroad. In the book, Tuskegee Institute's thorough influence on many African Cubans is explored. Guidry discusses Booker T. Washington's efforts to recruit and educate Cuban students who were interested in pursuing an education alongside African Americans. Moreover, the book probes the effectiveness of Marcus Garvey's Pan Africanist Movement on the enlightened Cuban population.

Righteous African Americans and Cubans had been jointly interwoven in anti-imperialist struggles for a century, when the Cuban masses once again rebelled against domination and tyranny during the revolution (1953–59). All through this modern rebellion, the Cubans captured the attention and imagination of twentieth-century Americans of African ancestry. The Cuban Revolution occurred simultaneously with the advent of the African American Civil and Human Rights struggles of the 1950s and 1960s. While many African Americans were involved with the integrationist struggles exemplified by the Reverend Martin Luther King, Jr, others were committed to eliminating racial subjugation through revolutionary means. It was the participants in the latter struggle who developed a conscious connection with the Cuban Revolution. In addition, these activists often struggled with their duality: being African and American. Black nationalists would often ask if they could be true to both of their realities, a quandary first addressed by W.E.B. Dubois.

Interestingly, the Cuban Revolution was the catalyst that forced some African Cubans to concurrently ask the same question which mystified their North American compatriots: Can we be both African and Cuban? Soon after 1959, some African Cuban intellectuals began secretly meeting in order to read the works of Malcolm X, Frantz Fanon, and Amiri Baraka. This was an act of solidarity, and an attempt to build a unified front that would more successfully challenge imperialism in both countries. Linda Howe, author of the book, *Transgression and Conformity: Cuban Writers and Artists after the Revolution*, speculates that during this period '... the connection between the radical black politics in the United States and in Cuba was solidly forged' (2004, p. 77).

The aforementioned connection was further solidified when on 24 September 1960, Fidel Castro, while sojourning at the Hotel Theresa in Harlem, New York, met the African American nationalist leader Malcolm X. In the article "Review/Harlem Hospitality and Political History: Malcolm X and Fidel Castro at the Hotel Theresa", Joy James writes, 'The meeting of

Malcolm X and Fidel Castro in Harlem came to symbolize an era of Post-World War II decolonization movements and human rights struggles of Black and Third World people on several continents' (1994, p. 2). This historic meeting had a lasting impact on Castro. On 24 May 1990, at the Malcolm X Symposium held in Havana, Castro offered this recollection: 'We have always been in solidarity with the struggle of Black people, of minorities, and of the poor in the United States. We have always been in solidarity with them, and they have been in solidarity with us' (1994, p. 3).

After 24 September 1960, and the subsequent decades, Cuba continued to confront US-based imperialism and sow the seeds of African American solidarity by offering political asylum to freedom fighters who ran afoul of the US government. To this end, Howe asserts, 'Unity between some North American and Cuban blacks continued when the "Black Panther leader Eldridge Cleaver and Assata Shakur, founder of the Black Liberation Army, were among the prominent black exiles given sanctuary in Cuba; Stokely Carmichael and Angela Davis made well-publicized trips there at the height of their fame." Government officials invited US Black Panther members and politically controversial African American figures, treating them as persecuted heroes' (2004, p. 78).

One of the politically controversial African American figures given sanctuary in Cuba was Robert Williams. Williams was the influential National Association for the Advancement of Colored People (NAACP) leader from Monroe, North Carolina, who urged the beleaguered African American Community to defend itself from the unrelenting attacks they experienced from white people. In 1961 he was falsely accused of kidnapping a white couple, which led to his exile to Cuba. Williams, along with his wife Mabel, became the quintessential anti-imperialists when they launched their Radio Free Dixie (RFD) programme from Cuba. Radio Free Dixie (1962–65) was established to bring the plight of African Americans to a larger and more diverse audience. In his thesis titled, 'The Sound of Revolution: Radio Free Dixie, Robert Williams, and Music as Protest and Propaganda', Cory LaFevers labels

Williams as a Cultural Nationalist and examines the RFD's format and programming. According to Lafevers, 'Robert and Mabel Williams employed a wide range of African American musical styles on RFD to help gain a listening audience and to support its protest agenda musically. Most of the music played had deep connections with African American protest and cultural history and proved fundamental in encouraging a cultural revolution' (2008, p. 18).

Furthermore, RFD broadcasts also included political editorials and conversations that encouraged African Americans to protest against their unfortunate social, political, and economic conditions. It is important to note that throughout the duration of RFD, it was supported and funded by the Cuban government. Williams's creativity was stimulated, while living in Cuba. In addition to producing Radio Free Dixie, he published the noteworthy newsletter *The Crusader,* which denounced imperialism, capitalism, and racism. In 1962 he also authored the bestselling book *Negroes With Guns*, an analysis of African America's fight against right-wing reactionaries.

Indeed, many Cubans and African Americans have coalesced to combat imperialism and oppression. From the earliest slave revolts, wars of independence, and protest movements, these comrades have provided each other with support, assistance, and encouragement. Cubans have not only provided assistance to their northern neighbours, but they have also expended resources to thwart imperialist machinations on the African continent.

In 1961 Communist Cuba established its first humanitarian, diplomatic, and military relationship with an African country. The Cubans provided aid to the Algerian people as they fought a war of independence against France. Cuba supported the Algerians by giving them medical assistance, military training, and supplies. While Algeria was Cuba's first experience in Africa, it would most certainly not be its last. In late 1964, Castro ordered Che' Guevara to Angola and the Congo in order to support anti-imperialist revolts. In Angola Guevara fought with the Marxist-Leninist People's Movement for the Liberation of Angola (MPLA).

While in the Congo, he aligned himself with the followers of the slain prime minister Patrice Lumumba, whose devotees were rebelling against the imperialist-backed government led by Joseph Kasavubu. Guevara's attempt at quelling imperialism in Angola and the Congo was unsuccessful. His efforts were thwarted by the Belgian and US-supported mercenary army led by the Afrikaner Mike Hoare. Eventually, in 1965, Guevara slipped out of the Congo, calling his botched foray 'a history of failure'.

Cuba's goal of suppressing imperialism in Africa was not damaged by its previous failure to end the subjugation of the Angolan and Congolese peoples. In both 1975 and 1988, Cuba deployed her army to Angola to assist its long-time ally, the MPLA, confront South African tyranny, racism, coercion, and violence. According to Piero Gleijeses, author of the book (2013b) *Visions of Freedom: Havana, Washington, Pretoria, and the Struggle for Southern Africa, 1976–1991*, 'Cuba is the only country in the world that sent its soldiers to confront the army of apartheid and defeated the army of apartheid, the South African army, twice – in 1975, 1976, and in 1988'.

Castro, in 1975–1976, responded to South Africa's invasion of Angola by ordering 36,000 Cuban soldiers into the country. The communist forces pushed the South African army into Namibia, which was controlled by South Africa. This joint Cuban and Angolan show of force was significant because it effectively met the challenge of the 'White Giants', as Gleijeses explains: 'This was the first real contribution of Cuba to the liberation of South Africa. It was the first time in living memory that the White Giants, the army of apartheid, had been forced to retreat. And they retreated because of a non-white army. And in a situation of internal colonialism, this is important' (2007, p. 1). The Cubans remained in Angola, thus preventing South African forces from recapturing important towns and cities. In addition, it was during this time that the Cuban Government and the African National Congress began their coalescence.

In 1987 the Cuban–Angolan coalition was, once again, challenged when the South African army intervened in an Angolan Civil War. By early November 1987, the South Africans had trapped Angolan army units in the town of Cuito Cuanavale. The imperialist forces were poised to destroy the beleaguered Angolan Military, until Castro deployed 1,500 soldiers, and his most sophisticated jets, to assist his allies. In the article titled, 'Remembering Cuba's Sacrifice for African Liberation', Gleijeses describes the battle, 'On March 23, 1988, the SADF launched its last major attack on the town.' Gleijeses continues, 'As Colonel Jan Breytenbach writes, the South African assault "was brought to a grinding halt" by the combined Cuban and Angolan forces' (ibid.).

After their defeat at Cuito Cuanavale, the retreating South Africans returned to Namibia, which was unacceptable to the Cubans. Cuba was poised to invade Namibia and rid that country of the vanquished South African army. However, at that very moment, the US encouraged both sides to pursue a diplomatic solution to the battlefield quandary. Not only did the anti-imperialist forces of Angola and Cuba win a decisive military victory, but they also proved to be just as skilled at the negotiating table. 'The Cubans' battlefield prowess and negotiating skills', writes Gleijeses, 'were instrumental in forcing South Africa to accept black Namibia's independence … This victory reverberated beyond Namibia' (ibid.).

Cuba's policy in Africa involved/involves developing strategic relationships and ties with African nationalists and socialists. This strategy was successful in preventing South African expansionism and hegemony. More importantly, it is Cuba's timely intervention in Angola (1988) that many scholars, including Nelson Mandela, assert was the event that ultimately led to the toppling of the racist South African Apartheid regime: 'The Cubans destroyed the myth of the invincibility of the white oppressor … [and] inspired the fighting masses of South Africa' (Mandela 2013).

Cuba's sphere of influence expanded beyond Africa into every corner of the world where the sting of imperialism was felt by innocent populations. In the Caribbean, the relationship with Cuba began in the early 1970s when Jamaica,

Guyana, Trinidad and Tobago, and Barbados (the largest Englishspeaking countries in the region) normalised diplomatic, military, and business affairs with their communist neighbour. Initially, the relationship between these nations hinged on security and the sustaining of the revolution. Gerardo Nunez offers the following observation in the article 'Cuba's Relations with the Caribbean: Trends and Future Prospects': 'Cuban foreign policy toward the Caribbean has been primarily focused on protecting its national security and the survival of the revolution' (2002, p. 6).

In the future, as the relationship between Cuba and Caribbean countries matures, foreign policy issues will expand into more reciprocally advantageous areas. To this extent, Nunez writes, '... Cuba–Caribbean relations have room for further improvement in areas of common interest that have not yet been fully explored, such as migration, and narcotics, terrorism, and the environment. These areas could be the starting point for enhanced and mutually beneficial collaboration and for the development of a common agenda vis-à-vis third parties' (7).

Cuba's most important province of influence, particularly in its unending fight against imperialism, is South America. The earliest Cuban revolutionaries, such as Marti, extolled the virtues of South American freedom fighters. The great Venezuelan Simon Bolivar (1783–1830), also known as 'the Liberator', shared Marti's and Castro's intolerance of totalitarianism and domination. In fact, Bolivar's struggles against Spanish imperialism were emulated by many Cuban leaders of the Ten Years War and the Second War of Independence. In addition, Bolivar's suspicions of the US government's imperialist schemes in South America were also shared by many Cubans. In an 1819 speech in Caracas, Venezuela, Bolivar shared his distrust of the US by saying, '... the United States would seem to be destined by fate to plague the Americas with miseries in the name of freedom' (1829: 135). This sentiment was clearly shared by Marti who, while fighting against Spanish imperialist forces in 1895, said, '... I am in daily danger of giving my life for my country and duty – for I understand that duty and have the

intention of carrying out – the duty of preventing the United States from extending through the Antilles as Cuba gains its independence, and from falling, with that additional strength, upon our lands of America' (Marti 1885).

Cuba has influenced many anti-imperialist efforts in South America such as Chile (1970s) and Nicaragua (1980s). However, Cuba shares its greatest affinity with Venezuela. Central to the contemporary relationship between Cuba and Venezuela is the unbreakable alliance, even in death, between Castro and the late Hugo Chavez (1954–2013). In 1992 Chavez led an unsuccessful coup against the regime of Carlos A. Perez. After serving a 2-year prison term for his participation in the previously mentioned revolt, he became associated with Castro, a relationship that continued throughout the rest of his life.

'At the root of the extraordinary close alliance Chavez built with Cuba', postulates Francisco Toro, 'was a deep paternal bond between two men ... Chavez's extraordinary devotion sprang from Castro's status as the mythical Hero-Founder of Latin America's post-war hard left' (2013, p. 1). For 20 years, Cuba provided sugar, military support, and assistance to the oil-rich nation. Moreover, Cuba became a major exporter of medicine, medical supplies, and physicians. Since the Cuban-Venezuelan Health Care Collaboration, an estimated 53,000 Venezuelans have received free medical treatment from approximately 30,000 Cuban physicians. In fact, Cuba has been practising 'Medical Diplomacy', as a method of confronting imperialism, since the 1960s. In response, Venezuela delivered to Cuba what it didn't/doesn't have: oil, natural energy, and financial support.

The seemingly unbreakable bond between Cuba and Venezuela is a source of immense discomfort for the US government. Nicholas Kozloff, in the article titled 'Washington's war on Cuba and Venezuela' suggests that as early as 1973, the US was suspicious of the connection between these Caribbean countries. Kozloff says that, 'In late 1973, US diplomats expressed concern about Venezuelan moves to end Cuba's diplomatic isolation, and were particularly worried that Caracas might "put together Organization of

American States [OAS] majority in support resolution permitting the reestablishment relations with Cuba" Washington was also perturbed by reports that Venezuelan Navy vessels had departed for Cuba in order to load up on large shipments of sugar, and diplomats contemplated a possible cut-off of aid to Caracas in retaliation' (2013, p. 2)).

To Washington's chagrin, Cuba and Venezuela have continued to present a unified front in the fight against imperialism and degradation, even after the death of Chavez. The new Venezuelan president, Nicholas Maduro, has continued the relationship with Castro's Cuba, vowing that the two countries '. . . will continue working together' (2014, p. 1). Recently, Cuba and Venezuela have signed 51 bilateral agreements related to a multiplicity of activities including health care, education, energy management, and recreation.

Notwithstanding the angst, frustration, and distrust the US has experienced with Cuba, recently there has been a normalizing of relations between the hemispheric neighbours. On 17 December 2015, Presidents Barack Obama and Raul Castro restored full diplomacy between the two former advisories, ending over 50 years of hostility. The aforementioned Heads of State, on 11 April 2015, exemplified the burgeoning alliance by shaking hands and exchanging pleasantries.

In addition to the reestablishment of diplomacy, the new relationship between the US and Cuba has enjoyed the following accomplishments:

- Prisoner releases
- Establishment of new travel and trade regulations
- Us companies allowed to invest in small Cuban businesses

Some people anticipate that this new era in hemispheric relations will have a positive impact on Cuba's struggling economy. However, any attempt to lift the long standing economic embargo will face stiff opposition from Republican politicians such as Speaker John Boehner, Senate Majority Leader, Senator Mitch McConnell, and Senator John Vitter of Louisiana.

Moreover, some people fear that the new thaw in US-Cuba relations may encourage Cuba to return to its racist and fascist past. Only time will reveal if Cuba continues to confront imperialism, aggression, and despotism or if it returns to the corruption and oppression its citizens experienced under the dictator Fulgencio Batista (1952–59).

From Cuba's earliest history, many of its citizens have struggled against imperialism. The Taino Native Americans, African Cubans, and righteous Cubans of European and Asian descent have fought to rid their homeland, and world, of subjugation and oppression. Throughout these heroic struggles, the names of the Cuban revolutionary leaders have changed; the places in which historic battles were fought are varied; and, of course, the outcomes of these struggles are diverse. What has been, and continues to be, persistent in Cuban history is its people's anti-imperialist fight at home and abroad.

Cultural Imperialism

Cultural Nationalism

Culture and British Imperialism in the Nineteenth Century

John M. MacKenzie
University of Lancaster, Lancaster, UK

Empires, to achieve their objectives in pursuing commercial, territorial, and demographic resources by military means, also need to be culturally expansive. They cannot be self-effacing but must exhibit their presence through what they consider to be the superior qualities of their culture, conceived as the central aspects of their identity (MacKenzie 2016). In modern empires, this was always known as the "civilizing mission," a mission which invariably started at home. In the British and Hibernian Isles, Ireland provides the classic case, and it is the cultural influence of England on Ireland that has proved to be most durable. Such cultural characteristics offered both the means and the alleged justification for the apparent ascendancy of imperial peoples. Empires therefore seem impelled to make cultural assertions as part of their acquisitive designs. Such statements take many forms of which perhaps the material presence of the dominant power is the most obvious – that is, the appearance of structures such as fortresses, walled settlements, later commercial, administrative and religious buildings, as well as domestic residences, sometimes at the center of plantations and other agricultural developments. New cities and towns often rise as a powerful expression of the manifestation of the new empire. In addition to this material display, a dominant empire seeks to expand the incidence and usage of its language, aspects of its political system, and its religious observance and associated institutions. It also invariably disseminates methods of socializing the young through education and other activities (MacKenzie 1984). But empires are also adaptable and, whether consciously or unconsciously, invariably assimilate characteristics of the subordinate peoples. Most importantly of all, empires require to seek the

acquiescence of their home populations in their expansive activities.

Such a description of the cultural effects of empires could encompass many empires in human history, and it is no less true of the global spread of British rule, initially hesitant in the seventeenth century, more aggressively in the eighteenth, and finally triumphantly in the nineteenth (Canny 1998; Marshall 1998; Porter 1999). The British, particularly the political, scholarly, and landowning elite, were well aware of the fact that their own territories had themselves been subjected to the imperial rule of the Romans and later the Normans. Progressively, as they made their military, maritime, commercial, and material presence apparent in North America, India, and elsewhere in Asia, Africa, and Australasia, they were conscious of following in the footsteps of other historic empires, albeit on a more extensive scale. They were also caught up in a strongly competitive urge to world domination. Spain and Portugal had been the first European states to embark on global expansion, very much bound up with the Roman Catholic Church. In the course of the seventeenth century, this sense of intense competition was particularly associated with the Dutch empire in Southern Africa and in Asia, but by the end of that century, there was no doubt that the principal rival was France. The struggle with France was to continue until the end of the Napoleonic wars in 1815. It was this fierce commercial and territorial rivalry, heightened by the realization that the French enjoyed considerable power in North America, the Caribbean, and in South Asia and by the recognition that it was a contest between a Catholic and a Protestant power, that was to infuse British imperial culture in profound ways (Armitage 2000). In the eighteenth century, the British also promoted the myth that it was a contest between a liberal and supposedly free political system competing with a royalist autocratic one (Colley 1996).

As the British prosecuted this rivalry through the sequence of wars that marked the eighteenth century, they became more and more convinced not only of the rectitude of their activities (partly confirmed by their apparent success) but also of the superiority of the culture which those exploits

represented. At the same time, this sense of an imperial destiny became closely bound up with patriotism and nationhood, a patriotic impulse which, after 1707, had become inseparably associated with the union between England, Wales, and Scotland, constituting the Britain which would always give its name to the empire (MacKenzie and Devine 2011). After 1800, the union with Ireland (long in effect a colony) brought together all of the British and Hibernian Isles into this imperial constellation. This sense of nationhood became closely associated with overseas expansion and the opportunities this afforded. It also became bound up with the continuing development of naval technology, with the emergence of the Royal Navy as the principal arm of an expanding state, with the commercial companies (such as the East India, Hudson Bay, and Royal Africa Companies) associated with maritime trade, with the great voyages of exploration, and, by the end of the century, with the evangelical impulse of the Protestant churches.

We should perhaps consider some definitions before examining these cultural phenomena in greater depth. We need to distinguish between **cultural imperialism** and **imperial culture.** These may be defined in the following ways. First, **cultural imperialism** involves the conscious efforts at conversion to an imperial culture; the proselytizing urge, in respect of the home population; the migrant diaspora to the colonies of settlement; and the conversion of indigenous peoples. It constitutes the ambitious attempt to create a genuine imperial community united by political, legal, religious, and social ideas, promoted by the material presence of the imperialists in architecture and settlements, as well as in the language, educational, sports, and entertainment forms that they disseminate. All of these incline toward offering a specific allegiance to a symbolic center, notably the monarchy and the metropolitan British state. Cultural imperialism can also be seen as the business of Christian missionaries, not just in religious proselytization but also in education, clothing, economic practices, and many other phenomena, although such an approach has been the subject of controversy among historians (Comaroff and Comaroff 1991,

1997; Porter, A, 2004). The objectives of cultural imperialism are also embedded in the activities of secular educationalists, administrators, elements of the press, the community of authors, and other aspects of print culture and can be additionally conveyed by some fragments of a newly emergent and culturally assimilated indigenous elite.

If cultural imperialism is the process, an **imperial culture** is the desired outcome resulting from the vehicles of cultural imperialism. It is the wished-for product which energizes the economic arms of the imperial state and creates the cohesive community through which imperial objectives can be attained. If it is ever attainable, this may be represented in town planning, architecture, infrastructures (Bremner 2016), and environmental transformations and with musical, dramatic, and, later, cinematic performances of the supposedly settled imperial culture. It can also be reflected in ceremony, pageantry, ritual, the dispensation of laws, and all the other ways in which empires display themselves. This is the ideal which some arms of the imperial state strain toward while always beset by dissenting voices both in the metropolis and in the empire itself.

The characteristic heightening of the patriotic significance of events and the presentation of personalities and key moments leading toward the emergence of an imperial culture became particularly apparent in Britain in the second half of the eighteenth century. Such phenomena included, for example, the development of the cult of heroes. The notion of the hero and the heroic life seemed to develop a much more powerful resonance once such heroism was located in exotic geographical contexts. Such heroes became almost superhuman and representative figures associated with the national success of the British state. Naval and military figures came to be elevated to the status of empire builders, celebrated in a whole variety of media (Cubitt and Warren 2000; Sèbe 2013). Admiral Vernon was one of the first of these, associated with the Wars of the Spanish Succession and of Jenkins' Ear, notably with his capture of Porto Bello from Spain. This constituted a relatively hesitant start to the phenomenon until it became a national passion with General Wolfe in his victory on the heights of Abraham in 1759,

one of the crowning victories of the Seven Years' War which massively expanded the British Empire in North America, the Caribbean, and India. Wolfe now became the subject of a major cult of statues, painting (as in the most celebrated "history" painting of the age, the "Death of Wolfe" by Benjamin West), and countless theatrical tableaux. At sea, Admiral Rodney became celebrated for his exploits in the War of Austrian Succession, the Seven Years' War, and the War of American Independence. In the latter, the Battle of the Saints against the French off Dominica was seen as saving significant islands of the West Indies for the British. Later, Horatio Nelson became the supreme exemplar of this national passion after his victory at Trafalgar in 1805 (Cannadine 2005). Wolfe and Nelson illustrated the fact that nothing heightened the status of such national figures more than a heroic death at the moment of supreme success. This was also true of a heroic figure in another field, exploration. Captain Cook's succession of voyages in the Pacific and his role in cartography and scientific discovery, followed by his death in 1779 on the Sandwich Islands (Hawaii), led to his apotheosis into the highest rank of national imperial heroes, particularly in view of the manner in which British success in the ultimate annexation of Australia and New Zealand was seen as resulting from the fame of his exploits. In all of these examples, artistic representations, statuary, and hagiographical biographies contributed to the developing cult of important imperial events. While some aspects of the consumption of such cults might be seen to be limited to an elite, they became progressively more available to the population as a whole through prints, book illustrations, and the development of spectacular theatrical representations.

Major changes occurred during the nineteenth century which resulted in many additional cultural phenomena representative of the British conviction that their rule constituted the most strikingly progressive empire of human history. These included the elevation of the British monarch, particularly in the reign of Queen Victoria, to the mythic rank of global ruler. This unquestionably contributed to the development of British architectural styles and a passion for monumental

sculpture representing the continents, their peoples, and the role of the British in supposedly bringing so many of them together into a vast empire with an allegedly common culture. Associated with this was the progressive rise in the status and reputation of the military. Famously, although the centrality of the navy led to the development of the cult of the "Jack Tar" or common sailor (Conley 2009), the military in the eighteenth and early nineteenth centuries was often viewed as "the scum of the earth," as Wellington put it, who needed to be turned into heroic, morally elevated figures through the army. As the nineteenth century developed, however, the soldiery came, in many respects, to be lionized, an effect which was heightened by their campaigns in distant and exotic places. Moreover, as western weaponry was transformed by industrial processes, particularly into the fast-repeating machine guns like the Gatling and, more particularly, the Maxim, the ratio of casualties changed such that indigenous opponents were in much greater danger than the British. Thus, soldiering on the part of the British for the extension and protection of the British Empire became less dangerous in terms of conflict but continued to have casualties through disease and the problems of the environment. Such colonial campaigns often became wars against nature as much as against people (MacKenzie 1992, p. 8; Spiers 2004). The reign of Queen Victoria was a time of almost continuous colonial campaigns (sometimes against rebellious settlers and subjects) in North America, Australasia, India, Southeast Asia, and the Far East, as well as in Africa during the period of that continent's partition among the European powers between the 1870s and the early years of the twentieth century. In the same period, after the Cardwell army reforms of 1870, the affiliations of regiments became more local, associated with specific counties, cities, and towns within the British Isles. By this time, the appearance and reputation of the military had become central to imperial culture, in paintings and prints, in the theater and patriotic songs, and in real life in the ceremonial departures and triumphant returns. In these ways, the soldiery became increasingly significant in national and civic events, almost a

ubiquitous sight on the streets of many places in Britain, cheered by the population consciously celebrating their role in creating national identity and in expanding and defending the empire. They also became central to local identities, not least through uniforms as, for example, with the highly visible Scottish soldiers. This was equally true, however, of Wales, Ireland, and individual counties. Yet all such heightening of local identities seemed to feed into the union sanctified by imperial success.

There can be no doubt that in imperial culture generally, the Indian Revolt of 1857 constituted a significant turning point. The events of the revolt were followed very closely indeed in the British press. It has been said that the horrors that were allegedly perpetrated by Indians (some were grossly exaggerated and in any case the retribution exacted by the British took horrendous forms) led to the heightening of racial ideas, a development which was exacerbated by the Morant Bay rebellion in Jamaica in 1865 and the actions of the Governor Edward Eyre. Support for Eyre by key figures in British culture, such as John Ruskin, Charles Dickens, Alfred Tennyson, Charles Kingsley, and Thomas Carlyle, served to heighten these racist ideas, although there were others, such as David Livingstone, John Stuart Mill, Charles Darwin, John Bright, and Thomas Henry Huxley, who took the opposite line. Such racial ideas were further heightened by events in Africa and the attitudes of the dominant whites in Southern Africa and later Kenya and elsewhere. Imperial culture had now adopted notably racist views, although there was always an alternative faction which attempted to mitigate the more extreme attitudes.

Another characteristic development of the nineteenth century heightened all these effects. It was an age which witnessed a massive growth in print culture. Newspapers had their origins in the eighteenth century, but in that period, patriotic ideas and the announcement of events in war were often conveyed by poetry, ballads, broadsheets, and posters which circulated on the streets. The price of newspapers, however, ensured that circulations were relatively low, generally among the elite. However, the significant change came in

1855 when newspapers were freed from the stamp duties which had rendered their cover price too high for a working-class readership, at a time when the extent of literacy was in any case fairly low. After the repeal of stamp duty, papers became available at twopence or a penny, ensuring that at least theoretically they were available to all. Their circulations grew considerably conveying news of imperial campaigns and other colonial events to every corner of the country. Another type of publication that emerged at this time was the illustrated journals such as the *Illustrated London News* (founded 1842) and *The Graphic* (1869) which exploited the new printing technologies with woodcuts and engravings to reproduce illustrations on a major scale, often of imperial campaigns, of heroic events, or of grand ceremonial, for example, in India. While these journals would have been too expensive for many ordinary people, still they would have been seen by the large class of servants in middle- and upper-class households, while the new development of free municipal libraries (after the act of 1850 which permitted local councils to raise a penny on the rates to fund them) made newspapers and illustrated journals available to all. This growth also promoted the striking explosion in advertising that became a characteristic of the age (Ramamurthy 2003). Such advertising, in newspapers, magazines, and on hoardings, often placed products in colonial settings, associating the specific manufacture with events and heroes of the day. The key to the further expansion of print culture and its consumption was the spread of literacy, promoted by the Education Acts of 1870 (in England and Wales) and 1872 (in Scotland).

Indeed, helped by this extensive availability of printed materials, the cult of heroes which had already developed in the eighteenth century grew considerably in the second half of the nineteenth. Major heroes included military figures who had served in the suppression of the Indian Revolt of 1857, the so-called mutiny, such as Henry Havelock, John Nicolson and Colin Campbell, and Lord Clyde (MacKenzie 1986). David Livingstone and his explorations, associated with the suppression of the Indian Ocean slave trade,

became one of the most celebrated heroes of all, complete with his remarkable funeral in Westminster Abbey after his body had been brought out of Africa (Lewis 2018). General Gordon in the Sudan was elevated to powerfully iconic status by his death at Khartoum and by the considerable admiration of Queen Victoria. We can add to these Henry Morton Stanley made famous through his search for Livingstone and other African exploits and Herbert Kitchener who was seen as retaking the Sudan, avenging Gordon, and then defeating the Afrikaans people of Southern Africa in the second Anglo-Boer War of 1899–1902. In the early twentieth century, exploration in the Antarctic produced another crop of heroes including Captain Robert Falcon Scott, who famously died on his return from the South Pole, and Ernest Shackleton who managed, through particularly heroic voyages in small boats, to bring out his followers alive. But, as has sometimes been pointed out, it was heroic failure that seemed to have a particularly heroic resonance for the imperial British (Barczewski 2016).

David Livingstone's heroic reputation had a galvanizing effect upon the continuing development of missionary activity. Catholic missionaries had been involved in the expansion of the Spanish and Portuguese Empires from the sixteenth century, but Protestant missions had relatively weak beginnings in the eighteenth century. Organizations like the Society for Promoting Christian Knowledge (founded 1698) were as much concerned with domestic society as with overseas. From the 1790s, however, the evangelical urge became an energizing force in developing missionary ambitions among the various Protestant denominations in the United Kingdom, including Anglicans, Baptists, Methodists, Congregationalists, and the Scottish churches. Much of this activity was channelled through missionary societies such as the Baptist (1792), London (mainly Congregationalist, 1795), Scottish (1796), and the Church (Anglican, 1799) missionary societies. The established Church of Scotland and the breakaway Free Church of 1843 both became highly active in India, Africa, and elsewhere. Such missionary societies continued to appear throughout the nineteenth century, with the Universities'

Mission to Central Africa (1860) founded as a direct result of Livingstone's appeal. His death in what is now Zambia in 1873 had the effect of recruiting large numbers of clergy and women missionaries to the cause, and there was an extraordinary upsurge of activity throughout the world. This evangelizing activity was immensely helped by the opportunities of the new and cheaper print culture. Missionary magazines and other publications became available in large numbers, as did cheap books about missionary endeavor and about the figures who were regarded as missionary heroes of the age. Such publications can be found to have had wide circulations down to the inter-war years of the twentieth century.

In addition to all these printed materials, missionary societies were able to propagate news of their activities and raise funds not only through the networks of churches of the various denominations but also through exhibitions in which they exhibited illustrations of their activities in Asia, Africa, and elsewhere. This was also a means of selling missionary publications and even postcards. Missionaries on furlough also made lecture tours, perhaps with the projection of magic lantern slides (a significantly popular visual development of the age), to spread news of their missions and also to raise funds. An essential part of this propagandist activity was the self-regarding and satisfying news that peoples elsewhere in the world were not only being converted to Christianity but were taking on the cultural characteristics of the home population, attending schools, wearing western clothes, and learning familiar crafts like brickmaking, carpentering, and printing, while girls were being taught the gendered, domestic activities of the missionaries' home society. In these ways, at a time of considerable piety and extensive church attendance, there can be little doubt that the missionary societies and the extraordinarily extensive network of mission stations which they established throughout the world were among the most potent disseminators of an imperial culture both within Britain and overseas. Moreover, both the national and local press regularly advertised the activities of missionaries and of lecture tours. Evidence from the Scottish newspapers in particular reveals the striking prominence that was accorded the work of missionaries, their schools, and other activities as well as the propensity of missionaries to see themselves as contributing significantly to the civilizing mission. Moreover, societies (sometimes of women) were founded in many towns to support these enterprises. To return to David Livingstone, it is an astonishing fact that in the 50 years after his death almost 100 popular biographies were published to celebrate his life. If there had not been a market for such works, it is highly unlikely that it would have been fed so assiduously.

If missionary publishing was significant, one of the most striking publishing phenomena of the age was the appearance of large numbers of popular books celebrating the empire, both in supposedly factual accounts and, above all, in the tradition of celebrated juvenile literature which extolled the virtues of heroes (and often included their names in the titles) and the events and wars in which they were involved (Richards 1989; Castle 1996). These books became part of a highly popular adventure tradition in exotic locations. There were a number of celebrated authors feeding this market, of which G.A. Henty was perhaps the most celebrated, prolific, and enjoying large sales. He wrote well over 100 adventure stories between 1868 and 1906, the majority of them about imperial events, often with titles that included names of heroes, such as *With Clive in India*, *With Kitchener in the Soudan*, and *With Roberts to Pretoria.* Several other authors wrote similar books for the young, while there were also "Annuals" (for the Christmas market) containing equivalent material. These ideas became so pervasive that they can also be identified in a different form in school textbooks, particularly those dealing with modern history but perhaps more particularly geography and aspects of religious and literary study (Yeandle 2015). Studies of such texts have revealed the extent to which they promoted a patriotic worldview which placed the exploits and achievements of the British at the center of the technological advances of the age, the urge to geographical and scientific knowledge, and the dissemination of British ideas, including, for example, notions of British freedoms and of democratic and libertarian politics, even although

so far as the suffrage was concerned, British society was itself far from being fully democratic. In this respect, settlement territories of the British Empire could be more advanced. New Zealand, for example, although it had been through an era of violence in the Maori wars between 1846 and 1872, had full male and female suffrage from 1893, although the Maori voted in separate constituencies.

Of all the popular conduits through which imperial cultural forms were transmitted, the theater was one of the most influential. Once again, there was a long history to this. The theater had already begun to offer recreations of events that were taking place in the empire and in warfare from the second half of the eighteenth century. At the time of the Napoleonic wars, a tradition of spectacular theater was developed in which battles (even naval ones) were reenacted for the edification and patriotic delight of the audience. These effects were heightened in the nineteenth. Imperial themes became a significant staple of theatrical productions, particularly in the second half of the century when events in India and in Africa were portrayed on the stage (Gould 2011). Themes of class conflict, which had been popular at an earlier period, were often replaced by plots that emphasized racial difference. One of the standard theatrical forms of the age, melodrama, was ideally suited for this kind of material. Imperial patriotism was also transmitted through the popular pantomimes of the age, as well as through some of the increasingly popular presentations of musical theater at the turn of the nineteenth and twentieth centuries (Yeandle et al. 2016). In the same era, the music hall became one of the most popular of all theatrical performances, and dedicated music halls opened throughout the country, both in large cities and in country towns. The music hall often featured patriotic songs, marching soldiers, and tableaux (such as the death of General Gordon in Khartoum, as portrayed in a famous painting by G.W. Joy). Many of these tableaux did indeed assume the form of imperial patriotic paintings, which must have been familiar since they had been disseminated more widely by prints and illustrations in popular magazines or books. In the same period,

statuary and other forms of monumental sculpture became one of the most visible aspects of the display of naval, military, and imperial heroes.

One of the features of the nineteenth century was the emigration of British people from the United Kingdom to colonial territories. Such migration had begun in a smaller way to the Caribbean and the American colonies in the seventeenth century, developing to a certain extent in the eighteenth. But the era of mass migration was only to come in the nineteenth and early twentieth centuries, often on sailing ships, but as the century wore on increasingly on steamships which rendered such voyages shorter, safer, and to a certain extent at any rate more comfortable (Richards 2004). It has been estimated that some 18.7 million people migrated out of Britain between 1815 and 1930, with Ireland contributing more than 8 million, by far the highest proportion of its population among the constituent ethnicities of the United Kingdom. Irish migration was partly impelled by the great famine of the 1840s, but migration continued throughout the nineteenth and early twentieth centuries. A high percentage of such migrants went to the United States, at least until quotas were imposed in the early twentieth century. But the peopling of the settlement territories of the British Empire, Canada, Australia, from 1840 New Zealand, and to a lesser extent South Africa was one of the characteristics of the age. Such settlement of course went along with the dispossession of indigenous peoples, and settlers were often involved in local wars, both great and small. These colonies remained within the British Empire, although progressive constitutional developments, notably the federation of Canada in 1867, the Australian Commonwealth of 1901, and the South African Union of 1910, leading to the Statute of Westminster of 1931, meant that their emergence as the fully independent countries of today proceeded by gradual stages. Nevertheless, for most of this period, they remained culturally within what has become known as the British World, English-speaking and replicating many of the cultural characteristics of Britain itself. These included the reproducing of the phenomena already described – the appearance of mechanics' institutes everywhere (for the

education of working men, the first founded in Scotland in 1821), the development of an active press of publications (many exported from Britain), the explosive spread of the Christian churches, and the missions to indigenous peoples, the schools, libraries, theaters, and other institutions to be found in the so-called metropolis. Migration contributed to an imperial culture in various ways: through the circulation of leaflets and pamphlets encouraging migration, through advertisements in newspapers, through the lectures of migration agents from various colonies, and through handbooks providing advice for migrants.

This migration of British people around the world has been divided into two major categories, settlers and sojourners. Settlers were generally permanent migrants, although some did return to Britain, particularly in the twentieth century. Sojourners were temporary migrants who travelled, for example, to India to work in administration, commerce, the military, or missionary work. Sojourners also went to the so-called dependent colonies of the empire in Southeast Asia, the Caribbean, Indian and Pacific Ocean islands, and above all the African colonies north of South Africa. Some colonies in East and Central Africa acquired settlers who imagined that they would remain there, based upon the illusion that African nationalism lay far off in the future. But in the majority of cases, they did turn out to be more temporary sojourners. In these colonies as well as in the settlement territories (which became known as dominions in the twentieth century), there is some evidence that this English-speaking community did operate, at least for a period, as an imperial whole, drawn together by the monarchy, the military (with local regiments recruited in all the settlement territories), and common passions. For example, there is considerable evidence from the colonial press that the Anglo-Boer War was given a great deal of prominence, with, for example, the celebrations of the Relief of Mafeking in May 1900 receiving wild rejoicing not only in Britain but throughout both the settlement and other colonies. This was partly because there were troops from Canada, Australia, and New Zealand involved in the war. It is perhaps ironic

that this sense of an empire operating together in the pursuit of an imperial campaign actually became an important milestone in the development of national identities in those countries, as is evidenced by the remarkable war memorials that were erected after the war. This was an effect which was of course even more pronounced with World War I. Although there was a fresh wave of migration after that war (and the United States was no longer such a significant destination), the territories which received them were becoming progressively less British, both through the arrival of many migrants from other parts of Europe and because of developing nationalist identities (Fedorowich and Thompson 2013).

Various cultural events were exported around the empire during this period. One of the most significant of these was the idea of the international exhibition. In Britain, the Great Exhibition of 1851 in the Crystal Palace contained a magnificent and much admired section on India, but colonies were not central to the exhibition (Greenhalgh 1988). It was much more concerned with manufacturing and economic rivalry with other European powers. The next exhibition, in London's South Kensington in 1862, had a larger colonial section, but the succeeding one, the Colonial and Indian of 1886, concentrated almost exclusively on empire as its name implied. From this time onward, all exhibitions had this focus. From the 1890s to World War I, they became almost annual events, some of them privately run, with two significant ones designed to celebrate the coronation of George V in 1911. The culmination of this activity came with the massive Wembley Exhibition in 1924–1925, followed by the Glasgow Empire Exhibition in 1938, the last of the sequence. These exhibitions all contained pavilions devoted to individual colonies, showcasing their products, agricultural and mineral, as well as the magnificence of their environments and invariably acting as further recruiting exercises for fresh migration. They also often contained "native villages," living displays of peoples from the colonies which became opportunities for what may be called ethnographic voyeurism (Qureshi 2011). More seriously, there were often stands at which craftspeople from India and

elsewhere worked on the production of the various crafts for which they had become celebrated and which were seen as offering a contrast with machine-made industrial items. The exhibitions were immensely popular, attracting very large numbers of visitors to the great variety of their exhibits and, it must be said, to the funfairs that invariably accompanied them.

But these extraordinary events were not restricted to Britain. One of the most striking aspects of exhibition history is the manner in which they were organized in many other places, both in the United States and in colonial cities. All the principal cities of the colonies of the British Empire mounted such exhibitions, and they became almost a "rite of passage" that revealed the economic, cultural, and organizational maturity of the respective colony. They appeared in several cities of Canada, Australia, New Zealand, Southern Africa, and India, with exhibitions being organized even in apparently less likely places such as Zanzibar and Bulawayo. They were often linked to the celebration of specific events or anniversaries and set out to bring aspects of the world, perhaps mainly a colonial world, to the city or town in which they were located while also displaying the peoples, products, design, and other attributes to visitors from overseas. It was a remarkable phenomenon and one which united the empire in what can be seen as striking cultural emporia. They stimulated many publications, press reports, visual materials (including in the twentieth-century postcards), as well as celebrations of scientific progress and the efficiencies of such nineteenth-century technological advances as the posts and telegraphs, the railways, and later electricity and the internal combustion engine.

In addition to these, there were other empire-wide celebrations or commemorations which seemed to create a degree of cultural cohesion. These included the jubilees of Queen Victoria, the deaths and coronations of monarchs, and events associated with imperial heroes. For example, the colonial press reveals that there were various celebrations of the centennial in 1913 of the birth of David Livingstone. There can be no doubt that the monarchy was seen as an effective glue which held the empire together, and celebrations of, for example, Queen Victoria's birthday were an empire-wide phenomenon. Royal tours seem to have been an important part of this and became increasingly frequent as the technologies of travel improved with steamships and railways. Modern royal tours are regarded as beginning in 1860 with the visit of the youthful Prince of Wales (future Edward VII) to Canada and his younger brother Prince Alfred to South Africa in the same year. The Prince of Wales made a highly significant tour of India in 1875–1876, just preceding the proclamation of Queen Victoria as Empress of India, while his son, the Duke of York, the future George V, and his wife made an extensive empire tour in 1901, the centerpiece of which was the opening of the federal parliament of Australia in the magnificent 1880 exhibition hall in Melbourne. The Duke and Duchess of York were in India in 1905 and returned for the Delhi Durbar in 1911. In turn, their son made a whole sequence of royal tours in the inter-war years. All of these were accompanied by extensive press coverage with cheering, loyal crowds in the streets (though rather more muted in India), with books being published at the end of each journey. Clearly intended as a prime means of maintaining an overall imperial culture, their efficacy rapidly declined after World War I when the comparative boredom and indifference of the future Edward VIII may well have communicated itself to some at least of those he was supposed to impress. Moreover, the intentions and effects of such tours often diverged. Colonial politicians and indigenous rulers set about adapting them to their own purposes, sometimes at odds with the imperial sentiment that they were intended to propagate (Reed 2016).

However, further technical developments did, albeit temporarily, promote this sense of an imperial community. In the 1890s, the printing of photography had become possible, and this ensured that newspaper reports of events now contained the immediacy of the photographic record. But moving pictures were to have an even greater

effect. There is newsreel film of Queen Victoria's diamond jubilee of 1897 and of her funeral in 1901. These were notable imperial occasions with many colonial troops marching in distinctive uniforms. There are also newsreels associated with the Anglo-Boer War, for example, depicting the departure of troops at British ports for service at the front. As newsreel became more sophisticated, it produced extraordinarily vivid impressions of colonial places and of remarkable events there. There had been some newsreel of the Delhi Durbar of 1903, but this was surpassed by the much more impressive filming (including the application of color) of the grandeur of the Delhi Durbar of 1911 when George V crowned himself as Emperor of India in a massive ceremonial pageant involving the Indian princes and their retainers, as well as many of the regiments and the administrators serving in India. Newsreels of these events were shipped rapidly to Britain (and to other colonies) and were shown in cinemas throughout the land to large and apparently appreciative audiences, at least if newspaper accounts are to be believed.

By this time, cinema was performing a different function, one involving spectacular entertainment in the shape of feature films involving adventures of various sorts in exotic locations. These had their origins before World War I but became standard fare in the inter-war years with a wave of highly popular imperial films being shown in the 1930s, set in India, Africa, and elsewhere. These films had titles such as *King of the Khyber Rifles*, *The Four Feathers* (set in the Sudan), *Clive of India*, *Lives of a Bengal Lancer*, and *Stanley and Livingstone*. More films with similar themes were made after World War II continuing into the 1950s and beyond. These films went around the world to be shown in colonial cinemas which had appeared almost everywhere sometimes as converted theaters but also as a new and dedicated architectural phenomenon (Chapman and Cull 2009). Radio was another medium which promoted a degree of imperial unity (Anduaga 2009). It was a means for the transmission of news and events. In 1924, the

speech of George V opening the Wembley Exhibition was broadcast in Britain, and in 1932 the king made a broadcast for transmission throughout the empire. This was usually followed by documentaries which described the celebration of Christmas across the colonies. These radio broadcasts were obviously important during World War II and continued in the years that followed.

It was also possible for intercolonial sports to become a source of entertainment for distant audiences through newsreels. The British Empire was very much a location for the dissemination and development of sports, perhaps more so than other empires of the day. These included sports for the elite, such as shooting, fishing and pig-sticking in India, as well as big-game hunting in Africa (and this produced a genre of film documentaries demonstrating that big-game shooting could involve the camera as much as the gun). Sports that had been nurtured at British public schools and universities, such as rowing, also became more widely popular, while yacht clubs appeared throughout the British Empire wherever there were coastlines or lakes. Horse racing became a particularly important interest, one that could unite the classes in attendance at race courses and in gambling. Race courses appeared throughout the British Empire, in some cases promoted by the presence of cavalry horses in the British imperial regiments. Other sports that enjoyed a more democratic participation and following were also disseminated around the world. Among these was football, the classic sporting development of the late-nineteenth century, much enjoyed by troops wherever the military went. Football was taken up with particular enthusiasm in Africa where it became a passion among both white settlers and sojourners and Africans. Missionaries were influential in this, seeing football as a means of inculcating a sense of common purpose and imperial virtues of team spirit combined with individual prowess and physical courage. Another sport very much associated with the military which was also encouraged in Africa was boxing which became immensely popular among Africans. Football did

not, however, develop with quite the same passion in Canada, where American sports became more influential as well as those associated with a very cold climate like ice hockey. Perhaps more influential was rugby, which was taken up as a major spectator sport particularly in South Africa, Australia, and New Zealand. Colonial territories adapted sports to their own ends, such as the unique appearance of Australian-rules football. But perhaps most influential and widespread of all was cricket. Cricket seemed to know no boundaries, particularly given climates which suited it well. It became a central aspect of sporting culture of the Caribbean islands, of India (and after partition, Pakistan), Ceylon, South Africa, Australia, and New Zealand. Intercolonial matches started in Australia (that is among the various colonies) in 1850, and the first English tour took place in 1861. One of the great advantages of cricket was that, unlike rugby, it was not a contact sport, and therefore, at a time of racial sensibilities, it became acceptable for different races to play each other. Cricket test matches started in 1877 (England and Australians in Melbourne, Australia, as a federation did not exist then) and became increasingly frequent in the twentieth century, becoming popular fare in the press, in newsreels, and later in radio broadcasts. Although such sports were indicative of an overall imperial culture (a distinctive one since such sports were at this time not played in the other European empires), they soon became very much part of the development of separate identities and distinctive nationalisms across the empire. Thus, as with so many other aspects of an imperial culture, they were transformed from illustrating a degree of unity in the British World to becoming evidence of growing nationalist separate identities. This was particularly potent in the case of Caribbean islands where it soon became apparent that cricket teams had the abilities and skills to beat the so-called mother country at their own game, as it were (Beckles 1998). Another sport of more significance for the future was snooker, a game that was actually invented in India and was to sweep the English-speaking world and become highly popular, particularly after the introduction of color television.

This notion of an imperial culture performing as a dominant ideology in British history, notably in the nineteenth and first half of the twentieth centuries, has not been without controversy. For a long time, the histories of the British Empire and of the domestic politics and society of Britain were treated as wholly separate categories, seldom fully brought together. It was only in the 1980s that it was suggested that the history of Britain and of its empire should be amalgamated through the study of cultural forms (MacKenzie 1984). This conjunction had always been apparent in economic history, in the extent to which the British economy was bound up with its imperial role (although even here it was thought that, given the extent of British trade with the United States and with Europe, it was possible to exaggerate the centrality of the colonial connection). But it was regarded as much less apparent in terms of social and cultural history. Once the connection had been suggested, however, there was some attempt at a resurgence of older ideas. The historian Bernard Porter suggested that in fact the British had little interest in their empire and that the notorious nineteenth-century phrase of the historian John Seeley "absent-minded imperialists" could indeed be seen to apply to the reactions of the British public to the fact that they were citizens of, as it was always described, the largest empire the world had known (Porter, B, 2004). There are, however, certain problems with this view. The first is that any survey of popular materials indicates the pervasiveness of empire and its ideologies. The second is the central place of imperial themes in publications and in entertainment. While there were of course people who found imperialism not only unappealing but reprehensible, still it appears to have been acceptable in so many popular works and above all in entertainments. The theater and other media would not have devoted so much attention to it if impresarios and filmmakers had imagined that it would alienate audiences. Moreover, so many advertisements of the period sold their products in connection

with current imperial events or by association with imperial heroes that it would be unlikely that those concerned with marketing would have linked their sales to contemporary events which were either unappealing or which inspired boredom. This indicates the extent to which these aspects of an imperial culture were certainly not part of a governmental or elite conspiracy. "The box office does not lie" nor do sales of products. These phenomena flourished because consumers, at least for a period, found them appealing.

There have, in any case, been many other interpretations by historians, political scientists, and anthropologists that an imperial culture was indeed a major phenomenon of British history, even in terms of the public at large. The most important of these was the book *Culture and Imperialism* by Said (1993). The author came from a literary tradition and had become highly influential through his seminal *Orientalism* (1978). His approach adopted the poststructuralist theories of discourse that were to become central to the postcolonial school, and he argued that the nineteenth-century canon of English literature acted as a "polyphonic accompaniment" to the expansion of Europe, interpreting works in the light of contemporary imperial contexts. He argued that "so vast and yet so detailed is imperialism as an experience with crucial cultural dimensions" that it was necessary to think in terms of "overlapping territories, intertwined histories common to men and women, whites and non-whites, dwellers in the metropolis and on the peripheries, past as well as present and future."

Some historians and literary scholars have found this far-fetched, but there can be little doubt that the prominence of the British Empire and its various territories can be tracked through a whole range of cultural forms. This is not to say that the British people, and the colonial migrants who had left Britain's shores, had much knowledge of the dimensions of the empire, of the events through which it had been acquired, or of the peoples who inhabited it. However, there was unquestionably a recognition that the empire had converted Britain into a major world power and

that the empire provided extraordinary opportunities for settlement, employment, and commercial success, not least because it ensured that Britain had by far the largest merchant navy in the world. During the hundred years between the middle of the nineteenth and twentieth centuries, Britain and its empire became, in a cultural and demographic sense, synonymous. This was heightened by the development of many aspects of an imperial and colonial culture. It was an effect which was perhaps heightened by World Wars I and II, although those same wars would ensure the rise of nationalist sentiment, the creation of new identities, and ultimately the collapse of the empire as a political and social unit.

However, while the creation and experience of these aspects of an imperial culture offer important insights into the dominant ideas of the British Empire at its peak, the breaking down of such cultures of empire is equally instructive for an understanding of the empire's decline. The progressive disintegration of the culture of imperialism took place over a period of many years, at different speeds, and at a variety of levels. Within Britain itself, imperial ideas seemed to become less relevant in the inter-war years of the twentieth century when the comparative decline of British dominance in industrial production, command of shipping and trade, as well as military and naval power became increasingly apparent to both politicians and public. Moreover, the cyclical booms and busts of the world economy exposed major problems of unemployment, social deprivation, and labor unrest in Britain. Some politicians and agencies tried desperately to maintain the imperial connection as a bulwark against these economic stresses, for example, in imperial preference after 1931 and such propagandist bodies as the Empire Marketing Board (Constantine 1986), but by World War II, it was already becoming apparent that these efforts to cling to an imperial past were no longer appropriate or effective. In addition, the effects of the worldwide great depression after the Wall Street crash of 1929 ensured that opportunities for white migration had become more restricted. Yet, despite all that, it was still the

case that particularly in the theater and films, imperial culture survived and in some respects continued to do so until the 1960s (Ward 2001). It seems that such cultural elements can survive beyond the increasing evidence of economic and political decline.

Beyond Britain it was also increasingly apparent that the dominions, following the Balfour Declaration of 1926 (which declared that these former colonies were now equal in status to Britain itself), were emerging as fully independent countries with their demographic makeup changing dramatically with the rapid growth of migration from Eastern and Southern Europe. World War II seemed to create an illusion of an empire once again coming together to fight the enemy, with the exception of Ireland or Eire which remained neutral. Indeed, the effective departure of the Irish Republic from the British system (the monarchy was dropped from the constitution in 1937, and the republic was declared, outside the commonwealth, in 1949) acted as a significant herald for the rapid processes of decolonization that were to take place between the 1940s and 1960s. While it certainly left many significant traces, an overall imperial culture now seemed to have died, although the British royal family, particularly in the person of Queen Elizabeth II after 1952, seemed to hold together its successor body of equal and independent states in the Commonwealth. The queen continues to be monarch of 15 former imperial territories as well as the remaining British Overseas Territories.

So far as indigenous peoples were concerned, this period became one of the acceleration of what has become known as "the decolonization of the mind," the escape from an imperial cultural hegemony. Of course, some Caribbean, African, and Asian people had embraced a British-style education and the use of the English language, occasionally also Christianity, as a route to personal advancement. Sometimes, this included aspects of the accompanying mind-set which became a useful attribute for entry to some, mainly professional and clerical, occupations, though few entirely abandoned traditional cultural norms. Still most people either remained indifferent to such a phenomenon (as was the case in many rural parts of Africa and Asia) or held it at arm's length. Alternatively, many recognized the value of creating hybrid cultural forms in order to face the challenges of the modern world. In India, a sequence of nineteenth-century reform movements, particularly in Hinduism, set about responding to and warding off the apparent seductions of Christian missions with their useful attributes of educational opportunity and access to modern medicine (although traditional medical practices remained important). Nevertheless, Christianity succeeded in maintaining its cultural and spiritual bridgehead in many Asian colonies, and churches, missions, schools, and hospitals remained part of the visible material evidence of an imperial culture. In Africa and the Caribbean islands, Christianity stimulated an extraordinary range of responses, from reasonably conventional religious practices to highly syncretic forms as well as the emergence of a whole range of separatist churches which chose to blend elements of Christianity with indigenous beliefs and performative modes of worship. For example, large numbers of nominal Christians in Africa pursue religious ideas and forms that owe as much to African traditions as to imported belief systems. Similarly, it is possible to identify a whole range of reactions to aspects of an imperial culture from partial acceptance as a pragmatic route into globalized systems through efforts at the creation of syncretic forms (e.g., by some African novelists) to outright rejection. Such rejection took political forms in the development of black movements, often but not exclusively Marxist, which drew inspiration from Caribbean and Black American leadership or from revolutionary movements elsewhere (Schwarz 2003). The former slave communities of the Caribbean islands became the leaders of many aspects of cultural decolonization while still converting the aspects of the formerly dominant culture that were useful to them. As we have seen, western sports were capable of being transformed into attributes of nationalist endeavor and propaganda.

These important intellectual and religious responses to British imperial culture were accompanied by others designed to avoid the visible outward appearance of individuals as well as the commemoration of significant figures in nationalist politics. In India, some Asian former colonies, West Africa, and other nonwhite territories, politicians and their followers set about the rejection of western clothing to return to what was conceived to be more traditional dress. This was particularly significant when certain aspects of clothing took religious forms, as among Muslims, Hindus, and Buddhists. Much of the celebrated charisma of Mahatma Gandhi was derived from his adherence to simple Hindu clothing, even although he had dressed as a suited western lawyer during his time in South Africa. This was partly bound up with his Swadeshi movement, the boycott of western industrially produced cloth in favor of hand-spun cotton produced on his ashram (Gandhi 1929). Similarly, Motilal Nehru, father of Jawaharlal, the first Indian post-independence prime minister, made a conscious decision to abandon his western suit and turn to a form of Indian dress, a movement which swept through the Indian National Congress by the 1920s. At a later date, nationalists everywhere reacted against the statuary of notable imperial figures which had been a powerful, visible characteristic of the street furniture of imperial and colonial cities. Statues were often attacked and either destroyed or damaged (symbolically heads and arms were often chopped off). Some, like the statue of General Gordon in Khartoum, were sent back to Britain, and some (particularly of Queen Victoria) went to Canada or Australia. While a few survived, as at the Victoria Memorial in Kolkata or in the Mumbai Town Hall, the sculpting of statues of nationalist leaders and heroes became an important response to these symbolic imperial figures (and royalty) that could be found throughout the British Empire. Museums were often converted from institutions propagating an imperial culture to places treating the British Empire as a historical phenomenon that had produced its nationalist response.

The former dominions established their own cultural nationalism, while in South Africa, Rhodesia/Zimbabwe, and earlier, Kenya, black majorities overthrew white minority ruling groups. This inevitably led to the re-establishment of the primacy of the black experience (e.g., in the teaching of history). In Canada and Australia, there were serious moves toward an internal cultural decolonization. In Canada, First Nations peoples finally rejected the efforts of Europeans to integrate them into a European cultural supremacy. White politicians had attempted to educate them, particularly the children, into the dominant and supposedly accepted norms of the white majority. But the First Nations at last succeeded in securing full citizenship and suffrage rights, which they had been denied in the past, and they re-enacted the central symbols and performances of their own cultures, which had never been fully lost. This was also true among the Aboriginal people of Australia. In New Zealand, these processes took place at a rather earlier period, although the cultural effects of warfare and of various forms of proselytization also had to be thrown off. The Maori people re-engaged with their own cultures, never fully abandoned, and to some extent, these entered into the overall culture of the country. In all three, there was at last some acceptance of the indigenous right to a symbolic acknowledgment of the need for whites to accept that they occupied the lands of a pre-existing people. Indigenous art was revalued and came to be valued as important elements in world art and also as constituent attributes of the identity of the former dominions. Such changes of attitudes, as well as of legal and political status, were confirmed by the justice and reconciliation commissions that were formed in various post-imperial territories like South Africa, Canada, and Mauritius. A central aspect of these elements of cultural decolonization throughout the former British Empire was the historical revisionism of the postcolonial school, the realization not only that history had to be rewritten from the point of view of those who had formerly been repressed but also in ways that eliminated the central tenets, often imbued with the celebratory and self-congratulatory notions of the dispersal of civilization and of progress, central to a former imperial historiography.

Synonyms

Colonialism; Denmark; Empire; Faroese Islands; Finnmark; Greenland; Iceland; India; Inuit; Postcolonialism; Race; Racialization; Slavery; The Danish Realm; West Africa; Whiteness

Description/Definition

The entry provides a historically informed overview of the history of Danish Colonialism until 1953 from a postcolonial perspective, with a focus on Race and racialization. The analytical focus on processes of racialization within the Danish empire allows for a perspective that describes Danish colonialism from the perspective of its colonized subjects, tying together the diverse colonial regimes within the Danish empire, from Slavery in the Danish West Indies to the racialized colonial rule over the Inuit and the ambivalent racial status of the populations of Denmark's "white" colonies, Iceland and the Faroe Islands. Danish colonial regimes are described in Denmark, India, West Africa, the Caribbean, the Finnmark in Northern Norway, The Faroese Islands, Iceland, and Greenland. The entry ends with sketching postcolonial relations between Denmark and the US Virgin Islands, and Denmark and Greenland, respectively.

Introduction

The Danish nation-state has often, both internally and externally, been portrayed as a small, culturally homogeneous nation invested in human rights and global equality. However, this perception and self-image are mostly the result of historical developments taking place in the second half of the twentieth century, and they tend to obscure Danish history as a regional and global imperial power. As Lars Jensen (2015, 2017, 2018, 2019) and others (Burnett and Höglund 2019; Maurer et al. 2010) have argued, Danish Colonialism remains understudied and underdiscussed, primarily with respect to challenging exceptionalist narratives about Denmark as a "benevolent" colonial power (Jensen 2018) by situating Danish colonialism within the global histories of European expansion, genocide, and racist subjugation. Further, discussions of Danish colonial history still too often shy away from critically dissecting this colonial past – in order to better understand its bearings on the present – with the lenses and tools that scholarly fields like Postcolonial Studies, Decolonial Studies, or Whiteness Studies offer by diminishing their relevance for the Danish context or simply ignoring the insights they have

produced. This essay can by no means claim to solve any of these broad issues, but it attempts to endorse Jensen's critique by offering an overview of Danish colonial history that engages with these fields of critical scholarship. In attempting to do so, it includes Denmark's colonial entanglements in the North Atlantic (Greenland, Iceland, Sapmi Lands and the Faroe Islands). Danish historiography has often treated Danish involvement in the trans-Atlantic trade in enslaved Africans (through its colonial possessions in Western Africa and the Caribbean), and the Danish involvement in the European colonization of Asia as "proper" colonialism, but looked at the relationship between Denmark and its possessions in the North Atlantic as being of a very different nature, if not non-colonial altogether (Jensen 2015). While it is true that there were important differences between the ways in which these domains related to the Danish metropole politically, economically, and culturally (Loftsdóttir 2019a), they were all part of the same imperial formation for several centuries and were in various ways tied into colonial relationships with the Danish mainland. The Danish metropole in turn was embedded into an expansionist Europe that throughout modernity increasingly came to understand itself and others through the prism of the naturalized superiority paradigm that was race (Lingner 2016; Lingner and Jensen 2018; Lowe 2015; Mbembe 2017). Taking this last observation as a point of departure, racialization – understood as "processes were race becomes meaningful in a particular context" (Loftsdóttir 2019b, p. 5) – becomes a lens that can reveal a great deal about Danish enrollment into the broader pan-European processes of identity formation while respecting the particularity of different contexts in which the Danish colonial projects manifested themselves. Racialization as an analytical lens allows a discussion of the different ways the various colonized populations were racialized – and resisted, but also sometimes internalized the racial hierarchies of colonial modernity (Mbembe 2017) – without losing sight of the overarching similarities in which race and racialization legitimated colonial rule.

This essay thus engages in a historical mapping of Danish colonialism that attempts to take the critiques referenced above seriously by drawing on insights and concepts produced by Postcolonial, Decolonial, Whiteness, and Racialization studies where appropriate. It starts with a general, historically informed discussion of Denmark as an imperial formation, wherefrom it proceeds to map Denmark's colonial projects by region, starting with the Danish presences in Asia, moving on to the plantation economy in the Danish West Indies and from there to the Danish slave forts in Western Africa. Finally, Danish colonialism in the North Atlantic, namely, in Greenland, Sapmi Lands in Denmark-Norway, the Faroe Islands, and Iceland are discussed. In each case the sections will attempt to simultaneously focus on the entanglements of Danish colonialism into the broader history of European expansion and racial rule, as well as the differences and similarities that constituted the relationships in which the various colonized groups were tied to the colonial metropole that was Copenhagen. The essay ends with a brief discussion of contemporary Denmark as a postcolonial nation and sketches three cases of current renegotiations of Danish colonialism.

The Danish Empire

Historical Overview

The Danish kingdom can be said to have been somewhat of a latecomer to the European colonial expansion. The early forms of modern, European colonialism started at the outgoing of the fifteenth century and picked up speed during the sixteenth, with increasing competition between "first-movers" like Spain and Portugal and newly aspiring colonial powers such as the Dutch Republic and, increasingly, France and England (Horne 2014, 2018). While the kingdom of Denmark-Norway had been the most powerful of the Nordic Kingdoms throughout the Middle Ages, it did not engage in any actual colonization projects outside Europe before the first half of the seventeenth century, during which the Danish crown started to push the engineering of mercantilist policies (Bregnsbo 2017a). This included the crown-backed inception of trading companies holding monopolies (Jensen 2008a), attempting to mimic the success of predecessors like the respective

Dutch and English East India companies (Bregnsbo 2017b; Mentz 2017a). Throughout the seventeenth and the eighteenth century, the Danish Kingdom managed to establish itself as a colonial power by acquiring possessions in Asia, the Caribbean, and on the coast of West Africa (Jensen 2015). Simultaneously, colonial logics and practices quickly came to bear in the relationship to Denmark-Norway's older North Atlantic possessions, as will be explained in more detail later.

The modern, colonial Danish empire experienced its peak in power and wealth during the second half of the eighteenth century. During this period, there were two main factors contributing to its success: Firstly, a maximized sugar production on the Danish West Indies, based on an escalation of the ruthless, and often lethal, exploitation of enslaved African labor, turning the imperial capital Copenhagen into a trading and distribution center for (not only Danish-produced) sugar and other colonial goods for all of Scandinavia and the Baltic Sea (Pedersen 2017; Simonsen and Olsen 2017; Vibæk 1966). Secondly, a policy of neutrality pertaining the numerous armed conflicts between the great European powers – especially England and France – throughout the eighteenth century. Denmark-Norway thus managed to keep itself out of any major wars between the years 1720 and 1801, using this position of neutrality to offer otherwise unavailable cargo transportation and capital transfer services to merchants and other parties who found themselves constricted by the ongoing wars. The Danish state thus actively encouraged Danish merchants and ships to help, for example, British or French merchants to dodge trade bans and blockades pertaining to the wars by smuggling their goods under the neutral Danish flag, as well as by relocating parts of their trade to Copenhagen's neutral port (Bregnsbo 2017a; Mentz 2017a, b; Simonsen and Olsen 2017). During this period, Denmark-Norway could be described as a middle-size power militarily and economically compared to other European powers. It commanded a huge fleet, second only to Britain's, and Copenhagen was an internationally recognized metropole due to its role in the colonial trade. It is important to note though, that the situation in the tropical colonies did not necessarily reflect this. The Danish possessions in Asia and Africa were geographically small and surrounded by bigger powers, either local or the expanding domains of other colonial powers, especially Britain. This meant that while the Danish empire was a force to be reckoned with in the Nordic region (at least until the beginning of the nineteenth century), its colonial projects in the tropics were, more often than not, shaped by a rationale that sought to secure a share of the victors' spoils for itself, rather than trying to actually compete with greater imperial powers like Britain (Bregnsbo 2017a). However, it is exactly the Danish attempt to defend its lucrative neutrality policy against British intervention that makes the two empires run afoul each other towards the beginning of the nineteenth century, resulting in two decisive British assaults on Copenhagen in 1801 and 1807. Further, Denmark-Norway found itself in bad standing internationally after the Napoleonic wars, thus having to accept humiliating peace terms dictated by the victors, the most devastating of which was the loss of entire Norway to long-term regional rival Sweden. Plunged in Debt, suffering a state bankruptcy in 1813 as a result of the war against Britain, as well as facing growing civil unrest in its German-speaking southern duchies throughout the first half of the nineteenth century (ultimately resulting in the loss of these domains as well in 1864), Denmark sold its colonies in India and West Africa to Britain in 1845 and 1850, respectively, and gradually dismantled its empire – the Danish West Indies are sold in 1917, Iceland declares itself independent in 1944, The Faroe Islands and Greenland obtain Home Rule in 1948 and 1979, respectively (Bregnsbo 2017c). As can be seen by this brief overview, Danish colonialism in Africa and Asia was terminated before the rise of high imperialism and the rise of colonial states, while Denmark maintained its colonial relationships in the North Atlantic well into the twentieth century. On the contrary, as will be discussed in the section on the North Atlantic, Denmark managed to translate some of its colonial power into its dominant position in the Commonwealth-like construction of "Rigsfællesskabet," or the Danish Realm (Jensen 2018).

An Imperial Conglomerate State

As a state formation, the Danish empire consisted of an accumulation of quite heterogeneous domains, which jointly and severely could claim global reach at the peak of the empires' expansiveness, but nonetheless remained comparatively small in terms of land area, with the vast landmass of Greenland as an exception (Heinzelmann et al. 2006). Not all domains who were subjected to Danish rule during the era of Colonialism were colonies, and their relationships to colonial power were often complex. For example, Norway, which was in a subjected position to the Danish Crown politically, took itself part in the colonization of Greenland and the Sapmi Lands to the north (Jensen 2015). Likewise, the duchies Schleswig and Holstein, which were mainly German speaking, ruled by the Danish Crown, but their elites were endowed with considerable political autonomy and influence (Bregnsbo 2017c). Further, the domains that were colonies did not always have a clear-cut designation as such either, while their relationship to the Danish metropole was colonial in nature – which will be discussed in the section on the North Atlantic. This diversity in terms of political status has led to historians often discussing the Danish Empire as a conglomerate state (Heinzelmann et al. 2006), thereby acknowledging the fact that the various domains under Danish rule differed from each other a great deal in terms of how their relation to the Danish metropole was constituted juridically and organized politically. Further, the populations under Danish rule were religiously, culturally, and linguistically diverse, and, as was common for modern European empires, Danish colonial rule often functioned as a racially constituted politics of difference – albeit in differentiated ways (Lingner 2016; Loftsdóttir 2019b; Rud 2017).

Danish Participation in Other Colonial Projects

The series of military defeats in the first half of the nineteenth century clearly mark the beginning of an unraveling of the Danish Empire, gradually reducing Denmark to a small nation-state with fewer and fewer colonial possessions (Bregnsbo 2017c). It is important to note though that Denmark as a nation of course remained to be embedded in a globally expanding Europe. This means that while colonial expansion is by and large off the table for the Danish state after 1814, Danish citizens and enterprises participated in a long number of other European powers' imperial projects (Jensen 2008b). A significant – and currently understudied – example would be the migration of roughly 300,000 Danes in the years 1870 and 1914, mainly to the USA, and their participation in what was probably the biggest settler colonial project during high imperialism. Other examples are the participation of Danes (and other Scandinavians) in the exploitation and ruination of the Congo Free State (Bregnsbo 2017d) or the colonial lifestyle internationally renowned Danish author Karen Blixen describes in her nostalgic memoir "Out of Africa" (Petersen 2006).

India, China, and the Nicobar Islands

Tharangambadi Under Danish Rule 1620–1845

At the beginning of the seventeenth century, India functioned as a node point for the voluminous trade taking place across the Indian Ocean, connecting the Arabian Peninsula with China (Mentz 2017a). As pointed out by several scholars, Europe, at this point, was an economic and cultural backwater in comparison (Loomba et al. 2005), yet ascending European empires like the Portuguese, Spanish, and Dutch had worked on establishing their presence in Asia since the late fifteenth century, paying their way into Asian markets with silver looted from the indigenous peoples of the Americas. The Danish monarch Christian VI initiated the founding of a Danish East Indian trading company in 1616, following the council of Dutch merchants. Despite abiding problems with raising enough capital for its initiatives, the company succeeded in negotiating a contract with the local political authorities – who seem to have viewed the Danish presence as a useful counterweight to growing power of the Portuguese – issuing them the right to establish a trading station in the village of Tharangambadi (in

Danish sources usually called Tranquebar). The newly established trading station served the Danish empire as an access point to Asian markets in spices and textiles. From the late seventeenth century on, tea from China also becomes an increasingly lucrative commodity, the trade in which the Danish "Asiatisk Kompagni" facilitates via small trading office in Canton (Asmussen 2018; Mentz 2017a).

Tharangambadi under Danish rule was a colonial trading town with a mainly Indian population of diverse cultural and religious affiliations. At its peak around 1700, the population of the town and the nearest, affiliated settlements numbered around 6000, with a European ruling elite of approximately 300 individuals. In typical colonial fashion, there were different sets of laws for different groups, even though the power of the Danish colonial administration was quite limited. Tharangambadi also housed a small Christian mission established in 1706. Initial differences in upholding contact with the Danish mainland due to the numerous military conflicts between Denmark and its neighbor Sweden circumscribing maritime trade in Copenhagen were overcome in the 1680s and Tharangambadi proves an exceptionally profitable venture around the shift from the seventeenth century to the eighteenth century (Brimnes and Jørgensen 2017a). After this period, the importance of Tharangambadi gradually recedes, both due to the growing importance in the trade with China in which it had no part (Brimnes and Jørgensen 2017b), but also since the technically highly developed production of Indian textiles was increasingly appropriated by the British empire, making middle-man trading stations like Tharangambadi all but superfluous (Lowe 2015). The last blow was the short British military occupations in 1801 and 1808 due to Denmark-Norway's clash with the British empire. After decades of overall unprofitability, Tharangambadi was sold to Britain in 1845.

Serampore and Private Enterprise in India

Throughout the fifteenth and sixteenth centuries, European presences in Asia could be precarious, as they initially found themselves at the mercy of powerful local political elites, as well as in fierce competition with other European powers. As is well known, this situation was gradually replaced by British imperial dominance on the subcontinent throughout the eighteenth century. After outmatching the French militarily in the beginning of the 1750s, The British East India Company increasingly dominated trade and politics, thereby also circumscribing other European powers' possibilities for expanding militarily or geographically. On the other hand, the political changes in India created possibilities for private enterprise, which were not lost on Danish merchants or the Danish trading company, who profited off the new situation in two main ways (Mentz 2017b).

"Asiatisk Kompagni" succeeded in establishing a new colonial trading station in Serampore (Frederiksnagore in Danish) in 1755, which experienced rapid growth in the ensuing decades. This growth was mainly fostered by an "open borders" policy, granting asylum to merchants and traders – Europeans and Indians – who either had been forced to leave home in the context of the ongoing political unrest brought on by British expansion in the region or who due to accumulated debts or other troubles wanted a fresh start for their business activities. In this way, Serampore is able to count a population of around 10,000 around 1782, among them Christian missionaries of the Herrnhuter brotherhood, who arrived in 1776. Further, Serampore College is established by British missionaries in 1818, a learning institution that contributed importantly to the Indian anticolonial movements of the nineteenth and twentieth centuries. Like Tharangambadi, Serampore loses its importance as a colonial trading station after the second British occupation, which in this case lasted from 1808 to 1815. Hereafter, Danish possibilities for colonial profits were increasingly squeezed, and even if Serampore maintained a certain significance as a Christian mission and cultural center, it was sold to Britain in 1845 as well (Brimnes and Jørgensen 2017c).

The other way Denmark-Norway was able to profit off British expansion is through Danish merchants (in their capacity as private traders) helping employees of the British East India Company, who had amassed private fortunes behind

the back of the company, to smuggle their fortunes to Europe with the help of Danish ships and/or via Copenhagen port. Consequently, while the Danish empire never succeeds in establishing Danish territorially extensive colonial dominance in India or China, this immensely profitable variant of the Danish neutrality policy contributed significantly to the British plunder of the Indian subcontinent (Mentz 2017b).

The Nicobar Islands

Simultaneously to the foundation of Serampore, a Danish expedition was sent out to colonize the Nicobar Islands, simply on account of that no other European or Indian power had laid claim to them so far. The Islands' populations were not consulted, but usually tolerated the Danish expedition members' presence. From 1755 until 1845, six different expeditions were sent out to the Islands with the establishment of settlements of various kinds in mind. All these attempts fail due to the expeditions quickly being decimated by disease. When the Islands are used by pirates and thus become the target of a British anti-piracy campaign in 1868, the Danish state chooses to simply sign the Islands over to the British, thereby formally ending Danish involvement in the European colonization of Asia (Rastén 2017).

Western Africa

Denmark and the Transatlantic Slave Trade

Compared to other European imperial powers, the Danish Empire asserted their presence in the Gulf of Guinea relatively late. The Portuguese empire had acquired enslaved labor, gold, and other merchandise from the region since the 1400s and managed to monopolize their access to these markets by military means well into the 1500s. During this period, Portuguese hegemony was increasingly challenged by other European imperial powers on the rise, wanting to secure their own access points to the various African dominions in the region and the markets they controlled. After over a century of enduring an enforced Portuguese trading monopoly over the Gulf region's maritime trade, African kingdoms themselves took an active interest in promoting the presence of various European powers, in order to create counterweights to another European power asserting hegemony (Hernæs 2017a, b, c). This created an overall situation, in which European establishments around the Gulf of Guinea usually consisted of rather small, coastal fortifications that functioned as nodal points for the channeling of various commodities, most significantly the displacement of millions of Africans acquired as slaves – and the Danish forts were no exceptions (Gøbel 2016). From the fifteenth until the beginning of the nineteenth century, these forts were dependent on alternating alliances and treaties with regional political elites who in turn are faced with the challenge of balancing the need to secure the advantage of access to European goods – especially firearms, which increasingly became indispensable militarily as European demand for enslaved prisoners of war reshaped warfare in the region – while on the other hand managing to not let a single European power become too dominant (Hernæs 2017d).

The Danish Slave Forts

The Danish Empire, or rather its agents in the form of trading companies, used the break-up of Portuguese hegemony in the 1640s to establish itself at the coasts of the kingdoms of Fetu and Akwamu (both present-day Ghana) were the forts Frederiksborg and Christiansborg are established during the 1660s. While Frederiksborg is overtaken by the British empire in 1685, Christiansborg (today Osu Castle) becomes the headquarter of Danish operations for the time of their stay (Hernæs 2017b).

From the middle of the 1660s onwards the transatlantic trade increases steadily, due to rising European demand for enslaved African labor, facilitating the various, expanding settler colonialist projects and plantation economies that European powers were establishing in the Americas (Horne 2018). The Danish empire became a part of this dynamic through the burgeoning sugar production in its Caribbean colony, the Danish West Indies. When the Danish plantation economy in the Caribbean was amplified by the acquisition of the Island of St. Croix in 1733, the

resulting increased demand for enslaved labor caused the Danish empire to expand their venture by constructing another slave fort, namely, Fredensborg (1736). Additionally, the smaller forts Kongesten (1783), Prinsensten (1784), and Augustaborg (1787) were added, both to boost trade capacities as well as for reasons of securitization (Hernæs 2017d).

The Danish forts in West Africa were thus fortified trading stations which also functioned as temporary prisons for the enslaved. The forts were dependent on contracts and alliances with local African powers and their chief purpose quickly became the facilitation of securing enslaved labor for the plantation economies in the Caribbean. As this function did not require huge numbers of military or administrative personnel, the number of Europeans stationed at the forts usually did not exceed 30 to 40 individuals. Often the European personnel numbered much less than that, not least because various diseases regularly decimated them. Nonetheless, the forts were also the sites of frequent marriages between Europeans and African women, sometimes over various generations (Ipsen 2015). Taken together, this meant that even though the African-Caribbean connection was an important lifeline for the Danish empire economically, especially during the second half of the eighteenth century, the Danish presence at the West African coast did not aim at further territorial expansion inland for the better part of its existence – which quite resembled the situation of the other European powers present around the Gulf of Guinea. This only changed after the Danish crown prohibited Danish ships to participate in the middle passage in 1803 (Hernæs 2017c; Ipsen and Justesen 2017; Ipsen 2015).

Danish Settler Colonialism in West Africa

From the onset of the nineteenth century onwards, the relationship between the European powers entrenched in their slave forts and the regional African powers started to change dramatically. The ending of the middle passage gradually redirected European demand towards other goods, especially palm oil, thereby creating European interests in bigger, fixed investments in West Africa, which in turn generated demands for military securitization of these interests through territorial control. Especially the British empire, thus, increasingly began establishing actual colonial domination in the region. In the Danish metropole, the ban on transporting enslaved labor across the Atlantic spawned lively discussions on attempting to expand Danish territory and establishing a plantation economy driven by slave labor (it was only the transportation of enslaved Africans via the middle passage that was banned in 1803, not the exploitation of enslaved labor), thus replacing some of the production hitherto carried out in the Danish West Indies and even expanding the range of colonial commodities produced under Danish administration. In colonialist circles in Copenhagen, this option is viewed with pronounced optimism during the first decades of the nineteenth century, given the Danish empire's need to recover from the defeat at the hands of the British. However, despite a number of officially mandated plantations being established in the first half of the nineteenth century, due to the Danish metropole getting caught up in the rising civil unrest in its southern Duchies (culminating in the outbreak of civil war in the Duchies in 1848), this brief attempt at establishing a Danish settler colonialist plantation economy in West Africa were dismissed and all Danish possessions sold to Britain in 1850 (Hopkins 2017; Justesen 2017).

The Caribbean

Settler Colonialism in the Caribbean

After a period of Spanish hegemony throughout the sixteenth century, other European powers started to establish more permanent settlements, especially after sugar production picks up from the 1640s onwards. As with the colonial projects in Asia and West Africa, the Danish empire was drawn to the region by the prospects of securing a slice of the wealth that was generated through European plunder, but increasingly also through the facilitation of what Gerald Horne has described as "the apocalypse of settler colonialism" (2018). European settlement in the Americas

throughout the sixteenth and seventeenth century was characterized by the violent establishment of plantation economies, enabled by genocidal dispossession of the indigenous populations and maintained through a constant supply of a growing, enslaved workforce of Africans – Thus initiating social formations that were designed to monoculturally produce commodities for the colonial metropoles under abysmally abusive working conditions, and that simultaneously advanced the development of "whiteness" as an entrenched category of identification. After all, even if European empires in the region often fought each other, the establishment of a production regime that depended on an enslaved workforce that usually came to outnumber European colonialists greatly and that rebelled often and fiercely, created mutual interests between different groups of Europeans (Horne 2018). Further, just as the enslaved African workforce, the European populations and their elites were nationally, ethnically, linguistically, and religiously diverse, not least due to a high degree of mobility amongst the Euro-Caribbean settlements, which further exacerbated the European need for an overarching identity in the face of military threats by unvanquished Indigenous and African populations (Gøbel and Sebro 2017; Horne 2018). Simultaneously, blackness was cast as identical with slavery, ascribing a set of properties to the enslaved population that naturalized their captive condition (Mbembe 2017). As in the other plantation societies in the Americas, the enslaved population was ultimately marginalized, relegated to what Frantz Fanon has termed "the zone of non-being" (Fanon 2016; Gordon 2015).

The Danish Plantation Society

Denmark-Norway established its first Caribbean colony on the island of St. Thomas in 1672, the nearby located islands St. John and St. Croix followed in 1718 and 1733, respectively. The Danish West Indies quickly developed into a quite typical Caribbean plantation economy, with all the features described above, with the exception that the Danish settlers did not encounter the island's indigenous population, who had fallen victim to the Spanish empire earlier (Simonsen

2017). It was especially the taking over of St. Croix, the largest of the three islands and the one most suited for agriculture, and the following systematic expansion of the sugar plantation economy which heralded a period of massive profitability, rendered possible by the Danish neutrality policy which allowed the Danes to ship and sell sugar to European markets in times of war (Simonsen and Olsen 2017), but also by an exacerbated mortality among the enslaved workforce. The mortality rates among the enslaved exceeded the birth rates, which made the entire plantation venture dependent on a continuous supply of newly enslaved Africans (Vibæk 1966). This period lasted approximately from the middle to the end of the eighteenth century, and the sugar economy thus constituted one of the most crucial economic lifelines of the Danish Empire at its peak of power and wealth.

With some exceptions, little is known about the precise national, cultural, lingual, and religious origins of most of the enslaved Africans brought to the Danish West Indies, but it is certain that the approximately 111,000 Africans brought to the Danish West Indies had roots stretching from Senegambia to Angola (Simonsen and Olsen 2017). As enslaved Africans were usually prisoners of war whom the Europeans acquired from the African victors, they would sometimes be sold, and thus arrive, in groups with shared cultural identities. Seen through European eyes, this heightened the potential of uprisings. This was the case in 1733 on St. John, where a newly arrived group of enslaved Akwamu, many of whom had had training as warriors, initiated an uprising, in the course of which they seized the entire island and drove the surviving whites off. Ultimately, the uprising was squashed, but before that, the insurgents managed to defend St John through for half a year, fighting off both British and French troops, who were sent from neighboring colonies to prevent a potentially contagious example of a successful overtaking of a colony by Africans (Gøbel and Sebro 2017). Even if no other armed uprising was carried out until 1848, the enslaved population remained unruly. Marronage, either in order to hide in the remaining woods on the islands or to attempt a full escape to nearby Puerto

Rico – where the Spanish crown had granted freedom to any Maroon who would plead allegiance to the Spanish monarch and embrace the Catholic Faith – was a common practice amongst the African population (Highfield 2012). The Danish West Indies was also the first of the Danish colonies in which the Herrnhuter Brotherhood obtained the crown's permission to proselytize in 1732 (followed by Greenland in 1733, Serampore in 1776, and Western Africa in 1826) not least because Christianization was thought to contribute to the pacification of the belligerent enslaved (Jensen 2005).

The Danish West Indies were originally initiated and managed through a trading company monopoly until 1755, whereafter the colony is administered directly by the crown. The plantation economy on the islands was chiefly initiated by creating incentives for moneyed individuals of all nationalities to settle and invest in establishing a plantation or merchant business, a policy that drew British, Dutch, French, German, Danish, and Spanish planters to the table. As a result, English and Dutch Creole functioned as lingua francas, enabling communication between Europeans and Africans, respectively. This also meant that the planters, the most powerful group in the Danish West Indies, were a nationally very diverse group, who had very specific, localized interests of their own, which often ran contrary to the Danish government's, represented through the administrative and military personnel and the governor. Conflicts regularly revolved questions about how far Copenhagen could regulate, monopoplize, or tax trade, thereby often limiting possibilities to trade with other colonies in the region and even between the three Danish islands themselves. While, for example, Charlotte Amalie on St. Thomas was declared a free port in 1764, trade on St. Croix remained tied to Copenhagen. Charlotte Amalie's status was another example of how the Danish empire utilized its neutrality policy economically. Throughout the numerous wars fought between the bigger imperial powers throughout the eighteenth century, the free port served as an international base for trade (not least in enslaved Africans), smuggling, and privateering. This brought huge economic boosts to the town during wartime and making Charlotte Amalie one of the ten biggest towns in the Danish Empire around the turn of the century (Heinzelmann et al. 2006; Riis 2012; Simonsen and Olsen 2017).

The End of Slavery, Fireburn, and the Sale

The plantation economy on the Danish West Indies got under increasing pressure from several sides from the start of the nineteenth century onwards. The discovery of beet sugar made sugar cane increasingly unprofitable (Jensen 2012). The ending of the middle passage complicated the acquirement of enslaved labor, while it became increasingly clear that it was a matter of time until slavery itself would have to end in the Danish West Indies, not least due to abolition throughout the British Empire 1833. Founded in a racist paternalism that doubted the capacities of the enslaved to administer their freedom, but also hoping to avoid having to compensate the plantation owners, the Danish crown opted for a gradual emancipation. This was not well-received among the enslaved, who responded with a coordinated uprising in the summer 1848, forcing the Danish General Governor to proclaim the emancipation of all enslaved individuals on the islands (Highfield 2009; Jensen 2015; Simonsen and Olsen 2017).

Following the end of slavery, however, the new regulation laws were designed to secure the labor supply for the plantations by prescribing binding 1-year contracts, fixed wages, and strict vagrancy laws, a system that advanced growing discontent. Further, the social hierarchies developed under slavery stayed in place, resulting in a society in which crass class inequality roughly corresponded with racial categories (Hoxcer Jensen 1998). The consequential social tensions erupted into another armed uprising, this time by the largely rural, black plantation workers in 1878. The uprising, known as the Fireburn, blatantly underlined the need for social and labor reforms on the island, but the Danish government seemed increasingly uninterested in the problems on the by now deficit-generating colony. Instead,

from 1864 onwards, the Danish government made several unsuccessful attempts to sell the colony to the United States. Meanwhile, political and social discontent on the islands resulted in the emergence of an organized labor movement, led by David Hamilton Jackson. The labor union organized a general strike in 1916, forcing a general rise in wages, but also provoking the Danish government to send a warship out of fear of a new uprising disturbing the newly resumed sale negotiations with the United States. The United States on the other hand were unmoved by the strike, as they had no commercial interest in the islands, but wanted them as a naval base. The sale was concluded in 1917, without any consultation of the population of the islands (Highfield 2009; Olsen 2017).

The North Atlantic

Sapmi Lands

The Kingdom of Norway had formed a union with Denmark in 1380, in which both kingdoms were ruled by the same king, while keeping separate political and administrative systems. This arrangement changed in 1536, after the Norwegian nobility took the losing side in the Danish civil war known as the Count's Feud (1534–1536). As a consequence, the Danish crown enforced Lutheranism by replacing the Catholic clergy with Danes. Further, Norway was from this point on treated as a province of Denmark, with its political, mercantile,and clerical elites in large part consisting of Danish noblemen and merchants, subduing the formerly independent kingdom a peripheral status in relation to the imperial center now squarely located in Copenhagen (Jensen 2015; Willumsen 2013).

However, the northernmost areas of Norway stretched into the use areas of the Sami peoples, spanning from northern Norway in the West to the Kola Peninsula in the East. This region had been used and inhabited by different non-Sami groups for a long time as well, and during the middle ages, Sami and Norwegians moving into the area to settle, hunt, or fish seem to have cultivated a largely peaceful, yet somewhat separate

coexistence. From the 1500 on, these relationships started to change. Sapmi lands had become the scene of a lucrative fur trade as well as timber, ore, and rich fishing grounds in the coastal areas. Thus, the Sapmi lands were claimed by Norway, Sweden, and Russia, all wishing to control the regional resources. Sweden here constituted the main rival to the Danish empire. The National borders between the three imperial powers in Sapmi land were settled during the Kalmar War 1611–1613 and finally the Great Nordic War 1700–1721. For the Sami, this meant intersections of their ancestral lands by national borders installed from far away, as well as a gradual and often forced enrollment into national state formations. Autonomous social structures of the Sapmi become undermined in this process. Furthermore, while increased integration into trading networks sometimes could open up new and alternative possibilities, the Sami were also subjected to an increasingly aggressive Christianization policy (Hansen and Olsen 2014). Part of the confrontation between Christianity and the older beliefs held in the region was the special reputation male Sami had among Christians for practicing witchcraft. This meant that when the witchcraft panics that haunted Europe in the seventeenth century reached Sapmi, while the most victims of the panics were Norwegian women, most Sami sentenced to death for witchcraft were men (Willumsen 2013). In the part of Sapmi seized by Denmark-Norway, roughly corresponding to the area today known as Finnmark, the efforts to Christianize the Sami intensified greatly after the clergy had learned that many nominally Christian Sami stuck to their old beliefs at the same time, sometimes creating their own, hybrid cosmologies. Starting in the 1720s, missionaries turned to systematically seeking out and destroying holy sites and artifacts. This proselytizing fervor would later develop into assimilationist, so-called "norwegianization" policies, undergirded and legitimated through the "race-science" of the nineteenth and twentieth century (Boyle and Carden 2016; Hansen and Olsen 2014). The Danish empire had disappeared as a colonial power from Sapmi by then, having been forced to cede Norway to arch-rival Sweden in 1814.

Iceland and the Faroe Islands

Just like in the case of Greenland, the Danish empire's territorial claims to Iceland and the Faroe Islands were a consequence of Denmark's union with Norway in 1380, yet all three remained part of the Danish empire after Norway became a part of Sweden in 1814. All these dominions had come under the rule of the Norwegian crown during the middle ages, mainly based on the presence of Norse settlements during the Viking Age. This was also case for the Shetlands and the Orkney Islands, who thus come under Danish rule in 1380, but were annexed by Scotland in 1468. The political changes in the Danish-Norwegian union after the end of the Kalmar Union (1523) and the subsequent Count's Feud (1534–1536) were to be felt in Iceland and the Faroese Islands as well, as the replacement of Catholicism by Lutheranism resulted in a new Danish-appointed clerical and administrative elites and the seizing of former church land by the crown (Magnússon 2010; Whylie 2015). In the case of the Faroe Islands, this also resulted in a marginalization of the Faroese language. Both societies were poor, rural societies dependent on fishing and farming, but with long established traditions for local political autonomy, manifested in their local parliaments that had existed since the Viking Age. In both cases, these political bodies lost almost all their power to the Danish crown (Whylie 2015).

Just a few years before his initiation of the first Danish East Indian company in 1616, Danish monarch Christian IV granted two of the newly initiated trade companies the respective monopolies on Greenlandic and Icelandic trade, while the Faroe Islands' trade was administered directly as a crown monopoly from 1529 onwards. For both Iceland and the Faroese Islands, this further undermined any potential for an autonomous national development and created exploitative trading relations. Sigurður Magnússon (2010) has described how in the case of Iceland, Danish merchants could fix prices simply by raising the margins on any imported goods Icelanders needed. Further, trading was mostly conducted as barter, thus preventing any kind of profit or capital accumulation on the Icelandic side. From

1619 to 1662, Iceland and the Faroe Islands were administered by the same trading company. The trading monopoly for the Faroes Islands was then granted to the Gabels, a merchant family from Glückstadt in the southern Duchies. From 1655 until 1709, the Gabels were acting liege lords (including the grant of trading monopolies from 1662 onwards) of the Faroe Islands, who squeezed the already sparse economy of the Island for private gain and through violent means (Whylie 2015).

The Danish trade monopolies over Iceland and the Faroe Islands thus meant an often arbitrarily administered Danish assertion of dominance over the economic and cultural life of the two dominions, restricting mobility and contact opportunities for the populations. Both on Iceland and the Faroese Islands, strongly independence-oriented, nationalist movements develop throughout the nineteenth century, resulting in prolonged political and social struggles with the Danish administration over questions of language and culture, as well as economic and political status, which gradually force concessions from the Danish administration. After having gradually being weakened from the end of the eighteenth century, the trade restrictions for both colonies were lifted completely in the 1850s, resulting in increasing contact with the outside world as well as the onsets of rapid industrializations. After the Danish constitutional reform in 1848, which is usually seen as the onset of democratic self-rule in Denmark, Icelanders are asked if they want to be represented in the Danish parliament but decline the offer in order not to legitimate Danish dominance further by acknowledging Danish sovereignty. The Faroese, on the other hand, are incorporated through two seats, but without being consulted on the matter at all. Further, as a result of the political pressure from the colonies, the local parliaments are reestablished in 1843 (Iceland) and 1852 (Faroe Islands) (Magnússon 2010; Whylie 2015).

For both Iceland and the Faroese Islands, the Second World War marked a watershed in the relations with Denmark, yet with significantly differing outcomes. As a reaction to the German occupation of Denmark, both Iceland and the

Faroe Islands were occupied by British troops. Iceland had gained the status of a separate state in 1918 but was still relegated to the status of a junior partner in a political union with Denmark. Seizing the moment in the face of Denmark being under foreign occupation in 1944, the Icelandic parliament unilaterally terminate the union and declare full independence. In the case of the Faroe Islands, a referendum on independence was held in 1946, resulting in a slim majority for independence. The Danish government dismissed the result, but had to concede to home rule, which is installed in 1948. As a result, the Faroese Islands remain under Danish dominance, today as a part of the Danish Realm, or "Rigsfælleskabet" (Jensen 2015, 2018).

Iceland and the Faroese Islands were thus treated as colonial domains within the Danish empire, but besides the differences from the tropical colonies in their historical, and thus legal relation that subdued them to the crown, there was also the question of racial categorization. Kristin Loftsdóttir (2019b) has explored the ways in which modern processes of Icelandic identity formation were influenced by and positioned themselves vis-à-vis the views on race, nation, gender, and modernity that were prevalent throughout the nineteenth century, especially how they related to the construction of the category of "whiteness" as a colonialist, Eurocentric paradigm of superiority. On the one hand, Icelanders had, due to their status as a subdued and impoverished society, often found themselves portrayed in undignified and diminishing ways in descriptions of Iceland by outsiders, sometimes including direct comparisons to "primitive," non-white societies (see also Magnússon 2010). On the other hand, European enlightenment scholars early on took an interest in Icelandic sagas and language as a sort of Germanic (and thus, in the thinking of the era, white, European) heritage, an interest that increasingly connected with the flourishing European "race science" of the nineteenth century, which in turn saturated debates about nationhood and modernity. The result was a paradoxical positioning of Icelanders in relation to racial and national categories. On the one hand, the Danish mainland viewed Iceland as a sort of repository for ancient Norse culture, thus ascribing to them a glorious past that was thought to reflect the ancestral culture of the Danish nation. At the same time, that very same portrayal cast said past as lost, and contemporaneous Icelandic society as degenerated and hopelessly backwards, thus legitimizing Danish paternalistic dominance through a perceived Icelandic cultural immaturity, and thus incapability for self-government. As Loftsdottir (2019b) demonstrates, Icelanders were not always aware of these views on their society as somewhat pre-modern, but when they were, they often fought them tooth-and-nail, asserting a modern, civilized, European identity on a par with their colonizers for themselves, trying to be recognized as fully valid, political subjects (Magnússon 2010). Unfortunately, this often also meant adhering to the civilizational hierarchies the intense racism against colonized subjects of the nineteenth century purported, for example, when Icelanders fiercely distanced themselves from other colonized subjects in the Danish empire such as the Greenlandic Inuit, who were cast as "primitive savages" (Loftsdóttir 2019b).

In sum, Icelanders occupied an ambivalent position in the colonialist, racialized hierarchies of the nineteenth century, which could be described by Homi Bhabha's (2004) phrase "white, but not quite." While Icelanders were included in the construction of the "European races" and even could claim a rather special place in that construction, they were simultaneously cast as a "pre-modern" society, in need of paternalistic guidance by the metropole. While this was a position that seems to have offered a good deal more cultural and political agency than Greenlanders, let alone the Afro-Caribbean population of the Danish West Indies, enjoyed, it did not prevent the Danish mainland from treating both Iceland and the Faroe Islands with a typically colonialist, arrogant paternalism. Lars Jensen (2018) has argued that the North Atlantic colonies' self-assertion as fully valid political subjects thus had to struggle with a pronounced Danish reluctance to grant any more political autonomy than was unavoidable, an antagonism that was even more pronounced in the case of Greenland.

Greenland

Due to the medieval Norse settlements on Greenland agreeing to pay taxes to the Norwegian Crown in 1261, the Danish crown considered Greenland a part of Norway when Norway became a part of the Danish conglomerate state in 1380. And just as Iceland and the Faroese Islands, Greenland stayed with Denmark after the loss of Norway to Sweden in 1814. Contact with the Norse settlements broke off in the beginning of the fifteenth century, but the Danish crown upheld its claim to the Greenlandic mainland, not as least the region started to reveal economic potential at the beginning of the seventeenth century. Blubber and whalebone were in high demand, and Basque whalers had established a profitable venture from the 1550s onwards. Soon, imperial powers like the British and the Dutch developed an interest, and it is in this context that the Danish monarch Christian IV attempts to assert Danish sovereignty over Svalbard – which at the time was believed to be part of the same landmass as Greenland. Dutch and British whalers were by no means willing to pay royalties to the Danish Crown, but from this point in time on, the ascending Danish colonial empire starts to develop an active interest in Greenland. Christian the IV thus, sent three expeditions to Greenland in 1605, 1606, and 1607 to "reassert" Danish sovereignty over Greenland and try to locate the Norse settlements. This mission fails, but the expeditions kidnap several Inuit to display them at the royal court, a practice that was repeated by European sailors several times during the seventeenth century. Still, European whalers, among them the Danes, also establish sporadic trade relations with the Inuit. Further, several Danish trading companies were established and granted royal monopoly for Greenlandic trade and a handful of trading expeditions were sent out, yet the financial burdens of the 30 Years War (1618–1648) circumscribe the Danish efforts somewhat (Gulløv and Toft 2017).

The first modern colonial settlement is established by the missionary Hans Egede in 1721. The project was enabled by capital from the merchants of Bergen, the king, as well as the Copenhagen-based Royal Mission College. This composition of interests mirrors the tripartite constellation of missionary activity (The Danish Royal Mission from 1721, in competition with the Herrnhuters from 1733), trade monopoly, and state administration that gradually colonized the Inuit societies of Greenland (Kalaallit Nunaat in Greenlandic) throughout the eighteenth century. After an initial period of improvised colonialism, it was also this combination of interests out of which a self-asserting colonial governing rationale of paternalistic cultural micromanagement developed, which informed the colonial administration's gaze on the Greenlanders for the next 250 years. More accurately, the economic premise for the Danish colonial project in Greenland was a viable and profitable trade in blubber and seal skin (Seiding et al. 2017).

Sealing was dangerous and required specific skills, so the colonialists were dependent on the activities of the Inuit seal hunters for the colonial project to turn to account. The administration therefore came to see seal hunting as an essential, and praiseworthy, feature of Inuit culture which needed to be culturally preserved and politically promoted. On the other hand, Christianization and a certain degree of Europeanization in terms of medicine and living standards were pivotal to the colonial project as well, so the Danish authorities – from their own point of view – had to strike a delicate balance between cultural preservation and intervention. This problem was further underlined by the debates surrounding the (from 1774 state-owned) trade monopoly. In other parts of the empire, lifting trade restrictions had generated considerable state revenue, but in the case of Greenland, it was feared that a too intensive "exposure" of the Inuit to European culture would corrupt their way of life and thus hunting activities. Ironically, besides alcohol, especially colonial goods like tobacco, tea, and coffee were identified as the culprits. As early on as 1782, the colonial administration tried to prohibit the Inuit population from access to such goods, while also trying to regulate what they saw as an excess of sexual relationships between colonists and Inuit. Colonial paternalism was thus legitimized by a perceived, racially determined, Inuit "vulnerability" to exposure to modernity due to their "cultural

immaturity," and a self-appointed mission as protector from this exposure by the Danish administration, which at the same time protected Danish economic interests. This rationale resulted in a quite typical, colonial politics of difference, where Danes in general enjoyed better political, economic, and social possibilities. Further, Danes were subject to Danish law, whereas the Inuit population lived under locally adapted, non-standardized versions (Rud 2017).

Throughout the nineteenth century, the Inuit population, who increasingly came to understand themselves as Greenlanders under Danish rule, started pushing back through the limited political channels available to them. The missionaries had early on started to build schools, in which the children were taught in their own language, as well as educating Greenlandic catechists to assist in teaching and religious tasks. This was meant to ease the process of thorough Christianization, but also provided Greenlanders with the means to articulate critique and pressure for political participation. In combination with the fact that traditional means of conflict-solving among Greenlanders had been oppressed by the missionaries, this meant that the colonial administration had to gradually allow for various political bodies of – very limited, and frequently overruled, but still moderately expanding – local self-rule by the Greenlanders in the second half of the nineteenth century. This process is informed by frequent Greenlandic critique and pressure for bigger participation possibilities and steps toward equality between Danes and Greenlanders, which were answered with an entrenched reluctance to cease control on the side of the Danish administration (Jensen 2018; Marquart et al. 2017).

The slow march towards Greenlandic self-determination picks up during the first half of the twentieth century. Simultaneously with a more and more vocal Greenlandic pressure for economical, political, and cultural development directed by Greenlanders, the prices for blubber and fur on the world market decreased and a gradual reorientation towards fishing takes place on Greenland. In 1940, the protracted struggle over political power in the colony was interrupted by the German occupation of Denmark, resulting in a break of the Danish-imposed isolation the by the arrival of American troops as well as an increased degree of autonomy during the war years. In other words, the war years rendered the continuation of the Danish colonial regime on Greenland untenable. Furthermore, the subsequent waves of formal decolonization following World War II opened a new, internationally recognized, forum of Greenlandic critique, namely, the UN. In an until today hotly debated negotiation process, the Danish government manages to convince the Greenlandic representatives that the best available option for Greenland is the amendment of its colonial status and integration into the Danish realm. Subsequently, a referendum was held in Denmark, but not in Greenland, and the incorporation of Greenland became a reality in 1953 (Heinrich 2017; Jensen 2012, 2018; Rud 2017). The postcolonial Greenlandic-Danish relationship will be sketched in the next section.

Postcolonial Denmark

Renegotiations

The year 2017 marked the centennial of Denmark's sale of the Danish West Indies (now US Virgin Islands) to the United States, an occasion that generated numerous artistic, scholarly, and activist projects and activities that tried to reflect and sometimes renegotiate questions of Danish colonialism and what its significance for the present might be. Some of the events surrounding the centenary seem to reflect a growing interest in critical self-reflection of Denmark's involvement in colonialism. Taken together with a slowly growing amount of critical literature, art, and activism since the 1990s on Danish Colonialism, the different initiatives, publications, and projects that emerged out of 2017 are far too numerous to list here (see also Lingner and Jensen 2018), so one exceptionally prominent example will have to suffice. Attracting a fair amount of international attention, artists LaVaugn Belle (US Virgin Islands) and Jeanette Ehlers (Denmark) raised a public sculpture entitled "I am Queen Mary," which fuses the commemoration of the 1917-sale and the 1878-Fireburn uprising on the

Danish West Indies with references to the American anti-racist struggles of the 1960s, as well as to the concept of cultural hybridity. At a height of 7 m, the first Danish monument to a black woman places the memory of resistance against (not only) Danish colonialism and racism squarely within Copenhagen's public space (Belle and Ehlers 2019). At the time of writing, due to financial constraints, the sculpture consists of materials that will deteriorate rather quickly, and negotiations with the Danish government about a permanent bronze version are ongoing. However, it is important to note that Danish colonialism also has tangible afterlives outside the borders of the nation-state as well, haunting Denmark's relations with some of its former colonies. The last sections of this entry will sketch two current political renegotiations of Danish colonialism: The demand for an apology from the US Virgin Islands and the current Greenlandic-Danish relationship.

The Call for Reparations and Apology

After the sale of 1917, the former Danish West Indies – now US Virgin Islands – became an unincorporated territory of the United States. Under the current status, the territory does not cast electoral votes for the presidency of the United States and is represented by a single delegate with no voting rights in the US Congress. The United Nations still considers the territory a de facto colony. The African Caribbean Reparations and Resettlement Alliance (ACRRA) was founded on the US Virgin Islands in 2004. The organization's claim for reparations and an apology for slavery had had predecessors in historian Arnold R. Highfield's formulation of the idea of an official Danish apology in 1996, and the establishment of the Homeward Bound Foundation by senator and lawyer Wayne James in 1998, who also formulated claims to reparations from Denmark. However, ACRRA has been the most visible, persistent, and successful group in terms of making its claims heard in Denmark. Typical for Caribbean reparations movements, the group is supported by local Afrocentric religious communities, such as the Rastafaris, but their exact number of active supporters is unknown. The exact claims made by the group have varied over the

years, but entail an official apology from Denmark, initiatives for proper memorialization of slavery, as well as other initiatives to further reparation and reconciliation. The organization builds its claims on pointing out that poverty, inequality, debt, corruption, and the unresolved political status of the territory all must be understood as the consequences of (not only) Danish colonialism. In 2014, the claims for reparations for the US Virgin Islands were reinvigorated by the Caribbean Community (CARICOM) launching its 10-point reparations plan and incorporating Denmark in the list of countries summoned to the negotiating table. In the course of 2017, ACCRA's claims caught public attention several time and have succeeded in opening a former national debate on colonial history in Denmark to voices from the Caribbean. Yet, an official apology or other official reparation initiatives have not manifested at the time of writing (Andersen 2014, 2017, 2018).

Greenland in the Danish Realm

After the incorporation of Greenland into the Danish Realm in 1953, a rapid modernization process ensued. Industrialized fishing was cast as the country's future and this new mode of production demanded rapid urbanization as well. While Greenlandic politicians initially seem to have welcomed the modernization process, the actual execution quickly raised Greenlandic criticism. The entire process was decided, monitored, and carried out by Danish authorities, who had envisioned Greenlanders as only working in the fish factories and thus not had planned any other educational initiatives, let alone longer educations. Greenlanders increasingly felt that they were belittled bystanders to the rapid transformations taking place in their country. Further, wage disparities of up to 25% between Danes and Greenlanders caused growing frustrations (Rud 2017).

One of the consequences of the modernization in the 1950s was a rebellious youth movement among Greenlanders, whose claims for equality for the former colonial subjects resonated strongly with the anti-imperialist and anti-capitalist movements of the 1960s and 1970s. In 1972, the

D

Greenlandic population voted overwhelmingly no to joining the European Economic Community, but joined anyway together with Denmark in 1973, thereby again making clear that Greenland's degree of political self-determination was insufficient. The result was the establishment of Home Rule in 1979, and subsequently, Greenland became the first country to leave the European Community in 1985. During the 1970s, a general reorientation towards Inuit culture took place, culminating in the founding of the Inuit Circumpolar Council (ICC) in 1980. Though not always free of tension, the Greenlandic political commitment to working with other Inuit living in Russia, Canada, and Alaska is one example of the ongoing development of an increasingly autonomous Greenlandic identity and cultural reorientation (Jensen 2014; Lund Jensen 2017; Rud 2017).

Greenlandic sovereignty was further expanded with the Self-Government Act of 2009, which recognizes Greenlanders as a distinct people with the right to self-determination and the Danish and Greenlandic parliaments are defined as equal parties. Further, two Greenlandic representatives are part of the Danish parliament. Yet, Greenland did not become a sovereign nation. Together with the Faroe Islands and Denmark, it is part of the "Danish Realm" or Rigsfællesskabet. Denmark retains political authority over substantial issues such as Greenlandic foreign policy, security, and international agreements. Just like the Faroe Islands, Greenland receives a yearly block grant from Denmark (Jensen 2014; Rud 2017).

Recent developments have reinvigorated Danish interest in a strong connection to Greenland. Climate Change causes the Greenlandic icecap to melt rapidly, making resources accessible that were unreachable hitherto. Furthermore, due to the prospect to an increasingly ice-free Arctic Ocean, Greenland is quickly developing into a strategically important location for the support of global transportation networks. In this context, Denmark has vital interests in upholding what is left of its sovereignty over its former colony but finds itself negotiating with a progressively self-confident Greenland (Jensen 2014). In this context, Greenland installed a reconciliation commission in 2014 that was to work on the unresolved colonial past. While no demands towards Denmark were articulated, the commission sparked fierce debates, sometimes betraying deep Danish investments in the image of the benevolent Danish colonizer, and Greenlanders as somewhat ungrateful wards (Rud 2017). Further, the work of the commission and the subsequent debates showed that the modernization period in the 1950s is remembered as the most destructive period of Danish sovereignty, as the rapid modernization in parts of Greenlandic society had resulted in social problems much resembling other indigenous communities, such as substance abuse, high suicide rates, and domestic violence. The renegotiation of the colonial relation in the Greenlandic-Danish case is thus entangled with a long list of highly sensitive, yet unresolved issues pertaining the colonial past as much as the colonial present (Jensen 2018).

Synonyms

China; Colonialism; Darfur; Humanitarian intervention; Imperialism; Oil; Sudan; United States

Definition

This essay seeks to delineate the involvement of foreign actors in Sudan's Darfur conflict. In addition to providing a basic outline of the conflict's origins and historical context, we review the lineage of colonial and imperial incursions into the region, with a particular focus on highly salient, though oft-forgotten, episodes in US–Sudanese relations. Further, we track the recent involvement of outside actors in the Darfur conflict and in Sudan more generally, from the US and China to the United Nations (UN) and African Union (AU). As we demonstrate, the Darfur conflict is intricately linked to two foreign-policy doctrines that have elicited significant debate in both scholarly and lay circles: humanitarian intervention and the "responsibility to protect" (R2P, in common parlance). Finally, the essay analyses the role of foreign actors in their efforts to mediate the conflict, and point to the paths not taken as a result of this outside involvement.

Introduction

During the peak years of violence in the mid-2000s, the Darfur region of west Sudan became a household word in the West, synonymous with

human tragedy, carnage, and depravity. Indeed, at its height, dispatches from Western reporters almost unfailingly referred to the Darfur conflict as "the world's worst humanitarian crisis." While violence in the region has declined, and the topic has largely disappeared from international headlines, a low-level conflict simmers on in Darfur, with a lasting political solution as distant as ever.

Though Darfur was the recipient of sustained Western interest during the conflict's height, mainstream media coverage was at best superficial, and almost universally failed to provide necessary background information for understanding the conflict – let alone for understanding the role of outside powers in the country (except for the favoured villain, China), or in Africa more generally. That is, little to no attention was paid to critically analysing the dynamics of imperialism in the region, past or present, at least insofar as the West could be implicated.

This essay seeks to address this gap by delineating the involvement of foreign actors in the Darfur conflict. In addition to providing a basic outline of the conflict's origins and historical context, we review the lineage of colonial and imperial incursions into the region, with a particular focus on highly salient, though oft-forgotten, episodes in US–Sudanese relations. Further, we track the recent involvement of outside actors in the Darfur conflict and in Sudan more generally, from the US and China to the United Nations (UN) and African Union (AU). As we demonstrate, the Darfur conflict is intricately linked to two foreign-policy doctrines that have elicited significant debate in both scholarly and lay circles: humanitarian intervention and the "responsibility to protect" (R2P, in common parlance). Finally, we analyse the role of foreign actors in their efforts to mediate the conflict, and point to the paths not taken as a result of this outside involvement.

The Darfur Conflict

Darfur was an independent sultanate until as recently as 1916, when the British folded it into

the cobbled-together nation of Sudan. Britain's manner of imperial rule, which based itself in Khartoum while largely ignoring the rest of the country, helped to lay the groundwork for the post-independence violence that has haunted Sudan for over five decades. Since it achieved the ouster of the British in 1956, the established pattern of unaccountable domination of peripheral regions like Darfur by the centre has continued. Power is concentrated resolutely in Khartoum and is wielded imperiously, prompting periodic separatist movements in a number of regions, including the ultimately successful breakaway of the south.

The proximate origin of the rebellion in Darfur lay in two uneasy groupings which emerged publicly in 2003: the Justice and Equality Movement (JEM) and the Sudan Liberation Army (SLA). The first has Islamist roots. Its then leader had once studied under Hassan al-Turabi, who had a long career as a sinister power-broker in Khartoum. The SLA by contrast was always less coherent and more secular in orientation. As the rebellion dragged on, the rebels splintered into dozens of smaller and typically hostile factions. Often rebel groups descended into mere banditry.

Periodic efforts at reaching a settlement with Khartoum that included most of the rebel forces have proven fruitless. Khartoum, despite having the full force of the Western propaganda machine turned on it, always had the upper hand militarily. Thus it pursued a war of attrition. The rebels, for their part, were bolstered with a false sense of empowerment by the fulsome rhetoric emanating from Washington, which championed the Darfuri plight. The effect quite probably led them to overplay their hand at the bargaining table, as they held out an illusory hope for US-NATO military assistance. Given the balance of forces, securing a just agreement with Khartoum was never on the cards. However, an accord that secured at least a few tangible benefits for Darfur might well have been possible if diplomacy had been conducted differently. The abortive Darfur Peace Agreement of 2006 was rammed through by the Bush Administration. Many rebels had not even been given a chance to read the would-be agreement, leading to a disastrous splintering of these groups. One rebel faction signed, while the others abstained. In the years that followed, the disunity and sectarianism of the rebel forces would worsen dramatically, obliterating hope of a settlement that would secure any tangible relief for Darfuris.

Darfur and the "New" Scramble for Africa

Foreign attention – and meddling – is nothing new for Sudan. Indeed, the country was a key battleground during the Cold War as the US and Soviet Union struggled for regional influence and supremacy. Before the rise to power of the more independently oriented Islamist party, the National Islamic Front (NIF), Washington assiduously supported Sudan, particularly during the tenure of Jaafar Mohammed Nimeiri. By the mid-1970s, Nimeiri's government was highly valued by Washington, both because it was a geopolitical ally in a strategically important area of the world and because oil had recently been discovered in Sudan.

The resumption of the civil war with the south, which had been raging off and on since independence decades earlier, occurred in 1983. For the next 2 years, until Nimeiri was overthrown by popular unrest in 1985 – a notable but oft-ignored forerunner to the Arab Spring – Washington provided his regime with crucial support as he waged a bloody campaign against the people of the south that would ultimately extract a death toll dwarfing that of the Darfur conflict. Such was the flow of military aid that, according to the regional specialist Douglas H. Johnson, Nimairi's most senior officials warned a group of southern politicians that Khartoum had built an "air bridge" from America to the Sudan for the supply of arms, and the first place such arms would be used would be in the south. This turned out to be no idle threat (Fake and Funk 2009, p. 32).

In waging its war against the southern rebellion, Khartoum also began enlisting and arming Arab-identified militias to its cause and promoting a racist, anti-African ideology. The strategy resulted in horrific atrocities against civilians and was revived decades later in Khartoum's repression in Darfur.

Concurrently with the brutal warfare, in the 1980s the southern and western regions of Sudan were repeatedly struck by grave famines. As Johnson observed (referring specifically to the 1984–85 famine, though the behaviour was repeated in 1988), during this period, "The US co-operated in obstructing the expansion of relief to non-governmentheld areas" (Johnson 2003, p. 146). Some southern refugees would resettle in the US, where they became known as the "Lost Boys of Sudan," producing flurries of anodyne, selfcongratulatory profiles. Pertinent political context, including US efforts to obstruct UN humanitarian relief to the unaccompanied minors, went unreported save in the specialist literature.

Washington was keen to maintain Sudan as a bulwark of influence in the region against Mengistu's Ethiopia and Gaddafi's Libya. Thus mass starvation was regarded as an acceptable outcome to avoid providing any incidental support to the southern rebels. However, the election of Sadiq al-Mahdi in 1986 marked the start of a gradual decline in relations with the US. Khartoum strengthened ties with Libya and trumpeted Pan-Arab solidarity. After Sudan incurred massive debt under the Nimeiri dictatorship, the newly elected government balked at prescriptions by the International Monetary Fund (IMF). The trend accelerated after Omar al-Bashir's 1989 coup. The leadership announced that it would not "follow the dictates of the West" (Burr and Collins 1995, p. 251). When Iraq invaded Kuwait in 1990, Sudan backed Saddam Hussein rather than the US position. It was not long before Washington began to consider providing support for the southern rebels. Suddenly the US "discovered" that Sudan was a state sponsor of terrorism. The IMF suspended Sudan's voting rights. Washington had switched sides.

The veteran journalist Dan Connell (2003, p. 228) notes that relations with the US "reached their nadir during the Clinton administration, which imposed strong sanctions on Khartoum and appeared to tilt toward a policy of displacing the NIF government, though it held back from providing more than token aid to the rebels challenging the regime." In 1998, US missiles levelled the al-Shifa pharmaceutical plant in Khartoum, ostensibly in response to the (actually entirely unrelated) US embassy bombings in Dar es Salaam and Nairobi. The pretext for the attack was erroneous intelligence suggesting that the facility was producing chemical weapons.

The strike came after Sudan had offered to extradite to the US two suspects it had detained in connection with the embassy bombings. The offer was ignored. Also ignored after the bombing were pleas for an apology from the US for its illegal act of war. In reality, the plant had UN contracts and produced a substantial portion of the nation's basic medicines, such as antimalarials. Taking into account the resulting lack of access to medication, the German ambassador to Sudan at the time estimated that the loss of the facility may have caused some "several tens of thousands" of deaths (Daum 2001). Only the year before, the US had imposed comprehensive sanctions upon Sudan. There is little doubt that the primary result was to increase hardship for the populace. The unpleasant consequences were of so little interest that no public studies of the impact of the sanctions were ever undertaken.

Sudan's strategic position along the Nile and a vital international shipping lane, once prized by Victorian Britain, is evidently well recognised by the US. Ann Mosely Lesch (1987), writing in *Foreign Affairs*, once observed that the nation's "geostrategic location means that changes in Sudanese political orientations have repercussions on the entire African continent and the Red Sea littoral."

As the *New York Times* noted, the new millennium augured renewed interest in Africa on the part of "Washington policy makers, and one word sums up the reason: oil" (Dao 2002). Though long hampered by warfare, Sudan was finally able to bring its oil operations online in 1999. However, owing to the sanctions and the outwardly hostile relations between the two countries, the US was frozen out of participation in the country's oil trade. In 2006, reflecting Washington's neoliberal agenda and designs on Sudan's oil, President George W. Bush explained that "The pervasive role played by the government of Sudan in Sudan's petroleum and petrochemical industries threatens U.S. national security and foreign policy

interests" (Riechmann 2006). This vexing problem would be significantly ameliorated in 2011 with the breakaway of a US-friendly South Sudan. The prior decade, however, witnessed an oil-fuelled economic boom for north Sudan. Outside Khartoum, the evidence of this new-found wealth was slim, particularly in far-flung peripheral regions like Darfur.

Yet discontent in Darfur is hardly restricted to the last decade. Nimeiri's regime also faced popular unrest in the deliberately neglected region. Though uninterested in developing the impoverished area, Nimeiri was content to collaborate with the CIA in using Darfur as a staging ground for supporting the odious Hissène Habré in neighbouring Chad.

Unsurprisingly, in the post-Cold War era, Sudan's size, oil wealth, and strategic location at the crossroads of the Middle East and Africa have continued to pique the interest of foreign powers. Here, we consider the role of two such powers in Sudan – the US and China – and how their machinations in the country relate to the Darfur conflict.

Media coverage of the Darfur conflict tended to divide foreign actors with an interest in Sudan into two groups, with strikingly different rationales behind their postures towards the country. On the one hand were the benevolent Western countries (that is, the US and European powers), which were said to be engaging in constructive efforts to resolve the conflict thanks to their deep-seated humanitarian impulses. On the other was China, whose insatiable demand for the country's oil resources was argued to be driving it into a strategic alliance with the al-Bashir regime; in turn, it protected Khartoum through weapons transfers and diplomatic foot-dragging. A number of other greedy spoiler (and non-Western) countries, such as Malaysia, were also lumped into the same group, though China was by far the most prominent. According to this narrative, China was essentially all that was standing in the way of Western-led international action that could finally resolve the Darfur conflict.

Yet the US's posture towards Sudan was of course much more complicated – and indeed, nefarious – than this dominant narrative suggests.

Two primary camps wrestled over control of Washington's Sudan policy during the Bush years. On one side was a curious network of advocacy organisations that had mobilised against Sudan's human rights violations (such as the Save Darfur Coalition, the United States Holocaust Memorial Museum, and the International Crisis Group), evangelical Christian groups that opposed al-Bashir's self-styled Islamist regime, and neoconservatives who were seeking to remake the world in the US's image. All of them pushed for strong US action in Sudan, perhaps even military intervention.

The other consisted of foreign policy "realists" who saw Darfur and Sudan primarily through strategic lenses. Consisting of major figures from the foreign policy establishment, this bipartisan group pursued quite different aims in dealing with Khartoum. Much like Bashar al-Assad's Syria or Gaddafi's Libya, Sudan was treated warily, but, for the moment, there was little interest in implementing Secretary of State Madeleine Albright's public call in 1997 for regime change. The point was to secure Sudan's continued co-operation in intelligence-sharing relating to the "War on Terror," as well as to avoid upsetting the US-backed north–south peace agreement, and to impede further Chinese influence in the region (as well as its access to the country's oil resources). This camp – which included the leadership of the US State Department, the Defense Intelligence Agency, and the CIA – shared the fundamental belief that Khartoum was "too important to be harshly treated." Thus, no matter how loud the protestations from Washington condemning its brutal activities in Darfur, the Sudanese government "should at least be helped even if perhaps not fully supported" (Prunier 2005, pp. 139–140).

While the first group was the loudest, and captured the most headlines, analysts indicated that the "realist" side won "every time" (Murphy 2006). Yet while the former camp was not setting policy, its advocacy implicitly helped to sell the notion that the Pentagon was merely, as some members of the punditry would have it, the "armed wing of Amnesty International" (Hari

2005; see also Cohen 2003). This idle fantasy is sufficiently tenacious that it is worth devoting some words to debunking the delusion. In one telling indication that strategic and not humanitarian interests were guiding US policy in Sudan, according to the prominent Sudan specialist Gérard Prunier (2005, pp. 138–140), "the interest level of US diplomacy on the Sudan question dropped sharply as soon as President Bush was re-elected" in 2004.

In this vein, the Bush administration pressured Congress to water down the Darfur Peace and Accountability Act – signing into law this weaker version of the bill in 2006 – and enacted its "Plan B" to address the Darfur conflict in 2007. This consisted of mild additional economic sanctions and financial measures while avoiding sanctions on a number of key government leaders. These were minor and largely ineffective measures, apparently designed for little more than domestic public consumption. A more realistic assessment of US policy is provided by the 2007 budget justification, which notes, "The United States will maintain its strong support for countries on the front lines in the War on Terrorism, especially Afghanistan, Pakistan, *and Sudan* ..." (US Department of State 2007; emphasis added).

In concrete terms, this translated into a close relationship with the head of Sudan's intelligence agency, Salah Gosh – who also happened to be a chief architect of the Khartoum government's violent scorched-earth campaign in response to the rebellion in Darfur, in addition to having served as Osama bin Laden's former handler in Sudan. His human rights credentials appeared to make no difference to Washington. Indeed, the CIA flew him to the White House in 2005 for discussions on intelligence collaboration. In the same year, a journalist witnessed a "senior CIA agent" give Gosh a "bear hug" at a counter-terrorism conference (Steele 2005).

Similarly, the US ensured that UN sanctions, which were to be targeted against key individuals within the Sudanese regime that bore culpability for the bloodshed in Darfur, would not include figures such as Gosh. As the Center for American Progress noted in 2006:

On the one hand, the United States pushed harder for the sanctions than any other country. On the other hand, U.N. Ambassador John Bolton successfully managed 'to keep top Sudanese commanders' from being targeted. Thanks to Bolton, the sanction list was whittled down to four from eight, only one of whom 'is a Sudanese government official, and a mid-level official at that.' (Fake and Funk 2009, p. 201)

By early 2008, the Bush administration was publicly offering to normalise relations with the al-Bashir regime, should it take sufficient steps to resolve the north–south and Darfur conflicts. For ideological reasons, initially it also openly opposed efforts to use the International Criminal Court to try human rights cases related to the Darfur conflict, and failed to take steps to facilitate the arrival of Darfuri refugees to the US.

In this latter regard, the record is even worse for two of the US's closest allies, Britain and Israel. Despite their militant verbal postures concerning Khartoum's crimes, both countries deported Darfuri refugees back to the region during the height of the conflict. Indeed, Downing Street actively collaborated with Khartoum in the refoulement of refugees back to Sudan, where they faced torture and death. Israel, which joined Washington in trumpeting the crimes of the "Arab" government of Khartoum for political effect, subjected many Darfuri and South Sudanese refugees who had managed to survive the treacherous journey to indefinite detention. Given its well-documented demographic obsession, Israel's primary concern was to stop the unwanted immigrants, lest the country be "flooded," as the interior minister reportedly warned (Fake and Funk 2009, pp. 118–121). In sum, while public rhetoric indicated that Sudan was virtually a part of the famed "axis of evil," the reality of US–Sudanese relations – and relations between Sudan and the West more generally – was quite different.

With a new election cycle under way in the US, leading Democrats were openly calling for aggressive measures against Khartoum. Several key figures called for a no-fly zone over Darfur and even the introduction of US troops into the country. Yet no such strident action was

forthcoming. By the time Barack Obama assumed the presidency in 2009, Darfur was fading from the headlines, though the afflictions facing the region were far from resolved. The "armed wing of Amnesty International" was once again revealed as illusory window-dressing for Western publics. Darfur had become a stabilised, low-intensity conflict, precisely of the kind that normally fails to pique the interest of the US media and political class. Further, with the US-led occupation of Iraq "winding down," Obama turned his focus to Afghanistan and to Asia, thus diminishing Khartoum's utility to Washington as a strategic asset. Finally, with independence for South Sudan then looming, US interests in Sudan revolved around preventing the outbreak of another civil war, and shoring up its alliance with the South, which would be home to the vast majority of Sudan's oil resources.

Throughout these years, blaming China for its more open and comprehensive strategic alliance with Khartoum, and for its failure to pressure the regime over the Darfur issue, became a national sport in Washington. This culminated in an effort to boycott the 2008 Olympic Games in Beijing. These were not unfair accusations, though they were also hypocritical. Washington itself had its own stable of brutal and authoritarian allies in Africa and elsewhere, and worked much more closely with the Khartoum regime than it was willing to admit publicly. Further, it failed to make common-sense efforts to address the conflict (such as providing sufficient humanitarian assistance, fully funding peacekeeping forces, and pushing for more inclusive peace talks). The larger context surrounding the Sino-US "war of words" over Darfur was what we and several other authors have identified as a new "scramble for Africa," as outside powers – primarily the US, China, and Europe, but also India, Brazil, and numerous Asian countries, among others – jockey to build political alliances and gain control of the region's resources (Carmody 2011). In this sense, recent decades have seen more continuity than change on the African continent.

Peacekeepers, Humanitarian Intervention, and the Responsibility to Protect

In 2001, the International Commission on Intervention and State Sovereignty (ICISS) released a landmark report on the "responsibility to protect" (R2P). R2P became a favoured topic in liberal-interventionist circles in subsequent years, re-invigorating the "humanitarian intervention" franchise. According to the report, "humanitarian" interventions carried out under the R2P framework were to be based on four "precautionary principles":

A. Right intention: The primary purpose of the intervention . . . must be to halt or avert human suffering. Right intention is better assured with multilateral operations, clearly supported by regional opinion and the victims concerned.
B. Last resort: Military intervention can only be justified when every non-military option for the prevention or peaceful resolution of the crisis has been explored . . .
C. Proportional means: The scale, duration and intensity of the planned military intervention should be the minimum necessary to secure the defined human protection objective.
D. Reasonable prospects: There must be a reasonable chance of success in halting or averting the suffering which has justified the intervention, with the consequences of action not likely to be worse than the consequences of inaction. (ICISS 2001, p. xii)

While these ideas have significant merit, it is unclear whether any real-world interventions – past or present – actually meet these criteria. The principle of "right intention" is of particular note in this regard, for it suggests that powerful, intervening states should act on the basis of "human suffering" instead of self-interest. The real world offers few, if any, examples of such high-mindedness (Walzer 1977, p. 101).

Instead, what have abounded are decidedly non-humanitarian interventions which are cloaked in humanitarian rhetoric. Indeed, perhaps

every intervention in history has been framed in this way by the invaders, from King Leopold's pillaging of the Congo (justified with anti-slavery rhetoric) to Hitler's conquering of Slovakia (which was said to be based on an "earnest desire to serve the true interests of the peoples dwelling in the area") (Murphy 1996, p. 62).

In turn, according to dominant Western discourses, interventions are "humanitarian" only when "we" are the ones holding the guns. It is axiomatic in the West that the 2001 invasion of Afghanistan was based on a sincere desire to help the Afghan people, particularly women, even if reality has departed from the premise. In contrast, Cuba's sending of troops to Angola in the 1970s and 1980s to support anti-colonial forces is seen as an act of self-interest, and ineligible for consideration as a "humanitarian" act. Stephen Shalom (2007) captures the double standard well by citing a hypothetical letter from a concerned citizen. It reads:

> What's going on in Bosnia and Haiti is appalling. I often wonder why our government can't intervene to stop the killing. I know our government isn't pure – far from it – but nor was it pure during World War II and I supported its participation then against Hitler. It's certainly true that in that earlier war our government didn't get involved out of noble motives, but the clear consequence of its involvement was to defeat the Nazi killing machine. And that was good. Today our government's motives are still far from noble. But is that any reason for us not to demand that our government intervene when so many lives are at stake? The human tragedies in Bosnia and Haiti are so profound, that surely this is a time for intervention.

As Shalom asks, are our reactions to this letter the same once we discover that it was written from one Russian citizen to another? Must we not also be sceptical of Western invocations of humanitarianism to justify wars? Are "we" the only ones with the "right" to carry out such interventions?

Many left-leaning commentators and activists were content to point to such double standards as a reason to dismiss any sort of intervening force in Darfur out of hand – even UN or AU peacekeepers deployed with Sudan's consent. Whatever one makes of the theoretical arguments surrounding such interventions, and in spite of

the presumably imperial motives of the involved states, one must also look to a more practical consideration: whether the presence of peacekeepers on the ground will have positive humanitarian consequences. As Justin Podur (2005) frames the issue:

> The real world demands not allowing genuine concern for victims of atrocities to be transmuted by interventionist hypocrites into apologetics for an imperialism that will ultimately produce more victims of more atrocities. But those same victims deserve better than mere denunciations of intervention and its apologists as hypocrites and warmongers.

So what are we to make of the AU, and later the joint AU–UN (UNAMID) force in Darfur? Peacekeepers in Darfur appear to have had mildly positive effects for the civilian population, leading to a moderate – though terribly insufficient – increase in the level of security in the region. Yet they were not the panacea that Western commentators and activists often suggested, nor were they able to compensate for the lack of a lasting political solution to the conflict – a missing piece of the puzzle that never attracted sufficient attention from the West.

Given that these peacekeeping forces were of some limited utility in putting a band-aid on the Darfur conflict, it is instructive to consider the Western, and particularly US, posture towards them. In short, it was to keep the AU and UNAMID forces on a starvation diet – sending along enough resources for them to subsist (barely), but never a sufficient amount for their potential to be fully realised. While US rhetorical support for the people of Darfur was ample, the provision of necessary funds and supplies never became a priority for the US. So extreme were the shortages that the AU force at times lacked, among other necessities, telephone lines and basic communication devices, properly coloured helmets, sufficient fuel to complete its patrols or food to sustain its troops, or the funds to pay its translators – who at one point as a result went on strike for 5 months. As the UNAMID force commander Martin Luther Agwai put it: "We remain desperately under-manned and poorly equipped . . . Our long shopping list of missing equipment

makes shameful reading" (Bridgland 2008). Yet here again, the West's humanitarian rhetoric would fail to materialise into meaningful concrete assistance for Darfuris.

In one particularly shameful episode, UNAMID was unable to persuade donor nations to supply the two dozen helicopters that it requested for its surveillance missions. Disgracefully, this transpired while – according to a report issued by more than 50 non-governmental organisations, entitled "Grounded: The International Community's Betrayal of UNAMID" – European countries had more than sufficient numbers "gathering dust in hangars or flying in air shows" (Withington 2008). Meanwhile, US helicopters were being used for decidedly nonhumanitarian ends in the occupations of Iraq and Afghanistan. Though China's role in the Darfur conflict was particularly shameful and unhelpful, China was far from alone, as we have seen, in serving as an obstacle to peace in the region.

Conclusion

Though prospects for justice in Darfur were never bright, a more skilful diplomatic facilitation of the 2006 peace agreement might well have resulted in peace and some genuine concessions from Khartoum. Instead, the violence continued, and indeed still lingers, despite a 2011 agreement between the government and some rebel factions. Rebels are still active, though without any apparent hope of regaining what little political leverage they had in the early years of the fighting. Life in Darfur has been permanently uprooted and reshaped. Many of the millions driven from their homes may never return, having been forced to resettle elsewhere. Meanwhile, in 2011 the country of South Sudan was born, though it is deeply impoverished, and tensions with Khartoum remain high. Elsewhere in the north, in South Kordofan and Blue Nile, Khartoum is waging violent campaigns against restive forces, extracting a terrible toll on civilian populations.

It is doubtful that any genuine peace, let alone prosperity, will reach Darfur while the current regime remains in Khartoum. The National Congress Party (NCP), the successor to the NIF, has managed to successfully weather the Arab Spring, in part by using its much-feared secret intelligence apparatus to arrest, torture, and "disappear" dissidents. Small public demonstrations of dissent are truly brave but have not yet managed to attract a critical mass.

The people of Darfur, once the focus of so much attention, have been largely forgotten by the Western press corps and the White House. Washington is surely pleased to have secured an ally in the region with the formation of South Sudan – which is an ironic outcome after heavily bankrolling mass killings in the south during the 1980s, an episode now thoroughly forgotten. Khartoum, still under sanctions and receptive to China and Iran, remains a nation that the US holds at arm's length. Yet unfortunately, we are far from the day when the people of Sudan can decide their own fate, free from both local tyrants and the machinations of external powers.

Queens College, City University of New York, New York, NY, USA

Definition

Simone de Beauvoir published philosophy and literature that explored the nature of freedom, individual and social responsibility, and subjectivity. As a philosopher, she is best known for her magnum opus *The Second Sex*, which has become an iconic work of second-wave feminism.

A prolific writer, Simone de Beauvoir published philosophy and literature that explored the nature of freedom, individual and social responsibility, and subjectivity. As a philosopher, she is best known for her magnum opus *The Second Sex*, which has become an iconic work of second-wave feminism. Although the reputation of Jean Paul Sartre had at one point surpassed her own as a thinker, recent scholarly interest in her work now recognises her significant and distinct contributions to philosophy and literature (Bergoffen 2004: 80). Some scholars have even speculated that it was *her* guidance that spurred Sartre's intellectual development. Nonetheless, her contributions to political theory and her lifelong activism have yet to be fully recognised. From her autobiographical account of her experience of the Nazi occupation of Paris to her campaign during the Algerian War on behalf of a young

Algerian woman and activist, Djamila Boupacha, the extent to which philosophy, literature, and politics were interconnected for her is clear. As Julien Murphy observes, the issues of colonialism and French imperialism took an especially prominent place in de Beauvoir's political activities and philosophical thought (Murphy 1995).

From an early age, de Beauvoir contested the conventions of her dour, middle-class upbringing. Her biographer, Deirdre Bair, writes that she had always "equated reading with happiness" (Bair 1991: 65). She was part of the first generation of French girls to take advantage of progressive reforms in higher education in early twentieth-century France, which finally allowed them to train for a professional degree. At the Sorbonne, she met Sartre, and they would remain close friends until his death in 1980. Sartre's approach to existentialist ethics contended that the individual alone generates the meaning of the social world. According to his view, ethics was simply an orientation that the lone individual invents rather haphazardly in building meaningful relationships and intellectual projects. She was intrigued by the idea of radical freedom and the problem of nihilism that preoccupied the young Sartre, but would later criticise his view because of the extreme individualism it presupposed.

It was under the Nazi occupation of Paris that de Beauvoir came of age as a political thinker. Although she would later write novels and a drama about the French resistance and post-war French politics (e.g. *The Blood of Others, Who Shall Die?* and *The Mandarins*), the extent of her own participation in the resistance is unclear. Some have even suggested that she and her inner circle colluded with the German occupiers to further their careers and secure steady work (ch. 17). What is clear, however, is that her wartime experience marked her political awakening, motivating her to rethink her pre-war political and philosophical commitments, among which was – as a successful, middle-class French woman – her own relationship to French colonial subjects. She would later describe her wartime experience as throwing her for the first time into the world, forcing her to realise that she could no longer indulge in a life in which she her private and

professional ambitions alone were central. Neither could she defend an existentialist philosophy in which meaning is constructed by lonely, anxiety-ridden individuals. She came to find meaning already abundant in the world around her.

In a 1965 interview in *The Paris Review,* de Beauvoir retrospectively describes her political awakening. She says that she realised that as a young woman she had been "swindled." She then went on to explain that being "swindled" does not simply mean being tricked:

> 'I'm swindled' also implies something else – namely, that life has made me discover the world as it is, that is, a world of suffering and oppression, of undernourishment for the majority of people, things that I didn't know when I was young and when I imagined that to discover the world was to discover something beautiful. In that respect, too, I was swindled by bourgeois culture, and that's why I don't want to contribute to the swindling of others and why I say that I was swindled, in short, so that others aren't swindled. It's really also a problem of a social kind. In short, I discovered the unhappiness of the world little by little, then more and more, and finally, above all, I felt it in connection with the Algerian war and when I traveled. (Gobeil 1965: 35)

Her gradual discovery of the unhappiness of the world is evident in her writing, through which one can trace an arc of moral and political development. Beginning with the musings on the purpose of human engagements that she had jotted down as a young philosophy student in the 1930s, her changing views on the relationship between morality and politics eventually led her to call vehemently on her fellow citizens to end the French occupation of North Africa in the 1950s and 1960s. She would also come to defend the right of colonial subjects to engage in violent revolt against their occupiers in the name of freedom and national self-determination.

Her first philosophical essay, "Pyrrhus et Cineas" (1944), did not endorse such a radical political position, but it did contain the germ of an ethical framework that is consistent with the latter. In the essay, the tyrant Pyrrhus advisor, Cineas, ponders the purpose of endless imperial expansion. For, he concludes, at the closing of a day and of a life, one always ends up back where one started: in one's motherland, alone. She uses this dialogue to set the stage for a discussion

about the purpose of undertaking any project whatsoever, given that human finitude is bound to render our projects unsuccessful or, at the very least, incomplete. She defends the importance of human endeavours in spite of their ultimate futility: our finitude is not an obstacle as much as a necessary condition for constructing meaning, since meaning is only possible for mere mortals, rather than gods and archangels. According to de Beauvoir, the latter could never feel the burden of responsibility for their choices because their lives extend into eternity. The capacity for freedom is distinctly human and thus necessarily an expression of human finitude, of the fact that we have a past and a future and that our present will 1 day dissolve in the impalpable instance of our death.

The imperialist overtones of the essay were lost on the young philosopher, and she decidedly sides with the imperialist Pyrrhus, goading us on to undertake projects in spite of their ultimate futility, as Pyrrhus did when he invaded Macedonia, Rome, and Thessaly before returning to rest in his imperial courts. At this point, she does not provide a clear criterion for distinguishing "meaningful" from "meaningless" collective political projects, contending only that action is better than inaction. She simply stipulates the importance of throwing oneself into the social world and of action more generally. The essay nonetheless demonstrates a nascent political consciousness that recognises the importance of others in building a meaningful life: in order to construct a truly free life, one must involve others in it and ensure that they have the minimal autonomy necessary to pursue collective actions. That is to say, one must be attuned to the miseries and strivings of others.

In the essay, she also begins to ponder how a political community that can feasibly undertake collective action is constituted. A single life, after all, is not expansive enough to include everyone nor is it small enough to exclude everyone. All action throws one into the world and requires one to assume one's "situation" – constitutive of a particular social identity and historical and geographic context. How to draw the bounds of political fellowship and to decide who warrants one's concern and who does not is a problem de Beauvoir poses in this early essay but leaves unsolved.

In "Pyrrhus et Cineas," her concern about colonialism and French imperialism, though palpable, is still only implicit. After all, in drawing the boundaries of human fellowship, French citizens must judge whether or not French colonial subjects belong under the arc of their moral and political consciousness. It was not until the publication of *The Ethics of Ambiguity* (1948) that she first clearly articulated a conception of freedom and subjectivity that is attuned to a social world marred by colonialism and imperialism. It is also here that she begins her lifelong philosophical engagement with Marxism and affirms her commitment to the universal humanism typical of communist and cosmopolitan political philosophies, though she was often a vocal critic, and never a member, of the French Communist Party (PCF).

She definitively breaks with Sartre's conception of radical freedom in favour of a position that takes seriously material and political inequality. In his early work, Sartre had argued that insofar as human beings are conscious, they are free. The onus of choosing a path for one's self and building a meaningful life is equally shared by every selfconscious individual. "[R] elations of unequal power have no bearing on the autonomy of the subject. "The slave in chains is as free as his master because each is equally free to choose the meaning of his own situation." The question of material or political inequality between master and slave is simply irrelevant to their relation as two freedoms, as two absolute subjects" (Sartre, quoted in Kruks 1992: 96). She instead argues that our capacity to make meaningful choices is profoundly influenced by the social world and our relationships with others. One cannot establish radical freedom due to the mere fact that we are all equally self-conscious agents, since many of us suffer exploitation on account of our sex, gender, race, class, religion, and nationality. This is precisely the "ambiguity" she identifies as the ineradicable feature of ethical life: we are neither wholly determined by our social context nor completely free of it. The social world necessarily mediates all our action and thought without wholly determining them.

In the spirit of Aristotle's virtue ethics, in *The Second Sex* de Beauvoir outlines the material conditions of freedom by arguing that women's liberation requires access to material and social "props" (*choregia*). These props consist of access to viable, self-affirming work, quality education, public life, and state-subsidised day care and maternity leave. She also emphasised the importance of reproductive rights, lobbying for contraceptives and the right to abortion. Her emphasis on material and social goods is also representative of her commitment to Marxism. For de Beauvoir, true liberation necessitates a more egalitarian organisation of the basic structure of the social and economic world that would support the civil and political rights we gain.

For her, the essential feature of immorality is the treatment of human beings as mere objects; such treatment undermines the prospect of engaging with others on the basis of the mutual recognition of one another's freedom. She uses several examples from the colonial context to illustrate this point. Colonial overseers often perpetuated atrocities according to a vision of empire that reduces colonial subjects to mere tools subordinate to the end of capital accumulation and the consolidation of power. "Oppression tries to defend itself by its utility" (De Beauvoir 1976: 95). According to this logic, the free market must advance unhampered because of the promise of "productivity"; colonisation exploits resources that would otherwise lie "fallow," thereby generating "value." Thus, in spite of all the violence visited upon colonised peoples, colonisers asserted that they were *benefiting* the latter.

She later develops her account of social and political distortion in *The Second Sex* to incorporate the phenomenon of "Othering." A "sovereign consciousness" defines the identity and worth of another human being in terms of the negative features that he projects onto them, often delegating women and certain racial groups as the "Other." Given the apparent rationality, self-control, and strength of whites and men, women and people of colour are irrational, infantile, and weak. The Other is not perceived to even have the capacity for self-determination – they are a "thing" for the sovereign consciousness to control, define, and exploit.

In her mature political and moral philosophy (*The Ethics of Ambiguity and The Second Sex*), she argues that the existence of *anyone's* oppression limits the freedom of all. She thus espouses the universal humanism that is characteristic of her particular brand of existentialism, which provides her with a conceptual apparatus for expressing solidarity with exploited peoples around the world, including colonial subjects and women of colour. For her, the ideal of reciprocal autonomy must be realised as a collective political project that spans the globe.

For her, the moral ideal is to recognise one another as sovereign subjects equally possessing autonomy and the capacity for self-determination. Although she has historically been associated with white bourgeois feminism, her characterisation and use of her own feminist philosophy galvanised her antiimperialist activism, particularly on behalf of colonised women. She believed that the moral ideal of mutual reciprocity must be achieved between French citizens and France's colonial subjects. In *Force of Circumstances* she explicitly links the oppression of women with colonisation, arguing that the same logic of domination operates in both contexts.

From the end of the Second World War, she made her home available to political refugees and other stateless peoples and dissidents emigrating from the so-called Third World (Bair 1991: 400). Arguably, the 1950s and 1960s were her most politically active period. She travelled extensively and lent her support to various political causes, meeting – among others – Che Guevara, Fidel Castro, Mao Zedong, and Franz Fanon. She became actively involved in the liberation movements in North Africa, particularly Algeria.

Presided over by President Charles de Gaulle, the occupation of Algeria protected French business interests in the country, culminating in the Algerian War (1954–62), during which the French army tortured and killed innumerable Algerian citizens in an effort to put down the Front de Liberation Nationale (FLN), the socialist liberation army fighting to end French occupation in the country. Only a year before Algeria would finally win

independence (1962), the violence spilled over to France. The Paris-based guerrilla army of the FLN called on Algerian citizens to protest against the military occupation of their homeland. In a show of solidarity, Algerian families crowded the streets. In her memoirs, she describes how, led by a former Nazi collaborator, Maurice Papon, French police massacred the protestors, throwing their mutilated and broken bodies in the River Seine or hanging them from the Bois de Boulogne in what would later be known as the Paris Massacre.

Along with other prominent French intellectuals, de Beauvoir signed the Manifesto 121 in support of Algerian independence, condemning the French military occupation of Algeria. As a feminist and supporter of the FLN, in 1960 she began to campaign on behalf of a young Algerian woman, Djamila Boupacha: an FLN member raped and tortured by French soldiers during the Algerian War (Murphy 1995). She collaborated with Gisèle Halimi, Boupacha's lawyer and a global advocate for women's rights, to raise awareness about Boupacha's case among the French public and the Western media. De Beavoir and Halimi co-authored a book about Boupacha's ordeal (1962). They would later work together on various feminist causes, spearheading a campaign for the right to abortion and contraceptives in France in the 1970s.

De Beauvoir's anti-imperialist political action forced her and Sartre into hiding in the early 1960s. They became the targets of the right-wing nationalist militia Organisation de l'Armée Secrète (OAS), which planted several bombs in their residences. She was undeterred and continued her activism. Moreover, she did not limit her criticism to French imperialism; she was a vocal critique of the Vietnam War and a member of the Russell Tribunal, which convened in 1967 to assess the consequences of the US's war crimes in Indochina.

In *The Mandarins*, de Beauvoir captures the post-Second World War sentiment of the French. Though many of the novel's political themes are now passé, the novel depicts the general ethos following the war: "This peace [...] gave us back our lives without giving us back our reasons for living" (De Beauvoir 1987: 76). With the end of the Second World War, she developed a moral philosophy that posited the struggle for freedom as expressive of the very fibre of the human spirit, and, to a considerable extent, the struggle for freedom became her own reason for living.

Definition

This essay argues that not only does the term
'imperialism' have a long history, but there are
various conceptualisations of what it entails,
including its impact on Africa. The discussion
presented here shows that there are contesting
views about the nature and impact of the debt
crisis in Africa and how to reduce it. In this con-
text, 'debt crisis' will be used as a general term for
the proliferation of massive public debt relative to
tax revenues. Imperialism is here considered as
the stage, mechanisms, and processes of interna-
tional capitalism characterised by monopoly cor-
porations and the compulsion to export capital
abroad, especially to the developing regions of
the world (including Africa) for higher profits.
These transnational corporations are supported
and protected by their respective governments.
The essay uses an analysis of secondary sources
to interrogate imperialism and the debt crisis in
Africa, which is one of the regions in the world
most affected by the same.

Introduction

George (2000) criticises imperialism and the debt
crisis with regard to Africa's increasing poverty
and misery. The impact is felt in all aspects of
people's lives, from health to environmental

degradation. This essay starts from the premise
that the concept of imperialism encompasses dif-
ferent meanings to the extent that one needs to
clarify it before using it in a discussion. It argues
that not only does the term 'imperialism' have a
long history, but there are various concept-
ualisations of what it entails, including its impact
on Africa (Abu-Lughod 2000).

The discussion will also show that there are
contesting views about the nature and impact
of the debt crisis in Africa and how to reduce
it. In this context, 'debt crisis' will be used as a
general term for the proliferation of massive pub-
lic debt relative to tax revenues. It has been mostly
used in reference to Latin American countries
during the 1980s, and the US and European
Union since the mid-2000s (Farah and Masongo
2011; Kang 2000).

Concerning different views of imperialism,
some relate it to a process of capital export from
developed capitalist economies to the developing
regions, including Africa. Others address it in the
context of the economic dominance by the world's
capitalist centres in North America and Western
Europe of the world's post-colonial regions. This
involves the exploitative effects of transnational
corporations, their technological dominance of
developing regions, and unequal exchange in
trade (Aglietta 1982; George 2000). In the context
of this conceptualization, inequities between
states, and within the interstate system, create
opportunities for these centres of world capitalism
to exploit peripheral regions. Ravenhill (2001)
looks at imperialism as the predominance of the
US and Western European countries, including
their militarised threats towards the developing
regions of the world since 1945. These hegemonic
processes and mechanisms characterising imperi-
alism could be categorised as 'expansive', on the
side of the dominant powers, and a state of
'dependency' for the developing regions.

In this essay, imperialism is viewed as the
stage, mechanisms, and processes of international
capitalism characterised by monopoly corpora-
tions and the compulsion to export capital abroad,
especially to the developing regions of the world
(including Africa) for higher profits. These trans-
national corporations are supported and protected

by their respective governments. The essay uses an analysis of secondary sources to interrogate imperialism and the debt crisis in Africa, which is one of the regions in the world most affected by them.

Imperialism and Africa's Contemporary Global Political Economy

Some scholars such as Asher (2001), George (2003), and Hussain and Oshikoya (2002) have argued that in order to show the relevance of imperialism to Africa's contemporary global situation, especially its debt crisis, one has to examine imperialism beyond the categories outlined above; that is, contemporary imperialism should be looked at as an integral part of the global political economy of capitalism. Ruppert and Smith (2002) summarise the characteristics of contemporary imperialism as the:

- relentless expansion of capitalism as a socio-economic system on a global scale;
- undoubtedly competitive, expansionist, and warlike character of the developed capitalist states (US and other Western powers);
- unequal nature of capitalist expansion, and the reproduction on a global scale of socioeconomic inequalities and poverty;
- creation on a global scale of structures of inequality of power and wealth not only in the economic sphere, but also the social, political, legal, and cultural ones;
- generation, through the very process of capitalist expansion, of movements of resistance, of anti-imperialism.

In addition to the above features of contemporary imperialism, the transplanted structures of imperialism through its various forms, including colonialism, have created their own seedlings in Africa to perpetuate exploitation through a rapidly growing, and often rapacious, economic and political elite characterised by greed and graft (George 2000).

In his discussion of the new forms of accumulation within the context of Africa and the global political economy, Simon (2000) indicates that using the conceptualisation of imperialism as discussed above does not reduce Africa to a passive recipient of global capitalist intervention. New forms of accumulation emerge within Africa, products of social relations in specific places and their articulation to broader networks of trade and production. There are also complexities to the interplay between state power and private economic power, an interplay that is changing its patterns in response to both external forces and popular movements (Randriamarao 2003). Meanwhile, external forces are themselves in a state of flux as there is a complex set of relations between the imperialist states and their transnational corporations. Furthermore, the financial flows into Africa promote investment by 'home' companies which themselves become sites of contestation as new forms of accumulation are infused with new forms of inequality and social differentiation (George 2003).

Africa and the Debt Crisis

The International Monetary Fund (IMF) indicated that the cash-strapped Zimbabwe could only get new financial aid if its old debts were serviced. The country is faced with a debt amounting to over US$10 billion and has US$142 million in arrears. Zimbabwe is seeking the cancellation of debt from its international creditors in order to relieve itself of the burden of servicing loans so that the money may be used for economic recovery and development. Foreign investment in Zimbabwe had more than halved in 2010, and its industries were either operating below capacity or shutting down (Woods 2012).

Mistry (1988) states that, a century ago, Africa was conquered and plundered by European powers because they had far superior technology. However, to date the continent is still being exploited by the same Western powers because they possess not only advanced weapons but financial capital. Robin (2008) defines financial imperialism as the system and process through which international capital dominated by Western powers exercises authoritarian control over the

economies of the developing world, including Africa. Matthews (2004) reveals a paradoxical situation whereby Africa is spectacularly rich, yet the natural resources benefit other regions of the world. Cline (2002) indicates that the Western capitalist powers use debt as a tool for exploiting Africa and the rest of the developing world. The use of debt to exploit Africa ensures that funds generated in these poor countries are diverted from their developmental investment strategies towards interest payments into imperialist banks.

The Western powers use financial institutions such as the International Monetary Fund (IMF) and the World Bank to put African economies, governments, companies, and households into debt, by sucking their incomes as debt interest payments. Indebting African governments allows creditors an instrument with which to take ownership and control of land, public infrastructure, and other property in the public domain. Edwards (2003) looks at the nature of debt historically by arguing that although the concept and practice of debt have been there for centuries, the contemporary debt crisis in Africa is controlled by a dictatorship of international private capital led by a consortium of imperialist banks in pursuit of profit without care for human suffering (George 2003).

However, Hussain and Oshikoya (2002) argue that debt is not the only way in which the capitalist countries keep Africa and other poor regions of the world underdeveloped and deindustrialised. The main weapon financial imperialism uses is the promotion of neo-liberal economic policies through Western institutions such as the IMF and World Bank, as well as through African puppet neo-liberal political parties and elites.

Neo-liberalism and Africa's Underdevelopment

Hill (2002) considers neo-liberalism to be the greatest cancer spreading across the African continent. Neo-liberalism is the promotion of a combination of counter-developmental economic policies (such as privatisation, austerity, and structural adjustment) that put the interests of foreign capital over local labour and the African masses.

Through debt and neo-liberalism, the IMF and World Bank exert de-facto control over the African economies, determining macroeconomic policies and national budgets. The indebted African state is thus left with only its judicial functions; that is, the maintenance of internal public order (Isard 2005).

Farah and Masongo (2011) indicate that financial imperialism ensures Africa cheaply exports raw materials such as minerals, and cash crops such as coffee, sisal, oil, tea, and so forth, and buys them back expensively as industrial products. This situation creates a great problem for Africa, but an opportunity as well. It is a problem because those capitalist countries and their transnational corporations constitute power without responsibility, and for the suffering African masses it means exploitation without justice. It creates an opportunity for Africa by creating awareness of the necessity not only to control its raw materials but also to build the processing capacity of these raw resources which would allow them to be exported as finished products with additional value (George 2000). The following section looks at some of the causes of the debt crisis in Africa.

The Causes of Debt in Africa

George (2003) demonstrates that with the loss of their African colonial territories after the Second World War, the Western European powers' direct military administration and control of these territories was replaced with economic control and domination, which was greater in effect than it had been in the past. The nascent capitalist class in the ex-colonial countries was far too weak to develop the economies of their countries without profound dependence on the rich imperialist states and transnational corporations. For instance, in 1960, the former colonial powers imposed a sum of US$59 billion in external public debt on the newly independent states with an interest rate of 14%. This was designed to maintain these newly

liberated states in perpetual poverty and debt, and keep them servile to their former colonial masters among the industrialist Western capitalist countries. Imperialism merely changed its exploitative tactics. In 2006, the developing countries, including those of Africa, paid almost £540 million interest on their debt every day to the Western banks, governments and financial institutions. This puts the poor developing countries, especially those in Africa, at the mercy of the imperialist powers. The poor masses in these countries stay in a perpetual state of poverty, and remain a massive reserve of cheap resources and labour for imperialist exploitation (Robin 2008).

The energy crisis in the 1970s and subsequent rise in inflation levels led many Western capitalist institutions to lend increasing amounts of money to the poorer ex-colonial countries. However, that money, which was to be used for economic development and the improvement of living standards, was generally spent on arms. There was massive corruption and generally large sums ended up in the Swiss bank accounts of Western-supported dictators such as Mobutu of the then Zaire. Interest rates rose sharply in the 1980s, resulting in more and more money being spent to pay off interest on loan repayments rather than the principal amount. For example, the money borrowed by Nigeria under President Obasanjo of Nigeria in the 1980s was around $5 billion. The country paid about $16 billion and yet it owed the Western financial institutions around $28 billion due to foreign creditors' interest rates.

The indebted ex-colonial countries have to repay these loans in hard currency, such as Euros, US dollars, or the Japanese Yen, which do not fluctuate much in value. Debt crises often occur because of the devaluation of a given developing country's currency; that is, the amount needed to be paid back rises. The indebted countries must generate the foreign exchange in hard currency, which is generally done through exports whose value keep on falling in the world market dominated by the same Western imperialist countries and their financial institutions. Therefore, to pay interest on their debts, the African countries have to export more. Most of them depend on just two or three export crops; that is, minerals or agricultural products whose prices keep on falling in the world market (Farah and Masongo 2011).

Falling export prices for these raw materials means that it becomes increasingly difficult for indebted countries to pay off the interest on the loans, let alone the principal sums. As a result, more and more countries refinance their loans by taking out new loans to cover the old ones, and sink further and further into debt.

In her discussion on the impact of drought on the debt crisis in Africa, George (2003) indicates that the situation was worsened by a prolonged and devastating drought in the 1980s which severely impaired Africa's agricultural production and exports, hence the financial structure of the continent's fragile economies. Furthermore, protectionism in the world's markets for agricultural products and low-technology manufactures makes it difficult for African countries to diversify and increase exports to hard currency markets. This also limits their ability to escape the debt trap.

Edwards (2003) reveals that in the 1990s the Western imperialist countries and their financial institutions such as the World Bank and IMF set up the Heavily In-Debt Poor Countries (HIPC) initiative to assist the most indebted countries handle their increasing debt payments. The debt of the HIPC countries was, on average, more than four times their annual export earnings, and 120% of GNP.

In order to force the African countries to pay back their debts to the imperialist banks, the World Bank and the IMF imposed so-called Structural Adjustment Programmes (SAPs) on African countries. These SAPs involved cutting welfare expenditure, privatisation, and increasing exports to cover debt servicing. The exports are mostly primary commodities such as mineral and agricultural products whose prices have been falling since the 1980s, whilst the cost of imports has continued to rise. This has caused a sharp decline in Africa's terms of trade, as the purchasing power of Africa's exports has been falling since the early 1980s. This is in spite of an increase in the volume of exports. For instance, the collapse of the International Coffee Agreement in 1989 meant that cocoa prices continued to fall, costing Africa

substantial amounts of money for development (Woods 2001).

Matthews (2004) elaborates that when a country is in danger of defaulting on its debt, the IMF usually intervenes with these SAPs. The packages are not meant to cancel the debt of these countries, or even significantly reduce it. They are designed to ease debt figures down to a level where they will be 'sustainable'. This means severe cuts to social spending, so that more money can be spent on debt repayment. This type of financial arrangement does not assist the indebted country. It only helps the capitalist countries and their financial institutions by ensuring that they receive payments on their loans. Africa's debt in 2006 amounted to about US$600 billion. This was equivalent to almost three times its annual export earnings. Africa's debt has become one of the most crucial factors constraining the continent's socioeconomic development (African Development Report 2006).

The Impact of Debt on Africa

An analysis of literature sources shows that the debt crisis has had devastating effects on Africa's development as will be discussed below.

Unsustainable Sacrifice

Substantial resources flow out of Africa as the continent struggles to service debt ratios averaging more than 40%. Despite the principal loan amount being smaller than those of other regions such as Latin America, Africa has a severe lack of foreign exchange resources for its developmental needs. The outflow is financed by drastic cuts in imports, in some cases amounting to more than 50% (Isard 2005). This strangles imports which are so crucial for African economies.

This essay contends that Africa's attempt to service the debt and meet repayment schedules amounts to a sacrifice which most African countries are unable to sustain because directly or indirectly it can lead to a reversal in the decline of mortality rates. The United Nations Children's

Fund (2005) blames the debt crisis for an increase in deaths of hundreds of thousands of children in some African countries. Average incomes have fallen by more than a quarter since the 1970s. The number of people living below the poverty line rose from 220 million to over 400 million in 2008 (Woods 2012).

Wasted Expertise

This essay agrees with the view that the continuous monitoring of the debt situation, including negotiations and so forth, takes up a lot of time for the few African experts available in their respective countries. These same experts are also expected to handle economic and financial matters for development policies and programmes. While it is difficult to quantify the loss these countries are incurring through having their experts 'tied down' to the debt crisis and related matters, the loss is substantial (Ndegwa 1990).

Divided not Collective Responses

Cline (2002) shows that the case-by-case approach followed by Western creditor institutions such as the World Bank and the International Monetary Fund undermines Africa's co-operative efforts against financial imperialism. The African countries are compelled by the Western capitalist countries and their financial institutions to develop policies and programmes in the context of individual national economies. The approach provides no opportunities for the indebted African countries to plan new recovery and development initiatives together. This co-operation could, through collective self-reliance in areas such as food security, minimise Africa's dependence of foreign sources.

Loss of Independence

The detailed and continuous negotiations with creditors, involving close scrutiny of individual African countries' economic and social policies,

undermines those countries' independence. The debt crisis is used by some creditors to impose their political and economic influence on Africa as a continent. Loss of that independence in deciding on their own economic, political, and social policies amounts to a recolonisation, with all its undesirable implications and consequences (George 2003).

Economic Performance

This essay notes that although there are other factors contributing to the poor performance of African economies (including adverse weather conditions, collapse of export earnings, social/political conflicts, economic mismanagement, etc.), the debt problem is also a direct and indirect contributing factor. This is related to the reduction in the volume of imports in order to service the debt. The number of African countries recording GDP growth rates below 3% (i.e. a rate below the average population growth rate of 3.2%) has been increasing since the 1980s (Matthews 2004).

Randriamarao (2003) indicates that there is a strong association between debt crisis accelerating urban unemployment in Africa. In most African countries, the industrial and commercial activities are located in urban areas. Therefore, when these countries implement the stringent financial measures dictated by imperialist financial institutions (involving reduction of food subsidies, bank credit, public expenditure, and in some cases laying-off civil servants), the adverse effects on urban employment are substantial. Furthermore, the scarcity of foreign exchange also constrains economic expansion through shortages of raw materials and spare parts, thereby leading to job losses for workers in the private sector. When such developments are accompanied by consumer price increases, they create social and political tensions which further undermine investment. Real wages have fallen in most African countries by 60% since the 1980s. However, this essay argues that the high levels of unemployment become counter-productive because they result in fewer taxpayers contributing to government revenue.

Health

The poor health of most Africans is staggering. Infant mortality rates are 50 times higher than in the imperialist nations. An estimated 6 million children under the age of five die from malnutrition each year. Another 30 million are underweight. About 20% of the population is anaemic. African women are 50 times more likely to die during childbirth than women in imperialist nations. In the 1990s, two-thirds of African governments were spending less on health per capita than they were in the 1980s. In Zimbabwe, spending per head on healthcare has fallen by a third since the 1990s when the Structural Adjustment Programme was introduced. In Uganda, US$4 per person is spent on healthcare (2014), compared with US$14 per person on debt repayment (United Nations Economic Commission for Africa 2012). Diseases considered to be eradicated (including yellow fever, yaws, etc.) are emerging again in some African countries due to a decline of treatment and vaccination coverage. West Africa is currently struggling with the Ebola epidemic and depends on Western powers and their financial institutions to deal with the crisis.

Education

African people's education is also affected by the debt crisis. For instance, the Jubilee Debt Campaign in 2007 showed that primary-school enrolment in some heavily indebted African countries fell from an average of 78% in the 1970s to below 50% in the 2000s. Less than a third of all children attend secondary education. For example, the situation in Tanzania – which was hailed for its universal primary education in the 1970s – has changed since the introduction of school fees in the 1980s as part of the Structural Adjustment Programme. Primary and secondary-school enrolment in the country has dropped significantly. Fewer parents can afford to send their children to school.

Food Self-sufficiency

One of the major effects of the debt crisis is that as Africa has become less and less self-sufficient in food, it has become a dumping ground for heavily subsidised European Union (EU) and US agricultural exports. For example, in Burkina Faso, EU grain is sold for $60 a ton, about a third lower than locally produced equivalents; this low price being guaranteed by a Common Agricultural Policy subsidy of $100 per ton. Likewise, the EU exported 54,000 tons of subsidised maize to Zimbabwe, which then had to sell its own stockpile under World Bank advice at a huge loss, leaving it without any strategic food supplies when it was hit by the 1992 drought. Whilst the EU and the US spend over $20bn annually on subsidising agricultural overproduction and export subsidies, the net effect on Africa is to undermine local agriculture, increase unemployment and increase dependence on food imports. Meanwhile, the environment becomes ever more degraded, mainly because of the increasing use of cash crops as a means of generating export income. Fragile grasslands and forests have been turned over to the growth of timber and cocoa, forcing nomadic herders onto poorer grasslands which have suffered intensified erosion. The result is increasing desertification, further reducing any chance of agricultural self-sufficiency (George 2003).

The Way Forward

There are divergent views on solving the debt situation in Africa. Some argue that the debt should be cancelled and then everything would be fine; African countries would be able to lift themselves out of poverty and misery (Aglietta 1982). Asher (2001), on the other hand, argues that cancelling the debt would solve the situation as the problem for Africa is not just about how much debt is cancelled, or the percentage this debt would represent in terms of total world debt. On the contrary, even though these countries might then be able to spend more money on health, education, and other social programmes,

they would again sink into debt. The African ruling elites are far too weak to develop their countries on their own. Most of the companies that operate in Africa or from whom African countries buy products for their various developmental needs (health, education, agriculture, mining, etc.) are from the imperialist countries. The profits created in Africa do not remain there but return to the banks of the imperialist countries (George 2000).

George (2003) adds that it is also in the interests of the imperialist financial institutions to continue this parasitic relationship and keep the ex-colonial world in perpetual debt. They lend the money and, in return, in the form of interest payments, make billions on their investment. Moreover, cancelling the debt is not going to cause capitalism to collapse, or cause it to seriously reform itself. The developing world's debt is essential for the continuation of international capitalism. It provides the imperialists with cheap resources and labour. The debt crisis also demonstrates that one cannot tinker with capitalism because as long as the means of production remain in the private hands of the capitalists, there will always be poverty and the ex-colonies will remain impoverished and indebted (Aglietta 1982). Others argue that not only must the debt of the developing world be annulled, but the major financial institutions of these countries must be nationalised and put under the democratic control of the working class, creating a harmonious plan of production (Callinicos and Rogers 1980).

However, this essay subscribes to the view that in considering future policy, African countries need to concentrate on those areas of critical importance where concrete action can be achieved. They should keep in mind that their situation in dealing with the imperialist financial creditors is different from that of Latin American debtor countries. The latter have bigger debts which enable them to get the attention of the creditors. They cannot be ignored because default on their part could have serious consequences for the imperialist financial institutions. Latin America is also a major market for some of the Western imperialist countries such as the US. It is this weaker position of African countries which, we

agree, demands that they adopt collective action and approaches if they are to exert any meaningful influence in negotiations with their international creditors (Raffer 2001; Ravenhill 2001).

This essay also argues that in spite of its political and social consequences, the debt crisis in Africa is basically financial, arising from African countries' lack of foreign exchange resources to meet their developmental needs. They desperately require foreign exchange for debt service, imports of the necessary items not locally produced, and for further investment. It therefore follows that for as long as they cannot get debt relief from their creditors, they have the responsibility and capacity to reduce the outflow of foreign exchange resources.

Ndegwa (1990) provides three examples of such outflows where African countries could act to great benefit. They are dealt with separately below.

Cutting Imports Which Could be Produced at Home

African countries, through collective self-reliance, could reduce the import of those goods which Africa can produce internally, especially foodstuffs such as grains and vegetable oils. Paradoxically, some African countries used to export the food items they are now importing. Food production is an area of critical importance for the continent's development and maintenance of its political independence and not just for alleviating the debt problem. African countries need to agree on the collective production and trade arrangements needed. As Haddad (1997) indicates, the problem is not technical so much as political, and the African Union (AU) is currently taking this issue seriously (Jemaneh 2012).

Murison (2003) shows that the debt crisis has resulted in reduction of intra-trade within Africa rather than inducing a sustained effort to promote it. This is due to the fact that in cutting down imports to service debts, African countries have reduced imports from each other more drastically than imports from the industrialised countries. Therefore, without harmonisation, co-operation,

and co-ordination in the 'adjustment' policies and programmes, there will be further reductions of intra-African trade as each country cuts down its imports and hopes to promote its exports to others.

Reducing Military Imports

Foreign exchange outflow could also be reduced through cutting down on military imports. In Africa these account for more than 10% of all imports. In some countries, military imports are more than 20% of the Gross Domestic Product (GDP). Okigbo and Eribo (2004) elaborate that in the 1980s some African countries spent more on military imports than on education and health.

Lowering Capital Flight

As well as dis-investment by foreign investors, capital flight due to economic, social, and political factors is another area of concern in Africa. It is estimated that the continent loses more than US$3 billion a year this way through various forms and mechanisms (e.g. over-invoicing of imports, underinvoicing of exports, smuggling of foreign currencies) undertaken by both foreigners and residents. It is suggested that capital flight can only be minimised through sound economic, social, and political management (Labonate 2004).

This is an area for which African governments should collectively accept that only they themselves are responsible and capable of finding solutions. In this case, realism, courage, and determination are crucial and necessary. The objective should be not only to prevent capital flight, but also to create a stable and conducive investment climate for both external and domestic capital. It is argued that attempts to deal with the problem of capital flight through more laws and exchange-control regulations will not succeed. Indeed, in some cases, a reduction in the number of such controls and regulations could be a significant factor in reducing capital flight and establishing a more favourable environment for inflow of foreign capital (Almounsor 2007).

Conclusion

This essay has shown that just as there are different conceptualisations of the term 'imperialism', so there are also divergent views on the nature and impact of Africa's debt crisis and how to solve it. The discussion has revealed that imperialism and the associated debt crisis are great burdens during Africa's developmental efforts. They affect all sectors of society, bring poverty to the masses, and result in environmental degradation. In spite of the argument that Africa will continue to depend on external assistance for its developmental requirements in the same way that the industrialised countries have done during their process of development, adequate relief measures for Africa's debt crisis are a matter of urgency. This essay propagates the view that in considering future responses, African countries need to concentrate on those areas of critical importance where concrete action can be achieved. In doing so they must realise that solving the existing debt crisis should not be regarded as the final objective but one of the necessary enabling conditions for the continent's economic recovery and sustainable development. The discussion has highlighted the continent's limitations in a world dominated by imperialist financial institutions which are driven by profit and pose grave danger to Africa's socioeconomic and political independence. The essay also argues that despite its political and social ramifications, as in the rest of the developing world, Africa's debt crisis is basically financial, arising from its countries' lack of foreign exchange resources to meet their developmental needs.

However, while they cannot get debt relief from their creditors, African countries and their respective governments have the responsibility and capacity to reduce the outflow of foreign exchange resources which occurs at significant levels in some areas. Through collective self-reliance, they should reduce importing those goods they can produce internally; cut down on unproductive military imports; and show courage and determination in lessening capital flight from the continent and establishing a stable and conducive investment climate for both external and domestic capital.

This essay has also emphasised the necessity for African countries to co-operate and co-ordinate their recovery and developmental efforts. This is based on the argument that by continuing to pursue such efforts individually countries will perpetuate their vulnerability to imperialism and underdevelopment.

Definition/Description

Scholars have defined the term "decolonization" in a number of ways, imparting the word with

various meanings and understandings. On one hand, they have used this word to describe the political process of transition from "colonial dependency to sovereignty" (Strang 1991: 429), while, on the other, it has been described as the "transference of legal sovereignty,... [as well as] a movement for moral justice and political solidarity against imperialism" (Duara 2004: 2). Some have offered more radical definitions like "rejection of the civilization of the white man" (Delavignette, cited in Betts 2012: 23) or "...the replacing of a certain 'species' of men by another 'species' of men....there is a total, complete, and absolute substitution....a whole social structure being changed from bottom up" (Fanon 1963: 33). M.K. Gandhi also had a radical vision in mind when he wrote in the early twentieth century, "English rule without the Englishman. . .. This is not the Swaraj (home rule/self-governance) that I want" (Gandhi 1921). If we take the narrower definition of decolonization – i.e., if we see decolonization as a political process where empires retreat and sovereign nation-states are established – then it is a process that spanned over centuries and across continents. As David Strang wrote in 1991, "beginning with Britain's continental colonies in 1783 and ending with the Caribbean islands of Saint Kitts and Nevis in 1983, 165 colonial dependencies have become new independent states or have been fully incorporated into existing sovereign states" (Strang 1991: 429). The process is probably not yet over as the world still has 16 "non-self-governing territories" (Betts 2012: 26). But it is generally accepted that the high ("core") period of decolonization was the twentieth century – more specifically, the three decades that followed the Second World War (ibid: 25; Duara 2004: 1). Moreover, scholars do agree that despite being a global phenomenon, decolonization as a process is shaped by historical specificities of different regions. Even within the same region, decolonization is experienced diversely by people of different gender, race, religion, class, and so on. The existing literature does not offer any single explanation behind the reasons of decolonization, particularly why so many erstwhile colonies in Asia and Africa witnessed the transfer of power within a

short span of few decades in the middle of the twentieth century. The postwar economic crisis in colonizing countries of Europe, changing pattern of international politics in the Cold War era, world opinion favoring the end of colonial rule, metropolitan public opinion no longer favoring the maintenance of the colonies, and, of course, the anti-imperialist struggle in the colonies are given importance – in different degrees by different authors.

Introduction

What today is known as South Asia had been attracting European traders and rulers since the sixteenth century. Over four centuries different parts of this region became the colonies of the Netherlands, Denmark-Norway, Portugal, France, and Great Britain. While the Dutch and the Danish rulers could not hold on to their territorial possessions in this region beyond the middle of the nineteenth century, the French, the Portuguese, and the British retained their colonies in South Asia for another 100 years. This article focuses on these three cases as it discusses the process of decolonization in South Asia. In terms of its sheer size, resources, and power, the British Empire was the most important colonizing force in South Asia. It spread across present-day India, Pakistan, Bangladesh, Sri Lanka, and Myanmar. Hence, while discussing the decolonization process in South Asia, the dismantling of the British Empire will receive the primary attention.

Decolonization of the British Indian Empire

Nehru's India

Decolonization of British India became an immensely complex process due to partition and the creation of two separate nation-states – India and Pakistan. Religion was the primary basis of this division as Muslim majority areas in the western and the eastern sides of British India were separated to form two wings of Pakistan (East Pakistan and West Pakistan). There is an extensive

body of work that explains the causes behind partition. Colonial policies and perceptions toward different communities within the Indian society, social movements from within the Hindu and the Muslim communities, economic grievances, a sense of relative deprivation among the educated Muslims in comparison to their Hindu counterparts, increasing political rivalry between the two communities, and the reluctance of the Indian National Congress to accommodate the political demands of the Muslim produced a sharp sense of religious identity and that of mutual antagonism which gained momentum in the late 1930s–early 1940s and led to the partition of British India (Roy, A. 1990, Roy, H. 2018: 16–56).

A Boundary Commission, chaired by a British lawyer Sir Cyril Radcliffe, was given little more than a month to draw the line that would separate India and Pakistan. Partition was accompanied by intense communal violence and massive mass migration. Partition violence can be dated back to the notorious "Great Calcutta Killings" of August 1946. On August 16, when the Muslim League called for a "Direct Action Day" in demand of separate homeland, violence engulfed Calcutta (Kolkata). From Calcutta, riots would spread to Noakhali in Eastern Bengal where Hindus would be targeted, then to Bihar where Muslims would suffer in larger number, and finally to Punjab, Delhi, and Sind, killing innumerable Hindus, Muslims, and Sikhs. These riots killed 200,000 to 1 million people (Roy 2018: 3). Women were particularly vulnerable as many thousands of them were molested, raped, and abducted by men of other faiths (Butalia 1993; Menon and Bhasin 1993). To escape the riots, people fled to areas where their co-religionists were more numerous. In some areas, Dalits were initially less affected by partition violence as the Scheduled Castes Federation (an important Dalit political party) had supported the Pakistan demand and their leader from Bengal, Jogendra Nath Mandal, had joined the Pakistan cabinet after partition (Rawat 2001: 111–139; Sengupta 2017). But many among them migrated in search of better economic opportunities, in fear of conversion, and as and when their religious

identity overshadowed their caste identity (Bandyopadhyay and Basu Ray Chaudhury 2014). Though Muhammad Ali Jinnah, the first president of Pakistan and the undisputed leader of the Pakistan Movement, and Jawaharlal Nehru (India's first prime minister) promised to safeguard the rights and interests of the religious minorities in their respective countries, violence continued and so did migration. Between 1946 and 1965, around 5 million Muslims left India for Pakistan, and approximately 9 million Hindus and Sikhs did the reverse trek (Roy 2018: 3). The migration pattern between West Pakistan and India was very different from that of East Pakistan and India. The governments of India and Pakistan jointly carried out the process of evacuating Hindus and Sikhs from Pakistan's Punjab and Muslims from Indian Punjab. Consequently, there was almost a total transfer of population within a short span of time. But migration between East Pakistan and India, discouraged on paper by the concerned governments yet caused by routine communal clashes, bureaucratic apathy, and economic difficulties, continued for decades after partition. The communal violence and the mass migration of people destabilized the subcontinent in innumerable ways and made the process of nation-state building immensely difficult for both India and Pakistan.

Rehabilitating the millions of refugees was the first challenge that India and Pakistan faced. In Indian Punjab the task was relatively easy because of the availability of sufficient amount of properties left behind by the Muslim migrants (Tan and Kudaisya 2000: 125–140). Punjab, however, was an exception as the total transfer of population had provided a "clean slate" to the policy makers here. West Bengal, on the other hand, had received 4.26 million of displaced people till 1962 (Chatterji 2007: 998) and did not have adequate land to accommodate them all. Consequently, thousands of refugees (particularly those who were low caste and were assumed to be used to hard manual work) were sent off from this province to the scarcely populated islands of Andaman and the forested terrain of Central India throughout the 1950s and 1960s. Known as the policy of "dispersal," it was supposed to serve three purposes –

(a) reducing the "demographic pressure" from West Bengal, (b) making the refugees "useful," and (c) reclaiming resources and wasteland in remote areas. The refugees were supposed to till the land, build roads, dig canals and wells, and work in industries to be set up by the government. One may mention here that the rationale behind this policy of sending "laborers" to sparsely populated areas and to reclaim wastelands was nothing new as we can trace colonial antecedents in this (Sen 2018a; Gidwani 1992). The dispersal scheme was hugely celebrated in the official discourse as it was seen as the ideal way of linking rehabilitation with the "developmental" needs of the Indian nation-state (Sen 2018b: 71–112).

"Development" was the buzzword of the early postcolonial India. The idea that India "needed" to "develop" had been prevalent since the British rule (Roy 2007: 107–111). But what constituted "development" in material terms and how to achieve it had no single answer. For instance, M. K. Gandhi's *swaraj* and Nehru's vision of modern India had very little in common (Mukherjee 2009). Nevertheless, by the time India had achieved independence, the dominant discourses around the meanings and modes of development had acquired certain common features. As identified by Benjamin Zachariah, in this discourse: claims to 'socialism' – or to some social concern for the poor and downtrodden – were obligatory.... Also invoked were 'science', technology and technical expertise as ways of achieving 'modern' social and economic goals.... To achieve these goals, a good deal of 'national discipline' was required, and the masses were to have to make some sacrifices in the short term, or in the 'transitional period'. And lastly, all solutions to social, economic or political problems had to conform to 'indigenous' values... (Zachariah 2016: 201). In a country ridden with communalism, the Nehruvian elite assumed that the emphasis on "development" could distract people from sectarian nationalism (Zachariah 2012). When Nehru described the big dams as the temples of modern India, he definitely indicated that the spirit of "development" could and should replace religious nationalism in India. This "developmentalist imagination" of Nehruvian time had two distinct components: an interventionist state which would steer the nation

on the way of development and an enthusiastic, disciplined, hardworking people eager to help the state in this developmental journey (Roy 2007: 105–132). Agitational politics and mass demonstrations – be it in the name of religion, language, region, or basic human needs – was seen as a deterrent to India's attempts to "develop." What was legitimate and celebrated form of popular politics to the Indian National Congress in the colonial period became "hooliganism" in the eyes of the national state (Chakrabarty 2007: 35–57).

The Curious Case of Pakistan and the Making of Bangladesh

Pakistan, when created in 1947, was "uniquely experimental" (van Schendel 2009: 107) for more than one reason. Imagined as a Muslim homeland, Pakistan – like Israel, which would be created in 1948 – was a political idea that was defined by religion (Devji 2013). The territorial shape that this idea took made Pakistan's case even more exceptional. It had two parts – East Pakistan and West Pakistan – separated by more than 1000 KMs of Indian land.

From the beginning it was not a smooth sailing for Pakistan. Though attempts were made toward an equitable distribution of assets and liabilities of the British Indian Empire between India and Pakistan (Sengupta 2014), in many ways, the former was the real heir of the colonial India. For instance, only around 80 of 1400 individuals, who manned the Indian Civil Service before 1947, opted to serve the Government of Pakistan (Cohen 2012: 41). Delhi – the capital of British India – became the capital of India as well. Major port cities, commercial centers, and administrative hubs like Bombay (Mumbai) and Calcutta (Kolkata) fell within India. Karachi – a provincial capital since the late 1930s – had to become the capital of Pakistan almost overnight. It did not have the necessary infrastructure to house the administration and the ruling elite of the country (Tan and Kudaisya 2000: 179–186). The condition of Dacca (Dhaka), the capital of East Pakistan, was perhaps worse. A sleepy town spreading across 7.8 miles[2], Dacca neither had a commercial bank nor a cantonment. Apart from a good university, a handful of small industries, and an urban heritage that dated back to the

Mughal era, Dacca had no resources that could distinguish her from other mufassil towns of Bengal (ibid: 165–172).

Pakistan did receive some of the most fertile raw material-producing regions. For instance, 75% of the world's jute-producing areas fell in East Pakistan, whereas West Pakistan was one of the top cotton-producing regions of the world (Begum 1950). But East Pakistan, at the time of partition, did not have a single jute mill and was almost entirely dependent on the Calcutta port for exporting her raw jute. On the other hand, out of more than 400 cotton mills of British India, only 11 fell within the borders of West Pakistan (ibid: 166). It was evident that both the wings of Pakistan needed immediate and rapid infrastructural development and industrialization for effective governance and to develop a self-sufficient national economy. However, in two decades that followed the creation of Pakistan, the development in the western wing outpaced that of the eastern wing largely because of the governmental policies. The government allocated less than 25% of its annual budget for East Pakistan, though it was more populous than the West; education and communication improved in the West far more rapidly than in the East; and the richest Pakistanis were all in West Pakistan (van Schendel 2009: 135–36). This uneven development, not surprisingly, became a reason for contestation between the two wings. But the fault lines between East and West Pakistan first became apparent around the question of national language.

For many Bengali Muslim intellectuals, Pakistan was an expression of their cultural autonomy. For long, they had complained that the Bengali Hindu writers had never tried to represent the Muslim world of Bengal, the language that Bengali Muslims spoke, their culture, and tradition. What went in the name of Bengali language and Bengali literature was the creation of the upper caste Bengali Hindus, where Muslims were either totally absent or were portrayed in negative ways. When the Pakistan Movement began to gain currency, Calcutta-based Bengali Muslim intellectuals formed the East Pakistan Renaissance Society to give this movement a literary and cultural connotation. Their aim was to develop a new Bengali literature for the future Pakistan, a literature that would not imitate the writing styles of the Hindu writers of Bengal. For many educated Bengali Muslims, their participation in the Pakistan Movement was shaped by the coupling of linguistic, regional, and religious identities. From the early days of East Pakistan, many of them became involved in various projects to "de-sansrikritize" Bengali (Shamsuddin 2001: 250–251). This passion, zeal, and enthusiasm of Bengali Muslim intellectuals, now mostly based in Dacca, received a jolt when in late November 1947, Urdu was proposed as the sole national language of Pakistan. Most of them vehemently opposed it. The students of the University of Dacca took out processions and staged demonstrations against this proposal and thus began the political mobilization around language in East Pakistan. In the coming years, the Language Movement escalated steadily. The ruling elite of Karachi/Islamabad and their allies in Dacca made every attempt to curb it by invoking Islam, by portraying Urdu as the only suitable language for the Muslims, and by blaming the "outsiders" (by which they meant India as well as the educated Hindu minorities of East Pakistan) for the agitations. But this complex clash of identities (linguistic/religious/regional) and the consequent production of "hyphenated citizens" (Pandey 1999) (like Bengali Muslims/Bihari Muslims) indicate how "clumsy, complicated and inherently incomplete" (Chakrabarty et al. 2007: 3) the transfer of power was in the Indian subcontinent. The tension between East and West finally culminated into a bloody civil war (known as *Muktijuddho* or the War of Liberation in the nationalist discourse of Bangladesh), and East Pakistan became Bangladesh, a sovereign nation-state in 1971 (Saikia 2004; Alamgir and D'Costa 2011; Bose 2012).

When troubles were brewing over linguistic, regional, and religious identities in East Pakistan, similar fissures were becoming apparent in the political life of West Pakistan as well. In the early years of Pakistan, the government, bureaucracy, and economy were dominated by the refugees (*Muhajirs*) – particularly those who had migrated from various urban centers of northern India. Many of them were highly educated and were proficient in Urdu. (*Muhajir* is a person who accompanied the Prophet Muhammad in his

emigration from Mecca to Medina in 622. The partition refugees from India to Pakistan were generally termed as *Muhajir* in official discourse as well as in common parlance.) They were most visible in the province of Sindh and the capital city Karachi, located in that province. The dominance of one particular group antagonized others, namely, the Punjabis (who had significantly high presence in the military), the Sindhis, and the Pathans. The tension between *Muhajirs* and these groups remained somewhat subdued till the late 1950s. But as Ayub Khan usurped power (he was made chief martial law administrator in 1958 and became the president in 1960), the rifts became apparent. One of the first things that he did was to shift the capital from *Muhajir*-dominated Karachi to Rawalpindi and then to the newly built city of Islamabad. This would be later translated as a calculated move to marginalize the *Muhajirs* in Pakistan's polity, economy, and society. To add to this, the constitution that Ayub introduced seemingly disenfranchised the *Muhajir* through electoral reforms and by the introduction of a complex reservation system (Rehman 1994: 120). The sense of "relative deprivation" among the *Muhajirs* (Haq 1995: 993) would culminate into violent clashes in Karachi and Hyderabad and the formation of "Muttahida Qaumi Movement" (MQM, initially it was called Muhajir Qaumi Movement) in the mid-1980s. In other words, decolonization with partition produced new minorities and new conflicts across the Indian subcontinent. Even after 70 years, as many of these conflicts remain unresolved, people and politics of India, Pakistan, and Bangladesh are rooted in "partitioned times" (Samaddar 2003: 21). Two examples will elaborate this point: the "problem" of the "Bihari Muslims" in Bangladesh and the ongoing Kashmir conflict.

The Incomplete Business of Partition and Decolonization in the Subcontinent: The Kashmir Issue and the Citizenship Question of the "Bihari Muslims"

Ruled by a Hindu king yet mostly populated by Muslim subjects, Jammu and Kashmir (hereafter mentioned as Kashmir) was one among some 550 princely states that existed within the British Indian Empire. The princely states shared a complex legal relationship with the British Crown. They were technically independent and enjoyed varied degrees of autonomy, yet they were under the British paramountcy. What would be the status of these states of various shapes and sizes in postcolonial South Asia became an important question in 1947. Despite some initial resistance, most of these kingdoms were coerced and cajoled by Vallabhbhai Patel (the first deputy prime minister of independent India) and V.P. Menon (secretary, Ministry of State, Government of India) to join India. As a result, India gained 500,000 miles^2 of territory which more than compensated the loss of 364,737 miles^2 due to partition and the creation of Pakistan (Kudaisya 2017: 47). The nawabs and the maharajas were allowed to retain their titles, privileges, and personal properties and were promised a hefty annual monetary allowance by the Government of India. Often described as a "bloodless revolution" in the nationalist histories written in India, the "integration" of the princely states is projected as a moment of glory for the Indian nation-state, when the subjects of these states became the right-bearing citizens of a democratic country. However, some recent historical writings on the modes of annexing the princely states of Hyderabad (Sherman 2007) and Junagadh (Ankit 2016) by the Indian government have challenged this nationalist discourse of non-violent and voluntary annexation. But more than Hyderabad and Junagadh, it is in Kashmir where this nationalist narrative of "bloodless revolution" gets spectacularly challenged till this day.

Hari Singh, the Hindu ruler of Kashmir, did not join either Pakistan or India as he cherished a dream of independent Kashmir. As a Hindu ruler, joining Pakistan was not appealing to him, and his bitter relations with the Indian National Congress made him wary of a future in India (Guha 2007: 59–64). Singh offered to sign a "standstill agreement" with India and Pakistan on August 14–15 (1947) to ensure that the transfer of power and the creation of India and Pakistan did not affect the economy of his territory. His dream, as one of his ministers noted in early October of 1947, was "to make Kashmir the Switzerland of

the East – a State that is completely neutral" (cited in Guha 2007: 64). By the end of that very month, however, it became clear that his dreams were not going to materialize anytime soon. A significant number of his subjects had different aspirations for Kashmir. The district of Poonch, situated in the west of Srinagar, witnessed a revolt against Hari Singh's regime and a strong demand in favor of merging with Pakistan. On the other hand, there was Sheikh Abdullah, the most prominent opposition of Hari Singh and a very close friend of Nehru, who had been demanding the end of princely rule in Kashmir and the establishment of a popular government which would "then decide whether the State should join India or Pakistan" (ibid: 63). The situation went out of Hari Singh's control when several thousands of armed Pathan tribesmen invaded the valley from the north. Several questions about this invasion do not have definite answers as the narratives that are spun in India and Pakistan widely differ from each other. For instance, it is not clear whether the Pathans came on their own or were they sent by the Pakistan government, whether they came as and when the news of Poonch reached them, or was it an invasion that was being planned independently. But they moved swiftly toward Srinagar forcing the king to flee to Jammu and also to seek help from India. India agreed to help but only after the *Maharaja* had signed the Instrument of Accession. But it was supposed to be a temporary accession, and the Indian government promised to hold a plebiscite to allow the common people of Kashmir to determine whether they wanted the valley to be a part of Pakistan, India, or none of the either. Moreover, by the Article 370 of the Indian Constitution, Kashmir was given a special status where "the Indian Parliament's legislative powers in Kashmir were limited to the three areas specified during the state's accession, namely defence, foreign affairs and communication. In all other matters, the state was to be governed by its own constitution" (Kudaisya 2017: 54). The accession was followed by reorganization of the administration of Kashmir with Sheikh Abdullah becoming the head of the interim government and Hari Singh

becoming a constitutional head of the state. The accession also ensured the immediate presence of the Indian forces in the valley. As they fought the tribesmen and the local rebels, Pakistan also sent her forces to combat the Indian Army, and a full-fledged war was fought between the two countries. It ended with an UN-negotiated ceasefire, but by then 5100 miles^2 of territory had been "liberated" by Pakistan from the Indian forces.

Since 1948, Kashmir has remained the trouble spot of South Asia. Despite the insistence of Pakistan and the UN, India did not conduct the promised plebiscite. India and Pakistan have already fought three wars over Kashmir (1947–1948, 1965, and 1999), and armed border skirmishes are routine affairs in the valley. Because of the "security" issues and the "strategic" location of Kashmir (with borders with China, Afghanistan, and Pakistan), the Indian Armed Forces are given extraordinary power with absolute impunity. They have been accused of gross human rights violation by the ordinary Kashmiris, the activists and social workers working in the valley, and the international press. Article 370, though irk the right-wing political parties of India, has provided no relief to the people of Kashmir on the face of the brutal military oppression. On the other hand, the valley has witnessed a steady rise of armed militant groups – a few of which adhere to Islamic extremism and many of them receive financial and other supports from Pakistan. Kashmir seems to be trapped in a never-ending circle of violence perpetuated by the Indian forces and the armed militants, each justifying the other's presence and actions. Kashmir remains in perpetual shadow of partition as "Kashmiris were a people who were 'bargained' into Indian/Pakistani nationhood when the British left the region" (Kaul 2010–2011: 43). In many ways the colonial rule has begun in this part of South Asia when the British rule ended in the subcontinent (ibid: 49). To borrow the words of Dipesh Chakrabarty, written in a different context, Kashmir "highlights the colonizing tendencies that an anti-colonial nationalism may also display as it mutates into official nationalism with the assumption of power by the nationalists" (Chakrabarty et al. 2007: 7).

D

"Bihari Muslims," also termed as the "stranded Pakistanis," are those whose ancestors had fled from Bihar to Eastern Bengal (the region that would become East Pakistan) during the riots of 1946 or at the time of partition. They were mostly poor and less educated who worked as mechanic, shopkeepers, mill workers, etc. in East Pakistan. Many of them had also joined the railways. Known as *Muhajirs* during the Pakistan period, these Urdu-speaking Muslims had very little sympathy for the Bengali nationalist movement and assisted the Pakistan army and the Pakistani militia during the Liberation War. When Bangladesh became an independent nation-state, violence was unleashed on them. They were killed, their properties were looted, and many women of the community were raped. The camps opened by the Red Cross across the country became their refuge from the ongoing violence (Haider 2016: 429). From then on, they became the subjects of complex international negotiations. Through the International Committee of the Red Cross, as many as 534,792 "Bihari Muslims" asked for resettlement in Pakistan (Ghosh 2008: 169). In a tripartite discussion in New Delhi (August 28, 1973), Pakistan agreed to take a "substantial number of non-Bengalis (who are stated to have opted for repatriation to Pakistan) from Bangladesh" (Farzana 2009: 225). In an accompanying memorandum, Pakistan added that it was willing to take "all those individuals having a permanent residents in West Pakistan (people who may have gone over to East Pakistan temporarily), all employees of the federal government and their families, and a small number of hardship cases (meaning orphans, widows and others who had no immediate relatives in Bangladesh)" (ibid). Moreover, the members of the divided families, irrespective of their domiciles, would be accepted by the country. In another agreement between the three countries, the decisions were reiterated (April 1974). Despite these agreements, the successive governments in Pakistan have been reluctant to act upon it. The repatriation process virtually stopped since the mid-1990s. Apart from MQM, no other political party was enthusiastic about the coming of the "Bihari Muslims." According to a 2016 article, "a total of 178,069 Biharis legally returned to Pakistan out of 534,792 who opted for repatriation through the ICRC. An estimated 100,000 Biharis have moved to Pakistan illegally through India, Nepal, and Burma and approximately, 250,000–300,000 are still staying in Bangladesh. They live in 116 camps across the country" (Haider 2016: 430). The conditions of these camps are deplorable with no privacy for the residents, extremely poor sanitary provisions, inadequate health, and educational facilities (ibid: 432–437). The abovementioned study also showed that only 13% of his respondents still wanted to be repatriated to Pakistan. The rest of the respondents wanted an end to the woes of camp life and resettlement in Bangladesh (ibid: 438). Though according to the court rulings, "Bihari Muslims" are now entitled to Bangladeshi citizenship, they are still de facto stateless as most of them have no access to the rights and entitlements associated with Bangladeshi citizenship (ibid).

Decolonization of Sri Lanka and Burma

An island across the Palk Strait in the south of India, Sri Lanka (Ceylon) had a long history of encounter with the colonial powers. It had a Portuguese past that began in the early sixteenth century and lasted for more than 100 years. The Portuguese power was replaced by the Dutch East India Company, and by the end of the eighteenth century, the British replaced the Dutch. Ceylon remained a British colony till February 4, 1948. Sri Lanka's experiences with the British colonial rule and the process of decolonization were drastically different from that of British India. Sometimes described as a "model colony" (Kumarasingham 2016: 377), this island did not witness any widespread popular uprising against the colonial regime, it had significantly better standard of living, and all the adult inhabitants enjoyed voting rights since 1931. The transition from the colonial regime to the national government was smooth, and Sri Lanka became independent without getting involved in any serious conflict with its colonial masters. The colonial period and the moment of transition did not witness communal clashes either, though the

population of the island was not homogeneous in terms of religion or language. But in less than a decade, the island emerged as the site of intense ethnic conflict between the Sinhalese (mostly Buddhist and constituting the majority of the population) and the Tamils (the minority, mostly Hindus). The roots of this fissure between the Sinhalese and the Tamils could be traced back to the peculiarities of the colonial experiences of Sri Lanka.

The Donoughmore Commission that recommended universal adult suffrage for Sri Lanka in 1931 made no provision for separate electorate or reservations for the minorities of the country. Rather, the existing communal electorates were replaced with a 58-member legislature where only 8 were to be nominated by the governor to "speak for interests otherwise unrepresented" (Kumarasingham 2006: 346). Not surprisingly, this apparently radical electoral reform irked the minorities of the island. The Tamil elites, who had till then enjoyed prominence and some influence in the legislative assembly and within the Ceylon National Congress, were particularly threatened by this move. As Kumarasingham writes, "The new democratic structure thus extensively reduced the influence and numbers of Tamils in the Congress elite and in politics as a whole, removing them from the centre of political leadership. With all positions on the Board of Ministers in the first State Council 1931–36 occupied entirely by Sinhalese, the fears of the Tamil community seemed to be realised" (Ibid: 348). Consequently, Sri Lanka witnessed mushrooming of numerous political parties organized around religion, language, and ethnicity (Kumarasingham 2016: 384). The Soulbury Commission, which was formed by the British government to chalk out the modes of decolonization in Sri Lanka, also did not introduce any significant measure to ensure higher representation of the minorities in the legislature. Therefore, though an independent and democratic Ceylon was created in 1948, it lacked "the constitutional, institutional and social infrastructure" required to govern a multiethnic community (Kumarasingham 2006: 350).

Despite the palpable tension between various groups, most importantly between the Sinhalese

and the Tamils, the first few years after independence was peaceful for Sri Lanka. But the politics of the island would operate around narrow ethnonationalism was quite clear from the very beginning. For instance, the Ceylon Citizenship Act (1948) did not give citizenship rights to the "estate Tamils" (i.e., those who had migrated from India in the nineteenth century as plantation laborers), who formed 12% of the population of the island. But it was in 1956, with the passing of the controversial "Sinhala Only Act" (Official Language Act No. 33 of 1956), the tension between these two communities came on the surface. According to this Act, Sinhalese replaced English as the official language of Sri Lanka, and no such recognition was given to Tamil. This was a watershed moment for the Sri Lankan polity and triggered widespread protests from the Tamil community. When Prime Minister S.W.R.D Bandaranaike tried to amend this act to appease the Tamil protesters, he faced massive backlash from the Sinhalese. The stage for communal riots and civil wars between the two communities were set. The year of 1958 would witness the first major anti-Tamil riot in Sri Lanka, and from then on, the island would remain perpetually volatile. As James Manor has argued, the absence of any popular support of the Colombo-based ruling elite also made them play the sectarian card and prevented any serious attempt of reconciliation (Manor 1979: 21–46).

On the other hand, though Burma was a part of the British Indian Empire for a long time, today it is associated with the countries comprising the category of Southeast Asia. In that sense, the decolonization process of Burma is more intimately connected with the political scenario of these countries than those of South Asia. Therefore, a very brief account of the events leading to the decolonization of this country will be provided here. Burma became a separate entity from India with the passing of the Government of Burma Act in 1935. With the outbreak of the Second World War, the Burmese nationalists tried to negotiate with the British for complete independence after the War in return for their support to the Allied powers. When they did not get any positive response, they looked to the East for a Japanese

assurance. Soon, Burma became the battleground between Britain and Japan, causing much distress to the common Burmese people. Japan held Burma from 1942 to 1945. The period of parliamentarianism (1937–1942) and "independence" under the Japanese can be viewed as "part of a single period in which unique circumstances allowed the Burmese to gain fluctuating degrees of independence and experiment with different models of government and political control" (Charney 2009: 46). British Army recaptured Burma in 1945. However, Britain was reluctant to grant independence. The celebrated leader, Aung San, "began a constitutional struggle, demanding the creation of an interim representative government with full powers over the affairs of the colony" (Ibid: 61). The election of a labor government in Britain, Aung San's assassination by political rivals, and growing discontent in Burma made certain that the British had to relinquish their colony. Finally, with the signing of the Anglo-Burmese Treaty on October 18, 1947, the Burma Independence Act was approved by the Parliament, and Burma became independent on January 4, 1948. Being a multiethnic region where the leaders of different communities had come together to form the Union of Burma only after ensuring autonomy in internal administration for the frontier regions (Panglong Agreement 1947), the idea of one nation was not a deep-rooted one in independent Burma among the various minority groups. From the beginning ethnic conflicts and insurgency problems were prevalent in this region (Kipgen 2011). The last phase of colonial Burma (1937–1947) witnessed the demise of the strong nationalist leaders which also proved disastrous for the independent nation-state, as in the absence of these leaders, "their lieutenants would lead Burma headlong into one of the world's longest civil wars" (Charney: 71).

Decolonizing the French Indian Empire and the Portuguese Indian Empire

Since the middle of the seventeenth century, French East India Company attempted to gain foothold in the Indian subcontinent. Like their British counterpart, their initial interest was limited to commercial activities. By the middle of the eighteenth century, however, French territorial interests in this part of the world became significant, and clashes with the British East India Company became inevitable. The series of Anglo-French wars fought in the southern and eastern India stunted the French ambitions. But the French Government managed to retain five enclaves till the 1950s – namely, Chandernagore (now Chandannagar in West Bengal), Pondicherry (Puducherry), Karikal and Yanam in Coromandel Coast, and Mahe in Malabar Coast.

With the end of the British Indian Empire, questions were raised about the future of the French Indian enclaves. On June 9, 1948, an agreement was signed between the Governments of India and France for holding a referendum to decide the future of these territories. A plebiscite followed, and the response was overwhelmingly in favor of merger with India. However, it is interesting to note that 38% adults of Chandernagore chose to abstain. Unlike Chandernagore, no plebiscite was held in other four enclaves. Lawlessness and petty violence were the reasons cited by the Indian government against holding a popular referendum (Namakkal 2017). Instead of that, the elected representatives of French India met on October 18, 1954, to vote in favor or against the proposed merger with India. The decision of this vote was in India's favor, and from November that year, these territories were under the de facto rule of the Indian government. The nationalist historiography has presented the merger of French territories with India as an inevitable act. The recent scholarship, however, has shown that despite being scattered and surrounded by the Indian territories, there were no unanimous demands for merger with India from the inhabitants of these enclaves. Several other possibilities were imagined and articulated including autonomy within the French Union and independence from both India and France. Between 1947 and 1954, there were 7 years of uncertainties and possibilities in these four enclaves. The setback of French power in

Indochina and the changing contours of internal politics of these enclaves finally led to the merger (Yechury 2015). As the French power withdrew from the subcontinent, the inhabitants of the erstwhile French colonies were given the option to retain the French citizenship. Since the Indian Constitution does not have the provision for dual citizenship, one could only become either French or Indian. In the erstwhile French territories of southern India, many opted for French citizenship that ensured numerous welfare benefits offered by the French Government (Miles 1992).

Portuguese India, encompassing almost 1500 miles^2 of territory, outlived the British and the French empires in the subcontinent. Portuguese presence in the peninsular India can be dated back to 1498. But it was Alfonso de Albuquerque who established the real foundation of Portuguese power by taking over Goa from the Sultan of Bijapur in 1510. Within another 50 years, Portuguese control extended to Diu and Daman. Portuguese control in these territories remained for little less than four centuries. After 14 years of diplomatic negotiations, followed by a reluctant yet controversial military intervention (Singhal 1962), the postcolonial Indian State managed to establish its control over these territories in December 1961.

Similar to that of the French Indian territories, for the residents of Portuguese India, merger was not the only possible option. Some people opposed merger and preferred an autonomous Goa under the Portuguese rule. There were also those who wanted independence from both Portugal and India. Nonetheless, the pro-merger voices were the most audible ones from the mid-1940s. Depending on their political and ideological orientations, they chose between Gandhian *satyagraha* and revolutionary methods to liberate Goa. The Portuguese Government was not yet ready to let the possessions go and tried to mobilize the international opinion against India, who allegedly was supporting this movement. The Nehru Government, on the other hand, was hesitant to engage militarily against Portugal – a NATO member. But failed diplomatic missions and mounting pressure from various political parties within and outside Portuguese India pushed for a military intervention.

Once the Portuguese power withdrew from Goa, Daman, and Diu, the neighboring states made claims over these territories citing linguistic affinity and territorial contiguity. While Maharashtra demanded Goa, pointing out the significant presence of Marathi-speaking population there, Gujarat laid a claim on Daman and Diu. Such claims were contested by invoking their unique Portuguese past and by citing the large presence of Konkani-speaking people. Goa, in 1987, was declared as the 25th state within India, and Daman-Diu is recognized as a separate union territory within India (for an overview of the political developments in Goa between 1960s and 1980s see Rubinoff 1992).

Concluding Remarks

The above discussion provided an overview of the process of decolonization in South Asia. As it indicated, decolonization here was not an event, rather a "long drawn out process of political transition" (Bandyopadhyay 2016: 2) that began in the colonial period itself through the negotiations between the indigenous elite and the ruling elite, and its ramifications continue to affect the polities of several South Asian countries. Therefore it is important to remember that contrary to the visions of Gandhi or Fanon, the actual moment of the transfer of power did not mean a moment of rupture for the South Asian societal and political structures. There were certain obvious continuities in terms of institutions and people. In postcolonial Sri Lanka, for instance, the Soulbury Constitution provided the legal framework for governance. In the Indian case, the Government of India Act 1935 provided the basis of the constitution to a large extent. The structure of the civil service of British India was retained intact in the successor states after August 14–15, 1947. The transfer of power did not mean a new set of bureaucrats or new faces in police. The same men were there, only now they were serving a new government. They were often accused of treating the citizens as subjects – with the same

brutality and disdain that they were notorious for during the colonial rule (Kamal 2007: 210–217; Das 2001: 7–8). Some of the British men also opted to remain in service under the national governments. The presence of men like Lord Mountbatten, the last viceroy of colonial India who became the first governor general of India, and Lord Soulbury, who was a minister in colonial Ceylon and became the governor general of independent Sri Lanka (1949–1954), was also a symbol of continuity between the colonial and the postcolonial regimes (Kamtekar 1999: 50). Despite certain obvious elements of continuity, to many people who experienced the formal transfer of power, it was a moment of rupture. A few historical studies have meticulously detailed the celebrations and festivities that took place across the Indian subcontinent on August 14–15, 1947 (Bandyopadhyay 2012; Kudaisya 2017: 1–8; Guha 2007: 3–11). In some instances, it was orchestrated "from above" by the local political elites. But people did not necessarily follow the script, giving the celebrations spontaneity. Of course, it was not a "common experience" (Chatterjee 2004: 12). People understood, experienced, and narrated the moment differently. For many, who became a minority or a refugee, it was a moment of mourning, yet a new beginning.

That the transfer of power could provide a space for new beginnings inspired the ruling elites, the policy makers, the scientists, the historians, and the literary minds in taking up fresh projects, formulating policies, and in planning new collaborations. For instance, Romila Thapar, perhaps the most important historian of ancient India, took up the responsibility of writing history textbook for school children as to her it was a "national cause." In her words, ". . .the notion of a national cause was very strong. My generation had been imprinted with the nationalism of the forties and early fifties. Its essential characteristic was the sense of enthusiasm that we were involved in the building of a nation and could therefore move away from conventions to some degree so as to encourage the implanting of new ideas. It was from this perspective that I agreed to write a textbook. . ." (Thapar 2009: 88). The rationale for such a project was clear: "We were

distancing our history from that written under imperial auspices - the writing of historians such as Vincent Smith, Edward John Thompson, Geoffrey Garratt and Hugh Rawlinson, or even their Indian counterparts" (ibid: 89). Thus, decolonization – in the radical sense – seemed possible and desirable at this moment. The transfer of power from colonial to a national government had made this moment possible. Decolonization in South Asia coincided with the beginning of the Cold War. As the global political order became bipolar, a wider Third World Network – neither aligned to the United States nor to Soviet Union – was conceived advocating mutual cooperation, end of colonial rule, noninterference, and nonaggression. Known as Non-Aligned Movement, it witnessed positive response from the newly independent countries of Asia and Africa. India played a leading role and Sri Lanka participated from the beginning. The formation of a Third World Network and the hope that it would play a crucial role in maintaining world peace was made possible only because the transfer of power was perceived as a break which had radical possibilities. More evidence can be put together to argue that decolonization was a moment of rupture or the reverse – i.e., a process ensuring continuity. Both these perspectives are true, and as has recently been argued, "decolonization in South Asia . . . was a complex and diverse process of continuity and change, fraught with multiple alternative possibilities" (Bandyopadhyay 2016: 19).

Dollar Diplomacy

Dollar Diplomacy: Roosevelt to Taft 1890–1913

Stacy Warner Maddern
Urban and Community Studies, University of Connecticut, Storrs, CT, USA

Synonyms

Capital export; Dollar diplomacy; Imperialism; Informal imperialism; Theodore Roosevelt; US foreign policy; William Howard Taft

Definition

This essay explores what is known as the 'dollar diplomacy' of the United States between the presidencies of Theodore Roosevelt and William Howard Taft. Dollar diplomacy was a US foreign policy designed to further US economic interests in South America and East Asia by means of loans made to countries therein, as opposed to the use of military force. By the 1890s, at the forefront of those pushing for an aggressive American policy abroad were various industrial leaders who feared that the US would soon produce more than it could consume. New dependent states could provide markets for these surplus goods, while also securing the supply of raw materials necessary to burgeoning US industry. In 1912,

President William Howard Taft claimed that his administration 'sought to respond to modern ideas of commercial intercourse' and that such 'policy has been characterized as substituting dollars for bullets'. Taft's remarks gave formal definition to the term 'dollar diplomacy', a phrase synonymous with the diplomacy his administration pursued between 1909 and 1913. Dollar diplomacy would serve diplomatic means in turning the US into a commercial and financial world power. The export of capital to provide economic stimulus was revived through the Washington Consensus and again by the North American Free Trade Agreement (NAFTA) in the 1980s and 1990s.

By the 1890s, many US leaders had begun to have new attitudes toward imperialistic adventures abroad. The reasons for this were numerous. At the forefront of those pushing for an aggressive American policy abroad were various industrial leaders who feared that the US would soon produce more than it could ever consume. New dependent states could prove to be markets for these goods. Some in business also perceived that in the future, industries would need raw materials that could simply not be found in America (e.g. rubber and petroleum products). In the future, the US would need dependent states to provide these materials. After experiencing a series of economic downturns in the 1870s and 1880s, the US economy had endured enough by the panic of 1893. Soon, business and political leaders needed to look no further than their own industrial over-production for the cause of their economic ills.

In 1912, President William Howard Taft claimed that his administration 'sought to respond to modern ideas of commercial intercourse' and that such 'policy has been characterized as substituting dollars for bullets'. Taft's remarks gave formal definition to the term 'dollar diplomacy', a phrase synonymous with the diplomacy his administration pursued between 1909 and 1913. Dollar diplomacy would serve diplomatic means in turning the US into a commercial and financial world power. Ever the lawyer, Taft surrounded himself with like-minded corporate lawyers and the bankers and businessmen who were their clients. The object of foreign policy

became concentrated on assisting US businessmen in the protection and expansion of investment and trade, especially in Latin America and the Far East. Such efforts would raise significant dilemmas regarding the division of public and private responsibilities (Rosenberg 2003, p. 3).

In *The New Empire* (1963), Walter LaFeber argues that America's 'expansionist' policies were a direct result of the maturation of industrialisation. Business and the capitalist economy needed new markets and this meant foreign ones. They would be backed up by a new navy and military power that would easily take away Spain's former colonies in 1898 (and influence most of the Western Hemisphere). LaFeber also incorporates early labour and immigration policies into his argument. He highlights that Secretary of State Seward (1861–69) advocated importing 'cheap labour' and created the 1868 treaty with China to bring in 'unskilled' workers. This was, LaFeber argues, part of his plan for US expansion or imperialism. A central point of his work is that policymakers (mostly presidents, secretaries of state, and businessmen) feared class unrest at home (as strikes and violence reached unprecedented levels in the later decades of the 1800s). Expansion abroad would quell this by unifying the nation and providing jobs both in the Navy and in revitalised industry. The expansion of US economic and militaristic might clearly held implications not only abroad, but at home.

In the first three decades of the twentieth century the US would emerge as a major economic power. US investment bankers would come to play an important role in international lending. During this time, those nations that were deemed stable and had already been incorporated into the world financial system were able to attract capital investment through US private bank loans. Those which were considered unstable, and thus unattractive investment opportunities, became the locations where dollar diplomacy would flourish. These nations would be given loans on condition that they would be under the US government's direct financial supervision in what is best understood as a receivership. Such practice involved the co-operation of three groups: private bankers, financial experts,

and government officials. The process began with private bankers considering which of the 'risky' nations they would lend to, followed by the financial experts who would bear the task of fiscal reorganisation and administrative management of the borrowing country. Finally, government officials would be responsible for orchestrating the entire deal under the guise of furthering global economic integration and strategic alliances for both US national and international interests.

The Open-Door Policy

The basic strategy of the 'open-door' policy, as developed by Charles A. Conant and Paul S. Reinsch, was an alternative to war through developing a worldwide system of investment, rather than one that was globally segmented. It was intended to offer shares in world development rather than spheres of influence closed off by annexationist empires. Its doses of 'insular imperialism' allowed for more emphasis on investment in exercising expansion as opposed to the older territorial forms of imperialism. Reinsch, in particular, saw how investing would require new political relations between the investing and host societies (Sklar 1988, p. 84). This would be the primary method by which the US would begin its expansion into the Pacific, developing island stepping-stones to the major market areas. The modification was not outright colonialism, but its effects could be just as damaging. Historian Martin J. Sklar provides a detailed description of his conception of the basis for globalism and the theory behind establishing the Bretton Woods institutions (81–82).

America's entry into the Spanish-American War and later annexation of territories such as Hawaii, Wake, Guam, and the Philippines was not a reflection of the Manifest Destiny credo, nor the venting of a 'psychic crisis'. In *The Paranoid Style in American Politics*, historian Richard Hofstadter expresses US imperialism in the forms of 'destiny and duty', suggesting that 'annexation of the Philippines in particular and expansion generally was inevitable and

irresistible' (1965, pp. 174–185). These new territories were specific targets for the implementation of coaling and cable systems and naval stations that would integrate a trade route which could facilitate America's primary reason for entering the Pacific: to penetrate and eventually dominate the fabled China market (McCormick 1963, p. 156). It also marked a significant turn for US capitalism, which up to that point had been primarily focused on territorial expansion within North America. Such expansion was the result of a westward push to seize what had been Native American land and later nearly half of the Mexican territories at the end of the US–Mexican War (1846–48).

In 'The Economic Basis of Imperialism', Conant held that advanced nations had maximised their investment in production to what was considered profitably manageable. They now faced a 'superabundance of loanable capital' with rapidly diminishing rates of return. Eventually, Conant explained, restless capital would need to turn 'to countries which had not felt the pulse of modern progress' to find profitable rates of interest. Conant claimed it was 'only a matter of detail' whether the US took possession of other lands, established quasi-independent protectorates, or developed a strong naval and diplomatic strategy as the promotional avenue for investment in uncolonised areas. Regardless, the endgame was the restoration of profits and prosperity to the imperial nation while simultaneously spreading productive enterprise to areas receiving US capital (Rosenberg 2003, pp. 15–16).

Ingrained in Conant's theory was a belief that both over-production and declining profits could be identified as the forces driving imperialism in the late nineteenth century. Both J.A. Hobson (1938) and V.I. Lenin (1939) would follow in developing similar theories. Yet, unlike Conant, these later theories had more to say about the adverse social conditions that would follow as a result of such practices. Since the late nineteenth century, Hobson and Lenin had recognised that colonial annexation in the era was a qualitatively new era of capitalism: the monopoly or imperialist stage. Hobson, in particular, argued that the emergence of widespread monopoly forms

would eventually lead to under-consumption (or over-saving), growing foreign investment, and imperialist expansion. Both theorists held imperialism accountable for the formation, development, and expansion of the world market, one built on a competitive search and annexation of colonies as a means of extracting surplus and bringing natural resources back to the imperial acumen. According to Lenin, since the fifteenth century, the world capitalist system had been created and consolidated on a foundational practice that divided the core capitalist powers from peripheral economies. The process permitted the regimes in the developed metropolis to exploit under-developed colonies in the global South by extracting profit, payment, or tribute through a system of unequal exchange where capitalist monopolies controlled and dominated international trade and investment. To assist in the process, a ruling class in the periphery functioned as intermediaries by maintaining an interest in the corresponding patterns of production. As a result, Conant believed that prosperity and profits in the advanced nations would ripple out into moral uplift where all would benefit. Such an economic interpretation is viewed as a celebration of both capitalism and imperialism (Rosenberg 2003, p. 16).

By 1900, opposition to colonialism grew to be so formidable that policymakers had to assume that force was no longer an option for the US when acquiring new territory. Still, such a policy was not conducive to US interests. During the first 5 years of the twentieth century, the Roosevelt Administration developed clear and expansive policies that sanctioned the creation of dependencies but not colonies. New justifications, such as spreading civilisation and securing a favourable economic and geopolitical position, were now the rationales for dollar diplomacy. The aim was to establish a level of control that did not require outright colonial possession (32).

The transition here is a significant one in understanding the changes occurring in the practices of colonialism itself. Harry Magdoff has contributed greatly to our understanding of formal control and direct colonialism or settlement. He argues the importance of considering imperialism

as a necessary means of reshaping the social and economic institutions of many of the dependent countries to the needs of metropolitan centres. In the case of the global South, and the US need for it, there is an intended exchange of capital accumulation for economic stimulus. After capitalist reshaping of local institutions has taken effect, economic forces (the international price, marketing, and financial systems) develop into adequate means of dominance and exploitation by the imperial centre. Reshaping allowed for political independence without making any essential changes or altering the initial conditions for conquest. Such reshaping can be another means of understanding the transition for an older imperialism to what is now referred to as 'new imperialism'. We could surmise colonialism as merely a phase in the process. However, the primary distinction involves the development of two historical factors: (1) the loss of British hegemony and a global competition for territorial influence by advanced capitalist states; (2) the rise of monopolistic corporations in becoming the dominant actors in all the advanced capitalist states (Magdoff 2003, p. 17). Similarly, Lenin emphasised that imperialism did not necessitate formal control. Lenin said as much in *Imperialism, the Highest Stage of Capitalism* when describing British imperialism in the nineteenth century: 'The division of the world into … colony-owning countries on the one hand and colonies on the other' did not discount the core–periphery relations between nation states (Lenin 1939/1916, p. 85). Lenin went on to claim that there was no distinction between dependent countries and those which were 'officially' politically independent.

Western observers have often treated the global South's 'under-development' or economic crisis, that was frequently the pitch for securing dollar diplomacy as an original historic condition. It would be as if prosperity has never touched certain regions of the world due to their barren, infertile land or their unproductive people. In *The Political Economy of Growth,* Paul Baran analysed the role of imperialism in reinforcing the economic under-development of those countries considered to be in the Third-World

periphery. He questioned the common practice of assuming all in those poorer peripheral economies had always been relatively backward. He questioned the lack of capitalist development in the periphery, unlike those core regions of advanced capitalist nation states. In addition, he explored the reasons why forward movement in the periphery had either been slow or altogether absent (Baran 1957, p. 136). In his analysis, Baran provided evidence that showed how European conquest and plundering of the rest of the globe had generated the great divide between the core and the periphery of the capitalist world economy that persists today. The analysis provided was clear: incorporation on an unequal basis into the periphery of the capitalist world economy was itself the cause of the plight of underdeveloped countries. This was the 'development of underdevelopment'. Baran concluded that imperialism was inseparable from capitalism. Its central underpinnings were to be found in the mode of accumulation operating in the advanced capitalist world. An international division of labour had evolved which geared production and trade of the poor countries in the periphery significantly more toward the needs of the rich countries in the centre or core of the system than toward the needs of their own populations (Foster 2002).

Roosevelt's Corollary En Route to Dollar Diplomacy

In 1904, Theodore Roosevelt announced his corollary to the Monroe Doctrine to Congress, which stated that the US had the right to intervene in any country in the Western Hemisphere that did things 'harmful to the United States'. Along these same lines, the corollary also stipulated that the US would intervene in Latin America when nations in the region acted improperly. This was essentially a declaration that the US had cast itself as the 'police officer' in the region. 'Any country whose people conduct themselves well can count upon our hearty friendship', Roosevelt said. 'Chronic wrongdoing, however … may force the United States to exercise an international police power'. This was particularly true in the case of the

Dominican Republic, which had repeated failed to repay loans to both Italy and France. Instead, by implementing the Roosevelt Corollary, the US intervened and seized control of Dominican customs collections and took responsibility for distributing the funds to repay both European nations.

During Roosevelt's term, the US used the threat of military power to bring about its foreign-policy objectives in Latin America and the Caribbean. US marines were often deployed to Central America. While the foreign-policy approach of Taft's presidency is referred to as 'dollar diplomacy', Roosevelt's has been referred to as 'gunboat diplomacy'. The Roosevelt Corollary strengthened US control over Latin America, and justified numerous US interventions in Latin American affairs in the twentieth century. As Roosevelt's successor, President Taft was not as aggressive in foreign policy and favoured 'dollars over bullets', stating that US investment abroad would ensure stability and good relations with nations abroad. Dollar diplomacy should be regarded as the process by which US capitalism became deeply rooted in the political economy of the global South.

Unlike Roosevelt, Taft saw a more significant role for US business to play in foreign policy. Having been long concerned with foreign trade, he recognised an over-abundance of produced goods in the US and an overwhelming need to increase exports. It was by no mere coincidence that in 1910, under the Taft Administration, the US began to export more manufactured goods than raw materials. Herein, the focus of trade changed from industrial nations in need of raw materials to less developed countries that required finished products. Accordingly, those developing areas of Latin America and East Asia were vital in discovering new economic opportunities that provided many benefits. The shift in policy, according to Taft, would provide the solution to the over-production problem plaguing the US economy. In addition, the change would benefit recipient nations, allowing for economic progress and eventually political stability. Such stability would allow for economic development of US interests in these under-developed areas. In his

first annual message at the end of 1909, Taft clearly indicated that the mission of 'American capital' was to seek 'investment in foreign countries' so that 'American products' could more readily seek 'foreign markets'.

To fill his cabinet, Taft wanted lawyers, which is why Philander C. Knox was an ideal candidate for secretary of state. Knox was a wealthy conservative lawyer and former US attorney general and senator from Pennsylvania. He had been what is now known as a corporation lawyer, the Carnegie Steel Corporation being one of his clients. He was thus sympathetic to big business. Knox also shared Taft's position that the protection and expansion of economic interests should be the focus of foreign policy. In doing so, the State Department would begin to support US financiers and businessmen by finding opportunities abroad. Certainly, the introduction and development of dollar diplomacy is significant because it was contrary to normal lending practices. However, its political and economic significance lie in the creation of 'controlled loans' as the vehicles of social reconstruction originally envisioned by Conant.

Fertile Soil: Latin America

In Latin America, where objectives of dollar diplomacy included deterring European intervention and maintaining regional stability, the Taft Administration's approach represented an extension of both the Monroe Doctrine and the Roosevelt Corollary. Together Taft and Knox viewed Latin America as a region ripe with opportunity for US interests to expand, while offering a jumpstart to what they considered to be an under-developed economy. Haiti, Honduras, Guatemala, Colombia, Cuba, and Nicaragua were but a few of the states in the region targeted by Taft's dollar diplomacy.

In China, where the US was a relative newcomer in terms of serious economic engagement, the goals of dollar diplomacy did not stretch far beyond the creation of a safe environment for US banking capital and surplus production. Since the Monroe Doctrine and its Roosevelt Corollary

did not apply to the Far East, the Taft Administration relied on the open-door policy crafted in 1899, in which the US decreed that all nations should have equal trading rights in China, as the basis for its dollar diplomacy there.

As president, Taft sought to extend what Roosevelt had established with his Corollary in securing the US position around the Caribbean. Rather than removing European influence from the region, as the Roosevelt policy had done, Taft and Knox sought to control the finances of the Caribbean countries. The means of doing this was by taking over custom houses as the Roosevelt Administration had done in the Dominican Republic. According to the Taft-Knox doctrine, it was important to get the Caribbean nations to repay European debts by means of loans from US businessmen or at least from multinational groups in which Americans participated. Concerned by the general instability of the Central American governments, Taft and Knox set a goal of stable governments and prevention of financial collapse. Fiscal intervention would make military intervention unnecessary. As Knox told an audience at the University of Pennsylvania on 15 June 1910: 'True stability is best established not by military, but by economic and social forces ... . The problem of good government is inextricably interwoven with that of economic prosperity and sound finance; financial stability contributes perhaps more than any other one factor to political stability' (Rosenberg 2003, p. 63).

Such statements did not mean that Taft and Knox were unwilling to use military power in the Caribbean. They did use it. They thought that fiscal control would lessen the need for intervention. They believed that the US and nations of the Caribbean would both benefit. For the US, an increase in trade, more profitable investments, and a secure Panama Canal would result. For the local inhabitants, the benefits would be peace, prosperity, and improved social conditions.

The flow of foreign capital to Latin America has been massive. Even more than resources or markets, capital comes in search of cheap, easily exploitable labour. Commodities, produced with Latin America's most precious resource (its labour), are destined for export to countries with well-developed markets which make selling at high prices easier. What results is a familiar enough story in under-developed countries. Dominated by foreign capital, they perpetually produce what they do not consume and consume what they do not produce.

Nicaragua

By 1909, relations between the US and Nicaragua had soured, largely due to the embittered reaction of Nicaraguan president José Santos Zelaya to the US building a canal in Panama rather than Nicaragua. Relations worsened as Zelaya accumulated European debt, was increasing hostile toward his country's Central American neighbours, and made repeated threats to end the US–Nicaragua concession, a US-owned mining property.

In October 1909, the US supported a faction of rebel nationalists in a revolt against Zelaya. Taft, aligned with opposition leader Juan Estrada, sent US gunboats and other military forces to Nicaragua to assist in removing Zelaya from power. As Zelaya's successor, Estrada formed a provisional government in 1910 after securing a loan from the US for the stabilisation and rehabilitation of the Nicaraguan economy. In January 1911, the US formally recognised the Estrada Government. However, after a turbulent start, Estrada stepped down after only 6 months in office. His replacement, Adolfo Diaz, signed a financial agreement called the Knox-Castrillo Convention, which in essence was a dollar-diplomacy package tailored for Nicaragua.

Under the new agreement, the US would provide a $15 million bank loan to pay off Nicaragua's European debts. For their part, the US government would gain control of the Nicaraguan customs house to ensure loan payments, and would have the right to intervene in Nicaragua to maintain order when necessary. Additionally, Nicaragua would allow US banks to control the National Bank of Nicaragua and the government-owned railway. Praising the treaty, Taft said it was 'of inestimable benefit to the prosperity, commerce, and peace of the Republic' (Maurer 2013, p. 108).

At home, the Knox-Castrillo Convention faced stiff opposition, particularly in the Senate where it failed to win approval due to growing concern about its interventionist aspects. The reaction among Nicaraguans was equally hostile, resulting in a revolt against Díaz in June 1912. Taft responded to the crisis by sending several warships and a contingent of 2,700 marines to restore order and protect US interests. In the end, the Knox-Castrillo Convention was never ratified. Instead, it was replaced by the Bryan-Chamorro Treaty, a watered-down version that lacked the interventionist powers of its predecessor. The new agreement was signed by both nations in 1914, when Taft was no longer president. In addition, as a result of revolt and the need to protect American interests, a US military presence would remain in Nicaragua until 1933.

Cuba

Of those nations that were ripe for dollar diplomacy, Cuba was probably the most fertile. After failing to achieve sovereignty at the end of its campaign for national independence ended in 1898, Cuba was first ruled by a provisional US military government and then became a protectorate of the US, as stated by the Platt Amendment to the 1902 Cuban Constitution. Such US influence was expected to ensure the creation of strong institutions and an underlying prosperous attitude, but neither materialised. Instead, the island nation was victimised by a wave of unrestricted foreign capital.

Foreign capital was an attractive short-term solution to finance the costs of reconstruction. It also promised to get the economy off the ground after 30 years of disruption. Employment, tax revenues, and exports were expected to soar. People would have money to spend and the government would obtain the necessary resources to finance projects of reconstruction. These promises were sufficient for the Cuban government to open the doors of the island to US money. The sugar industry became the main beneficiary of foreign investment, so much so that the national economy became almost entirely dependent upon its exports. In 1909, the year in which Taft was inaugurated and dollar diplomacy was made official, the total amount of US investments (not just sugar) in Cuba was $141 million. In 1924, US investment totals were nine times that of the previous figure, nearing $1.25 billion, of which $750 million, or 60%, were invested directly in the sugar industry.

During the dollar-diplomacy era, with the resurgence of sugar production, companies sought and purchased plots of land previously owned by local families in order to create large, profitable land-holdings. It wasn't long before large numbers of peasants were unemployed as families lost ownership of land which had always been their most basic source of security. Foreign investment forced a shift in the state of affairs in two separate yet dependent areas. First, the infusion of foreign investment as a means to resuscitate sugar production allowed for it to become the focus of the Cuban economy. Second, the social structure was vastly changed with the transition in land ownership from mediumsized family-owned plots to large landholdings owned by foreign capitalist corporations.

In the dollar-diplomacy era, however, capitalist forces prompted a change. Because companies were constantly on the lookout for cheap labour to cultivate and harvest their immense landholdings, jobs became insecure and temporary. Seasonal workers had to leave the household during both the dry and the wet seasons in order to obtain a salary. Men were roaming the fields or the city streets for most of the year, which meant that a stable family life was no longer possible. For rural Cuba, this was a new state of affairs that furthered poverty and fuelled unrest. Jobs offered by US companies attracted record amounts of immigration and caused the breakdown of the traditional family structure. This allowed for a shift in the agricultural market in Cuba from one that was community-based, subsistence, and small-scale farming to one where large portions of land were owned by a single entity. The new system was wage-based and demanded large numbers of workers to maximise productivity.

The change in land ownership also reconfigured the system of labour to one that was wage-based and more conducive to capitalist enterprise. The new system also attracted record amounts of immigration from Haiti, Jamaica, and Spain, which caused rising populations on the island never seen before. The overcrowding also adversely affected the labour market as wages decreased with the rising demand for jobs. Due to the lack of sustainable employment, more men were forced off the plantations and into the cities to find work. This caused an increase in impoverished female-headed households and a significant drop in consensual unions. What the influx of foreign direct investment failed to account for was the stabilising societal power that the traditional family nucleus had provided. What was intended to increase the potential of becoming a prosperous nation had resulted in the destruction of the traditional family culture and an increase in the struggle to sustain a living (Smith 1966; Timoneda 2008).

Imperial Legacy

Imperialism is often explained primarily as an outcome of economic expansionism. This is certainly the case in Latin America, where, for example, in the cases of United Fruit in Guatemala and International Telephone and Telegraph in Chile, political and military initiatives were undertaken largely to support the interests of particular corporations and to create the political climate for the expansion of US economic interests as a whole (Harvey 2003, p. 49). However, in the development of neo-liberal capitalist imperialism there has also been the drive to maximise profits by lowering labour costs. The global South has offered numerous opportunities to discover new sources of cheap labour. Repeatedly, the arm of the US state has assisted corporate needs through enhanced government policies designed to lower the cost of labour by any means. This has allowed businesses to take advantage of the massive global over-supply of labour. In his own analysis, Stephen Hymer focused on the enormous 'latent surpluspopulation' or reserve army of labour in

both the backward areas of the developed economies and in the under-developed countries, 'which could be broken down to form a constantly flowing surplus population to work at the bottom of the ladder'. Like Marx, Hymer equated the 'accumulation of capital' with an 'increase of the proletariat'. Herein, the Third World provided a vast 'external reserve army' that would supplement the 'internal reserve army' that already existed within the developed capitalist countries. Accordng to Foster and McChesney (2012), this would serve as 'the real material basis on which multinational capital was able to internationalise production', by maintaining a steady stream of 'surplus population into the labour force' (150). It was Hymer's contention that this would eventually weaken labour globally through a process of 'divide and rule' (Hymer 1979, pp. 262–269).

Early in the twentieth century, when the US began to emerge as a global power, the central question concerning architects of US foreign policy was not whether the US should be a global power, but rather how the US should best go about becoming one. Between 1909 and 1913, President Taft's answer to that question was dollar diplomacy, a series of policy initiatives that attempted to broaden the scope of US economic and political influence around the world through financial measures such as bank loans to developing nations. When those measures alone proved insufficient, dollar diplomacy relied on more traditional foreign-policy practices, such as military intervention, to achieve its objectives.

In the end, dollar diplomacy created more havoc then it originally intended to prevent. The question for the US has never been whether or not it should become a global force, but rather how it should become one. Taft's implementation of dollar diplomacy from 1909–13 was yet another attempt to extend the borders of influence under US control. The exchange of capital accumulation for economic stimulus (the force driving dollar diplomacy) was later reinstated through the Washington Consensus and again by the North American Free Trade Agreement (NAFTA) in the 1980s and 1990s. The imperialist nature of the US state is driven by the ever

expanding nature of capitalist political economy and has been marked by more than a century of continuous military and economic intervention abroad.

Dollar Hegemony

Duccio Basosi
Dipartimento di Studi Linguistici e Culturali Comparati, Ca' Foscari University of Venice, Venezia, Italy

Introduction

"Dollar hegemony" is a loosely defined phrase, usually referred to historically determined contexts in which the US dollar is adopted as the main international reserve instrument, unit of account, and means of payment. Throughout the twentieth and early twenty-first century, it has been used to describe a number of different situations, namely some regional contexts in the Atlantic area in the 1920s and 1930s, the non-Communist world between 1945 and 1989, and the entire global economy afterwards. While originally used almost exclusively in the journalistic jargon in continental Europe, the phrase has progressively "gained currency" with broader audiences, globalizing in both a linguistic and a social sense.

As will be discussed in the sections below, if "hegemony" were measured only in numbers, it would seem fair to claim that the dollar enjoyed a hegemonic condition in progressively larger geographical contexts starting from the 1920s and that it is keeping it today: despite a slight tendency toward decline in the dollar's international use in the second decade of the twenty-first century, at the end of 2018 the US currency still represented around 62% of international official reserves, with its closest competitor, the Euro, around 20% (IMF 2019). But to describe an international monetary situation in terms of a currency's "hegemony" – or, more broadly, as the monetary aspect of a country's "hegemony" – implies more than numbers: it implies establishing a relationship between the position of that currency and a set of special advantages accruing to the political economy of the country that issues it, both in terms of "prestige, seigniorage, balance of payments flexibility, and policy autonomy" and in terms of "capital and

exchange-rate gains [and] long-term commercial, financial and political gains" (Norrlof 2014: 1043). It also implies understanding the international position of that currency as a product of the power of the country that issues it, as well as an instrument for the perpetuation of that same power, in keeping with the common core of all the interpretations of the "H-word" itself since ancient Greece (Anderson 2017). Finally, it implies an understanding of the origins of such privileges and power theoretically distinct – at least in the abstract – from what is communicated by alternative expressions such as "dollar diplomacy" on one extreme and "dollar imperialism" on the other.

As a consequence, the attribution of "hegemonic" features to the position and function of the dollar has never been fully consensual in any of the three broad contexts mentioned above: if anything, no President of the USA has ever referred to "dollar hegemony" in public, even though a former chairman of the US Federal Reserve has recently accepted, at least in principle, that the dollar's international position does confer to it a special "privilege" (Bernanke 2016).

In her contribution to this encyclopedia, economist Ramaa Vasudevan provides readers with an excellent synthesis of how the international position of the dollar since 1945 has contributed and contributes to US power, while also allowing the US political economy to enjoy special advantages unavailable to others: of why, in other words, such a position can be seen as configuring "dollar hegemony" (Vasudevan 2019). In this entry, I take a different approach, moving from words to meanings in the attempt to show how the notion of "dollar hegemony" has evolved over time, what specific situations it has been applied to, and what political and intellectual messages were attached to its use – or to eschewing its use – in different historical and geographical contexts.

Genesis

When in his 1912 annual message to the Congress then-US President William Taft claimed that "the diplomacy of the present administration has

sought to respond to modern ideas of commercial intercourse [by] substituting dollars for bullets," the press was quick to coin the expression "dollar diplomacy" to characterize the link that was being established between the promotion of the US currency abroad and US foreign policy (Rosenberg 1999). As numerous countries in Central America and the Caribbean soon came to realize, US foreign policy in the 1910s never really succeeded in doing away with bullets. If anything, Marxist-Leninist critics would not easily distinguish "dollar diplomacy" from outright "imperialism" (Bukharin 2003). But as to the diffusion of the use of the dollar abroad, US policy was definitely successful. It can be said that the concept of "dollar hegemony" – if not the phrase itself – began to take shape in this connection.

The "roaring twenties" saw the dollar consolidate its position in the Americas. Thanks to the so-called "Dawes plan," aimed at reigniting Germany's payments of war reparations, the US currency also made indents in the European heartland (Kindleberger 1973; Eichengreen and Flandreau 2008; Tooze 2014). It is difficult to provide a definitive birth date for "dollar hegemony," but the phrase likely made its first circumstantial appearances in this context, namely in daily newspapers in France and Italy. By the end of the decade, French reporters from various newspapers not only described the Antilles as an "American Mediterranean," where the "hegemony of the American dollar [*hégémonie du dollar*] blew in the sea-breeze" (*"Méditerranée"* 1928), but also reported on Berlin's growing anger at "dollar hegemony" ("L'Allemagne" 1928). They also took comfort in the observation that "in spite of the certainties that they derive from the dollar's hegemony, the natives of Hollywood have not been able yet to produce in series a Bach, a Mozart, a Chopin [...]" ("Le cinéma" 1930). Shortly afterwards, the phrase appeared on the Italian *Corriere della Sera* – usually conservative and then (since 1925) firmly under the control of the Fascist regime: in commenting the hectic meetings of bankers that took place in the aftermath of the suspension of the British pound's convertibility into gold in September 1931, a correspondent explained that it was widely believed

that "the devaluation of the sterling [...] would establish once and for all the hegemony of the dollar [*egemonia del dollaro*] and would move the financial center of the world from London to New York" ("Riunione" 1931). In short, "dollar hegemony" initially carried a rather undefined meaning but also a vaguely pejorative connotation, in line with the use of "hegemony" in commentaries of international politics since the late nineteenth century (Anderson 2017).

The expression does not seem to have circulated much outside France and Italy. In particular, US political and financial elites framed their actions and intentions in different terms: as noted by Anderson, in English, "hegemony" traditionally maintained an even greater derogatory connotation than in other European languages, which made it unacceptable both to the British that were ostensibly the declining "hegemons" of the time and to the Americans who were emerging as the most likely candidates to replace them. In American parlance, "good neighborhood" was the official policy toward Latin America after the 1930s (even though it might have implied that the USA had been a rather bad neighbor until then), and then Henry Luce's "American century" soon emerged besides more sober talk of "American leadership" to designate the USA's role as the main world power during and after World War Two (Luce 1999). To the extent that commentators wanted to highlight the specific role of the dollar in US foreign policy, "dollar diplomacy" remained by far the most popular expression. In turn, Communist newspapers in the Soviet Union and Western Europe used a different language: throughout the 1920s, "dollar diplomacy" in the Caribbean and the "Dawes plan" were but manifestations of "dollar imperialism" [*imperializm dollara*] for Moscow's *Pravda* ("Po inostrannym" 1926) or even of the "super-imperialism of the dollar" [*super-impérialisme du dollar*] according to the French *L'Humanité* ("Plan Dawes" 1925).

Whatever bankers believed, the events of 1931 did not mark the smooth transition of the epicenter of global finance from London to New York, but rather the beginning of the dissolution of the world's economic order and a step towards the creation of the economic-military blocs of World

War Two. Interestingly enough, newspaper and journal archival databases indicate that "dollar imperialism" disappeared from *Pravda*'s vocabulary from 1930 to 1948 – a period corresponding more or less to the rapprochement between Moscow and Washington DC – while "dollar hegemony" came to be used interchangeably with "dollar imperialism" in at least two of the Axis countries ("Amari" 1942; Haraguchi 1942).

Bretton Woods

With the end of World War Two in sight, in the summer of 1944, the international monetary conference of Bretton Woods established a system of fixed but adjustable exchange rates, guarded by newly created multilateral institutions – the IMF and World Bank – and rotating around the dollar, whose value was fixed against gold at the parity of 35$/oz. In her essay for this encyclopedia, Ramaa Vasudevan characterizes the Bretton Woods system as the "launching pad" for "dollar hegemony" (Vasudevan 2019). As will be seen below, such characterization of Bretton Woods has become rather common since the 1970s, in the context of a broader tendency to use the term "hegemony" – if with diversified nuances – to describe the overall condition of the USA in the aftermath of World War Two, and particularly in reference to Western Europe in the years of the Marshall Plan. But during the first 15 years of Bretton Woods' existence, few observers referred to the USA as a "hegemon," and even fewer hinted at "dollar hegemony."

As US-Soviet relations deteriorated, critics of US power in the Soviet Union and in the Communist parties elsewhere quickly recovered the language of "imperialism" to describe US foreign policy in general, and that of "dollar imperialism" when they wanted to highlight the peculiar capitalist nature of US foreign economic relations. Alexei Leontiev's (1949) highly militant pamphlet, *Imperializm Dollara v Zapadnoi Evrope* [Dollar Imperialism in Western Europe], epitomized this tendency. The booklet oscillated between two extremes: attacking the Marshall Plan both for entailing the penetration of the dollar

in Western Europe and for not providing enough dollars to the Western European economies. And yet, whatever the actual reason for attacking the Marshall Plan, the booklet was straightforward in judging it a quintessential "imperialist" operation, aimed at replicating in Western Europe the "dollar servitude" [*dollarovoi kabali*] already prevailing in Latin America. Where plans of "world hegemony" [*mirovaya gegemoniya*] were attributed to US policymakers, "hegemony" was clearly a mere synonym for "domination" [*gospodtsva*] that appeared in the same passage (Leontiev 1949: 80, 86–87). Coherently, no entries for "dollar hegemony" are recorded on the French and Italian communist dailies for the years up to the 1960s.

On the other hand, supporters of US power likely considered the talk of "US hegemony" and "dollar hegemony" politically incorrect for the opposite reason, as it attributed too negative connotations to the country and the currency that now "led" what loved to call itself "free world" – even though substantial portions of it were actually colonies and autocracies of various types. The phrases "US hegemony" and "American hegemony" did recur occasionally in the Western European non-Communist press (though not in the USA) during the late 1940s and 1950s, but Morgenthau's *Politics Among Nations* (Morgenthau 1948) and other international relations textbooks carefully eschewed it.

Of course, that the promotion of the use of the dollar abroad was not only about trade was clear to anybody who wanted to see. In March 1947, in a *New York Times* article published only a few days after the proclamation of the so-called "Truman doctrine," the renowned Princeton economist Jacob Viner reflected on the virtues and limits of "the use of disposable financial resources as an instrument of diplomacy, conciliatory or coercive": while expressing his support for Truman's "dollar diplomacy," the economist admitted that it was difficult in certain situations involving areas of "weak sovereignty" to distinguish such practice from outright "dollar imperialism" ("In defense" 1947). As far as Western Europe was concerned, given the prevalent association of "hegemony" with a pejorative meaning – if not one as pejorative as "imperialism" – it must have seemed

particularly impolite in certain contexts to dub "hegemonic" the same currency that Western European governments were so desperately begging for. Only scant exceptions can be found: for instance, the Italian conservative *La Stampa* on one occasion assured its readers that "Communism was not a threat in Latin America" because of the "hegemony of the dollar" prevailing there ("Il comunismo" 1950). At any rate, the French bourgeois press, once so bold in making irony about "dollar hegemony," now more soberly called US policies a "means to alleviate our dollar shortage" [*moyen pour pallier notre pénurie de dollars*] or simply "*le plan Marshall*" ("Un S.O. S." 1947).

The situation changed quite dramatically during the 1960s when, as for Molière's Monsieur Jourdain, commentators from many quarters suddenly realized they had coexisted with "dollar hegemony" for almost two decades without knowing it. The dollar's centrality in Bretton Woods came under increasing criticism as the monetary order suffered from the so-called "Triffin dilemma" (from the US-Belgian economist Robert Triffin who theorized it in 1960): in order to provide the system with liquidity, the USA had to run persistent deficits in its balance-of-payments, but these in turn caused weakening confidence in the dollar itself (Triffin 1960). In that context, in September 1960, *Le Monde* was quick to register that "in several quarters the end of dollar hegemony would not be met with anger" ("Une dévaluation" 1960). But in the years that followed no official dollar devaluation occurred – the price of gold remaining fixed at 35$/oz throughout the decade – and a *de facto* overvalued dollar increasingly allowed the US political economy to reap the benefits of *seigniorage* and pass onto others the inflationary effects of US domestic policies and military expenditures (Eichengreen 2010).

In that context, in Paris, the criticism of the dollar's position soon radicalized, leading Finance Minister Valery Giscard d'Estaing to famously denounce the "exorbitant privilege" of the dollar, and President de Gaulle to demand, in 1965, the actual conversion into gold of the dollars accumulated by the Banque de France. The instability of Bretton Woods under the strain of the growing

deficits in the US balance of payments, and the increased criticism of the US government's alleged indifference to the problem, led to the quick spreading of the talk of "dollar hegemony" beyond its traditional linguistic boundaries, even though a review of the press commentaries of the 1960s leaves the reader somewhat unsure as to what precisely was happening to the dollar: while in 1963 a Spanish journal reported about "the end of dollar hegemony" [*el fin de la hegemonía del dólar*] ("El fin" 1963), in Mexico, 8 years later, a daily newspaper explained that the Franc had lost so much value after the 1968 protests as to cause the disappearance of "de Gaulle's weapon to threaten the dollar's hegemony" [*el arma degaullista para amenazar la hegemonía del dolar*] ("Francia" 1971). Similarly, in 1966, the Austrian journal *Berichte und Informationen* wrote about a "battered dollar hegemony" [*Angeschlagene Dollar-Hegemonie*] ("Die Angeschlagene" 1966), but in 1970, the *Frankfurter Allegemeine Zeitung* was of the opinion that the French government could no longer afford to "attack the dollar's hegemony" ("Unter Pompidou" 1970). In London, the *Times* took a somewhat intermediate position when it explained that, after all, "the extent of the American – or the dollar – hegemony was always more circumscribed than showed on the surface" ("From Marshall" 1968).

Also the Communist world(s) participated in the globalization of "dollar hegemony" (here intended as a phrase, of course). The escalation of the US war in Vietnam (which dollar *seigniorage* actually financed) and de Gaulle's dramatic criticism of the dollar gave the chance to *l'Unità*, the Italian Communist' Party house organ, to make its first use of the phrase, when it polemically invited Italy's "anti-gaullists" to show that their "opposition to authoritarianism did not work only to protect the dollar's hegemony, but also against the barbarian methods of the American imperialist authorities" ("La politica" 1965). In the context of the emerging US-Soviet Détente, scholarly volumes in the Soviet Union began to debate the state and prospects of "*gegemoniya dollara*" (Borisov 1963), and the debate intensified as Soviet economists grappled with novelties such as the EEC's designs for a

single currency (Cutler 1982). Of course, in these instances, "dollar hegemony" was still mainly interpreted within an "imperialist" framework, but an implicit – if possibly unwitting – analytical differentiation might also have been at work in the distinction that was being drawn, between the "hegemonic" role of the US economic influence in Western Europe and its purely terroristic methods in Vietnam and the Third World. Be it as it may, a similar distinction does not seem to be applicable to the Chinese case: condemnation of "hegemony" and "hegemonism" became a regular feature in international commentaries during the 1960s, but in a context in which *bàquán* was an extremely derogatory term with virtually no distance from "imperialism" (Anderson 2017).

Most importantly, with Bretton Woods in crisis, 40 years after its European conception, "dollar hegemony" finally entered the political parlance of the country that supposedly was most concerned with it. But this occurred with an ironic twist. What unified all talk of "dollar hegemony" outside the USA during the 1960s was that the phrase was used to refer to the Bretton Woods system: to the extent that increasingly perplexed and outraged trading partners were left with few alternatives to the accumulation of inflated dollars, "dollar hegemony" was being revealed, even though this was precisely what jeopardized it. On the contrary, when "dollar hegemony" entered the US lexicon, this was only to deny its existence and to voice the US establishment's opinion that it would be "unwise," at least as far as public discourse was concerned (Rockefeller 1968: 193).

Dollar Standard, 1971–1989

There is reason to believe that by the late 1960s, US elites were quite conscious that their position in international monetary affairs had indeed something to do with "hegemony." In early 1969, President Richard Nixon created an interagency group on international monetary policy, which took the name of "Volcker Group" (from the name of then undersecretary of the Treasury Paul Volcker, who coordinated it). In its report, submitted to the

President in June of the same year, the group wrote that:

> [US objectives are] the retention of substantial flexibility for the US both in terms of domestic economic policy and foreign spending (including military and aid outlays) [...]; the encouragement of the free flow of goods, services and investment internationally [...]; politically, a substantial element of US control [...]. However, in the interest of facilitating international harmony, the appearance of US hegemony should not be sought. [T]his tends to point to the desirability of working in a context of multilateral cooperation and consultation, so long as this does not [...] frustrate needed change" (Volcker Group 1969: 12–13).

After 2 years of unfruitful negotiations – and increased US "benign neglect" of its balance of payments – on August 15, 1971, President Nixon unilaterally announced that the US Treasury would "suspend" its commitment to redeem gold for dollars and allowed the dollar to float on monetary markets (Eichengreen 2010). Various interim agreements and multilateral negotiations to revive Bretton Woods would punctuate the 1970s, but *de facto* that was the beginning of the period, that lasts to these days, when the world would run on a pure dollar standard. Ramaa Vasudevan indicates Nixon's decision as a passage towards "the consolidation of dollar hegemony" (Vasudevan 2019). And if one follows the logic of the "Basic options" paper cited above, such judgment is indeed consequential. But again, not everyone would have agreed with it at the time.

If "hegemony" meant a quasi-unilateral imposition, one should not be surprised to find that the post-1971 dollar standard was condemned by many as a flagrant imposition of "dollar hegemony." For example, when in March 1972, the Finance ministers of the European Community met to evaluate a set of proposals for monetary cooperation, the *Corriere della Sera* told its readers that the envisaged measures would "bring an end to the dollar's hegemony" ("La lunga" 1972). Similarly, in 1973, then French Foreign minister Michel Jobert publicly invoked increased European monetary cooperation "in order to defend ourselves from the hegemony of the dollar" (Jobert 1973). Others accepted that the *de facto* pure dollar standard in place after 1971 was "dollar hegemony"

but could not believe such situation could last in the future: when the expression entered the official record of the *New York Times* in October 1971, it was to report the opinion of US bankers who claimed it was "unrealistic" to expect the European countries to accept "an inconvertible dollar standard, with its overtones of dollar hegemony" ("National" 1971). In protest with Nixon's decision, economist Fred C. Bergsten even resigned from his position in the National Security Council and wrote that "such dollar hegemony is politically, and therefore economically, impossible [...]" (Bergsten 1975: 40).

But if "hegemony" required an undisputed hierarchical relationship, then the end of Bretton Woods likely meant the end of "dollar hegemony" or at least a severe weakening of it: only days after the closing of the gold window, the Soviet *Pravda* was firm in the judgment that the "undisputed [*besrazdelnaia*] hegemony of the dollar ha[d] been thoroughly undermined" ("Protivorechija" 1971). Political scientists David Calleo and Benjamin Rowland made a not-so-different point when they wrote that the post-war had configured a condition where "nuclear hegemony in NATO ha[d] matched dollar hegemony in the IMF," but defeat in Vietnam and the end of the dollar's convertibility into gold had now opened a new phase, where "US hegemony" in general was simply anachronistic (Calleo and Rowland 1973: 87).

Different understandings of "hegemony" led to different conclusions about the actual existence and possible prospects of "dollar hegemony," but all participants in this multilanguage discussion agreed on one basic point: whatever the degree of legitimacy of the dollar's role under Bretton Woods, in August 1971 that had been lost. Indeed, while he personally disliked the term "hegemony," which he consciously never used, in 1973, economic historian Charles Kindleberger gave the keynote for what successive generations of political scientists would call "hegemonic stability theory," and made the case that, by unilaterally ending Bretton Woods, the USA had virtually renounced its "leadership" position (Kindleberger 1973).

Such judgment was only reinforced in the next few years, when the dollar's post-1971 devaluation contributed to the oil-producing countries'

decision to abruptly quadruple the price of oil (Garavini 2019). The "oil shock" provoked large deficits in the balance of payments of all oil-importing countries, thus compounding the legitimacy crisis of the US currency and challenging US power more generally. According to economist Benjamin Cohen, "the political and economic conditions that made dollar hegemony acceptable-or tolerable-in the early postwar years currently no longer exist. [. . .] Establishment of a new and formal dollar hegemony would inevitably be regarded [...] as illegitimate and exploitative" (Cohen 1977: 233).

Nevertheless, the events of 1971–1973 did not bring the international use of the dollar to an end: as explained by Barry Eichengreen, "there was no shift away from the dollar. Volatility there was in the share of dollars in foreign exchange reserves in the 1970s, but no secular decline. The dollar's share of total identified international reserves remained close to 80 percent in 1977" (Eichengreen 2010: 63). The key for this surprising development was soon identified in OPEC countries' decision to keep oil priced and sold in dollars – which required all oil importers to possess dollars in the first place. Many of the contemporary explanations for the process of creation and circulation of "petrodollars" were largely based on conjecture and ideology, simply assuming that "unfettered markets" were determining outcomes, without ever questioning their own assumptions: in a coherent "neoliberal" perspective, there was of course room only for economic choices that were freely and rationally operated by utility-maximizing individuals, whatever the contrary evidence (Spiro 1999). However, for those who were not convinced that states had simply disappeared from the map of international monetary affairs, the objective permanence of the dollar as the world's main international currency allowed renewed reflections on "dollar hegemony," particularly after the second amendment to the IMF's articles of agreement in 1978 virtually ratified Nixon's *fait accompli*. No sooner had the ink dried on the IMF's amended charter – with its fig-leaf appeal to member states to "assure orderly exchange arrangements and to promote a stable system of exchange rates" – than the US Federal Reserve impressed a radical u-turn to its "weak dollar" policy by raising interest rates to unprecedented levels in what passed down onto history as the 1979 "Volcker shock" (again from Paul Volcker, now the chairman of the Fed): the move led to 5 years of "strong dollar" policy, squarely placed finance at the heart of the US economy and reverberated globally through the transmission wires of the dollar standard, draining capital from all corners of the world through what the then German Chancellor reportedly called "the highest interest rates since Jesus Christ." As by-products, the Fed's turn supported the military-technological relaunching of the superpower of the Reagan years, destabilized Western European macroeconomic performance, and precipitated a devastating "debt crisis" in much of the Third World and Eastern Europe (Arrighi 2010).

In what seemed an extremely unstable context, but also one with few visible alternatives, reflections on the notion of "hegemony" itself became more nuanced. Recovering some of Antonio Gramsci's reflections from the *Prison Notebooks*, the Italian sociologist Giovanni Arrighi made the case that "US hegemony" after World War Two had determined an "imperial order" whose main products were the "unity of the world market and the transnational expansion of capital," obtained with the collaboration of the dominant classes in subordinate countries: under multiple challenges, during the 1970s, the USA had shed the "formal aspects of hegemony" (the Bretton Woods multilateral arrangement) but had successfully kept – at least for the time being – these "substantive aspects of hegemony" (Arrighi 1982). Owing more or less directly to Gramsci, during the 1980s, a growing number of authors began to represent Bretton Woods as the apex of "US hegemony" for the US elites' capacity to rule the system with means other than pure coercion: but if that had been true for Bretton Woods, what was left "after hegemony" was either a regime that somehow spontaneously survived on its own legs (Keohane 1984) or a renewed hierarchy were US "dominance" was much less tolerated by its subordinates (Cox 1981).

Those who did not consider "hegemony" much dependent on legitimacy, or even equated it with

outright exploitation, had fewer problems concluding that the 1970s were the dollar's "hegemonic" decade by definition. "The current monetary crisis was preceded by the imposition of the hegemony of the dollar by the United States," declared Cuba's *comandante en jefe* Fidel Castro, in his capacity as chairman of the Non-Aligned Movement (Castro 1980), while *Le Monde* argued that the launching of European Monetary System in 1979 represented "a first response to the formidable disorders created by the hegemony of the dollar" ("Points" 1981). Nor would similar comments disappear after 1985, when the dollar took another u-turn, this time downwards as the Reagan administration began to push US exports ("Il n'y a pas" 1987; "Egemonia" 1987): the central role played by the US currency in world affairs forced all other actors – short of closing their trade and capital markets unilaterally – to adapt their policies to Washington's preferences.

Dollar Standard, 1989–?

Iconically represented by the ruins of the Berlin Wall in November 1989, the years between 1989 and 1991 were marked by the collapse of the Soviet grip on Eastern Europe and then by the dissolution of the Soviet Union itself. For some enthusiastic commentators who had previously interacted with the debate on "US hegemony," "hegemony" itself was no longer an issue, since the USA was again simply "bound to lead": to the extent that "power" did support US global preeminence, this was to be intended mainly as "soft power," or the capacity to "attract" others into the USA's own preferences (Nye 1991). Charles Kindleberger now spoke of a recovered "primacy" for the USA, whose currency was widely adopted for international purposes as a simple reflection of the size and vitality of the US economy, which made unproblematic even the structural deficit that was now a regular feature of its trade account (Kindleberger 1996). Be it as it may, in the early 1990s, talk of "dollar hegemony" receded in official circles in the USA: when it was mentioned, it was only to claim

complacently that "the dollar's hegemony of world finance and trade remain[ed] largely unchallenged" (O'Brien 1994: 84).

Things, however, looked differently from other perspectives, including in Europe, where the "dollar's gyrations" [*giravolte del dollaro*] produced unexpected and often unwanted consequences (De Cecco 2003: 21). Indeed, those thinkers that had adapted the Gramscian use of "hegemony" to international relations consolidated their conviction that after the 1970s, "US hegemony" – in general and in the monetary field in particular – had been replaced by a long phase of "hegemonic crisis" or, better, US "dominance without hegemony," sustained not so much by US attractiveness, as by the USA's huge military apparatus, part of whose costs were financed by the USA's creditors, who exported goods and commodities in the USA and received pieces of paper in exchange (Arrighi 1994; Arrighi and Silver 1999). Indeed "US dominance" and "dollar dominance" – located somewhere between the Gramscian notion of hegemony and the old Leninist notion of imperialism – turned out to be successful phrases to refer to the status of the USA and its currency in international affairs in critical, but not simplistic terms (Gowan and Stokes 2012). Otherwise, "dollar hegemony" was always available in its non-Gramscian understanding: in 1998, with East Asian currencies falling like dominoes against the dollar and only months before a dramatic devaluation of the national currency, the Brazilian *Folha de Saõ Paulo* introduced the phrase "*hegemonia do dólar*" to its readership, explaining, contextually, that "money is power" [*dinheiro é poder*] ("Bom artigo" 1998).

An attempt at bridging the gap between alternative understandings of "dollar hegemony" – and of "hegemony" more broadly – was David Spiro's carefully researched work on "petrodollar recycling" in the 1970s: far from relying on supposedly impersonal "market mechanisms," Spiro showed that the US government had actively operated so as to ensure that Saudi Arabia deposit its oil revenues with the US Treasury and with US-based banks, thus objectively violating to its own advantage the rules of cooperation it had established with the other oil-importing countries. To the

extent that such process had implied the maintenance of the dollar at the heart of the monetary order, one could still speak of "hegemony" after the end of Bretton Woods, provided that the adjective "exploitative" be added to it (Spiro 1999).

As had already occurred in the past, talk of "dollar hegemony" intensified when the dollar's position came to be seen as less secure, at least in perspective. The birth of the Euro – sometimes vaguely presented as a competitor to the dollar by European official circles – reignited the debate as early as 1999 (Portes and Rey 1999: 49). Chinese authors began to show particular interest in the subject of "*meyiuan baquan*" (Chin et al. 2015). But it was after the Bush Jr. administration's deliberate aggression to Iraq in 2003 and the collapse of Lehman Brothers in 2008 that the phrase received its true consecration as a recognized tag in the global jargon of international politics. As a keyword search on popular online search engines easily shows, mentions of "dollar hegemony" appear in hundreds if not thousands of books after 2003.

While in many cases recent works elaborate on past interpretations, a new trend consisted in linking US military operations in the Middle East (from "Desert Storm" to "Iraqi Freedom" and beyond) directly to the need to preserve "dollar hegemony" – or in some versions "petro-dollar hegemony": owing somewhat to Spiro's research cited above, economist Henry C.K. Liu defined "dollar hegemony" as a phenomenon "created by the geopolitically constructed peculiarity that critical commodities, most notably oil, are denominated in dollars" (Liu 2001). From this perspective, Iraq's announcement in 2001 to price and sell its oil in Euros threatened to undermine "dollar hegemony" and what some authors now called an "oil-dollar standard," and should thus be seen as the main reason for the US invasion 2 years later (Clarke 2005; Patnaik 2009; Gokay 2019). To be sure, alternative explanations for the Iraq war have also been also offered, where "petrodollars" were not as crucial (Muttitt 2011). But whatever the "true" motives behind it, the war itself – much like the Vietnam war to which it has often been compared – not only proved a political fiasco but also a drain on US resources, readily

financed with lax monetary and fiscal policy, that is by what some would call "dollar hegemony." Or, in David Calleo's words:

> So long as America has its hegemonic position, the money it needs will flow to it. In other words, American hegemony includes the ability to summon cheap and ready credit from the rest of the world. That credit allows the U.S. to pay for the guns and butter that sustain its hegemonic lifestyle (Calleo 2009).

However, the greater the perception that the USA abused the "exorbitant privilege" of the dollar, the greater the attacks to the dollar's position itself, often in the form of harsh denunciations of "dollar hegemony." While the financial crash of 2008 and ensuing "great recession" called for new criticism from many quarters, the deterioration of US-Russian relations in the second decade of the twenty-first century went along with a particularly steep increase of the number of attacks to, or skepticism about "dollar hegemony" by Russian authors (Perechod and Perechod 2016; Khalina 2019). Understandably, real and potential Chinese divestment from the dollar is usually indicated as a cause of concern for "dollar hegemony." In some of the more recent writings, as was already the case in the past, the "end of dollar hegemony" is presented as near. Other authors are not as sure: in what is possibly the most detailed study of the subject so far, political scientist Carla Norrlof concluded that:

> the evaluation of the relative monetary capabilities of all countries in the world (i.e. their share of GDP, world trade and capital markets) as well as other variables relevant for assessing the potential for currency influence, such as military power and financial openness [...] shows that pessimism about the durability of dollar hegemony is built on faulty premises (Norrlof 2014: 1065–66).

Of course, whatever the forecasts, the fact that talk of "dollar hegemony" now occurs globally, and that it occurs in such terms, brings us back to where we started: if not a synonym of outright "dollar imperialism," "dollar hegemony" carries today a pejorative connotation that indicates a less-than-fully consensual adoption of the US currency for international purposes and hints at the power plays involved in keeping things as they are, as well as in changing them.

Dollar Standard and Imperialism

Ramaa Vasudevan
Department of Economics, Colorado State University, Fort Collins, CO, USA

Definition

The dollar's role as internationally accepted money is the outcome of the historical evolution of the United States as the financial center of the global economy and the dominant imperialist power. This chapter explores the implications of the dollar's international role for the working of imperialism. It traces the history of the emergence and evolution of the dollar standard after the Second World War and discusses some of the different analytical approaches to understanding the pivotal role of the international dollar standard in the mechanisms of contemporary imperialism.

Capital exports played a key role in Lenin's analysis of imperialism at the turn of the twentieth century. In a curious breach of Lenin's formulation, the dominant imperialist power in the contemporary global economy, the US, is a major

importer of capital. The growing debt of the US is, however, not a reflection of a decline in imperialist hegemony but rather of its strength. The puzzle of an imperialist country that holds the bulk of the global balance of payments deficits can be explained by the privileged position of the dollar globally as the dominant key currency. The dollar is the main currency used to denominate and settle international transactions. The fact that the rest of the globe uses dollars for its international dealings places the US in a unique position to exercise an 'exorbitant privilege' over the rest of the world. The US can finance its external debt and deficits by issuing its own monetary liabilities, thus enjoying an elastic credit line that is not available to most other countries.

Dominance in the international financial system has allowed the US an easy access to global savings and has given rise to the growing global imbalances that emerged in the first decade of the twenty-first century. The emergence and persistence of global imbalances is a reflection of the international hegemony of the dollar and the central role that the US has come to play in sustaining global demand. In 2007, when the subprime market was unwinding, the dollar entered on one side of about 88% of all foreign exchange transactions, while its closest competitor, the euro, entered on one side of 36% of foreign exchange transactions. At the same time about 61% of foreign exchange reserves were held in dollars, while the euro share of foreign exchange reserves was about 26% in 2007.

The crisis triggered by the collapse of the subprime market in the US brought the hegemonic role of the dollar into sharp focus. Far from setting off a run on the dollar, the complete seizure of financial markets, after the fall of Lehman in 2008, precipitated a global flight to the dollar safe haven. There was a surge in the global demand for US treasury bills and the US Federal Reserve had to extend dollar swap lines to overseas central banks that sought dollar liquidity. The crisis reflected the contradictions of an international monetary system hinged on the dollar standard (Vasudevan 2009a). The key question is whether it also presages the end of the dominance

of the dollar or the decline of the US imperial power.

This chapter explores the implications of the dollar's international role for the working of imperialism. Drawing on Vasudevan (2008), it traces the history of the emergence and evolution of the dollar standard after the Second World War and discusses some of the different analytical approaches to understanding the pivotal role of the international dollar standard in the mechanisms of contemporary imperialism.

The Historical Evolution of the Dollar Standard

The International Gold Standard that prevailed before the First World War hinged around the dominance of Britain and the pound sterling in the international financial system. Britain emerged after the Second World War with its dominant international position significantly eroded. The US, on the other held substantial reserves of gold and was now the leading creditor in the international arena. The world capitalist economy, in the wake of two world wars confronted the emergence of a new balance of forces globally. This changing balance of power paved the way for the establishment of the dollar standard.

The Bretton Woods System and the Launch of Dollar Hegemony

The establishment of an international dollar standard required that the critical problem of a global dollar shortage be solved. In particular, the urgent need was to find means of financing the post-war reconstruction of Europe and Japan (Eichengreen 1996).

The Bretton Woods negotiations reflected the tensions of forging a new international monetary order under the hegemony of the dollar. Keynes's Plan for an International Clearing Union sought to ease the credit restraints facing deficit countries through the aegis of a supranational authority

that extended the principle of banking to the international sphere, while transcending the narrow political constraints of a system based on the fiduciary issue of a hegemonic country (Keynes 1980). But the actual outcome of the negotiations cemented the dominance of the US and established a de facto dollar standard. The Bretton Woods arrangements involved fixing the dollar's price with respect to gold, while all other currencies were pegged to the dollar.

The International Monetary Fund (IMF), which had initially been conceived by Keynes and White as an institutional mechanism to enable member countries to overcome temporary liquidity problems and balance-of-payments crises, played only a marginal role in the immediate post-war transition; in large part because of its limited resources, US resistance to any increase in IMF quotas, and the increasing stringency of the conditions for drawing on IMF funds. Even when special drawing rights (SDRs) were created as an alternative source of liquidity in 1969, the stringent provisions for drawing and repaying SDR loans meant that SDR arrangements played only a limited role and did not undermine the dollar's international role.

Instead of depending on the mechanisms of the IMF, the US government launched the Marshal and Dodge Plans for the post-war reconstruction of Europe and Japan, as the means by which the dollar shortage would be alleviated. The US state was also trying to ensure that closer integration with the US economy would circumvent the possibility that these countries would shut out US capital. After the lapse of the Marshal and Dodge Plans, the US began a programme of military and economic aid. These mechanisms of offsetting capital flows enforced the asymmetric dependence of the international monetary system on the dollar for expanding liquidity, and helped solidify the role of the dollar as an international reserve currency. Thus, recipients of Marshal aid could not turn to the IMF for additional funds.

The desirability of dollar-denominated capital flows would fuel the resort to private foreign capital flows to meet the dollar gap, and sections of the US regime actively promoted the expansion of private dollar investment as an alternative to official channels when faced by the problem of international liquidity (Helleiner 1994).

Establishing the international role of the dollar required, in addition, pre-empting any possibility that Britain would reassert the dominant role of pound sterling. The terms of the Anglo-American Loan negotiated after the end of the war targeted the system of Imperial Preference (while pursing the agenda of a liberal trade regime) and the blocked sterling balances of British colonies. The premature launch of convertibility of the pound, as part of this agreement, led to a wholesale conversion of the sterling balances of the colonies into dollars, precipitating the sterling crisis of 1947. Apart from prying open former British colonies to US exports, the vulnerable payments position of Britain also meant that the pound had been effectively set up as a lightning rod for international speculative pressures, providing a measure of insulation to the dollar from the strains that the international monetary system faced (Block 1977).

The Suez Crisis and the ensuing collapse of the pound in 1956 was an important milestone in the effective eclipse of the pound's international role. It marked a shift in Washington's attitude towards the IMF. The IMF was drafted into the rescue of the pound from speculative attacks, in what could be considered its first 'bail-out' operation. The US was also able to use the promise of an IMF bail-out to oust the British from Egypt, while making a minimal contribution to the rescue. With the reinstatement of capital controls following the Suez Crisis, British financiers began to resort to offering dollar loans against their dollar deposits in an attempt to evade these controls. This paved the way for the growth of the euro-dollar market (dollar denominated bank deposit liabilities held in foreign banks or foreign branches of US banks). British banks began to substitute an international financial business based on dollars for one based on sterling, as a way of preserving the role of the City of London as a financial centre in the face of the erosion of sterling's importance.

The dollar's position at the apex of the international monetary system was well established by

the end of the 1950s. However, as Europe and Japan emerged as strong competitors to US industries, the US current account balances began deteriorating through the 1960s and the problem of a dollar shortage transformed into a dollar glut. With the large overhang of short-term dollar liabilities overseas, the possibility of a speculative run on the dollar posed a threat to the international payments mechanism. The rapid growth of unregulated international financial flows, through the eurodollar markets, also came into conflict with the constraints of the Bretton Woods system, precipitating the dollar crisis of the 1960s. However, the US external deficit and debt also reflected the burden borne by the US as the provider of international liquidity (Kindleberger et al. 1966).

A variety of measures were adopted to contain the dollar crisis. The prevailing financial arrangements of offsetting finance and the system of unilateral capital controls failed to prevent speculative flight from the US to Western Europe and fuelled inflation in these countries. The persistent deficits eroded the willingness of foreign central banks to hold dollar liabilities. The growing speculative pressure on gold prices and the demands of financing the war in Vietnam and the Great Society programme in the US brought the crisis a head. Finally, the US government suspended gold convertibility in August 1971.

The Consolidation of Dollar Hegemony Under a Floating Dollar Standard

The closing of the gold window and the subsequent 'float' did not result in the dollar losing its privileged position in the international monetary system. Rather, the dismantling of the Bretton Woods arrangements paved the way for the evolution of a floating dollar standard (Serrano 2003) – an international monetary system based not on a commodity like gold, but on the monetary liability of the leading country. Crucial to this role is the willingness of central banks and private investors to hold dollar liabilities.

With European central banks (Germany and France in particular) displaying increasing reluctance to support the US's exorbitant privilege, the US state drew the growing surpluses of the OPEC countries after the oil price shock of 1973 into the service of financing its deficits. US political and economic power ensured that these surpluses were recycled through the private channels of the euro-dollar markets so that the funds were routed through American banks. The US vetoed proposals to channel these surpluses through multilateral channels like the IMF (Spiro 1999). Initiatives directed at controlling the offshore Euromarket – including the introduction of reserve requirements and limiting central bank borrowings in the Euromarkets – were also blocked. There was a shift in focus to promoting private capital flows as the critical means to finance the US deficit and promote dollar dominance.

Capital controls were lifted in 1974 and in 1980 the Deregulation and Monetary Control Act was enacted in US. The sharp hike of interest rates enforced by the Federal Reserve head, Volcker, in 1979 was directed at battling inflation and stabilising the dollar after the 1978–79 dollar crisis. The Volcker shock was also a defining moment in the launch of the neo-liberal phase.

Internationally, too, the US pushed for a 'liberal financial order' promoting liberalisation of not only trade in goods and services but also flows of capital (Helleiner 1994). Oil surpluses that had been channelled into the eurodollar markets were then recycled to the emerging markets, in particular in Latin America, through syndicated loans in the 1970s. This bonanza of cheap credit came to an end with the debt crisis of the 1980s. This debt crisis was used to give a further impetus to liberalisation of financial markets in emerging markets. The Bretton Woods institutions were also refashioned under the so called 'Washington Consensus' into a means of imposing deflationary policies of fiscal austerity and monetary stringency on indebted developing countries.

There was a revival of capital flows in the 1990s along with a proliferation of new financial instruments including derivative contracts. Unlike the previous wave, the capital flowed increasingly to private entities rather than sovereigns. Apart from Latin America, South-East and East Asia

become important recipients of private capital flows in the 1990s. The continued surge of US deficits throughout this decade propelled international liquidity and capital flows to emerging markets and reinforced the pivotal role of the dollar internationally.

While the surge of private capital flows had helped preserve and expand the role of the dollar, the persistent current account deficits and the gross overvaluation of the dollar in the 1980s would pose a challenge. The US government brokered the Plaza Accord in 1985 that committed the central banks of G5 countries to adjust their monetary and fiscal policies in order to effect an orderly depreciation of the dollar. Two years later, in 1987, US policymakers engineered a new agreement, the Louvre Accord to put a floor on further depreciation of the dollar. Foreign Central Banks were thus drawn into the defence of the dollar and official purchases of dollars. Official holdings of US treasury bills have also played an important role in the multilateral clearing mechanisms of the 'floating-dollar regime'. In fact, the Revived Bretton Woods thesis ascribes the stability of the global adjustment mechanisms primarily to the reserve holdings of current account surplus countries (Dooley et al. 2004). Japan was the principal creditor country through the 1990s with the largest holdings of US reserves. Since 2000, China has emerged as a major holder of dollar reserves. The experience of the Asian crisis in 1997–98 also triggered a pattern of increasing reserve accumulation by developing countries in order to insulate their economies from the debilitating impact of capital flight.

There are thus two dimensions to the process of refashioning the dollar standard after the collapse of the Bretton Woods system. It was based, on one hand, on the concerted advocacy of liberalisation of international private financial flows in the interests of preserving dollar dominance. The pivotal role of the US in global financial markets reinforces the privileged status of the dollar, enabling the US to generate international liquidity by running up its trade deficits and external debt. On the other hand, its stable functioning also drew on the interventions of official investors and central banks to buttress the dollar. The

official demand for US treasury bills serves as the basis for the profusion of private financial flows. The dollar is the monetary liability of the US state, but the international dollar standard is constituted by the global private dealer system and its interface with the hierarchy of central banks (Mehrling 2013).

Theorising Imperialism in the Context of the Dollar Standard

The dollar standard is a critical element in the institutional edifice of US imperialism. The precise character of US imperial power exercised through its privileged key currency status involves the interactions and interlinkages of states and private capitalist institutions in the global economy.

Characterising Contemporary Imperialism

There are (at least) three broad characterisations of contemporary imperialism hinged around the dollar standard: first, the domination of other states by the US state in pursuit of its own geopolitical objectives (Hudson 2003); second, the deployment of US structural power in the wider interests of expanding and managing capitalist accumulation globally (Panitch and Gindin 2012); third, the global hegemony of the US and US-dominated finance in the restoration of capitalist accumulation in the neo-liberal period (Duménil and Lévy 2004, 2010).

In Hudson's (2003) view, the dollar-debt standard that emerged after the collapse of the Bretton Woods system signifies a new form of imperialism in which the US state exploits and exercises power over other nations while pursuing strategic advantages and agendas, independent of the profit motives of private corporate capital. The US's dominant status in the international arena was not undermined by the transformation from creditor to debtor status since the establishment of the dollar-debt standard meant that balance-of-payments deficits and rising public debt no longer

imposed a constraint on US policy. Hudson relates the transformation of the US from a creditor to a debtor to US military interventions in Korea and the dollar crisis of the 1960s to the demands of the war in Vietnam. The military adventures of the Cold War were the primary impetus to the subsequent growth of US deficits and debt in Hudson's account. The key role of the dollar-debt standard and this 'deficit strategy' was to enable the US to prosecute its military imperatives while running up debt without necessitating domestic adjustment. He characterises the dollar-debt standard as 'super-imperialism' since the privilege of unrestrained deficits is exercised only by a single state, the US. Super-imperialism entailed the siphoning of surpluses by the US state from the rest of the world through the interventions of central banks and multilateral institutions like the IMF and World Bank, rather than by the actions of corporations.

In contrast to Hudson (2003), Panitch and Gindin (2012) do not envisage contemporary imperialism as primarily a conflict between the US state and other states. The privileges of the reserve status of the dollar and the related economic and financial hegemony that the US enjoys have not, in their view, been directed to drawing surpluses to the US state or even to exclusively promoting US capital. Rather, the strategic objectives of the US state are directed towards superintending global capitalist accumulation of capital and widening markets for capital in general. As the dominant imperial state, the US has taken on the responsibility for ensuring the smooth reproduction and expansion of capitalism and has overseen the restructuring of global capitalist relations to fashion an integrated global capitalist system by promoting liberalisation. At the intersection of the US state and international finance, the US treasury and Federal Reserve have played a key role in promoting global capital mobility and free trade, and also in containing and managing capitalist crisis. It serves as the ultimate guarantor of capitalist interests. This role is also central to the successful containment of inter-imperial rivalry in their analysis, as the US state acts not in the interests of US capital alone, but of global capitalist system more generally.

While Panitch and Gindin (2012) argue that the US state has promoted neo-liberalism to further the interests of a global capitalist class rather than the specific interests of American capital, Duménil and Lévy (2004, 2010) link the rise of neo-liberalism to the resurgence of the hegemony of US finance (defined as the upper fraction of capitalists and their financial institutions). The euro-dollar market was the terrain where finance launched its revival in the 1970s. The coup of finance that was launched following the hike of interest rates in 1979 paved the way for this revival. With the coup of finance, the neo-liberal model was also pushed globally as a means of sustaining the dollar's international role within a world of floating exchange rates. The dollar's key international role provided the US with a greater degree of freedom in pursuing its broader policy imperatives, and with a measure of insulation against the impact of crisis that other nation states did not enjoy. More important, the US economy can grow and accumulate capital unfettered by its external imbalances. US imperialism is characterised by the US private corporate capital pumping surpluses from the rest of the world in the form of net flows of financial income from abroad. That the US has been earning more income on its foreign asset holdings compared to what it pays out on its liabilities to the rest of the world is a manifestation of imperial mechanisms in their account.

Contemporary imperialism entails the complex and contradictory process of the integration, under the hegemony of the dollar standard, of the interconnected hierarchy of nation states that constitutes the world capitalist economy. The exercise of imperial power by the US state is embedded in the structure of the financial system. The dollar standard has played a pivotal role in relaxing the external constraint on the US economy and the US state as argued by Hudson (2003) and Duménil and Lévy (2004, 2010).

Hudson's (2003) argument that these gains are garnered exclusively by the US state misses the role US imperial power has played in the smooth coordination of global capitalist accumulation system stressed by Panitch and Gindin

(2012). The analysis of Panitch and Gindin (2012), on the other hand, underplays the dominance of US financial and corporate capital over other capitals and the asymmetric gains that US financial and corporate capital has reaped with the neo-liberal backlash and the emergence of a floating dollar standard. It also underplays the extent to which the 1970s crisis constituted a structural break both in the manner in which the US exercised its imperial hegemony and the global regime of capitalist accumulation.

Imperial power and the dollar standard played a crucial role the restoration of profitability after the stagflationary crisis of the 1970s that is central to the analysis of Duménil and Lévy (2004, 2010). The collapse of the Bretton Woods system did signal a fundamental structural transformation of capitalist relations globally in response to this structural crisis. Arrighi (1999) also sees the resurgence of finance and the collapse of the Bretton Woods system as the outcome of the crisis of the 1970s, which he characterises as an over-accumulation crisis. The subsequent expansion of finance signalled, in Arrighi's historical world view, the closing moments of American hegemony. Parboni (1985) also saw the floating of the dollar as a reaction to the relative decline of the US economy *with respect* to Western Europe and Japan. However, the post-war period actually witnessed a restructuring of imperial relations and a consolidation of US imperial power under the floating dollar standard as outlined by Panitch and Gindin (2012) and Duménil and Lévy (2004, 2010).

Panitch and Gindin's (2012) elaboration of the manner in which the US deployed its imperial power in the post-war period to mitigate inter-imperial rivalries throws light on an important dimension of imperialism. In particular, the imbrication of rival nation states in international financial markets centred on the US has been a major means though which this cohesion was welded. The integrated global order is thus not simply an outcome of the spontaneous workings of capitalist expansionist tendencies, but has been forged through the concerted actions of states – in particular the US state.

Integrating the Periphery

Contemporary imperialism involves a hierarchy of state power; not just domination of rival imperialist nation states by the US, but also that of the periphery by imperialist countries. The integration of nation states in the periphery into the global circuit of capital under US hegemony entails the articulation of corporate and financial capital from the advanced capitalist countries with changing class configurations within these countries. The trajectory of development in the periphery is fundamentally altered by its absorption into the circuit of capital's global circuit.

Hudson's (2003) account stresses the use of debt as a crucial lever for the exercise of power. Debt enables the US state to pressure foreign governments to align their policies to the imperatives of US policy. The Washington consensus, in his view, encapsulated the strategic objectives of the US and was imposed on debtor countries as part of the conditionalities associated with IMF bailouts and World Bank loans that enforced the dependence of the debtor countries in the periphery on global finance. At the same time, the dollar-debt standard obliged the central banks of surplus countries of Europe and Asia to extend short-term loans to the US in the form of holdings of US treasury bills.

Panitch and Gindin (2012) emphasise the crucial role that the US Treasury and the Federal Reserve play in enforcing the US's geo-political agenda to shape and govern global capitalism. In their perceptive account, the structural power that the US state wields over its informal empire does not depend on wars and military occupation or the interventions of the Pentagon, but more fundamentally on the inter-penetration of elements of the US state in the international financial system. US imperialism has forged a new international division of labour that has embedded domestic capitalist classes in the periphery more deeply in the process of global capitalist accumulation. In a departure from most accounts of imperialism, they argue that nation states in the rest of the capitalist world economy have been absorbed into the informal American empire not solely through US pressure or the actions of multilateral

institutions, but also significantly through the active initiatives of the ruling elites in these nation states who in a sense 'invited' integration within the US informal empire as a strategy for furthering capitalist accumulation and relations. They place short-term capital in US financial markets, not necessarily because of military threat or diplomatic pressure, but because of the unrivalled attractiveness of the dollar.

The dollar standard and the dominant position of US financial markets in the pyramid of global capital markets have, however, also helped preserve the structural vulnerability of the periphery and the fundamental asymmetry of the imperial hierarchy. The coup of finance, launched with the 'Volcker shock', marked an important juncture in US imperial relations in Duménil and Lévy's (2004, 2010) analysis, and brought countries of the periphery deeper into the embrace of the US finance-dominated dollar empire. The integration of the periphery through the ne-liberal phase also helped resolve the crisis of the 1970s.

Apart from restoring profitability and providing a market stimulus, the periphery plays an essential role in ensuring the stability of the capitalist accumulation in the core imperial countries. In Patnaik's (2008) formulation, countries in the periphery perform the functions of being both a market on tap and a shock absorber, imparting stability to the dollar standard. This stability rests on the existence and perpetuation of a reserve army of labour both within core countries and in the pre-periphery. The persistence of unorganised and informal producers within the pre-capitalist sectors in the periphery weakens the bargaining power of workers in the capitalist sectors in both the core and the periphery. This pauperised populace in precapitalist sectors serves an essential function in stabilising the dollar standard by securing favourable terms of trade for the goods produced in the periphery and also by putting a lid on the wage claims of workers in the core. Patnaik (2008) argues that US imperialism under the dollar standard has a dual character, furthering both retrogression in terms of perpetuating the pre-capitalist relation in the periphery on one hand; and on the other hand, enabling a limited diffusion of capitalist relations by providing access to markets in the core countries through its growing deficit.

Apart from stabilising the dollar standard by curbing wages, Patnaik argues that the periphery also helps sustain the growing deficits of the US through triangular patterns of offsetting balances, whereby its surpluses with primary goods exporting semi-capitalist peripheral countries balances deficits with other capitalist countries. This offsetting role is more important, in his view, than the role of the periphery in providing a stimulus to investment. He sees the pressure placed on surplus countries in the periphery to appreciate their currencies as a reflection of the growing strains on these offsetting mechanisms.

But the unfolding forms and strategies of Western imperialism cannot be understood solely on the premise of the continued existence of pre-capitalist regions. Patnaik's account of the role of the periphery in stabilising the dollar standard does not address the implications of financialisation for the functioning of the dollar standard. Financialisation is, however, central to Lapavitsas's (2013) account of the dollar standard. He argues that the US state fostered the 'subordinate financialization' of developing countries in the periphery through the 1990s and promoted private financial mechanisms based on the capital market as the means of integrating these countries into the US imperial system. As primary commodities prices and export of manufactures grew, there was a big surge in the reserve holdings of developing countries. Lapavitsas (2013) sees this stockpiling of reserves by countries in the periphery as a manifestation of their subordinate status; the imperatives of 'selfinsurance' from capital flight and of maintaining favourable exchange rates in order to promote exports. It is not a sign of a fundamental reordering of their place in the imperial hierarchy but an integral dimension of their subordinate financialisation. Since the bulk of these reserves are held as US treasuries, the accumulation of reserves boosted the demand for dollar holdings by foreign central banks. Subordinate financialisation induced uneven development and imposed a significant burden on the periphery in terms of rising interest rate spreads between countries in the periphery

and the US and the cost of sterilisation of these excessive reserves. The reverse flows of capital from the periphery to the core, which stem from interactions between states rather than private capital, are characterised by Lapvitsas as an informal tribute extracted by the US state. This tribute is deployed, in Lapavitsas's framework, not solely to benefit the US state but also private capital more generally.

Vasudevan (2008, 2009a) elaborates on the triangular patterns of adjustment that characterised core–periphery relations in both the floating dollar standard and during the pre-1914 International Gold Standard. The mechanism of recycling surpluses and the export of fragility to Latin America through the unregulated euro-dollar market during the 1970s and early 1980s paved the way for the neo-liberal impetus to liberalisation in international capital markets at the end of the century. The essence of these mechanisms of triangular adjustment is not so much that they provide offsetting finance, as Patnaik (2008) stresses, but that they underwrite the capacity of the US to draw on the surpluses of creditors and continue to incur debt despite growing deficits, and recycle these to other debtor countries in the periphery. These capital flows are instrumental in sustaining the US deficits and the ability of the US to act as a banker to the world. The debtors in the periphery bear the brunt of the burden of deflationary adjustment in the form of recurrent currency crises and serve as a safety valve against speculative attacks on the dollar. The export of financial fragility to the peripheral countries in this framework is an integral component of the triangular adjustment mechanisms that mediate adjustment and liquidity creation and help preserve stability in the centre. This pattern of recycling surpluses that underlies the generation of international dollar liquidity engendered and depended on the tremendous growth of private international capital flows and not just the actions of states, and has been fuelled by the ability of the US to 'borrow' internationally from both official and private investors. These borrowings were then recycled to buttress global demand and restructure the international production system with the relocation of production from the advanced core to developing countries. The US is not merely the banker to the world, it is also the prime engine of global demand.

Finance, World Money and the Dollar Standard

The analyses of Patnaik (2008), Vasudevan (2009b), and Lapavitsas (2013) approach the working of the dollar standard through the prism of Marx's elaboration of world money. In Marx's analysis, world money evolves as the ultimate material embodiment of power internationally, once the money-form 'breaks through the barriers of home circulation to assume the part of a universal equivalent in the world of commodities'. World money serves as 'the universal means of payment, as the universal means of purchase, and as the absolute social materialization of wealth as such' (Marx 1976/1867, p. 242). It is the means by which wealth is redistributed across nations. The distribution of reserves is thus also a measure of power between nations (De Brunhoff 1976).

The international monetary system that Marx was investigating was in essence a commodity standard and bullion was the prevalent form of world money. The actual historical development of the international monetary system has witnessed the evolution of a key currency system, with the dollar currently performing the role of world money among a hierarchy of currencies.

Patnaik (2008) characterises Marx's conception of money as 'propertyist', in that the value of money is determined outside the demand-and-supply fluctuations. Patnaik puts forward the argument that in a fiat money system, like the dollar standard, the stickiness of wages in the key currency country helps ensure the relative stability of the value of money. The pre-capitalist periphery where the pauperisation of large populations has created a price-taking reserve army of labour is essential to stabilising wages in the core. This conception of world money also provides a framework for analysing imperialism, seen here as primarily a relation between the capitalist centre and the pre-capitalist sectors in the

periphery where stability is ensured from 'outside' through the preservation and recreation of this reserve army of labour. The leading key currency country is the dominant imperialist power mediating the relationship between the advanced capitalist nations and the periphery. Its relation with the pre-capitalist periphery is integral to the confidence its currency enjoys among wealth-holders.

Patnaik (2008) also puts forward the argument that the floating dollar standard is still in essence a commodity standard. With the erosion of union power, increased capital mobility, and the erosion of the scope of traditional Keynesian demand management policies since the 1970s, rising wages have not been the primary threat to the stability of the dollar. Rather, he argues that the price of oil, as the critical primary commodity, has become the more pervasive threat to the value of the dollar. Patnaik (2008) characterises the floating dollar standard as an oil-dollar standard, not because oil transactions are denominated in oil or that the oil surpluses are denominated in dollars, but because of the significance of oil prices to price stability. He sees the imperative to control oil resources as a motive force for the US's military adventures in the Middle East.

Patnaik's crucial insight about the link between world money and the international division of labour forged by the exercise of imperial power does not go far enough in situating this division of labour in a hierarchy of international credit relations. The breakdown of the Bretton Woods system marked the severing of the connection between the dollar and gold. It also signalled the maturation of a state credit standard, through a process that was embedded in the rise to dominance of finance (Duménil and Lévy 2004, 2010) and financialisation (Lapavitsas 2013). The dollar standard rests on the interplay of the actions of the state and central banks on one hand, and private financial institutions on the other, what Gowan (1999) has christened the Dollar-Wall Street regime.

McNally (2010) ascribes the spread of financialisation to the mutation that occurred in the form of world money after formal convertibility between the dollar and gold was abolished and world money became tethered to the dollar. He argues that the heightened volatility in currencies and the uncertainty in valuation of international transactions precipitated under the new floating dollar standard gave an impetus to trade in foreign exchange. In particular it led to a tremendous growth of trade in new financial instruments, such as exchange-rate and interest-rate derivatives that were designed to hedge against volatility by commodifying risk. While intended to serve as efficient means of hedging risk and reallocating capital, this derivative trade was increasingly used for speculation and evading regulatory requirements, leading to the buildup of leverage and fragility in the financial system. Financialisation in McNally's framework is not only about the rising power of rentiers and financiers and the changing pattern of accumulation to financial channels, or even the pursuit of liberalisation and deregulation, but more fundamentally about the product of this metamorphosis of the money form to a fully fledged credit-money standard and the related transformation of financial intermediation to the riskier terrain of capital markets.

In Lapavitsas's (2013) framework, the monetary basis of contemporary financialisation ultimately also derives from the emergence of the dollar-US treasury bill as world money. The US treasury bill lies at the apex of global capital and money markets, and plays a central role in generating international liquidity. The dollar standard is a reflection of the use of the power of the US state to establish the dollar as key currency by transforming it into a secure financial asset that is perceived to be relatively free from the risk of default. Such a risk-free liquid asset is essential to the smooth functioning of the international financial system (Fields and Vernengo 2013).

However, as Mehrling (2013) has argued, monetary systems are hybrid in that public and private liquidity is interlinked, and hierarchical in that monetary instruments are qualitatively distinct and organised around the dominant key currency – the dollar. Thus, financialisation and the growth since the 1990s of a private, global, shadow banking system has supported the official public dollar system, but its growth has also

eroded the US Federal Reserves's ability to manage the monetary system.

Lapavitsas (2013) also argues that the dollar as a state-backed debt instrument combines elements of fiat and credit money but he treats it as essentially a form of 'valueless tender'. However, once money as a means of payment takes the form of a financial asset, it is not strictly 'value-less', though its valuation is subject to principles of valuation which are distinct from those of other produced commodities. Marx had put forward his formulation of fictitious capital as a distinct basis for valuation of financial assets like public debt. The evolution of the floating dollar standard also implies the emergence of an international monetary system based on fictitious capital (de Brunhoff 1976; de Brunhoff and Foley 2007; Foley 2005; Vasudevan 2009b.

The valuation and management of state debt is thus a useful point of departure for comprehending the link between US imperialism and the dollar standard within the framework of Marx's theorisation of world money (de Brunhoff and Foley 2007; Foley 2005). The US treasury bill is not simply the link between the US state and private capital markets. As world money, the dollar is the link between the US state and a hierarchy of other nation states and private capital in the international sphere. The management of public debt and the development of finance are integral to the exercise of imperial power in the international dollar standard. These were also critical during the phase of British financial hegemony under the International Gold Standard (Vasudevan 2008, 2009b).

The working of the dollar standard requires the willingness of foreign investors to buy the debt instruments of the US state. The growing debt burden necessary to sustain this role would, however, tend to undermine the status of the dollar as world money as it faces the prospect of speculative outflows of capital. This is the crux of the contradictions in the use of a country's currency as international money – the 'Triffin dilemma' (Triffin 1960). The floating dollar standards resolved this dilemma by displacing the thrust of deflationary crisis to debtors in the periphery, while compelling creditors countries in Asia to share part of the burden of adjustment (Vasudevan 2008, 2009a, b).

The privileged capacity to generate and sustain international liquidity and sustain global demand is both a reflection of and mechanism for the exercise of imperial dominance by the US. The ability of the central bank of the key currency country to calibrate capital inflows, without eroding confidence in its credit worthiness, does not depend simply on the magnitude of the debt burden but, more significantly, on the liquidity of the market for its public debt. This liquidity is contingent on the depth and breadth of the key currency country's financial markets and the position of the currency within the structure of international credit relations as the principle means in which international transactions and wealth holding are denominated.

The dollar's role as internationally accepted money is thus the outcome of the historical evolution of the US as the financial centre of the global economy and as the dominant imperialist power. While the contemporary crisis does not necessarily herald the end of dollar hegemony, it does, however, signal a protracted period when the imperial relations fashioned under the US-led dollar standard are being restructured. The future trajectory of global capital accumulation and the evolution of the international monetary system will be shaped by the manner in which the current crisis and the contradictions of the imperial dollar standard are resolved.

Definition

William Edward Burkhart Du Bois (W.E.B. Du Bois) was born on 23 February 1868 in Great Barrington, Massachusetts. His achievements include founding the Niagara Movement, a

group of prominent black intellectuals advocating the full enfranchisement of blacks through economic and educational justice, and the National Association for the Advancement of Colored People (NAACP). He authored numerous books, studies and articles including the first large-scale sociological study of African Americans *The Philadelphia Negro* (1899), a standard-setting text for sociology.

William Edward Burkhart Du Bois (W.E.B. Du Bois) was born on 23 February 1868 in Great Barrington, Massachusetts. He completed a general undergraduate degree at Fisk University in 1888, before transferring to Harvard University and graduating cum laude with a bachelor's in Philosophy in 1890. He then obtained his PhD from Harvard in 1896 and completed his dissertation 'The Suppression of the African Slave-Trade to the United States of America, 1638–1870' (1896) while a professor at Wilberforce University in Ohio. His achievements include founding the Niagara Movement, a group of prominent black intellectuals advocating the full enfranchisement of blacks through economic and educational justice, and the National Association for the Advancement of Colored People (NAACP). He authored numerous books, studies and articles including the first large-scale sociological study of African Americans *The Philadelphia Negro* (1899), a standard-setting text for sociology. Du Bois's earlier works were empirically based, social science-oriented studies that illuminated the plight of and the policies affecting African Americans in the US.

Du Bois's work became decidedly less positivist over time and increasingly critical of 'accommodationist' views, eventually culminating in a Marxist internationalist understanding of race relations and Euro-American global hegemony. He ascribed this intellectual shift to pivotal experiences while on the faculty at Atlanta University (now Clark Atlanta University) from 1897–1910. Specifically, Du Bois cited an incident in which the severed knuckles of Sam Hose, a black victim of a white lynch mob, were displayed in an Atlanta store front, writing 'Two considerations thereafter broke in upon my work and eventually disrupted it: first, one could not be a calm, cool, and detached scientist while Negroes were lynched, murdered, and starved; and secondly, there was no such definite demand for scientific work of the sort I was doing' (2007, p. 34). His movement from positivist-based inquiry towards a multi-generic discourse composed of History, Psychology and Sociology paralleled his increasing sense that racism and imperialism were integrally implicated systems of exploitation based in both cultural and material conditions, a condition which could not be dissolved by objective inquiry alone but rather through intellectual activism and political, social, and economic mobilisation. By emphasising the structural and economic forces underlying a system of oppression based on race, Du Bois broke with the long-lasting and dominant tradition of liberal legalistic civil rights activism that had marked the black struggle in America, commenting that as an ideology 'it was not wrong so much as short sighted' (1940, p. 289).

Du Bois is best known for his analysis and critique of race in the US; however, he was also one of the first and most consistent and vocal critics of Euro-American imperialism. He preferred the terms 'semi-colonialism' and 'quasi-colonialism' to 'imperialism', 'deliberately using the term colonial in a much broader sense than is usually given it' (1988, p. 229). Expanding the definition of colonialism emphasised the sometimes subtle methods and indirect practices of continuing colonial rule by Western nations of newly independent former colonies that masked how the real relations of power had remained fundamentally unchanged. Decolonisation, then, was a ruse that hid the ongoing system of domination in which the global South remained in a subservient position to the global North. Du Bois believed that at the core of this system of global inequality was a racialised imperialism that buttressed the global economic and political systems of the nineteenth and early twentieth centuries and originated with colonial slavery, American racism, and European chauvinism. As his interests became more global in orientation, so too did his race analysis, mirroring his political development, from liberalism to socialism and finally communism.

From his earlier work on slavery in America, Reconstruction and the plight of African-Americans in Philadelphia to his later pan-Africanist cultural nationalism and finally to an internationalist anti-imperialism, Du Bois saw the enduring 'race concept' and the history of racialised slavery in America as the seed of 'modern industrial imperialism,' as well as a template and rationale for the colonisation and domination of native peoples and groups within what would become the US and those farther afield in the global South. His oft-quoted line from *The Souls of Black Folks* that 'the problem of the twentieth century is the problem of the color line . . .' (1903, p. 8) extended his analysis of slavery, Jim Crow segregation in the South, and the 'race concept' to include a worldwide economic, political, and cultural system that privileged white Euro-American interests at the expense of colonised and exploited peoples of colour. For Du Bois, the process that established and perpetuated slavery and racism in America was rooted in economic exploitation and accompanied by three distinct ideological phases. Ideologically, this system first emerged from ideas of European cultural superiority contrasting and hierarchising the civilised white to the 'savage', 'primitive' and/or 'uncivilised' non-European. Later, notions of a taxonomy and hierarchy of human groups based on putative biological differences that loosely correlated with skin colour (scientific racism) were developed to justify and rationalise slavery and colonialism. Finally, arguments of a social technological superiority (during decolonisation) served to justify the continuing exploitation and subjugation, both physical and psychological, of non-white peoples through paternalistic neo-colonial relations. This international racialised system of stratification, born in the slave-holding colonies of North America and exported around the globe with the expansion of capitalism and colonialism was based in the race concept.

In contrast to other prominent critics of racism, slavery, and imperialism of the time, Du Bois argued that both American slavery and modern imperialism were historically exceptional systems unlike earlier forms of slavery, forced unfree labour, and empire. Each was not only distinct in its geography and scope, as the modern form encompassed the globe and subjugated a majority of the world's population either directly or indirectly, but also ideologically unprecedented as both systems were constructed upon pseudo-scientific notions of race, notions that infected the very people they oppressed through an internalised racist psychology he dubbed 'double consciousness'. For instance, the systems of slavery present in ancient Europe were legalistic and based upon social status not physical traits or biological difference. Even the intensive stratification of the medieval feudal system subjugated serfs through a complex social web based on fealty and property relations, not physical traits or race. And he argued, both ancient slavery and medieval serfdom were limited in geographic scope, and, in the case of slavery, duration. Hence, the American example of a global systemic, and therefore imperial, inherited and universal race-based stratification system resulted in the subjugation of entire peoples and lands. Du Bois argued this was nefariously novel since it employed a superficial rationality and pseudo-scientific schema that totalised the experience of oppression and exploitation to include both the mind and bodies of those subject to its force. His earlier understanding of imperialism, in which cultural discourses about the inferiority of non-Europeans figured more prominently than economic factors, prefigures more recent scholarship on neoimperialism, neo-colonialism and post-colonialism while his later analysis tended toward an international class system based upon colonial racism. Yet, even as early as his 1898 dissertation, Du Bois understood American racism and slavery as institutions grounded in economic interests as well as a landed white southern aristocracy, writing 'the development of Southern slavery has heretofore been viewed so exclusively from the social and ethical standpoint that we are apt to forget its close and indissoluble connection with the cotton market' (1904, p. 152). For the time, this was a brilliant and radical departure from the standard moral condemnation of slavery.

As mentioned, Du Bois was one of the first thinkers to see imperialism operating even after

post-Second World War decolonisation. He saw the global hierarchy of nation states as a parallel to the internal racial order of the US and Europe, as, for him, nations were racialised and placed into a strict hierarchy in which white America and Europe were at the top of the political, economic, and cultural order. Of course, he recognised that dominant states still operated directly within foreign lands, but Du Bois argued that they also increasingly operated indirectly through cultural and social domains. Rather than possessing colonies through direct occupation and force, he maintained that imperialism operated within spheres of political influence, frequently protecting the interests of corporations acting with impunity on foreign territory. Hence, he deliberately employed a broad use of the term 'colonial' to explain uneven international relations. Further, these corporations deliberately manipulated cultures and governments for market expansion and control while exporting Western lifestyles, ideas, and values to solidify market control and subdue resistance. Du Bois, then, is one of the first critics of imperialism to argue that culture, in addition to politics and direct military might, is integral to imperialism. This profound insight forms the basis for later post-colonial critiques that see the role of culture as an important, if not *the* dominant facet of expanding, cloaking, and consolidating the control of foreign lands, peoples, and resources by Western powers.

While Du Bois in his early works emphasised the importance of culture as well as racism in the formation and extension of imperialism, he also insisted from his earliest work 'The Suppression of the African Slave-Trade' (1896, published 1904) that the fundamental roots of all forms of imperialism are economic. By his last and posthumously published *Autobiography* (1967), he concluded that while race and gender were important components of a complex web that supported and extended imperialism on all levels, class was the key underlying factor of imperialism. He thus ultimately embraced a Marxist understanding of imperialism, gender, and race, arguing that the global capitalist class dominated a world economic system in which overwhelmingly brown people and nations are exploited for profit. As he

grew increasingly disenchanted with the possibility of reform within the US he gravitated towards the Soviet Union and openly sided with Stalin. Yet, to call Du Bois simply a Marxist is to miss one of his greatest contributions to social theory and social justice struggles: that race and class, while historically and categorically separate, had been blended into one seamless reality for most of humanity. Marx's simple bipartite class division elided over the complex triangulation in which the capitalist elite and white working class exploited the coloured majority of mankind, going so far as to build the nation state upon this foundation. The US, he argued, based its selfcharacterisation, its self-understanding, and its actualisation upon an alliance between rich and working-class whites. In 'The African Roots of War' he wrote, '[The] white workingman has been asked to share the spoils of exploiting "chinks and niggers". It is no longer simply the merchant prince, or the aristocratic monopoly, or even the employing class that is exploiting the world: it is the nation; a new democratic nation composed of united capital and labor' (1915, p. 709). Yet both these privileged categories (whiteness and wealth) are the product of the race concept. So, while Du Bois embraced the Soviet Union, he continually emphasised that the global proletariat was overwhelmingly nonwhite. Further, that the white working class in places such as the US and Europe shared in the 'spoils' of Third-World subjugation and exploitation and benefited from an omnipresent racial order.

Unlike Booker T. Washington, Du Bois saw the plight of African Americans in the US as part of a larger global system of race-based oppression that affected the 'darker races of men, who make the vast majority of mankind' (2007, p. 159). Du Bois maintained that culture was an important component of colonisation and imperialism as well as a mode of resistance and the path towards full emancipation, enfranchisement, and decolonisation. He championed the reconstruction of culture to produce 'race pride' and advocated 'black awareness' to counter the colonisation of culture and mind under slavery and colonialism. He proposed fostering a black

elite, the 'Talented Tenth', along with mass agitation and protest in order to transform conditions affecting African Americans. Although a continuous theme in his work, the 'Talented Tenth' underwent lifelong revision. Du Bois originally described the concept as a vanguard of educated black elites who would lead the way out of oppression and poverty for all peoples through an enlightened moral order. Their 'self-knowledge, self-realization and self-control' would allow them to 'guide the Mass away from the contamination and death of the Worst, in their own and other races' (Du Bois 1948, p. 165). Some scholars have criticised Du Bois's cultural nationalist vanguardism as accepting the disparaging premise that African Americans were the victims of a degenerate or stunted culture due to the history of slavery and oppression. But by the end of his life he had shifted his hope away from a black cultural elite to the 'mostly' brown and black working masses. He had become disillusioned with the Jeffersonian individualism of the black elite who served their own self-interests before those of the black masses. The 'Talented Tenth' thus became the 'Guiding Hundredth,' as his original vision of an educated black vanguard leading all Americans out of ignorance, poverty, and oppression morphed into 'the great majority of men, the poverty-stricken and diseased [who] are the real workers of the world' (Du Bois 1944: para. 29). Nevertheless, again, Du Bois never abandoned the race concept entirely. Even in his Marxist reformulation of the Talented Tenth, he maintained that the colour line persisted, producing 'a complete separation of classes by race, cutting square across the economic layers' (Du Bois 1940, p. 205).

Clearly, then, Du Bois's understanding of imperialism was deeply intertwined with what he called 'the race concept' which 'guided, embittered, illuminated and enshrouded [my] life' (2007, p. 71) and which functioned on a material, social, political, and intrapsychic level. While always emphasising the economic dimensions of slavery, colonialism, and imperialism, he also highlighted the intrapsychic or personal effects of institutional and structural race and racism with his concept of the 'veil' and 'double consciousness'. The veil was both a metaphor for racism and the colour line and a referent to the physical, social, and psychological barriers and divisions produced by race. It serves as a marker for the psychosocial moment of recognition and of difference for blacks in a white-dominated society. Du Bois's concept of double consciousness first appeared in *The Souls of Black Folk* (1903). Influenced by, but radically different from Hegel's master-and-slave dialectic, double consciousness is a condition that results from a system of racism that produced a split in perception in which the oppressed sees herself both through her own perspective and through the perspective of the oppressor. This causes a split in self-awareness and self-conception that Du Bois argued was antagonistic and contradictory, and that he maintained had produced a bifurcated and alienated identity for the victims of racism and colonialism. And yet this split of consciousness also endows the oppressed with 'second sight': the ability to perceive social reality, and therefore political and economic realities, from the perspective of both the oppressor and the oppressed. This duality of understanding is a burden as well as a type of clairvoyance. The victim of racism intuitively understands the mechanism of race and its effects while the privileged remain entirely ignorant of the most powerful social force of the century.

Du Bois extended the logic of 'second sight' into his analyses of imperialism, connecting domestic and international revolts against slavery and colonialism to a Euro-American revolutionary tradition – one that situated the Haitian Revolution, abolitionism and Reconstruction, and the ongoing project of decolonisation as moments in the unfinished emancipatory project of the Enlightenment. In this sense, it is the 'second sight' of the oppressed that perceives the need for and demands equality and freedom, forcing Euro-American nations and peoples to realise their own historical processes. In this context, the Talented Tenth and the Guiding Hundredth are not merely a reconfigured elitism in the first case, and revolutionary mass in the second, but the assertion that reason and revolution always emerge out of oppression.

While condemning US imperialism, Du Bois also perceived a progressive and emancipatory potential for imperialism to spread democratic institutions and racial tolerance, particularly in contrast to European imperialism, a system he understood to be much more racially rigid and exploitative. At the same time, however, Du Bois understood that this democratic potential would be the product of a white US that dominated foreign markets and land in search of cheap labour because the internal domination of the white working class was unsustainable due to class conflict. In this way, Du Bois prefigures a contemporary understanding of First and Third World, neo-imperialism and globalisation. The colour line is both the problem and solution for America, as he believed that a first-world labour problem (labour shortages and resistance) generates racialised imperialism as a solution to the antagonism between the white working class and capitalist elite at home. This global racial division of labour then aligns whites in the First World as a group, collectively exploiting non-whites in the Third World. This global racial and class order does more than just support racism domestically and internationally, it stabilises and supports a class order as well preserving and protecting the domination, privilege, and power of a small white elite over and against a general underclass that is both white and non-white. Racism forms a type of currency that is used to pacify an otherwise restive white underclass by dolling out gifts of social prestige, psychological superiority, and material benefit. This international racialised division of labour operated in both Europe and the US with some differences:

> Western Europe hopes that without essential alteration in its way of life an accommodation can be made between their demands and the upsurging of the lower classes and peoples. They see this chance in four ways: home labor appeased by elementary education and some political power; with higher wages paid out of profit from investment in foreign lands, which the home labor makes sure by fighting in world wars. (Du Bois 1967, p. 16)

The US on the one hand has an endless flow of immigrants who form the basis of a stratification system ostensibly predicated on achievement or 'boot strap capitalism'. Du Bois tears down the façade of the American dream by pointing to the underlying basis of white assimilation and mobility: black oppression and exploitation. The potential and promised assimilation and mobility into the white elite is only possible against the backdrop of a permanent black underclass under a racialised capitalist system. Some 25 years later, sociologists would rediscover Du Bois's profound insight into the racist foundation of the 'melting pot' (assimilation and social mobility), without ever giving him credit for it, and call it 'segmented assimilation'. On the other hand, the American class and race system can also depend upon an ever-expanding global labour market, a 'worldwide new proletariat of colored workers' (Du Bois 1995, p. 542). These cheap non-US labourers require little in terms of compensation and even less in terms of social welfare (schools, housing, medicine, retirement, policing), enriching the capitalist class in the US to such a degree that with their historically unprecedented massive stockpiles of wealth they are able to undermine democratic institutions and bribe white workers as a racial mercenary class. The white working class are used as soldiers, sailors, and foremen to discipline and police and when necessary kill this 'new proletariat' of 'colored workers'. American imperialism then is merely an extension of American racism and a means to sustain a domestic class system as well as a global racialised division of labour.

Along with his observations that race and class are integral to imperialism, Du Bois mounts a feminist critique of imperialism as well. In *Darkwater* (1920) he argues that black and white women are marginalised groups and that their emancipation is part of the fulfilment of the Enlightenment's promise of equality. Gender thus forms another node in the nexus of oppressive mechanisms that exploit the labour of the marginalised by a system of patriarchal, paternalistic capitalism that has its origins in American racial slavery and, he hoped, its future demise in the international class consciousness that would overcome racism and imperialism.

Du Bois's complex and sweeping body of work defies simple categorisation: positivist social scientist, integrationist, cultural and

economic separatist, anti-imperialist, and communist. Yet he pursued a consistent and clear intellectual project of emancipation, justice, and equality through his attempts to demystify, deconstruct, and resist the totalising and ubiquitous racist-imperialist world system. While his insights operated on multiple levels of analyses, fields of discourse, and planes of action, Du Bois always focused on the inequities produced by an economic system that originated with American racial slavery and that, by the end of his life, had come to dominate the globe. Like a good detective, he relentlessly pursued and documented all the working parts of a cancerous system of exploitation that inter-penetrates human social relations on every level and covers the globe. While never losing hope of fulfilling the Enlightenment's promise of justice and equality, by the end of his life he felt the US was unredeemable. He was indicted as a spy by the US in 1951, something which, despite his acquittal, led to his total disillusionment with the country. He joined the Communist Party in 1961, renounced his US citizenship and decamped to Ghana where he died on 27 August 1963 on the eve of Martin Luther King's march on Washington.

Synonyms

African slave trade; Caribbean imperialism; Colonialism; Netherlands Antilles; Racism; Slavery; Struggle for independence

Definition/Description

The Dutch colonization of the world over four centuries has been a major force in the creation of inequality. The Netherlands Antilles were a major geographic center of the slave trade in the Americas as the peoples of the Caribbean islands continue to strive for independence from their colonial masters.

Dutch Imperialism in the Caribbean

In the seventeenth century, the Netherlands – at that time called the Republic of the Unified Netherlands – ruled over a vast empire stretching from Asia to the Southern Cape Colony and coastal trading ports in Africa and, ultimately, to the New World. It was the interest in sugar, slaves,

and salt – a core component of the lucrative herring trade – that led the Dutch in the 1630s to establish vital commercial ports and colonies in the Antilles including the Leewards islands of Curaçao, Aruba, and Bonaire just north of the Spanish main and the Windward islands of St Eustatius, Saba and St Maarten. Ousted from northern Brazil by the Portuguese in 1667, the Dutch moved northward and established a colony in Surinam. Private trading companies such as the Dutch West India Company (WIC) administered these scattered territories. The Society of Surinam, which governed Surinam between 1683 and 1795, was owned jointly by the WIC, the city of Amsterdam and the Van Aerssen van Sommelsdijck family, relatives of the founding colonial governor. However, the riches – in pursuit of which the Dutch justified colonisation and the brutality of slavery – proved elusive. And in spite of the waning economic importance of their West Indian colonies by the nineteenth century, the Dutch have remained in the Caribbean to this day.

Today, the enduring trans-Atlantic ties that bind the Dutch Caribbean to the former metropole are rooted in the legacy of imperialism. This essay chronicles the evolution of these relations in the Netherlands, the Netherlands Antilles, and Surinam from the turn of the nineteenth century until the present. In these roughly 200 years, imperialism in the Dutch Caribbean has followed an unlikely course: ranging from metropolitan disinterest at the zenith of the age of 'new imperialism' to, strikingly, an intensified post-colonial investment in the West Indies as Antilleans have insisted on their right to remain within the Kingdom. While other European powers in the nineteenth century undertook 'civilising missions' that stimulated pride and nationalism in the metropole, Dutch officials and their countrymen remained largely apathetic about the flagging colonies of the Netherlands Antilles – then called 'Curaçao and dependencies' – and Surinam. A nadir in this history is the maintenance of slavery until 1863, decades after both the British and French had abolished it. Politically, relations between the metropole and West Indies remained colonial until the Second World War, after which the

governing autonomy of the Netherlands Antilles and Suriname were significantly broadened. In the period of radical anti-imperialism during the 1960s and 1970s, only Surinam followed the seemingly normative model of decolonisation when it exited the Kingdom in 1975. Meanwhile, Antilleans have repeatedly broadened definitions of anti-imperial resistance by insisting that self-determination includes the right to remain under Dutch sovereignty. The tremendous diversity in experiences throughout the Antilles and in Surinam lays bare the ambivalent impact of the imperial project to make the Caribbean 'Dutch'.

Colonial Governance

In the nineteenth century, the administrative organisation of Dutch colonies in the Caribbean began to take a more lasting shape with the transfer of authority from private trading companies to the Dutch government. Despite a more centralised approach to colonial administration in the West Indies, the nineteenth century in the Antilles and Surinam reads in many ways against the grain of 'new imperialism.' Indeed, as the commercial importance of the Dutch Caribbean waned by the nineteenth century so too did the zeal for the imperial project there. Unlike in the East Indies, imperialism in the Caribbean was never a source of pride and national celebration in the metropole. Nevertheless, the structures of governance and patterns of rule that metropolitan and colonial officials forged would endure into the twentieth century.

With the conclusion of the Napoleonic Wars in 1815 and the establishment of a Kingdom in the Netherlands, the first Dutch king, Wilem I, assumed direct rule over Dutch colonies in the Caribbean. During the Napoleonic Wars and French occupation of the Low Countries, the British had temporarily gained control of Dutch possessions in the Caribbean, which also included the colonies of Berbice, Demerara, and Essequibo. When Wilem I took over the Dutch West Indian empire in 1815, only Surinam and the six Antillean islands – Curaçao, Aruba, Bonaire, Saba, St Eustatitius and St Maarten – were returned to the

Netherlands. To streamline colonial governance after the demise of the WIC, in 1845 the West Indian empire was divided into two administrative entities: Surinam and the Netherlands Antilles, which until 1948 retained the name 'Curaçao and dependencies.'

In political terms, the administrative relationship between the colonies and metropole throughout the nineteenth and early twentieth centuries remained essentially colonial. For most of the nineteenth century, the Crown appointed a governor in each colony who held executive and legislative authority. Governing regulations implemented in 1866 introduced colonial councils (*Koloniale Staten*) to the governing apparatus of West Indian colonies, yet these bodies were advisory in nature, lacked any legislative authority, and were appointed largely by the governor himself. Further, the governor retained the right to adapt any of the councils' suggestions. Predictably, governors and members of the colonial councils were born in the Netherlands or else members of the European colonial elite. Until 1962, the governor of the Netherlands Antilles was invariably a European Dutchman with a military or academic background.

Managing colonial economies was one of the most important tasks of imperial governments. By the mid-nineteenth century, the West Indian colonies failed to turn a profit. Because of this economic state of affairs, The Hague insisted on its right to intervene in the colonies' budgets if they were not balanced. Thus, in spite of the 1866 governing regulations that aimed to broaden the autonomy of colonial governance, the fact that the budget was not balanced in Surinam until the 1940s and in the Antilles until the 1930s meant that into the twentieth century The Hague maintained tremendous authority in approving and adapting colonial budgets.

Slavery and Racial Hierarchies in Colonial Societies

One of the metropole's most significant interventions in the life and economy of its West Indian empire came in 1863 with the abolition of slavery.

For the WIC, who ruled over much of the colonies in the Americas and whose monopoly on the African slave trade ended only in 1730, the traffic in African slaves to the new world was essential business. Indeed, from 1600–1808 – when, during their occupation of Surinam, the British abolished the slave trade – the Dutch were responsible for bringing an estimated half-a-million slaves to the New World. The migration of enslaved Africans profoundly shaped the societies of the Dutch Caribbean, where free European settlers remained in the minority and indigenous populations were virtually non-existent in the Antilles owing to earlier Spanish contact.

Since the initial founding of their colonial empire, the Dutch struggled to impose a rigid racial hierarchy on what was a thoroughly heterogeneous colonial population. The organisation of social relations in Aruba, Curaçao, and Surinam attest to the tremendous variety throughout the Dutch Caribbean. On Aruba, which unlike the other Antillean islands did not have a majority enslaved population of African descent, Amerindians migrating from South America settled on the island and in many cases mixed with the small European population.

Curaçao, the most populous and economically significant of the Antilles, emerges as an outlier amongst Caribbean colonies. Its commercial character and function as a free-trade hub created an atmosphere of relative openness amongst the resident population, although the conditions of life under slavery remained brutal and oppressive. Given the island's commercial character and its arid climate, which prevented the development of large-scale plantation agriculture, slaves worked on the docks, as sailors and domestic servants, and produced food for local consumption. The relatively large segment of a free coloured population on Curaçao is also striking. Although the elite Dutch Protestants and Sephardic Jews of colonial Curaçao married endogamously to protect wealth and privilege, lower-class European Dutch who arrived in the eighteenth century as petty officers and labourers began to marry light-skinned middle-class creole women. Indeed, such marriage patterns attest to the low number of Dutch women who migrated to the New World and the

prevalence of unions – both official and unofficial – amongst males of European descent and females of African and Amerindian descent. White elites viewed this group with anxiety, fearful that a mulatto middle class would upset the boundaries of the colonial racial hierarchy.

Although plantation agriculture was scarcely imaginable in the arid or else small and mountainous terrain of the Antilles, by the eighteenth century Surinam had emerged as a quintessential plantation colony. Contemporary observations about the unique cruelty of planters in Surinam bear out statistically, where each year more slaves died on plantations than were born there. The negative birth rate demanded the merciless importation of more slaves from Africa, upon whose labour tropical cash crops such as sugar and coffee were produced and destined exclusively for Dutch markets. From 1668–1828, between 300,000 and 325,000 slaves were sold to planters in Surinam. On the eve of emancipation in 1863, some 36,000 individuals remained enslaved and 216 plantations continued to operate.

If the nature of colonial slavery varied throughout the Dutch Caribbean, so too did forms of resistance. The jungles of Surinam's vast and uninhabited interior served as a sanctuary to communities of runaway slaves, known as maroons, who often formed tribes alongside the native Amerindians of the rainforests. In the eighteenth century, Dutch officials were forced to conclude a peace treaty with maroon leaders, granting them their autonomy. By the time of emancipation in 1863, maroon communities along the Surinam River constituted a nation within a nation, including some 8,000 people living in isolation from colonial authorities.

On Curaçao, slave revolts erupted several times in the eighteenth century. One of the largest occurred in 1795 and was influenced by the principles of freedom and equality emanating from the Haitian Revolution. On 17 August 1795, about 50 slaves on the plantation De Knip refused to work and deserted the plantation. What initially began as an apparent strike grew in the coming weeks to attempt an island-wide revolt that included some 2,000 – a significant portion of the island's 12,000 slaves. Despite early successes, by September the slave militias had been brutally suppressed by Dutch forces. Today on Curaçao, Tula, the proclaimed leader of the 1795 slave revolt, is recognised as a national hero and 17 August is annually commemorated as a milestone in the struggle for freedom.

Although slave resistance threatened the security of planters and colonial elites, the institution of slavery would not be abolished until 1863. Who was responsible for abolishing slavery and what were their motives? Scholars of Dutch Atlantic slavery have debated the explanation and significance of late abolition – indeed, the British had abolished slavery in 1833 and the French in 1848. Whether metropolitan officials were motivated by the poor economic performance of the colonies, humanitarian reasons, or perhaps simply because they appeared backward amongst their European neighbours for maintaining slavery, what is clear is the lack of a strong abolitionist movement in the Netherlands. Tellingly, one of the most intense debates surrounding abolition, and one that contributed to its late date, concerned the remuneration of planters, not slaves.

Whereas slave labour had already lost its economic importance throughout much of the Antillean islands by the mid-nineteenth century – in fact, in St Maarten slaves had already declared themselves free in 1848 when slavery had been abolished on the French side of the island – in Surinam official emancipation in 1863 and its aftermath would have a different impact. Given Surinam's plantation economy, Dutch officials prepared for a dramatic labour shortage by inviting indentured workers initially from British India and later from Java and China. This second wave of immigration to Surinam in the mid-nineteenth century resulted in the creation of Latin America's most diverse society, with sizable Hindustani (British Indian), creole or Afro-Surinamese, Javanese, Chinese, Maroon, and Amerindian enclaves. Although in the colonial period more people spoke Dutch in Surinam than elsewhere in the Caribbean, the widely spoken creole language of Sranan Tongo reflects the diverse peoples and colonial history of Surinam, as it includes English, Portuguese, Dutch, and Central and West African influences. Meanwhile, the colonial economy in

Surinam continued its downturn in the latter half of the nineteenth century. Faced with increased global competition and declining prices, sugar plantations after 1863 did not recover and the dearth of capital prompted planters to abandon their estates, which were subsequently broken down into small farm plots and typically cultivated by former slaves.

The post-emancipation period in the Antilles and Surinam continued to be characterised by racial inequality, metropolitan disinterest, and elite colonial dominance in the realms of politics and economics. In Surinam, which garnered more metropolitan investment than the Antilles given its larger population and abundance of natural resources, the metropolitan state subsidised Christian missionary activities in the education and conversion of former slaves and their descendants. Although efforts at Afro-Surinamese assimilation were ambivalent at best, a Dutch-language educational curriculum enabled a class of creoles – typically the progeny of white planters and civil servants and Afro-Surinamese female concubines, the so-called 'Surinamese marriage' – to initiate colonial careers. It would be this group who first called for self-government in Surinam.

Resistance, Independence, Autonomy

With changes in colonial social organisation underway by the turn of the twentieth century, the next 100 years would bring dramatic transformation in trans-Atlantic relations. The Second World War is a watershed in this history, ending centuries of colonial rule. Yet unlike familiar narratives of post-war decolonisation entailing bloody struggles for national liberation, in the Dutch Caribbean demands for immediate territorial sovereignty have proven the exception, not the rule. As enduring partners in the Kingdom of the Netherlands, the experiences of the Antillean islands demonstrate that struggles for equality need not manifest in demands for unequivocal independence.

Until the Second World War, modernising reforms in Surinam and the Netherlands Antilles proved half-hearted. Even after a representative council was introduced in the Antilles in 1936, only 5% of the population was eligible to vote. For metropolitan and colonial officials, parliamentary democracy and fully autonomous governance in the West Indian empire were simply not options.

During wartime, however, a devastated and powerless Dutch government in exile began to accept that colonial governance must change if the empire were to survive. In 1942, Dutch officials proposed reforming the post war Kingdom to become a commonwealth of equal-partner states, each possessing autonomy in internal affairs. The primary purpose of this concession, however, was to maintain Dutch influence in Indonesia, which in 1945 had proclaimed independence. Following a protracted and bloody struggle for sovereignty, the Netherlands at last relinquished control of Indonesia and, for the first time in over a century, was compelled to focus on its lingering imperial investments in the Caribbean. In 1948 the Netherlands honoured Antillean and Surinamese petitions for governing reforms. That year, 'Curaçao and dependencies' became known as the Netherlands Antilles. Both here and in Surinam, parliamentary democracy and the extension of the franchise replaced the powerful rule of colonial governors and undemocratic councils. At this stage, no official mentioned the possibility of independence.

It took until 1954 to produce a comprehensive constitution of the Kingdom of the Netherlands. During a series of round-table conferences initiated in 1948, delegates throughout the Kingdom attempted to strike a constitutional balance between full independence and metropolitan integration. On 29 December 1954, the Charter of the Kingdom of the Netherlands was proclaimed that enacted a new constitutional order for the three ostensibly equal states of the Netherlands, the Netherlands Antilles, and Surinam. While the latter two possessed governing autonomy in internal affairs, the Netherlands was careful to ensure that many responsibilities for Kingdom-affairs remained grounded in The Hague. Among them, nationality, foreign affairs, defence, and the guarantee of good governance would be administered from Europe.

Although the Netherlands undoubtedly retained the upper hand in Kingdom affairs, trans-Atlantic relations after this point can no longer unequivocally be characterised as colonial. The extension of the franchise and the introduction of autonomous and democratic governing institutions issued a fundamental break from the governing regulations laid down a century earlier. Nevertheless, the absence of any Kingdom-wide representative body or judiciary ensured that the Netherlands – its parliament and judicial courts – would have de facto authority throughout the Kingdom.

In an era of heightened radical anti-imperialism, in the late 1960s Curaçao and Surinam began to press for further changes within the Kingdom. On Curaçao, frustration evolved out of a labour dispute amongst workers at the Shell oil plant. In the 1920s, oil refineries established on Aruba and Curaçao brought significant industrial changes to the Antilles, expanding the industrial working class and drawing immigration of skilled technicians from the Netherlands and labourers from throughout the Caribbean and Latin America. Employment cutbacks and the increased reliance on sub-contracted labour by midcentury disproportionately affected the black working class on Curaçao, who received lower wages than immigrant workers. After negotiations failed, on 30 May 1969 downtown Willemstad became the site of a violent protest. Moving beyond its origins as a labour dispute, the protestors railed against the vestiges of Dutch colonialism and the endurance of racial inequality and economic exploitation. Local police struggled to contain the revolt as protestors looted businesses and burned buildings. The Dutch, owing to their promise of mutual aid and the guarantee of defence as outlined in the Charter, aided Antillean authorities in ending the revolt.

Trinta di mei, or '30 May 1969,' although subdued in just a number of days, was a major milestone in the struggle for Antillean equality. For the first time ever, a political party representing the interests of the Afro-Curaçaon working class came to power on the island. Although May 1969 brought relations between the Netherlands and Curaçao to a head, the event also heightened tensions between Curaçao and neighbouring Antillean islands. Aruba, which had long complained of political dominance by Curaçao, worried in particular about the ascendance of radical working-class politics there.

In The Hague, the revolt of May 1969 troubled the new centre-left governing coalition, whose members grew concerned that the perpetuation of 'neo-colonial' ties would frustrate an increasingly progressive Dutch self-image and foreign policy agenda. For Dutch officials, ushering the former colonies to total independence seemed the only course of action. In 1974, the Surinamese government under the leadership of Prime Minister Henck Arron unexpectedly announced its intention to accept independence the following year. Dutch officials were enthusiastic about the prospect, and negotiations over the next 2 years culminated in the peaceful transfer of sovereignty to Surinam on 25 November 1975. Although some radical nationalist movements percolated in the years leading up to independence, no popular referenda on Surinam's political status had ever been issued, and what transpired in 1975 was largely a closed-off, political affair. Popular scepticism surrounding independence is perhaps best expressed in the dramatic exodus that occurred between its announcement in 1974 and 1980, when the Netherlands ceased to recognise the Dutch citisenship of Surinamese. During this time, upwards of one-third of Surinam's population left permanently for the former metropole.

As this dramatic postcolonial exodus suggests, political independence did not meet all of the nationalist aspirations in Surinam. Within 5 years of the transfer of sovereignty, a military coup led by Desi Bouterse, a former soldier, overthrew the democratically elected government. During his military dictatorship, Bouterse was accused of killing 15 of his top opponents and opening the country to drug trafficking and crime. Although independence has delivered on other expectations in Surinam, the country's tumultuous post-independence history became a cautionary tale for other would-be nationalists throughout the Antillean islands.

Aruban leaders cautiously observed the evolving state of affairs in Surinam. Curiously, it was

not separation from the Netherlands that Aruba sought but distance from Curaçao, perceived as a hegemonic political force in the Antillean state. Dutch officials had long been reluctant to break apart the six-island Antillean state, believing the unity of the islands to be crucial for later realising independence. In 1983, however, Dutch officials acquiesced to Aruban separatist leader Betico Croes and agreed to recognise Aruba as a separate constituent country of the Kingdom on the condition that Aruba accept full independence within the next decade. When Aruba achieved its *status aparte*, or separate status in 1986, Aruban officials worked quickly to revoke the guarantee of eventual independence. Strikingly, as this and subsequent changes in the Kingdom reveal, calls for Antillean independence have originated largely in The Hague. Antilleans have resisted such moves while asserting that sovereignty rests in the right to disavow independence and choose amongst forms of associated statehood.

Towards the Kingdom of Today

By the 1990s, The Hague began to accept that their role in the Caribbean would be a permanent one and, barring independence, grew anxious about further decentralising the Netherlands Antilles. Although opinion polls conducted throughout the Antilles in the 1990s indicated general support for the maintenance of the five-island state, by the turn of the twenty-first century, perceived dominance by Curaçao amongst the smaller Antillean islands and Curacao's mounting resentment over its responsibility to the 'little brothers' of the Antilles led to a drastic overhaul of the five-island state. Referenda issued throughout the Antilles after 2000 ultimately laid bare the deep dissatisfaction with the state. Of the four options on the referenda – total independence, separate status within the Kingdom, direct constitutional ties with the Netherlands, or maintenance of the Netherlands Antilles – Curaçao and St Maarten chose to pursue separate status within the Kingdom while a majority of voters on Bonaire and Saba wished to develop direct ties with the Netherlands. Only St Eustatius voted to maintain the Netherlands Antilles, and in a reissued referendum sided with Bonaire and Saba in forging direct ties with the Netherlands.

Overhauling the Antillean state per the referenda would be a significant endeavour for the Netherlands: tremendous Antillean debt to the Netherlands would need to be forgiven in order for economies, in particular in the newly created states of Curaçao and St Maarten, to function independently. And the exact nature of 'direct ties' with Bonaire, St Eustatius and Saba, known as the BES islands, would involve years of intense negotiations ultimately resulting in the extension of Dutch borders overseas. By 2006 a plan for constitutional restructuring was in place: on the symbolically chosen date of 10 October 2010 (10/10/10) the islands of the Netherlands Antilles would secede from one another, though each of them would remain within the Kingdom of the Netherlands. Curaçao and St Maarten would become autonomously governing member states of the Kingdom, joining Aruba and the Netherlands. The BES islands would forge direct ties with the Netherlands according to Article 134 of the Dutch Constitution, bringing the smallest and least populous of the Antilles under direct constitutional rule as 'public entities' of the Netherlands. In effect, the BES islands would integrate into the European Netherlands, electing representatives in The Hague and being subject to Dutch law.

Despite intense negotiations over debt, government corruption in the Antilles, and the dramatic change in governing coalitions in both Curaçao and Bonaire, which intermittently threatened to halt the process, on 10 October 2010 the next historic phase of Kingdom relations commenced when the Netherlands Antilles – a state that was created and, for most of its history, maintained as a colonial administrative unit – dissolved. For the residents of the former state, little love was lost for a country that many felt had only ever existed in the eyes of Dutch officials.

The dismantling of the Antilles, a major diplomatic undertaking for all parties, pointed up the difficulties of building a more equitable Kingdom. First, Antillean restructuring failed to address the Kingdom's so-called 'democratic deficit.'

Member states do not answer to a single Kingdom-wide legislative or representative body. Although residents of the BES islands now vote for members of Dutch parliament, the fact that Dutch institutions stand in for most Kingdom-wide affairs while representing only constituents in the Netherlands remains a perennial problem. Secondly, discussions over Antillean dismantlement in the Netherlands occurred in a political climate where debates over immigration and increased government spending are flashpoint issues. Proposed measures to restrict the immigration of high-risk Antillean youth to the Netherlands – perceived as poorly assimilated and overrepresented in criminal statistics – have heightened tensions between the Netherlands and the Antilles, for whom Dutch citizenship and access to the Netherlands is a primary reason for remaining within the Kingdom. Lastly, for many in the BES islands, the near total legal assimilation with the Netherlands has threatened traditions of political and cultural autonomy. Controversially, some standards for social security, schools, and hospitals remain lower in the BES islands, while the Dutch parliament has insisted, alternatively, that the islands accept Dutch law on same-sex marriage, abortion, and euthanasia. Sensitivity to these issues amongst religious and political leaders on the islands is compounded by a perceived sense of marginalisation in negotiations over the evolving relations between the Netherlands and its Caribbean public entities, evoking fears of 'recolonisation' on the islands. Here as elsewhere throughout the former Dutch Antilles, contentment over this new phase of post-colonial relations remains under evaluation.

Conclusion

The history of colonialism and inequality that has characterised trans-Atlantic relations throughout most of the past four centuries looms large in contemporary Antillean and Dutch political imaginaries. Although most experts dismiss independence amongst the Antillean islands as an unlikely outcome, the rhetoric of territorial sovereignty continues to resonate – in the Antilles and the Netherlands alike. In the European Netherlands, ascendant anti-immigrant political parties like the Party for Freedom (*Partij voor de Vrijheid*) have notoriously proposed selling the islands on marktplaats.nl, an e-commerce website akin to Ebay. In the Antilles, political parties like Curaçao's leading Sovereign People (*Pueblo Soberano*) continue to proclaim eventual sovereignty as a core component of their platform.

Nevertheless, the Netherlands and the Antillean islands are more closely intertwined as post-colonial partners today than they were two centuries ago. The hundreds of thousands of immigrants from Suriname and the Antilles currently residing in the Netherlands have blown open the long silenced history on the Dutch slave and colonial past, debates that also concern enduring anxieties around racial equality and post-colonial statehood. The fact that in 2010 three Caribbean islands became juridically 'Dutch' after a half-century of political autonomy raises questions about the enduring and ambiguous legacies of imperialism. What remains to be seen, however, is whether an enduring multinational Kingdom can be made more equitable for all its citizens.

Easter Rising (1916) in Ireland and Its Historical Context, Campaign for an Irish Democracy

Féilim Ó hAdhmaill
School of Applied Social Studies, University College Cork, Cork, Ireland

"And the world did gaze in deep amaze at that gallant band but few
For slavery fled 'neath the Liffey swell when they fell on the foggy dew" (The Foggy Dew)

Introduction

This entry focuses on the Easter Rising in Ireland (1916), its causes, and its impact nationally and internationally. As such, this is a study of the development of resistance to British colonial rule in Ireland, the beginnings of Irish republicanism, its challenges to existing power structures such as the Catholic Church, the landowning, and emerging capitalist class and the British Empire, and the resulting tensions and conflicts which emerged within the Irish population and between it and British political and strategic interests. It also discusses the legacy of the Rising and its aftermath in relation to Ireland's place within the world, the continuing uncertainty and unresolved issues around conflict, and peace within Ireland and Anglo-Irish relations today.

The Background to the Campaign for Political Democracy in Ireland

On Easter Monday morning 24 April 1916, armed bands of about 1200 men and women took control of a number of key buildings and areas of Dublin, the capital city and the center of British administration in Ireland (McGarry 2017). Their leader, a man called Patrick Pearse, read out a document which was then posted on the General Post Office in the main avenue, Sackville Street (now known as O'Connell Street). It proclaimed an independent Irish republic free from British rule. Fighting broke out as British troops were sent to retake the buildings. A number of other parts of the country experienced disturbances, but these were of a much more limited nature.

By the end of the week, what the authorities called "the rebels" had surrendered, and a ragtag band of prisoners, most in civilian clothes, were marched away to captivity. An estimated 485 people had been killed, the majority, about 260 of

them, civilians (including 40 children) and nearly 3,000 wounded during the fighting (Glasnevin Trust n.d.; Duffy 2017). In the immediate aftermath, the British authorities, having introduced martial law, executed 14 of the alleged leaders in Dublin, 1 in Cork and a sixteenth later in London. Others were sentenced to life and other various lengths of imprisonment. Throughout Ireland an estimated 3,500 men and 79 women "suspects" were arrested, and nearly 1800 were imprisoned "without trial" in Britain. The Rising appeared to have failed miserably.

The Irish media, the Catholic Church hierarchy, and the main nationalist Irish Parliamentary Party all condemned the Rising. The vast bulk of the population did not rise in its support as had been hoped by the leaders, and indeed contemporaneous reports suggested that many people in Dublin apparently abused the prisoners as they were led away (McGarry 2017:255). Many more men were fighting with British forces overseas in World War I and in the police forces in Ireland, the Royal Irish Constabulary (RIC) and the Dublin Metropolitan Police (DMP), than were involved in the Rising. Yet in the space of just over 2 years, the "constitutional" Irish Parliamentary Party had been decimated in the 1918 elections, and the republican party, Sinn Féin, had secured an overwhelming majority of seats in Ireland, on a platform of abstention from Britain's Westminster Parliament and establishing an independent Irish parliament, Dáil Éireann. The Rising and in particular the response of Ireland's British rulers to it appeared to have succeeded in awakening what Thomas Davis, the nineteenth-century republican revolutionary, had described (in his celebrated song "The West Awake") as the "slumbering slaves" of Ireland. To paraphrase the Irish poet, W.B. Yeats' "a terrible beauty" appeared to have been born.

Why did the Rising take place in 1916? What did it mean for Ireland and indeed the world, and what has been its legacy?

To understand the 1916 Rising, it is important to look at the context in which it took place. It did not happen in a vacuum but was the result of a culmination of a range of factors in the early years of the twentieth century and a long history of British rule and resistance to it over many centuries. It was that long history which provided part of the incentive for the "rebels" to organize the Rising. It also provided part of the narrative which legitimized their actions in their view and the view of their supporters. The Rising can only be understood in the context of that long-drawn-out struggle to achieve political democracy and in the context of a world controlled by the male property-owning classes of imperial powers.

In the early twentieth century, the island of Ireland was ruled directly by the Westminster Parliament in London as part of what was called the United Kingdom of Great Britain and Ireland. This entity had been created by the 1801 Act of Union in the aftermath of yet another rebellion against British rule in Ireland in 1798 and its brutal suppression. In reality the people of Ireland had had little say in the creation of this "United Kingdom" or indeed in British rule of Ireland over the previous six centuries. Only about 3% of the population of Britain and Ireland had the vote in 1801, and Catholics, the vast majority of the people in Ireland (80%) at the time, were not allowed to take seats in Parliament. This ban was lifted in 1829 after Daniel O'Connell's Catholic Emancipation campaign, and there was a gradual extension of the vote to more people throughout the nineteenth century through the campaigning efforts of social reformers, socialists, labor unions and suffragettes. However, by 1916 it was still the case that only a small minority (15%) of the people of Ireland actually had a vote in Parliamentary elections.

In 1916 therefore, any notion of democracy in Ireland under British rule was highly underdeveloped. Attempts had been made from the late eighteenth century on to change this, by both revolutionary and "constitutional" means. However on the eve of the 1916 Rising despite a range of promises and a Home Rule Bill, suspended due to the outbreak of World War I and political opposition in Ireland and in Britain, political democracy still appeared to be elusive and a site of continuing struggle.

The Background to the Campaign for Political Democracy in Ireland

Colonialism, Plantation, and the Sectarianization of Ireland

While attempts by power elites on the island of Britain to rule Ireland began with the Anglo-Norman invasions from 1169 on, they were initially successful in only parts of the country, around the greater Dublin area in what was termed "The Pale". Gradually over the centuries most of the country came under English control, through a mixture of invasion, suppression of resistance, bribery, and divide and conquer of local chieftains.

Prior to the Reformation, both colonists (from the island of Britain) and Irish were Christian/Catholic. The main factors distinguishing Irish natives from English rulers/landowners related to language and culture. As time progressed intermarriage and interrelationships led many colonists and their descendants to acquire the Irish language and customs. Fearing the Anglo-Irish were becoming "more Irish than the Irish themselves" (indeed many of the early uprisings against English rule were led by the Anglo-Irish), the English Government in Ireland passed the Statutes of Kilkenny (1366) aimed primarily at stopping the Anglo-Irish mixing with natives (Bartlett 2010:34–79).

It was the Reformation however and responses to it which was to lead to the greatest and most enduring divisions in Ireland. Differences in religion became associated with differences in ethnic/cultural identity and with political and national loyalty and disloyalty. Differential sets of civil, political, and economic rights were also developed by the British state in Ireland based on these religious differences.

After the Reformation and the English King Henry VIII's break with Rome in 1534, the vast majority of the Irish remained Catholic, despite being ruled by a now Protestant England. They were viewed as being "disloyal" because they had sided with Rome and not the King. Clergy were banished and could be executed if captured and Church land confiscated. From that period, the connection between religion, notions of identity,

and loyalty or disloyalty to Britain developed. The fact that the native Irish found themselves in conflict with both a "foreign" religion as well as a "foreign" power strengthened the importance of religion as a bond of identity and solidarity. The same was true for the settlers from Britain, planted in Ireland to provide support for the crown. The result was the creation of an historic bond between Catholicism and a concept of ethnic Irishness on the one hand and Protestantism and the ethnic identity of the colonizer on the other.

Despite the suppression of numerous uprisings, the wholesale confiscation of land, and the imposition of a number of plantations of loyal subjects from the island of Britain, it was not until the early seventeenth century, the Flight of the (last Gaelic) Earls, and what became known as the Plantation of Ulster from 1609, that British control of all of Ireland became complete. The confiscation of land and the plantation of often relatively poor tenant farmers as settlers from England and Scotland had a devastating impact on the socioeconomic position of the Catholic ("native") Irish in Ireland. This was particularly the case in Ulster. By 1704 the native Irish owned about 14% of land in Ireland but only 5% in Ulster (Hayton 2018:134; Corish 1981:74). The Ulster Plantation, in particular, laid down segregated living patterns (where Irish Catholics and Scots/English/Protestants lived in separate communities and separate lives) which exist to this day in parts of Ulster. The dispossession of the native Irish was to be exacerbated, reinforced, and reproduced into the seventeenth century with the imposition of the penal laws.

The Penal Laws

Uprisings continued to disrupt stable control of Ireland until the final crushing of Irish supporters of the English King James 11, a Catholic, by William of Orange's Protestant forces in 1690 in the Williamite War (1689–1691). The penal laws which followed almost completely suppressed native Irish demands for independence from Britain for more than a century. They operated from 1695 until the early years of the nineteenth

century and categorized citizenship rights according to religion. Catholics were discriminated against socially, politically, and economically. Presbyterians also suffered though this was mainly in terms of restrictions on religious practice rather than economic or political participation in society, although Presbyterians could be excluded from holding public office, practicing law or teaching if they refused to accept the sacraments on Sunday according to the English rite (known as the Test Act). Unlike Catholics, Presbyterians with the necessary property qualifications (many of whom did not) could vote and take seats in the Irish Parliament (Connolly 2008:205). Draconian property ownership restrictions were imposed on Irish Catholics, and they were denied access to education. The main purpose was to deprive the majority Irish Catholic population of political and economic power and remove any threat to control by Britain and its loyalist supporters. As a result of these restrictions, which bore most heavily upon the Catholic gentry and lay leadership, political leadership of the Catholics passed to the clergy. As a wealthy international organisation, the Church was the only body which could provide education, albeit outside of Ireland, and thereby give status and power to Irish Catholics. On their return to Ireland as educated clergy, they assumed the leadership role of the native Irish. Thus the tremendous influence wielded by the Catholic Church among Catholics in Ireland up until the twenty-first century "has its roots in the historic elimination of alternative avenues for Catholic political participation in Irish politics" (Probert 1978:21).

Although Catholics in Ireland and their Church were viewed as disloyal, this did not mean that they favored radical social and economic change. Both the Church and its congregation wanted an end to persecution, but for the vast majority, the most that meant was changing the rulers or the way they ruled. There is certainly an argument that since Catholics followed a hierarchal system of religion, similar to monarchy, they would be more inclined culturally to embrace monarchy politically rather than democracy, unlike, say, Presbyterians. As long ago as 1732, Jonathan

Swift had argued, for example, in his "Reasons for Repealing the Sacramental Test" that:

> the Catholics were always defenders of the monarchy, as constituted in these kingdoms, whereas our brethren the Dissenters were always Republican both in principle and practice. (Swift 1964:286)

Whether or not this was true, the depressed state of most Catholic Irish economically, politically, culturally, and educationally meant that when republican ideas were brought to Ireland from revolutionary France in the late eighteenth century, it was primarily educated Protestants and in particular Presbyterians who embraced and promoted them.

The Birth of Irish Republicanism

In the late eighteenth century, it was the Protestant middle classes, not the politically silenced Catholic/Irish, who began to demand greater democracy in Ireland and then an independent republic. Thomas Paine's *Common Sense* (1776) and the *Rights of Man* (1791) and the revolutions in both America (1776 on) and France (1789 on) had a profound effect on radical ideas and actions among many throughout Europe, including the educated classes, primarily Protestant, in Ireland at the time. The American struggle for an end to rule from Britain and the French Revolution's struggle for an end to rule by absolute monarchs sparked the imagination of those who saw political democracy as a solution to their economic well-being. The revolution in France in particular showed that not only could governments be changed but that Catholics (in France) could embrace radical change, oppose monarchy, and in the process challenge their own Church hierarchy. In Ulster in particular, the effect of Britain's economic policies (aimed at protecting the economy of Britain rather than promoting the economy of Ireland) had created discontent among those engaged in the new industrialization of the late eighteenth century. The Volunteers were set up as a militia in 1778 ostensibly to defend Ireland in the event that the American revolutionaries would use that country as a stepping stone to attack Britain during the American War of

Independence. However, they used their position of strength to demand greater independence from Britain (and Britain's executive in Dublin) in relation to passing legislation for Ireland. While Grattan's (Protestant) Irish Parliament gained greater legislative powers from London by 1782, the country was still governed by an Irish executive appointed by Britain, and Catholics, the vast majority of the population, remained excluded from political life (Mansergh 2004). It was not until the founding of the United Irish movement in 1791, led primarily by Protestants, that the demand for political rights for Catholics began to be widely articulated.

The United Irish Society was the first major movement in Ireland to articulate the concept of a republic, one which was secular and in which the different religious strands of Protestant, Catholic, and Dissenter would be united together "under the common term of Irishmen." The organization was, in the beginning, open, reformist, and constitutional. The majority of its founders were parliamentary reformers (Moody et al. 1998). Although it initially tried to bring about reform through peaceful means, under increasing state coercion, it turned to revolution, culminating in the failed rebellion of 1798.

The United Irish Society was up initially in Belfast and then Dublin. It established "clubs" throughout the country and a newspaper in Belfast – *The Northern Star*. Wolfe Tone, was one of its main leaders. In the pamphlet, *An Argument on Behalf of the Catholics of Ireland* (1791), he called for full Catholic Emancipation and the removal of the remaining penal laws. A series of discussions ("the Belfast debates") developed among Protestants and in particular northern Presbyterians about the idea of equal rights for all religious groups in Ireland. In 1793 Catholics owning or renting property worth two pounds or more were given the vote (on the same basis as Protestants), though they were still barred from sitting in Parliament. They were also allowed to attend university and serve in the military and civil service. However these reforms didn't go far enough in the direction of political democracy for the United Irish. In the same year, Britain went to war with revolutionary France, and those in Ireland who appeared to be supportive of the French revolution were seen a threat to the establishment in Britain. In 1794 the United Irish Society was banned and went underground as the British Government began rounding up, torturing, "pitch-capping" (pouring hot tar on the scalps of victims), and killing suspects. Wolfe Tone escaped to the USA and then to France where he attempted to get military aid for a rebellion in Ireland. By this stage the United Irish had made it clear that it was an independent republic which was required. Tone's diary entry for 11 March 1796 stated:

> Our independence must be had at all hazards. If the men of property will not support us, they must fall; we can support ourselves by the aid of that numerous and respectable class of the community, the men of no property. (Moody et al. 2001:107)

By August 1796, Tone articulated his aims thus:

> To subvert the tyranny of our execrable Government, break the connection with England, the never-failing source of our political evils, and to assert the independence of my country – these were my objects.
>
> To unite the whole people of Ireland, to abolish the memory of our past dissensions and to substitute the common name of Irishmen in place of the denomination of Protestant, Catholic and Dissenter – these were my means. (Bartlett 1998:46)

In 1796 a French invasion fleet was wrecked by storms off Bantry Bay in Cork. Rebellion broke out in May 1798 mainly in Antrim and Down in the North and in Leinster, particularly around Wexford. It lasted 3 months and was brutally suppressed by the government with tens of thousands killed. Many were transported to the colonies as prisoners. Toward the end of the rebellion another French force landed in Co. Mayo in August 1798 but after a short period was surrounded and surrendered. A final French force also landed off the coast of Donegal with Tone on board. It was defeated and Tone was captured and sentenced to death. He took his own life before being executed. The 1798 Rebellion had been another failure in a history of failures of attempted rebellions against British rule in Ireland. What was different about it however were the ideas it was trying to promote of secular republicanism and political democracy – the

E

ideas of the French revolution, liberté, fraternité, and egalité. These were ideas which were to influence future generations of republicans in Ireland, and it is from this point that the future Irish Republican Brotherhood (IRB) which organized the 1916 Rising traced its roots.

The 1798 Rebellion had been largely led by the Protestant Irish, and although Catholics did part in it particularly in Wexford, the vast majority did not. The Catholic hierarchy had vehemently opposed the rebellion, greatly lessening the participation of the Catholic Irish. Some did become involved, especially in Wexford; Father Murphy, the priest who led the Wexford Rising, was excommunicated by the Catholic Church. However, most historians agree that the vast majority of Catholics, especially in the North, spurned it, and many joined government militias, set up in 1793, to help suppress it. Most of the northern rebels who took up arms were Protestants, while the largely Catholic Monaghan Militia was, in fact, one of the mainstays of the government forces in the North (Berresford Ellis 1985:81). While some Catholics fought on the rebel side at Ballynahinch, many more served with the militia (Budge and O'Leary 1973:12).

Catholic Church and British Government Rapprochement

By the late eighteenth century, the relationship between the Catholic Church and the British state had begun to change. One pivotal event was the death in 1766 of the son of the deposed Catholic King James II who had been recognized by the Pope as King of Britain and Ireland while in exile. The Pope did not recognize his son, "Bonnie Prince Charlie," as King. This allowed Irish Catholics to recognize the de facto King George III, removing one particular impediment to their potential treatment by the British authorities as loyal subjects (Phoenix 2001). Besides this by the latter half of the eighteenth century, the Catholic Irish had not rebelled for 100 years. Both the British establishment and the Catholic Church were also terrified of the possible repercussions of the French Revolution, especially as there were

revolutionary rumblings in Ireland in the form of the United Irish Society with links to the French revolutionaries. The new conditions meant that elements in the British Government began to develop a different approach to the Catholic Church in Ireland – the only effective remaining political leadership of the Catholic Irish – and view it as a potentially useful ally, in its rule in Ireland, rather than as a foe.

In 1795, Maynooth College was established with an annual government subsidy. This enabled priests to be educated in Ireland instead of travelling to foreign colleges in Europe where they might be influenced by anti-British or revolutionary ideas (Berresford Ellis 1985:70–83). Of course, even without Maynooth, the Catholic Church, because of its very nature, would not have favored revolutionary change in Ireland, or anywhere else, especially if it was allowed to operate freely by the powers that be. The Catholic Church was anxious to prevent the spread of revolutionary secular republican ideas from France, having actively opposed them in France. It was also anxious to develop and maintain a positive relationship with the British Government. As an international Church, it was important that it developed good relations with the rulers of the states in which it operated. It was not a national Church. It had members in England also. It thus had a different set of interests than those wishing to create an Irish democracy free from British rule. Indeed throughout the nineteenth and twentieth centuries while the Catholic Church was to play a pivotal role in national politics in Ireland, it was always on its own terms and in the interests of the Church. While different priests and indeed bishops may have been influenced by personal political interests (either nationalist, republican, or indeed pro-British), the Church itself usually found itself supporting moderate reform and opposing radical revolution (Ó hAdhmaill 2013).

The Orange Order

While the main leaders of the 1798 Rising had been Protestant and, in particular, Presbyterian, they had also been opposed by many other

Protestants who opposed unity with Catholics and/or who feared the consequences of a rebellion which provided political power to the Catholic majority in Ireland. The massacre of mostly Protestant men, women, and children (viewed as loyal to the British Government) as a revenge attack by rebels at Scullabogue in Wexford during the 1798 Rebellion seemed to justify those concerns. Though condemned by the United Irish as not in their name, it was a terrible reminder to Ireland's minority Protestant community of what could happen to them (Bartlett 1998). The news emanating from France of what was happening to alleged supporters of the old regime from 1789 on also played a part in these concerns.

In 1795, a sectarian battle between Catholics and Protestants in Armagh had led to the formation of a new solely Protestant organization with totally opposite views to the United Irish. Rather than uniting Catholic, Protestant, and Dissenter against British rule, the Orange Order sought to unite Protestants in Ireland against the threat of the majority Catholic population and promote Protestant supremacy and loyalty to the British crown. Throughout the nineteenth and twentieth centuries, it was Orangeism rather than republicanism which was to attract the bulk of Protestants particularly after it came to be utilized by the land-owning gentry and big business owners to oppose the Home Rule campaign. It was to play a dominant role in ensuring that the ideals of the United Irish were never realized (Senior 1966).

The Act of Union 1801: "Perfidious Albion"

The abortive rising of 1798 led directly to the 1801 Act of Union. The British Government decided to rule Ireland directly from London. The Irish Parliament was dissolved by the Act of Union (1801) and Ireland incorporated (along with Britain) into the UK. It hoped that this arrangement would create stability in Ireland and rule out further threats to British control. The British were not just concerned about the Irish revolutionaries but the fact that they had had links with the French revolutionaries and the enemies of the British Empire. Indeed a French Army had actually landed in Ireland in an abortive attempt to link up with the United Irish and assist them in the rebellion. The British wanted to prevent any further attempts to use Ireland as a potential stepping stone from which to attack Britain. This had been one of the factors historically which had strengthened British resolve to subdue Irish resistance to their rule.

There was also a view that within the Union the Protestants of Ireland, loyal to Britain, would feel safe even if Catholics achieved political rights, since Protestants would still hold the political majority within the UK. The UK majority would also ensure that Ireland could not easily secede from British rule. Likewise it was felt by the government that only by dealing with some of the grievances of the Catholics could it hope to stave off the possibility of further and potentially more devastating revolution in Ireland. The Catholic hierarchy had proven to be a loyal supporter during the 1798 Rebellion, and the more astute British leaders saw them as a useful ally in governing Ireland. However, the British establishment was not united in this view. Many powerful figures in both Britain and Ireland, including the King, opposed any concessions to Catholics. This was to create an obstacle to reform and be a continuing source of grievance for the Catholic Church and the majority Catholic population in Ireland into the nineteenth century.

In reality, the people of Ireland had had little say in the creation of this "UK" or indeed in British rule of Ireland over the previous six centuries. Although a local Parliament had existed in Ireland in the eighteenth century, its powers had been limited by the imperial Parliament in London. Its membership was also limited to the property-owning class and to the minority Protestant community, descendants, in the main, of colonists/settlers from the island of Britain. The lack of democracy in Ireland was one of the major factors influencing the establishment in Belfast of the United Irish Society in 1791 to strive for a secular republic, initially by peaceful means and then, when this met with repression by the British state, through revolution in 1798.

E

In 1801 it is estimated that only about 3% of the population of Britain and Ireland had a vote (National Archives.gov.uk). Catholics had regained the vote (denied during the penal days) in 1793, but this was restricted to those who were wealthy enough to own or rent property worth at least two pounds. Thus neither the Irish Parliament which voted itself out of existence in 1801 under the influence of British Government bribes and threats (Bolton 1966; Geoghegan 1999) nor the British Parliament, which took over its limited functions, actually had any mandate from the Irish people. The vast majority of the population of Ireland were Catholics (80%), yet until 1829 they were barred from Parliament by a requirement that all members should take an oath abjuring Catholicism, a hangover from the penal laws of the eighteenth century. Although the British Government had promised the Catholic hierarchy an end to all religiously discriminatory legislation if they backed the Act of Union in 1801 (which they did), the bar on entrance to Parliament remained.

Ironically the powerful Orange Order was split on the Union. Set up to protect the Protestant Ascendancy in 1795, it opposed any attempts at Catholic Emancipation after the Act of Union. Much of the English and Irish establishment including the King also threw their weight behind this anti-Catholic Emancipation campaign, something that was viewed as another example of "perfidious albion" in relation to Ireland's majority Catholic population and another grievance to add to a list of many against British rule.

"Catholic Emancipation" and the Birth of Constitutional Nationalism

In 1803 a further attempt at rebellion by republican Robert Emmett was again a dismal failure, and this was followed by another failed attempt by the Young Irelanders in 1848. Both were condemned by the Catholic hierarchy and failed to attract much support. Instead the Church threw its weight behind "constitutional" methods to try to end the remaining discriminatory laws. This

approach was buoyed by the success of the Catholic Emancipation campaign in 1829.

The first great Catholic Irish constitutional nationalist leader in the early part of the nineteenth century was Daniel O'Connell. His political activities largely took place within the British political structures, and many future constitutional nationalists were to follow his strategy and tactics. He was strongly opposed to revolution including Robert Emmett's attempted rising in 1803. He also stated that no cause was worth the shedding of one drop of human blood.

O'Connell's great success was in forcing the British to grant Catholic Emancipation in 1829. This allowed Catholics to take their seats as MPs in the Westminster Parliament without having to renounce their faith. This measure had been promised in return for Catholic support for the Act of Union (1801) but had been reneged upon. O'Connell founded the Catholic Association in 1823, mobilizing hundreds of thousands of Irish Catholics in support of the campaign. In 1828 he stood and was elected to the UK Parliament and refused to take the oath. The government fearing rebellion in Ireland agreed to remove the oath. Using monster rallies to show the depth of Catholic discontent across Ireland, O'Connell was able to convince the British that reform would be better than rebellion. However the "success" came with a caveat – in return for Catholic MPs in Parliament, O'Connell had agreed to support an increase in the property qualification for the vote. Minor landholders owning or renting property worth at least two pounds had been given the vote in 1793. This was now raised fivefold to ten pounds, reducing the electorate in Ireland from 216,000 to 37,000 men in a population of about 8 million people. As a community disproportionately socioeconomically disadvantaged, this was to particularly affect Catholics, O'Connell's support base. Thus, in the process, many of those who had elected O'Connell in the first place were disenfranchised, and a perceived threat to the British establishment – a large effective Irish vote – was removed.

What was termed "Catholic Emancipation" was not emancipation for the vast majority of Irish people, Catholics or otherwise. Indeed

despite a steady increase in the franchise during the nineteenth century under pressure from democracy campaigners, socialists, and labor unions, by 1916 only an estimated 15% of the population of Ireland could vote in Parliamentary elections, and none of those were women (Dorney 2014). It wasn't until 1918 that all men over the age of 21 got the vote regardless of property or income. Despite the efforts of the suffragettes, no women were to get to vote for Members of Parliament until 1918 and then only those over 30 with property or married to a man with property. A "Government" of Ireland did sit in Dublin, but it was appointed by the British Government in London not elected by the Irish people. It consisted of the chief secretary for Ireland, appointed by the prime minister; the undersecretary for Ireland; the head of the civil service, appointed in Whitehall; and the lord lieutenant (or viceroy), the King's representative, appointed in consultation between the British Government and the monarchy. Socioeconomically, the removal of the penal laws against Catholics did lead to a growth in the Catholic property-owning, business, and professional classes, throughout the nineteenth century and early twentieth century. However, by 1916 the majority Catholic population remained a predominantly poor, disadvantaged sector of society.

Nevertheless for O'Connell and indeed the Catholic Church, the success of the "Catholic Emancipation" campaign appeared to open up new possibilities of using British "constitutional" methods, through the Westminster Parliament, to promote political changes of benefit to the Catholic Church and its flock and also to advance the cause of a more independent Ireland within the empire through the repeal of the Act of Union. The old Irish Parliament dissolved in 1801 had been the preserve of Irish Protestants. Any new Parliament in Ireland would have a majority of Irish Catholics which for both nationalist and religious reasons might appear attractive to the majority of Ireland's population. However, it was at one and the same time viewed as a threat by most of the minority Protestant population whose position of relative privilege, reinforced and reproduced through centuries of land confiscations, colonization, and penal laws, was potentially at threat.

O'Connell was to have less "success" with his Repeal of the Union campaign. With Catholic Emancipation achieved, wealthy Catholics supported by the Church could see an advantage in the return of a Parliament in Ireland which would now have Catholic MPs who, even with the property qualification, would have a majority there. It would potentially mean that laws could be passed which would suit the majority Catholic population there. That was exactly the same reason why many Protestants in Ireland feared the Repeal of the Union and campaigned against it. The British establishment also opposed it. Although O'Connell wasn't calling for independence or a republic but Home Rule within the empire, British legislators feared that such a move might be the thin edge of the wedge. Many in the British establishment had major land holdings and business interests in Ireland. There was also always a fear, which had existed over a number of centuries that Britain's enemies might use Ireland as launch pad to attack Britain. In 1798 the French had landed in Ireland for that same purpose and relations with France continued to be bad throughout the nineteenth century.

O'Connell established his Repeal Association as a mass membership political movement in 1830 supported by sympathetic MPs. The campaign was boosted by the extension of the franchise provided by the 1832 Reform Act, allowing more nationalist MPs to be elected. However, it was not until long after O'Connell's death (in 1847) when Irish nationalist MPs began to hold the balance of power in Westminster that the first Home Rule Bill for Ireland was introduced by Gladstone's Liberal Government in 1886.

Throughout the nineteenth century, the Church increased its influence among Irish Catholics, now with the assent of the British state, by an increasing involvement in the provision of welfare and education services for Catholics. This was aided by the laissez-faire attitude of the British Government. The introduction of free primary education via the National Schools in 1831 gave the Church control over the moral and cultural development of virtually all Catholic children in Ireland – as

E

well as their obedience – and paid for by the British Exchequer. British state funding of National Schools in Ireland (before similar funding had even been provided in England) was focused primarily on two main aims – the promotion of English as the main language of Irish people (rather than Irish) and the nurturing of loyal (to Britain) subjects in Ireland (Akenson 1970).

By appealing to the power elites in the Irish Catholic community, the state hoped to lessen any threat to its control in Ireland. By coupling this with the repression of those who refused to accept the system, it tried to effectively control dissent in Ireland through a "carrot and stick policy." The result of the policy was to reinforce and reproduce political divisions among the Catholic Irish and the development of sometimes cooperating but often competing political strands of constitutional and revolutionary nationalism. Throughout the nineteenth century, it was constitutional nationalism supported by the Church which captured the bulk of the support and imagination of most Catholic Irish and remained dominant. Revolutionary nationalism continued to exist, but it continued to receive only limited support from Catholics. It was also often denounced by the leaders of the Catholic Church and constitutional nationalism. While it is also from this period that republicanism began to take root among some elements in the Catholic community, it was to take well over another hundred years before the revolutionary strand was able to successfully challenge constitutional nationalism in most of Ireland in the 1918 elections.

The Young Irelanders: "Ireland Long a Province be A Nation Once Again"

By the middle of the nineteenth century, a new nationalist movement had been established in Ireland. The Young Ireland movement founded in 1842 was influenced by other nationalist movements in Europe such as the Young Italy movement which had been established in 1831 to work for a united Italian republic. It aimed to promote the establishment of an independent Irish republic

by developing a "national consciousness" among the people. Comprised of both Protestant and Catholic nationalists, it wished to establish a democratic secular republic in Ireland much like that proposed by the United Irish movement in the 1790s. Like the United Irish, it also started off as an open, constitutional, reformist organization adopting peaceful educational and awareness raising methods. Much of its work centered on the publication of the nationalist journal, *The Nation*, which supported O'Connell's Repeal of the Union campaign. One of its leaders, the Protestant republican Thomas Davis, was to pen some of the most famous patriotic songs still known in Ireland today (such as "The West's Awake" and "A Nation Once Again"). It was the Young Irelanders who introduced the green, white, and orange tricolor flag to Ireland on which the current national flag is based. Modeled on the French tricolor, it was brought over from France by Thomas Francis Meagher and William Smith O'Brien in 1848. It symbolized peace and reconciliation between the native Irish (green) and the descendants of the colonists (orange).

Initially the Young Irelanders and Daniel O'Connell worked together and used *The Nation* to whip up support for his Repeal of the Union campaign. However after O'Connell's arrest and imprisonment following the banning of his big Repeal rally in Clontarf in 1943, he began to explore federalism within the UK as a possibility and came into conflict with the Young Irelanders. O'Connell finally ousted the Young Irelanders from his Repeal Association in July 1846 when they refused to pledge their allegiance to nonviolence and constitutionalism.

The whole movement, exasperated from the effects of the Famine 1845–1847 and the policies of the British, collapsed after a disastrous attempt at a rising in July 1848. 1848 was a year of democratic uprisings throughout most of Europe, and the Young Irelanders hoped to link Ireland to this. However, Ireland was still suffering from the catastrophic effects of the famine, disease, evictions, and continuing emigration. Initially the hope was that the revolution in Ireland could be peaceful. However, increasing British Government repression of the movement and the decision

to suspend habeas corpus and imprison people without trial forced their hand. The attempted rising was ended before it could really get started at a standoff in what became known as the Battle of Widow McCormack's Farm House, at Ballingarry, Co. Tipperary. Most of the leaders were rounded up and transported to Van Diemen's Land (modern day Tasmania). Two who escaped to France and then the USA were James Stephens and James O'Mahony. In the USA they found support from a growing Irish emigrant community, many of whom felt bitter about British rule in Ireland and in particular Britain's handling of the Famine (1845–1847). They would later found in 1858 the Irish Republican Brotherhood (or Fenians) the movement which was active throughout the late nineteenth century and which was eventually to organize the Easter Rising in 1916.

The period of the Young Irelanders movement illustrates some of the tensions which existed throughout the nineteenth and twentieth centuries within nationalism in Ireland about how far demands for independence should go and whether or not constitutional or revolutionary methods were the most effective or justifiable. O'Connell made limited demands for Irish independence and promoted British constitutional means. The Young Irelanders wanted full independence; in the words of the famous Thomas Davis song, 'A Nation Once Again' - "and Ireland long a province be, a Nation once again". They were also prepared (though not effectively able) to use revolutionary means to achieve it. This created tensions between them and O'Connell and an eventual rift.

Tensions between the Young Irelanders and the Catholic Church had also manifested themselves linked to their demands for a secular democratic republic, something which potentially threatened the power of the Church as the leader of the majority of the country's population. The Church also opposed revolution. According to Berresford Ellis (1985:116), Pope Pius I admonished priests involved with the Young Irelanders after pressure from the British, and they were suspended by the Irish hierarchy. One of the leaders, John Mitchel, who wrote prolifically about the period claimed that "the Church had ever been the enemy of Irish freedom" (Mitchell 1854:15).

The Young Irelanders rebellion may have been another abject failure, but it provided another strand to nationalist folklore and the republican narrative which was to nurture and replenish revolutionary republicanism in the second half of the nineteenth century.

The Great Hunger 1845–1847

One of the most calamitous events to ever hit Ireland was the Famine or Great Hunger (1845–1848). It was to have a catastrophic effect on Ireland for decades to come. Not only was it profound in terms of human cost but also in terms of its effects demographically, economically, socially, culturally, and politically. It was to have a huge impact on Anglo-Irish relations for generations to come and was to create a narrative which was reinforced and reproduced in the decades ahead of British cruelty toward and unfitness to rule the Irish. It was also to lead to the creation of an Irish diaspora in the USA which was to become a powerful support base, funder, and supplier of weaponry for future republican campaigns to end British rule in Ireland.

Most of those most badly affected by the Famine was poor tenant farmers paying rents to (often absentee) British and Irish landlords and subsisting on potatoes. The potato, cheap and easy to grow in an Irish climate, had become the main food of the poor. In 1845 and subsequent years, the potato crop was hit by blight, leading to starvation, disease, and eviction as tenants were unable to sell crops and pay the rents. The British Government of the day had a "laissez-faire" attitude to the economy, and while some soup kitchens were provided and Indian corn imported to feed some of the hungry, it was not enough, and food continued to be exported out of the country at the height of the Famine. The inhumane language used by some in the British establishment in describing the Famine, as the fault of the peasant farmers for being idle and not planning for such events or even as God's or nature's way of dealing with overpopulation, did not endear future generations of Irish people to Britain (Crowley et al. 2012). Some like the Young Irelander, John

Mitchel, accused the British of a deliberate policy of extermination, and while there is little evidence of that (Ó Gráda 1999), the lack of response from Britain and the devastation caused led to a lasting hatred, especially among those who emigrated to America.

During the Famine an estimated 1 million died and 1 million emigrated. The 1841 Census in Ireland recorded a population of 8.2 million making Ireland one of most populous countries in Europe (people per acre). As a comparison, the population of England was only 13.6 million. Indeed some British establishment figures were to argue that the Famine was a natural disaster needed to reduce an overpopulated Ireland. After the Famine, the 1851 Census recorded a population of just 6.5 million.

Emigration continued unabated throughout the nineteenth century and into the twentieth century, mainly to English-speaking countries like Britain and the USA, but in effect Irish people emigrated to the four corners of the earth. The result was that by 1911 the population of Ireland had been nearly halved to 4.4 million. At a time when the populations of Europe were growing exponentially, Ireland was one of the few which wasn't. Thus by 2016 the population of the island of Ireland was still only 6.6 million while that of England (by 2018) was just nearly 56 million.

Emigration had another effect of course. Many Irish people were able to make successful lives in other countries, and many continued to remember the mother country and the way its people had been treated by its British rulers. A narrative was created, reinforced, and reproduced by the emigrants and their descendants of oppression, discrimination, and loss and that "cruel England" was to blame. It was that Irish diaspora based in the USA which was to be pivotal in the next stage in the development of the campaign for an independent republic in Ireland.

The Fenians: The Birth of the Irish Republican Brotherhood (IRB)

In the second half of the nineteenth century, both strands of Irish nationalism – constitutional and revolutionary republicanism – continued to develop, sometimes in cooperation and sometimes in opposition to one another.

In 1858 the Irish Republican Brotherhood (also known as the Fenian Brotherhood) was set up by, among others, James Stephens and James O'Mahony, two former members of the Young Irelanders. It attempted to take up the mantle of revolutionary nationalism from the Young Irelanders. It was the forerunner of the organization which was to eventually organize the 1916 Easter Rising. With organizations in Ireland, Britain, and the USA, the impact of the emigration since the Famine was now playing out in Irish republican politics. From now on the influence of emigrated Irish and their descendants was to have a major impact on the funding, arming, and promotion of republicanism in Ireland. Irish America in particular was to play an important role not just in the failed 1867 Fenian Rising in Ireland but more importantly in the Fenian dynamite campaign in England in the 1880s. Once again, the British Government attempted to pre-empt any rebellion in Ireland by closing down the Fenian newspaper, The Irish People, in 1865, suspending habeas corpus and arresting the leadership, including Stephens and Jeremiah O'Donovan Rossa. Plagued by informers and spies and further arrests, an attempted rebellion in Ireland in 1867 broke out in different areas but was quickly suppressed. More dramatically, in the USA, in the aftermath of the Civil War in which many Irish had fought, a series of attempts to march armies of Fenians into Canada, then ruled by Britain, and take it over, failed. The execution of a number of Fenians in England was however to provide a new set of martyrs for the republican cause. In December 1867, a bungled attempt to free a Fenian prisoner from Clerkenwell jail in London failed, but the explosion led to the death of 12 civilians and 120 injured, and the later execution of Michael Barrett, the last person to be publicly hanged in England, in 1868. In particular, the Manchester Martyrs – Allen, Larkin, and O'Brien – who were publicly hanged in 1867, after the apparent unintentional killing of a policeman while they tried to free fellow Fenians from a prison van, led to widespread anger throughout

Ireland, the erection of monuments, and their immortalization in the republican ballad, "God Save Ireland."

The dynamite campaign in particular was organized from the USA and included notables like Jeremiah O'Donovan Rossa and Thomas Clarke who were both to be imprisoned for many years in England. Thomas Clarke was later to be one of the leaders of 1916 to be executed. His name appeared first among the seven signatories of the 1916 Proclamation of the Republic. It was at O'Donovan Rossa's funeral in 1915 that the 1916 leader Patrick Pearse made the famous impassioned speech – "the fools the fools the fools" – often credited with having enthused a new generation to join in the republican struggle. The funeral was an event stage-managed by the IRB for maximum drama and propaganda value.

The dynamite campaign from 1881 to 1885 was influenced by the invention of dynamite by Alfred Nobel in 1866 and the use of explosives during the US Civil War. It was aimed primarily at property in England rather than people and meant to disrupt and damage the economy and everyday life. A number of civilians were killed and injured however, and such incidents led to hostile reactions not just in England but also in Ireland. Bombs were left outside military barracks, police stations, railway stations, and public buildings, mainly in England, and in 1883 a new Special Branch detective service was established by the British to deal with the threat. The dynamite campaign was a new type of physical force campaign, one that was to be modified and used in subsequent republican physical force campaigns in the 1920s, 1940s, and in particular in the 1970–1997 period. It was also used in other armed nationalist, revolutionary, and resistance campaigns throughout the world from the late nineteenth century. Indeed, it could be argued that modern warfare from the early twentieth century has included such methods on a much wider scale with aerial bombardment and the use of long-range missiles to attack property as well as populations.

The activities of the Fenians also led to many of them being imprisoned usually under extremely harsh conditions. This in turn often evoked sympathy. Karl Marx (1818–1883) was one who was moved to write in the Belgium press condemning the treatment of Fenian prisoners in England (Marx 1870). Interestingly enough there was also speculation that Marx's friend and comrade, Friedrich Engels, who co-wrote *The Communist Manifesto* with him, was himself close to the Fenians or rather that his partner Mary Burns was. She was from an Irish background and lived with Engels in Manchester. While Marx didn't openly support the Fenians, he nonetheless believed that an independent Ireland would weaken the British Empire and thus would be a progressive move (Rodden 2008).

Although the Fenians themselves were not overtly socialist, it is clear that they were influenced by the growth in socialist and other radical movements in Britain and Europe in the second half of the nineteenth century (Metscher, 2001). They did make links with other radical movements in Europe, including the First International (International Working Men's Association – IWMA). James Stephens and John Devoy, both founding leaders of the Fenians, joined the IWMA in the USA (Boyle, 1972:45–46; Lane, 1997:22), and the sympathies of the movement were also made clear in its Proclamation of the Republic in 1867:

> . . . we aim at founding a Republic based on universal suffrage, which shall secure to all the intrinsic value of their labour. The soil of Ireland, at present in the possession of an oligarchy, belongs to us, the Irish people, and to us it must be restored. . .
>
> We declare, also, . . . complete separation of Church and State.
>
> . . . thus we intend no war against the people of England – our war is against the aristocratic locusts, whether English or Irish, who have eaten the verdure of our fields – against the aristocratic leeches who drain alike our fields and theirs.
>
> Republicans of the entire world, our cause is your cause. Our enemy is your enemy. . . . workmen of England, it is not only your hearts we wish, but your arms. Remember the starvation and degradation brought to your firesides by the oppression of labour. . . . avenge yourselves by giving liberty to your children in the coming struggle for human liberty. (Lee 2008:56)

Indeed, the IWMA itself stated in 1867:

> Fenianism is the vindication by an oppressed people of its right to social and political existence. The Fenian declarations leave no room for doubt in

this respect. They affirm the republican form of government, liberty of conscience, no State religion, the produce of labour to the labourer, and the possession of the soil to the people. (Marx and Engles 1971:383).

Thus the Fenians were not just calling for "political democracy" in a secular republic independent from Britain but a republic which appeared to exhibit some of the attributes of socialism, demanding workers ownership of the land and the product of their labor. They also adopted an internationalist perspective on workers struggle. From at least the mid-nineteenth century, there had been a socialistic constituent in revolutionary nationalism in Ireland (Metscher 1986). James Fintan Lalor, for example, who took part in the failed Young Ireland revolt in 1848, had said in the same year:

> The principle I state and mean to stand upon, is this, that the entire ownership of Ireland, moral and material, up to the sun and down to the centre, is vested of right in the people of Ireland. . .. that the entire soil of a country belongs . . . to the entire people of that country, and is the rightful property, not of any one class, but of the nation at large. (Lalor 1848)

The Fenians were clearly not just interested in issues relating to "political" democracy either but also "economic" democracy. This was to become a theme and indeed a cause of tension within different manifestations of Irish republicanism in the years to come.

While the constitutional nationalists on occasion cooperated with the more militant republicans when it suited them, tensions also remained between them over a range of other issues including aims and methods. In the late nineteenth century, Isaac Butt had established the Irish Parliamentary Party (IPP) with a policy of campaigning for a Home Rule parliament within the British Empire. At the same time the IRB was demanding a completely independent secular republic. The IPP believed in working within the British constitutional mechanisms, while the IRB believed that revolutionary physical force was necessary to achieve their objectives.

Into this mix went the Catholic Church whose hierarchy were generally critical of IRB methods

(though not necessarily of their objectives), even though individual Irish priests and even bishops often had their own political preferences, whatever about the official policy of the international Church (Ó Fiaich 1968). For example, despite the moderate nationalist sympathies of figures like Cardinal Cullen, in 1863 the Catholic hierarchy condemned the Fenian Brotherhood, and in 1867 Bishop Moriarty of Kerry denounced them as criminals saying:

> . . ..when we look down into the fathomless depth of this infamy of the heads of the Fenian conspiracy, we must acknowledge that eternity is not long enough, nor hell hot enough to punish such miscreants. (Norman 1965:117)

Pope Pius IX issued in his 1864 encyclical *Quanta Cura*, a condemnation of anyone who supported the separation of Church and state, one of the tenets of Fenian republicanism. In 1870, on the prompting of Cardinal Cullen, he issued a general condemnation of Fenianism (Ó Corráin n.d.). Yet others in the Church were more ambivalent or even quietly sympathetic toward revolutionary nationalism, and this is partly why when independence was achieved for 26 of Ireland's counties, the Church, far from being viewed as divorced from "Ireland's freedom struggle," was mythologized as having led the people then and now. In nineteenth-century Ireland, the ambivalent, or even sympathetic, attitude of some local priests and even bishops to "popular" revolutionary activity meant that the Church could remain closely connected to its flock. Dr. John MacHale, archbishop of Tuam, appears to have been one with some level of republican sympathies, for example. The 1863 Convention of the Chicago Fenians received autographed portraits of him to auction. In 1886 Archbishop Thomas Croke of Cashel contributed five pounds toward a monument in the grounds of Limerick Cathedral to the "Manchester Martyrs" of 1867. However, neither expressed open support for the organization, and the Church continued to oppose revolutionary nationalism, excommunicating members of the Irish Republican Brotherhood, for example (McCartney, 1967; Rafferty, 1999). According to Rafferty (2016):

From the time of the papal condemnation of Feni-
anism, Cullen inserted into the Lenten pastoral let-
ters of the Archbishop of Dublin a condemnation of
Fenianism and warned members of his flock of the
spiritual dangers of attachment to the IRB. He also
forbade confessors to give absolution to members
of the Fenian organisation. His successors contin-
ued the practice of condemning Fenianism in their
Lenten pastoral letters, even the advanced national-
ist William Walsh, archbishop from 1885 until
1921. (Rafferty 2016:47)

Ambiguities were also reflected in the Church
attitude to the Land League. Michael Davitt, a
member of the IRB who had been jailed for gun-
running, set up the Land League, Ireland's first
national peasant organization, in 1879. Davitt had
spent a long time in England where he had been
active in trade union activities and had lost an arm
in an industrial accident. The Land League argued
for fair rents, fixity of tenure, and free sale of land.
It demanded rent reductions and organized resis-
tance to evictions and boycotts of landowners.
Indeed the word "boycott" was introduced into
the English language when the League organized
the community's shunning of a bailiff named Cap-
tain Boycott (Ó Raghallaigh 2011). Emotions
raised by evictions often led to violence from
both the police and those opposing the bailiffs.
The Church was concerned about this rising rural
agitation for land reform. While many priests and
bishops had sympathy with the plight of their
parishioners on the land, and many, such as Arch-
bishop Walsh, supported the Land League, there
was also concern that the agitation would turn into
anarchy. Many priests and bishops were also land-
lords themselves. In April 1888, Pope Leo XIII
issued a condemnation of the Land League's Plan
of Campaign and the practice of boycotting
(O'Hara 2009).

During the late 1800s, the Church developed
close links with "Constitutional Nationalists" who
wanted Home Rule for Ireland within the British
Empire. The Church at this time was interested in
the concept of an independent Catholic Ireland.
William Gladstone had won the 1868 election for
the Liberal Party with the help of 65 out of 105 of
the Irish seats in Westminster. He immediately set
about promoting a policy of "Justice for Ireland"

in the hope that this would pacify the Irish. In
1870 the first Irish Land Act was passed which
provided some element of security of tenure for
tenant farmers, providing compensation for evic-
tion. Gladstone's election and apparent interest in
Ireland influenced the establishment of the Home
Government Association, by Isaac Butt, a former
member of the Conservative Party, in 1870. Call-
ing for an Irish parliament, it popularized the idea
of "Home Rule," and in 1873 it became the Home
Rule League. This in turn led after the 1874 elec-
tions to the formation of a separate Home Rule
Party – the Irish Parliamentary Party – by a num-
ber of the newly elected MPs. It included a group
of MPs with close connections to the Fenians
including Charles Stewart Parnell who was to
become the leader. Parnell was a Protestant
nationalist, who although a constitutional nation-
alist working through Parliament, on occasions
used the violent actions of republicans as a lever
to achieve his objectives, at times even apparently
going into alliance with such forces. He publicly
flirted with the Fenians. He also worked with
Davitt's Land League. The combination of popu-
lar and parliamentary agitation induced Britain to
supplement the routine coercion acts with a seri-
ous attempt to solve the agrarian problem (Steele
1979).

Continuing violent attacks on the land eventu-
ally led to Parnell's imprisonment in 1881. How-
ever violent attacks increased to such an extent
that the state was forced to negotiate with him in
jail. Parnell was thus able to use the threat of force
as a lever in his negotiations for greater conces-
sions. He did nevertheless condemn violence
including the killing in Phoenix Park of the new
Chief Secretary Cavendish and his undersecre-
tary, Burke, in May 1882 (Hawkin 1973).

In 1886, after years of campaigning for Home
Rule (within the empire), Parnell's IPP finally
got Gladstone and a British Liberal Government
to support the introduction of the first Home Rule
Bill. It was opposed by the Conservative Party
and a growing unionist lobby in Ireland mobi-
lized by the Orange Order, and a split in the
Liberal Party led to the defeat of the Bill in the
same year.

Then disaster struck Parnell and the IPP. In December 1889 a man called Captain O'Shea filed suit for divorce from his wife citing the leader of the IPP, Parnell, as her lover. The case destroyed Parnell's political career. The Catholic bishops opposed him, and many constitutional nationalists and their supporters refused to support him. The Party split, and while he continued to lead a small minority faction until his death in 1891, his power was ended. A second Home Rule Bill was introduced in the Westminster Parliament in 1893, but it was vetoed by the House of Lords which had a Conservative majority. At that time the House of Lords could veto new legislation. In 1911 the veto was removed and the Lords could then only delay new legislation for a maximum period of 2 years.

The Parnell affair greatly damaged the IPP and its Home Rule campaign. John Redmond (1856–1918) who had supported the minority Parnell faction of the IPP led it after Parnell's death. However, it took a further 10 years for the split in the IPP to be healed (Lyons 1960). By the late nineteenth century, while constitutional nationalism remained important, it was now being augmented by a range of different strands to nationalism developing and evident in different campaigns and different aspects of life. There was also a growing revolutionary nationalist movement, demanding more than simply Home Rule.

The Radicalization of Ireland

By the late nineteenth century, despite the failure of two Home Rule Bills at Westminster, there was a growing confidence among nationalists in Ireland that Home Rule was only a matter of time. The IPP had by far the largest number of MPs elected to the Westminster Parliament by the Irish people. This provided some measure of the support for Home Rule there even though only about 15% of the population had a vote. By this time, the Catholic Irish who, along with their Church, were the most likely to want Home Rule made up not only the vast majority of the population, but they also disproportionately made up the majority of

those without a vote. It was therefore assumed that any further extension of the franchise to include those men without property and women was only likely to increase the vote for Home Rule. With campaigns to extend the franchise ongoing in Britain, it seemed the vote for Home Rule MPs was only set to increase.

However, other elements were also fanning this growing nationalist confidence. The end of the penal laws meant that although the Census figures (1891, 1901, and 1911) showed that the Protestant Irish were still disproportionately represented among the owners of industry, big business and land, as well as in the professions, Catholics were now common among such classes. The Wyndham Land Purchase Act 1903 had also allowed small tenant farmers to buy their land from landlords with government loans. This had encouraged farmers to make improvements on the land without fear of its increased value leading to increased rent as in the past. Security of tenure allowed farmers to invest for the future in agriculture. While poverty remained high particularly in the cities among the Catholic (and indeed Protestant) urban working classes, the National School system had opened up primary education to the masses. Church-run schools often provided grants to allow poorer children to join the children of richer parents to obtain a secondary school education. The nondenominational Queen's Colleges set up in 1845 in Belfast, Cork, and Galway in the mid-nineteenth century opened up university education – once the preserve of Protestants – to wealthy Catholics. They were followed in 1851 by the establishment of the Catholic University of Dublin. The emergence of a new confident educated Catholic middle class was to influence the development of two new cultural movements in the late nineteenth century.

In 1893 the Gaelic League had been set up by Douglas Hyde and Eoin MacNeill to promote the speaking of Irish throughout Ireland. Involving both middle-class (in the main) Catholics and Protestants and nationalists and unionists, it was to become increasingly politicized in the early twentieth century as republicans like Patrick Pearse came to see it as a way of promoting an Irish nationalist consciousness. Indeed many of the

leaders of the 1916 Easter Rising had been involved in the Gaelic League (Conchubhair 2018).

Poets and writers like W.B. Yeats and Lady Gregory also became involved in the Anglo-Irish literary movement. Using the medium of English, they promoted nationalist plays, such as "Cathleen Ní Houlihan" (or in Irish, Caitlín Ní hUallacháin) and poetry associated with nationalism. A number of the leaders and activists of the 1916 Rising were involved in this nationalist literary movement including Joseph Plunkett and Thomas MacDonagh (both of whom were executed after the Rising). Patrick Pearse, the leader of the Rising, also published widely in both Irish and English in prose and poetry.

Probably the most influential and enduring of all the Irish national cultural movements was the Gaelic Athletic Association (GAA). This was set up in 1884 and aimed to promote Irish athletics and particularly the games of hurling and Gaelic football. It also had a clear nationalist agenda, promoting the concept of an independent Irish nation. It was to be particularly influential among the working classes and the rural poor. The organization itself operated in parishes and usually also had a strong connection with the Catholic Church at both national and parish level. Many of its lay leaders came to be involved in the Irish revolutionary movement in the early twentieth century. Its ability to link nationalism to Gaelic sports, local community, and Church was to have a profound effect on the incorporating of a nationalist political ideology and an Irish cultural identity into the day-to-day community identity of many people throughout the island (Ó Tuathaigh 2016).

In the late nineteenth century and early twentieth century, a number of small republican parties were established though they did not provide much of a challenge to the IPP. Cumann na nGaedheal was set up in 1900 by activists like Arthur Griffith to campaign for an independent Ireland. Belfast IRB members Bulmer Hobson and Dennis McCullough were instrumental in the setting up of the Dungannon Clubs in Belfast in 1905 (named after the 1782 Dungannon Volunteer Convention) to promote the idea of a nonsectarian secular republic. Hobson was also to join with Countess Markievicz in founding Na Fianna Éireann in 1909 (the republican scout movement) in response to the development of an offshoot of Baden-Powell's British Boy Scouts movement in Ireland in 1908. It was Hobson who was to swear Patrick Pearse into to the IRB in 1913. Although on the IRB Supreme Council, he disagreed with 1916 Rising and did not take part. Dennis McCullough was the President of the IRB Supreme Council at the time of the 1916 Rising. He had led the Belfast Volunteers to Coalisland for the 1916 mobilization, but the countermanding order led most to return to the city thinking the Rising had been called off (McCullough 1953).

Cumann na nGaedheal and the Dungannon Clubs eventually merged in 1907 under Arthur Griffith to form Sinn Féin (Ourselves) to campaign for political independence from Britain. In Griffith's view the best strategy was to argue that the 1801 Act of Union was illegal and that in fact the legal constitutional arrangements for Ireland should be those pertaining during Grattan's Parliament – a Home Rule Parliament with a dual monarchy (i.e., under the British crown). Thus although not a monarchist himself, Griffith's Sinn Féin when originally founded wasn't a republican party at all although it included members of the IRB who were.

Griffith disagreed initially with the physical force approach of the IRB and argued instead for a campaign of passive resistance based on MPs being elected and boycotting Westminster and setting up an independent assembly in Ireland, the boycott of British goods, the refusal to pay taxes, and the establishment of alternative courts and local authorities (O'Broin 2009). In many ways these were the tactics which were to be adopted by the First Dáil Éireann when it was set up in 1919. In the early twentieth century, however, Sinn Féin was politically very weak. It had won a few council seats in the 1911 local government elections but little else and had little popular support.

In 1914, after the split in the Irish Volunteers (see later), Sinn Féin members, including Griffith, joined the anti-Redmond faction. They got the nickname "Sinn Féin Volunteers." There was

also a lot of cross-over membership in Sinn Féin, the Irish Volunteers and the IRB. Thus when the 1916 Rising occurred, it was referred to as the "Sinn Féin Rising," though Griffith himself did not take part and Sinn Féin had not been involved in its organisation. After the Rising, Sinn Féin became the banner under which many republicans mobilized, and it was after its 1917 Ard Fheis that the party became committed to a republic for the first time. It was under the Sinn Féin banner that republicans stood in the 1918 election winning 73 out of the 105 seats on a platform of abstention from the Westminster Parliament and the establishment of the independent First Dáil and in the process leading to the demise of the Home Rule Party, the IPP. Sinn Féin also supported the IRA during the War of Independence 1919–1921.

Of course it was not just republicanism and nationalism which was influencing the radicalization of people in Ireland at the turn of the nineteenth century. The suffragette movement and workers movement were also influencing political thought, organization, and action.

A new movement was gaining momentum among women throughout Britain and Ireland campaigning for women's suffrage. Up until 1918, all women were denied the vote in Parliamentary elections, although some who had property were able to vote in local government elections. Indeed very few countries allowed women's suffrage at the time. New Zealand was the first to offer women the vote in Parliamentary elections in 1893 followed by Australia in 1895. In Manchester the Women's Suffrage Committee had been set up in 1867 to campaign for votes for women in the UK. In 1897 it merged with the National Union of Women's Suffrage Societies (NUWSS). Impatient with the slow progress of the campaign and with the tactics of the NUWSS, Emmeline Pankhurst established the breakaway Women's Social and Political Union (WSPU) in 1903. It aimed to engage in direct action including acts of sabotage and damage to property, to raise the issue. This led to a series of protest actions including bombings carried out in Britain and Ireland aimed at property. At least five such bombings took place in Belfast. Over a thousand women were to be arrested and imprisoned for

actions during this period. From 1909, imprisoned women began to engage in hunger strike as a weapon (something that was to be used later by republican prisoners) to demand their release. The British Government embarked on a policy of release and rearrest when this happened – entitled the *cat and mouse* policy.

In general women's suffrage was supported by socialists but often not very enthusiastically. It was opposed by Conservatives and thus many Unionists who were aligned to the Conservative Party. In Ireland, while the women's movement was active, it was seen as a British-based body at a time when nationalists were demanding independence from Britain, and this caused some problems in terms of developing unity between unionists and nationalists around the issue. Although all the women activists wanted votes for women, there were therefore tensions around whether that should be within the Union (as desired by unionist women) or in an independent Ireland (as preferred by nationalists and republicans). As with the Connolly/Walker debates in Irish socialism (Berresford Ellis 1985:189), there were disagreements within the women's suffrage movement over the issue of Union with Britain.

In light of this, the Irish Women's Franchise League (IWFL) was founded by Hanna and Francis Sheehy-Skeffington in 1908 as an Irish equivalent to Emmeline Pankhurst's Women's Social and Political Union (WSPU). As nationalists they felt that women's suffrage needed to be linked to the cause of Home Rule rather than as part of a campaign for increased rights for women within the UK (Ward 1996).

While republicans were more likely to support women's suffrage than Unionists, there was still resistance among males. Even in revolutionary France, which had so inspired Irish republicanism, the vote continued to be denied to women. In response to the French Revolution, Mary Wollstonecraft as far back as the 1792 had argued in her book *A Vindication of the Rights of Woman* that women should be treated as equal to men. However it wasn't until 1945 that women in republican France received the vote on an equal basis as men. Thus the model for many republicans wasn't that good when it came to women.

The Irish Citizen Army the socialist republican organization did support women's suffrage and had a number of women in its ranks including Countess Markievicz. Maud Gonne had established an organization for women republicans in 1900 called Inghinidhe na hÉireann (daughters of Ireland). This became absorbed into Cumann na mBan in 1914, the women's branch of the Irish Volunteers, which also supported women's suffrage.

The 1917 Sinn Féin Ard Fheis (the Ard Fheis when Sinn Féin became overtly republican) declared its support women's suffrage. However, only two women stood for Sinn Féin in the 1918 elections, where there 105 seats being contested. Countess Markievicz became the first woman to be elected to the Westminster Parliament (although she did not take her seat in line with the Sinn Féin abstentionist policy). In 1919 she also became the first woman to become a government minister when she was appointed Minister of Labour in the First Dáil. Only one other woman stood for Sinn Féin much to the consternation of some republican women, Winnifred Carney. A socialist and secretary to James Connolly, she had been in the GPO during the 1916 Rising and had been imprisoned. She stood in East Belfast, a Unionist-dominated area and lost. It was Sinn Féin policy to stand in every constituency in 1918 because they looked on the election as a referendum on Irish independence. Hannah Sheehy Skeffington had been nominated to stand in Antrim but declined arguing the seat was unwinnable (Woggan 2018). While it is clear that at least on the surface republicans were generally supportive of women's rights, when a new Free State was eventually established in 1922 the position of women remained subordinate to men in the public sphere for many years into the future. Markievicz was the last woman minister in Ireland until the appointment of Maire Geoghegan-Quinn in 1979, and up until 1973 female civil servants were still expected to leave their jobs when they were married.

Unionists and Conservatives by and large remained opposed to votes for women, including Sir (later Lord) Edward Carson, the Unionist leader, who in his opposition to women's suffrage at least shared something with John Redmond, leader of the IPP. James Craig (who succeeded Carson as Ulster Unionist leader in 1921) was a supporter, however, and in September 1913 the Ulster Provisional Government which had been set up by the Unionists to oppose the Home Rule Bill and also contained a number of women, promised to support it. Theresa Londonderry leader of the Ulster Women's Unionist Council was also an advocate. In the 1918 elections, however, no Unionist female candidates were nominated to stand.

In the late nineteenth and early twentieth century, there was also a growing labor movement particularly in the cities, Belfast and Dublin. The Irish Trade Union Congress was set up in 1894, and trade union organizers like Jim Larkin and James Connolly (who was one of the leaders executed after the 1916 Rising) were active in organizing labor to fight for better working conditions. Larkin set up the Irish Transport and General Workers Union in 1910, and when he went to the USA in 1914, Connolly led it until his death. The Dublin Lockout occurred in 1913 when workers were locked out of their employment by employers for being members of the trade union movement. The lockout was organized by William Murphy, Dublin's most prominent business owner, a prominent Catholic, constitutional nationalist, former Home Rule MP, and owner of the *Irish Independent*, *Sunday Independent*, and newspapers. The lockout lasted for 7 months, during which time Murphy used his newspapers to attack the workers and their leaders. Throughout the early twentieth century, the Catholic Church denounced socialism, and it opposed Jim Larkin and the ITGWU during the 1913 Dublin Lockout (Yeates 2000). It even opposed a scheme whereby children of Irish strikers would be temporarily looked after by British trade unionists on the grounds that their souls might be endangered by Protestant or atheist influences (Kostick 2009:18). Republicans such as Patrick Pearse and Countess Markievicz supported the workers in the media, but the lockout ended with the workers having to return to work defeated and forced to sign pledges not to join the ITGWU. The level of police violence used against picketing workers also led to

the ITGWU setting up the Irish Citizen Army to protect striking workers. This organization was pivotal in 1916 in mobilizing socialists and trade unionists for the Rising (O'Connor 2017).

The constitutional nationalists in the IPP continued to have a major influence on politics in Westminster and on the Liberal Party in this period, especially after the Parnell split was mended. Redmond was to lead the party in the early twentieth century until his death in March 1918. After the 1910 election, the Liberals had to depend on Redmond's party to form a government in Westminster. This gave the IPP control over the balance of power and led to the introduction of the third Home Rule Bill in 1912. The Conservative and Unionist control of the House of Lords had ensured the defeat of the second Home Rule Bill in 1893 by using the veto they had on new legislation. However, that veto had been removed in 1911 and replaced instead by an ability only to delay new legislation. As a result it seemed certain to many that Home Rule would be passed by 1914 and Ireland would get its own Parliament (albeit still within the Empire).

However, not everyone in Ireland and Britain was prepared to allow Home Rule for Ireland, and powerful forces which had been building since the 1880s in opposition to Home Rule began to mobilize once again.

The Unionists: "Ulster will Fight and Ulster will be Right"

By the early twentieth century, most (but not all) Irish Protestants, who were in the minority in Ireland and traced their roots back to the descendants of colonists/settlers from the island of Britain, were unionists. They wished to remain part of the UK for economic, religious, and identity reasons and were fearful of an Ireland ruled by the Catholic majority. In general they also occupied a position of higher social and economic status and feared this would change in a new constitutional arrangement. In the main, they had opposed Daniel O'Connell's Catholic Emancipation campaign at the start of the nineteenth century and his repeal of the Union campaign which followed. Utilizing

the Orange Order to promote unity among Irish Protestants for unionism, they mobilized support, especially in Ulster, where they had become a majority since the Ulster Plantation from 1609, in opposition to the Home Rule campaign throughout the nineteenth century. When the third Home Rule Bill was introduced to Westminster in April 1912, Ulster Unionists had responded to it with 500,000 signing the Ulster Solemn League and Covenant pledging to oppose Home Rule "by using all means which may be found necessary" (Buckland, 1973).

Ulster's Solemn League and Covenant (1912)

Being convinced in our consciences that Home Rule would be disastrous to the material well-being of Ulster as well as of the whole of Ireland, subversive of our civil and religious freedom, destructive of our citizenship and perilous to the unity of the Empire, we, whose names are underwritten, men of Ulster, loyal subjects of his Gracious Majesty King George V, humbly relying on the God whom our fathers in days of stress and trial confidently trusted, do hereby pledge ourselves in solemn Covenant throughout this our time of threatened calamity to stand by one another in defending for ourselves and our children our cherished position of equal citizenship in the United Kingdom and in using all means which may be found necessary to defeat the present conspiracy to set up a Home Rule Parliament in Ireland. And in the event of such a Parliament being forced upon us we further solemnly and mutually pledge ourselves to refuse to recognise its authority. In sure confidence that God will defend the right we hereto subscribe our names. And further, we individually declare that we have not already signed this Covenant.
The above was signed by me at

Ulster Day, Saturday 28th, September, 1912.
God Save the King (PRONI, n.d.)

Among the signatories at a massive rally at Belfast City Hall on 28 September 2012 designated as Ulster Day were Sir Edward Carson, Lord Londonderry, Sir James Craig, and a host of other notables including police and civil servants (Connell 2012). In January 1913 a new paramilitary organization, the Ulster Volunteer Force, was also formed. It received support among Unionist

and Conservative MPs. It also appeared to be supported by the military commanders of the British Army in Ireland. In March 1914 in what became known as "the Curragh Mutiny," British officers at their Curragh base in Co. Kildare made it clear that they would be unwilling to enforce Home Rule on Ulster or march against the UVF there (O'Brien 2014). In September 1913, a new Provisional Government for Ulster, composed of a range of prominent members of society, was announced by the Unionists. It was planned that this would take over and rule the province of Ulster in the eventuality of Home Rule being introduced in Ireland. At a subsequent rally on September 13, 1913, addressed by the Unionist leader Sir Edward (later Lord) Carson, at Balmoral Showgrounds, Belfast, a new flag was unfurled for a new state of Ulster, with a red hand of Ulster and a star for each county (Century Ireland, n.d.). In April 1914, an estimated 25,000 rifles and machine guns imported from the German Empire by the Ulster Unionist Council were landed at Larne, Bangor, and Donaghadee for use by the UVF. The Unionists were making it clear that whatever decisions were made in Westminster or by the Irish people as a whole about Home Rule, they were going to resist them by force of arms.

The Irish Volunteers and the Irish Citizen Army

By 1913 two other military organizations had also formed in Ireland. The Irish Volunteers (IV) was established as an open nationalist organization in November 1913 with behind-the-scenes encouragement from the secretive physical force organization the Irish Republican Brotherhood (IRB). A unionist paramilitary force, the UVF, had been established with the backing of much of the establishment in the North, to oppose Home Rule, and it was felt that a counterbalancing force was needed to defend Home Rule. However, the IRB also saw this as an opportunity to enable the IRB to organize militarily for a coming rebellion. The IRB asked Eoin MacNeill, from Antrim, a history professor in University College Dublin to lead it.

It was felt that someone of his standing with a moderate political perspective would attract many more followers. In effect at this stage, the IV was viewed not as a revolutionary body but as an organization setup to defend the Home Rule process and not engage in offensive action. Most of the members were supportive of the IPP rather than the IRB and in March 1914 John Redmond, the leader of the IPP fearing a loss of influence in events demanded and was granted seats for his party on the Irish Volunteers Provisional Committee.

In December 1913, the Irish Citizen Army (ICA) was set up by members of the Irish Transport and General Workers Unions, Jim Larkin, James Connolly, and Capt. Jack White from Antrim and included such notables as Countess Markievicz, Francis Sheehy-Skeffington, and Sean O'Casey (though the latter two later resigned). Set up in the context of the 1913 Dublin Lockout to defend striking workers from attacks from police and company vigilantes, it went on to join the Easter Rising with the much bigger Irish Volunteers. It was an overtly socialist organization, unlike the IV, but was still viewed as an open defensive rather than an underground revolutionary organization. In April 1914, despite a ban on the importation of arms into Ireland, the UVF successfully landed 24,000 rifles through Larne. The Irish Volunteers likewise landed arms in Howth. The scene seemed set for an armed confrontation, and one occurred – but not over Home Rule. By 1914 the Liberal Government was proposing that the only way to deliver Home Rule in Ireland would be through partition. The notion was that partition would temporarily allow six of Ulster's nine counties – Antrim, Armagh, Down, Derry, Tyrone, and Fermanagh – to opt out of Home Rule, while the South would get its own Parliament within the Empire. Although many southern Unionists including Carson were dismayed at the idea of partition and of any part of Ireland having Home Rule, the Ulster Unionists saw this as a potential solution. Six counties were chosen purely and simply because they would give the Unionists a more sustainable majority of 66%:34% based on a religious headcount of Protestants and Catholics. If the other three counties of

Ulster (Donegal, Cavan, and Monaghan) were included, the majority would be only 55%:45%, and there was a concern that that might be whittled away over time, particularly with a higher Catholics birth rate. That the six counties chosen included two counties – Tyrone and Fermanagh – as well as major parts of other counties and indeed the towns of Derry and Newry, which had nationalist majorities, was not viewed as a problem. This solution might also secure the shipbuilding and engineering industry around Belfast so important to the Empire, for the British.

The proposal however split nationalism. Redmond and his IPP supported a form of temporary partition in order to get any form of Home Rule for the rest of the country from the British and in the hope that the North would eventually rejoin the rest of the country once the Unionists realized there was no threat. The republicans in Sinn Féin and the ICA however rejected the proposal. Connolly who had lived and worked in Belfast, (in the North) for a number of years was particularly concerned. He believed it would allow for the establishment of two conservative sectarian states, North and South, preventing workers' unity and progress toward a united socialist society. In March 1914 he wrote:

> Such a scheme as that agreed to by Redmond and Devlin, the betrayal of the national democracy of industrial Ulster would mean a carnival of reaction both North and South, would set back the wheels of progress, would destroy the oncoming unity of the Irish Labour movement and paralyse all advanced movements whilst it endured.

> To it Labour should give the bitterest opposition, against it Labour in Ulster should\fight even to the death, if necessary, as our fathers fought before us. (Connolly 1914)

In August 1914 World War I broke out between the imperial powers of Europe. Arguments at Westminster in relation to the content of the Home Rule Bill and in particular as to whether six of the nine counties of Ulster should be excluded temporarily from Home Rule were set aside. The Home Rule Bill was passed by the Westminster Parliament and received the royal assent in September but was simultaneously suspended until the end of the war and in fact was never implemented.

The Outbreak of WW1

The outbreak of war was not politically problematic among unionists – the interests of the UK and its empire were under attack and had to be defended. Unionists joined the British army in their tens of thousands to fight for King and country. Nationalism in Ireland was split between those led by Redmond and the IPP who felt it was their patriotic duty to fight for Ireland and the empire (since Ireland was part of the empire) and those like Pearse and the IRB who felt that Ireland's interest lay not in fighting for the British Empire but opposing it. In Europe socialists were divided; the Second International of socialist and labor organizations attempted to develop a united anti-imperialist war policy, but many social democratic parties and trade unionists began to support their own nation states' war efforts. In Ireland too socialists and trade unionists were split. Many followed the lead of Connolly, the Irish Citizen Army, and the ITGWU, whose Liberty Hall banner in Dublin declared "We Serve Neither King nor Kaiser". However, many more followed the Unionists (particularly in the North) or the IPP who advocated support for the empire. Their view was that it was the patriotic duty to support the empire in its hour of need.

Redmond, in the hope of winning British Government support for the implementation of Home Rule after the war, called on Irishmen and the Irish Volunteers in particular to join the British Army and support the British war effort for "the freedom of small nations". British propaganda promoted the view that the war was about the invasion of Belgium by Germany and "a freedom struggle." That both Britain and France on the allied side had massive empires themselves in which many "small nations" were not "free" (including Ireland in the view of republicans) was not lost on republicans. While Redmond pledged the Irish Volunteers to fight for the crown in the belief that in so doing the crown would reward them with Home Rule, Carson the Unionist leader did the same with the UVF expecting the reward to be the maintenance of the Union, at least for Ulster. The socialist and republican George Gilmore claimed to have observed a recruiting poster in

Belfast addressed to Protestants which said "Fight Catholic Austria". He claimed that he took it to Dublin and placed it alongside a poster addressed to Catholics saying "Save Catholic Belgium" (Coughlan, 2015).

Although support for the British war effort was opposed by the IRB, the ICA, and other nationalists and socialists, the vast majority of the Irish Volunteers, about 175,000, followed Redmond, splitting the organization and forming the National Volunteers. A minority of only about 13,500 remained with the Irish Volunteers under MacNeill supporting the call for Irish neutrality. Tens of thousands of nationalists joined the British Army during World War I – many more than were to turn out to fight for Irish Independence a few years later. They tended to join Irish regiments like the Connaught Rangers or Dublin Fusiliers and fought in the 10th and 16th Irish Division, while the unionist volunteers fought in the 36th Ulster Division. It is estimated as a result that about one quarter million Irish men fought on the British side during World War I (Probert 1978:39).

There are many reasons for this. The main nationalist newspapers in Ireland supported the Redmondite strategy. The Catholic Church also provided moral sustenance for those joining to fight the Germans. There was none of the condemnation that had been issued in relation to the Fenians, and they provided padres for the British Army. Thus the recruitment campaign promoted a sense of legitimacy. A general hype was created that everyone should do their duty – the famous Lord Kitchener poster pointing the finger at passersby and saying "your country needs you." Others heard the call of Redmond and joined up for the cause of nationalism. Whole communities of young and not so young men joined up in what was often viewed as a community effort. Joining the British Army was also viewed as something of an adventure. It also provided much needed income for many whose career opportunities were limited in Ireland at the time.

Historically the British Army had been a source of income and adventure for many working class people across the empire. The 1881 Census had shown that in Belfast where Catholics made up 28.8% of the working population and were disproportionately among the most economically deprived, they composed 31.9% of British Army soldiers, though none of these held officer ranks. At the same time Catholics only represented 17.2% of the legal profession, 9.7% of doctors, 7.1% of engineering workers, and 14.7% of shop owners/merchants (Jones 1960:163). James Connolly the revolutionary socialist leader, who was a leader in the 1916 Rising and was executed, had himself been a former British soldier in his youth. Indeed some of those who later returned from World War I, such as Tom Barry, who was to lead a flying column in West Cork, were to join the IRA in what came to be known as the War of Independence (1919–1921).

While many tens of thousands marched off to war, many were not to return. John Redmond's brother Willie who was one of five Irish MPs to fight in World War I was killed in 1917 as was former IPP MP Tom Kettles in 1916. In the last verse of his well-known poem "To My Daughter Betty, the Gift of God," written just days before his death, he appears to challenge those who criticized those Irish who were fighting in the British Army:

> So here, while the mad guns curse overhead, and tired men sigh, with mud for couch and floor, know that we fools, now with the foolish dead, died not for Flag, nor King, nor Emperor, but for a dream born in a herdsman's shed, and for the sacred scripture of the poor. (Pierse 2017:247)

At least 49,000 Irish people are listed as having died during the war by the "In Flanders Field Museum Project" in Ypres, Belgium (In Flanders Field Museum Project). Initially there was a general belief that the war would be over quickly. In the end it was to last 4 years with between 17 and 29 million dead (soldiers and civilians). Any initial romantic notions of heroic fighting for a good cause became subsumed by the horrors.

David Starrett, a young working class unionist and UVF man from Belfast who survived the war, wrote in his unpublished memoir, "Batman":

> So the curtain fell, over that tortured country of unmarked graves and unburied fragments of men: murder and massacre: the innocent slaughtered for the guilty: the poor man for the sake of the greed of

the already rich: the man of no authority made the victim of the man who had gathered importance and wished to keep it.

Greed and lust of power, that was the secret. We were said to be fighting to stop future war, but none believed that. Nor ever will. (Starrett unpublished)

A cold irony is that his views on the war appear similar to those socialists who opposed it and would soon rise against British rule in Dublin.

An interesting point in relation to World War I worth considering is the impact of the growing Home Rule crisis in Ireland on the developments on continental Europe at the time. The killing of the Austrian Archduke Franz Ferdinand in Sarajevo in June 1914 by Serbian nationalists had set in motion a chain of events far beyond a relatively simple nationalist attack. The Austro-Hungarian Empire's ultimatum to Serbia was rejected, leading to a declaration of war on that country by the empire. This then led to the intervention by Russia on the side of its ally, Serbia, and then the intervention by Germany on the side of its ally the Austro-Hungarian Empire. Britain, France, and Russia had signed a treaty to support one another in the event of war. Thus when Germany declared war on Russia, France, and Belgium, Britain had to decide whether to enter into the war itself. According to Jerome aan der Wiel (2017), archives and memoirs suggest that there was belief among some of the German and Austrian leaders that a potential conflict in Ireland would distract Britain and make an intervention on the side of Russia and France less likely. The threat of potential war in Ireland, between the UVF, the Irish Volunteers, and the British over Home Rule, meant that Britain was reluctant to deploy large numbers of troops away from Ireland to engage in war on the continent. This in turn may have emboldened the Germans in their own war efforts if they believed that Britain would not intervene. In the event the immediate crisis in Ireland was averted (at least for the moment) by Redmond's announcement in the House of Commons on 3 August of support for the British war effort. With his and Carson's agreement, the Home Rule Bill was suspended until after the war. The next day, 4 August,

Britain declared war on Germany (Aan der Wiel 2017a).

This leads to a number of possible speculative perspectives around "what if." What if "Home Rule" had not been a bone of tension in Ireland in 1914? What if the Conservatives and Unionists had accepted that the wish of the vast majority of the people of Ireland was for Home Rule and that this should be respected with limited Home Rule for Ireland within the empire? Would this have placated Irish nationalists (the vast majority of whom seemed to support such a policy in 1914) and marginalized the republicans? Would this in turn have presented a 'united' UK rather than a "disunited" one to Germany and led to diversion from war? Could World War I have been prevented as a result? What if Redmond had refused to support the British war effort in August 1914? Would this have prevented Britain entering the war and saved the lives of tens of thousands of Irish (and British)?

Of course neither of these happened. Britain entered the war with the support of many more nationalists than those who opposed it but a new "opportunity" also now presented itself for the minority of nationalists and socialists who wanted an independent republic in Ireland. Operating on the old Irish nationalist maxim, "England's difficulty is Ireland's opportunity," the IRB and its nationalist allies set about planning for revolution.

The Lead up to the Rising

The split in the Irish Volunteers over World War I and Redmond's call to support the British war effort provided the IRB with an opportunity to consolidate their control over the organization, and they infiltrated a number of key positions, though Eoin MacNeill remained the leader. Four of the seven signatories to the 1916 Proclamation held important positions – Patrick Pearse, Direction of Military Organisation; Thomas Mac-Donagh, Director of Training; Joseph Plunkett, Director of Military Operations; and Eamonn Ceannt, Director of Communications.

The war itself also presented an opportunity to make contacts with Britain's enemy, Germany, in

the hope of obtaining weapons and possibly other military support, as nationalists had done in previous centuries with other states, such as France and Spain, when Britain was in conflict with them. The IRB set up a secret military council, separate from the Irish Volunteers. The official position of the Volunteers was that it would only engage in military activity if attacked. In May 1915 Pearse had written in *The Irish Volunteer* publication by way of an explanation as to why the Volunteers existed:

> What if conscription be enforced on Ireland? What if a Unionist or a Coalition British Ministry repudiates the Home Rule Act? (*The Irish Volunteer* 1915)

The IRB however had other plans for the Irish Volunteers. It was planning a Rising. The IRB's organization in the USA under John Devoy engaged in communications with the Germans. Both Joseph Plunkett and Roger Casement travelled to Germany in 1914 and 1915 to try and get agreement on weapons' shipments to Ireland and a German invasion force. Although some weapons were agreed, an invasion of Ireland wasn't part of the German war strategy. With the agreement of the Germans, Roger Casement was sent to try and recruit Irish volunteers among British Army prisoners of war held in Germany for a new Irish Brigade to fight the British. He met with little success however and left disillusioned (Aan der Wiel 2017a). He was attacked by the Irish press for his efforts. For example, in 1915, the Belfast-based IPP supporting nationalist paper, the *Irish News*, carried an editorial denouncing Casement's attempt to get "these heroic Irish fighting men" to desert as an "evil scheme" (*Irish News*, 28th June 1915).

One of the problems the IRB had in relation to a Rising was the lack of support among the wider nationalist population. Families had sons and fathers fighting in the British Army overseas, while the Irish Volunteers were marching around Ireland and opposing the war. One incident from the police files from the period reports that a band of Volunteers led by Pearse on a march through Limerick in May 2015 was attacked by stone-throwing women whose family members were fighting overseas (RTE n.d.).

The death of the veteran Fenian, Jerimiah O'Donovan Rossa, provided an opportunity for the IRB to mobilize support for their cause. Taking control of the funeral, they decided to use it as a powerful propaganda event. O'Donovan Rossa's body was brought from New York to Liverpool to Dublin and given a full military funeral with uniformed members of the Irish Volunteers marching behind the coffin and firing shots over the grave in Glasnevin Cemetery. It was one of the biggest funerals ever seen in Ireland. Pearse's eulogy on 1 August 1915 went down in history as one of the most stirring revolutionary speeches ever made in Irish politics:

> Life springs from death; and from the graves of patriot men and women spring living nations. The Defenders of this Realm have worked well in secret and in the open. They think that they have pacified Ireland. They think that they have purchased half of us and intimidated the other half. They think that they have foreseen everything, think that they have provided against everything; but the fools, the fools, the fools! – they have left us our Fenian dead, and while Ireland holds these graves, Ireland unfree shall never be at peace. (Library Ireland n.d.)

By January 1916 the IRB had decided on a date for the Rising – 23 April, Easter Sunday. There is no doubt that the date was symbolically significant in Catholic Ireland – Easter Sunday celebrates the Resurrection of Christ. Indeed an attempt was even made to try and get the Pope to endorse the Rising. Count George Plunkett was sent to Rome in April 1916 to tell the Pope about the Rising and to ask him to bless it, but he declined (Rafferty 2016:52; Aan der Wiel 2017a:231).

Easter was also a holiday period (Easter Monday being a holiday), and there would be an expectation that many British troops and officials might be on leave. James Connolly who had been increasingly vocal in his own publication *The Irish Worker* about a need for revolution was brought into the confidence of the IRB. Over the period 19 to 22 January, he entered into discussions with the IRB leadership, was sworn into the IRB, and was made a member of their Military Council (Greaves 1976:383–387; Berresford Ellis 1985:218–220).

The IRB in Ireland informed Devoy in the USA about their plans for the Rising in February, and he contacted the Germans and asked for

weapons and other support. They responded by sending the Aud with 20,000 rifles to Ireland. However the British had broken the German code and followed the ship all the way to Ireland where it was captured after failing to land the weapons off the West coast. Roger Casement has been landed on the Kerry coast on 21 April 2016 by a German U Boat to liaise with the Volunteers over the transfer of the arms. However, he was quickly captured by the British. Casement himself was brought to London, where he was charged with treason and hanged in the aftermath of the Rising becoming the 16th leader to be executed.

The evidence suggests that the British must have known about plans for a Rising (Aan der Wiel 2017a:229–231). Certainly this was one of the factors which influenced Eoin MacNeill to make the countermanding order to try and stop it. Eoin MacNeill had initially opposed any Rising on moral grounds, being opposed to armed struggle unless it took place in the context of self-defense. However, the IRB eventually convinced him, with a forged document allegedly from Dublin Castle that the British planned to move against the Irish Volunteers. They told him about the plans for a Rising and of the plan to land weapons from Germany. He initially agreed to go along with the plan for major mobilizations of Irish Volunteers throughout Ireland on Sunday 23 April. However, when he found out about the deception and the loss of the Aud he issued the countermanding order, cancelling the mobilizations (Aan der Wiel 2017a:229). The order which was published in the *Sunday Independent* on Easter Sunday led to a great deal of confusion among the Volunteers, with some mobilizing in different parts of the country and then returning home. A decision was made by the IRB to go ahead with it the following day on Monday. However by that stage, few of the Volunteers were aware of the plans.

The 1916 Easter Rising

'Twas far better to die 'neath an Irish sky, Than at Suvla or Sud el Bar. (The Foggy Dew)

On Easter Monday morning 24 April 1916, about 1200 men and women took control of a number of key buildings and areas of Dublin. Most of them were members of the Irish Volunteers, but they included about 200 members of the ICA as well as members of Cumann na mBan (the women's branch of the Irish Volunteers) and Na Fianna Éireann, the republican scouts movement. The GPO became the headquarters where the leader Patrick Pearse was based along with James Connolly and other leaders. There Pearse read out the Proclamation of the Republic which was signed by seven signatories – Thomas Clarke the veteran Fenian, Thomas MacDonagh, Sean Mac Diarmada, Eamonn Ceannt, James Connolly, Joseph Mary Plunkett, and Patrick Pearse. The Volunteers also took control of a number of other strategic buildings including the Four Courts, Boland's Mill, Jacob's Factory, and St Stephen's Green. These were chosen to command the main routes into Dublin or because of their strategic positions in relation to the major military barracks. They also occupied the College of Surgeons for a while. At one point they attacked Dublin Castle, and there was later speculation that since there was only a limited number of armed police in the Castle at the time due to the holiday, they might have been able to take it over had they proceeded with the attack. The failure to control the railway stations meant that once they were in a position to move troops into the city, the British could do so via train (McGarry 2017).

Outside of Dublin, the countermanding order meant that very few areas rose up. In Co. Galway, 500 rebels mobilized under Liam Mellows and made several unsuccessful attempts to take over a number of RIC Barracks (McGarry, 2016). Mellows, a prominent socialist republican, was to go on to fight in the War of Independence 1919–1921. He also went on to fight on the republican anti-treaty side in the Civil War (1922–1923). He was captured in June 1922 at the Four Courts in Dublin which had been occupied by anti-treaty forces. He was executed by the Free State along with three other leaders, Joe Kelvey, Richard Barrett, and Rory O'Connor, one from each province, in December 1922, in reprisal for the assassination of pro-treaty TD, Sean Hales (Greave 2004).

The most successfully uprising outside Dublin was in Ashbourne, Co. Meath, where Volunteers

led by Thomas Ashe captured several barracks. Enniscorthy, Co. Wexford, was the only other town which was occupied for a period by the rebels. Due to confusion over the countermanding order, the Rising did not take place there until Thursday 27 April. A number of buildings were taken over and held until the general surrender order was made by Pearse on Saturday 29 April (McGarry 2017:258–259). Interestingly the *Evening Herald* reported that the supporters of Redmond's party had turned out to support the police during this period, with 600 including the nationalist mayor enlisting as special constables (Evening Herald, 5th May 1916:1). Thomas Ashe was later to die due to force-feeding while on hunger strike in 1917.

Although there was no Rising in Cork, the RIC had been sent to round up republican sympathizers around the country, and a gun battle broke out at the home of the Kent family when they attempted to arrest the Kent brothers. An RIC man was killed along with one of the brothers, and the other brothers were arrested. Thomas Kent was executed over the incident by the British.

In the North, the IRB President, Dennis McCullough had led the Belfast Volunteers to Coalisland for the 1916 mobilization to meet up with Tyrone Volunteers, but the countermanding order led most to return to the city thinking the Rising had been called off. The plan apparently had been to join up with Liam Mellows in Connaught and not to engage in any armed activities in Ulster (McCullough 1953).

The Proclamation of the Republic reflected the different and sometimes conflicting strands of thinking within the IRB, Irish Volunteers, Irish Citizen Army, and Cumann na mBan at the time. It was different from the Fenian Proclamation of 1867 in that it was not so overtly socialist, but there were nonetheless socialist ideas contained therein. It was clearly nationalist, republican, secular, anti-sectarian, internationalist, and indeed quite feminist for its time.

It started off with its call to "Irishmen and Irish women," making it clear that both were equally important in this republic.

The continuing importance of Catholicism for most Irish people, including the revolutionaries,

was reflected in the wording of the 1916 Proclamation:

> . . . In the name of God and of the dead generations. . . We place the cause of the Irish Republic under the protection of the Most High God, Whose blessing we invoke upon our arms, and we pray that no one who serves that cause will dishonour it. . ..

However, it is also clear that many of those involved in the Rising had a radical agenda and, while the words might be open to different interpretations, potentially a socialist agenda:

> We declare the right of the people of Ireland to the ownership of Ireland, and to the unfettered control of Irish destinies, to be sovereign and indefeasible. . .

It promoted the notion of rights for all citizens regardless of creed and indeed reconciliation between all parts of Ireland:

> The Irish Republic guarantees religious and civil liberty, equal rights and equal opportunities to all its citizens, and declares its resolve to pursue the happiness and prosperity of the whole nation and all of its parts, cherishing all the children of the nation equally, and oblivious of the differences carefully fostered by an alien Government, which have divided a minority from the majority in the past. . ..

It also linked the 1916 Rising to other rebellions in Ireland down through the centuries, creating a narrative of an unbroken lineage of an old nation which had struggled against bondage for centuries, and in the process legitimizing the claims and actions of those involved in the Rising:

> The long usurpation of that right (to the ownership of Ireland) by a foreign people and government has not extinguished the right, nor can it ever be extinguished except by the destruction of the Irish people. In every generation the Irish people have asserted their right to national freedom and sovereignty; six times during the last three hundred years they have asserted it to arms. (Proclamation of the Republic 1916)

In Dublin, fighting was limited on Monday. The British appeared to have been taken unawares of the Rising, despite historical evidence that they had intelligence on it and the fact that they had just captured Casement and the Aud. Many of the senior military commanders were out of the city, including the military commander in Ireland,

General Friend, who was in London on leave. It wasn't until Tuesday that the British were able to move troops into Dublin and the fighting really began. The Viceroy, Lord Wimborne, declared martial law in Dublin, and on the following day the Cabinet in London extended it throughout the whole of Ireland. The Chief Secretary, Birrell, and the Viceroy both resigned. The Prime Minister Asquith sent General Maxwell to Ireland as Military Governor, and he arrived in Dublin on Friday (Townsend 2016:3).

British troops began sectioning off the city in an effort to isolate the rebels and began to shell the buildings which they occupied. There was a belief among the Volunteers that if they held out for a week, the international community might recognize the legitimacy of the republic which they had proclaimed. They held out for nearly a week, but by Saturday 29 April, the Rising was over, and Pearse had signed an unconditional surrender.

During the week nearly 3,000 had been wounded during the fighting and 485 people had been killed, about 260 of whom were civilians (including 40 children). 126 (about 26%) were British forces (120 British soldiers, 5 Volunteer Training Corps members, and 1 Canadian soldier). 82 (about 16%) were Irish rebel forces (64 Irish Volunteers, 15 Irish Citizen Army, and 3 Fianna Éireann), and 17 (about 4%) were police (14 Royal Irish Constabulary and 3 Dublin Metropolitan Police). All of the police and a number of the soldiers who died were Irish (Glasnevin Trust n.d.).

In the immediate aftermath of the Rising, the British authorities, under General Maxwell's orders, held secret court martials. No details of "trials" or evidence were provided by the media, just a list of names of those sentenced to death or imprisonment. A series of executions took place, drawn out over a number of days. In total 14 of the alleged leaders in Dublin including all of the signatories of the Proclamation and Patrick Pearse's brother, Willie, were executed. Thomas Kent was executed in Cork, and the sixteenth, Roger Casement, was executed for treason after a trial in London. A number of others including Countess Markievicz who had commanded the volunteers in St Stephen's Green and Eamon De Valera, later

leader of the republicans and a future president of the new Irish state, were sentenced to death but had the sentences commuted to imprisonment. Others were sentenced to life and other various lengths of imprisonment (Townsend 2016).

The large number of executions and their long-drawn-out nature with executions every day began to move public sympathy in the direction of the rebels. Redmond appealed to the PM Asquith to stop the executions because they are "causing rapidly increasing bitterness and exasperation" among people in Ireland (*Daily Telegraph*, 9th May 1916:9). On 10 May, after 8 days of trials and 13 executions, Asquith put a stop to the process of trials, but he allowed the executions of James Connolly (strapped to a chair because he had been badly wounded and couldn't stand) and Sean Mac Diarmada. General Maxwell however continued to round up republican supporters. Throughout Ireland an estimated 3,500 men and 79 women "suspects" were arrested. Many were transported to imprisonment in Britain with nearly 1800 imprisoned "without trial" (Townsend 2016).

Reaction to the Rising

When the Easter Rising took place in 1916, the Irish Parliamentary Party like most of the Irish population regarded it as a "stab in the back" for the Irishmen fighting overseas. Many more men were fighting with British forces overseas in World War I and in the police forces in Ireland, the Royal Irish Constabulary (RIC) and the Dublin Metropolitan Police (DMP), than were involved in the Rising. The vast bulk of the population did not rise in its support as had been hoped by the leaders, and indeed contemporaneous reports suggested that many people in Dublin apparently abused the prisoners as they were led away. The bulk of the Irish media and a number of Catholic bishops and clergy joined the IPP in condemning the Rising.

The British authorities and many in the press referred to the rebels derisorily as "Sinn Féiners." The Unionist *Weekly Irish Times* published immediately after the Rising said that "many instances of cold-blooded murder by Sinn Féiners took

place" (*Weekly Irish Times*, April 26th-May 13th:1). In its editorial, it called for continued martial law saying:

> for many months to come, firm and well-directed military government will be essential to the public safety. (*Weekly Irish Times*, April 26th-May 13th:6)

The daily *Irish Times* in its editorial on 6 May rejected criticism from the nationalist *Freeman* newspaper of its aggressive response to the Rising:

> We said, and we repeat, that the surgeon's knife of the State must not be stayed until the whole malignant growth has been removed. . . We have called for the severest punishment of the leaders and responsible agents of the insurrection. (*Irish Times*, 6th May 1916)

The IPP supporting *Irish Independent* called the Rising "Criminal Madness" in its editorial just after the Rising, saying that it cared little for the fate of the leaders who brought it on themselves by their actions (*Irish Independent*, April/May 1916:2). By this stage, 4 May, three had already been executed.

On 10 May 1916 after 13 executions had been carried out, the *Irish Independent* stated that:

> Some of these leaders are more guilty and played a more sinister part in the campaign than those who have already been punished with severity and it would hardly be fair to treat these leniently because the cry for clemency has been raised. . .Let the worst of the ringleaders be singled out and dealt with as they deserve, but we hope there be no holocaust or slaughter. (*Irish Independent*, 10th May 1916)

This seemed to be a clear reference to James Connolly who had been badly injured in the GPO. Connolly had been a thorn for many years in the side of William Murphy, the owner of The *Irish Independent*. Murphy had tried to break Connolly's trade union, the ITGWU, during the Dublin Lockout in 1913. Two days later, Connolly was strapped to a chair and executed by firing squad. Also shot that day was Sean Mac Diarmada.

The *Irish Catholic*, another newspaper owned like the *Irish Independent* by William Murphy, described the Rising in its edition on 29th May 1916 as both insane and criminal and appeared to support the executions:

> Pearse was a man of ill-balanced mind, if not actually insane. . .selecting him as "chief magistrate"

was enough to create doubts about the sanity of those who approved of it. . .no reason to lament that its perpetrators have met the fate universally reserved for traitors. . . (Berresford Ellis, 1985:230)

The wide gulf between the revolutionaries and the constitutional nationalists was illustrated just a few days after the Rising at the Conference of the Ancient Order of Hibernians. This body which was prominent in mobilizing political support for the IPP at the time was a different organisation from the U.S. organisation of the same name. Developed by the IPP's Joseph Devlin as a support organisation for the IPP it was particularly strong in Ulster. It voted at its conference to condemn:

> the foolish action of the Sinn Fein organisation. . . causing needless destruction of life and property. (*Irish News*, 18th May 1916)

Individual priests were undoubtedly sympathetic to the republican struggle from 1916 to 1922. Indeed one priest, Fr. O'Flanagan, who had been friends with many of the 1916 leaders, was made vice president of a reorganized and overtly republican Sinn Féin in 1917. However, the hierarchy was generally much more hostile (Keogh 2007). Seven bishops publicly condemned the 1916 Rising. Cardinal Logue stated that no one could fault the government for punishing the rebels, provided that it did so "within the laws of humanity." Nevertheless of the 31 bishops and auxiliaries, the bulk, including the archbishop of Dublin, William Walsh, remained silent (Rafferty 2016:52).

In June a subcommittee of bishops was appointed to draw up a statement setting out the Church's hostility to revolution, but by October 1916 they concluded that such a statement would serve no useful purpose (Rafferty 2013). By this stage the ongoing reaction of the British to the Rising was creating increasing hostility among the nationalist population.

The End of the IPP and the Rise of Sinn Féin

In the aftermath of 1916, the sympathy of Irish nationalists began to move to the revolutionaries. People were affected not just by the long-drawn-

out series of executions but by the emergency provisions enacted by the British authorities including internment without trial, house searches, movement curtailment, and harassment by police and troops. This was coupled with a growing anger and disillusionment with the ongoing deaths in World War I. Tens of thousands were continuing to die in Europe in the war, and there was talk now of conscription in Ireland. By 1917 Sinn Féin had come to be the party which represented the IRB and the Irish Volunteers. At its October 1917 Ard Fheis, it made clear that it stood for an independent republic and it began to win seats in by-elections. It was to lead to the rapid demise of Home Rule supporting Irish Parliamentary Party. In the December 1918 elections, standing on a platform of abstentionism from the UK Parliament at Westminster and stating that it would instead establish its own independent Parliament in Ireland, Sinn Féin won 73 out of the 105 seats, most of them uncontested, leaving only 6 for the IPP. Indeed the 6 seats won by the IPP were partly the result of an intervention in Ulster by the Catholic Church, fearful that a split vote there would give the seats to Unionists. As a result an electoral pact was agreed by Sinn Féin and the IPP.

On 21 January 1919, the first Dáil Éireann met with only 27 TDs present, the rest being in jail or "on the run." It proclaimed allegiance to the 1916 republic and declared support for a socialist program entitled the Democratic Programme, a program which it was never able to implement. On the same day, armed men in what was to become known as the Irish Republican Army (IRA) ambushed members of the RIC escorting explosives at Soloheadbeg in Co. Tipperary, killing two RIC officers. This is often regarded as the first incident in what came to be known in Ireland as the "War of Independence, 1919–1921." In September 1919 the First Dáil was declared illegal by the British who set about disrupting its activities and imprisoning its representatives. While the "war" continued, the British Government passed the Government of Ireland Act 1920 which partitioned Ireland, establishing a Free State Parliament for 26 counties in the South and a Northern Ireland Parliament for six counties in the

North. In December 1921 negotiations between the republicans and the British Government led to the Anglo-Irish Treaty. Controversially signed by the Irish delegates under a British Government threat of 'terrible and immediate war' if they did not, it was passed by the Dáil by a majority 64 to 57. The treaty agreed to the partition of Ireland with the North remaining part of the UK with its own Parliament and the South becoming a dominion within the British Empire.

The treaty split Sinn Féin and the IRA, leading to a Civil War from June 1922. The Civil War was even more brutal than the War of Independence with former comrades set against one another and ambushes by the IRA followed by extrajudicial assassinations/executions and other reprisal attacks by the Free State. In the 7-month period November 1922 to May 1923, the Free State Government officially executed 77 republican prisoners. This was more executions than the British had carried out in the 5 years from 1916 to 1921 – 40 official executions, 16 in 1916 and 24 in the War of Independence. Free State forces also carried out an undetermined number of unofficial killings, in response to IRA attacks, such as at Ballyseedy Cross, Co. Kerry, in 1922. A formal cessation of hostilities was announced in May 1923 although that didn't end the killings (McArdle, 1924; Campbell 1994).

From 1923 a much reduced IRA (or IRAs) continued to exist with the aim of ending British rule in the North, re-establishing the 32 County Republic proclaimed in 1916, and engaging in attempted armed campaigns to achieve this. The longest of these was from 1970 to 1997 after which the new Sinn Féin party (remaining after a series of splits) agreed to the Belfast/Good Friday Agreement (1998). While the bulk of the remaining IRA appears to have supported this, what have been termed "dissident" republicans in much smaller numbers have continued to try to develop an armed campaign against British rule in the North.

As for the Free State, in 1937 a new Irish Constitution gave it the name 'Ireland'. Then in 1948 it became an independent state and no longer a British dominion by mutual agreement with the British Government, while Northern Ireland

remained part of the UK with its own local Parliament.

The Legacy of 1916

The Legacy of 1916 is, as many historians have agreed, quite complex. It has proven difficult for subsequent generations of Irish people to come to terms with on a number of different levels.

The move towards total independence and partition

On the one hand, it is possible that without the 1916 Rising Ireland might not have been partitioned. It is possible that if Ireland had united around support for the British effort in World War I, it may have remained united in the aftermath of the war as Home Rule was again negotiated. However, such a scenario was unreal given the circumstances in Ireland at the time.

For a start it seems certain that regardless of World War One, Unionists would not have been prepared to trade their majority status within the UK for a minority status within a semi-independent Catholic Ireland. They feared for the loss of their rights and freedoms; their religion; their ethno-religious identity; their social, economic, cultural, and political links with Britain; and indeed their disproportionately advantaged economic and social status position in Ireland. They also feared that limited independence would simply become extended to full independence over time, providing them with even less protections. It was for these reasons they had set up the armed paramilitary group, the UVF in 1913, and threatened rebellion, with the apparent support of the Conservative Party, the army officers in the Curragh, and prominent members of the business and landowning classes. Even, the Liberal Government under Asquith had come around to the notion of partition by 1914 to safeguard their (and Britain's) interests. With such support from within the establishment, the notion that their position would change or become weakened by nationalist involvement in the war seems naïve.

It is highly unlikely that the British would have contemplated delivering Home Rule to all of Ireland never mind independence sought by republicans. The British Government was not just thinking about domestic politics, Parliamentary majorities, and the balance of power in Westminster. Nor was it simply thinking about the safety of the Unionists in the North: it didn't seem to worry much about the Unionists in the South when it partitioned the island. There were a number of strategic and economic interests at play, linked to concerns for the integrity of the UK and the British Empire. That is why the British wanted to hold onto the treaty ports. They were also interested in maintaining the links to the shipbuilding and engineering industries around Belfast. More importantly perhaps they did not want Ireland to set an example for other parts of its empire, particularly India, in demanding independence. And of course British pride was also at stake. Britain had to be seen to win. That British interests rather than a desire for "peace and reconciliation" were to the fore explains why Lloyd George was prepared to threaten "terrible and immediate war" on Ireland if the republicans were not prepared to accept Britain's imposed "agreement" in December 1921.

It is also important to remember that a large republican and anti-imperialist socialist opposition to British rule had developed in Ireland fueled by British action and inaction, a lack of democracy and self-determination, and a sense of grievance built up over centuries of British rule. That opposition was unlikely to disappear.

Likewise even without republican and socialist opposition, it seems unlikely that support for the war from nationalists could have continued for much longer given the impact of the horror of World War I (on both British and Irish, not to mention other nationalities). By the end of 1916, people in Ireland were sickened by the mindless slaughter and maiming of the war, its long duration, and the lack of any sign of an end in sight. By 1915 it had been clear that the British war effort couldn't depend on volunteers anymore, and in January 1916 conscription had been introduced in Britain (but not in Ireland) with the Military Service Act. The IPP had urged against it being extended to Ireland, realizing that it could weaken its own political support (having supported the

war in the first place). When the British Government decided regardless, in the aftermath of 1916 to extend it to Ireland in April 1918, the IPP withdrew from Westminster in protest. As a result the IPP was now adopting a similar position to Sinn Féin of abstaining from Westminster, something not lost on the population. Now abstentionism, long criticized by the IPP, no longer appeared a mindless or irresponsible idea. Conscription then became a cause celebre in Ireland with the Catholic hierarchy also coming out against it. The result was that the British having enacted it never introduced it in Ireland. The whole process, however, seemed to legitimate even more the Sinn Féin position and weaken that of the IPP. Thus by 1918 the tide of support for the war and for the IPP had turned in Ireland. Among nationalists this meant a move towards republicanism and support for total independence from Britain.

As sympathy for those who had died in the 1916 Rising grew in the face of both the executions and the general aggressive handling of the country in the aftermath by the British, those who had condemned the republicans had to find ways of reintegrating themselves into the dominant discourse which was developing.

The Catholic Church

On a religious level, the Catholic hierarchy and laity had to deal with the contortions of whether or not the square peg of the Rising could be screwed into the round hole of Catholic "Just War" theology (not to mention the Catholic hierarchy's long history of on the one hand condemning "violence" by republicans and on other supporting the rule of law implemented by the British Government). This was made easier by the fact that most of the 1916 republicans were Catholics. The leader Patrick Pearse, in particular, reflected a devotion to the Church and its teachings in his writings (Pearse 1922). Poems like "The Mother" or "The Fool" indirectly linked the sacrifice of dying for Ireland with the sacrifice of Christ. Even Connolly the socialist was reported to have received the sacraments before he died. The Church was to

continue to yield enormous power in the years during the War of Independence and throughout the twentieth century in Ireland. By the 1918 Elections in which Sinn Féin won an overwhelming majority of seats, the Church was more willing to accept Sinn Féin as representing the bulk of the Irish people. However, during the conflict 1919–1921, bishops and priests continued to condemn acts of violence by both the IRA and the British forces. Nevertheless, as during the Land League, different bishops and particularly priests took differing stands. Thus when the bishop of Cork, Daniel Coholan, excommunicated the IRA, Tom Barry, a republican leader in Cork, described how most local priests still administered the sacraments to them (Barry 2013:56–57). As a result the bond between republican volunteers and the Church may have been strained but was never broken. Though they strongly opposed partition, the Catholic hierarchy came out in favor of the 1921 Treaty, before Dáil Éireann had voted on the issue (*Irish News* 10 December 1921). Cardinal MacRory, the archbishop of Armagh, publicly denounced and encouraged the excommunication of anti-treaty republicans during the Civil War including a future president of the Free State – De Valera. Despite this, the Church's power was such that it could retain influence even with those political leaders it had condemned, after the establishment of the Irish state. The Church continued to condemn radical republicanism and socialism in Ireland into the 1930s. In 1931 the bishops issued a statement condemning the IRA and Saor Éire, a left-wing republican organization and the left-wing Republican Congress. After 1921 it continued to be dominant in moral, social, educational, and welfare matters in the new Irish state, and this role was encouraged by the government. De Valera consulted with the Church over the content and wording of the 1937 Constitution, for example. Catholic social teaching and the principle of "subsidiarity," outlined in Leo XIII's 1891 encyclical *Rerum Novarum*, which rejected state intervention in relation to individual and family welfare, fitted with the conservative and laissez-faire approach of successive governments. Consequently the Irish state developed the character of a "Catholic" state for "Catholic" people.

Provision of schools, hospitals, and social services was usually left to the Church, and most attempts to alter that – such as Noel Browne's 1950/1951 Mother and Child scheme – ended in failure. It was not until the 1980s that the combined effects of EU membership in 1973 and European Convention on Human Rights court cases that Church control and influence over welfare provision and gender and sexual rights began slowly to wane, accelerating from the 1990s onward with the publication of clerical abuse cases and the general decline in vocations. In the North, now controlled by a majority Unionist Government since 1921, the Church operated for the most part as a state within a state. The Unionist state remained hostile to the Church and its followers regarding them as a disloyal fifth column attempting to destroy the entity. Discrimination against this minority was publicly sanctioned and indeed encouraged by successive Unionist Governments and practiced at public and private sector levels (Farrell, 1976). The minority for the most part did not recognize themselves as a minority at all, but part of a majority in Ireland who had been denied democracy in a new all Ireland state. They resented what they felt had been an injustice implemented by force of arms. On occasions when republican attempted to engage in physical force campaigns from the 1920s on to end partition, the Church remained forceful in its condemnation. The Church attempted (along with constitutional nationalist politicians) to negotiate better conditions for its flock with some limited success and remained the most important spiritual and political leader as well as a provider of education of welfare services for its followers into the 1980s and 1990s (Ó hAdhmaill 2013).

Women

While a large number of women were involved in the 1916 Rising, for the most part, they occupied subordinate roles, assisting the men as was the culture of the time. Countess Markievicz was probably an exception in this regard, commanding one of the units. The proclamation seemed to suggest an acknowledgment of equal rights for women, and Sinn Féin, the ICA, and Cumann na mBan all expressed support for women's suffrage. In the aftermath of 1916, however, rights for women were slow in coming. The new Free State did introduce female suffrage on the same basis as males (all people over 21), in 1922 and before this was introduced in the UK. Thus it is clear that at least on the surface republicans were generally supportive of women's rights. However, for much of the existence of the state, the position of women remained subordinate to men in the public sphere. Markievicz was the last woman minister in Ireland until the appointment of Maire Geoghegan-Quinn in 1979, and up until 1973 female civil servants were still expected to leave their jobs when they were married. The Church's influence was particularly determinate in this respect. It was membership of the EEC/EU in 1973 rather than the radical legacy of 1916 which heralded in new rights for women in employment, and it wasn't until the decline of Church power from the 1990s on that gender and sexual rights began to develop and be legislated for.

Socialism

The dreams of Connolly and the ICA of establishing a Workers' Republic came to nothing in the aftermath of 1916. The First Dáil had passed the overtly socialistic Democratic Programme in January 1919.

It stated:

...we declare that the Nation's sovereignty extends not only to all men and women of the Nation, but to all its material possessions, the Nation's soil and all its resources, all the wealth and all the wealth-producing processes within the Nation, ... that all right to private property must be subordinated to the public right and welfare. ... declare the right of every citizen to an adequate share of the produce of the Nation's labour...

It shall be the first duty of the Government of the Republic to make provision for the physical, mental and spiritual well-being of the children, to secure that no child shall suffer hunger or cold from lack of food, clothing, or shelter....all shall be provided with ....proper education....

...The Irish Republic fully realises the necessity of abolishing the present odious, degrading and foreign Poor Law System, substituting therefore a sympathetic native scheme for the care of the Nation's aged and infirm, who shall not be regarded as a burden, but rather entitled to the Nation's gratitude and consideration. Likewise it shall be the duty of the Republic to . . ..safeguard the health of the people. . . (Democratic Programme 1919)

However, there was no ability or inclination to implement the Democratic Programme during the War of Independence. For a short period in April 1919, the Limerick Soviet embodied the hopes of some for a new type of economic as well as political order in Ireland (O'Connor Lysaght 1979). However, the deaths of Connolly and Mellows, the partition of the country in 1921, and the defeat of the republican forces in the Civil War (1922–1923) summoned in conservative and in many ways reactionary governments, North and South, and throughout the twentieth and the early twenty-first centuries, radical forces had limited impact, either side of the border. As Connolly had predicted about partition:

Such a scheme as that agreed to by Redmond and Devlin, the betrayal of the national democracy of industrial Ulster would mean a carnival of reaction both North and South, would set back the wheels of progress, would destroy the oncoming unity of the Irish Labour movement and paralyse all advanced movements whilst it endured. (Connolly 1914 in Berresford Ellis 1997:275)

In the South, the pro-Free State Cumann na nGaedheal (later called Fine Gael) Government sought to "balance the books," establish "a good credit rating" with the capitalist world, and appear "responsible" in fiscal and budgetary matters. One of the first acts of new finance minister, Ernest Blythe, after the end of the Civil War in 1923 was to cut the old-age pension by a shilling (5c) to try and save on public expenditure. This government was followed by a conservative Fianna Fáil Government in 1932, which introduced the 1937 Constitution, a constitution reflecting Catholic social teaching and promoting "a conservative and distinctly sectarian state" (Powell 1992:220). Thereafter governments in the South were dominated by one or other of these conservative parties. In the North, the conservative Ulster Unionist Party dominated from 1921 to 1972 when direct rule from Westminster was introduced (Farrell 1976).

There are many reasons why the momentum for radical change in Ireland was lost in the 1920s. These include the loss of many progressive elements through conflict and emigration; the division in the labor movement and working classes, caused by both the War of Independence and partition; the absence of a strong industrial base in much of Ireland; the problems with economic development and continuing dependence on Britain for trade and income, North and South; and the persistent, controlling conservative influence of the Catholic Church among Catholics, North and South.

The Competing Narratives of 1916 and Contemporary Politics

One major legacy of 1916 was that despite being a military and political failure at the time and being roundly condemned by major Catholic Church figures, most of the press, and constitutional nationalism, the Rising came to be rebranded and embraced by conservative forces in Ireland and used to challenge and condemn latter-day revolutionaries as representing the antithesis for which those who died in 1916 had stood. Metaphorically speaking the Rising and its leaders were retrospectively canonized by the powerful interests in Irish society – the Church, the political parties, and the business class – and they used the association with the Rising to promote their own particular brand of politics and legitimacy among the masses. Indeed 1916 became commodified, with iconography which could be sold to make a profit. Streets, buildings, and sports clubs were renamed after what became known as the 1916 "martyrs" in the new Irish state. However, in the new Northern Ireland, the new "heroes" of the new Irish state remained the "criminals" and "murderers" they had been branded in 1916. That entity had its own set of "heroes" whose names and images bedecked streets, city centers, and statues – those who had fought to maintain the Union with Britain. Two narratives had emerged of the 1916 Rising, and these were to be reinforced and reproduced throughout the

remaining part of the twentieth and into the twenty-first century. In the rush to identify themselves with their fallen heroes, the adherents of both entities made little attempt to promote a concept of a shared narrative, a shared island, or peace and reconciliation, ironically the aim of the 1916 leaders in the first place.

The 1916 Rebellion not only inspired those who were to turn to Sinn Féin and the IRA in the post-1916 era and during the War of Independence 1919–1921, but it also inspired those who were to fight on both sides in the Civil War in 1922–1923 and who were to continue to fight after 1923, during sporadic outbursts of armed struggle, in an effort to end British rule in the North and reunite the country. Indeed allegiance to the 32 County Republic proclaimed in 1916 became part of the constitution of the post treaty IRA (and subsequent versions of it). The 1916 republic was viewed as having been subverted by the British and those who had accepted the treaty. The legitimacy of continuing the armed struggle was in part provided by that Proclamation of the Republic.

It was also provided by the words and ideas of the 1916 "martyrs." At his court-martial in 1916, before being executed, Connolly had provided the ultimate "justification" for future republicans in the physical force tradition:

> Believing that the British government has no right in Ireland, never had any right in Ireland and never can have any right in Ireland, the presence in any one generation of Irishmen of even a respectable minority ready to die to affirm that truth, makes that government forever a usurpation and a crime against human progress. (Connolly 1916)

After the Civil War, two new major constitutional nationalist parties emerged in the South, each intent on inheriting the iconic mantle of 1916. The new Free State Government was led by Cumann na nGaedheal, the party which had supported the Treaty. (which in 1933 became Fine Gael). Fianna Fáil was set up in 1926 by Eamon De Valera and many of those who had opposed the treaty, after splitting from Sinn Féin over their policy of abstention from both partitioned Parliaments in the North and South of Ireland. De Valera hoped the new party would be able to re-establish

the 1916 republic by constitutional means. Both parties tried to outdo one another in proving themselves the genuine inheritors of 1916. De Valera was to go on to create the 1937 Bunreacht na hÉireann (Irish Constitution) which in its Articles 2 and 3 was to lay claim to the whole of Ireland for the Irish state.

> Article 2: The national territory consists of the whole island of Ireland, its islands and the territorial seas.
>
> Article 3: Pending the re-integration of the national territory, and without prejudice to the right of the parliament and government established by this constitution to exercise jurisdiction over the whole territory, the laws enacted by the parliament shall have the like area and extent of application as the laws of Saorstat Éireann and the like extra-territorial effect. (Bunreacht nah Éireann 1937)

In theory this created a constitutional imperative on behalf of the Irish state to reunite the country. In reality the state did nothing, outside of rhetoric, to achieve this aim. From 1922 to 1972, when the British Government prorogued the Northern Ireland Parliament and introduced direct rule from Westminster, the effect was to link Fianna Fáil to the 1916 republic and to alienate even further Unionists in the North who viewed the claim to "their" territory as a threat. De Valera consistently referred to the North as the "Occupied Six Counties." In 1933 he was elected to the northern South Down constituency as an MP but refused to take his seat. However, he steadfastly refused to allow northern nationalists elected in the North to sit in the Dáil in Leinster House, as had happened during the First (1919–1921) and Second Dáil (1921–1922). He did not wish to upset his own balance of power in the Dáil with the introduction of northern nationalists. He also had no compunction in acting aggressively against the IRA, an organization which refused to recognize the legitimacy of the southern government as much as the northern government and which engaged in armed activity in both parts of Ireland. In the space of 5 years – 1940–1944 – his government oversaw the execution of 6 republicans. In the 51 years of the whole existence of the Unionist Government in the North 1921–1972, only one republican, Tom Williams in 1942, was ever executed.

Fine Gael, for its part, declared the 26 County State a republic in 1948, and this was recognized in mutual legislation in Britain and Ireland. The effect was to link Fine Gael to the concept of a republic, though one that comprised only 26 counties.

By the 1980s, challenged by the ongoing armed conflict in the North and in particular the armed struggle of the Provisional IRA (1970–1997) and by their own inability to do much to achieve Irish unity by constitutional means over 50 years, both parties, Fine Gael and Fianna Fáil, began to distance themselves from Articles 2 and 3. In both the Sunningdale Agreement (1973) and the Anglo-Irish Agreement (1985), the Irish Government agreed to aspire to Irish reunification but accepted that this could only occur with the consent of a majority in the North. The Belfast/Good Friday Agreement (1998) was to copperfasten this in legislation and in changes to the Irish Constitution. The claim to the North was removed and replaced with new clauses declaring a desire "to unite all the people who share the territory of the island of Ireland" but accepting the necessity of consent on either side of the border for any reunited Ireland.

> Article 3
>
> It is the firm will of the Irish nation, in harmony and friendship, to unite all the people who share the territory of the island of Ireland, in all the diversity of their identities and traditions, recognising that a united Ireland shall be brought about only by peaceful means with the consent of a majority of the people, democratically expressed, in both jurisdictions in the island. . . .. (Bunreacht nah Éireann 1937). The new Article 2 asserted that everyone born on the island of Ireland was entitled to be 'part of the Irish nation'.

> Article 2
>
> It is the entitlement and birthright of every person born in the island of Ireland, which includes its islands and seas, to be part of the Irish nation. . ..

This right has since been qualified by the Twenty-seventh Amendment. Adopted in 2004, this amendment did not alter the new wording of Articles 2 and 3 but nonetheless limited the constitutional right to citizenship to those born on the island to at least one parent who was already an Irish citizen.

While opinion polls in the South of Ireland continue to show a large majority in favour of Irish unity, including a RedC/RTE/TG4 poll in May 2019 (Red C, 2019), in the North, despite an increasing (and younger) nationalist population and a declining (and older) unionist population, opinion remains deeply divided. The North has witnessed massive change since the onset of the peace process of the early 1990s. A new generation has grown up in a more peaceful,, less militarised, less discriminatory society, albeit one that is still heavily segregated geographically, residentially, socially, economically, culturally and politically. Changing demographic patterns, globalising influences such as increasing foreign travel, increasing immigration and increasing ethnic/religous diversity, the decline of the power of the Catholic Church North and South, the increasing secularization of society, and the advancement of a human rights-based approach to policy and practice are all impacting on society. Whether this will lead to the development of a desire for Irish reunification among northern unionists in the near future,however, remains open to debate. The decision of a majority of the people of England to bring the United Kingdom (and the North) out of the European Union (EU) (while the South of Ireland remains in the EU) raises all sorts of questions. The threat of a 'hard border' being implemented North and South in Ireland (something that hasn't been seen since the late 1990s), and the potential impact on the peace process; the stability of the UK itself given that majorities in both the North of Ireland and Scotland voted to remain in the EU; renewed demands for a border poll (allowed for in the Belfast Agreement 1998) in the North and independence for Scotland, all mean that the future remains very unclear.

The Legacy of the Easter Rising 1916 Internationally

Historically, those who had risen against British rule in Ireland had always looked across Europe for potential allies in order to try and even up the great imbalance between Irish resistance and British control in what was to increasingly become a

highly asymmetric conflict. Looking initially to England's international enemies – Spain in the sixteenth and seventeenth centuries and France in the eighteenth century – for potential support, the Irish resistance was traditionally based on the premise – England's difficulty is Ireland's opportunity. So it was in the early twentieth century when both unionists and nationalists in Ireland sought out Imperial Germany, to obtain weapons for their diametrically opposed causes. Such overseas assistance was based less on support for Irish democracy or self-determination and more on the national and imperial interests of European powers competing with England. The French Revolution and the threat to it from England and other European dynasties did create a bond, however, short-lived between revolutionary France and Ireland with the spread of the democratic ideas of liberty, equality, and fraternity to Ireland. By the mid-nineteenth century, the Young Irelanders were also greatly influenced by the liberal democratic struggles throughout Europe culminating in the 1848 uprisings and linked their own struggles to those opposing absolute monarchies there. Daniel O'Connell also became a champion for the ending of slavery in the USA and promoted the escaped slave, Frederick Douglas on his tour of Ireland in 1845. Throughout the nineteenth and twentieth centuries, Irish revolutionaries were also to the fore in labor struggles in Britain. It was the Fenian movement in particular which was to find solidarity in the developing workers movement in Europe in the later nineteenth century, creating close ties with the First International. While constrained in their socialism by the reality of the controlling influence of the Catholic Church over the mass of Irish peasantry, they nevertheless produced an overtly secular and socialistic proclamation of the Republic. Michael Davitt, the land leaguer and Fenian, was active in the labor movement in Britain, as was IRB member Jim Connell who penned the famous socialist anthem, "The Red Flag."

The IRB in 1914 along with a minority of Irish Volunteers and the Irish Citizen Army had opposed the World War as an imperialist war and Irish involvement in it. In particular, the 1916 leader James Connolly had argued for anti-imperialist solidarity among working people across Europe and a banner was strung across the doorway of the ITGWU's headquarters, Liberty Hall, in Dublin, proclaiming, "We Serve Neither King nor Kaiser." Connolly and the ICA supported the minority of European socialists like Lenin and the Bolsheviks and Rosa Luxemburg, who refused to side with those fighting a war for capitalist and imperialist gain. According to Aan der Weil (2017b) while Lenin appeared sympathetic to the Irish struggle after 1916, writing that "a blow delivered against the British imperialist bourgeoisie in Ireland is a hundred times more significant than a blow of equal weight in Africa or Asia" (Lenin 1916), the Bolsheviks in general had their own difficulties after 1917, trying to maintain their revolution against western European armies (Aan der Weil 2017b). While attempts were made to obtain Soviet recognition for the First Dáil after 1919, much more important for the republicans was not to alienate the Catholic Church. There was also a belief that the USA could provide more important support for the newly proclaimed republic.

Indeed it was the Irish diaspora in both Britain and the United States which was to have a particular influence on the cause of Irish independence from the mid-nineteenth century onward.

The Great Hunger 1845–1849 led to massive emigration of Irish people and with them went a sense of grievance against British rule. Irish Americans in particular organized and funded the Fenian campaign in the later nineteenth century, and it was to the USA that De Valera and others went after 1916 in search of funds, weapons, and recognition for the newly proclaimed republic. The 1918 election with the landslide win for Sinn Fein and the establishment of the First Dáil led to attempts to get Ireland's case heard at the Versailles Treaty negotiations. While the victorious European powers talked about the freedom of small nations, this only applied to those people formerly ruled by the defeated Austro-Hungarian, Germany, and Ottoman Empires. The empires of the victorious French, British, and Belgians remained intact (Throntveit 2011:445–450). The right to self-determination related only to some nationalities, and, indeed,

by the end of the interwar period, the majority of the world's currently recognized nation states still remained under the control of the colonial powers.

Despite lobbying from Irish-America and the support of a majority of votes in both the US Senate and House of Representatives, President Wilson, under pressure from his British allies, refused to allow the Irish republican representatives a hearing (Phoenix 2019). The British then set about militarily crushing what they saw as a "rebellion" in Ireland. Similar expressions of dissent were also crushed in Egypt and at Amritsar in India, both in the spring of 1919.

The 1916 Rising and the struggle for independence no doubt influenced other peoples' struggling under imperial control. O'Malley (2017) notes in particular the influence on the Indian struggle for independence. Gandhi is said to have been particularly influenced by Griffith's Sinn Fein approach to passive resistance prior to 1916 but actually denounced Sinn Fein's support for physical force during the War of Independence. Those Bengalese involved in the Chittagong Uprising of 1930 are said to have been inspired by the likes of Terence MacSwiney and in particular Patrick Pearse. O'Malley also cites revolutionaries in Egypt, Ghana, Algeria, and Indonesia as having been influenced by Ireland's struggle. She mentions that Tom Barry's Guerilla Days in Ireland had been invoked by a wide range of revolutionaries from Che Guevara and Fidel Castro (Cuba) to Mao Zedong (China), General Giap (Vietnam), and others (O'Malley 2017). It has even been suggested that a young Ho Chi Minh, later the leader of the Vietnamese revolution, who was studying at University in Dublin at the time, was greatly influenced by the guerrilla tactics used by the IRA leader Michael Collins. Ho Chi Minh was also denied a hearing at the Versailles Treaty talks.

The struggle for self-determination in Ireland had the potential to place Ireland firmly in the camp of solidarity with others opposing imperialism throughout the world. However, the close economic, social, and cultural links with Britain, the USA, and latterly the European Union and the reality of survival in a capitalist world often diminished such potential in the post-1921 period. While republicans in the various manifestations of the republican movement since 1921 appeared to forge links with struggles in Spain (1936–1939), the Basque Country, South Africa, Palestine, Latin America, and other struggles in Africa and Asia, as well as the international workers movement, others in the Irish establishment have often sided with the rich and powerful in the world. The execution of the socialist leaders Connolly and Mellows and the defeat of the more radical faction of the IRA during the Civil War (1922–1923) reinforced the position of what Free State Government Minister Kevin O'Higgins (1892–1927) had stated were "the most conservative-minded revolutionaries that ever put through a successful revolution."

After 1922, the new Free State set about proving to its neighbors in Britain and Europe that it was not a threat to capitalist economic stability by balancing the books and relying on the Catholic Church for charitable forms of welfare provision rather than providing state provision as of right. When fascism evolved in Europe in the 1930s, Ireland's own fascists, the Blueshirts, antecedents of the current (more liberal democratic) Fine Gael Government, led by former IRA commander and police commissioner Eoin O'Duffy, held center stage. While republicans and socialists joined the Connolly Column to fight for democracy in the Spanish Civil War (1936–1939), many more Irish joined to fight for fascism, supported by the Catholic hierarchy.

The new Irish state attempted to forge a pathway based on "neutrality" in international relations, supporting, for example, the acceptance of the Peoples Republic of China into the UN despite US opposition. Its own colonial past and struggle for independence was beneficial in UN peacekeeping missions in the post-World War II period, in post-conflict scenarios in former colonies. However, in later years, such neutrality appears to have been increasingly compromised by the use of Shannon Airport as a staging post for the USA transporting troops to war zones in Afghanistan and Iraq and prisoners for extraordinary rendition/torture in other countries. Ireland's involvement in some EU decisions has also raised similar

questions of Irish neutrality, especially since the establishment of an EU foreign policy, since the signing of the Lisbon Treaty (2007), the potential involvement of the Irish Army in a new EU army, and more recent Irish state involvement in EU military activities in places like the former French colony, Mali. Increasingly the Irish state may be viewed not as a former colony but as a partner with the other "former" colonial and current neo-colonial powers in the West.

That said, many in Irish civil society and a number of political parties on the Left have not forgotten Ireland's past colony status or its struggle for self-determination, and, up to the time of writing Irish society appears to have resisted the development of overtly racist anti-migrant populist movements which appear to have mushroomed in the West in recent years.

Easter Rising 1916

Eco-imperial Relations: The Roots of Dispossessive and Unequal Accumulation

Gustavo A. García López[1] and Grettel Navas[2]
[1]Graduate School of Planning, University of Puerto Rico-Rio Piedras, San Juan, Puerto Rico
[2]Institute of Environmental Science and Technology, Autonomous University of Barcelona, Barcelona, Spain

Introduction

Over the last decades, "imperialism" and "environment" have become closely linked concepts (Arnold 2015). Traditionally, scholars of empire had tended to ignore environmental issues (Arnold 2015; Foster and Clark 2004). Yet the surge of the environmental question in the social sciences and humanities in the last two decades has generated a breadth of studies from history, sociology, anthropology, political sciences, and other disciplines, showing how environmental issues at global, national, and local scales are inextricably linked to the history of colonization, postcolonial struggles, and the broader conditions of coloniality and imperialism persisting until this day.

From these new studies, a consensus has emerged that histories of imperialism and globalization are crucial to understand current environmental issues – and that indeed there is a symbiotic relation between imperialism and global environmental changes (DeLoughrey et al. 2015; Foster and Clark 2004). As DeLoughrey et al. (2015) observe, "experiences of environmental violence, rupture and displacement" related to colonization are central ecological challenges across the Global South. Yet, despite the increasing attention to these issues, there is still insufficient conceptualization and empirical investigation of environment-imperialism relations, and there is great variation in the approaches taken to their study (Arnold 2015; DeLoughrey et al. 2015). Most works focus on the *historical* dimension of environmental issues in the formal colonial period, looking usually at one,

though sometimes at several, empires, while more recent works also attend to the recurrent (neocolonial or neo-imperial) manifestations. Some focus on the ecological changes and knowledges that emerge in colonial encounters, others focus on the violent resource extraction processes and toxic effects that accompanied (or still accompany) colonization, and still others focus on conservation initiatives. There are overarching analyses and particular histories of specific resources (forests, energy, waste). And overall, there are many different concepts used, including ecological and eco-imperialism, green imperialism, green colonialism, environmental colonialism, toxic colonialism, energy imperialism, and carbon colonialism. Some of these concepts are used interchangeably to mean the same thing, while the same concept is often used to mean somewhat different things (see Table 1). As Arnold (2015, p. 35) concludes, there is "no clear consensus on what in essence characterizes the eco-imperial relationship" (also DeLoughrey et al. 2015; Dyer 2011).

This chapter presents an integrated, multidimensional approach to analyze how eco-imperial relations manifest themselves in reality and are discussed in the literature. We argue for integrating the multiple dimensions of these relations in both their historical and current manifestations. In the section "Eco-imperial Relations: A Multidimensional Approach," we elaborate five (distinct yet interrelated) dimensions of these relations. For each, we define key issues and identify links to other related concepts. Table 1 presents the different concepts used to refer to this relation, provides definitions and examples, and identifies related concepts. In the section "The Slow Violence of Eco-imperial Relations: Cases from Central America and the Caribbean," we provide illustrations from case studies around the world, using the Environmental Justice Atlas (EJAtlas), a worldwide database of environmental justice struggles and we deep into US geopolitical influence and forms if neocolonialism and imperialism in Central America and Puerto Rico. Section "Conclusions" provides a final concluding discussion. We argue for more engagement with *configurations of the multiple dimensions* of eco-imperial relations and for

Eco-imperial Relations: The Roots of Dispossessive and Unequal Accumulation, Table 1 Definitions of concepts referring to eco-imperial relations

Concept	Definition and author	Similar and related concepts	Example
Ecological imperialism	1. *Ecological/biological impacts of the historical process of colonization or "ecological colonization"* (Crosby 1986)		Invasive species and infectious diseases that destroyed native fauna and killed millions of indigenous in the Americas
	2. *Recurring resource extractivism and toxic dumping*: "the pillage of the resources of some countries by others and the transformation of whole ecosystems upon which states and nations depend; massive movements of population and labour that are interconnected with the extraction and transfer of resources; the exploitation of ecological vulnerabilities of societies to promote imperialist control; the dumping of ecological wastes in ways that widen the chasm between centre and periphery; and overall, the creation of a global 'metabolic rift' that characterises the relation of capitalism to the environment, and at the same time limits capitalist development" (Foster and Clark 2004, p. 187)	Environmental colonialism (Concepcion, Atiles-Osoria) Environmental imperialism (Austin and Phoenix, Gonzalez) Mining imperialism (Gordon and Weber) Extractrive imperialism (Veltmeyer) *Related concepts:* Accumulation by dispossession (Harvey), accumulation by contamination (Demaria), and dispossession by contamination (Pellow) Ecologically unequal exchange (Hornborg) and ecological debt (Accion Ecologica)	The invasion and occupation of Iraq for oil, biopiracy by Northern corporations in the Amazon, the exploitation of guano/nitrate by Britain and other imperial countries in Peru and Chile
Eco-imperialism	1. *Imposed global environmental protection policies:* "imperialistic forms of environmental governance – those that constrain participation in societal decision making, or that cause social and even ecological harm under the guise of environmental protection... reflecting inequality and exploitation... shorthand for neo-imperialist manipulations of the political economy, or the more direct territorial interventions and transgressions of traditional imperialism, *but now in the name of environmental protection*...may also be used more positively to test the undesired side effects of otherwise desirable environmental initiatives" (Dyer 2011, pp. 189–190) Other authors: Driessen (2003)	Environmental colonialism (Agarwal and Narain) Carbon colonialism (Bachram, Lyons and Westoby) *Related concepts:* First-world environmentalism (Martinez-Alier) Environmentalism of the rich (Dauvergne)	Global climate change policies and REDD+, environmental provisions of free trade agreements, environmental projects of the World Bank, and conservation initiatives of large international NGOs and corporations
	2. *Conservation areas imposed by Global North (states or NGOs) on Global South* (Hall 1994)	Green colonialism (Kumar, Zaitchick) Environmental colonialism *Related concepts:* Green grabbing (Fairhead et al.) Accumulation by conservation (Büscher and Fletcher)	

E

Eco-imperial Relations: The Roots of Dispossessive and Unequal Accumulation, Table 1 (continued)

Concept	Definition and author	Similar and related concepts	Example
Green imperialism	*Environmental awareness and policies "pioneered" by European scientists during colonial period* (Grove 1995)[b]	Green colonialism (Kumar, Zaitchick) Eco-imperialism (Dyer, Driessen)	
Green colonialism	*Conservation areas imposed by Global North on Global South, either historically through colonial-era policies (*Kumar 2010*) or, currently, with similarities to historical processes* (Zaitchick 2018)	Environmental colonialism Eco-imperialism (Hall) *Related concepts:* Green grabbing (Fairhead et al.) Accumulation by conservation (Büscher and Fletcher) Imperial nature (Goldman) Cult of wilderness (Martinez-Alier)	
Environmental colonialism	1. *Recurring processes of extractivism and toxic dumping during and after formal colonial rule* (Concepción 1988; Atiles-Osoria 2013)	Ecological imperialism (Foster and Clark, Austin and Phoenix, Gonzalez)	
	2*. Conservation areas imposed by Global North on Global South* (Nelson 2003)	Green colonialism (Kumar, Zaitchick) *Related concepts:* Green grabbing (Fairhead et al.) Accumulation by conservation (Büscher and Fletcher) Imperial nature (Goldman) Cult of wilderness (Martinez-Alier)	Establishment of protected areas displacing indigenous peoples and peasants, as in Yosemite and Yellowstone National Parks in the USA and Serengeti National Park in Tanzania
	3. *Discourse blaming Third World countries for global environmental/climate change* (Agarwal and Narain 1991)	Eco-imperialism (Dyer, Driessen)	Global climate change policies Global forest protection policies, for instance those promoting conservation of the Amazon with a discourse blaming weak enforcement by Brazil and ignoring the demand from the Global North that drives the deforestation.
Toxic colonialism	Export of highly-polluting industrial wastes, products and technologies of the global North on territories of the global South, (Bernstoff et al. 1993) Other authors: Pratt (2011)	Garbage imperialism (Stebbins) Waste colonialism (Basel Convention, Liborion) Nuclear colonialism (Endres)	Côte d'Ivoire petroleum toxic waste dump (Pratt) Toxic waste from France shipped to Benin in exchange for debt reduction Current dumping of plastics, electronics and other supposedly 'recyclable' wastes on global South countries
		Related concepts: Toxic (waste) dumping Accumulation by contamination (Demaria)	
Carbon colonialism	*Carbon trade initiatives that rely upon the implementation of mitigation strategies in the Global South to offset industrial and polluting activities in the Global North* (Lyons and Westoby 2014) Other authors: Bachram 2004	Greenhouse imperialism (Altvater) Climate colonialism (Moe-Lobeda)	Global climate change policies: Clean Development Mechanisms (CDM) and REDD+ Eucalyptus plantations that are subsidized as carbon-offsetting under dubious calculations and which displace peasant and indigenous communities.
		Environmental colonialism (Agarwal and Narain) Eco-imperialism (Dyer, Driessen)	

(continued)

Eco-imperial Relations: The Roots of Dispossessive and Unequal Accumulation, Table 1 (continued)

Concept	Definition and author	Similar and related concepts	Example
Nuclear colonialism	*"A system of domination through which governments and corporations disproportionately target and devastate indigenous peoples and their lands to maintain the nuclear production process"* (Endres 2009)	Radioactive colonialism (LaDuke and Churchill) Toxic (waste) colonialism (see above) Energy imperialism/colonialism (see below)	To test, produce, and dispose nuclear weapons in low-income countries US nuclear tests in Marshall Islands French nuclear tests in French Polynesia Uranium mining and nuclear waste dumping in indigenous lands in the US
Energy imperialism	*Foreign countries or companies with high levels of energy consumption appropriating and contaminating a region's land or resources in order to generate energy; often done through geopolitical interventions (political, economic, or military) to secure energy supplies* (Gustafson 2017)	Energy colonialism (Batel and Devine-Wright, deOnis) Nuclear colonialism (Endres) Radioactive colonialism Oil imperialism (Alvater) Petro-imperialism (Watts) Petrochemical colonialism (Bullard) Ecological imperialism (Foster and Clark) *Related concepts:* Accumulation by decarbonization (Bumpus and Liverman)	The use of indigenous territory as site for highly polluting energy activities from mining/extraction (e.g. of coal, oil or uranium), related infrastructure (e.g. gas pipelines) to deposit (e.g. of toxic coal ash or nuclear energy waste), often not permitted or not wanted on the imperial power Shell operations in Ogoni territory in Niger delta Gas pipelines passing through Native lands in the US US-UK invasion of Iraq and Afghanistan for oil

[a]Similar concepts are those close to a synonym, though often with some differences. Related concepts are those that link to the concept being defined by referring to a specific process or outcome that is captured within the definition (e.g. the accumulation by dispossession characteristic of extractive forms of eco-imperialism).

[b]Contrary to other authors such as those employing the concepts of eco-imperialism and green colonialism, Grove (1995) does not offer a critique of these policies, but rather makes the straightforward argument that the environmental degradation caused by colonization, led to an environmental awareness amongst colonizers, particularly scientists, who then went on to promote environmental conservation measures.

doing so in comparative perspectives which can underscore similarities and differences over time (from the formal colonial period to current times) and across space.

Eco-imperial Relations: A Multidimensional Approach

Attention to the connections between imperialism and environment suggests that imperial powers influence the ways environments are governed in colonized and post-colonized territories. By imperial powers, we mean not just imperial countries but a global network (cf. Hardt and Negri 2000) also including global or transnational corporations, financial entities (e.g., World Bank or Inter-American Development Bank), and nongovernmental organizations (e.g., World Wildlife Fund or The Nature Conservancy). By governed, we mean how environments are conceptualized and used/extracted or "protected" and how the benefits and costs of these governance actions are distributed within and between regions. These links are both material (managing natural resources and territories) and ideological (ideas, values, and discourses about "the environment" and "nature"). In addition, they often refer to historical process (i.e., during the colonization) and/or to ongoing process. Indeed, post- and decolonial scholars have emphasized the endurance of colonial ideologies and materialities to this day (Mignolo and Walsh 2018). In what follows in this section, we elaborate on five interrelated domains of eco-imperial relations: (1) *as extractivism*, (2) *as contamination*, (3) *as conservationism*,

(4) *as energy and climate control*, and (5) *as knowledge*.

Imperialism as Extractivism: Ecological/Eco-imperialism

As a historical phenomenon, imperialism was centrally a claim over the colonies' land and resources for their extraction (Rutazibwa and Shilliam 2018) and over the people who provided the labor for it. This dimension has been labelled **eco-imperialism** (Dyer 2011; Foster and Clark 2004; Gonzalez 2001), though this concept is also used with other meanings (see Table 1). The history of imperial extractivism is memorably documented in works such as Eduardo Galeano's *Open Veins of Latin America* (1971) and Walter Rodney's *How Europe Underdeveloped Africa* (1973). Both documented the immense wealth that was extracted by European countries and corporations from free labor and resources in these regions – gold, silver, copper, diamonds, timber, rubber, guano, ivory, soil, etc. – in turn depriving the colonized societies of that wealth. For instance, in South Africa, Mackenzie's *The Empire of Nature* (1988) documented how Great Britain used the vast wild animal resources of the colonies as a material support for its imperial enterprise in nineteenth- and twentieth-century Africa and Asia. He observed a pattern where animals first suffered an initial period of mass exploitation as ready source of food for colonists and lucrative products (e.g., horns, skins) for foreign markets, later were reserved as species for elite hunting, and finally, in a still ongoing phase, became part of conservation and tourism initiatives. Some European colonial scientists critiqued the environmentally destructive practices of colonial projects, leading to some conservation measures (Grove 1995), though not always motivated by environmental concerns. Thus, as we discuss below (section "Imperialism Through Conservationism: Green Imperialism"), from the colonial period, imperial extractivism also became historically interlinked with *conservationism*.

Marx used the concept of **primitive accumulation** to refer to this enclosure and pillage of indigenous common resources in the initial phase of capitalism: "The discovery of gold and silver in America, the extirpation, enslavement and entombment in mines of the aboriginal population, the beginning of the conquest and looting of the East Indies, the turning of Africa into a warren for the commercial hunting of black-skins, signalised the rosy dawn of the era of capitalist production" (Marx 1967, p. 751). These analyses thus help visibilize that the extractivism of imperialism was intricately tied to the historical emergence of global capitalism as a hegemonic ecosystem world (Machado 2018).

However, a focus on the colonial past is insufficient because ecological imperialism – indeed coloniality more generally – is an ongoing process, intimately tied to current neoliberal global capitalism. As Rosa Luxemburg had observed in *The Accumulation of Capital* (2003 [1913]), primitive accumulation is a recurring process inherent to (and an economic prerequisite for) the continued expansion of capitalist production on a global scale: "Capital... cannot manage without the natural resources and the labour power of all territories. Seeing that the overwhelming majority of resources and labour power is in fact still in the orbit of precapitalist production—this being the historical *milieu* of accumulation—capital must go all out to obtain ascendancy over these territories and social organisations" (Luxemburg 2003 [1913], p. 346). Imperialism was "the political expression" of this accumulation process "in its competitive struggle for what remains still open of the noncapitalist environment" (Luxemburg 2003 [1913], p. 426).

Therefore, a broader definition of ecological imperialism is needed, one that captures the recurrent forms of exploitation that characterize it. As Luxemburg did, Foster and Clark (2004, p. 187) draw on Marx to observe that capitalist production requires ever-expansive the control over "material-ecological flows," thus coming to the broader definition of **eco-imperialism**:

> "the pillage of the resources of some countries by others and the transformation of whole ecosystems upon which states and nations depend; massive movements of population and labour that are interconnected with the extraction and transfer of resources; the exploitation of ecological vulnerabilities of societies to promote imperialist control; the dumping of ecological wastes in ways that widen

the chasm between centre and periphery; and over-all, the creation of a global 'metabolic rift' that characterises the relation of capitalism to the environment, and at the same time limits capitalist development"

Simply put, eco-imperialism is "the North's systematic and ongoing appropriation of the South's ecological resources" (Gonzalez 2001, p. 983). (This also includes the "sinks" to which waste is dumped, as we discuss below in the section "Imperialism as Contamination: Toxic Waste Colonialism.") Harvey (2003) identified the continuation of these processes under neoliberal capitalism, referring to a "new imperialism" characterized by what he called "accumulation by dispossession": in search of new sources of accumulation, capitalism separates laborers from their means of production through privatization (enclosure) of commons and public goods, expanding capitalist relations into precapitalist spaces. This is evidenced in the current processes of dispossession of peasants and indigenous communities through **land grabs** by states or corporations for large-scale industrial agriculture, biofuels, conservation initiatives, energy, and other infrastructure projects (Fairhead et al. 2012; White et al. 2012; Yenneti et al. 2016). A clear example is the role of Northern companies in mining in Africa and Latin America. A report by the NGO War on Want found that 101 of the companies listed in the London Stock Exchange – 71 of them British and many others London-based – control at least $1.05 trillion worth of gold, diamonds, platinum, oil, and coal resources in Africa (Curtis 2016). The report observes that UK's policies today are a continuation of British foreign policy goals since 1945, when, as now, one of the main (and often the main) objectives was to promote British corporations' access to and control over Africa's resources. This "scramble for resources" is thus a "new colonialism" (Curtis 2016). Similar observations have been made about Canada and its mining sector in Latin America, in what has been called **mining imperialism** (Gordon and Webber 2017) and **extractive imperialism** (Veltmeyer 2013). As with Curtis (2016), Gordon and Webber's (2017) analysis concludes that Canadian foreign policy in

Latin America is designed to "enable and enhance the profit-making potential of Canadian multinational firms, above all in finance and mining." In both cases, this includes the promotion of liberalized markets and weak environmental regulatory regimes, the active support for military coups (in Haiti and Honduras), the containment or repression of social movements, the weakening of leftist governments, and the opposition to actions against corporate human rights abuses. Another prominent example is the influence of the USA in Central America since the beginning of the twentieth century in relation to the interests of banana production corporations such as United Fruit Company (Pérez-Brignoli 2006).

Eco-imperialism is closely related to the concept of "**imperial mode of living**" (Brand and Wissen 2017), which captures the fact that capitalism implies "uneven development in time and space as well as a constant and accelerating universalisation of a Western production model." This imperial mode is based on three logics: "(i) the unlimited appropriation of resources; (ii) a disproportionate claim to global and local ecosystems and sinks; and (iii) cheap labor from elsewhere" (Brand and Wissen 2017). This concept adds that ecological imperialism is rooted not just in the actions of "imperial countries" or corporations, but in people's everyday practices and identities, normalized in a way that hides imperialist intents, and supported through state institutions.

Finally, the modes of environmental governance and development generated by eco-imperialism reference three additional interconnected processes: **underdevelopment**, **ecologically unequal exchange** (and **ecological debt**), and **extractivism**. The theory of **underdevelopment** explains how colonization and postcolonial processes of resource extractivism created interlinked patterns of development in the North and underdevelopment in the South (Nkrumah 1965; Rodney 1973). Rodney (1973) observed how after formal independence, "Africa has not yet come anywhere close to making the most of its natural wealth, and most of the wealth now being produced is not being retained within Africa for the benefit of Africans." He used the concept of a "Scramble for Africa" to refer to the

E

colonial and post-colonial extractivism. Nkrumah (1965) referred to this as "necocolonialism". The difference between dependency theory and eco-imperialist approaches is that the former was concerned mostly with the distribution of wealth (and "development") from the extraction of resources, but did not pay so much attention to the ecological effects (Foster and Clark 2004), nor to the imperialist ideology behind the concept of "development" itself (Escobar 1995). In this sense, **ecological unequal exchange** or trade (Hornborg 1998) highlights the unequal amounts of natural resources (including land and energy) embodied in the products traded in the global market, where, usually, Global South countries provide natural resources (or ecological sinks) for Global North consumption. This type of exchange gives rise to what the NGO Acción Ecológica called the **ecological debt**: "the debt accumulated by Northern, industrial countries toward Third World countries on account of resource plundering, environmental damages, and the free occupation of environmental space to deposit wastes, such as greenhouse gases, from the industrial countries" (Martinez-Alier et al. 2014; also Foster and Clark 2004). Prominent examples of the ecological debt generated through eco-imperialism are the history of the global guano/nitrate trade during British colonization (Clark and Foster 2009) and the appropriation of the global carbon sink by Global North industries since the industrial revolution – i.e., **carbon colonialism** (Bachram 2004). (A revolution, let us be reminded, financed through the pillage of the resources of the colonies.)

Extractivism, a concept coined by Latin American scholars, is a mode of accumulation based on extraction of raw materials for export (Acosta 2013; Brand et al. 2016; Svampa 2015). This model started with colonization itself but continues as "neo-extractivism" (Acosta 2013; Machado 2014). Even in cases of independent, leftist, and "post-neoliberal" countries (i.e., Ecuador, Brazil, Bolivia), which use extractivism to fund social programs, these processes still reflect the eco-imperial relation: they are based in the intensive exploitation of nature for the "colonial fantasy of development," historically associated to **underdevelopment**, in a region which remains in a peripheral, dependent position in the global capitalist system (Machado 2014; Svampa 2015). This neo-extractivism in Latin America is part of global capitalist dynamics with a deepening and expansion of the 'imperial mode of living' capitalist centers and semi-peripheries, including emerging superpowers such as China, driving a continued high demand of natural resources, and a shift (dumping) of 'dirty' industries to the global South (Brand et al. 2016). Svampa (2015) has called this a, "commodities consensus" where, in spite of the global consensus on the ecological crisis' extractivist forms linked to commons enclosure and **dispossession** in the peripheral global South continue to be the dominant economic model (Svampa 2015). These processes are directly linked to environmental conflicts and violence against grassroots movements who oppose to this extractivism; violence includes repression, murders and criminalization (Global Witness 2016; Del Bene et al. 2018) but also other non-direct forms of violence (Navas et al. 2018; Roy and Martinez-Alier 2019).

Imperialism as Contamination: Toxic Waste Colonialism

As the discussion above already suggested, ecological imperialism also manifests itself as a form of contamination. **Extractivism** itself generates multiple forms of contamination – as demonstrated in many cases of water contamination from arsenic and other pollutants in gold mining and the pollution from phosphate mining in Nauru (Micronesia) by Australian and British corporations, which has rendered most of the zone uninhabitable due to contamination (EJAtlas 2017a). But there are other mechanisms. Possibly the first use of the concept, Crosby's (1986) *Ecological Imperialism*, referred to a form of *biological contamination*. He documented how the introduction of exotic animal and plant species and diseases, and the imposition of new land uses (e.g., clearing native forests for large-scale agriculture), led to major shifts in the ecology of the colonized areas and to collapses in the local human and nonhuman populations (see also Piper and Sandlos 2007 in Canada). Crosby's analysis

thus highlights how an "ecological colonization" of the non-European world was toxic for the local environment and generated the conditions for military colonization (and, by extension, also for extractivism).

Another aspect of this dimension is related to the *waste* generated by industrial production, mostly in the North. The term **toxic colonialism**, coined by Jim Puckett from Greenpeace in 1992, refers to the export and dumping of toxic industrial wastes by the rich or "developed" countries (former imperial colonizers) to poorer or "underdeveloped" nations (Bernstorff et al. 1993; Gonzalez 2001; Pratt 2011). It is also labelled as "waste colonialism" (Basel Convention 1989), "toxic waste colonialism" (Pratt 2011), and "garbage imperialism" (Stebbins 1993). This includes "electronic-waste, persistent organic pollutants (POPs), industrial waste, decommissioned ships, municipal solid waste, radioactive waste, and other toxic waste" (Liborion 2018), and it is often illegal or quasi-legal, with organized global criminal networks (Greenpeace 2010).

An example of a legal but clearly colonial arrangement is Benin's acceptance of toxic waste from French traders in exchange for a significant sum of money that would allow Benin to repay loans to France acquired after independence (Pellow 2007). Other examples of quasi-legal and illegal dumping activities include toxic petroleum waste in Abidjan (Ivory Coast) by a Swiss-based oil and commodity multinational shipping company (Pratt 2011); smelter sludge (full of toxic heavy metals) by a Swedish mining company in Chile (Pino Vargas and EnvJustice 2019; EJAtlas 2019a); toxic (including radioactive) waste by an Italian network – some associated to the Mafia and backed by Swiss corporations – in Somalia (an ex-colony of Italy), Nigeria, Western Sahara, Guinea, Mozambique, and Congo, among others (Campbell-Dollaghan 2014; Greenpeace 2010); millions of used car batteries from the USA to Brazil, China, India, and South Africa (Gonzalez 2001); the contaminated discarded ships from European corporations such as Geneva-based Mediterranean Shipping Company broken apart in India, often causing fires and other accidents (Demaria 2016); and the growing electronic waste shipped to Global South regions such as Asia by rich countries, including Japan (Kirby and Lora-Wainwright 2015; Puckett et al. 2002). All of these cases created significant public health problems that are still being dealt with today in the receiving countries.

The recurrence of toxic dumping shows that despite the Basel Convention being approved in 1989 to deal with what it called "waste colonialism," the unequal neocolonial patterns of the transboundary hazardous waste trade still persist (Pratt 2011; Pino Vargas and EnvJustice 2019). The affected countries or communities typically lack the resources, knowledge, political organization, or capital to resist the practice and decontaminate their environment from these hazardous substances. Recurrence is also linked to the **neoliberal globalization** logic where poorer countries and populations are "worth less." As infamously argued by Lawrence Summers when president of the World Bank, the costs of health-impairing pollution would be lower in developing countries since they are supposedly "underpolluted," the economic costs of mortality are lower (i.e., lives are economically worth less), and there are supposedly less demands for a clean environment – assumed as a concern of wealthier countries (Gonzalez 2001).

At the same time, while toxic (waste) colonialism has mainly referred to waste dumping from rich to poor countries (ex-colonies), there is variation in the flows of waste and contamination, and there is also dumping in indigenous territories or marginalized communities *within countries* in both the Global North and Global South – a form of "internal colonialism" (LaDuke and Churchill 1985). In this sense, waste colonialism refers to "how waste and pollution are part of the domination of one group in their homeland by another group" (Liborion 2018). For instance, in the USA, Native American reservations (Ishiyama 2003; LaDuke and Churchill 1985) and working-class Latino and black communities (Pellow 2007; Bullard 2000) are also used as toxic dump sites. In some cases (e.g., Ishiyama 2003; LaDuke and Churchill 1985), these toxics come from nuclear mining and waste, connecting to the **energy** dimension of eco-imperialism (section

"Imperialism Through Energy"). There is also a clear link here to the military-industrial complex, which not only serves to sustain these processes of accumulation by contamination by force, but becomes one of the main perpetrators of this contamination: in the US, for instance, close to 900 of the nearly 1,200 highly-contaminated industrial "Superfund" sites are abandoned military facilities or sites that supported military activities (Webb 2017).

Bernstorff et al. (1993) also refer to the dumping of dirty technologies and products not wanted in the global North, as part of this toxic colonialism. Following this lead, in this chapter, we further expand the concept of toxic colonialism to include how transnational Global North corporations and imperial countries shift to the Global South toxic chemicals used in the extractivist process (e.g., pesticides and herbicides for expanded export-oriented, corporate-controlled monoculture) or for military practices (e.g., napalm, nuclear energy), despite knowing these substances are toxic and hazardous for human health. On occasions, these toxic chemicals are even banned in the imperial countries for health reasons but still exported and used in the Global South, making it also an ethical and a human rights issue. The use of persistent and bioaccumulative pesticide substances generates a toxic legacy as some of these substances remain in the soil, air, and water for decades. The case of the massive expansion of GMO soy in Argentina, heavily dependent on the toxic herbicide Roundup, is a clear example. A case of the use of a pesticide in the Central American banana plantations is discussed in the section "The Slow Violence of Eco-imperial Relations: Cases from Central America and the Caribbean."

Issues of toxic colonialism, and toxic dumping more generally, link to the processes of **ecologically unequal exchange** (section "Imperialism as Extractivism: Ecological/Eco-imperialism"), as well as to **environmental justice**: the inequalities in the exposure to pollution, access to environmental quality, and participation in related decisions, and the often-ensuing conflicts (Demaria 2016; Gonzalez 2001; Pellow 2007). The global toxic waste trade is generated by patterns of capitalist production and consumption in the Global North: wealthier countries (and wealthier regions within countries) consume much more and thus generate much more waste than the poorer countries/regions, yet they often encounter much more regulation and opposition locally and thus have higher disposal costs, leading to the rapidly expanding and lucrative global trade in waste to poorer countries (Gonzalez 2001; Demaria 2016; Pellow 2007). Unequal power relations facilitate this *ecologically unequal exchange*, where "the core, through unequal power relations, manages to export entropy to distant sinks in the periphery" (Demaria 2016, p. 274). As observed by Pellow (2007, p. 17), the unequal exposure to toxics and their risks globally are related to the production of racial, class, gender, and national inequalities which is the "normal, routine, functioning of capitalist economies."

The declaration of Principles of Environmental Justice from the First National People of Color Environmental Leadership Summit in 1991 explicitly linked colonialism with environmental justice, stating the commitment of the EJ movement "to secure our political, economic and cultural liberation that has been denied for over 500 years of colonization and oppression, resulting in the poisoning of our communities and land and the genocide of our peoples." Byrne et al. (2002), citing Agarwal and Narain (1991), explicitly link **environmental colonialism** to environmental justice, as a way to underscore that global economic development is an attempt "to colonize not only the labor and resources of societies, but whole cultures and ways of life through an appropriation of the environmental conditions upon which communities depend." Thus, while the political control of the colonial era may be formally over, neocolonial relations of economic dependence, exploitation, and cultural inequality (devaluation of entire non-white populations) are central to current forms of toxic colonialism (Pratt 2011).

Demaria (2016), drawing on Harvey's (2003) concept of **accumulation by dispossession** (section "Imperialism as Extractivism: Ecological/Eco-imperialism"), further links waste

dumping to processes of **accumulation by contamination**: the capitalist processes of socializing the environmental costs and risks from polluting activities (**cost shifting**) in ways that threaten the means of existence/subsistence of people, thus expanding and deepening capitalist relations (Demaria 2016, p. 300). Accumulation by contamination implies a de facto enclosure of commons – the environmental "sinks" where pollution and waste are stored – in ways that surpass their assimilative capacity. These sinks include water and air, but also, as Liborion (2018) observes, the lands where the wastes are often supposed to be dumped or "processed." The consequences most likely fall upon the most vulnerable social groups (e.g., small-scale farmers and indigenous populations in the South, marginalized nonwhite and indigenous/marginalized communities in the North), but society as a whole – both present and future generations – can be affected (Demaria 2016), as evidenced, for instance, by the more than 250,000 tons of plastic waste afloat in oceans worldwide (Eriksen et al. 2014).

Imperialism Through Conservationism: Green Imperialism

A third dimension of imperialism-environment relations is related to *conservation*, especially the creation of protected areas, and more generally also to *environmental protection*. The concepts of "green colonialism" (Kumar 2010; Zaitchick 2018), "environmental colonialism" (Nelson 2003), "neocolonial conservation" (Garland 2008; Hayward et al. 2018), and "eco-imperialism" (Hall 1994) are used to refer to this dimension.

A majority of studies focus on the intimate links between the history of colonization and the creation of protected areas and associated recreational activities (e.g., hunting and tourism) by colonial authorities. Neumann (1995) observes that in Africa, colonial conservation policies were coercive and displaced local settlements and outlawed historical access rights to land and natural resources, to create tourism industries catering to Westerners who wanted to observe or hunt exotic animals (see also Mackenzie 1988). This is precisely what happened with the Germans and then the British in the Serengeti National Park

and other parts of Tanzania, where historical pastoralist uses were restricted to create game and forest reserves (Neumann 1995). Locals, despite being the most affected, were often the last to be notified of these restrictions.

Some authors refer to these historical processes in a positive light. Grove's (1996) *Green Imperialism* argues that the environmental degradation caused by colonization led to an environmental awareness among colonizers, particularly foresters, botanists, and other scientists, who then went on to influence colonial authorities to develop "green" measures to protect these "fragile" ecosystems. Barton (2002) argues along similar lines that imperial forest conservation – starting with Britain's protected forests in India – were "the origins" of today's "environmentalism" and that these measures were taken to protect the "public interest": "In the late nineteenth and early twentieth century the most sweeping environmental initiatives emerged under the auspices of British imperialism" which "would serve settlers, industrial development, governance revenue, *and* environmental purposes ... By 1928, British foresters managed environmentally every major forest type in the world" (p. 1). Certainly, these were examples of imperial conservationism, and the environmental concerns of imperial scientists are well documented. But these narratives ignore the historical fact that indigenous peoples had been "conserving" their environments much before the empires came to extract and destroy them (see section "Imperialism as Extractivism: Ecological/Eco-imperialism") and that the imperial science narratives tended to blame local indigenous populations for their supposedly "irrational" and environmentally destructive practices, despite substantial evidence to the contrary (Fairhead and Leach 1996; Kumar 2010). Fairhead and Leach (1996), for instance, show how imperial scientists "misread" the African savannah landscape, erroneously concluding that forest patches where remains of a once extensive forest cover supposedly degraded by indigenous grazing and shifting agriculture. The opposite was true: these patches had been *created* and cared for by the indigenous communities. These colonial and neocolonial conservationist discourses also ignore the underlying political-economic motivations of empires (e.g.,

increasing extraction of resources, revenue, and political control over territories), the policies' impacts on the local livelihoods of indigenous forest dwellers, and their often contradictory conservation results. Indeed, in some cases, conservationism seems to have operated more as a discourse than as an actual practice or operated only partially in some areas subject to protection, while extractivism expanded in others. Extractivist and conservationist eco-imperialism, in other words, were two sides of the same coin. In India, for instance, Kumar (2010) shows how the British attempts at forest conservation (management of natural forests for timber production) under a discourse of "dissecation" and protection of water resources emerged as an anxious reaction to the evident overexploitation of forests that the British themselves had caused and the threats this posed to the expanding resource needs of the colonial apparatus (e.g., wood consumed for shipbuilding, military barracks, and railways). Because these objectives conflicted with indigenous customary uses of forests for shifting cultivation, the British imperialists needed to label these uses as "irrational" and "destructive" in order to achieve total control over the forests. Colonial scientists thus ended up blaming shifting cultivation for the deforestation caused by the British imperial activities.

Some authors draw attention to the connections between colonial policies and current ones: many of the current protected areas around the world were created during colonial times, for colonizers' interests, such as hunting and tourism (e.g., Akama et al. 2011; Garland 2008; Neumann 2001; Zaitchick 2018). Today, protected area creation in the Global South continues to be heavily promoted by imperial countries, by international agencies and conservation organizations from the Global North. Protected area tourism became key to the development plans of the independent governments in Tanzania and elsewhere in Africa, despite the fact that "many Africans saw tourism as exhibiting the worst aspects of the old colonial order of European dominance and African subservience" (Neumann 1995, p. 363). In this continuation of colonial conservationist policies, African governments, international environmental NGOs, such as the International Union for the Conservation of Nature (IUCN, now World Conservation Union) and the African Wildlife Foundation (AWF), played a key advisory and influencer role, seeking to continue and expand African conservation initiatives (Neumann 1995). Nelson (2003) argues that the motivations of this postcolonial conservation movement have been similar to the religious motives that were behind the colonization – to "save" Africa from Africans. At the same time, the conservation measures taken (creation of protected areas) mostly appealed to the interests of Western forces, not the needs of African people (Nelson 2003). In Kenya, for instance, the model of safari tourism and wildlife conservation today continuethe historic patterns of exclusion and marginalization of the Masaai tribe developed during the colonial period (Akama et al. 2011). Zaitchick (2018) documents how protected areas often deprive these ancestral inhabitants of control over their own lands, while governments fail to protect the ecology and the indigenous people from encroachment of illegal extractive activities but also undermine conservation by supporting extractive industries and infrastructure projects in these same protected areas. He reminds us that "the founding worldview of modern conservationism...was conceived not during today's battle to save the rainforests and protect the climate but during the genocidal Indian wars waged in the deserts of the American West." Indeed, the first two national parks in the USA – Yellowstone and Yosemite – were created in the late 1800s by forcibly removing the Native American inhabitants and set a template for conservation policies in the twentieth century, based on the idea that "nature" was best protected uninhabited (Zaitchick 2018).

A third group of scholars focus more generally on the imposition of global environmental policies by the Global North on the Global South. This is at the heart of the debates related to global environmental governance and especially climate change policies (Bachram 2004; Dyer 2011; Agarwal and Narain 1991) and is thus related to the concept of "carbon colonialism" (section "Imperialism Through Energy"). For instance, in a World Economic Forum on East Asia held in Singapore 2007, Asian business and government leaders were

critical of the "hypocrisy" of rich Western countries which blamed countries like China for worsening climate change; Malaysia's deputy finance minister labelled this as "**green imperialism**" (The Guardian 2007). Chambers (2010) makes a similar critique, arguing that developing countries should not be asked to curtail their economic growth, while rich countries continue to increase their greenhouse gas emissions. Here, the discussion shifts to the hampering of development opportunities of the Global South, and the double speak of the Global North, rather than to the environmentally destructive practices of imperialism. Indeed, this critique of eco-imperialism as imposition of environmental policies is used both by leftist or progressive scholars and activists (as Agarwal and Narain 1991; Gonzalez 2001) and by free-market fundamentalists critiquing Northern global environmental elite which seeks to hinder "freedom" (a la Hayek) and "development" of the Global South (as Driessen 2003; Chambers 2010). The latter "market fundamentalists" critique any form of global environmental governance and any form of environmental protection as imperialist (Dyer 2011). Gonzalez (2001) recognizes the validity of this critique where Northern countries attempt to impose environmental regulations in the Global South without addressing their own much larger environmental impacts. However, she observes that the conclusion cannot be for the Global South to not adopt any environmental protections and follow the developmentalist path of the North, for that too is eco-imperialism (as seen in sections "Imperialism as Extractivism: Ecological/Eco-imperialism" and "Imperialism as Contamination: Toxic Waste Colonialism"). The global market itself is imperialist (Dyer 2011): it shifts the environmental (and socioeconomic) costs of high levels of consumption of the Global North to the Global South while hindering – through neoliberal "free trade" rules – the freedom of poorer countries to develop environmental protection policies (Gonzalez 2001).

The conservationist dimension links with the concept of "**imperial nature**": the production of a hegemony of "green neoliberalism" by the World Bank – a marriage of sustainable development with neoliberal development which is "remak

(ing) nature in the South, transforming vast areas of community-managed uncapitalized lands into transnationally regulated zones for commercial logging, pharmaceutical bioprospecting, export-oriented cash cropping, megafauna preservation, and elite eco-tourism," along with the forceful relocation of tens of millions of "primitive" people to transform them into a new agro-industrial workforce (Goldman 2006, p. 9). The World Bank's lending is not to alleviate poverty or promote development but to make business for Global North countries and corporations. It is part of what has been called an "internationalized imperialism" (Cooper 1993, cited in Ferguson and Gupta 2002) where Global South countries are indirectly governed by transnational organizations which work with and for the benefit of Global North countries. In this sense, the eco-imperialist critique of imposed environmental policies helps to underscore that said policies are not really meant to protect the environment in the Global South, so much as to greenwash the same old patterns of developmentalism, while opening new business opportunities (Goldman 2006). In this neoliberal context, protected areas become another form of dispossessive accumulation of land and marine resources, an "accumulation by conservation" (Büscher and Fletcher 2015) also referred to as "green/blue grabbing" (Benjaminsen and Bryceson 2012; Fairhead et al. 2012).

More generally, the critique of the sustainable development discourse is also connected to the critique of the dominant varieties of environmentalism in the Global North, which Martinez-Alier (2002) considered the alliance between the "cult of wilderness" and the "gospel of eco-efficiency" and which Dauvergne (2016) called the **environmentalism of the rich**: an approach which sees the environment as a luxury good and is focused on more eco-friendly technologies and business and consumption practices and wilderness preservation. This is opposed to the "environmentalism of the poor" (Martinez-Alier 2002), more prevalent in the Global South and indigenous Northern cultures, which defends the environment not only for its "pristine nature" or 'wilderness' but (also) for its intrinsic cultural and livelihood links to communities.

E

Imperialism Through Energy and Climate Change

The energy sector provides keen insights into the relations between environment, imperialism/colonialism, militarism, and capitalism. Energy is a key aspect of the modern industrial capitalism, and in comparison to other energy sources, fossil fuels almost perfectly fit capitalist requirements for accumulation (Altvater 2007), hence our system has been appropriately labelled "fossil capitalism" (Angus 2016) and "carbon capitalism" (Di Muzio 2015). Dominant forms of fossil energy are often extracted for export from the Global South to the North, generating toxic contamination at local (air, water, and land pollution) and global levels (climate change), in a process often controlled by Northern corporations and under highly unequal exchanges. The concept of **energy imperialism/colonialism** (Batel and Devine-Wright 2017; Curtis 2016; de Onís 2018a, b; Foster 2008; Gustafson 2017) captures this broad relation. It is used to refer to different but interrelated processes, from the imperial plunder of energy resources of the Global South by countries and corporations of the Global North to the deployment and operation of polluting energy infrastructure. Three related concepts deepen our understanding of energy imperialism through attention to different aspects of this dimension: **oil/petro-imperialism**, **carbon colonialism**, and **nuclear imperialism/colonialism**.

Oil or **petro-imperialism** (Altvater 2007; Watts 2008) refers to the process in which competition for petroleum (oil) (extendable to other fossil fuels) – the main energy sources of the twentieth century – fosters new bids for domination over space and people and the control of oil resources from different dimensions: the strategic control of oil territories, the control of transport and its logistics, the influence on the market oil prices, and the currency in which the oil is invoiced (Altvater 2007). The abovementioned study by the NGO War on Want found that 27 London Stock Exchange-listed companies were working in 27 different sub-Saharan African countries, controlling 6.6 billion barrels of oil worth $276 billion; the main ones are Tullow Oil, which controls 307 million barrels of oil in 12 countries in sub-Saharan Africa, and Shell,

which controls 691 million barrels, mainly in Nigeria, and is one of the most well-known human rights and environmental abusers (Curtis 2016), with a long history of pollution and repression in the ancestral lands of the Ogoni people in the Niger delta (Watts 2008). Petroleum has served as a motivation of imperial wars and other imperial geostrategic interventions, as in the US-UK invasions of Iraq, Kuwait (Foster and Clark 2004), and Afghanistan, the strategic alliance of the USA with the Saudi Arabian dictatorship for maintaining imperial influence in the Middle East, and the recent interest of the USA in Africa as a region of "growing strategic importance" (Watts 2008). Under conditions of increasing energy scarcity and rising energy prices (peak oil), 'energy security' becomes a more prominent priority of powerful countries and corporations to guarantee continued processes of capital accumulation, which increasingly take the form of accumulation by dipossession (Altvater 2007). As Foster (2008, p. 12) states, "The rise in overt militarism and imperialism at the outset of the twenty-first century can plausibly be attributed largely to attempts by the dominant interests of the world economy to gain control over diminishing world oil supplies." The military dimension of these processes is further linked to continued unequal ecological exchange and ecological debt of eco-imperialism: for instance, the US Military burns an estimated 340,000 barrels of oil a day – only 35 countries in the world consume more (Klare 2007). Essentially, the US war machine burns oil to capture oil from other countries, to burn more oil. Oil imperialism is also linked to **toxic** eco-imperial forms, as highlighted by cases such as the Caribbean island of Curaçao, an ex-colony of the Netherlands – which ranks in the top ten environmental polluted sites globally due to the emissions of the hundred-year-old refinery "La Isla" owned by Dutch multinational Shell (EJAtlas 2017b). While the focus is mostly on the Global South, energy colonialism can also be analyzed as a phenomenon *within* countries, even Northern ones, where marginalized communities are "colonized" by new energy infrastructures (Batel and Devine-Wright 2017).

The concepts of climate colonialism (Moe-Lobeda 2016; Whyte 2017) and carbon

colonialism (Bachram 2004; Lyons and Westoby 2014) connect the debates about energy with global climate change and associated environmental protection initiatives (section "Imperialism Through Conservationism: Green Imperialism"). Climate colonialism refers to the fact that the imperial countries of the Global North (and the wealthy classes in the "North of the South") have contributed by far the most to the climate crisis, while the Global South is suffering the most impacts from it, as starkly evidenced by events such as the historic hurricanes in the Caribbean in recent years. This inequality manifests a climate debt of the rich to the poor, and it is a reminder that the Anthropocene – or more adequately Capitalocene (Moore 2017) – is ultimately rooted in colonialism (Davis and Todd 2017; Whyte 2017). Carbon colonialism refers to the implementation of carbon trading where Global North corporations and countries, instead of reducing their own high levels of emissions, attempt to "offset" them artificially through "credits" they receive from the financing of projects in the Global South, such as low-carbon energy infrastructure and "reforestation" and forest protection initiatives (Bachram 2004; Lyons and Westoby 2014). Hence, Southern countries are left with the impacts of climate change, and the blame for causing them, but with projects that often translate into forest conservationism or polluting energy infrastructures, at the expense of rural communities' livelihoods (i.e., green imperialism). Climate and carbon colonialism further underscore that the recent decarbonization of European economies is facilitated by the relocation of carbon-intensive industrial production in the Global South – in what Bumpus and Liverman (2008) call **accumulation by decarbonization**.

Finally, **nuclear imperialism/colonialism** refers to "[a] system of domination through which governments and corporations disproportionately target and devastate indigenous peoples and their lands to maintain the nuclear production process" (Endres 2009; also Johnston 2015; Keown 2018; Salvador 1998). It has also been called "radioactive colonialism" (LaDuke and Churchill 1985). As stated above, nuclear colonialism is intimately tied to **toxic colonialism**, since nuclear waste is

part of the toxic waste dumped on poorer regions within a country – such as indigenous territories in the USA (e.g., Ishiyama 2003) – or transported to Global South countries (e.g., Greenpeace 2010). There are three main interrelated processes captured here: the mining of uranium, the disposal of nuclear waste, and the testing of nuclear weapons. In the US, native reservations have been used for uranium mining; the health effects from the mining pollution (on workers and surrounding communities) are combined with those of nuclear testing, and the waste dumped on the same territories (and others) after. Johnston (2015) argues that the combination of atomic science and nuclear militarism created new ecosystems of radiogenic communities "colonized by nuclear militarism" and "located near uranium mines, mills and enrichment plants, weapons production facilities, military proving grounds, battlefields, and nuclear waste dumps." A case in point is that of the Marshall Islands (a United Nations trust territory), where between 1946 and 1958, the USA detonated 67 atomic and thermonuclear bombs, destroying entire islands and filling the inhabited ones with toxic chemicals and mutagenic effects, making dozens of islands uninhabitable (Johnston 2015; EJAtlas 2018a). The US legacy in the archipelago is one of health problems and displacements of local communities seeking to avoid radioactive contamination. This is not the only case – for instance, France also used Polynesia for nuclear testing (Danielsson and Danielsson 1986; EJAtlas 2019b).

Imperialism as Hegemonic Environmental Knowledge

The previous discussions have focused on the *material* dimensions of eco-imperial relation, but these also have a crucial ideological basis, inextricably linked to the material ones. Decolonial scholars have emphasized how the imperial/colonial project (during and after colonization) involved not only control over economy and resources, authority, and gender but also *control over knowledge and subjectivities*: the imposition of the dominant Euro-modern rational-scientific knowledge about the environment – which saw nature as an engineering system and resources separate from humans, to be manipulated and

E

used – and the concomitant devaluation and erasure of widely diverse ancestral, rooted epistemologies, i.e., worldviews and ways of life closely related to their environments (Quijano 2000; Lander 2000; Mignolo and Walsh 2018; Walsh 2011). Boaventura de Sousa Santos (2018) has called this the **epistemicide** of a **cognitive imperialism**. These processes were intertwined, because the extractivist, toxic/radioactive, and conservationist processes of eco-imperialism (sections "Imperialism as Extractivism: Ecological/Eco-imperialism," "Imperialism as Contamination: Toxic Waste Colonialism," "Imperialism Through Conservationism: Green Imperialism," and "Imperialism Through Energy") have been justified on the "irrational," "ignorant," and "backward" knowledges and practices of the non-Euro-modern worlds. Indeed, ecology as a "science" flourished during the British Empire (Anker 2001), and it was British ecologists who created a discourse of blaming locals for supposed "irrational" use of forests. The uncolonized areas were seen as a "wild frontier" which had to be conquered and civilized through intensive cultivation of land, hunting, the drying of wetlands, the introduction of new species, and the domestication of natives (Crosby 1986; Gudynas 2004). In sum, the enclosure and dispossession of the material commons were accompanied by – and supported through – an epistemological enclosure.

The foundational acts of epistemicide during colonization have continued to this day. The concept of **development** emerged after the end of World War II and the end of colonial rule in most of the world as a key part of this hegemonic ideology seeking to expand Euro-modern ways of life and knowledges, as well as to advance and consolidate imperial interests, especially of the USA (Escobar 1995). In this sense, Escobar argued, international development policy and practice became akin to a new form of colonialism and "cultural imperialism." As is evident today, the hegemony of "development" is directly related to the current global ecological crisis and, despite being covered in a veneer of "sustainability," today continues to operate in much the same

fashion, promoting large mega-infrastructures, extractive industries, hyper-consumerist lifestyles, and "technological fixes" as the model of society (Goldman 2006).

Lastly, the ideological dimension also emphasizes that ecological imperialism is embedded in "people's everyday practices, including individual and societal orientations, as well as identities," becoming a "mode of living" (Brand and Wissen 2017). We could thus speak of the emergence of eco-imperial governmentalities, in the same sense that scholars speak of colonial and postcolonial subjectivities and environmental governmentalities.

The Slow Violence of Eco-imperial Relations: Cases from Central America and the Caribbean

Central America and the Caribbean is a particularly relevant region to study eco-imperialist relations. The region has long been considered by US imperialists as its "backyard" (Livingstone 2013), as well as a "backward" region in need of pro-"development" interventions. As such, it has been subject to constant geopolitical interventions, often related to extractivist and conservationist initiatives. The Caribbean is perhaps also the region with the most nations still remaining as formal colonies of current and former empires: the USA (Puerto Rico, American Virgin Islands), the UK (British West Indies/BVI), France (Saint Barthélemy, Saint Martin, Guadeloupe, Martinique, French Guiana), and the Netherlands (Aruba, Curaçao, Sint Maarten). In what follows, we focus on two cases: the **toxic colonialism** related to US companies in Central America which have used the pesticide dibromochloropropane (DBCP) in their banana plantations, even after being banned in the USA (section "Toxic Legacies of Neocolonialism in Central America and the Caribbean"), and the multiple dimensions of **environmental colonialism** associated to industrialization and its disastrous aftermath in Puerto Rico (section "Industrialization and Environmental Colonialism in Puerto Rico").

Toxic Legacies of Neocolonialism in Central America and the Caribbean

While pollution is often caused by toxic forms of extraction and waste disposal, we expand the concept of **toxic colonialism** that manifests in agricultural activities by using toxic chemicals and hazardous substances. The common pattern of these manifestations is the knowledge about the toxicity of these substances (commonly previously banned in the imperial countries) but still being use in the colonies and the **toxic legacy** of these hazardous substances which bioaccumulate in the environmental and human bodies affecting human and nonhumans species over more than one generation. This process of slow-motion, accumulative toxicity from pollutants for human and environmental health is one example of what Rob Nixon ([2011](): 2) has called **slow violence**: one "which occurs gradually and out of sight, a violence of delayed destruction that is dispersed across time and space... typically not viewed as violence at all", and which is meshed with the long histories of colonial and neoliberal dispossession.

Dibromochloropropane (DBCP) was manufactured by Dow Chemical and Shell Oil Company in 1956 (Benedict and Wohlers [2018](); Babich et al. [1981]()). DBCP is the active ingredient of *nemagón* and *fumazone* – two nematicides used until the late 1980s by several banana companies in Africa, Asia, and Latin America (Babich et al. [1981](); Slutsky et al. [1999]()). Nowadays, DBCP is discontinued and banned from use; however, health damages and the contamination that it caused remain in the environment, bodies, and memories of dozens of communities worldwide.

In 1977, the first episode of health damage linked to DBCP exposure took place in the Occidental Chemical Company in California where DBCP was manufactured. Through a popular epidemiology process, men workers and their partners began to share among them their inability to father children. After a medical study, researches concluded that workers were suffering from oligospermia (deficient sperm) and azoospermia (absent sperm) leading to different levels of infertility. Studies concluded that exposure to DBCP in their working

place was the main suspected cause (Whorton et al. [1977]()). In response, the US Environmental Protection Agency banned DBCP in 1979. Yet as a clear example of toxic (neo)colonialism, the chemical continued to be exported to the Global South, where banana companies (mainly from USA) used it without any warnings. The **cost shifting** would be absorbed by the health of the workers, while economic profit would be accumulated by the banana companies, a case of **accumulation by contamination** (cf. Demaria [2016]()).

Two decades later, during the 1990s, similar cases of male infertility among banana workers spread out along the countries where DBCP was used: Guatemala, Honduras, Nicaragua, Costa Rica, Panama, and several Caribbean Islands (Slutsky et al. [1999]()). Although the number is contested, approximately 75,000 men are estimated to have been injured (Rogers [2004]()). In Central America, besides infertility in men and women workers, their families and dwellers living near banana plantations have linked the chemical to spontaneous abortions; newborns with malformations; skin and chronical diseases; breast, brain, and uterus cancer; dizziness; and vision problems (Thrupp [1988](); Mora [2017]()). Although Californian men won judgment against Dow Chemical for male infertility, thousands of banana workers in the Global South still have not been compensated, and after 30 years of struggle, people are still demanding justice. Currently, lawsuits related to DBCP are being carried out worldwide in national and international courts in Ecuador (EJAtlas [2015]()), Costa Rica (EJAtlas [2016a]()), the Philippines (EJAtlas [2016b]()), Nicaragua (EJAtlas [2016c]()), Honduras (EJAtlas [2017c]()), Ivory Coast (EJAtlas [2017d]()), and Panama (EJAtlas [2018b]()), but most remain unresolved or have been disregarded. In this case, it seems that the poor are not worth less, they are just "not worth at all."

Industrialization and Environmental Colonialism in Puerto Rico

Puerto Rico, colonized by Spain in 1493 and later by the USA in 1898, offers a clear case of the multiple dimensions of eco-imperialist relations,

E

which local scholars have labelled "environmental colonialism" (Anazagasty Rodríguez 2018; Atiles-Osoria 2013; Concepción 1988). As a historical phenomenon, the Spanish exploited the country's mineral resources (and its indigenous *taino* population of course) and later converted the territory into a plantation economy for the empire. This led to massive deforestation – up to 90% of the original forest cover had been lost by the end of the nineteenth century, motivating the Spanish Crown to establish the country's first "forest reserve" (Domínguez Cristobal 2006). After the USA invaded and took control of Puerto Rico as part of the Spanish-American war, eco-imperialism continued. The US government dramatically expanded sugarcane production in the first 30 years of the twentieth century while expropriating land for military bases and for protected areas across the country, planted for high-value timber species and for the model of imperialist **green imperialism** that the government had begun to experiment with indigenous territories in the USA (section "Imperialism Through Conservationism: Green Imperialism").

In the 1940s, the US government changed its policy in Puerto Rico toward one of industrialization, in what it called *Operation Bootstrap* (*Manos a la Obra* or "Hands to Work" in Spanish). The "Operation" was discursively legitimized using racist and colonialist ideologies and US academic research arguing Puerto Rico was too small, overpopulated and lacking enough human and natural capital to develop autonomously (Berman-Santana 1996). In the context of the Cold War, the objective was to turn Puerto Rico into the "showcase of the Caribbean" (*vitrina del Caribe*) for the rest of Latin America to see the supposed "benefits" of "progress" under US capitalist "democracy." The program began with textile factories but quickly shifted to highly polluting petrochemical refineries and, later, to pharmaceuticals. In the 1960s, the need for raw materials to feed the American postwar economic "boom" also led to a proliferation of mineral exploration permits by US companies. A copper and gold pit mine was proposed on 14,000 hectares of the island's central mountainous region, leading to the emergence of the country's first

environmental movement (Berman-Santana 1996; Colón-Rivera et al. 2014; Concepción 1995). That movement made clear the links between national liberation and environmental struggles: for the main groups opposed to the mining project, the natural resources of the country were a national patrimony which should be the basis of the development of an independent republic. Thus, their opposition was mainly based on a critique of the colonial exploitation by American companies, and their slogan was "Puerto Rican mines or no mines" (Concepción 1995). Others, however, questioned the **extractivism** logic of the mining project as an ecocide that should not be carried out under colonial or formally independent rule. Puerto Rican intellectuals identified the increased exploitation of agrarian land and natural resources by the US empire, and its planned exploitation of copper mines and petroleum, as a characteristic of the colonial condition of Puerto Rico (Anazagasty Rodríguez 2015, 2018). Juan Mari Bras, leader of the Puerto Rican Socialist Party, used the specific term "environmental colonialism" to refer to the **toxic** dimension of eco-imperial relations to Manos a la Obra's importation of the most polluting US industries which were not allowed to operate in the USA given that country's recent environmental legislation, but were given "exceptions" to operate in Puerto Rico: for instance, the Sun Oil refinery processed the lowest-quality, highest-sulfur content petroleum, prohibited in the USA (Mari Bras, cited in Anazagasty Rodríguez 2018; (see also Concepción 1988)). The colony thus became the "dump site... of the toxic waste of the most polluting means of US industrial production" (Anazagasty Rodríguez 2018). The petrochemical industries left, but their *toxic legacy* remained in the form of highly contaminated abandoned sites, designated by the US government as "superfunds." Puerto Rico today has 17 sites with this designation.

The fossil energy infrastructure that emerged to fuel the petrochemical industries in this period, and that remains almost intact to date, is a clear example of **energy colonialism** (de Onis 2018a, b) or an *energy slavery* to fossil fuel interests (Massol 2015, 2019), clearly linked to *toxic* processes. An

emblematic case which also shows the complexities of Global North/South eco-imperial relations is the coal plant operated since 1996 by US multinational Applied Energy Systems in the southeast town of Guayama. The south of Puerto Rico is the most polluted region in the country, home to abandoned sugar plantations and most of the petrochemical industries, operating pharmaceuticals, thousands of hectares of experimental genetically modified seed production crops, a cement kiln and tire burning plant, and a regional landfill which has also been receiving the coal ashes (Santiago 2012) – a "South within the South" according to local activists. In the beginning, AES dumped its toxic coal ashes in Dominican Republic, but after birth defects and other health problems started emerging in the communities near the dump site, the Dominican government cancelled the contract and sued the company (successfully). The toxic pollution from the plant's emissions and ashes are associated to numerous health illnesses in the region.

In parallel to (and in support of) these toxic industrial developments, from the 1940s onward, Puerto Rico became a center of a vast system of US military bases for directing operations and experiments in the Caribbean and Latin America (García Muñiz 1983). In the 1960s, the highly toxic "Rainbow" herbicides (used in the so-called Agent Orange and Agent White) were tested in military practices in the El Yunque National Forest – ironically labelled as Puerto Rico's "last wilderness" – to measure their effectiveness at defoliation in similar tropical environments in the midst of the Vietnam war (Wood et al. 2019). Scientists proudly describe these tests as part of a "legacy of large-scale ecosystem manipulation experiments in Puerto Rico" (Wood et al. 2019). By 1978, military spending accounted for more than 60% of all US government spending on the country (García Muñiz 1983). Puerto Rico became the main training site of the US Navy, with the island of Vieques at its center. In Vieques, the Navy expropriated 2/3 of the island's territory and carried out live bombings for over 60 years using toxic chemicals like Agent Orange and heavy metals, until a national movement kicked the military out. As with the factories, the Navy

left, but the legacy of this **toxic militarism** (Santana 2002) remains: lands still unusable because of their pollution and residents with a range of health problems, including rates of cancer, cardiovascular disease, and diabetes, that are significantly higher than the average in Puerto Rico. The Navy has dragged its feet on cleaning up the land, and its chosen method to do so – detonating remaining ordinances – is increasing pollution. Furthermore, instead of transferring the land to Viequenses, the US government established a "wildlife refuge" under the ownership of the US Fish and Wildlife Service, in a clear example of **conservationist** dimension of imperialism.

Conclusions

In this chapter, we have pointed out in the need to address current environmental issues from the lens of the historical and recurring processes of imperialism. We have led our discussion by an exhaustive theoretical revision and the definition of key concepts to describe different manifestations of eco-imperial relations as forms of political-economic control through the environment. These multiple manifestations are interconnected: extractivism generates contaminant and waste flows and is accompanied by conservationist policies to "mitigate" its effects. They are connected by the way imperial relations facilitate control of the environment and its commons (land, resources, sinks) as a *commodity* to extract and export in international markets, to dump waste, to produce energy, or to conserve in protected areas, in ways that maintain and reinforce existing inequalities.

Analyzing eco-imperial relations helps underscore the historical interdependence and co-constitution between colonialism, global capitalism – in its dispossessive, environmentally unjust forms of "development" and "conservation" – the persistence of these articulations and the global ecological crises of today. This shows how current environmental governance regimes (policies, discourses, relations, behaviors) are shaped by imperial powers' uses of and ideas about the environment during colonization, as

well as in ongoing neocolonial relations. It opens up the understanding of how unequal power relations and the increase of inequality between regions and social groups persist until nowadays, and how these conditions shape the environment, and the global ecological/climate crisis of today. These relations are not homogeneous across space and time, and they cannot always be neatly categorized as North vs South in the terms usually conceived. There is also a South in the North and a North in the South so to speak, as, for instance, evidenced with indigenous peoples within countries in both the North (US) and South (Brazil) threatened with imperialist extractivist/toxic/energy projects and with a colony like Puerto Rico dumping its toxic waste in the Dominican Republic. Eco-imperial relations also make visible how current neoliberal forms of global capitalism are a new form of imperialism, to whose reproduction and expansion the environment is central. In other words, the current processes of marked ecological degradation and the climate crisis are effects directly linked to the history of colonialism and to these enduring colonial-imperial patterns in global capitalism. As such, the topic of "imperialism and environment" connects to key concepts in critical social studies today, such as *primitive accumulation* and *accumulation by dispossession*, *accumulation by contamination*, *land/green/blue grabbing*, *ecological unequal exchange*, *(neo)extractivism*, *ecological debt*, *environmental racism/justice* anthropocene, and capitalocene. Finally, bringing imperialism to the forefront contributes to decolonize environmental studies (DeLoughrey et al. 2015) while simultaneously "ecologizing" studies of imperialism. This is a crucial double task to deepen our understanding of dominant forms of environmental governance today, and possible decolonial, anti-imperial alternatives.

Ecological Imperialism: A Theoretical Overview

Mariko Frame
Merrimack College, North Andover, MA, USA

Synonyms

Accumulation by dispossession; Ecologically unequal exchange; Finance capital; International trade; Neoliberalism; Structural adjustments; Transnational corporations; World-systems theory

Definition

As global ecological crises deepen, the scramble by the powerful for what land, water, and resources are left is accelerating. The resulting environmental injustices, whether known as accumulation by dispossession, ecological debt, ecologically unequal exchange, or other related forms, are intensifying. Behind all such trends is a complex global political economy- a capitalist world-system enabling and reinforcing ecological imperialism. Ecological imperialism can be conceptualized as the subjugation of the economic, political, and/or social institutions of a (generally semiperipheral or peripheral) country for the biophysical, metabolic needs of the (generally core or semiperiphery), inextricable from the purpose of making such resources accessible and amenable (in the right quantities and for the right price) to the needs of (foreign) capital accumulation. Understanding the structures and policies that ensure the continued flow of both resources and profit from certain regions and social groups to other regions and social groups is the study of ecological imperialism. The current system of international trade, foreign investment, and international finance, the very pillars of neoliberal globalization built upon a long history of exploitation and dependency stretching back to colonialism, is the very structure through which ecological imperialism currently occurs.

Introduction

In its simplest definition imperialism is the system by which a dominant power is able to control the trade, investment, labor, and natural resources of other peoples. Theories of imperialism have always acknowledged the role of natural resources in global capital accumulation; indeed, imperialism operates as whole, a system, so it is impossible to isolate specific parts such as the exploitation of labor from the exploitation of Nature. But in an era of global ecological crises, it becomes important to emphasize imperialism's ecological aspect. For one, even as mainstream discourses on sustainability are proliferating, economic policies, environmental degradation, and global structures of inequality are continuously treated as separate and unrelated issues. Sustainability itself is a contested political issue. Attempts to explain global environmental crises without explicitly acknowledging the links between the grossly unequal accumulation of capital and consumption of resources by certain groups and the impoverishment and environmental devastation shouldered by less powerful

groups leads to analyses which are consistently fragmented and incomplete, and perhaps most importantly, biased towards business-as-usual solutions. Furthermore, as global ecological crises deepen, the scramble by the powerful for what land, water, and resources are left is accelerating. The resulting accumulation by dispossession, ecological debt, ecologically unequal exchange, and other related forms of environmental injustice are intensifying, driven by a global political economy that is, essentially, neoliberal globalization operating in a capitalist world-system.

This short chapter seeks to provide a brief theoretical overview of the primary characteristics of ecological imperialism and the global political economic system that drives it and enables it. As a complex, ever evolving global phenomenon, such a short entry will undoubtedly neglect many important details and nuances, but this paper seeks to address some of the most salient features. Section "Ecological Imperialism: Some Essential Characteristics" outlines essential dynamics of ecological imperialism, section "Ecological Imperialism and the Hierarchy of the World-System" situates ecological imperialism in the world-system, and section "The Political Economy of Ecological Imperialism in the 21st Century: Neoliberal International Trade, Foreign Investment, and International Finance" discusses the main international economic mechanisms through which ecological imperialism occurs in the twenty-first century, primarily international trade, foreign investment (particularly foreign direct investment), and international finance. All three form the pillars of neoliberal globalization, and all three pivot around an increasing concentration of capital in the form of large transnational corporations.

Ecological Imperialism: Some Essential Characteristics

The first and primary characteristic of ecological imperialism, of imperialism in capitalism in general, is that it is rooted in the endless drive for capital accumulation. It is not, as some may suggest, purely an expansionary outcome due to the physical needs of industrialization but is rooted in capitalist relations of production. Capitalism is an expansionary system, driven by inherent characteristics both normal to its operations as well as by its own inner contradictions. In contrast to other modes of production, in the capitalist mode of production the drive for capital, that is the advancement of value in money form in order to produce more value (M-C-M'), dominates production. Marx had argued that capitalism as a social relation is defined by the complete social separation of the direct producers from the necessary material conditions of production, starting with the appropriation of land. Separated from any way of sustaining themselves, workers become forced to sell their labor-power for wages. Marx denoted this process 'primitive accumulation' and the phenomena of peasants being forced off land still occurs in what many scholars denote 'continuing primitive accumulation. Only now, in an era of global ecological crises, the land has become just as important, and at times even more so, than the labor. With primitive accumulation, these 'freed' material conditions and 'freed' labor are recombined in the wage-labor production of commodities in pursuit of the endless accumulation of capital. From the standpoint of capital, as Marx wrote, the natural conditions of production become 'free gifts' of nature, to be freely appropriated by capital, providing use-values that capital needs to produce and realize surplus-value (Burkett 2006). Capitalism is continuously engaged in a process to appropriate and commodify labor and nature as inputs for production in the pursuit of endless profit.

The problem is that the conversion of labor and nature into separate capital assets for the purpose of creation of profit is fundamentally destructive, both to nature and human development. As Marxist ecologists such as Burkett, O'Connor, and Foster have pointed out, capitalism's reproduction requirements are autonomous from the sustainable reproduction of labor-power and natural conditions. Capitalist reproduction does not recognize any of the processes, complexities, and limits of the natural world. Given its drive of endless accumulation, capitalism has an inherent tendency to overextend the limits of its natural

conditions (Burkett 2006). In capitalist economies, individual capitals use profits to make more profits, which become self-expanding capital. Quantitatively, capitalist self-expansion has no strict limits per se. Nature, which organizes itself on very different principles, very much does. (O'Connor 1998)

Thus, a relatively straightforward explanation for ecological imperialism is that the continued accumulation of capital is utterly dependent upon the accessibility and affordability of 'natural capital,' which is obtained globally. This dynamic underpins the history of capitalism from the very beginning with the exploitation of resources under European colonialism. And it continues today, for example, with foreign investment regimes and multilateral trade treaties that keep strategic resources in the mining sector cheap and accessible to transnational corporations. Magdoff (2003) also pointed out that capital, in its drive for endless accumulation, undergoes technological changes that require specific and strategic resources, many of which are largely found overseas, a process intensified by competition between capitalist powers. Such a dynamic can be witnessed in the current scramble for African resources, not just between individual capitals from the United States and Europe, but emerging 'Southern' countries as well.

On the other hand, a more complex dynamic behind imperialism may stem from spatio-temporal fixes for crises of accumulation- both under and overaccumulation- arising from contradictions that are unresolvable within the capitalist system itself. Classical theorists of imperialism such as Luxemburg (1964) had emphasized how crises of over-accumulation necessitated global expansion in the restoration of the conditions for accumulation. More recently, Harvey (2005) links neoliberalism to an over-accumulation crisis that began in the early 1970s (over-accumulation being the surplus of capital, and potentially also labor, lying idle and having no profitable outlets). He argues that 'accumulation by dispossession' helped solve the over-accumulation problem through releasing a set of assets such as natural resource, and including labor power, at a very low. In Harvey's formulation, over-accumulated

capital can seize hold of such assets and immediately turn them to profitable use. Neoliberal privatization, he argues, opened up vast fields for over-accumulated capital to seize upon, releasing cheap raw materials, such as oil, into the system, whereby input costs would be reduced and profits thereby enhanced.

Moore's work (Moore 2001, 2003, 2011, 2012) emphasizes how crises of 'under-accumulation' has historically led to new spatial expansions of capitalism and new capitalist appropriation of natural wealth, which, in turn, create new ecological crises and crises of human development while setting the stage for future accumulation crises. Moore argues that capitalism has a tendency to undermine its conditions of production. Specifically, increasing the extraction of surplus value hinges on increasing labor productivity, which does involve technical and social innovation, but most importantly from an ecological perspective, it is the abundance of 'free gifts' which has fueled capitalism's technological dynamism. Capitalism, Moore asserts, has sustained itself on the basis of cheap inputs (Moore 2001, 2003, 2011, 2012). But these dynamics necessarily push expansionary tendencies on a global scale, as they typically reward the rapid exhaustion of nature (and human nature), and instigate ecological crises, which can act as fetters on the accumulation of capital. Thus, when the exhaustion of human and biophysical natures becomes significant enough to fetter labor productivity in a serious way, capitalists and empires begin to look for new frontiers. This dialectic of plunder and productivity, Moore insists, is at the heart of capitalism's recurrent waves of geographical expansion, and he cites the examples of sugar, silver, forest products, fish, iron, and copper, all having moved with the same rhythm: occupying, producing, and exhausting the ecological formations of the North Atlantic.

Additionally, both Foster (2002) and (Burkett 2006) have pointed out that environmental crises do not always create a crisis of capital accumulation, and that ecological crisis itself may be used as a new source of investment and profit- carbon trading, the melting of the Artic from climate change and the rush to obtain the fossil fuel

deposits there, even the global land rush driven by biofuel production for renewable energy could be seen as the more obvious examples. One can also add that the creation of *scarcity* due ecological crises can be a source of profit for individual capitals through rising prices and opportunities for speculation. The global drive to privatize scarce water resources, speculation on fuel and food, among other examples, are attempts within the system to directly expand private riches by exploiting scarcity and are an important dynamic behind certain expansionary appropriations of peripheral resources. Importantly, however, we must realize that it is nearly impossible to isolate one single dynamic driving ecological imperialism. Rather, for any given instance, it is more likely that several dynamics are at work, to be ascertained through concrete analysis rather than an overarching theory.

The second characteristic of ecological imperialism is that it hinges upon the dynamics of unequal power of the world-system. Unequal power can be economic, but also technological, political, military, ideological, and so on. As world-system theory argues, the contemporary dynamics of unequal power originated from the hierarchical international division of labor created during colonialism. However, as capitalism must constantly obtain resources that are cheap and easily accessible, the necessary political economic conditions must be continuously created and enforced. Beginning in the 1970s, that current political economic configuration is neoliberal globalization. Neoliberal globalization arose out of a crisis of profit for the capitalist class in 1970s, on the ashes of Keynesian economies in Global North and the collapse of Third World economic nationalism in the Global South. Neoliberal policies and the unleashing of global capital in the form of multinationalization of production destroyed the fragile compromise between labor and capital in the Global North. It prepared the groundwork for the exploitation of labor in the Global South through structural adjustment policies emphasizing 'labor reform' and labor 'flexibility.' Significantly, such structural adjustment policies also laid the foundation for the 'neoliberalization of nature,' through trade treaties,

foreign investment regimes, and in general export-intensive development plans that emphasized trade liberalization and open arms to foreign investor. The 'neoliberalization of nature,' is a general and intensified trend of commodifying nearly every aspect of environments across the globe (Heynen 2007). For the Global South this neoliberalization not only included the commodification of Nature but also the subjugation of their environments to the transnational corporations of the Global North. The current forms of neocolonialism such as foreign dominance in extractive sectors in Sub-Saharan Africa facilitated through binding multilateral and bilateral trade treaties, or the selling off of huge tracks of land under national laws that enable land grabs, are simply outcomes of the neoliberal policies enforced by the structural adjustment policies of the International Monetary Fund and the World Bank. However, we should also keep in mind that ecological imperialism works in a less direct way than economic policies- it arises as relations of dependency within a hierarchical international division of labor in the world-system. Many peripheral countries, since colonialism, are locked into the export of natural resources as their primary source of income, compounded by their need to pay off international debt.

The third characteristic is that ecological imperialism results in some sort of negative socio-ecological impacts for peripheral countries. If this were not true, what we would be witnessing would simply be the textbook version of international trade. The study of ecological imperialism is the study of the displacement of environmental and social burdens outside of imperial centers borders. Equally important, it is also the study of the capture of profits with the associated economic activity.

Finally, a fourth characteristic is that the form that ecological imperialism takes is also an outcome of the dialectical unfolding of movements and counter-movements that arise in response to social resistances. Ecological imperialism necessitates an amenable political-economic context within the imperialized country; historically this has been met with resistance at certain times. As O'Connor (1998) originally noted, nature, like

labor, must be made available to capital in requisite quantities and qualities, at the right place and time. Contrary to neoclassical economic theory, the price of nature in the periphery depends not only on market supply and demand and ground rent but also on class, anti-imperialist, and environmental struggles. Relatedly, one must note the crucial role of the state and the associated peripheral elites- government officials, the bourgeois class associated with agriculture and the mining sector, etc.- whose interests align with the extraction and exploitation of peripheral environments. The state itself is the extra-economic actor that ultimately resists or acquiesces to the demands of foreign capital, creating the conditions for which nature is made available to capital in requisite quantities and qualities.

Overall, then, we can define ecological imperialism as the subjugation of the economic, political, and/or social institutions of a (generally semi-peripheral or peripheral) country for the biophysical, metabolic needs of the (generally core or semi-periphery), inextricable from the purpose of making such resources accessible and amenable (in the right quantities and for the right price) to the needs of (foreign) capital accumulation. Understanding the structures and policies that ensure the continued flow of both resources and profit from certain regions and social groups to other regions and social groups is, this paper suggests, the study of "ecological imperialism." The current system of international trade, foreign investment, and international finance, built upon a long history of exploitation and dependency stretching back to colonialism, is the primary mechanism through which ecological imperialism currently occurs (though illegal activities like smuggling also occur, and unequal appropriation of the global atmosphere commons could count as well).

Ecological Imperialism and the Hierarchy of the World-System

As stated above, ecological imperialism hinges upon unequal power in the global capitalist world-system. This is not a new formulation per se; Magdoff, for example, recognized the significance of the world-system as a hierarchical international division of labor in enabling imperialism. However, by the twenty-first century, there are some important new characteristics of imperialism, some of which began decades ago, but have now grown or intensified. One of the most important characteristics include the saturation of capitalist relations of production of economies across the globe, driven by multinational corporations that began outsourced manufacturing tasks in the 1960s, and also international finance. Correlated with this has been the rapid economic and industrial growth of emerging economies as they became the recipients of the outsourced manufacturing tasks. As Smith (2016) emphasizes, neoliberal globalization has multinationalized the links in the chain of production and value-creation across national borders, driven by voracious appetite for ever cheaper labor. Compared to previous eras of imperialism (classical imperialism) the world-system is now linked by billions of global commodity chains. As will be discussed, this multinationalization of production has obvious environmental consequences. In addition, global ecological crises itself has shaped ecological imperialism in distinctive ways. Intense competition for resource, the increasing vulnerability of the periphery and marginalized peoples, dwindling supplies of fossil fuels, metals and minerals, land and fresh water have resulted in a fierce form of ecological imperialism, a brutal scramble, with devastating consequences.

With these changes in mind, one can consider how ecological imperialism manifests in the hierarchical international division of labor of the capitalist world-system in the twenty-first century. In world-systems theory the global economy is studied as a hierarchical division of labor where economic tasks are distributed geographically, with each primary part of the world-system- the core, the semiperiphery, and the periphery- playing a distinct role. Though the global economy is increasingly complex as a result of industrial outsourcing and the rise of emerging economies as economic powers, many economic tasks are still geographically distributed. Core countries

remain characterized by high development of forces of production, including high-paid labor, capital-intensive production, and technological advancement. Transnational corporations are primarily headquartered in the Global North, though emerging economies TNCs do exist and South-South investment has increased in recent decades. In contrast, peripheral countries are characterized by low-level forces of production, including low-paid labor and labor-intensive production such as the export of raw materials. Geographically, the core is constituted by the advanced industrial countries, including Europe, North America, and Japan. Peripheral countries include regional areas such as Sub-Saharan Africa, and countries in Latin America and Asia. Semi-peripheral economies contain both core and peripheral characteristics. Emerging or middle-income economies occupy an important part of the semi-periphery. Some, such as China, occupy an increasingly ambiguous role as they become economic power houses in their own right.

In the world-system schema, the first fundamental relationship upon which ecological imperialism hinges is the deep inequality perpetuated by the continued dependency and exploitation of peripheral regions, by core regions but also increasingly by emerging economies as well. The origins stem from colonialism, as peripheral economies throughout Africa, Latin America, and Asia were re-organized to become exporters of natural resources to fuel the industrial needs of their European colonizers. This relationship continued post-independence, described as 'neocolonial' by such post-colonial leaders as the Ghanian revolutionary Nkrumah, to denote the continued economic, political and technological dependency of Sub-Saharan countries on their former colonial masters. Peripheral countries experience ecological imperialism in two primary ways: first, within the world-system international trade hierarchy, they are exporters of natural resources, leading to ecologically unequal exchange and ecological debt. Second, in places like Sub-Saharan Africa especially, such international trade is controlled by transnational corporations, particularly in the extractive and agricultural sectors, so profit as well as resources flow overseas.

Ecological imperialism manifests through semi-peripheral countries in a more complicated way. In the world-system semiperipheral countries constitute a varied and at times ambiguous category, but nonetheless plays a distinct role. Chase-Dunn and Hall (1997: 78) define the semi-periphery as:

1. Regions that mix both core and peripheral forms of organization.
2. Regions spatially located between core and peripheral regions.
3. Regions spatially located between two or more competing core regions.
4. Regions in which mediating activities linking core and peripheral areas take place.
5. Regions in which institutional features are intermediate in form between those forms found in adjacent core and peripheral areas.

In regards to ecological imperialism emerging economies occupy an intermediate semi-peripheral status that if often not fully explored in the critical political ecology literature which tends to focus on the extractive or land sectors of the periphery. Importantly, in the twenty-first century the emerging economies of the semiperiphery are the centers of manufacturing and all of its associated industrial degradation, from polluted air to toxic rivers. In a case study on East Asian land grabbing in Cambodia, Frame (2018) argued that emerging economies face a number of complex, contradictory dynamics and pressures that drive ecological degradation both within and outside of their national borders. Specifically, historically such countries have faced an intense, upward competition in a hierarchical capitalist global economy that pressured them to industrialize rapidly, resulting in environmental exhaustion of their own domestic natures. The environmental degradation of China, with its high levels of air pollution, is a prime example. In addition, such countries also continue to engage in peripheral activities that are centered on the extraction and export of primary commodities, and such activities also drive domestic environmental degradation, for example, deforestation due to both domestic   and   foreign-owned   large-scale

agribusinesses and timber companies in Malaysia, Vietnam, and Thailand. In response to both of these dynamics, as well as their increasing levels of consumption resulting from economic growth, emerging economies are increasingly seeking to externally secure land and resources regional ecological imperialism. Particularly for land, the recipient countries are invariably poorer and lower on the world-system totem pole. Other preliminary studies (Singh and Eisenmenger 2010) have also noted the increasing propensity for certain developing countries like China are becoming net importers of biophysical resources.

However, even as some semi-peripheral countries are engaging in forms of ecological imperialism with peripheral countries, they remain subordinate to core economies in a number of ways. To begin with, such countries do not occupy the same position as core countries in terms of the global hierarchy of wealth, even if they are industrializing. Relatedly, in many cases semi-peripheral economies operate as suppliers and subcontractors to corporations in the Global North, and many of their exports end up consumed in the Global North. This is important, because it means that while emerging economies have shouldered the environmental burdens from the outsourcing of manufacturing from core country transnationals, they do not capture all, or even most, of the value-added (Smith and Mahutga 2009). This is a fundamental distinction between the industrialization of the core countries, which historically captured the associated profit, even though the Global North dealt with its own environmental destruction due to industrialization. Third, international financial institutions of the Global North, particularly the World Bank and International Monetary Fund, have been instrumental in promoting the industrialization and neoliberalization of semi-peripheral natures. They have also been instrumental in opening up peripheral economies and allowing the appropriation of their natures by both core and semi-peripheral countries. With rapid economic growth, rising consumptions patterns, and environmentally destructive investments overseas, coupled with the continued degradation of their own environments, emerging economies

occupy the ambiguous role as both the exploiter and the exploited.

The Political Economy of Ecological Imperialism in the Twenty-First Century: Neoliberal International Trade, Foreign Investment, and International Finance

With a brief introduction as to the fundamental dynamics of ecological imperialism and a rough sketch of how it manifests in the hierarchy of the capitalist world-system, we can now look at the global economic mechanisms of international trade, foreign investment, and international finance.

Ecological Imperialism and International Trade

International trade patterns, arising from the hierarchical international division of labor of the capitalist-world system, are the primary mechanism through which ecological imperialism occurs. A highly related and widely substantiated theory is ecologically unequal exchange. Ecologically unequal exchange draws from world-systems theory and argues developed countries are able to appropriate a net asymmetrical transfer of resources from developing countries (Hornborg 2011). There is substantial evidence that international trade has served as a mechanism through which developed countries are able to maintain high levels of unsustainable consumption through offshoring their environmental burdens onto developing countries. For example, a study (Wiedman et al. 2013) using the comprehensive material footprint indicator (Defined as the global allocation of used raw material extraction to the final demand of an economy) found that developed countries achievements in decoupling- the much touted and hoped-for process by which economies continue their economic growth while decreasing their use of natural resources through technological innovation- is small or even nonexistent when using the indicator of material footprint. Rather, the authors found that as wealth grows, countries tend to reduce their *domestic* portion of materials extraction through

international trade, while simultaneously allowing the overall mass of material consumption generally increases. This occurs due to the increasing spatial separation of production and consumption in global supply chains that has led to a shift of resource use and environmental pressures among countries. Wiedman et al. also note that offshoring of environmental burdens has been well-documented for greenhouse gas emissions (Davis and Caldeira 2010; Hertwich and Peters 2009; Wiedmann et al. 2010), land use (Yu et al. 2013; Weinzettel et al. 2013), water use (Steen-Olsen et al. 2012; Feng et al. 2011; Lenzen et al. 2013; Galli et al. 2012), and threats to species (Lenzen et al. 2012).

It is important, however, to see ecologically unequal exchange, or however one wishes to describe such an offshoring of environmental burdens, as the *symptom* of ecological imperialism. It is the symptom of an entire capitalist global economy that facilitates both ecologically unequal exchange *as well as* the continued flow of profits to wealthier nations. As stated above, the fundamental international trade patterns originated under colonialism, where developing countries were forced to restructure their economies as exporters of natural resources. However, even with the end of formal colonialism, such international trade patterns continue due to deliberate economic policies that reinforced developing countries role as exporters of natural resources. It is true that underdevelopment and dependency of peripheral countries on the technology and financial resources of the wealthier nations reinforces peripheral countries position within the world-system, but subjugating neoliberal economic development policies were crucial. As alluded to above, with the debt crises of the 1980s, developing countries globally where forced to undertake extensive structural adjustment plans that re-ordered their entire economies along neoliberal lines in order to borrow loans from the International Monetary Fund (IMF) and the World Bank. The central features of neoliberal policy, captured in a set of economic policies known as the Washington Consensus, encouraged trade liberalization, devaluation of currencies to stimulate export-growth, the encouragement of

foreign direct investment, and the securing of property rights, among other policies. As Peet (2009) writes, such policies favored an outward-oriented, export economy, organized through markets, with minimal state regulation along with privatization, trade liberalization and limited state budget deficits. Central to the formation of such policies and to neoliberal economic policies in general is Ricardo's classical liberal concept of comparative advantage which states that, to optimize production output and hence overall welfare, countries should specialize in producing and exporting the goods and services for which they have a comparative advantage. For peripheral countries in Latin America and Africa, this meant, in the eyes of the Western-dominated institutions of the IMF, World Trade Organization and World Bank, specializing in the export of natural resources. Chief among the sectors that are targeted for export-promotion included, and continue to include mining, agriculture and forest products.

Additionally, it is not just that trade liberalization has reinforced the position of peripheral economies as exporters of natural resources. Such liberalization both introduced and reinforced particular *patterns of production* associated with exports that are highly environmentally damaging, i.e., capitalist relations of production, technology, and organization that are geared to the ceaseless pursuit of capital, such as monocropping for exports.

Ecological Imperialism and Foreign Investment

One central point that is often overlooked on the discussion of international trade and the offshoring of environmental burdens is that most international trade is intra-industry trade, occurring within hierarchical, vertically organized transnational corporations as they extract their resources and outsource their production globally. This may be foreign direct investment, in which the investing firm has a controlling interest, or through arms-length subcontracting, in which large transnational corporations outsource to subcontractors, but still coordinate and control their operations. Either way, as the excellent work on

imperialism by Smith (2016) demonstrates, profit is overwhelmingly captured by transnational corporations in the production of most global commodities.

This has several important implications for ecological imperialism. Transnational corporations have, since colonialism, been integral to the system of obtaining peripheral resources in addition to outright political control and plunder. While TNCs were challenged in the brief era of economic nationalism through measures such as nationalizations, primary commodity cartels, and the push for fairer terms of trade through the United Nations platform of the New International Economic Order, these efforts quickly collapsed and capitulated to neoliberal reforms with the developing world debt crises of the 1980s. On the one hand, structural adjustment policies (SAPs) reinforced trade liberalization and export-led growth based on comparative advantage. On the other hand, such 'development' policies deepened global markets and the construction of multitudes of global commodity chains through economic policies and regulations that favored transnational corporations and their capacity to exploit peripheral and semi-peripheral labor and resources. As the other pillar of the neoliberal globalization, SAPs created the conditions favorable to opening up peripheral countries for foreign capital through privatization and various incentives to attract multinational corporations. Even now, attracting FDI continues to be promoted as integral to development and economic growth. The International Monetary Fund, World Bank, and Organization for Economic Cooperation and Development (OECD) argue that FDI is central to increasing the foreign exchange of low-income countries and avoiding further build-up of debt.

For example, Frame's work (2016) work on foreign direct investment in African resources found that neoliberal policies were designed to repeal policies enacted during the era of economic nationalism, shifting power, resources, and profits to the side of foreign investors. Such policies could be split into two rough categories; external policies that aimed to bind African countries through a host of multilateral and bilateral trade treaties, such as trade-related investment measures (TRIMs), and internal policies that restructured domestic laws particularly in regards to mining and land. The central aim of TRIMs is to provide a safe haven for Western investments with favorable domestic conditions, undermining developing countries' capacity to regulate the behavior of foreign firms for the purpose of development objectives. Internally, since the 1980s the World Bank has promoted a process of liberalization, deregulation, and privatization under the auspices of economic growth, which has resulted in the creation of new regulatory frameworks for mining in Africa. The reforms simultaneously created a more favorable environment for foreign investors while undermining the protection of the environment in the countries concerned. Reforms emphasized creating a stable legal and fiscal framework, including mining codes, contractual stability, a guaranteed stable fiscal regime, and channels for profit repatriation. In practice, such reforms lowered taxation on FDI to negligible amounts, forbade nationalizations, and deregulated land sectors, leaving African countries bleeding billions of dollars in profits overseas. In the era of global ecological crises, the scramble for African resources has been associated with corruption and lack of democracy, the dispossession of local communities in oil-producing areas, and environmental despoliation. Throughout the periphery, foreign dominance in natural resource sectors has left vulnerable peripheral countries witnessing the wholesale grabbing of arable land, water sources, timber, fisheries, fossil fuels and minerals, with the resultant degradation and collapse of ecosystems. Peripheral countries, in turn, have witnessed political and social strife between governmental elites who benefit from their cooperation with multinationals and the citizens who are left with the environmental and socio-economic destruction.

International Finance

The current capitalist world-system is beleaguered by two paradoxical and exacerbating trends; the rapid escalation of ecological crises coupled with a tremendous overaccumulation of capital in the financial sector. The past several

decades has seen a rapid proliferation of what Marx termed 'interest-bearing capital,' signifying a systemic shift in capitalism with the emergence of the hegemony of the financial class and the increasing control of economy by the finance sector. As such, no discussion of ecological imperialism is complete without an acknowledgement of role international finance.

To being with, the financial system, as Marx discussed in Capital Volume III, acts a mechanism of concentration of multiple streams of revenues, from non-reinvested industrial profits (previously exploited surplus value) to the savings of workers. Through banks it centralizes the revenues of various social classes; through this process the multiple scattered, small funds, unable to act on their own accord, become a concentrated money power at the disposal of the financial class. In contemporary capitalism this process is magnified at a global level with a wide array of financial institutions, the sources of revenue even more diverse and the scope and scale exponentially increased. This creates the first fundamental contradiction; trillions of dollars of financial capital circle the global for rates of highest return as global ecological crises intensify.

Second, Marxist scholars have pointed out (Heinrich 2004), what is new in capitalism is that a large number of loans serve the enrichment of the debtors: they borrow money to use as capital. This form of credit, which only existed as an exception in pre-bourgeois societies, is the typical form of credit for capitalist enterprises. In capitalism finance of some sort is implicated in nearly every economic activity, and nearly every economic activity, from extraction, to production, distribution, to consumption, has troubling implications for the environment. As Vasudevan (2017) (https://mronline.org/2017/09/18/the-signifi cance-of-marxs-theory-on-money/), points out, the system of credit accelerates the expansion of the scale of production, development of technology and creation of the world market; the expansion of individual capitalist enterprises need not be limited to the reinvestment of their retained earnings. Further, in contemporary capitalism large financial actors have significant corporate control globally. If it is machinations of the global

capitalist economy that is destroying the planet, then interest-bearing capital as credit and the central source of funding is the lifeblood that enables it and expands it.

Third, in the hierarchical international division of labor of world-capitalist system, this concentrated and internationalized money power, the locus of which is in the developed countries and large emerging economies, is deeply implicated in processes of enclosure and accumulation by dispossession. From colonialism onwards through the structural adjustments of the 1980s and 90s, Third World loans and debts have been instrumental in shaping the economic policies in developing countries conducive to ecological imperialism and ecologically unequal exchange, as discussed above. Peet (2009) traces the substantial influence that the financial sector played in creating the structural adjustment policies, arguing that the structural adjustment policies of the Washington Consensus, through creating export-oriented economies with minimal state spending and private properties rights, maximized the loan capacity of developing countries and ensured the ability of such countries to repay principal and interest. Further, developing country debt itself has encouraged environmental destruction through the drive for intensified exports.

Beyond all of this, financial deregulation, the growth of the international capital market, and the push to diversify of portfolios has created a mammoth source of funding. This has meant that behind virtually every environmentally damaging extractive industry, and even the direct speculation and enclosure of resources, land and water, stands a diverse of array of international financial actors who are as equally responsible as the multinational corporations and corrupt governments involved. (Several NGOs have created website with extensive data collection on the banks and investors behind fossil fuel companies and deforestation. See for example https://fossilfreefunds.org and https://deforestationfreefunds.org.) As long as extractive, environmentally damaging industries remain profitable, the financial sector follows.

Fourth, Marx's other relevant insight was into the extreme fetishism characteristic of interest-

bearing capital; with interest-bearing capital, capital appears to multiply of its own accord, its origination in the appropriation of surplus value is completely obscured. In an era of global ecological crises, the extreme fetishism of globally mobile interest-bearing capital now plays out at international level. Lack of regulation, the distancing of accountability, and opaqueness in the value chain obscure the underlying appropriation and material basis of surplus value. There is no international regulation of financial flows in regards to the environment. While various financial institutions tout their 'greening of finance,' such claims must be taken with a grain of salt. For example, a recent OECD 2019 report on finance and biodiversity loss states that the progress in integrating biodiversity in business and investment decisions remains limited across most corporation, investors, and insurers. Another report by Banktrack, compiled by environmental NGOs, finds that since the Paris Climate Summit, banks, mostly from the Global North, have financed fossil fuels with $1.9 trillion.

Conclusion

At the heart of the global ecological crises today is ecological imperialism, a subjugation of Nature across the Global South that off-shoulders the ecological burdens of production and consumption of wealthier nations while funneling profits and resources for continued economic dominance and unsustainable consumption. Ecological imperialism is a complex and ever-evolving topic which necessitates a deep analysis of the fundamental workings of the global capitalist system. This short essay sought to provide a basic theoretical overview of the salient characteristics of the capitalist world-system that enable and exacerbate ecological imperialism. The world-system itself, with its international division of labor manifesting as international trading patterns originating from colonialism and re-created through neoliberal globalization, is a hierarchy that locks peripheral countries into exporting their natural resources and undermines the environments of emerging economies through rapid

industrialization. Neoliberal economic policies have reinforced the power and dominance of transnational corporations in concrete rules and regulation, cracking open resources and laying bare land for dispossession throughout the Global South while funneling profits overseas. International finance, itself ultimately an accumulation of the surplus value of hundreds of millions of workers globally, coalesces into finance capital, circling the global for highest rates of return and providing the life blood for further extraction of resources and accumulation of dispossession.

Ecological Unequal Exchange

Jan Otto Andersson
Åbo Akademi University, Turku, Finland

Synonyms

Disjunctive ecological exchange; Ecologically unsustainable exchange; Embodied emissions in trade; Net export of ecological footprint; Net transfer of "negative entropy"; Non-equivalent ecological exchange; Physical trade balance

The theory of *ecologically unequal exchange* (EUE) posits that "northern" consumption and capital accumulation, to a large existent, is based on "southern" environmental degradation and extraction. A commonly accepted definition has been formulated by Andrew K. Jorgensen:

> [E]cologically unequal exchange refers to the environmentally damaging withdrawal of energy and other natural resource assets from and the externalization of environmentally damaging production

and disposal activities within less-developed/less-powerful countries. It constitutes the obtainment of natural capital . . . and the usurpation of sink-capacity (waste assimilation properties of ecological systems in a manner enlarging the domestic carrying capacity of more-powerful/more-developed countries). It is therefore focused upon the manner and degree to which less-developed/less-powerful countries tend to fulfill a role in the global system as a tap for the raw materials and sink for the waste products of industrialized (and post-industrial) countries, thereby underwriting the disproportionate production-consumption-accumulation processes of more-developed/more-powerful countries. (Jorgenson 2016a, 335–336)

However, EUE has been measured, appraised, and explained from different perspectives. In this overview we separate three different aspects, which can be designated as follows:

1. Disjunctive ecological exchange
2. Nonequivalent ecological exchange
3. Ecologically unsustainable exchange

Disjunctive exchange relates to the effects of trade from the point of view of economic development. This concept is related to the so-called resource curse. Does a country or region that specializes in the exports of natural resources tend to suffer from less growth or distorted economic development in comparison to a country that specializes in the exports of manufactured goods and services? The world-system analysis separates between core, semi-peripheral, and peripheral countries. Disjunctive exchange is an inherent characteristic of the system – both creating and maintaining the hierarchical international relations.

Nonequivalent exchange relates to various ways to measure the ecological contents of exports and imports. Is a country (or region) a net importer or exporter of an environmentally relevant aggregate, such as energy, material mass, land use, or pollution?

Exchange can be unsustainable in the sense that it hurts the ecological sustainability locally or nationally. Trade can also be ecologically unsustainable for both partners involved and even threaten the global social and ecological system.

Disjunctive Ecological Exchange

Stephen G. Bunker's book from 1985 *Underdeveloping the Amazon: Extraction, Unequal Exchange, and the Failure of the Modern State* contains a chapter "Toward a Theory of Ecologically Unequal Exchange." The book and a related article published in 1984 (Bunker 1984) are seen as the first effort to establish a concept and theory of EUE. Bunker argues that "when natural resources are extracted from one regional ecosystem to be transformed and consumed in another, the resource-exporting region loses values that occur in its physical environment; these losses eventually decelerate the extractive region's economy" (Bunker 1985, 22). Paradoxically then, the efforts to develop the Amazon Basin has resulted in its underdevelopment.

Bunker's theory combines a concept of nonequivalent exchange with a version of disjunctive exchange. The nonequivalent exchange between an "extractive" and a "productive" economy leads to underdevelopment in one and development in the other. Since there are historical examples of how economies, which have been net exporters of natural resources, still have managed to avoid underdevelopment, it is not evident that being a net exporter of natural resources necessarily involves a disjunctive exchange.

Bunker and Andrew J. Jorgensen have continually deepened and broadened the world-system-inspired studies of ecologically unequal exchange. In an overview article, Jorgensen argues that "ecologically unequal exchange theory helps to address key limitations of both the treadmill of production and ecological modernization approaches, most notably their lack of attention paid to how structural and unequal relationships between nations influence environment and development." He emphasizes the need for greater integration between ecologically unequal exchange theory and environment and development perspectives (Jorgenson 2016b, 227).

Already the mercantilists distinguished between "good" and "bad" trade. "Good" was such exchange which brought into the country natural resources, especially gold, and which made foreigners buy goods incorporating a lot of

labor, especially manufactured goods. James Steuart summarized this mercantilist idea as follows:

> In all trade two things are to be considered in the commodity sold. The first is the matter, the second is the labour employed to render this matter useful. The matter exported from a country is what the country loses; the price of labour exported is what it gains. (Cited in Andersson 1976, 25)

A country was thought to develop its "arts" and industry by exporting labor- and skill-intensive goods and services and to maintain scarce natural resources by importing "matter," goods only slightly processed. According to the mercantilists, foreign trade was a means by which one country could strengthen its economic growth and political power at the expense of its rivals, and the most important aspect of the trade was the type of commodities imported and exported.

Since the mercantilists, several critics of the classical free-trade position have adopted a similar view. One needs only mention Friedrich List, "the apostle of economic nationalism," who prescribed protection of the nascent manufacturing industries and cheap imports of food and raw materials. Other variants of disjunctive exchange are Johan Galtung's "asymmetric exchange," where "trade, or interaction in general, is symmetric, or on equal terms, if and only if the total inter- and intra-actor effects that accrue to the parties are equal." Among these effects, Galtung counted exports of manufactured goods or raw materials, pollution, depletion, and exploitation (Galtung 1971, 38).

"The Resource Curse" and the "Dutch Disease"

The concept of resource curse relates to the finding that countries rich in minerals and other natural resources counterintuitively tend to have a poor or distorted economic growth. Several studies have evaluated the effects of resource wealth on a wide range of economic outcomes and offered explanations for why a resource curse is likely to occur. Factors that often have been found to influence the risks are how the income is spent,

the kind of government and institutions, the sort of resource, and the early or late industrialization (Venables 2016). Especially, if the resources – such as guano, oil, or diamonds – can be appropriated by those who wield political power, the risk for coup d'états and wars is high.

The Economist magazine coined the term "Dutch disease" to describe what the Netherlands experienced during the 1970s. The Dutch discovered a huge natural gas field in 1959. Due to the sharp increase in incomes from the export of gas, the local currency started to appreciate. The higher value of the guilder harmed the ability to export other products and favored imports of goods competing with the local production. Thus, large parts of the Dutch economy were hurt. There are several other well-known instances of the disease, often related to the exports of oil: Indonesia at the end of the 1970s, Nigeria in the 1990s, and Russia, Azerbaijan, and Venezuela in the 2000s. Historically, gold has had similar effects on the economy: Spain and Portugal in the sixteenth century and Australia in the mid-nineteenth century. A recent example of the Dutch disease and the resource curse is Suriname:

> Throughout the twentieth century Suriname's economy was dominated by bauxite, but the industry declined as Suriname neared the next century. Gold and then oil became the dynamics for the economy in the early twenty-first century. On the back of gold, oil, and at decreasing levels, alumina exports, the economy expanded from under $1 billion in 2000 to a little over $5 billion in 2014...
>
> As long as the commodity boom ran, revenues flowed into state coffers and bloated employee rolls could be maintained. Commodity largesse also meant that inefficiencies could continue without consequences. Moreover, outside advice was ignored. As the 2016 IMF Article IV report ... observed: "During the boom there was no institutional arrangement to save resources for future prices corrections, and implementation of IMF advice on strengthening the policy framework was limited. Suriname has thus had a much sharper recession, steeper exchange rate depreciation, and larger rise in inflation and government debt than most commodity exporters." (MacDonald 2017)

A somewhat unexpected example of disjunctive exchange, which can be interpreted as ecological, was that between England and Portugal in the eighteenth century. The Methuen Treaty of

1703 has gained a special historical significance, since the exchange resulting from this treaty constituted the empirical counterpart to David Ricardo's famous example of how trade in accordance with the principle of comparative costs benefits both parties. The substance of the treaty consisted in permitting the entry of English woollen manufactures into Portugal, whereas Portugal's wines were to be admitted into England at much lower tariffs than wine from France and other countries.

In Portugal the imports of English woollens quadrupled, eliminating the entire domestic production. At the same time the exports of wine grew rapidly, eliminating both the English domestic production and imports from France. Portugal lost the most dynamic sector at the time and strengthened the position of its landowning, feudal class. But England's concentration on the cloth industry was essential for the process of industrialization. England got "matter," wines, and Brazilian gold, in exchange for "arts," "labor," and cloth (Sideri 1970, 42–49).

However, the fact that some countries, which have been heavily dependent on exports of "matter," still managed to avoid the resource curse shows that the mercantilist position cannot be generalized. Three examples of countries that have strengthened their belonging to the "North," despite their dependence on material exports, are Finland, Norway, and Australia.

Finland's economy used to be dominated by exports of forestry goods – tar, sawmill products, pulp, and paper. However, it managed to create a coherent forest industrial block and to diversify into several high-tech branches. Norway has been able to create the world's largest sovereign wealth fund saving the proceeds from its oil exports. The fund has been used both to stabilize the economy and to provide a considerable income stream for the future.

Australia – named "the wonder down under" by *The Economist (2018)* – has been growing more years in a row without a recession than any other OECD country. A crucial reason for this must be ascribed to the prolonged and fast economic growth in China – the main market for Australian exports. The most important export item has been iron ore, Australia's share of global exports being almost 60%. It has also been a major exporter of wheat, beef, wool, gold, aluminum, natural gas, and coal. Despite this overwhelming dependence on extractive activities, the Australian economy has managed to avoid the resource curse. Whether it has been a victim of disjunctive ecological exchange in relation to China can be discussed, but in comparison to other OECD- or raw material-exporting countries, its development has been outstanding.

Nonequivalent Exchange

Associated with the labor theory of value, the concept of unequal exchange of labor, or nonequivalent exchange, has lingered as a minor theme in the history of economic thought. We find the idea in the works of Smith, Ricardo, and Marx and in a long row of Marxian economic studies. The concept gained a large audience thanks to Arghiri Emmanuel's book *L'échange inégal.* (Emmanuel 1969) (For a historical overview, see Andersson 1976, 38–42.)

In a recent work *Imperialism in the Twenty-First Century*, John Smith (2016) further elaborates a Marxist theory of unequal exchange of labor. He introduces the theme by looking at the production and distribution of three items: the T-shirt, the cup of coffee, and the iPhone. By outsourcing production to low-wage countries, rich countries manage to import considerably more labor than they export.

Instead of using labor as the meter of nonequivalence, ecological economists have used several environmental measures to describe and calculate an ecological unequal exchange: raw material equivalents, ecological backpack, ecological footprint, water footprint, emergy/dollar, embodied emissions, and displaced environmental loads.

Material Flow Accounts

Since trade statistics comprise both value and weight, a relatively straightforward nonequivalence measure is in terms of material

mass. How much does a country's imports weigh in relation to its exports? Such overall material flow statistics has been calculated on a regular basis by national and international statistical offices, such as Eurostat. Measures on direct material inputs (DMI), domestic material consumption (DMC), and physical trade balance (PTB) are available for many countries. However, import and export flows can be expressed in terms of raw material equivalents (RME). The direct imports and exports are converted into raw materials needed to produce the imported and exported products. These estimates can include immaterial items such as electricity and services:

> The EU uses Economy-wide material flow accounts (EW-MFA) to provide an aggregate overview, in thousand tonnes per year, of the material flows into and out of an economy. EW-MFA cover solid, gaseous, and liquid materials, except for bulk flows of water and air. The general purpose of EW-MFA is to describe the interaction of the domestic economy with the natural environment and the rest of the world economy in terms of flows of materials.
>
> While the EU trade balance in monetary values is more or less even, its physical trade balance is clearly asymmetric. The EU imports about three times more goods by weight from the rest of the world than it exports. Quantitatively the physical imports into the EU are dominated by fossil fuels and other raw products which typically have low values per kilogram. On the other hand, the EU exports high-value goods such as machinery and transport equipment. (Eurostat 2018)

Eurostat material flow accounts comprise actual weight of direct material inputs (DMI), as well as the direct and indirect raw material requirements of the traded goods and services, raw material equivalents (RME). In 2016 the actual weight of imported materials was slightly more than 3 tons per capita; in terms of RME, it was over 8 tons. The actual weight of EU exports was more than 1 ton, and in RME terms it was over 5 tons.

Furthermore, total material requirement (TMR) accounts have been used to include the unused extraction – e.g., unused overburden and waste rock in mining and logging residues left to the forests. Methodologically total material flows can be considered as an extension of the raw material equivalent flows, even if the flows are about twice as high as the raw material equivalent flows. The "ecological backpack" concept is defined as TMR, but is mostly used to calculate the weight of individual consumption habits.

In a study of the material flows for Finland for 2015, the direct material imports were 10 tons per capita, RME 32 tons, and TMR 72 tons, while the direct exports 9 tons per capita, RME 34 tons, and TMR 72 tons. Measured in these ways, the Finnish trade seems to be rather well balanced ecologically. The massive imports of fossil fuels were neutralized by the exports of wood-based items (Mäenpää et al. 2017). However, with particular countries, Finnish trade was highly unequal, since the imports of fossil fuels came overwhelmingly from Russia, whereas exports of forest industry products went mainly to other EU countries, the USA, and China.

There are several problems related to using weight as an indicator of unequal exchange. The environmental and social impacts are quite different depending on the kind of material. There are low-volume flows (e.g., toxic metals) with high impacts and high-volume flows (sand and gravel) with low impacts. Many difficult issues related to the material flow analysis are discussed in detail by one of its central researchers (Fischer-Kowalski 1998, 1999).

MFA has been used to assess whether an ecologically unequal exchange characterizes trade between the northern core and the southern periphery. Simon Jit Singh and Nina Eisenmenger cover this discussion and find that "MFA appears to be a useful tool to operationalise the notions of 'unequal trade' and 'accumulation' within the world system perspective." They stress that accounting for flows of materials across regions is not sufficient unless interpreted within the politico-economic context. "The significance of MFA can become more apparent if it serves as a tool not only for 'social metabolism' but also for the 'world system perspective'" (Jit Singh and Eisenmenger 2010, 78).

Land Use and Ecological Footprint Accounting

Land use is another indicator that has been central in measuring ecologically nonequivalent

exchange. Several studies show how the extension of land use for the production of different primary products – such as soya, cocoa, palm oil, shrimps, and cattle – has influenced the environment, reduced the space for local lifestyles, and hurt the wild life. Large flows of biodiversity-threat-implicated products from Africa, Asia, and Latin America come into North America and Western Europe. How trade has been an important driver of deforestation in the South has extensively been made known by Jorgensen (2010).

Land use is related to the concept of biocapacity, the biological capacity of an ecosystem to produce renewable useful natural resources and to filter or absorb other materials, such as carbon dioxide. Biocapacity is measured in terms of global hectares. A global hectare is an adjusted unit that represents the average biological productivity of all productive hectares on Earth in a given year. It is possible to calculate the global hectares that it takes to satisfy the yearly consumption of a population.

A comprehensive way to measure biocapacity and the land and water area required for the consumption of a population is the ecological footprint (EF). The ecological footprint accounting (EFA) was established by Wackernagel and Rees (1996) in 1996.

The EFA has been further elaborated by the *Global Footprint Network*. The network continually publishes the ecological footprints of practically all countries, as well as for the Earth as a whole. "[T]he simplest way to define ecological footprint would be to call it the impact of human activities measured in terms of the area of biologically productive land and water required to produce the goods consumed and to assimilate the wastes generated. . .Ecological Footprint accounting measures the *demand* on and *supply* of nature" (Global Footprint Network 2018).

The EFA shows a close connection between the ecological footprint and the GDP per capita. It also shows that there are many rich (but also poor) countries that have an "ecological deficit," that is, they consume more biocapacity than is available inside their own territories. One can therefore suggest that these deficits are reduced thanks to imports of biocapacity – maybe from poor

countries that have no other option than to export part of their biocapacity. This would be a clear instance of an ecologically unequal exchange. This possibility was pointed out already by Wackernagel and Rees and has been further elaborated and measured by several researchers (Torregrosa-López et al. 2007).

James Rice, describing ecologically unequal exchange as disproportionate appropriation of environmental space measured in terms of ecological footprints, found, based on data for 137 countries, that low- and middle-income countries tend to be victims of EUE. Although they themselves consume less environmental space than the high-income countries, they still are net exporters of biocapacity. "The results contradict neoclassical economic thought. We find trade shapes uneven utilization of global environmental space by constraining consumption in low and lower middle-income countries" (Rice 2007, 1369).

A study using embodied ecological footprints to assess whether we can find nonequivalent patterns in trade between core (OECD), semi-peripheral (BRIICS), and developing countries was made by Dam et al. (2017) at the Jena University. There empirical results show a pattern that confirms the following five hypotheses:

1. Net export of ecological footprint increases with higher relative abundance of the environment (biocapacity per capita).
2. Net export of ecological footprint increases with less stringent environmental policy.
3. Rich countries are more likely to become net importers of ecological footprint.
4. Net export of ecological footprint decreases with the greener production and increases with the greener consumption.
5. The higher the biocapacity per capita and the less stringent the environmental policy, the higher is the net FDI inflow in case of EF net exporting countries.

These, and similar results from other studies, answer the question put by Daniel Moran et al. who, using EF as a pivotal indicator, doubted that there existed a systematic ecologically unequal exchange between low-income developing

nations and wealthy developed nations. Instead they asserted that "high income nations are mostly exporters, not importers, of biophysical resources" (Moran et al. 2013, 185).

Dorninger and Hornborg (2015) took issue with the method used by Moran et al., and although skeptical to environmentally extended multiregional input-output analyses, they maintained that current research on EEMRIO-based flows of embodied materials, energy, land, and labor in international trade confirms the theory of ecologically unequal exchange.

An interesting study combining ecological footprint accounting with accounting in terms of labor was made by Jit Sing and Ramanujam. They focused on the Nicobar Islands in the Bay of Bengal from 1880 until 2000. Since the islands represent a small area that has been specialized in the same product – coconuts and copra – all the time, it was possible to make rather exact calculations of embodied labor, land, and energy in the exports of copra and the imports of cloth and rice. During the British rule, the Nicobar Islands were disadvantaged in terms of land and megajoule. Under independent India, the exchange value of copra in terms of rice improved considerably, thanks to a copra price support scheme and to the supply of rice at subsidized rates. In terms of embodied labor, the Nicobarese were always a big gainer. In 2000, for 1 ton of rice, the islands paid 51 man-hours and received 758; for 1 ton of cotton textiles, they paid 1087 man-hours, receiving as much as 16,422. The authors contend that it would be difficult to view the Nicobarese as victims of this exchange. Coconuts were in abundance and land was not a limiting factor (Jit Sing and Ramanujam 2010, 35).

Energy, Emergy, and Exergy

Efforts to use energy as a descriptive or normative measure of economic value have a long, although hidden away history (Martinez-Alier 1987). As a measure of value transfers between nations, the term emergy – "embodied energy" or "energy memory" – was developed by Howard T. Odum. He defined emergy as a measure of energy used in the past. "The unit of emergy (past available

energy use) is emjoule, as distinguished from joules used for available energy remaining now." Odum calculated differences in the emergy/dollar ratios between different parts of the world and concluded that the periphery was being underpaid for the emergy content of its natural resources (Odum 1995).

Torbjörn Rydberg has continued Odum's effort to calculate emergy flows in order to define unfair or unequal exchange. He sees emergy as "an environmental accounting tool that can compare work of the human economy with "work" of the environment in terms of a common metric. Its theoretical and scientific base is in thermodynamics and systems ecology" (Rydberg 2010, 49). Rydberg calculated the solar emergy flows for 1 US dollar in international trade for Sweden, Nicaragua, and Switzerland. Whereas Nicaraguan exports had an emergy/dollar quotient of 16×10^{12} solar emjoules, the corresponding figure for Sweden was 1.4×10^{12} and for Switzerland 0.7×10^{12} sej/USD:

> This means that every dollar that circulates between these two countries transfers 11 times more real wealth to Sweden from Nicaragua than what is transferred in the opposite direction... Trade between Nicaragua and Switzerland favors Switzerland with approximately 22 times more real wealth. (ibid. 59)

According to Rydberg, trade that maximizes profits in terms of money is not geared to fairness. When trade is not equal in emergy terms, it maintains inequality in the world. "If our prosperity and sustainability are dependent upon draining other nations and regions of their resources and the production capacity of their ecosystems, then our kind of wealth creation and 'sustainability' must be considered fatally flawed" (ibid. 60).

The book, *The Power of the Machine*, written by Alf Hornborg, contains a chapter called "The Thermodynamics of Imperialism: Toward an Ecological Theory of Unequal Exchange." Hornborg objects to Odum's use of emergy as a measure of unequal exchange. "The notion that the dissipated energy is somehow still there in the object only confuses things" (Hornborg 2001, 41). The correction Hornborg makes changes the perspective. He prefers the concept of exergy – the part of energy that is available for mechanical work.

Exergy is a standard concept of thermodynamics and relates to entropy. "Up to the point where the final product is sold, there is a negative correlation between the price and the proportion of the original exergy that is left in a set of processed substances. The more of the original exergy that has been dissipated, the higher the price" (ibid. 42).

Hornborg links exergy to Ilya Prigogine's concept "dissipative structures" – "systems that stay far from thermodynamic equilibrium by continually drawing in exergy from the outside and exporting entropy, or disorder, they produce in the process" (ibid. 42). Energy is the foundation of the industrial system, and Hornborg sees the appropriation of productive potential trough unequal exchange as a requisite for continued capital accumulation. His conception of imperialism reminds of that of Rosa Luxemburg. Capitalism – in Hornborg's view industrialism – is incapable of maintaining itself without a continuous exploitation of the periphery:

> Calling trade exploitative . . . is more than a value judgement. It is an inference based on the Second Law of Thermodynamics. If production is a dissipative process, and a prerequisite for industrial production is the exchange of finished products for raw materials and fuels, then it follows that industrialism implies a *social* transfer of entropy. . . The net transfer of "negative entropy" to industrial centers is the bases for techno-economic "growth" and "development". . . The ecological and socioeconomic impoverishment of the periphery are two sides of the same coin, for both nature and human labor are underpaid sources of high-quality energy for the industrial "technomass." (ibid. 11)

Chen and Chen introduced the concept "global embodied exergy density" (GEED) as the "ratio of the global cosmic exergy consumption to the surface area of the earth." They calculated "the embodied exergy ecological footprint (EEEF) for China and found that EEEF can serve as a modified indicator of EF reflecting the ecological overshoot of the general ecological system. Chen and Chen argued for their choice of indicator by referring to a notional limit to human exergy consumption:

> Since the anthropogenic exergy use is in the order-of-magnitude of 1% of the global exergy consumption of the material earth and can be dominant for some terrestrial processes, the budget of cosmic energy can be regarded as a necessary indicator for ecological evaluation as it raises a unified

thermodynamic metric for objectively evaluating resource depletion, environment degradation and ecological overshoot and provides an essential measure of "use scarcity" of the real power driving the earth system. (Chen and Chen 2007, 373)

Pollution and Embodied Emissions in Trade

Economic activity causes different pollutants. From an environmental point of view, a country can gain from trade if it is able to import more goods that embody local pollutants than it exports. In an article that thoroughly discusses different measures of EUE, Roldan Muradian, Martin O'Connor, and Joan Martinez-Alier preferred to use embodied emissions to define "environmental terms of trade" (ETT) and "balance of embodied emissions in trade" (BEET):

> [I]f consumption is assumed as the key economic force 'steering' the environmental transformation, the assessment of the environmental performance of a national economy requires us to make the distinction between environmental costs borne and caused by a nation, and therefore, to expand the scale of analysis beyond the national political frontiers. Inter-country flows of goods and services (trade) and transboundary flows of pollutants are the two main ways by which international links can be established between local consumption and foreign environmental degradation, or vice versa. (Muradian et al. 2002, 52)

The authors define "displaced environmental loads" as environmental pressures, such as pollution, land transformation, and resource depletion, which are linked to international trade. They calculated the embodied emissions in trade for different pollutants and presented the balance of embodied emissions in trade, as well as the environmental terms of trade for different regions of the world. The results did not unambiguously confirm that the periphery is subjected to an ecological unequal exchange, since even though Western Europe and Japan had a positive balance and improving ETT in relation to the periphery, the opposite was the case for the USA.

However, the authors found an increase in the embodied emissions over time that indicated an increasing environmental displacement in the industrialized world. Therefore, the

environmental Kuznets curve did not necessarily reveal a decoupling between economic growth and environmental degradation, but rather was the result of an increasing transfer of environmental loads abroad as countries become richer.

Christina Prell examined the distribution of pollution and wealth over a 20-year period. She studied pollution produced inside a country as well as pollution triggered along global supply chains. The pollutant she chose was sulfur dioxide. Core countries consume more pollution-intensive goods that are produced around the world and trigger pollution along global supply chains. Furthermore, they also generate high amounts of pollution within their own countries. "Said differently, core countries may indeed disadvantage others though patterns of trade, but they are also experiencing environmental costs at home as well" (Prell 2016, 119).

Kanemoto et al. (2014) found that the Kyoto Protocol targets were undermined since countries – mostly developed – that managed to holding down their emissions often increased their imports of embodied CO_2 from less-developed countries. The study concluded that "if regulatory policies do not account for embodied imports, global emissions are likely to rise even if developed country emitters enforce strong national emission targets" (Kanemoto et al. 2014, 58).

An elaborate study of how trade between China and the EU also involves embodied emissions has been made by Tian et al. (2017). It covered two types of footprints: environmental and resource footprints. The environmental footprints included seven different emissions, which cover global warming, acidification, and tropospheric ozone formation. Four resource footprints were also taken into account: energy, land, materials, and water. China's exports to EU countries embodied much higher quantities of environmentally sensitive goods than its imports. This disadvantage for China took place despite the fact that China's environmental and resource footprints per capita were smaller than EU's (Tian et al. 2017, 329). Similar results of pollutive trade between "North" and "South" – including China – were shown by Shuijun Peng, Wencheng Zhang, and Chuawang Sun:

14%–30% of air pollutant emissions in the South were caused by consumption in the North in 2007. There is a large 'pollution deficit' between the North and South, which significantly increased during the period 1995–2007, that favors the theory of ecologically unequal exchange. (Peng et al. 2016, 147)

In a thorough study of the environmental load of Dutch private consumption that took place abroad, the authors found rather remarkable results:

A large proportion of the environmental load of Dutch private consumption takes place abroad. For greenhouse gases this amounts to 49%; for pesticide use to 56%; for summer smog to 61%; for eutrophication to 64%; for acidification to 74%; and, for land use to 84%. (Nijdam et al. 2005, 167)

Most land use was found to take place in developing countries, whereas most emissions occurred in industrialized countries.

Water Footprint

Although water is a critical resource for the existence of life, and access to fresh water is becoming scarcer, embodied water in trade has seldom been an object for investigation. An exception is a study by Jared B. Fitzgerald and Daniel Auerbach on water footprints and unequal exchange. The authors define the water footprint of production as "the amount of local water resources that are used to produce goods and services within a country." The water footprint allows researchers to examine water used in the entire production process by taking into account virtual embodied water as well as the origin of water usage.

Fitzgerald and Auerbach found that a country's position in the global economy mattered. Lower-income countries are not able to displace their water footprint to the same extent as high-income countries. They, however, did not want to interpret the results as exploitation, or as a zero-sum game:

Instead of direct exploitation, our results elucidate disparities within a world economy where there is inequality in trade relationships in that high-income countries are able to benefit their water resources through trade with other high-income countries. Lower-income countries, on the other hand, have disadvantageous positions in the global economy

which do not allow them to displace the burdens on their water resources to the same extent. This demonstrates, we believe, a nuance to the ecologically unequal exchange literature. (Fitzgerald and Auerbach 2016, 13)

Ecologically Unsustainable Exchange

Ecological nonequivalent exchange, however measured, is inherent in any economic system. Areas with plenty of natural resources do export more materials, energy, or footprints than they import from densely populated urban localities. Nonequivalence does not necessarily imply that a country or region is a "victim" of unequal exchange even though it is a net exporter of natural resources. Actually, it can quite often be a net importer in terms of labor time.

Even if a region or country is the victim of a disjunctive ecological exchange, its economic development being weak or lop-sided, it can still be ecologically sustainable. It may even be the case that a country, whose economic growth is fast, runs a greater risk of being a victim of pollution and unsustainable extraction. Originally "development" referred to investments making land more valuable for humans, i.e., projects that increased the value of property. This generally implied economic growth, but at the same time destruction of existing ecosystems. From an ecological point of view, disjunctive exchange might hurt the fast-growing country more than the slow-growing.

EUE theory should concentrate on whether trade is ecologically sustainable or not. In order to do that, a clear definition of ecological sustainability is needed. A useful definition is provided by the Royal Institute of Technology in Stockholm:

> Ecological sustainability includes everything that is connected with the Earth's ecosystems. Amongst other things, this includes the stability of climate systems, the quality of air, land and water, land use and soil erosion, biodiversity (diversity of both species and habitats), and ecosystem services (e.g. pollination and photosynthesis). When it comes to the ecological systems, it is often possible to give quite a good definition of sustainability. Production of goods and services must not compromise the carrying capacity of ecosystems, i.e. nature has to be able to regenerate utilised resources. (KTH 2018)

Ecological sustainability is not necessarily linked to the territory of a nation. Mostly it refers to a certain locality, a region, a civilization, and even to the globe as a whole. However, since the political power is concentrated to the state level, and the responsibility for the preservation of sustainability lies with the national governments, it is meaningful to ponder whether a country is ecologically sustainable or not. If a country – or group of countries – can "import" sustainability at the cost of sustainability in other parts of the world, we can design this type of ecologically unequal exchange as unsustainable. This is evident if we live in a "full world," which is threatened by different ecological disasters (Andersson and Lindroth 2001; Andersson 2010).

How do our different measures fit the need to indicate whether ecologically nonequivalent exchange also can be characterized as unsustainable exchange?

Material flow accounts are problematic indicators at the national level, although they can have serious effects locally. However, if a country is heavily dependent on the export of a resource – say oil and gas, iron ore, or forest products – the extraction of which exceeds the rate of new discoveries or regeneration, it would be appropriate to characterize the situation as unsustainable. The total weight of material exports would be a too vague indicator, since we do not have a measure of the limits to how much weight that could be used without damaging the sustainability.

Pollution would fit the purpose better. Some pollutants have a clear territorial effect; some of them crossing national borders. Some – such as carbon dioxide and freons – affect the globe as a whole, although different parts in different and uncertain ways. Trade that involves local pollutants could be used to assess whether the trade is unequal and unsustainable, but to assign the global pollutants to trade of certain countries is more problematic. It is easier to show that, e.g., Chinese exports do cause pollution that seriously damages the land, water, and air of the country, than to assign the responsibility for carbon emissions between two trading countries.

How the overuse of carbon emissions could be allocated to the actors has been discussed by Jiun-

E

Jiun Ferng. He combines the benefit and the ecological deficit principles. The benefit principle assigns the responsibility of pollutant emissions to those consuming the goods and services that cause the emissions, not to the direct emitters. The ecological deficit principle assigns responsibility to a country if its emissions exceed its capacity to assimilate them. How much weight should be given to each of the two principles?

> On the basis of the following three reasons, this paper suggests that a country is responsible for the CO2 emissions associated with its imported production inputs. First, from the perspective of the adopted demand driven criterion, a country's demand for imported production inputs is a main force that drives the origin countries of its imports to produce these products. Second, the imported inputs help to realize the domestic production of the importing country, and thus contribute indirectly to its income generation from domestic production. Third, in the context of global warming, incorporating this indirect benefit might help to discourage carbon leakage. (Ferng 2003, 128–129)

Ferng also estimated the amount of carbon "over emissions" of a country by subtracting the net amount of carbon sequestered by local ecosystems from the emissions calculated according to the benefit principle. Thus, a country can "export" sustainability to the world by improving its capacity to absorb carbon emissions.

Of the measures used to identify EUE, the ecological footprint fits an assessment of sustainability best. EF accounting comprises a conception of a limited capacity of the Earth to transform solar energy into biomass. It covers all renewable natural resources and the most important pollutant: carbon dioxide. A high ecological footprint in relation to the available biocapacity indicates that an ecosystem is unsustainable – unless it is able to "import" enough sustainability. Natural capital is depleted or degraded when there is an "ecological deficit" or "overshooting" in terms of ecological footprints. Strong ecological sustainability implies that nature's capacity to reproduce biomass on a continuous basis is not contracting. Material flow accounting, overall pollution, and embodied energy can be complementary to EF accounting, but their connection to sustainability is vaguer. As Siche et al. (2010) have shown,

reckoning in terms of emergy can come close to the EF indicator, but it is more difficult to estimate the limits to emergy use.

A problem of using EF accounting in order to assess the sustainability of a certain country is the fact that half, or even more, of the calculated footprints is due to the need to absorb the carbon emissions by forestation. If this need for forest land is disregarded, the world, and most countries, would seem to be sustainable. The damage caused by CO_2 emissions affects the whole globe and only partly the emitting country and the country importing the goods causing the emitted carbon. EF, therefore, is only partly an indicator of how EUE affects the sustainability of the trading nations in question.

Using EF measures, it is possible to roughly divide the countries into six different groups, depending on whether they have an ecological deficit or not and whether they are net exporters or importers of biocapacity.

1. Countries with an ecological surplus that exceeds the net exports of biomass and sink capacity. Their ecological capital is intact or increasing. Australia, Brazil, and Russia belong to this group.
2. Countries with an ecological surplus smaller than their net exports. This implies a loss of ecological capital, in particular if the carbon footprint is small in relation to the deficit. Angola and Honduras are probably in this category. Indonesia and Costa Rica used to have a small reserve, but now belong to group 3.
3. Countries with an ecological deficit that nonetheless are net exporters. Their ecological capital is being damaged and reduced. Several African countries, such as Algeria, Kenya, Ghana, and South Africa, are in this group. So are most of the former soviet republics in Central Asia and Caucasus.
4. Countries with an ecological deficit larger than their net imports. Their natural capital decreases although they gain from a non-equivalent exchange of EF. Examples are the USA, Germany, China, India, and Egypt.
5. Countries with an ecological deficit smaller than their net imports. Their ecological capital

is preserved thanks to an unequal exchange in terms of biomass and sink capacity. Ireland with a small deficit (and a large carbon-related footprint) is a possible example.

6. Countries with an ecological surplus and yet are net importers in terms of EF. They are able to preserve and even increase their sustainability both by a moderate use of their biocapacity and by enjoying imported capacity. Sweden and Finland, with large reserves, very likely belong to this group.

The world and most countries do have ecological deficits. The greatest number belongs to the groups 3 and 4. Of the large regions, Oceania and probably South America belong to group 1. Africa is in group 3, with Asia, Europe, and North America in group 4. If the carbon footprint is disregarded, Asia is the only continental region that still has an ecological deficit.

Countries in group 2 and 3 can be said to be victims of a "unilateral unsustainable exchange," which damages their ecological sustainability. If they trade with countries in group 4, which, even though they are net importers, do not manage to reproduce their ecological capital, we may call the situation "mutually unsustainable exchange." It implies that the stronger nations are not strong enough to maintain a unilaterally unsustainable exchange with the weaker nations.

Since ecological unsustainable exchange is not easily observable and most countries eagerly participate in a game of positional competition – economically, militarily, culturally, and ideologically – the risk for ecological overshoots is imminent. This risk is gravely reinforced by the capitalist accumulation imperative and by the status-driven consumerism spreading all over the world.

Free trade and free movement of capital imply that any agent rich enough may decide – directly or indirectly – how global biocapacity is used. The losers can be the less rich, the poor, other living beings, or future generations. Røpke (1994) and Gale (2000) argued from an ecological and justice point of view that there was a case for limitations on trade. International trade and anonymous multinational capital blur the responsibility for the ecological effects of production and consumption.

The more overexploited the ecosystems become, the more likely nonequivalent ecological exchange will be transformed into an unsustainable exchange. In a full world, the consequences of sharp income inequalities are fatal both socially and ecologically. The rampant commodification of all resources emphasizes the inequalities and spurs international rivalry as well as individual consumerism. The environmental space for the poor deteriorates, at the same time as the rich can buy at least temporary release from global ecosystems destruction. International trade in a full and unequal world is something very different from the story told by standard economics.

Definition

Arghiri Emmanuel was a Greek-French Marxian economist who came to prominence in the 1960s and 1970s for his theory of 'unequal exchange'.

Arghiri Emmanuel was a Greek-French Marxian economist who came to prominence in the 1960s and 1970s for his theory of 'unequal exchange'. In the 1930s, Emmanuel received a degree from the high school of economics of the University of Athens and another from the faculty of law. In 1942, he volunteered for the Greek liberation forces in the Middle East, and he was active in the leftwing uprising of the Middle Eastern forces against the government-in-exile in Cairo in April 1944. Emmanuel would later find his way to the Belgian Congo, where his family was involved in the textile industry. His experiences there provided a microcosm of the capitalist world, revealing an economy with certain characteristics which inhibited investments in the downward phase of the business cycle, precisely when they would be needed.

In the 1970s Arghiri Emmanuel reformulated Marx's (1967) contribution to the transformation of value into prices of production as a means of explaining why the terms of trade for developing countries are consistently unfavourable. He coined the term 'unequal exchange' in his theoretical exposition of the trade relationship that existed between the 'core' and the 'periphery' (1972). In particular, this provides an explanation of the growing inequalities that have been observed in the terms of trade between developing countries and the advanced industrialised economies. In recognising the possibility that the rate of profit is to be equalised on the world scale, Emmanuel also understands that there are huge differences in both wages and rates of exploitation between advanced and developing countries. Because of the international mobility of capital, substantial gaps in profits have seemingly been eliminated. Accordingly, Emmanuel claims that wages 'can vary enormously in space but very little in time' (1972: 120). For him, wage differentials between rich and poor countries explain why it is that commodities produced in the Third World are so cheap in comparison with those produced in the West. This, he argues, is a primary reason for the wide and growing gap in economic development between the two regions. In this regard unequal exchange acts as the basis for a process of unequal development on two separate fronts. First, capital is attracted to demand, so that the high incomes generated by unequal exchange attract further investment, and start a cumulative process of development. Second, high wages lead to the use of capital-intensive methods of production, which raise productivity and promote development. Emmanuel explains:

> Even if we agree that unequal exchange is only one of the mechanisms whereby value is transferred from one group of countries to another, and that its direct effects account for only a part of the difference in standards of living, I think it is possible to state that unequal exchange is the elementary transfer mechanism and that, as such, it enables the advanced countries to begin and regularly give new emphasis to that unevenness of development

that sets in motion all the other mechanisms of exploitation and fully explains the way that wealth is distributed. (1972: 265)

Continued prosperity in rich countries increases the speed of their overall economic development. This, according to Emmanuel, allows for additional raises in wages, while the narrowness of the internal market of poorer countries means that accumulation is retarded, allowing for unemployment increases and decline in wages. As this gap widens, the consequences of unequal exchange grow dire for those underdeveloped areas. Most importantly, Emmanuel attacks any notion of international working-class solidarity, claiming that any class struggle must be understood within the conflict between rich and poor countries and the central divide in world capitalism. He identifies workers in the advanced countries as the chief beneficiaries of unequal exchange and as no longer having a common interest with those in developing areas, whose continued exploitation provides for their high standard of living. Such loyalty to nation, according to Emmanuel, transcends class interests, and 'national integration has been made possible in the big industrial countries at the expense of the international disintegration of the proletariat'; he goes on to suggest that in the coming global revolution, workers in the West are likely to be on the wrong side (1972: 339–340).

At its core, Emmanuel's contribution can be viewed as a rejection of Ricardo's theory of comparative costs and international division of labour because of its assumption that capital was immobile and wages could be equalised in a full-employment economy. According to Emmanuel, the rate of profit was equalised because of the mobility of capital, thus contributing to Marx's Labour Theory of Value in its understanding that wages may not always be determined by biological factors, but must recognise the impact of sociological and factors as well. For example, Emmanuel highlights trade unionism as an essential factor in determining higher wages in developed countries. Consequentially, in developing countries the product of their labour will have lower value in international trade in comparison to the amount of labour in a developed country. Emmanuel contextualises imperialism as a means

of exploitation and inequality rather than political or military domination of one country over another. Such a view underlines an essential feature of imperialism, whether colonial or not, which is that it is mercantile in character. While this is not a direct intention of Emmanuel it does serve as a by-product of his analysis (Bernal 1980; Brewer 2012).

In terms of development, Emmanuel cites unequal exchange as a mechanism that permits relatively high wages in one country without a corresponding relative depression of profits. He argues that the 'organic composition of capital' occurs when capitalists try to minimise costs by substituting means of production for labour when wages are high. By exploiting the means of production produced in low-wage countries they can avoid price increases occurring from high-wage labour (Brewer 2012). The consequence for the highwage country is a reduction of employment in much the same way as that effected by substitution of lower-priced for higher-priced products, and a reduction in the attraction of capital to the production of non-traded goods in high-wage areas. Emmanuel argues that the cause of development and under-development is the transfer of value involved in international trade. There is a transfer of value from underdeveloped countries to developed countries which is sufficiently large to cause development in the recipient countries and underdevelopment in the countries from which value is drained. Simply put, relatively high wages preceded and are the cause of economic development, and low wages cause underdevelopment (Emmanuel 1972: 103). Emmanuel argues that once wage disparities exist, a 'cumulative' process of interaction between economic development and wage levels results. The mechanism which operationalises and sustains this process is unequal exchange, through which value is transferred from the underdeveloped countries, thus retarding accumulation, to the developed countries to fuel accumulation. Herein, 'the impoverishment of one country becomes an increasing function of the enrichment of another . . . super-profit from unequal exchange ensures a faster rate of growth' (Emmanuel 1972: 130).

Through the integration of 'unequal exchange and the theory of international value into the general theory of value' (1972: 266) Emmanuel demonstrates that exploitation of underdeveloped countries by developed countries takes place through international trade. Draining value from underdeveloped countries severely handicaps the ability to accumulate capital and therefore prevents economic development. Developed countries offer high wages, high organic composition of capital, continual technological improvement, and high productivity of labour. In contrast, developing countries have low wages, low organic composition of capital, a lack of technological improvement, and low productivity of labour. Such exploitation of developing countries through international trade was a product of manipulated exchange by mercantilist policies during colonialism before 1840. After 1870 unequal exchange continued under the guise of 'free trade' (Emmanuel 1972: 186–188).

Whereas raw materials and certain agricultural products have to be sought where they can be found, Emmanuel suggests that the movement of capital is not an increasing but a decreasing function of difference in incomes. Because of the limits to import-substituting industrialisation the advanced countries are too rich to be able to absorb all the new capital that is formed in them, and the underdeveloped countries are too poor to offer attractive investment prospects to this same capital, apart from their few import-substitution industries. All this, in turn, keeps them poor, or makes them even poorer. Imperialism is not self-destructive: it is self-reproducing (Emmanuel 1974). It is possible, despite these general deficiencies, for certain marginal movements of capital to enable a developing country to cross the threshold of development. Such examples would include the ability of an individual to rise out of their social or economic class. The prospects, however, for underdeveloped countries becoming developed are so slight that there is no danger of capitalists losing a workforce to operate the factories, and it is perfectly reasonable to believe that those countries in the periphery will continue to follow the same path. In a separate analysis, Stephen Hymer (1979) refers to the enormous 'latent

surplus-population' or reserve army of labour in both the backward areas of the developed economies and the underdeveloped countries, 'which could be broken down to form a constantly flowing surplus population to work at the bottom of the ladder'. Hymer reinforces Marx's understanding (1967) of the accumulation of capital as an increase of the proletariat. The vast 'external reserve army' in the Third World, supplementing the 'internal reserve army' within the developed capitalist countries, constituted the real material basis on which multinational capital was able to internationalise production – creating a continual movement of surplus population into the labour force, and weakening labour globally through a process of 'divide and rule' (Foster and McChesney 2012).

Consequently, Emmanuel concludes that in order for developing countries to push up wages at home and thus improve their trade position, they will have to resort to policies of economic diversification and protectionism rather than seeking to select and develop industries which have proved to be dynamic in the developed world. In recognising that no country can hope to improve its living standard without trade, Emmanuel argues that unequal exchange cannot be rectified simply by channelling additional funds into poor countries in the form of investment capital, foreign aid, expanded exports, or higher commodity prices. These funds must also be transformed by one means or another into an increase in the general wage level in the country. Herein he identifies 'a link between the variations in wages and those of development . . . based directly on the incentives to invest, on capital movements, and on the subsequent specialisation and techniques'. Thus it is not unequal exchange that determines development, but the very rise in wage itself (Emmanuel 1972: 54).

Empire and Imperialism in Education Since 1945: Secondary School History Textbooks

Karel Van Nieuwenhuyse
Educational Master in History, Faculty of Arts, KU Leuven, Leuven, Belgium

Description

Modern imperialism not only heavily impacted many people's life across the globe during the era itself, it still exerts an important influence on the political, social, economic, and cultural domain of present-day societies worldwide. It might hence be obvious that representations of empire and modern imperialism are included in history textbooks for secondary education across the world. The question arises as to how these representations look like and how their outlook can be explained. This is what this contribution examines in history textbooks since 1945 in different countries in the world, both former colonizer and colonized countries, in an international comparative perspective. History textbooks are compared on their content, the perspective they take, the agency they attribute, their tone and judgment, the way they (do not) connect past and present to each other, the extent they relate to academic historiography, their representation of "the other", the identity construction they put forward, and the goals they aim for. That way, it is examined to what extent in this postcolonial world, the representation of modern imperialism is still colonial or has been decolonized.

Introduction

Since its establishment as an autonomous secondary school subject in the nineteenth century, history education has been attributed with different rival and even contrasting aims. In many countries, particularly throughout the nineteenth and first half of the twentieth century, history education had to contribute to nation-building and social cohesion and to the fostering of a national identity (Berger and Lorenz 2010; Carretero 2011; Grindel 2017). A second main goal that was attributed to history education, particularly from the 1960s onwards, in substitution for the aforementioned goal, was the fostering of a transnational (sometimes even global) citizenship and critical democratic civic participation. This often led to the replacement of attempts to build a national identity by fostering a global identity, which in practice, however, came down to a Western and Eurocentric-oriented identity-building attempt (Arthur et al. 2001; Van Nieuwenhuyse and Wils 2015). Those two aims can be

considered as two sides of the same coin, as they both orient history education toward supporting certain identity construction processes and the transmission of values. A third aim for history education concerns a different coin, as it puts a disciplinary understanding to the fore, in educational terms called "historical thinking" (Wineburg 2001; Seixas and Morton 2013).

Those three divergent and competing aims hold many differences in approach of history education. The aims of "nation-building and social cohesion" and "democratic participation and civic behavior" do not only rely on academic historiographical representations of the past yet include social representations and historical myths within collective memory as well (Van Nieuwenhuyse and Wils 2012). Both clusters hence testify to the fostering of a rather naïve historical consciousness. The aim of "disciplinary understanding" by contrast relates much more solely to the academic discipline of history.

Despite the differences, however, some similarities can be discerned as well. All three aims, for instance, include the idea that a certain content needs to be taught to students and that historical knowledge and understanding need to be transferred. Each of them also connects past and present to each other, be it in differing ways: the first two in a rather naïve way, believing that the past can provide *exempla* for present-day behavior, and the third in a constructivist way, emphasizing that historical knowledge is always constructed in a present that exerts influence on the construction of historical representations. All three also aim to foster a certain historical consciousness, an awareness that past, present, and future are interconnected, on a societal level but on a personal level as well. Young people are situated in a continuum past-present-future; present-day society serves as the starting point for reflection on who they are and how they will act. In so doing, young people take the past into account and reflect for the future. The way in which they do so, nevertheless, differs significantly according to the pursued aim (Rüsen 2005).

Present-day society hence has an equally important place as the past in history education. In both studying the past and considering the present, one can rightfully observe that both past and present have been fundamentally influenced by empire and imperialism. Modern imperialism – by which is meant the colonial past from the mid-nineteenth century up to decolonization in the 1960s and 1970s – constitutes the object of study of this contribution. Modern imperialism had a huge and global impact on many people's life during the era itself. Even though almost all former colonies have meanwhile turned into postcolonial countries, and despite the fact that European youth seems to emphasize discontinuity between the imperial past and the global present (Licata et al. 2018), modern imperialism still exerts an important influence on the political, social, economic, and cultural domain of present-day societies worldwide. The looting and racketeering of natural resources in parts of Africa, the unequal power balance and relations between the global north and south, the shaping of collective identities, phenomena as (intercontinental) migration and multiculturalism, and the worldwide entanglement of countries, nations, social, ethno-cultural, and religious groups and individuals, as well as so many other phenomena, can be directly linked to the imperial past. Understanding modern imperialism is hence a crucial issue to be addressed in history education, in order to foster a historical consciousness among young people.

The question then arises as to how modern imperialism actually is understood by young people within societies in a postcolonial world. Is modern imperialism still understood in a colonial or rather in a postcolonial way? Has the understanding of modern imperialism been decolonized, meaning that a mindset arose enabling to exercise critical distance from a colonial and Eurocentric regime of truth of the West and the Rest (Hall 1992) and from binary oppositions between former colonizers and the once-colonized (Grindel 2017)? A related question is where young people come into contact with representations of modern imperialism. Where do they learn about it, in order to build an understanding of the phenomenon? Representations of the modern imperial past circulate in different areas. In popular historical culture, young people

encounter statues, museums, heritage sites, television documentaries, historical films, family stories, etc. related to the modern imperial past. Often, however, those carriers offer a rather dichotomous representation of the modern imperial past, attempt to contribute to specific identity constructions, and hence to not contribute to decolonizing young people's minds. In academia, the approach of the imperial past has fundamentally changed since the 1980s and 1990s with the rise of the so-called New Imperial History. It pays much more attention than before to transnational, intercultural, and non-Western perspectives in colonial history. New imperial historians no longer start from a nation-centered model but concentrate on links between metropolises and colonies, on reciprocal encounters and influences, on cultural and social interconnection, and on migration (Grindel 2017; Stanard 2018). A third area in which representations of modern imperial past are disseminated is secondary school history education. This is a very important one, as in many countries history is a compulsory school subject, meaning that young people certainly encounter colonial representations here. History education can be situated in between popular culture and academia, as research has extensively shown that secondary school history education draws on both in constructing historical representations.

It is not easy to study history education from an international comparative perspective, as its outlook is different throughout the globe. In some countries, history is an autonomous school subject, while in others it is combined with other disciplines in subjects such as social studies or *géohistoire*. Furthermore, the subject is not always composed of one general history course yet sometimes of different ones such as general history, world history, or East Asian history (in the case of South Korea, for instance, see Kang 2017). Also, history education serves various goals in different countries, has different curricula, and is attributed a different weight (in terms of hours/week). An entry to nevertheless conduct international comparative research on history education concerns the analysis of history textbooks, as around the world, history textbooks are published and used in history classrooms. Of course, textbooks cannot be considered as a literal reflection of concrete classroom practice – far from that, textbooks are complex media, hard to interpret – and represent only one element of teaching practices; nevertheless, they provide a valid insight in what happens in history classes worldwide and in how modern imperialism is represented and young people are exposed to it.

Research Question and Method

This contribution examines representations of empire and imperialism in secondary school history textbooks in different countries in the world, both former colonizer and colonized countries, in an international comparative perspective. The analysis will be done in a diachronic perspective, starting from the post-World War II era (1945). It focuses on representations of modern imperialism, meaning the colonial past from the mid-nineteenth century up to decolonization in the 1960s and 1970s. History textbooks will be compared on the content they offer with regard to modern imperialism, on the perspective they take, on the agency they attribute, on their tone and judgment, on the way they (do not) connect past and present to each other, on the extent they relate to academic historiography, on their representation of "the other," on the identity construction they put forward, and on the goals they try to achieve. That way, it can be examined to what extent in this postcolonial world the representation of modern imperialism is still colonial or has been decolonized and what possible explanations for the findings might be.

In so doing, this contribution draws on concepts and theories of different fields, such as New Imperial History (history discipline), us-them thinking and homogenization (social psychology), historical thinking including notions such as multiperspectivity and agency (history education research), collective memory and memory cultures (memory studies), and structures of thought, cultural framing, and categories of representation (postcolonial studies). From the field of the history of education, it takes into account

the notions of the grammar of schooling (describing the structures and rules that organize and regulate education, whose inherent inertia and resistance to change often hinder educational innovation, see Tyack and Tobin 1994; Roldán Vera 2018) and of educationalization (the process enacting young people's induction into socially desirable or societally required norms and values, see Depaepe 1998).

The international and diachronic analysis of textbooks leans on two types of sources. For a number of countries, such as Belgium, France, and England, history textbooks themselves have actually been analyzed. The second type of sources concerns secondary research literature particularly about representations of modern imperialism in history textbooks, such as special issues of three scientific journals the *Internationale Schulbuchforschung* [*International Textbook Research*] (Grindel 2008a), the *Journal of Education Media and Memory Studies* (Fuchs and Otto 2013), and the *International Society of History Didactics Yearbook* (Wojdon 2014); contributions in recently published handbooks on history education research, such as the *Palgrave Handbook of Research in Historical Culture and Education* (Carretero et al. 2017); and a recently published edited book entitled *The Colonial Past in History Textbooks: Historical and Social Psychological Perspectives* (Van Nieuwenhuyse and Pires Valentim 2018). The latter contains contributions not only on representations of modern imperialism in history textbooks from former (European) colonizer countries – the object of most studies in this field (Müller 2018) – yet also from former colonized countries. Ultimately, textbook representations from no less than 23 countries have been taken into account in the analysis: from Belgium, Chile, Cameroon, DR Congo, England, Estonia, France, Germany, Greece, Italy, Japan, Kenya, Malta, Mozambique, Portugal, Russia, Rwanda, South Korea, Spain, Switzerland, Tanzania, the United States, and Zimbabwe.

In what follows, history textbooks will first be interpreted as educational media, at the same time addressing the question how to consider their content. The next part consists of the actual international and diachronic comparative history textbook analysis and includes possible explanations. Findings will be discussed afterwards.

The Complex Nature of History Textbooks as Cultural, Commercial, and Pedagogical Artifacts

History textbooks constitute much more than pure didactic teaching aids. They are commonly considered as cultural artifacts, as concrete manifestations of the historical culture(s) in a society (Klerides 2010). The values and norms that a society (through its government) considers important and wants to propagate are also present in history textbooks, as they underlie them to an important extent. History textbooks hence provide cultural clues about the society in which they are made and in which they are used. Does this at the same time mean that history textbooks are to be considered a mirror of the mentality within a society and of the dominant popular historical (and political) culture? This is subject of great debate among textbook researchers. Roughly speaking, a distinction can be made between maximalists and minimalists (De Baets 2004; Vanhulle 2009). Maximalists consider textbooks to be representative of the mentality of society and an expression of the knowledge that society expects young people to master (Müller 2018). In their view, history textbooks are socialization instruments that propagate norms and values with which society legitimizes itself. For textbooks support the societal consensus on the past and thus help to guarantee the cultural continuity of society. Minimalists, on the other hand, do not deny the ideological backgrounds of textbooks but rather regard textbooks as a reflection of the perspectives, understandings, and opinions of their authors and publishers. They also refer to the requirements that accompany textbooks as commercial and pedagogical products (such as the use of short texts and speaking images, or not deviating too far from existing learning content) and the influence they exert on the production process of textbooks and their

content. This debate clearly shows that many (f) actors have an impact on the outlook and content of history textbooks.

Governments control textbooks, to a certain extent. This control can be exercised directly, through a system of official approval before permission of distribution. In other countries, where such system does not exist, control often takes place indirectly, via the issuing of curricular standards, delineating the objectives to be achieved by the students (Grindel 2017). If textbooks want to be successful as a commercial product, they must take these objectives into account. In that sense, (history) textbooks partly reflect – to a greater or lesser extent – the societal and political expectations as expressed in standards. Nevertheless, within one country, differences between textbooks are always to be observed, in terms of attention for different topics and of tone (critical, judgmental, neutral).

This immediately indicates that (teams of) *textbook authors* also have an impact on the historical representations in textbooks. These authors can be both teachers and academics. This finding can help explain why some textbooks lean more toward representations from popular historical culture, while others relate more to academic historiography. The time pressure that publishers impose on authors to prepare a new edition also plays a role. This pressure can bring about that textbook authors often rely to a considerate extent on previous versions of textbooks in preparing a new version and limit themselves to only few substantial changes. That way, textbook narratives form a relatively autonomous, stable, and fixed, not very changeable, vulgate, which develops independently of academic historiography (Tutiaux-Guillon 2006).

Besides authors of textbooks, *publishers of textbooks* also play a role. Not only the aforementioned time pressure that they impose on authors but also their commercial interests exert an influence on the historical representations in textbooks (Apple 1989). After all, a textbook is a commercial product that must be sold (Fuchs and Henne 2018). In the very competitive market of textbooks, with its often small profit margins, publishers hesitate to disseminate and sell textbooks that are too innovative and too different from what the customers (teachers and students) are used to and that contain too much controversial information. In that sense, publishers contribute to ensuring that textbooks closely reflect and reinforce the prevailing mentality and popular historical culture in society as well.

Since textbooks are intended for use in education, *pedagogical-didactical theories* also influence the editing of textbooks. "Traditional textbooks," as Klerides (2010) calls them, mainly situated in the nineteenth and first half of the twentieth century, reflect the then dominant pedagogical model that considered education mainly in terms of the pure transfer of knowledge from experts to novices. This model strongly influenced the content and outlook of the textbooks. Textbooks till deep into the 1950s (and even 1960s) of the twentieth century consisted mainly of text. Visual and other source material was scarce. The texts were very "closed": they did not distinguish between past and history yet rather presented their representation of the past as "the historical truth," with no eye for suggesting alternative interpretations. Throughout the second half of the twentieth century, a paradigm shift took place in both pedagogical and historical science. Constructivism, the theory that places the student at the heart of the educational learning process, because he/she actively constructs knowledge, came to the fore. In historiography, the idea that historical knowledge is always constructed and that history is a construction and interpretation of the past gained importance (Donnelly and Norton 2011). Both evolutions influenced history textbooks. They underwent a process of didactization, meaning that source material was included in textbooks, in order to allow students to actively construct knowledge. Here and there, divergent, sometimes conflicting historical interpretations by historians, received attention in history textbooks.

In addition, history textbooks show a number of typical genre characteristics. They approach the past in a very abstract, structural, and social sciences way, through which they aim to identify broad and underlying patterns in the past. In so doing, they have little eye for the concrete human

being of flesh and blood or for microhistory. Moreover, common people are often not attributed much agency (Wilke et al. 2018). The ability to act actively and take decisions, to bring about change in the past (agency), is almost exclusively attributed to large, nonhuman actors, such as "the government," states, or powerful groups ("the army"). Such an approach also involves a very specific use of language. The language in textbooks is often very abstract and terse and avoids words that bring in doubt or irony and thus the existence of different historical interpretations. At the same time, the narrative of textbooks is very concise, connected with a formal template, in which each theme is assigned only a limited number of words.

Content and outlook of history textbooks are therefore not self-evident to analyze. They are influenced by many and diverse factors and also evolve over time (Christophe et al. 2018). The latter aspect makes any analysis even more difficult, since new generations of textbooks always rely on previous ones. Textbooks as cultural artifacts can therefore be considered as a palimpsest (Christophe and Schwedes 2015). Traces of different underlying narrative templates, different traditions, and different underlying norms and values can be found in one and the same text. This immediately makes it clear that textbooks always only reflect to a particular extent the prevailing mentality and popular historical culture of a certain time.

Comparative Analysis of Textbook Accounts Since 1945 on Empire and Modern Imperialism

The accounts on empire and modern imperialism in history textbooks worldwide since 1945 differ significantly in time and in space. In what follows, first the representations in textbooks since the end of the Second World War until decolonization (occurring from 1945 until mainly the 1970s) are examined; second, the influence of the decolonization on the textbook accounts; and third the current accounts in history textbooks.

History Textbook Accounts Since the World War II Until Decolonization

In history textbooks across European countries that possessed colonies, a lot of attention was paid to empire and modern imperialism. The same applied to the history textbooks used in the colonies. The colonizers had the monopoly on education there and imported European textbooks written by Europeans to be used in the colonial school system (Bentrovato and Van Nieuwenhuyse 2019). The textbooks of the various countries in first instance especially addressed the own empire and did so within the chapters on the national history (Grindel 2017; Van Nieuwenhuyse 2014). Besides, in separate chapters, they also included an account of modern imperialism in general and paid attention to the situation across Africa, Asia, and Oceania, as well as to both European and non-European (such as the United States, Japan, and Russia) colonizers. Those accounts were very extensive, yet "closed": they only offered one representation of the imperial past and presented that as "the historical truth."

Modern imperialism was almost exclusively framed in national terms and hence looked at through a nation-state lens (Grindel 2017; Müller 2018). Other perspectives, such as a pan-European, gender, or social class perspective, were not presented. The "own" empire and modern imperial endeavor were always perceived in a positive way and depicted as a *mission civilisatrice* (Müller 2018). Textbook authors emphasized that the own nation-state brought education, medical care, abolition of slavery, infrastructure, etc. to the territories it colonized (e.g., Haydn 2014). The violence and racism inherently accompanying modern imperialism were almost completely ignored (e.g., Pires Valentim and Miguel 2018). It is interesting to note that on the other hand, history textbooks across Europe were sometimes rather critical for other European colonizers. Belgian textbooks, for instance, stressed that Europeans (particularly the British, French, Spaniards, and Portuguese) brought order in indigenous territories as well as prosperity and development yet on the other hand imposed an authoritarian white rule and exploited the colonized territories (Van Nieuwenhuyse 2018). British textbooks then criticized the

exploitation of indigenous people in the Congo Free State under the rule of Belgian king Leopold II (MacKenzie 1985).

The accounts of the own imperial past (and present) that were very positive, even triumphalist, served the fostering of a national identity. Textbook authors took national pride from their own nation, from a homogenized "us" (the national "in-group") bringing civilization to a homogenized "them," the uncivilized, backward, primitive indigenous peoples, who constituted the "other" or the "out-group." That way, modern imperialism was "constitutive of the self-characterization of the nation" (Müller 2018, p. 284). It was presented in very dichotomous terms, and very simplistic identity markers were used to foster a national identity (Grindel 2013, 2017; Müller 2018).

In so doing, history textbooks across colonizer countries reinforced the "stereotypical dualism" (Hulme 1986) of a civilized West versus an inferior and backward rest of the world. They confirmed the (since the seventeenth century) long-existing "regime of truth" of "the West and the Rest" (Hall 1992, p. 205), in which "the West" refers to a developed, industrialized, urbanized, capitalist, secular, and modern society and provides criteria of evaluation against which other societies can be judged upon and ranked. Those criteria concern simplifying dichotomies (developed versus underdeveloped, modern versus backward, civilized versus uncivilized, etc.). This idea of "the West and the Rest" privileged a view as if the West walked a distinctive path into modernity, "excluding non-European trajectories" (Grindel 2017, p. 260). Europe's and the Western World's slow but steady rise toward democracy and freedom was set as the standard to judge other societies upon.

Textbook authors considered the modernity of the own nation as the driving force behind the nation's imperial enterprise and at the same time the modernization of indigenous territories as the outcome of the colonial expansion (Grindel 2017). Taking this perspective, they ascribed agency solely to the colonizers: white Europeans seemed to be the only agents in the modern imperial endeavor. The indigenous, colonized peoples were represented as nothing but passive objects.

That is, at least, if they were mentioned at all. For not only was the pre-colonial past of indigenous peoples almost completely ignored yet often were the territories that had been colonized described as "virgin lands" without any political and social organization. While for Asian societies the existence of a pre-colonial culture was acknowledged, particularly sub-Saharan Africa was represented as *terra nullius*, as if African territories were "uninhabited lands, rich in natural resources, waiting to be occupied and exploited without resistance" (Brescó de Luna 2018, p. 85; also see Macgilchrist and Müller 2012; Pires Valentim and Miguel 2018; Van Nieuwenhuyse 2014, 2018).

The triumphalist, ethnocentric, nationally oriented, and oversimplified history textbook accounts from the 1940s to 1950s reflected the state of the art in both popular historical culture and contemporary academic historiography. Here as well, the angle through which modern imperialism was approached was a national perspective. Furthermore, academic historians also lauded modern imperialism as a *mission civilisatrice* and made use of binary oppositions in their narratives in terms of modernity versus tradition, civilization versus a savage existence, or Europe versus the Orient and Africa.

History Textbook Accounts in the Era of Decolonization

Decolonization brought about a – gradual, not abrupt – shift in textbook accounts around the globe. The process of decolonization appeared on different moments in time. In 1946, the Philippines gained independence from the United States and India in 1947 from Great Britain. Many French colonies gained their independence throughout the 1950s and 1960s. The Congo became independent from Belgium in 1960, just as Somalia from Italy. Several colonies of Portugal gained independence after the Carnation Revolution in 1974. Even though the timing differed, decolonization nevertheless caused similar evolutions in history textbook accounts on empire and modern imperialism.

In *European and American history textbooks*, it is first of all notable that the attention for modern imperialism, both in general and with regard to the

own colonial enterprise, decreased, once the own colonies gained independence. Furthermore, the textbook accounts limited themselves more and more to a description and analysis of what happened in Asia and in Africa and to European states as imperial agents. Imperialism in Oceania, and the United States, Japan, and Russia as agents of imperialism, was increasingly ignored. The nation-state lens to look at modern imperialism, which was common during the imperial period itself, kept prevailing in many American and European history textbook accounts after the decolonization of the "own" colonies (e.g., Carretero et al. 2002; Grindel 2017). The attention paid to the "own" national imperial enterprise nevertheless decreased. Sometimes, even a true amnesia for the own modern imperial past occurred, as was the case in Belgian history textbooks, especially in the 1970s and 1980s (Van Nieuwenhuyse 2014). They started to ignore to a large extent the Belgian-Congolese colonial past.

The tone in which modern imperialism was addressed in most European and American history textbooks became somewhat more critical after the decolonization of the "own" colonies. Although they continued to present imperialism as a *mission civilisatrice*, history textbooks nevertheless launched debates about whether empire was a force of good or bad and started to pay more attention to colonial violence and at the same time to colonial resistance (e.g., Haydn 2014; Jackson 2018). This means they started to attribute – to a limited extent only – to the indigenous peoples. Textbooks also showed an increasing awareness of racism accompanying the imperial enterprise or resulting from it (Haydn 2014). Some textbook authors connected the imperial past and the present to each other. They established a link between the poor state in which the former colonies were in as well as the existence of a "Third World" on the one hand and the preceding modern imperial past on the other (e.g., Kokkinos et al. 2014). Other authors, however, did not make a connection between the imperial past and the contemporary state of the (third) world and passed the responsibility for the bad state of the former colonies solely onto the new independent states themselves (Van Nieuwenhuyse 2015). In general, the critical

tone of European and American history textbooks with regard to modern imperialism should not be exaggerated. Although some bad sides of imperialism were somewhat mentioned, the overall judgment of the imperial enterprise remained positive.

Textbooks also kept addressing the "own" imperial past in a less critical way than modern imperialism in general. This is very obvious in, for instance, Russian, Portuguese, and Belgian history textbooks (Khodnev 2014; Pires Valentim and Miguel 2018; Van Nieuwenhuyse 2014). At the same time, however, in the first of two decades after decolonization, textbooks in many countries made less efforts to foster a national identity via their account of empire and modern imperialism. As a result of, among others, the diminishing attention for modern imperialism altogether in the whole of the textbook account; the call for a more global approach of history in history education in the 1960s and 1970s; the introduction of a more structural, social sciences approach of history education in that same period; and the troubled course of the decolonization process in several countries, textbook authors started to address the imperial past in a more distant and neutral way. Although in words a global identity was adhered to, in reality, a Western and Eurocentric rather than a national identity-building attempt came to the fore. This did not really contribute to decolonizing students' minds.

Also, this evolution from a national to a Western identity construction underpinning the textbook accounts was not always continued. In Britain and France, for instance, in the 1980s and following decades, fierce debates took place about the extent to which the own empire was a force of good or evil and whether it should be taught about in a critical or a pride-stirring way. Conservative, right-wing voices required that history education in general, and the accounts on empire in particular, would approach the own nation in a positive way and instill national pride. Kenneth Baker, Secretary of State for Education in Thatcher's first administration and considered to be the architect of the first version of the National Curriculum (introduced in 1991), argued that "pupils should be taught about the spread of

Britain's influence for good throughout the empire in the 18th and 19th centuries. . . These things are matters in which we should take great pride" (cited from a speech at the Conservative Party Conference in 1998, in Haydn 2014, p. 27). More patriotic forms of school history celebrating Britishness and British values were adopted since in English history education (Grindel 2013; Haydn 2014).

When comparing the American and European history textbook accounts for secondary education on empire and modern imperialism with the state of the art in academic historiography, it can be found that from the 1960s to 1970s onwards, a divergence commenced, with textbooks substantially departing from an academic historiography beginning to distance itself from the triumphalist discourse and to critique imperialism. The novel perspectives arising from the New Imperial History international research tradition since the 1980s, such as transnational, gender, and social class perspectives, and the constructed nature of historical knowledge of the imperial past were not adopted by most history textbook authors, who kept looking at empire through a nation-state and a quasi-exclusive Western lens (see Grindel 2012, 2013; 2017; Müller 2018; several contributions in Van Nieuwenhuyse and Pires Valentim 2018). This can be related to processes of educationalization, as many governments or other agents responsible for education were convinced that history curricula and textbooks should not introduce students to the most recent state of historiography but should rather foster national pride. Coinciding with a growing globalization trend and increasing intercontinental migration flows since the decolonization wave of the 1960s, such a view gained strength. Other reasons for the widening gulf between secondary school history textbooks and academic historiography might be found in the fact that textbook writing was passed on much more into the hands of history teachers rather than of academics and – illustrating the abovementioned notion of "grammar of schooling" – in the fact that textbook authors often relied on previous editions of their textbooks while writing new ones and only confined themselves to slight changes, rather than making significant changes. Textbook representations hence rather clung to representations of imperialism in popular historical culture within society at large than to historiography.

In the former colonies, it often took some years before the new independent states succeeded in establishing own national curricula for history education and, based on these, history textbooks. When analyzing the *history textbooks from former colonies* in the decades after their independence, a number of common characteristics come very obviously to the fore (see e.g. Bentrovato 2018; Bentrovato and Van Nieuwenhuyse 2019; Cabecinhas et al. 2018). First, these textbooks put a lot of emphasis on the own history and in many cases by extension on the region they belong to. Many African history textbooks, for instance, testified to a pan-African perspective. Second, they paid a lot of attention to the precolonial history of their country or broader region. Third, the textbooks focused on colonial violence and accompanying resistance. In so doing, fourth, they testified to a very dichotomous approach of empire and modern imperialism, in terms not only of violence versus resistance yet also of good versus evil, homogenized colonizers versus colonized (without attention for in-between stances), and a presumed (and often illusory) national "us" versus Western "them." Arising from this, fifth, was a very morally oriented rather than analytical approach of the past, being very critical for the West. Sixth, in all the history textbooks from former colonies, a clear and explicit connection was made between the contemporary situation of the country (and broader region) and the preceding imperial past, thereby again pointing at the preponderant responsibility of the West for the often difficult contemporary situation of its former colonies.

Current History Textbooks from Around the Globe

Empire and modern imperialism are systematically present in current history textbooks worldwide, also in states which never colonized others, such as Switzerland (Minder 2011). No history textbook series for secondary education exist that simply ignore those issues. The reach of

imperialism is often shown via maps, on which all colonizers and colonized areas are specified. In the written accounts, however, the focus is particularly on Africa and Asia, leaving Oceania as colonized area and the United States, Japan, and Russia largely out of the picture (apart from these countries themselves of course; see Cave 2013; Khodnev 2014). The "own" imperial past, in those countries having been either colonizer or colonized, still receives the bulk of attention. It is, however, much more than before located in a regional and global context (Fuchs and Henne 2018; Schissler and Soysal 2005). The "own" national imperial past, in other words, is often not addressed in a separate way anymore in chapters on the national past yet regionally or globally contextualized.

Compared with the 1940s and 1950s, the amount of attention paid to modern imperialism decreased in most history textbooks in Western countries (e.g., Cave 2013; Van Nieuwenhuyse 2014). In former colonies, by contrast, the attention remains high, both in Asian and in African countries. Another difference that can be noted is that Western history textbooks continue to mention Africa (and to a lesser extent Asia) only in relation to the West, when discussing imperialism. Furthermore, the representation of particularly Africa as "virgin land" or as *terra nullius* continues to exist (Abadia and Collins 2018; Brescó de Luna 2018; Gorbahn 2014; Marmer et al. 2010; Pires Valentim and Miguel 2018; Van Nieuwenhuyse 2018). This is also visible on maps: those areas not having been colonized at a certain time are simply left blank (literally, as white spots) without any explanation in the accompanying legend. History textbooks within former colonies on the other hand address to a large extent the pre-colonial past of their own area and emphasize the enormous disruption modern imperialism caused (Müller 2018).

In almost all countries worldwide, a nation-state lens to look at modern imperialism continues to prevail or even gains strength again, as is the case in, for instance, Britain, France, and Portugal (e.g., Abadia and Collins 2018; Azzopardi and Buttigieg 2018; Grindel 2017; Otto 2018; Pires Valentim and Miguel 2018). History textbooks in

Europe do, for instance, still not discuss imperialism as a European project but continue to address it predominantly from a nation-state standpoint (Grindel 2008b; Müller 2018). The nation-state perspective is often closely connected to goals of nation-building and a national identity construction. Furthermore, it is accompanied by an underlying ethnocentric approach of the past. In Europe and the West, it concerns a Eurocentric approach and in Africa a pan-African approach (Gorbahn 2014; Holmén 2011), hence continuing to support a very simplistic and dichotomous identity-building process, in terms of homogenized us-them thinking (see, e.g., Abadia and Collins 2018; Pires Valentim and Miguel 2018). Two notable exceptions where the nation-state does not serve as a lens to look at modern imperialism, yet nevertheless with the aim to support a national identity, are Spain and Chile. In Spanish textbooks, the own modern imperial past is not paid much attention to and is dealt with rather critically, contrary to the premodern imperial past, which is addressed much more extensively and in laudatory and even triumphalist terms (Brescó de Luna 2018). In Chile, having been colonized in premodern time but being a colonizer country itself during the era of modern imperialism, history textbooks focus mainly on the different European colonial powers and the Western world. The "own" imperial past and particularly the conquest and occupation of the Araucanía territories where the Mapuche people in the nineteenth and twentieth centuries by the Chilean state are completely silenced (Figueiredo and Gazmuri 2018). For Chile does not acknowledge this as a form of imperialism yet called the occupation of the Araucanía territories an act of "pacification." Only in 2017, Chilean president Michelle Bachelet formally apologized for the historical injustice done by the Chilean state toward the Mapuche. To what extent this will influence future history textbook accounts is unclear at the moment.

The tone in which empire and modern imperialism is addressed in Western history textbooks has become more than before rather neutral, as a consequence of the textbook accounts taking a more structural and social

sciences approach (e.g., Brescó de Luna 2018; Van Nieuwenhuyse 2018). Causes for and consequences of modern imperialism as well as different kinds of imperial systems are described in a somewhat distant way. At the same time, critical noises reverberate, as the violence accompanying the imperial enterprise is addressed in the accounts (without, however, being emphasized very much) and even debated (Cave 2002; de Michele 2011; Grindel 2017; Lantheaume 2013; Müller 2018; Van Nieuwenhuyse 2015, 2018). The finding nevertheless remains that in many textbooks, the "own" modern imperial past is addressed in a less critical way than that of other former colonizers (e.g., Haydn 2014; Khodnev 2014); in Flemish-Belgian textbooks, particularly the remote imperial past is critically dealt with the more recent past far less (Van Nieuwenhuyse 2015). Some textbooks start to include multiple perspectives in their account of the imperial past and, in so doing, to acknowledge the constructed nature of historical knowledge, hence – very carefully though – starting to foster young people's historical thinking and a critical historical consciousness. In the history textbooks from former colonies, the tone is much more morally judging and condemning (Bentrovato and Rath 2018; Gorbahn 2014). Imperialism is strongly convicted, and violence is explicitly acknowledged as a constituent part of modern imperialism. At the same time, these history textbooks also use rather heroic terms while emphasizing the indigenous peoples' colonial resistance.

This also means that current history textbooks in former colonies attribute a lot of agency to indigenous peoples (Bentrovato 2018; Cabecinhas et al. 2018; Müller 2018). The role of local population resisting the colonizers often gets the most attention. In Western history textbooks, by contrast, it is still the (homogenized) colonizer who is the most important agent. Indigenous peoples in the colonies, equally homogenized, are only sparsely attributed agency. Bentrovato and Rath (2018), for instance, clearly demonstrate this with regard to the representation of the First World War in European and African

textbooks. They come to the conclusion that only few European textbooks include portrayals of Africa's and Africans' active participation in the Great War, while African textbooks include much more depictions of active Africa's and African involvement.

History textbooks from former colonies also pay explicit attention to the continued effect of modern imperialism on the present-day world. They strongly connect past and present to each other, and emphasize that the difficult circumstances the former colonies often find themselves in are the consequence of the imperial past and are hence the responsibility of the Western former colonizers, are the consequence of imperialism and hence the responsibility of the Western former colonizers (Bentrovato 2018; Cabecinhas et al. 2018). In Western history textbooks, this continued effect is not always present in the accounts, even though the tone with regard to modern imperialism as such became more critical. Some textbooks indeed acknowledge the connection between modern imperialism on the one hand and racism, feelings of superiority, Third World problems, and the existence of a North-South divide on the other hand (Grindel 2017; Otto 2018; Raudsepp and Veski 2016). Others, however, ignore or silence this connection, as is, for instance, the case in all but two current Belgian history textbooks (Van Nieuwenhuyse 2015). In that sense, also taking into account the various degrees to which a national identity is supported and multiperspectivity is included, it can be stated that history textbooks worldwide only to limited extent instigate a critical historical consciousness and contribute to the decolonization of young people's minds.

The latter finding can be closely connected to another finding by one, namely, that history textbook authors worldwide seem to not really or only to a limited extent connect with the current state of academic historiography on empire and the imperial past (e.g., Abadia and Collins 2018; Cajani 2013, 2018; Khodnev 2014; Van Nieuwenhuyse 2018). For New Imperial Historians precisely draw attention to multiple entanglements between colonizers and colonized, thus transcending a nation-state perspective, illuminating the

E

transnational and intercultural dimensions of colonial history, and emphasizing the interpretive nature of history (Stanard 2018). Several reasons can be found to explain this gulf between secondary school history textbooks and academic historiography. The notion of "grammar of schooling" helps to explain that both publishing houses and textbook authors are reluctant to change too much in new history textbook versions, as customers (teachers and students) are presumed not to like too much change. As a result, both recent historiographical and educational insights do not or only very slowly trickle through school history textbooks. Besides, the notion of "educationalization" helps to understand that school history and academic historiography serve different goals. While academic historiography seeks to connect to the current state of affairs and in the research field and to expand historical knowledge, secondary school history education is primarily oriented toward the personal, social, and intellectual development of young people. The school subject is expected to induce young people into socially desirable or societally required norms and values and to support them in coming to a private understanding of the past, enabling to either urge upon them a certain identity or support them to develop their own identities (Husbands 1996).

Conclusion and Discussion

When looking in general at the history textbook accounts on empire and modern imperialism worldwide since 1945, it is striking to see that a number of characteristics remained the same throughout the past seven decades. All textbooks contain basically rather simplified than complex and nuanced historical narratives of the modern imperial past. They all start from a nation-state perspective and, in so doing, largely ignore other perspectives such as transnational, gender, or social class perspectives. This finding closely relates to the agency textbook authors attribute. This is done in very simplistic ways, not only with regard to the acknowledgment and amount of agency attributed but also with regard to the

homogenization of agents. Textbook authors often offer very stereotypical and binary representations of the parties involved in modern imperialism, namely, colonizers versus colonized and Western versus indigenous peoples. More in general, textbook accounts are riddled with "stereotypical dualism" and simplistic dichotomies between good and evil, right and wrong, and us and them, "which in many ways remains 'colonial knowledge' instead of 'postcolonial knowledge'" (Grindel 2017, p. 265). These accounts fail to facilitate complex, multiperspectivist and nuanced understandings. The complexity of the whole phenomenon of modern imperialism, the very existence and consequences of the entanglement that occurred throughout the imperial past, and the very mixed and various positions people involved in the imperial enterprise took are to a large extent silenced in the history textbooks. In so doing, history textbooks clearly do not truly connect to recent academic historiography written by New Imperial Historians.

When evaluating the history textbook accounts on empire and modern imperialism in the light of the main goals attributed to history education as discussed in the introduction, it is obvious that in many countries, the textbook accounts primarily (still) serve the aims of nation-building, reinforcing social cohesion and fostering a (homogeneous) national identity. Deconstructing identity construction processes or supporting an open and global identity-building, as well as fostering a global and critical citizenship or historical thinking, including taking into account multiple perspectives, is far less pursued. This is an important finding, as previous research has shown that the approach history education in general and many history textbooks in specific take has important consequences on young people's historical thinking and worldviews, in terms of a narrow-minded and colonial instead of postcolonial understanding of the past and an ethnocentric stance toward intergroup relations (e.g., Licata et al. 2018; Marmer et al. 2010; Van Nieuwenhuyse 2019). History education and textbooks hence still have a long way to go in bringing young people to a true postcolonial understanding of the modern imperial past in this post-colonial present.

Enslaved African Labour: Violent Racial Capitalism

Andrew Higginbottom
University of Kingston, London, UK

Synonyms

African enslavement; Manufacturing; Mode of exploitation; Primitive accumulation; Racial capitalism; Slavery

Definition

This entry reconsiders the relation between early colonial capitalism and European enslavement of Africans. The paper addresses two standard Marxist readings: the first positions slavery as part of the primitive accumulation of capital; the second reading sees capitalism as exclusively the exploitation of "free" wage labour. In contrast, this article argues colonial plantation slavery as a mode of exploitation within mercantile capitalism. This approach extends Marx's value theory to include slavery as a racialized mode of labour exploitation, an early phase of colonial capitalism with its own especially oppressive characteristics, and an early form of racial capitalism. The violent working to death of enslaved Africans on the sugar plantation was a matter of calculation by the slave owner, weighing value produced against the costs of purchase and maintenance. Moreover the cost of slave purchase relied on the supply of Africans seized from their home continent. This approach suggests continuities as well as changes from colonial forms of sugar plantation slavery in Latin America and the Caribbean into the "second slavery" of the nineteenth century, epitomized by cotton plantations in the US South.

Introduction

Even though not based on wage labour, in what sense did slavery and other forms of coerced labour in the colonies nonetheless constitute an early form of capitalist production? This paper considers African enslavement in the Americas as an instance of the general condition of labour in the colonized world and reflects on what this means for the closely related debates on the birth of capitalism and the nature of the capital-labour relation in categorical-theoretical terms. It provides an interpretation that sees capitalism's slavery as a racialized mode of exploitation, a parallel form to manufacture which was the prevalent form of the labour process of emergent capitalism in Europe. The plantation was an early form of specifically capitalist enterprise, in that the enslaved African's labour power was purchased in order to create surplus-value through the production of commodities, in a process that relied on the continual European looting of other continents to provide that labour power. The article connects with related literature on "racial capitalism" and the "second slavery." Not only was this "first slavery" strongly linked with merchants and banking capital through circulation, but there were aspects of the production process that were identifiably capitalist. The interpretation offered here views the plantation as a division of labour similar to manufacture, with violence as a lever of production.

In what follows, Sects. II, III, IV, and V survey and critique various aspects of Marx's *Capital* insofar as colonized labour is concerned; so equipped, Sects. VI and VII consider the origins and theorization of the colonial plantation slavery; and Sect. VIII offers concluding remarks.

Surplus-Value as an Entry Point to the Problematic

The study of the capitalist mode of production has many entry points, and they need not coincide with a genealogy of its historical origins. Marx in *Capital* Vol. 1 gives us at least four entry points to the capitalist mode of production. The first is to begin at the beginning, the analysis of the simplest value-form as the commodity and then money in Part 1, Chapters 1–3. There is a well-rehearsed debate over the role of the logical and the historical in this difficult opening, especially on the issue of simple commodity production. Did simple commodity production exist as a historical stage, or is it simply a layer of abstraction, the simple commodity *form*, within the developed capitalist mode of production that is already present? The weight of argument has tilted against Engels' historical stage view. Yet Marx's unfolding of the concepts through a series of determinations leaves a major problem at the end of the beginning, Part 2 on the transformation of money into capital. The movement is from the simple commodity form of exchange that starts with one commodity that is sold and ends with another that is purchased, with money as the intermediary, as expressed by the notation C-M-C; to the capitalist form of exchange that starts with money and ends up with more money through the purchase and sale of a commodity as the intermediary, as expressed by the notation M-C-M′, where M′ is greater than M. The derivation of value that starts from the commodity ends with a flip in the sequence of exchanges, transitioning from the simple commodity form of value to money capital as value, a flip that appears to be just formal but in historical terms is immense. The significance of Marx's chosen opening is that it proves the necessity of surplus-value as the essential internal mainspring of the capitalist mode of production, independent of any particular form. Surplus-value is both the means by which money capital expands itself and the product of a social relation of exploitation of labour power that has been purchased as a commodity.

Contrast this with the second beginning which Marx puts toward the end of Vol. 1, in Part 8; where he picks out the main elements of a broad historical narrative from the fourteenth to the eighteenth century and beyond under the heading the so-called primitive accumulation, so-called because Marx disagrees with the legend of Adam Smith that this was in any way a benign process and emphasizes the violence involved in the birth of the capitalist mode of production. Magdoff (2013) rightly suggests that Marx's meaning in the original German is better translated as "primary accumulation" or, suggesting a theoretical content that is distinct again, "original accumulation," to emphasize this was the original accumulation *of capital*. The last chapters of Vol. 1 are written in the historical narrative mode, synthesizing the genesis of capitalism. Marx here resists classical political economy's universalistic paradigm on the grounds of history, by insisting on the historical and hence transitory nature of capitalism as a mode of production that came into being and will be superseded, whose fetters must and will be cast asunder. Marx provides here a clarion call and a suggestive outline, but not yet a full history.

Sandwiched between the above two starting points, the logical and the historical, there is a third, which is more internal and starts from the production of surplus-value, which takes shape in the sequence in the middle parts of *Capital* Vol. 1. According to Marx's headings, Parts 3 and 4 are about first absolute surplus-value and then relative surplus-value. These are explained succinctly as:

> The production of absolute surplus-value turns exclusively on the length of the working day, whereas the production of relative surplus-value completely revolutionizes the technical processes of labour and the groupings into which society is divided. (Marx 1976, p. 645)

While Marx's focus is on conceptual development, Parts 3 and 4 relay a transition narrative *within* the capitalist mode of production. This order of exposition has led many Marxists to believe that absolute surplus-value came before relative surplus-value in a linear fashion, and there are indeed textual grounds from Marx himself for this reading. Marx's apparently linear presentation brings to the fore the turn that took place

in England around 1850 from "machinofacture" to "Modern Industry," an important point of inflection in its own right and certainly the dominant economic change in Marx's adult lifetime.

Marx of course presents a complex argument that through the power of abstraction begins to approximate to the multifaceted complexity of his subject. The notion of simple sequence from absolute surplus-value to relative surplus-value has a counterpoint that punctuates the linear narrative interpretation at three points. Firstly, Chapters 7–9 which, despite falling under the heading "The Production of Absolute Surplus-Value" are rather an introduction to the concept of surplus-value *as such*, in outline prior to its breakdown into particularities. The second disruption to the sequential narrative, that first came absolute surplus-value and then came relative surplus-value, occurs in Chapter 13 on Cooperation, where it is explained that both absolute and relative surplus-value arose together in the form of the labour process that Marx terms "manufacture," a collective workshop production but with a division of labour under the command of a capitalist owner-manager. The manufacturing capitalist increases relative surplus-value by taking advantage of cooperative labour, by reorganizing the labour process to increase output. The idea of historical sequence is thirdly countered in Part 5, Chapter 16 where Marx considers absolute surplus-value and relative surplus-value interacting dialectically in various combinations with labour intensity; all three must be present.

Even as Marx isolates one aspect of surplus-value and then another, we have highlighted here the totality that is present as an undercurrent. All labour processes in whatever mode of production entail both duration of labour effort and a degree of labour productivity; there cannot be one without the other. Beyond this, Marx points out the necessary connection between labour duration and productivity within the capitalist mode of production (1976, p. 646), labour exploited by capital must be sufficiently productive to create more commodities than the equivalent required for the labourers own consumption, and at the same time, the surplus labour, and from

that surplus-value, can be increased by extending the working day.

There is a fourth angle on the emergence of capitalism in Vol. 1, another underlying theme, which is the idea of capital subsuming the labour process. Subsumption is introduced in Chapter 16 and developed in the appendix *Results* (1976, pp. 949–1066). Marx looks at the social forms of labour before capitalist production and their transition through a conceptual lens that distinguishes between the "formal subsumption" and "real subsumption" of labour to capital, which he connects to absolute and relative surplus-value, respectively. In formal subsumption capital lays hold of the labour process without yet changing its material technical foundation, whereas in real subsumption, the labour process is restructured, recast, and revolutionized.

Summing up this section, capital can increase its surplus-value by applying the lever on absolute surplus-value or relative surplus-value, but these categories should not be reified; both must be present as co-determining dimensions of surplus-value.

Marx on Wakefield and the Theory of Colonization

So far we have considered Marx's presentation of surplus-value as an interaction of theory and history. Now we question the fullness of Marx's articulation from the perspective of *social geography*, and here we identify gaps in Marx's theory of surplus-value.

The violent colonial phenomena Marx highlights in Vol. 1, Part 8, and that he recognizes in several other places, are nonetheless not brought into sustained theoretical focus in *Capital*. There are many scattered insights into plantation slavery but not a substantive analysis of it. The slave plantation needs to receive a parallel theoretical treatment in terms of its specific social relations of commodity production as did domestic manufacturing production in Parts 3, 4, and 5. If we are to reach a more inclusive theoretical account of the capitalist mode of production in Marx's own time, this analysis is required, as are

plantation slavery's colonial trade and finance relations with the parallel development of industry in the colonial centers.

Let us now consider how far the colonial dimension comes into Marx's theory of capitalist exploitation. To unravel the tangle of knots that awaits, we pick up a thread that begins at the end, or at least at an apparent ending, which is the final chapter of *Capital* Vol. 1. In this chapter Marx discusses "the modern theory of colonization" put forward in his day by E. G. Wakefield writing about Western Australia. The subject of Wakefield's concern is not colonized labour, the aboriginal first nations; indeed for him the colonized people are invisible. The problem that Wakefield addresses is the procurement of white settler labour. The subject is colonies settled by Europeans, as Marx makes clear "we are dealing here with true colonies, i.e. virgin soil colonized by free immigrants" (1976, p. 931).

Wakefield's preoccupation is how to draw surplus labour from the influx of white colonizers in a capitalist fashion. For capitalism to flourish in Australia, the mass of white colonizers must be prevented by the state from settling on the newly taken land, for if they are allowed to do so, they would prefer working on their "own" plot rather than labouring for a capitalist (assumed to be another class of white settler). Here the reproduction of capitalist social relations appears as a policy choice that the English colonial state in Australia should create one type of regime rather than another if it is to oversee the continuing accumulation of capital. Wakefield recommends a prohibitive land policy to ensure the reproduction in a colonial setting of capitalist social relations that the state set an artificial high price on land because if immigrants were to have free access to that land, they would set up a small farm and not volunteer as workers, and they would produce for themselves and not for capital, so the question for Wakefield becomes free land or free labour? His answer is that white immigrants must be prevented from settling on the land.

Marx turns this discussion of colonial policy into a matter of essence; he says that in Wakefield the truth of the capital labour relation is revealed. More pertinently, Marx says the essence of the capital labour relation at home *in England* is revealed by Wakefield's discussion:

> It is the great merit of E.G. Wakefield to have discovered, not anything new *about* the colonies, but, *in* the colonies, the truth about capitalist relations in the mother country. (1976, p. 932)

For Marx that truth is the separation of the immediate producer from the means of production as the presupposition of the capitalist mode of production. Marx leaves this as the capstone on the analysis already presented in the previous six chapters. But something new did need to be said about the colonies.

As we have noted, the historical mode of Part 8 contrasts to the dialectic of system-logic unfolding from the commodity which is the presentation form Marx takes in the opening parts of Vol. 1. The end chapter of *Capital* Vol. 1 is not a neat and symmetrical response to the book's opening; rather than a conclusion, it is more an alternative opening that poses new questions. Some of these are partially answered in the draft materials assembled as Vol. 3 of *Capital* that Marx had already worked on but were destined not to be published until 1894, under Engel's editorship, more than a decade after Marx's death and nearly 30 years after the first edition of Vol. 1. The way Marx puts the problem of white immigrant labour in the colony in Chapter 33, shows he anticipates answers already prepared for Vol. 3. Of these the most elaborated but difficult is his surplus profit theory of rent, how capitalism works in agriculture and associated sectors of operation such as mining and logging, a theory that in turn depends on the modification of the law of value to take account of its specifically capitalist character, wherein simple value is converted into prices of production. Wakefield's policy is that the colonial state should impose a land tax that would operate like an absolute rent (in Marx's Vol. 3 terminology) to prevent the movement onto the land of poorer whites.

Returning to the closing of Vol. 1, Marx's concluding paragraph is:

> However, we are not concerned here with the conditions of the colonies. The only thing that interests us is the secret discovered in the New World by the political economy of the Old World, and loudly

proclaimed by it: that the capitalist mode of production and accumulation, and therefore capitalist private property as well, have for their fundamental condition the annihilation of that private property which rests on the labour of the individual himself; in other words, the expropriation of the worker. (1976, p. 940)

Turning to the "fundamental condition" of the capitalist mode of production in "the Old World," Marx deliberately *switches the argument away from the specific character of the colonial capitalist relation*. But then, what of the "New World," the colonies where the expropriation of the labourer also takes place?

David Harvey (2016) seeks to pick up the journey again from this fork in the trail. According to Harvey, from this point Marx returns in Vol. 2 to the internal contradictions of the capitalist mode of production rather than giving systematic treatment to capitalism in its external relations. Marx writes elsewhere on Britain's unfolding colonial relations with India, Ireland, and so on, but not in a systematic and theoretical way. Marx does begin to do this in his analysis of social relations in Ireland as a distinct illustration of the general law of accumulation that was different to England. Despite the famine and mass emigration, in Ireland the immediate producers had not yet been forced off the land entirely; they were exploited in situ through colonial land rents. These conditions of colonial occupation gave rise to the Fenian national independence movement (Marx 1976, pp. 854–870; Higginbottom 2014).

Harvey rightly notes that occasionally in *Capital* Marx refers to national differences, but does not make this the focus of sustained analysis. In short, Harvey poses anew the problem we seek to address, suggesting a turn toward systematic theorization of capitalism's colonial policy. Harvey's approach is still for many reasons unsatisfactory to our purpose; he persists in framing colonization as an *external* relation of capitalism, stressing that the frontier is an outer transformation resulting from an inner dialectic, a "spatial fix" in his terms. But this manner of spatial framing is itself one sided, insofar as its shifts attention away from the *internal* transformation to the social relations of the capitalist mode of

production that is inherent in this very drive to colonial expansion. Colonialism is not an external bolt-on to capitalism, it is part of it; and the theory of colonial capitalism must therefore affect the central social categories of what we understand capitalism to be, specifically the concept of surplus-value. Moreover, capitalism's colonial "spatial fix" does not resolve its inner contradictions, but reproduces them differently and at a higher level.

We now come to the strategic debate within Marxism concerning the domestic and overseas colonial faces of accumulation. To argue, as Brenner (1977, 1985) does, that not only the origins but also the *essence* of the capitalist mode of production is uniquely found in the social relations and class struggles of its emergence and early stages in England (and by extension in Western Europe and the global North) reduces the epistemological role of the colony to no more than an illumination or reflection back on this essence, to assist in its revelation. Are not colonial conquest, the modes of labour exploitation and the oppressed nation and class struggles of resistance that it involves also constitutive of the essence of the capitalist mode of production? *Pace* Brenner, we argue that colonialism is not external to the capitalist mode of production but part of its very conditions of existence. Accordingly critical political economy has to put colonized labour at the center of its theoretical project. What is considered as the totality of the capitalist mode of production has to be reconceived to take colonialism into account, not only as an external relation or limit but as an expanding *internal* relation that includes the occupation of colonized territories and *the coercive expropriation of the colonized labourer*.

In an excellent introduction to the topic, Barbara Solow posits the central question for the colonial powers was "by what methods did Europeans solve the problem of exploiting overseas conquests in regions with abundant land?" (1991, p. 38). She argues that colonial occupation was necessarily a different setting for the origins capitalism, as the state had to set up the conditions of private ownership of the means of production on which capitalist accumulation depended.

She identifies two routes that the colonial power could take in ensuring a labour supply, free labour and coerced labour. So, from the colonial capitalist perspective, slavery offered another solution to Wakefield's problem, but Marx does not follow up this line of thought. Taking another direction again, both to the turn taken by Marx from Wakefield and by Harvey: capitalism's colonization should be seen as an expanding frontier of expropriation; what constitutes the capitalist mode of production mutates to exploit labour in different ways as it expands geographically, as it occupies new territories, and the land and peoples it "discovers" there, subordinating them for its own purposes.

Free Labour and Subjugated Labour at the Multiple Birth of Capitalism

The "original sin" of capitalism was not one immaculate conception; it was multiple rape. The dispossession of the producer from their means of subsistence was not just one transition, at one place at one time in one way, but a series of struggles in many places, at many times, and in many ways. It was a contradictory accumulation of transitions over a historical epoch. This is the argument sketched out by Immanuel Wallerstein who wrote not of one unique transition from feudalism to capitalism but many transitions by which the expanding capitalist world economy both incorporated and rendered internal processes such as the "proletarianization of labour and commercialization of land" (1976, p. 278). Wallerstein's work founded the world system approach, which was largely coincident with many Latin American authors of the dependency school that crystallized independently in the late 1960s and 1970s.

In direct critical contrast, Robert Brenner insists that the birth of capitalist production took place specifically in the English agriculture around the sixteenth century (Brenner 1985). Basing his argument on a selective reading of Marx's primitive accumulation chapters, Brenner emphasizes class structure, power relations, and class struggle as the explanation over the

alternative demographic model (population changes) and the commercialization model (increased trade). He sees "surplus-extraction relations" as conflictive property relations in a declining serfdom. Peasant resistance to feudal landowners resulted in some being expelled from ties to the landed estates; they became free labourers. Thus there arose an agrarian capitalism, involving a tripartite relation between landlord, capitalist tenant, and wage labour that succeeded to replace serfdom in England, Brenner argues, because of its greater productivity. These conditions both freed up labour and created a home market:

> English economic development thus depended upon a nearly unique symbiotic relationship between agriculture and industry. It was indeed, in the last analysis, an agricultural revolution, based on the emergence of capitalist class relations in the countryside, which made it possible for England to become the first nation to experience industrialization. (1985, p. 54)

The issue to be addressed here is not the concrete analysis of how agrarian capitalism emerged in England, so much as the ontological inferences that Brenner and his school built from it, especially their downgrading of colonialism's systemic role in over centuries as a long running relationship that accelerated the movement from preindustrial capitalism to manufacturing and then on to industrial capitalism (Brenner 1977).

The Brenner school sharpened its approach in opposition to the world systems theory, the classic confrontation being between Brenner and Wallerstein. This is a debate that jumps around from one point of focus to another. The literature is expertly reviewed in Spanish by Astarita (2009 [1992], 2010), who is sympathetic to Brenner, and in English by Tomich (2003), who is more sympathetic to Wallerstein. Banaji (1983, 2013) has made subtle contributions, critiquing both Wallerstein and Brenner. Seabra (2015) provides a collection in Portuguese of contributions from the dependency perspective.

Historical sequence does not confer logical priority of one phase over others in the final outcome. Yet Brenner selects one element in Marx's synthetic account of the primitive accumulation

of capital and magnifies its importance. Here Brenner is contrary to the internationalism of Marx. In Marx's own account, the combined effects of internal transitions and European colonialism are treated in a much more holistic manner. Notably in contrast to the developed capitalist mode of production itself, Marx does not specify any "laws of motion" of the primitive accumulation of capital. Adopting Hegel's notion idea here, Marx does point to the different elements of a systemic totality in movement:

> The different moments of primitive accumulation can be assigned in particular to Spain, Portugal, Holland, France, and England, in more or less in chronological order. These different moments are systematically combined together at the end of the 17th century in England; the combination embraces the colonies, the national debt, the modern taxation system, and the system of protection. These methods depend in part on brute force, for instance the colonial system. But they all employ the power of the state, the concentrated and organized force of society, to hasten, as in a hot-house, the process of transformation of the feudal mode of production into the capitalist mode, and to shorten the transition. (1976, pp. 915–916)

It hardly needs adding that by the end of the seventeenth century, the Americas had already suffered two centuries of violent colonial wealth extraction and that large parts of Africa and Asia as well as the Americas had by then been attacked by European expansionism. Thus for Marx the predatory colonial dimension was a part of the processes of primitive accumulation of capital taken as a whole. One does not need to argue that Spanish and Portuguese societies were already capitalist at the time of the conquest, but rather that they had contradictions that gave birth to a capitalistic impulse, an expansionist project seeking to profit from conquest overseas. The external expression of these societies was that they most frankly and greedily sought precious metals as the universal bearer of value. The plundering egoism of the merchant class was the freest of any constraints; obligations to the crown and the church only fuelled the conquest and the mercantile profiteering that proceeded to dominate the colonial economies.

We can now reflect on the distinction between the Brenner school and the dependency school,

which articulates a different historical experience of the birth of capitalism that connects capitalism inseparably with colonial and neocolonial extraction. One of the school's most celebrated authors, Eduardo Galeano, identified in the *Open Veins*' two different categories of labour, *free* labour and *subjugated* labour (1973, p. 147). This distinction is of course a broad generalization, but it is one of cardinal importance. If the test of capitalist social relations is restricted narrowly to the emergence of "free labour," then capitalism did not emerge in most parts of Latin America until well into the twentieth century, most typically around transport workers and other wage labourers involved in commodity export chains. If the test is subjugated labour, then we go right back to the years following the conquest onward as early capitalist enterprises, as argued by dependency authors (Bagú 1949; Frank 1971).

The Brenner thesis is one of the more unrepentant expressions of Eurocentric Marxism. Blaut critiques Brenner by looking at colonial relations in the seventeenth century, before the generalization of manufacturing and clearly before the industrial revolution and factory production. Blaut argues "the key question is this: How central was the role played by colonial and semi-colonial enterprise in seventeenth century rise of Europe and the rise of capitalism within Europe?" (1993, p. 199; see also 1992, 1999). This question refers to a central tenet of the dependency thesis that Europe became rich by extracting wealth from the Latin American colonies, thus at the same time actively impoverishing Latin America, and furthermore that the colonial enterprises were a key mechanism of value transfer. We need then to analyze the mechanisms of production behind the value transfer, how colonized labour produced the value that ended up being transferred.

The hundreds of thousands of indigenous labourers put to task digging out Potosí, as evoked by Galeano and still part of the collective memory, could hardly be described as free labour. The response from the Brenner school is that because the silver miners were not free labour, then by definition, it could not have been capital that exploited them, and so they must have been

exploited in a pre-capitalist relation. The tautology is based on the simple identity that capitalism = wage labour. This concerns the form of employment of labour power, which is important in its own right, but stops there and does not enquire into the content of the exploitation relations even though not expressed in the form of wage labour. The point is that wage labour is the simplest and most general form of the purchase of labour power in the capitalist mode of production; it is not the only and exclusive form (Wallerstein 1976, p. 280).

The question resolves to this, how does subjugated labour fit into the theory of Marx? Neither Brenner nor Wallerstein answers this satisfactorily, largely because they do not engage critically with the theoretical problematic of labour's production of surplus-value elaborated in the central chapters of *Capital* Vol. 1. The primary candidate to take the analysis deeper must be the theory of surplus-value. Brenner (1977, pp. 30–31) takes from Marx's argument in *Capital* Vol. 1 a sharp contrast between relative surplus-value and absolute surplus-value, repeating the received wisdom that capitalist production based on relative surplus-value presupposes and follows on after production based on absolute surplus-value. The Brenner school privileges "free labour," because it is considered as more productive labour, producing relative surplus-value through the employment of machinery. The upshot is that for Brenner capitalism is defined theoretically and politically based on the prevalence of relative surplus-value, without including colonial exploitation as a necessary component. This fits in the Eurocentric tradition of identifying the *essential* characteristics of the system as a whole as only those features which were first or most prominently manifest *in Europe.* This false universalization from the European experience leaves the manifestations of the birth of capitalism in the colonized world as particulars and the nexus of colonial relations of exploitation as *inessential to specifying the core relations of the mode of production.* In this way the colonial manifestations of capital accumulation are relegated to the periphery of theory, and so there is an epistemological reproduction of the core-periphery but in this case in a system of knowledge claiming Marxist heritage.

Just because a region produces commodities for the world market, argues Brenner, does not make it capitalist. He characterizes colonized Latin America as a pre-capitalist region. Compare this to the characterization by Wallerstein (1976) of a capitalist system, not a mode of production, a definition in which the production of surplus-value and the role of labour are left in the background. Brenner characterizes world system theory as ignoring the social relations of production and hence being too "circulationist" in its approach, which is overly concerned with the world market and commodity circulation, as opposed to the relations pertaining to commodity production. Wallerstein does however emphasize the international in the definition of capitalism, for he argues that capitalism starts with the formation of the world market. At least Wallerstein's perspective allows for, although he does not provide, more substantive analysis of how subjugated labour is surplus-value producing. We therefore have two incomplete sides, both miss capitalism as a colonial international social relation of production in which different forms of exploited labour power produce surplus-value as an essential of the capitalist mode of production.

Another version of the question is reposed in another classic debate: was there a significant reinvestment of profits gained from slavery into early forms of industrial capitalism in England? The pioneering work of Eric Williams (1994 [1944]) responds to this question by pointing out various mechanisms of profit transfer, for which he gives extensive evidence, but he does not analyze the conditions that created these same profits. Williams' innovation is that he treated slavery in international relation terms, but his limit is that the analysis is still not in value production terms, and this "conceptual fragmentation makes Williams vulnerable to his critics" as Dale Tomich notes (2011, p. 308). It is a fair criticism of Williams at least that he only makes a "circulationist" case of the connection between slavery and capitalism.

In contrast to Williams, while also writing from the dependency perspective, Ruy Mauro Marini stands out as the author who does look at the social relations of production of subjugated labour

in Latin America. Marini's original contribution occupied the huge gap between the Brenner and the Wallerstein camps, the one giving priority to labour conditions in Europe and the other to the market relations of colonial extraction. The gap is evidently the political economy of colonized labour and its role in international value production. Marini's grounding of unequal trade relations in labour super-exploitation in the colonies and former colonies remains the foundational breakthrough that opens up an entire field of conceptual development and critical analysis (Marini 1973). For summaries in English, see Higginbottom (2010) and Latimer (2019).

As we proceed we will find Marini's concept of labour super-exploitation provides a vital means to analyzing "New World" slavery in historical materialist terms, in their relation to Marx's theory. Before reaching that point, there are other aspects of the origins of capitalism under colonial conditions of exploitation that we need to draw into the picture.

What Class Turned Capitalist?

Each theoretical generation comes back to this argument between the internal and external origins of capitalism, in terms set by that generation's particular challenges. The Brenner-Wallerstein debate was itself a reprise of an earlier exchange between Dobb and Sweezy concerning the emergence of capitalism. We explore this briefly to bring out another important aspect of the overall picture, which is through what class did capitalism emerge? What class turned to capitalist production? Here again we find a multiplicity of answers rather than one single defining experience.

In his study of the breakup of feudalism and the origins of capitalism in Western Europe, Maurice Dobb (1963) builds his theoretical structure around the distinction of two ways that capitalist production relations came into being drawn from Marx. The specific quote from Vol. III of *Capital* reads:

> The transition from the feudal mode of production takes place in two different ways. The producer may become a merchant and capitalist, in contrast to the

agricultural natural economy and the guild-bound handicraft of medieval urban industry. This is the really revolutionary way. Alternatively, however, the merchant may take direct control of production himself. But however frequently this occurs as a historical transition – for example, the English clothier of the seventeenth century, who brought weavers who were formerly independent under his control, selling them their wool and buying up their cloth – it cannot bring about the overthrow of the old mode of production by itself, but rather preserves and retains it as its own precondition. (Marx 1981, p. 452)

The first way was from below; the immediate producer such as an artisan or a better off peasant becomes a capitalist. Procacci (1976, p. 137) exemplifies this process with the social base of Cromwell's New Model Army in England in the seventeenth century, demanding a fuller, more democratic political transition than Cromwell produced. The second way of transition into capitalism was decidedly from above. The example given here by Marx was the "putting out" system, whereby merchants controlled scattered wool weavers, who continued to work in their own household even though they were squeezed by capitalist pressure. As Marx points out, the merchant's "sway over production" was still quite limited at this point: domestically produced wool, the seventeenth century, in England. This would be an example of merely formal subsumption by capital of the legacy labour process, referred to above.

To build an entire theoretical structure of the transition to capitalism around this one quote from Marx from a chapter concerning the historical facts about merchant's capital is limiting historically and geographically. The result is an arbitrary narrowing of scope and a limited understanding of the sweep of transitions taking place to form early capitalism through a multiplicity of connected yet different paths. Evidence of Dobb's historical selectivity even as far as England is concerned comes from *Capital* Vol. 1 Chap. 13 on Cooperation, where Marx explains that by the eighteenth century, and with variations by sector, the transition "from above" began to take on different forms of division of labour in production. Colonial monopoly was a hothouse for domestic manufacture. The

eighteenth century sees the English state combining mercantile trade and slavery as impulses to *manufacturing* production, which they protected from the competition of better and cheaper cotton goods from India, in an expanding system of colonial exploitation and capital accumulation (Inikori 2002).

Merchants becoming capitalists did so primarily by bringing together the producers into a workshop or similar unit of manufacture, by putting labourers to work in cooperation within labour processes under capital's direct command. The way that capitalism emerged "from above" had moved from the scattered producers of the putting out system, which continued to persist alongside manufacture according to the sector. Significantly, Marx positions this material on the rise of manufacture not as a moment of primitive accumulation but within his conceptual determinations of the capitalist mode of production *as such* and builds its determinations around capital's direct appropriation of surplus-value from the labourers employed. To emphasize, according to Chap. 13, an early yet distinctively capitalist mode of production was present and becoming generalized through the spread of manufacturing in England in the eighteenth century. The merchants turned manufacturers were by then clearly capitalist and found their expression in the political economy of Adam Smith at the last point before industrialization. The capitalists were not yet building factories, not yet using machines comprehensively, but they were directing labour processes that relied on an increasingly extensive and minute division of labour.

We come to the evident geographical selectivity of Dobb's theoretical construction. Western Europe's centuries-long transition from feudalism to capitalism did not only occur on its own territories; colonization was a major component of this broad process. In the colonies there was not an emergence of capitalism flowing "spontaneously on the basis of the formal subsumption of labour under capital" (Marx 1976, p. 645), cited in (Brenner 1977, p. 31). To the contrary there was a world-shattering rupture, violent conquest and occupation, and a forced march from many types of pre-capitalist society to early forms of capitalist production. That is, there was a *colonial* movement from the merchant to the capitalist which involved the appropriation of subjugated labour rather than free labour. There was a distinct colonial face of the merchant-to-capitalist transition, that involved the exploitation of colonized and forced labour in the mines and on the plantations from the sixteenth century, and was based from the start on imposed forms of labour cooperation.

Furthermore the Latin American colonial experience of the transition into capitalism included a long interregnum in which the Europeans occupied the land and extracted indigenous labour tied to landed estates in a semifeudal manner and from the white settler *latifundistas* and *hacendados* classes another; now a fourth way of transition into capitalism emerged, from a class not even mentioned in the above quotation from Marx. The fourth way of transition into capitalism was also from above but through the colonially empowered *landowners* (neither the immediate producers, nor merchants) becoming commodity producers for export. The examples of this are many and become the main current in the period of neocolonial informal empire of the nineteenth century on.

Finally, for the sake of completeness for now, we can readily identify a fifth way also well known to Marx (1981, pp. 808–9) and used as a point of contrast by Galeano, which was the white settlers of North America who were granted cheap land to become proto-capitalists based on the first instance on the labour of their families. This route of the small farmer becoming capitalist echoes the rich peasant way but in a colonial setting of racial privilege based on the dispossession of the original immediate producers, fundamentally qualifying the claim that this way is as democratic as a racially exclusionary "democracy."

Summarizing this section, in addition to the two paths that Dobb highlighted in England, we have identified at least three further ways that capitalist labour relations of production were established in the American colonies: from the colonial merchant turned capitalist, from the colonial landowner turned capitalist, and from the colonial small farmer turned capitalist. Each of these paths involved different early forms of

capitalist relations with colonized labour. From this prolonged prologue, we now turn to the installment of plantation slavery in the colonized "new world."

Plantation Slavery: The "Genius" of Columbus?

Among the many things that Columbus brought with him to help colonize was the *intent* to enforce labour in order to make profit. Columbus' journal comment on 16 December 1492 was "The Indians . . .need only to be given orders to be made to work, to sow, or to do anything useful." According to Chaunu such remarks "bear the mark of genius. After such a trial and amid such anxiety and uncertainty, he could show this lucidity and this unhurried attention" (cited in Solow 1987, p. 10).

Unhurried or not, Columbus' will to command was *not* "genius" – it was part of the social formation he carried with him across the ocean. He was already well acquainted with slave production for profit, and it sat alongside the looting of precious metals as his primary motive. An orthodox textbook records that Columbus:

> Married in 1480 with Felipa Moniz de Perestrello, daughter of Bartolomé Perestrello, discoverer of the Madeira . . . [and] . . . lived some time in the possessions that the Perestrello had in Puerto Santo. (Losada 1990, pp. 20–22)

However, this sanitized version fails to record that Columbus's father-in-law was in fact a slaveholder. In the years before he set sail, Columbus had been groomed in slaveholding. Indeed behind the individual figure lies an entire inter-generational process of formation, the transmission belt of slave plantations from the Eastern Mediterranean to the Atlantic that was controlled by Italian merchants over three centuries. The westward movement dates from the Capture of Tyre from the Fatimids in 1123: "Venice proceeded to engage in the sugar industry that it found in its new possessions." Islands were preferred locations. From Crete and Cyprus, "the Italians transferred the sugar-slave complex, which they had developed as a means of colonial exploitation, to

Madeira, the Canaries, and the West African islands. . .to Sao Tome to Brazil and to the Caribbean" (Solow 1987, p. 6). It was only once the sugar-slave complex reached Madeira, by the middle of the fifteenth century, that the Genoese began enslaving peoples from West Africa. "It was black slavery that was chiefly used in Madeiran sugar production" writes Solow, who concludes that "the spread of the slave-sugar complex played a major role in the discovery and economic exploitation of America" (1987, p. 6).

If capitalist slavery had already arrived in the Americas with Columbus, it was not until the sugar plantation took hold that it really prospered. Lochardt and Schwartz reveal the sugar *engenho* in Brazil as a profit-making engine, based on exploitation. It is hard to imagine a more complete and brutal regime; these authors describe it as hell on Earth. Slaves could replace their purchase price within 3 years and were worked to death within 6 years, to be replaced by newly bought arrivals (1983, p. 218). The *engenho* was a system that had no need for children; to buy a new adult labourer from the slave traders was cheaper than to raise them. And so the voracious appetite for profit in the Americas continued the depredation of Africa, for three centuries and more. There is no sense here of a mode of labour exploitation that is concerned to generate its own conditions of reproduction; *in this regard* we are not yet at the developed capitalist mode of production creating the basis of its own reproduction.

As Moreno Fraginals (1976) details in the case of Cuba, the sugar plantation went through a series of transitions both in its technical basis, especially concerning the mechanization of sugar manufacture, and in the supply of labour. The slave plantations were set up in order to accumulate capital, by adapting a "primitive" form of obtaining their labour supply. European merchant capital did not only steal goods from other societies; it stole live human beings from the African continent and forced them to work to death in the Americas. Merchant capital moved out of circulation and into the realm of production to expand itself. In this respect the slave plantations were an advanced point, an anticipation of

how the more developed forms of capitalism would operate as a mode of production, in that labour power was a commodity that had been obtained solely because it was the source of surplus-value and hence profit.

Theorizing Plantation Slavery: Moving Beyond the Impasse

The primitive accumulation of capital involves different processes, one is direct looting of resources that are then sold as commodities for profit; this is what the *conquistadors* and the Atlantic slave traders did; another is putting the enslaved Africans to work, creating surplus-value to be realized and spent as revenue or accumulated as capital. The various processes that Marx summarized as the primitive accumulation of capital were not all pre-capitalist; rather they constituted capitalism in its becoming, the early stages of capitalism as a mode of production. The processes were the original accumulation *of capital*. The slave plantations from the beginning demonstrate major characteristics of capitalist enterprise: the purchase of labour power, setting enslaved labour to work in order to produce commodities for sale, and the realization of a profit. How then do we conceptualize enslaved African labour in terms of the production of value and surplus-value?

What is at issue here is not so much the description of slave plantations as work to death camps but testing the limits and adequacy of Marx's concepts as applied to those conditions. In her analysis of the Jamaican plantation, Abigail Bakan gives a well-articulated version of a standard Marxist view. She rightly argues that:

> The critical feature in defining the capitalist mode of production in the historical sense is not the presence of wage labour as a phenomenon, but the *social relationship* between wage labour and capital. The distinct feature of the wage labour form is not primarily how it is paid for, but that it stands, in Marx's terms, as "capital-positing, capital-producing labour." (1987, p. 77)

Bakan also rightly distinguishes different uses by Marx of the term capitalist "mode of production," which she designates as either the entirety or the particular, in which "each historical instance is a distinct 'mode.'" From this dual definition of mode of production, a dichotomy between the historical and the technical follows:

> Jamaican slavery can be identified as part of the general historic epoch during which capitalism became predominant as a "mode of production" on a world scale. Yet the specific form of labour exploitation was not marked by the wage labour/capital relationship. In the *technical* sense of the concept, Jamaican plantation slavery therefore cannot be considered to be a capitalist "mode of production." (1987, p. 74)

And again, the theoretical framework:

> must point out not only the similarities between slave and free labour in the capitalist mode of production in the historical sense, but also the features which differentiate them from one another as modes of production in the technical sense. (1987, p. 85)

Depending on how one defines the capitalist mode of production, slavery is part of it, or not. It is at this point the analysis peters out, for Bakan has reached an impasse, from which there is no escape within the premises of the argument. Bakan takes seriously the question of slavery's correspondence with surplus-value and searches for a theoretical grounding in absolute surplus-value:

> Plantation production was based on absolute surplus-value, though it differed from the classic form Marx describes in *Capital*. (1987, p. 74)

Bakan recognizes the need for an analysis of nonwage labour in the capitalist mode of production, but here we come to sticking point of an analysis that modifies Marx's existing categories marginally rather than moving beyond them in a necessary determination. *The production of surplus-value by enslaved labour cannot be fully understood by the two categories of absolute surplus-value and primitive accumulation alone*, for two major reasons. In the first place, as Moreno Fraginals (1976) demonstrates, the production of sugar involved increasing labour productivity, that is, relative surplus-value is also necessarily part of the valorization process on the slave plantation. Secondly, to resolve the conceptual impasse, a further determination is needed.

What is missing between two senses of mode of production presented as the universal and the particular is the intermediate concept of *mode of exploitation*, a concept present embryonically in Marx in his contrast of the slavery of antiquity with modern capitalism (1981, p. 923). Slavery as a mode of exploitation was qualitatively different to wage labour and cannot be reduced to it without eliding the racial oppression involved. The enslavement of African labour had specific characteristics of white supremacy within the capitalist mode of production (in the broad sense), with its own contradictions. The enslaved labourer did not own their labour power; they were owned and sold by another. The commodification of their labour power involved the capture of their body and the commodification of their entire being, including the capacity to labour. The enslaved labourer's entire life, not only their working life, was lived under the racial domination of the exploiting class.

If not a combination of primitive accumulation and absolute surplus-value, in what theoretical terms were the plantation system a capitalist labour process? Plantation slavery was a colonial form of cooperation adopted in the period of capitalist manufacture that had many similarities as well as crucial differences with it. Marx sums up the chapter on cooperation as follows:

> In the simple shape, as investigated so far, co-operation is a necessary concomitant of all production on a large scale, but it does not, in itself, represent a fixed form characteristic of a particular epoch in the development of the capitalist mode of production. At the most it appears to do so, and that only approximately, in the handicraft-like beginnings of manufacture, and in that kind of large-scale agriculture, which corresponds to the period of manufacture, and is distinguished from peasant agriculture, mainly by the number of the workers simultaneously employed, and the mass of the means of production concentrated for their use. Simple co-operation has always been, and continues to be the prevailing form, in those branches of production in which capital operates on a large scale, and division of labour and machinery play but a subordinate part. (1976, pp. 453–4)

We have seen that the first appearance of the capitalist mode of production in manufacturing occurred in the sixteenth to eighteenth century.

Marx shows that cooperation between labourers in the labour process, the creation of the collective workforce, can have major advantages for capital over leaving the work to be carried out by fragmented individual labourers. In the first place, bringing the workforce together in simple cooperation, even when the workers each do the same kind of work, can create advantages in terms of labour productivity.

Beyond that, in industries where critical moments occur, such as at harvest time, cooperation allows for a "large mass of labour to be thrown into the field of production" (Marx 1976, p. 445). Marx points out that the twofold nature of capitalist direction of social labour – "on the one hand, a social process for the creation of a product, and on the other capital's process of valorization" (1976, p. 450) – means it must be despotic. Even as wage labourers, the workers' cooperation is not voluntary. Marx identifies two forms of division of labour in the manufacturing system, depending on the nature of the article produced. The concept of increasing relative surplus-value therefore does not depend exclusively on machine production but rests initially on reorganization of the labour process under capitalist direction. Moreover, it is clear that Marx distinguishes two forms of the capitalist mode of production and two periods in its history, precisely around this point. This is the transition from manufacture (Chap. 14) to machinery and large-scale industry (Chap. 15).

Many of these insights can be applied with appropriate modification to the analysis of colonial plantation slavery in its different forms. Except cooperation in the labour effort took place on the premise of force at every step and in every sinew (Craton 1974). Marx designates the separation of the mental and the manual as a product of the division of labour in manufacture. The further special product of the division of labour on the plantation was the separation of the overseeing parties who would perpetrate violence and those who received it. The calculated use of force was a constant lever in production.

This argument has already been made in more detail in the work of Sidney Mintz, who writes:

The seventeenth century was preindustrial; and the idea that there might have been "industry" on the colonial plantation before it existed in the homeland may seem heretical. First, it has been conceived of as predominantly agricultural because it was a colonial enterprise and manned mostly by coerced, rather than free, labour. . .. It may seem a topsy-turvy view of the West to find its factories elsewhere at so early a period. But the sugar-cane plantation is gradually winning recognition as an unusual combination of agricultural and industrial forms, and I believe it was probably the closest thing to industry that was typical of the seventeenth century. (1985, p. 48)

The one difference I have with this is to lower the claim, to deliberately align it to manufacture in Marx's terminology rather than the factory.

Conclusion

The becoming of industrial capitalism from pre-capitalism passes through both the manufacturing workshop and the slave plantation. The availability of colonized, subjugated, and enslaved labour was, just as much as free labour, a presupposition of the capitalist mode of production. The original sin of colonial capitalism was twofold: violent plunder and the plain robbery of accumulated wealth, followed by ruptures that tore labourers away from their homelands and communities and threw them into labour *for the purpose* of their exploitation. The combination of profit-making and force renders colonial slave enterprises open to conflicting interpretations. On the one hand, the systematic use of force by the masters on the enslaved could disallow the relation to be considered capitalist; on the other hand, the formation of the relation was clearly impelled by the profit motive.

The social relation between plantation master and the enslaved Africans in the Americas was forged under conditions of a colonial capital accumulation. The enslaved labourers produced value and surplus-value through commodity production. Plantation slavery is best interpreted within a Marxist framework as a form of colonial capitalist enforced "cooperation," with many features similar to manufacture, but with the key distinction of racial violence that has the purpose of even more exploitation through domination. Sugar

plantation slavery is here considered akin to the manufacturing workshop in England, an early form of capitalism with a single point of command and a division of labour set in motion to accumulate capital, although still not yet with the generalized use of machines. The plantation was not quite the factory in the field, but rather the workshop in the field.

For this reason it is not enough to leave the theoretical definition of plantation slavery outside the internal relations of the capitalist mode of production, as an element of the original accumulation of capital, or as a pre-capitalist form as does Brenner. The form has to be analyzed in terms of value production and surplus-value expropriation. Although Marx did not make this analysis, he provides us with the tools and methodology to do so. But we also reached the limits of a literal application of Marx to the problem.

We have shown how selective readings of Marx are used to validate a Eurocentric reading. However we have not yet solved the problem beyond that critique. Within the conceptual framework of *Capital 1*, there remains a problem which is the limitation of the concept of surplus-value to absolute surplus-value and relative surplus-value. It has been argued that on the one hand, the enslavement of Africans was an early form of the capital labour relation, hence of the production of surplus-value, and yet on the other hand, the categories of surplus-value from Marx are in and of themselves insufficient to explain the relation. If we are to use Marx, it must be in a modified way. Based on the work of Marini, we have opened up the argument that as a mode of labour exploitation, plantation slavery combined absolute surplus-value, relative surplus-value, and intense labour within an envelope of violent *racial super-exploitation* of the workforce.

For close on four centuries, enslaved Africans in the Americas produced value and surplus-value for the Europe-centered world capitalist system. This essential truth concerning racial capitalism should be beyond denial. This chapter thus fits well with other readings of "racial capitalism" from its origins in Europe (Robinson 2000) to the nineteenth century "second slavery" serving industrial capitalism (Johnson 2017: Tomich

2017), to imperialism and white supremacy in South Africa, and to the structural reproduction of racial oppression in contemporary capitalism (Bhattacharyya 2018).

This analysis suggests a reversal of Robin Blackburn's view that slavery was an "extended primitive accumulation" lasting well into the nineteenth century (1997, p. 572). The length of extension is not in issue, it is the connotation of primitive accumulation that is misleading. The current presentation conceives colonial plantation slavery from the sixteenth century on as an early if particular form of capitalist super-exploitation. Adapting the more apposite term "para-industrial," also from Blackburn (1988, p. 520), the capitalist colonial slavery mode of exploitation corresponded to a form of *para-manufacture* that did indeed persist over centuries as a node of value production within mercantile and then industrial capitalist systems.

Labour productivity in an agricultural context involves another aspect, the climate and fertility of the land appropriate to the crop, and what this means for capitalist surplus-value production. Plantation owners sought to increase productivity by moving to new lands, either on the same island or in new territories. This aspect is noted here as a limitation of the present study; it became all the more important in the rapid expansion of cotton production to meet industrial demand.

We will see further that subjugated or super-exploited labour in the Americas is not only an artifact of the original accumulation of capital that is later converted into free labour under the wage form; rather it is a continuing essential feature of the capitalist mode of production, which is reproduced as capitalism reproduces its class relations on a world scale.

Epeli Hau'ofa (1939–2009)

Holger Droessler
American Studies at Harvard University, Cambridge, MA, USA

Definition

Epeli Hau'ofa was a Tongan-Fijian activist, writer, and scholar. Criss-crossing the Pacific in both life and work, Hau'ofa became one of its most prominent advocates. To many scholars of the Pacific, he is best known for his essay 'Our Sea of Islands', first published in 1993.

Epeli Hau'ofa was a Tongan-Fijian activist, writer, and scholar. Born to Tongan missionaries in the Australian-administered Territory of Papua in 1939, he attended school in Papua, Tonga, and Fiji before entering the University of New England in Armidale, Australia. After a stint at McGill University in Montreal and in the West Indies, he returned to Australia to study social anthropology at the Australian National University in Canberra. His PhD thesis, directed by Marie Reay and Michael Young, was published in 1981 under the title *Mekeo: Inequality and Ambivalence in a Village Society*. After teaching at the University of Papua New Guinea, Hau'ofa became a research fellow at the University of the South Pacific (USP) in Suva, Fiji. From 1978 to 1981, he was appointed deputy private secretary

to His Majesty, Tupou IV, King of Tonga, in charge of keeping the palace records of Tonga. In 1981 he returned to academic life and became the director of the newly created USP Rural Development Centre in Tonga. Hau'ofa returned to Fiji in 1983 to become head of the Department of Sociology at USP's main campus in Suva, teaching sociology and anthropology. In 1997, Hau'ofa became the founding director of the Oceania Centre for Arts and Culture at the USP in Suva. A naturalised citizen of Fiji, he died in Suva in 2009.

Criss-crossing the Pacific in both life and work, Hau'ofa became one of its most prominent advocates. To many scholars of the Pacific, he is best known for his essay 'Our Sea of Islands', first published in 1993. In this much cited piece, Hau'ofa criticised the long and fraught history of outlanders belittling Pacific islands and their peoples and thus robbing them of control over their future. Stressing the power of Pacific traditions, Hau'ofa argued that there is 'a world of difference between viewing the Pacific as "islands in a far sea" and as "a sea of islands"'. Oceanians (Hau'ofa's preferred term) have long thought of themselves as ocean peoples whose shared home – the Pacific Ocean – connected them through ancestral myths, seafaring, and trade. It was only when 'continental men' from Europe and North America came to the Pacific that this interdependent 'sea of islands' came to be reduced to 'islands in a far sea'. The long-term effects of this symbolic (and often very material) violence on Oceania and its peoples, he noted, were still visible in contemporary debates about the political, economic, and environmental future of the region. For Hau'ofa, 'smallness is a state of mind' and needed to be overcome to achieve a more self-determined future for Oceania. He concluded his essay by proclaiming: 'We are the sea, we are the ocean, we must wake up to this ancient truth and together use it to overturn all hegemonic views that aim ultimately to confine us again, physically and psychologically, in the tiny spaces that we have resisted accepting as our sole appointed places, and from which we have recently liberated ourselves'. For him, decolonisation of Oceanian minds was far from complete with the

achievement of political independence. Ultimately, the rebirth of Oceania would begin with the rediscovery of its rich communal past.

Hau'ofa's powerful call for solidarity and its lucid presentation in several speeches reverberated across the region. Many Pacific islands had gained their formal independence between the 1960s and 1980s (from Western Samoa in 1962, Tonga and Fiji in 1970, to Vanuatu in 1980), but long-established political and economic dependencies were harder to leave behind. Economic advisors, non-governmental activists, and government officials from the West descended on the Pacific to help 'develop' the region. It was in this context that Hau'ofa's essay intervened with a powerful call for Oceanic solidarity based on a proud history of inter-island exchange. He repeated and refined his argument in other essays and soon matched his rhetoric with institution building. After complicated negotiations with university administrators and donors, the Oceania Centre for Arts and Culture opened under his leadership at the USP in Suva in 1997. As the Centre's founding director, Hau'ofa became the mentor for a whole generation of aspiring young artists, writers, dancers, and musicians from all parts of Oceania.

Hau'ofa's involvement with the Oceania Centre for Arts and Culture was the culmination of a lifetime spent in the productive spaces between academic research, political activism, and creative writing. To many Oceanians outside of the academy, he is best known for his satiric writing in verse, and both short and long prose. In his short story collection *Tales of the Tikongs* (1983), and his only novel *Kisses in the Nederends* (1987), he poked fun at the contradictions of contemporary life in the Pacific. From the Christian orthodoxy of his missionary parents to the myth of the 'lazy native' still persistent among many outlanders, Hau'ofa's narrative voice used comic allegory and biting self-irony as weapons in the fight against economic exploitation, political corruption, and individual irresponsibility. His satirical fiction drew on Tongan tall tales, which rely on humour and self-deprecation to critique individual and institutional misbehaviour. In his own words, Hau'ofa attempted 'to translate into writing the

cadences of sounds produced in the islands by story-tellers, preachers, orators, people in supplication, people giving orders, arguing, quarrelling, gossiping and so forth' (Hau'ofa 2008: 108). He saw himself as a clown who liked to laugh a lot, and his creative writing brimmed with anarchical laughter about the absurdities of modernity in Oceania. In the opening story of *Tales of the Tikongs*, for instance, Manu, our guide on the fantasy island of Tiko, challenges an old preacher by claiming: 'Our people work so hard on Sunday it takes a six-day rest to recover'. As proof, Manu tells the story of his great relative Sione Falesi, who prefers playing cards with his secretary instead of securing foreign aid for his island. In stories like these, as in Hau'ofa's more explicitly political non-fiction, 'truth comes in portions, some large, some small, but never whole' (Hau'ofa 1983: 7).

Hau'ofa's biography around the Pacific world – from his birthplace in Papua to his education in Australia to his chosen home in Fiji – informed his creative and political work between disciplines and identities. He persistently cultivated his status as an outsider – to academic circles, church communities, and the political and class establishment at large. Fluent in several Pacific languages (including New Guinea Pidgin, Tongan, and Fijian), he not only moved from island to island, but also from genre to genre. His creative writing began early in youth and continued to evolve in dialogue with more academic and political work. During his time in Tonga in the late 1970s, for example, Hau'ofa edited a bilingual literary magazine, *Faikara,* in collaboration with his longtime wife Barbara. Besides short stories and an autobiographical novel, he also wrote numerous poems about nature, colonialism, and belonging (many of which were first published in the groundbreaking literary magazine *Mana*). Like other writers from the Caribbean (such as Édouard Glissant), Hau'ofa saw a productive tension in fearlessly straddling genres and adopting different masks. And like other Oceanian writers of his generation (such as the Samoan author Albert Wendt), he combined a firm rootedness in his local environment with a cosmopolitan approach to the global challenges Oceanians confronted. Hau'ofa's

attention to place and scale was visible from his anthropological thesis on the social relations of the Mekeo in Papua New Guinea to his later political speeches and essays on the need for an expansive Oceanian community.

Hau'ofa's historical and political diagnosis of the state of Oceania shone through in both his fiction and non-fiction. For him, three C's shaped the lives of people in Oceania, mostly for the worse: colonialism, Christianity, and capitalism. As he put it in 1984: 'To me the most unfortunate things that colonialism, Christianity, and international capitalism have given to the Pacific Islands have been, first, the transformation of hitherto self-sufficient, proudly independent people into wards of rich and powerful countries; and, second, as a consequence of forced dependence, the compulsion on people to compromise their integrity and use all manner of trickery in order to survive in an economic and political world over which they have no meaningful control' (Hau'ofa 2008: 106). According to Hau'ofa, the psychological damage done to Oceanians by colonial exploitation – political, economic, as well as spiritual – outlasted the end of formal colonial rule. As became particularly clear in his fiction, his sympathies lay with the underdogs who were trying to do the best with what was done to them. Much of his popularity in Oceania and beyond can be attributed to this heartfelt identification with the victims of Euro-American imperialism. As he acknowledged himself in an interview: 'For me, this capacity for laughter, for grabbing moments of joy in the midst of suffering, is one of the most attractive things about our islands' (2008: 139).

If Hau'ofa clearly differentiated between elitist and grassroots perspectives on the future of Oceania, he was acutely aware of (and uncomfortable with) his partial complicity in the former. After his return to Tonga in 1978, he found himself 'an Expert on more things than I care to enumerate' (Hau'ofa: 103). After all, he was one of only two residents in Tonga with a PhD. As evidence, he cited his study of overpopulation and environmental challenges in Tonga, *Our Crowded Islands* (1977), initially a 'ten-or-so-page paper . . . miraculously transformed into a forty-page mini-picture book that instantly established me as an Expert on

population problems and environment' (Hau'ofa 2008: 103). As adviser to the Tongan King, Hau'ofa certainly exerted considerable influence on top-level policy decisions, at least for a few years. As an academic and university administrator at the USP, he also helped shape the educational future of the region.

Hau'ofa's call for Oceanian unity against continuing Euro-American imperialism has not remained unchallenged. As the protracted struggles to establish educational and political institutions in Oceania have shown, forging unity across such a vast ocean remains a formidable challenge. Some scholars have charged Hau'ofa with downplaying longstanding cultural, political, and economic differences and antagonisms among Oceanian islands and their peoples. Conflicts among Samoans, Tongans, and Fijians, for example, reach back as far as the distant genealogical past, but continue to inform present-day interactions, including those taking place far away from the islands themselves. Hau'ofa's vision of a powerful 'sea of islands', other critics objected, amounted to little more than 'postcolonial utopianism' and risked foundering on the shoals of self-interested *realpolitik*. Hau'ofa, for his part, treated such criticism with characteristic self-deprecation when he quipped: 'I have written very little in fact, and the little that I have written has had no impact on anyone or anything' (2008: 102). His self-belittlement revealed itself most clearly as the mask of a skilled artist when he wrote about the natural environment of the Pacific.

For Hau'ofa, the vast expanse of the Pacific Ocean served as the basis for a common regional identity among Oceanians. In his essay 'The Ocean In Us' (1997), he returned to his earlier argument in 'Our Sea of Islands', founding his vision of Oceanian unity on the common inheritance of the sea: 'An identity that is grounded in something as vast as the sea should exercise our minds and rekindle in us the spirit that sent our ancestors to explore the oceanic unknown and make it their home, our home' (Hau'ofa 2008: 42). Reminding his audience of the courage of earlier generations, he called for solidarity among Oceanians to confront the challenges of an endangered natural environment that knows no post-colonial condition. Faced with rising water

levels, deep-sea mining, and droughts, many Pacific Islanders bear the brunt of climate change and environmental exploitation mainly driven by the large and growing economies that encircle their ocean. Present developments, Hau'ofa made clear, have to be seen within the longer history of ecological imperialism in the Pacific. Then as now, the people living on the islands most affected by these environmental changes were rarely asked for their opinion. Against this reality of disempowerment, he proposed a radical return to the natural environment that surrounds Oceanic peoples. Echoing Derek Walcott's dictum that 'the sea is history', he captured his vision in the essay's last paragraph: 'The sea is the pathway to each other and to everyone else, the sea is our endless saga, the sea is our most powerful metaphor, the ocean is in us' (2008: 58).

Oceania's natural environment played a central role in Hau'ofa's personal life as well. Upon his return to Fiji in the early 1980s, he bought a farm in the hills of Lami and enjoyed the relative quiet of the countryside just outside Suva. And when this exuberant spirit ceased his lifelong wanderings across Oceania in 2009, his body found its final resting place in the womb of the land he so loved.

Definition

Imperialism is a global economic system based on the exploitation, oppression, and sometimes outright colonization or occupation of less developed countries by aggressive more developed ones. Social imperialism is "socialism in words, imperialism in deeds," or imperialist practices disguised by revisionist, falsely socialist rhetoric as practiced (according to certain schools of thought) by the Soviet Union in the era of its decline in the 1960s, 1970s, and 1980s.

Description

Before the 1970s, imperial Ethiopia was politically aligned with the agenda of US imperialism in Africa as well as dependent on it for arms and aid. A mass uprising in 1974 challenged the rule of the authoritarian emperor and demanded democratic reforms. But the revolution was hijacked by the shadowy military committee known as the *Derg* which soon found itself at war with much of the civilian Ethiopian left and various national liberation movements including the one in Eritrea on the Red Sea coast. The *Derg* began to institute dramatic economic reforms tempered by an appetite for strong social control and repression. After a 1977 coup, the military regime moved sharply to the Soviet sphere of influence, leading leftist

opponents of the regime to charge the USSR with "Soviet social imperialism" and military aggression. This article examines the roots of the 1974 revolution, the conflict between revolutionary forces and the new government, a debate over the meaning of socialism itself, and the implications of Soviet domination and influence up until the fall of the *Derg* regime in 1991.

In the 1960s, Ethiopia was a strong ally of the United States on a continent undergoing a historic transition away from European domination. Its military was dependent on American aid, its policies in line with US imperialism's aggressive agenda for the continent as it emerged from colonization: It lent, for example, troops to the imperialist mission in the Congolese civil war. Yet the following decade, Ethiopia was to host thousands and thousands of Cuban troops, hundreds of Soviet advisors, and was allowing the Soviet Union to advise it in remaking its economy and political order on the model of other Soviet client states in the global south.

What happened? Was socialism taking a step forward in Africa?

While the military government that ruled the country starting in the mid-1970s would have answered "yes" to this question, a deeper look at Ethiopia's 1974 revolution and its aftermath reveals a far more complicated story. Civilian Ethiopian leftists opposed to that military regime talked about the USSR as they had once talked about the United States:

> The Soviet Social imperialists are striving frantically to turn Ethiopia into their colony and to exploit our people blindly. At the same time, the Moscow hegemonists are advocating the 'sanctity of Ethiopia's frontiers' as if they had not been the most notorious violaters of other nations' frontiers. The aim of the social imperialists is quite clear — they want to control Ethiopia and at the same time they want to assure that 'their' Ethiopia assumes full control of Eritrea as Moscow needs the Red Sea ports as part of its grand hegemonist design in the whole region. Thus, the social imperialists manoeuvres vis a vis Eritrea. (EPRP Foreign Committee, "Eritrea: The Soviet Manoeuvre Must Fail!!," *Abyot*, Vol. 3, No. 2, Feb–Mar. 1978)

So, what actually happened? What was the actual story of the Ethiopian revolution? Could it be that the Soviet Union actually replaced US imperialism as regional exploiter and predator?

Of all the nations in Africa, only the empire of Ethiopia successfully resisted European conquest. The 1896 defeat of an invading Italian army at Adwa by the Ethiopian emperor Menelik and his warrior consort, empress Taitu, was a rare military and diplomatic triumph that allowed Ethiopia's ancient and complex feudal society to survive into the twentieth century. While the Italians and other Europeans clung greedily to border and coastal regions surrounding the empire, Ethiopian sovereignty over most of the country was preserved until the eve of World War Two when Mussolini's legions exacted a brief but gory revenge. When the calls to defend Ethiopia – or Abyssinia as it was often known – from Italian fascism in the 1930s seemed to stir only global communities of the radical and far-sighted, the resulting occupation lasted only a few short years but inflicted a heavy human toll. By some estimates, 7% of the population perished.

In the aftermath of the war, the coastal region of Eritrea was first federated to and then annexed by the restored Ethiopian empire, having been ruled separately by Italian colonists for decades. As decolonization swept the continent through the 1950s and 1960s, Emperor Haile Selassie shrewdly positioned his regime as its champion and as a proponent of African Unity. But he also positioned himself as a pro-Western bulwark against the advancing tide of African socialism gaining widespread support in the continental independence movement. Ethiopian troops fought in the UN coalition during the American war against the People's Democratic Republic of Korea in the early 1950s, and as mentioned earlier, in Congo in the 1960s. The emperor forged close political relations with the United States and Europe, but he did also maintain cordial ties with the avowedly anti-imperialist camp of the Soviet Union, the People's Republic of China, and smaller players such as Tito's Yugoslavia. His travels became legendary, one minute being fêted in Washington, the next in Moscow and Beijing.

By 1960, sharpening political contradictions led to an abortive military coup, quickly drowned by the regime in blood but exposing cracks in the façade of an otherwise tightly controlled and managed society. Facing the obvious challenges of modernization in the context of the heavy pressures of neocolonialism, the emperor prioritized higher education, seeing it as a kind of factory for turning the children of the country's nobility and upwardly mobile classes into docile technocrats. But within a few years of the 1960 coup, the student community he had allowed to grow began to transform itself into a mass political opposition movement. In 1965, a secretive radical student group called The Crocodile Society emerged. Its first action was a demonstration of several 1000 calling for "Land to the Tiller," and other democratic reforms in a country dominated by feudal land tenancy schemes.

Over the next few years, fueled by contact with the global student movement of the late 1960s, a mass Ethiopian student movement soon widely embraced extraordinarily radical politics. In a country without legal political parties or freedom of the press, the student movement – cross fertilized by the thousands of Ethiopian students who were completing their education in the universities of North America, Europe, and the Middle East – began to fully embrace a spectrum of radical politics ranging from anti-imperialism to outright Marxism-Leninism. Student journals were transformed into forums of revolutionary debate. Openly inspired by everyone from the Vietnamese fighting American aggression, to guerrilla hero Che Guevara, to the nascent Black Power movement in the USA, to the canon of revolutionary literature written by the likes of Marx, Lenin, and Mao, the student movement began to strategize what it would take to end imperial rule. (See Bahru Zewde's *The Quest for Socialist Utopia: The Ethiopian Student Movement* for further detail on the Ethiopian Student Movement.)

A 1968 resolution presented by the World-Wide Federation of Ethiopian Students to a Vietnam Solidarity conference in Europe gives the flavor of the student movement's deepening anti-imperialist mood:

> Believing that US government is a war criminal in Vietnam murdering and slaughtering heroic people of Vietnam who are fighting for national salvation...Realizing that the so called US aid is

a tyrannical instrument for plundering and subverting the economic development of recipient countries…Believing that the US government does not protect the rights of the Afro American of the USA, [We]…Support with all things we can master the heroic people of Vietnam to see that the American aggressors are shamefully defeated, Alert all the people of the world to defend themselves against US aggression, cultural, political, economic and military as well, Support Stokely Carmichael and the Black Power Organization, we confirm our resolute determination to fight American imperialism and its running dogs. Down with US imperialism and its lackeys!… Vietnam Is Our Example. (WWFES Flyer, "Solidarity! Solidarity…" Feb. 2, 1968)

That same year, Ethiopian students studying in France secretly formed the All-Ethiopian Socialist Movement, known by the Amharic acronym *Meison*. Led by a young linguist named Haile Fida, the group would spend the next few years in the shadows building an underground network of activists in the diaspora student movement in Europe and the United States. Like an increasing percentage of the global revolutionary left in that moment, its politics looked more toward the militancy and confrontationalism of Mao and People's China than to the accommodationist *realpolitik* of the Soviet bloc.

But even at home, leaders of the student movement began openly suggesting that it transform itself from a movement of students into a party of professional revolutionaries. Revolutions, after all, are not made by students, at least, not alone. The rule of the emperor himself was questioned, as was the right of Ethiopia to rule over the patchwork of ethnic and national minorities in its border regions. Open sympathies were expressed for rebellious peasants, and even for separatist rebels in the northern province of Eritrea. That key strategic area, now that it had finally been formally annexed by the emperor, was home to the Eritrean Liberation Front (ELF). The ELF was at first a small guerrilla force building support largely among Eritrea's Muslim population and aided not only by nationalist Arab regimes but by the People's Republic of China. The imperial response to that rebellion included a vicious anti-insurgency campaign by the US- and Israeli-armed and trained Ethiopian military that didn't hesitate to target civilians.

The Eritrean liberation movement rejected Ethiopian sovereignty of Eritrea completely, even suggesting that the historical relationship between the two nations was overstated, and that its incorporation into Ethiopia was the fruit of imperialist manipulation. An ELF statement read, "Modern imperialism in tight control of the empire-state which Haile Selassie inherited demanded an outlet to the sea. And Ethiopia's 'legitimate need for adequate access to the sea' was precisely formulated by the USA and its satellites for the common imperialist interest" (ELF Foreign Information Bureau, *The Eritrean Revolution: 16 Years of Armed Struggle*, Beirut, 1977). The Eritrean rebel analysis eventually came to understand Eritrea not just as an issue of a national minority demanding self-determination but as an issue of Ethiopian *colonialism* over a captive nation.

The student movement experienced a watershed moment in its radicalization in 1969. Student leaders were jailed for publishing attacks on the emperor. A small group of Ethiopian students led by a founder of The Crocodile Society, Berhane Meskel Redda, hijacked an airplane from Ethiopia to Khartoum in neighboring Sudan. The group soon set up shop in revolutionary Algiers, building an exile base for a future revolutionary organization and hobnobbing with other exiled revolutionaries including the US Black Panther Party and representatives from dozens of national liberation movements from across the globe. It pitched its cause without much success to representatives of Cuba and People's China; in the end, finding some material support from the Palestinian resistance. Fighting for political hegemony in the diaspora student movement, this group would go on to form a second secret and clandestine revolutionary organization that would eventually call itself the Ethiopian People's Revolutionary Party (EPRP). Their first official congress was a small meeting in West Berlin in 1972; by 1975, they formally announced themselves as a full party with a congress in Addis Ababa. (See Kiflu Tadesse's extraordinary *The Generation*, Parts 1 and 2, for a full account of the rise and fate of the EPRP.)

The end of 1969 was marked by the assassination by presumed government agents of Tilahun Gizaw, the very popular head of the student body at Addis Ababa University. Imperial repression spiked: mass gatherings to protest the assassination were met with live fire, killing dozens. The government used arrests and temporary university shutdowns to tamp down the movement. Many, many student activists fled into temporary exile; others staying behind to spread a revolutionary message to incoming classes as well as to younger high-school students.

The early 1970s was marked by massive ideological ferment in the student movement both at home and in the diaspora. Behind the scenes, cadre from the two competing secret leftist organizations waged a struggle of words to influence the direction of the movement and prepare it for engagement with the escalating social struggle on the ground. The main differentiation between the two revolutionary Ethiopian factions at this point was that Haile Fida's *Meison* presumed a long march lay ahead of the Ethiopian left while the faction that would go on to form the EPRP believed that a revolutionary conjuncture was imminent and that the left had no time to waste in preparing for it.

In Eritrea about this same time, ELF split, generating the somewhat more radical Eritrean People's Liberation Front or EPLF. Significantly, EPLF gained significant support among Eritrean Christians, which weakened (but did not eliminate) the frequent charge that the Eritrean rebellion was just an excuse for some kind of Arab/Muslim encroachment on Ethiopian territory. Both groups fielded guerrilla forces in rural regions, eventually setting up liberated base areas.

The radical movement developed an understanding of imperialism that put it the strategic core of their message. An editorial in a journal of the Ethiopian Students Union in North America in 1971 read:

> The question of national liberation is intimately tied to the problem of imperialism. With its global system of control and its gigantic military power, international imperialism today is the most serious opponent of national liberation struggles. Without imperialism, the life span of the puppet regimes in many countries, Ethiopia included, would be much shorter…. It is therefore essential for any popular struggle, at every stage of its development, to make adequate ideological, political and military preparations against imperialism. Any movement that fails to put the question of imperialism at the heart of its calculus cannot be revolutionary. (Melesse Ayalew, "Editorial: Imperialism and National Liberation," ESUNA *Challenge*, Vol. XI, No. 1, Jan. 1971)

The oil embargo of 1973 organized by OPEC nations against Israeli allies in the aftermath of the October War had an intense effect in Ethiopia. Petrol price hikes brought taxi drivers strike to the country in February of 1974; that job action set off a chain-reaction of walkouts by teachers, students, and airline workers. Military units mutinied. Soon after, the Confederation of Ethiopian Labour Unions, or CELU, organized the previous decade with the assistance of the CIA and the American labor movement to promote labor peace, shocked the country by mobilizing a general strike of the country's small but influential urban working class. Minority Muslims, priests from the state Ethiopian Orthodox church, and even prostitutes held mass marches and protests. Revolutionary leaflets were distributed everywhere. These actions became known as the *Yekatit* revolution, after the Ethiopian month corresponding roughly to February. (See John Markakis and Nega Ayele's classic *Class and Revolution in Ethiopia* for a full examination of the 1974 revolution and the economic and social forces which led up to it.)

Haile Selassie was forced to withdraw price hikes and to reorganize his government. Liberal-minded aristocratic politicians were brought in to replace conservative ones, and by the middle of the year, a committee of mid-level military officers began to insist on its right to influence state policy. That committee of officers, its makeup and organization largely secret after the ways of Ethiopian politics, became known as the *Derg,* and the summer of 1974 is often described as the period of a creeping coup. But as the *Derg* demanded a greater role at the seat of power, the popular movements in the street did not subside: the Ethiopian population continued to politicize, radicalize, and mobilize.

While the Ethiopian workers and students had been exposed to revolutionary ideas via the student movement, most of the organizational power of the radicals was outside the country. The initial strikes were not led by radical organizations, though small collectives of leftists had begun to establish themselves. But this began to change as radical students and other exiles abroad realized the time had come to return home and put their ideas into practice. One student activist of the time, recruited to an underground leftist cell in 1974, recalled in a memoir:

> We mostly read and discussed books that were shipped from Russia and China. Ideologically, we preferred the books from China. We thought the Chinese revolution was purer and more profound, and held relevant lessons for our situations. All of us…were fascinated by how a small group of guerrilla fighters who started from a small base of operations in a remote area could finally defeat a powerful government and establish the People's Republic of China. (Mohamed Yimam, *Wore Negari: A Memoir of an Ethiopian Youth in the Turbulent '70s*; Xlibris/Self published 2013 paperback)

The group that would soon become the EPRP began to publish an underground newspaper called *Democracia*, or "Democracy." Haile Fida's *Meison* would follow suit with an underground paper called *Ye Sefiw Hizbe Demts*, or "Voice of the Broad Masses." The two groups began to raise the call for a popular provisional government, making broad democratic demands and winning substantial support among the Ethiopian population.

Parts of Ethiopia were hit by a devastating famine that year, and in September of 1974, after painting the emperor as cruel and insensitive to the starving rural masses, the military announced that it had deposed the emperor and seized the reigns of power. Haile Selassie was driven from his palace in a VW beetle to the house where he would die in powerless obscurity the following year. There was jubilation in the country, tempered by concern over the prospects of military rule. The *Derg* would mark the September coup as the revolution's actual anniversary, despite the lack, in that moment, of popular participation. To the surprise of many, the *Derg* announced

that the ruling philosophy of post-Haile Selassie Ethiopia would be something they called "Ethiopian Socialism." And with that, the great powers of east and west took notice.

The military created the PMAC, the Provisional Military Administrative Council, as a triumvirate of three officers – two of whom were members of the *Derg* – to rule the country. (Eventually, the word *Derg*, Amharic for "committee," came to refer to the military regime in general, not just the ad hoc committee established earlier that year.) Those three were Chairman Aman Andom, a general of Eritrean ethnicity renowned for liberal and progressive views, and two vice chairs, Major Atnafu Abate and the American-trained Major Mengistu Haile Mariam. The peaceful overthrow of the imperial regime was widely welcomed and celebrated, and the socialism promised by the PMAC and the *Derg* was painted in progressive, nationalistic terms. However, in November of that year, things took a dark turn when Aman Andom was killed in a shootout, and 60 prisoners, largely officials and nobles of the *ancien regime*, were executed without due process. Major Mengistu was believed to be behind the violence, but Aman Andom was replaced in the PMAC junta by another outsider to the *Derg*, General Teferi Bente. The government began to announce various revolutionary initiatives such as the *zemecha,* where tens of thousands of urban students would be sent to the countryside to evangelize the revolution (and stay out of urban protests). It announced the nationalizations of banks and many businesses, along with urban and rural property in quite radical reforms. But at this same time, it also became quite clear that the *Derg* was more than willing to use repression to silence dissent. A number of radical students were arrested, and further executions followed (Fred Halliday and Maxine Molyneux's *The Ethiopian Revolution*, and René Lefort's *Ethiopia: An Heretical Revolution?* remain excellent sources on the rise of the *Derg*, despite a discernable bias toward the military regime).

Despite the revolutionary rhetoric of socialism, the *Derg* displayed very little depth in the way of ideology. It initially remained dependent on the United States for arms, and it remained dependent

on those arms to continue its campaigns against the Eritreans and various other regional rebels. The rallying cry of the new regime, *Ityopya Tikdem*, or "Ethiopia First," served as a cry for political unity behind the new regime but also as a warning to separatists and ethnic nationalists.

The United States, facing its final defeat in Vietnam, beset by the political crisis of Watergate and its aftermath, wearily and warily watched the apparent leftward motion of the country with only half an eye, exhausted and preoccupied elsewhere. The *Derg* made ample use of anti-imperialist messaging in its appeals, despite availing itself of US and Israeli military assistance. But the *Derg* did begin to look for sponsorship and assistance from what it saw as the socialist camp, sending delegations to the USSR, People's China, and North Korea to beg for aid. Little substantial was particularly forthcoming, but Mengistu especially seemed to have begun a behind the scenes relationship with Soviet advisors. The Soviets did offer political training to members of the military, of which the *Derg* promptly began to avail itself.

The Ethiopian left began to fracture. *Meison* switched from advocacy of a democratic civilian government to a policy of supporting and advising the military regim*e*. While leftists of all stripes agitated inside the military, there is no evidence that *Derg* members had more than casual exposure to Marxist-Leninist ideology until a number of student movement veterans, members of *Meison* included, began to tutor them. Major Mengistu was one of the most apt students, becoming a quick study in using radical rhetoric to maneuver inside the new regime. Eventually, *Meison* leaders were invited into the government, acting as part of an informal *politburo* that advised the *Derg* and focused its ideological messaging. *Meison*'s leader, Haile Fida, is believed to be largely responsible for the 1976 National Democratic Programme of Socialist Ethiopia, a document intended to serve as a blueprint for the country's path to socialism.

The activists behind *Democracia*, however, formally launched the Ethiopian People's Revolutionary Party with a congress in 1975, soon attracting a mass following to its red,

hammer-and-sickle laden banners. The EPRP became fierce foes of the military regime; while they expressed critical support for most of the regime's reforms, they accused the military of hijacking the revolution, of stifling democracy, and limiting the revolution's potentials. For this they earned the wrath of the regime. They also urged peaceful and democratic resolution of the various national rebellions, eventually even advocating Eritrean independence. Their continued insistence on the right of the people to rule themselves in actuality not in formality brought them support among radical students and other young people, but also among workers in a number of industries, and even among layers of the *petit bourgeoisie* including urban traders and shopkeepers. They had mass organizations for women and for youth; they managed to win control of CELU, the trade union confederation, and when the *Derg* banned it in favor of a state-organized association, they set up a new red trade union.

A statement from pro-EPRP Ethiopian students in Europe explains the orientation of the party to revolutionary democracy:

> The demand for a popular provisional government is neither reformist nor utopian. It is a concrete demand to further the development of the revolutionary process in Ethiopia. . .. With characteristic contempt for the masses. . .the military rulers state that the masses are not conscious enough to take their destiny into their own hands. So what is the solution? The military rulers say: 'We will stay in power and make sure that the masses become conscious!' Therefore, anybody who asks for the right to organise, who demands the formation of a provisional government made up of the true representatives of the popular masses is labelled as an 'extremist' by the military and repressed as such. To all this, our masses have answered clearly by saying: 'We are conscious and we don't want an American-backed military rule.' The masses say: 'We want a popular provisional government that will be a step ahead in the bitter class struggle we are engaged in to end all exploitation.' (Editorial, "The Fight Against the Reactionary Leaders of ESUE," *The Proletariat*, labelled Vol. 1, No. 1 1974 but actually 1975, published by the Ethiopian Students' Union in Holland)

By the end of 1976, the country was increasingly riven by political divisions. The *Derg* purged its ranks, in one case executing a high-

level figure, Major Sisay Habte. It evinced little tolerance for dissent, and arrests and persecution of dissidents became commonplace. By this time the two main civilian left factions, EPRP and *Meison* had moved into opposing corners, waging fierce arguments over the future of the revolution. The arguments became increasingly heated, and laden, as *Meison* was in some ways now part of the state apparatus, with a controlling relationship to the forces of repression. At first, the arguments were civil, carried out in meetings, rallies, and in the press; pseudonymously in the mass media still formally subject to censorship, and in the pages of the two groups' underground albeit widely circulated media. But by late 1976, *Meison* apparently began drawing up lists of EPRP members to handover to local police authorities. The *Derg* began to arrest and execute EPRP members, the work itself often carried out by *Meison* members inside the state apparatus. The EPRP responded by creating an urban defense wing, initiating a campaign of targeted assassinations against government officials and *Meison* members who had snitched them out, and even making an attempt to assassinate Mengistu himself.

While both groups had roots in similar ideological circles of Marxism-Leninism, influenced by Maoism without identifying as such, the split over their respective orientations to the military regime pushed their politics further and further apart. The EPRP program, for instance, called for popular democracy and such basics as the right of workers to strike; the *Meison* program made no such promises, actually not even mentioning the military control of society that loomed over everything.

By the beginning of 1977, the faction-ridden *Derg* and the various left parties looked like they might pull back from the sectarian conflicts that were threatening something close to civil war, but bold action on the part of Mengistu nipped civil peace in the bud as he staged a coup against General Teferi Bente. The general was executed along with several of his associates, including at least one *Derg* member who was said to be close to the EPRP and urging reconciliation. A shootout after the executions took the life of an important pro-*Derg* leftist, but when the smoke cleared,

Mengistu was in absolute control of the government. While his co-vice chair survived a few months longer, he was also eventually executed.

Upon seizing power, Mengistu immediately moved to strengthen the ties of the regime to the Soviet Union. It is highly likely, in fact, that his Soviet advisors had been well aware of his plans to take control of the PMAC: on the eve of the coup, Soviet and American embassy officials held a secret meeting where the Soviet Political Counselor probed his American counterpart for US attitudes toward the regime and its "socialist" character. While Mengistu seems to have been listening to Soviet advice for some months, with the coup Ethiopia definitely moved into the so-called socialist camp of the Soviet Union. Treaties of friendship and cooperation soon followed, in turn followed by a rush of advisors and experts from countries in the Soviet bloc including East Germany, South Yemen, and most importantly, Cuba.

1977 would be a massive turning point. Upon seizing full control of the government, Mengistu began an extermination campaign against the EPRP. He eventually called it the "Red Terror," after the campaign against counterrevolutionaries in the early years after the Russian Revolution, though ironically the red-flag waving communist dissidents of the EPRP were his main target. Estimates vary, but by the end of the period of mass killings in 1978, the toll had reached into the hundreds of thousands. Torture, rape and sexual abuse, the total absence of due process, piles of corpses left on street corners, and even charging parents for the bullets used to execute their children were standard features of the terror. Soviet warnings against excess were balanced by Soviet calls for the regime to purge the Ethiopian left of Chinese influences. (See Dawit Shifaw's *The Diary of Terror* and Babile Tola's *To Kill a Generation* for more on the "Red Terror.")

The 1970s was the decade of the Sino-Soviet split. Simmering tensions had brought the former allies of the USSR and PRC to an actual brief border war in 1969. An almost generational split in the world left followed, each side examining the ideological ramifications. Whether it was simply an argument over ideology or geopolitical

positioning, those Chinese influences in Ethiopia were identified by the Soviets as a threat to the consolidation of Mengistu regime. "The Soviet Ambassador directed Mengistu's attention to the anti-socialist and even anti-Soviet (Maoist) propaganda which is being disseminating by certain private publishing houses. Mengistu declared that implementation of the program of propaganda of Marxist-Leninist ideas has indeed been unsatisfactory. . .. Concerning the Chinese, Mengistu noted that they are not only disseminating literature, but are rendering direct support to Eritrean separatists and extremists" (A. P. Ratanov, Ser. No. 276, "Notes of Conversation with Chairman of PMAC of Ethiopia Haile Mariam Mengistu," 29 July 1977; Wilson Center digital archive). Thus, the Soviets enabled the campaign of violence directed against the civilian left.

Despite its attempts to fight back, EPRP's leadership was decimated in the killings, and its presence in Ethiopia's urban areas was devastated. EPRP members fled to rural base areas of the EPRP's military wing, the Ethiopian People's Revolutionary Army, or EPRA, and attempted to rebuild and reorient their opposition to the *Derg* as guerrillas waging people's war.

Sensing weakness in the regime, those "Eritrean separatists and extremists" of the EPLF launched a massive offensive in Eritrea encircling important cities like Asmara and Massawa. And the neighboring Somali Democratic Republic, itself ruled by a Soviet-backed avowed Marxist-Leninist general, launched an invasion of Ethiopia's eastern regions in July, allegedly in support of ethnic Somali rebels. This military crisis provoked a dramatic regional realignment, with the Soviet Union openly siding with Ethiopia, abandoning its former ally in Somalia, which promptly turned for assistance to the United States. The *Derg* severed its floundering treaties and military arrangements with the United States.

Mengistu displayed an increasing unwillingness to share power with left parties he could not control. Deeply suspicious of the tight new Soviet embrace of Mengistu and sensing an imminent turn against their presence in the state apparatus, it was *Meison*'s turn to break with the military

regime. Its leaders fled into exile or into the countryside where many were soon captured. Its members were then also targeted by the "Red Terror," suffering the same kind of extreme losses that *Meison* had helped the government inflict on the EPRP. It is worth noting that both *Meison*'s Haile Fida and EPRP's Berhane Meskel Redda, former movement comrades turned mortal enemies, were captured and later executed secretly on the same day in 1978. Other small leftist parties met similar fates.

The Somali invasion was defeated with the assistance of hundreds of thousands of Cuban troops. Mengistu evoked the national spirit of the 1896 battle of Adwa and largely successfully rallied the population behind the war effort with appeals to patriotism. The Cuban regime, known in the 1960s for its support of global national liberation movements, had once postured as a friend to the Eritrean revolution. Fidel Castro outwardly claimed his aid to the *Derg* was only meant to deter imperialism; he claimed Cuban troops would not be shifted to the northern front against the EPLF. But behind the scenes, he condemned the rebels as agents of the West allied with reactionary Arab regimes, and the presence of Cuban troops in the east of the country freed up Ethiopian regulars to head north. The Soviet Union had no apparent need to make such claims; it sent skilled military advisors to help the *Derg* route the Eritrean advance directly, which it soon did. Some of those advisors were captured by Eritrean rebels.

The Eritrean advance was turned back in the late 1970s; the rebels retreating to arid base areas and one liberated town which the government never recaptured. It was not until a decade later that rebel offensives began to bear new fruit. Outside Eritrea, the left disappeared from Ethiopia's cities, its membership killed or imprisoned, the lucky survivors fleeing to guerrilla bands in the countryside, escaping abroad, or otherwise forced into silence. The EPRP's guerrilla army EPRA wound up bogged down in a conflict with the Tigray People's Liberation Front, or TPLF, a national liberation movement in the country's northern Tigray province which was closely allied to the EPLF. While the EPRP

criticized the TPLF for being "narrow nationalist," and anti-socialist, eventually a secret core of the TPLF called the Marxist-Leninist League would go on to identify itself as followers of the international line established by the late Albanian leader Enver Hoxha. The TPLF turned out to be able to win support among the peasants of Tigray province in a way that EPRP/EPLA had not been able to.

Through the 1980s Mengistu attempted to consolidate and legitimize his regime. After destroying the independent civilian left, he created the Workers Party of Ethiopia (WPE) with himself as chairman: the leadership bodies were overwhelmingly military. He created new mass organizations like trade unions, peasant associations, and women's groups. An analysis of these shows they were instruments not of popular empowerment but of social control. The models for all these groupings were the state-sponsored top-down parties and fronts that were a hallmark of Soviet-client state social organization.

Much of the conventional narrative about the Ethiopian revolution of the 1970s omits detail about the civilian revolutionary movement in lieu of a narrative of radical military seizure of power, followed by the imposition of Soviet-style socialism, lasting until the overthrow of the *Derg* in 1991. It paints the *Derg*, after the regime's own propaganda, as some kind of authentic Marxist-Leninist movement instituting popular and radical reforms while battling it out with the agents of US imperialism. And it paints Cuba and the Soviet Union as the nation's saviors in a time of need. There are a few kernels of truth within this narrative – Cuban troops did defeat a foreign invasion – but overall it is a great disservice to the actual revolutionary movement that was co-opted, stifled, and ultimately exterminated by the military regime.

While as we have seen, the Ethiopian left grew up with a deep respect for Mao and the Chinese path, they initially avoided open declarations of affinity out of the pragmatic need for solidarity from anyone who would offer it. But as the *Derg* got closer to the Soviets, and began to institute policies cribbed from modern Soviet practice, many on the left began to draw conclusions. In

understanding what was happening on the ground in that time, it is especially instructive to look at the words of the key players themselves to see how they struggled to come to terms with the radical transformation of the Soviet Union from revolutionary ally to unwelcome oppressor.

The issue of political democracy was initially central. Had not Lenin stressed the relationship between socialism and democracy? The EPRP questioned whether the Ethiopian military, fundamentally still the same armed body of men that served the emperor, had any interest in actually sharing power with the people. An article in an issue of "Voice of the Air Force," an underground publication by EPRP supporters inside the military, confronted this quite clearly as early as 1976.

> [O]fficers who say that they have gone to the Soviet Union to learn how to form a political party should stop declaring that 'democratic liberties should not be accorded to the masses during revolutionary times.' They should stop their deceitful actions because we know fully that they want to cling to power under the pretext that the 'masses are not still organised.' We know (and we did not have to voyage to the Soviet Union to know this) that 'a revolution without an organisation and an organisation without democratic liberties' cannot just come about. 'Revolution is a festival of the oppressed,' *[quoting Lenin, ed.]* and we know quite clearly that popular democracy is necessary (crucial) during the time of revolution. … We have heard that these persons taking courses in the Soviet Union have erased from Marxist books what Marx and Marxists have said on (a) the need to destroy the army set-up by the oppressing classes and build a new (people's) army and (b) the incapability of soldiers to lead the socialist revolution. Our intelligent philosophers (!) have made this revision on the ground that 'Ethiopia's revolution is different from all other revolutions'! Bravo socialists! But this is not socialism. ("Voice of the Air Force," reprinted in the EPRP's *Abyot*, Vol. 1, No. 2, January 30, 1976)

Eventually, as the hammer of repression came down upon them, the EPRP began to label the *Derg* "fascist," and the judgment of its Soviet allies became much harsher.

> Democracy, according to our party, EPRP, is not simply a means to mobilize the masses against the fascist regime. On the contrary, EPRP believes that democracy [is] a crucial feature of its internal make-up and of the kind of society that it was to establish in Ethiopia.… We do not aim to be another Soviet Union or East Germany where socialism means

dictatorship of a clan of exploiting bureaucrats over the working people. Hence, EPRP's conception of socialism is intrinsically linked with the broadest democracy for the proletariat and the working masses. ("EPRA Successfully Conducted a Vast Rectification Campaign," *Abyot*, Vol. 2, No. 7, Nov. 1977)

The repression they experienced, fully celebrated in Soviet organs like *Pravda* lauding the Mengistu regime, forced the EPRP to make ideological conclusions. A pro-EPRP student journal wrote in 1978,

The supply of arms, 'experts,' interrogators, etc. and the diplomatic support the USSR is giving to the crumbling fascist state cannot be isolated from the nature of today's 'Soviet' state. *Abyot* describes the 'Soviet' Union as a 'country where democracy has been stifled. It is a country where a clique of bureaucrats rule with iron hands in the name of the working class. It is a country where the working class has no say either in the running of the government or the industries. It is a country where the people are muzzled, where genuine Marxists are hounded, sent to concentration camps or destroyed in psychiatric hospitals. In the Soviet Union (and in East Europe) Socialism is a mask behind which ruthless counter-revolutionary revisionists hide.' ("Soviet Hegemonism Exposed," *Forward*, WWFES, January 1978, Vol. 2, No. 4)

As the relationship between the *Derg* and the USSR tightened, the revolutionary opposition to the military regime extended its analysis. By 1978, Ethiopian leftists were fully calling out the Soviet Union not just for having an inadequate, revisionist version of socialism but for being an imperialist, or more specifically, a *social-imperialist* power.

Pro-EPRP Ethiopian students in the diaspora published an extensive statement detailing the nature of the problem, detailing the predatory economic and political practices of the modern Soviets and bluntly calling for opposition to Soviet "aggression." The statement explained that "The Ethiopian masses, through their own experience, are learning that the Soviet Union today is an imperialist state engaged in aggression and expansion everywhere and desperately contending for world hegemony" (Statement of the Central Committee of the Ethiopian Students Union in North America, "Soviet Social-Imperialism and the Ethiopian Revolution," *Combat*, ESUNA, March 1978, Vol. VII, No. 3).

It was not just the military intervention at issue. According to these Ethiopian civilian revolutionaries, the *social-imperialism* of the Soviet Union actually served to limit the revolutionary transformation and liberation of the country. The statement continued, "However much the Soviet revisionists trumpet their propaganda alleging theirs is a socialist country, their theory and practice and real life shows that they are, in fact, socialists in words and imperialist-in-deeds. Lenin says that, 'We judge a person not by what he says or thinks but by his actions.'" They used "social-imperialist" to communicate that the USSR was not guilty just of an aggressive, interventionist foreign policy but of attempting to exploit the underdeveloped countries in its orbit. "Soviet social-imperialism, in securing a neo-colonial stronghold, wants to exploit the labor of millions, plunder our rich mineral and agricultural resources, and dump its shoddy commodities while imposing fascist reaction on our people" (Statement of the Central Committee of the Ethiopian Students Union in North America, "Soviet Social-Imperialism and the Ethiopian Revolution," *Combat*, ESUNA, March 1978, Vol. VII, No. 3).

The EPRP condemned this new exploitation of the Ethiopian economy for Soviet benefit:

The social imperialist drive to control Ethiopia in all spheres is being intensified. High ranking envoys of all sorts continue to flock to Addis Ababa from Moscow and its puppet countries. Economic agreements are signed, 'courtesy visits' increased, good are dumped on Ethiopia and more vital materials taken out of the country to Moscow and Eastern Europe. The Social imperialist drive to neo-colonize Ethiopia fully is a vivid reality. (EPRP Foreign Committee, "The Process of Ethiopia's Neo-colonisation" *Abyot*, Vol. 3, No. 2, Feb.–Mar. 1978)

Struggling for survival, the EPRP took terminological clues from the anti-revisionist wing of a polarized world left movement and finally labelled the Soviet regime "new Tsars." "For the new Tsars in the Kremlin turning Ethiopia to a Russian neo-colony constitutes the cornerstone of their African policy. That requires maintaining Mengistu's regime in power and destroying the Ethiopian revolution" (EPRP Foreign Committee, "Social-Imperialism Undertakes 'Rescue'

Operation to 'Save' Fascist Junta from Crumbling," *Abyot*, Vol. 3, No. 1, Jan. 1978).

This was not just name-calling. The EPRP backed up its accusations against the Soviet Union not with anti-communist epithets but with arguments straight out of its vision of Marxism-Leninism.

> Russia today is no longer the Union of *Soviet Socialist* Republics. The changes that took place in the one time USSR have transformed that country greatly. The dictatorship of the proletariat has been replaced by the dictatorship of the ruthless bourgeoisie. The party of Lenin, the CPSU, has become a counterrevolutionary bourgeois party. In their foreign policy, the present day rulers of Russia have thrown overboard the Marxist-Leninist motto of 'proletarians and oppressed peoples of the world, unite.' The revolutionary principle of proletarian internationalism has been replaced with counter-revolutionary and imperialist interference in the internal affairs of other countries, parties and revolutions in order to destroy proletarian or national democratic revolutions. They are involved in a fierce contention with US imperialism to divide and re-divide the world. . . . Like other imperialists, it has become not only an imperialist power but one of the two super-powers in the world. (EPRP Foreign Committee, "Social-Imperialism Undertakes 'Rescue' Operation to 'Save' Fascist Junta from Crumbling," *Abyot*, Vol. 3, No. 1, Jan. 1978)

Worst of all, the EPRP's statement continued, the Soviets were actually mimicking the historical role of US imperialism:

> On basis of what considerations the Kremlin Tsars decided to be committed to a crippled regime, is not yet known. One thing, however, is obvious, i.e.: they are trying to fulfill an imperialist task which US imperialism could not succeed in fulfilling: mainly to maintain a stable neo-colony in Ethiopia. To keep a tottering regime in power, which is threatened by a dynamic social revolution from below, they had to do exactly what the US imperialists did in Indo-China. . . . Just like the US imperialists, the social-imperialists are also doing all they can to keep the fascist junta in power. (EPRP, "Social-Imperialism Undertakes 'Rescue' Operation to 'Save' Fascist Junta from Crumbling," *Abyot*, Vol. 3, No. 1, Jan. 1978, p. 4)

For its part, *Meison*'s critique had a less ideological flavor, but was still harsh. Writing in the 1980s, surviving *Meison* cadre Abera Yemane-Ab wrote,

> [T]en years of overwhelming Soviet presence in Ethiopia has resulted in the reversal of the democratic gains of 1974 to 1977 and the virtual annihilation of the Ethiopian Revolution. During the last ten years, with Soviet approval and encouragement, the military government of Mengistu Hailemariam has committed untold crimes against the Ethiopian peoples and their Revolution. The National Democratic Revolution Program (NDRP) has been systematically undermined and repealed but for its name. (Abera Yemane-Ab, "The Defeat of the Ethiopian Revolution and the Role of the Soviet Union," manuscript prepared for the Conference on the Ethiopian Left and the Revolution, May 1987, New York)

Further, *Meison* found that Soviet economic advice felt more like exploitation than mutual assistance.

> Following the increasing dependence of the Derg on the Soviet bloc countries in general and the 20-year 'Friendship Treaty' with the Soviet Union in particular, the non-aligned foreign policy and thereby the national independence and sovereignty of the country is capriciously and continuously humiliated. . . .[T]he local and foreign policies and therewith the destiny of the country at present do not lie in the hands of its own citizens but in those of foreigners who are operating as 'experts' in the different government agencies and regions of the country. ("Editorial: Another February Is Inevitable," *New Ethiopia Newsletter*, Me'isone Foreign Section, Spanga Sweden, May 1980)

Exiled *Meison* spokesperson Frewe Abayneh predicted in a 1979 interview that Soviet economic exploitation would only get worse:

> But one cannot get the real measure of Soviet bloc economic ties with Ethiopia by what has already been achieved but rather by what lies ahead if resent trends are allowed to develop unchecked. East Germany, now the second most important buyer of Ethiopian coffee, is holding key posts in the Ethiopian planning commission thus disposing of an important instrument to control the Ethiopian economy and gear it to the needs of the Soviet bloc countries. (in *New Ethiopia Newsletter*, Me'isone Foreign Section, Spanga Sweden, March 1980)

For the Eritrean rebels, it all came down to the military struggle they were waging to liberate Eritrea. The EPLF called out Soviet hemming and hawing with platitudes about peace as a cover for sheer aggression. The EPLF-aligned Association of Eritrean Students wrote,

The Soviet Union has stayed, prior to its all-out aggression at this stage, on the fringes — sometimes indicating that it 'favoured' a non-military solution to the Eritrean question. But this was essentially, connived in order to delude progressive opinion. … . The blatant Soviet aggression negated the fundamental leninist principles on the sovereignty of a people — the rights of nations and peoples, however weak, however small, to freely determine their affairs. It is an affront to all peace-loving peoples, but more particularly to world revolutionary forces since this crime is being committed on a just and genuine revolution in the name of 'defence against imperialism,' 'proletarian internationalism' and other 'revolutionary ideals'. … . [We call] on all the revolutionary forces, all the peace-loving forces and countries to condemn Soviet aggression. ("Condemn Soviet Aggression in Eritrea," in *Resistance*, Newsletter of the Association of Eritrean Students, Nov/Dec. 1978, Vol. 1, No. 2)

The EPLF itself said the war against the national liberation forces was actually being waged by the Soviets directly. "Soviet Generals and other high ranking officers are leading this deplorable offensive. Hundreds of Soviet troops, pilots and marines are involved. The heavy guns and artilleries shelling our positions are fired and manned by Soviet troops. The Migs which are strafing our liberated areas and civilian centers are flown by Soviet pilots" ("Statement on Soviet aggression in Eritrea," *Mekalih Sewrana*, Newsletter of the EPLF, Dec. 1978, Vol. 1, No. 2).

After routing the EPRP from Tigray province, the Tigray People's Liberation Front spent the 1980s struggling to build base areas despite intense food insecurity in the province and continued military pressure from the *Derg* and other opposition groups. Towards the end of the 1980s, they began marshaling allies into an offensive to challenge not just the provincial but the central government, coinciding with the advance of the TPLF's allies in the EPLF. They too felt themselves up against the Soviet domination of the regime, though as the cold war heated up in the 1980s, they were keen to not be seen as supporters of *American* imperialism instead. A statement issued by the TPLF in 1988 reads,

In the Ethiopian situation the main enemies are the ruling classes, Soviet imperialism, and the dependent capitalist bourgeois system in power. These are enemies who are exercising dictatorial state power. Although feudalism has been weakened by the resolute struggle of the people, it has not been completely destroyed and must still be considered as an enemy. To identify Soviet imperialism as the main enemy in the Ethiopian situation does not indicate that American Imperialism has ever ceased to be an enemy of the Ethiopian peoples or that Soviet Imperialism can be fought by siding with American imperialism. America Imperialism is a fundamental enemy which can never be considered as an alternative. (Joint Communique of the Ethiopian People's Democratic Movement [EPDM] and the Tigray People's Liberation Front [TPLF], May 10, 1988)

On a side note, observers of post-1991 TPLF rule might find this statement full of ironies.

Official statements from the period by the Ethiopian and Soviet governments are full of platitudes about lasting friendship and solidarity. Behind the scenes, it is clear the Soviets were settling in to seize the wheel. One secret document declassified after the fall of the Soviet Union was a memo documenting a discussion between Russian and Cuban diplomats in Ethiopia that spells out some of the advice being dispensed to Mengistu and the *Derg*. The advice was a bit of a warning to put the brakes on social change.

The PMAC needs to solve the following political tasks: 1. To take additional measures to strengthen its social base. In order to achieve this it is necessary to make the socio-economic policy more concrete, so that it could assure the peasants that the land would remain in their possession, and that the regime would not rush with collectivization. In addition, some measures in order to, as a minimum, neutralize the national bourgeoisie, are necessary to assure it that the regime would not expropriate its property. 2. To develop the nationality policy and to make it more concrete (to create autonomous national regions), even though now it would not be an easy task because cadres from non-Amhara nationalities which were discriminated against before the revolution have not been prepared yet. 3. To create a political party and a broad people's front with participation of not just workers and peasants, but also with the national bourgeoisie. ("Memorandum of conversation between Soviet Ambassador to Ethiopia A.N. Ratanov and Cuban military official Arnaldo Ochoa," July 17, 1977; Wilson Center digital archive)

Another declassified document records a discussion between East German and Soviet advisors in Addis Ababa in late 1977, which seems to suggest that the regime actually start talking *less* about any kind of socialist transformation.

On the question of non-capitalist development with Socialist orientation: Within the leadership there is nobody who knows what this state of development really means. It is presented as a Socialist revolution. For example, the development of kulaks is rejected. 75% of the rural population is still involved in a produce-based economy. Who should develop agricultural production? There are no social statistics on which the development of the Ethiopian village could be based. There are regulations for private investments but they are not propagated. The bourgeoisie has money but is afraid to invest because it fears nationalization. One should follow the example of the USSR and develop a NEP [New Economic Policy], thus providing a prospect for all social classes….[T]here is the danger that the PMAC will become too distant from the people. ("Memorandum of Conversation, East German official with Soviet Ambassador to Ethiopia Ratanov, Addis Ababa," 6 December 1977 [dated 7 December], *CHWIP Bulletin*, p. 83)

So what happened in the end, to "Socialist Ethiopia" and its revolution?

Mengistu developed a taste for heroic statues designed in North Korea and giant Russian-style posters of Marx and Lenin in public places, but failed at creating a cooperative, democratic society. By all accounts he held on to power through continued personal ruthlessness, with frequent purges and a heavy-handed security service brooking little dissent. His politics were hollow, his real interest, maintaining his personal privilege and prestige. He pretended that the creation of the WPE was following the traditions of a Leninist vanguard party, when it actually was just a channel for control from the top and for corruption and social-climbing from the bottom. (See former *Derg* official Dawit Wolde Giorgis' *Red Tears: War, Famine and Revolution* for more on the state of Ethiopia in the 1980s.)

The era of the student revolutionaries (referred to in today's Ethiopia wistfully as "The Generation") was effectively over by the early 1980s. They had been brutally driven into silence at home. Diaspora communities were now host to waves of political refugees being resettled, setting aside the Lenin and Mao study groups as exiles began new lives and professions. EPRP continued to field its EPRA in base areas through the 1980s, never quite finding mass support. EPRP and *Meison* remained alienated from the ascendant TPLF, with most of their urban support and their

leaders either silenced, imprisoned, or in exile. Maneuvers with the central government aimed at political inclusion on the eve of the TPLF victory ensured continued enmity between the TPLF and the civilian opposition. By then both EPRP and *Meison* significantly jettisoned the open Marxist-Leninist content of their programs, on the EPRP's part fully transitioning to a form of progressive social democracy.

The Soviets had funneled billions and billions of dollars into the Ethiopian military regime's war chest, but successes on the battlefield were short-lived; all that aid money wasn't able to fix what ailed the country. Massacres of civilian villagers didn't win hearts or minds. And neither, apparently, were Ethiopian agricultural exports enough to hold Soviet attention when the USSR entered its terminal crisis with the era of *glasnost* and *perestroika*. The devastating famines that swept northern Ethiopia again in the mid-1980s barely registered as priorities for the government or its Russian sponsors, leaving Western charities to perform the heaviest relief work. A nominally civilian run government was established in 1987, yet the faces ruling the new People's Democratic Republic of Ethiopia remained dominated by figures from the *Derg* era including Mengistu himself, a head of state who simply turned in his military fatigues for a business suit.

At some point, the Soviet Union began to cut back on aid, urging reforms before backing out of its commitments altogether as pro-Soviet regimes began to fall from power in Eastern Europe and elsewhere. Abandoned by the Soviets, by the time Mengistu attempted a more market-based change in course to preserve his regime, it was too late. He boarded a plane to Zimbabwe and tanks from a broad multiethnic opposition alliance led by the TPLF entered the Ethiopian capital in May of 1991. The new government led by the TPLF's umbrella coalition the Ethiopian People's Revolutionary Democratic Front (EPRDF) definitely announced it would not follow a socialist direction. Some *Derg* figures and "Red Terror" criminals were imprisoned, but both the EPRP and *Meison* were effectively banned by the new EPRDF regime, which promptly imprisoned or disappeared a number of leading activists from both groups.

Marching separately, the EPLF liberated the main cities of Eritrea about the same time, and shortly afterwards held a referendum in the region that lead to a declaration of independence. Ironically, in 2018 post-Soviet Russia and independent Eritrea began discussions for some form of Russian naval presence in the strategic Red Sea nation (Neighboring Djibouti is now already home to a Chinese military base).

Much of the *Derg*'s economic failures may be ascribed to its heavy-handed and top-down methods. Markakis and Nega note that while the radical land reform that utterly dispossessed the landlords won the support of large numbers of the dominant peasant classes, the peasants were not particularly self-empowered by the reforms. "It would not do to grant a real measure of self-government to the peasantry, any more than it would to allow worker participation in the management of the economy" (Markakis and Nega, p. 188). In the words of Ethiopian political scientist Dr. Ghelawdewos Araia, "in the Ethiopian case, both in land reform and other revolutionary undertakings, politics and economic were apparently dissociated; the people were not empowered and hence government policies were not effectively implemented" (Ghelawdewos, p. 175). This meant that in the face of micro-managing from the military government, the peasantry acted in ways not always proactive, farsighted, or in the national interest. The land reforms didn't cause the famine of the 1980s but they laid the basis for the mismanagement and poor planning that contributed to it. (See Christopher Clapham's late 1980s study *Transformation and Continuity in Revolutionary Ethiopia* for a wealth of detail on the economy of the *Derg* period.)

The economy of Ethiopia had always been bureaucratically dominated and managed; the emperor himself had personally owned quite a number of businesses and companies. It remained underdeveloped as imperial control passed to state control under the *Derg*. Foreign investment was important to the emperor and to the military regime, but development stagnated until the EPRDF/TPLF regime opened the floodgates to privatization.

The rapid economic growth since the fall of the *Derg* has been twinned with low salary growth, oppressive working conditions, environmental destruction, and the one constant, repression of dissent. None of this has involved democratic participation. Ironically, Chinese industry is perhaps the biggest beneficiary of the Ethiopian economy today, and EPRDF-ruled Ethiopia has acted as a regional military proxy for the United States. That, as they say, is another story.

Understanding the pernicious nature of political revisionism as practiced by the late Soviet Union and its allies is a complicated task: words of the Marxist-Leninist canon become twisted in ways both subtle and severe. Truth must be pursued through rigorous investigation of the realities behind claims and platitudes. As Mao Zedong once wrote, "no investigation, no right to speak," and this introduction to the big issues presented by the Ethiopian revolution and its diversion and defeat demands attention beyond a single short essay.

That Socialist Ethiopia was not actually socialist, that Soviet aid was actually a beachhead of a new brand of imperialism, these are claims requiring something other than the repetition of government propaganda. A starting point must be the reaffirmation of concepts themselves: what is socialism? What is imperialism? Further, the acceptance of appearances must be met with a study of events as they actually unfolded. Revolutions are surely acts of violence, this is true. But what kind of revolution murders hundreds of thousands of its own children? These are the contradictions and standards that must be unearthed to understand reality in a useful way.

Facing unimaginable repression, the EPRP continued to publish its underground journal *Democracia* even in the face of insurmountable odds and the physical extermination of a large percentage of its membership and base. This passage from a 1979 *Democracia* editorial affirms that the stakes are high for getting it right. If one believes imperialism is still a vampiric threat to the world's peoples, and socialism is still a realistic hope, then a clear-sighted vision of reality and possibility is not optional, it is a necessity.

> Socialism is a system in which the proletariat and broad masses organize themselves in many forms to be able to administer themselves. Socialism is a system in which the proletariat and broad masses acquire more democracy, welfare and development than the

capitalist system in the political economic and cultural fields….For the social-imperialists and fascists, socialism means a system of which a regime of handful few dictators has the control of the masses and when the people do not have any control of the government. For them, socialism is being against democracy, anti-proletarian, anti-people and which combines the reactionary superstructure and practices which enables them to maintain their fascist and exploitative rule. The difference between the socialism we are fighting for and the 'socialism' of the social-imperialists and fascists is as wide as heaven and earth. To us socialism is a system in which the proletariat and broad masses hold state power; in which they take part in all responsible positions, in which the right of the people to call or change the officials of the government elected locally or at a country-wide level is guaranteed, in which there is a proletarian-led regime that stood for the broad masses of the people….. There is no socialism if the proletariat and broad masses do not take part in decisions of government affairs and if they do not administer themselves in a democratic system. Socialism is not democracy for the ruling class and government officials and dictatorship over the masses as it is like in the Soviet Union and its allies. Socialism cannot be a system in which those who oppose are imprisoned, kept in concentration camps, tortured, executed and where the freedom of speech of the masses is abolished. (EPRP, *Democracia*, Vol. 5, No. 4, quoted in *Abyot*, Feb.–March 1979 issue, Vol. 4, No. 2)

For a deeper investigation into the political and economic realities of the Ethiopian revolution as it confronted US imperialism and fell prey to Soviet social-imperialism, the following sources are highly recommended.

Synonyms

Colonialism; Imperialism; Modernization

Definition

Eurocentricity is an ideological attitude that takes Europe as the norm to assess or compare societies, cultures, and histories. It has been used to justify imperialism to the people of colonizing countries and to colonized peoples. Eurocentricity has created anthropology and has informed archaeology, geography, history, economics, development studies, and international relations. Some Dependency and World-Systems writers on the one hand and Global History and Post-Colonial Studies writers on the other, all of whom claim anti-imperialism, have criticized each others' views with the charge of Eurocentricity.

Introduction: Formal Definitions

Eurocentrism or Eurocentricity is an ideological aspect of imperialism. These terms are used interchangeably, both deriving from the adjective Eurocentric, according to the Oxford English Dictionary. Eurocentricity has resulted from and justified -both to ordinary people of the imperialist power and to the subject peoples- the colonialism, slavery, the "civilizational projects" of the Spanish in the sixteenth century, of the English and French in the eighteenth and nineteenth centuries, and the neocolonialism of the twentieth century. Eurocentrism and its avatars have "distorted...[social science] analysis and its capacity to deal with... problems of the contemporary world" (Wallerstein 1999: 169).

Eurocentricity cannot be separated from the history and political economy of capitalism. As imperialism was germane to capitalism, Eurocentricity was germane to imperialism. It has served to shape public opinion -through education, media and academic discourse- in support of imperializing efforts on the part of capitalists and the dominant states in which they are located. Possibly, without such effort, imperialism would have been harder to "sell" to the citizenry of imperialist states.

A simple focus on Western Europe -its culture, politics, history, institutions, etc.- is an inadequate explanation of Eurocentricity. The term "European" includes the history, culture, etc. of the off-shoots of Western Europe: Canada, the US, Australia and New Zealand -but not of Latin America presumeably because Latin America remained "backward" and was therefore not "European" or "Western." Similarly, a simple focus on Europe or "the West" *can* be perfectly valid. A history of colonialism that indicts the West is not Eurocentric.

A general definition of Eurocentricity might include: (a) a focus on Western Europe or "the West" as if its history and rise to power can be explained in terms of itself alone; (b) a celebration of Western Europe's history, society, culture and "achievements" as models for others to follow; and (c) a tendency to use "the West," Europe, or the "European" as a norm against which other peoples, cultures, or social formations are judged.

J. M. Blaut defined Eurocentricity in history as diffusionist. Diffusionist meant that all good ideas and inventions originated in Europe; that all places gained from the diffusion of these; that non-Europe was socially and technologically stagnant; and that Europe was rewarded for diffusion by the wealth of other places being returned to it (Blaut 2000: 7).

Immanuel Wallerstein (1999) says Eurocentricity is expressed in five ways: (1) historiography -the explanation of European dominance of the world in terms of some quality – psychological, cultural or social, that Europeans have evinced; (2) universalism – in the social sciences expressed as a stageist theory of history in which the present is the outcome of the past;

stages of history are universalized to include the history of all societies, and the present assumed to be better than the past; (3) civilization -defined in the social sciences by its supposed opposites- barbarism or primitiveness; historically, to be "civilized" meant that the colonized had adopted the colonizer's values and norms; (4) Orientalism ". . .a stylized and abstracted statement of the characteristics of non-Western civilizations. . . [which]. . . creates a binary view of the world. . ."; (5) the idea of 'progress' which "became the consensus viewpoint of nineteenth century Europe. . . the underlying explanation of world history. . . the rationale of stageist theories [and]. . . the motor of applied social science" (Wallerstein 1999: 173– 176). Normative Eurocentrism asserts the universalism of Euroamerican values (Dirlik 1999).

Loci of Eurocentricity: The Social Sciences, History, and Economics

Eurocentricity is pervasive within academia -from mathematics (Anderson 1990; Joseph 1987) to feminism (Mohanty 2003). Practitioners of natural science have a priori relegated the knowledge systems of earlier societies to the category of folk wisdom, or superstition, thus manifesting a closed attitude which may have lost accumulated knowledge. The areas in which Eurocentricity most damages perceptions and distorts analysis are the social sciences and history.

Eurocentricity has two loci: the intellectual arenas where Eurocentricity is manifested, and the ways in which Eurocentricity has been applied. The social sciences are Eurocentric in: the denigration and disparagment of non-Westerners, the idea that the West did something special and good, and in normative and prescriptive propositions. Anthropology and Oriental Studies belong to the first category.

Anthropology was created by colonizers to study non-Western, non-literate societies in order to dominate them. This involved attributing to the objects of anthropological study certain characteristics which portrayed them as other-than human. Anthropology dehumanizes its objects of study by denying them a sense of time or of past history

(Fabian 1983). As a sense of history is normal to human-ness, the anthropologized became, by definition, other-than-human. Asmarom Legesse (1973), an anthropologist from Ethiopia, criticized fellow anthropologists for their inability to view the peoples they studied as having rationales and histories, and analyzing them in terms that made sense to the anthropologists but not to their informants. "Tribe", so beloved of anthropologists, is not an analytical category, but originally was a colonial concept denoting a people "destined for contempt" as Franz Fanon (1968: 211) said. The term "tribe" has served to give Africa a "counter-identity" to the West by creating a comparison between "dynamic" Europe and "static" Africa. "Tribe" has functioned to "disaggregate the social foundations of power." It has limited a proper understanding of how the capitalist world-system functions by reducing the problem of global inequality to explanations internal to societies (Ngaruka 2007). The British in India tried to re-introduce "caste" for similar reasons (Samarendra 2011).

Oriental Studies was the field through which the colonizer "knew" about those societies which constituted "great civilizations" of Asia. This meant that the civilizations were characterized by writing, sophisticated numeracy, monumental architecture, well-developed divisions of labor and social hierarchies, and well-developed agricultural and other technologies. Little attempt was made to apply the techniques of analysis used in anthropology, or to construct a political economy of any oriental society living or dead. Oriental Studies confined itself to translating (religious) texts. As a variant, ancient and defunct societies of Asia were the focus of archaeological reconstructions, and the deciphering of ancient languages. The approach was to classify them as mid-level in a hierarchy of stages, or consign them to the "Asiatic Mode of Production," a catch-all category for societies that were not "primitive" in terms of social organization or technology, but which were not industrialized like the West.

For the colonizers the problem was how to explain this "underdevelopment" to justify colonization. The answer was two-fold: that Asians

were more concerned with religion than with material conditions, and social conditions were unchanging due to the existence of the Oriental Despot, who supposedly owned or controlled all the resources (especially water) and who exercised life-and-death control over all subjects. The result was a lack of motivation to invest, acquire skills or property, or make rebellions or political changes (Wittfogel 1957). (Japan's industrialization challenged this, but because Japan is an Asian country its development in the twentieth century "...ensured a more...effective penetration of normative Eurocentrism in East Asia" (Paik 2000: 74–75)).

Thus, Asian societies, like African ones, were constructed to give the West a counter- image of itself, and concealed the functioning of the capitalist world-economy. Conflicts among the colonized could thus be explained away as "ages-old" religious conflicts or used to prevent unity against the colonizer. Colonization could be promoted as the herald of emancipation and change and a regulator of ancient sectarian (hence, irrational) conflicts. Oriental Studies devolved into Orientalism, a cultural construct, which sees the West as rational and the East as irrational and in need of "control" and modernizing, an image promoted in the media, literature, and the social sciences (Said 1979).

Two academic fields presenting Europeans as natural masters of the world have been geography and history. The various cartographic ways whereby the world is mapped carry subtle visual suggestions. The centering of the global map around the Atlantic; the exaggeration of the size of temperate and cold zones, and the presentation of the northern hemisphere (where Europe is located) on the upper side have connotations with respect to importance and hierarchy. Mercator's Projection, which combined these features, was consciously adopted in British maps after 1830 and influenced atlas and map-making in France, Germany, and the United States. Following Edward Quinn's *Historical Atlas* (1830), world atlases used colors to hierarchalize different parts of the world in accordance with the European evaluation of levels of civilization. Such maps were often used in schools. Thus,

children learned the appropriate social hierarchy of the world's peoples (Black 1997).

J. M. Blaut identified eight historians that he believed were *egregiously Eurocentric*: Max Weber, Lynn White, Robert Brenner, E. L. Jones, John Hall, Michael Mann, Jared Diamond and David Landes. Explanations of what made Europe world-dominating included references to: climate and geography, Christianity, personality traits, and social institutions. Weber alone relied on a straightforward racism (Blaut 2000: 200–202). These authors assumed that European domination can be understood by reference to Europe alone. Entirely missing was any mention of imperialism or expropriation of other societies' wealth. As these authors form part of the canon of European history, such historical constructions commonly appear in university curriculums and school textbooks. Thus, such views become "naturalized" among the population.

Economics has been Eurocentric ever since Adam Smith explained the differences between "civilized" nations and "the savage nations of hunters and fishers," with civilization bringing higher levels of consumption and general well-being, despite the fact that he possessed books which attested to the general well-being of hunter-gatherers (Marchionatti 2012). In the nineteenth century neoclassical economics assumed as normal a rational, self-interested individual who was utility-maximizing, subject only to his or her own tastes and budget constraint. Such behavior rejects the ethics of altruism or reciprocity (Mehmet 1995: 136–37). Economics is defined as the study of the efficient allocation of scarce resources through the market activities of hedonistic, rational humans, activities which result in the common good. While economists claim universal validity for this framework, it is Eurocentric insofar as non-capitalist societies practiced reciprocal exchanges and redistribution as well as market exchanges (Polanyi 1957). Economic development models which were implemented in decolonized countries after 1945 accepted the industrialized societies as the model to strive for (Hoogvelt 1997: 36). Economic growth in itself may be considered a Euroamerican goal.

International Relations is Eurocentric in its basis because its analytical unit, the nation state, is an institution that originated in Euramerica between the late eighteenth and the mid-nineteenth century. Its theoreticians are mainly European. The field has been criticized for ignoring the legacy of colonialism (colonial conquests, anticolonial struggles, suppression of anti-colonial struggles, the relations of colonies and neo-colonies with dominating states), and the counter-insurgency activities of dominating states in the periphery and semi-periphery during the Cold War. There has been no sustained analysis of major wars in Sierra Leone, Rwanda, Somalia, Chad, Congo or Liberia (Gruffydd Jones 2006).

Eurocentricity in Time Perspective and Challenges to It

Eurocentricity has had a long history. Its origins may go back to ancient Greece where, in the dramas of Aeschylus and Euripedes, Asia, "...that hostile 'other' beyond the seas... speaks through and by virtue of the European imagination..." (Said 1979: 56). In the Middle Ages, Europeans posited an ideological dichotomy between Christendom, then largely coterminous with Europe, and 'others', dangerous infidels who required conquest and/or conversion.

A type of civilizational project can be discerned during the Spanish conquest of the Americas. It imposed Christianity on Native Americans and constructed them as Spanish peasants, while it institutionalized Africans as non-humans and therefore enslaveable (Todorov 1992). This hierarchalized an "international division of labor."

Seventeenth century English settlers in North America justified the expulsion of Native Americans from their lands with the notion that the Natives did not make the land "productive" in the Lockean sense -i.e. did not make commercial use of their land- nor privatize it as property. This was against Natural Law. Reference to Natural Law appealed to the educated elite. Ordinary people used the rationale that Native Americans did not use the same housing forms, clothing styles,

food, legal or religious frameworks and marriage customs as Europeans did. They were therefore savages, and so, removable (Hodgen 1967).

The Enlightenment was ambiguous in its attitude towards non-Western peoples. Voltaire admired China. West European high society welcomed visits from South Sea Island natives. Yet the Enlightenment thought about non-Europeans was contradictory -they were "simultaneously exotic and familiar, exemplary and exploitable." While advocating the "brotherhood of Man" the Enlightenment thinkers could not bring themselves to condemn slavery, perhaps because many of them had interests in the transatlantic trades. The eighteenth century saw the start of classification of humans by physical appearance (Outram 1995).

In the nineteenth century Africa, China, the Middle East and parts of Central Asia were brought into the capitalist world-economy, the exploitation of India intensified, and the US government carried out genocide on the Great Plains. The motive for these expansionary policies was to obtain new sources of raw materials, cheap labor, land and markets. French colonial occupations were justified by the term *mission civilizatrice.* The British had their own model for the 'civilizing mission' based on Darwin's concept of evolution. A notion of historical stages with Europe at the apex of a developmental hierarchy was promulgated by Herbert Spenser. In Liberal mainstream thinking, Europeans had a right and a duty to "civilize" non-Europeans.

Karl Marx introduced his own stages, suggesting that all societies should pass through modes of production characterised as primitive communal, slavery, feudal and capitalist. This scheme reflected the Liberal notion of progress, and was distilled from European history. Marx (1853) was ambiguous on the effects of colonialism; but in his later work he had second thoughts about historical stages (Lindner 2011). However, *Marxists* made his early scheme of consecutive stages into a dogma.

Eurocentricity was first challenged in the 1930s and 1940s in the work of A. Appadurai, C. L. R. James, R. P. Dutt, Eric Williams and van Leur (Blaut 2000: 8). After World War II

E

colonized territories became politically independant. Anti-Eurocentric scholarship continued. "Third World" scholars such as Ramkrishna Mukherjee (1957), and Walter Rodney (1972) exposed colonialism's destructiveness; Anouar Abdel-Malek (1977) predicted cultural revival in the "Third World." Martin Bernal's *Black Athena* books (1987, 1991, 2006) raised an Afro-centric challenge to the civilizational project. Marshall Sahlins' 1974 study of hunter-gatherers showed that non-technologically advanced people could be affluent -living within their means, they were people of leisure amidst plenty. In 1972 Arno Peter's map of the world gave greater emphasis to the southern hemisphere (Black 1997). Yet Western ideas of state formation, economics, household practices, ideologies of gendering, race, and ethnicity as well as their opposites informed politics almost universally (Dirlik 1999: 9–10).

After 1949 the US government promoted the idea of "development" primarily to make raw materials available on world markets (Hoogvelt 1997: 35), but also as a weapon in the Cold War. The intellectual underpinning for "development" was modernization theory popularized by W. W. Rostow (1960). (It is no accident that the subtitle of Rostow's book was "... *a non-Communist manifesto*.") Poverty in the Third World was ascribed to stagnant traditionalism. Rostow adopted the stageist view of history, and suggested that all countries model their societies on Western nations in order to "catch up" with them economically. In practice "development" meant industrialization and Western-style consumerism.

Dependency theory was a reaction to modernization theory. S. Amin (1988), A. G. Frank (1967), W. Rodney (1972) and others showed how structural relations between the metropole, or core countries (Euramerica) and colonies or semi-colonies in Latin America, Africa and Asia, caused and deepened economic polarization between these groups, which explained underdevelopment. There could be no catching up.

For Frank there were no stages. Amin criticized Marxist dogma for universalizing *European* stages, but invented other stages. Amin wished to

revive the Enlightenment universalism that recognized the validity of all humans, but his view that all societies could become capitalist was Eurocentric. All Dependency theorists were Eurocentric, because of the implied assumption that all societies aspired to the consumption and life-styles of the Western metropoles.

Immanuel Wallerstein, the main exponent of World-Systems Analysis, also criticized developmentalism, and challenged Liberal epistemologies in the social sciences. World-Systems analysis is not a theory but a lense through which may be seen the historical processes by which Euramerica (and now Japan) have increasingly dominated the rest of the world in a social system called capitalism. Capitalism has structures. One is the division of the world into three economic zones: the core, highly developed and wealthy; the periphery, ruralized and impoverished; and the semi-periphery, an intermediate zone. An alliance between capitalists and the state was another structure, and households of a certain type were another. Capitalism also has typical processes: commoditization, proletarianization, and incorporation into the system to name a few. Labor has historically been waged, slave labor, or near gratis labor: serf, debt bondage or household (usually women). There is a world-scale division of labor in which, where any individual stands has been determined by race, ethnicity, gender and class. There is a dynamic between core, periphery and semi-periphery in which historically the core became wealthy at the expense of the periphery. World-Systems proponents do not see modernism as good; the Industrial Revolution was not the apex of human achievement; and historically capitalism is thought to have generated a negative balance sheet for the world's peoples and environment.

World-Systems Analysis, International Political Economy and Dependency have recently come under attack from Global History, Post-Colonial, and Subaltern Studies. Global History scholars purport to be anti-Eurocentric because they claim capitalism or modernity (and therefore rationality) developed in ancient Chinese and Islamic civilizations. They base this claim on the existence of long-distance trade in these

civilizations. Hence Europe was not exceptional. Examples of the Global History school are Andre Gunder Frank's and Barry Gills' *The World System—Five Hundred Years or Five Thousand* (1993), John Hobson's *The Eastern Origins of Western Civilization* (2004) and Janet Abu Lughod's *Before European Hegemony* (1989). Meanwhile, Post-Colonialism and Subaltern Studies claim to attack Eurocentricity by rejecting "meta-narratives" or "foundational narratives" which their practitioners say erase differences among peoples, ignore the local, deny subjectivity to the colonized or subalterns in their own history (Bahl and Dirlik 2000).

Wallerstein's answer is that Global Historians are *very* Eurocentric because: they have no substantive basis on which to argue for capitalism in former societies, and we still have to account for the European conquest of the world. Most importantly, "[Their] view of... history... accepts the significance of the European 'achievement' in precisely the terms that Europe defined it..." (Wallerstein 1999: 179). True anti-Eurocentricity rejects the idea that what Europe did was an achievement. Finally, Eurocentricity leaves no room for alternative possibilities.

Bahl and Dirlik (2000) accuse Frank of attempting to "erase capitalism from history." They contend that Global History does this in order to hide the fact that globalization is really modernization theory, but in a new guise - one in which the dominant players are as likely to be members of Third World elites as Western ones. Bahl and Dirlik suggest that Post-Modernism, Post-Colonialism, and Subaltern Studies disguise the recolonization of the world, and that dismissing meta narratives "...makes it impossible to confront power systematically." In their promotion of "difference" practitioners of these intellectual trends become complicit in the defusion of collective resistance to this process.

According to Dirlik (1999), culturalist critiques of Eurocentricity provide no explanation for its hegemony. What is needed is a connection to the political economy of imperialism. The notion that "to speak of oppression... erase[s] the subjectivities of the oppressed" ignores the fact that not to speak of oppression "...is to return

the responsibility for oppression to its victims," while Third World revolutions are a reassertion of subjectivities (Dirlik 1999: 16, 21).

Conclusion: Toward a New Universalism

Many have pointed out that the response to Eurocentricity cannot be positing other ethnic-centrisms; this would not comprise a project for humanity. If capitalism is intolerable and unsustainable, a new universal project is called for.

The findings that societies have through most of history successfully constructed redistributive systems and practiced reciprocal exchanges outside markets, and that non-market-dominated societies have enjoyed affluence, seriously question the assertions of the advocates of capitalism with respect to human nature. Hence a universalist project to replace the system that Eurocentricity has been used to maintain may have to be constructed from the wealth of knowledge and historical experiences of all societies.

Introduction

Human development is a process whereby transformations take place as a result of social change and political struggle between opposing forces. It

would be naive to believe that the process of transformation is the result of a painless natural selection progression. Historians in the Marxist tradition are aware of the dialectics of history-making as the result of the balance of forces between different actors/agencies in a social formation. In the worlds of Karl Marx:

> Men make their own history, but they do not make it as they please; they do not make it under self-selected circumstances, but under circumstances existing already, given and transmitted from the past. (Marx (1852/1958): 247)

Not only is history made under conditions not chosen by the people involved, but interpretations of the transformation processes confront each other and reflect an arena of struggle where opposing positions face each other. This axiom applies with equal strength, or even more forcibly, in the case of conflict in the sphere of inter-societies and interstate contradictions. Nowhere else is this recognition of the limits of history-making as exposed as in the explication of the capitalist world system and the divisions created through its *modus operandi*.

The study of world history is still at the stage of groping with the task of assembling the various narratives of the different parts of the world in order to make sense of their contributions to the project of conceptualizing and understanding the development of global capitalism which has led to the present state of world order/disorder. Simply stated, the problematique is to what extent the "European Miracle" (capitalism) was a self-made and independent endeavor which didn't require the contribution of non-European peoples and civilizations. As the anthropologist Jack Goody formulates, the problem is related to the fact that the interpretation of world history has been hijacked and monopolized by the traditional European narrative:

> 'The theft of history' ... refers to the take-over of history by the west. That is, the past is conceptualized and presented according to what happened on the provincial scale of Europe, often Western Europe, and then imposed upon the rest of the world. That continent makes many claims to having invented a range of value-laden institutions such as 'democracy', mercantile 'capitalism', freedom, individualism. However, these institutions are found over a much widespread range of human societies. (Goody 2006: l)

However, reluctantly there is an increasing confrontation within the realm of social sciences concerning the appropriate historical paradigm for understanding the origin and formation of the process of capitalist expansion encompassing the entire world.

One suggestion finds the attempts at creating a "world history" while seeking to avoid over-estimation of the European contribution to be legitimate (Bihr 2018). This notwithstanding, it comes with warnings that this should not lead to the notion that the West had not, initially, been the main actor in this process of globalization and the transition from feudalism to capitalism. However, the paradigm of development which gives prevalence to an interpretation-based "European exceptionalism" and "non-European backwardness" fails to explicate the reasons for the divide between "early comers" and "late comers" in the evolution and growth of human history and underplays the question of imperialism as the organizational pattern of the world to serve the interests of the "European Miracle." The supposition that capitalist imperialism was/is a benevolent philanthropic model and pattern of political economic relations conducive to the establishment of a harmonious commonality deserves to be questioned and rejected as not consistent with past or present experience and reality.

The Clash of Narratives

The global system which entailed the forced submission of non-European peoples in the world to serve the interests of the Atlantic imperialist states was/is central to the rise of the ideological superstructure encapsulated in the implicit notion of "Eurocentrism." As a consequence, the praxis of the so-called advanced core nations attributed to Westerners the vocation of imposing worldwide capitalism and presenting Europe's model of development as the key for the emancipation of non-Europeans. However, the economic, political, and ideological hegemonic project under the slogans of "The White Man's Burden" and

"mission civilisatrice" did not aim at the universalization of the world's peoples from the colonization period up to the present. As posited by Samir Amin, the discourse of Western universalism is convoluted:

> Eurocentrism is a culturalist phenomenon in the sense that it assumes the existence of irreducibly distinct cultural invariants that shape the historical paths of different peoples. Eurocentrism is therefore anti-universalist, since it is not interested in seeking possible general laws of human evolution. But it does present itself as universalist, for it claims that imitation of the Western model by all peoples is the only solution to the challenges of our time. (Amin 1989: VII)

The corollary to the European (Western) constructs of capitalism and colonialism was the emergence of political imperialism which expressed itself, on the one hand, in the reduction of non-Europe to a sublevel and, on the other hand, in a structure of competition between advanced capitalist nations for extraterritorial aggrandizement and, of course, the control and access to economic resources. The division by the core nation-states of the territories and colonies in the periphery led to interstate antagonisms and competition between imperialist powers. The struggle for colonies and semicolonies outside the European cultural sphere encouraged the emergence of military conflicts and wars between various "advanced" nations. Imperialism in this sense resonated with the *Pax Britannica* as not necessarily characterized by direct conquest of states but on having the social and ideological power of the bourgeoisie become the leitmotif of hegemony during this phase of dominance. Liberal imperialism characterized a new phase slowly being replaced by the welfare nationalist state (Cox 1981: 142). Old and new imperialism simply denote the incorporation of the periphery into the exchange relations where the main difference was direct or indirect control over the state apparatus and thereby linking colonies more closely to their imperialist metropoles.

As Paul Baran and Paul Sweezy put it in their book, *Monopoly Capital*, the question of the relationship between capitalism, colonialism, imperialism, and militarism has a past history which is affecting the present-day structure of the international system:

> From its earliest beginnings in the Middle Ages capitalism has always been an international system. And it has always been a hierarchical system with one or more metropolises at the top, completely dependent colonies at the bottom and many degrees of superordination and subordination in between. (Baran and Sweezy, p. 178)

The importance of the features of imperialism was/is crucial to the functioning of the system from the very beginning of European capitalism but whose context have been ignored or denied by liberal economists as well as underestimated by some Marxist social scientists. The question of whether imperialist militarism was a function of capitalism or the reverse is of academic relevance in the present era. To a certain degree, the recognition of the primal synergy between capitalism and imperialism represents a challenge to the Leninist conceptualization of imperialism as the last stage of capitalism (Lenin 1917/1951). In the words of Baran and Sweezy, militarism not only played an important role in the capitalist development until today as "... it would be quite impossible to understand the role of armed forces in capitalist societies without placing the international character of the system at the very center of the analytic focus" (ibid.).

The Contemporary World Order/ Disorder

The analysis of the contemporary world order/ disorder created needs to reflect on the dichotomies of the past. Present-day modernity is in fact the child of the genesis of capitalism, colonialism, imperialism, and militarism pitting nations against one another. Seen through this prism, the twentieth century showed itself to be an epoch of various transformations in the world system of capitalism: inter-imperialist conflicts, World War I, the Socialist Revolution in Russia, the Great Depression, World War II, atomic bombs over Hiroshima and Nagasaki, the US attempt at establishing a regime of benevolent domination over "collective imperialism," survival of the USSR in the war against Nazism, the rise of the Cold War, the Keynesian Welfare State, the military-industrial complex,   the   decolonization   and   national

liberation movements of the colonies, the Maoist victory in the Chinese Civil War, the Korean War pitting the US against North Korea and China, the Cuban Revolution, the wars in Indochina, the rise of the Japanese and East Asian capitalist developmental state, the demise of the Soviet Union and the disintegration of socialism in Europe, the rise of the neoliberal counterrevolution and globalization, the end of Cold War I, the dismemberment of Yugoslavia, the neoconservative upsurge and the unipolar moment of US "full-spectrum dominance," the restart of Cold War II, the rise of the People's Republic of China as the second economy in the capitalist world system, 9/11 and World Trade Center, the US-led war on terrorism, as well as the destabilization of the Greater Middle East.

All these interrelated and interconnected events lead to the conclusion that the present turbulence in the world is subsumed in essence to the downturn in the economic and political ability and capability of US hegemony. How can the analysis of present world disorder be interpreted in any other way than showing the contours of the future world system? How does an "America First" strategy harmonize with the centrifugal tendencies which "Making America Great Again" are bound to release on the international plan? These aspects of the Donald Trump "doctrine" that acknowledges a certain weakness ought not to be seen, however, as a repudiation of the foreign policy doctrines of previous administrations projecting superiority and power.

Contrary to the proclamation of the "end of history," the world order is going through seismic rumblings below the surface that are bound to bring about a tectonic transformation that will affect the future landscape of geopolitics and economic structures. That we are going through such a transition is discernible for those who refuse to be blinded by ideology. It is apparent that this work in progress is an ongoing process which the dominating Western discourse and political practice attempt to hide behind a curtain of ignorance and the use of "weapons of mass distraction"!

To measure the scope and distance of the ideological discourse that arose on the heels of the victory of the West in the Cold War against the USSR, it is worth reflecting on what Francis Fukuyama explicitly had in mind concerning the future of the hegemony of the United States following the meltdown of the Soviet Union. He was proclaiming an end of the socialist ideological challenge to liberal democracy which later morphed into the neoconservative hubris of perpetuating "the unipolar moment" through the expansion of the scope of global US supremacy. In the last instance, this meant, implicitly, a vision of permanent American hegemony in the world system:

> What we are witnessing, is not just the end of the cold war, or a passing of a particular period of postwar history, but the end of history as such: that is, the end point of mankind's ideological evolution and the universalization of western liberal democracy as the final form of human government. (Fukuyama 1989: 1)

Contrary to this agenda-driven mindset, the task at hand for sociopolitical science is not only to identify the forces at work and their interplay but likewise to project the contours of the future organization of the world (i.e., a US-driven unipolarism versus a Russo-Chinese-driven multipolarism). The attempt to conceptualize and contextualize the ontological transformation that is in store requires a toolbox which only inclusive economic history can provide. The difficulties that arise in this context are related to the fact that history is not an objective and neutral field of study in the Weberian mold but a battleground between different ideologies, actors, agencies, and causes. Thus, while history is an objective process, its comprehension is subjective as suggested by the development economist Gunnar Myrdal.

The ideological and political struggle encapsulated in the interpretation of history was also recognized by George Orwell. The following formulation in his book *1984* is heuristic and helpful in contextualizing historical development: "Those who control the present control the past and those who control the past control the future." Thus, as the present analysis aims to show, the shape of the future will depend on the outcome of the contemporary contradictions and struggles within the world system. History may be made by people, but not in conditions of their own

choosing, as Marx wrote in the context of the defeat of the French Revolution.

The road to the resolution of present and future conflicts and contradictions is twisted and open-ended. The complexities of the contemporary dichotomy, i.e., world order/disorder, are related to the constellation of forces on the international stage. In essence, the future prospects will depend on the outcome of the age-long non-European challenge to the prevailing historical Western dominance of the capitalist system. This awareness was recognized by the political scientist, Samuel P. Huntington, who, in opposition to the end of history thesis, promoted the "clash of civilizations" as the new paradigm of international relations. Although this construct did not in fact exclusively focus on ethnicity and cultural/civilizational differences between the Muslim world and the West, it became popularized almost exclusively as a confrontation between Christianity and Islam, especially after the 9/11 destruction of the World Trade Center in New York. (It ought to be pointed out that "the 9/11 Commission Report" did not conclusively prove Jihadist participation in the hijacking of the planes. Nevertheless, the crime opened a window of opportunity for the United States to wage war first on Afghanistan and Iraq to be followed by the wars against Libya and Syria.)

Writing before 9/11, Samuel P. Huntington projected an alliance between Confucian and Islamic countries based on economic complementarities which would challenge the existing Western world order. The assumed perspective was that the resulting confrontation would pit the West against the Rest (Huntington 1993).

Consequently, he was warning that the Western world needed to take this menace seriously and consolidate its political and military unity. Simultaneously and bringing balance in his thesis, he showed awareness to the fact that the expansion of the West and the emergence of the European capitalist world system that had taken place during and following the industrial revolution had not been the result of a harmonious cultural/political process, but had been the outcome of the application of force and coercion:

> The West won the world not by the superiority of its ideas or values or religion (to which few members of other civilizations were converted) but rather by its superiority in applying organized violence. Westerners often forget this fact; non-Westerners never do. (Huntington 1998: 51)

The juxtaposing of the two opposite post-Cold War paradigms, from within the US foreign policy establishment, concerning the state of the world can help clarify the trajectory of the development of modern capitalism and perhaps its destination. While Fukuyama is respectful and in awe of liberal democracy, failing to mention the historical costs this process entailed, Huntington on the other hand touches upon the collateral damage of "organized violence" the West imposed on the rest. Nevertheless, neither positions projected rejection of "American exceptionalism" whose birthmark, "Manifest Destiny," is to be found in the Monroe Doctrine of 1823 whereby the United States declared itself to be the sole "protector" of Latin America from the European imperialist powers.

The Shape and Trajectory of Historical Capitalism

It is undeniable that the historical contact between Europe and the rest significantly influenced the rise and trajectory of Western capitalism. In this connection the question of the costs and burdens imposed by the West on the non-Europeans has not been given its proper due by mainstream sociopolitical science. Consequently it is mentioning that both Adam Smith and Karl Marx, from different ideological positions, recognized the importance of the (forced) contribution by the non-Western world to the emergence and direction of European capitalism. In *The Wealth of Nations*, Adam Smith goes as far as to note that "The discovery of America, and that of the passage to the East Indies by the Cape of Good Hope, are the two greatest events recorded in the history of mankind." Simultaneously and in contrast to his present-day adherents, the "father" of classical economics expressed skepticism concerning the

benefits these great occurrences would bring to the non-European peoples (Frank 1998: 13).

Almost a century later, Karl Marx and Friedrich Engels, adjusting to the time laps with the publication date of Smith's magnum opus, were even more adamant and explicit in their acknowledgment of the importance of the "discoveries" for the transition of European feudalism to capitalism:

> The East-Indian and Chinese markets, the colonization of America, trade with the colonies, the increase in the means of exchange and in commodities generally, gave to commerce, to navigation, to industry, an impulse never before known, and thereby to the revolutionary element in the tottering feudal society, a rapid development. ...Modern industry has established the world-market, for which the discovery of America paved the way. (Marx and Friedrich (1872/1958): 35)

Not only is there no explicit mention of the non-European contribution in this document, but the "fathers" of socialism/communism actually praised the forceful expansion of industrial capitalism relative to what at that time were called inferior societies. They expressed that the transformation of the world is ascribed to a dynamic European capitalism:

> The cheap prices of its commodities are the heavy artillery with which it batters down all Chinese wall, with which it forces the barbarians' intensely obstinate hatred of foreigners to capitulate. It compels all nations, on pain of extinction, to adopt the bourgeois mode of production; it compels them to introduce what it calls civilization into their midst, i.e., to become bourgeois themselves. In one word, it creates a world after its own image. (op cit.: 38)

It is not possible to conclude that Karl Marx was unaware of the connection between national capitalisms and the world economy. However, in the opinion of Baran and Sweezy, Marx did understand the determining importance of the international structure of capitalism but, because of the plan of the project of writing *Capital* as well as the fact that Marx did not live to complete his work, has given the impression that he considered the international character of the system to be of secondary importance or significance. This made many later-day Marxists insist on assuming that capitalism as an international system could only be understood as a collection of national capitalisms (Baran and Sweezy op. cit., p.178).

Regardless of the dominance of the discourse of Christianity in Europe, the trajectory of European national capitalisms that took place together with the globalization of a capitalist world economy was far from being a natural peaceful process. As put by Karl Polanyi, while "primitive" economies (meaning precapitalist societies) were built on social obligations and coercion, modern market/capitalist economies depended on deliberate state action/intervention in society. Consequently "regulation and markets, in effect, grew up together" (Polanyi (1944/1957): 68). The evolution toward the development of capitalism depended on a process of "creative destruction" (Schumpeter) of traditional society. This destruction was implemented in both the European context and in the realm of colonialism. To quote Polanyi once again:

> Eighteen century society unconsciously resisted any attempt at making it a mere appendage of the market. No market economy was conceivable that did not include a market for labor, but to establish such a market, especially in England's rural civilization, implied no less than the wholesale destruction of the traditional fabric of society." (Polanyi ibid.: 76)

Politics and violence likewise played a determining role in shaping the world from the time of the conquest of the Americas, the European-dominated triangular trade between Africa, Americas, and East Asia (China and India), the transfer of slaves to the plantations of the Americas, the colonization of Africa, and settler colonialism in South and North America, as well as Australia and New Zealand. All these activities contributed to the creation of the international division of labor whose implementation became the mission of the military enforcement agencies of the metropolises.

Consequently, while the European project of creating "a world after its own image" (Marx) succeeded, it took more than enforced commercial and trading relations to establish the world system of capitalism. Of greater significance than the economics and politics involved in the process

was the fact that European ideological dominance portrayed itself as the prototype model for non-Europe to emulate. At the same time though, the colonial powers (chiefly England) were doing everything possible to prevent others (including European latecomers) from catching up or reaching a higher stage (Chang 2002). This British developmental strategy fomented conflictual relationships which would inherently lead to colonial wars and inter-imperialist armed conflicts.

The Entrance of International Political Economy

The argument can be made that the world expansion of European capitalism created the need for an analytical toolbox to understand the direction of its past trajectory as well as its perceived destination. Unfortunately for the sake of comprehending the workings of the system, the dominant narrative has until relatively recently been monopolized by proto-Westernized social and political sciences. Critics of this dominance in Western theory-building realized that this was related to the fact that it was embedded in Eurocentrism. The political scientist Robert C. Cox makes the point that "theory is always for someone and for some purpose" (Cox 1981: 128). The meaning, in the context of the present analysis, is that international theory-building has not produced a value-free universalist paradigm of interstate relations. Instead, international relation has provided a body of knowledge that celebrates and defends Western civilization as the main subject and player of world politics. According to one scholar, Eurocentrism can take varied forms which can be imperialist-friendly or anti-imperialist (Hobson 2012). In our optic, though, we would argue that Eurocentrism should mainly be seen as an ideology that is imperialist-friendly.

This state of affairs makes it imperative to critique the established status quo paradigm because it prioritizes the conceptualization of the world as the domain of Western hegemony and control. As the social scientist Ziauddin Sardar puts it, in a developmental context, the control of the tools of analysis and definitions of

concepts by the West needs to be understood and seriously opposed:

> The real power of the West is not located in its economic muscle and technological might. Rather, it resides in its power to define. ... To understand Eurocentrism we thus have to deconstruct the definitional power of the West. (Sardar 1999: 44)

Especially with regard to the conceptualization of the interstate system, did the question of Eurocentrism create its share of fallacies and misunderstandings? Not least in the comprehension of imperialism as a benign bearer of change and transformation. It is necessary to understand that in fact the tensions that came to the fore in the field of international affairs and interstate relations in the context of the world system's expansion and institutionalization were more related to the rise of imperialism and interstate competitive relations than to idealistic and realism motivations. As two students of international relations note: "The discipline of IR had its real beginnings in the study of imperialism, not in world order, as has so often been suggested" (Olson and Groom 1991:47).

As children of their time, nearly all known classical theorists, including Karl Marx (who it seems never used the term imperialism), the liberal British politician John A. Hobson, and the Russian revolutionary Lenin, were to various degrees Eurocentric in their analyses of capitalism as a world system (Wilson 2005: Chap. 5). Their approach toward imperialism and the colonies was to a large extent affected by economism as their focus centered mostly on the question of economic surplus creation and utilization/reproduction in the metropoles, with Great Britain as the principal exemplar (Hobson 1902). The axiomatic and intrinsically contradiction between underconsumption and income distribution played a key role in their conceptualization of surplus absorption through the export of capital.

Essentially this was a natural follow-up to Marx's assumption concerning the expansion of capitalism in non-Europe, which he originally saw as a positive development since it would inevitably lead to the negation of capitalism and fit in with the unilinear scheme of historical development. According to this schematization of human evolution, humanity had gone through different

stages of societal transformation from primitive communism, slave society, feudalism, and capitalism before arriving at the stages of socialism and communism. The first two stages being relegated to the status of prehistoric social formations, feudalism, and capitalism are singled out for putting humanity on the path of socialism.

At the time of the *Manifesto*, the projection of European history as valid for non-European history-making reveals a Eurocentric ideological deformation. Samir Amin, for instance, rejects the dominant view of world history which posits a progression from the Greco-Roman classical world to Christian feudalism and the European capitalist system as it excludes the Arab Islamic world or the so-called Asiatic mode of production (China and India). In order to surmount the hurdle created by the utilization of the non-inclusive notion of European feudalism, Samir Amin proposes the more inclusive concept of "tributary mode of production and accumulation" with different modalities applicable to especially East Asia and the Arab world (Amin 2010).

The critique of the Marxian approach encapsulated in a schematic Eurocentric historical narrative has given rise to serious criticisms leveled against the authors of the *Manifesto*. One such criticism shares that: "The general tone of Marx's views on the non-European world is set in *The Communist Manifesto*" (Avineri 1968: l). The charges laid at Marx's door concerning his interpretation of world history as based on Eurocentrism is to be taken seriously. In his book *ReORIENT*, Andre Gunter Frank goes as far as exorcizing Marx and Engels from the ranks of critical anti-imperialist scholars.

This notwithstanding, basing the critique of Marx mostly because of some formulations found in the *Manifesto* when Marx and Engels were in their early 20s shows a certain narrowness of mind as well as scholarly fatigue or more seriously being part of a hidden agenda to reduce the appeal of Marxism in the non-European world.

Methodologically the question that arises is whether Karl Marx was a hard-core Eurocentrist immune to the irregularities that weakened the central axioms of Eurocentrism as implied by the critics. We know with Thomas Kuhn (1962) that

the scientific method consists in incorporating the anomalies that question the accepted norms and narratives, thus bringing new understanding and interpretation of a phenomenon to a higher level.

Consequently, it should be pointed out as Samir Amin did in one of his last writings that "Marx himself continuously developed and revised his views throughout his lifetime" (Amin 2018: 17). As a matter of fact, it can be argued that this appears to have been part of the method employed by Marx. As shown by various scholars, this way of doing scientific work involves revising one's assumptions and certainties when accessing new knowledge concerning the object of analysis. In the words of Kevin Anderson:

> Over the years, I will argue, his perspectives on these [non-European] societies evolved. In the 1840s he held to an implicitly unilinear perspective, sometimes tinged with ethnocentrism, according to which non-Western societies would necessarily be absorbed into capitalism and then modernized via colonialism and the world market. But over time, his perspective evolved toward one that was more multilinear, leaving the future development of these societies as an open question. (Anderson 2010: 2)

It has been argued that Marx's adherence to the unilinear scheme of societal change was related to the intellectual mood of evolutionism which was particularly strong in European thought at the time. The strength of this mindset is its acceptance of change as a necessary element of reality, while its most important lacuna was the optimism and unilinear determinism ascribed to it. According to Teodor Shanin who makes this point, Marx seemed to have been unhappy with the unilinear simplicities of the evolutionary scheme. The way out of this conundrum laid in the conceptualizing of a more complex and more realistic global heterogeneity of social forms and interdependence:

> In consequence and already by 1853 Marx had worked out and put to use the concepts of Oriental Despotism and of the Asiatic Mode of Production, its close synonym, as a major theoretical supplement and alternative to unilinear explanations. (Shanin 1983:. 4–5)

Unfortunately the exit from the evolutionism schema via the acceptance of a more heterogeneity-based understanding of societal

formations did not signify a clear-cut break with Eurocentrism. At the same time, and in relation to the critiques of Marx for placing the capitalism of Europe as the model to be followed ought to be tempered with his other writings criticizing the ideological construction of European exceptionalism and superiority. This comes to light in his analysis of British rule in India:

> The profound hypocrisy and inherent barbarism of bourgeois civilization lies unveiled before our eyes, turning from its home, where it assumes respectable forms, to the colonies, where it goes naked. (Marx 1853, n.d.: 88)

Not only did Marx show contempt for the violence involved in the implementation of colonialism especially in India and China, but he was becoming more open to the possibility of these social formations taking over the lead of the march toward socialism and thereby implicitly the possibility of bypassing capitalism. In an article published in the "New York Daily Tribune" in 1853, Marx ironically raises the paradox of a more politically advanced Asia:

> It may seem a very strange, and a very paradoxical assertion that the next uprising of the people of Europe, and their next movement for republican freedom and economy of government, may depend more probably on what is now passing in the Celestial Empire [China],-the very opposite of Europe,-than on any other political cause that now exists ... [Marx, no date: 15] See also the discussion in Wolfe (1997: 391–393)

Remarks such as these showed comprehension by Marx of the evolution of non-Europe which had been subjugated to European (British) colonialism as well as a rejection of the xenophobic overtones of the ideological construct of Eurocentrism. Unfortunately, residues of this mindset have survived in latent form and are increasingly becoming once again part of the Western's paradigm in world affairs.

Eurocentrism as the Avatar of Imperialism

Following the defeat of Fascism and Nazism in World War II, open "scientific" racism and "raw" imperialist discourses were erased from the dominant Western body of theories of international relations as the task now was to make room for the inclusion of the postcolonial world as newly independent nation-states. During the conflict in the European theater, troops from the colonies had participated in the war against Nazism and had thus been introduced to the democracy discourse of the colonial metropoles and the Soviet ideology of socialism. Likewise African-Americans had fought in the segregated US troop contingent in Europe and the Pacific to save democracy, while, at home, American society was still struggling with segregation and the legacy of slavery.

Consequently, the emerging Third World entity had to be integrated in a new institutional framework and ideology of postcolonialism based on a value system of universalism and acknowledgment of interdependence. Simultaneously the emergence of a socialist bloc (essentially the Soviet Union and China) impacted on the balance of forces between the hegemonic countries (the Western powers and former colonial metropoles) and the new nation-states who were now becoming members of the United Nations. With the entrance of these newly liberated countries on the diplomatic stage, the task that arose in the post-1945 world called for a necessary overhaul of Western colonialist ideology and terminology (Eurocentrism). Not to be forgotten, of course, was the emergence of the USSR as a competitor to the capitalist world and as the promoter of a socialist ideology and development model. Consequently the debates concerning British or American dominance contributed to the replacement of the concept *hegemony* with neorealism and liberal theories, while the notions of "civilization versus barbarism" were modified to the notions of "modernity versus tradition" (Hobson 2012: 10).

As a consequence of the complexities of decolonization, the implicit recycling of Eurocentrism, by modernization theory, propelled the Western capitalist economies as the development model to be emulated by the "new" nations. This discourse appears to have been used as an ideological cover thrown over the past in order to disguise the brutality of the organized violence of colonialism. This period of world history cannot be understood

without reference to "the structures of power that EuroAmerica produced over the last five centuries, which in turn produced Eurocentrism, globalized its effects, and universalized its historical claims" (Dirlik 1999: 8).

By projecting the European capitalist model of development during the post-World War II period, Eurocentrism became the cultural and ideological vindication for the imperialism of the West. In this context, it is significant to point out a main difference between two types of colonialism/imperialism. While in pre-World War II, European direct rule colonialism was territory-based to the extent that the colonies were seen as the property of the colonialist powers, American imperialist strategy did not, on the whole, take over the administration of colonies. As the US victor of World War II had not participated in territory-based colonialism, apart from the Philippines, the discourse of modernization signified the reentrance of a type of neocolonialism similar to the indirect rule the United States had practiced toward the independent nations of South America. The dependency of these countries was thus based principally on economic ties with the United States, but as sovereign nations, while simultaneously "protected" by Washington from European imperialism since the proclamation of the Monroe Doctrine (see Julien (1968), Arévalo (1961), and Nearing and Freeman (1966)).

The modernization school of development theory, by offering the Western capitalist model, recycled the Eurocentric-based supposition that the natives of the developing countries were incapable of devising their own paths. Like old wine in new bottles, the basic assumption of European superiority is implicitly recognized. In this way, the legacy of European colonialism is reproduced in more modern settings such as an environment of nominal political independence.

Consequently, modernization theory implicitly depicted colonial subjects as childlike, uncivilized, backward, and weak in contrast to the perceived material and moral superiority of European/Western civilization. Seen in this perspective, the ideological construct was/is the product of inherent racism, which Pieterse views it as "the psychology of imperialism, the spirit of

empire, because racism supplies the element that makes for the righteousness of empire. Hence racism is not simply a by-product of empire but... part of the intestines of empire" (Pieterse 1990: 223). Hobson alternates a dialectical relationship by ascribing a *pioneering agency* to the Western imperialist countries, who in their self-serving imperial civilizing mission, i.e., "paternalist Eurocentrism," are able to "auto-generate or auto-develop into modernity while conversely Eastern societies are granted *conditional agency* and are unable to auto-generate or self-develop" (Hobson 2012: 6).

Understanding the Modus Operandi of Capitalism

Like all living organism, capitalism, as an organic socioeconomic and political structure and organization pattern of human activities, has a past, present, and future. These three parameters are dependent upon one another for the survival and expansion of the system. Seen in this light, the history of capitalism needs to be understood in order to comprehend the present opportunities and dangers which may influence the shape of the future(s). In this context, the comprehension of the system is itself a subject of confrontation between at least three main bodies of perspectives or ideologies, liberalism, economic nationalism, and Marxism, which at the same time contributed to the implementation and generation of varied forms of capitalism on the world scale.

When this is said, projecting the Western experience with societal development as the ideal-type model for newly independent former colonies was a cynical attempt to deflect attention from the responsibility of imperialist nations for the state of underdevelopment in the postcolonial Third World nations and their continuous exploitation. This was done consciously by conventional Western social scientists during the decolonization period and in competition with proto-Marxist interpretations of imperialism. The volume by W.W. Rostow "The Stages of Economic Growth" with the subtitle: "A Non-Communist Manifesto" (Rostow 1960) exemplified the attempt to cement

Eurocentrism in development studies while implicitly seeming to attack Marx's disputable thesis of unilinear development.

While the "dependency school" of development studies rejected and criticized "modernization theory" for its projection of the Western model based on integration in the international division of labor, a tendency within the Marxist approach seemed to accept arguments of the stages of economic growth. Thus, the theoretician, Bill Warren, attempted to turn the table on the Leninist understanding of imperialism as well as the dependency approach for its rejection of relations with the capitalist world (delinking!) in favor of greater "self-reliance" in socioeconomic and political development. As indicated in the provocative title of his book, Warren was implying that imperialism in fact had not exploited the periphery enough and that the expansion of Western imperialism was a pioneer of development in the Third World! (Warren 1980).

It is not our aim here to take a position pro or against this approach to development, but it is worth signaling that the demise of socialism in the Soviet Union and the Eastern Europe, as well as the opening of China (and Vietnam!) to the capitalist world market changed the apparent balance of forces between socialism and capitalism toward the closing of the last century. Even Cuba and North Korea are knocking at the door wanting to become involved in world trade and liberalization of their economies in a capitalist direction. (We will come back to this problematic toward the end of this analysis.)

The question that arises in this connection is whether the globalization of capitalism is an all-inclusive process which will guarantee all participants decent rewards in the form of basic standards of living and protection from the ecological problems and climate change which the existing mode of capitalist production participated in creating. Will the future world be as flat as the US journalist Thomas Friedman promised?

In order to answer this question, the process of capitalist production and distribution has to be taken into consideration. Can the system accommodate the expectations that have/are being created? To what extent was the conceptualization of

the world in the schematic categorization proposed by world system theory (Wallerstein 1974) which recognized a stratification of the global economy. According to this approach, the division of the capitalist international system is defined by three types of participation in the world economic and political system: (1) the core (under the hegemony of a leading nation), (2) the periphery (which includes most of the postcolonial world), and (3) the semi-periphery (the nations that have reached an intermediate space between the other two). The explanatory strength of the schema is due to the fact that it takes into consideration the upward or downward mobility over time of the nations composing the world system, for example, changes of hegemonic leadership over the core or movement of core nations to a higher or lower position. With regard to upward mobility from the periphery, three possibilities come to the fore: "Successful strategies of national upward mobility include 'promotion by invitation', 'self-reliance', and "seizing the chance" (Hoogvelt 1997: 60).

Needless to point out is that geopolitics as well as geo-economics played/plays a determining role in the strategic decisions of the American hegemonic power. This explains the contrast between US policies in Latin America preventing the emergence of economic growth strategies like those that were implemented in the East Asian model of the "developmental state." Likewise the convergence of Chinese willingness to open itself to the world market and the US acceptance of normal economic relations with China influenced the American geostrategic confrontation with the Soviet Union. This proved to be a short-term advantage for Washington. As far as China was concerned, the transformations in the geopolitical context of East Asia and the Cold War with Russia allowed the three strategies of upward mobility from the periphery to the core to be implemented.

It should be noted that the opening of the Chinese economy to the capitalist world system was not a departure from the Maoist model. In fact, it had been the United States that had attempted to isolate China through an economic boycott. Consequently, the strategy of self-reliance and delinking which the Chinese

leadership followed after the victory in the civil war was making a virtue of necessity.

Looking Back at the Genesis of Capitalism

The historical emergence of independent (liberated) former European capitalist colonies after World War II forced itself on the agenda of Western socioeconomic and political sciences. The difficulties of interpretation the new relationship between core and periphery were seemingly connected to the fact that capitalism is considered by many to be a structural construction rather than as a process giving it analytical fluidity.

Based on a prototype Marxian approach, the historian Henry Heller presents and discusses the origin of capitalism, its nature, as well as its sustainability now that the question of environmentalism has belatedly come to the fore. In the attempt to clarify the trajectory of capitalism, he offers a global perspective that includes the following four points of repair: "that capitalist development was drawn out over a long period, three centuries and counting; that class struggle and changes in the relations of production were historically decisive in their emergence and evolution; that home and world markets developed simultaneously; and that the territorial state was, and remains, an integral component of capitalism" (Heller 2011: 9).

Shaping the conceptualization and contextualization of capitalism are the narratives that can be derived from including the ideologies and perspectives which in time came to influence the evolution of this mode of production and distribution as well as its internationalization. What is implied here is that a methodology and categories of analysis have to be taken into consideration in such an endeavor. The implication of course is that in the course of its internationalization/globalization, capitalism affected other societies while these in return influenced its evolution. The result of this process was the rise of variants of capitalisms: core, periphery, and semi-periphery as well as different modalities in the implementation of development strategies. This opened the way for understanding the upward and downward mobility of nations in the world system as well as explaining wars and conflict in the age of imperialism.

The body of rivalling ideologies and perspectives that addressed the rise of capitalism and its trajectory was composed of liberalism, economic nationalism, and last but not least Marxism. These were not only descriptive analyses of the process involved but were also politicized doctrines as they each had sociopolitical agendas and agencies to push development forward in the preferred directions. In other words it would be erroneous to consider capitalism purely as an economic construct. As Henry Heller puts it, "Capitalism is certainly a mode of production, but it should not be looked upon in merely economic terms" (Heller 2011: xii).

Regardless of the logic behind this argument, such an approach is probably one of the main weaknesses of economic liberalist theory which operates on the assumption "that a market arises, spontaneously in order to satisfy human needs and that, once in operation, it functions in accordance with its own logic" (Gilpin 1987: 27). But operating with the notion of spontaneous market creation is a huge misunderstanding of the rise of capitalism or worse. Historically, the transition from feudalism to capitalism was a highly politicized process which, although underplayed by economic liberalism, needs to be recognized. The approach to market creation and the transition to capitalism were not, and could not be, in the context of social change, anything but the result of violent struggles and class creation. The dispossession of agrarian laborers in order to force them into the new industrial production structure could not be left to the forces of nature (Thompson 1963/1968).

As the scholar of the transition from feudalism to capitalism, Karl Polanyi points out there was a fundamental anomaly in the liberal paradigm of market creation:

> The road to the free market was opened and kept open by an enormous increase in continuous, centrally organized and controlled interventionism. To make Adam Smith's 'simple and natural liberty' compatible with the needs of a human society was a most complicated affair. (Polanyi 1944/1957: 141)

Another shortcoming of economic liberalism is related to the conceptualization of the international expansion of capitalism in the world. Around the time of the Industrial Revolution in England, the English economy did not have a dominant comparative advantage with especially the economies of East Asia (China) and sub-Asia (India). Britain was in fact running serious deficits in its trading relationship with these nations. This was a serious weakness for the takeoff of British dominance in the world economy. The inherent disadvantage of this trading relationship was due to the fact that there was no demand for British goods in China, while the opposite was the case in Britain where there was an important demand for Chinese and Indian produce and commodities. As a matter of fact, these countries had a comparative advantage in their commerce with Britain. To resolve the problem of the imbalance in the trading relation, Britain, after having established its hegemony over India and forcing it to grow opium, waged the so-called Opium Wars in order to make China import the narcotic. Empire building required the agency of the state!

Not only that, Britain also put tariffs on imports of Indian and Chinese textiles in order to protect "infant" British light industries from the competition that came from Asia. It was first after having established itself as an industrial power that economic liberalism promoted the discourse of "free trade" and "comparative advantage." The hypocrisy of British political economy was recognized by the theoretician of economic nationalism, Friedrich List (1885/1977).

While the self-regulating market is assumed to be the best agency for "rational maximizing creatures," this institution will contribute toward equilibrium and inherent stability over the long term for humanity. This assumption was harshly critiqued in connection with World War II by Karl Polanyi who argued that the failure of economic liberalism had a large share of responsibility for the great conflict (Polanyi 1944/1957).

As Robert Gilpin implicitly points out, the proponents of the self-regulating market are immune to criticism. This is done by covering their ideological and political agenda with idealistic and humanistic notions but do not explicate the formation of the world structure of capitalism:

> In essence, liberals believe that trade and economic intercourse are a source of peaceful relations among nations because of the mutual benefits of trade and expanding interdependence among national economies will tend to foster cooperative relations. (Gilpin 1987: 31)

Contrary to this assumption which is based on a convoluted reading of economic history, the ideology/perspective of economic nationalism offers a different interpretation based on the struggle for economic development. In short, while the vision of liberalism proposes a harmonization of relations based on market relations between countries in the world system, economic nationalism dismisses this understanding. Its main proposition is that economic development is the responsibility of the national state which implies subordination of the market to the strategy of industrialization and a strong military in order to defend the nation. According to the economic nationalism perspective, and based on history, the leading nation of the system (Britain) was more interested in preserving and expanding its control of the world rather than assisting the "catching up" of competitors.

Not only did England implement protectionism in its early development against more advanced nations at the time, but once the state-directed intervention in the domestic economy had succeeded in making it the leading nation in the world, it proclaimed the tenets of economic liberalism, i.e., "laissez-faire" and free trade, to be of universal validity. The challengers to British hegemony in the end of the nineteenth and first part of the twentieth centuries were the three nations of the United States, Germany, and Japan. These "latecomers" did not follow a strategy of economic liberalism in their catching-up strategy which resulted in dislodging Britain from its position of leadership of the world.

It is worth mentioning that the statist/nationalist approach to economic development was bound to come into conflict with British hegemony (which, truth be told, was not less nationalistic!). The aim of the three upcoming countries was not to replace the world system of capitalism but to

achieve a better position in it. In so doing they did not follow an anti-imperialism strategy but remained in a position of "contra-imperialism." Consequently, the resulting inter-imperialist contradictions initiated a conflict for the redivision of colonies leading to both world wars. Japanese imperialism aimed at establishing a co-prosperity sphere in Asia through its brutal occupation and control of Korea and China and during World War II tried to "liberate" the European colonies (and the United States) from their metropoles. This was a challenge of huge proportion to the Eurocentric cultural sphere on the part of a non-Western source.

The Marxist Search for the Negation

Of the three ideologies/perspectives which the genesis of capitalism in Europe gave rise to (economic liberalism, economic nationalism, and Marxism), it was the latter approach that attempted on the basis of a normative commitment to socialism (Heilbroner 1980: 20–21) to propose an exit (over the "long durée") from the conundrum of capitalist development. Socialism was accordingly conceived as the next stage in the evolution of human development.

This in itself distinguishes the Marxist approach from the other two analytical perspectives of European capitalism. Consequently, economic liberalism and economic nationalism appear as belonging to the problem-solving theoretical tradition within social sciences rather than to the body of critical theories who goes beyond descriptive explanations in order to analyze the essence of a phenomenon (Cox 1981).

Besides proposing socialism as the outcome of capitalism, Marxism proclaimed the class struggle to be the agency capable of instrumentalizing the transition. While economic liberalism assumes the existence of "economic man" as "a rational maximizing creature" responding to the self-regulating market (Gilpin 1987: 31) and economic nationalism marginalizes the individual and prioritizes the nation-state, Marxism builds on the assumption of "political man" behaving within a collectivity through class adherence.

Through an irony of history, the class struggle in the European context contributed to improvement for the population although the two world wars decimated young generations of members of working classes. The nexus of the class struggle to the colonialism and imperialism of their nations did result in the improvement of the conditions of the masses in the imperialist countries but was a difficult conundrum for the fundamental socialist perspective. The theoreticians of Marxism were aware of this political contradiction rather early on. For example, Friedrich Engels in a letter to Karl Kautsky comments the position of British workers to colonialism:

> You ask me what the English workers think about colonial policy. Well, exactly the same as they think about politics in general: the same as the bourgeoisie think. There is no workers party here... and the workers gaily share the feast of England's monopoly of the world market and the colonies. (Engels 1882 n.d.: 340)

The inability of surmounting the economism of the labor movements in the imperialist nations did both improve the standards of living of the general populations and neutralize the struggle for socialism in their societies. Under these circumstances nationalism and Eurocentrism were strengthened, while solidarity with the fate of the colonial people was reduced. In his pamphlet on imperialism, Lenin quotes the British politician, Cecil Rhodes, for the following argument for colonialism:

> I was in the East End of London yesterday and attended a meeting of the unemployed. I listened to the wild speeches, which were just a cry for "bread," "bread" and on my way home I pondered over the scene and I became more than ever convinced of the importance of imperialism.... The Empire, as I have always said, is a bread and butter question. If you want to avoid civil war, you must become imperialists. (Lenin 1917/1951: 513–534)

Superseding Marxism's tendency of focusing on a theory of domestic capitalist political economy, Lenin converted the approach to a theory of international political relations between capitalist state formations. The lines of inquiry which Lenin conceptualized and contextualized with his understanding of imperialism revolved around (1) imperialist rivalry (war and peace as well as uneven development) and (2) the impact of

capitalism on non-capitalist social formation (development and underdevelopment). In other words, Lenin "internationalized" the doctrine of class struggle by bringing in rivalry and uneven development in the analysis of capitalism as an international system. In doing so, he dismissed Karl Kautsky's argument of "ultra-imperialism" whereby the imperialist powers could collectively exploit the colonies. According to Lenin the "law of uneven development" between them would prevent "collective imperialism" in the long run.

A fundamental theoretical shortcoming in the Marxian approach to the question of capital accumulation in the context of European capitalism weakened awareness of the fact that non-capitalist formations also contributed to the process of accumulation and reproduction. By giving the impression that exploitation of European societies was exclusively the source of accumulation, this may have made organic solidarity between the working class in Europe with progressive elements of non-Western societies more difficult.

Taking her point of departure in Karl Marx's opus magnum "Das Kapital," Rosa Luxemburg became critical of its methodological approach. The model of accumulation proposed by Karl Marx appeared to her to be wanting. She had arrived at the conclusion that this pattern of accumulation was based on the analytical assumption of capitalism as a closed system composed only of laborers and capitalists. She rejected this proposition and argued that capitalism since its origin had needed the contribution of non-capitalist labor (peasants and artisans) both in the capitalist sphere and in the colonies:

> Thus capital cannot accumulate without the aid of non-capitalist organisations, nor, on the other hand, can it tolerate their continuous existence side by side with itself. Only the continuous and progressive disintegration of non-capitalist organisations makes accumulation of capital possible. (Luxemburg 1913/1968: 416)

Even though the claim can be made that the Marxist critique of capitalism at times concentrated mostly on its modus operandi in the capitalist/imperialistic European nations, there were instances when the cannibalism of capitalism was acknowledged. Marx and Engels on certain occasions recognized the incorporation of non-capitalist nations in the capitalist world system as a menace to the metropoles.

Conclusion: The Rise of China

The opening of Japan by the American Commodore Mathew Perry in 1853 resulted in the Meiji Reformation which became the agency for the strengthening and revival of Japanese nationalism and its joining the imperialist club of nations and then challenging Western presence in Asia. Similarly, the Western (and Japanese!) encroachment on the Chinese mainland following the Opium Wars led to the imposition of unequal treaties on China. A development opened for Chinese concessions in different regions of China to all the imperialist powers. Both Karl Marx and Friedrich Engels toyed with the thought of how this might affect the future of capitalism now that isolationism was made impossible to sustain. In prescient words of Engels:

> But as soon as Chinese competition sets in on a mass scale, it will rapidly bring things to a head over here (London). And thus the conquest of China by capitalism will at the same time furnish the impulse for the overthrow of capitalism in Europe and America.... (Engels 1854, n.d.: 348)

This is a lesson which the US elite did not pay attention to when it played the Chinese card against the Soviet Union during the Cold War. Opening the door to the capitalist world economy to post-Mao China has been a step the United States could not control. There is no space here to go into an analysis of this evolution, but the consequences are bound to be felt in this century (Schmidt and Hersh 2018). Eurocentric imperialism may not be challenged by any anti-capitalist entity at the moment, but the rise of China and partly India and Russia encompasses a challenge to the hegemony of Euro-Atlantic dominance.

European Imperialism in West Africa

Mark Omorovie Ikeke
Delta State University, Abraka, Nigeria

Definition

The imperialist venture in West Africa was vast and spanned many years and epochs, and hence, cannot be covered in any chapter comprehensively. It will give a brief definition of imperialism, highlight some aspects of imperialism in West Africa, look at some reasons for imperialism in West Africa, examine the effects of imperialism in West Africa, present some of the responses to imperialism, and thereafter conclude. The study is done from a critical anti-imperialist point of view.

Introduction

It is important to note from the outset that an essay on European imperialism in West Africa cannot be comprehensive as the imperialist venture in West Africa was vast and spanned many years and epochs. No doubt the topic is the subject of entire textbooks and university courses. Because of this, this essay is by its nature skeletal and selective. It will give a brief definition of imperialism, highlight some aspects of imperialism in West Africa, look at some reasons for imperialism in West Africa, examine the effects of imperialism in West Africa, present some of the responses to imperialism, and thereafter conclude. The study is done from a critical anti-imperialist point of view.

The term 'imperialism' can be defined in a broad or narrow sense. In the broad sense it includes all that the dominant centre does to dominate and control peripheries that may be outside it, while in the narrow sense, as A.K. Dutt states, it is how the 'dominant economic and political elements of one country expropriate for their own benefit the land, labour, raw materials, and market of other countries' (2010, p. 393). A.K. Chaturvedi writes that imperialism is 'the extension of control by one country over another. This can take the form of colonialism, the attempt to establish overt political control and jurisdiction over another country; neo-colonialism, control exercised through economic domination; or cultural imperialism, the destruction or weakening of an indigenous culture and the imposition of an alien one' (2006, p. 143). This is a very broad and inclusive definition. In fact imperialism includes all of the above. For A. I. Okoduwa and S.E. Ibhasebhor, 'imperialism can be seen as a situation in which a particular country or a group of countries impose its control on another. It involves expansion of economic spheres of influence and sometimes the forceful plunder and exploitation of the economic resources of the countries so dominated' (2005, p. 7). But the subject of this essay is the classic form of imperialism as colonialism that took place in West Africa. This is no longer in place, as all the countries of West Africa have gained independence from their former imperial powers such as Britain and France. Classic imperialism, as O. Igwe writes, involves a 'coerced unequal relationship between states or peoples, especially between a victorious imperial state and its

militarily vanquished empire' (2005, p. 197). This form of classic imperialism was imposed upon the peoples of West Africa as they were subdued, oppressed, and exploited by the European imperial powers.

Imperialism in West Africa

European interests in West Africa date back to the beginning of recorded history. Y. Akinyeye (2012), citing Herodotus, writes of the quest for a road that would lead to the gold reserves of the Negroes of the Sudan. Akinyeye states further: 'The French and the British were also engaged in brisk business in gold with West Africa, which they called Guinea, at this time, from the 15th century. By the 17th century, the British were already toying with the idea of conquering West Africa as a way of undermining the Moorish trade in that commodity. The British were making plans for the conquest of the major rivers such as Niger, Senegal, and Gambia. Even though not much came out of this plan, there is no doubt that Europe benefited immensely from the gold trade in West Africa, through North Africa' (2012, pp. 148–149). As Akinyeye writes, when Germany and Italy grew more powerful around 1871, Germany displaced France as it had a larger population after the Franco-Prussian War of 1870–71 a larger percentage of the German population was between 18 and 35 years and could bear arms in war:

> This was at a time when France nursed the hope of revenge against Germany for her humiliation in the Franco-Prussian War, and victory in battle was still largely a function of number under arms than fire power. In case of another war, therefore, France was more vulnerable to defeat by Germany. She needed to look for extra-European sources of manpower for her army. As already shown elsewhere, West Africa was the most advantageous area to recruit soldiers to offset French numerical disadvantage in relation to Germany. This quest for military manpower both for the defence of metropolitan France and overseas imperial ventures was the major idea behind the French policy of 'la force noire'. (Akinyeye 2012, pp. 149–150)

France also needed abundant supplies of iron and coal as she had lost the coal-mining towns of Alsace and Lorraine in the Franco-Prussian War, and at the same time her iron ore was not very profitable for the making of steel because it contained too much phosphorus (Akinyeye 2012). For all these reasons France needed an overseas territory such as West Africa. As for Britain, after 1870 her naval power was threatened by the emergence of the German Empire, especially when Emperor Wilhelm II argued for the creation of a strong navy to enable Germany to control the seas (Akinyeye 2012). This undoubtedly meant that the 'German market could no longer be assured for British industry and Germany herself would need overseas market. Also, the naval rivalry could lead to war and in that case adequate arrangements had to be made for British security' (Akinyeye 2012, p. 150). The British acquired coaling stations in Freetown, Accra, Lagos, and Portharcourt, and from these places they began to make inroads into the hinterland of West Africa. As for the French, they acquired Dakar and some other locations along the coast from which they would control the French West African territories.

It is important to note that earlier, from the sixteenth century to the middle of the nineteenth century, European powers had been involved in the transatlantic slave trade. As France's involvement in West Africa grew, with its attention focused on the Senegal River, it began to implement a policy of assimilation; this meant that its West African territories effectively became part of France. At the same time, the British were also expanding their hold on the region. By the time of the Berlin Conference in 1884–85, each European power already had an area of influence and control; from that time onwards the French controlled Senegal, Mali, Burkina Faso, Benin, Guinea, Ivory Coast, and Niger, though they did not implement a policy of assimilation in all of their territories.

While European powers acquired some territories in West Africa forcefully, through military tactics, many other areas were acquired by means of treaties. These treaties varied, and the African people involved often did not know their full implications. A European company, such as the Royal Niger Company (RNC), would make an

E

agreement with the local chiefs or leaders that permitted it to trade, and soon afterwards it would invite its own government to take over the territory in order to protect it. In some cases a treaty came about as a result of a local chief himself inviting the colonial power to come in and protect its territory without seeing the implications. For instance, before Nigeria was under the control of the RNC until it became a British colonial territory in 1900.

The British colonies in West Africa included the Gambia, Sierra Leone, and Ghana. As a result of the slave trade and the search for resources such as gold and ivory, British merchants already had trading posts in Sierra Leone, Nigeria, Ghana, and elsewhere. S. Chilsen (2009) notes that with the abolition of the slave trade, the movement for industrialisation in Europe, and the loss of the American colonies to revolution, there was a need to be more involved in West Africa. This led to many explorers going to Africa in the 1870s and the beginning of the scramble for Africa at the Berlin Conference of 1884–85, at which the European powers divided up the continent of Africa. Two articles produced at the conference indicated how territories were to be acquired and controlled.

In order to establish effective control over the territories that she claimed, Britain used the RNC until she was able to assert control and to rule, and exploit them directly. The RNC was invested with political rights and had its headquarters in Asaba, with a police force, a high court, and many agents to handle its trading posts (Okoduwa and Ibhasebhor 2005). Okoduwa and Ibhasebhor (2005) show that in 1897 the RNC and its forces fought and defeated Bida and Ilorin and began the process of the conquest of north Nigeria; but because of challenge from France, the British Government abrogated its charter and took over the territories.

The Consequences of Imperial Activities in West Africa

The effects of imperialism have been recounted by many African authors and others. Walter Rodney (1972), without fully acknowledging some limitations and weaknesses in Africa's past, blames the imperialists for depriving Africans of their capacity to develop the resources of nature, administer themselves, and make military progress and for replacing these with European models of exploitation. Frantz Fanon (1968) also has examined how colonialism made Africans 'the wretched of the earth'. According to Kwame Nkrumah (1965) there is no doubt that the purpose of the Europeans was the economic exploitation of Africa. As Rodney (1972) puts it, the Europeans, with their superior navigational equipment, ships, machines, and weapons, turned the ports of Africa into economic satellites and ensured that all the roads and railways led to them in order to facilitate the exportation of resources to Europe.

White European powers showed no regard for the dignity and rights of West Africans, who were seen as less than human. The region was carved up arbitrarily into various countries to be ruled by the British and French without regard for the West Africans. At the Berlin Conference in 1884–85 they were fought over and divided up without their consent. What mattered to the imperialists was what would enhance their exploitation of the peoples, the land, and its resources. They had no respect for traditional land boundaries, sacred rivers and mountains, languages, or cultures. Peoples who had lived together and shared a common language and culture all of a sudden found themselves in different countries separated by artificial national boundaries. Fanon is largely right when he writes that 'European opulence is literally scandalous, for it has been founded on slavery, it has been nourished with the blood of slaves and it comes directly from the soil and from the subsoil of that underdeveloped world. The well-being and the progress of Europe have been built up with the sweat and the dead bodies of Negroes, Arabs, Indians, and the yellow races' (1968, p. 96). It is not true, however, that all that Europe has accomplished comes from its exploitation of other peoples.

One of the fundamental effects of imperialism is what it has done to the African psyche. The imperialists condemned most of the aspects of

African culture and life that they encountered. They condemned African traditional religion as pagan and superstitious and regarded whatever they could not understand as magic and evil. They viewed Africans as having no knowledge of the true God. Seeing African names as evil, they renamed geographical features and locations. They made Africans see themselves as inferior, and this is the mentality that many Africans still carry today.

P. N. Chikendu (2004) classifies the effects of imperialism in political, cultural, and economic categories. In the political area, he writes that West Africans lost their autonomy and sovereignty, for instance when the British colonised Lagos in 1861 in order to control the governance of Lagos: an alien political system was imposed on the colonised country. The people of West Africa also lost their cultural autonomy: their spiritual, religious, and social beliefs, attitudes, and practices were subjugated, and a way of life that was foreign to them was imposed on them through education. In terms of the economic effects, the colonies were milked of their resources and made to work to export crops to Europe, for little or no pay.

The Reasons for Imperial Activities in West Africa

One of the main motives that drove imperialism was the search for raw materials and other resources in foreign territories (Okoduwa and Ibhasebhor 2005, p. 7). For some writers, such as John Hobson (1902), it was the drive for new markets for goods produced by the imperialists that propelled the conquest of other foreign countries: they had surplus goods and services which the purchasing power of the working class could not meet, and so customers had to be found in foreign countries. Vladimir Lenin (1917) viewed imperialism as the inevitable consequence of capitalism, stating that the goal of capitalists is a global monopoly of the market forces and the domination and exploitation of other nations' resources. It has been argued by Okoduwa and Ibhasebhor (2005) that in Hobson imperialism is a

result of capitalist maladjustment, but in Lenin it is the necessary consequence of capitalism.

With regard to imperial activities in Africa, including West Africa, Okoduwa and Ibhasebhor (2005) indicate that there were economic, political, and social factors. The economic factors included 'the quest for raw materials for manufacturing industries in Europe', 'the search for markets', and 'investment of surplus capital'; among the political factors were 'the need to maintain balance of power in Europe', and the social factors were the 'need to solve socioeconomic problem in Europe' and 'racialism' (Okoduwa and Ibhasebhor 2005, pp. 21–26). According to Dutt, the reasons for imperialism in West Africa may have included 'the dominating nature of human beings and groups; strategic and security advantage; giving other people a superior way of life or freeing them from tyranny; and obtaining access to resources, investment outlets, and markets for the products of the center' (2010, p. 393).

There are those who justify imperialism as being humane and beneficial to the colonised. While it is true that there may have been some benefits that came from colonialism, the damage it did to West Africans was greater and should not be overlooked. Chikendu (2004) quotes Lugard, a governorgeneral of Nigeria, who argued that colonialism benefited the colonised because they received services from the colonisers in return for raw materials and a cheap market. Chikendu (2004) also cites Kipling, who claimed that Africans were wild beasts and needed to be civilised by the white race.

The Response to Imperial Activities in West Africa

The main response to imperial activities can be summed up in the word 'nationalism'. The experience of West Africans during the Second World War opened their eyes to the need to struggle for their right to govern themselves. Before nationalist movements organised for national independence, there were various other responses that are important to note here. They include anti-

colonial organisations led by Kwame Nkrumah, Nnamdi Azikiwe, Obafemi Awolowo, P.S. Nije, and Dauda Jawara, aimed at immediate socio-political, cultural, and economic national self-administration.

Okoduwa and Ibhasebhor (2005) have described various patterns of African response to European invasion, which are summarised in this paragraph. African leaders did not surrender their territories to the Europeans voluntarily: the European took them by force, false treaty, or hand-twisting diplomacy. In Ghana, the Asante people fought the British and defeated them in 1864, but eventually the British captured Kumasi in 1896 and exiled their king, Prempe. In Nigeria, the Sokoto caliphate resisted with bows and arrows until it was defeated. Samouri Toure fought the French between 1882 and 1898 to preserve the Senegambia area until he was defeated. In other places African leaders entered into diplomatic treaties with the Europeans supposedly to protect their areas, but these were effectively traps, as very often the Africans did not understand their full implications. For instance, in 1880 Seku Ahmadu of Senegambia signed a treaty of protection with the French, but the French were nevertheless bent on acquiring his territory, and he had no option but to resist through force until the French defeated him in 1893. In West Africa, according to Okoduwa and Ibhasebhor (2005), Professor E.A. Afikpo affirmed that there were many Igbo people in south-east Nigeria who resisted through the use of medicine and by calling on spiritual powers to destroy the white man. Again according to Okoduwa and Ibhasebhor (2005), A.I. Asiwaju (1977) stated that some resisted the French in French West Africa by migrating from their territories because they did not want a physical confrontation with the French.

The major response to imperialism or colonialism in West Africa occurred in the form of the nationalist movements. This response is summarised here from information given by Chikendu (2004). There were both nationalist uprisings and nationalist movements in French West Africa and British West Africa. In Nigeria the Nigerian National Democratic Party was initiated by Herbert Macaulay in 1923, arising from an elective principle in the 1922 Clifford Constitution. According to A.A. Babatunde (2014), the Clifford Constitution gave birth to a new legislative council for the Colony of Lagos and the Southern Protectorate that replaced the 1914 Nigerian Council; in the north the governor general remained the sole legislator. Though it was an advisory council, as the governor general had a veto power, the elective principle in the constitution encouraged the formation of political organisations through which the people could express their political aspirations, and it was during this period that Herbert Macaulay set up the first political party in 1923 (Aghalino 2006).

The formation in 1934 of the Lagos Youth Movement, which later became the Nigerian Youth Movement, also fanned the flames of nationalism. In 1944 the National Council of Nigeria and Cameroons was formed. Other parties would eventually be formed in Nigeria, such as the action group formed by Chief Obafemi Awolowo, the Northern People's Congress. With the nationalist drive informing more constitutions and conferences, Nigeria eventually became independent of British imperial rule on 1 October 1960. In Ghana, the former Gold Coast, after the First World War, Joseph Casely Hayford founded the National Congress of British West Africa. In the 1930s the global economic depression led to restiveness the world over, including Ghana. A youth conference was founded in the country by Dr J.B. Danquah. With the end of the Second World War, nationalistic agitations grew rapidly in the 1940s, precipitating the formation of the United Gold Coast Convention (UGCC) in 1947. When Dr Kwame Nkrumah returned to Ghana from studies abroad he joined the UGCC; he eventually left and formed the Convention People's Party (CPP) with two others. Nkrumah was sentenced to prison in 1950, but while he was in prison the CPP won overwhelming victories in the municipal elections and the governor-general, Sir Charles Arden-Clarke, released him; upon his consequent electoral victory, Nkrumah became Ghana's first independent prime minister in 1957. In the Gambia, the first of the four British West African countries, the first of her main

political parties, the United Party, was formed in 1957, followed by two other political parties, the People's Progressive Party and the People's Society on Progress for the Protectorate. The Gambia became an independent nation in 1965 with Sir Dawda Jawara as prime minister. In Sierra Leone, owing to the presence of two distinct groups of peoples, the Westernised freed slaves along the coast and the Islamised people in the interior, nationalism did not begin until the introduction of a new constitution in 1952. Through the leadership of Sir Milton Margai the country gained independence in 1961.

Chikendu (2004) has indicated that Francophone West Africa was administered as an integral part of France, and so nationalism was late in coming. Because of the French policy of assimilation, educated Africans were regarded as full French citizens and could be elected into the French national assembly or chamber of deputies from 1946. When the educated Africans came to realise that assimilation estranged them from their African roots they began to agitate for independence, often inspired by the writing of Aimé Césaire, especially his essays on *Négritude.* Because of the unusually inhuman treatment meted out to Africans, the African members of the chamber of deputies formed a nonparty bloc to argue for their African interests (Chikendu 2004). Nationalistic feelings heightened when in 1946 a group of African leaders, gathering in Bamako, Mali, formed the political organisation Rassemblement Democratique African (RDA). With inspiration from the RDA, nationalism grew in French West Africa, and eventually French West African countries gained independence like their British counterparts.

Conclusion

It is insufficient to attribute the entire range of failures of West Africa, and indeed of all of Africa, to imperialism. While it is true that imperialism raped and ravaged West Africa, West Africans have also contributed to the sufferings of their sub-region through eth-nicism and tribal rivalries that followed independence, corruption and embezzlement of public funds, inept leadership, wars over natural resources, and so on. There is a need for Africans to become mentally free and to take the challenge of the development of their regions of the continent into their own hands. It is true that European imperialism damaged and impeded the development of West Africa and of the entire African continent. It is now time for Africans who have long been politically independent to ensure that they draw on their authentic African and global values to build up their continent. It is important to note that Africans did not surrender to imperialism. Many brave and courageous Africans resisted imperialism, and many lost their lives in the struggle for freedom and formal independence. The nationalist movement also contributed, and several African countries gained their independence through the struggles of various nationalists. Imperialism was essentially for the European interest. Yet, in spite of the havoc it caused, it is now time for Africans to assert their freedom in every area of human existence.

European Periphery in an Age of Imperialism

Derek H. Aldcroft
University of Leicester, Leicester, UK

The Core-Periphery Debate

Economic development is a complex and puzzling phenomenon. There is no telling where, when, and how it will happen – why some countries and regions become rich, while others remain desperately poor. The classical notion that free factor flows would lead to convergence in development has long since been confounded by the glaring disparities in the levels of income that now prevail across the globe.

On a global scale, the most tantalizing issue is why Eastern civilizations, once very advanced, lost out to the West and why in Europe the Iberian and Mediterranean countries gave way to Northern Europe. That Europe, or at least part of it, came to dominate the political, economic, and cultural life of much of the world in its heyday in the nineteenth century is not open to question. When it emerged from the Dark Ages, it steadily extended its control and influence over the vast majority of the Earth's surface, from 7% in 1500 to 84% by 1914.

Yet for all its supremacy, Europe itself was a continent deeply divided, politically, economically, and socially. The core of modern development lay in the northwest corner, while to the south and east, there was persistent lagging, from the Iberian Peninsula along the Mediterranean, into the Balkans up through European Russia, and back into Poland and the Baltic states. The dividing line was Austria-Hungary, not quite up to western standards, but far better than the periphery here outlined. There were exceptions to this geographical categorization of course. The Scandinavian countries would not fall into this category, nor would Switzerland. More doubtful cases are Italy and Finland.

Such was the lagging in these peripheral countries that some historians have tended to regard Europe's peripheral states as also-rans in the process of modern development, dependent for much of the time on the core nations of the West. Many scholars likened the laggards to countries of the Third World. Spulber (1966, 7–8), writing in the 1960s, compared the East European countries with the developing nations of Asia and Africa. Even Spain was seen as an economic colony of the advanced nations by the economic nationalists of the 1920s.

The core-periphery debate, with its Marxist overtones, is a complex one which has been applied more generally to the twentieth-century less developed countries. However it is not without its relevance to the nineteenth- *and* twentieth-century Europe. The main tenets of the thesis are that peripheral countries are poor and less civilized and tend to concentrate on low-technology primary production by virtue of their dependence on richer countries, which in turn exploit the international division of labor for their own benefit, thereby reinforcing the peripheral states' dependent role in the international economy. There is therefore a certain degree of inevitability in the process. As some countries develop industrially and become wealthy while others lag behind, the latter will tend to take on the characteristics which bracket them as dependent economies.

Poor countries have generally laid the blame for their unfortunate circumstances on the capitalist exploiters of the West for, as Landes (1999, 252) once noted, "It feels better that way." But the nineteenth century cannot be regarded as one of complete suppression of modern development in

peripheral regions by the advanced core. Berend and Ranki (1982, 9) while admitting that the relationship was fundamentally an unequal one which tended to benefit the core while often proving destructive to the periphery, felt that it was also beneficial to the latter by acting as "an inducement to development, serving – under appropriate conditions – to lift the area from its peripheral position."

The core-periphery analogy is complicated in its application to Europe since it was not simply a question of an East-West, North-South split. It was in fact replicated at a more microlevel in many regional and local guises. For example, the Habsburg dynasty had its own East-West gradient, with the more industrialized western half serving as market for the products of the agrarian-based eastern sector, while the Balkans were in turn dependent on Austria-Hungary's large domestic market. At more local levels, the developing industrial/commercial centers such as Budapest, Bucharest, Sofia, Istanbul, Athens, Barcelona, Madrid, and Lisbon acted as magnets for the more backward agricultural hinterlands. In some cases there was even a reversal of the stereotyped roles. The nascent industrial sectors in the Baltic states, Poland and Finland, served as suppliers to the more backward imperial regime of Russia.

The core-periphery/dependency theory can also be somewhat misleading if it is put in a politico/economic context since economic subordination was not synonymous with political status. Some peripheral countries had a more independent existence than others. Spain, Portugal, and Greece after 1830 were autonomous countries in their own right, yet they were clearly laggards in development. And while much of the rest of peripheral Europe was in thrall to the crumbling empires of Ottoman Turkey, Russia, and Austro-Hungary, political dependence did not always mean economic subservience. The Baltic states and the western parts of Poland were more advanced than their political masters and became important industrial suppliers to Imperial Russia, whereas the Balkans could never really throw off the Ottoman yolk even when they secured independence.

Another point to bear in mind is that peripheral or marginal areas have changed over time and that some of the later laggards were once at the cutting edge of development. But what is noticeable is that there have always been marginal regions or countries, even though they may have changed over time. As Pollard notes, there has always been a marginal Europe, but the players have changed hands over the centuries. Greece and Rome were the power points of civilization in their heyday. England, Wales, and Scotland, along with the Scandinavian countries and Hungary, were the peripheral locations in the period when the prosperous core was located in Italy, Flanders, the Rhineland, and Southern Germany (Pollard 1997, 10, 267). At what stage the "golden triangle" of North-west Europe emerged as the key center of modern economic development is still open to debate, but there is little doubt that it had been well established by the nineteenth century.

The Backwash of Western Development

Whatever the exact timing of the global divide, there can be no doubt that by the latter half of the nineteenth century, the countries of Southern and Eastern Europe were seriously lagging and could be regarded as marginal players as far as the process of modern economic development is concerned. Not that peripheral Europe remained completely unaffected by developments in the West. As Berend (2003, 137) noted, "The fringe of an unprecedented European prosperity carried the sleepy, stagnant, unindustrialized countries along." Western influence came through many channels, via trade, imported capital, the influx of foreign workers and entrepreneurs, foreign technology, the construction of railways, and the creation of western style institutions, especially in banking. In the later nineteenth century, the underdeveloped countries of Europe tried to foster industrialization by tariff protection and other forms of state assistance, especially in Hungary, the Balkans, and European Russia.

The process was a slow and erratic one, and it sometimes led to lopsided and inefficient development. When western enterprise and capital were directly involved, it was often concentrated in the exploitation of minerals and raw materials

for use in the investing nations' own markets. This was true, for example, of the pyrites and mining concerns in Spain, which became foreign enclaves of development with most of the cash benefits being drained off by overseas operators, and perhaps even more so in the resource exploitation of the Balkan countries. The development of the Romanian oil industry was dominated by foreign companies, while 40% of western industrial investment in Serbia went into extractive industries (Berend 2003, 157). Railway construction was also heavily dependent on outside capital and enterprise. However, much imported capital was indirect in the form of loans to state governments which was used for military purposes, to cover budgetary deficits and for building up the state apparatus, and only a small proportion found its way into what might be called productive investments. As a result of official profligacy, most of the Balkan countries were insolvent by the end of the nineteenth century, Greece being the classic example.

Given the poverty of these countries, modernization was inevitably very dependent on western assistance in one form or another, but this had the unfortunate effect of leading to unbalanced development either in the form of foreign dominated enclaves, especially in resource extraction, or in the shape of heavy dependence on specific sectors, notably agriculture, in order to serve western markets. Thus Hungary and much of the Balkans and parts of European Russia became the granary of Europe in the latter half of the nineteenth century. Unfortunately cereal monoculture regions or countries heavily dependent on a handful of agricultural products were rendered very vulnerable to market changes. This was especially so in the case of cereals when American producers invaded Western Europe in the later nineteenth century. In this respect the Balkan countries were more vulnerable than either Hungary or Poland since the latter had a more diversified economic structure.

Within marginal Europe there was of course a considerable divergence in economic performance and the extent of industrialization. The degree of political subordination was not necessarily a good indicator of the rate of progress. While Balkan backwardness might reflect relics

of Ottoman rule even after independence was secured, the same excuse cannot be used for the Iberian Peninsula, that is Spain and Portugal, which had once waxed high in the European firmament. Pollard (1981, 243) believes that both the Iberian and Balkan Peninsulas did not get beyond the beginnings of the industrialization process except in very limited sectors and regions, and even then it was not internationally competitive. By contrast the Baltic countries did somewhat better industrially than their political master and became important industrial suppliers to the less developed Russian Empire. Poland too, despite its political subordination to three countries, developed a worthwhile industrial base. Hungary, as part of the Dual Monarchy, also boasted a more diversified economic structure, though falling behind its more advanced partner.

In the decades before the First World War, most of the peripheral countries probably kept pace with and in some cases exceeded the economic performance of the richer western nations. It should be stressed however that they all started from a very low base and also estimates for domestic output expansion are not the most robust. Even so, by and large the peripheral countries remained largely agrarian and/or raw material producing entities where islands of capitalism or industry floated in a sea of primitivism.

The low levels of income per capita by the end of the long nineteenth century tell their own story. They were but a fraction of those of the more advanced countries of the West, one half or less, and possibly as low as 20% in the case of Albania and Turkey. For those none too happy with the reliability of national income estimates for this era, there are plenty of other indicators to illustrate the degree of backwardness. Data on levels of industrialization, railway mileage, and agricultural productivity confirm how far these countries lagged behind the West. Per capita levels of industrialization were but a fraction of those in the UK, Belgium, and Germany, and the same is true of the density of railway development. The most telling statistics are the very low level of goods transported and the journeys made per inhabitant compared with those in Western Europe. For example, the number of railway journeys made per inhabitant

annually in the Balkan countries and Spain and Portugal was miniscule compared to the number in Britain, Germany, and Belgium. Even more significant was the very low level of human resource development. As well as being predominantly agrarian-based, the population of these countries was very illiterate judged by western standards. Many of the countries had illiteracy levels of 40% or more in the early twentieth century, in Portugal the rate was over 60%, while in the case of Albania and Turkey it was as high as 80–90%. Only Poland, Hungary, and the Baltic states had reasonable literacy levels (Aldcroft 2006, 5).

There is little doubt that all of the peripheral countries, with perhaps the exception of little Albania, showed some signs of development and change through the long nineteenth century. Yet when all is said and done, much of the change was of a marginal type, and by 1914 all of the peripheral countries could be classed as underdeveloped. Agrarian employment was still dominant and structural change had made very little impact on them. Referring to the eastern and southern provinces of the Austro-Hungarian Empire and the Balkans, Berend (2003, 180) writes: "The phase of modern structural changes remained a distant goal in the overwhelmingly agricultural and raw material producing countries. Despite its economic progress and advances, the region humiliatingly failed to modernize." Lampe (1989, 202) came to a rather similar conclusion with regard to the Balkan regions: "The sweeping structural changes that turn growth into development would not appear in the Balkans until after the Second World War." As we shall see, before then there were dramatic shifts in the peripheral landscape as a result of the changes wrought by two world wars and a great depression.

The Reconfiguration of Europe After 1918

The Great War marked a significant turning point in the history of Europe. Europe's power and influence in the global arena waned visibly in the ensuing decades as political and economic forces worked against it. The map of Europe was transformed as a result of the postwar peace settlement. The great empires which had once manipulated the European power system were gone. In their place emerged several weakened national powers and a motley collection of new and reconstituted states, mostly small, backward, and weak, which struggled in a hostile climate and against the political machinations of the larger nations to retain independent identity. These were the countries which constituted peripheral Europe.

In all fairness it was only a matter of time before the old order of prewar Europe was undermined because of national rivalries, nationalism, and ethnic unrest and greater participation in government. Apart from Germany, the older empires were rotten from within and were crumbling visibly before 1914. The Ottoman Empire was at its last gasp in Europe; it had steadily lost territory during the nineteenth century, and, following the destructive Balkan Wars of 1912–1913, when Serbia, Greece, and Romania had made substantial gains at its expense, it was left with only a toehold on the mainland of Europe. The same wars signalled the virtual end of the Austro-Hungarian Monarchy as a great power, which, along with the Ottoman Empire, had long been regarded as decaying dynasties. Despite its creditable economic record, it was surrounded by virulent nationalist forces on all frontiers which it had been powerless to accommodate within its unwieldy imperial structure. Simultaneously revolutionary forces and social ferment in Russia were also having a disintegrating effect on the Romanov Empire. Thus, even without a major war, it seems very likely that much of the formal imperial control of Europe would have crumbled in short order.

The war in effect completed the process of imperial disintegration. As the European empires faded away (Austro-Hungarian, Romanov, Ottoman, and German), many lively and independent states emerged from the ruins. Even before the formal peacemaking exercise got under way, aspiring contenders were laying claims to former imperial territories, and many of these were later confirmed by the peacemakers in the treaties concluded with ex-enemy powers.

The result was the largest redrawing of the map of Europe ever undertaken. Most countries were

affected in one way or another except for the neutrals. Apart from Spain and Portugal, all the peripheral countries gained or lost something. The Baltic states secured their release from Russian control, while Albania's prewar independence was confirmed, but only just. The ex-enemy powers were cut down to size so that both the main parts of the Dual Monarchy – Austria and Hungary – became shadows of their former selves. Turkey managed to retain a toehold in Europe, and Bulgaria's frontiers of 1914 were more or less confirmed which meant she sacrificed most of the gains made in the First Balkan War. Poland was resurrected as a united and independent national state from the component parts which had been under German, Austrian, and Russian control since the partitions of the later eighteenth century. Serbia, along with Croatia, Slovenia, Bosnia and Herzegovina, Montenegro, and a few other bits and pieces, formed the new Kingdom of the Serbs, Croats, and Slovenes and thankfully shortened to the more manageable title of Yugoslavia in 1929. The most spectacular beneficiary was Romania which was rewarded somewhat lavishly for being an unreliable ally of the western powers, by gaining large tracts of territory at the expense of Russia, Hungary, and Bulgaria. As a result the size of the country more than doubled in terms of both area and population. Greece, who had joined the Allied side late in the conflict, was another significant gainer though falling short of her original expectations.

The peacemaking exercise was scarcely a resounding success, and it probably caused more problems than it solved. It created a multitude of small and weak states and left many national minorities under alien rule. Though the peace settlement reduced minority status compared with before the war, around one third of the inhabitants of East European successor states were left stateless in the sense that they constituted national minorities. In the case of Hungary, nearly one third of its citizens were located outwith its borders. The fact that nations were defined largely in ethnic terms served to heighten national perceptions of ethnic perfection, giving rise to demands for ridding nations of "alien" elements which had once lived and worked fairly peacefully together

and fostering claims for the reconciliation of expatriates. Ethnic nationalism was in fact to become a major force in the rise of fascist movements in these countries.

Most of the peripheral states had large minority populations with diverse religious affiliations. In Poland and Romania, the proportion approached one third. The worst case was that of Yugoslavia which had a dozen or more minority groups. Though Slavic interest accounted for the majority of the population, the two main groups the Serbs and the Croats were scarcely the most congenial of partners, nor for that matter were the Slovenes. But apart from the main Serbo-Croat contingent, there were a dozen or so assorted minority interests including Germans, Magyars, Romanians, Albanians, Turks, Poles, Italians, Bulgarians, Czech/Slovaks, Macedonians, and Gypsies, none of whom could assimilate easily with one another. Perhaps no other country in Europe had to use Tiltman's terminology, such an "ethnological souffle" (Tiltman 1934, 266).

Weak states, ethnic rivalry, limited social cohesion, and right-wing political forces were to become grist to Germany's ambition to extend its influence in Europe. The political vacuum created in Central/East Europe provided an ideal opportunity for a determined predator since the new and reconstituted states were, in Newman's words: "extremely weak reeds to place in the path of Germany, and they possessed few features that would lead to any hope of their being anything but satellites . . . of Germany, Hitler or no Hitler" (Newman 1968, 27, 201). The battle for the control of the region enjoined France and Germany almost from the first moment of peace, with Germany's claims fortified by what she considered to be her ignominious treatment at the peace table and the significant pockets of Germans living in many other countries.

What Price Peripheral Independence? The Transwar Period

Like the African states which one by one secured independence from colonial rule in the later 1950s onward, the new European states were poor but

hopeful for their future once released from western domination. They were free at last and initially they readily embraced parliamentary democracy and all its trappings. Domination by foreign powers may have stunted their development, but they did benefit in some degree from spin-offs of western industrialization. The way forward was therefore to build on these limited foundations and in particular to shed their heavy dependency on the primary sector and raise the educational standard of their workforce. Again, as with the postcolonial African states, they were soon to be disappointed in the hostile conditions of the interwar years.

During the early postwar years, it was a question of battling with the problems of reconstruction in a very turbulent period and no sooner had these difficulties been surmounted than their economies were shattered by the impact of the Great Depression in the early 1930s. In desperation they resorted to autarchic measures, and one by one most of the countries jettisoned parliamentary systems and moved to authoritarian regimes. These soon fell prey to the ambitions of Nazi Germany, and they became increasingly dependent on that country for markets and military hardware. The outbreak of the Second World War completed the circle since most of the peripheral states were once again subject to external domination in one form or another.

For much of the 1920s, most European countries were grappling with the problems of reconstruction and rehabilitation. At the end of the war, much of continental Europe was literally destitute, and most countries were desperately in need of external assistance to prevent starvation and revitalize their economies. The war had affected every conceivable aspect of economic and social life. Apart from the severe setback to economic activity, serious physical destruction was fairly widespread, population losses and movements were severe, former markets had been lost, government finances and currencies were in disarray, and transport systems were in a chaotic state. Added to these problems were the tasks of assimilating the new territorial arrangements, setting up new constitutions and unifying economic, legal, and administrative systems. All this at a time when resources were very short, people were starving,

social and revolutionary ferment was widespread, and border disputes over territory and populations were rife.

The peripheral countries, apart from Spain and Portugal, were in a far worse position than the major powers and the neutrals. The Baltic states had lost their main market and were engaged in disputes with Germany and the Soviet Union. Greece was in confrontation with Turkey, while Albania was fearful of losing her newly won independence. Hungary and Austria were trying to get to grips with a much reduced size, while for Romania it was the reverse situation. For Poland and Yugoslavia, the two most severely devastated countries, there was the enormous task of welding together disparate economic and administrative systems. Of the two Yugoslavia had the most formidable problem for, unlike Poland, there was no true sense of national identity but a large conglomeration of assorted ethnic groups and religious affiliations that made it virtually impossible to forge a truly coherent national state. Eastern Europe as a whole was in a very bad way at the close of the war since social and economic systems were very close to the point of collapse.

Unfortunately the relief program that was organized under the auspices of the Supreme Economic Council, the bulk of the assistance coming from the United States, was too short and totally inadequate. Most of the relief consisted of food and a small amount of clothing and 20 European countries were recipients of supplies mostly on a credit basis. The official relief program was terminated abruptly in August 1919, and thereafter relief activities were confined to private and semiofficial charities which dispensed small amounts of food and clothing.

The upshot was that countries were forced to seek their own salvation. In desperation governments were driven to adopt extreme measures to cope with relief and reconstruction and ease the pressure from political and social disorder. Most countries ran large budgetary deficits, allowed their currencies to depreciate and inflation to take its course. Such policies provided temporary relief and gave an artificial boost to economic activity, but in the longer run, they proved

disastrous, resulting in currency collapse and violent inflation, with five countries (Hungary, Poland, Austria, Germany, and the Soviet Union) experiencing hyperinflation.

Most of the poor peripheral countries suffered bouts of inflation, and for much of the decade, they were grappling with the task of restoring financial and currency stability. As a consequence full recoveries from the ravages of war were delayed, and in Eastern Europe, economic activity had not been restored to prewar levels even by the middle of the decade.

Conditions were somewhat more propitious for sustained development in the latter half of the 1920s when political and economic conditions were more stable internationally than in the early postwar years. Most countries, apart from Poland, were able to surpass prewar levels of output by the end of the decade. Despite progress the peripheral countries did not experience any significant structural transformation of their economies which remained backward and economically vulnerable. By western standards both agriculture and industry were highly inefficient, and the policies employed to encourage industry tended to foster inefficient and high-cost enterprises. Primary production still tended to predominate, and most of agricultural Europe (The term "agricultural Europe" is largely synonymous with peripheral Europe which is usually taken to include the following countries: Bulgaria, Estonia, Finland, Greece, Hungary, Italy, Latvia, Lithuania, Poland, Portugal, Romania, Spain, and Yugoslavia.) remained extremely sensitive to trends in the international economy because of their dependence on the export of primary products at favorable prices. Some countries were also becoming heavily dependent on the influx of foreign capital.

Given the vulnerability of the peripheral countries, the onset of the great depression was little short of catastrophic. Primary product price fell by about 60% between 1929 and 1933, whereas manufacturing prices fell by 41% with the result that the terms of trade for primary producers declined by around one quarter. For farmers and peasants, the price collapse was devastating, and initially producers made the situation worse by increasing output to bolster their gross revenues.

Farm incomes collapsed and many farmers were heavily in debt. Throughout Eastern Europe agrarian indebtedness was a pervasive problem. One contemporary observer who made an extensive tour of the region reckoned that 70% of all peasant holdings in Eastern Europe were threatened by debts and that peasants were worse off in terms of real purchasing power than they had been before the war (Tiltman 1934, 118–120, 169, 249).

The final blow came with the financial crisis of 1931 which led to a drying up of foreign capital and credits and a scramble for liquidity which rendered many countries virtually insolvent. In such circumstances it was inevitable that countries resorted to autarchic measures to stave off complete collapse. External accounts were defended by every conceivable form of trade and payment restriction barring blockade which meant that by the mid-1930s, trade volumes had sunk to an historical nadir. Debt burdens were considerably eased by partial or complete suspension of debt servicing in 1931 and 1932 and in some cases by the outright repudiation of external debts. On the surface trade restrictions and exchange control served their immediate purpose. The upshot was a shift in trade patterns within specified blocs, including the sterling area and exchange control countries. The latter involved the negotiation of clearing agreements among exchange control countries which specified the bilateral balancing of claims between countries, thereby minimizing the use of free foreign exchange. The first agreement was concluded between Austria and Yugoslavia in January 1932 to be following by a whole raft of similar agreements among Central and East European countries and to a lesser extent the Baltic states. By the end of the 1930s, much of the trade of Germany, Austria, Italy, Hungary, the Balkans, Greece, Albania, and Turkey was conducted by means of bilateral clearing (Berend 1998, 270).

One of the inevitable consequences of the closer affinity among exchange control countries was the growing economic and political influence of Nazi Germany in many of the peripheral countries. Germany became the major trading partner of the Balkan countries, the Baltic states, Hungary, Albania, and Turkey. This trend was also

facilitated by the growing trend of nationalism in the peripheral countries and the steady shift toward authoritarian regimes and autarchic policies which eased the way for German infiltration. Whether these countries gained from increasing domination has been the subject of much but somewhat inconclusive debate. It was difficult to resist Germany's encroachment since she was one of the few countries prepared to buy agrarian products and other commodities at prices above those ruling on the world market. In the glutted commodity markets of the 1930s, the German outlet was invaluable. On the other hand, it can be argued that Germany exploited the countries for strategic purposes to gain access to food and raw materials. In the process her trading partners piled up large blocked Reichsmark balances which could only be used to purchase German goods the most famous examples of which were aspirins and cuckoo clocks. These were allegedly dumped in large quantities on the erstwhile suppliers, such that Yugoslavia received enough aspirins to last a decade, while Romania, a key target for Germany because of its importance as an oil producer, was even more lavishly supplied with aspirins to relieve 500 years of headaches (Einzig 1938, 26; Jones 1937, 76–77).

In the long run, it all ended in disaster as the wheel turned full circle. Germany's economic influence was but a prelude to political and military domination. Germany in fact used her trade connections as a smoke-screen in Southeastern Europe in particular to infiltrate Nazi agents who spread the Nazi gospel. Under commercial disguise political agents were widely employed throughout the region, and by the end of the 1930s, Nazi agents were thick on the ground. Contemporary accounts record the case of a German soya bean factory in Romania employing no less than 3000 commercial agents to spread the Nazi creed, while in Bulgaria German military experts dominated the army. By this time it was too late to disengage, and one by one the unfortunate countries were swallowed up the German military machine. The 1930s also saw the beginnings of slave labor camps on Germany territory which were later to become major generators of labor for the German war machine.

The 2 years following the outbreak of the Second World War brought a remarkable transformation in the map of Europe as it was steadily engulfed by the Third Reich. Hitler's march across Europe, which started in a preliminary way before September 1939 with the annexation of Austria and Czechoslovakia, proceeded virtually unchecked, and by early 1942 the new German Empire was practically synonymous with that of continental Europe. It stretched from the Channel Islands and Brittany in the West to the mountains of the Caucasus in the East and from the Artic tip of Norway to the shores of the Mediterranean. At its peak the new empire embraced about one third of the land area and included half the population of the continent. States and territories disappeared almost overnight under Hitler's onward drive, and only a few managed to retain their autonomy. The latter comprised the neutral countries of Spain, Portugal, Eire, Switzerland, Sweden, and Turkey, none of which could be said to be wholly unsympathetic to the German regime. The neutrals were fearful of antagonizing Hitler following his spectacular blitzkrieg strategy until it was eventually stalled by the Soviet Union's failure to "collapse on schedule." In addition, Romania, Bulgaria, Hungary, and possibly Finland slipped from neutrality to quasi-alliance with Germany by joining the latter as military allies. They retained a semblance of sovereignty though in practice they became very much satellite dependencies of the Reich.

The new Nazi regime consisted of a motley collection of states and territories at different stages of development, embracing a bewildering array of ethnic and religious affiliations. They were acquired in an unsystematic manner and ruled in different ways reflecting in part their diverse historical development. Thus in the case of the dissection of Czechoslovakia southern Slovakia, Western Ruthenia and the sub-Carpathian Ukraine went to Hungary, Bohemia-Moravia became a protectorate of the Reich, while the rest of Slovakia was set up as a nominally independent state. Poland received similar treatments in the autumn of 1939. Western Poland, including the Free City of Danzig, was incorporated into Germany; Central Poland became a protectorate

under the General Government of Poland, while the remainder of Poland was absorbed by Russia. Following the invasion of the latter in the summer of 1941, the Russian Polish territories were occupied by Germany. The turn of Yugoslavia came in April 1941. Northern Slovenia and most of the Dalmatian coast went to Italy which also acquired Montenegro as a protectorate. Other parts of Yugoslavia were distributed among Hungary, Bulgaria, and Italian Albania, while Croatia (including Bosnia and Herzegovina) was set up as a semi-independent puppet state under German and Italian military influence. Croatia served as a model for regional domination in the Balkans and was responsible for the mass murder of many Serbs and Jews. Finally, Romania, one of the main gainers of the postwar peace treaty settlements, lost a large proportion of territory to Russia (Bessarabia and northern Bukovina), to Hungary (the northern part of Transylvania), and to Bulgaria (southern Dobruja). These territorial arrangements remained firm until the latter half of the war when Germany's hegemony was on the wane.

It is difficult to discern any consistent and logical strategy in Hitler's territorial ambitions. In some respects the changes harked back to the nineteenth century insofar as the territorial incorporations into Germany and Hungary reflected the former German and Magyar spheres of influence in Europe. On the other hand, there is little evidence of a concerted attempt to rectify the imperfections of the fragmented units and population displacements arising from the peace treaty settlements after 1918 since Hitler's dispensations tended to multiply the number of administrative units, currencies, fiscal systems, and legal frameworks.

According to Mazower (1999, 149), the Third Reich accorded the new Europe with a patchwork of more or less provisional regimes. In practice as each piece of territory was acquired, Hitler assigned to it, in an ad hoc manner, the type of governance that seemed least likely to prove a threat to The Third Reich's military security. Initially there was also some notion that in the long run, a New Order for Europe would be established which envisaged the formation of a single economic community for the whole continent, working under German domination with the Reich constituting the industrial hub of the system. In fact this concept was soon relegated to the back burner in the face of concentrating on the war effort and exploiting all occupied territories for the benefit of the German war machine.

Indeed, Germany exploited most of the territories over which it had direct control mercilessly to service its military needs. Occupied territories had to yield labor, resources, and industrial products in increasing quantities. "Like a gigantic pump, the German Reich sucked in Europe's resources and working population" (Kulisher 1948, 27). In fact after 1939 much of the increase in national product available to Germany came from foreign contributions and levies including foreign labor which accounted for around a fifth or more of the civilian labor force at the peak. It is difficult to give an exact figure for the total foreign contribution to Germany's domestic product for the war period. Occupied Europe probably contributed about one quarter of the economic burden, and this rises to nearly one third if dependent, but non-occupied Europe, is included. But even these figures may underestimate the total contribution (Klemann and Kudryashov 2012, 36, 104–105, 108). The method of extraction and use was not however the most efficient because of the ruthless and harsh fashion in which it was carried out. The sheer waste of resources is evidenced by the loss of labor, some of it highly skilled, through the horrendous extermination program of killing Jews, prisoners of war, and anyone who appeared to pose a threat to the regime. Increasingly the SS driven Holocaust strategy also consumed scarce resources such as labor, fuel, and transport capacity, thereby adding to the problems of the Nazi war effort.

The End of an Era

Europe as a whole was more devastated and prostrate by 1945 than it had been at the conclusion of the Great War. Occupied Europe and the Soviet Union were especially badly affected, whereas the damage and losses in the Western sector were less

severe. The extent of the damage and loss of production was more serious than it had been in the First World War. Manufacturing industry was paralyzed, commerce almost at a standstill, agricultural output well down, and communications badly disrupted. Shortages of almost everything prevailed over a wide area of the continent and starvation was prevalent. Financially most countries were in an extremely weak state, with huge budgetary deficits, swollen money supplies, a severe shortage of hard currency, and strong inflationary pressures. Very few countries, part from Sweden and Switzerland, had not suffered severely from several years of hostilities. Europe's position stood out in sharp contrast to that of the United Sates, and it soon became apparent that the task of rebuilding Europe would depend on the policies adopted by that country since without substantial external assistance, the prospects of an early European revival looked very grim indeed.

Fortunately the postwar settlement proved neater and more effective than that following the First World War. It did not involve an extensive carving up of the continent. In fact the victors did not rush into formal peace treaty negotiations with the losers, but instead they arranged informally among themselves what boundary adjustments should be made. Strong political differences between the Western Allies and the Soviet Union inevitably resulted in the marking out of spheres of influence in Europe leading to the east-west split and the onset of the Cold War. Although territorial changes were less extensive than those after 1918, they were significant in terms of later events, and they did involve considerable movements of population. The major losers were Germany, Poland, Romania, and Hungary, while the Soviet Union was the chief beneficiary, not only in terms of population and territory but also because she was left in a strong position to exercise control over the Baltic states and the East European nations especially with the transition of the latter countries to full-blown socialist regimes in the immediate postwar years.

Two other features were an improvement on the First World War settlement. The long wrangle over war debts and reparations was largely avoided, while more lavish assistance was provided to aid recovery and reconstruction. War debts proved much less of an issue after 1945 thanks to American munificence, while though reparations were exacted from ex-enemy countries by the Soviets, these were less pernicious than those imposed after 1918. Relief assistance was in fact inaugurated long before the end of the war under the auspices of the United Nations Relief and Rehabilitation Administration (UNRRA), set up in November 1943, at the behest of the United States to organize and distribute supplies and aid to newly liberated territories. This was subsequently replaced by the more lavish Marshall Aid program started in April 1948. The shift was prompted partly by the turn of political events, notably the expansionist policy of the Soviet Union including the hardening line over Germany, culminating in the blockade of West Berlin. Fear of political and social disturbances and the threat from emerging communist regimes in the East played no small part in the launching of the new program of assistance. When the offer was first announced in June 1947, it was made clear that it would be confined mainly to countries in Western Europe. It was fortunate that the United States did not, as it had done after 1920, retreat into glorious isolation, but instead became the universal provider of Western Europe which meant that reconstruction and recovery were more rapid and sustained than anything that could possibly have been contemplated in 1945.

With the help of Marshall Aid, recovery in Western Europe was fairly rapid, and by 1950 most countries had well surpassed their prewar levels of output, though income per capita gains were less striking because of an overall lagging in the agrarian sector. In the East recovery was somewhat more protracted because of the upheaval arising from the transition to new political structures and also because of the exactions imposed by the Soviet Union on Hungary, Poland, and East Germany.

After the main recovery and reconstruction phase through to the early 1950s, there followed the golden age of economic growth when output and incomes expanded at a faster rate than ever

before, both in Europe and also in the wider world. According to Bairoch's calculations, European income per capita expanded at around 4.5% per annum in the postwar decades, whereas it had barely reached 1% a year over the long period from 1800 to 1950 (Bairoch 1976, 298– 99). In short, in the generation from the late 1940s, income per capita had made greater progress than it had in the century and a half since 1800. Virtually all countries experienced continuous expansion including those along the periphery of Europe. In fact the communist countries appear to have expanded more rapidly than those in the West though there is some doubt as to the reliability of the data sets for the Eastern Bloc countries.

Expansion slowed down with the onset of the financial turbulence and inflationary conditions in the 1970s and 1980s, and serious problems emerged in the Eastern Bloc countries which served eventually to undermine their regimes. Though they had expanded rapidly in the postwar era, consumers did not enjoy the same real income gains and lifestyles of people living in the West, partly because of hefty state exactions to bolster investment in capital intensive sectors including defense procurement. Hence the consumer sector was squeezed severely. Secondly, rigid state direction and detailed systems of control over economic activity tended to lead to high cost and inefficient production and a deterioration in technological competence. The absence of price and profit signals in the command economies resulted in a misallocation of resources, and in time the socialist countries found that they were not at the cutting edge of technical development.

With increasing political and social unrest in Eastern Bloc countries including the Soviet Union, it was only a matter of time before the socialist regimes collapsed. This occurred in spectacular fashion at the end of the 1980s with the disintegration of the Soviet Union's command economy and its loss of control over her Eastern Bloc neighbors. One by one the Baltic states and the countries of Eastern Europe were released from the grip of the Soviet Union. They were at last free to establish their own brand of political and economic regimes and eventually to make application to join the West as members of the

European Union. Sadly, the euphoria that accompanied the revolutionary phase of 1989–1990 soon gave way to grim reality as economic activity fell dramatically and unemployed soared following the collapse of communism. It would take many years before these countries recovered from the shock of regime transformation.

In conclusion, it had taken two centuries before marginal or peripheral Europe was able to free itself from the clutches of the dominant European powers. Whether this will prove to be more than cosmetic is open to debate. The core-periphery dichotomy may in fact be a never-ending continuum since the economic and financial interests of the western powers within the EU will remain the dominant force along the periphery. The subordinate status of the peripheral countries was starkly demonstrated in the fiscal and debt crises of 2012 when Spain, Portugal, Ireland, and several Balkan countries were forced to seek bailouts. The extent to which the eurozone economies had diverged rather than converged was evident in the differentials in bond yields. In May 2012 Germany, regarded as the safe haven for investors, was able to issue 2-year bonds at virtually zero rate of interest, while yields on 10-year bonds were at a record low. By contrast, Greece, the weakest member of the eurozone, was shut out of bond markets, while Portugal, Spain, Ireland, Italy, and Bulgaria struggled to find buyers for their bonds notwithstanding attractive yields of interest, for the simple reason that investors were not convinced that their money would be safe. This was in marked contrast to the optimistic years of the eurozone when any country's sovereign bonds were regarded as a safe bet, an illusion that helped to create the crisis. It owed much to the cultural differences among member states. The efficient and hardworking Germans were prepared to make the necessary sacrifices to get through a difficult period engendered by absorbing the costs of reunification. Conversely, many of the peripheral countries had attitudes that were the polar opposite of the German. Their governments elected to gamble and invest unwisely, shirking the opportunity to enact structural reforms to modernize their economies to bring them nearer the German level. The absence

of financial discipline, low levels of productivity, and lack of competitiveness in many peripheral countries remained ever-present, and rescue packages could serve little more than "sticking plasters" so long as fundamental problems continued to linger.

In short, despite some major transformations in the map of Europe by the new millennium, the peripheral countries were still the poor relations on the European continent, whose real incomes and lifestyles fall far short of those in western countries. So far, under the umbrella of the EU, it has not proved possible to eradicate the disadvantages of the past, and on present trends it seems very likely that the peripheral countries of Europe will remain in a subordinate status for some time to come.

Definition

This essay explores the life and work of West
Indian psychiatrist, political philosopher, and
anti-colonial revolutionary Franz Fanon
(1925–1961).

Frantz Fanon remains one of the most impor-
tant theorists of anti-imperialism born in the twen-
tieth century. Widely read in Asia, Africa, the
Middle East, the Americas, and Europe, his texts
have been used in anti-colonial, black theory, anti-
imperialist, feminist, cultural, post-colonial, and
visual studies. He has been a reference for
scholars, artists, filmmakers, and activists alike
and his remarks, arguments, and analysis continue
to resonate in communities around the world
which are engaged in a struggle against exploita-
tion and subjugation. Born Martinican but later
thinking of himself as Algerian and trained as a
psychiatrist, Fanon joined the Algerian National
Front of Liberation and became an ardent advo-
cate of emancipation from the colonial yoke.

Fanon was the first theorist to powerfully artic-
ulate the link between political and individual
emancipation, between race and modernity,
between psychic life and the political, between
the look and subjectivity, between national revo-
lution and its aftermath. Fanon engaged with
issues that authors, singers, and poets such as
Aimé Césaire, Richard Wright, James Baldwin,
Léon-Gontran Damas, or Rabindranath Tagore
among many others had explored in their writings:
the malaise of the colonised, his estrangement
from his body and psyche, his rage, his anger,
his desire to live as 'a man among other men'.
Yet Fanon did not impute all the failings of the
national struggle or of the post-colonial state to
the colonial regime. One cause was 'also the result

of the intellectual laziness of the national middle class, of its spiritual penury, and of the profoundly cosmopolitan mould that its mind is set in', as he argued in *The Wretched of the Earth*. Fanon called for an active role for intellectuals, who 'must take part in action and throw himself body and soul into the national struggle', and for the people, since the 'collective building up of a destiny is the assumption of responsibility on the historical scale' (Fanon 1990: 152). Finally, Fanon clearly and forcefully rejected the idea of a nation based on ethnic identity, on a defined and fixed 'ethos'.

'Each generation must, out of relative obscurity, discover its own mission, fulfill it, or betray it', Fanon wrote (1990: 166). His generation discovered its mission through its participation in the fight against Nazism and the struggle against racism and colonialism, through the *Négritude* movement, the emergence worldwide of new nation states born out of the defeat of European colonial empires, Bandung, and the African cultural and political emancipation movement. Yet Fanon foresaw many of the problems faced by decolonised countries, the consequences of the hegemony of asymmetric relations maintained by global capitalism and its racial element as well as the failures of the national bourgeoisie. His work challenges ahistorical approaches or the illusion of a natural order of things to explain failures by post-colonial nation states, and it is important for an understanding of the colonial roots of contemporary social realities.

Although *Black Skin, White Masks* (1952) and *The Wretched of the Earth* (1961) are his best-known texts and are widely translated, his articles written for *El Moudjahid* collected in *A Dying Colonialism and Toward the African Revolution* testified to Fanon's wide range of concerns, his attention to cultural difference, his understanding of the nature of violence, and his knowledge of the imperialistic project.

At the beginning of *Black Skin, White Masks*, Fanon wrote, 'I do not come with timeless truths' (1967: 7). This suggests a revolutionary programme open to difference, the unforeseen and unexpected, one that Fanon feared would not be followed by the decolonised dominant classes and leadership of the future.

Biography

Frantz Fanon, writer, psychiatrist, activist, was born on 20 July 1925 at Fort de France, Martinique, at the time a French colony. His parents, who were of mixed heritage, belonged to the urban middle class. His father, Félix Casimir Fanon, worked in the French customs service; Eléanore Médélice, his mother, was a shopkeeper. Fanon studied at the Lycée Schoelcher, where one of his teachers was the poet and writer Aimé Césaire, whose writing style and passionate denouncement of colonial racism had a major influence on Fanon. At 18, Fanon took part in agitation against the Vichy regime in Martinique and travelled to Dominica to join the Free French Army. Sent for military training to Algeria, he encountered racism and later became disillusioned with the cause of freeing Europe from Nazism. He wrote to his elder brother, Joby, that 'Nothing there, nothing justifies this sudden decision to make myself the defender of a farmer's interest when he himself doesn't give a damn' (Julien 1996). Wounded in battle in the winter of 1945, he was decorated with the Croix de Guerre. After 2 years of military service, he returned to Martinique, where he worked for Césaire's election campaign.

Awarded a veteran's scholarship in 1947, Fanon left Martinique for Paris, and then for the University of Lyons, where he enrolled at the faculty of medicine and read psychiatry. In 1952, he married Marie-Josèphe Dublé (know as Josie). They had a son, Olivier, that same year; a daughter, Mireille, had been born in 1948.

Fanon was an avid reader of post-war French philosophers – Jean-Paul Sartre, Simone de Beauvoir, Maurice Merleau-Ponty – of journals such as *Présence africaine, Esprit*, or *Les temps modernes*, of African-American literature, of poetry and drama. He read the postwar psychiatrists and psychoanalysts who were highly critical of French psychiatry and of the branch of psychiatry developed in the French colonies.

Fanon obtained his diploma in 1953 and left for Algeria in the same year to lead a psychiatric ward at the hospital of Blida-Joinville. Travelling throughout Algeria, Fanon discovered the

corruptive element of the French civilising mission: anyone of European descent could exploit and brutalise the Algerians. He was appalled by the poverty of the Algerian population, by the racism and the plundering of resources. In November 1954, the war of national liberation started. Fanon was contacted by Algerian nationalists and agreed to treat their wounded soldiers in the hospital.

In 1956, Fanon was present at the First World Congress of Black Writers and Artists in Paris. In a speech, he criticised colonial racism and called for it to be ended through struggle. That same year, Fanon resigned from his post at Blida and went to Tunis. There he worked as a psychiatrist at the Clinique Manouba and in May 1957 became a spokesman for the Algerian National Front of Liberation; he wrote for its paper *El Moudjahid*, and acted as an ambassador for the Algerian cause with the newly independent African nations.

In 1961 in Rome, Fanon met Simone de Beauvoir and Jean-Paul Sartre, whom he admired immensely. Fanon had already conceived the idea of writing a manifesto for the Third-World revolution, and he fervently discussed the idea with Sartre. In 1961, he started to write what would be his second seminal text, *The Wretched of the Earth*, and Sartre agreed to write the preface.

Fanon never saw his book in its final form. While visiting Ghana he was diagnosed with leukaemia, and he went to the Soviet Union for treatment. In October 1961, he was persuaded, despite his reluctance, to travel to Washington, DC, to receive treatment at the Bethesda Hospital, where he was admitted on 10 October. On 6 December 1961, Fanon died. His body was taken back to Tunisia and carried by soldiers of the Algerian National Front of Liberation for burial in Algeria following his wishes. Fanon was survived by his wife, son, and daughter.

'Total Liberation'

Fanons's work proposed three interacting processes in the move towards total liberation: *restitution* of land, of rights, of customs, of culture, language, and history that had been ignored,

denied, viewed with contempt by the colonial order; *reparation*, financial, economic, and psychic; and *reinterpretation* of the past, of ideas and ideals, made possible by rejecting the colonial images, representations, and ideas that the colonised had assimilated. It was about starting anew, and this would be accomplished through revolution, a cleansing through its fire, the redemptive and cathartic fire of violence.

The recovery of land and rights went along with a psychic recovery. To Fanon, his work as a psychiatrist, which he pursued until the end of his life, was inseparable from his struggle for the end of imperialism. The recovery of land and political independence had to be accompanied by regaining the dignity and self-esteem which had been damaged by colonial racism.

When Fanon was pursing his studies, psychiatry in France was slowly emerging from a rigid framework according to which madness was seen as a threat to society and patients were locked into cells, abandoned to their suffering. Though the debt of Fanon to Lacan has been widely discussed, the influence of the psychiatrist Francisco Tosquelles, a Spanish refugee who after the Second World War had become a leading theorist and practitioner of institutional psychiatry, was more important. A member of the Trotskyite Partido Obrero de Unificación Marxista, or POUM (Workers' Party of Marxist Unification), Tosquelles had invented new ways of treating the trauma of Spanish republican soldiers and had looked at the psychic consequences of fascism. As an intern with Tosquelles, Fanon learned his methods, such as group therapy and non-hierarchical relations between nurses, doctors, and patients. For Tosquelles, the hospital had to be organised around the social reality of the patient, and workshops and group activities had to take place in common rooms in order to encourage all patients to participate. This school of institutional psychiatry was critical of the ways in which psychiatry had until that time been punitive and repressive, and it advocated a radical reassessment of the asylum, working to transform it into a convivial place and to encourage new relations between the therapist and the patient. The move was revolutionary and opened the

F

way for new therapeutic methods. Fanon fully adopted this vision of institutional therapy and applied its insights to the study of the colonised's psyche and colonial racism as well as in Blida.

Although the theories and goals of psychiatry and psychoanalysis have been perceived by many anti-colonial revolutionaries as too Western to be useful (an opinion still widely shared; the Marxist Cedric Robinson (1993: 82) has written that *Black Skin, White Masks* had a 'petit bourgeois stink'), Fanon found in them the tools to make sense of torments and sufferings that could not be solely assigned to the loss of land or civic rights. In the last chapter of *The Wretched of the Earth*, 'Colonial War and Mental Disorders', Fanon remarked: 'Because it is systematic negation of the other person and a furious determination to deny the other person all attributes of humanity, colonialism forces the people it dominates to ask themselves the question constantly: "In reality, who am I?"' (Fanon 1990: 200). He inscribed the powerful and contradictory sentiments at work in the unconscious in the larger political, social, and cultural context of destruction, alienation, racism, and subjugation that European imperialism had brought to the world, and gave them meaning. However, 'Psychoanalysis is a pessimistic view of man. The care of the person must be thought as a deliberately optimistic choice against human reality' (Fanon 1967: 16); its insights could be useful but its full theory and practice could not. But if 'total liberation' should 'concern all sectors of the personality', it was important to free the colonised from the 'untruths implanted in his being', and psychiatry could help (Fanon 1990: 250). His analysis, which preceded two other influential studies of the psychology of the colonised, Albert Memmi's *The Colonizer and the Colonized* (1957) and Ashis Nandy's *The Intimate Enemy* (1983), belongs to a long literary and philosophical tradition (to which he acknowledged his debt) that had explored colonial alienation. Fanon foresaw the insights of the theorists of anti-psychiatry, that madness is not disease but a story, the story of a situation and of the impossibility of being heard. He opened the way to a school of post-colonial psychiatry, critical of the Western racialised and gendered nomenclature of mental disorders yet concerned with the psychic dimension of human life and with social and political emancipation.

Discovering, as had so many before him, that he was a 'Negro' when he arrived in France, Fanon sought to deconstruct 'The Fact of Blackness' ('L'expérience vécue du Nègre', the title of chapter 5 of *Black Skin, White Masks*), the lived experience of being black and male in a society whose modernity had been founded on racism. Influenced by Simone de Beauvoir's *The Second Sex*, by Jean-Paul Sartre, and by the phenomenology of Maurice Merleau-Ponty, Fanon looked at the constitutive role of the 'look' as a site of power knowledge and at the fetishisation of skin colour. For decolonisation to occur, the issue of representation and subjectivity could not be dismissed.

Fanon insisted on the importance of *listening* to patients, to women, to peasants, to soldiers, to the oppressed, to all of those who had been put at the bottom of society. The psychiatrist had to remain attentive to potential misunderstanding which could bring to light the 'impossibility of finding a meeting ground in any colonial situation' (Fanon 1965: 125). Thus, in an article that has been widely discussed, 'Algeria Unveiled', Fanon made a powerful argument about women's emancipation in a colonial situation, arguing that the veil was 'a technique of camouflage, a means of struggle' (Fanon 1965: 35–67, at 61).

Looking at the long history of capitalism and at its intimate relation with colonialism, racism, and predation, Fanon argued that the 'total destruction of the colonial system' would mean getting rid of fear, of the 'fashion and of the images of the colonialists' (Fanon 1988: 105), taking risks, not being afraid of death, building transcontinental alliances, and being ready to constantly assess what was at stake. Echoing Aimé Césaire's opinion of a French left contaminated with colonial thinking – paternalism, racism, feeling of superiority, desire to guide – Fanon criticised a posture of conditional support, foreseeing the limits and pitfalls of the abstract discourse of human rights that disavows excesses and pleads for

reconciliation in the hour of war. The left had to accomplish its own process of decolonisation and recognised that 'In a very concrete way, Europe has stuffed itself with the gold and raw materials of the colonial countries: Latin American, China and Africa' and owed its ' renown to millions of deported slaves' (Fanon 1990: 81). Western democrats had to acknowledge that their social formations had been structured by colonial racism and the privileges and advantages that they had thereby acquired.

Fanon advocated violence as a cathartic process for the colonised and as an inevitable step towards emancipation. Revolutionary violence had a humanistic aim because it led to the creation of a society in which health could be gained, and it would never reach the level of colonial violence. Once this had been accomplished, a new step would take place and the Third World would 'start a new history of Man [sic]' (Fanon 1990: 254). This would be accomplished by dropping the European model, which had failed to live up to its promises of progress, had justified crimes, and had legitimised slavery. There was no reason either to envy or to blame Europe; the objective was for humanity 'to advance a step farther' (ibid.).

The reading of Fanon's theory has been dynamic: his work is regularly assessed, criticised, read anew. His view of the colonial society and regime as monolithic and rigid has been challenged; his praise of violence as cathartic has been questioned; his celebration of the peasantry as the true revolutionary class and his suspicion of the proletariat and the urban classes have been shown to be problematic; the position of women in his theory has been criticised by black feminists. These critiques have spurred new defences of Fanon, creating a whole field of Fanonian studies and testifying to the continuing relevance of his texts.

Definition

Imperialism in Latin America is not a distant memory. No country is free of its new variations and developments. This chapter is about the armed struggle against US imperialism in Colombia waged for over 50 years by the Fuerzas Armadas Revolucionarias de Colombia – Ejército del Pueblo (Revolutionary Armed Forces of Colombia – People's Army, FARC-EP). Since the late 1990s, there have been significant developments within Latin America in the mass redistribution of wealth, the recovery of sovereignty, and moves to promote regional integration. Mass movements throughout the continent have risen

against the Free Trade Area of the Americas (FTAA). Leaders in Venezuela, Bolivia, Ecuador, Nicaragua, and Argentina have emerged bringing hope of greater independence from imperialism. US efforts to isolate Cuba have changed to incorporation within the imperialist chain. No longer are the Organization of American States (OAS) and FTTA reliable mechanisms for the imposition of US interests on the region. Most recently, the Colombian government and FARC have been engaged in peace talks since 2012. This chapter argues that these important new developments have led to a readjustment of US domination in Latin America, not its ending. These changes were pivotal to the transformation of US imperialism in Latin America and are a reflection of the growing, global, inter-imperialist rivalries of the US, China, and Russia.

These changes were pivotal to the transformation of US imperialism in Latin America and are a reflection of the growing, global, inter-imperialist rivalries of the US, China, and Russia.

Colombia provides an extreme example of this unusual accommodation with US imperialism, described here as 'twenty-first-century imperialism', with a reimposition of the Colombian comprador bourgeoisie and its rapprochement with neighbouring Venezuela. In this context, the FARC is the leading force resisting a twenty-first-century imperialism where the twentieth-century counter-insurgency and destabilisation programmes continue through new forms of control and domination.

Origins of FARC and US Imperialism in Colombia

Since the Wars of Independence against Spain, the Colombian ruling class has fought for its title to land. Simon Bolivar's attempts to carry out a bourgeois-democratic revolution in Colombia, Venezuela, and Ecuador failed. Colombia's semi-feudal backwardness, historic formation, and geography preserved the hacienda system left behind by imperial Spain (Hylton 2006; Safford and Palacios 2002). In the nineteenth century, Colombia was composed of small agricultural communities widely dispersed and often isolated by mountains, rivers, jungle, and savannah.

From the time of the Spanish departure in 1823, the fundamental problem in Colombia was that all land was owned by a small but powerful oligarchy. Colombia's land problem and the failure of the Liberal and Conservative Parties to resolve it after nearly 125 years unleashed a civil war, *La Violencia*, from 1948–58.

In the 1946 Colombian presidential election, a Liberal Party candidate, Jorge Eliecer Gaitan, attempted to unite the majority of Colombians against the landowning oligarchy. Conservatives saw Gaitan as a threat to the social order (Pearce 1990). The Liberal Party and the leadership of the Partido Comunista de Colombia (Colombian Communist Party, PCC) presented Gaitan as a political rival. When Gaitanistas won control of the Colombian Congress in 1947, there were strikes and protests in the cities and land seizures in the countryside (LeGrand 1992). When right-

wing paramilitaries killed 14,000 protestors, Washington saw an emerging revolutionary situation (Federal Bureau of Investigation 1945; National Archives of the United States 1948; US State Department 1943). On 8 February 1948, Gaitan led a silent protest in Bogotá of 100,000 supporters demanding peace (Márquez 1978). Two months later the populist leader was shot dead in a Bogotá street, instigating *La Violencia* (Idels 2002; Weiner 2008).

In the capital, Bogotá, Gaitanistas and Communists blamed the new Conservative government for Gaitan's murder (FARC-EP 2000). Radicalised students called for juntas *revolucionarias* similar to those formed during the Wars of Independence (Hylton 2006). The urban masses attacked police stations and government offices during the *Bogotázo* uprising. This popular upsurge failed to bring about a revolutionary transformation (Braun 1986). Conservatives formed paramilitary groups in the cities uniting with wealthy landowners' paramilitary forces in rural and remote areas to crush the rebellion. The army and police were purged of Liberals. All public officials were appointed by Conservatives (Hobsbawm 1963). Paramilitary groups of citizens and police carried out military operations against Communists and Gaitanistas (Sánchez et al. 2001).

The PCC called for the 'people's mass self-defence' to resist the rising level of violence (Partido Comunista de Colombia 1960). Reviving a guerrilla tradition dating back to the Independence Wars, the PCC established a guerrilla base and organised a peasant armed resistance (Bailey 1967). *La Violencia* – which cost the lives of approximately 300,000 Colombians, with 600,000 wounded, maimed, and traumatised – came to its official end in 1958 with the National Front's election (Campos et al. 1963; FARC-EP 2000; Hecht 1977). The social conflict did not end. Instead, 'the violence' was largely concentrated in the countryside (Campos et al. 1963).

When *La Violencia* ended, Washington found in Colombia a willing Cold War. The National Front blamed *La Violencia* on communism. Information on the state's enemies, known or suspected, was centralised. Pacification programmes or 'military civic action' forced poor peasants into 'rehabilitation programs', as Communist guerrillas remained at large (Gomez 1967). These operations would be constructed under the direction of President Kennedy's Alliance for Progress (AFP) programme of 1961 (Vieira 1965). The 'land problem' was replaced by the communist problem as the root cause of Colombia's disorder.

With US aid and assistance Colombia became a 'showcase state' in the Latin American Cold War. The commercial export-oriented agriculture of bananas and coffee was the dominant sector of Colombia's economy and major landowners controlled the government. The AFP made Latin America more reliant upon the US and attempted to negate the radicalising effect of the Cuban Revolution (1959) through military, technical, and economic aid (Randall 1992). In Colombia's Communist-held regions, selective agrarian reforms were implemented.

In April 1955, the Colombian security forces led by General Rojas Pinilla launched a ground and aerial assault on a guerrilla stronghold at Villarrica in Tolima Department, forcing them into a strategic withdrawal and displacing 100,000 peasants (Hylton 2006; Ospina 2008; Pérez and Lenguita 2005). At Tolima, several hundred guerrillas defended 20,000 peasant families fleeing the government's extermination campaign (FARC-EP 2000; Pérez and Lenguita 2005). In their withdrawal, the guerrillas formed two fighting columns and embarked on a long march over hundreds of miles (FARC-EP 2000; Ospina 2008). Under attack by the army and air force, half the Communist guerrillas retreated to Sumapaz. The other half trekked towards the cordillera, crossing the Magdalena River to establish settlements in El Guayabero in western Meta and El Pato in north-western Caqueta. The number of guerrillas and peasants killed on this march numbered several thousand (Partido Comunista de Colombia 1960). Those captured were interrogated, tortured, and killed (ibid.; Pérez and Lenguita 2005). The surviving guerrillas became guerrilla commanders and founded Marquetalia, rebel agrarian communities at Marquetalia, Rio Chiquito, El Pato, Guayabero, and Santa Barbara

(Arenas 1972; Kirk 2003). The attacks on the guerrilla forces led to strikes and street protests in Bogotá, forcing General Rojas Pinilla's resignation.

On 18 May 1964, a US counter-insurgency force of 16,000 troops, tanks, helicopters, and warplanes attacked Marquetalia (Black 2005; Colby 1996; Osterling 1989). US advisers and Colombian veterans of the Chinese Civil War (1945–49) and the Korean War directed the operation (Grandin 2006). The surviving guerrillas retreated into Amazonia's agricultural frontiers (Schneider 2000). The Cuban revolution and the growth of guerrilla movements throughout Latin America marked the beginning of Colombia's geo-strategic importance to US hemispheric domination (Petras 2012). The FARC was considered a greater threat to US interests than the Vietcong in Indochina by Kennedy's policymakers (Grandin 2006).

On 20 July 1964 the FARC issued a 'revolutionary agrarian policy to change the root social structure of the Colombian countryside, integrating the land completely free to campesinos working or wanting to work the land' (FARC-EP 1964). At its 10th PCC Congress, the FARC was officially recognised as a revolutionary movement by Castro's Cuba, the Soviet Union, and People's Republic of China (FARC-EP 2000; Gott 1970).

The Liberal Gaitanistas and the Movimiento Revolucionario Liberal (Revolutionary Liberal Movement, MRL) left the Liberal Party in 1959, when Gaitanistas and former Liberal guerrillas, opposing the PCC, formed the Frente Unido de Accion Revolucionaria (United Front of Revolutionary Action, FUAR), a coalition of primarily left-wing intellectuals. Until 1964, the official PCC did not support armed struggle. The FUAR and a group of Bogotá students called the Movimiento de Obreros, Estudiantes y Campesinos (Movement of Workers, Students and Peasants, MOEC) failed to build an urban guerrilla movement (Bethell 1995). The FUAR and MOEC members were devoted to 'Gaitanismo' (Hobsbawm 1963). Through the 1960s and 1970s, the broad Colombian left remained MRL Gaitanista (ibid.).

In 1965, militants from the FUAR and MOEC formed the Cuban-inspired National Liberation Army (ELN), combining Marxism-Leninism with Christian Liberation Theology. In 1968 the Maoist-oriented *Ejército Popular de Liberación* (Popular Liberation Army, EPL) was also established to wage revolutionary war in the countryside against the National Front dictatorship (Richani 2002). The EPL emerged because of the Sino-Soviet split and the ELN remained opposed to the PCC despite the party supporting rural insurgency. The PCC's change in policy occurred because of the increasing prestige of the Cuban regime among left-wing forces in Latin America and its friendship with the Soviet Union. Widespread opposition to the National Front by the Colombian left compelled the PCC to endorse the FARC's revolutionary army of 3,000 peasant fighters (Bethell 1995; FARC-EP 2000).

The War of Position and Development of Twenty-First-Century Imperialism

Since the mid-1960s, the revolutionary forces have maintained a 'war of position' against the Colombian state and Washington. As a consequence, two different 'Colombias' emerged. Defended by US imperialism, the first Colombia represented the coffee and manufacturing interests in Antioquia, the Western Andean Departments of Valle, Caldas, Risaralda, Quindio, and the Caribbean port of Barranquilla. This 'richer' Colombia received government assistance and direct American investment through the AFP programme (Hylton 2006). Those 5% of Colombians owned more than half of the land, received half of the national income, and represented the 'developed Colombia' (Ospina and Marks 2014). The FARC's 'Colombia' covered 70% of the remaining territory. Blacks, Indians, frontier settlers, the poor, and landless lived and worked in this second undeveloped Colombia of the southern and eastern plains, lowlands, the Pacific and Atlantic coasts (see Map 1). This Colombia received no electricity, few public services, and minimal infrastructure from the state (Richani

FARC in Colombia: Twenty-First-Century US Imperialism and Class Warfare, Map 1 Map of Colombia. (Source: http://www.lib.utexas.edu/maps/americas/colombia_rel_2001.jpg)

2002). In this second 'undeveloped' Colombia the FARC emerged as a virtual state-making force.

In 1974 the National Front period ended when the Liberal Alfonso Lopez Michelsen was elected president, promising to make Colombia the 'Japan of South America' (Zamosc 1986). During the Lopez presidency, Colombia's growing cocaine trade channelled funds to the political campaigns of both Liberal and Conservative Parties (Strong 1995) by money-laundering its

drug money through the Banco de la Republica (Hylton 2006). Lopez promised land reform but sacked many public-sector workers and responded to trade-union action with repression. In September 1977, a national strike of over 5 million workers by Colombia's four largest trade unions (the Conservative Union de Trabajadores Colombianos [UTC]; the Liberal Confederacion de Trabajadores Colombianos [CTC]; the Communist Confederacion Sindical de Trabajadores de Colombia [CSTC]; and the smaller Confederacion General del Trabajo [CGT]) paralysed the nation for several days (Hecht 1977). The strike was the first general strike in Colombia's history. Falling wages and growing popular opposition to the government's imposition of structural adjustment and privatisation programmes fuelled it (ibid.). Lopez saw the mobilised working class as a catalyst for another *Bogotázo,* responding with armed repression leaving 80 workers dead and 2,000 injured (Hanratty and Meditz 1988; Hecht 1977). Plans for land reforms were abandoned.

The Lopez regime faced a resurgence of FARC and ELN activity throughout the countryside and an urban-based insurgency. After the FARC's 'final eradication' by Conservative president Misael Pastrana Borreo (1970–74), Washington shifted its attention from communism to drugs. Under pressure from US secretary of state Henry Kissinger, the issue of drugs became paramount in Bogotá. After Kissinger's fact-finding trip to Colombia, President Nixon believed that Lopez was 'totally committed' to 'go to war' against drugs (Friman and Andreas 1999). Lopez's neoliberal policies created 'the informal sector' which, by 1980, employed more than half of the urban workforce in the 'narco-economy' (Hylton 2006).

President Reagan declared a war on 'narcoterrorism' in Colombia, linking the 'drug war' to the FARC, the Soviet Union, and other left-wing forces (Scott and Marshall 1998). The US 'War on Drugs' in the 1980s occurred during Colombia's 'cocaine decade' when the Medellin and Cali cartels fought for supremacy. The drug cartels along with the largest landowners maintained repression in the countryside and the continuous supply of cocaine to the huge American market (Lee 1998; Richani 2002). The CIA worked with Colombian military officers to reorganise Colombia's intelligence network, strengthening the anti-guerrilla death squads with direct links to drug cartels, to wage a counterinsurgency war against the FARC (Scott 2003; Stich 2001).

Deepening unrest threatened the peace of the 'first Colombia' as urban workers took strike action in the major cities throughout the 1980s. A paramilitary organisation called Muerte a los Secuestradores (Death to Kidnappers, MAS) was established to kill guerrillas who kidnapped members of the national business class for ransom. MAS murdered leftists, trade unionists, civil rights activists, and peasants working with the FARC (Scott 2003).

Conservative president Belisario Betancur (1982–86) extended the internal repression. In contrast, the Liberal Party found new sources of funding and support from an emerging narco-bourgeoisie which, by the end of Betancur's presidency, ended Conservative rule in Colombia (Strong 1995). In 1985, the FARC founded the Union Patriotica (Patriotic Union, UP) as part of a strategy to combine 'all forms of struggle' with peace negotiations that the guerrillas and other Colombians sought with the Betancur Administration (Dudley 2004). From 1985–95, 5,000 activists and leaders including elected officials, candidates, and community organisers of the UP were assassinated (Amnesty International 1988).

A virtual 'narco-state' subservient to US interests controlled the 'first Colombia' (Villar and Cottle 2012). Since the 1980s, elected regimes in Bogotá rule 'stable' Colombia where paramilitary death squads arrest, torture, and kill those identified as 'enemies' (Robles 2012; RPASUR 2012). In 1985, the FARC and ELN formed the Coordinadora Guerrillera Simón Bolívar (Simon Bolivar Guerrilla Co-ordination, CGSB). Together with M-19, a short-lived indigenous rebel group named the Quintin Lame, and the Partido Revolucionario de los Trabajadores (Workers Revolutionary Party of Colombia, PRT), the CGSB formed an armed united front (FARC-EP 2000). In 1980, the EPL announced it

had abandoned Maoism and prolonged war (Richani 2002). By 1991, EPL had been infiltrated and absorbed into MAS's successor paramilitary organisation the Autodefensas Unidas de Colombia (United Self-Defense Forces of Colombia, AUC) (Hylton 2006). The AUC were death squads formed by landlords and cattlemen with links to politicians and businessmen who wanted rebel forces killed. In response, FARC moved to eliminate the EPL. In 1991, the EPL initiated 'peace talks' with the Cesar Gaviria Trujillo Government where 2,000 EPL fighters 'demobilised' to form the political party Ezperanza, Paz y Libertad (Hope, Peace and Liberty).

In 1989, as the Cold War and the 'cocaine decade' ended, progressive Latin American writers and intellectuals including Gabriel Garcia Marquez urged the FARC and ELN to lay down their arms and to pursue reform through peaceful means (Bergquist et al. 2001). With the end of the Cold War, the US devised and sponsored the 'Central American Peace Accords' (Fukuyama 1992; Huntington 1991), which demobilised leftist insurgencies and armed struggles against the US-backed juntas in El Salvador, Nicaragua, Honduras, and Guatemala (Huntington 1991). Contradicting the expectations in Bogotá and Washington, the revolutionary war in Colombia continued.

In 1991, a US Defense Intelligence Agency (DIA) report identified the Liberal senator Alvaro Uribe Velez as one of the 'more important Colombian narco-traffickers contracted by the Colombian narcotics cartels for security, transportation, distribution, collection and enforcement of narcotics operations in both the US and Colombia' (National Security Archive 2004). As governor of Antioquia, Uribe established a 'civilian-military force' known as Convivirs (meaning to 'cohabitate') which were absorbed by the AUC. By 1995, over 500 Convivirs existed throughout the country coercing rural civilians to act as paramilitaries under its local military command (Aviles 2006; Tate 2002). Thousands of trade unionists, students and human rights workers were murdered, disappeared or displaced (Feiling 2004). The creation of 'civilian militias'

was endorsed by the RAND study, 'The Colombian Labyrinth', which argued for the restructuring of US counter-insurgency operations (Rabasa and Chalk 2001). A DIA 'top secret' report concluded that the FARC could defeat Colombia's military within 5 years unless the armed forces were drastically restructured (Farah 1998).

Responding to this conclusion, President Clinton authorised 'Plan Colombia', a $1.3 billion US package to fight the 'War on Drugs' in 2000. The plan provided greater military assistance, including helicopters, planes, and training, a massive chemical and biological warfare effort, as well as electronic surveillance technology (Storrs and Serafino 2002; Villar et al. 2003). Plan Colombia's budget expanded to $7.5 billion, of which the Colombian government pledged $4 billion, the US $1.3 billion, and the European Union and other countries $2.2 billion (Livingstone 2003). Colombia ranked second to Israel and Egypt in US military aid and assistance, reflecting the sense that, as stated in the RAND study, the US needed to prevent FARC from taking state power there in the twenty-first century: 'The Colombian government, left to its own devices, does not have the institutional or material forces to reverse unfavourable trends' (Rabasa and Chalk 2001). President Pastrana described the American penetration and concentration of Colombia as a 'Marshall Plan', involving greater investment by developed countries and an official document which could serve 'to convene important US aid, as well as that of other countries and international organisations' by adequately addressing US concerns: the FARC and growing leftist forces in the region (Pastrana 2005; Petras 2001b).

Plan Colombia involved a close relationship between the CIA and paramilitary death squads which carried out most of the political killings in Colombia (Amnesty International 2001; National Security Archive 2008). Regionally, the Clinton intervention equipped Colombia to become a launching pad for future military interventions and destabilisation programmes in the hemisphere. Internally, Plan Colombia completely militarised the nation with a focus on southern

and eastern areas of Colombia, two of the country's main coca-producing regions (Martin 2012). By the late 1990s, 30% of Colombia's total wealth derived from the cocaine trade, according to Colombia's Central Bank, thereby strengthening the growing influence of the drug trade's operators (Villar 2007). Plan Colombia prepared right-wing forces to fight FARC and other left-wing forces in the twenty-first century.

During Pastrana's presidency (1998–2002), FARC controlled San Vicente Del Caguan, known as the *zona de despeje* or the demilitarised zone (DMZ). The DMZ consisted of five municipalities the size of Switzerland, where tens of thousands of workers and peasants lived and participated in its daily management (Leech 2002). San Vicente Del Caguan was described as '"FARClandia," the world's newest country', where negotiations between the FARC and the government took place (Lamb 2000; Novak 1999). On 21 February 2002, Pastrana accused the FARC of drug-trafficking and hiding kidnapped victims (Ruth 2002). Under pressure from US President George W. Bush to wage 'War on Terrorism', Pastrana ordered the Colombian military to invade the zone and the Colombian air force to bomb its communities (Hylton 2006). Anticipating a military attack on San Vicente, FARC ordered residents to evacuate and retreat to mountain hideouts.

In 2001, President Bush added $550 million to Plan Colombia, to terminate 'narcoterrorism' (Giordano 2001). Between 1996 and 2001, US military aid to Colombia increased from $67 million to $1 billion (Tickner 2003). Pastrana's support for the 'War on Terror' prepared the way for Alvaro Uribe, who became president from 2002 to 2010. Uribe had run as an independent Liberal presidential candidate on a war platform to defeat the FARC and ELN. 'Uribismo' found its coherence in Colombia Primero (Colombia First), a political movement of the far-right which campaigned for Uribe in the 2002 and 2006 presidential elections (Ospina 2008). Uribe declared there was no 'conflict' in the country, whereas past presidents acknowledged that FARC and ELN were an inherent part of the nation's troubled history (Gardner 2000). Uribe declared that 'narco-terrorists' were attempting to overthrow a democratic state. 'If Colombia [did] not have drugs, it would not have terrorists', Uribe told the Organization of American States (OAS) Permanent Council (2004).

In October 2002, US special operations teams were ordered to eliminate 'all high officers of the FARC', and 'scattering those who escape to the remote corners of the Amazon (Garamone 2004; Gorman 2002). In March 2008, FARC's chief negotiator, Raul Reyes, and another senior member, Ivan Rios, were murdered. On 3 March, in the mountainous area of Caldas, Rios was shot dead by Pedro Pablo Montoya 'Rojas', his bodyguard. Rojas stated that he was 'betrayed' by state authorities who had offered a reward for Rios's death. Rojas was imprisoned for 54 years for kidnapping and rebellion but not for the murder of Rios and his partner (RCN Radio 2011). Reyes was slain in a targeted killing by army and air force personnel.

In 2010, US President Barack Obama praised Colombian security forces for the murder of FARC Comandante Jorge Briceno (Mono Jojoy) (Feller 2010). Obama compared the death of the FARC leader to killing Osama bin Laden, stating that Colombia had come '180 degrees' from being a failed state to a country 'exercising leadership' in the region (Burns 2010). In 2011, Alfonso Cano, who had replaced the 84-year-old veteran Manuel Marulanda on his death as the FARC leader in 2008, was also murdered in a military raid. It was concluded that these deaths weakened the FARC, causing 'desertions' and 'organisational decay' (Brittain 2010). Uribe and his deputy Santos claimed victories over the FARC which involved false body counts or Falsos Positivos in which thousands of young men from slum districts were murdered by the Colombian military then dressed as guerrillas killed in combat (National Security Archive 2009). Uribe dismissed these revelations as 'false accusations' invented by the FARC (McDermott 2009; Terra Colombia 2008). President Uribe was hailed by his Western supporters as winning the war against narcoterrorists (Shifter 2010). In reality, it

demonstrated that a military approach was incapable of bringing peace to a country riven by war. With Plan Colombia's work to hold back FARC in the countryside accomplished, 'the evil hour' had passed with cocaine seemingly no longer a state-security problem. Colombia's leaders and the US were prepared to face a new century of challenges.

The Impasse: Social Imperialism and the FARC

In contrast to the restoration of liberal democracy in Argentina, Chile, Uruguay, and Central America in the 1990s, Colombia's political system remained unchanged under the presidencies of Uribe and his successor Juan Manuel Santos (Petras 2012). Plan Colombia set out to militarise the country by consolidating the extreme expression of oligarchic rule (Ospina 2011). 'Uribismo' and its 'war on terror' exposed Colombia's two-party system with far-right extremism and narco-paramilitarism. In 2005, Santos cofounded Partido Social de Unidad Nacional (Social Party of National Unity), composed of former Uribistas, power brokers, and leading members of the Colombian elite. Since the inauguration of President Santos, political differences between himself and Uribe have surfaced reflecting the divisions within the elite. Santos promised reparations to victims of the conflict and the restoration of lands seized from peasants by right-wing paramilitaries and landowners. Unlike Uribe and the narco-bourgeoisie, Santos represents Colombia's urban, cosmopolitan bourgeoisie and is more closely intertwined with the interests of US finance capital and the Colombian comprador class (Justice for Colombia 2014b; Wilpert 2012). Uribe argues that Santos has weakened his opposition to the FARC and has criticised him for strengthening diplomatic relations with Venezuela (Boadle 2011). According to Santos, Uribe sought peace negotiations with FARC for 5 years during his term in office (Edling 2012). Their main area of disagreement is Santos's new counter-insurgency approach, based on the recognition that the FARC cannot be defeated militarily (Ince 2013).

Uribe's military focus kept Colombia back in the mid-twentieth century. On 1 March 2008, relations between Colombia and Venezuela broke down when Uribe ordered the Colombian air force to bomb a FARC encampment near the Ecuadorian border. The FARC emissary Raul Reyes and 24 foreign sympathisers (including four Mexicans and an Ecuadorian) died in the bombing raid, provoking the worst crisis of inter-American diplomacy of the last decade (Marcella 2008). Ecuadorian president Rafael Correa ordered his army to the border and suspended diplomatic relations with Colombia. Venezuelan president Hugo Chavez mobilised troops on the border. Chavez had begun mediations between FARC and Colombian government representatives before Uribe terminated the talks and launched the bombing raid (Marcella 2008). After the raid, Chavez urged the FARC to free its prisoners of war and end the armed struggle (BBC News 2008).

Chavez's announcement was welcomed by all Latin American leaders including Fidel Castro, who offered a critique of the FARC. He argued that US military interventionism was imposed on Colombia from outside the country and not from the class struggle within Colombia. Castro called for peace without US military intervention (Petras 2008; Ruiz 2009). This reconfiguration of the Latin American left was immediately registered in Washington, with Republican presidential candidate John McCain hoping 'the FARC would follow Chavez demands to disarm' (Petras 2008). For the leftist forces which followed Chavez's parliamentary road to twenty-first-century socialism, Latin American capitalism reflected a shift in the balance of power that promised state survival with diplomatic and economic ties to Colombia. It would also strengthen ties with America's imperial rivals China and Russia. It would require an accommodation with US imperialism by opposing all guerrilla movements and refraining from criticising the Castro-Chavez vision for regional integration. By 2005, twenty-first-century imperialism was undeniably imposed on Latin America by the US, the European Union, the rise of China and a reassertive Russia through

competing trade agreements and security arrangements penetrating the entire continent. Despite the social developments in Latin America and multilateral changes in international relations through the growing opposition to US intervention in the Middle East and the formation of the 'BRIC' countries, these developments could only be 'progressive' or 'socialist' in name, not in actuality.

In 2005, a centre-left social-democratic party, Polo Democratico Alternativo (Alternative Democratic Pole, PDA), emerged to oppose the Uribistas in the Colombian electoral system. The PDA sought to reform Colombia but could never challenge the power of the oligarchy or US imperialism (Leech 2011). In a country where 60% of the population did not vote in recent presidential elections, a parliamentary resolution to Colombia's internal conflict remains unachievable, despite growing support for peace and reconciliation with the FARC from Colombian society. Among those supporting peace are: the former Bogotá mayor Gustavo Petro, banned from public office; the former Liberal senator Piedad Cordoba, who has been banned since 2010; and the Marcha Patriotica (Patriotic March) movement which opposes the Colombian oligarchy. This movement stands for a 'second and definitive independence' from colonialism and imperialism (International Institute for Democracy and Electoral Assistance 2010; Marchapatriotica.org 2012; Colombia Reports 2013). The revolutionary left has campaigned to reinstate the Patriotic Union (UP) Party into the electoral process from which it was eliminated in the 1980s through state terror. According to UP spokesperson Nelda Forero, the party will serve as a 'political platform for the results achieved in Havana' which, under the auspices of Cuba, Venezuela, Norway, and Chile, the FARC has been demanding land reform for peasants and an opening of democratic space for workers (ABC News 2012; BBC News 2013b; Hansen-Bundy 2013). Despite the survival of the left, political assassinations and arrests targeting FARC supporters, unionists, and human rights workers continue throughout Colombia (Jordan 2012; Justice for Colombia 2014a; Leech 2011).

The Reimposition of the Colombian Comprador Bourgeoisie

Santos inherited Uribe's war. Plan Colombia set out to eliminate the FARC and secure foreign capital investment. A focus on the latter through an accommodation with the FARC has underlined Santos's counter-insurgency approach. The failure to defeat the FARC is, in part, caused by the insurgency's Plan Rebirth of 2008 which switched to more frequent 'hit and run' tactics with smaller units, improvised explosive devices, and 'nomadic leadership' (Martin 2012; Willis 2012). In 2011, the Colombian state's complete intelligence database was leaked to the public, prompting Santos to replace his entire military command except the National Police director (Alsema 2011; Noto 2011). Uribe's militarist strategy toward the FARC actually reminded the insurgency of the strategic value of fighting as guerrillas and not as a regular army. A 2011 RAND study, reported:

> Until the 1980s, the FARC engaged in small-scale attacks on military and police units in remote areas of Colombia. In the late 1990s, the FARC attempted to make a qualitative jump to a higher stage of military operations by engaging and defeating battalion-sized units of the Colombian army (Las Delicias in August 1996 and El Billar in March 1998). However, the sequence of successful large-scale attacks on isolated army units was broken toward the end of the decade when the Colombian military learned to combine air power with land forces to defeat FARC attempts to overwhelm local garrisons. Since then, the Colombians have used air-land synergies to prevent guerrilla concentrations. (Rabasa and Chalk 2011)

In 2012, the British multinational Emerald Energy shut down operations in San Vicente del Caguan, and other companies, including the American Occidental Petroleum, threatened to follow suit unless security was maintained (Martin 2012). Attacks against Colombia's oil industry increased 300% in the first 6 months of 2012 compared to the same period in 2011, limiting oil production in the departments of Putumayo, Nariño, Norte de Santander, Arauca, and La Guajira (Pettersson 2012b). Reports of closures by petroleum and energy companies reflect 'growing industry concerns' of a deteriorating security situation in

Colombia (Kraul 2011). According to *Colombia* Reports, the security environment deteriorated following the FARC's two-month unilateral ceasefire on 20 January 2013. FARC attacks against security forces and infrastructure reportedly exceeded pre-peace talk levels, with 33 attacks following 20 January, eight being directed at oil and mining companies (Pettersson 2013). Both the FARC and the Colombian government maintained that negotiations in Havana were advancing with FARC pressing for land reform, rural development projects, legalising coca, regulations on multinationals, and greater autonomy in relations with the US (Alsema 2012; BBC News 2013a).

Amid the talks in Havana, the war continued as Santos sought to secure infrastructure for foreign investment rather than the defeat of the insurgency. Plan Colombia's militarisation of the country led to a huge increase of police and military resources which never neutralised FARC's strategic capacity. Traditional FARC strongholds in remote and border regions were maintained (Martin 2012). Military patrols have attempted to capture these regions of hundreds of square miles of inhospitable jungle (Center for International Policy's Colombia Program 2009; DeShazo et al. 2007; Giugale et al. 2003; GlobalSecurity. org 2010). A temporary military presence in the Amazonian war zone demonstrated that the Colombian state was capable of only a limited security and sovereignty.

On May 2012, Obama rewarded Santos with a Free Trade Agreement (FTA), whose main beneficiaries were the landlord and business classes (O'Hagan 2014). Plan Colombia's goal of capturing land through state terror for neoliberal trade had succeeded (El Espectador 2012). Colombia's former minister for mining and energy, Carlos Rodado Noriega, described it as a 'piñata of mining concessions', which allowed compradors, landowners, and narcotraffickers to buy up mining concessions to speculate on their price rising with the arrival of US and Western multinational companies (El Espectador 2012). The FTA has opened the door to foreign extractive capital, favourable treatment, guarantees and protections to safeguard investments aligned with US finance

capital and the elimination of tariffs and trade barriers. These companies included Harken Energy (US), Drummond (US), Exxon Mobil (US), Occidental Oil (US), Conquistador Goldmines (Canadian/Colombian – subsidiary of US Corona Goldfields through front company San Lucas), Sur American Gold (Canadian), BMR (Canadian), Barrick Gold (Canadian), Greystar (now Eco Oro, Canadian), Pacific Rubiales (Canadian), Anglo American (UK), Rio Tinto (UK/Australian), Xstrata (Swiss), B2 Gold (South African) (Ismi 2012; Leech 2004; O'Connor and Montoya 2010; Richani 2010).

Santos's 'Law 1148' promising the restitution of lands to victims of cattle ranchers, narcotraffickers, landowners, military and paramilitary officers and multinationals has proven to be a chimera (El Universal 2012). Some 40% of Colombian land has been licensed to or is pending approval for 'multinational corporations in order to develop mineral and crude oil mining projects'. US and Western transnational monopolies own the rights to mine over 12 million acres of land with South African AngloGold Ashanti holding the largest share. Eco Oro trails behind with nearly 100,000 acres of land. Oil companies have been granted over 90 million acres for oil exploration and production across Colombia. The American corporation Cargill, the world's largest agribusiness, recently bought 220,000 acres (Richani 2012b). The Israeli company Merhav has invested $300 million in 25,000 acres for the production of sugar cane to produce ethanol. Over 280,000 acres have been sold to foreign companies for biofuel crop production (Ahumada 2012; Dominguez 2012; Semana 2012). If land 'reform' is to be taken seriously, it would mean having to reverse decades of neo-liberal underdevelopment rivalling Brazil and Guatemala in land concentration. On a scale of 0 to 100, Colombia ranks 86 which, according to Colombia's GINI index, is close to complete inequality (Programa de las Naciones Unidas para el Desarrollo 2011).

Santos's economic success, under the banner of 'desecuritisation', has meant waging Uribe's war without holding any expectations. Santos is silent about the 'war on drugs' and 'war on terror' without any change in its violence against the

insurgents. In January 2012, Santos launched Operacion Espada de Honor (Operation Sword of Honour) to reduce the FARC's capacity by half in 2 years. His aim was to repel the insurgency's repeated attacks on mining, energy, and oil companies (Martin 2012; Murphy and Acosta 2012). According to intelligence analyst Colby Martin, Espada de Honor, was not a major strategic shift in the war against insurgency and crime but an admission by the Santos Government that 'the end of the violence in Colombia is not around the corner'. Santos has 'put aside the goal of completely defeating the FARC and other groups, instead focusing on strategically defending its interest by disrupting the enemy through tactical offensives' (Martin 2012). Generals David Patraeus, the former CIA director, and Stanley McCrystal, former commander of Joint Special Operations in Iraq, have advised Colombia on a new strategy to restrain the insurgency, which continues to attack comprador businesses (Richani 2012a).

During the Summit of the Americas in April 2012, the US Army's General Martin Dempsey and President Obama visited Colombia. Dempsey recommended that US Army and Marine Corps colonels who commanded combat brigades in Iraq and Afghanistan should be sent to Colombia (Richani 2012a). Obama and Santos discussed a new military regional action plan to include training police forces in Central America along the lines of Plan Colombia (US Office of the Press Secretary 2012). This ongoing US military intervention in the region occurs when there is increasing support for the current peace talks in Colombia. Supporters of the peace process include Luis Carlos Sarmiento Angulo, the first billionaire in Colombia and ranked 55th in the world by *Forbes Magazine,* over 70% of Colombians, the Castros in Cuba, and Venezuela's President Nicolas Maduro (Forbes 2014; Ospina 2013; El Tiempo 2012).

Santos's efforts to secure foreign investment for Colombia has been achieved through low-intensity violence throughout Colombia, a massive PR campaign, and the logic of US counter-insurgency experts. Colombia has the worst human rights record in the Western Hemisphere with state forces linked to death squads responsible for 97% of forced disappearances (Human Rights Watch 2007, 2010; United Nations High Commissioner for Human Rights 2013; Vieira 2008). Under Uribe and Santos, over 250,000 leftists have 'disappeared', according to the Colombian investigative journalist Azalea Robles. Wikileaks confirmed a total of 257,089 'disappeared' (Kovalik 2012). During Uribe's second term in office and the election of his successor, approximately 38,255 leftists 'disappeared'. Colombia's twenty-first-century *desaparecidos* outnumber the recorded mass murders committed by the military juntas of Guatemala (200,000), Argentina (30,000), Chile (3,000), and Uruguay (600) in the previous century, and was, according to Azalea Robles, lowered through unmarked mass graves and secluded crematoria (Robles 2011). Since 2005, 173,183 political assassinations of leftists have been carried out. Nearly 10,000 political prisoners ranging from academics, unionists, and students, to guerrilla combatants were gaoled without trial in Colombia and are subject to systematic torture and abuse (Peace and Justice for Colombia 2006; Robles 2012). With a population of over 46 million Colombia has 5.2 million displaced persons, mostly poor peasants, because of the Colombian state's war against them (Manus 2011).

According to the United Nations Conference on Trade and Development (UNCTAD), foreign direct investment in Colombia increased from $11.2 billion in 2000 to $74.1 billion in 2009 (UNCTAD 2010). Most of the FDI inflow was concentrated in mining and quarrying for gold, coal, and oil extraction. The US is the largest source of FDI in Colombia's resources (Kalin 2009; Manchego 2011; Portfolio.co 2011; Pro-export Colombia 2010; US State Department 2010).

Conclusions? The Imperialist Chain of Control and Command for an American Century?

As the Colombian war demonstrates, the comprador bourgeoisie reassert their power in Latin

America with a policy of peaceful coexistence with US imperialism. The Colombian oligarchy maintains power through state violence and social immiseration. The post-Uribistas have unrestrained political and military power backed by an evolving 'War on Terror' which includes the extradition of FARC guerrillas from neighbouring countries (Bargent 2011; Greenwald 2013). Santos was forced to prosecute a different war against FARC to Uribe's 'total war' strategy. Colombia's position in the imperialist chain (from pro-US imperialist Latin American nations to the European Union to the US rivals China and Russia) makes it central to the US strategy by balancing the forces of twenty-first-century imperialism in one geostrategic pressure point. Latin American regional political and economic integration, unlike the FARC, is not opposed to US imperialism. Latin America's twenty-first-century capitalists (like their BRIC nation counterparts) have devised a strategy to compete in the world market by encouraging imperial rivalries for the best economic outcome. Plan Colombia had sought to turn the tide of social change on the continent with containment before rapprochement.

The Obama doctrine in the post-Bush era has developed a targeted killing policy. Leading commanders of the FARC secretariat have been killed. Latin American leaders who have criticised US policies have fallen ill (Gye 2011; Watson 2013). Venezuela has made frequent allegations of assassination plots against former President Hugo Chavez and has recently accused Uribe of ordering President Maduro's assassination (Mallett-Outtrim 2013; Marquez 2004). According to Venezuelan interior minister Miguel Rodriguez, a plot was thwarted on 13 August 2013 with the arrest of two Colombian hitmen on orders from the former Colombian president. President Maduro said it involved far-right Venezuelan opposition figures in Miami (Agence France Presse 2013). Reports of US destabilisation efforts in Venezuela have prompted officials in Caracas to allege that Uribe has played a role in recent disturbances and violence through the use of Colombian mercenaries (Bhatt 2014; Pearson 2014).

During the *Bogotázo* and throughout *La Violencia,* the Colombian oligarchy maintained its interests through parliamentary parties against Gaitanismo. Fearing the poor peasantry and sections of the urban workers would support the FARC, the Uribe-Santos regime combined infrequent elections and state terrorism backed by the narco-bourgeoisie (Lopez 2013; Villar and Cottle 2012). Paramilitary groups such as the 'anti-land restitution army' and Aguilas Negras known generically as *bandas criminales* (BACRIMs) are active throughout the country (Ospina 2013; Stringer 2013). The three largest are Los Rastrojos, El Ejercito Revolucionario Popular Anticomunista de Colombia (ERPAC) and Los Urabeños, which in the recent presidential elections urged citizens to support Santos as the 'candidate of peace' (Bedoya 2014; International Crisis Group 2012). One-third of Colombia's newly elected senators are suspected of having paramilitary ties (Vieira 2014).

Colombian officials claim the FARC makes up to $3.5 billion annually from drug trafficking. No irrefutable factual evidence has ever been provided to support this allegation (O'Gorman 2012). FARC is rumoured to have acquired surface-to-air missiles from the black market and Venezuela, but the insurgents have never used them (McCleskey 2013). According to the US, successful 'antidrug trafficking operations' have forced the FARC to expand into other activities such as illegal logging, mining, and in Colombia's oil and gas industries, which if true fund their war against US imperialism (Fox 2012). How the 'war on drugs and terror' in Colombia is exported to Mexico and Central America remains an unquestioned mystery in most analyses, allowing the Colombian narcoruling class to fulfil their imperial obligations. The Colombian bourgeoisie are represented by two factions. The oligarchic rural elite composed of narco-traffickers, landowners, military and paramilitary officers, agribusiness and cattle ranchers. The most prominent representative of this narco-connection is Alvaro Uribe Velez (Villar and Cottle 2012). The other faction has been represented by the presidents of recent years: Gaviria, Samper, Pastrana, and now Santos. They are the modernising, transnational,

F

urban elite of industrial and finance capital joined by some agro-industrialists and supported by President Obama. Their 'candidates of peace' and 'smarter' wars have replaced their narcopredecessors as Colombia's compradors in twenty-first-century imperialism. The Fidelistas and Chavistas are wrong in their expectations for social change through adaptation and accommodation. Increasing incorporation into the global economy via China or any other imperial competitor does not put their revolutionary programmes on hold. Paradoxically, it risks losing them altogether at the expense of revolutionary transformation. US–China relations are central to the control and command structure of US imperialism globally, and the FARC in Colombia represents a 50-year old unresolved and unwanted problem. Those who benefit most from this imperial architecture are the rising business classes as in Colombia: mostly, but not exclusively, the agro-mineral, financial, and manufacturing elites linked to Latin American and Asian markets.

In 2011, Obama pledged his support to fight 'narco-terrorism' by providing $600 million in military aid to Colombia and to protect 'a potentially failed state under terrorist siege' (DeYoung and Duque 2011; Shifter 2010). Colombia's military spending nearly doubled from $5.7 billion in 2000 to $10.42 billion in 2010, $7 billion was funded by the US (SIPRI Military Expenditure Database 2012). Since 2000, Colombia's military has almost doubled in size to over 350,000 soldiers (Petras 2013). Santos has announced plans to recruit 25,000 more soldiers into the Colombian armed forces and to allocate an extra $5.7 billion in the budget to combat the FARC (Pachico 2012). Since 2013, efforts have been underway to consider Colombia a potential member of the North Atlantic Treaty Organisation (NATO 2014; Pearson 2013).

The Colombian insurgency is a revolutionary war of the twenty-first century. In the new millennium, the FARC's 'war of position' has changed to a 'war of manoeuvre', through consolidating popular support amongst the poorest in Colombian society. The Santos Government has responded by promising basic services and jobs to

large sections of Colombian society and reducing the endemic inequality (El Heraldo 2012; Pettersson 2012a). In regions under FARC control, land has been redistributed to the peasants (Brittain 2010; Leech 2011; Richani 2002). In the cities, FARC militias and support bases exist in an ephemeral clandestine form where unions, NGOs, students, and intellectuals are violently repressed by the Colombian state through forced displacement, 'disappearances', or political exile (Brittain 2010; Petras 2001a; Villar 2012). Since 1993, the FARC has been building the Clandestine Communist Party (Partido Comunista Clandestino Colombiano, PCCC). It argues that conditions for open political work in Colombia remain dangerous for the revolutionary left. Since Plan Colombia was devised, the FARC's membership was reduced from 40,000–50,000 in 2005 to 6,500 and 10,000 at the end of Uribe's term according to some estimates (Brittain 2010; Mares 2012). Given the FARC's current fighting capacity and the Colombian state's change in counterinsurgency policy, these estimates are either exaggerated, manufactured, or speculation. The real number of the FARC is unknown as its members are condemned as 'narcoterrorists' while currently in peace talks with the government. By one estimate in 2013, the FARC operates in 25 of the country's 32 departments, which is consistent with the insurgency's actions against state forces (InSight Crime 2013).

The long Colombian war sparked by the *Bogotázo* was never about Liberal and Conservative Party loyalties. Nor did it degenerate into terrorism. The National Front blamed *bandoleros* and terroristas as the 'national problem' to deny class justice and a solution to the land problem. Since *La Violencia,* the Colombian state has never totally controlled the country. Despite Santo's strategy of accommodation with the insurgency, the central state is unable to project its control and extend its authority throughout the country. The geography, ecological diversity, and population imbalance of the 'two Colombias' constitute obstacles to state normalisation and comprador peace. There have been regional elites which have historically preferred to defend their local

fiefdoms over a nation under siege. As in most of Latin America, Spanish colonialism left a legacy which restored a wealthy, landowning oligarchy who both fear and despise the poor nonwhite majority, and, who are often in conflict with themselves.

Colombia's history of social upheaval has always been viewed by the Colombian state as a security threat. Defence minister Juan Carlos Pinzon has accused the FARC of 'infiltrating ongoing protests' and seeking to 'rope peaceful farmers into their struggle against the government' (Murphy and Peinado 2013). In Havana, Cuba, the FARC has demanded a general constituent assembly to integrate the people in the peace talks. The oligarchy which Gaitan had opposed reject any such proposal. If the insurgency is too powerful to be defeated then so must its support base be which enables the guerrillas to negotiate from a position of strength. Between 1999 and 2003, the FARC maintained a military presence 16–50 miles from the capital (Brittain 2010). The remote regions of jungles, mountains, and plains are where the most severe social and economic inequality is present. The land problem will remain until Latin America breaks free from imperial-comprador relations shaped by twenty-first-century imperialism. It is argued (Bernard et al. 1973; Brittain 2010; Richani 2002) that the popular insurgency has consolidated 'political power at the local municipal levels instead of seeking outright military victory', choosing instead 'political consciousness', to build the Colombian revolution.

The FARC represents a dangerous idea like those of Che Guevara, who argued that not only is it just to fight imperialism but also that its defeat is possible. The FARC expects nothing and fights for the liberation of Colombia from US imperialism.

Definition

Luigi Federzoni was an important Italian cultural and political figure in the first half of the twentieth century. He was founder of the Nationalist Party and a leading member of the Fascist Party. He served as Fascism's first colonial minister from 1922 to 1924 and from 1926 to 1928. Afterwards, he mobilised institutional support for colonialism and shaped a nationalist imperial discourse that survived Fascism.

Luigi Federzoni was an important Italian cultural and political figure in the first half of the twentieth century. He was founder of the Nationalist Party and a leading member of the Fascist Party. He served as Fascism's first colonial minister from 1922 to 1924 and from 1926 to 1928. Afterwards, he mobilised institutional support for colonialism and shaped a nationalist imperial discourse that survived Fascism.

Born in Bologna in 1878, a generation after Italian unification, he belonged to a family that had solidified its place among the provincial elite in Reggio Emilia through his father's connection to the poet Giosuè Carducci. His father, a specialist in Dante Alighieri, had been among Carducci's first students at the University of Bologna. Luigi was among the last. Luigi gained privileged access through his father to Carducci's circle, which included professors at the University of Bologna, national literary and artistic figures, and many former students who had swelled the ranks of Italy's intelligentsia and political classes.

As a university student bent on becoming a famous writer in his own right, Federzoni fell under the sway of Alfredo Oriani, a colourful local figure who championed the cause of colonialism after the disastrous Italian defeats of Dogali (1887) and Adua (1896). Federzoni participated in the tail end of the Florentine nationalist revival, becoming a close disciple of the nationalist and imperialist writer Enrico Corradini. Unsuccessful as a novelist, Federzoni tried art criticism before settling on a career in journalism. In 1910, together with Corradini and others, he founded the Italian Nationalist Association (ANI). Owing in great part to Federzoni's leadership, the ANI's leaders transformed the group from a cultural association bent on revitalising national self-esteem into a doctrinaire, neo-conservative political party bent on expansion in the Mediterranean and the defeat of liberalism and socialism at home.

As an editor of both the ANI's official organ, *L'idea nazionale,* and the important Roman daily *Il giornale d'Italia,* in the period leading up to the

First World War, Federzoni developed imperial memes that were later central to the Fascist world-view. He argued that imperialism was both a political programme and a cultural way of being. The one required the other. He insisted that acting and thinking imperialistically was an essential part of what it meant to be Italian (*italianità*) even as most members of the political classes, including Benito Mussolini, then a socialist, had turned their backs on imperialism. Federzoni's conception of the term drew on his neo-classical formation under Carducci, his informal schooling in imperialism under Oriani, his friendship with Corradini, and his reading of the nationalist writer Giuseppe Mazzini. Federzoni argued that imperialism signified both a reclaiming of Italy's classical heritage and a point of departure for the Risorgimento. To this he added a strong dose of social Darwinism, arguing that only imperialism could enable the national organism to capitalise on its most valuable natural resources – the fertility of its people. For him, uncolonised spaces in Africa were simply voids for Italians to fill. Italy's historic mission was to supplant indigenous populations with its own, thus creating a modern *mare nostrum*. His conception of imperialism is also remarkable for the manner in which he united colonial aspirations in Africa with irredentism – an older political movement aimed at annexing the so-called unredeemed lands from Austria-Hungary, where Italian speakers lived outside the borders of unified Italy. Federzoni's imperialist designs, however, did not stop with the *terra irredenta*. He envisaged Italian hegemony over Albania, Greece, Switzerland, Corsica, and Malta.

Italy's leading political figure in the early twentieth century, Giovanni Giolitti, unwittingly contributed to Federzoni's political success when he provoked war with the Ottoman Empire (1911–12). The war marked a fundamental shift in Italian politics. Most Catholics had been estranged from national politics up to that point. They now enthusiastically supported the war, and even the Vatican gave its tacit blessing. In contrast, the Italian socialists and most radicals, republicans, and democrats actively opposed it. Thus, unlike Italy's colonial

ventures in East Africa in the nineteenth century, imperialism in the twentieth century bridged the gulf between the church and the state and derailed efforts by left-leaning liberals like Giolitti to narrow the gap between liberals and the democratic and socialist left.

Federzoni was the first politician to exploit this shift successfully for political gain. As a war correspondent for *L'idea nazionale* and *Il giornale d'Italia*, he conflated the war for Libya with a concurrent battle over the extension of the suffrage. He painted the democrats as un-Italian men who hid behind pacifism, humanitarianism, and respect for indigenous African populations abroad in order to derail Italy's historic mission of bringing civilisation to Africa and asserting Italy's standing as a Great Power. During the war, when a scandal broke in the army that involved Freemasons, a group associated with the political left, Federzoni conducted a survey of leading intellectual, political, and military leaders about the place of Freemasonry in modern society. He published the responses in *Il giornale d'Italia.* They overwhelmingly portrayed the Masons as a foreign group associated with the Ottoman Young Turks on the one hand and with radical, republican, and socialist advocates of atheism, divorce, and democracy on the other. Federzoni's prominence spread as newspapers picked up the story. A few months later, he ran successfully for parliament against an incumbent Socialist deputy and a centre-left candidate. Imperialism played an important role in the election. Federzoni attacked his opponents as un-Italian enemies of imperialism. He demanded a more active imperialist policy that took the Italo-Turkish War as a starting point for further expansion. Many on the right who were dissatisfied with the leftward drift of the political classes under Giolitti were attracted by Federzoni's blending of nationalism and imperialism as the basis for an anti-socialist, anti-democratic, and anti-liberal alliance of forward-looking conservatives and Catholics.

After volunteering in the First World War, Federzoni ran successfully for re-election and encouraged the nascent Fascist Party to align itself

with the Nationalist political platform, which was still aimed at expansion in the Balkans and Africa. As Mussolini's movement gained ground and drifted rightwards, Fascism found a valuable ally in Federzoni. Once Mussolini renounced his anti-clericalism and his opposition to the monarchy, the Nationalists were ready to back Mussolini. Federzoni's support earned him the post as colonial minister in Mussolini's first cabinet. In 1923, the Nationalist and Fascist parties merged into a single party, with the Fascists adopting the Nationalist Party's ideology as its own.

Federzoni's tenure as colonial minister was divided into two periods: 1922–24 and 1926–28. The intervening period coincided with the Matteotti Crisis, when Federzoni took charge of the interior ministry from Mussolini and shored up Fascism. As colonial minister, Federzoni was markedly more ambitious than his liberal predecessors. He continued their efforts to reassert control over the coastal regions of Libya, which had been weakened during the First World War. But he also sought ascendency over the interior, which meant the abrogation of previous agreements with the Senussi Muslim confraternity. This policy strengthened the insurgency against Italian domination. In response, Federzoni demanded the same harsh treatment that his predecessor had used. In 1928, when Federzoni resigned, owing to a political realignment in the government, the Senussi had not yet been defeated. His successors would intensify Italian efforts, utilising new methods, including the establishment of concentration camps.

Federzoni advocated a more effective exploitation of Italy's colonies by supporting public-private ventures aimed at increasing the importation of colonial agricultural goods to Italy and the exportation of Italian settlers to the colonies. At the same time, he applied the same heavy hand in the colonies to tame Fascist *squadrismo* as interior minister. He also created an important precedent for later racial policies by forbidding *fasci*, or local fascist groups, in the colonies to admit indigenous people. Federzoni rejected the idea that indigenous people could become Italian, an idea

he dismissed as the French form of colonialism. Instead, he saw himself implementing a British form of colonialism predicated on the separation of the races.

Federzoni believed that the creation of a culture of imperialism was an important facet of his duties as colonial minister. He intended that the production and consumption of cultural life connected to imperialism – art, music, theatre, architecture, the humanities, the social sciences, and the pure sciences – should serve as a matrix for the creation of the Fascist 'new man' and as proof of the racial vigour of modern Italians. He created an annual celebration dedicated to colonialism and used his network of friends to speak to local audiences about the essential imperialist nature of being Italian. He sent artists to the colonies to re-imagine the world according to an imperialist gaze and sponsored exhibitions to awaken the middle classes to their role as imperialists.

Federzoni's tenure as colonial minister was also marked by two important administrative innovations. In December 1922, he created the Consiglio Superiore Coloniale (Superior Colonial Council) to serve in an advisory capacity on colonial matters for the state. He also oversaw the drafting of the *Legge organica per l'amministrazione della Tripolitania e della Cirenaica,* or Organic Law (26 June 1927), which defined citizenship in Libya and established a new administrative and legal basis for colonial rule there. It created separate legal standings for Italians and indigenous Jewish and Muslim populations, giving the Jews a more favourable standing owing to his belief that they had in them the seeds of *italianità* for having served as agents of Italian culture and civilisation under Muslim rule. The Organic Law also strengthened the governor's powers and paralleled the decidedly authoritarian trend in the metropole.

After 1928, Federzoni continued to play an important role in propounding a culture of imperialism. As president of the Istituto Coloniale Fascista (Fascist Colonial Institute; 1928–37) and the Istituto Fascista dell'Africa Italiana (Fascist Institute of Italian Africa; 1937–43) he

F

strengthened his position as a gatekeeper to governmental largesse, publishing opportunities, and the professoriate for those in the younger generation in academic fields that could be linked, even tangentially, to colonialism. As director of Italy's premier scholarly journal, the *Nuova antologia* (1929–43), he made imperialism a leading topic by opening its columns to explorers, geographers, historians, linguists, theorists, and colonial administrators. As president of the Italian Senate (1929–39), he took a keen interest in imperialism and made sure that the Senate gave visible support for the Ethiopian War (1935–36) and the proclamation of the empire. When Mussolini appointed him president of the Royal Academy of Italy (1938), he again used his position to foster scholarship on imperialism, now emphasising Italian expansion in the Balkans. He dedicated significant parts of the academy's resources to expanding scholarship that emphasised ancient Roman and medieval Italian legacies in Albania and Yugoslavia, economic ties between the two sides of the Adriatic, and ethnic, linguistic, and historical studies that demonstrated enduring relationships between Italians on the one hand and Croats, Slovenes, Albanians, and Greeks on the other. In 1939 he had the academy's charter revised so that he could have the Albanian Franciscan Friar Giorgio Fishta appointed to it.

Federzoni wrote hundreds of articles and gave numerous speeches on imperialism. He also edited important works and wrote several studies of his own, including *L'Italia nell'Egeo* (Rome: Garzoni-Provenzani, 1913); *La Dalmazia che aspetta* (Bologna: Zanichelli, 1915); *La politica economica in Eritrea* (Rome: Tipografia del Senato, 1923); *Venti mesi di azione coloniale* (Milan: Mondadori, 1926); *Contributo degli italiani alla conoscenza del continente africano* (Rome: Sindacato Italiano delle Arti Grafiche, 1928); *La rinascita dell'Africa romana* (Bologna: Zanichelli, 1929); *Il re in Eritrea* (Rome: Nuova Antologia, 1932); *A.O.: il 'posto al sole'* (Bologna: Zanichelli, 1936); and *Dal regno all'impero* (Rome: Reale Accademia dei Lincei, 1937).

After going into hiding in 1943 and seeking refuge in Portugal and Brazil after the war, Federzoni returned to Italy and connected with scholars with whom he had worked under Fascism. Many of them participated with him in recuperating Italy's imperial legacy by writing histories that glossed over any negative aspects of Italian efforts to dominate the Balkans, East Africa, and Libya and painted Italian efforts at colonialism as a benign exception to a malefic period in world history.

Film Festivals and Imperialism

Viviane Saglier
Concordia University, Montreal, QC, Canada

Definition

Looking at film festivals through the lens of imperialisms and anti-imperialist struggles illuminates the power relations embedded in the multiplicity of festival networks. It also complicates the common understanding of film festival networks as alternative, while they are at the core of global strategies of powers.

Film festivals and their networks have both built upon imperialist strategies and taken part in anti-imperialist struggles. As part of a privileged circuit for the international circulation of films as cultural, commercial, and ideological products, film festivals constitute an ideal platform for articulating various geopolitical and economic interests, and a visible stage for the performance of global powers and counter-powers. Looking at film festivals through the lens of imperialisms and anti-imperialist struggles illuminates the power relations embedded in the multiplicity of festival networks. It also complicates the common understanding of film festival networks as alternative, while they are at the core of global strategies of powers.

Developed as a sub-field in its own right in the last 20 years, film festival studies has been mostly structured around a European history, justified by the idea that Europe was the 'cradle' of film festivals (de Valck 2007). While research has focused on contemporary global networks and economies, it has paid less attention to histories of non-Eurowestern film festivals, such as Third-World film festivals of major importance, and their central role in the shaping of the global circulation of films. Examining the relations of film festivals to imperialism provides new narratives in addition to the Eurowestern capitalist ones that have been applied in order to read the growth of film festivals and their marketing strategies in comparison and/or opposition to Hollywood. It reminds us that other heterogeneous political economies were also involved in shaping the film festival circuit. Re-inserting undermined geographies, histories, and industries in the study of the constitution of film festival networks underlines the highly political role of film festivals. As a result, Eurowestern logics should be considered as only one among many understandings of film festival networks since their inception in the early twentieth century, and one that is inevitably connected to, and influenced by, a multiplicity of unacknowledged global players.

This introduction to an anti-imperialist and a de-Westernized history of film festivals is therefore unfortunately limited by, and dependent on, the extent of the research conducted on non-Eurowestern film festivals and their networks. The focus in film festival studies is gradually shifting towards new geographical regions. However, extensive research is still needed in order to have a clearer account of the role that Latin American, African, and Asian film industries played in the development of international regulations of film circulation in the mid- twentieth century; the connections between Third-World film festivals and the Eastern and Western blocs during the Cold War; the role of Soviet film festivals and their networks; the current festival industries in Asia, Latin America, Africa, and the Middle East, as well as the way they all relate together and with Eurowestern festivals; diasporic festivals and how they negotiate identity politics and global networks; geopolitical readings of online film festivals; and networks of solidarity that successfully avoid or re-appropriate the logics of global capital. Finally, there is a need to look at different types and sizes of film festival and to keep in mind the social and political disparities within the ensembles taken into consideration.

Early Film Festival Circuit and Imperialisms: 1930s to the Post-War Period

Spreading and Countering Fascisms
Strategies of ideological imperialism are tightly connected to politics of nationalism and

internationalism, which played a central role in the formation of film festivals in the inter-war period in 1930s Europe. In the wake of the First World War and the economic depression, European nation states worked to consolidate themselves through new alliances. Highly political gatherings from the start, film festivals were conceived as spaces for diplomatic exchanges, exhibition of power, and claims of authority or opposition. Not only did the powers at play in film festivals reflect larger political tensions and repartition of forces, but festivals themselves had a role in reinforcing alliances and conflicts. The two first major festivals, in Venice and Cannes, were created respectively in 1932 and 1939 in an increasingly tense political climate that saw the rise of German and Italian imperialist fascisms in Europe as a result of the poor management of the peace process in 1918. Hitler's invasion of Poland on 1 September 1939 actually prevented the first edition of the Cannes festival from happening, and the festival was finally launched after the Second World War, in 1946. The Venice film festival, which grew as a very profitable extension of the long existing Art Biennale (1885), offered a model whereby nations were invited to present their finest selection of national productions in an international setting. Directly supported by Mussolini, the festival became a tool to legitimise and spread fascism through an international cultural event that would arguably profit the glory of all European national cinemas. The Venice Mostra served the intensification of the ideological ties between Fascist Italy and Nazi Germany with the visit of the German minister of propaganda, Goebbels, in 1936, and the awarding of the Mussolini Cup prize to Leni Riefenstahl's *Olympia* in 1938. In turn, the Cannes festival resulted from the collaboration between France, Great Britain, and the US to respond to the German–Italian alliance, which reflected the division of forces in the coming Second World War.

Early film festivals provided a showcase for national representation through a set of films selected by national committees, while maintaining ambiguous relationships with industrial and commercial forces seen as threatening and imperialist, such as Hollywood. Hollywood

was in fact considered as the dominant film market against which European cinema had to compete. However, the US, backed by the United Kingdom, contributed to the creation of Cannes. In addition, in Cannes and Venice, Hollywood commercial strategies were both exploited and re-appropriated to celebrate the glory of nations. In Venice, the festival meant to both raise cinema at the level of high art and enable a larger population, including the middle class, to access productions that would encourage adhesion to the regime (Stone 1999). This tension between the elitist and the popular encouraged borrowings from the Hollywood model that offered reconciliation through the use of the glamour, also re-asserting the power of Hollywood cultural imperialism. Moreover, while the emphasis on nationalism over commercialism countered the Hollywood logic, the MPPDA (Motion Picture Producers and Distributors of America) was a guest of the festival and used it as a stage to show off American stars (de Valck 2007). Early film festivals were therefore not primarily meant to boost national film industries. Rather, they were exhibiting film industries' already existing power to promote national culture but also tourism, as a way to showcase both national cinemas and the national space of exhibition. As a result, while serving the imperialist endeavours of fascist Italy and Germany, the international showcase of national cinemas also led film festivals to negotiate the cultural imperialism of the Hollywood industry as both an enemy to counter and a strategy to exploit.

Cultural Imperialism and Imperialist Protectionism

This is not to say that film festivals were not embedded in major economic logics and networks. In the post-war period especially, film festivals in Europe were more than ever serving protectionist strategies to support not only economic regional ensembles (Europe versus the US) or national cultural supremacies, but also the ruling of colonial empires, whose foundations were starting to vacillate. Hollywood industries came out of the Second World War strengthened by the US's victorious position, and with renewed

support from the MPAA (the Motion Picture Association of America, replacing the MPPDA). The department of the Motion Picture Export Association (MPEA) was created to unify American film productions' exportation fees in order to have more impact on foreign exchanges, a strategy that was reinforced by local bilateral agreements that favoured American film distribution in Europe. The urge to develop circuits for European film distribution then became even more pressing in the late 1940s than it was in the 1930s. Film festivals mushroomed in Locarno (1946), Karlovy Vary (1946), Edinburgh (1946), Brussels (1947), and Berlin (1951), but would be soon caught up in the Cold War as a cultural, economic, and political support to the international crisis.

Therefore the European countries that had seen the political potential of festivals gathered to keep control over the multiplication of film festivals. They foresaw the possibility of a network that would quickly exceed the European borders, and initiated collaboration with regimes in Latin America. The Fédération Internationale des Associations de Producteurs de Films (FIAPF) was created in 1939 (as opposed to 1933: Moine 2011) and reinstated in 1948 as a way of being in command of international regulations. The FIAPF had substantial consequences for the development of film festivals. The presidency was shared between France and Italy, but also included extra-European members such as Mexico and Argentina. Film festivals were at the core of the FIAPF's mandate, and the 'Producer's Charter' ('La charte du producteur') that formed the basis of the association's renewal was launched at the 1949 Venice festival. The festival became an institution where legal issues could be discussed, as it hosted several yearly assemblies that the member countries and also the US attended. Primarily, the FIAPF sought to organise all festivals within one unique network that fell under its jurisdiction, which led to the establishing of the festival calendar. The first project was to create a global showcase of nations called 'Olympic of Films', but this was greeted with general reluctance. The FIAPF finally gained control by establishing a classification that would restrict the number of competitive

film festivals to the following categories: 'competitive festivals', which included only Cannes and Venice at the time (A); 'non-competitive film festivals' (B); 'special events' (C); and 'national events' (D) (Moine 2011). The charter also aimed to increase the control of producers over the exhibition of films, and therefore over festivals' programming. However, the very definition of the role of the producer was left uncertain because different models coexisted in Europe and the Americas, which were the areas then covered by the global agreement. Finally, the protectionist model advocated by the FIAPF tended to be in contradiction to the development of film markets on the side of film festivals that encouraged open film trade, as was the case in Cannes from 1950 (Moine 2011). The charter was therefore designed to privilege European interests but soon faced the need to integrate its festival network globally.

Film Festivals and Diplomatic Imperialism

The federation's stance against the US's cultural and economical domination became confused when the MPEA joined the FIAPF in 1951, at a moment when Cold War logics complicated mere economic interests. The FIAPF in the early 1950s then became dominated by the US's diplomatic demands. It constituted the stronghold of the so-called Free World and a continuation of the Marshall Plan, which aimed to rally countries potentially interested in joining the Eastern bloc. As a result, non-European countries were also represented within the FIAPF, including Turkey, Israel, Egypt, India, Pakistan, and Japan, in addition to the preexisting members Mexico and Argentina. Coincidentally, film festivals emerged in Mar del Plata (Argentina, 1954) and Cartagena (Colombia, 1960), both accredited to the FIAPF and supported by military regimes. Film festivals were of major importance for the West as a means of gaining a foothold in the Eastern bloc. The Berlinale was initiated in 1951 by Oscar Martay, a film officer of the American military administration in West Germany, and was aimed at audiences from both the Western bloc and the Eastern bloc. It screened only Western productions, which it promoted in border theatres in order to introduce Eastern populations to

F

Western ideology until the Berlin Wall was built in 1961. Similarly, Karlovy Vary (1946) and Moscow (1959) became accredited as competitive festivals to the FIAPF, extending its control further east but also enhancing the diplomatic power of the Eastern bloc. In fact, the Soviet Union, which maintained a strong national film industry, boycotted Cannes and Venice in some years, according to the state of its relationship with the US (Gallinari 2007).

The multiplication of film festivals worldwide under the FIAFP's control followed the aims of the Club International du Film created in Cannes in 1947, which took as a model UNESCO's defence of the role of cinema as a central weapon in international relations, but also served collaboration with extra-European military regimes. The imperialistic international reach of the FIAPF and its regulation endeavours coexisted with the ongoing colonisation of nations that were forced to be part of the Cold War by default, while discontent was growing in the colonies. Protectionism in film industries was not only applied against hegemonic competitors, but also functioned to restrict indigenous productions, as in French Africa, where laws such as the Laval decree forbid Africans to produce their own films (Diawara 1992). Film festivals in turn also played a central role in the development of indigenous film industries and the popular struggle in the decolonising world.

Anti-imperialisms and the Proliferation of Film Festival Networks: from the Post-War Period to the 1980s

Third-World Film Festivals and Regional Anti-imperialist Movements

While the Cold War was shaping new international dynamics and divisions, the FIAPF relentlessly tried to constrict the festival circuit to one network serving the interests of the Western bloc. Yet the processes of decolonisation introduced new players to the world's map of exchanges, opening up the way for alternative networks of film circulation. The Non-Aligned Movement (NAM) was constituted at the

Belgrade Conference in 1961 after a first gathering at Bandung in 1955. It then comprised African and Asian countries that were newly independent or in the process of decolonisation, but the movement became tri-continental in 1966 at the Havana Conference. The new states gathered to develop the 'Third World Project', a political alliance that asked for 'a redistribution of the world's resources, a proper rate of return for the labour power of their people, and a shared acknowledgement of the heritage of science, technology and culture' (Prashad 2007). Film festivals became integral to the Third World Project because they were ideal vehicles for the new national theories that it promoted, which that would revolve not around the idea of race but around the historical struggle against colonialism and imperialism. Film festivals also responded to the need to develop structures that could showcase widely the new indigenous cinemas emerging from decolonisation. The Third World's international ethos therefore required a new model of film festivals, one that would serve not the competition between countries, but their dialogue and alliances. At the end of the 1960s, both Latin America and Africa had developed their own multiple networks, which had yet to be connected together.

Third-World film festivals therefore started as separated regional projects. In Latin America, Viña del Mar (Chile) and Mérida (Venezuela) became the two major events for the development of a Latin American cinema. After several attempts starting in 1963, Viña del Mar was finally called Festival de Nuevo Cine Latinoamericano in 1967, whose appellation gave its name to the regional film movement. Mérida in turn focused on documentaries, and contributed to the importance of the genre in Latin American cinema. Both Viña del Mar and Mérida were structured around a competition, which facilitated the circulation of the prizewinning films outside the regional confines in other market-free networks. In fact, the Pesaro film festival, established in Italy in 1965, bridged European audiences and films from Latin America, to which it dedicated its 1968 edition premiering Fernando Solanas's *La hora de* los

hornos (1968). Political filmmakers were also instrumental to connecting the different film festivals together as they travelled from one festival to another. Viña del Mar had organised an encounter between Latin American filmmakers in 1967 and 1968, placing discussions and debates at the heart of the festival's mandate. Similarly, Pesaro included conferences and political debates, and these also reflected on the structure of European film festivals, which started to be contested in the late 1960s.

The regional impetus was even stronger in Africa, where film festivals ambitiously served as a platform for conversation between not only filmmakers but also politicians and activists, and generated fundamental initiatives. The first and only edition of the Pan-African Culture Festival in Algiers in 1969 was funded by the Algerian state and the Organization of African Unity, and gave birth to two important statements. First, the festival issued the 'Pan-African Cultural Manifesto' in order to consolidate African unity. It also allowed filmmakers to gather and create the continental organisation that took the name of Fédération PanAfricaine des Cinéastes (Fépaci) and was established in 1970 at the Tunisian Journées Cinématographiques de Carthage (JCC). Fépaci was designed to make possible the development of African and Arab cinemas outside the control of foreign distribution companies. It also aimed to strengthen the Pan-African vision through the nationalisation of film distribution and production, and the creation of regional film schools such as the Institut Africain d'Études Cinématographiques (INAFEC), founded at the University of Ouagadougou in 1976. Created in 1969 in collaboration with the French Ministry of Co-operation, the Festival PanAfricain du Cinéma de Ouagadougou (FESPACO) in Burkina Faso (then Upper Volta) developed to meet these expectations. In addition to following what had become a recurring feature of Third-World film festivals, namely organising symposiums and debates, the FESPACO was also dedicated to archiving African cinema. The project took shape in 1989 with the creation of the Cinémathèque Africaine de Ouagadougou.

Connecting the Third World with the Two Blocs

By the early 1970s, and thanks to the platforms of exchange allowed by film festivals, many African countries had nationalised their film industries and had connected them through an inter-African distribution network that bypassed the French-American monopoly. In the continuity of film festivals, ties were strengthened between the two continents, and exchanges developed between filmmakers from Latin America and Africa. In December 1973 and 1974, the Third World Cinema Committee met in Algiers and Buenos Aires to implement the Third World Project through cinema. Yet these networks were not isolated from the Western and Eastern blocs, a fact which complicates binary understandings of imperialism and anti-imperialism. For example, the Rencontres Internationales pour un Nouveau Cinéma in Montreal in 1974 sought to include Third-World filmmakers and militant cinema groups from the Free World in a common dialogue against imperialist strategies of distribution, which was thought in direct continuity with the meetings of the Third World Cinema Committee. Another example is that of delegations from Third-World countries sent in the 1970s to the Tashkent Film Festival (Uzbekistan), which served as a major meeting point in the Eastern bloc. In addition, some countries were truly dedicated to the communist ideology, including Cuba, for which the idea of a Latin American cinema became a key concept in international diplomacy. Havana was a hub for film circulation between the Eastern bloc and the Third World, in a context where the Cuban film industry was supported by strong national institutions such as the film school *Instituto Cubano del Arte e Industria Cinematográficos* (ICAIC). In turn, Pesaro and other festivals in the Netherlands, Germany, Belgium, France, Canada, and the United Kingdom constituted important relays to introduce 'New Latin American' productions labelled as political cinema to the Western bloc. Some productions would also infiltrate mainstream festivals such as Cannes (Isaza 2012). Yet the Third-World film festival networks

were also regularly in conflict with circuits identified as imperialist and grounded in their own geographical space. In Latin America, Viña del Mar and Mérida were in open confrontation with official festivals organised under military regimes, such as those in Rio de Janeiro (Brazil) and Mar del Plata (Argentina), the latter being also accredited to the FIAPF (Mestman 2002). Already present in Latin America, the FIAPF tried to assert its authority in Africa and accredited a new festival in Cairo (1976), trying to further expand the influence of the Western bloc while also being welcomed by the Egyptian president Anwar Sadat and his policy of offering an 'open door' to foreign investments (Intifah). The FIAPF also attempted to become involved in North Africa by calling on the JCC to respect its regulations. As a result, the Fépaci was partly constituted at the JCC in 1970 in order to respond to the FIAPF's injunction with a strong declaration of independence.

Challenging the Imperialist Structures of Eurowestern Film Festivals

Third-World cinemas reached Western film festivals quite soon after the Second World War, and the introduction of this new aesthetic contributed to a crisis in 1968 during which the structure of the European festivals was challenged. In the late 1950s, dissatisfaction started to grow against the nationalist format of film festivals, which was regarded as antiquated and conservative. French critics in particular protested against the glamour and prizes of Cannes, and asked for more attention to be paid to alternative auteur cinema, which privileged independent filmmakers and low-budget equipment over big productions and was spreading from France to other parts of Europe. Protests culminated in 1968 when the head of the Cinémathèque Française, Henri Langlois, was dismissed and the festival had to be shut down. In other words, the capitalist strategies that had served the nationalist discourses of early film festivals had become inadequate to the new generations of alternative cinema, which included not only European new waves and Eastern films, but also Third-World productions. Berlin and Venice went through similar crises, and European leading festivals were reconfigured to include a parallel section dedicated to alternative cinemas (the Quinzaine des Réalisateurs in Cannes, the Forum des Jungen Films in Berlin, the Giornate del Cinema Italiano in Venice).

Ultimately, this re-structuring was a direct attack on the supremacy of the FIAPF's ruling, which went against artistic freedom for the benefit of geopolitical purposes then largely related to Cold War logics (de Valck 2007). While the A-status of these festivals was finally maintained, the FIAPF still had to re-adjust its regulations regarding the selection procedure. The national selection committees disappeared, and the decisionmaking was handed down to festival directors. Festivals therefore went from a model where capitalist states were omnipotent to a format where artists and films were considered as individual entities, which allowed both more co-productions and the inclusion of new national productions. However, the new parallel sections in the leading European film festivals framed the new indigenous cinemas as 'discoveries', which repeated the colonial enterprise of mapping the emergence of cultures by perpetuating a Eurocentric point of view.

Globalisation and the Rule of Capital: from the 1980s Onwards

The intensification of financial and trade flows in the 1980s, reinforced in the 1990s at the end of the Cold War with the opening of new markets, had numerous consequences for the festival industries. Expanding globalisation thickened film festival networks worldwide, enhanced the competition between the major players, allowed the emergence of new economic actors, and endangered festivals that were depending on less viable national economies. As mainstream festivals became increasingly market-oriented and less state-sponsored, networks were reorganised according to corporate interests and niche industries that grew out of new politics of programming. By the 1980s, the Third World was completely crippled by corruption and debts, and

depended on the assistance of the International Monetary Fund and the World Bank (Prashad 2007). As the economic gap between rich and developing countries increased, the Third World Project withered away and the NAM countries came to be understood as part of the unclearly defined ensemble of the Global South, which encompasses all developing countries in the context of globalisation. In the early 2000s, however, new regions came to the fore, such as East Asia and the Gulf area. Regional urban centres have gained global attraction and become home to strong media industries and financial decisional bodies. Moreover, the multiplication of transnational co-productions, facilitated by film festivals, has complicated a clear North–South divide. Yet as new hegemonies are arising, new gaps have been created within the regions.

Recuperation of the Third World Project and New Politics of Programming

On the one hand, the shift in programming politics enabled Eurowestern and A-list festivals to negotiate the arrival of new cinemas and incorporate them within the logic of global capital. Framed as anti-Hollywood, global film festivals however still partake in imperialist logics of economic expansion. The shift in programming also served enhancing the discrepancy between the film economies of the North and the South, although only to a certain extent, since these logics have also been exploited by very competitive emerging festival industries. The re-structuring of film selection practices in Eurowestern film festivals and the focus on art cinema since the late 1960s led to the specialisation of film festivals and to the rise of 'thematic film festivals' (de Valck 2007). This specialisation had been initiated with the creation of parallel sections in Cannes, Venice, and Berlin due to the introduction of auteurist discourses on Eurowestern films which were also being applied to new national cinemas from the Eastern bloc and the Third World. Similarly, many festivals emerged in the late 1970s and early 1980s that built on the new waves coming from the South in order to constitute a supposedly alternative network away from mainstream glamour. Therefore, when in the late 1970s revolutionary festival

projects in Latin America and Africa started experiencing difficulties in existing without sustainable and independent funding, they were recuperated by festivals in Europe and North America, which capitalised on Third-World cinemas that they uniformly categorised under the appellation 'world cinema'.

World cinema has now penetrated the global market beyond thematic festivals and niche networks, and has become very prominent in A-list film festivals. Filmmakers of the South have profited from the international exposure that these niche markets and, later, wide networks have allowed, and for that reason have prioritised them over exhibiting their productions at home. The system of premieres, which is predicated on the accumulation of cultural capital preserving the status quo, and its centralisation in the hands of few dominant festivals categorised as A-list by the FIAPF or other growing institutions, such as the Toronto International Film Festival (TIFF), have helped to push away festivals of the South towards other networks in the peripheries of global capital. Festivals in Africa such as the FESPACO are now competing against thematic festivals such as the Milan African Film Festival (Italy), Vues d'Afrique in Montreal (Canada), or the Amiens International Film Festival (France), but also mainstream festivals in Cannes, Venice, Berlin, and London (Diawara 1994). Conversely, in Cuba, the International Film Festival of New Latin American Cinema in Havana was created in 1979 in order to rekindle the political flame of the 'Nuevo Cine Latinoamericano' in the region. The Havana festival soon became a meeting point for leftists from all over the world, including Europe and North America. As well as facilitating collaborations with the Toronto International Film Festival (Canada) and Sundance (Salt Lake City, US), Havana also worked as a catalyst for capitalisation on the Latin American cinema brand (Isaza 2012). The play on the category of regional cinema has therefore allowed both the submission of ensembles in the South to capitalist logics and the exploitation of the global network to the regions' own ends, blurring clear distinctions between anti-imperialist struggle and adhesion to imperialist logics.

Film Festivals, Trade, and the Rise of New Regional Hegemonies

Processes of regionalisation, which were central to the anti-imperialist Third-World struggle, have developed and taken other shapes as a result of globalisation. The current phenomenon of regional film festivals is connected to the flourishing of film markets within film festivals, and to the new importance of cities now functioning as central nodes in the global networks of trade that is not limited to the West (Sassen 2001). In Europe, film markets that existed on the side of festivals have been incorporated in the official structures since as early as the 1980s (Cannes, from 1983; Berlin; Rotterdam). In China, festivals created in the 1970s by state initiatives have been gradually sold to corporations, and have become modelled on profit-making commercial enterprises. Their success attracts sponsors, and the cities in which they are set accumulate both financial and media capital (Hong Kong International Film Festival, since the 2000s; see Cheung 2009). Emerging economies embracing late capitalism have profited from the new centrality of trade within festivals. For example, in the Gulf region, the Abu Dhabi and Dubai festivals were created around their film markets in the 2000s. In the same decade, East Asian film festivals acquired high profile through their film markets (Hong Kong, 1997; Tokyo, 2004; Busan, 2006; Shanghai, 2007).

As a result, categories of world cinemas have also become economic weapons exploited by emerging industries, and are deeply entangled with processes of region-alisation. The new role assigned to global cities, in which film markets participate, has changed the previous dynamics that were still inflected by national interests. Having had their roles reinforced after the Asian financial crisis of 1997–98, film festivals and film markets have strengthened the circulation between three major poles within East Asia: Hong Kong, Tokyo, and Busan. This network and other lesser ones including Taipei and Taiwan have favoured the discursive formation of a regional cinema – echoing the rhetoric of 'world cinema' and 'Latin American branding' – marketable to both internal and external buyers, and

competing with major industries and mainstream festivals (Ahn 2012; Cheung 2011). As they build on the rise of global cities, however, processes of region-alisation as discursive formations tend to hide new imbalances of power within these discursively unified ensembles. Moreover, other regions are left out from global capital dynamics because of internal dissensions. For example, heavy politics of sponsorship have not favoured the development of the Pan-African festival FESPACO in the context of the economic crisis of the 2000s. Rather, these politics have benefited tourism more than Pan-African cinema; tourism is judged more profitable by a state whose legitimacy has been more and more contested by the population (Diawara 1994; Dupré, 2012).

Film Festivals: New Functions, New Imperialisms?

The centralisation of capital in global festivals has also impacted on their function within the film economy, and enhanced them with additional prerogatives. Previously limited to exhibiting and facilitating distribution, film festivals now also play the role of producers. Funds are developed to help 'world cinema' as it has become a major asset in the marketing strategy of global film festivals. These funds also create new networks of influence, reinforcing pre-existing power relations or constructing new regional discourses. As an example of the latter, set in a city that has become a centre for arts sponsorship in the Gulf area and is itself in rapid economic expansion, the Abu Dhabi Film Festival developed the SANAD Fund (from the Arabic word for 'support') in the 2000s to help the post-production of Arab films. On the other hand, in 1988, the International Film Festival of Rotterdam launched the Hubert Bals Fund to support filmmakers from developing countries. Similarly, the fund Cine en *Construcción (2002)* is a joint initiative of Donostia–San *Sebastián* International Film Festival (Basque Country/Spain) and the Rencontres Cinémas d'Amérique Latine de Toulouse (France) and aims to help the post-production of uncompleted Latin American features. While it builds upon the historical ties that constituted the Ibero-American sphere, it also implies a certain economic dependence among

Latin American productions (Ross 2010). These funds however also reveal the importance of transnational co-productions, which complicate unilateral power relations that would always disadvantage countries of the South. Diasporic film festivals, for example, because they foreground collaborative work in co-productions, provide good models for challenging clear binaries.

Alternative networks of international solidarity of various forms have tried to exploit the potentialities of globalisation to their own ends, and have strived to exist outside globalised film economies. However, there is always a risk that activist festivals will become other thematic events susceptible to being capitalised upon, or placed under the control of overarching organisations such as international non-governmental organisations that are subjected to their own global aid economy. Following the growth of Human Rights Film Festivals worldwide since the 1980s, the Human Rights Film Network (HRFN) was launched in 2004 in Locarno (Switzerland) as a regulating authority. The HRFN is supported by a charter that offers definitions of human rights, which have been accused of primarily reflecting Western conceptions. Moreover, as the category of 'human rights film' is formulated, its penetration into global festival markets is also made possible (Grassili 2012), which reveals the difficulty of constituting worldwide networks without global capital. Similarly, LGBT and queer film festivals first developed as grassroots formations. As they have mushroomed globally, they have developed a niche market around New Queer Cinema that has tamed the previous activist endeavours (Loist and Zielinski 2012). However, the impact of queer film and video festivals is still important locally (e.g. in Taipei and Seoul), and contributes to shape counter-publics (Kim and Hong 2007; Perspex 2006).

Conclusion

Because their primary function is to establish networks, film festivals have been central to historical and global negotiations of geopolitical powers through the circulation of films. Film festivals have reflected, actively participated in, and been shaped by imperialism and economic, discursive, political, and cultural strategies both disabling and empowering political formations, sometimes simultaneously. They have also served the articulations between various geographical scales such as the city, the country, the region, and the global that nuance preconceived understandings of political ensembles and the relations between them, often shaped by imperialism and capital. Film festivals therefore allow us to understand imperialisms and antiimperialisms as forces of organisation and networks of influences that are in constant evolution and vary from one geopolitical space to another.

Definition/Description

The relationship between finance and imperialism has been a constant dynamic for more than a century. Viewed by leading scholars as a source of extraction and exploitation, finance capital has been used to pillage colonies and semi-colonies in the Third World through extracting surplus value through capital investments. The system of financial investment has deepened in the era of neoliberalism as the withdrawal of state protection has

expanded the capacity of capital to transfer value from the Global South to the Global North.

The late 1800s and early 1900s witnessed a wave of colonial expansion and increasingly hostile rivalries among major capitalist countries, while at the same time significant transformations were taking place in these countries' economic structures. Capital concentration and centralisation were growing, integration between financial and industrial capital increased with finance seemingly having the upper hand, and cross-border capital movements expanded. Hobson (1902), a British left liberal, provided a first explanation that brought these two developments together and a number of Marxists, including Hilferding (1910), Luxemburg (1913), Kautsky (1914), Bukharin (1917), and Lenin (1917) theorised the relationship between the rise of finance and imperialism. The broad argument was that the concentration and centralization of capital indicated a new era in capitalism and competition was giving way to monopolies. In order to sustain profitable accumulation, these monopolies had to constantly expand, not only to export products but also to export capital. In the meantime, finance capital acquired greater power and a dominant position, pushing the state towards imperialist expansion to secure its international investments and to acquire colonies.

The concept of *finance capital* was first used by Rudolf Hilferding, who analysed the rise of the financial capitalists in the context of Germany and Austria and focused on the relations between credit, banks and industrial capital in *Finance Capital: A Study of the Latest Phase of Capitalist Development*, published in German in 1910. Hilferding (1910) argued that under modern capitalism 'free competition' was replaced by a process of concentration and centralisation of capital that led to the creation of cartels and trusts. This process brought banks and industrial capitalists together as finance capital – a close integration of the financial capital of banks with industrial capital in which banks acquired a dominant position and representatives of banks started sitting on the boards of corporations in a reflection of not just economic leverage but direct control as well. Finance capital was created as large monopolistic corporations had to rely increasingly on banks to finance their investments. This new institution was not only economically important but it also impacted social and political power as finance capital pushed governments to implement policies that would protect it domestically while supporting it internationally in efforts towards global expansion. Hilferding (1910) wrote:

> The demand for an expansionist policy revolutionizes the whole world view of the bourgeoisie, which ceases to be peace-loving and humanitarian. The old free traders believed in free trade not only as the best economic policy but also as the beginning of an era of peace. Finance capital abandoned this belief long ago. It has no faith in the harmony of capitalist interests, and knows well that competition is becoming increasingly a political power struggle. The ideal of peace has lost its luster, and in place of the idea of humanity there emerges a glorification of the greatness and power of the state …. The ideal now is to secure for one's own nation the domination of the world. (335)

Hilferding thought that imperialism was a direct outcome of finance capital, but he did not regard imperialist wars as the inevitable outcome. Instead, he saw the dominance of finance capital over the state as a structure that could be taken over and used by the working class. Later, Bukharin (1917) defined imperialism as 'a policy of finance capital' in *Imperialism and World Economy*. Lenin (1917) took the core arguments of Hilferding and Bukharin and produced what would later become the classical Marxist theory of imperialism in *Imperialism: The Highest Stage of Capitalism*. He saw finance capital as directly related to imperialism since states attempt to gain power not only through trade but also through export of capital. The rise of finance capital resulted in the establishment of trade barriers, the export of capital, and a drive towards militarism and imperialism. Imperialist powers searched for colonies where finance capital could export its excess capital and surplus. Lenin particularly emphasised that imperialism was not a political choice but a necessity rooted in the modern capitalist system; the centralisation and concentration of capital both underlay finance capital but were also given added impetus by it. Therefore, finance capital was inseparable from imperialism:

[F]inance capital, literally, one might say, spreads its net over all countries of the world . . .. The capital exporting countries have divided the world among themselves in the figurative sense of the term. But finance capital has led to the *actual* division of the world. (66–67, emphasis in the original)

The characteristic feature of imperialism is *not* industrial *but* finance capital. It is not an accident that in France it was precisely the extraordinarily rapid development of *finance* capital and the weakening of industrial capital, that from the eighties onwards, gave rise to the extreme intensification of annexationist (colonial) policy. (91, emphasis in the original)

Hobson (1902) had argued that the principal driving force behind capital export was insufficient demand among lower-income groups of the core countries, and had suggested that the problem could be solved by a redistribution of income. Lenin (1917) did not see this as a possibility and argued that within the context of finance capital, since the world was already divided, further expansions would result in a struggle for a re-division and this would be the principal reason for imperialist wars. Hence, imperialist wars were a direct outcome of the dominance of finance capital.

At the time, this theory of imperialism was both new and sophisticated and seemed to provide an explanation for the events that were unfolding. The period from 1914–45 witnessed two world wars, one great depression and the emergence of the Soviet bloc. After 1945, the capitalist world entered a new era. The conflict among capitalist powers gave way to the Cold War, while a process of decolonisation changed the nature of the relationship between advanced capitalist countries and the rest of the world. As the uncontrolled expansion of finance was seen as one of the major causes of the Great Depression, the international financial system and domestic financial structures were strictly regulated and attention turned towards state-led economic growth. This led to a change in the focus of theories of imperialism, since in this new set-up the thesis of finance-driven imperialism seemed out of date. New theories of imperialism relied on concepts such as monopoly capital (Baran and Sweezy 1966) and dependency and unequal exchange (Amin 1974; Frank 1966; Emmanuel 1972;

Wallerstein 1974) rather than finance capital. In fact, the finance capital thesis was criticised for representing more of a transitional phase that only applied to Germany but not the US or UK. Instead, the new focus was on management-controlled and largely self-financed corporations and it was argued that imperialism occurred mostly through trade, not so much through finance. In this view, surplus is transferred from the dependent periphery to the core, while excess surplus in the core is directed to wasteful expenditures such as military spending.

The multifaceted crisis of the 1970s, which included declining profitability and stagflation in leading economies and the collapse of state-led, import-substitution industrialisation strategies in less-developed countries, paved the way for major changes. As all these countries opened their doors to neo-liberal policies in the 1980s, finance was once again ascendant, this time globally. The concept of *financialisation* was developed as a means of analysing this era. It refers to the increase in the size, importance, and power of financial markets, as well as transactions, institutions, motives, and financial elites in the functioning of the economy. Some describe the financialisation process as a shift from productive activities to financial activities, while others emphasise the dominance of finance in general over economic activities. Indicators of financialisation are abundant. For example, total global financial assets as a percentage of the world's gross domestic product (GDP) increased from 109% in 1980 to 263% in 1990, 310% in 2000 and 355% in 2007. Moreover, the size of the financial sector with respect to the GDP, financial incomes as a percentage of national incomes, financial corporations' profits with respect to non-financial corporations' profits, debt to GDP ratios, non-financial corporations' financial incomes, and financial payments have all shown sharp increases in the last three decades (Orhangazi 2008, 2011). Financialisation has also entailed an increase in cross-border capital movements in the forms of foreign direct investment and portfolio investment flows. In some regards, the era of financialisation bears similarities to that of Hilferding's and Lenin's theorisation: the world economy is dominated by large corporations

(though these are more multinational today), capital export has substantially grown, the role and power of finance has substantially increased, and imperialism has reasserted itself. However, there are no trade barriers corresponding to territorial powers. Moreover, in the new era, finance is not limited to banks, not even to financial institutions, as large non-financial corporations now also run sizeable financial operations integrated with productive and commercial operations.

This new rise of finance led some scholars to argue that it has played a key role in securing the hegemony of the US as the leading imperialist power (Gowan 1999; Hudson 2003). Some have interpreted financialisation as a 'sign of autumn' marking the decline of the US as an imperial power (Arrighi 1994). According to this approach, as rivalries among economic powers intensify, a financial expansion centred around the hegemonic power in decline occurs and a new locus of power in the world economy begins to emerge. In this formulation, these financial expansions are repeated throughout capitalist history at times of imperial decline. The prime reason behind this is the over-accumulation of capital – reflected as an exhaustion of profitable investment opportunities in the real sector, preceded by increased competition in product markets. Profits grow relative to stagnant business opportunities and this gives rise to financial liquidity. The difference between the post-1980 period and the early twentieth century is that the US, as the major imperialist power, now has greater potential than Britain did to preserve its declining hegemony through 'exploitative domination', which includes both taking advantage of financial flows into the US and the use of military power to secure resources (Arrighi and Silver 1999). However, financialisation undermines the hegemonic power's imperial position at the same time, since it weakens the industrial sector as US firms turn to offshoring. The US economy becomes more and more a *rentier* economy with respect to the rest of the world, while domestically it shifts towards a service economy (Harvey 2003).

Leaving aside the debate about whether US hegemony is in fact facing a decline, the relationship between financialisation and imperialism is presented through the argument that financial mechanisms are managed by the imperialist power(s) and work in their interests. In particular, the US Federal Reserve, together with the US Treasury and Wall Street, sets the conditions for financialisation. The International Monetary Fund (IMF) and the World Bank support this set-up globally. The US Federal Reserve can largely determine the levels of international interest rates by moving its domestic interest rate targets. Washington decides the level of financial regulation and supervision through its (de)regulatory interventions. When faced with international financial crises, the US Treasury and the IMF intervene in the interests of the large financial corporations and investors of the core countries.

The US and other leading powers benefit from this set-up through the availability of low-cost funds from the rest of the world. This is ensured in the US case by the reserve role of the US dollar and in the UK case by the London-based banking system. While the role of the US dollar as a reserve currency was created before the era of financialisation, it has been dramatically strengthened in recent decades (Vasudevan 2008). Moreover, the dollar holdings of developing countries in the form of reserve accumulation – mostly in US Treasury bonds – have become a seigniorage tax levied by the US on the rest of the world (Hudson 2003). However, in contrast to the earlier era of finance capital when Britain was a major capital exporter, the US is a large capital importer. In the late 2000s, the US economy received financial investments from the rest of the world equal to more than twice the amount of US financial investments abroad. However, there is an asymmetry here since the rates of return realised on US capital exports are about twice as high as the rate of returns obtained from capital exports to the US from the rest of the world. A main reason behind this is the composition of these investments. A significant portion of capital exports to the US goes into low-return treasury bills. While capital incomes coming from abroad now constitute a large and increasing portion of capital income in the US, other major powers – including the UK, Germany, and France – also acquire large flows of financial income from the rest of the world

(Duménil and Lévy 2011). Furthermore, the financial centres located in core countries capture a share of the globally produced surplus value as they provide financial services, including loans, to the rest of the world; and in return, they receive large sums of interest and other financial payments, both from government and private enterprises. In addition, by financing the operations of the core's large corporations either through bank financing or through the stock market, they enable concentration and centralisation of capital globally.

Furthermore, the increased cross-country mobility of financial capital together with frequent financial crises have been effective in imposing on countries in the periphery an increasingly deregulated and liberalised financial system that works in the interest of imperialist powers and a small group of elites in these countries. Financial crises have been occasions for furthering financial deregulation and liberalisation, while financial capital has used them for quick returns and transfers of ownership, and hence power in its favour. The crises in Latin American countries in the 1980s, the 1997 Asian crisis and the 2001 crisis in Turkey are all examples of this (Dufour and Orhangazi 2009; Wade and Veneroso 1998). Increasing unemployment and impoverishment, as well as the loss of public services through privatisations after these crises, led to a shift in the tone of anti-imperialism as well.

In short, the nexus between finance and imperialism has been theorised since the early 1900s. Even though there is no definite fully fledged theory of the link between financialisation and imperialism, there is much interest in the issue. Clearly, there is still a need for more empirical work examining the propositions advanced in the literature. On the other hand, the 2007–08 US financial crisis and the ensuing global financial crisis and economic slowdown suggests that while the US and other leading powers might have benefited from being able to manage the process of financialisation, the future of financialisation and the position of the core within this set-up remains uncertain.

Definition

Imperialism, the worldwide expansion of capitalism, motivated by the lust for raw materials such as petroleum, markets and cheap labour, involved fierce competition among great powers such as the British Empire, czarist Russia, and the German Reich, and thus led to the Great War of 1914–1918, later to be known as the First World War or World War I.

The First World War was the product of the nineteenth century, a "long century" in the view of some historians, lasting from 1789 to 1914. It was characterized by revolutions of a political, social, and also economic nature, especially the French Revolution and the Industrial Revolution, and ended with the emergence of imperialism, that is a new, worldwide manifestation of capitalism, originally a European phenomenon. This essay focuses on how imperialism played a decisive role in the outbreak, course, and outcome of the "Great War" of 1914–1918; it is based on the

author's book, *The Great Class War 1914–1918*, James Lorimer, Toronto, 2016.

When the French Revolution broke out in 1789, the nobility (or aristocracy) constituted the ruling class in just about every country in Europe. But because of the French Revolution and other revolutions that followed – not only in France – in 1830 and 1848, the *haute bourgeoisie* or upper-middle class was able, by the middle of the century, not to unseat the nobility, but to join it at the apex of the social and political pyramid. Thus was formed an "active symbiosis" of two classes that were in fact very different. The nobility was characterized by great wealth based on large landownership, had a strong preference for conservative political ideas and parties, and tended to cultivate clerical connections. The upper-middle class, on the other hand, favored the ideology and parties of liberalism as well as free-thinking and even anti-clericalism, and its wealth was generated by activities in commerce, industry, and finance. The two had been on opposite sides of the barricades during the revolutions of 1789, 1830, and 1848, when the bourgeoisie had been a revolutionary class and the aristocracy the counter-revolutionary class *par excellence*. What united these two *propertied* classes, namely in 1848, was their common fear of a class enemy that threatened their wealth, power, and privileges: the poor, restless, and potentially revolutionary "underclass," *propertyless* and therefore known as the proletariat, the "people who own nothing but their offspring."

The upper-middle class ceased to be revolutionary and joined the nobility on the counter-revolutionary side after the revolutions that shook Europe in 1848. Those events revealed that the lower classes aspired to bring about not only a political but also a social and economic revolution that would mean the end of the power and wealth of not only the nobility but also the bourgeoisie. In the second half of the nineteenth century, then, and until the outbreak of the First World War, the nobility and the haute bourgeoisie formed one single upper class, one single "elite" or "establishment." But while the bourgeois bankers and industrialists enjoyed more and more *economic* power, *political* power tended to

remain a monopoly of the aristocrats in most countries, and certainly in big, quasi-feudal empires such as Russia. In any event, all members of the elite were obsessed by the fear of revolution, increasingly embodied by proletarian political parties that subscribed to revolutionary Marxist socialism.

The nineteenth century was also the century of the Industrial Revolution. In all countries where that revolution took place, the economy became much more productive. But this eventually caused the economic supply to exceed the demand, as was revealed in 1873 by the outbreak of a totally new kind of economic crisis, a crisis of *overproduction.* (Earlier economic crises had always been crises of *underproduction*, in which supply was insufficient in comparison to demand, for example, the infamous potato famine in Ireland in the 1840s.) In the most developed countries, that is, in Western and Central Europe and in the USA, countless small industrial producers disappeared from the economic scene as a result of this economic depression. The industrial landscape was henceforth dominated by a relatively restricted group of gigantic enterprises, mostly incorporated, joint-stock companies or "corporations," as well as associations of firms known as cartels, and also big banks. These "big boys" competed with each other, but increasingly, they also concluded agreements and collaborated in order to share scarce raw materials and markets, set prices, and find other ways to limit as much as possible the disadvantages of competition in a theoretically "free" market – and in order to defend and aggressively promote their common interests against foreign competitors and, of course, against workers and other employees. In this system, the big banks played an important role. They provided the credit required by large-scale industrial production and, at the same time, they looked all over the world for opportunities to invest the surplus capital made available by the megaprofits achieved by the corporations. Big banks thus became partners and even owners, or at least major shareholders, of corporations. Concentration, gigantism, oligopolies, and even monopolies characterized this new stage in the

development of capitalism. Some Marxist writers have referred to this phenomenon as "monopoly capitalism."

The industrial and financial bourgeoisie had hitherto been very much attached to the liberal, laissez-faire thinking of Adam Smith, which had assigned to the state only a minimal role in economic life, namely that of "night watch." But now the role of the state was becoming increasingly important, for example, as buyer of industrial commodities, such as guns and other modern weapons, supplied by gigantic firms and financed by major banks. The industrial-financial elite also counted on the state's intervention to protect the country's corporations against foreign competition by means of tariffs on the importation of finished products, even though this violated the classical liberal dogma of free markets and free competition. (It is one of the ironies of history that the USA, today the world's most fervent apostle of free trade, was extremely protectionist at that time.) "National economic systems" or "national economies" thus emerged, and they proceeded to compete fiercely against each other. State intervention – to be labelled "dirigism" or "statism" by economists – was now also favored because only a strong state was able to acquire foreign territories useful or even indispensable to industrialists and bankers as markets for their finished products or investment capital and as sources of raw materials and cheap labor. These desiderata were not normally available domestically, or at least not in sufficient quantities or at sufficiently low prices, they privileged a country's industrialists and bankers vis-à-vis foreign competitors, and they helped to maximize profitability.

The kind of territorial acquisitions that could only be achieved under the auspices of a strong and interventionist state, also suited the nobility, the partner of the industrial-financial bourgeoisie within the ruling elite, and in many if not most countries still the class with a near-monopoly of political power. The aristocrats were traditionally large landowners, so it is only natural that they favored territorial acquisitions; the more acreage one controlled, the better. In noble families, moreover, the eldest son traditionally inherited not only

the title but the family's entire patrimony. Newly acquired territory overseas or – in the case of Germany and the Danube Monarchy – in Eastern Europe could function as "lands of unlimited possibilities" where the younger sons could acquire domains of their own and lord it over natives who were to serve as underpaid peasants or domestic servants, just as the Iberian Peninsula's Reconquista had provided "castles in Spain" to junior aristocrats during the Middle Ages, the nobility's golden age. Adventurous scions of noble families could also embark on prestigious careers as officers in conquering colonial armies or as high-ranking officials in the administration of colonial territories. (The highest functions in the colonies, for example, that of Viceroy of British India or Governor General of Canada, were indeed reserved almost exclusively for members of aristocratic families.) Finally, the nobility had started to invest heavily in capitalist activities such as mining, a branch of industry interested in overseas regions rich in minerals. The British and Dutch royal families thus acquired enormous portfolios of shares in firms that were prospecting for oil all over the world, such as Shell, so they too were likely to profit from territorial expansion.

Like its upper-middle class partner in the elite, the nobility could also expect to gain from territorial expansion in yet another way; such expansion proved useful as a means to exorcize the spectre of revolution, namely by co-opting potentially troublesome members of the lower orders and integrating them into the established order. How was this achieved? First but not foremost, considerable numbers of proletarians could be put to work in colonized lands as soldiers, employees, and foremen on plantations and in mines (where the natives served as slaves), low-ranking bureaucrats in the colonial administration, and even missionaries. There they could not only enjoy a higher standard of living than at home but also a certain amount of social prestige, since they could lord it over, and feel superior to, the colored natives. Thus, they became more likely to identify with the state that made this form of social climbing possible and to be integrated into its established order. Second, within the mother

countries themselves, a similar socialization of an even larger segment of the lower orders resulted from the acquisition of colonies. The ruthless "super-exploitation" that was possible in the colonies, whose denizens were robbed of their gold, their land, and other riches, and be made to slave away for virtually nothing, yielded "super-profits." In the mother country, the employers could thus offer somewhat higher wages and better working conditions to their workers, and the state could start to provide modest social services. At least some of the proletarians in the mother lands thus became better off at the expense of the oppressed and exploited denizens of the colonies. In other words, the misery was exported from Europe to the colonies, to the unhappy lands that would later collectively be known as the "Third World." (In the USA, the prosperity and freedom of the white population was similarly made possible by the exploitation and oppression of Afro-Americans and "Indians.") In any event, under those conditions, most European socialists (or social-democrats) increasingly developed warm feelings towards a "fatherland" that treated them better, so they gradually abandoned their traditional Marxist internationalism to become rather nationalistic; discreetly, they – and their socialist (or social-democratic) parties – also ceased to believe in the inevitability and necessity of revolution and migrated from Marx's revolutionary socialism to socialist "reformism." This explains why, in 1914, most socialist parties would not oppose the war but would rally behind the flag to defend the fatherland that had presumably been so good to them. Third, territorial expansion also offered an advantage much appreciated by the many members of the elite who subscribed to Malthusianism, a trendy ideology at the time, which blamed overpopulation for the great social problems that ravaged all the industrialized countries. It made it possible to dump the restless and potentially revolutionary demographic surplus in distant lands such as Australia, where they could acquire land and start a farm, for example, by expelling or even exterminating the natives.

Projects for territorial acquisitions, undertaken under the auspices of a strong and even aggressive state, then, were favored by the aristocratic as well as the bourgeois factions of the elite. And they received considerable popular support, because they appealed to the romantic imagination and, more importantly, because even some of the proletarians could help themselves to the crumbs that fell off the table. The second half, and particularly the final quarter, of the nineteenth century thus witnessed a worldwide territorial expansion of European as well as two non-European industrial powers, the USA and Japan. However, the conquest of territories, where desiderata such as precious raw materials were to be found and where there existed plenty of investment opportunities, was rarely possible "next door." The great exception to this general rule was provided by the USA, who grabbed the vast hunting grounds of the Native Americans, stretching all the way to the coast of the Pacific Ocean, and robbed neighboring Mexico of a huge part of its territory. It was generally more realistic, however, to dream of territorial acquisitions in faraway lands, above all in the "dark continent" that was to become the object of the famous "scramble for Africa." Great Britain and France acquired vast territories, mostly in Africa but also in Asia. The USA expanded not only on its own continent but robbed Spain via a "splendid little war" of colonial possessions such as the Philippines, and Japan managed to turn Korea into a dependence. Germany, on the other hand, did not do very well, mostly because it remained focused for too long on the establishment of a unified state; as a latecomer in the scramble for colonies, it had to settle for relatively few and certainly less desirable possessions, such as "German Southwest Africa," now Namibia. In any event, the industrial giants of Europe, plus the USA and Japan, without exception states organized according to capitalist principles, morphed at that time into "mother countries" or "metropoles" of vast empires. To this new manifestation of capitalism, originally a purely European phenomenon, that was henceforth spreading itself over the entire globe, a name was given in 1902 by a British economist, John A. Hobson: "imperialism." In 1916, Lenin was to offer a Marxist view of imperialism in a famous pamphlet, *Imperialism, the Highest Stage of Capitalism*.

Imperialism generated more and more tension and conflicts among the great powers that were competing to acquire control over as many economically important territories as possible. At that time, social Darwinism was a very influential scientific ideology, and it preached that competition was the basic principle of all forms of life. Not only individuals but also states had to compete mercilessly with each other in a struggle for survival. The strongest triumphed, and thus they became even stronger; the weak, on the other hand, were the losers, and they were left behind in the race for survival and were doomed to perish. To be able to compete with other states, a state had to be economically strong, and for that reason its "national economy" – that is, its corporations and banks – had to have control over as much territory as possible with raw materials, potential for the export of goods and investment capital, etc. Thus was generated a merciless worldwide scramble for colonies, even for lands one did not really need but did not want to fall into the hands of a competitor. Considering all this, the British historian Eric Hobsbawm drew the conclusion that capitalism's trend towards imperialist expansion inevitably pushed the world in the direction of conflict and war.

However, in spite of tensions and crises, including a conflict about East African real estate that brought Britain and France to the brink of war in 1898, the Fashoda Crisis, Europe's imperialist powers managed to acquire vast territories without fighting a major war against each other. By the turn of the century, the entire globe seemed to be partitioned. According to historian Margaret Mac-Millan, this means that the imperialist powers no longer had any reason to quarrel, and she concludes that an accusing finger cannot be pointed at imperialism when the causes of the First World War are discussed. To this it can be replied – as the French historian Annie Lacroix-Riz has done – that there remained at least one "hungry" imperialist power which felt disadvantaged compared to "satisfied" powers such as Great Britain, was not prepared to put up with the status quo, aggressively pursued a redistribution of existing colonial possessions, and was in fact willing to wage war to achieve its objectives. That "hungry" power

was Germany, which had belatedly developed an imperialist appetite, namely after Wilhelm II became emperor in 1888 and promptly demanded for the Reich a "place in the sun" of international imperialism, in other words, a redistribution of the colonial possessions that would provide Germany with a larger share. Colonial possessions, Lacroix-Riz points out, may have been *distributed*, but they could be *redistributed*. That redistributing the colonial possessions was possible, but also unlikely to be achieved peacefully, was demonstrated by the case of former Spanish colonies like the Philippines, Cuba, and Puerto Rico, which were transformed into satrapies of America's "informal empire" as a result of the Spanish-American War of 1898.

Moreover, a considerable part of the world did in fact remain available for direct or indirect annexation as colonies or protectorates, or at least for economic penetration. MacMillan herself acknowledges that a "serious scramble for China," similar to the earlier, risky race for territories in Africa, remained possible, the more so since not only the great European powers but also the USA and Japan displayed much interest in the land of unlimited possibilities that the Middle Empire seemed to be. The imperialist wolves were also keenly – and jealously – eying a couple of other major countries that had hitherto managed to remain independent, namely, Persia and the Ottoman Empire.

The competition between the imperialist powers was and remained very likely to lead to conflicts and wars, not only limited conflicts such as the Spanish-American War of 1899 and the Russian-Japanese War of 1905 but also a general conflagration involving most if not all powers. It almost came to such a conflagration in 1911 when, to the great chagrin of Germany, France turned Morocco into a protectorate. The case of Morocco shows how even supposedly satisfied imperialist powers such as France were never truly satisfied – just as immensely rich people never feel that they have enough riches – but continued to look for more ways to fatten their portfolio of colonial possessions, even if that threatened to cause a war.

Let us consider the case of the "hungry" imperialist power, Germany. The Reich, founded in

1871, had entered the scramble for colonies a little too late. It could actually consider itself lucky that it was still able to acquire a handful of colonies such as Namibia. But those hardly amounted to major prizes, certainly not in comparison to the Congo, a huge region bursting with rubber and copper that was pocketed by minuscule Belgium. With respect to access to sources of vital raw materials as well as opportunities for exporting finished products and investment capital, the tandem of Germany's industry and finance thus found itself very much disadvantaged in comparison to its British and French rivals. Crucially important raw materials had to be purchased at comparatively high rates, which meant that the finished products of German industry were more expensive and therefore less competitive on international markets. This imbalance between extremely high industrial productivity and relatively restricted markets demanded a solution. In the eyes of numerous German industrialists, bankers, and other members of the country's elite, the only genuine solution was a war that would give the German Empire what it felt entitled to and – to formulate it in Social-Darwinist terms – what it believed to be necessary for its survival: colonies overseas and, perhaps even more importantly, territories within Europe as well.

In the years leading up to 1914, the German Reich thus pursued an expansionist and aggressive foreign policy aimed at acquiring more possessions and turning Germany into a world power. This policy, of which Emperor Wilhelm II was the figurehead, has gone down in history under the label of *Weltpolitik*, "policy on a worldwide scale," a term that was merely a euphemism for what was in fact an imperialist policy. In any event, Imanuel Geiss, an authority in the field of the history of Germany before and during the First World War, has emphasized that this policy was one of the factors "that made war inevitable."

With respect to overseas possessions, Berlin dreamed of pinching the colonies of small states such as Belgium and Portugal. (And in Great Britain a faction within the elite, consisting mostly of industrialists and bankers with connections to Germany, was in fact willing to appease the Reich, not with a single square mile of their own Empire,

of course, but with the gift of Belgian or Portuguese overseas possessions.) Nevertheless, it was above all within Europe itself that opportunities seemed to exist for Germany. Ukraine, for example, with its fertile farmland, loomed as the perfect "territorial complement" (*Ergänzungsgebiet*) for the highly industrialized German heartland; its bread and meat could provide cheap food for German workers, which would permit keeping their wages down. Likewise eyed by German imperialists was the Balkan, a region that might serve as source of cheap agricultural products and as market for German commodities. Germans in general were impressed with America's conquest of the "Wild West" and Britain's acquisition of the Indian subcontinent and dreamed that their country might similarly obtain a gigantic colony, namely by expanding into Eastern Europe in a modern-day edition of Germany's medieval "push to the East," the *Drang nach Osten*. The East would supply the Reich with abundant raw materials, agricultural products, and cheap labor in the shape of its numerous, supposedly inferior but muscular natives; and also a kind of social safety valve, because Germany's own potentially troublesome demographic surplus could be shipped as "pioneers" to those distant lands. Hitler's infamous fantasies with respect to "living space," which he was to reveal in the 1920s in *Mein Kampf* and to put into practice during the Second World War, saw the light under those circumstances. In this respect, Hitler was not an anomaly at all, but a typical product of his time and space, and of the imperialism of that time and space.

Western Europe, more developed industrially and more densely populated than Europe's east, was attractive to German imperialism as a market for the finished products of German industry, but also as a source of interesting raw materials. The influential leaders of the German steel industry did not hide their great interest in the French region around the towns of Briey and Longwy; that area – situated close to the border with Belgium and Luxembourg – featured rich deposits of high-quality iron ore. Without this ore, claimed some spokesmen of German industry, the German steel industry was condemned to death, at least in

the long run. It was also believed that Germany's *Volkswirtschaft*, its national economy, would profit greatly from the annexation of Belgium with its great seaport, Antwerp, its coal regions, etc. And together with Belgium its colony, the Congo, would of course also fall into German hands. Whether the acquisition of Belgium and perhaps even the Netherlands would involve direct annexation or a combination of formal political independence and economic dependence on Germany was a matter of debate among the experts within the German elite. In any event, in one way or another, virtually all of Europe was to be integrated into a "great economic space" under German control, The Reich would finally be able to take its rightful place next to Britain, the USA, etc. in the restricted circle of the great imperialist powers. (The historian Fritz Fischer has dealt with all this in his classical study of Germany's objectives in World War I.)

It was obvious that Germany's ambitions in the East could not be realized without serious conflict with Russia and the German aspirations with respect to the Balkans risked causing problems with Serbia. That country was already at loggerheads with the Reich's biggest and best friend, Austria-Hungary, but it was supported by Russia. And the Russians were also very annoyed by Germany's planned penetration of the Balkan Peninsula in the direction of Istanbul, since the straits between the Black Sea and the Mediterranean were at the very top of their own list of desiderata. St. Petersburg was almost certainly willing to go to war to deny Germany direct or indirect control of the Bosporus and the Dardanelles.

The German ambitions in Western Europe, and Belgium in particular, obviously ran counter to the interests of the British. At least as far back as the time of Napoleon, London had not wanted to see a major power ensconced in Antwerp and along the Belgian coast – and certainly not Germany, long a great power on land but now, with an increasingly impressive navy, also a menace at sea. With Antwerp, Germany would not only have at its disposal a "pistol aimed at England," as Napoleon had described the city, but also one of the world's greatest seaports. That would have made

Germany's international trade far less dependent on the services of British ports, sea lanes, and shipping, a major source of revenue of British commerce.

The real and imaginary interests and needs of Germany as a great industrial and imperialist power thus pushed the country increasingly rapidly, via an aggressive foreign policy, toward a war. But the possibility of war raised no great concerns within the elite of the military giant that Germany had already been for quite some time. To the contrary, among the industrialists, bankers, generals, politicians, and other members of the Reich's establishment, only some rare birds did not wish for a war; most of them preferred a war as soon as possible, and many were even in favor of unleashing a preventive war. Of course, the German elite also featured less bellicose members, but among them, there prevailed the fatalist feeling that war was simply inevitable.

That the merciless competition between the great imperialist powers – a struggle of life and death, as seen from a social-Darwinist viewpoint – was virtually certain to lead to war, was also demonstrated by the case of Great Britain. That country marched into the twentieth century as the world's superpower, in control of an unprecedented collection of colonial possessions. But the power and wealth of the Empire obviously depended on the fact that, thanks to the mighty Royal Navy, Britannia ruled the waves. And in that respect a very serious problem arose around the turn of the century. As fuel for ships, coal was quickly being replaced by petroleum on account of its far greater efficiency. Albion had plenty of coal but did not have petroleum, not even in its colonies, at least not in sufficient quantities. And so the search was on for plentiful and reliable sources of oil, the "black gold." For the time being, that precious commodity had to be imported from what was then the world's foremost producer and exporter, the USA. But that was not acceptable in the long run, since Britain often quarrelled with its former transatlantic colony about issues such as influence in South America, and the USA was also becoming a serious rival in the imperialist rat race. Looking out for alternative sources, the British found a way to

F

quench their thirst for petroleum, at least partly, in Persia. It was in this context that the Anglo-Iranian Oil Company was founded, later to be known as British Petroleum (BP). However, a definitive solution to the problem only appeared in sight when, still during the first decade of the twentieth century, significant deposits of oil were discovered in Mesopotamia, more specifically in the region around the city of Mosul. The patriciate ruling Albion – exemplified by gentlemen like Churchill – decided at that time that Mesopotamia, a hitherto unimportant corner of the Middle East destined to become Iraq after the First World War, but then still belonging to the Ottoman Empire, had to be brought under British control. That was not an unrealistic objective, since the Ottoman Empire was a large but weak country, from whose vast territory the British had already previously managed to carve attractive morsels, for example, Egypt and Cyprus. In fact, in 1899, the British had already snatched oil-rich Kuwait and proclaimed it a protectorate; they were to transform it in 1914 into a supposedly independent emirate. Possession of Mesopotamia, then, was seen to be the only way to make it possible for unlimited quantities of petroleum to flow unperturbed toward Albion's shores.

However, in 1908, the Ottoman Empire became an ally of Germany, which meant that the planned acquisition of Mesopotamia was virtually certain to trigger war between Britain and the Reich. But the need for petroleum was such that plans were nonetheless made for military action. And these plans needed to be implemented as soon as possible. The Germans and Ottomans had started to construct the *Bagdad Bahn*, a railway that was to link Berlin via Istanbul with Baghdad, the Mesopotamian metropolis, situated close to Mosul, and that raised the prospect that barrels full of Mesopotamian oil might one day start to roll toward Germany for the benefit of the Reich's growing collection of battleships, which happened to be the most dangerous rival of the Royal Navy! Since the *Baghdad Bahn* was expected to be completed in 1914, quite a few British political and military decision-makers were of the opinion that it was better not to wait

very long before starting a war that appeared unavoidable in any event.

It was in this context that London's traditional friendship with Germany came to an end, that Britain joined two former archenemies, France and Russia, in an alliance known as the Triple Entente, and that the British army commanders started to work out detailed plans for war against Germany in collaboration with their French counterparts. The idea was that the massive armies of the French and the Russians would smash Germany's host, while the bulk of the Empire's armed forces would invade Mesopotamia from India, beat the Ottomans, and grab the oil fields. The Royal Navy also promised to prevent the German Navy from attacking France via the English Channel, and on land, the French army was to benefit from (mostly symbolic) assistance by the relatively tiny British Expeditionary Corps (BEF). However, this Machiavellian arrangement was concocted in the greatest secrecy, and neither the Parliament nor the public were informed about it.

On the eve of the Great War, a compromise with the Germans remained possible and even enjoyed the favor of some factions within Britain's political, industrial, and financial elite. A compromise would have provided Germany with at least a share of the Mesopotamian oil, but London sought to achieve nothing less than exclusive control over the "black gold" of Mesopotamia. The British plans to invade Mesopotamia were prepared as early as 1911 and called for the occupation of the strategically important city of Basra, to be followed by a march along the banks of the Tigris to Baghdad. Complemented by a simultaneous attack by British forces operating from Egypt, this invasion was to provide Britain with control over Mesopotamia and much of the rest of the Middle East. This scenario would indeed unfold during the Great War, but in slow motion, as it turned out to be a much tougher job than expected, and the objectives would only be achieved at the end of the conflict. Incidentally, the famous Lawrence of Arabia would not suddenly appear out of nowhere; he was merely one of the numerous Brits who, during the years leading up to 1914, had been carefully selected and

trained to "defend" their country's interests – mostly with respect to oil – in the Middle East.

The conquest of the oil fields of Mesopotamia constituted the prime objective of Britain's entry into the war in 1914. When the war broke out, and the German and Austrian-Hungarian partners went to war against the Franco-Russian duo plus Serbia, there seemed to be no reason for Britain to become involved in the conflict. The government in London was confronted with a dilemma; it was honor-bound to keep the promises made to France but that would have revealed that these plans had been concocted in secret. However, Germany's violation of Belgium's neutrality provided London with the perfect pretext to go to war. In reality, the fate of the small country was of little or no concern to the British leaders, at least as long as the Germans did not proceed to grab Antwerp. Neither was the violation of a country's neutrality deemed to be a big deal; during the war, the British themselves would not hesitate to violate the neutrality of a number of countries, namely, China, Greece, and Persia.

Like all plans made in preparation for what was to become the "Great War," the scenario concocted in London failed to unfold as anticipated. The French and Russians did not manage to crush the Teutonic host, so the British had to send many more troops to the continent – and suffer much greater losses – than foreseen. And in the distant Middle East, the Ottoman army – expertly assisted by German officers – unexpectedly proved to be a tough nut to crack. In spite of these inconveniences, which caused the death of about three quarters of a million soldiers in the UK alone, all was well in the end; in 1918, the Union Jack fluttered over the oil fields of Mesopotamia.

This short survey demonstrates that, as far as the rulers of Britain were concerned, World War I was not fought to save "gallant little Belgium" or to champion the cause of international law and justice. At stake were economic interests, the interests of British imperialism, which happen to be the interests of the rich and powerful British aristocratic gentlemen and bourgeois burghers whose corporations and banks lusted for raw materials such as petroleum – and for much else.

It is also obvious that for the patricians in power in London, the war was not a war for democracy at all. In the conquered Middle East, the British did nothing to promote the cause of democracy, to the contrary. Britain's imperialist interests were better served by subtle and not-so-subtle un- and even anti-democratic arrangements. Occupied Palestine was ruled by them in approximately the same way that occupied Belgium had been ruled by the Germans. And in Arabia, London's actions only took into account its own interests – as well as the interests of a handful of indigenous families that were considered to be useful partners. The vast homeland of the Arabs was parcelled out and distributed to those partners, who proceeded to establish states they could rule as if they were personal property. And when many denizens of Mesopotamia had the nerve to resist their new British bosses, Churchill ordered bombs to rain down on their villages, including bombs with poison gas.

On the eve of the outbreak of the Great War, in all the imperialist countries there were countless industrialists and bankers who favored a "bellicose economic expansionism." Nevertheless, many capitalists – and possibly even a majority – appreciated the advantages of peace and the inconveniences of war and were therefore not warmongers at all, as Eric Hobsbawm has emphasized. But this observation has wrongly caused the conservative British historian Niall Ferguson to jump to the conclusion that the interests of capitalists did not play a role in the eruption of the Great War in 1914. For one thing, countless industrialists and bankers and member of the upper-middle class displayed an *ambivalent* attitude with respect to war. On the one hand, even the most bellicose among them realized that a war would have most unpleasant aspects, and for that reason, they preferred to avoid war. However, as members of the elite, they also had reason to believe that the unpleasantness would be experienced mostly by others – and of course mostly by the simple soldiers, workers, peasants, and other plebeians to whom the nasty jobs of killing and dying were traditionally entrusted.

Moreover, the assumption that peace-loving capitalists did not want war reflects a binary,

F

black-and-white kind of thinking, namely that peace was the alternative to war and vice-versa. However, reality has a way of being more complex. There was in fact another alternative to peace, namely revolution. And that other alternative to peace was far more repulsive than war to most if not all capitalists and other bourgeois and aristocratic members of the elite. The aristocracy and the bourgeoisie had been obsessed with fear of revolution ever since the events of 1848 and 1871 had revealed the revolutionary intentions and potential of the proletariat. Afterwards, working-class parties subscribing to Marx's revolutionary socialism had been founded, had become increasingly popular, and remained officially committed to overthrow the established political and social-economic order via revolution even though, as we have seen, they had in fact discreetly become reformist. The decade before the outbreak of war, finally, ironically called *Belle Époque*, witnessed not only new revolutions (in Russia, in 1905 and in China, in 1911) but also, throughout Europe, a never-ending series of strikes, demonstrations, and riots that seemed to be harbingers of revolution in the very heartland of imperialism. In this context, war was promoted not only by philosophers such as Nietzsche and other intellectuals, by military and political leaders, but also by leading industrialists and bankers as an effective antidote to revolution.

During the years leading up to 1914, countless members of the bourgeoisie (and the aristocracy) thus imagined themselves to be witnessing a race between war and revolution, a sprint whose outcome could be decided at any time. Which one of the two was going to win? The burghers, fearing revolution, prayed that war would be the winner. With revolution, rather than peace, as the most likely alternative to war, even the most peace-loving capitalists definitely preferred war. And since they were afraid that revolution might win the race, that is, might break out before war, the capitalists, and the bourgeois and aristocratic members of the elite in general, actually hoped for war to come as soon as possible, which is why they experienced the outbreak of war in the summer of 1914 as a deliverance from unbearable

uncertainty and tension. This relief was reflected by the fact that the famous pictures of folks enthusiastically celebrating the declaration of war, taken mostly in the "better" districts of the capitals, almost exclusively featured well-dressed ladies and gentlemen, and not workers or peasants, who are known to have been mostly depressed by the news.

In its imperialist manifestation, capitalism was definitely responsible for the many colonial wars that had been waged and was also responsible for the Great War that broke out in 1914. Countless contemporaries realized this only too well. As the great French socialist leader Jean Jaurès already declared in 1895, "capitalism carries war within itself just like the thundercloud carries the storm." Jaurès was a convinced anticapitalist, of course, but many members of the bourgeois and aristocratic elite were also keenly aware of the link between war and their economic interests, and occasionally acknowledged this. General Haig, for example, who would command the British Army from 1915 until the end of the war, declared on one occasion that he was not "ashamed of the wars fought to open up the markets of the world to our traders." It was the fateful emergence of the imperialist version of capitalism, then, that, to use Eric Hobsbawm's words, "pushed the world to conflict and war." In comparison, the fact that numerous individuals among the industrialists and bankers may privately have cherished peace is of little or no importance and certainly does not permit the conclusion that capitalism did not lead to the Great War. It would be equally fallacious to conclude that Nazism was not really anti-Semitic and did not play a role in the origins of the Holocaust, because quite a few individual Nazis were personally not anti-Semitic.

It is also because imperialist aspirations were responsible for it, that the war that broke out in 1914, essentially a European conflict, developed into a world war. We should not forget that there was fighting not only in Europa but also in Asia and Africa. While the great powers would fight each other primarily, and most "visibly," in Europe, their armies would also do battle in each other's colonial possessions in Africa, in the

Middle East, and even in China. Finally, in Versailles, the victors would divide and claim not only the relatively modest booty represented by Germany's former colonies but especially the petroleum-rich regions of the Middle East that had belonged to the Ottoman Empire.

Let us take a quick look at the role played by Japan in the Great War. With its victory over Russia in 1905, the "land of the rising sun" revealed itself to be the only "non-Western" member of the restricted club of imperialism's great powers. Like all other imperialist powers, Japan was henceforth keen to acquire additional lands as colonies or protectorates in order to make raw materials and such available to its industry, thus making it stronger vis-a-vis the competition – for example, from the USA. The war that broke out in Europe in 1914 provided Japan with a golden opportunity in this respect. On September 23 of that year, Tokyo declared war on Germany for the simple reason that this made it possible to conquer the Reich's mini-colony (or "concession") in China, the Bay of Kiao-Chau (or Kiao-Chao), as well as its island colonies in the Northern Pacific. In the case of Japan, it is obvious that the country went to war in order to achieve imperialist objectives. In the case of the Western imperialist powers, however, we continue to be told that in 1914, arms were taken up solely to defend liberty and democracy.

The Great War was a product of imperialism. Its focus was therefore on profits for the big corporations and banks under whose auspices imperialism had developed and whose interests imperialism purported to serve. In this respect, the war did not disappoint. It was admittedly a catastrophe for millions of human beings, for the plebeian masses, for whom it offered nothing but death and misery. But for the industrialists and bankers of each belligerent country – and quite a few neutral countries, such as the USA before 1917 – it revealed itself as a cornucopia of orders and profits.

The conflict of 1914–1918 was an industrial contest in which modern weapons such as cannon, machine guns, poison gas, flamethrowers, tanks, airplanes, barbed wire, and submarines were decisive. This materiel was mass produced in the factories of the industrialists, yielding gargantuan profits, profits that were taxed only minimally in most countries. Profitability was also maximized by the fact that in all belligerent countries the wages (but not the prices) were lowered, while the working hours were lengthened and strikes were forbidden. (That was possible because, as we have seen earlier, imperialism had integrated the leaders and the rank-and-file of the supposedly internationalist and revolutionary socialist parties – and labor unions – into the established order and turned them into patriots, who in 1914 revealed themselves ready to rush to the defense of the fatherland and make the sacrifices presumably required to ensure its victory.) The most famous of the arms manufacturers to be blessed with war profits was Krupp, the world-famous German producer of cannon. But in France too, "merchants of death" did a wonderful business, for example, Monsieur Schneider, known as the French Krupp, who in 1914–1918 enjoyed "a veritable explosion of profits," and Hotchkiss, the great specialist in the production of machine guns. State orders for war materiel signified huge profits not only for corporations but also for the banks that were asked to loan the huge sums of money needed by governments to finance these purchases and the costs of the war in general. In the USA, J. P. Morgan & Co, also known as the "House of Morgan," was the undisputed champion glutton in this field. Morgan not only charged high interest rates on loans to the British and their allies but also earned fat commissions on sales to Britain by American firms that belonged to its "circle of friends," such as Du Pont and Remington.

In the spring of 1917, after a revolution had broken out in Russia and the French ally was rocked by mutinies in its army, it was feared that the British might lose the war and therefore not be able to pay back their war debts. It was in this context that the Wall Street lobby, headed by Morgan, successfully pressured President Wilson to declare war on Germany, thus enabling Albion to ultimately win the war and avoid a catastrophe for the US banks, especially Morgan. This development likewise illustrates the fact that the First

World War was primarily determined by economic factors, that it was the fruit of imperialism, a system that purported to serve the profit-maximizing interests of corporations and banks – and did.

With respect to the entry of the USA into the great clash of imperialisms of 1914–1918, another remark is in order. It was clear that the imperialist powers that would exit the war triumphantly would pocket great imperialist prizes, and that the losers would have to cough up some of their imperialist assets. And what about the neutrals? In January 1917, the French Prime Minister, Aristide Briand, publicly gave the answer, obviously anticipating a victory for the Triple Entente; neutral countries would not be invited to the peace conference and would not receive a share of the loot, that is, of goodies such as German colonies, the oil-rich regions of the doomed Ottoman Empire, and concessions and lucrative business opportunities in China. In this respect, Japan, America's great competitor in the Far East, had already made a move in 1914 by declaring war on Germany and pocketing the Reich's concession in China. In the USA, this conjured up the risk that Japan might end up monopolizing China economically, excluding American business. It is extremely likely that Washington took Briand's hint and that this consideration also influenced the decision, taken in April of 1917, to declare war on Germany. In the 1930s, an inquiry by the Nye Committee of the American Congress was to come to the conclusion that the country's entry into the war had indeed been motivated by the wish to be present when, after the war, the moment would come "to redivide the spoils of empire."

The war provided a mighty stimulus for the maximization of profits made by corporations and banks. But was that not one of the reasons why they had looked forward to war? (Another reason was of course the elimination of the revolutionary threat.) But the conflict also yielded them other considerable benefits. In all belligerent countries, the war reinforced the trend toward gigantism, that is, the ongoing emergence of a relatively small elite of very big corporations and banks. This was so because only big firms could benefit from the state orders for weapons and other war materiel. Conversely, small producers did not profit from the war. Many of them lost their personnel, their suppliers, or their customers; their profits declined, and many of them disappeared from the scene, never to return. In this sense, it is true what Niall Ferguson has pointed out, that during the Great War, the *average* profits of businesses were not very high; however, the profits of the big firms and banks, the capitalist big boys who dominated the economy since the emergence of imperialism were in fact considerable, as Ferguson himself acknowledges.

Class conflict is a complex, multifaceted phenomenon, as Domenico Losurdo has emphasized in a book on that topic. It is not merely a bilateral conflict between capital and labor but also reflects contradictions between bourgeoisie and nobility, between industrialists of different countries, between the colonies and their mother countries, and also between factions within the bourgeoisie. An example of the latter is the conflict between big and small producers, big business and little business, the upper-middle class or haute bourgeoisie, and the lower-middle class or petite bourgeoisie. Imperialism was – and continues to be – the capitalism of the big boys, the corporations and big banks, and it was imperialism that gave birth to the Great War. It is no coincidence that this big war also favored the big capitalists in their struggle against the little capitalists.

The Great War also privileged the upper-middle class, the gentlemen of industry and finance, vis-a-vis their partner within the elite, the landowning nobility. The nobility had also wanted war, because it expected many advantages from it. But the conflict revealed itself as something very different from the old-fashioned kind of warfare they had expected, in which their beloved cavalry and traditional weapons such as swords and lances would be decisive but, as Peter Englund has written, "an economic competition, a war between factories." The Great War was an industrial war, fought with modern weapons mass-produced in the factories of the bourgeois industrialists, and in the course of the war, representatives of corporations and banks – such as Walter Rathenau in Germany – played an

increasingly important role as "experts" within governments and state bureaucracies. The bourgeoisie thus managed to increase not only its wealth but also its power and prestige – very much to the disadvantage of the aristocrats, whose weapons and expertise proved useless for the purpose of twentieth-century warfare. Until 1914, the haute bourgeoisie had been the junior partner of the nobility within the elite in most countries but that changed during the war and because of the war. After 1918, within the elite, the industrial and financial haute bourgeoisie was on top, with the nobility as its sidekick.

The Great War was very much determined by economic factors, and it was the product of the merciless competition among the imperialist powers, a competition about territories with considerable natural and human resources. It is therefore only logical that this conflict was eventually decided by economic factors; the imperialist powers that emerged as victors in 1918 were those who already controlled the greatest colonial and other territorial riches when the war started in 1914 and were therefore abundantly blessed with strategic raw materials, especially rubber and petroleum, needed to win a modern, industrial war. Let us examine this issue in greater detail.

In 1918, Germany managed to snatch defeat from the jaws of victory, so to speak, because in the spring and summer of that year, the Reich had actually come tantalizingly close to achieving victory. The Treaty of Brest-Litovsk, signed with revolutionary Russia on March 3, 1918, had enabled the Reich's army commanders, led by General Ludendorff, to transfer troops from the eastern to the western front and launch a major offensive there on March 21. Considerable progress was achieved at first, but the Allies succeeded time and again to bring in the reserves of men and materiel needed to plug the gaps in their defensive lines, slow down the German juggernaut's advance, and finally to arrest it. August 8 was the date when the tide turned. On that day, the Germans were forced onto the defensive and had to withdraw systematically until they finally capitulated on November 11. The allied triumph was made possible by the fact that they – and especially the French – disposed of thousands of trucks to quickly transport large numbers of soldiers to wherever they were needed. The Germans, on the other hand, still moved their troops mostly by train, as in 1914, but crucial sectors of the front were hard to reach that way. The superior mobility of the Allies was decisive. Ludendorff was to declare later that the triumph of his adversaries in 1918 amounted to a victory of French trucks over German trains.

However, this triumph can also be similarly described as a victory of the rubber tires of the Allies' vehicles, produced by firms such as Michelin and Dunlop, over the steel wheels of German trains, produced by Krupp. Thus it can also be said that the victory of the Entente against the Central Powers was a victory of the economic system, and particularly the industry, of the Allies, against the economic system of Germany and Austria-Hungary, an economic system that found itself starved of crucially important raw materials because of the British blockade. "The military and political defeat of Germany," writes the French historian Frédéric Rousseau, "was inseparable from its economic failure." But the economic superiority of the Allies clearly has a lot to do with the fact that the British and French – and even the Belgians and Italians – had colonies where they could fetch whatever was needed to win a modern, industrial war, especially rubber, oil, and other "strategic" raw materials – plus plenty of colonial laborers to repair and even construct the roads along which trucks transported allied soldiers.

Rubber was not the only strategic type of raw material that the Allies had in abundance while the Germans lacked it. Another one was petroleum, for which the increasingly motorized land armies – and rapidly expanding air forces – were developing a gargantuan appetite. During a victory dinner on November 21, 1918, the British minister of foreign affairs, Lord Curzon, was to declare, not without reason, that "the allied cause floated to victory upon a wave of oil," and a French senator proclaimed that "oil had been the blood of victory." A considerable quantity of this oil had come from the USA. It was supplied by Standard Oil, a firm belonging to the Rockefellers, who made a lot of money in this type of business, just as

Renault did by producing the gas-guzzling trucks. It was only logical that the Allies, swimming in petroleum, had acquired all sort of modern, motorized, gas-guzzling equipment. In 1918, the French not only had huge quantities of trucks but also a major fleet of airplanes. And in the war's final year, the French as well as the British also disposed of cars equipped with machine guns or cannon and above all of large numbers of tanks. If the Germans had no significant quantities of trucks or tanks, it was also because they lacked petroleum; only insufficient amounts of Rumanian oil were available to them.

The Great War happened to be a war between imperialist rivals, in which the great prizes to be won were territories bursting with raw materials and cheap labor, the kind of things that benefited a country's "national economy," more specifically its industry, and thus made that country more powerful and more competitive. It is therefore hardly a coincidence that the war was ultimately won by the countries that had been most richly endowed in this respect, namely the great industrial powers with the most colonies. In other words: that the biggest imperialisms – those of the British, the French, and the Americans – defeated a competing imperialism, that of Germany, admittedly an industrial superpower, but underprivileged with respect to colonial possessions. In view of this, it is even amazing that it took four long years before Germany's defeat was a *fait accompli*. On the other hand, it is also obvious that the advantages of having colonies and therefore access to unlimited supplies of food for soldiers and civilians as well as rubber, petroleum, and similar raw materials, as well as a virtually inexhaustible reserve labor force, were only able to reveal themselves *in the long run*. The main reason for this is that in 1914, the war started as a continental kind of Napoleonic campaign that was to morph – imperceptibly, but inexorably – into a worldwide contest of industrial titans. In 1914, Germany, a military superpower, still stood a chance to win the war, especially since it had excellent railways to ferry its armies to the western and eastern fronts – and more than enough of the coal needed as fuel for the steam trains. This is how a big

victory was achieved against the Russians at Tannenberg. However, after four long years of modern, industrial, and in many ways "total" war, economic factors revealed themselves as decisive. By the time Ludendorff launched his spring-offensive in 1918, the prospects for a final victory had long gone up in smoke for a German Reich that was prevented by a Royal Navy blockade from reaching territories where it might have been able to fetch adequate amounts of the collective sine qua non of victory in a modern war – strategic raw materials such as petroleum, food for civilians as well as soldiers, cheap labor for industry and agriculture, and so forth.

The Great War of 1914–1918 was a conflict in which two blocks of imperialist powers fought each other for the possession of lands in Europe itself, Africa, Asia, and the entire world. The result of this titanic struggle was a victory for the Anglo-French duo, a major defeat for Germany, and the inglorious demise of the Austrian-Hungarian Empire. In reality, the outcome of the war was unclear, confusing, and unlikely to please anybody. Great Britain and France were the victors but were exhausted by the enormous demographic, material, financial, and other sacrifices they had had to bring; they were no longer the superpowers they had been in 1914. Germany had likewise paid a heavy price, found itself punished and humiliated at Versailles, and lost not only its colonies but even a large part of its own territory; the country was allowed to have only a tiny army, but it remained an industrial superpower that was likely to try once again to achieve great imperialist objectives, as in 1914. Moreover, the war had been an opportunity for two non-European imperialisms to reveal their ambitions, namely, Japan and the USA. The struggle for supremacy among imperialist powers, which is what 1914–1918 had been, thus remained undecided. To make the situation even more complex, along with Austria-Hungary yet another major imperialist actor had departed from the scene, though in a very different way. Russia had morphed, via a great revolution, into the Soviet-Union. That resolutely anti-capitalist state revealed itself to be a thorn in the imperialist side, because it functioned not only

as source of inspiration for revolutionaries within each imperialist country but also encouraged anti-imperialist movements in the colonies. Under these circumstances, Europe and the entire world continued to experience great tensions and conflicts that were to yield a second world war or, as many historians now see it, the second act of the great "Thirty Years' War of the 20th Century."

Introduction

Issues of food and land have always been central to both exploitative systems and to the fightback against them: peasants have been held in thrall to landed property relations, ruling classes justified themselves as organisers of farming, revolutions often demanded 'bread and land'. In one sense, the situation under imperialism merely gives specific form to contradictions stretching back to the origins of class society.

But in another sense, capitalism fundamentally changed things, in ways essential to our understanding of imperialism.

Previous agrarian structures, however exploitative, had safeguarded a sphere of self-sufficiency, localism, and grassroots autonomy. Some lands were held in common, and even more importantly, knowledge was a commons: farmers experimented, shared, and transmitted experience; seeds and animals were selectively bred and a broad spread of different strains maintained as genetic material for future experimentation; most people consumed what they produced and there were few 'food miles'. With capitalism, in the metropolitan countries, common lands became 'enclosed', people lost their livelihoods and were forced to migrate to towns. The new urban proletariat then had to be fed, which forced the rural economy to raise productivity of both *labour* (a shrinking proportion of the population engaged in farming) and of *land* (having reached the limit of enlarging the cultivable surface through deforestation, land had to be farmed

more intensively). For colonies it was even worse: they were super-exploited for cash-crop production and exposed to famine.

One question persistently haunts capitalism/ imperialism: in order to keep revolution at bay, urban-industrial populations must be fed somehow. Early on, Thomas Malthus warned that food supply would never keep pace. And although at certain periods this has been repressed by a modernist propaganda of scientific omnipotence, underlying anxieties resurface. Hunger currently afflicts at least an eighth of world population (FAO 2012); mostly in the global South, but in the North, too, austerity policies, which respond to crisis by prioritising the interests of the rich, leave working people hungry.

A big question therefore arises: Given the existence of this food insecurity, is it merely a distributional problem? Amartya Sen's argument (Sen 1982) is appealing from an anti-imperialist standpoint because it highlights exclusion and inequality: there is indeed plenty of food 'around' today, it simply doesn't reach those in need, partly because so much is wasted – estimated at 30–50% of what is produced (IME 2013) – and partly because some sectors overconsume and poor people lack entitlements.

However, it could be a fatal error to assume that the current form of food 'plenty' is sustainable into the future. Food is genuinely insecure; not, however, as Malthus thought, because it is *absolutely* impossible to produce enough but rather because capitalism and imperialism are set on a course diametrically opposed to the only viable way this could be achieved. In order to understand why, I will briefly sketch a conceptual framework, building especially on the work of Marx and Malcolm Caldwell.

Conceptual Framework: The Fundamental Basis of Imperialism's Food Crisis

The impact of capitalism was not just to change the ownership of land, but also to start treating farming as an offshoot of industry. Initially,

this was particularly the chemical industry, synthesising fertilisers – in place of natural composting and manures – to supply nitrogen (derived from a fossil-fuel feedstock), potassium, and phosphorous. The results of this bid to conjure away the Malthusian spectre were to prove disastrous; its impact was however *delayed,* 'exported to the future', to become fully apparent only in the longer term.

In this respect, Marxism successfully predicted what capitalism has today *become.* Engels thus warned in general terms that 'Each victory ... [over nature] in the first place brings about the results we expected, but in the second and third places it has quite different, unforeseen effects which only too often cancel the first' (Engels 1970, p. 74); and Marx, more specifically, that 'all progress in capitalistic agriculture is a progress in the art not only of robbing the laborer, but of robbing the soil, as well; all progress in increasing the fertility of the soil for a period of time is progress towards ruining the lasting sources of that fertility' (Marx 1954, p. 506). It should therefore have come as no surprise that the twentieth century revealed a law of diminishing returns in chemical fertiliser application (Carlson 2005, p. 100): statistics show a fivefold increase of fertiliser inputs for only a twofold increase of cereal yield per hectare in the 50 years up to 2010 (H.M. Government 2011, p. 79). And only in the twenty-first century have we witnessed the full effects of the export to the future of the climate effects generated by emissions from the food system.

One interesting general definition of imperialism might be: the era in which latent contradictions of capitalism rise to the surface and the mode of production begins to unravel. The case of food would illustrate this well.

As a result of treating agriculture like industry and forgetting that it is part of nature, food became not just a *condition* for capital reproduction (feeding the urban proletariat so they can work in industry), but *part* of it, a major site of accumulation and more recently of speculation by finance capital.

In this context, Caldwell's contribution was to link circuits of accumulation/exploitation to a loss

of quality or structure; that is, an increase of entropy. It thus becomes possible to represent, and to some extent quantify, imperialism through its flows of energy (Caldwell n.d.), in particular in relation to the food chain – which both consumes and provides energy – a challenge Caldwell was beginning to undertake (Caldwell 1977) prior to his untimely death in 1978. Specifically, his notion of 'protein imperialism' – taking the meat industry as a case – depicts a process, at the same time both a degradation of nature, and an exploitation of the global South by the world-system's parasitic core.

If we bring together Caldwell's insights with those of Marx, adding in recent scientific developments around soil and its relationship to climate, we can succinctly explain the workings of this loss of quality as follows. In nature's cycles the 'waste' of one process serves as an input to another (de Rosnay 1979). With capitalism, there comes a 'rift' in these metabolic loops, a realisation fundamental to Marx's argument and developed in an interesting way by Bellamy Foster (Bellamy Foster 2009). Because of this rift, we could say the loops become 'unplugged': for example, water, sewage and compostable solid waste are not ploughed back. Waste products then become ejected; however, these ejecta don't just disappear, they feed back into the system, only now in a destructive rather than constructive form, primarily in the shape of climatic disturbance through the disruption of temperature regulation in the wider earth system.

A key manifestation of this entropy is the loss of the soil itself (cf. Montgomery 2007). As a result of natural evolution, a healthy soil is a complex system possessing its own metabolism, a symbiotic interaction of mineral and organic components, worms, microorganisms, fungi and bacteria (Bourguignon and Bourguignon 2008), which in turn forms an integral part of the carbon cycle regulating temperature in the wider earth system. Only when capitalism broke these cycles did soil-structure begin to be lost, a development which is arguably the fundamental basis of today's crisis. The interaction with climate is key: a healthy soil sequesters carbon, and in the same process augments its fertility (Lal 2004). Today, through capitalism/imperialism's metabolic rift, the soil loses carbon, a loss which then feeds back through the greenhouse effect in the form of extreme weather events.

Having defined the above conceptual framework, we can now fill in some details of the history of food and imperialism.

From Colonialism to Neo-colonialism and the Green Revolution

The imperialist era witnessed great strides both in the technical and organisational scope of capitalism. R&D, driven by both corporate interests and state military research, developed apace, with huge effects on farming. Chemical fertilisers were now complemented by pesticides and herbicides, mechanisation took off, farms gave way to plantations while agribusiness became just another facet of capitalism, notably in the factory farming of animals. The energy demands were immense, at least 10 calories being required to produce one calorie of food, and the entropy this released being expressed in CO_2 and methane emissions.

These developments in turn had big political implications: they raised the possibility of new forms of imperialism *through* food.

While the idea of ruling a people through their food is not new (witness British dominance in Ireland), the vast new scope of agribusiness in all its ramifications took this to a qualitatively new level which happened to coincide, in the second half of the twentieth century, with both the Cold War and decolonisation. The crucial role of food in the international politics of that period is not always appreciated, and I would argue that control over the food system was actually a critical condition for the transition from direct rule to neo-colonialism: it's safe to decolonise if you control how people are fed. And this in turn laid the foundations for succeeding forms of food imperialism.

A key approach was to arm-twist countries of the South to espouse 'development' strategies dictated from the North. In the preneo-liberal

'modernisation' phase (till about 1980), policies pushed by people like Walt Rostow (a development economist doubling as US psy-ops mastermind) presented traditional societies as 'backward' where they were able to rely on the produce of their fertile land (Rostow 1958, p. 159). In order to escape this 'backward-ness', they were instructed to industrialise *rapidly,* which would mean extorting, somehow, a massive food surplus from the countryside (to feed the urban population) even though investment was all flowing into industry. The result could only be to undermine food autonomy in the South, which is exactly what happened with lasting results.

Rostow's role might suggest this was all a conspiracy, which is partly true, but at the same time it is essential that we do not lose sight of the *structural* dimension of the imperialist era, an area where we can continue to learn from dependency theory. After all, the strategy of squeezing farmers to feed the city found a certain basis, too, in Soviet policy (Amin 1981), and proved seductive to populist nationalist regimes with a semblance of anti-imperialism – Egypt under Nasser being just one case. Mao Zedong in China was one of very few to realise that such an approach would be disastrous for development, including that of industry (Mao 1977, p. 286). As Amin showed, in contrast to a theoretical closed-economy model where the proceeds from exploiting farmers would remain within the national economy, accumulation circuits are in reality global (Amin 1974): any surplus extracted from the Southern agricultural sector therefore tends to flow to the core. I would argue that many lessons of the dependency school still apply (Biel 2000), and the global food chains, which impose such horrific exploitation on Southern rural dwellers (Patel 2008), can still be understood as expressions of accumulation on a world scale. It should be noted, too, that dependency implies its opposite: a delinked model in which national development serves agriculture in the first place (Amin 1980, 144 ff.). Here, too, the dependency school merits recognition as an antecedent of the food sovereignty movements which we will discuss below.

By starving its rural sector of investment, a country would depend on imports, either of food itself or of agricultural technology. With respect to the former, a pattern was introduced, which persists to this day, through which parts of the imperialist core where agribusiness productivity is very high become major staple food exporters to the South, often displacing indigenous staples (such as sorghum) in the process. Cold warrior Henry Kissinger spoke openly of using 'food as a weapon' (Linear 1985); and in his secret National Security Study Memorandum of 1974 (NSSM 1974), he advocated that food aid be tied to population reduction, thus revealing the Malthusian undercurrent beneath the surface modernist triumphalism.

If imports of food itself became a major tool of imperialist control, we could say this even more of *technology* imports.

The paradigm for this was the Green Revolution, a programme – beginning in the 1940s but enjoying its heyday in the 1960s – to push hybridised 'high-yielding varieties' (HYVs) of rice and wheat. What is fascinating about the Green Revolution is the structural evolution within imperialism itself as it explored and refined an interaction between power politics, corporate profit, and scientific research. As with GMOs later, HYVs were bred specifically to 'require' high inputs of the very chemicals (fertiliser, pesticide, etc.) and machinery manufactured by the corporations which sponsored it (Glaeser 1987). And because F1 (first generation) hybrids from two parent strains do not reproduce true to type, Southern farmers were left dependent on the seed supplier. One of the worst results was to make global food security dependent on an extremely narrow range of crops and strains. Pre-capitalist systems had always made a point of reproducing the widest possible variety of strains, because each has its own evolved forms of resistance (to pest, disease, weather) which may prove vital in future unforeseen circumstances. Through the Green Revolution, much of this genetic variety, along with traditional staples, disappeared; the result being an extreme lack of resilience which now leaves the world tragically exposed to twenty-first-century climate challenges.

The Neo-liberal Phase

While the Cold War/decolonisation phase set the tone for much of what followed, the advent of neo-liberalism around 1980 introduced further major qualitative changes.

Since its origins, imperialism has had a dual character: from early capitalism it inherited the notion of expanding international trade, through a process where each country should specialise in sectors where it supposedly enjoyed 'comparative advantage'; this would mean scrapping any form of localism or self-sufficiency, and create scope for exploitation through unequal exchange. However, in reality, imperialism remained strongly statist and security-obsessed. This found many expressions, such as national industrial policies, but nowhere more so than in food. In the First World War, Britain used food sanctions to starve Germany; in the Second World War, Germany sought to retaliate, and imperialism retains an autarkic streak pulling against the 'free' trade discourse: definitions of food security as an offshoot of national (military) security persistently trump definitions in terms of the well-being and livelihoods of communities. During the Cold War, the UK discreetly raised its food self-sufficiency to a point where (in the early 1980s) 95% of indigenous-type food was locally grown (Barling et al. 2008, p. 11).

The neo-liberal era revolutionised this picture with a massive increase of global food trade and a further reduction of local and national self-reliance. Alongside dependent food production for local consumption in the South (à la Green Revolution), development orthodoxies were now tweaked, forcing Southern countries – notably through World Bank/IMF Structural Adjustment – to seek niche agricultural export markets; and as a way to control these niche exports, buyer-driven chains took shape, dominated by core supermarkets. This of course intensified Southern dependence on staple food imports, since if you are growing cash crops you won't be growing for local consumption.

Complementary to World Bank/IMF tyranny, there occurred the final phase of the General Agreement on Tariffs and Trade (GATT Uruguay Round) and its transition to the World Trade Organisation (WTO): by the early 1990s food was at last brought fully within the sphere of globalised trade, undermining the scope for countries to protect themselves, for example by combating dumping or imposing food safety rules. In effect, because state powers in relation to food were weakened in the South *relatively* much more than in the North – where agricultural protectionism and subsidies remain rife – the subservience of the former greatly increased.

Besides its provisions *directly* addressing food, GATT/WTO also brought in something of even more massive significance to food imperialism: Trade-Related Intellectual Property Rights (TRIPS). By this, the knowledge commons were 'enclosed' by private property rights, enforceable internationally. In essence, we could say, just as the Green Revolution had facilitated a 'safe' decolonisation, TRIPS now removed the risks from freeing up food trade by entrenching corporate control over agricultural technology and genetic resources. Notoriously, corporations embarked on a field day of patenting organisms which are the fruits of both nature and of painstaking selective breeding over millennia by traditional farmers.

Currently, mainstream propaganda spares no effort to convince the world that GM is the future. In this sense, GM seems an extension of the Green Revolution, and in fact the corporate interests and institutions forged during that period are still active. Thus, the Consultative Group on International Agriculture Research (CGIAR), effectively run by the World Bank, still quietly co-ordinates global research agendas (Alston et al. 2006, pp. 326–327). It is interesting to note that, in contrast to the genetic uniformity of crops which are forced on farmers, corporate interests require *variety* of germplasm as a basis for their own experimentation – hence a new form of food imperialism led by CGIAR in collaboration with the Global Crop Diversity Trust (CGIAR 2013) over genebanks, including the Svalbard Global Seed Vault ('doomsday vault'), a massive frozen seed repository sponsored by the Gates Foundation.

The question of whether GM is simply Green Revolution Mark II raises, however, important issues. There have been immense developments in the sciences during the imperialist period, some of which can have great progressive potential; but, of course, besides being generally driven by militarism, even civil applications under corporate control often encapsulate the most reactionary tendencies of capitalism, as the case of agriculture illustrates only too well. But could this science be used in a different and progressive way under popular control? In the case of the Green Revolution, since there is nothing wrong with hybridisation per se and the problem was entirely the imperialist goals it served, this argument would probably apply. A similar argument *might* be made about GM, but in this case there is a strong counterargument, namely that the approach which reduces the functioning or evolution of the organism as a whole to the individual gene is intrinsically misguided (Goodwin 1994; Ho 1998; Noble 2006; Shapiro 2011). This will be an important future issue for anti-imperialist movements.

The Food Crisis of the Twenty-First Century

The ecological context, more specifically that relating to food and agriculture, is indispensible to any understanding of capitalist crisis as a whole (Perelman 1987). Since about 2007–08, capitalism/imperialism has evidently been sick, the finance crisis being just one expression. In part, this sickness reflects the exhaustion of a particular accumulation regime, and food, like everything, is dragged into this. But the food crisis also proceeds from its own intrinsic, and much deeper logic, which would in no way be alleviated even if capitalism were eventually, in a narrower sense, to discover a new accumulation regime (in itself improbable – cf. Biel 2006). From a technical angle, we may analyse three factors to explain this: first, diminishing returns from chemical inputs, to which the system responds by a *fuite en avant* towards ever madder scientific fixes; second, the loss of the soil itself, a loss of structure

which is equivalent to an increase in entropy, graphically illustrated by dust storms now sweeping many regions; third, climatic factors, themselves a reflection of the unleashing of carbon which in a natural system would be sequestered in the soil: these include localised extreme heat, water-loss, erosion etc. and more generally the increasing frequency of extreme events.

An era of grave food insecurity – manifested most notably in wildly fluctuating prices – therefore began around 2007–08, which in the deepest sense reflected a qualitative, step-level change in the above factors. Although this food crisis was fundamentally distinct from the structural economic crisis with which it happened to coincide, the latter latched onto, *and magnified,* it in the worst possible way. And through this interaction, two key characteristics identified by imperialism theory assert themselves: parasitic finance capital and militarism.

A case which illustrates both these facets is land grabs. While in one respect a continuation of colonial practices (which reflects a broad unity running right through the history of exploitation), a highly specific contemporary form of land grabbing began to define itself (Rice 2009). On the one hand (the aspect linked to militaristic definitions of food security), there were grabs of tracts of land in the South, particularly Africa, carried out by states as a reflection of resurgent nationalist reflexes; on the other, grabs by speculative capital, partly because (with other investments now insecure) land is the surest value; partly because, as food runs out, this is a way to hedge other risks. These processes perfectly illustrate a wider trend whereby imperialism parasitises the insecurity it itself causes (Biel 2012).

The historic link between hunger and social unrest therefore returns to plague the system, highlighted by recent research wherein academics warn the US State Department (Lagi et al. 2011) to take seriously a strong statistical correlation – evident since the watershed of 2007–08 – between high food prices and social unrest. The ruling interests' fear of this scenario then further intensifies the headlong rush to risky technologies like GM, both as a temporary fix to stave off revolution by providing the food which

conventional chemical-based agriculture (plagued by diminishing returns) can no longer do; and to deepen still further the core's stranglehold over technology.

Counter-Imperialist Struggles Over Land and Food

But the correlation of hunger with unrest misses the key point: what really counts is not 'unrest' but struggle. The thing which probes the reality of imperialism most profoundly is always struggle against it, which we will now briefly discuss.

Crisis has proved the catalyst for a new generation of social movements, to which food is central (Holt-Giménez and Patel 2009), and these are not merely reactive to food insecurity, but look forward to strategic alternatives. They thus take up the challenge issued at the very outset of the imperialist era by Peter Kropotkin (Kropotkin 1892), that revolutions must make it their central task to feed the people.

In one sense, these new movements are a prolongation of peasant-based national liberation or landless struggles which have persisted from colonialism through the Cold War/neo-colonial era and beyond.

But what changed has been, first, a sense of the systemic importance of food in structures of dominance; second, a commitment to realistic and convincing alternatives: for in order to respond meaningfully to Kropotkin's challenge, it cannot be enough just to proclaim an intention to deliver food security, you must say *how*. The precursors of this new consciousness go back some way: we could cite the leadership of Thomas Sankara in Burkina Faso in the mid-1980s, who not only castigated food imperialism in his speeches, but, in a constructive spirit, collaborated with Algerian/French organic agriculture pioneer Pierre Rabhi to develop concrete alternatives, premised both on self-reliance and sustainable technical practices.

We may say that a qualitative step came in the second half of the 1990s, of which two examples can be given: the Indian Farmers' Movement against the GATT/WTO rules, which at its height mobilised hundreds of thousands on issues of intellectual property, something which had never been seen before; and the Zapatistas in Mexico, who not only critiqued the North American Free Trade Area (NAFTA) – among whose many disastrous effects has been its assault on Mexicans' nutrition – but also posited, both in theory and practice, the issue of autonomy in a radical new way, one which was to influence profoundly thinking on food independence. While the main focus of these struggles was in the global South, food-related fightbacks by working people in the North were complementary (Carlsson 2008) and introduced interesting features.

Such movements soon gave rise to the notion of 'food sovereignty' (Rosset 2009), which came to prominence at a meeting of the grassroots umbrella organisation La Via Campesina in Mexico in 1996. Parallel to this, 'food security' has been given a more radical expression in the form of the Right to Food, particularly in the hands of the progressive UN Special Rapporteurs Jean Ziegler and Olivier de Schutter.

Food sovereignty, while not being contradictory to the Right to Food, takes it into new territory. It contains an element of state sovereignty, which is logical given the WTO's drive to smash all national barriers restraining corporate interests. But the most interesting and innovative aspects concern grass-roots autonomy. As Michel Pimbert says, referencing the work of Ivan Ilich, food sovereignty reflects a fightback against a dominant trend to 'replace non-marketable use-values with commodities by reshaping the social and physical environment and by appropriating the components that enable people to cope on their own' (Pimbert 2009, p. 3). It is therefore about people recapturing the power to do things independently. The Indian version, for example, draws on Gandhian notions of swaraj (self-rule) which is as much about community self-reliance as about conventional sovereignty in a state-centric form.

The usefulness and validity of the term 'food sovereignty' is itself up for debate (Yale University 2013). But in any case, whatever the popular movement decides to call it, the essence of a commitment towards communities reclaiming the equipment to determine their future

will not go away. In this sense, the food issue is now, and will continue to be, a rallying-point for struggles against imperialism more generally.

The urgency lies in the fact that the current food system is not only socially unjust – which would be reason enough to challenge it – but has also exhausted itself ecologically. So a new farming practice must mean fundamental changes both in landholding and farming technique. In this sense, we could consider agroecology the practical 'wing' of food sovereignty/autonomy.

Agroecology signifies a commitment to a new agricultural science, one which recognises that methods of farming cannot be separated from socio-institutional change. It thus addresses both institutional dimensions (structures of autonomous local power) and technical ones (agricultural practices which act in harmony with natural processes and restore the soil). The intrinsic principle linking the two is that both proceed by unleashing the creative forces of self-organisation (emergent order) in complex systems, of which both society and the soil are examples.

In an institutional sense the guiding principle is *commons*, applied both to property relations (e.g. in land) and to creating a cooperative approach to knowledge and technique, which will facilitate the invention of a new paradigm. While such principles have always been around in peasant struggles, they are qualitatively deepened in today's movements, notably by an infusion of indigenous perspectives and ecofeminism; they thus explicitly break with capitalist/imperialist attitudes to the natural world and our relationship with it. In the words of the People's Agreement of Cochabamba, 'Humanity confronts a great dilemma: to continue on the path of capitalism, depredation, and death, or to choose the path of harmony with nature and respect for life' (PWCCC 2010). The definition of commons becomes in this case less a form of 'ownership' – of land, genetic resources or ideas about farming technique – and more one of stewardship.

In the first place, agroecology recognises that grass-roots experimentation and popular knowledge systems *are* science, and are indeed

its foundations because they offer a way of reconnecting with traditional sustainable practices. At the same time, research institutes and laboratories will have an indispensible role. In this respect, Cuba provides a valuable example, where research institutes offer practical high-tech support for grassroots experimentation (Rosset 1996). In the Cuban case, the degradation of the soil has been seriously addressed (Gersper et al. 1993), and there is evidence that a Marxian approach to science – holistic and less reductionist – has been key (Levins 2005). It is therefore not just a question of freeing agricultural R&D from corporate agendas – which would be the minimum requirement – but more profoundly of a recognition that complexity and holism are both the creative edge of 'official' science and the central principles of traditional knowledge, and can therefore be the unifying principle between the two. Self-organising systems look in the direction of autonomy and robustness in response to system perturbations (Heylighen 2008), which will in fact be the only possible human response to the acute climate challenges of the future.

In all these respects, the imperialism of food is already beginning to generate its opposite.

Food and Imperialism: Food Regimes, Hegemony and Counter-hegemony

Carlos Maya Ambìa
Universidad de Guadalajara, Jalisco, Mexico

Synonyms

Agriculture; Colonialism; Food scarcity; Green revolution imperialism; Peasants; Rural labour

Definition/Description

To understand food, this chapter conceptualizes the entire agri-food system and global supply chain, including seeds, fertilisers, pesticides, machinery, implements, fuel, and logistics. The agrifood industry is dominated by the large global multinational corporations in the North supporting affluent consumers and marginalizes rural workers.

Introduction: The Mutations of Imperialism

According to the economist Samir Amin, imperialism is 'the perpetuation and expansion of capitalist relations abroad by force or without the willing consent of the affected people' (Amsden 1998, p. 728). Imperialism has always been closely related to agriculture and food. This is particularly clear from the work of Rosa Luxemburg (Kowalik 1998), who, putting agriculture at the centre of imperialist relations of exploitation, defined imperialism as 'the political expression of the accumulation of capital in its competitive struggle for what is still left of the noncapitalist regions of the world' (Amsden 1998, p. 728).

Modern imperialism has also been defined as a certain period in the history of capitalism, from around 1870 to 1914. However, it has been recognised that imperialism has adopted new forms and is still a current phenomenon. This is important if we focus our attention that we give to food, more precisely, on the political economy of food.

Imperialism and Food Regimes

Food goes beyond agriculture. Therefore it is more accurate to speak of an agri-food system, which includes inputs into farming (seeds, fertilisers, pesticides, machinery and implements, and fuel) as well as purchasing farmers' products, processing, transporting, wholesaling, and retailing (Belasco 2009; Burch and Lawrence 2007; Friedland 1994; Magdoff and Tokar 2010). The agrifood system comprises a net of global commodity chains which links developed and underdeveloped countries and regions (Fold and Pritchard 2005). Therefore, understanding the relation between imperialism and food is particularly useful to the food regime theory, developed from the perspective of Marxist political economy (McMichael 2009). According to this framework the subordination of food to the self-regulating market system involves specific methods of disembedding the economic relations of land and people. On the other hand, capitalism and its self-regulating market must become world systems in order to reproduce their existence. Capitalism can only be world capitalism, and in the realm of world capitalism the food regimes have emerged, together with imperialism, as certain periods of stable relations in the areas of power, production, and consumption in the world food economy

(Friedmann 1993, pp. 220, 214). Three food regimes have been identified. The first one (1870–1914) functioned around Great Britain as hegemonic power. (Friedland (1990) suggests that it started with capitalism and with the modern form of slavery at around the middle of the seventeenth century, and was based upon sugar and slavery.) After a period of turbulence the second food regime (1945–80) took shape under the leadership of the US. The third food regime began to appear in the 1980s and is still under construction.

Fundamental to the first food regime was the trade in agricultural products (foodstuffs and raw materials) from the colonies and other underdeveloped countries to the centre of the British Empire, which at the same time played the role of 'the workshop of the world'. In this case, cheap food from abroad was the key to keeping the wages of the growing industrial labour force low and to increasing the urban population in the developed world. At the same time, these regions and countries were forced to specialise as exporters of such products.

During the second food regime a link was created between agriculture and 'national' development, supported by protectionism. The axis of this regime was the mechanism of foreign aid, which allowed the US to channel its agricultural surplus abroad through subsidised exports. This increased the vulnerability of other countries to American subsidised agricultural exports, which they were forced to assimilate. Thus their domestic agriculture remained underdeveloped and their economies became increasingly dependent on imported food. The transnational integration of agri-food sectors was also consolidated. The 'Green Revolution' promoted the industrialisation of agriculture, whose products changed from final consumer goods to industrial raw materials for the manufacture of processed foods. Farms became integrated with and subordinate to agri-food industries. These industries, linked to key sectors such as chemicals and energy, have since then been some of the most dynamic parts of the advanced capitalist economies. Farmers in intense competition with each other were on a 'technical treadmill'. They had to buy industrial inputs (foodstuffs for animals, chemicals and machinery

for crops) and to sell their products, at low prices, to food-processing industries, and increasingly had to borrow capital, thus struggling to strike a balance between their own livelihoods and the commercial criteria of farming businesses (Friedmann 1993, pp. 222–225). The imposition of the industrial agriculture in the Global South was initially carried out by the World Bank and International Monetary Fund through 'development' aid and later imposed through structural adjustment programmes and the rules of 'free trade' of the World Trade Organization (WTO).

Several authors (Friedland 1990; Le Heron and Roche 1995; McMichael 1992) identified the first signs of the birth of a third food regime during the 1970s and its consolidation in the 1980s. This food regime is characterised by the dominion of corporate agribusiness, which has begun to develop 'industrial' production systems and contractual integration arrangements in which decisions about how to produce crops and animals are increasingly being taken over by the large agribusinesses. Moreover, contractual integration reduces independent farmers to the position of labourers, but without the rights of workers to bargain collectively (Lewontin 2000). At the same time, in the third food regime trade flows of fresh fruits and vegetables are the pillar of a new 'international division of labour', whereby underdeveloped countries and regions must specialise in the production and export of these products for consumption by the affluent strata in the US, the European Union, and Japan.

Hegemonic Central Powers, Food Regimes, and Counter-hegemonic Social Movements

From the point of view of an imperialism and anti-imperialism analysis it is important to highlight the fact that each food regime has been centred on a particular hegemonic power: Great Britain in the case of the first one, the US in the second, and corporate transnational agribusiness in the present third food regime. We speak of hegemony in the Gramscian sense, that is, as economic and political dominion together with intellectual and moral

direction or leadership. This is valid in the realm of nation states as well as in the international or global economy and politics (Gill 1993; Morton 2007), and it has been especially significant in the second and third food regimes, because the economic and political elites in underdeveloped countries have usually entered into alliances with foreign governments and companies and have shared with them the profits of the exploitation of their own peoples. Besides, it has often been the case that such elites promote the dominant ideology and try to replicate the way of life of the metropolis in their own countries. (The Mexican experience of the triumph of neoliberalism during the government of Carlos Salinas is a good example of this phenomenon; see Morton 2007, pp. 153–167.)

For more than a century, the world food economy has shown a tension between expansion of the self-regulating market system and the self-protection of society (Friedmann 1993, p. 218). In each food regime counterhegemonic or anti-systemic movements have emerged to challenge the imperial hegemony. The dialectic of expansion of the self-regulating market system at different levels (nation states, international relations, global economy), and the corresponding movements of self-protection of peoples and societies faced with the disruptions caused by the aforementioned expansion, explain the relationship between imperialism and anti-imperialism in each of the three food regimes.

Imperialism and Anti-imperialism in the First Food Regime

In the first food regime the growth of capitalist industrial and agricultural production in Europe included the huge expansion of a class of workers whose income was in the form of money and whose food was obtained through markets. Poverty, together with the opportunities offered by flourishing food markets, created the basis for a world food market. Many Europeans, unable to survive either on the land or in labour markets, migrated en masse, mainly to North America, Australia, and Argentina. They settled there at the expense of the indigenous peoples, whom they forcefully dispossessed. Many of them became not peasants but commercial farmers directly involved in world markets, and their grain and livestock products were cheaper than those of the Europeans. The flood of imports of these foods into Europe further impaired domestic agriculture and displaced more people, who too became potential migrants. Particularly relevant was the world wheat market, which linked waged workers in Europe to European settlers in the Americas and Australia. Both workers and settlers promoted movements for selfprotection, demanding governmental social welfare for workers and price regulation for farmers. Tensions and contradictions within the first food regime engendered social and political movements against the British imperial rule. The struggle for independence and national sovereignty in the former colonies, together with the breakdown of the civilisation of the nineteenth century (Polanyi 2001, p. 3), put an end to the first food regime centred on British political and economic power (Friedmann 1993; Friedmann and McMichael 1989; McMichael 2009).

Imperialism and Anti-imperialism in the Second Food Regime

The forms of self-protection that emerged at the end of the first food regime, after a long period of turbulence, were the background of a second food regime, in which the selfregulating market expanded and new movements for self-protection appeared. In this regime, capitalist enterprise swelled thanks to the state regulation of land, labour, and agricultural products, and expanded the selfregulating market system beyond the limits of national economies. The problems of disembedding food, land, and labour from their social contexts led to attacks on the old forms of self-protection, which created obstacles to further expansion. The second food regime depended on the US having a monopoly over world trade and its own subsidised exports, and it conditioned by the Cold War. The US food aid policy was used as a weapon against the

expansion of Soviet influence on the Third-World countries. Later, the monetary and oil crises allowed several countries to join world markets in ways that weakened the status quo. Underdeveloped countries, which had borrowed to pay for oil and food imports in the 1970s, entered the debt crisis of the 1980s and 1990s. Since then they have been forced to export at any cost, and their nontraditional agricultural exports deeply transformed the second food regime (Friedmann 1993, pp. 218–219, 227).

Imperialism and Anti-imperialism in the Third Food Regime

Following the crisis of the second food regime, the 1970s and 1980s saw the emergence of the third food regime, whose principal features are the concentration of corporate power in the hands of transnational agribusiness and the increasing relevance of fresh vegetables and fruits in global trade flows. In this regime the power is exercised not just by a single country, like Great Britain in the first food regime and the US in the second, but above all by corporations whose economic and political interests do not always coincide with the immediate aims of American and/ or European governments. However, usually the governments of the hegemonic nations, as well as those of the subordinated nations, are in the service of these corporations. They control the key points of the global commodity chains of the agri-food system, from the seed sector and the agri-chemical market (Monsanto, Aventis, DuPont, Syngenta, Bayer, Dow) to the food manufacturing sector (Nestlé, Unilever, Philip Morris, Kraft, Coca-Cola, Pepsi) and even the retail sector (Wal-Mart, Kroger, Carrefour, Albertsons, Safeway, Ahold, Tesco) and food service sector (McDonald's and Burger King). These powerful companies decide what is produced, chiefly in underdeveloped agri-export countries, to satisfy the demand from developed nations and also the high-income strata of Third-World societies. But they also exercise a considerable influence on patterns of consumption around the world, particularly in poor countries. The transformation of

people's diets in the Global South has also been encouraged by the US Government through 'aid' programmes. At the same time, overwhelming marketing of Western cultural values and products (especially foods that are high in fat, sugar, and salt, and low-fibre fast foods and soft drinks) is carried out by transnational companies. Important effects of this penetration have been the high levels of migration from the countryside to big cities slums, the promotion of crops for export, and the growing dependence on cheap food imports from the US (Magdoff and Tokar 2010). However, eco-imperialism is negatively affecting people in developed as well as underdeveloped nations. Accordingly, there are critical responses throughout the world, some of them mostly based in the European Union and the US (for instance Slow Food, Food Sovereignty, community-supported agriculture, the promotion of the local over the global), and others more related to the Global South (for instance Fair Trade, La Vía Campesina). In addition, several non-governmental organisations are playing an important role in these struggles, and even within international organisations such as the WTO there is some room for anti-imperialist initiatives (Bello 2009; Morgan et al. 2006; Patel 2013; Wright and Middendorf 2008).

Conclusion

Under certain circumstances foodstuffs can be treated as commodities, but the total commodification of food is a complete nonsense and tragic mistake, because access to food is first of all a human right (Magdoff 2012; Rosset 2006). However, the commodification of food has been the channel for reproducing imperialist rule over peoples and nations, and the central form of imperialism today is eco-imperialism or agribusiness imperialism, which allows corporations to control energy, water, air, land, and biodiversity (McMichael 2000). To break this imperialist rule a radical transformation of the global agri-food system is necessary and must be promoted as a movement for the self-protection of society against the unlimited expansion of the market

economy that supports the corporate agri-food system. This movement may lead to a new agri-food system, whose underlying principle must be 'food for people, not for profit'. It may follow a path of re-ruralisation, because 'Food means farming, and farming means rural livelihoods, traditions and cultures, and it means preserving, or destroying rural landscapes. Farming means rural society, agrarian histories; in many cases, rural areas are the repositories of cultural legacies of nations and peoples' (Rosset 2006, pp. 9–10), stopping the coercion of trade liberalisation, and re-writing the rules of trade to favour the local (Magdoff and Tokar 2000).

In the current circumstances of climate change, peak oil, and food crisis, the selfprotection of society means the recovery of dignity and sovereignty, the conquest of sufficiency and satisfaction through selforganisation. In other words, the struggle is for the recognition that all beings and all peoples are equal and have rights to the earth's resources.

Food and Imperialism: The Corporate Regime and Global Peasant Resistance

Ahmet Bekmen
Faculty of Political Sciences, Istanbul University, Istanbul, Turkey

Definition

The international peasant movement aiming at the re-establishment of peasant autonomy is prevalent worldwide. Its representative organisation, La Via Campesina (The Peasant Road), comprises about 150 local and national organisations in 70 countries from Africa, Asia, Europe and the Americas, and has become a global platform where alternative theses on agricultural production are being formed and numerous interventions are being organised globally. The emergence of such a global peasant movement is closely related with the transformation of the food regime in the neoliberal era.

Marx, who metaphorically described the French peasantry as a 'sack of potatoes' to emphasise their disconnectedness from each other, would be surprised to witness the worldwide extent and connectedness of the recent international peasant movement. Its representative organisation, La Via Campesina (The Peasant Road), 'comprises about 150 local and national organisations in 70 countries from Africa, Asia, Europe and the Americas' (see Via Campesina 2015), and has become a global platform where alternative theses on agricultural production are being

formed and numerous interventions are being organised globally (Borras 2004; Desmarais 2007; Edelman 1998, 2002). The emergence of such a global peasant movement is closely related with the transformation of the food regime in the neoliberal era. Rural producers have always claimed to hold two powers that stand in the way of agricultural capitalism. First, within the boundries of the natural and local conditions, they have claimed their right to choose what to produce and how (particularly regarding inputs). Second, they have claimed their power to resist the complete commercialisation of agricultural inputs such as seeds and fertilisers by reproducing them naturally (Lewontin 1998, p. 75). This essay addresses the destruction of the peasant autonomy and the almost complete proletarisation of peasants by the corporate food regime (see McMichael 2005), which has in turn led to the emergence of a global peasant movement aiming at the re-establishment of peasant autonomy by presenting a holistic, radical alternative for food production and consumption.

Food Regimes

Because the history of the decline of peasant autonomy runs in parallel with the transformation of the imperialist system, it is necessary to trace this historical path in order to grasp the deepening of this process in the neoliberal era. In this regard, the concept of the food regime, developed by Harriet Friedmann and Philip McMichael during the 1980s, identifies 'the ways in which forms of capital accumulation in agriculture constitute global power arrangements, as expressed through patterns of circulation of food' (McMichael 2009, p. 140), and thus provides a useful theoretical framework to understand the shifting modes of power relations with regard to agriculture and food production (see Friedmann and McMichael 1989; McMichael 1998, 2009). The first global food regime, which emerged during the era of classical imperialism led by Britain, was based on the global division of labour in agricultural and industrial production. Within this division of labour, powerful European states, particularly

Britain as 'the workshop of the world', focused on industrial production, while the colonies and settler colonies undertook agricultural production. Following the 1834 Poor Law Amendment Act in Britain, which abolished all traditional mechanisms of protecting and feeding wage labour, in 1846 the government repealed the Corn Law, which had protected cereal producers in Britain and Ireland. This enabled the task of feeding the huge proletarian masses that capitalism was creating in cities to be outsourced to the colonies. Thus, the emerging international food market linked agricultural production in the wider colonial world that was based on bloody practices, such as 'extermination of indigenous populations and the seizure of extremely productive lands, alongside with continuing plantation slavery and unpaid family labour' (Araghi 2009, p. 122), to industrial production based on the wage labour system in the industrial centres. In this way, underpriced food kept wages in Western industrial centres low, thereby increasing the rate of accumulating surplus value.

The post-colonial food regime that emerged after the Second World War took a developmentalist economic perspective that aimed to integrate the agricultural and industrial sectors within newly independent nation states (see Harriet 1982). Thus, following decolonisation, the food policies of sovereign states were reformulated on the principle of self-sufficiency, with agricultural modernisation being introduced as the only way to achieve this aim. Rapidly introduced agricultural technologies were accompanied by land reforms that rearranged class relations and moderated conflict in rural areas. The 'Green Revolution', first implemented in Mexico in the 1940s before spreading to South Asian states like India and the Philippines in the 1960s, fundamentally transformed the agricultural sector. New factors in agricultural production, such as agricultural machinery, irrigation systems, hybridised seeds, and synthetic fertilisers and pesticides, resulted in the dependence of agriculture on the emerging agri-industrial sector. Moreover, the expansion of agricultural development agencies in many countries and the dispersal of their 'experts' and 'technicians' into all rural areas led to the consolidation of nation states and a spreading of their developmentalist perspective in the countryside.

This post-colonial food regime, however, was not to last, undergoing a gradual transformation which opened the way for corporate power to dominate, primarily because of the US and European invasion of world cereal markets. Specifically, after the Second World War, the production surplus of the US agricultural sector, created mainly as a result of the New Deal's agricultural policies, was pumped into underdeveloped countries as food aid or through agricultural loans offered by the US Government with long terms and low interest rates. This process was seemingly contradictary: on the one hand, the Green Revolution introduced highly efficient agricultural technologies; on the other hand, US-originating food aid and low-cost food import loans made agricultural imports highly attractive for the same countries. The result was decreasing agricultural production and growing food import expenditure across the entire underdeveloped world, where the ratio of food imports to food exports increased from 50% in 1955–60 to 80% in 1975 (Manfredi 1978, quoted in Araghi 1995, p. 350). In contrast, the US increased its exports in agricultural products between 1970 and 1980 by 150%, and was followed by France with an increase in exports of 100% (Edelman 1998, p. 106). Thus, having gained independence as nation states, the countries that had previously fed the European proletariat during the colonial era became increasingly dependent on the food surplus produced in the US and Europe. Moreover, their rulers were quite happy with this dependence, considering it a cheaper way to feed their own newly emerging urban masses. However, the destruction of rural life was appalling, with farmers who were unable to compete with cheap food imports abandoning the countryside to become the 'new workers' of the global South. In short, an intense depeasantisation was experienced (see Araghi 1995).

This gradual transformation was accompanied by the emergence of corporate agribusiness, particularly in the US, with an expansion of businesses mediating the oneway food traffic

between the US agricultural surplus and underdeveloped countries. In this new regime, the US Government provided financial incentives to US agricultural producers, and the resulting agricultural surpluses were then bought by giant corporations at low cost before being mostly distributed to underdeveloped or developing regions of the world under various international agreeements signed by the US Government. That is, US agricultural policies actually functioned to transfer public resources to facilitate the emergence and development of global giants of agribusiness, such as Cargill and Continental. They also allowed the capital of corporate agribusiness to become increasingly concentrated: 'In 1921, 36 firms accounted for 85 per cent of U.S. grain exports. By the end of the 1970s, six giant "Merchants of Grain" controlled more than 90 per cent of exports from the United States, Canada, Europe, Argentina, and Australia' (Shiva 2000, p. 27). This concentration increased further thanks to the industrialisation of food production, both as an incentive for and as a response to the escalation of mass consumption. Meanwhile, agricultural products gradually became inputs for these industries. In particular, increasing meat consumption led to the creation of a huge 'meat complex':

> Beef, the symbolic centre of the post-war diet, after staying steady for the first half of the century, increased 50 per cent after 1950. Much more impressively, poultry consumption per person, also steady from 1910 to 1940 at about 16 lb/person, increased almost 45 per cent between 1940 and 1950, and almost tripled to 70.1 lb/capita in 1985 ... To supply this consumption livestock producers were increasingly linked to corporate purchasers that processed and distributed livestock products on an ever-extending scale geographically and socially. (Friedmann and McMichael 1989, p. 106)

This transformation in meat production also created its own agricultural supply chain. To meet the demands of the feedstock industry supplying large-scale animal husbandry, there was widespread adoption of capital-intensive production of hybrid maize. The durable food industry also triggered the integration of similar products. For instance, since sweeteners were one of the main inputs of this industry, the production of sugar cane, sugar beet, and later, with the increased use of high-fructose corn syrup, corn became integrated into the durable food industry.

Hence, the post-war food regime brought about the almost complete linkage of agricultural production to agribusiness at all levels, thereby creating a corporate food regime. However, the neoliberal era should be understood as the radicalisation and institutionalisation of this tendency at a global scale, rather than as a rupture. During this era, the impractical ideal of agricultural self-sufficiency was abandoned both ideologically and politically. In 1986, when the process that would end in the foundation of the World Trade Organization (WTO) in 1995 started, John Block, the US Minister of Agriculture, described this transformation as follows: 'The idea that developing countries should feed themselves is an anachronism from a bygone era. They could better ensure their food security by relying on US agricultural products, which are available in most cases at lower cost' (quoted in McMichael 2003, p. 174). The necessary condition for removing all remaining obstacles to this ongoing process was the elimination of various public interventions in agricultural production in order to make it subject to the rules of the free market. After 1980, this process was conducted first by the World Bank and then by the International Monetary Fund through structural adjustment programmes which imposed the decreasing of the agricultural supports and making agricultural loans further controlled by finance-capital. However, the key moment in forcing agriculture to engage with the rules of free trade was the Uruguay round of the General Agreement on Tariffs and Trade (GATT) in 1994.

When GATT was originally signed in 1947, the agricultural sector was not even included within its system. After GATT's replacment by the WTO in 1995, agriculture was opened up to the global regulations of trade liberalisation. When the Agreement on Agriculture was signed by most of the underdeveloped or developing countries, the main motive was to increase their foreign exchange revenues by increasing agricultural exports. Given that the public agricultural subsidies were mostly implemented by the US and other developed countries, others were expecting

to benefit from the free trade rules enforcing the removal or at least reduction of such subsidies. However, because of the WTO's complicated and unfairly implemented subsidy regime, the result has been the total opposite of what had been originally expected. While the demands of Southern governments for subsidies with 'legitimate environmental, economic, and rural development purposes' were caught in the net of the WTO subsidy regime, Northern countries maintained in various ways their own domestic agicultural subsidies, export subsidies, and other dumping practices (Schanbacher 2010, p. 36). The 'world price' that emerged from these practices was totally disconnected from actual production, with world agricultural prices falling from a mean of 100 in 1975 to 61 by 1989 (McMichael 2005, p. 278). The invasion of the markets by corporate agribusiness through these artificial prices further accelerated the elimination of small producers in the global South, while food expenditure in those developing countries that had signed the WTO agreement in the expectation of increasing their foreign exchange revenues increased by 20% between 1994 and 1999.

Another dimension of corporate agribusiness domination has been built on new patented gene technologies, known as the second Green Revolution. While the first Green Revolution made peasants dependent on the agricultural industry, the second one deepened this dependency almost to the point of slavery. For instance, the modified and patented seed industry made peasants totally dependent on corporations, as became obvious in the case of Indian peasants forced to pay transnational companies for patented Basmati rice, although such rice had already been produced and enriched for centuries by Indian peasants themselves. Underpinning this process were regulations related to intellectual property rights. For example, the agreement on Trade Related Aspects of Intellectual Property Rights (TRIPS), signed when the WTO was established, concerns intellectual property rights that are subject to trade, and is now one of the major threats against rural producers. Unsurprisingly, Jose Bové, one of the celebrities of the global peasant movement, defines genetically modified products 'a technique of tyranny', and their patenting as the most significant tool of this technique (Bové and Duvour 2001, p. 89). The use of genetically modified products has expanded rapidly because of government policies. According to one report, '2012 marked an unprecedented 100-fold increase in biotech crop hectarage from 1.7 million hectares in 1996 to 170 million hectares in 2012 – this makes biotech crops the fastest adopted crop technology in recent history' (ISAAA 2012). This development can undoubtedly be considered as embodying the new imperial practices of seizure in agriculture, defined by Harvey (2003) as 'accumulation by dispossession'.

And lastly, as a resut of the 'supermarket revolution' (Reardon, Timmer, and Berdegué 2004), processing between the production and consumption of the food started to be controlled by large companies, such as Carrefour and Wal-Mart, namely the giants of the retail sector where capital is highly concentrated. Because of the 'the technologies of seed modification, cooling and preserving, and transport of fruits and vegetables as nonseasonal or year-round', seeding times and size of agricultural products have become detached from their 'natural cycle' to become instead subject to the supply chain management of the global retail companies that increasingly represent – or in fact, create – the demands of Western consumers (McMichael 2009, p. 150; see Burch and Lawrence 2007). Consequently, more and more Southern peasants have been turned into contract workers of these retail corporations.

A Radical Alternative: Food Sovereignty

The opposition of La Via Campesina to the corporate food regime can be traced back to the Declaration of Managua, drawn up by representatives of eight agricultural organisations that convened in a congress held in Nicaragua in 1992. Officially, however, the organisation was established one year later by 46 farmers' leaders assembled in the Belgian town of Mons. La Via Campesina made its international debut at the

Global Convention of Food Security in Quebec, Canada, in 1995, before making its first significant impact by attending the Food Security Conference of the United Nations' Food and Agriculture Organization (FAO) in Rome one year later. La Via Campesina refused to sign the conference declaration drawn up by non-governmental organisations and asserted its independence from both government agencies and non-governmental organisations that had, until then, held decision-making powers on agriculture on the international arena. From this point on, La Via Campesina gradually increased its authority to become the internationally recognised representative organisation of the global peasant movement.

La Via Campesina struggles in particular against the elimination of small producers or their conversion into the proletariat of the corporate food regime, with the consequent loss of autonomy. In this sense, the international peasant movement is engaged in a struggle against both the free trade regulations, implemented and administered by a global power network comprising international financial institutions, the WTO, free trade agreements, transnational corporations, and governments, and the practices of agribusiness based on the notion of 'accumulation by dispossession'. From 'the dumping of food at prices below the cost of production in the global economy' and a policy of 'food aid that disguises dumping, introduces GMOs into local environments and food systems and creates new colonialism patterns' to the 'technologies and practices that undercut our future food producing capacities, damage the environment and put our health at risk', such as transgenic crops and industrial biofuel monocultures, La Via Campesina has a huge agenda of opposition (see Declaration of Nyéléni 2007).

Despite this, La Via Campesina should not be regarded as a mere oppositional organisation because the approach it takes implies an alternative constitutive tendency. This sustainable agriculture perspective, which centres on small producers, is expressed in the concept of 'food sovereignty'. The 2007 Declaration of Nyéléni describes food sovereignty as follows:

Food sovereignty is the right of peoples to healthy and culturally appropriate food produced through ecologically sound and sustainable methods, and their right to define their own food and agriculture systems. It puts those who produce, distribute and consume food at the heart of food systems and policies rather than the demands of markets and corporations. (Declaration of Nyéléni 2007, p. 1)

This presents a model which conflicts in every aspect with the corporate model. While the corporate model reduces agricultural products to a matter of global commodity trade, the food sovereignty model, which takes the food as a basic human right, is predicated on the principle of local, national, and regional self-sufficiency. The corporate model is capital-intensive with the incentivised use of machinery, chemicals, and genetic technology, while the ecological agriculture model has a labour-intensive character based on the balance between the producers' historical experience and the ecological environment. However, the contrast is not just a matter of production. First, the former model is company-based while the latter is family- and community-centred. Second, while the alternative model sees the increase of geographical distance between production and consumption as a problem, the industrial model is based on this very principle. Finally, the corporate model wishes to impose a diet intended to become globally standardised, while the alternative model highlights product diversity and localism, and therefore diversity of diets. That is, the alternative agriculture advocates cultural diversity.

In brief, the alternative agriculture model, developed within a framework of food sovereignty, is not just an opposing model; rather, it is based on a far-reaching perspective regarding how food production and consumption, two of the basic activities of human life, should be organised. It is a model which integrates many issues within its struggle: the prevention of rural poverty; prioritising women's labour as the principal and determinative force in rural areas; problematising the spatial distribution of production and consumption; and highlighting the relationship between the human and ecological environment and diversified food consumption. In this sense, the food sovereignty movement is also

F

transformative for most of the participating peasant organisations. Stedile, a leader of the Brazilian Landless Movement, summarises this rich blending of ideas and experience in La Via Campesina as follows:

> From the time of Zapata in Mexico, or of Juliao in Brazil, the inspiration for agrarian reform was the idea that the land belonged to those who worked it. Today we need to go beyond this. It is not enough to argue that if you work the land, you have proprietary rights over it. The Vietnamese and Indian farmers have contributed a lot to our debates on this. They have a different view of agriculture, and of nature – one that we've tried to synthesize in Via Campesina. We want an agrarian practice that transforms farmers into guardians of the land, and a different way of farming, that ensures an ecological equilibrium and also guaren-tees that the land is not seen as private property. (Quoted in Metres 2004, p. 43)

As a model describing food not as a commodity, but a basic human right, food sovereignty, first, is predicated on local distribution networks that directly connect small producers with consumers against the dominance of companies and agricultural product markets; second, it highlights the organised knowledge of producers regarding agricultural production against capital-intensive technologies; and third, it includes the ecological sustainability as a fundamental principle. Thus, the food sovereignty model carries the potential of surpassing the conventional limits of the concept of sovereignty: 'Food sovereignty is the right of peasants, as subjects of production, to control production, land, seed and water, and it is at the same time the right of consumers to choose safe foods to consume' (Whan 2006, p. 30). In contrast, other definitions tend to force the concept to fit into more conventional limits of the idea of sovereignty and to convert it into a merely governmental policy: 'Food sovereignty is defined as the right of peoples and sovereign states to democratically determine their own agricultural and food policies' (IAASTD 2008, p. 15). As a matter of fact, the food sovereignty concept was actually first proposed to overcome the limits of an officially approved concept, namely 'food

security', which is recognised by international governmental agencies such as the FAO. Food security attributes sovereignty to governments, imposing on them the obligation to provide sufficient nutrition to their population. It therefore surrenders all decision-making processes to nation states or relevant institutions of the international system created by nation states. Thus, food security, which before the neoliberal era was defined within the general principle of 'agricultural self-sufficiency', has been redefined in the last two decades as something attainable through the mechanisms of global trade which necessitates the reshaping of global regulations and nation states accordingly. The break signified by the notion of food sovereignty is, therefore, deeply ideological and political. According to McMichael (2004, p. 4),

> Whereas food security is a concept associated with the state/system, food sovereignty is at bottom a non-state concept, concerned with political and economic rights for farmers as a precondition of food security. Food security and food sovereignty represent distinct organizing principles shaping development trajectories at the turn of the twenty-first century. Each concept represents a model of agriculture: whereas food security has come to depend on the agroindustrial model, food sovereignty is rooted in agro-ecological relations.

Thus, food sovereignty represents a radically democratic reconstruction of relations within the agricultural sector, predicated primarily on the power of production communities and standing against the global capitalism represented by the corporate food regime. This perspective carries it onwards from being a mere agricultural movement to a wider force regarding the structuring of a radically alternative society. As Hardt and Negri put it,

The most innovative struggles of agriculturists today, for example, such as those of the Confédération paysanne in France or the Movimento sem terra in Brazil, are not closed struggles limited to a sector of population. They open new perspectives for everyone on questions of ecology, poverty, sustainable economies, and indeed all aspects of life. (Hardt and Negri 2004, p. 125)

Food and the International Division of Labour

Juan Grigera
Department of International Development,
King's College London, London, UK

There have always been many vital reasons for a significant interest in the study of food. Starvation (and its continuation by other means such as famines), social determinants of obesity, the question of national "food security" or people's right to "food sovereignty" and the need for agricultural surplus as a prerequisite of any kind of economic development are a few of the many topics of significant interest. This well-founded interest and wide range of topics are nevertheless not enough to establish any evident link of food with imperialism, nor with the main question of this essay: the international division of labour. Yet, let us recall that the question of food has been part of states' agenda since the early days of colonialism and, as we will see, a concern of the students of imperialism since the very beginning of its theorising.

A single issue, terms of trade, (sometimes known by its acronym NBTT, for net barter terms of trade), has dominated the debates about food and the international division of labour in the twentieth century. It is only recently that new perspectives and other topics have been debated at reasonable length. We will begin by summarising early views on this issue in the works of Kautsky as a first critical approach to the "agrarian question." Then we will move from this and other subsidiary remarks in the formulation of the classical theories of imperialism to its predominance in the first formulation of the concepts of centre and periphery in the thought of Latin American structuralism and its long-standing influence in dependency and world-systems theories. We will present a summary of the enormously wide empirical and theoretical questions and criticism raised about the structuralist formulation. Finally, we will briefly review the renewal of the agenda on the question of food and the international division of labour as seen, for example, in the study of global value chains and food sovereignty.

Kautsky: Food Production in Transition

While trying to lay out the foundations of how to understand the process of the expansion of capitalism's social relationships in the countryside and its various tendencies and counter-tendencies, Kautsky (1988) formulated several systematic observations on agriculture in the international division of labour. First of all he noted that the last quarter of the nineteenth century had involved a change in the terms of trade of agricultural products. Despite these being favourable to agriculture up until 1870, Kautsky observed that the movement has been reversed since then and proposed that this was the consequence of the expansion of industry. It should be noted that this was at odds with what classical and neo-classical economists alike expected, due to diminishing returns in the production function of primary products. Kautsky's explanation was an early insight into the idea that competition in the world market operates by articulating different modes of production. For Kautsky, the deterioration of food's terms of trade stemmed from its prices not being determined by costs of production under regimes of simple commodity production. Instead, prices were formed below those costs as a desperate response by agriculturalists to state tax pressure and indebtedness (by-products of militarism and national debt under imperial rule). This in turn could be sustained over time because most food producers did not depend on wages for their subsistence but rather on their own production (and were thus subject to over-exploitation). Kautsky predicted that people in colonial countries thus became vulnerable to the outbreak of famines after integration into the vortex of world competition, a measure of whose power and atrocity is blatantly illustrated by the image of countries

exporting food while their farmers starve. On the other hand, European producers faced productive reorganisation as a consequence of competition. Landowners had to convert their production to manufacturing activities: breweries, sugar factories, and distilleries became common in the countryside. Thus, Kautsky expected that the growth of agro-industries would become centralised and concentrated. In other words, the industrialisation of agriculture left smallholders even more bound to the monopsonist power of capital, leading them to become serfs of industrial capital.

In sum, what stems from Kautsky's masterpiece is a picture of food production as a residual pre-capitalist production that is facing strong transformation with worsening terms of trade (though presumably transitionally) as the system moves quickly towards agro-industrialisation.

The Prebisch/Singer Hypothesis

Almost half a century later, Latin American Structuralism (also known as *cepalismo* after CEPAL, the Spanish acronym for the Comisión Económica para América Latina y el Caribe [Economic Commission for Latin America and the Caribbean]) also began by ascertaining that the terms of trade vis-à-vis manufactures were worsening for food and other primary products in which developing countries had a major interest. This was the basis for a theoretical framework intended to bolster a development strategy that sought to replace imports with the production of value-added goods domestically, which would entail a long-term widening and horizontal integration of manufacturing industry. Their "manifesto" (Prebisch 1949) proposed an innovative view attributing the ongoing changes after the 1930s to a response to the new international situation, in sharp contrast to the dominant neoclassical interpretation that assumed there were no alternatives to primary exportled development. It understood the moment as a long catastrophic conjuncture for economic growth. structuralists interpreted this crisis of export-led development (something they termed *desarrollo hacia afuera,* and whose limits and social

drawbacks they took the opportunity to criticise) as a positive transition towards internally oriented urban-industrial development (*desarrollo hacia adentro*) that opened up the opportunity for a reshaping of the international division of labour. Their proposal was to further support this transformation of world trade with the help of the state in order to overcome backwardness and income inequalities by sponsoring a project of industrialisation.

But if this was the context that these theories originally attempted to explain, their enduring influence went well beyond these initial parameters. The question of the deterioration of terms of trade of agricultural products (and other primary products) is at the core of Structuralist ideas, as well as those of Dualism which posits that the world can be divided into a "centre" of industrialised countries and a "periphery" of primary products exporters. Their key policy proposal presupposed the idea of unequal exchange as well: a framework to advance late industrialisation in order to overcome underdevelopment.

Against the neo-classical narrative of comparative advantage, Structuralists popularised the hypothesis of the deterioration of the periphery's terms of trade, named ever since the Prebisch/Singer Hypothesis, after Prebisch (1949) and Singer (1950). Defined as the ratio between the unit prices of exports and imports, the terms of trade decline when the relative price of the country's imports increases. Besides highlighting the obvious pressures that this situation places on the current account (exacerbating a trade deficit), Structuralists also attempted to verify the empirical validity of the hypothesis that relative prices have been constantly moving against peripheral countries, understood as primary producers since 1870. The shift from agricultural prices to national trade was not the only difference with Kautsky: the causes of adverse terms of trade were grounded on quite different arguments. Instead of resorting to the articulation of pre-capitalist and capitalist modes of production, they proposed the concept of structural heterogeneity and pointed towards the structure of the periphery's international trade.

F

Structural heterogeneity is the second level of Dualism in *cepalino* thought. Structuralists argue that the centre and periphery have different production structures arising from a certain historically constructed international division of labour. The periphery has "another economy," in the sense that it is supposedly governed by a different set of rules (Love 2005). At the same time, the productive structure of the centre is assumed to be homogeneous, whereas the periphery suffers from structural heterogeneity; that is to say, dualism on an international scale is replicated *within* the peripheral countries. Structural heterogeneity is defined mainly in terms of productivity: homogeneous countries have highly productive sectors all across the economy, whereas in peripheral countries a "modern pole" coexists alongside "primitive sectors whose productivity and income per capita are probably comparable to those that prevailed in the colonial economy or even in the pre-Columbian era" (Pinto 1970). High productivity is usually restricted to a small enclave dedicated to agricultural or other primary exports, generally owned by foreign capital, and to a large extent isolated from the rest of the economy. Thus, there are few potential spillovers from "progress" within the "modern pole"; for instance, profits are expatriated via imported luxury goods or remittances. Structuralist ontology thus begins by dividing the world system into centre and periphery, and then further applies this dualism to the internal dimensions of peripheral countries.

The deterioration of terms of trade was explained both from supply and demand sides. In the former, structural heterogeneity implies a situation characterised by high rates of long-term rural (and urban) unemployment in which many producers subsist on small-scale food production. This in turn exerts a pressure on wages that ultimately prevents redistribution of productivity improvements in the peripheral modern sector and thus unit costs fall, allowing a transfer of productivity gains to the buyers; that is, to the centre. From the demand side, the story is better known: a disparity in income elasticities of imports in centre and peripheral economies favours the increase in prices of products produced by the centre. As the periphery exports food and other primary products while importing luxury goods, any rise in the income of the periphery leads to an increase of the demand of imported goods and a further deepening of its imbalances. At the same time, the centre improves its balance of payments, even as its income rises. Union pressures in industrialised countries contribute as well to this price distortion mechanism. This dynamic, together with the oligopolistic protection of the rate of profit, prevents a decline of manufactured products' price proportional to the constant rises in their productivity. Cardoso's correct inference of this statement, namely that in ECLAC's view, agents of production "manage, by virtue of their *politico-organizational* strength, to obstruct the operation of the [international] market" (Cardoso 1977, p. 12) shows the causal hierarchy behind their reasoning: at the core of structuralist thought, institutions are conceived in a normative fashion as separate from (and above) social relationships of production and exchange (see Grigera 2013).

Latin American Structuralism inspired a few other traditions that departed from ECLAC's thought in different ways. One was Dependency Theory, a more revolutionary break with free-trade liberalism. For Dependency, not only were terms of trade uneven for food exporters, but this was in turn creating a wicked class structure in the periphery: the domestic bourgeoisie was becoming a *comprador* class, a lumpen bourgeoisie that was unable to lead national development. The only way out of this perverse structure of the international division of labour was a socialist revolution that would unlink from the world market or heavy state intervention.

Critiques and Alternatives to the Prebisch/Singer Hypothesis

This characterisation of the trends in terms of trade was rejected both on theoretical and empirical grounds. Neo-classical economists were first in advancing a strand of critique against Structuralism. Viner (1951) argued that because of an economic law – ignored by structuralists – that technology would advance most rapidly in the manufacturing sector relative to agriculture, terms of trade should, *pace* the structuralists, actually

favour agriculture in the long term. Viner's line of argument would later be quite closely replicated by Baumol (1967), regarding the relative prices of manufacturing and services, a process that came to be known as "Baumol's disease." Criticism of structuralism stemming from Marxism, on the other hand, often pointed out the lack of relevance of physical quantities to understanding the nature of (international) exchange; that is, to the difficulties in accounting for labour differences. Thus, terms of trade is not to be expressed in physical quantities but in exchange value terms; that is to say, according to amounts of abstract labour for each kind of commodity.

These critiques were acknowledged and partially answered, but showed the quite different theoretical influences behind structuralism and Dependency Theories. While structuralists engaged in a deeper reformulation of international trade theory that further departed from neo-classicism's comparative advantages premise mainly on its empirical inadequacy, some dependency theorists tried to reconcile their findings with Marxist thought. One such attempt was an alternative to the idea of declining terms of trade: "unequal exchange" that stemmed from a strong imbalance of wage levels between centre and periphery and equalising of rates of profit. The unequal exchange hypothesis implied that value was transferred to the centre not just in the export of primary products but rather with any kind of commodity. For instance, Marini (1973) reconciles the law of value with unequal exchange through the idea of over-exploitation; that is to say, a wage level consistently below the cost of reproduction of labour power. For Marini, this situation could be sustained in the long run due to the existence of a large relative surplus population (ultimately a product of structural heterogeneity). Others in turn questioned the applicability of the law of value for the international market. They showed that Marx's writings on international trade (despite being incomplete) acknowledged the theoretical possibility for unequal exchange of labour and exploitation in international exchange. For instance, Marx in *Theories of Surplus Value* argued that in the world market "the law of value undergoes essential modification. The relationship between labour days of different countries may be similar to that existing between skilled, complex labour and unskilled, simple labour within a country. In this case, the richer country exploits the poorer one, even where the latter gains by the exchange" (Marx 1975, pp. 105–106; for a recent review see Itoh 2009).

Along with these discussions on the causes of declining terms of trade, the debates on the pertinence of statistical data and ultimately on the actual empirical existence of such a tendency were quite important as well. First, the data originally used by Prebisch to rest his statistical case measured the terms of trade of under-developed countries against the United Kingdom only, so it was argued that it could not serve as a proxy for industrial countries as a whole, as Prebisch intended. Then, these statistics mixed food and other primary products imported by the centre that where sourced from the periphery and the centre itself, valuation was inconsistent (imports where valued cost insurance freight [CIF], i.e., including insurance and freight charges, whereas exports were expressed in free on board [FOB] values, that is to say free of any shipping costs) and price indexes could not properly account for quality changes in manufactures over time. The choice of base years was also subject to controversy, as the "secular" deteriorating trend was not to be confirmed but from 1870–1940 and with a smaller magnitude than what Prebisch originally suggested (Spraos 1980). Extending the analysis beyond those years resulted in a trendless pattern. Moreover, after 2000, a significant improvement occurred in the terms of trade of food and other commodities, thus reopening the question of how to explain both the deterioration of the relative prices of food between 1870 and 1940 and the contemporary reversal of this trend.

The Contemporary Agenda

Over the past three decades, a renewal of the agenda within political economy has brought new analysis of food and the international division of labour that finally moves beyond the debate on terms of trade. The perspective of global value chains (GVC) applied to food products, the political debate over "food security" and "food sovereignty," and the

encompassing approach of the political economy of food are amongst the most relevant.

Even though global supply chains have been part of business and management concerns for a long while, it is only since the early 2000s that the concept of GVC has become popular among academic analysis of the global organisation of industries and their value chains (Gereffi and Korzeniewicz 1994; Gereffi and Lee 2012). As a loose prescription of how to describe the multiple dependencies behind a single final product and a concern on where surplus is accumulated, the application of GVC in the case of food products has led to varying results and conclusions. These range from cases where (in line with a general world-systems perspective) profit concentrates in the centre (such as the contemporary coffee chain; Ponte 2002) to others where peripheral countries have or had strong market power, were prime pricemakers, and developed cutting-edge technology in production (see Topik et al. 2006).

The question of "food security" has served both to reveal the multiple tensions behind the international division of labour and as a tool for many developed countries in reshaping it. Defined as the right of states to determine food policies and intervene in food systems, under the sponsorship of several international organisations (such as the World Bank or United Nations), a detailed analysis of risks and possible shortages of the food provisioning systems and research on improvements to food productions was developed. "Food security" served other purposes as well, such as defending the controversial subsidies to local agriculture in Europe and North America during GATT and WTO negotiations.

With a different emphasis, the international peasant movement Via Campesina has countered "food sovereignty" with the idea of "food security" by focusing on the decisions of those who produce, distribute, and consume food as opposed to the market and corporations. They have justly criticised the impact of the "Green revolution" that increased crop yields without resolving the multiple situations of hunger and starvation and the "food from nowhere" regime (Bové and Dufour 2001), though at the expense of romanticising non-corporate agrarian production.

Finally, the analysis of "food systems," as complex, distinct systems of provision (whose uniqueness is presupposed on the significance of organic factors, the structural position of agriculture and household, and the persistence of articulation with non-capitalist forms of production) has been the trademark of the literature on the "political economy of food." Among other issues, the idea of a strict separation of agriculture and industry has generated several debates crucial to understanding the picture of the international division of labour behind structuralist and Dependency Theories. This view (that could be traced to classical economists) associated a strong agricultural sector with the impossibility of development. That was, for instance, the apparently inoffensive opening of Kautsky's *The Agrarian Question* (1988, p. 13): "With the exception of a few colonies, the capitalist mode of production generally begin its development in *towns*, in *industry*." Whether capitalist social relationships have completely disintegrated agriculture as a distinctive non-commodity production rumbles on after more than a century of debates about the nature of food production and its relation to industry.

Overall, after almost a century dominated by a static view of the international division of labour, where food production was associated with underdeveloped non-capitalist countries with adverse terms of trade, a new scenario is re-opening both new perspectives that transcend its theoretical assumptions and a contemporary and historical reappraisal of its actual patterns.

Summary

Despite the many dimensions in the study of food (starvation and famines, food sovereignty, agricultural surplus) its link with the International Division of Labour has been dominated by the question of terms of trade. This entry summarizes the first debates in Kautsky as a first critical approach to the "agrarian question," moves to the role of this debate in the classical theories of imperialism and in the debate after Latin American structuralism, dependency and world-systems theories. It summarises the long empirical

and theoretical questions and finalizes with a few remarks on the recent renewal of the agenda on the question of food and the international division of labour.

Food Import Dependence

Food Scarcity

Food, Imperialism, and the World System

Michael J. Haynes

Definition

Throughout recorded history some people have gone hungry while others have feasted. Even

today, perhaps $+/-15$ per cent of the world's population suffers from hunger-related malnutrition. This finds expression in their reduced life expectancies, susceptibility to illness and diseases, and an abject quality of life. Famine has involved a more intense and periodic worsening of this situation leading to mass starvation, epidemic disease, a large rise in mortality, a fall in the birth rate, and mass migration in search of food and security.

Introduction

Humanity is part of the Earth's constantly changing ecological system. Settled agriculture has involved an attempt to subordinate 'nature' to human needs and wants in order to supply us with food, raw materials (especially for clothing), and fuel. But throughout recorded history some people have gone hungry while others have feasted. Even today, perhaps $+/-15$ per cent of the world's population suffers from hunger-related malnutrition. This finds expression in their reduced life expectancies, susceptibility to illness and diseases, and an abject quality of life. Famine has involved a more intense and periodic worsening of this situation leading to mass starvation, epidemic disease, a large rise in mortality, a fall in the birth rate, and mass migration in search of food and security.

Crises of subsistence, dearth, and famine have also existed throughout recorded history. Thomas Malthus famously argued that famines are a natural check on population growth; they are 'the last, the most dreadful resource of nature ... [which] ... levels the population with the food of the world'. (Malthus 1992/1798, p. 42) Neo-Malthusianism was a dominant way of thinking about famines in the 19th and early 20th centuries and it is still found in popular discussions. But in historical and scientific analysis it has been displaced. Malthus and his followers tended to overestimate the rate of population growth and underestimated the expansion of the food supply within modern capitalism. Beyond this there is now widespread recognition that the growth of population, the

growth of the food supply, and food distribution are all moulded by how society is organised, whether on a local or global scale.

If the food supply has seemed to be a problem, this has been partly because of what we eat and how we eat it; partly because of how we produce food; and partly because of how we distribute it. This has been analysed in terms of a succession of food regimes based on structures of production and consumption built around the changing forms of power of the advanced states. A focus on socio-economic forms, modes of production, and their different priorities is also necessary for a real understanding of famine dynamics when there is a catastrophic failure in a system. Famine, wrote Michael Watts, is 'an environmental crisis [that] not only probes the darkest corners of environmental relations, but throws into sharp relief the organisation and structure of social systems' (Watts 1983, p. 352).

In pre-industrial societies most of the population was rural and employed in agriculture. Today, in the most advanced countries, less than 2–3% are employed in agriculture. In the previous two centuries, world population increased some 6–7 times but agricultural output grew some 10 times. This was made possible by rising productivity, which enabled the most advanced societies to become urban-industrial-service ones. On a global scale, too, the world's population became predominantly urban around 2000. But the gains in the world's poorer regions have been less impressive. On one estimate, some 11 million people in 2000 worked in agriculture in the most advanced countries. In the poorer countries, which contain most of the world's population, some 1.3 billion (US) got their living directly from agriculture.

There has been a tendency for some to romanticise the pre-capitalist and pre-colonial past and to picture the development of capitalism from the sixteenth century onwards as disrupting ecological equilibrium. This view has been caricatured as a model of Merrie England, Europe, Africa etc. But the evolution of human society beyond the hunter-gatherer stage involved the unequal control of the means of production, the development of social classes, and conflicts over any

surplus. Pre-capitalist subsistence crises could therefore be serious, reflecting a dynamic interaction between humans, their forms of social organisation, and the environment. There is more support for the argument that pre-capitalist societies did evolve some ways, albeit varying ones, to enable them to try to reduce (but not eliminate) the risk of famine, and that these societies also had some customary mechanisms to try to reduce some of the consequences of famine when it broke out.

With the development of capitalism as a mode of production, the organisation of agriculture became more sophisticated but also more contradictory. This makes the analysis of agriculture an important part of the wider discussion of capitalism and imperialism. Although output increased, in the short to medium term, the development of capitalism created new patterns of production and trade that undermined traditional support mechanisms. This has led to the argument that over the last few centuries the world has seen first an intensification of famines, and then their retreat. This, the argument continues, is to be explained by the particular historical evolution of capitalism and the changing forms of imperialism and colonialism within it. In the longer run major famine appears to have disappeared, save in areas of political turmoil. But new issues have arisen. With rising incomes has come a 'nutrition transition' involving a diet of higher value meat, dairy, vegetable, and fruit foods. This is straining production capacity. Food is also now highly processed. No less, if malnutrition and a daily struggle for food marks the lives of one part of the world's population, others struggle with obesity and everywhere clear class gradients continue exist in what is eaten, in what form, and how much of it.

Global food consumption per head, 2005–07 (kg per person per year, FAO Data)

	Population million	Cereals	Meat	Milk and Dairy	Cereals All uses	Daily Total Calories
Developed	1,351	167	80	202	591	3,360
Developing	5,218	155	28	5^2	242	2,619
World	6,569	158	39	83	314	2,772

Agriculture and the Global Division of Labour

From the sixteenth century onwards a global capitalist economy gradually developed based on an unequal geographical division of labour. Economic, political, and military power enabled the most advanced countries to seek to determine the opportunities available for development on the periphery. In this division of labour the poor countries (for a period as colonies then as independent countries known variously as the 'underdeveloped world', 'the Third World', the 'developing world', 'the South', the 'emerging markets', and so on) produced and continue to produce lower value goods which they exchange for higher value goods and services produced in the core. Until the late twentieth century this division of labour led to their exporting foodstuffs and agricultural raw materials and importing manufactured goods. The table below shows the dominance of agricultural goods in poor countries' exports before the Second World War.

In the late twentieth century, some countries (and most notably China) began to produce and export more basic industrial goods, but agriculture remains important and now many of these poorer countries import subsidised Western agricultural exports creating even more distortion in the role of agriculture.

Throughout history, most trade has been between advanced countries, although the precise share has varied. In the colonial era some 70–75% of Europe's imports came from other European or advanced states and some 70% of exports went to these states. The rest of the world has always been involved in the smaller part of world trade and this remains the case today. Indeed, despite the predictions of mainstream economists, most international trade in agricultural goods has also tended to be between the more advanced countries. This is not to say, however, that some businesses in the advanced economies have not had a strategic dependence on certain foodstuffs and agricultural raw materials produced in the poorer countries.

With the arrival of Columbus in the Americas, a process of 'ecological imperialism' was set in

motion. With European penetration (and sometimes ahead of it in the case of diseases), new plant and animal species were transferred and established themselves as part of the agricultural economy. Many of the foods that we think of as growing 'naturally' in different countries are in fact a product of such a diffusion, structured in no small part by food and raw material needs set at the core of the evolving global system.

In the Americas (and later Australia and New Zealand), the indigenous population was reduced in number and economically marginalised by European settlers. In the Spanish colonies, land grants enabled those favoured by the monarchy to establish large *latifundia* alongside smaller-scale forms of agricultural settlement. In the Caribbean and the southern US, plantations were developed to supply sugar, tobacco, and cotton to the Atlantic economy. In the seventeenth and eighteenth centuries, some Europeans migrated as free men and women but many went as indentured servants and labourers. But the major part of the plantation labour force was made up of black African slaves and their descendants. Some 9.6 million were transported between 1451 and 1870 with the highest numbers in the eighteenth century. Free agriculture in North America, which became more important during the nineteenth century, tended to involve grain and livestock production.

While slaves, tobacco, sugar, and cotton dominated the trade in the Atlantic in the seventeenth and eighteenth centuries, to the east it was the high-value spice and silk trade pioneered by the Portuguese, but then controlled for a long period by the Dutch, that was the initial means of a closer link between East and West.

Commodity composition of Third-World exports (%), 1830–1937

	1830	1912	1937
Agricultural raw materials	29.9	34.7	39.9
Food stuffs	47.2	50.2	46.3
Drugs	7.9	3.9	1.7
Metals	7.0	2.8	3.2
Manufactured	8.0	8.5	8.9

European Expansion, Colonialism and Agriculture

In the nineteenth century a more extended and deeper global economy developed in which the balance in agricultural trade and production shifted. While some early colonies gained independence in the Americas, there was a new round of colonial conquest so that European rule reached its peak in the first half of the twentieth century. The number of colonial subjects rose from some 205 million in 1830 to 725 million in 1930 – around a third of the world's population with 75% of these colonial subjects in Asia and 20% in Africa. But establishing economic influence and political control on the ground took some time, especially when formal colonial rule was established by drawing lines on maps in European capitals. What some call the 'imperial high noon' lasted a relatively short time, from 1918–39. In the 1930s, in particular, the economic crisis encouraged the imperial states to look to tie their colonies more closely to the 'mother country'.

From the early nineteenth century to the Second World War, Britain was the world's leading colonial power. But its role was distinctive. As early as the 1800s, agricultural employment had fallen to less than 40% and by 1851 Britain was 50% urban. By the 1900s, agriculture provided only some 10% of employment – a share that would fall to less than 1% a century on. Agricultural output rose consistently, but by the 1900s Britain was importing over 70% of its food needs; a dependence on global agriculture that no other major economy had at this point. Britain's ties with its formal and informal colonies were very close. In the mid-nineteenth century, John Stuart Mill described Britain's colonies less 'as countries, carrying on an exchange of commodities with other countries, but more properly as outlying agricultural or manufacturing establishments belonging to a larger community' (Mill 1940/1848, p. 685) In many other advanced states, domestic agriculture would continue to play a more prominent role in the food supply system until the second half of the twentieth century.

Trade in the global economy, subject to significant shorter-term variations, has historically tended to grow faster than production. In the nineteenth century, the crude estimates available suggest that trade may have risen from 3% to 30% of output. This was made possible by improvements in communications and transport, economic reorganisation, and the increasing commoditisation of production. But the trade of the colonial countries started from lower levels and grew slightly less fast and more unevenly than world trade. Nevertheless, by the late nineteenth century, the first multinational agricultural businesses had emerged linking the different parts of the food chain and helping to supply and mould changing food-consumption patterns in the advanced countries.

In thinking about the development of the wider food supply system in the colonial era it is normal to divide the world into three zones. Within Europe (to the north in Scandinavia, to the east as far as Siberia, and to the southern shores of the Mediterranean), a heavily agricultural semi-periphery developed exporting grain, fruits, and dairy products to Western Europe. Here could be found differing mixtures of landed estates run by more or less modernising aristocracies and a mass of peasant producers, themselves divided into richer, middle and poor peasants, the latter struggling to resist decline into a landless class.

A second zone was made up of areas of European settlement; initially the Americas but then also Australia and New Zealand. Forms of slavery and unfree labour migration continued to be important into the nineteenth century. Some 160,000 'convicts' were transported to Australia between 1787 and 1868 to create a new labour force there. But free labour movement became more important for these areas. Some 44 million migrated from Europe between 1821 and 1915. Alongside the traditional plantation crops of the Americas, the production and trading of grain, animals, and dairy products became increasingly important, assisted by developments in communications and shipping. The area under crops in Europe and these regions of European settlement doubled between 1850 and 1930 as frontiers were pushed outwards. These regions had the most

sophisticated forms of agriculture, with the highest levels of agricultural exports per head, and relatively high levels of per capita income. This stimulated new patterns of food consumption. The high per capita income in late nineteenth-century Canada and the US is well known, but Argentina, Chile, and Uruguay too had relatively good per capita incomes based on their agricultural export trade to Europe and not least the United Kingdom.

The third zone was made up of the largely tropical colonies in Africa and Asia acquired in the nineteenth century. Here agriculture was much less directly focused on meeting imperial needs. The larger part of food production continued to be subsistence or for local markets, and most colonies had relatively small shares of output going into international trade. Europeans saw themselves having a civilising mission in which the imposition of more advanced liberal market economic processes was central. The scale of the consequent disruptive impact is highly contested. Some colonies had high levels of exports per head; for example, Malaysia, Sarawak, and Mauritius. But in many, exports per head were very low. In the cases of India (a formal British colony) and China (formally independent but prey to European influence), exports per head were tiny even though overall these countries were important to the international economy. But the fact that some more advanced sectors were created did help to define the wider political economy of the colonies.

Commercial exploitation of agriculture in these states involved the creation of cash crops. Where continuous cropping was possible and some capital larger inputs were needed, commercialisation involved the creation of plantations under settler control or management. This included the production of goods like tea, coffee, some palm oil, and raw materials such as rubber. Where crops were annual and capital inputs smaller, cash cropping took the form of peasant farming, as in the production of cocoa and groundnuts. Here, risk was pushed onto the shoulders of the peasant household and this encouraged a degree of self-exploitation to survive. In both instances, however, to create the basis for

commercialisation the traditional forms of land ownership and labour had to be undermined to create a more market-based system.

The dynamic of colonial accumulation was uneven. Crop acreage expanded (on one estimate by 70% in these regions between the 1850s and the 1930s) more slowly than in more advanced regions. Output grew but productivity was low and its growth less impressive. Another sign of the weaker integration was the limited infrastructure development, it being designed to secure political rule and to get agricultural goods and other raw materials to the ports rather than to lay the basis for sustained development. By 1930, Latin America had only 13% of the world's railways, Asia 11%, and Africa 5%.

It was once common to talk of an economic dualism between a backward, traditional sector and a more modern 'enclave'. More radical accounts recast these arguments in terms of social formations, perhaps combining different modes of production. The practical difficulty is to understand how different forms interpenetrated, directly and indirectly, rather than existed side by side.

There were also other flows that were important in this third zone. In the Indian Ocean and Pacific, the nineteenth century also saw the development of a growing trade in rice. Migrant labour moved too, especially from India and China. Trade in agriculture-based drugs was also important; not just tobacco but for a period a high-value trade in opium under British control. This helped to open up the Chinese economy and laid the basis for some still-surviving multinationals as well as feeding the general process of accumulation.

From the late nineteenth century until the late twentieth century, political discussion of the problem of agriculture, colonialism, and imperialism was bound up with what was called 'the agrarian question'. Given that industrial capitalism characterised the smaller part of the world, radicals focused on whether 'the peasantry' could be an agent for political and social change either independently (or led by intellectuals) or as part of a worker-peasant alliance led from the towns. But the peasantry, described by some as 'an awkward class', proved an ongoing political and theoretical problem. There was a widespread

agreement that land reform had to be part of a process of rural change. This took place in a number of countries in the twentieth century, sometimes from above, sometimes pushed from below. But, even where it had a positive impact, it did not realise popular hopes and create the basis for sustained rural prosperity.

Famine and European Capitalism

In Europe, the heartland of the early capitalist economy, subsistence crises gradually disappeared as incomes rose, agricultural output increased, and it became possible to import food from other regions and states. Famine disappeared first in Southern and Western Europe in the seventeenth and eighteenth centuries. On the European periphery, however, major famines occurred in the nineteenth century including Ireland and Finland in the mid-century and Russia from 1891–92. By this point, these economies were already part of the wider global capitalism. While some starved, food was exported and governments tended to watch fatalistically for fear of disrupting what many at the top saw as a natural correction of population to the means of subsistence. The famine in Ireland from 1845, when a million died and another million migrated (reducing the population from 8.2 to 6.5 million between 1841 and 1851), is often seen as a paradigmatic case for the debate over the relation of famine to capitalism, colonialism, and imperialism.

In the twentieth century, mass famines did occur in Europe, especially in Russia in 1921–22, 1932–33, and 1946–47, but these were more clearly linked to war and state policies, though these too can be argued to have had their roots in the deeper political economy of global capitalism.

Famines and European Expansion and Control

European expansion from the sixteenth century onwards began to integrate the Americas, Africa,

and Asia into an evolving capitalist world economy. In the sixteenth century, the biggest changes were in the Americas where conquest and the spread of 'old world' diseases had a catastrophic effect on local populations. Estimates are more or less speculative but all point to huge population losses. But most attention in famine history has been devoted to the impact of informal and formal imperialism and colonialism in the two centuries after 1750. China escaped formal subjugation but its economic development was disrupted by successive wars and crises in which competing European interests played a role. Elsewhere, in Asia (but not Japan), and in Africa, formal colonisation took place in the nineteenth century. Where the incorporation of new regions into European empires involved the deployment of force and plunder, this often provoked immediate famine crises. These were an indirect product of the disruption of conquest but also a direct product of military action. The extent to which colonial armies deliberately destroyed crops and agriculture to enforce their domination is often not appreciated.

The colonial stage of integration into the global economy and its imperial subsystems was more systematic though still uneven. Commercialisation and new forms of taxation threw more risk onto the weaker sections of the rural and urban populations in many colonies. This increased their vulnerability in bad years. The worst period came in the late nineteenth century when, as Mike Davis puts it, 'there is persuasive evidence that peasants and farm labourers, became dramatically more pregnable to natural disasters after 1850 as their local economies were violently incorporated into the world market' (Davis 2001, p. 288). Harvest problems intensified in Africa, India, and China, creating major famines in the late nineteenth century. Within some colonies there could also be shifts in the areas affected. In his study of famines in Zimbabwe, Iliffe argued that 'whereas early colonial famines centred where the European impact was least, later colonial scarcity concentrated where the European impact was greatest' (Iliffe 1990, p. 79).

After the First World War, the scale and frequency of famine in most (but not all) colonies diminished. As in Europe, most twentieth-century famines have been a product of war and political action in existing or newly decolonised states (e.g. India, 1942–43; China, 1958–62; parts of Africa, 1960s–1980s; North Korea, 1995–2000).

Analysing Famines

Deaths in famines are hard to estimate because famines have tended to occur in societies whose weak administrative structures are disrupted further by a famine crisis itself. There are also political pressures to understate. In the great Indian famine of 1876–78, the governor of Bombay said there were 150,000 dead but an official enquiry said 5 million. In other cases, critics of regimes have been accused of exaggerating the scale of famine deaths. Population losses (deaths plus the fall in the birth rate) are more speculative too. But crude estimates suggest that in the nineteenth century some 100 million might have died in famines and in the twentieth century some 70 million. These are huge numbers but they are less than the cumulative impact of premature mortality from everyday hunger and disease. They are also less than those who died in wars but, given the close links between war and some famines, drawing too clear a line between them is not sensible.

Accounts of colonial famines seek to integrate a number of elements. There is the manner of incorporation of formal and informal colonies into the global economy; there is the scale and nature of their subsequent vulnerability to external shifts. There is the longer-term issue of the creation of new forms of land rights and the creation of wage-labour relations as well as the greater degree of commercialisation and specialisation involved in rural life. There is also the disruption of traditional forms of customary protection and moral economy in favour of colonial state policies based on a market political economy.

Here the work of historians interacts with that of other social scientists and, not least, economists. Amartya Sen (1981) has been especially influential in undermining both Malthusian accounts and those which attribute famines to

simple market failures. Sen argues that the problem is not the lack of markets but the way that they function to reduce the purchasing power of some (reducing what he calls 'entitlements' to food) while enabling others to command a greater share of the food supply. The normal functioning of the market price mechanism can therefore be a key part of the famine process. Sen's radical critics regret that he incorporates too many of the assumptions of conventional economics, but his analysis of the contradictions of markets has been important in both undermining earlier arguments 'from within' and encouraging the view that active policies of income support can help deal with famines.

The Internal Nature of Famines

If the causes of famine are rooted in global and social inequalities, so too are its processes. Famine victims tend to be the poorest as they have least access to food and are most susceptible to the diseases that accompany famine crises. The Cooper Memorandum (1881) on Indian famine said that 'If the famine mortality in 1879 be tested it will be found that about 80% of the deaths come from the labouring classes, and nearly the whole remaining 20% from the cultivators owning such minute plots of land as to be hardly removed from labourers' (Ambirajan 1976, pp. 8–9). It then dismissed these victims as a class 'low in intellect, morality and possessions'. This class nature of the famine process has been confirmed time and again (and is supported by Sen's analysis of who gets what). Amongst the poor the victims then come disproportionately from the very young (especially babies who have been weaned) and the old. The one peculiarity is that in some instances adult women have been found to have had higher survival rates than men. Whether this is because the texture of household relations is more nuanced than accounts often suggest or because women have better biological, individual, and collective ways of coping remains unclear.

The term 'famine victim' is itself controversial. People do not wait passively to die. They struggle to survive but are forced to make 'tragic choices'. Survival involves various household strategies. These include looking for work, scavenging, selling off less important possessions. The balance between animals and humans shifts in favour of the humans. As hunger intensifies it then becomes necessary to sell off (in a more or less structured way) tools, animals, and land with the most irrevocable decisions left till last. When this fails, survival then might involve fleeing as refugees to escape death or to find it in new places if the gamble to migrate does not work.

Part of our difficulty in understanding this is that outsider accounts tend to veer between the sensational, stressing how famines bring out the worst in human beings (abandonment, murder, and cannibalism), to accounts that stress fatalism and passivity to other accounts which focus on 'coping' by co-operation and mutual aid.

Recovery is also part of the famine process. Demographic recovery may be quick. A famine not only increases the death rate, it reduces the birth rate. Marriage rates fall, sexual activity diminishes as the human body weakens, conception is harder, spontaneous abortions and stillbirths more frequent and infant mortality (often unrecorded) rises. But with increased nutrition, marriage and birth rates can rise quickly and the death rate falls to pre-famine levels. But some health analysts speculate that the human body continues to carry the hidden scars of famine in later life, and is reflected in development problems and susceptibility to later disease and diminished life expectancy. Little is known about any long-term 'psychological' and ideological wounds.

Famine processes involve winners as well as losers. Someone must buy the land, animals, tools, and possessions that are sold. In the process, buyers increase their relative position and status. At the macro level, Mike Davis has stressed the contribution of famine to a larger global process of proletarianisation on the one side and accumulation on the other. 'The great Victorian famines were forcing houses and accelerations of the very socio-economic forces that ensured their occurrence in the first place' (Davis 2001, p. 15). But we have too little knowledge of how this

might have worked at particular times and in particular places and what was done with the different possessions that some gained from the dispossessed.

Famine Policies

The recognition of the role of policy in famine has led to claims that famines involve acts of genocide. But few non-fascist governments appear ever to have seriously willed the death of part of their own population. Culpability arises rather because other priorities have helped cause famine and created the justification for doing too little too late to deal with famine once it occurs. One common factor has been a reckless determination to accept a degree of rural suffering as part of the process of development; an idea brutally expressed in the late nineteenth-century Russian comment that 'Even if we starve we will export grain'. (Figes 1996, p. 158) In war, too, victory at all costs has meant a willingness to risk famine for parts of your own population (apart from imposing hunger on your enemy through blockages etc.); something seen in the notorious Bengal famine of the Second World War.

'Other priorities' have also helped mould weak policy responses. In the nineteenth century, responses were further constrained by the economic thinking that saw famine as a necessary correction and all but the harshest forms of relief as a disruption of the market mechanism; a situation evident in both Ireland and India.

Development of the Modern Global Food System

The Second World War disrupted the existing colonial ties, and aspirant imperial powers in the form of Nazi Germany and imperial Japan briefly attempted to create new agricultural hinterlands for themselves. Although the older colonial ties were re-established after 1945, decolonisation came fast from 1948 to the 1970s, by which point only a number of smaller European colonies were left.

This helped shift the global food regime from one built around European colonialism to one, from the 1950s to the 1980s, structured by US policy and the Cold War. Then, from the late 1980s, another shift took place to an increasingly (but still largely US-dominated) neo-liberal corporate regime.

Before 1945, only Japan of the peripheral countries had managed to achieve a degree of sustained industrial growth. After 1945, Japan, along with many European states, modernised agriculture, industry, and their wider economies. Then, in the late twentieth century, some newly industrialising countries in Asia began to follow them, significantly reducing the role of agriculture in their own economies.

This was possible because after 1945 there was a massive but uneven growth of agricultural output. Land devoted to agriculture globally increased from 1.2 to 1.5 billion hectares. Forests have been cut down to grow grains for humans and animal feed, a necessary step as richer people consume a higher share of their diet as meat. But the main cause of the output growth was 'the green revolution': a combination of specialised breeding of grains and animals to increase yields, and the intensification of agriculture with the use of equipment, energy, chemicals, and water. Ecological problems and the high inputs involved mean that there are serious doubts about the possibility of projecting this model indefinitely into the future to meet the needs of a larger global population with higher incomes.

Increase in population, calorie supply, and agricultural production (FAO Data)

	World		Developed		Developing	
	1961/ 1963	2005/ 2007	1961/ 1963	2005/ 2007	1961/ 1963	2005/ 2007

Meat (million tonnes)	72	258	52	109	20	149
Daily energy supply index	100	100	134	121	84	94

In the global South as a whole, the rural economy became ever more closely tied to a wider global economy dominated by rich states and their agri-businesses. Neo-liberal policies, pushed by the powerful capitalist states, focused on opening up agricultural markets but, with agricultural production heavily subsidised in the dominant economies, this created further problems in the global South. These policies continue to involve the use of the 'visible hand' of the state to encourage a continuing process of 'accumulation by dispossession'. The exact pattern that has emerged varies by region and country but the general tendency has been towards an intensified commercialisation and commodification of land, labour, and capital in the countryside, and more high-level food processing, especially for urban consumers.

The global food system is now often described as an hourglass with large numbers of farmers at the top and large numbers of consumers at the bottom but linked by narrow channels controlled by a small number of agribusinesses. These agribusinesses have grown at a national and regional level, pushing aside local actors and co-operatives. But they have also increasingly come to be dominated by global transnationals. These (e.g., Monsanto) control inputs like equipment, seed, fertilisers, and other chemicals. They involve wholesale traders, sometimes called the 'invisible giants' of the global economy who buy up most of the world's harvest of major crops (Cargill, Bunge, Archer Daniels Midland). There are the global food processers and manufacturers (e.g., Kraft, Unilever) and more recently we have seen the rise of global supermarket chains which not only dominate retailing in many countries but now also control parts of the food-supply chain as well (e.g., Walmart, Tesco, Carrefour). This has also involved the development of different forms of contract farming which directly tie producers at the bottom end of the food chain to companies and consumers at the top. With this concentration, it is not surprising that perhaps one-third of global agricultural trade now takes place as intra-company trade. 'There isn't one grain of anything in the world that is sold in a free market. Not one! The only place you see a free market is in the speeches of politicians,' said the CEO of Archer Daniels Midland in the 1990s (Patel 2008, p. 99).

Some countries continue to develop with strong agricultural sectors. Brazil is now a major food exporter of red meats, coffee, corn, and soybeans. But more rapid growth in much of the developing world has more often led to these economies becoming net importers; a trend that is likely to grow with the current structure of production and distribution. Subsistence forms of agriculture have been pushed to the margins of the rural economy and many poor countries now export specialised agricultural products to the advanced ones (fruits, vegetables, flowers etc.). But they have become net importers of more basic grains, often from subsidised production in the advanced countries.

Within countries, the process of rural dispossession has reduced the numbers of peasants both relatively and absolutely. There is significant debate about the extent to which 'a classical peasantry' still survives as a class. In the countryside, landless labourers live alongside small-holding households whose family members are forced to engage in offfarm work to keep the household going. They do this either by working on bigger farms or in local trades or by migration to the towns, often joining the burgeoning informal economies that characterise southern cities. These processes help to increase the reserve army of labour but do not lead to sustained industrial growth. They also impact in new ways on internal rural and household relations, including the role of women, rural community support networks, consumerism etc. as well as on forms of social action and political perspectives.

The unequal command of food supplies in the global system is generating new issues or a reformulation of old ones. 'Food security' is a problem for those with little food but also for richer states, including developing ones. China moved ahead of the US as a food importer in 2012, for example. There is a growing interest from both the Middle East and China in land

deals in Africa. These are, in part, a product of concerns about future food availability. This has led to speculation that new forms of agri- and food-based imperialism will mark the twenty-first century in the ways that they have marked previous centuries.

In the second half of the twentieth century, the evolution of international agencies began to allow the monitoring of famine threats and some forms of inter-state international aid began to develop. Non-governmental organisations began to take up the question of famine. The Save the Children Fund was created in the aftermath of the First World War. Oxfam was created during the Second World War. At the end of the century, famine was taken up as a global issue by pop stars and the music industry. But some governments saw such interventions as foreign interference. Others argued that if national priorities were distorted, so too were global ones. In the late 1980s, when famine hit Ethiopia, the resources devoted to dealing with mass starvation there are estimated to have been less than 0.01% of global military expenditures.

Today it is commonly argued that, compared to the past, only smaller-scale local famines are possible. But endemic hunger marks the life of a significant minority of the world's population. In the future, food demand will rise, partly because of global population, which will peak sometime in the next century, and partly, perhaps, because of rising incomes. The capacity of global agriculture to meet this as well as the global sustainability of an even more intensive industrialised agriculture is far from assured. Problems will also worsen if the current patterns of consumption based on meat consumption, high levels of food processing, and the move into bio-fuels etc. are maintained.

The likely scale of food problems in the future is disputed but, as with persistent hunger and famines in the past so in the future, endemic hunger cannot be seen as natural. It arises as an organic part of the way that the global capitalist economy has been and is organised. One political manifestation of this has been the return and likely persistence of food riots as those at the bottom of the system have protested against shortages, price rises, and speculation, and have looked towards a different and more moral economy for food production and distribution.

Capitalism therefore continues to develop as a contradictory system. But these contradictions take a dynamic form in which the one constant is capitalism's inability to equalise relations between person and person, state and state, and the countryside and the town. In a global population of seven billion, the world's poorest people and those most affected by hunger are often those closest to the production of food.

Forced migration and Imperialism in the Neoliberal Era

Raúl Delgado Wise
Universidad Autónoma de Zacatecas, Zacatecas, Mexico

The nature of contemporary migration cannot be understood without a deep understanding of the nature of contemporary capitalism and imperialism. One of the main features of the current global architecture, boosted by the emergence of one of the most distressing global crises since the Great Depression, is the assault on the labor and living conditions of the majority of the working class, and in particular the migrant labor force, which stands among the most vulnerable segments of the proletariat.

The main purpose of this chapter is to analyze some of the key aspects underlying the context in which contemporary migration is embedded, with emphasis on the process of segmentation and growing precariousness of labor markets worldwide. More specifically, it aims to unravel (a) the re-launching of imperialism (policies of global domination) in search of cheap and flexible labor, as well as natural resources from the Global South; (b) the growing asymmetries among and within countries and regions; (c) the increase and intensification of social inequalities; (d) the configuration of a gigantic global reserve army of labor associated with the emergence of severe forms of labor precarization and exploitation; and (e) the predominance of forced migration as the primary mode of human mobility under conditions of extreme vulnerability. From this perspective, the migration and labor questions are two sides of the same coin, whose currency translates into unbearable conditions of systematic oppression of the working class. To combat this, there must be, among other things, a unity of social organizations and movements in alliance with progressive intellectuals in order to foster social – anti-systemic – transformation processes.

Imperialism Today: The Restructuring of Monopoly Capital

While the monopoly position of the labor aristocracy in the Global North has been eroded in the neoliberal era, the commanding heights of global capitalism remained solidly entrenched there, with increasing monopolization of finance, production, services, and trade, leaving every major global industry dominated by a handful of large multinational corporations (MNCs). In the expansion of their operations, the agents of corporations, or monopolistic engines of capitalism, have created a global network and process of production, finance, distribution, and investment that has allowed them to seize the strategic and profitable segments of peripheral economies and appropriate the economic surplus produced at

enormous and unbearable social and environmental costs. Thus, while labor faced increasing global competition, it confronted an increasingly centralized and concentrated capital, fundamentally altering the balance of class power in the favor of capital.

In the international political economy, monopoly capital has become, more than ever, the central player, to the extent that Samir Amin (2013) portrayed contemporary capitalism as the "era of generalized monopolies." Through mega-mergers and strategic alliances, monopoly capital has reached unparalleled levels of concentration and centralization: In 2014 the top 500 largest MNCs acquired 31.2 trillion USD in sales revenues (Fortune 2015), equal to 40% of the world's GDP (World Bank 2015). More important is the fact that, in the neoliberal era, monopoly capital has undergone a profound restructuring process characterized by:

1. The *upsurge of monopoly-finance capital*, i.e., the ascendancy of finance capital over other fractions of capital (Bello 2005). Finance capital began this ascendancy with the onset of an overproduction crisis in the late 1960s, when German and Japanese capital recovered from the devastation of World War II and began to compete with US capital on world markets (Brenner 2002). With the lack of profitable investment in production, capital began shifting toward financial speculation based on an unprecedented reserve of fictitious capital: In 2007 global financial assets, 206 trillion USD (McKinsey 2015) nearly quadrupled global GDP, 57 trillion USD (World Bank 2008). The result has been the financialization of the capitalist class, of industrial capital, and of corporate profits (Foster 2010).

2. The *configuration and expansion of global networks of monopoly capital* as a restructuring strategy led by the large MNCs, which, through outsourcing operations and subcontracting chains, extend parts of their productive, commercial, financial, and service processes to the Global South in search of abundant and cheap labor through *global labor arbitrage* (Delgado Wise and Martin 2015). This strategy, supported by Information and Communications Technologies (ICTs) and the wide range of reducing labor costs by taking advantage of global labor arbitrage, is exemplified by the export platforms that operate as enclave economies in peripheral countries. This turn toward global production chains has been impressive: "[the] top one hundred global corporations had shifted their production more decisively to their foreign affiliates [mainly in the South], which now account for close to 60 percent of their total assets and employment and more than 60 percent of their global sales" (UNCTAD 2010). This represents a "new 'nomadism' [that] has emerged within the system of global production, with locational decisions determined largely by where labour is cheapest" (Foster et al. 2011a, p. 18). Moreover, an outstanding feature of contemporary global capitalism is the degree of network articulation and integration with the operations of large MNCs dominating international trade: at least 40% of all global trade is associated with outsourcing operations, including subcontracting and intra-firm trade (Andreff 2009); an estimated 85 million workers directly employed in assembly plants in the Global South; and over 3500 export processing zones established in 130 countries (McKinsey 2012). This restructuring strategy has transformed the global geography of production to the point that now most of the world's industrial employment (over 70%) is located in the Global South (Foster et al. 2011b).

3. The *restructuring of innovation systems* through the implementation of mechanisms such as outsourcing (including offshore) the scientific and technological innovation process allows MNCs to benefit from the research of scientists from the Global South. This restructuring reduces labor costs, transfers risks and responsibilities, and capitalizes on the advantages of controlling the patent

process (Delgado Wise 2017). Five overarching aspects characterize this restructuring process:

(a) The increasing internationalization and fragmentation of research and development activities. In contrast to the traditional innovation processes occurring "behind closed doors" in research and development (R&D) departments internal to large MNCs, this trend is known as "open innovation" (Chesbrough 2008).

(b) The creation of scientific cities – such as Silicon Valley in the United States and the new "Silicon Valleys" established in peripheral or emerging regions, principally in Asia – where collective synergies are created to accelerate innovation processes (Sturgeon 2003).

(c) The development of new methods of controlling research agendas (through venture capital, partnerships, and subcontracting, among others) and appropriating the products of scientific endeavors (through the acquisition of patents) by large MNCs.

(d) The rapidly expanding highly skilled workforce in the Global South – particularly in the areas of science and engineering – is being tapped by MNCs for research and development in peripheral countries through recruitment via partnerships, outsourcing, and offshoring (Battelle 2012).

(e) *The creation of an* ad hoc *institutional framework* aimed at the concentration and appropriation of products created by the *general intellect* through *patents*, embodied in the World Intellectual Property Organization (WIPO) and the World Trade Organization (WTO) (Delgado Wise and Chávez 2015).

Since the late 1980s, a trend toward ad hoc legislation has been initiated in the United States, in line with the strategic interests of large MNCs regarding intellectual property rights (Messitte 2012). The rhythm of patenting has increased exponentially in the last two decades, tied to the logic underlying "free trade" agreements (NAFTA, ASEAN, TFTA) as an imperialist strategy for controlling/administrating global markets by the large MNCs, mainly based in the United States. (According to PCT-WIPO data in the last two decades, the United States held one of every four patents granted in 2014.) In fact, this trend can also be conceived as a higher stage in the development of the global networks of monopoly capital, as the New International Division of Labour moves up the value-added chain to R&D and monopoly capital captures the productivity and knowledge of a highly skilled workforce in the Global South.

4. The renewed trend toward *extractivism and land grabbing* led by the continuing overconsumption of the world's natural resources and the expansion of carbon-based industrial production. The growing urbanization and industrialization in Asia, particularly China, has increased demand for raw materials, which, combined with the transformation of commodities from a hedge asset to a speculative asset for finance capital, created a commodities boom since 2002 that has recently declined with the de-accelerating Chinese economy. Soaring prices for commodities have driven the exploration for and production of nonrenewable natural resources into remote geographies, deeper into the oceans and the jungles, in the process exacerbating social conflicts over land and water (Veltmeyer 2013). This new extractivism has worsened environmental degradation, not only through an expanded geography of destruction but also by global extractive capital's strategy of environmental regulatory arbitrage (Xing and Kolstad 2002). Moreover, despite 25 years of increasingly dire warnings from the Intergovernmental Panel on Climate Change (IPCC), the global consumption of fossil fuels continues to rise, "triggering a cascade of cataclysmic changes that include extreme heat-waves, declining global food stocks and a sea-level rise affecting hundreds of millions of people" (World Bank 2012). Given that the revenues of some of the world's most powerful and

profitable MNCs depend on fossil fuel consumption, this pattern will likely continue, setting the world on the path toward a deepening *ecological crisis*.

This planetary "order" or "disorder" encompasses deep and dangerous contradictions (Harvey 2004) that sparked a global crisis that began in the 1970s, a crisis that opened the door for the introduction of neoliberalism and which it has not been able to shake off. On the contrary, the capitalist hydra with its new faces has only presented false and limited solutions to the current crisis, and even worse, far from opening up new paths toward a phase of sustained growth in the global economy, at each step it has led to a deepening of the crisis and let loose the storm. In the words of Humberto Márquez:

> The crisis that faces contemporary capitalism represents a break in the process of capitalist expansion fostered by the core countries, led by the United States, since the 1970s. It is a failed restructuring that has resulted in the collapse of its own core, of the world capitalist system, and above all of the most powerful financial and industrial centres, and which has been swiftly communicated to all of the sectors, networks and corners of capitalism. However, we cannot lose sight of the strategy of restructuring and expansion that has occurred with growth in its principal goal: to concentrate capital, power and wealth in the hands of a small elite of transnational capitalists and, simultaneously, has brought about a drastic deterioration in the conditions of life and work for the majority of the population. (Márquez 2010: 67)

As a result, contemporary capitalism is facing a profound multidimensional crisis (e.g., financial, economic, social, ecological) that undermines the main sources of wealth creation – labor and nature – to the point that it can be characterized as a civilizational or epochal crisis with a potentially catastrophic outcome (Foster 2013; Arizmendi 2016). It is crucial to realize that it demands both engaging in a radical social transformation process as well as constructing a social transformation agent capable of confronting the current power structure. Unfortunately, this power structure has responded to this multidimensional crisis with desperate attempts to maintain this unsustainable and unstable form of capitalism.

The Labor Question Today

One of the main engines of neoliberal capitalism is cheap labor. Costs of labor are lowered by any and all means, as capital takes advantage of the massive oversupply of labor, reflected in growing levels of unemployment and precarious employment the world over. With the dismantling of the former Soviet Union, the integration of China and India into the world economy, and the implementation of structural adjustment programs (including privatizations and labor reforms) in the Global South, the supply of labor available to capital over the last two decades has more than doubled from 1.5 to 3.3 billion, in what Richard Freeman calls the "Great Doubling" (Freeman 2006). This rapid expansion of the global reserve army of labor has occurred most dramatically in the Global South, where 71.3% of the "reserve" global workforce can be found (ILO 2019).

The exorbitant size of this reserve army of labor is dialectically related to the abysmally low wages and chronic insufficiency of "decent" employment that characterizes contemporary capitalism, since the global oversupply of labor has scaled down the global wage structure and increased the overall precariousness of labor. According to estimates of the International Labor Organization (ILO), the number of workers in conditions of labor informality rose to 2 billion (61%) in 2018, encompassing more than half of the world's workforce, with 700 million receiving a salary of less than 3.2 US dollars per day and nearly half of those finding themselves in situations of extreme poverty – while the global number of unemployed continues to rise (ILO 2019). This, in turn, has led to growing structural pressures to emigrate internally and/or internationally under conditions of extreme vulnerability.

Neoliberal capitalism restructured labor markets and reconfigured the global working class in the following ways (Márquez and Delgado Wise 2011):

F

1. *The creation of a dispersed and vulnerable proletariat attached to the global networks of monopoly capital.* The social and productive fabric of the MNCs covers strategic and profitable economic sectors, such as agriculture, mining, industry, services, trade, and finance. The neoliberal restructuring of labor markets has dismantled labor protection and imposed a "new labor culture" based on competitiveness, while creating a regime of job insecurity characterized by labor flexibility and precariousness. Outsourcing stands out as the main corporate management strategy to cheapen labor costs and generating a permanent threat of layoffs. Business requirements have also led to a new profile of labor: desperate young workers without union experience and willing to work under insecure and poorly paid conditions. The new proletariat is compelled to subject itself to high levels of exploitation, in order to access a source of income. This labor becomes increasingly alienated from its sense of class belonging, and its place in the socio-economic and geographic fabric, given the predominance of what resembles abstract forms of capital – that is, global capital that depersonalizes, even more so than in the past, the relationship between capital and labor in a transnational arena. These abstract expressions of capital leave the proletariat without a human referent for their exploiters, only a faceless, mobile, and de-territorialized corporate entity that, if necessary, can quickly shift production to other factories. This abstract form of capital undermines the development of a consciousness of what happens in the work process and prevents workers from building long-term relations necessary for cooperation and solidarity when confronting employers; the daily struggle to earn a livelihood occupies their vital energies with little social cohesion.

2. *The covert proletarianization of the scientific and technological laborer.* Monopoly capital has managed to absorb scientific and technological labor into an innovation system, protected by patents, that generate extraordinary profits for the large MNCs. In this way, the fruits of technological progress are directly appropriated by monopoly capital. Scientists and technologists constitute a privileged segment of the working class, and do not conceive of themselves as workers, but, rather, as part of the global ruling class, and even promoters of social transformation inasmuch as their innovations affect everything from production patterns to the daily lives of ordinary people. This highly qualified workforce has gradually lost, directly or covertly, its relative autonomy and control over the means of knowledge production and the tools of their labor (laboratories, research agendas, etc.). In this sense, scientific and technological labor is subsumed by the large multinational corporations, while researchers' awareness of the work process is progressively lost. One of the strongest forms of scientific and technological labor appropriation and subsumption is that of the disguised proletarianization of this type of worker under forms of outsourcing and offshoring, embedded in the dynamics of the restructuring of innovation systems, as previously described. Given the precariousness of labor and lack of worker control over the means of knowledge production, MNCs drive R&D research agendas and appropriate the products of the research.

3. *The real or disguised proletarianization of the peasantry.* A global agribusiness system dominated by large multinational corporations controls all stages of the productive, financial, and trading processes, leaving practically no room for small-scale agricultural production. Like other economic sectors, agribusiness employs subcontracting schemes that degrade peasant autonomy and entail visible, or covert, forms of proletarianization with a high degree of precariousness. "Accumulation by dispossession" (Harvey 2007) dismantles the peasant subsistence system and expands the presence of large-scale agribusiness production for export, annihilating political attempts at local food sovereignty, appropriating the nature and biodiversity, blocking public resources from being channeled into the peasant sector, and "freeing" the workforce from the land so that it can, in turn, be employed in precarious and unsafe

conditions in manufacturing, trade, or services. In order to subsist within the new institutional framework of neoliberal capitalism, peasants are forced to either (i) become a proletariat working for agribusiness, even on lands they might have formerly owned; (ii) migrate to the cities in search of precarious jobs, many of them offered by the large multinational corporations, and in areas such as the maquiladora industry zones; (iii) survive within the ranks of the lumpenproletariat, through black market or criminal activities; or (iv) migrate abroad to work in vulnerable social conditions and in degraded, poorly paid jobs. These processes of overt or covert proletarianization and sub-proletarianization have exacerbated further the dynamics of semi-proletarianization already in place before the neoliberal onslaught. Despite the social decomposition of the peasantry as a subaltern class that lies even below the proletariat, it is worth noting that some of the most visible and consistent anti-globalization movements come precisely from the ranks of the peasantry and indigenous groups (i.e., Via Campesina, the Zapatista Army of National Liberation in Mexico, CONEI in Ecuador, and the Landless Workers Movement in Brazil), which demonstrates that many of these groups retain the social and geographic space necessary to develop counter-hegemonic ideologies and bases of resistance (Scott 1992).

4. *The expansion of the reserve army of labor and the proliferation of pauperism, including the growing presence of a lumpenproletariat.* These surplus workers suffer from the worst living and employment conditions and are confined to the lowest social strata. This is a highly degraded and large segment of the global population. To survive, the poorest of the poor work on the margins of society and, often, on the margins of legality, participating in petty crime, organized crime, human trafficking, and prostitution. They also carry out activities in public spaces, working as mendicants, shoeshiners, announcers, vendors, and street musicians, among many other things. This group also includes door-to-door vendors and informal workers. The dysfunctional nature of their work, their detachment from the institutional framework, and the discrimination they endure prevent these groups from developing a class identity or interacting openly with power, capital, or other categories of the proletariat.

5. *The sub-proletarianization of forced migrants.* Neoliberal capitalism has accelerated mechanisms of social exclusion and dispossession. The most evident result of this is the creation of a population that has no means of earning a living and whose livelihood is precarious at best. These social groups – as will be discussed in the following sections – are forced to migrate domestically or internationally in order to access any source of income that will enable family subsistence. Migration in this context is far from being a free and voluntary movement; rather, it is a structural imperative. A wide range of social subjects are forced to move from their places of origin: peasants deprived of land or unable to make a living out of it; unemployed or poorly paid workers; youths with no employment prospects; professionals without access to social mobility; women lacking access to the labor market; and skilled workers with few or no opportunities for work and income. Those who participate in forced migration are placed in relatively more adverse conditions than native counterparts; they become a highly vulnerable proletariat, or sub-proletariat, facing social exclusion, wage discrimination, the lack of social and labor rights, loss of citizenship (or a precarious citizenship status), and criminalization. This massive contingent of the labor force works under conditions of insecurity, vulnerability, and considerable risk; as proletarian subclass, they are often subject to conditions of super-exploitation which hark back to precapitalist features of coercion, bordering on new forms of slavery (Márquez and Delgado Wise 2011).

Under these circumstances, working conditions erode the social wage, and the social welfare system excludes the subordinate classes from accessing basic needs to such a degree that wages no longer ensure subsistence, and thus

labor is super-exploited. This and other violations of basic labor and human rights engender a situation of systemic violence and human insecurity affecting the majority of the world's population.

The Mushrooming of Unequal Development and the Emergence of a New Mode of Unequal Exchange

A major and inescapable feature of the current form of capitalism is unequal development. The global and national dynamics of capitalist development, the international division of labor, the imperialist system of international power relations, the conflicts that surround the capital-labor relation, and the dynamics of extractive capital have made economic, social, political, and cultural polarization more extreme between geographical spaces and social classes than ever before in human history. A conspicuous output of this development is the disproportionate concentration of capital, power, and wealth in the hands of a small elite within the capitalist class. Nowadays, the richest 1% of the world's population concentrates 40% of total global assets (Davies et al. 2008). Moreover, "from 1970 to 2009, the per capita GDP of developing countries (excluding China) averaged a mere 6.3% of the per capita GDP of the G8 countries" (Foster et al. 2011a).

In fostering the above trend, global labor arbitrage has become a key pillar of the new global architecture. Arbitrage refers to the advantage of pursuing lower wages abroad. This allows capital to "earn" enormous monopolistic returns, or imperial rents, by taking advantage of the relative immobility of labor and the existence of subsistence (and below) wages in much of the Global South. Through the mechanism of global labor arbitrage, social and geographic asymmetries are reproduced on a global scale. Social inequalities are one of the most distressing aspects of this process, given the unprecedented concentration of capital, power, and wealth in a few hands while a growing segment of the population suffers poverty, exploitation, and exclusion. Increasing disparities are also expressed, ever more strongly,

in terms of racial, ethnic, and gender relations; reduced access to production and employment; a sharp decline in living and working conditions; and the progressive dismantling of social safety nets.

A fundamental mechanism in the promotion of this new global architecture and its underlying trend toward unequal development has been the implementation of structural adjustment programs in much of the Global South and former socialist economies. These programs have been the vehicle for disarticulating the economic apparatus in the periphery and its rearticulation to serve the needs of core capitalist economies, under sharply asymmetric and subordinated conditions. In particular, these programs served the needs of capital through the export of labor in its two modalities, indirect and direct, which are key to conceptualizing this process. On the one hand, the indirect, or disembodied, export of labor is associated with the configuration of global networks of monopoly capital through outsourcing, offshoring, and subcontracting operations to the Global South, as previously described (Delgado Wise and Márquez 2007; Delgado Wise and Cypher 2007). In this case, the main input of domestic origin in the exported commodities is the labor used in the assembly, service, or commercial process. On the other hand, the direct export of labor refers to international labor migration, mainly composed of South to North and South to South flows. In fact, 187 million of the existing 258 million migrants, or 72%, come from the periphery (World Bank 2017; IOM 2018).

It is crucial to realize that the export of the workforce, i.e., the export of the most critical commodity characterizing the capitalist mode of production, labour power, underlies the materialization of a new international division of labor along the South–North axis. This, in turn, implies the advent of new and extreme modalities of unequal exchange. Regardless of the centrality that the concept of unequal exchange had in past decades to explain the dynamics of unequal development, the nature of the ties between core countries and emergent or peripheral countries (as conceived by the Economic Commission for Latin America, ECLAC, as well as among

dependency theorists) demands its inclusion in the analysis of contemporary capitalism. It is important to keep in mind that most of the debate on unequal exchange was and remains limited to an analysis of the international division of labor that places the periphery in the role of source for raw materials and the developed countries as the providers of industrialized goods. And although this division remains relevant for a significant number of peripheral countries, it has stopped being exclusively a feature of new North–South relations. Some recently industrialized peripheral countries – principally in Asia – ever more frequently play the role of providers of industrialized goods. Even more important is the fact that, to this classic mode of unequal exchange, a new factor has been added in the age of neoliberal capitalism, and one that is increasingly playing a key role: the direct and indirect export of the workforce.

In order to analyze this factor, with its dual fronts, it is important to note that these mechanisms of unequal exchange are more disadvantageous to the periphery than the exchange of raw materials for manufactured goods. On the one hand, the indirect export of the workforce, associated with the participation of peripheral nations in adding value to global commodity chains, carries with it a net transfer of profits abroad. This represents an extreme form of unequal exchange, which implies a transfer abroad of practically the total surplus generated by the workforce employed in the maquiladoras, or assembly plants, in the export processing sector. This mechanism, which revives the logic of the export enclave, inhibits any economic growth and development derived from the export process performed under the guise of manufactured exports, by the peripheral nation. In fact, its key contribution to the process of national accumulation is limited to a meagre income flow from low wages that, in the best of cases, contributes to a small multiplier effect by way of consumption. Even more, the installation and operation of assembly plants in peripheral countries are usually supported through generous subsidies and tax exemptions, which put the weight of reproducing the workforce on revenue-strapped governments of the Global South, while imposing collateral

damage through precarious labor markets and environmental degradation.

Another aspect of the indirect export of labor power, which has begun to gather force in the context of peripheral or emerging countries, is the creation of joint scientific–technological complexes, as we have seen, in the restructuring of innovation systems in some of the more developed countries, with the United States in the lead role. By way of these complexes, which function under subcontracting arrangements, associations, or other forms of partnership, intangible benefits are transferred abroad that have a value and a strategic significance beyond the net profits accruing from the maquila and assembly plants. We refer to the transfer of development and technical capabilities, which takes the form of competitive advantages and extraordinary profits, from South to North. The knowledge and technical skills that have historically played a central role in the transformation of peripheral economies to developed ones are now captured by the Global North through the new geography of innovation.

On the other hand, the direct export of the workforce, via labor migration, implies a transfer of the anticipated future benefits that arise from the costs of training and social reproduction of the workforce that emigrates. These costs – as the case of Mexico has shown – are not compensated in the flow of remittances (Delgado Wise et al. 2009). On the contrary, in a more profound sense, this transfer implies the loss of the most important resource for capital accumulation in the country of origin: its workforce. Furthermore, the export of the highly skilled workforce exacerbates this problem by seriously reducing the sending country's capacity to innovate for its own benefit and drive its own technology-intensive development projects.

To analyze these new modes of unequal exchange presents theoretical, methodological, and empirical challenges, which require changes in the perception and characterization of categories typically used to interpret contemporary capitalism. Without disregarding the significant contributions of ECLAC to advance the understanding of these new modes of unequal exchange, it is important to bring to bear Marxist

theories of unequal exchange in its dual aspects. In both a strict and a broad sense, these theories provide a solid and fertile conceptual basis upon which to advance the conceptualization of the emergent modes of unequal exchange, implied by the direct and indirect export of the workforce (Emmanuel 1972). On the one hand, unequal exchange, in the strictest sense, places wage differentials (or differentials in surplus value) derived from barriers to population mobility at the center of the analysis. On the other hand, unequal exchange, in the wider sense, expands those differentials to include value emanating from diverse compositions of capital, such as the differentials arising from scientific and technological progress (Críticas 1979). We take into consideration that the internationalization of capital in the framework of neoliberal globalization seeks incessantly to lower labor costs – including those relating to the highly skilled workforce – while maximizing the transfer of surpluses generated from that labor from peripheral to core countries, which is the purpose in taking advantage of wage differentials in the first place.

Another key piece of this plot is the unbridled growth of social inequalities at previously unimaginable levels: "Currently, the richest 1% of the world's population possess more wealth than the other 99% of people on the planet. Their power and privileges are used to manipulate the economic system and widen the gap, stealing hope from hundreds of millions of poor people" (OXFAM 2017).

Forced Migration in the Era of Generalized Monopolies

According to recent United Nations (UN) figures, there are 258 million international migrants (UN 2017) and 750 million internal migrants worldwide (Swing 2015). This implies that one out of every seven and a half inhabitants and nearly one of every four members of the working class is a migrant, in most cases exposed to vulnerable, discriminatory, and precarious labor conditions (ILO 2015a). Regardless of the strategic importance of this phenomenon, migration studies and

public perceptions of human mobility are fraught with myths that distort reality under a unilateral, decontextualized, reductionist, and biased view. The recent refugee crisis in Europe has hardened this narrative and exacerbated the problematic and challenges posited by migration in the international arena.

The dominant political and research agendas in the field tend to reproduce – not disinterestedly – much of the prevailing mythology, ignoring the context in which contemporary migration takes place and its root causes. They assume human mobility is a free and voluntary act oblivious to any kind of structural conditioning and/or national or supranational agents. The multiple economic, demographic, social, and cultural contributions made by migrants to host societies and nations are often ignored, hidden, or even distorted, regardless of their legal status and categorization (economic migrants, refugees, asylum seekers, etc.), to the point where the former are portrayed as a socioeconomic burden for destination countries and in times of crisis are turned into public scapegoats. Moreover, this narrative has yielded significant dividends in the political-electoral arena, opening a broad avenue for the rise of extreme right and neo-fascist regimes in various countries and regions across the world.

In this regard, it is crucial to realize that in the current capitalist context, migration has acquired a new and fundamental role in the national and international division of labor. Uneven development generates a new type of migration that can broadly be characterized as *forced* migration. Although the conventional concept of "forced migration" does not apply to all migrants (Castles 2003), the most current migration flows are forced *displacements* and therefore require a more accurate descriptor. In the field of human rights, the term "forced migration" refers specifically to asylum seekers, refugees, or displaced persons. From a dominant perspective, most migrants cannot be grouped under this category since these population movements are supposedly carried out voluntarily and freely. However, it is a fact that the dynamics of uneven development have led to structural conditions that foster the massive

migration of dispossessed, marginalized, and excluded populations. People are literally expelled from their places of origin and are compelled to search for access to means of subsistence or at least minimal opportunities for social mobility. Under these circumstances, migration has essentially become a *forced* population displacement encompassing the following modalities (Delgado Wise and Márquez 2009):

1. *Migration due to violence, conflict, and catastrophe.* Social, political, and communitarian conflicts, natural disasters, major infrastructure developments, and urbanization can severely affect communities, social groups, families, and individuals, to the point of forcing them to abandon their place of origin and sometimes their country. This category includes refugees, asylum seekers, and displaced persons. These modalities, which tend to mainly affect populations in the Global South, have been acknowledged in international law and there are protection instruments in place. According to the United Nations High Commissioner for Refugees figures, there are 65.6 million people affected worldwide, including 22.5 million refugees, 40.8 million internally displaced, and 3.2 million asylum seekers (UNHCR 2015).

2. *Human trafficking and smuggling.* This modality of forced displacement has increased at an alarming rate in recent years, becoming a highly lucrative business due to the restrictive policies of receiving countries and increasing hardship in less developed ones. Human trafficking is associated with coercion, abduction, and fraud and includes sexual exploitation and illicit adoptions among other serious violations of human rights. The global response to the sustained increase in this form of criminal activity – which has become an increasingly profitable activity for organized crime – includes the United Nations' Convention against Transnational Organized Crime, signed in Palermo in the year 2000, and the subsequent Protocol to prevent, suppress, and punish trafficking in persons, especially women and children. It is estimated that at least 21 million people are currently engaged in forced labor because of internal and international human trafficking (ILO 2015b).

3. *Migration due to dispossession, exclusion, and unemployment.* As argued in this section, the most current labor migration falls under this category, which is characterized by extreme vulnerability, criminalization, discrimination, and exploitation. It is by far the largest category of forced migration encompassing around 600 million international and internal "economic" migrants. Instead of adequately categorizing the problems and risks to which these migrants are exposed, they are generally subsumed under the notion of "economic migrants," which assumes they travel in a context of freedom and opportunities for social mobility in transit and destination countries, ignoring the growing vulnerability, insecurity, and forced disappearances to which these migrants are subjected.

4. *Return migration in response to massive deportations.* This is a growing trend in international migration associated with the irregular status faced by an increasing proportion of migrants derived from a State policy by destination countries – not a criminal act. It entails a process of *double* forced migration: they were forced to leave their countries origin and they are forced to return under increasingly vulnerable and insecure conditions.

In a less strict sense, migration due to overqualification and lack of opportunities can be considered as a fifth type of forced migration. It ensues from the restructuring of innovation systems and the structural imbalances in the labor market and limited institutional backing in peripheral countries, which result in many highly qualified workers being unable to find suitable occupational opportunities in their own country. This category of forced migration encompasses nearly 30 million professionals. While these migrants do not face serious problems when moving or seeking to cover their basic needs, they migrate to fulfil their labor and intellectual capacities, even if they are often subjected to labor degradation and wage discrimination in destination countries.

The Global Governance of Migration Under Scrutiny: The Win–Win–Win Fiction

In line with the recognition of the critical challenges propelled by human mobility, the global governance of migration has become a fundamental issue on the international agenda. Contrasting with other transnational issues such as trade and finance, the creation of a UN institutional framework for the governance of migration has followed a complex and uncertain route (Betts 2010).

Derived from the need to discuss pressing issues on the international migration agenda, a broader initiative for building a global migration regime was envisaged at the UN General Assembly with the launching in 2016 of the High-Level Dialogue on Migration and Development (UN-HLD), conceived as a formal event with a strong emphasis on policy issues that would be held at the UN headquarters every 7 years. The first HLD gave rise to the creation of a yearly state-led, nonbinding, related forum, alternatively hosted by a migrant-receiving and a migrant-sending country: the GFMD. To provide institutional support for this emerging process, the UN Secretary-General created an interagency coordinating mechanism, the Global Migration Group, integrated by 15 entities of the UN system "to promote the wider application of international and regional instruments and norms relating to migration and to encourage the adoption of more coherent, comprehensive and better coordinated interagency approaches" (IOM 2017). It is important to note that the World Bank stands as a key member of this group – as well as many other UN initiatives – playing a leadership role in establishing the dominant framework within which the debates surrounding the migration-development nexus have been entrenched.

In September 2016, the UN General Assembly formally designated the International Organization for Migration (IOM) as the UN migration agency. On that occasion, the New York Declaration for Refugees and Migrants was adopted by its 193 Member States, giving rise to an intergovernmental consultation and negotiation process that culminated with the adoption of a global compact for safe, orderly, and secure migration in December 2018.

To varying degrees, this process has been dominated by a perspective which envisions family remittances as an essential tool in the development of migrant-sending, peripheral countries. This perspective is essentially one-sided, decontextualized, and misleading. It overlooks the context in which contemporary migration is embedded, and disregards human and labor rights as central and intrinsic elements of coherent migration and development policies, as well as the exploitation, social exclusion, human insecurity, and criminalization suffered by international migrants. In addition, it masks most of the fundamental contributions made by migrants to the destination countries and ignores the costs of migration for the countries of origin, costs that greatly outweigh the overemphasized "positive" impact of remittances (Delgado Wise 2018).

Despite the insistence of international bodies and governments regarding the alleged positive effects of migration and remittances as detonators of development in countries of origin, there is no empirical evidence to warrant this assumption. Among the cardinal elements of the dominant discourse, we can mention remittances, microfinance, human capital (a term that reflects a narrow economistic view), and, perhaps more importantly, the pretention to govern or manage migration without changing or even mentioning its root causes.

It is worth adding that the practices and discourses under the label of *migration management* advocated by the World Bank, the IOM, and other multilateral agencies have been promoted through new narratives that distort reality, depoliticize migration, negate the existence of divergent interests or asymmetries of power and conflicts, and promote an unsustainable and incoherent triple-win scenario in favor of the interests of the migrant-receiving countries, and more specifically, the large MNCs rooted in such countries. In this view a "good migrant," regardless of his or her status and condition, is respectful of law, flexible to market needs, and eager to contribute to the

development of his or her country of origin (Geiger and Pécoud 2010).

Toward an Alternative Agenda: Resistance from Below

The development of social alternatives must address two fundamental aspects. The first one has to do with deconstructing the power of capital and the state – a constituent, structural power that acts as a hegemonic force that must be confronted. Not doing so will nullify any attempt to develop alternatives and justify illusory, naïve, and irrelevant positions. The second consideration involves detecting points of weakness or rupture, or spaces from which subordinate social segments may generate social transformation alternatives. This challenge is at the center of the debate between those who attempt to achieve social change without seizing power (e.g., by limiting change to institutional reform or developing noncapitalist economic forms of organization within capitalism) and those who propose the need for a thorough change: another world, a different economy and society, and a social transformation process that is more equitable and socially inclusive, and sustainable in terms of both the environment and livelihoods. Without going into details, it must be stressed that, from a South-based perspective, the current social order (or disorder) is perceived as an unfair, inhumane, and predatory system: there is a need for counter-hegemonic alternatives.

From a critical perspective (that is to say, one that questions the institutional structure of neoliberalism and, more fundamentally, the structural dynamics of capitalism and imperialism in order to promote social alternatives that benefit the majority of the population), resistance from below – not passive or reactive, but transformative in essence – is understood as a process of social construction that starts by creating awareness: the need for change, organization, and social participation in order to generate a popular power that can then strive for social emancipation. This involves eschewing socially alienated relations that deprive people of their merits, destroy the environment, and damage social coexistence.

As revealed by Marx's analysis of the Paris Commune (Marx 1968 [1871]), revolutionary transformation is not something that can be derived exclusively from theoretical reflection: it is nurtured by the experience of revolutionary struggle and the resistance of popular movements against each and every advance of capitalism, and the systematization of these experiences in a dialectical learning process. In this regard, there are important lessons derived from the theory and practice of social movements in Latin America – particularly, the Zapatista movement (Delgado Wise and Martínez 2017) – that are of special relevance for our analysis. First, the social transformation process must be centered on human life and conceived in opposition to capital and its demand for the highest possible profits. The realization of this first element is necessary but not sufficient, since it can remain in the realm of abstract humanism. Real human development requires social conditions that can enable equity and social justice on all social and spatial levels. Sustainability requires, in turn, that the strategy of development be feasible, realistic, and long-lasting, with solid social, political, economic, cultural, and environmental foundations. This implies the need to redirect the development of productive forces toward what may be conceived as an *alternative modernity*, i.e., the "… possibility of a non-capitalist modernity... [which] would not be an unfinished project; it would be, rather, an ensemble of possibilities explored and updated only from one perspective and in only one way, and be prepared to approach from another side and illuminate with a different kind of light" (Echeverría 2011, p. 70). It essentially means to foster an alternative development of the productive forces that privilege their use value and which are in harmony with nature.

Second, human development cannot be defined *ex ante* as a globally applicable model; it is not a prefabricated, one-size-fits-all design. It requires proposing and specifying concrete strategies, having initially addressed structural barriers, institutional restraints, local peculiarities, regional cultures, and the practices of involved social actors. In this vein, the Zapatista movement has envisioned an emancipatory future that could be summarized in a simple but eloquent concrete utopia: to build a *world encompassing many worlds*.

To round-up the argument, the current model of world accumulation and its power system cannot be dismantled nor shifted without the development of an autonomous and independent social power. There is currently no collective agent that can confront the power of the major MNCs, imperialist governments and their armies, international financial organizations, and the associated actors that provide them with ideological, diplomatic, and political support. There have been, however, major local, domestic, and international efforts to organize social groups and movements that have defended their rights from the neoliberal onslaught and proposed some alternative ideas and projects. Resistance from below is expanding and growing on the local, national, and, above all, international levels. The forging of a counter-hegemonic social power is advancing and cannot be postponed, as evidenced by initiatives such as the International Peasant Movement: La Vía Campesina, the World Social Forum, the People's Global Action on Migration, Development and Human Rights, and the World Social Forum on Migrations, among others.

The conclusion that we draw from the analysis is that the capitalist system in the current conjuncture is facing an epochal or civilizing crisis that necessarily weakens the social and institutional structure of the system, generating forces of change. It is important that in this conjuncture the global working class not take a purely defensive position against the current imperialist offensive, but go on mobilizing the forces of resistance. It is also important that in this counteroffensive the global labor movement be strategic and form alliances with other forces of resistance that share its vision of a world beyond neoliberalism, imperialism, and, ultimately, capitalism.

Definition

This essay describes the expansion, development, and decline of France's second colonial empire (1830–1962), as the nineteenth century saw a politically and economically resurgent France move away from the Western Hemisphere and begin to colonize large parts of Africa and South-East Asia, eventually constructing an empire second only to Great Britain's in size and population. This empire would take many forms, from formal *colonies d'exploitation* in Indochina, French West Africa, and French Equatorial Africa, to the so-called protectorates of Tunisia and Morocco, and, later, to the mandates of Syria and Lebanon. The essay concludes with an examination of the legacies of colonialism in contemporary France.

The Construction of Empire

Like other European nations in the nineteenth century, France had numerous, varied, and contradictory reasons for constructing a colonial empire. Economically, a newly industrialized France sought to monopolize vast sources of raw materials to feed its emerging factories, as well as new export markets in which to sell its growing supply of manufactured goods. Politically, the rising tide of nationalism throughout Europe led French politicians, intellectuals, and social commentators to view imperial expansion as a source of national prestige and even of geopolitical survival. Culturally, many Frenchmen and women saw it as their moral duty to spread "civilization" to the "backwards" peoples of the world. And yet, the harsh if rarely acknowledged reality of imperial rule was its utter reliance on exclusion, racism, and violence. For this reason, throughout its roughly 130-year existence, France's empire drew intense criticism from its colonial subjects. Ultimately, only an end to institutionalized exclusion or, failing that, the use of violence itself would finally bring France's imperial epoch to a close.

As part of its first colonial empire, France's Bourbon monarchy controlled present-day Haiti,

Guadeloupe, Martinique, La Réunion, coastal Senegal, and much of North America. In the mid-eighteenth century, however, this empire began to disintegrate. First, France lost its colony of Quebec to Great Britain in the 7 Years' War (1757–1763). In 1803, amidst the chaos of the French Revolution, Napoleon then sold France's largest landholdings in North America to the USA. Finally, France's most profitable sugar-growing colony, Saint-Domingue, successfully defeated the French army and renamed itself the independent nation of Haiti in 1804.

This essay will focus on France's second colonial empire (1830–1962), as the nineteenth century saw a politically and economically resurgent France move away from the Western Hemisphere and begin to colonize large parts of Africa and South-East Asia, eventually constructing an empire second only to Great Britain's in size and population. This empire would take many forms, from formal *colonies d'exploitation* in Indochina, French West Africa, and French Equatorial Africa, to the so-called protectorates of Tunisia and Morocco, and, later, to the mandates of Syria and Lebanon. Formal colonies entailed direct rule over French imperial subjects; protectorates ceded part of their sovereignty to France while their inhabitants retained their own nationalities. The League of Nations gave France control over newly created mandates after the First World War with the stipulation that France prepare these territories for formal independence in the distant future.

France's most prized asset, however, was the North African settler colony of Algeria, due to its proximity to Europe, its large and diverse European population, and its unique legal status. The invasion of Algeria in 1830 represented the beginning of France's second wave of imperial expansion. From Algeria, the French army would spread south and west throughout much of Africa. To be sure, the initial invasion met with heavy resistance under the leadership of the charismatic young marabout Abd-al-Qadir (1808–83), who organized Algeria's tribal leaders under the banner of an Islamic holy war against the French invaders. According to one contemporary, French soldiers had free reign to "kill all the

men above fifteen, take all the women and children . . . in a word, annihilate all of them who do not grovel at our feet like a dog" (Lucien François de Montaignac, quoted in Crapanzano 2011, pp. 41–42). Only in 1847, after 17 years of fighting, did the French ultimately quash Abd-al-Qadir's resistance. Nevertheless, from this point forward, Islam would serve as a useful rallying cry for uniting Algerians against colonial rule.

Despite such violence, Algeria's proximity to Europe and fertile coastal farmland rendered it an attractive place of settlement for Europe's laboring and peasant classes. By 1848, amidst a republican revolution in France, the estimated 115,000 Europeans in Algeria convinced the French National Assembly to legally assimilate Algeria to the French metropole. Algeria would henceforth consist of three French departments – Oran, Algiers, and Constantine – each of which would have the right to send French representatives to the French legislature and, theoretically, to govern itself with the same republican institutions used in the metropole. In 1848, the French government also extended limited citizenship to the inhabitants of its "old colonies" in the Caribbean and coastal Senegal. In Algeria, however, French settlers saw the practice of Islam – especially the use of Sharia law – as incompatible with democratic governance, and used this belief to withhold all political rights from indigenous Algerians. Throughout the imperial epoch, Algeria's Muslims had to renounce their Islamic legal and familial status in order to gain French citizenship, a requirement which only a handful of Algerians fulfilled in the 130 years of French rule. (In 1870, the Crémieux Decrees granted automatic citizenship to Algeria's roughly 5,000 Jews.)

The creation of a society based on the racial and religious exclusion of the majority of the population only engendered continued violence. On 1 March 1871, a rebellion broke out in the mountainous northern region of Algeria known as Kabylie. The rebellion stemmed from the extension of French civilian rule over previously self-governing tribal areas, and from a horrific famine in 1867 that caused at least 300,000 Algerian deaths. Led by the young tribal leader Muhammad

al-Muqrani (?–1871), whose call for religious jihad inspired over a million native Algerians, the rebellion occupied the French military until October 1871. In the end, the French crushed the uprising, killed al-Muqrani, and responded with intensified land confiscation of 500,000 ha and total reparations of Ff65 million francs. The rebellion only hardened the French desire never to extend citizenship rights to the Muslim population of Algeria.

France ruled Algeria for 50 years before it looked to expand elsewhere. In the 1880s, however, prime minister Jules Ferry (1832–1893) began a series of colonial wars that consolidated the empire overseas. As Ferry informed the French Senate in 1884, "The considerations that justify the policy of colonial expansion [are] the need for outlets . . . and places of supply, shelters, and ports for defense" (Ferry 1897). These economic and military needs led Ferry and his successors to incorporate Tahiti and Polynesia in 1880, Tunisia and Indochina in 1881, Djibouti in 1885, and Madagascar in 1886. Further, after intense military campaigns in West and Central Africa, France fixed its two largest administrative units to include French West Africa (Senegal, Ivory Coast, Dahomey, Guinea, French Soudan, Mauritania, and Niger) with its capital at Dakar, and French Equatorial Africa (Western Sudan, Gabon, Middle Congo, Oubangui Chari, and Chad) with its capital at Brazzaville.

Again, this effort met with heavy resistance. In the Tukolor Empire of West Africa, the army struggled repeatedly to overcome raids led by Sultan Ahmadu Seku. In Western Sudan (Mali), Samori Touré, leader of the Islamic Wassoulou Empire, rallied 35,000 men in a 13-year campaign against the French military before he was finally subdued in 1898. In France, meanwhile, leaders like Paul Déroulède on the right argued that the military should work to retake the territories of Alsace and Lorraine that it lost in the Franco-Prussian War of 1870 rather than expand abroad. On the left, socialists like Jules Guesde saw imperial expansion as a distraction from working-class politics. In the end, neither could compete with the nationalist rhetoric of prime minister Léon Gambetta, who proclaimed that France "lies not just between the Atlantic and the Alps, the Vosges and the Mediterranean, but wherever there are French interests and wherever French industry and trade are active" (quoted in Conklin et al. 2011, p. 68).

Colonial Administration, the *indigénat,* and the Civilizing Mission

By 1914, France and its empire encompassed 100 million people, 60 million of whom were colonial subjects. These subjects fell under the jurisdiction of about 4,000 French administrators and their indigenous auxiliaries. Beginning in the nineteenth century, the government in Paris divided each colony into administrative units under the rule of a governor general, who in turn subdivided his territory into districts (*cercles*) led by a French civil commander (*commandant*) responsible for collecting taxes, facilitating commerce, and administering justice.

Despite touting a republican rule of law at home, the French instituted a different legal regime abroad. First used in Algeria in 1881, the *Code de l'indigénat* applied exclusively to indigenous subjects and allowed French authorities to mete out arbitrary justice for even the smallest infractions. It was, in the words of one historian, "perhaps the most important element of the administrative tool kit." (Mann 2009, p. 334). Under the indigénat, French officials could administer fines and jail sentences of up to 15 days for offences ranging from travelling without a permit to failing to show proper respect for colonial officials.

Enforcement of the indigénat varied from colony to colony and, because it was never codified, depended on the whim of the local commandant. In 1930s French West Africa, a French official invoked the indigénat to force villagers to wade into the Niger Delta in the middle of the night and slap the water with their hands in order to quiet the incessant din of frogs that interrupted his sleep. Elsewhere, commandants in Senegal applied the indigénat to jail or even physically bind peasants for failing to collect enough peanuts or for growing too much pepper. More prosaically, the colonial regime could require indigenous subjects to

provide unpaid labor every month to build roads and undertake other "public works" to promote trade.

The indigénat, as a "regime of exception," coexisted uneasily with the official justification for French empire, the *mission civilisatrice*. The French used the ideology of the civilizing mission to sell their empire both at home and abroad. The paradox of this ideology stemmed from its two opposing goals: it at once sought to "uplift" France's imperial subjects and assimilate them to French "civilization" and, at the same time, to preserve these subjects' "essential" cultures and traditions. As prime minister Jules Ferry told the Chamber of Deputies in 1883: "Gentlemen, we must speak more loudly and more honestly . . . the higher races have a duty to civilize the inferior races" (Ferry 1897). This duty took many forms. Here, we will consider the mission as it took shape in education, religion, urban planning, and bourgeois culture.

The French saw education as key to the civilizing mission. Despite an almost unceasing stream of educational rhetoric, however, at no time in any French colony did more than 10% of the native population ever set foot in a French school. The handful of colonial subjects who did attend such schools learned primarily that they were racially and ethnically different from their French rulers. On 1920, elementary textbook exhorted students to recite the following: "I live in Africa. I am an African. I have black skin. I belong to the black race. I am a black African". Students then repeated similar statements about the "whiteness" of their French teachers (quoted in Kelly 2000, p. 192). Ultimately, this system of colonial education produced a small cadre of educated elites or so-called *evolués* – some of whom, such as Franz Fanon, Léopold Senghor, and Ho Chi Minh, would later become anti-colonial critics – and a rather larger number of low-level colonial functionaries.

At times, religious missionaries could offer a better, if no less contradictory, educational experience. By 1900, an estimated 58,000 Catholic missionaries had fled anti-clerical persecution in France to open up schools, orphanages, and hospitals throughout the empire. Indeed, despite the growing scorn for Catholic clergy in metropolitan France in the decades before the First World War, one of the leading anti-clerical politicians, Léon Gambetta, could proclaim that "anti-clericalism is not an article for export," especially not to the French colonies, where missionaries provided valuable services for little or no pay (quoted in Ageron 1972, pp. 196–197). The Jesuits, who were expelled from metropolitan France in 1881, continued to work with colonial authorities in places like Madagascar, where they served as geopolitical allies in the fight against English Protestant rivals. Politically naïve missionaries, however, could also invoke the ire of the colonial state. In one notorious incident from 1888, French adventurer Charles-David de Meyréna used missionaries in Indochina as guides through the jungle, eventually proclaiming himself King Marie I of the Sedang tribe, an act that put him into direct competition with French authorities.

In addition to teachers and missionaries, engineers and architects also hoped to use the colonies as laboratories for their own pet projects. By the 1890s, French engineers had set up vast networks of railroads and canals that transported colonial cash crops and resources to coastal capitals like Dakar, Brazzaville, and Algiers on their way to the French metropole. Hubert Lyautey (1854–1934), the governor general of Morocco, undertook what was perhaps the most ambitious engineering initiative. In 1912, he began to capitalize on a lack of building codes and bureaucracy to construct a model "rational" city that could both "civilize" Moroccans and provide a template for urban planning in France itself. To this end, he expropriated property, levied exceptional taxes, and coordinated zoning policies to construct the ideal modern city. Lyautey's project, however, remained dogged by a lack of finances and the stubborn refusal of Moroccans to accept their new built environment. Elsewhere, urban initiatives were designed to separate the French from their colonized subjects. In Indochina, the colonial "hill station" of Dalat provided a refuge from both the tropical climate and Indochinese subjects alike. Similarly, in large cities such as Hanoi and Saigon, colonists built entire French quarters of

F

residential and commercial districts off limits to non-Europeans.

Finally, the civilizing mission entailed attempts to impose European bourgeois culture on indigenous families. This effort provided one of the rare opportunities for French women to actively partake in empire building. Many Frenchmen felt that women's "apolitical nature" and "natural maternal instincts" rendered them perfect vessels for spreading proper notions of motherhood and domesticity to indigenous women (Horne 1998, p. 35). Feminist groups like the Society for the Emigration of Women to the Colonies (established in 1897) or the Society for the Protection of Cambodian Children and Mothers (established in 1926) hoped that Frenchwomen could both keep European men from "going native" and train indigenous mothers in the arts of childcare and housekeeping. French colonial wives like Marie Bugéja actually saw Muslim women as "the fulcrum by which the Algerian Muslim population could be elevated to the level of French civilization" (Bowlan 1998, p. 177). In response, colonial authorities invoked the "degraded" state of women under Islamic law to argue that Muslim men did not deserve political rights or citizenship. Still other commentators contended that the French should respect Islamic law by not undermining a "naturally patriarchal" society. In any event, these claims served to mask very real gender inequalities in France itself.

In the end, whether in the realms of education, religion, industry, or family values, the civilizing mission repeatedly ran up against the reality of economic imperatives. For only through the use of authoritarian rule and forced labor could French officials coerce colonial subjects into contributing to an economic system that redounded only to the benefit of the French themselves.

First World War and the Inter-War Years

The First World War (1914–1918) marked a turning point in the history of the French Empire. For the first time, the war effort required that large numbers of colonial subjects come to the metropole itself. Ultimately, this experience would provide many of them with a first-hand glimpse of the rights and privileges enjoyed by French citizens on European soil. These men would in turn draw on French traditions of liberty, fraternity, and equality to demand an expansion of their political and social rights. Only when this effort failed did many begin to demand full independence for themselves as members of new nation states.

Despite not enjoying the rights of citizens, colonial subjects owed both taxes and military service to the French state. In 1914 the military enlisted upwards of half-a-million colonial soldiers, or *troupes indigènes*, and 220,000 colonial laborers to contribute to the war effort. Colonial workers received less pay, put in longer hours, and became the objects of more intense scrutiny than their European counterparts. French authorities worried in particular over the inevitable interracial intimacies that arose between Frenchwomen and colonial men, as such relationships reversed the customary colonial practice of Frenchmen taking indigenous concubines. As a military censor noted in 1917, for a colonial man to have sex with a French woman "was not only a pleasure . . . but also a form of vengeance" (quoted in Fogarty 2009, p. 54). To keep knowledge of such subversive relationships from spreading to the colonies, French censors worked tirelessly (and illegally) to read and confiscate the mail sent home from France by colonial soldiers and workers.

The war's end led to further unexpected changes for the empire. First, the newly created League of Nations granted France "mandate" – or tutelary – power over the former Ottoman Empire's territories of Syria and Lebanon. Second, France now had to confront the prospect of thousands of colonial subjects remaining in the metropole. Although nearly 80,000 colonial soldiers lost their lives fighting for France, their service and continued presence only heightened the public's fear of interracial relationships and "racial degeneration." French author Ludovic Naudeau warned that immigration from the colonies would "blur the boundaries between the ruler and the ruled," adding further that, "France will not sustain our place in the world if we do not

remain what we have always been: a white nation" (quoted in Camiscioli 2005, p. 228). Such anxiety led to a new citizenship law in 1918 requiring colonial subjects to prove that they and their families were "accustomed to a French lifestyle and education" before gaining French citizenship (Conklin 1998, p. 75).

Despite such trepidations at home, the demographic and economic losses of the war only bolstered efforts to consolidate French influence abroad. On the most fundamental level, the empire finally began to make economic sense. By 1939, France aimed fully 40% of its exports at the colonies, which in turn accounted for 37% of its imports. Much of this trade resulted from an increased emphasis on colonial *mise en valeur*, or rational economic development of agriculture, infrastructure, and social services. To be sure, the economic benefits of such development continued to elude the large majority of colonial subjects.

To tout the supposed success of this new policy, Paris hosted the ostentatious European Colonial Exposition of 1931. Organizers provided European tourists with "authentic" recreations of the "natural habitats" of colonial subjects, accompanied by images of the massive public-works projects undertaken by the French government to modernize such habitats. As the exposition's official guidebook boasted, "for the first time in Paris, Morocco appears to us in its entirety" (Anon 1931, p. 87). Tourists could also dine at food stalls "served by indigenes themselves." The event's centrepiece, a full-scale reconstruction of the Cambodian temple of Angkor Wat, depicted the glorious but supposedly long stagnant history of Indochina. Ultimately, such pavilions portrayed an ahistorical colonial culture in order to demonstrate the superiority of French civilization and the necessity of spreading it abroad.

And yet, the inter-war years also saw a handful of intellectuals from Africa and the diaspora embrace this caricatured portrayal of their supposedly static and irrational culture and use it to push for French citizenship. Léopold Senghor (1906–2001) and Aimé Césaire (1913–2008) helped found the largest such movement, Négritude. Writing in journals like *La Revue du Monde Noir* and *L'Etudiant Noir*, Senghor and Césaire hoped to probe the limits of European reason and the capitalist and exclusionary society it fostered. Senghor, like many other colonial intellectuals, received an elementary education from French missionaries near Dakar and later graduated from the University of Paris. Drawing from elements of both Surrealism and Marxism, his poetry valorized unreason, instinct, and emotion as necessary antidotes to Western individualism. Similarly, Césaire, a French-educated poet and dramatist from Martinique, rewrote African history in a triumphalist narrative in an attempt to rescue it from decades of European condescension, which itself had provided the ideological foundation for the civilizing mission since the 1880s.

Finally, a handful of Algerian intellectuals in the inter-war years began to contemplate the idea of full independence from France. To attenuate such demands, France's coalition of leftist parties known as the Popular Front, led by Léon Blum, drafted the Blum-Viollette proposal in 1936 (named after Algerian governor general Maurice Viollette). The bill would have extended citizenship to French-educated Algerians while still allowing them recourse to Islamic law in social matters such as divorce, child custody, and inheritance. Although the proposal would have only enfranchised 21,000 out of 5 million native Algerians, the colony's European community (later known as the *pieds-noirs*, or "black feet") stymied the move before it could even come to a vote in the National Assembly.

Regardless, Algerian activists like the young Messali Hadj (1898–1974) rejected the bill for not going far enough. Messali, an Algerian of Turkish origin who resided in Paris, founded in 1926 the first modern movement for Algerian independence, known as the Étoile nord-africaine (North African Star). The group called for freedom of the press and association, universal suffrage, and an increased focus on Arabic schools in Algeria. In 1927, Messali attended the Anti-Imperialism Congress in Belgium, where he met Ho Chi Minh and won initial support from the French Communist Party. In 1929, however, the government banned the *Star* and Messali lost communist

support as he narrowed his focus from workers' rights in general to Algerian nationalism in particular. Messali returned to Algeria in 1937 and created the Parti du peuple algérian (PPA) to incorporate the working classes into the independence movement. Although his efforts proved invaluable in organizing both military and political resistance to French rule, in the 1950s the PPA would ultimately be eclipsed by a new, more radical nationalist group known as the Front de libération nationale, or FLN.

Second World War and the End of Empire

The onset of the Second World War marked the beginning of the end of the French Empire. First, Germany's rapid defeat of the French army revealed its relative susceptibility to armed resistance elsewhere. Second, the numerous human rights abuses committed by the Nazi regime only served to galvanize postwar public opinion against similar abuses in the European colonies. Third, for the second time in a generation, colonial troops proved invaluable to the Allied war effort and now saw either more equitable incorporation with the metropole or outright independence as the only forms of just recompense. Finally, once the possibility of equitable integration became more than empty rhetoric, French taxpayers proved less than willing to foot the bill for extending metropolitan labor laws, healthcare, and education to colonial subjects-cum-citizens.

The empire's disintegration began during the war itself and took many forms. After the fall of France to Nazi Germany in 1940, the Free French Resistance movement, spearheaded by General Charles de Gaulle (1890–1970), granted independence to Syria and Lebanon to prevent them from falling into Nazi hands. Next, in September of 1940, the Nazi-allied Vichy regime in France allowed the Japanese military to occupy the colony of Indochina. Elsewhere, the majority of French colonial administrators remained loyal to the Vichy regime throughout the war. Only Félix Eboué, the Guadeloupe-born governor of Chad and the only black governor in France's entire empire, worked to aid the French Resistance effort.

At the war's close, France sought to salvage the remnants of its empire by granting significant concessions to its colonial subjects. These concessions marked a shift in the very conception of empire – from the belief that "colonies were supposed to pay the costs of their own repression" to the concept that colonies formed an integral part of France and as such deserved access to metropolitan social benefits (Cooper 2003, p. 5). In 1946, a newly formed constituent assembly invited elected deputies from throughout the empire to help draft a new constitution for the Fourth French Republic. In the ensuing debate, representatives like Lamine Guète from Senegal and Félix Houphouet-Boigny from the Ivory Coast succeeded in abolishing the notorious indigénat legal code. In addition, Réunionnais deputies Raymond Vergès and Léon de Lepervanche joined with Caribbean deputies Gaston Monnerville and Aimé Césaire to push for and win full integration of the old colonies of La Réunion, Guadeloupe, Martinique, and Guiana as French overseas departments (*départements d'outre-mer*, or DOM). As such, departmental prefects now replaced governors general to bring the former colonies more in line with metropolitan departmental administration. Finally, the resulting constitution of 1946 officially renamed the French Empire the French Union and granted all colonial subjects the opportunity to join the Union as full French citizens.

Much of the intellectual fodder for these and later reforms came from activists like Senegal's Aliounne Diop (1910–1980), an early member of the Négritude movement who in 1947 founded the journal (and, later, publishing house) known as *Présence Africaine*. The journal invited writers from Africa and the diaspora to contribute articles and poetry that rehabilitated African cultures and promoted the liberation or equitable assimilation of peoples under colonial domination. In 1956, editors at the *Présence Africaine* helped to

organize the first international Congress of Black Writers and Artists in Paris. Diop invited Pablo Picasso, whose cubist paintings themselves drew inspiration from African art, to design a commemorative poster for the event. The intellectuals who gathered at the Congress would go on to form the influential Society for African Culture. Overall, the journal, congress, and society all shared the belief that a common cultural identity existed among all peoples of the African diaspora and that this identity had to be celebrated and liberated from European tutelage.

Elsewhere, however, colonial activists unwilling to join the new French Union resorted to violence to win full independence. In 1947, anti-colonial violence flared in Madagascar, where French troops killed as many as 100,000 Malagasy nationalist fighters. This continued obstinacy would lead to two of the most protracted and bloody wars in the history of decolonization: first in Indochina from 1946 to 1954, and immediately after in Algeria from 1954 to 1962.

Organized resistance to French rule in Indochina dated from the 1930s and revolved around the Communist Party and its leader Ho Chi Minh (1890–1969). An attendee at the founding of the French Communist Party in Tours in 1920, Ho organized his own Vietnamese Communist Party and guerrilla forces known as the Viet Minh to reject French rule in the inter-war years. After helping to repel Japanese invaders during the Second World War, Ho established a provisional government in 1945 to negotiate Vietnamese independence with the Allied forces. To his dismay, however, the Allies divided Vietnam at the 17th parallel and returned the southern half to France. In 1946, French military commander Thierry d'Argenlieu then moved to retake the North by bombarding the port city of Haiphong, leading to 6,000 casualties. The Viet Minh retreated to the countryside, where they formed rural guerrilla squadrons to ambush French forces. The decisive battle occurred at the strategic valley of Diem Bien Phu, where in March 1954 Vietnamese General Vo Nguyen Giap began a

2-month siege of French troops. Ultimately, although Viet Minh casualties reached upwards of 30,000, compared to 7,000 for the French, Giap succeeded in taking the valley.

This defeat forced the imperial government in Paris to either commit more troops – an option favored by few – or to concede defeat. In 1954, Pierre Mendès-France was elected prime minister on a platform of ending the war and on 20 July 1954, he signed the Geneva Accords, which granted independence to the Indochinese colonies of Laos, Cambodia, and Vietnam. Again, Vietnam was divided at the 17th parallel, with Ho Chi Minh gaining control of the North and the Catholic politician Ngo Dinh Diem presiding over the South. Ultimately, in an effort to prevent a communist electoral victory in South Vietnam, the US unilaterally cancelled elections scheduled for 1956, thus marking the beginning of American-Vietnamese hostilities that would last until 1975, when a unified Vietnam finally gained independence.

No sooner had France extricated itself from the war in Indochina than it entered another war, this time with its most prized possession. Although Tunisia and Morocco would win independence peacefully in 1956, Algeria, as legally assimilated to the metropole and as home to nearly a million European settlers, presented a more complicated puzzle. Despite his desire to end the war in Indochina, Mendès-France himself asserted that "the Algerian departments are part of the French Republic ... Between them and metropolitan France there can be no conceivable secession" (quoted in Crapanzano 2011, p. 49).

Violence began in 1945, when the end of the Second World War sparked celebrations throughout Europe and the colonies. In the town of Sétif, parades turned into protests as Algerians unfurled banners calling for independence. The French police responded by firing on and killing a number of protesters. Violence quickly escalated and, after 103 pieds-noirs were murdered, the French undertook brutal reprisals that cost anywhere between 6,000 and 45,000 Algerian lives. For nationalists like Ahmed Ben Bella (1916–2012), the Sétif

massacre "succeeded in persuading me in the only path: Algeria for Algerians" (47).

By 1954, Ben Bella and Hocite Ait Ahmed had assumed leadership of the nationalist movement known as the Front de Libération Nationale (FLN) and its military wing the Armée de Libération Nationale (ALN). This consolidation of power entailed the brutal suppression of nationalist rivals in Algeria and France, including Messali Hadj's Mouvement National Algérien. In the so-called Café Wars of Paris, the FLN used military cells to wipe out its Algerian rivals, resulting in as many as 5,000 deaths. When the war moved to Algeria, the FLN's adoption of terrorist tactics drew influence, in part, from the writings of Franz Fanon (1925–1961), a French-educated doctor from Martinique. Fanon argued that colonial revolutionaries must resort to violence in order to overthrow colonial regimes that were themselves founded on coercion and domination.

The Algerian War began on All Saints Day, 1 November 1954, when FLN militants coordinated 30 attacks across Algeria using bombs, fires, and armed combat. These "events" – as the French government labelled them until 1999 – quickly escalated and by 1956 the French had sent upwards of 400,000 troops to Algeria. The FLN targeted French civilians and ambivalent Algerians alike, murdering and mutilating men, women, and children in an attempt to turn the French public against the war and to intimidate hesitant Algerians into supporting independence. The French military, for its part, resorted to systematic torture of anyone suspected of aiding the FLN. Waterboarding, electroshock, and rape all comprised what prime minister Guy Mollet called "extended questioning" tactics. The French public remained largely unaware of such torture until Henri Alleg, a journalist and member of the French Communist Party, published *La Question* in 1958. The book recounted Alleg's own torture at the hands of the French military and helped erode global support for the "events" in Algeria.

The war's turning point came with the 10-month-long Battle of Algiers. The battle began on 30 September 1956, when the FLN recruited three women to detonate bombs in two popular European cafes, the Milk Bar and the

Cafeteria, and in an Air France airline office. Throughout the battle, the FLN imposed a general strike on Muslim workers in Algiers that coincided with the United Nations debate on the escalating crisis in Algeria. Although France won the battle militarily – capturing FLN leader Saaidi Yacef and killing his chief lieutenant Ali la Pointe – it lost the support of global public opinion. Further, when the government in Paris began to contemplate an exit strategy, French generals under the leadership of Jacques Massu took control of the city of Algiers and threatened to stage a military coup to overthrow the government in France itself.

Ultimately, this uprising led to the fall of the Fourth Republic, and on 1 June 1958, a 67-year-old Charles de Gaulle was invited by the National Assembly to form a new government under the name of the Fifth Republic. General de Gaulle immediately visited Constantine to announce his "peace of the brave" plan, which would have allowed Algerians to join France as equal citizens. After FLN leaders rejected this proposal, de Gaulle reversed his position and, in 1959, first uttered the words "self-determination." De Gaulle opened talks with the FLN at the town of Evian in May 1961 and, after a series of stalled negotiations, finally agreed on a ceasefire on 10 March 1962. In an ensuing referendum, 91% of the French electorate and 98% of the Algerian electorate voted for an end to the hostilities and an independent Algeria. Only the pied-noir community and the right-wing terrorist branch, the Organisation de l'Armée Secrète (OAS), continued to support French Algeria.

Despite, or perhaps because of, their refusal to see Algeria as anything other than part of France, Algeria's European community chose to immigrate to France en masse following the ceasefire. The French state welcomed these settlers as "repatriates." For the 200,000 Muslim Algerians who remained loyal to France throughout the war, however, the government proved less accommodating. Known as Harkis, these Algerians scrambled desperately to flee to France and escape FLN reprisals. The French government classified them as "refugees," and ultimately only about half were admitted to the metropole, while as many as

40,000 died at the hands of the FLN in Algeria. In total, historians estimate at least 800,000 Algerians and 25,000 French died during the war for independence.

In Algeria and elsewhere, however, even independence did not end conflicts that began in the colonial era. Further, many Africans continued to favor equitable integration to France over formal independence. African politicians were still debating the issue when, in 1960, the French government itself voted to break formal ties with its federations of French West Africa and French Equatorial Africa. Léopold Senghor, as the first president of an independent Senegal, quickly moved to suppress his more radical rivals and in 1962 imprisoned his prime minister Mamadou Dia (1910–2009) for allegedly planning a coup. Dia – a teacher who had attended the French-run William Ponty School in Dakar – had supported independence long before Senghor, who up until 1958 still hoped to keep Senegal part of the French Union. The two erstwhile allies eventually split over the issue of socialism, as Dia hoped to reform the lucrative groundnut industry that was controlled by wealthy Islamic marabouts previously allied with French business interests. This radical move sparked the alarm of Senghor, who with French support had Dia imprisoned from 1962 to 1974.

Despite the formal end of empire, 2.5 million French citizens continue to live in overseas departments today, and they continue to divide French opinion. In the 1960s, the government in Paris initially hesitated to extend social welfare legislation to overseas citizens because of the continued belief that such people were "naturally poor." Ironically, it was conservatives like one-time prime minister Michel Debré (1912–1996) who, as a deputy from La Réunion in 1963, helped create the Fonds d'Action Sanitaire et Sociale Obligatoire (FASO) to provide subsidized housing, healthcare, and employment opportunities for the largely impoverished indigenous communities. In doing so, Debré hoped to outflank local Communist Party calls for full independence. This "welfare colonialism" (Finch-Boyer 2013, p. 133) remains an attractive alternative to national sovereignty in France's overseas departments today.

Finally, the legacy of empire continues to shape metropolitan France as well. Since 1962, an estimated 5 million postcolonial immigrants and their families have fled to France in search of work or refuge. Most of these immigrants are concentrated in the notorious *banlieus* – or suburban slums – that encircle large cities like Paris and Marseilles. France's 4 million residents of North African origin have in particular struggled to gain acceptance in a society that mandates strict *laicité,* or an absence of religion from public spaces. The right-wing National Front party has famously called for an expulsion of all North Africans – even those born in France – due to their supposed failure to integrate into French secular society. This fear culminated in a 2004 law that prohibited Muslim girls from wearing the headscarf, or "veil", in all public schools. In 2011, a similar ban prohibited Muslim women from wearing face covering veils in any public space whatsoever. As these laws demonstrate, France continues to struggle, as it did throughout its period of imperial rule, to accept cultural, religious, and ethnic differences within its supposed belief in universal republicanism.
